
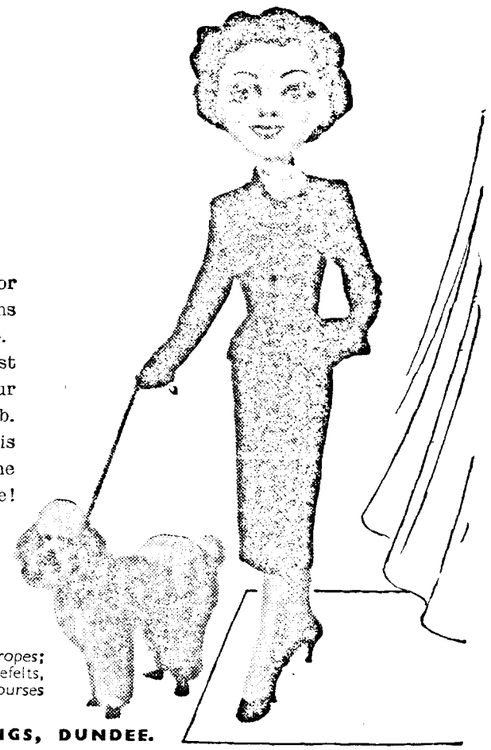
puts her best foot forward

PUT YOUR foot down where you will, you are putting it on jute. For jute lines the lining of your shoes. It backs your carpets. It forms the underside of your linoleum. Surprising, the places jute gets to.

It calls itself twine, hessian, scrim, brattice cloth. It is best known, perhaps, as sacks. It is also string and rope. Are your shoulders padded? Your lapels stiffened? Jute most likely does the job.

Astonishing, jute's versatility. How few there are who give this stuff the recognition it deserves. All over the world, every hour of the day, down-trodden, indomitable, jute is hard at work. Hats off to jute!

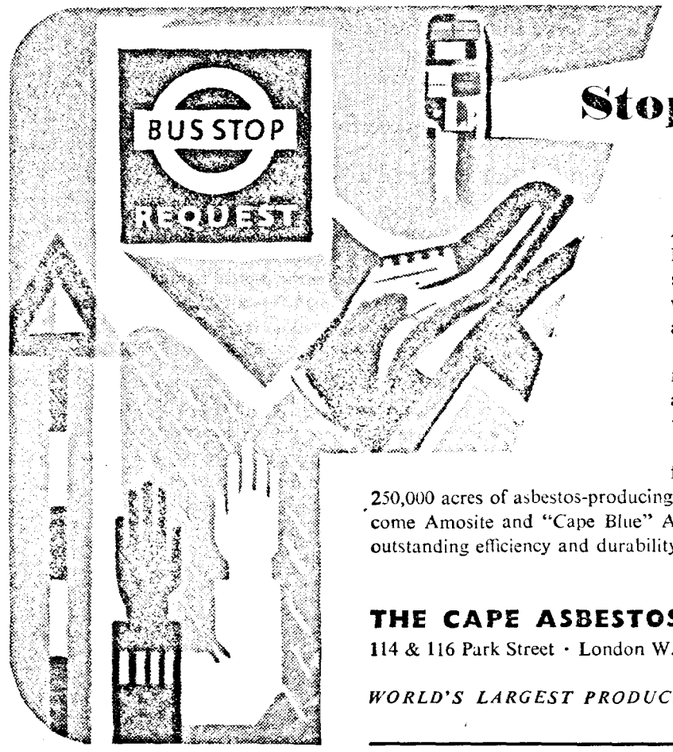


JUTE INDUSTRIES LTD.

There may be an application of jute to your business. Why not write to us:—

— makers of jute bags and sacks; twines, cords and ropes; yarns for woven carpets; cloth for tufted carpets and needlefelts, for backing linoleum, for tarpaulins; roofing felt, damp-courses and plasterers' scrim; webbing; and cotton belting.

JUTE INDUSTRIES LIMITED, MEADOW PLACE BUILDINGS, DUNDEE.



Stopping the bus

A hand is raised, a foot goes down. Seven tons of loaded bus come swiftly, surely, safely to a standstill. It happens thousands of times a day, almost without a thought—yet not without considerable assistance from Cape Asbestos.

CAPASCO moulded brake linings, which are fitted to London buses and coaches as well as to a high proportion of all British heavy commercial vehicles, are made by The Cape Asbestos Company.

"Cape" today is a group organisation embracing factories in many countries and owning more than 250,000 acres of asbestos-producing properties. From our own South African mines come Amosite and "Cape Blue" Asbestos whose special qualities contribute to the outstanding efficiency and durability of the range of "Cape" manufactured products.

THE CAPE ASBESTOS COMPANY LTD.

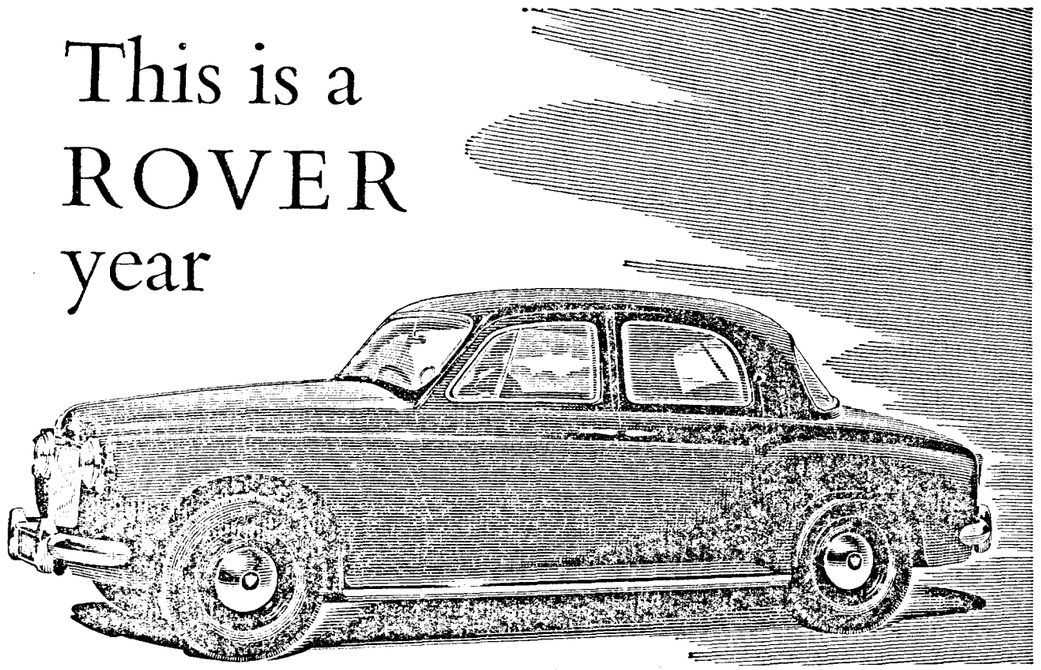
CAPE

WORLD'S LARGEST PRODUCER OF AMOSITE AND BLUE ASBESTOS

This is a ROVER year



To the improved versions of the three existing models are now added two exciting new-comers—the 105R with fully automatic transmission, and the 105S, the most brilliant performer ever to come from Rover. With free-wheel, automatic overdrive and fully automatic 2-pedal transmission to choose from, and overall design improved by a new front contour, this is indeed a Rover year.

THE NEW FIVE-CAR RANGE

● **THE 2-LITRE 60, THE 75 AND THE 90** These well-established models are now all available with automatic overdrive as an optional extra. This is an alternative to the free-wheel on the 2-litre 60 and 75, and gives a higher maximum speed and fast, silent cruising at low engine speeds, with a consequent reduction in engine wear and petrol consumption. Top gear flexibility, so valuable when driving in traffic, remains unaffected.

● **THE ROVER 105R** A new luxury car fitted with ROVERDRIVE — fully automatic, 2-pedal transmission with built-in automatic overdrive. Whether for effortless driving in traffic or restful long distance touring, this 105R is a notable addition to "Britain's fine cars".

● **THE ROVER 105S** Powered by the same 105 b.h.p. twin carburettor engine as the 105R, this model has a conventional transmission system with automatic overdrive. The result is the liveliest Rover in the range, with superb acceleration that few cars on the road can match.

By Appointment to Her Majesty Queen Elizabeth II Manufacturers of Land-Rovers The Rover Co. Ltd.

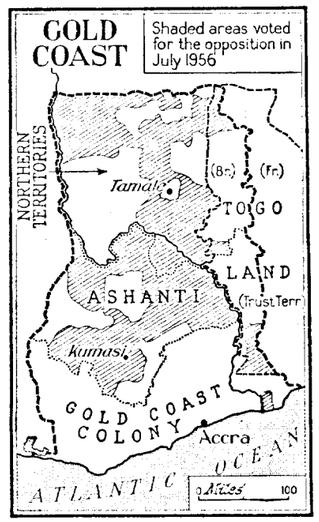
state, and one that is specifically to be a member of the Commonwealth.

This is momentous—but it leaves the question of an agreed constitution completely out of account. The constitution is for the Ghana single-chambered parliament to enact (and Dr Nkrumah's government commands 71 out of 104 seats in that parliament). No clauses for the protection of minorities are entrenched in the bill, no hindrance to changes in Ghana's constitution by simple majority vote, and there are none of the checks of a federal constitution. It is this lack of safeguards which the Gold Coast opposition still finds unacceptable. The opposition members from Ashanti and the Northern Territories utterly distrust the paper guarantees in the proposed constitution (which, indeed, offers rather less devolution than was proposed by Sir Frederick Bourne, and fewer safeguards for chiefly rights). The opposition is particularly dissatisfied with the safeguards for an independent judiciary and civil service. Despite lengthy conferences, the division between the different provinces of Ghana is as great as at the time of the general election last July.



There are now ominous rumours that Ashanti and the Northern Territories are preparing to secede on March 6th, the date for independence; they are even said to be organising a frontier guard. This may be a desperate bid to get the British Government to intervene even at this late stage; opposition leaders have pressed for a visit from the Colonial Secretary or even a parliamentary delegation. The formal answer to this agitation is likely to be that Ashanti at least has no legal justification for secession, since it was originally conquered, not taken over as a protectorate by treaties. But Dr Nkrumah and Mr Gbedemah should reflect before they drive the opposition to desperate measures. Even if they have the right to enforce sovereignty after March 6th, they would have to do so with troops and police mainly recruited from the North; these troops, incidentally, are led by British officers, who could be put by secession in a very equivocal situation.

Murder More and Less Foul

So far it is the abolitionists who have done most of the talking in the committee stage of the Government's Homicide Bill. Last week, they moved amendment after amendment seeking to make it easier under the first part of the bill for a person to be convicted of manslaughter instead of murder. They thus tried to make the clause abolishing "constructive malice" wider than it stands; they tried to remove the limitations attached to "abnormality of mind" and remove from the defence the onus of proving that an accused person's mental responsibility for his acts was diminished by such abnormality; and they tried to do away with the criterion of the "reasonable man" in the clause relating to a defence of provocation.

All these amendments the Government stubbornly resisted, and its spokesmen were equally adamant this week both about abolitionist amendments to restrict the murders for which the death penalty will be retained and about a retentionist amendment to extend it to murder with rape. Ministers have adopted this attitude, not because there was no substance in the abolitionists' arguments, which in some respects at least tried to make the bill less chancy and anomalous, but because they realise that their only hope of pushing through their compromise measure is to compromise no more. Thus in the committee stage the Government Whips have been on; the amendments were moved in a practically empty House; and when the divisions came members crowded back to vote for or against amendments which they had not heard explained. The Government's reaction to the result of the free vote on capital punishment in the last session has been to make sure that on this bill no member should cast a free or thoughtful vote at all.

The only satisfaction, in fact, that the abolitionists can draw from the Government's determination to steamroller the bill through the Commons is that the other retentionist amendments, when they come, seem likely to be as flattened as completely as their own. The Home Secretary made it quite clear in rejecting the first relevant amendment (about murders after rape) that the criterion for deciding which murder shall attract the death penalty is the maintenance of law and order—or rather what the police think is necessary to maintain law and order. The Government has no intention of doing what the Labour Government attempted to do in 1948: to distinguish between one murder and another on the basis of how heinous they are.

Progress or Repression in Cyprus?

The sudden wave of optimism last weekend over the prospects of a Cyprus settlement is not easy to explain. It is true that on his return from New York last week Mr Karamanlis, the Greek prime minister, made a moderate statement of policy on Cyprus to the Greek parliament, and that although he was attacked for his moderation, he seems to remain firmly in the saddle. Apart from this there are only rumours and hopes—and depressing news from the island itself.

One rumour said that the British Government intended to consult Archbishop Makarios about the Radcliffe constitution; it has been firmly knocked on the head by a Colonial Office spokesman. There has been a feeling that the Turkish attitude was softening; but no positive sign of this has appeared yet. Another rumour said that the Radcliffe constitution would prove to be "remarkably" liberal, and it has been suggested that the visits to London of the British ambassadors in Athens and Ankara portends a really serious

effort by the United Kingdom Government to break the present deadlock.

These last suggestions may even be true. But unfortunately the authorities on the island have not improved the chances of a sympathetic reception by the Cypriots of any new proposals that the Government may produce. The severe new security measures include a mandatory death penalty, not merely for the discharging of firearms or the throwing of bombs, but for carrying or manufacturing weapons, or even consorting with those who carry arms, if it is believed that the accused has helped the terrorists or intended to help them. Moreover, a new press law virtually destroys the remnants of a free press in Cyprus ; no doubt it is aimed at isolating Eoka, but it will make it difficult for the islanders to discuss Lord Radcliffe's constitution adequately.

Admittedly the ugly upsurge of terrorism in recent weeks is a great temptation to the authorities in Cyprus to sharpen the weapon of repression still more. But the weapon is double-edged. Experience has shown that it destroys the good will of the ordinary Cypriot for the British more effectively than it destroys Eoka ; and to preserve that good will, if any is left, is just as important as to destroy Eoka. If the authorities really believe, as they insist, that they can wipe out the terrorist gangs once they get enough troops properly trained for the job, why make still more difficult the political settlement which will have to follow?

"Facilities" in Ceylon

MR BANDARANAIKE has expressed himself as very pleased with the course of the latest talks about base facilities in Ceylon, but there still seem to be some details to be tidied up, and an agreed statement has yet to be issued. There is nothing surprising about that ; what is remarkable is that the talks have proceeded so quietly against the

Some Proposals for Local Finance

LOCAL government has become far too dependent upon grants from the central Government. The Government is now the senior financial partner in local affairs, contributing in 1954 £414 million in grants compared with only £378 million raised from the rates. This is an unhealthy situation. Administratively, it means excessive central controls over local expenditure, which waste the time of experts both in Whitehall and town hall. Democratically, it leaves councillors with the feeling that all really important decisions are taken in London where the money comes from.

Mr Sandys is shortly to announce his own proposals for the reform of local government finance. Those who hope that these proposals will be radical have just received support from the publication of a far-reaching plan by an expert study group of the Royal Institute of Public Administration.* As a first step, the group recommends the ending of industrial and agricultural derating. But it recognises (as all who have studied the subject have done) that even if this were done rates would remain a relatively regressive and inelastic tax. To secure a real measure of financial independence for the local authorities, the group recommends that rates should be supplemented by three new sources of local revenue :

(1) The group's first and strongest recommendation is for the introduction of a strictly limited type of local income tax. The local authority would levy a tax at its discretion up to a maximum rate of 3d. in the £ on personal incomes ; because of its small size no exemptions or allowances would be necessary. In the case of wages and salaries, collection would be simple. Employers would be responsible for deducting the tax and paying it to the local authority in whose area they operated. (To divide up the tax according to the areas where employees lived would of course be far more complicated. This part of the proposal closely resembles the "payroll" taxes in force in many American cities, and would be perfectly simple and feasible. But the group also suggests that the local authority should utilise (on a confidential basis) the assessments of business and professional profits made by the Inland Revenue, and that it should require separate individual returns for all investment income in excess of £100. The last part of this plan seems far too complicated ; if any action were taken along these lines it would be better to confine the proposal to a small payroll tax, plus possibly a small tax on business turnover or gross receipts.

(2) Secondly, the group recommends that the right to levy entertainments tax should be transferred from the Treasury to the local authorities. Administratively, this change would be a simple one. But Mr Macmillan would certainly have to precede it by his promised review of the whole structure of this tax —including a final codification of the various discriminations intended to encourage "live" entertainment.

(3) Similarly, the group suggests that the levying of motor vehicle licence duties should be transferred to the local authorities. As the local authorities already collect these duties on behalf of the Government, the change makes administrative sense. But the registration of large fleets of lorries in particular areas might give some local authorities an undue advantage—unless such fleets were required to be centrally registered and the proceeds shared.

It is estimated that a local income tax, at the level suggested, might raise about £150 million a year. Entertainments tax at present yields about £40 million, and motor licence duties £80 million. Rerating of industry and agriculture would provide (at present rate levels) another £115 million. Taken together, these four additional sources of revenue would theoretically enable local government to raise almost all its own revenue.

★

It is most unlikely that Mr Sandys will look at anything as radical as these proposals. But he ought to look at them, at their advantages as well as their snags. Apart from the usual arguments against disturbance, the main objection to the group's recommendations is that local authorities would benefit very unequally. To spread the benefits as widely as possible, the group suggests that the taxing authorities in all three cases should be the counties and county boroughs. But while the County of London and the large provincial cities would do very well out of a local income tax geared (as this one would be) to the location of employment, the mainly suburban or rural counties would gain very much less. As an offsetting factor, however, the Exchequer Equalisation Grant would presumably be continued as the principal remaining form of Government aid, and its benefits would accrue heavily to the poorer counties.

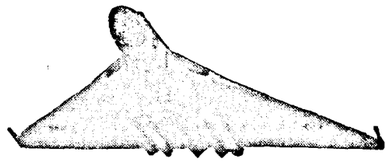
Avro Vulcan

NOW IN SERVICE WITH THE R.A.F.



The Avro Vulcan, the world's first 4-jet delta bomber has entered the Royal Air Force.
Behind the recent Air Ministry announcement lies a brilliant chapter of aeronautical progress that marks the beginning of a new era in Britain's air power.
With its near sonic speed, its great range and altitude and its large carrying capacity, the Vulcan, powered by four Bristol Olympus turbo-jets, is a formidable aircraft.
Add to this its fighter-like manœuvrability, exceptional safety and pleasant handling characteristics and you have the reasons why the Vulcan is the most effective bomber in service today.
But that is not all. The Vulcan has a great development potential.
It has been engineered to allow for new operational requirements which can be met without major alteration to the basic design.
In the tough testing ground of the R.A.F., on routine exercises and on long-range training flights, the Vulcan has already shown its paces.
Like its illustrious predecessors from the Avro stable — the Lincoln, the Lancaster, the Anson, the 504 and many others — the Vulcan is destined to become one of the world's really great aircraft.

offer a saving of £130

YES! At least £130. That's the difference between the normal First Class fares out to 'down under' and home, and the Special First Class return ticket known as 'Boomerang'.

To qualify for this concession simply arrange to sail outward between the 1st of February and the end of May—the quiet season. You can return to Britain between September 1st and December 31st of that same year or next. Thus your visit can be of 3 or 18 months duration as you wish. Why not take advantage of this special inducement?

On the journey itself you will be treated as a welcome guest. Your comfort and convenience will be studied from every angle. You will find the appointments, the service and the cuisine well up to luxury hotel standards. Ports of call normally include Port Said, Aden, Bombay, Colombo, Fremantle, Adelaide, Melbourne and Sydney.

ONE WAY ONLY

Again quiet season travelling has advantages. Travel during Feb. to May offers a wider choice of first class accommodation—more for your money.

Human Values in Construction

However scientifically a construction job may be organised, however widely its operations may be mechanised, successful completion depends on human factors—on the skill, loyalty and morale of the men to whom the work has been entrusted

THIS VITAL ASPECT of construction has always been fully recognised by John Laing and Son Limited. Although the Company's operations are widely spread over a large number of frequently isolated sites, every care is taken not only to promote the wellbeing of workers on these sites but to keep alive the sense of a common objective, of being part of a team.

It is this sense of team spirit — fostered from the first moment of joining the organisation — which calls forth personal loyalty and gives a creative purpose to the exercise of individual skills. On construction sites throughout the country, regard for human values is reflected in the willing effort, mutual reliance and quality of work by those on whom the Company's reputation has been established.

LAING

John Laing and Son Limited · Building and Civil Engineering Contractors · Great Britain, Canada, Union of South Africa, Rhodesia

feverish background of the conflict in Egypt and the consequent inflaming of Asian opinion against Britain. When the Bandaranaike government came to power earlier this year, it put the removal of British forces from Ceylon in the forefront of its programme. Negotiations in July produced a British acceptance of the principle of evacuation and a Ceylonese undertaking to allow continued "facilities" covering such matters as storage, communications and movement, but not the maintenance of a command. Inevitably, the Suez clash has changed the picture. Suspicion arose in Ceylon when British warships refuelled at Trincomalee during the recent weeks of tension, and Mr Bandaranaike sought and obtained from the British Government an assurance that no use would be made of that port or of the Katunayake airfield in connection with operations against Egypt.

His attitude now is that not even facilities can be provided any longer. The logic is clear. A government in Colombo dedicated to neutrality and full national sovereignty could not tolerate the indefinite occupation of bases, but it could go as far as the provision of facilities as long as these were not used for a purpose which Ceylonese opinion bitterly opposed. Now that it has emerged that Britain may on occasion pursue such a purpose, even facilities are inadmissible. And in London this week Mr Bandaranaike clinched his argument with the virtually unanswerable remark that "if, whenever these facilities are really most needed by Britain, Ceylon is going to refuse them, then they become really valueless to Britain, and it is in her interests to make alternative arrangements."

Prisoners' Base in Jordan

THE British taxpayer who learns first from Libya, and now also from Ceylon, that British forces may not use the bases or facilities they hire in these places if engaged on missions of which the Libyans, or the Ceylonese, do not approve, is entitled to ask what he is getting for his money. Confronted as he is with the huge bill for the recent adventure at Suez, are these not points at which expenditure is no more than a habit, and could be cut without loss? And does not the same apply to the £12 million a year he spends in Jordan?

The British troops and air force in Jordan appear to be coralled at two points, Mafraq on the edge of the northern desert and Aqaba in the far south (they were originally installed at the second, ironical enough, at King Hussein's request). At Mafraq, where there is no water, the Jordan water-carriers who normally supply this need by lorry have been on strike; Jordanian armoured vehicles are said to have been stationed round the camp, and such equipment as is kept outside its perimeter seems to have been looted. In a word, a parcel of ground is in British hands, but it is, in fact, useless

It has become the general belief in Jordan that, if Russia had not intervened, Britain and Israel would have attacked Jordan and divided the country between Israel and Iraq. Jordanians are said to be saying as they greet each other, "Thanks be to the Soviet." It is hardly surprising that the Jordanian parliament has almost unanimously voted for an abrogation of the Anglo-Jordanian treaty. But the government has as yet gone no farther than saying to London that it intends to take "all diplomatic steps and measures to guarantee the realisation of this determination." It has not taken them Perhaps it is waiting to see whether its rich Arab neighbours really intend to give it a subsidy equivalent to the British one. Perhaps it is pausing at the thought that this would be an uncertain source of revenue unless paid in advance and for some years ahead. But need Britain show any like hesitation when it is getting no value for money for which it could find more intelligible uses?

Spreading the Teachers

THE Minister of Education, after a brief venture into the politics of Suez, has returned to the problems of his department, one of the chief of which is the maldistribution of teachers. There is no longer a general shortage of teachers—at least by present ideas of staffing ratios—but people have an awkward way of preferring some areas to others. Bristol, for example, has an average of 26 pupils per teacher, whereas Birmingham has 31 and Hull 32.

As a result of some agonised appeals for help, especially from Birmingham, Sir David Eccles called in October a conference of teachers and local authorities to consider what could be done. The first and obvious measure which he had recommended was that understaffed authorities should do everything in their power to make their teaching posts attractive; for example, by earmarking flats for teachers, as Birmingham will now do. But after that there were two possible ways of spreading the supply. One was to restore the system of "rationing" the number of teachers who can be employed in favourite areas, a system which was abandoned last July; the other was to pay special allowances in unattractive places. The trouble was that the first, the way of compulsion, risked putting people off teaching altogether; while the second raised the usual difficulty that the teachers tend to be furious unless all those with similar qualifications are earning the same money

★

As a result of the October conference a plan has emerged which avoids both these dangers. It is for planned self-restraint. To make the total supply of teachers go further, local authorities are asked to employ all the married women they can, even if they could get full time spinsters; and if the married women are more willing to work in primary than in secondary schools, room should be made for them, it is suggested, by getting other suitably qualified teachers to transfer to secondary schools. The Ministry has worked out a quota for each authority which would result in the transfer of 3,500 teachers during 1957. There is no compulsion yet, but Sir David will want to know how each authority is fulfilling its part in the plan, and if not, why not.

Will it work? The local authorities will have to be strong-minded in turning down promising applicants; but at least they will not have to dismiss anyone—or only two or three authorities will have to—because they are taking on extra staff every year. It seems hard that teachers who have to go and work in places they do not like should not get some compensation, but if this is the way they prefer it, so much the better for the ratepayers.

Ex-Colonial Development

THE key to the debate on Commonwealth development which was held on a private member's motion last Friday lay in a Labour amendment which the Speaker disallowed, lest it should unduly restrict the debate. This amendment, tabled by Mr James Johnson, specifically proposed that the Colonial Development Corporation should be taken over by, or form the nucleus of, a new development corporation which should not be restricted to the colonies in its activities. The reason for this is clear. CDC, which has had its efficiency improved and its prospects brightened under Lord Reith's management, dislikes the idea of having to abandon a number of potentially profitable projects which it has started in some territories, like the Gold Coast and Malaya, which are shortly to cease to be colonies ; it would indeed like an assurance that it can continue its operations in ex-colonies indefinitely, and extend them, if the governments concerned agreed, to full member states like Ceylon or presumably even Canada. As the British colonial empire contracts, the corporation would like to see its own empire expand. For this purpose it would need a new injection of British Government capital. There can be little doubt that CDC will have read the debate with approval. But should the British taxpayer ?

With the general idea of developing the colonies, whether dependent or newly independent, there can be no cavil. But it is much more of a question whether an enlarged CDC would be the right instrument for the purpose. Common sense suggests that the corporation should be allowed to complete projects which it has started ; no scheme should be suddenly discontinued merely because a new flag has been run up over Government House, and no doubt some of the ventures in hand will not be completed for years. But an indefinite extension of CDC activities, into entirely new ventures in independent countries, would be quite another matter. The corporation has succeeded in reducing its former heavy losses by changing its method to decentralisation and partnership with private enterprise. When the colonies are independent, the proper way for this partnership to continue would seem to be for the local government to become the official partner and raise the official capital. In so far as British Government aid and finance are solicited, the extension of the Colombo plan to underdeveloped ex-colonies would seem to be the most appropriate answer.

An Icelandic Somersault

THE Icelandic government, it has been unofficially but reliably reported, is now prepared to reverse its declared election policy and ask the United States to continue to man the Icelandic bases of the North Atlantic Treaty Organisation. But in future the American forces will be there as a result of a bilateral agreement between Iceland and the United States, not as a result of Iceland's obligations as a member of Nato ; and the Icelandic government will be able to determine their numbers and turn them out without the eighteen months' notice required under the former agreement. The terms, which were settled last week, will not be published until they have been ratified by the United States.

This political somersault from the original unqualified notice to quit seems to have been inspired by a number of motives. The first signs of weakening came in mid-October, before the present Suez crisis and the Hungarian revolt ; so it is not quite true that the Icelandic government has relented, as the Icelandic Social Democrat party implied at their annual conference, simply because the danger of world war has increased ; though recent events have probably made agreement easier. A more compelling reason was probably the realisation, forgotten in the first flood of peaceful enthusiasm, of how heavy the price would be. The 6,000 American troops in Iceland provide 20 per cent of the country's foreign revenue and that, in the present state of Iceland's economy, is of immense importance. The initiative in inviting the Americans to stay seems to have come from the Social Democrats, who with the Progressives and the Communists form the coalition government and to whom Hi Gudmundsson, the foreign minister, belongs. It is unfortunate that the new agreement means that Iceland will no longer make any direct practical contribution to Nato, which is already weak enough ; and unfortunate, too, that, coming at this moment, it could be interpreted as a new expression of distrust of Britian.

North Africa Looks to Washington

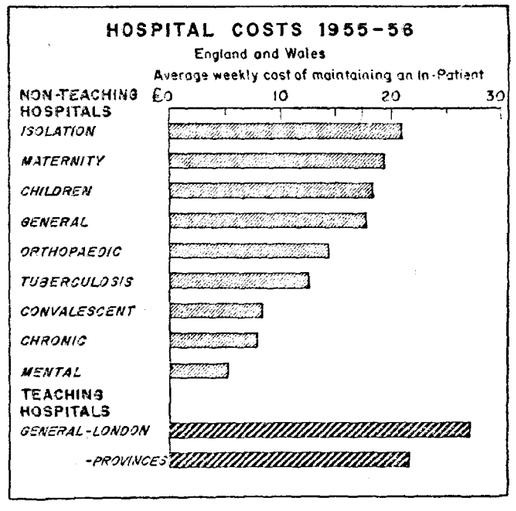
MANY Frenchmen, seeking a scapegoat for the failure of intervention in Egypt, see a great American plot to oust France (and Britain) from their overseas positions. Yet it has sometimes to be wondered whether their governments are not themselves precipitating such an American succession. The visit to the United States of Mr Habib Bourguiba, prime minister of Tunisia, and of the Moroccan foreign secretary, Mr Ahmed Balafrej, brings the question to mind. These two North African leaders have taken advantage of the session of the General Assembly for talks with important Americans. Both asked for economic aid, promising guarantees and fiscal reliefs for foreign capital.

Despite a cordial reception—Mr Bourguiba spent an hour with President Eisenhower when the representatives of some more important countries would have been glad of twenty minutes—the two African leaders are not, apparently, returning with any tangible offers. The combined amount they have asked for (estimated at some $140 million) may be too large to allow a snap decision. More important, however, is probably American reluctance at this stage to hurt French feelings unnecessarily. On the contrary, US officials took pains to emphasise that their country's funds should only complement French efforts as part of a mutually concerted programme. They may change their minds if France fails to re-establish friendly relations with Tunisia and Morocco.

When M. Mendès-France set Tunisia on the road to independence his move looked like the first step in a plan to keep North Africa within the French orbit by means more subtle than brute force. Independence for Morocco, though granted grudgingly and after grave errors, still fitted the same pattern. The whole scheme was to be crowned by a solution for Algeria ; its absence explains why France is rapidly losing ground in the two other countries as well. France's relations with Morocco and Tunisia are now at their worst. French policy has not yet lived down the *ruse de guerre* by which, on October 22nd, the Algerian leaders were kidnapped when they were travelling as guests of the Sultan of Morocco. The inevitable sequel followed: diplomatic relations were suspended, economic talks broke down ; Arabs massacred Frenchmen ; many French officials left precipitately ; the flight of French capital reached a rate which has been put at £1 million a day. If the situation is not swiftly redressed, it would seem inevitable that the former protectorates should look to Washington for the help which they might in other circumstances have preferred to seek in Paris.

Costing Patients

THIS chart, based on the annual hospital costing returns, shows the average cost of maintaining a patient in the main types of hospitals in 1955-56. Compared with the previous year, the average cost in both the larger general hospitals and the teaching hospitals has gone up by between 7 and 8 per cent. In mental hospitals, on the other hand, the cost has increased rather more—by 10 per cent. This probably reflects the wholly laudable efforts to improve the



standard of food in these hospitals. In 1954-55, their weekly cost of provisions per person (including staff) was only 16s. 11d. Last year it was 18s. 5d., an increase that rather more than offset the rise in food prices ; but the mental hospitals' expenditure on food is still a long way below that of the general hospitals (which spend £1 7s. 7d. per person a week).

A feature of the new returns is an item for other than long-stay hospitals called "in-patient cost per case," calculated by dividing the total expenditure on in-patients by the number of discharges and deaths. It is thus partly determined by the length of time that a patient stays in hospital. In the larger general hospitals the average cost per case is about £41, which means that the average patient in them stays in hospital for about two and a half weeks.

Socialists at Odds

THE Socialist International is one of the many bodies shaken by the Suez crisis. At a meeting held last weekend in Copenhagen the Soviet intervention in Hungary was unanimously condemned ; but unanimity could not be reached over a motion, sponsored by the British Labour party, condemning Anglo-French intervention in Egypt. Indeed, the French were so incensed by the proposed censure of their Socialist-led government that they walked out of the meeting altogether. In their absence nobody actually voted against the resolution, though four delegations abstained : the Israelis and the Jewish *Bund*, as was to be expected, but also the Belgians and the Spaniards-in-exile. The motion was finally carried by the nine votes of the British, German and Scandinavian parties.

The split is a reminder that not only the Communist world is divided at the present day. It is also yet another illustration of the paradoxical situation of M. Mollet, a Socialist prime minister praised by the true blue Tories but under fire from even the moderates of Labour. Blessings from Mr Amery and other members of the Suez group reinforce the apprehensions among French Socialists, particularly in the Paris region, about the wisdom of their government's handling of African affairs. Many think that the operations in Egypt and Algeria not only are blunders in themselves, but have cost their party a golden opportunity to make capital out of Communist difficulties over Hungary. The Egyptian blunder has been made and cannot be wholly repaired. This makes it all the more important, they argue, to break the Algerian deadlock by some new initiative. A mixture of nationalist feeling, right-wing support and simple parliamentary arithmetic may keep M. Mollet safely in power for some time to come. His government, however, runs the risk of finding itself in the international dock when the United Nations Assembly debates Algeria, as well as at the Socialist assizes. More worrying still for M. Mollet must be the potential verdict of his Socialist supporters.

India Counters Inflation

INDIA'S surprise budget is a welcome sign that the Government recognises the need to fight inflation now if the five year plan is not to be jeopardised. Exchange reserves have fallen steeply this year from £559 million in March to £407 million, and prices are rising steadily. To curb spending and check the speculation which has played a nasty part in the rise in prices, particularly of food, new

taxes have been imposed on capital gains and on dividends. Drastic new import taxes are designed to conserve foreign exchange.

These measures are not sufficiently important in themselves to determine whether India's resources can be stretched to meet the plan's ambitions within five years or whether the threat of inflation will enforce a slower pace. Critics of the plan have long expressed doubts about the wisdom of the deficit financing which it appears to involve, and some have suggested that prices will rise by as much as 30 per cent within three or four years. Introducing his new measures Mr Krishnamachari, the finance minister, admitted that the expansion of credit and the drain on exchange reserves had already advanced more rapidly than had been foreseen.

But India still hopes to resolve the dilemma through foreign aid. The latest letters from the World Bank have given it much encouragement. The Indian government now hopes that the Bank will finance a large part of its £400 million railway programme and other projects, too. The exchange of letters between the bank and India, indeed, seems to have achieved all that could be desired. The bank has shown to its backers a prudent concern that their money shall not be wasted. But it has also made it clear to India that it can expect backing from the Bank on a scale larger than anything the Bank has so far undertaken anywhere. India itself, by its new tax measures, has shown a will to do what it can to curb inflation short of sacrificing the aims of the plan itself. And the generous compensation given to the Mysore gold mines, recently nationalised, was an encouraging gesture to private foreign investors, who have been frightened by the nationalisation of insurance. India's budding friendship with the United States could well bear fruit in the form of further help.

Lucrative Centres

It would be a mistake to view the "new towns" simply in terms of industrial and housing development. As Mr Henry Wells told the annual conference of the Town and Country Planning Association last week, the focus and most important part of any town is its shopping and commercial centre. Hemel Hempstead Development Corporation, of which Mr Wells is chairman, has set a good example by planning a quite impressive, spacious and well-designed town centre which is now rapidly taking shape. The architecture of the new stores, banks and offices, if not brilliant, is at least harmonious; the enlarged market is proving a success; and there has been a serious attempt (though it will certainly prove inadequate) to anticipate future car parking requirements.

The interesting thing about all these good works is that Mr Wells could also claim a considerable commercial and financial success for the new centre. Against acquisition and layout costs of £38,000 an acre can be set land values which have already reached between £80,000 and £160,000 (and may rise much further). The corporation has undertaken much of the development itself and expects an average return of about 8½ per cent. This is sound economic sense. It was always hoped that a part of the public expenditure on developing new towns would be recouped from the rising land values that public initiative brought about. The corporation was of course greatly helped by its ability to buy out the previous owners compulsorily, at the same time as it announced its development plans; but Mr Wells defended this advantage, fairly reasonably, by pointing out that otherwise large windfall profits would have been derived simply from prior knowledge of the new centre's location.

★

What is the lesson of this for the many small towns which are now contemplating expansion under the Town Development Act? Can they do likewise and cover part of the bill for new public services by developing improved town centres? Mr Sandys thinks that they can and has urged them to try. But in practice there are snags. The chief of them is that small, elected local councils are naturally more reluctant than independent corporations to plan and buy ahead on a sufficiently bold scale. Even at Hemel Hempstead many residents were initially highly sceptical, and it was only when one or two department stores were persuaded to move from the old to the new centre that its success was assured. How can small towns like Huntingdon be sure that the anticipated large trade expansion will in fact occur? Yet, for all the qualifications, Hemel's experience should encourage any small town councillors with dreams of greatness to try boldness. After all, Mr Sandys has almost promised to bale them out.

The Economist Diary

THE CHRISTMAS PRESENT FOR THE MAN WHO SEEMS TO HAVE EVERYTHING

A week's appointments at an opening; a book that lies open flat on the desk	A diary lay-out specially designed to meet the needs of the busy man
Bound throughout in red leather: title blocked in gold	All information easily found by means of handy thumb-indexes
A memorandum book, an appointments register, and a complete reference book	Facts and figures covering the world always available when required
43/- Price for U.K. only, including postage and purchase tax	Prices to overseas addresses vary widely: a schedule will be sent on request

ILLUSTRATED PAMPHLET FROM DIARY DEPT

Letters to the Editor

Middle East Oil

SIR—In connection with your note, in the issue of November 10th, I have not noticed any suggestions that an East-West pipeline be built across the waist of Africa to make oil shipments independent of the vagaries of the Suez Canal and obviate the need for any material expansion of tanker capacity.

It is worth noting that a pipeline across the waist of Africa would not be notably longer than the Alberta to Sarnia pipeline in Canada and can be routed through territory controlled by as few as two West European powers that are substantial consumers of oil. Judging from Canadian experience, a "crash" programme of Trans-African pipeline construction could probably be completed within a matter of months if the interested powers gave the matter first priority in labour and materials.

It is not known what the economics of such a line would be, but the costs would probably be much less than those already incurred in connection with the military gestures which have taken place over Suez. If the United States wishes to spend money to lay the basis of a Near East settlement, a contribution to capital costs would make the line more economic and would certainly be better than subsidising Nasser through the Aswan Dam.—Yours faithfully, JOHN WALTERS
Montreal

Exports to the Middle East

SIR—It is no doubt very important to analyse the situation created by the British and French military operation in Egypt, particularly in the field of economics. May I suggest, however, that having assessed the extent of the damage, it is vital to concentrate on what is to be done to save as much as can yet be saved from the wreckage.

I was greatly perturbed to learn within the last few days that at least three of our leading manufacturers of radio and television, motor cars and tyres have suspended their exports to Iraq, our most important market among the Arab lands. Exports, I was told, will be resumed when peace and security are restored in the Middle East.

What is to happen in the meantime? Can anyone seriously assume that Iraqi importers will wait until such time? Someone is going to fill the gap, whether it is the United States, Germany, Italy, the Soviet Union or even Japan. If we allow this to happen we will have to add to the many losses already listed in your paper, that of a large and well-paying export market.

Rather than curtail our exports to the Near and Middle East, should we not try to maintain them and indeed intensify our sales? The risks involved are insurable. Surely there is a very strong case for the Export Credit Guarantee Department of the Board of Trade to help exporters effectively in the present emergency. This will be well-spent money, and the expense much smaller than that incurred in landing us in our present unenviable position.—Yours faithfully, JULIUS LADA
London, W.1

Salvage

SIR—It would scarcely be possible to draw a more completely wrong conclusion from the Suez crisis than does Mr Graham Hutton in your issue of last week. The essential fact which that crisis has brought out is that we are too weak. Mr Hutton would have us weaken ourselves further—to a point, indeed, where we could scarcely reply to any pressure or any blow. The proper policy is the exact opposite. We must increase our armed strength until it commands the respect of our friends and the fear of our foes. If we face realities and find the will to surmount them, England can once again save herself by her exertions and Europe by her example. Along any other road—Mr Hutton's in particular—we shall find ignominy and destruction.—Yours faithfully,
London, N.W.3 JULES MENKEN

Shock and Distress in Ottawa

SIR—Don't let yourself be fooled by your published letter from here that western Canada is overwhelmingly supporting the move on Egypt. As you know, we have a great number of former Britishers here. Ninety per cent of these think that in every case Great Britain is always right, the other countries unfailingly wrong. On the other hand, the true Canadians, very many being second or third generation British, with whom I have discussed this Suez Canal issue, are just as strongly condemning what they consider a rash and extremely stupid act. In fact many consider Sir Anthony a misfit for the important position that he holds. Some of these Canadians think that it is a great joke, although a sad one, that while Nasser was maintaining the operation of the canal as well as ever, Great Britain and France took action to "secure" what most erroneously has been described as a "lifeline," and only succeeded in manœuvring themselves into a position of extreme economic danger.—Yours faithfully, M. P. OLSEN
Vancouver, Canada

A Word in Search of a Meaning

SIR—In the review of ten books on automation and associated topics, contained in your issue of November 10th, your reviewer writes, "Lord Halsbury, for example, . . . now denies that the vague word has any independent meaning at all or that the subject as such exists." May I point out that it is not only recently that I have emphasised this point of view. The first public utterance I ever made on the subject stated in the conclusion of the first paragraph that "there is in fact no single feature to which one can point and say 'this is automation.' For this reason many are tempted to deny that the word stands for anything at all."

I accordingly have good grounds for asserting that my views on this subject have been consistent throughout. The word could have been given a meaning had people been willing to give it one by the exercise of a little semantic self-discipline. As a result of their not doing so, its meaning has now become so dilute that it had much better be dropped. Every one of the topics which are grouped under the heading of automation has in fact a technical name in its own right, and these recognised technical names should be used whenever the context requires it.—Yours faithfully, HALSBURY
National Research Development Corporation, London W.1

★

SIR—Your reviewer seems to join Lord Halsbury in an attempt to bury automation, not to praise it, at least as far as the term itself is concerned. The report of its death, however, is greatly exaggerated.

Automation has quite a definite meaning to the ordinary engineer, whatever the pundits may find wrong with the word. It means converting a process or machine to self-acting (i.e. automatic) operation. This means that automation, as distinct from mechanisation, replaces some mental work, rather than muscle power.

As automation in this sense is not new, it is futile to expect world shaking results from it. What is new is its greatly increased scope, due to recent developments in electronic and other control devices. As your reviewer points out, this is a quantitative change and economists will have little of interest to contribute to this subject, until they are prepared to make quantitative statements.—Yours faithfully, E. G. SEMLER

Books & Publications

From Arnhem to Hiroshima

HISTORY OF THE SECOND WORLD WAR: *Grand Strategy Volume VI.*
By John Ehrman.
Her Majesty's Stationery Office. 422 pages. 30s.

THIS is the final volume of that part of the Official War History which purports to deal with overall strategy. Mr Ehrman insists that it and its immediate predecessor are to be read as parts of a single whole. Nevertheless they are far from leaving in the mind of the reader an overwhelming idea of unity of theme. Perhaps this was too much to expect seeing that for the whole of the period covered there were three virtually separate wars in progress. Moreover, for the latter part of it, as the author remarks, strategy in the military sense was left increasingly to the theatre commanders while the higher direction of the war became more and more a turmoil of politics and diplomacy.

Volume VI takes up the story at the point where the repulse at Arnhem had ensured that the war against Germany would continue well into 1945. The effects of this on the British effort were bound to be serious after the overstrains of the previous five years, and it would clearly aggravate the difficulty of redeploying our forces so as to make an honourable contribution to the war in the Far East. The inevitable victory in the west was still further delayed by the American misfortunes in the Ardennes ; nevertheless, it came early in May, 1945, with the British and Canadian armies under General Montgomery reaching the Baltic and sealing off Denmark, with the Russians getting first to Berlin and the Americans making no attempt to anticipate them there but deliberately deciding to link up further south in the neighbourhood of Leipzig. In the Far East it had been assumed for planning purposes that the Japanese would survive the German defeat for eighteen months and innumerable projects for offensive action against them were ventilated ; in the end most of these were overtaken by the decision to drop atomic bombs on Hiroshima and Nagasaki, and all was over by August, 1945, by which time President Roosevelt was dead and Mr Churchill had been shattered at the polls. Before that, however, we had seen the brilliantly successful British operations for the recovery of Burma and the massive developments of American amphibious strategy in the Pacific. And for good measure this volume gives us Tito's manœuvres in Jugoslavia terminating in the capture of that country for communism, the British intervention in Greece to forestall a communist coup there, the unsuccessful attempts at Yalta and elsewhere to recreate a free Poland and finally a description and critique of the central war machines in both the United Kingdom and the United States.

Among the impressions which crowd into one's mind on reading this concluding instalment of the account of "General Strategy" are discomfort that we so easily abandoned Mihailovitch ; resentment at the preposterous speech of Mr Stettinius about our Greek salvage operation ; wonder at the delusions of the Americans over Kuomintang China ; sardonic amusement that both Mr Churchill and the President clung so long to the hope that Stalin had changed his spots, and a certain rueful admiration for the skill shown by the unchanged leopard in trading his entirely unneeded entry into the Japanese war ; shock at what now looks like the casualness with which the decision to use the atomic bomb was taken ; and a sense of waste that we should have toiled and bled so much to recover Burma and preserve India if we were going to give them up immediately afterwards—as it turns out to the not inconsiderable advantage of the communists. Then there is General Eisenhower's refusal to try to reach Berlin before the Russians, which seems to have been entirely his own decision. By the light of hindsight this appears as a Himalayan blunder and it is not much consolation that many of the British thought so at the time.

The chapters on mechanism are among the most interesting and readable in the volume. Mr Ehrman describes how, in the British organism, the War Cabinet and the Defence Committees were more and more edged aside and how effective authority in the United Kingdom came to reside with the Prime Minister and the Chiefs of Staff committee, supported by a capable and devoted secretariat. And the system worked, though those who were familiar with its day-to-day operation might be tempted to think that too much credit is given to the secretariat for this and too little to the three service chiefs. They would not be so surprised as he is at Mr Churchill's lack of success in making his views prevail with the Americans. It is conceivable that the Prime Minister would have been wiser to use Sir John Dill more freely as a channel of communication with the heart of the United States administration, but, be that as it may, for the last two years of the war the Americans were unavoidably the senior partners in the Grand Alliance.

Mr Ehrman concedes genius to the Prime Minister and many of the virtues necessary in a successful war leader, but on the whole his judgment is a tempered one. He does, however, apply to Mr Churchill a glorious quotation about the great Chatham from Sir G. O. Trevelyan, with part of which this review may fittingly end :—

> Without a moment of hesitation, without a twinge of diffidence, he set himself at the head of his countrymen ; and they, placing their blood and treasure at his disposal, believing all that he asserted, paying all that he demanded, undertaking everything that he advised, followed him through an unbroken course of effort and victory with an enterprise and a resolution worthy of his own.

Professor President

LO SCRITTORIO DEL PRESIDENTE, 1948-1955.
By Luigi Einaudi.
Einaudi, Italy. 693 pages. Lire 3,000.

ITALY today has a professional politician at President : between 1948 and 1955 it had a professor. Today the *Quirinale* is kept constantly in the limelight : while Luigi Einaudi was there he was content to remain in the background. Yet there is no doubt that so distinguished an economist exerted a constant and important influence on affairs ; especially in those matters with which his own studies and his term as Deputy Prime Minister and Minister of the Budget under De Gasperi had made him so familiar. This volume—a miscellaneous collection of his writings during these years (which is to be followed by others dealing with other phases of his career)—is proof of this. It does not attempt to be an account of his presidency, much less a justification of it ; the author in many cases does not indicate to whom his comments were addressed, nor does he attempt to assess their importance in the formulation of policy. Personalities are entirely absent ; of the political battles that went on in these years there is hardly an echo. Even so this collection of occasional essays and comments, at first sight dry and academic, gives a vivid picture of President Einaudi at work.

His primary object was to eradicate the Fascist institutions and ways of thought which cluttered up the economy and administration of the country. It was a formidable task. The moment that it was proposed to abolish one of the Fascist creations vast memoranda were produced by the interested parties purporting to show that it remained vital to the economy ; more than once the author drily remarks that such proposals merely guaranteed the survival to eternity of such abuses. Most of the legislation, he found, was based on a *filosofia di scarsità ;* a "Stone Age mercantilism." The only thing which kept unemployment down to 2 million was that "fortunately in Italy the laws are not always put into effect, and that everyone disobeys as far as they can

laws which are foolish and anti-social." The belief that it was necessary to restrict and to distrust extended into every sphere of the national life. For example, the citizen's right to a passport was contested and made as difficult as possible : even proposals for reform still required him to produce not only a mass of unnecessary documentation but also an authenticated photograph of himself. Why *authenticated,* asked the President? Was the issuing officer unable to trust the evidence of his own eyes ?

Against this state of affairs Sr Einaudi launched a ceaseless campaign of witty, sarcastic and closely argued comments. He distrusted economic experts and their jargon ; they were invented, he says, to *put off* the execution of good ideas to the Greek Kalends. They only listened to the vociferous demands of organised interests ; all too easily the general good escaped them. Throughout these writings, which are for the most part concerned with legislative technicalities, runs the conviction that the state must serve its citizens, that it must remove restrictions on their movements and activity. This is the message of a lifelong Italian liberal ; and if in the formulation of some of its ideas it is not ashamed to acknowledge its debts to the nineteenth century, it also allows Sr Einaudi to face boldly the problems of the present day. "The necessity of unifying Europe is evident," he writes. "The existing states are dust without substance." It is all very well to talk of projects for a common market in economic terms, but none will make sense unless they are accompanied by a political decision. The lesson of Italy's own past is a fearful warning. The failure of its various states at the end of the fifteenth century to agree meant the end of their independence for three hundred years. Europe now faces a similar decision. The Italian Republic was fortunate indeed to have during such troubled years so modest, so far-sighted, and so fearless a President.

One Against the Law

TRIAL BY ORDEAL.
By Caryl Chessman.
Longmans. 309 pages. 18s.

TO an English reader, the staggering thing about this book, and its predecessor, "Cell 2455, Death Row," is that they should have been written at all. In the first, Mr Chessman gave an account of his life of crime, which culminated in his being sentenced to death, at the age of twenty-seven, in June, 1948, for a kidnapping crime of which he has steadfastly declared his innocence. He ended the book with a claim to have achieved some insight and to have realised the uselessness of his war with society. In the meantime his death sentence had already been postponed more than once, and his new book carries the story of his battle with the law and his fight for life up to January, 1955 ; it also describes some of the other inhabitants of "Death Row" in California's penal institution, St. Quentin. Now, nearly two years later, Mr Chessman is still alive, and his first book has been made into a film.

Neither book could, of course, have been written in the condemned cell had he been an Englishman. But the English reader, however addicted to the crime reports of the Sunday press, will find stranger still the freedom allowed to the American press to discuss the case, even with Mr Chessman himself. They will also wonder at a legal system which, though enough doubt in the case is admitted for execution to be repeatedly put off over a period of eight and a half years, has still refrained from allowing clemency or commutation.

So a sadder and a wiser Mr Chessman continues his legal struggle for survival. His story shows that even the most apparently hardened criminal can eventually change his outlook, which supports one of the abolitionist arguments against capital punishment—that, *ipso facto,* it rules out reformation. But as an explanation of why the psychopathic criminal is made both books are disappointing. Nothing in his childhood, except perhaps a serious illness, explains Mr Chessman's resort to delinquency, for though his early years were tragic enough at times, he had kind and gentle parents whose love and trust he retained even after he had passed into the condemned cell. These are certainly not pleasant books.

The Disintegrator

PRICE, COST AND OUTPUT.
By P. J. D. Wiles.
Blackwell. 313 pages. 30s.

MR PETER WILES has acquired a well-justified reputation for setting cats among pigeons. Not so long ago he was shocking complacent western commentators out of their skins by demonstrating that the rate of economic progress in Russia was vastly greater than that of even the United States, let alone the free world as a whole ; he has just made a devastating frontal attack, in the columns of *Encounter,* on the moral pretensions and *raison d'être* of trade unionism in the modern economy ; in the present volume, more ambitiously, he sets out to smash and atomise the whole majestic structure of price and output theory.

In the name of "humility before the facts" of business behaviour, he denies that any one theory of the firm's price and output policy (profit maximisation, equality of marginal cost and marginal revenue) will either serve to explain events over the whole economic field or even yield a determinate result in any one sector. Price formation and output decisions are correlated in a completely different manner ; causal sequences run in different directions ; data are differently available and differently interpreted, according to the nature of the firm's business, its ownership and managerial structure, and historical accident. The new Emperor (installed by Professor Chamberlin and Mrs Robinson with the theory of imperfect or monopolistic competition) is as naked as the old Emperor of the purely competitive realm ; more so, indeed, for the old Emperor, reigning over the diminished and re-named territory of the "price-takers," the agricultural sector, retains in Mr Wiles's view a substantial fig-leaf. In the manufacturing sector business men do not in fact make marginal calculations ; do not maximise profits ; and would not have more than the remotest idea how to do either. Moreover, within that sector, contractors do not behave like continuous producers, and owner-managers do not behave like the executives of public companies ; and, finally, no sound deductions can be drawn ex-post—that is, from recorded price and output results—about calculations ex-ante—that is concerning business men's decisions about price and output policy.

Standing among the wreckage, Mr Wiles does not cut an entirely nihilistic figure. Marginalist calculations are not useless ; they are normative, they represent a welfare ideal, and when reality is compared with that ideal a guide is provided for political or economic action. Certain kinds of organisation (the cartel, the trade association) can be identified as anti-welfare, others (the merger, the discriminating monopoly subject to public control) as pro-welfare. Certain forms of control can be seen to be potentially effective in certain situations, others ineffective. Certain myths conducive to wrong action can be dissipated. (One such myth, in Mr Wiles's view, is that firms can grow too big for their own good. Cost curves, to put the matter technically, are in fact typically L-shaped, not U-shaped. He adduces powerful evidence to that effect ; but the practical conclusions which he draws rather suggest that it would also be a good idea to import a few thousand crates of swallows in order to produce a warm spell over Christmas.)

"Price, Cost and Output" is not for the entirely uninstructed public ; as the author says in his preface, "a fair knowledge of the textbooks is demanded." It is, however, written in a human and lively style ; formulæ and diagrams are few ; there are some nicely irreverent chapter headings and asides ; and the qualified reader can count on enjoyment as well as enlightenment and exasperation.

Contours of Faith

MORE NINETEENTH CENTURY STUDIES.
By Basil Willey.
Chatto and Windus. 304 pages. 21s.

IN this sensitive study Professor Willey continues the quest he began several years ago—to relate the literature of successive generations to the changing intellectual background. The present volume is a sequel to "Nineteenth Century Studies" (1949) : its central theme is the Victorian reinterpretation of religious orthodoxy in the light of new canons of historical and scientific

criticism, or, stated differently, the shifting contours of individual faith. We cannot understand the Victorians unless we take account of this central theme: Mr Willey suggests also that we of a later, more volcanic century cannot ignore or by-pass such questions ourselves.

Both the theoretical and the practical foundations of nineteenth-century Protestantism were insecure. On the one side was the Bible and the Bible only; on the other side, "disputes, tea-meetings, openings of chapels, sermons." Out of insecurity there developed two "drifts," first towards Rome and second towards unbelief. It is appropriate that Mr Willey chooses Cardinal Newman's younger brother, Francis, as the subject of his first essay. The scepticism of the Cardinal drew him to Rome: the scepticism of Francis, uncontaminated by German criticism, led him to criticise the whole inherited structure of dogmatic Christianity, and to turn not to agnosticism but to "modernism." One of Mr Willey's later essays on "Mark Rutherford" brings out the insecurities of Nonconformity as well as Anglicanism, and the inherent pathos of men who came to the conclusion that "a childlike faith in the old creed is no longer possible, but it is equally impossible to surrender it."

Concerned as he is with the contours of faith, it is not surprising that Mr Willey's central essay examines the much-battered authors of "Essays and Reviews" (1860). Their mild liberalism not only shocked High Churchmen and Low Churchmen into horrified alliance, but alienated the secularist minority, which accused them of "dishonesty." Whatever contemporaries thought of them, the "Seven against Christ" have clearly won Mr Willey's sympathies: at this point in the book, indeed, the author boldly steps into the arena himself. Although not all readers will be in sympathy with his own contribution, no modern critic will write in the same mood or style as the embittered critics of his liberal forebears.

The change in the tone of the debate as well as in the questions raised is surely of basic importance. Professor Willey says little of it, nor in his travels does he reach the late Victorian frontier, where interest in religious questions touched a new and far-reaching interest in social questions. There were many strange contours in this new region of intellectual controversy, which perhaps Mr Willey will choose as the subject of a further study.

The Duke as Before

WELLINGTON.
By Charles Petrie.
James Barrie. 288 pages. 25s.

THAT he had been much exposed to authors is a frequently quoted complaint of Wellington's: Sir Charles Petrie's excuse for yet another biography is that it is a "reassessment." And yet it is hard to find that he has told us anything that we did not know, or had not been told already, about Wellington's Protestant - Ascendancy background (much more amusingly and informatively considered by Philip Guedalla, whose name, incidentally, Sir Charles misspells in his brief bibliography); about his supreme military competence; or his political rearguard actions.

What, in fact, we find more of in Sir Charles's than in any other book about the Duke is Wellington's contempt for the British private soldier as a man, and for British cavalry as an arm (which explains his muscle-bound inability ever fully to exploit a victory by pursuit); the occasional pettiness and spite, which Sir Charles insists upon with equally tiresome petulance; and the failings as a politician: "wrecked the Tory party in a few months, and so undid the life-work of the much-maligned Liverpool . . . then came Wellington's own Premiership, which was disaster . . . his incursion into the field of politics was a misfortune both for himself and for his country." It is a Tory infuriated by inept Tory leadership, a phenomenon always awe-inspiring.

What students of the period will find more conveniently here than elsewhere is a just assessment, neatly concentrated, of the value to a liberating army in the Peninsula of what we would now call the Spanish and Portuguese "*maquis*" or "resistance." But it is wasteful to organise an otiose biography of Wellington for the sake of these few, however valuable, paragraphs. It may be the verbal coruscations of Guedalla's twenty-five year old "The Duke" that have prevented its ever being taken as seriously as it should as a work of scholarship; it would be a pity if scholars were to suppose that because Sir Charles is stilted, where Guedalla was gay, his matter is more grave.

Philosophy Made Too Easy

LANGUAGE AND THE PURSUIT OF TRUTH.
By John Wilson.
Cambridge University Press. 105 pages. 8s. 6d.

"THIS book," Mr Wilson tells us, "is an attempt to do something new: to present semantics, which is the study of linguistic communication, to the general public." A little later on, however, he reassures those who may be alarmed by this intimidating start. "The subject," he says, "does not require an unusual intelligence. It requires only the patience to master a particular technique."

These introductory remarks are misleading in two ways. All serious philosophers from Plato to the present day have realised that an important part of their job was to guard against the careless and incautious use of words. What has happened in the present century, largely as a development of Russell's inquiries into logic and mathematics, is simply that this part of the job has received more concentrated attention than it had done before. Some enthusiasts, especially in the nineteen-thirties, came to think that it was the whole job. In the second place, mastering a technique is not always a perfectly safe undertaking. It is at least as hazardous to try to acquire the technique of flying an aeroplane with only an efficient manual as a guide.

What Mr Wilson is offering is an introduction to philosophy, and what those who read his book should realise is that his position is by no means uncontroversial. In particular his use (or uses) of the dangerous word "verification" would be roughly treated in a philosophical review. Humpty Dumpty would tell him that, if he makes it do all that work, he ought to raise its wages.

Some of what he says, especially in his first section on "Words," is sound enough; on "Statements" he is less reliable, since to talk about misusing statements is rather queer. "Truth" in 30 pages is inevitably over-simplified, occasionally to the point of silliness. Perhaps it is unfair to Mr Wilson to criticise him for making philosophy seem much easier than it is. Surely it is the aim of introductory text-books to do that? Up to a point one may agree. "Language and the Pursuit of Truth" would be quite a good book for an instructor to read with a class provided he were himself a competent philosopher who could explain its limitations. It may, however, do much more harm than good if it is used as a "Teach yourself" manual by beginners who assume that "Semantics" is a magic key to open all the doors, especially if their aim is to do well in scholarship general papers.

Germany in the Ascendant

DOCUMENTS ON GERMAN FOREIGN POLICY, 1918-1945: *Series D, Volume IX. The War Years, March 18 to June 22, 1940.*
Her Majesty's Stationery Office. 801 pages. 35s.

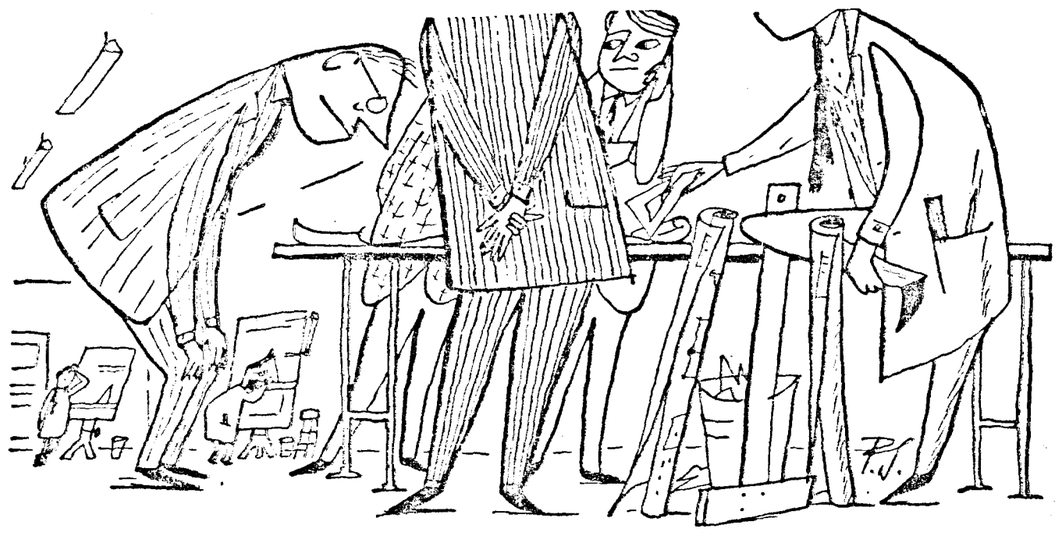
THE new volume of German Documents takes the reader from the meeting of Hitler and Mussolini at the Brenner in March, 1940, to the armistice after the capitulation of France. It is full of miscellaneous interest, in particular on account of the letters between Fuehrer and Duce, which have been published only in more fragmentary fashion hitherto, and on account of the considerable number of despatches concerned with Russo-German affairs which did not appear in "Nazi-Soviet Relations."

After the difficult and long drawn-out negotiations that had preceded the economic agreement of February 11, 1940, its implementation proved equally tricky. Within seven weeks the Russians were complaining bitterly of having received nothing until two of their representatives saw Goering, who promised to make amends. At a meeting of experts on March 30th the Field Marshal insisted that "all German departments must proceed from the fact that Russian raw materials are absolutely

The seats are emptying fast. Nothing runs across the field now but the wind. Another great game is over and yet not quite over. For, warm in our chairs at home, we shall live it through again while our White Horse glows softly in our glasses.

WHITE HORSE
Scotch Whisky

Maximum prices: Bottles 36/-, ½-Bottles 18/9, ¼-Bottles 9/9, Miniature Bottles 3/9.



the things they say!

That's a grand idea! Did one of the chaps on your Design staff think it up?

No, as a matter of fact it came from one of our fitters.

That's unusual, isn't it? Surely most bright ideas that come to the workers in our big industries just die for want of encouragement?

Well, not here in I.C.I., at any rate. We have a scheme to discover and reward the man who's got a useful and practical idea.

You mean you actually pay them?

Certainly. The minimum reward for each suggestion we adopt is thirty shillings, and there's no limit. The record so far is an award of £1000 for a method of clearing deposits out of long lengths of pipeline.

What other suggestions do you get?

Anything from a jig for drilling flanges to an idea for safer working.

Yes, but in actual figures how many suggestions do you really get?

In 1955 the scheme brought in over 33,000 suggestions, of which about 40% received awards. That shows you the interest our men take in their work.

Imperial Chemical Industries Limited

vital to us" and that therefore "even the most valuable material" (this meant military material) must be delivered to the USSR. A memorandum by Clodius two months later, on "Aspects of the Economic Organisation of Peace," records the dreams of the then victorious Germans of liberation from this bondage to the Soviet Union. "The further development of close economic relations with Russia will be one of the most important tasks," but "the opening up of large new sources of raw materials for Germany will make us less dependent than before upon the supply of Russian raw materials." Just above this Clodius states that "The creation of a German colonial empire in Africa, to include all the German colonies and the Belgian Congo, would enable Germany largely to close the gaps in its supplies of raw materials. Cotton and wool, rubber and various ores are the main exports of the areas mentioned," he continued, but the document shows handwritten question-marks over the words cotton, rubber and wool.

The German despatches from Washington during this period deserve to be noticed. On the one hand the German Chargé d'Affaires, Thomsen, complained that he could not distribute propaganda as Berlin supposed because, for instance, "influential journalists of high repute with whom I am in contact will not lend themselves, even for money, to publishing outside material under their name without alteration or re-editing." On the other, the German Military Attaché, General Bötticher, is found reporting with unbridled optimism on May 24th that German military success is liberating the American Army from the pettiness of democratic supervision: "It is just as if a fresh breeze of the German spirit were blowing across to America from the battlefields of northern France and Belgium." How glad Hitler must have read these words, which belittled the warnings from those wretched civilian diplomats.

Tilling Bantu Fields

THE BANTU OF NORTH KAVIRONDO: *Volume II, Economic Life.*
By Günter Wagner.
Published for the International African Institute by *Oxford University Press.* 192 pages. 36s.

THE Kavirondo tribal area of Kenya was much in the public eye in the early thirties owing to the opening up there of the Kakamega gold mines. The data for this book were gathered during two years of field research in 1934-38 and therefore provide material for a picture of the tribal economy just before the full impact of the changes symbolised by the advent of the gold mines was felt. It was a transition economy primarily based on the cultivation of subsistence crops and some cattle husbandry but already partly involved in the cash crop market for cotton and maize. There was also a substantial amount of labour migration, as the Kavirondo tribal area was very densely populated, even by Kenya reserve standards. But, in the area as a whole, the traditional technology and modes of farming, animal husbandry and exchange of produce, livestock and services were dominant. It is this traditional economy that forms the main subject of the book, though relevant information about the newer trends is also given. It is an anthropological description of the economy; hence the emphasis is on the institutional framework of production, consumption and exchange. Information on income and expenditure, for example, is incidental and scanty. As a description of a tribal economy it is, however, among the best so far produced for Africa. It is lucid and straightforward and will be very useful for all concerned with problems of economic development in Africa.

After giving an account of the most important technological processes followed in the tribe—house-building, ironwork, pottery—the book describes in detail the processes of tillage and animal care. Modern hoes, simple ploughs and improved seed were eagerly accepted, whereas improvements in cattle husbandry are not. An excellent analysis of bride-price and other exchanges between kin shows how cattle are used to maintain the complex ramifications of the family system and helps to explain the conservative attitude of the Kavirondo Bantu towards improving their cattle husbandry.

But probably the most valuable part of the book is the description of the system of land rights. The recent Royal Commission has popularised the idea that various forms of communal and tribal land control constitute a major handicap to agricultural progress in East Africa. The analysis here given of a typical East African Bantu land system shows how misleading generalisations about communal ownership can be. In Kavirondo it is the individual farmer who owns his fields more or less outright as far as their tillage is concerned, and his rights pass to his successors without reference to clan authorities. It is only land not under cultivation or used for communal grazing that can strictly be regarded as falling under clan control.

Shorter Notices

THE BIBLE AS HISTORY.
By Werner Keller.
Translated from the German by William Neil. *Hodder and Stoughton.* 429 pages. 25s.

This is a journalist's account of biblical archaeology which will grieve the experts, and grieve them not only because it is written by an amateur. The material is well collected, and the story of the excavations of the last century and a half will grip every reader, as will the reconstruction of the history since those excavations. A simply written and admirably arranged book like this cannot but fascinate, and the author has set his account amid a wealth of excellent photographs and drawings and plans. Yet he has surrounded his material with pretentious and inflated claims, passing beyond the reasonable and moderate assertions justified by the facts, that archaeology makes it easier for the narrow Biblicist to continue believing rigidly in the historical truth of everything in the Bible. The sober facts, says the blurb with justice, are "eloquent, dramatic and exciting," and it would have been better if no spurious eloquence had been superimposed on them.

★

THE HAWAIIAN LABOR MOVEMENT.
By Edward Johannessen.
USA: *Bruce Humphries.* 181 pages. $3.75.

It is a pity that the first history of the trade union movement in Hawaii, so long awaited, should not be better—even bigger. Mr Johannessen sets down neatly a lot of compressed information about the Hawaiian economy and its uniquely polyglot labour force—of which 40 per cent is Japanese and only 20 per cent Hawaiian. But only in reading between the lines does one glimpse an unusually violent and terrible history of employers deliberately importing race to be pitted against race. The book, alas, seems more designed to please all three of Hawaii's leading industries—defence spending, pineapple plantations and tourism—than to record the problems and the rise of organised labour. It at least stands to the credit of Mr Harry Bridges's Longshoreman's Union that, since the war, it has been able to amalgamate the previously purely ethnic trade unions. But Mr Johannessen is obsessed by the fact that Mr Bridges may be a communist (a charge which the federal government has recently abandoned after fifteen years of fruitless litigation). There are so few good studies of American colonialism that it is a pity that what could be an important subject has not been given a fuller and even mildly dispassionate treatment.

★

CHRISTOPHER COLUMBUS, MARINER.
By Samuel Eliot Morison.
Faber. 236 pages. Illustrated. 21s.

The name of Professor—or Admiral—Morison is familiar as that of the historian of the United States Navy in the last war. In the introduction to this book he explains how he got the job. As an amateur sailor he followed Columbus's routes. In the light of this experience he wrote the best modern biography of the Admiral of the Ocean Sea in 1942, a book which President Roosevelt so admired that he commissioned its author to write the official naval history. The original two-volume work was shortened to a single volume edition, and now we have a popular version of the same thing. Unfortunately the result is a certain vulgarity of style, and though the book could not be bettered as a guide to Columbus's voyages, one regrets that the author has not probed deeper into the character of this strange man. The truth is that the historian has had his say: the story should henceforth be treated as a tragedy in four acts—the exultation of the first voyage, the hints of impending disaster in the second, the catastrophe of the third when he was sent home in chains, and the pathos of the failure of the fourth. A mathematician who underestimated the distance to Japan by 8,000 miles, a geographer who could not tell what he had found, a colonial governor who could not keep order became a central figure in history because, as Jung said, "by using subjective assumptions, a false hypothesis and a route abandoned by modern navigation he nevertheless discovered America."

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

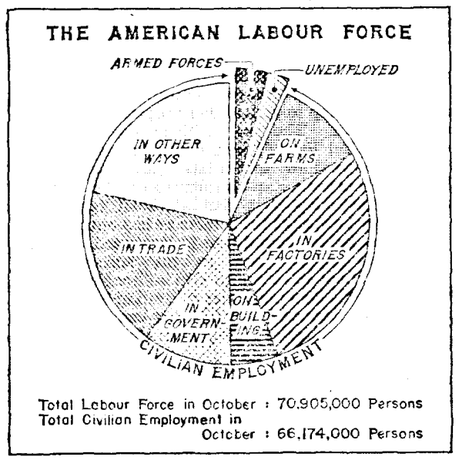
Inflationary Stability

Washington, D.C.

THIS has been a bad year for the economic pessimists in the United States. They had a brief fling in the spring, when their charts and statistics told them that there would be a recession in the third quarter. But instead there was a steel strike and the "tone" of good business never changed. Now at the year's end, when prophecies are as traditional as Christmas trees, the pessimists are for the most part in hiding. Although, according to custom, the forecasters are talking ominously about this or that sector of the economy, or this or that trend, the great majority of them believe that business as a whole will go right on being very good indeed. Government spending at all levels is due to rise again; it has been officially predicted that construction will reach another new record in spite of some decline in house building; capital expenditures by business are expected to decline little, if at all, from this year's quite unprecedented level; and, as is becoming customary, the steady rise in personal incomes promises that consumption will remain lively. The election results, needless to say, are scarcely likely to make business worse, and the stirrings of the international situation seem to have done little more than to increase prices in a few important commodity markets.

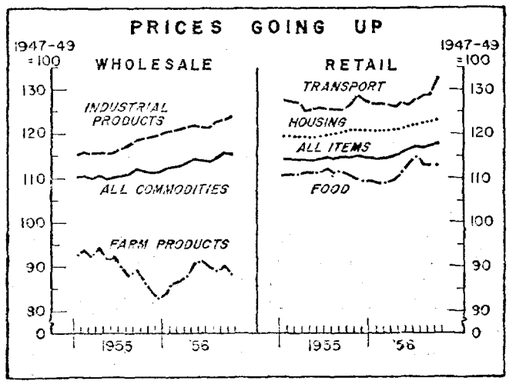
During the course of the past eighteen months people have found cause for worry in a variety of events or trends in the economy—an apparently dangerously speculative stock market, a zoom in hire purchase buying, the money squeeze, and a sharp slump in automobile sales, among others. Although none of these things turned out to mean very much in terms of general prosperity, this experience has not prevented the professional Cassandras—political and otherwise—from finding new things to worry about for next year. Every time a business fails, every time an industry lays off a few thousand workers, every month that shows a decline in the number of new houses started, these people find proof that the doom they have been awaiting is at hand. This kind of perpetual nervousness has its merits. Complacency still seems unlikely to afflict Americans, even after a decade of almost uninterrupted prosperity. But it is beginning to appear that the fundamental mistake made during recent years by the pessimists—many of them people of intelligence and good will—has been their failure to recognise the "prosperity effect" provided by the astonishing diversity of an economy with the standard of living of America today.

The United States manufactures far more than any country on earth, but it is not a manufacturing nation: only about one in four members of the labour force works in a factory. It eats very well and exports vast quantities of farm products besides, but it is not a farming nation: only 10 per cent of the labour force is now engaged in agriculture, compared with 20 per cent as recently as 1939. It builds more than any other country except perhaps the Soviet Union; yet less than 5 per cent of the labour force is engaged in construction. Americans now earn their livings predominantly by providing services or by distributing and transporting goods. With workers at all levels of government added, these people come to half of the total labour force and well over half of the non-agricultural labour force. Consumers spend three times as much on services as they spend on all durable goods put together, including automobiles.



So far, at least, an economy with this bias toward service and distribution seems to be inherently more stable than an economy based on manufacturing or farming or both. There has been a farm slump for four years, and there was a sharp manufacturing slump in 1954, and yet, in terms of total employment and income, the United States has never stopped being prosperous since the war. What is more, the experience of stability—plus the widespread conviction that the government can and will act to prevent anything serious from happening to prosperity—has contributed to the amazing willingness of industry to invest. One of the economic clichés today is that capital investment in America is scheduled on a long-term basis and is subject to only minor fluctuations as a result of current conditions.

But an economy so luxuriant in services may have a serious flaw, one which is connected with the only worry which is universally expressed about 1957: that prices may go on rising. In 1956 the cost of living rose by nearly 3 per cent after almost four years of remarkable stability. The partial recovery of prices at the farm was an important cause of this particular movement in the consumer price index, but for the long run the fundamental question may turn out to be something not discussed much up to now—that of productivity in distribution and services. An American garage mechanic or bus driver or shop hand or bartender rightly insists on being paid a wage in line with the rising standards of his society, but in this type of work it is frequently impossible to do anything by capital investment to improve productivity. Therefore the price of the services provided must of necessity rise to cover the higher wage costs. Charges for services and for most types of transportation have in fact risen regularly all during the period of price stability which ended this year. The consumer price index as a whole remained steady only because food prices were falling and the prices of most



manufactured consumer goods were either falling or stable. This year food prices rose and the index whirled briskly upward.

This "inflation" is not a problem of excessive demand. It is certainly not a problem of monetary laxity—for the past eighteen months American monetary policy has been increasingly stiff, with the result that the money supply has actually grown at a slower rate than has the gross national product. It is not even a problem of excessive trade union power and insufficient labour restraint, bolstered by full employment. Most workers in services and distribution are not even organised, and trade unions in general bargain for only about a quarter of the labour force. If it be argued that the unions have set the wage pattern and standard of living which the workers in services and distribution feel they are entitled to emulate, this can scarcely be blamed on the unions. In manufacturing generally, where the trade unions are concentrated, a good case can be made for the argument—extremely elusive statistically—that wages have risen roughly in line with productivity.

It would indeed be ironic if the great, and admirable, dream of an economy of full employment with stable prices should founder on this rock of productivity in services and distribution. If the difficulty is a real one—and statistics on productivity are scarcely adequate to give any answer more clear-cut than does plain common sense—then there is no visible solution to it. Indeed this is not really inflation at all, in the sense of excessive demand hoisting up prices, and yet it is what people in general think of as inflation and presumably dislike. If the bias toward services gives this unprecedented American economy an unlooked-for stability, that same bias may hold out the prospect of a constant—though slow—rise in the cost of living.

Almost Back to Normal

WITH Mr Dulles, miraculously restored to health, returned to the State Department and prepared to resume his travels and with the President in Georgia playing golf at the end of a telephone line, Washington is almost back to normal. So, to some extent, are its relations with America's European allies. As the Suez withdrawal began, so the "tough line" also began to soften—sooner than had been expected, but none too soon, in the opinion of many newspaper commentators. The emergency plan, to ensure that as much oil as possible will go to Europe from America, is being acted upon and the United States has now turned its attention to the longer-term aspects of the middle eastern conflict. Mr Dulles is going to the North Atlantic Treaty meetings in Paris to patch up the alliance and settle "misunderstandings," although he considers them a less important problem than that of achieving peace with justice and renouncing the use of force. Nor does he as yet hold out any promise of the three-power meeting with the President which the French and British would like.

At least the Administration is again practising what it has always preached; that the economic strength of America's allies must be maintained not for their own sakes but because it is essential to the strength of the United States. This is the argument being advanced in favour of the British request for a waiver of the interest due on the American loan. From first reactions it appears that Congress is prepared to accept the argument, which is fortunate since the Administration insists that the waiver must be approved by the legislative branch of the government. But it will be at least a month before Congress, not now in session, considers the request. While the delay will allow time for resentment against Britain to die down, it will also allow time for objections to generosity to grow up.

Grounding the Army

IN the past fortnight the American Army has suffered grievously in substance and in sentiment. It might have been easier to say farewell to the last remaining carrier pigeons and mules, which are being replaced by helicopters and other mechanical devices, if their departure had not synchronised with a sharp setback to the Army's most forward-looking aspirations. The Secretary of Defence,

Mr Charles Wilson, last week made a series of major rulings on the boundary lines between the armed services. If sustained, they will douse the Army's hope that the coming of the guided missile would outdate the Air Force's arrogant "concept of 'air power' as an entity apart from other types of military power." The decisions had obviously been preceded by an acute struggle in the Department of Defence, since Mr Wilson had to use his power of last resort to take them on his sole responsibility. The Joint Chiefs of Staff had failed to come up with a joint recommendation, a fact which of itself practically guarantees another outburst of congressional curiosity about the conflict of forces within the Department.

By far the most significant of the decisions are those which deny the Army any missiles with a range of over two hundred miles and severely limit the type of tactical air support which ground forces can maintain under their own command. The most immediate practical effect of the two hundred mile limit is to disabuse the Army's research station at Redstone, Alabama, of any idea that their service will be allowed to own the Jupiter, an intermediate range ballistic missile with a maximum reach of 1,500 miles, which is being developed there,

But although this issue is the more spectacular, the clipping of the Army's tactical wings has more direct relevance to the basic argument between the Army and Air Force. The Army accuses the Air Force of concentrating exclusively on the problems of total war and of failing to provide aircraft for the long-range airlift of mobile divisions that might be required at very short notice in a limited war—if, for instance, it had been American policy to use force recently in the Middle East. The types of supersonic jet aircraft on which the Air Force spends its money are also said to be quite unsuitable for the tactical support which ground troops need in the new conditions of rapid dispersal and concentration and the disappearance of clearly defined battle areas. Mr Wilson evidently decided that he had better stamp on this line of thought before it led to a case for a second "Air Force within the Army." From now on the Army is only to have aircraft for observation, reconnaissance and the airlift of men and material strictly within the immediate battle zone.

Negro Switches

SINCE the election Negro leaders have been predicting optimistically that the dramatic switches in the coloured vote which it revealed will have a pronounced impact on the next Congress's attitude to civil rights for Negroes. The four million Negroes who voted—in a total poll of sixty-one million—are mainly concentrated in the decaying hearts of the great cities. No one doubts that in a presidential race which was closer than the last one these Negroes might make the crucial difference in several key states with large electoral votes. This time, the more detailed electoral figures now coming in from the individual wards show that in all but two of the major cities there was a swing of some sort from Mr Stevenson in 1952 to Mr Eisenhower in 1956.

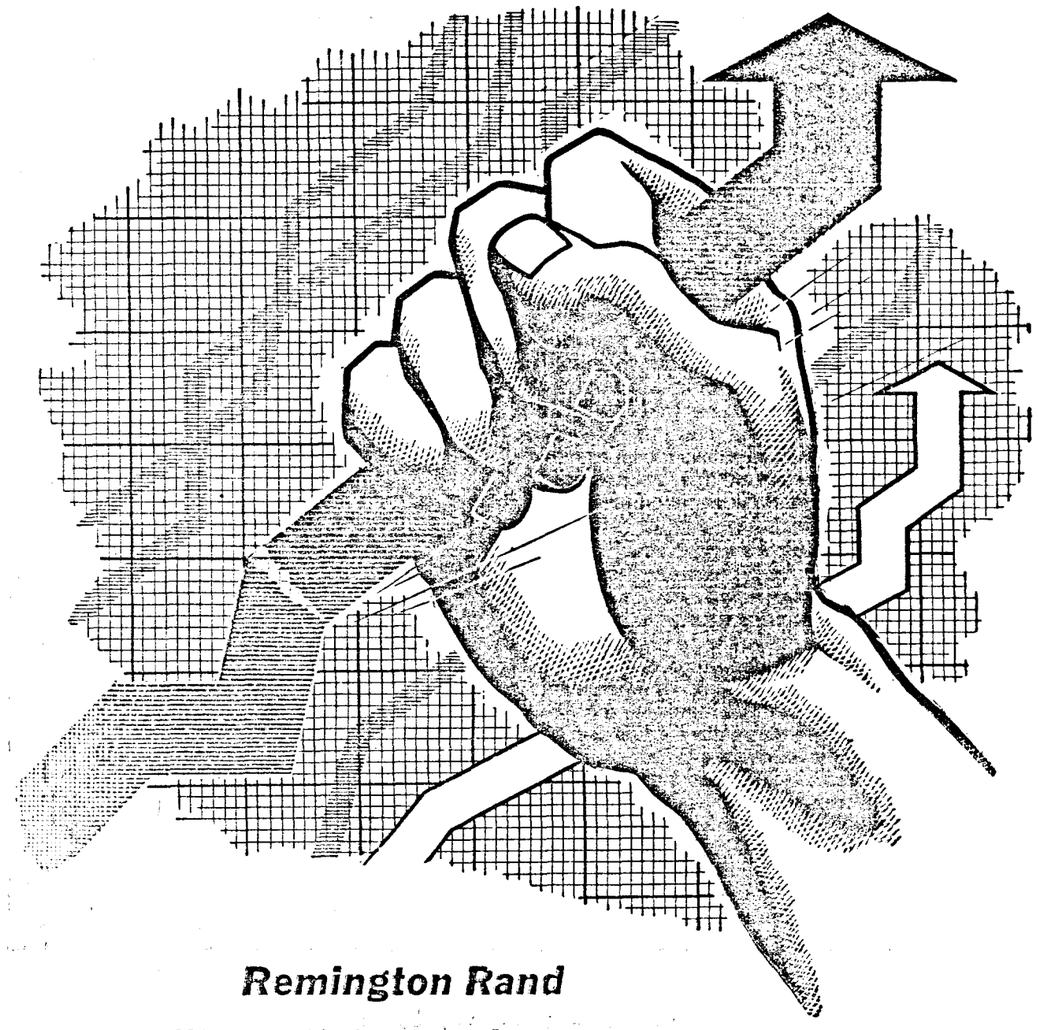
The Negro switch reached striking proportions in the South. For instance, the President only retained Tennessee, which he had captured by an exceedingly narrow margin in 1952, because a Democratic trend among the white voters was more than counterbalanced in the coloured wards of Memphis. An all-Negro ward in Atlanta, Georgia, increased its Republican vote from 33 per cent in 1952 to 87 per cent last month, and a similar precinct in Richmond, Virginia, gave Mr Eisenhower 72 per cent in 1956 compared with a mere 8 per cent four years ago.

In the North, where social issues and loyalties are not quite so totally overlaid by racial considerations, the trend was less extreme but probably more worrying to the Democrats, since there the parties are more evenly balanced. In a few northern cities, especially Chicago, readiness to vote Republican was much more marked in the districts where the growing coloured middle class lives than it was in the slums. Between different cities there was substantial evidence that Negroes were consciously out to reward local political leaders who had shown good faith over matters of civil rights. In Detroit, where a liberal Governor, Mr Williams, was leading the Democratic campaign, the vote for Mr Stevenson in several completely Negro wards fell in four years only from 91 to 87 per cent. By contrast the almost total switch to the Republicans of the Negro wards in Baltimore, in the border state of Maryland, first occurred not this year but in the state election of 1954, out of gratitude to the Republican Governor for the prompt manner in which he had backed up the Supreme Court's decision over racial segregation in schools.

Steel in Demand

AFTER producing at full capacity for twelve weeks in succession, the American steel industry is nevertheless faced with the prospect of government controls over the distribution of those steel products which are in shortest supply. The most acute scarcity is of steel plates used for building ships and railway wagons and for large welded pipes; also short are structural shapes for building and drill pipe and other "oil country goods" needed by the petroleum industry. Only cold rolled sheets, the type of steel most wanted for motor cars, are still in adequate supply. And, although the recovery of the automobile industry's demand for steel has been somewhat hesitant, continued success for the 1957 cars could soon take up any slack on that side of the mills—especially if any cold rolled sheet capacity were to be converted to produce more steel plate.

The heavy demand for steel plate and tubular products has developed independently of the Suez affair. For the first time since the war the shipyards are enjoying healthy order books, containing contracts for both dry cargo freighters and passenger vessels for the shipping lines which are helped by government subsidies, and for large tankers negotiated privately with the oil companies. On the railways, the shortage of rolling stock, which has long been evident, has already brought orders for 120,000 new goods wagons. The additional demands arising from the closure of the Suez Canal are still more prospective than real. If the plan to build fifty super-tankers is given some more concrete government support, it could raise by as much as 10 per cent the present demand for scarce steel plate. If producers are encouraged to step up oil drilling programmes in Texas and Louisiana and measures are taken to extend the network of



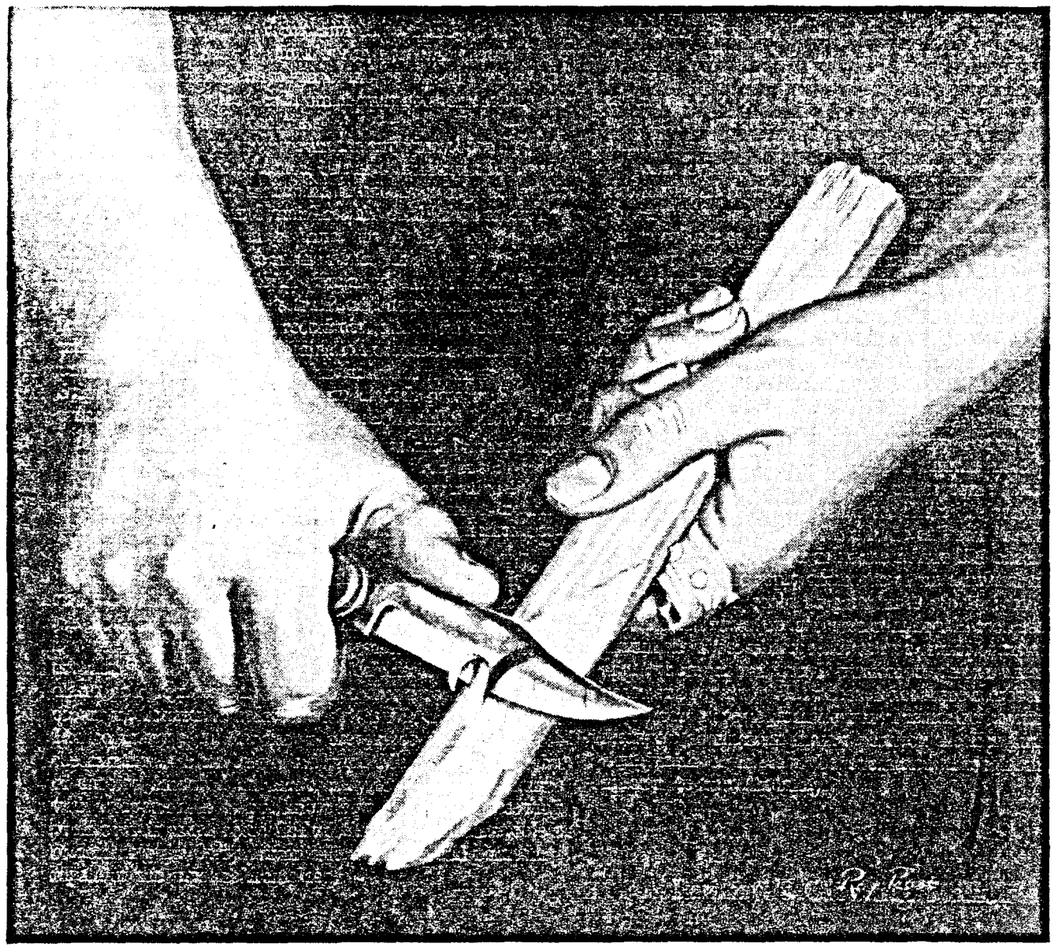
Remington Rand
office efficiency gives you
the upper hand on rising costs

There is one way to force down the graph of rising costs. It is the sound way of office efficiency and planning.

The business executive who is wise will give as much attention to streamlining his office planning as he does to factory equipment. In fact, the office is of equal importance because it is the finger on the pulse of finance, production, and selling; the *organised* office will save you money.

REMINGTON RAND

REMINGTON RAND LIMITED · 1-19 NEW OXFORD STREET · LONDON WC1



One of a kind!

Kids still love jacknives, but no longer seem to do much whittling. Like the circus big-top this vanishing pastime seems to be one more casualty of this high-G, triple-carburetion age.

The production engineer also has lost his enthusiasm for whittling metal. Machining from solid bar is still a necessity when making one part or a few prototypes. But, for hundreds of parts, extruded shapes save metal and machining time.

TMCA has pioneered the difficult art of extruding Titanium alloys. Many thousands of pounds of extruded Titanium sections are regularly shipped to jet engine and airframe industries. Seamless extruded tubing is another regular production item at TMCA.

Write today for information on Titanium extruded shapes and tubing.

. . . FIRST IN Titanium

TITANIUM METALS CORPORATION OF AMERICA, 233 Broadway, New York 7, N.Y.

pipelines, a further substantial increase in the supply of steel pipe will be required.

Although these new demands have not yet been made, the knowledge that both the tankers and the pipelines are urgently required and that steel supplies will presumably become even shorter is already having a strong psychological effect on steel buyers. The shipyards, in particular, complain that they are getting 20 per cent less steel than they need and that, unless the government intervenes to give them priority in the distribution of steel plate, they will soon be receiving an even lower proportion. But if priority is given to the shipyards it could hardly be denied to other strong claimants, such as the builders of railway wagons. This raises what to many is the unattractive prospect of the resurrection of a comprehensive allocation system similar to the one operated during the Korean war. Meanwhile, the steel companies can press, with more chance of success, their pleas for tax concessions to help them to build new facilities for the production of steel plate, pipes and other scarce products.

Votes to Deliver?

FROM A CORRESPONDENT RECENTLY IN NEW JERSEY

MR EISENHOWER'S spectacular triumph last month in New Jersey dealt a severe blow to one of the country's most famous political machines and jeopardised the career of Governor Robert Meyner, one of the leading candidates for the Democratic presidential nomination in 1960. By polling nearly two-thirds of the votes cast and doubling the majority he gained in the state four years ago, the President helped to oust two Democratic members of the House of Representatives and very nearly achieved the defeat of a third. His accomplishment in becoming the first presidential candidate ever to carry all twenty-one New Jersey counties struck to the very roots of Democratic strength in the state.

For thirty years under the unbroken personal rule of the late Mayor Hague, Hudson County (which includes Jersey City and its environs just across the river from New York) had been a Democratic bulwark. Its huge Democratic vote usually overwhelmed Republican power in the rest of the state. Four years ago General Eisenhower carried New Jersey but not Hudson County; this time he swept the county by the almost unbelievable majority of 66,000 votes. In his wake, little-known Republican candidates captured one House seat from Jersey City and, after a recount, narrowly missed winning a second, although both had long been safely Democratic.

This revolution marks the final decay of the old-style party machine built on immigrant loyalties and political favours. Since Mr Hague yielded the leadership of the party a decade ago, his political heirs have been squabbling over his fiefdom and slowly dissipating it. Repeated disclosures of endemic corruption have had disruptive effects which his successors, unlike the dead boss, have not been able to check. Poles and Italians grew restive in an organisation in which the Irish monopolised the places of power. Finally, fifteen years of prosperity gave the poorer voters a new sense of status and diminished their need for the services and patronage of the local party officials.

The Democratic organisation in Hudson County this year did no work for Mr Stevenson, because it presumed that he could not win, and did no work for its congressional candidates because it presumed that they could not lose. The machine counted on the voters' habit of Democratic regularity to bring success on November 6th; when that day came, the habit had disappeared. The question in Jersey City as in Boston, New York, Chicago, and other metropolitan centres is no longer whether the Democratic organisation will deliver the vote but rather whether it any longer has a vote to deliver.

★

The outcome in Union County, where the Democrats lost a second seat in the House, shows this political revolution carried to its second stage. The election there was unusual in several ways. In this suburban district, made up predominantly of business men and their wives, 92 per cent of the registered voters cast their ballots. The district had never gone Democratic for any office before Representative Harrison Williams captured it in a by-election three years ago. He won then because the Republican organisation made the mistake of nominating a conservative stalwart of routine talents, and the voters rebelled. Mr Williams lost this year because the same organisation, having learned its lesson well in the meantime, chose Mrs. Florence Dwyer, an articulate exponent of Mr Eisenhower's "modern Republicanism." Since both candidates waged their campaigns on a liberal and internationalist platform, the voters chose Mrs Dwyer by a narrow margin largely because she was a member of the President's party.

If Republican organisations in other parts of the country were to emulate the ability of their colleagues in the Sixth District of New Jersey to learn from experience, it would be easier for Mr Eisenhower to rehabilitate and modernise his party. Likewise, Mr Williams, an uncommonly attractive young politician, polled in defeat some twenty thousand votes more than Democratic candidates for local offices; the Democrats in New Jersey and elsewhere might therefore infer that the nomination of candidates with an appeal to independently minded voters offers their best hope of countering the loss of Hudson County and those other crumbling urban strongholds.

Because New Jersey is one of the small number of states where gubernatorial elections are held in odd-numbered years in order to keep them clear of the public's devouring preoccupation with the presidential contest, Governor Meyner goes to the voters in 1957 to seek another four-year term. His decisive re-election would materially enhance his stature as a Democratic presidential possibility; at the same time any Republican who unseated him would score an impressive personal triumph. The size of Mr Eisenhower's victory banished Republican defeatism about the chances of knocking out the popular Mr Meyner. The Republicans now eager to dance on his political grave include such notables as Mr Bernard Shanley, an influential member of the President's personal staff, and, less likely, Mr William Tompkins, an Assistant Attorney-General, and Mr Douglas Dillon, the present Ambassador to France. Mr Meyner has been an energetic reform Governor and, like Representative Williams, he has a political appeal that cuts across party lines. If he is opposed next year by a champion of "modern Republicanism" such as Mr Shanley, the election is likely to provide an important clue as to which party can benefit more from the current political changes.

Moving the Oil

NOW that some official sanction has been given to the efforts already made by individual companies to supply more oil to Europe, the regulatory authorities in the producing states may be prepared to play a larger part than they have so far. Louisiana has increased its permitted production rate by 200,000 barrels a day since the emergency began, and Oklahoma has raised its "allowables" by 45,000 barrels a day. But Texas, which accounts for 40 per cent of America's oil output, and has the most shut-in capacity, has so far raised its allowables by only 75,000 barrels a day.

There is now no major barrier to producing an extra 600,000 barrels a day of oil, although it will take time to reach this level, but the success of the operation depends on the availability of pipelines, barges, and even rail tank wagons to transport the extra oil from the inland fields to the loading points on the Gulf Coast.

Spare pipelines from West Texas, which has most of the state's excess production capacity, are particularly difficult to find. Some West Texas crude has even been sent by pipeline as far north as Illinois, and then back down the Mississippi by barge, in a costly manoeuvre to reach the Gulf coast loading ports.

On present estimates, not more than half of the anticipated increase in output could be shipped off the oil fields. If the Texas Railroad Commission were prepared to depart from its usual practice and allow specially high production quotas to those fields most readily accessible from the coast, part of this difficulty could be overcome. Emergency shipments of American crude oil to Europe in November, which reached a rate of over 300,000 barrels a day by the end of the month, were mainly drawn from crude stocks, but withdrawals cannot continue at anything like that rate. The high level of crude oil stocks throughout the United States is not a reliable indication of supplies available for export, as most of the stocks are held inland and can be moved to the coast only with the greatest difficulty.

Manufacturing Energy

FROM A SPECIAL CORRESPONDENT

TWO hundred and fifty industrialists from thirty-one countries of the western world have just been attending the third international conference of the National Association of Manufacturers in New York. During the four days of the meetings formal speeches were limited and the accent was on "shirt-sleeve" discussions between American industrialists and their foreign counterparts. The adjective must be understood in a figurative sense only; in the dignified ambience of the Plaza Hotel, the assembled manufacturers displayed no more linen than the dictates of Savile Row and Jermyn Street permit. The general mood was sombre. A dominant concern was the inordinate amount of energy which would be required if economic activity were to continue to expand; capital needs were also discussed in terms calculated to dampen the optimism of the expansionists.

Two of the main topics were automation and company organisation, but chief attention was devoted to the industrial applications of nuclear energy. This part of the programme was sparked by Mr John Jay Hopkins, president of the General Dynamics Corporation, which built the first atomic submarine. He called for the creation of an economic and scientific community of countries outside the Soviet block, patterned on the North Atlantic Treaty Organisation. This group would be a

> flexible alliance of the free world nations, aimed as much at eradicating poverty through the wide-scale application of nuclear power as at providing rapidly a world-wide equalisation of energy resources.

A Swedish industrialist, Mr Sven Ture Aberg, stated that the Suez crisis has "given European business men and statesmen the impetus that was needed to accelerate atomic energy programmes." In the closed round table meetings, however, many reservations were expressed about the rapidity with which atomic power would be available on a wide scale. British delegates appeared especially dubious about the immediate future of the small package reactor, a piece of hardware which is of particular interest to the less highly developed nations.

SHORTER NOTES

The appointment by the President of a special representative, Mr Tracy Voorhees, to co-ordinate private and public efforts to help Hungarian refugees was quickly followed by steps to quadruple the number who can go to the United States. Over 20,000 refugees will now be admitted as "parolees" under the basic Immigration Act: this enables the Hungarians to be brought in quickly, without the usual processing, but, if they wish to remain permanently in the United States, special action by Congress will be needed.

★

The final party position when the House of Representatives meets next January will almost certainly be 234 Democrats to 201 Republicans, compared with 232 to 203 in the last Congress. The counting of absentee ballots in the undecided districts has in each case given the seat to the incumbent. Thus in the end the Democrats did not win a seat in either Washington or Nebraska and the Republicans won only two, not three, in New Jersey. Altogether 20 seats changed hands, with the Democrats winning 11 and the Republicans 9. There is still a vacancy in New Mexico, where the candidate died, but there seems no doubt that the Democrats will hold this seat.

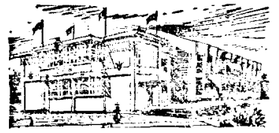
The National Industrial Conference Board has begun a new statistical survey of capital spending by manufacturers. Each quarter it will publish in *Newsweek* magazine the answers to a questionnaire on how much has been appropriated by a company for capital outlays during the preceding three months, how much has actually been spent, and how much is still outstanding.

BRITISH MAURITIUS

Future Bright on Sugar Island



Little Maria is a child of Mauritius — island of sugar far out in the Indian Ocean. Maria's mother wants her baby to grow up healthy and happy and to enjoy some of the comforts of life. But the fruits of civilisation seem a long way off, for Mauritius has only limited resources. Projects like the 10-year development programme of the island's Central Electricity Board with its new power station at Port Louis, the capital, are a hope and an inspiration to the people of Mauritius. Perhaps the future is bright for little Maria.

BRUSH IN ACTION

Once the problem at Port Louis was urgent. The designs for the new station were completed in March 1954 and building began in May. The first set was running *before the end of that year.*

Equipment for the Port Louis power station is designed for continuous operation, especially during the drought season from September to December. It comprises four Mirrlees 12-cylinder diesel engines, two KVS 12 and two KVSS 12, with Brush Alternators and Brush Switchgear.

The Brush Group produces about a third of the U.K. output of industrial diesel engines and generating sets — and is, in fact, the world's largest exporter of this type of equipment. The Group constantly exports over fifty per cent of its entire production and, in the past few years, it has exported as much as seventy per cent.

Not a matter of form...

WHEN IT CAME TO HORSES the Romans thought more of colour than of form. That is why when Julius Caesar returned in triumph from his second African expedition the chariot in which he drove was, by order of the Senate, drawn by a team of milk-white horses. For the Romans believed that white horses were specially favoured by the gods, and naturally wished to afford their valued leaders every protection under the sun.

Today, in industry, the choice of adequate protection —reliable packaging—is no matter of form. It is a serious decision on which the reputation of a firm may well depend. That is why most leading manufacturers favour stout "Fiberite" cases, and crisp, attractive cartons made from "Thames Board". These names are as famous in the world of commerce as those of the goods they protect.

French Afterthoughts

FROM OUR PARIS CORRESPONDENT

THE almost total lack in France of critical discussion of the problems involved in the Suez intervention, and particularly of its effects east of the canal, could easily be taken as a symptom of public apathy and of a dangerous shrinkage of French awareness of the world. Yet, for many Frenchmen, the events of the year in North Africa, the Middle East and Eastern Europe have in fact torn the veil from many brutal realities. Their changes of attitude in 1956, though not violent, show every sign of having been, and of continuing to be, profound.

The most visible effects have been on the left. The Communists' support of the Russian repression in Hungary has probably not lost "the party" its clients (it remains the great champion of the French working class); but it has dealt a crippling blow to its drawing-power. Since the Popular Front and the Resistance, the Communist party, as the torch-bearer of the revolutionary tradition, has exerted an influence over liberal minds which is almost unimaginable in Britain. The Communists have been the "tough," the "pure," revolutionaries. The left-wing reformists who, bred in the same revolutionary tradition, have been forced in government to compound with the Right because, having broken with the Communists, they had not the power to impose their views, have been all too aware of being the "softies." Thus, Communist influence has gone far beyond the party. Its part, for example, in French anti-Americanism could hardly be exaggerated. But the Hungarian upheaval has led the party to offend against the most hallowed traditions of 1789, 1848, and the Commune. Jean-Paul Sartre, and an obscure delegate to the congress of the federation of primary school teachers, where the Communists had a bad time, used almost the same phrase: "Had we been Hungarians, we would have been among the shot and you among the shooters." In 1956, the Communists have for the first time appeared as possibly not the party of the revolution.

This blow confirms the trends of recent years, for instance, in the union movement and among politically conscious youth. The communist-led CGT (much the strongest labour federation) has displayed an unwonted neutrality over Hungary in order to avoid a split—and nevertheless lost some votes to the non-communist unions in welfare committee elections in several major plants. This weakens the party's political control of the labour movement, which was already sapped by the decline of the unions after the political strikes of the forties and their relative revival during the recent boom as a result of strictly wage negotiations. As for intellect, an eminent educationist, writing in *Le Monde*, has noted how the students at the Sorbonne have been moving to the non-communist (but anti-colonialist) left. A few years ago it was normal for fifty of the 200 students at the élite *Ecole Normale Supérieure* to be party members. Today, perhaps ten are.

Unfortunately, the "reformist" parties, caught in the Algerian imbroglio, are in poor shape to snap up the heritage. The Socialists have disappointed left-wing opinion, especially over Algeria; and the Algerian crisis, which was the main cause of French interest in Nasser, drags on. The position of M. Mendès-France, who now leads only half the Radicals, but whose name still has magnetism, is ambiguous. Over Suez and Algeria alike, anxious to maintain his prestige but also to keep in touch with the Socialists, he has dissociated himself from government policy without opposing it. He half-plays the cards both of anti-colonialism and of "national renovation." The moderate left has contributed its full share recently to the nationalist mood of a frustrated country—a mood which should normally favour the right. Hence the pessimism of left-wing intellectuals like Sartre and Duverger who fear coming "fascism" and, though grateful that Poujade "is an imbecile," ask who will succeed him.

Is this fear justified? Not even General de Gaulle in the hungry forties, scared by Communism, was able to sweep a new, right-wing Radical party to power. Today, one could only succeed with the assent of the orthodox parties. Unless the coming economic crisis turns out to be worse than it is reasonable to suppose, it is hard to see anyone obtaining this support. If the situation seriously deteriorated—and despite mounting criticism the distribution of parliamentary seats gives the government an immensely strong position—a national coalition, from the socialists to the conservatives, would be much more likely.

It should not be assumed that, even with such a coalition, French policy would necessarily freeze in postures of denial. The leaders of the right are M. Pinay, who is said to believe that Algerian nationalism is a fact that must be reckoned with; M. Reynaud, who has been outspoken against Suez; and M. Edgar Faure, who saw early in 1955 the need for Moroccan independence. The ally they most seek is the MRP which has been more forward lately than the government in suggesting Algerian reform. The Right is much more nationalist than some of its leaders over Algeria. But the precedent of last year's votes on Morocco shows it may be more adaptable when it comes to the point than

its instinctive reactions would lead one to conclude.

Another important factor of adaptability is that whatever their resentment of America, or disbelief in Uno, the failure of the Entente Cordiale to impose itself at Suez has chastened most Frenchmen into realising that an "independent" policy is impossible. It is M. Mendès-France himself who pointed out last weekend: "It is an error for a country like ours to try to play a subtle game between America and Russia. . . . At a time when Russia is acting as she is doing in Hungary, let us not allow a dangerous gap to grow between America and ourselves. Otherwise, one day, we might learn they were directly settling their affairs together—and even ours."

In these circumstances, the Suez crisis has considerably strengthened the "European" case in France. The ambition to build up atomic power resources as rapidly as possible in order to circumscribe Europe's future dependence on Middle East oil has put a favourable wind in Euratom's sails. It is also possible for the first time to detect in the French press a friendlier note on Germany. The Germans, too, quite apart from their reluctance to rearm, now seem dwarfed by Russian and American power. And the reasonable agreement over the Saar this summer has offered a striking contrast with incessant trouble elsewhere. The French never really expected to obtain the canalisation of the Moselle from the Germans and the gratification of their desire has had its effect. Big industry's hostility to integration plans, which was a major cause of the rejection of EDC, has given place to guarded approval of a common market. There is less resistance than six months ago to M. Mollet's European policy.

Whatever the line taken, either the expansive one, through European unity, or the restrictive one, through some kind of nationalist self-absorption, the aim will be the same: greater independence of the truly great powers. The choice will depend mainly on Algeria and the economic situation. The "Europeans" have lately been marking up points partly because recent prosperity has encouraged the jettisoning of protectionist attitudes. Were the oil shortage, by hastening a serious balance of payments crisis, to lead now, or later, to much graver economic difficulties than the authorities hope, the ever-present spirit of nationalism could still take control. As long as the Algerian crisis lasts, the emotions that encourage nationalism will continue to be stimulated.

Choice for Canada's Conservatives

FROM OUR CORRESPONDENT IN OTTAWA

THE people of Nova Scotia, who are generally reckoned to be the most canny and phlegmatic of Canadians, have achieved a political change which was beginning to seem impossible. They have thrown out their provincial Liberal government after 23 years of uninterrupted rule and substituted a Conservative administration under Mr Bob Stanfield in its place. Thus they have broken the long run of provincial elections in which existing governments of every conceivable political hue have been re-elected without difficulty. The Liberal party now controls only three provincial administrations—Newfoundland, Prince Edward Island, and Manitoba.

In these prosperous times, when everybody had seemed to be content with whatever government they had, Nova Scotia's revolt had the makings of drama about it. It could have been taken, even, as a warning to the federal Liberal administration, preparing for a general election next summer, that governments can be overthrown even after 23 years. But Nova Scotians do not care for the dramatic. This was no sudden, impatient demand for a change. It had been coming over the Nova Scotians, very gradually, for the last eight years that, after all, it was probably time the other fellow had a chance.

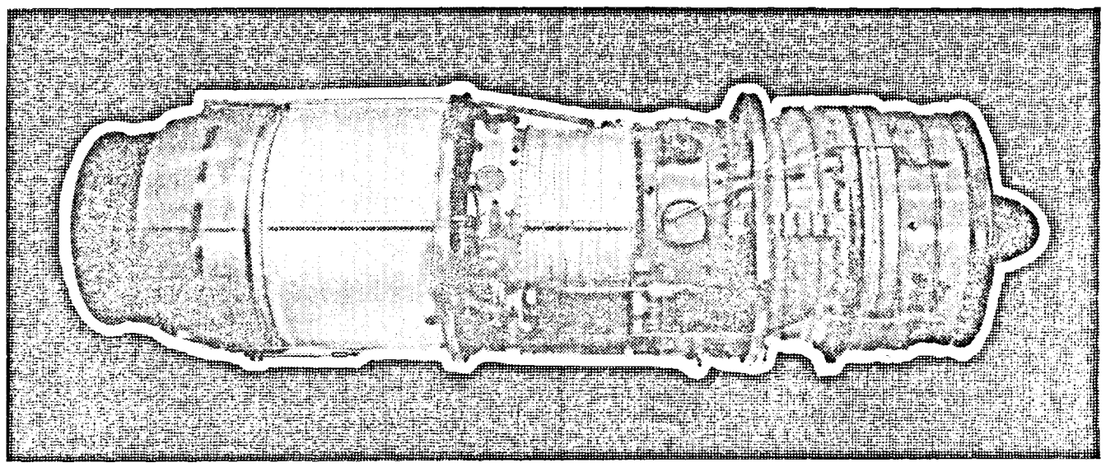
This is now the second of the Atlantic provinces to turn Conservative after long years of Liberal rule; New Brunswick made the break in 1952. It would have been a tremendous encouragement to the federal Conservatives at Ottawa, if it had not been for the retirement of Mr George Drew as their leader. As it is, the Nova Scotia victory finds the federal party in the throes of a rather dismal attempt to choose a new leader. Mr Drew had been carrying such an appalling load of hard work and responsibility that he simply broke down under the strain, just when his leadership was at last beginning to show signs of starting a revival in the Conservatives' fortunes. Hopes were high that, even if the Conservatives had no chance of winning the 1957 election, they might at least make substantial gains.

A Party Convulsed

Mr Drew's retirement, in circumstances of some personal tragedy, has shown up more clearly than before the inadequacies of the other leading members of his party, and the even more serious lack of any proper research organisation to serve the party. Mr Drew was driven by the former circumstance to take the lead himself in countless debates which the Prime Minister could easily leave to his colleagues; and by the latter to do himself nearly all the work of preparing his speeches. The party is now convulsed trying to select a new leader. It might be wiser to be more worried about providing a proper central organisation to support the leader it does choose.

With an election to be faced next summer, the Conservatives had not had time, even if they had the inclination, to try to find another leader from outside the ranks of the federal MPs. The choice, to be made at a national convention which opens on Monday, will have to be made between four or five contenders, each of whom has almost as much to be said against him as for him. Leading the race at this stage is the one Conservative who has consistently held a seat in Saskatchewan. He is a lawyer named Mr John Diefenbaker, just turned 61, who tried for the party leadership at its last convention in 1949. People have sometimes said that he is really more of a Liberal in outlook than a Conservative. He is an impressive platform speaker, and this weighs very heavily in his favour among Conservatives who are primarily concerned to win as many seats as they can at the next election. But his Liberal opponents in the House of Commons, who have closely diagnosed all the weaknesses of the possible new leaders, claim that his characteristic parliamentary role, as an outraged prosecuting counsel, has long ceased to cut any ice.

Mr Diefenbaker's chief rival is also a perfect contrast. He is another lawyer, this time from Toronto, called Mr Donald Fleming and is 51 years old. He is somewhat ponderous as a speaker and quite lacking in humour. But he has



NEW BRISTOL OLYMPUS GIVES 16,000LB THRUST WITHOUT REHEAT

The latest announced version of the Olympus, the B.Ol.6, is officially rated at 16,000 lb thrust without reheat. This makes it the most powerful turbojet for which figures have yet been released.

New versions of the Olympus under development will produce even greater thrust, emphasizing the fact that the Olympus has the greatest development potential of any engine of its class.

Low fuel consumption, high power at high altitudes—these are the basic advantages of the Olympus range, made possible by the twin-spool principle.

Olympus engines now in quantity production, deliver 12,000 lb thrust. Civil versions are available to the world's operators.

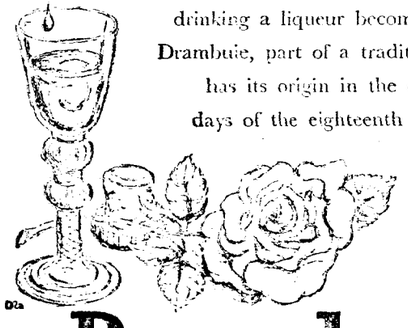
It is more than two hundred years since Drambuie was first brought to Scotland by Bonnie Prince Charlie. The pleasant custom of drinking a liqueur becomes, with Drambuie, part of a tradition that has its origin in the colourful days of the eighteenth century.



Drambuie

always done his homework. The Liberals say they are not afraid of him because he is too earnest and unexciting to capture the popular imagination. But they readily acknowledge that in the House he has to be taken seriously, because he briefs himself studiously and fully. Mr Fleming also has the advantage of speaking French with some fluency, and of having taken great pains over the years to try to cultivate friendship with Quebec. Mr Diefenbaker will not be so well regarded, it seems, by the French-speaking voters.

The youngest declared contender for the leadership is from Kamloops in the interior of British Columbia, Mr E. Davie Fulton, who is just 40. If the Conservatives felt that they could ignore the pressing challenge of next year's election and pick a leader to build up for the future, they might well choose Mr Fulton. He is attractive, youthful and red-headed in appearance. He is diligent, persistent and intelligent. But it will probably be felt that he does not carry enough guns to lead the Conservative battlefleet into action next year.

It is indeed a fleet lamentably short of big ships. Its best immediate hope is to present the appearance of such responsibility, cohesion and discretion that Canadian voters will be prepared to take the risk of turning to it as a tolerable alternative to the Liberal party. But, whoever the new leader is, the Conservatives will find that it is useless to expect a frigate to shoot like a battleship. Their real test will be whether they can furnish some intellectual artillery behind the scenes.

Apartheid at the Assembly

FROM OUR UNITED NATIONS CORRESPONDENT

MR ERIC LOUW has announced South Africa's partial withdrawal from the United Nations in protest against UN "interference" in South African domestic affairs. South Africa "will in future maintain only a token or nominal representation" at Uno and its chief delegate, Mr Donald Sole, is to return home. Mr Sole is one of those able men who is held in high personal esteem, even affection, by many who deplore the internal policy of his government. Mr Louw will remain in New York with two colleagues "until there is an easing of the present tense international situation," but South Africa will not participate in the ordinary business of the General Assembly except when budgetary questions arise.

Three South African issues have regularly arisen at the United Nations: *apartheid*, the treatment of persons of Indian or Pakistani descent, and the status of South-West Africa. These issues raise conflicting principles. The South African government insists that they are matters "essentially within the domestic jurisdiction" of a state and therefore outside UN competence. The Bandoeng countries, on the other hand, assert that what is happening in South Africa is a denial of "human rights and fundamental freedoms for all without distinction as to race. . . ." Each party accuses the other of only relying on the Charter when it is advantageous to do so.

The Afro-Asian countries presumably do not believe that discussion at Uno has a moderating effect on South African policy; indeed, the evidence points the other way. But it is their belief that forthright condemnation of the Union's racial policy gives aid and comfort to the oppressed peoples of South and South-West Africa. Debates take place, resolutions are adopted, reports are prepared, commissions are established, not with the idea of persuading the South African Nationalists to give up *apartheid* but in the hope that in this way the flame of resistance to racial oppression can be kept alight in South Africa.

On purely legal grounds the South African government has a much stronger case than its opponents admit. The UN Assembly has unquestionably discussed matters which are essentially of domestic jurisdiction, though whether such discussion constitutes "intervention" is open to question. But what has rankled most has been the fact that some of the most outspoken critics of South African race policies have been representatives of countries where there is little regard for human rights.

Unfortunately little is known in South Africa of the constructive and non-controversial activities of the United Nations. South Africa is one of only a handful of countries that do not contribute to Uno's extra-budgetary funds for refugees, technical assistance or its emergency fund for children (UNICEF). To most white South Africans the United Nations is merely a place of ignorance and prejudice. South Africa will not be attracted back into full UN membership unless efforts are made to evoke the co-operation of the Union government by demonstrating that it is in South Africa's interest to co-operate more wholeheartedly in the activities of the United Nations.

Libya on the Fence

FROM A CORRESPONDENT

LIBYAN resentment at British and French behaviour in the Middle East is unlikely to go beyond protestation. Libya's rulers are not only good nationalists: they are also practical business men. Libya, like Jordan, is dependent on foreign aid; but its rulers, unlike Jordan's, cannot stall with talk about handing the hat round to rich Arab neighbours since there are none. And already worried by Egyptian influence in Libya, they are determined not to extend it.

The Libyan House of Deputies is now considering a private motion calling for the abrogation of the Anglo-Libyan treaty. But in his speech from the throne last week the prime minister, Mustafa Ben Halim, said no more than that the treaty should be reviewed, and while condemning aggression in general terms, avoided naming Britain as villain. Although the prime minister played down British military aid (placing it second to the much smaller help received from "our friend the United States"), the extent of the British contribution has in fact exceeded Libyan expectations. Moreover, Britain has a good friend in King Idris who is by no means a powerless monarch. But if the tie between the two countries remains intact, it will be more through necessity than goodwill.

Feelings towards France are more bitter than towards Britain; the severity of French action in Algeria has caused more lasting ill-will than the Anglo-French action in the canal zone. And feelings were exacerbated by the recent interception of the aircraft carrying nationalist leaders. The presence of French troops in the Fezzan was also straining Libyan patience. When France last week ratified its agreement to withdraw immediately, a battalion (half the

total Libyan army) was on its way to enforce evacuation. Although it is almost inconceivable that the Libyans would in fact have ever attacked the French garrisons, the gesture indicates the strength of anti-French feelings.

But although the British are in bad odour and the French disliked, there is no love lost for the Egyptians. Egyptian influence entered Libya to fill the vacuum left by Italian colonialism and the British military occupation. Since the Italians had made virtually no attempt to train Libyans for responsible posts (and the British had not had time to), the country has had to draw heavily on foreigners. Although Britain supplied most of the army and police officers, many jobs were better filled by Arabs—and Egyptians were available. The pro-Egyptian tendencies of the students is directly attributable to this influx of Egyptian teachers.

Alarmed by the extent of Egyptian influence, the prime minister is doing his best to limit it. Mustafa Ben Halim was himself educated in Egypt and, according to some accounts, born there, but he is an astute politician who puts Libyan nationalism well before any Egyptian sympathy. Three cabinet ministers who were known to be pro-Egyptian have recently "resigned," including the minister of education who had been largely responsible for bringing in Egyptian teachers. And some days ago the Egyptian military attaché, Colonel Sadek, was summarily expelled. This diplomat had made himself thoroughly disliked by his efforts to stir up a riot in protest against British action in Egypt. With arrogance, energy and generous funds he had tried unsuccessfully to secure official cooperation, and was eventually discovered by the police in possession of cases of explosives and, apparently, some hundreds of machine guns. As an obvious sop to Egyptian feelings, Mr Greatorex, the first secretary at the British Embassy and a close friend and adviser to the king, was also told to leave the country.

Libyans have strongly resented Egyptian tactics throughout the present crisis. In order to circumscribe the energies of Egyptian agents, the government imposed a curfew at nights and posted armed police at all key points. At the same time all foreign information centres were closed, a ruling which was clearly aimed at the active Egyptian centre rather than at the relatively ineffectual British or American centres.

Libya, which will be celebrating its fifth anniversary of national independence on Christmas eve, is a proud country determined not to be subservient to the policies of Egypt or any other state; and the designation last week of an heir to the throne is an encouraging sign of stability and progress.

Economic Power for Afrikaners

FROM OUR CORRESPONDENT IN SOUTH AFRICA

SINCE the days when the "poor whites" flooded the towns in search of work, Afrikaner leaders have been bitterly conscious of their small stake in the commercial life of South Africa. Although dominant in politics and agriculture, the Afrikaner in commerce takes second place to the South African of British origin. Nationalist Afrikanerdom made its first big move to correct this deficiency in 1938 when a co-ordinating body was formed to mobilise resources to win for the Afrikaner his "rightful place" in the economic life of the country. But recently the campaign has been stepped up. The Nationalist party leaders, assured of political control for as long as Afrikaner unity is preserved, have embarked on the next stage of their plan to dominate South Africa: a drive to make the Afrikaner nation fully capable of taking charge of every aspect of the Union's economic affairs.

The prime minister, Mr Strydom, summarised the position when he spoke recently at a conference of Afrikaner business men in Cape Town. It was most unhealthy, he said, that one group, the Afrikaners, should be primarily concerned with agriculture while the other, the English-speaking section, possessed nearly all trade and industry and therefore the greatest sources of wealth. A more equitable distribution of wealth between the two groups would contribute to better relations between them. He described as "shameless, brutal and provocative" an alleged boycott of Afrikaner business undertakings. This boycott is news to almost everyone, but the Nationalists are making great play with it in their efforts to whip up Afrikaner patriotism.

The campaign is being launched on moral as well as practical grounds. Differences of language, education and culture are being exploited as propaganda levers to ensure that "Afrikaner supports Afrikaner business." This bending of Afrikaner cultural ambitions to economic ends was openly demonstrated at a recent meeting of the Federation of Afrikaner Cultural Societies. The more the Afrikaner is isolated by language and education, the more, according to the conference, he is likely to support the Afrikaner commercial and banking concerns as a patriotic duty. The cultural societies must continue to spread their doctrine of isolationism until "the ideal of an economically independent Afrikaner nation has been realised. . . ."

The air at this cultural conference was uneasy with fears and dark warnings. The conference leaders urged the people not to live in a fool's paradise but to wake up and prepare for the struggle ahead. The enemies in this struggle were not named but are not hard to identify: white, black or coloured who oppose the hegemony of Nationalist Afrikanerdom. Professor Thom, Rector of the University of Stellenbosch and chairman of the conference, warned the delegates that despite all the victories won in the last quarter century in the fields of language, literature, education, religion, economics and politics, the struggle was far from over. There were still people, unfortunately, who preferred newspapers in English to those in Afrikaans; there were still some who did not believe in separate schools for the children of the two language groups. Wealth and luxury were in danger of softening the Afrikaner.

The movement towards cultural isolation will have succeeded when the Afrikaner feels unpatriotic if he uses a non-Afrikaner bank, insurance company or retailer. Already many individuals and, more important, public bodies are moving their accounts and trade to Afrikaner concerns for no reasons other than racial. But the movement is still a long way from success.

Although in the last twenty years the Afrikaner has gone into retail business and has established banks, insurance companies, building societies, finance corporations and co-operative concerns, there is still a tremendous leeway to make up. Mining and industry generally is still in non-Nationalist hands. The next major Nationalist effort is likely to be in the direction of wholesale trade, for here the party feels it can gain the support—and money—of all good Afrikaner Nationalists. Already considerable progress has been made in the drink and cigarette fields.

Indonesia's Restive Soldiers

FROM A CORRESPONDENT IN DJAKARTA

CONFUSED, but persistent reports that a group of army officers was trying to stage a military coup have recently been keeping Djakarta in a state of suspense; the political temperature became as hot as the local equatorial climate when Major Djuhro, the commander of the Djakarta garrison, used a loud speaker to order troops who had gone to the Kada Stadium, to return to barracks. But this proved to be only a precautionary measure, "to keep an umbrella open in case of rain," in the Indonesian phrase, and nothing more happened.

According to the newspapers the coup was originally planned for last August when on the orders of Colonel Kawilarang, who was then commanding in West Java, an attempt was made to arrest the foreign minister, Mr Abdulgani, on charges of corruption. Officers came to his house at six o'clock in the morning, a few hours before he was due to leave for London to head the Indonesian delegation to the first Suez Canal conference. Only the intervention of the prime minister, Dr Sastramidjojo and the army chief of staff, General Nasution, prevented the arrest, and, according to the newspapers, simultaneously foiled the coup. Further attempts, said to have been planned for October 5th and November 20th, never materialised.

Colonel Lubis, the former deputy chief of staff, and General Nasution's principal rival, was summoned three weeks ago to account for disobedience to military orders, but he disappeared from Djakarta and so far has not been found. Several other high-ranking officers from the army headquarters have been arrested. Their object, if the newspaper allegations against them are true, was to overthrow the government and establish a military dictatorship to deal with the "steadily deteriorating internal situation." Neutral observers believe that the opposing faction in the army has similar aims. This group is led by General Nasution, who at the moment is supporting President Soekarno (the president dismissed him after a military rebellion in 1952), and who exercises wide powers, including control of the recently established press censorship. General Nasution advocates fighting corruption through the legal government. In a recent nationwide broadcast he said that "dissatisfaction and disappointment were prevailing in Indonesia," and in some cases had led to "slackness, passivity and even despair." But he added that Indonesians must continue to strive for improvement; and now that a government based on the results of last year's general elections has been installed they could work for improvements in all fields.

A Risky Dream

Dissatisfaction with corruption, mismanagement and red tape is not confined to the army: it is to be found throughout Indonesian society. President Soekarno recently suggested that the solution lay in a "guided democracy" without parties. The vice-president, Dr Mohammed Hatta, has warned the country that it would go the way of Chiang Kai-shek and China if corruption was not stamped out. The pro-government Nationalist party newspaper, *Suluh Indonesia* said that some people, apparently inspired by the Egyptian revolution, were dreaming of a military junta to put an end to red tape and corruption. But it warned that it might also put an end to the Indonesian republic and there was a danger that there would be not one, but many, military juntas. "Let us therefore forget this risky dream and try to find other means to improve our country." The independent *Indonesia Raya*, which has been crusading against corruption for months, has called on the prime minister and his government to resign if they cannot solve the complicated problem of the army nor find out the real cause of "the present bad conditions." Certainly the arrest of a few officers has done nothing to solve the dissensions within the army or remove the causes of the widely felt dissatisfaction with present conditions.

Americans on Okinawa

FROM A SPECIAL CORRESPONDENT

IS colonialism necessarily evil, or sometimes an evil necessity? If you are doing an obviously good job for people not yet able to do it themselves, should you quit when some of them tell you to? And, if you feel you can't quit, what do you do about your critics?

Some able American military officers on the Pacific island of Okinawa have recently had to ask themselves these questions. As Americans, their instinct is to frown heavily on colonialism in whatever disguise. As practical administrators, however, they know differently. Indeed, some of them have been so moved by their recent experiences as to describe the Okinawans as politically backward children who respect authority but can hardly be expected to understand democracy—terms that would rejoice the hearts of any surviving Blimps.

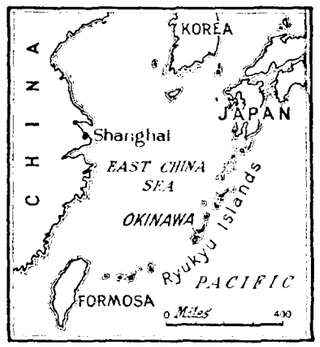
Two things about Okinawa are undeniable: first, that the United States has devoted enormous amounts of time, trouble and money to increasing the islanders' welfare; second, that Okinawa's political structure very closely resembles that of a not quite self-governing British colony. The United States has spent some £62 million on purely economic aid to Okinawa, and is spending some £18 million a year on military construction. Over £3 million has been spent on building schools for island's children; £5 million of American counterpart funds are loaned on a revolving basis to Okinawa businessmen, with some startling results in a community which, before the war, mainly occupied itself with growing sugar-cane and sweet potatoes: one enterprising middle-aged ex-carpenter and his four brothers now control half the island's new business, including construction, warehouses, a food company, shipping, lumber, and cinemas. The islanders' standard of living has risen rapidly. Their death-rate is less than 40 per cent of the prewar figure, and they spend $400,000 a year on Coca-Cola.

It is of course true that probably none of this would have happened if the United States had not decided to turn Okinawa into a military base. There is inevitably a good deal of bureaucracy. RYCOM (the Ryukyu Islands Command) dominates USCAR (the US Civil Administration of the Ryukyus) which in turn undoubtedly dominates GRI (the Government of the Ryukyu Islands). Okinawa has a legislature, with 29 members, but the chief executive is appointed by the American deputy governor. Okinawans grumble about this. They grumble about people having to carry passes to enter military areas. Above all, they grumble about the land which the Americans occupy.

There are 680,000 Okinawans, and the density of population is 1,270 per square mile. On Okinawa there are

40,000 Americans, and they occupy 10,000 of the island's 80,000 arable acres and are alleged to have displaced 34,000 local families. Financial compensation has been offered but indignantly refused: the islanders are demanding seven times more rent than the Americans initially offered, plus large lump sum payments.

On this land issue, the Americans have pointed out that the "displaced" families had in fact already been displaced by the war, and that most of them have found employment, and enjoy a standard of living considerably higher than their former subsistence level, as a result of the impetus given to the island's economic development. The population is increasing at the rate of 20,000 a year, and a shift from the land was becoming inevitable without American intervention, which came in time to offer the Okinawans an alternative to large-scale emigration or Malthusian starvation. Yet there is a general readiness to believe that far from aiding Okinawa the United States is ruthlessly exploiting it.



Japan's Interest

The administrators faced their first severe test when some students of the university defiantly joined in communist-sponsored "Yankee Go Home" demonstrations. Under Japanese rule, Okinawa never had a university. The Americans provided one and equipped it with a magnificent $200,000 library. Under pressure from the university's endowment fund, the Okinawan principal expelled six of the students. The students did not pause to ask what severer weapons either Okinawa's former Japanese masters, or the communists, would have employed in similar circumstances. But the Americans have disdained to use this argument. On the contrary, they are conscience-stricken.

Japan takes a deep interest in Okinawa and the Japanese press vigorously plays up the islanders' grievances against the Americans. Japanese Socialists and even some conservatives argue that if the Americans got out of Okinawa, Japan would stand a better chance of getting other islands back from Russia. Many if not most Okinawans would probably welcome a reversion to Japanese rule, though it was never conspicuously benevolent. The Americans cannot accede to these arguments, and not only because Okinawa is a military base and is likely to remain so for years to come. There is another argument besides the military one. Before the war, Okinawa's imports were valued at about £4 million and its exports at about £3 million: Japan financed the deficit. But today, while Okinawa's exports have risen to some £6 million, it is importing at the rate of £21 million. In other words, its new postwar economy is completely geared to American spending, with all that that means in the way of employment for the island's rapidly increasing population.

The dilemma is not unfamiliar to colonial administrators. Some Americans are angered by what they feel to be persistent distortions of the facts of the situation, and are moved to mutter darkly about unrest on the island being all the work of a handful of agitators. "The simple chap down there in the rice paddy," they insist, "*likes* us." Others, while not entertaining any illusions about being especially liked, sincerely feel that their presence is beneficial. They belong to the small but growing number of Americans who, as a result of personal experience, would no longer return the traditional and dogmatic American answers to the questions with which this article began.

Hungarian Refugees in Austria

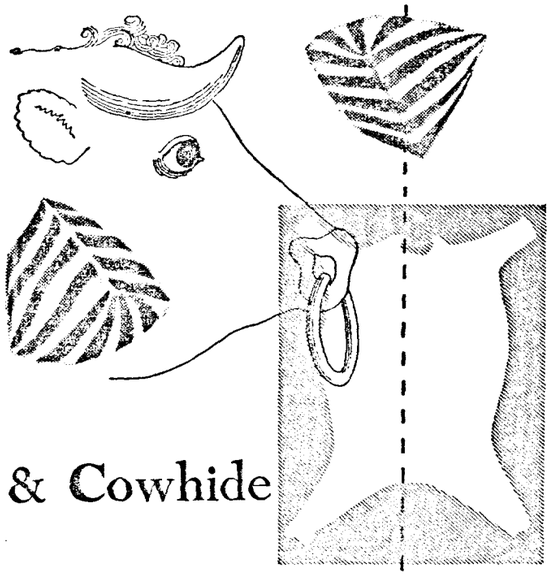
FROM AN AUSTRIAN CORRESPONDENT

THE number of Hungarian refugees has now passed the 100,000 mark and—though at considerably reduced speed—several hundred are still daily crossing the Austrian frontiers. The grave problems presented by this mass exodus, both material and moral, are obvious. So heavy has been the demand for accommodation that in Vienna some schools have had to be handed over to provide temporary shelter with the result that at other schools lessons have had to be spread well over into the evening hours. Many difficulties arise in trying to make arrangements to send the refugees on to those countries willing to accept them. Some of them seem reluctant to move too far away from their country while others will only agree to go overseas in order to be "far enough from the Russians." The foreign selection commissions have very naturally tried to pick the best workers from the crowd. This has caused some anxiety among Austrians lest they should eventually be left with too many of the more undesirable elements.

Probably a minority of the refugees have fled their country because of a direct danger of persecution. By far the greater part have either been victims of panic or have taken the first chance to leave a country that offers no prospects of an easier or better life. The proportion of conscious opponents and active fighters is naturally highest among the young people. I have met some who fled because of attempts to coerce them into fighting against their own people with a Russian soldier on each side. A young archæologist from the National Museum in Budapest said that he had decided to leave chiefly because he was afraid of being deported. He maintained that there was no system in the deportations. A few days earlier a friend of his had been queueing for bread when a group of Russian soldiers jumped off a truck and seized a number of young people from the crowd. By sheer accident his friend had managed to escape. Another young scientist gave a very convincing account of the peaceful and disciplined first rising by the students and their moderate demands. He had no doubt that had these been fulfilled there would have been no bloodshed in Hungary.

There are plentiful supplies of clothes, food and money not only from Austrian homes but from countries all over the world. Unfortunately there are some among the refugees who are ready to make the most of a life without work, some who trade their gifts for money and others who through various channels manage to get hold of enough money to buy on a large scale. To be sure, such people are only a minority but experience shows that they may easily do damage to the great majority of refugees who fully deserve every consideration and help.

Bull's-eyes & Cowhide



Confectionery manufacture and tanning are among the many hundreds of jobs that more than 80 industries are doing more efficiently with the help of starches, dextrines, and glucose.

CAN STARCH HELP YOU?

That's a question worth asking—and we're the people to ask: we could give you an exceptionally well informed opinion—and would be pleased to do so.

STARCHES, GLUCOSE, OR DEXTRINES ARE USED IN:

ADHESIVES
BULL'S-EYES & SIMILAR SWEETS
COWHIDE (& OTHER) TANNING
DOLLS
EXPLOSIVES
FACE & TALCUM POWDERS
GRINDING WHEELS
HOUSEHOLD STARCH

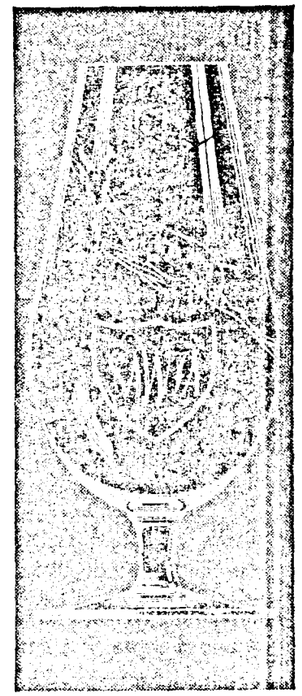
6 Good Reasons for choosing SOUTH AFRICAN SHERRY



1 Because South African Sherry is very good sherry: *real* sherry, most carefully matured, expertly selected—genuine in every way.

2 Because South African Sherry costs *you* less: as it benefits by a preferential import duty.

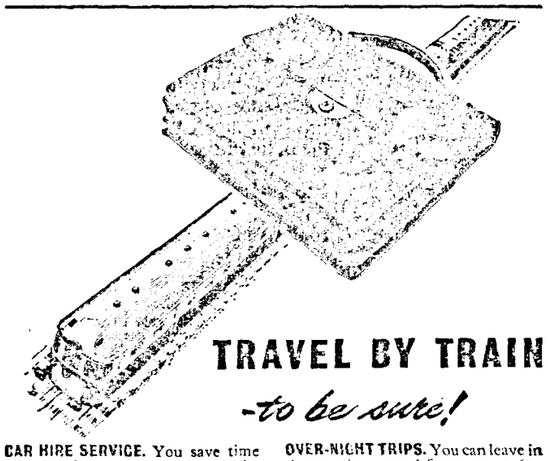
3 Because you can count on a South African Sherry to suit your personal taste—from light and very dry to full, rich and sweet.

4 Because the wonderful climate and soil of the Cape makes South Africa one of the finest wine producing countries of the world.

5 Because there is a guarantee of quality in South Africa's 300 years of wine-growing experience.

6 Because once you've chosen South African Sherry you'll choose it again.

SOUTH AFRICAN SHERRY



TRAVEL BY TRAIN -to be sure!

CAR HIRE SERVICE. You save time and trouble when you are met at the station by a French Railways Self-drive Hire-car. This special service for French Railways passengers operates in Paris and *115 other towns* in France. Make arrangements for your Renault or Simca hire-car when booking railway tickets in this country.

NEW DIESEL RAILCARS. Ideal for businessmen! New diesel railcars offer travellers high speed with noiseless running and complete comfort on many long-distance non-electrified runs between large centres.

OVER-NIGHT TRIPS. You can leave in the evening, travel from 500 to 600 Km., stay the night at an hotel, devote most of the following day to your affairs and return that night. Examples: Over-night return trips from PARIS include Bordeaux, Grenoble, St. Nazaire or Zurich.

DAY TRIPS. You can leave in the morning, travel from 350 to 500 Km., have several hours in which to conduct your business and return the same evening, in comfort. Examples: Day return trips from PARIS include La Rochelle, Lyon, Antwerp or Sarrebruck.

PERICLYMENUS, son of Neleus, possessed boundless strength and the power, given him by the sea god, Poseidon, to transform himself into every conceivable shape. Taking full advantage of this useful gift during the siege of Pylos, he changed rapidly from lion into serpent, from serpent into scorpion, thence into an ant and into an eagle and finally he combined all these shapes, to the vast confusion of Heracles, who was attacking the city. Thus he became " very famous " which is the meaning of his name.

The number of shapes into which aluminium and its alloys can be wrought is less alarming but no less famous than the feats of Periclymenus. Needless to say, in countless forms it is indispensable to defence.

THE BUSINESS WORLD

Money's Role

IN his attempt to shape domestic economic policy to the problems that spring from the Suez crisis, the Chancellor this week gave first place to monetary measures—" control over bank and other forms of credit." But all he said about these measures was that they must be " firmly maintained and if need be strengthened." Like many other people, he evidently doubts whether a strengthening would serve any useful purpose at this stage. His reaffirmation need not, it seems, be taken as a warning that any deliberate toughening, such as a further rise in Bank rate or official tactics that would put new pressure on gilt edged, is to be expected. The emphasis put upon the continuance of existing measures does, however, imply that they are regarded as having worked, up to date, more or less according to plan, in spite of the crisis. How far is this true ?

The aims of monetary policy were this year set out with more than usual clarity. In the second half of 1955, after Mr Butler's blunt " request " to the banks to reduce their advances, the monetary authorities had been widely criticised for putting too much reliance upon this arbitrary control of bank advances and paying too little attention to the volume of money as a whole. To keep due control over the total volume of bank deposits, the authorities have to keep due control over the supply of liquid assets to the banking system, and in particular over the supply of Treasury bills. Recognition of this basic principle led early this year to a good deal of discussion of the possibility of new devices for regulating bank liquidity—either by the imposition of compulsory but variable liquidity ratios or by the switching of part of the Treasury's floating borrowings from Treasury bills to a non-liquid security, such as the wartime Treasury deposit receipt. But in the end the Treasury and the Bank of England acknowledged not only the importance of controlling the total volume of credit but also the desirability of doing so by the accustomed means. A large part of Mr Macmillan's budget, it will be recalled, was designed for this purpose. The savings drive and the new method of financing the nationalised industries were intended to minimise the Treasury's recourse to floating debt and to facilitate funding operations, and thus to guard against any undesirable expansion of credit. And this orthodox plan was to go hand in hand with the " directive " control.

In the event the performance of monetary policy has fallen short of these apparent intentions. By the time of the budget the cutting edge of the directive had already been blunted, in the sense that whatever reduction it achieved in advances was being more or less offset by new lendings either under old commitments or in response to new sanctions for purposes regarded as in the national interest. Over the whole period from March to November last, the total advances of the clearing banks declined by only £23 million ; allowing for an estimated net increase in the overdrafts of the nationalised industries, borrowings by the private sector probably declined by some £40-45 million, but they have been rising slightly in recent months.

★

Much more significant than this minor net contraction of bank advances has been the big expansion of other forms of credit. In the seven months up to the eve of the Anglo-French action in Egypt, net bank deposits rose by no less than £287 million, to £6115 million, whereas in the similar period of 1955 they had fallen by £14 million. Moreover, this rising trend had been steepening, as can be clearly seen from the behaviour of the index of deposits compiled by Lloyds Bank, which is corrected for seasonal variations. The credit restriction that started with the rise in Bank rate to 4½ per cent in February, 1955, brought the index down

from its peak of 112.0 (1948=100), reached in that month, to 104.6 by April last. It held that level for three months, and then started to rise again, reaching 105.3 in September and 105.6 in October.

The direct source of this credit expansion was the borrowings of the Treasury, as reflected in the banks' liquid assets: these rose over the seven months by £353 million (compared with a rise of only £240 million in the similar months of 1955) and in July/October they rose by £219 million (compared with £149 million). Their ratio to deposits, which in March

last stood at 33.1 per cent, its lowest this year and a relatively comfortable minimum, rose by October to 37.1 per cent, compared with only 33.8 per cent in October, 1955. In spite of the success of the new savings certificate, introduced in August, it seemed evident that the official grip was loosening, willy-nilly.

Then, in November, the credit trend changed. The banks' latest monthly statement, covering a period of five weeks, three of which fell within the new phase of the crisis, shows a contra-seasonal fall in net deposits, by £27 million, carrying the index down by 0.6, and an even sharper contraction of liquid assets. Hence the liquidity ratio dropped by 0.7 per cent, and, at 36.4 per cent, is now only 1.4 per cent higher than at the corresponding date last year.

This abrupt reversal of the behaviour of deposits and liquid assets, coming in the very month of the début of the premium bonds, might suggest at first glance that the Chancellor's plan was beginning to work out after all. Unfortunately, this comforting conclusion cannot be drawn. The premium bonds, sales of which totalled about £30 million during the period, made a notable contribution, without, it seems, significantly impairing the good performance of other "national" savings. But the big new factor was the severe loss of gold, representing sales of foreign exchange by the Exchange Equalisation Account and thus providing the Treasury with sterling that enabled it correspondingly to reduce its borrowings from the domestic banking system. Given the size of the gold loss, it is indeed rather surprising that the contraction of bank credit and of liquid assets was not even larger; but there are grounds for thinking that the true domestic expenditures of the Government may have been somewhat larger than appears from the Exchequer return.

These latest movements do not, therefore, mean that there has been any corresponding check to the easing of monetary pressure that had been proceeding during the previous seven months. The banks report that during November the withdrawal of foreign deposits as such was not large; but much of the counterpart of the gold drain must represent a running down of funds that were held, in various forms, on foreign account or for the purpose of making external payments. In other words, the extinction of deposits in consequence of a pressure upon sterling and a drain upon reserves does not afford, except perhaps to a very minor degree, any true disinflationary relief. The deposits that are thus extinguished are mainly those that would have been kept idle in any case, and did not form part of the domestic money circulation.

This point is important in appraising the credit trend not only during the intensive phase of the crisis but also during the earlier months. The external influence was not suddenly reversed in November; on the contrary, it was sharply intensified. Aside from some brief fluctuations, the short position in sterling has been building up throughout this year, and especially since the Suez pressure began at end-July. Over the whole period, as the Chancellor pointed out, the volume of

* After deducting items in course of collection. † Ratio of assets to published deposits.

external balances has been steadily reduced. This means that the potential inflationary effect of monetary policy has throughout been greater than might be judged from the rise in total bank deposits: the true domestic circulation has been rising faster than can be seen from the published figures.

If the principal factors are analysed separately, it appears that the most important influence making for credit expansion this year has been the swing of the current external balance of payments from deficit into surplus. If the effect of the capital strains on the reserves are left out of account, it seems that the additional pressure put upon the Treasury's sterling finances by this saving in the external current account has more than offset the improvement in its domestic finances as such. Thanks to the sharp fall in borrowings by local authorities from the Public Works Loan Board, and the good flow into National Savings—the Treasury's domestic requirements have been less than in the similar period of 1955, in spite of the sharp deterioration of the above-line account, contrary to the budget forecasts.

The improvement in the external current account, which put a new internal strain on the Treasury's borrowing programme, was, however, the very object of the whole exercise. And if monetary policy really had been working according to plan, the Treasury would have been meeting its additional requirements by correspondingly stepping up its sales, if not of "savings" securities, then of marketable gilt-edged securities, thereby avoiding the undesired rise in bank liquid assets and deposits. Actually, it seems to have been securing the additional finance partly by sales of gold to meet the external capital strain and partly by increased domestic borrowings on Treasury bills. In short, if the crisis is to be blamed for the indifferent performance of policy as judged by the budget aims, the argument has to rest upon the weakness of the gilt-edged market and the unwillingness of the authorities to add to its difficulties by pressing their sales still further. In the special circumstances, it may be argued, there was no need—or even point—in striving thus to prevent credit expansion. But it is certain that, when monetary pressure is demonstrably needed again, a corresponding problem will again arise

A Chance to Clear the City?

"MOTORISTS have a tough enough deal already," said Mr Harold Watkinson at a press conference last week; and in the House this week, reporting that the shortage of petrol had already reduced traffic in Central London by about 10 per cent, he added, "I am entirely opposed to banning motorists from any area of London or using the difficult and temporary petrol situation for the same purpose." This is all very sporting—and certainly nobody could accuse the Government of recent undue favours to the motoring voter. Cars occupying free parking space along the kerbsides of inner London are going to gum up traffic for other motorists rather less than usual during the coming months of rationing, simply because there will be fewer of both. But nobody, seriously, has put forward any practical proposals to the Minister of Transport that he should ban any motorists from any roads anywhere in London. He has, to his honour, already committed himself to a sensible principle of charging for kerbside parking. And the committee he appointed to decide where he could usefully put parking meters to regulate short-term and long-term parking has now given him the answers. Does the Ministry really propose to use an unexpected opportunity to put its chosen policy into practice as yet another excuse for doing nothing?

It probably does not. The Minister, and local authorities can obtain the legal powers under the new Road Traffic Act to instal parking meters, but the meters have to be ordered, made, and delivered. He has already said that during the coming lull in city motoring he will take the opportunity to get on with road repairs and extensions as fast as possible. If the lull should last long enough for a start to be possible on putting the meters in, no scruples about being beastly to the motorist would be likely to deter the Minister. He has already braved a good deal of opposition from "organised motorists," resolutely defending this application of the pricing mechanism as the best way of rationing available street space among motorists who want to stop after the needs of those who want to keep moving have been observed. And the latest count of vehicles parked during the day at kerbsides in this inner area—before the petrol shortage eased matters—showed that in many districts virtually all the space available was already filled.

An idea of the scale of parking charges that the Minister had in mind was given by Mr Molsom during the third reading debate on the bill last June. He envisaged a shilling for one hour, two shillings for two hours, and steeply rising charges for longer periods—up to 7s. 6d. or 10s. This is the right balance. The car commuter would have to pay a fairly heavy rent for the road he occupies all day. More room would probably be left for the short-term parker who may come in to spend money in the city's shopping areas, or actually to do business around the town, not merely to occupy the streets as well as the offices. The local authority, or the private developer, might once again be given an economic inducement to build more off-street garages. At best, these charges for street parking which imposes such heavy costs on other road users should allow site developers to obtain a return on garages comparable to those fetched by building offices. At the least, they might make it as expensive to drive in and park in the city centre as to park the car in a parking lot away from the congested centres of big cities and finish one's journey by public transport.

London Transport has now provided 41 "fringe" car parks at strategic Tube stations, but the value of this particular palliative for the problem of urban traffic congestion should not be over-rated. For many people who drive in the marginal cost of motoring is probably lower than parking, say, at Stanmore and paying a couple of shillings to come by Tube to the city; and the time saved does not outweigh the inconvenience of

strap-hanging at peak hours. Those who are persuaded will be making their own tiny contribution to the congestion on the inner lines of the public transport services. These services, in their turn, are inadequate to the peak loads they have to carry, and last week the Minister set up another committee to encourage the staggering of working hours. This is the third such committee so far, but at least it will have some executive powers. Further efforts to regulate and improve traffic flow can be made under the new Road Traffic Act by raising the speed limit on main urban access roads to 40 mph and by introducing "experimental traffic schemes" in London—one-way systems, perhaps variable according to the time of day. Within the present limits set for total spending on road investment, too, Mr Watkinson is placing an emphasis upon improving the major thoroughfares in and around congested cities as well as upon constructing the fast, new motorways and wider trunk roads that will unload more traffic to circulate in them.

All these measures—designed on the one hand to adapt traffic demands to the roads that are available and on the other to step up the traffic capacities of urban areas—form the seeds of a respectable policy. They will not bring traffic demand and capacity quickly into balance. But neither would any programme attuned to the practical needs of today. It would be equally unrealistic to seek a balance by major reconstruction of cities to match the transport demands that have arisen from their unplanned growth—or conversely to press for some form of licensing system for "downtown traffic." With the costs of constructing new roads in inner London reaching up to £10 million a mile, counting the purchase of site values, reconstruction of urban traffic routes will have to be tackled primarily as part of the constant process of renewal, as areas are gradually cleared and redeveloped.

★

The beginning that may now be made in tackling the apparently intractable problem of urban traffic seems to be on reasonable lines, presuming it can be put into practice rapidly and sustained over a lengthy period. But two important needs for traffic policy in the cities must be stated. The first is that the problem in each urban area ought to be considered as a whole and not as a series of separate, though related questions. The second is the need for a better scientific basis to traffic studies. The lack of both has been commented upon recently by PEP in two valuable broadsheets on the traffic problem† and by the Road Research Board in its latest annual report; while the second recently appears to have attracted the attention of the Minister of Transport. Short courses on "traffic engineering" have been given by the Road Research Laboratory and by some universities with the laboratory's help. But the staff of the laboratory is heavily loaded with its own investigatory work.

The weakness at the basis of the present road programme may be illustrated by the paucity of accurate information about the volume and pattern of traffic in built-up areas. Isolated studies have been made of particular stretches of road and of individual intersections, but no large-scale "origin and destination" surveys have been made in the London area or in any other major British city to determine where traffic comes from and where it wants to go. These are now a regular feature of urban transport planning in the United States; common enough for "traffic consultancy" to have arisen as a profession to fill the demand.

★

It is the lack of such comprehensive surveys that causes so many approaches to the problems of urban traffic to be lop-sided and sectional. Considerable study and discussion have been devoted in Britain this year to the possibilities of urban motorways, fast feeder roads with restricted access that would lead into the centre of British cities the motor traffic that hopes to be able to keep up high speeds between them on the arterial motorways. As such, these urban motorways would offer major economies. Yet the experts who discussed them this summer—offering plans in quite considerable detail for London, for example—possessed inadequate data to take any accurate account of where these traffic lines into London would fit into the existing and projected pattern of other road and transport services—and whether, by attracting in more motor traffic, they might intensify congestion in the city centre. Similarly, it may be admitted that some of the most sensible things said about urban transport in Britain recently have come from spokesmen of public transport—but even their best arguments always have a slight flavour of propaganda.

The problem created by the outward city sprawl, with a high concentration of employment in the centre and a wide diffusion of residential areas on the periphery, is basically that of the surges of transport demand that arise twice a day into and out of the inner areas. This is the concern of both private and public transport. American students of this problem, which is intensified across the Atlantic, are increasingly suggesting that the complete transport needs of a city should be considered and organised by a single executive authority. It is certainly too early to suggest any such single executive authority for transport in and out of London—though there are probably too many sharing the powers today, some of them thoroughly out of touch with modern ideas about traffic. But to centralise the responsibility for the study of the developing transport needs of this city and its vast catchment area—using existing investigatory bodies, among others, but seeing the problem whole—is a more modest proposal. What the planning of urban transport in British cities needs, in more senses than one, is adequate intelligence.

Business Notes

How Much from the Fund?

THE Chancellor has caused some surprise by his announcement that he is prepared if necessary to lean on all three of the immediately available reinforcements to the reserves—the International Monetary Fund, the Government's dollar securities and the waiver; but it seems likely that the biggest contribution will come from the Fund. The Chancellor has stated simply that the Government is making an immediate approach to draw on part of Britain's quota of $1,300 million. On the basis of the liberal interpretation of its articles that the Fund has shown in recent years, it may be expected that at least $236 million, the amount of Britain's initial gold subscription, will be available automatically, and that a further $325 million (representing Britain's first credit tranche at IMF, comprising 25 per cent of its quota) could be drawn with little formality. In mid-October, France was granted a stand-by credit for $263 million, absorbing its gold tranche and its first credit tranche.

A loan from IMF is obtainable on cheaper terms than could be arranged with any other official agency or from private sources. The drawing of $236 million would carry only a single service charge of one half per cent; further drawings that raise the Fund's holdings of sterling up to 25 per cent above Britain's quota, would be charged interest on an ascending scale. This starts at 2 per cent on the Fund's excess of holdings after three months, rising to 2½ per cent after eighteen months and by a further one half per cent after every subsequent six months, reaching a maximum of 5 per cent on excess holdings after more than four years. Credits from the Fund are normally expected to be repaid within three to five years.

The Dollar Stocks

THE biggest element in Britain's second line of currency defence—the dollar stocks belonging to the Exchange Equalisation Account—has been mobilised. The Chancellor has promised to use them if necessary as collateral for a loan "from the appropriate agency of the United States." That unnamed agency must clearly be the Export-Import Bank and the Chancellor is assured that its help would be promptly available if requested. As a result all those who may be interested in sterling now know a little more about the strength of this second line of defence. The securities are worth between $750 million and $1,000 million. They are mainly a mixed bag of American industrial stocks, but there has also been a small amount—about $60 million—of US Treasury short-dated stocks. The Chancellor seems to have no objection to selling those Treasury shorts to raise dollars quickly and indeed just over half the total was sold and brought into the November gold figures.

The stocks are the residue of those collected from British subjects during the war and deposited as security for the Reconstruction Finance Corporation's line of credit of $425 million, against which $390 million was actually drawn and which was always well covered by its collateral. The loan was finally repaid in 1951, partly out of the investment income arising from the collateral portfolio, and partly out of sales. Eventually the British Government repossessed the remaining collateral, handed back to their former owners those of the securities that had been borrowed and retained most of those that had been bought, though it allowed a few former owners of the bought securities to repurchase. It also offered on the London market for the appropriate dollar premium during 1955 two lots of $15 million and then announced its intention of making further sales without prior announcement. From those various offers the Government broker still has a tiny residue to sell. An unknown but relatively small quantity of US Treasury shorts was sold in August this year, when an attempt was made to support security sterling by curbing the premium at which dollar stocks were selling in the London market. Clearly the rise in the Wall Street market since 1941 is mainly responsible for the present high value of the Exchange Account's portfolio, but it is not possible to calculate out of what figure that $750-$1,000 million portfolio has grown. The Treasury has never disclosed how much stock it sold to repay the RFC loan, or how much it returned to its prewar owners.

★

One operation in the chain can now be seen to have been unfortunate. The sale of US Treasury stocks rather than American industrials in the London market this summer was made against the advice of some at least of the City experts. Those Treasury shorts would have been useful now. The City has not failed also to notice that Mr Macmillan has quite properly said nothing at all about Britain's third line of currency defence, the dollar stocks that remain in private British ownership. The curious cannot even estimate their value, but since 1947, when they must have stood at almost nothing, they have been swelled steadily by the funds of immigrants, bequests, and capital transfers. With a dollar premium always ruling in London the total can only grow and never shrink. There is no reason to suppose that holders of them need worry.

Invoking the Waiver

THE Financial Agreements of 1945 with the United States and Canada laid down specific conditions in which a year's interest (but not the instalment of principal) on the two loans could be waived. When the first instalment on the debt fell due at the end of 1951, the British Government, after long deliberation, decided not to invoke the waiver clause, although it seemed certain that the technical conditions had been satisfied. Last year, following the autumn drain in the reserves, Mr Butler explored the possibility of invoking the waiver, and discussions were held with the US Treasury. It quickly became apparent that the original conditions could not be sensibly interpreted in the changed circumstances. This year, as Mr Macmillan has now revealed, the British Government has submitted a formal claim for a waiver to the United States (which if granted would apply also to the interest on the Canadian loan and would mean a total saving to the reserves of $103.8 million). The Government has been assured that the US Administration will submit the proposal to Congress when it meets next month "with the definite recommendation that appropriate modification of the present language be made to carry out the spirit of the original intention." Pending the formal sanction, Britain will pay the $103.8 million of interest on the two loans from the reserves to a special holding account; but the end-year payments will still include $71.7 million in repayment of principal besides the other special loan instalments listed below.

The first of the two conditions in the 1945 Agreement that have to be fulfilled is that, over the preceding five years, United Kingdom exports plus net receipts from invisibles averaged less than the annual average of UK imports in 1936-38, adjusted for changes in import prices. Interpretation of this condition is a major exercise in which different statisticians will arrive at different results; the designated

Suez and the Reserves

THE fall of $279 million in the gold and dollar reserves in November was much the largest monthly fall for nearly five years; yet the true strain on sterling was larger still. The impact on the reserves was cushioned first by the sale by the Treasury of rather over $30 million of US short-dated government securities and secondly by the practice of settling the account with the European Payments Union one month in arrear; the deficit of £24 million incurred in November will require a gold payment of $50 million this month, whereas last month's payment in respect of the October deficit was $28 million. If adjustment is made for these two influences, and for the $4 million received in defence aid, the current commercial dollar deficit was no less than $335 million. The fall in the reserves since Colonel Nasser's seizure of the Suez Canal at the end of July, even after crediting the receipt of $177 million from Trinidad Oil, was $440 million.

The pace of the drain is much faster than in the late summer of 1955, when sterling was last under heavy pressure. It has reduced the reserves to $1,965 million, below their level at the beginning of the year, and to the lowest point since the end of 1952. At their low point on September 18, 1949, the reserves stood at $1,330 million, having fallen by $580 million in the five and a half months before devaluation. In the backwash of the Korean boom, the reserves toppled from $3,867 million in June, 1951, to $1,662 million in April, 1952.

The Chancellor has attributed the recent strain "almost entirely" to the pressure on sterling resulting from "the events of the past four months and the international tension they have caused." The bulk of that pressure has been speculative and psychological, but there have also been the first payments for western hemisphere oil. This month, such payments must be expected to increase; and notwithstanding the waiver of the interest on the North American postwar loans, the reserves will be burdened by over $137 million of special payments. These are: $71.7 million in repayment of principal of the loans, $7½ million as the quarterly instalment on the Canadian wartime loan, around $5 million on the small part of Marshall Aid that took the form of a loan, $3 million as the regular monthly payment to EPU creditors, and $50 million as the gold settlement of last month's EPU deficit.

Nuclear power
for the nation's future

AN EXAMPLE of industry pooling its resources to prepare for a mighty project is the linking of the A.E.I.—John Thompson Nuclear Energy Company with two important firms of Civil Engineering Contractors—Balfour, Beatty and Co. Ltd. and John Laing and Son Ltd.

To the strength of the A.E.I.—John Thompson Nuclear Energy Company and its constituents (British Thomson-Houston, Metropolitan-Vickers and John Thompson) is added a fund of knowledge in the civil engineering field.

The Balfour Beatty Group has a world-wide reputation in all forms of engineering and construction work and is at present carrying out major contracts for the Central Electricity Authority. John Laing and Son Ltd. has carried out building and civil engineering work at the first Government Atomic Energy Establishment at Windscale and is at present engaged in the construction of power stations in the United Kingdom, as well as in major development schemes in Canada.

RADBROKE HALL · KNUTSFORD · CHESHIRE

arbiter is the International Monetary Fund. It is generally expected that the Fund will now grant the "statistical certificate." Re-interpretation if not re-writing is however needed for the clause that demands that in the event of an interest waiver being exercised there must be a proportionate reduction in releases of sterling balances accumulated during the war. These balances have not, as was then expected, been separated from balances accruing since the end of the war, and it is now impossible even to identify them.

The Revenue and the Ration

REINFORCEMENT both of the revenue and of petrol rationing by an increase in duty on motor spirit and other light oils was obviously a wise move for the Chancellor at this time. Mr Macmillan had previously put his losses in motor spirit duty from the cut in supplies at about £6 million a month; presumably this is the basis of the increase which he expects to bring in some £30 million—say £24 million from motor spirit and aviation fuels consumed inside Britain and £6 million from duties on other light oils and on diesel oil for road vehicles. The anomaly that industries which use light hydrocarbon oils will once again bear this increased duty (though certain of them can obtain "drawbacks" in respect of some of their consumption), while those using the black oils escape it, remains unchanged.

The Chancellor is counting upon the increase to maintain his estimated revenue from these duties. In the case of motor spirit, his figuring suggests that he expects total motor spirit and aviation fuel supplies to be slightly over 70 per cent of "normal" during the four months from now until April. Since goods transport, agriculture and industry take slightly more than half of motor spirit, and will probably get about 75 per cent of their normal supplies, this implies that the total of basic and supplementary rations for private cars may not offer more than about 60-65 per cent of the petrol that they would apparently have been expected to use this winter.

The oil companies have added their contribution to raising the marginal cost of motor transport to the Chancellor's, and have unaided brought about a significant rise in fuel costs for certain industries, by their increases in price. These were clearly unavoidable, and indeed may be only a first instalment, since crude prices are beginning to rise, while spot tanker rates are still soaring. Out of the increase of 5d. a gallon on motor spirit 1½d. a gallon is going to help retailers during a bleak winter: the oil companies are getting 3½d. to cover the cost of re-routing and higher tanker freights (representing about 2¾d. a gallon) and the increased costs of internal distribution (say ¾d. a gallon). Diesel oil for road vehicles goes up 4½d. a gallon, plus the Chancellor's shilling: fuel oil 3½d. a gallon, or 31 per cent, which is about the same proportion as the effective increase in motor spirit prices; and other products 3d. a gallon. There would be good reasons for increasing the price of fuel oil a little more than other products as a matter of principle, since this is the product in tightest demand and the one of which it is hoped to maintain the highest proportion of normal supplies. But in any case world fuel oil prices have begun to rise earlier than those of other products, and only part of the rise has been passed on.

Bad News is a Tonic

TO record what has happened in the markets is easy. To interpret it leaves much to the predilections of the interpreter. Stock markets were headed upwards before the Chancellor spoke. He broke the rally, but for no more than a few hours on Tuesday evening and Wednesday morning. On Wednesday afternoon the market was rising again and over the week ended on Wednesday *The Economist* share indicator has jumped 6.4 to 176.4. Commodity prices were without a clear trend but the easing of metal prices went only a little further after the Government statement. Sterling was still dragging along near to its effective support level of $2.78½-⅝ when Mr Macmillan spoke. His statement lifted it off that platform; on Wednesday it touched $2.78½ and closed at $2.78¾, apparently without support, but the strength was not fully maintained on Thursday. Gold shares enjoyed an active market and rose sharply after the Chancellor's speech.

Three at least of those events need explanation. Why the market was already rising before the Government's economic measures were announced, why the dip caused by those measures was so short lived, and why on the very day that sterling seemed to be finding relief from its recent pressure the gold share market should have burst into new activity, the jobbers receiving more orders than they had seen for a month? The rise in the market at the end of last week was based partly on a domestic fact, the cessation of the forced selling that followed the recent Stock Exchange failure and a little bear closing when it was realised that further repercussions need not be expected. That forced selling had affected oil shares, and it is now known that it affected gold shares too. The steps taken to get increased supplies of American oil to Europe, coupled with the plans for an Anglo-French withdrawal from Port Said, occurred when the market was ripe technically for a rally.

Investors faced with grave facts seldom react badly to strong measures. They gave Mr Macmillan full marks—fuller than the jobbers had allowed in their precautionary marking down on Tuesday evening—for the strength of his intention to defend sterling. When they saw the rise in sterling (and the narrowing of the discount on three months forward sterling by ¼ cent to 2¾ cents) their confidence grew further. It may be illogical that measures designed to defend sterling should also have made some investors see the point in holding a hedge against sterling in their portfolios, but it is quite understandable. And when the premium on dollar stocks is approaching 10 per cent and the possibility of a recession on Wall Street is being canvassed, gold shares rather than dollar stocks are the best hedge. The buying of gold shares is also a reminder that investors do not yet trust the industrial market far.

Co-operation about Oil

THE decision of the American government to waive the operation of the anti-trust laws and permit the Middle East Emergency Committee to function means, at best, that the British Government should now be able to honour the

petrol ration and maintain the reduced level of deliveries of other products. Now that the American oil companies are permitted, within closely defined limits, to form a tanker pool and co-ordinate information on supplies it should be possible to transport additional oil from the Western Hemisphere in sufficient quantity to maintain Europe's imports of petroleum at 75 per cent of the normal rate. To do this, the OEEC Oil Committee has now estimated, oil production in the Western Hemisphere will have to be increased by between 600,000 and 800,000 barrels a day. Not more than 200,000 barrels a day of this can be expected from Venezuela, and the measure of the extra oil that it is hoped can be moved from the oilfields in Texas, Louisiana and Oklahoma to loading points in the Gulf of Mexico is thus about 600,000 barrels a day. About half of this will be needed by the refineries on the East Coast of the United States to replace crude formerly imported from the Middle East, leaving the other half for Europe. Some of the difficulties which still have to be overcome before the extra supplies can be shipped are discussed in an American Note on page 884.

The greatest benefit from the waiving of the anti-trust laws should come from the operation of the tanker pool. Owing to the delay in reactivating the MEEC some of the tankers bringing Middle East oil to the United States were not immediately rerouted, and one was even sent from Sidon in the Mediterranean through the Panama Canal to California after the Suez Canal had been blocked. Now that a tanker pool has been set up all of this tonnage can be diverted to carry supplies from the Caribbean to Europe. The detailed plans for rerouting have, however, still to be approved by the American Department of Justice before they can be put into operation. And the anti-trust waiver does not yet apply to the participation of the American oil companies in the OEEC Petroleum Emergency Group which has been set up to assist the OEEC Oil Committee in assessing Europe's needs and allocating available supplies between member countries.

The Cost of Crude

PRESSURE for higher crude oil prices in the United States to offset rising production costs will become stronger as crude stocks there are drawn down to supply Europe and the American east coast refineries. Venzuelan crude, especially prized because of its high fuel oil yield, has already risen in price by 15 cents a barrel, but so far, although some unofficial premiums have been paid, there has been no increase in the posted price of Texas crude. When the Caribbean price increase becomes more general, it will pose uncomfortable problems for the oil companies operating in the Middle East.

If the normal movement of Persian Gulf crude through the Suez Canal to the United States were continuing, then a more or less simultaneous increase in Middle East and Caribbean prices, however unpopular in Europe, would still leave Persian Gulf crudes competitive with Caribbean crudes delivered to the refineries on the east coast of the United States. But now that Persian Gulf supplies have to be shipped all the way round the Cape the existing Persian Gulf fob price is clearly uncompetitive with Caribbean crudes delivered either to the United States or to Europe Economically, therefore, there is an overwhelming case for a cut in Persian Gulf prices, rather than a rise. But with royalty incomes in producing countries of the Middle East already sharply depleted by the enforced cuts in production there, a fall in the fob price in the Persian Gulf can be ruled out on political grounds. The most likely course is a compromise between economic and political pressures, which would leave the Persian Gulf price unchanged as the Caribbean price goes up.

In the Eastern Mediterranean the fob price of Middle East crude delivered from the pipeline terminals—which at present means only from Tapline—is normally fixed so as to be roughly competitive with Persian Gulf crude shipped round the Arabian Peninsula and through the Suez Canal. This week's increase of 23 cents a barrel in the price posted by Esso Export Corporation for supplies drawn from Sidon, the Tapline terminal in the Mediterranean, had been held in abeyance for some months, and reflected merely higher tanker freight rates round Arabia when the Suez Canal was still open. It is not intended to reflect the increased cost of hauling Persian Gulf crude round the Cape. Nevertheless, the price of crude delivered to European countries from Tapline could hardly be less in future than one which would equate the delivered cost of Arabian crude with that from the nearest alternative source of supply—the Caribbean. Similar considerations may apply if deliveries are resumed through the Iraq pipelines to Banias and Tripoli before the Suez Canal is cleared. The latest reports from Baghdad suggest that Syria may shortly begin negotiating with the Iraq Petroleum Company on the repair of the pumping stations.

Smaller Rise in Stocks

IN manufacturing industry, at least, there are now clear signs that the rate of stock building is slowing down. The Board of Trade's provisional estimate for the third quarter is that the value of stocks and work in progress in manufacturing rose by only two per cent compared with a rise of over three per cent in the second quarter and of four per cent in the first quarter of this year; stocks are taken at cost or market value, whichever is the lower. There was also a change in the source of that increase. In the first half of the year the increase in stocks was mainly in work in progress and in finished goods; in the third quarter it was mainly in materials and fuel. There are dangers in trying to rationalise these changes, but the pattern does conform to what one would expect. Manufacturers do not cut production at the first signs of a slackening in demand; hence stocks of finished goods and work in progress tend to rise. That rise then levels off as production is brought into line with sales, at the expense initially of a rise in stocks of materials and fuel (fuel stocks, in any case, are the least likely to be cut at this or any other time). It is also possible that the changes in the third quarter were partly the result of seasonal influences.

The slower rate of stock building in manufacturing, which accounts for roughly half the total stocks in Britain, is not necessarily a guide to the rest of the economy. The only

Titanium

is to the metals of today

Now and again, a development occurs so dramatic as to transform age-old ideas and traditions.

Today, titanium — at last harnessed to the needs of engineers — holds out the exciting promise of far-reaching changes.

Already, aircraft designers have learnt to appreciate titanium's special properties, especially its high strength-to-weight ratio and outstanding resistance to corrosion. Titanium has answered some of their most exacting problems. It may provide the answer to yours.

I.C.I. are now producing titanium as a raw metal, and are also making sheet, strip, rod, tube, wire, plate and forging stock from titanium and its alloys. For full technical information about this remarkable new metal, write for the booklet "Wrought Titanium".

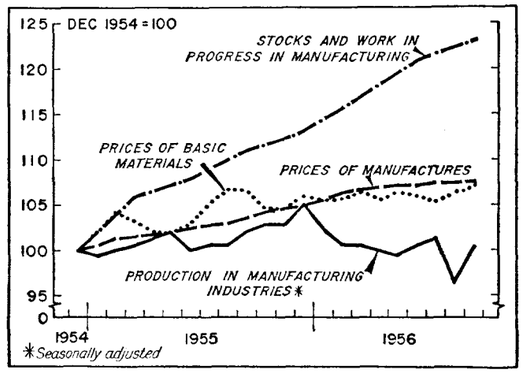
quarterly returns of stocks held outside manufacturing cover about one-quarter of all stocks held by wholesalers (including merchants and importers) and in the government's trading and strategic stocks. Stocks covered by these returns, however, contain a high proportion of industrial materials, and were valued in December, 1954, at about



£350 million (at average cif prices in the fourth quarter of 1954), compared with about £4,000 million for manufacturers' stocks. For what it is worth, these stocks are provisionally estimated to have risen by two per cent in value and by four per cent in volume in the third quarter.

Chemicals and the Canal

THE extremely guarded answer given by Mr Errol in the House of Commons on Tuesday to a question about raw material supplies to plants making petroleum chemicals concealed the potential danger. The effect of the oil shortage on refinery throughput may threaten the petrochemical plants with a wholesale disruption of supplies. The gases that these plants use as raw materials come directly from the catalytic crackers ; they also use middle-cut naphthas from the ordinary distillation process. These plants have been so closely geared to a certain pattern of refinery operations that sharp changes in that pattern throw petroleum chemical production into confusion. If the oil companies shut down their cat crackers one after the other —some are already closed—in order to step up the proportion of fuel oils produced from their reduced volume of crude, they cut off the gaseous feedstock for the petrochemical plants.

The huge ICI petrochemicals plant at Wilton is one of the plants that use naphtha as their feedstock, as are the Petrochemicals plant at Partington and the Grangemouth plant of the Distillers-British Petroleum subsidiary, British Hydrocarbons. These can expect to continue to get supplies of naphtha from the straight-run distillation that precedes any subsequent cracking and reforming operations. But distillation is a highly flexible operation and there is already talk at the refineries of incorporating a high proportion of the naphtha present in crude oil into finished motor spirits in order to increase its volume. This suggests an impending tug of war between the managers of the chemical plants and those on the petrol selling side.

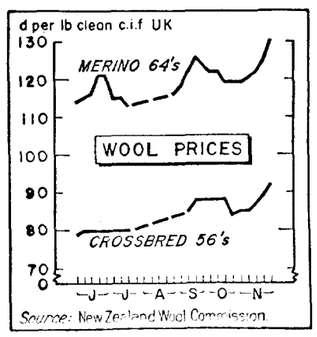
It would be more difficult still to find a substitute for the refinery gases that supply other installations, such as the Shell solvent plant at Stanlow. This plant produces 60 per cent of all the organic solvents made in the country and draws most of its supplies of propylene gas directly off the Stanlow cat cracker. Some alternative sources of propylene are available, but it is difficult to see how they could provide enough gas to keep output up to its normal levels if the cracker shuts. The effects of a shortage of petroleum chemicals would be most severely felt in the plastics and paint industries ; but there would also be repercussions on household detergent powders, although one principal detergent is a by-product of lubricating oil production and would be less affected. But so many industries use these oil-based organic chemicals at one stage or another that a return to imports from the United States may well be unavoidable.

Australia's World Bank Loan

THE Commonwealth of Australia has borrowed a further $50 million from the World Bank for its dollar capital expenditure, on terms that must seem highly attractive against those which it now has to pay for its sterling borrowing in the London market. This is in addition to the $9¼ million borrowed from the bank last week in conjunction with the placing of $17¾ million of serial notes with institutions. The loan is for 15 years at 4¾ per cent including the 1 per cent commission charged by the bank. Amortisation is to start in July, 1959. Australia is already a substantial customer of the bank, and has now borrowed a total of $317.73 million towards financing the equipment needed from the dollar area for its expanding economy.

Wool Buyers Caught Out

THE Suez crisis caught the wool industry in Britain and other countries on the wrong foot. Before the crisis prices of raw wool were easing and buyers were tempted to buy less than they needed. Events in the Middle East sent them hurrying to cover their needs. Prices rose quickly, and that encouraged further buying. Competition from Europe was backed by heavy purchases by Japan ; Russia and the East European countries joined in ; so did the United States, which has little wool left from the domestic clip. The upshort is that prices of most grades of merino and crossbred wool have risen by about 10 per cent since the end of October and are now at the highest levels for about two years. There were signs this week that the spate of buying has eased ; prices in Australia have levelled off and in New



Zealand prices have declined. But with the Christmas break in the auctions approaching it seems unlikely that a decline can go far. The testing time will come in the New Year, when supplies should be arriving in quantity and offerings in the dominions will be heavy.

Membership of the Wheat Scheme

THE membership of the International Wheat Agreement is now settled, and the Wheat Council has been able to bring into balance the quantities which the exporters guarantee to sell at the maximum price of 200 cents a bushel and the importers guarantee to buy at the minimum price of 150 cents a bushel. By December 1st, 38 importing countries had accepted the agreement; another four—Brazil, Lebanon, Holland and Panama—have been given more time to deposit their instrument of acceptance, and three—Ceylon, Jordan and Colombia—have failed to signify their intention to accept. The guaranteed quantities of the 42 countries amount to 7,991,000 metric tons, compared with 10,749,000 tons in the previous agreement. The guaranteed quantities of the six exporters—Argentina, Australia, Canada, France, Sweden and the United States—which were initially fixed at 8,244,000 tons, have accordingly been reduced *pro rata* to 7,991,000 tons. The council, which now has the power "to study any aspect of the world wheat situation," also announced that it has accepted an invitation to be represented at a meeting on grains convened by the Food and Agriculture Organisation next spring.

Light and Shade for DCO

BARCLAYS DCO is the biggest British bank operating overseas; and in Egypt, as in many other countries, its interests are more extensive than those of any other foreign bank. In the report Mr Julian Crossley, the chairman, gives no news of the bank's experience during the past month, promising up to date information at the annual meeting on December 28th. It is believed, however, that all members of the bank's staff of United Kingdom nationality have now returned to Britain. The bank's business, together with that of other British and French banks, was sequestered early in November. It is known that under the control of the Egyptian authorities business is being carried on.

In the period covered by the report and accounts, however—the twelve months to September 30th—the keynote was still expansion; the year saw the establishment of the thousandth branch of the bank. The increase in deposits was £28.5 million, compared with £15.8 million in 1954-55, bringing total deposits to £537 million. The bank made good the whole of last year's decline in its liquidity: its holdings of cash, call money and Treasury bills all rose markedly, and the liquidity ratio which last year declined from 40.5 to 37.7 per cent, was restored to 40.6 per cent. Advances fell off by £10.5 million to £208.2 million, but the whole of the decline was experienced in the last few months of the accounting year. This and the higher rates on short loans and bills helped to raise revenue by more than the increase in costs, and the disclosed net profit after tax rose by £109,000 to £1,261,000. The increase in trading profits was probably considerably larger; Barclays DCO still strikes its profit after making full provision through transfers to inner reserves for depreciation in the market value of its gilt edged portfolio. This must have been appreciable in the past year, yet the bank shows its total quoted investments, "at under cost and below market price," up by £11.4 million to £116.6 million.

The bank is maintaining its total dividend unchanged at 8 per cent, but the ranking capital has again been increased this time by the one for five scrip issue of July, 1955. It is proposed to increase the present authorised capital from £15 million to £30 million though no issue is at present in view. Since the bank operates under its own Act of Parliament, an amending bill will be needed.

Retail Business

CUSTOMER TRENDS

This is a new quarterly bulletin for those interested in the home market for consumer goods. It includes short and long-term forecasts of sales by different outlets and merchandise groups, regional surveys and reports on special investigations.

London Office: 2 Metal Exchange Buildings, London, E.C.3. Tel: MANsion House 4521.

remind shareholders, "prior to the immobilisation of the Suez Canal and of the Iraq Petroleum Company's pipeline." The effect, the directors add, has been to reduce oil supplies and to add materially to costs, though such increases "will be recovered in the selling prices to the greatest extent possible."

All this statement can do is to confirm the impression that the directors will not go beyond their earlier promise to pay a tax-free dividend of 15 per cent on the Shell capital as increased by the 25 per cent free scrip issue. The tax-free interim dividend of 5 per cent points in the same direction, as does the statement by Royal Dutch that the interim dividend of 7½ per cent, against 6 per cent, should not be construed as implying a bigger total payment.

SHORTER NOTES

International Nickel Company of Canada has decided to raise its price by £81 to £600 a ton, delivered UK, and to open up a huge new nickel property in the Mystery-Moak Lakes area of Northern Manitoba.

The outflow of notes from the Bank of England for Christmas spending is now gathering force; in the week to Wednesday it reached £31.4 million, making £43.3 million in the past two weeks. This compares with an outflow of £47.9 million in the comparable weeks of 1955. To accommodate the increase, the fiduciary issue has been raised this week by £50 million to £1,975 million.

★

Bootle Corporation is to make a public offer of £1½ million of a 5½ per cent stock, 1961, at 98½.

★

In 1957 the fixed price of sugar bought under the Commonwealth Sugar Agreement will be £42 3s. 4d. a ton, an increase of £1 8s. 4d. on this year's price.

★

The Export Credits Guarantee Department has suspended cover on new business with Hungary.

Company Notes

TURNER AND NEWALL. Some directors are by nature optimists; others studiously avoid prophecy; and others are so cautious as to leave behind the impression—unintentionally perhaps—of confirmed pessimism. In the last category are the directors of Turner and Newall. Less than six months ago they issued a half-yearly statement, which without giving figures, said that towards the end of the half-year the volume of sales "was tending slightly downwards" and that at home the credit squeeze was reducing some of the orders placed by the customers of the group. They also described the volume of trade abroad as being "static," adding it might be "somewhat lower before long." There was no evidence, they said, to warrant pessimism, but the "ever-forward movement appeared to have ceased."

	Years to Sept. 30, 1955	1956
Consolidated earnings:	£	£
Trading profit	15,562,858	16,664,935
Other income	597,891	805,301
Depreciation	2,605,044	2,846,707
Development	859,824	878,777
Taxation	6,740,938	7,467,019
Net profit	*5,753,879*	*5,876,800*
Tax credits	484,080	503,895
Ordinary dividends	1,573,303	1,730,633
Retained profits	4,568,945	4,216,453
Ordinary dividends (per cent)	*25*	*27½*

£1 ordinary stock at 100s. yields £5 10s. per cent.

Investors, remembering the company's conservative dividend record, guessed that the ordinary payment would be left unchanged at 25 per cent. Yet the figures for the full year to September 30th have brought the fifth successive increase in the dividend—this time from 25 to 27½ per cent—and another advance in earnings. Before all charges the consolidated trading profit has risen from £15,562,858 to £16,664,935 and net earnings from £5,753,879 to £5,876,800. The dividend, slightly bigger though it is, is still conservative, over 70 per cent of net earnings being retained.

Among the group's biggest customers are the building and motor industries. And if there were reason for caution six months ago, there is reason for even greater caution now. But this asbestos group enjoys the advantages of vertical integration; of a dominant position in the business; and of a large volume of business overseas. If its earnings turn down this year, as well they might, they seem unlikely to fall so heavily as to put the dividend in danger. The company's £1 stock units are among the bluest of blue chips, at the moment yielding about 5½ per cent, and only a major economic storm could alter their standing—as it would alter the standing of many other leading equities.

★

FLOWERS BREWERIES. The story of Flowers begins with Greens. In 1947 Mr Bernard Dixon became the chairman of J. W. Green of Luton, which at that time controlled about 250 public houses. Since 1948 the group has expanded and developed at a remarkable rate in an industry which has not been expanding, but which has been changing in composition. Through a series of amalgamations, involving both new issues for cash and share exchanges, the group has grown until it now controls about 1,500 public houses. The biggest single acquisition came in 1954, when Flowers and Greens were amalgamated and the name of the group was changed to Flowers. It has now become one of the 20 or so big brewing groups in the country and it has certainly been the one that—in terms of the number of tied houses it controls—has grown fastest since the war.

Amalgamations of breweries have become common and the trade is being concentrated into fewer, larger groups. Flowers is an outstanding example of the tendency. The group has an unusual geographical shape; its trunk is in the industrial Midlands, but it has limbs as far apart as Kent and Durham. It is a shape on which a national business could be built. The ownership of tied houses smooths the path towards selling beers in registered clubs, heaviest on the ground in the industrial areas, and in the words of the 1954-55 report Flowers' free trade has "made substantial progress towards national coverage." By intensive advertising Flowers, like many other brewers, is promoting the sale of its bottled beers both inside and outside its own tied houses. The group has also taken the step of selling a draught bitter beer casked in such a way that its quality is not affected by the time it is left "on tap" in the barrel. This beer will now be sold in Meux's London houses, following the purchase by Flowers of a small minority interest in Meux. This technique hints at a possibility of selling a draught beer by small and slow individual sales wherever the rapid turnover of a well-frequented public house cannot be achieved.

The group's progressive and aggressive intentions are revealed in other ways. It is encouraging its licensees to be more efficient; it has sold 30 of its outlying public houses; and its aim is to build up its trade in and near the industrial areas. Such a policy of expansion means heavy expenditure and in such a competitive industry as brewing it may not lead to a quick improvement in earnings. In the meantime the group's results are about average. Its gross trading profits have risen slightly, from £912,693 to £935,982,

and its ordinary dividend, covered about one and a half times, has been left unchanged at 15 per cent. On this dividend the 5s. ordinary units at 9s. 6d. yield 7.9 per cent.

★

BORAX (HOLDINGS). The rise of Borax deferred from £4 2s. 6d. last year to £13 13s. 9d. has been one of the outstanding features of the Stock Exchange. It may be a well-justified advance for the market value of the investment in the American subsidiary suggests a still higher valuation for the holding company's deferred stock, but it has the disadvantage that it has made that stock decidedly "heavy." The company's new proposals are obviously designed first to counteract that heaviness and secondly to give the company, which now has many American stockholders, a more impressive nominal capital. It is proposed first to capitalise £6 million of reserves and make a two for one free issue, secondly to split the £1 units into 5s. units., Holders will thus have twelve 5s. units (priced in the market presumably somewhere about 21s.) for each £1 unit now held. The directors have also given stockholders an indication of the final dividend they will pay for the year ended September 30th. It is to be 6½ per cent on the new capital, equivalent to 19 per cent on the old. With the interim dividend of 6 per cent paid on the old capital the total distribution for the year will be equivalent to 25 per cent on the old capital, compared with 23 per cent. Investors seem to have been hoping for a little more, for the stock fell 3s. 9d. on the announcement, but the yield is still only £1 15s. 11d. per cent. Borax is not a stock where the price reflects only the current yield. A more complex set of factors determine the price and the yield: first the company with its heavy American investment is a good transatlantic hedge; second it is a growth stock for all that has happened in the last few years has shown its earnings to be growing and likely to grow further; thirdly the history of the company over the last two years, the struggle for control and the information it brought to light, and the reorganisation that turned the parent company in England into a holding company has tended to spotlight the asset values.

★

ALLIED BAKERIES. The coming of age of Allied Bakeries, which is controlled by Weston Holdings, has been marked by the proposal for a one for two free issue of ordinary shares and by a decision to revalue the group's properties. In the balance sheet of March 31st, the estate properties stood at £11,114,000; in the current year's accounts their value will be not less than £18,500,000, excluding any additions made in the year.

In themselves these book-keeping entries mean little unless they are set against the background of a vigorously growing organisation. The group is continuing to acquire new businesses in the baking and confectionery trades; it is continuing to spend money on its manufacturing facilities; and to write down the value of these properties at a high rate. It is adding to its interests abroad also and it controls businesses outside the bakery and confectionery trades. Indeed, Mr Garfield Weston has told shareholders that these other businesses earn substantially more than is required to cover the ordinary dividend.

Expansion has brought its rewards. The group's sales of confectionery have risen and it has not felt "the full effects" of the fall in the consumption of bread. In 1955-56 its trading profits rose by £179,000 and the ordinary dividend was raised from 22½ to 30 per cent, a dividend which still represents less than one-quarter of net earnings. The group is continuing to plough back a high proportion of its earnings to meet the costs of extensions, re-equipment and modernisation. So far this year profits have been maintained and Mr Weston hopes that they will be maintained "at their present level until at least the end of the present financial year." Investors, who possess only a minority interest in the concern, must believe that Mr Weston will soon be ready for a much more liberal dividend policy, for at the current price of 48s. the 5s. "A" shares yield only 3¼ per cent.

LONDON STOCK EXCHANGE

Next Account begins: December 12th
Next Contango Day: December 12th
Next Settlement Day: December 18th

PRICES of industrial stocks turned sharply upward last Friday when Throgmorton Street took a more favourable view of the international situation. The revival was accelerated on Monday and extensive gains were made; AEI rose 2s. 6d., British Aluminium 2s. 9d. and Imperial Tobacco 3s. 6d. Gilt-edged remained at their lowest levels up to the close of the week in anticipation of the disclosure of the loss in the reserves. But at the start of this week there was an improvement, 4 per cent Consols and 3½ per cent War Loan both hardening ¼. When the size of the gold loss and the Chancellor's statement were known late on Tuesday the market weakened, but both gilt-edged and industrial stocks rallied on Wednesday. Japanese dollar-clause bonds and gold mines rose.

From the low point reached last week industrial stocks have risen substantially in a narrow market, *The Economist* indicator advancing from 170.0 to 176.4, and further gains followed on Thursday. Ford was 9d. higher at 27s. 9d., Tube Investments gained 3s. 3d. to 53s. 9d., Unilever 4s. 6d. to 70s. 6d. xd and Vickers 1s. to 36s. 9d. Bristol Aeroplane rose 1s. to 17s. 3d. following the Britannia orders and Turner and Newall jumped 8s. 3d. to 101s. following the increase in dividend. Steel shares recovered in anticipation of the results, but the discussion of hire-purchase controls lowered finance issues, United Dominions losing 1s. 6d. to 61s. 6d. xd.

Oils made a substantial recovery, British Petroleum rising 12s. 10½d. to 126s. by Wednesday. On Thursday, following the Royal Dutch/Shell quarterly statement, British Petroleum advanced to 132s., while Shell gained 3s. 1½d. to 144s. 4½d. Kaffirs advanced sharply on Wednesday, Western Holdings picking up 4s. 4½d. to 75s. and WRIT 3s. 1½d. to 35s. 7½d. De Beers was depressed by reports of Russian diamond discoveries and fell 3s. 9d. to 92s. 9d. Tea shares were firm again this week.

[1] Electricity production for New Zealand represents about 87 per cent of total generation. [2] Copper and tin refer to metal production. [3] General trade (including re-exports) except for Canada, which is special trade only. Imports are cif except for Australia, Canada and S. Africa which are fob; exports are fob. Trade for India includes that going by land; annual figures for India are for 12 months beginning April 1st of year stated and for Australia 12 months ended June 30th. [4] Gold and foreign exchange holdings are those of the government and central bank; only figures for Australia include holdings of commercial banks. Cost of living for S. Africa and S. Rhodesia relates to Europeans only and for S. Africa includes direct taxes. [5] Including foreign investments. [6] Including semi-processed gold. Beginning January, 1955, including South-West Africa. [7] In July 1948, part of holdings was transferred to the State Bank of Pakistan. [8] April, 1948—March, 1949. [9] Including some long-term securities. [10] Average for second quarter.

Financial Statistics

EXCHEQUER RETURNS

For the week ended December 1st, 1956, there was an "above-line" deficit (after allowing for Sinking Funds) of £17,138,000 compared with a surplus of £25,927,000 in the previous week and a deficit of £32,651,000 in the corresponding period of last year. Net expenditure "below-line" last week reached £14,048,000, bringing the total deficit to £657,269,000 (£651,535,000 in 1955-56).

THE MONEY MARKET

CREDIT conditions have been difficult in the past week. On Thursday before the weekend a number of houses had to repay seven day loans from the Bank, and very large official purchases were necessary; smaller special help was given on Friday. Large purchases were again made on Monday and Tuesday, yet on both days one or two houses still needed to take loans at Bank rate. The shortage of market funds was caused mainly by a dearth of maturities, owing partly to preparations for the Trinidad Oil pay-out three months ago and also to recent bill purchases by the Bank.

The market's bid for both the three months and two months maturities was unchanged at the tender on Friday at £98 14s. 11d. per cent and £99 2s. 7d. per cent respectively. The offer of 91-day bills was up by £10 million to £220 million, and as total applications dropped sharply by £28.9 million to £325.7 million, the market's allotment rate jumped from 30 to 52 per cent. However, the offer of 63-day bills was under allotted by £10 million, to £60 million compared with £80 million last week; and the market's proportion of these maturities fell from 94 to 77 per cent. Its average rate of allotment of the two maturities together rose from 48 to 58 per cent.

The Bank return shows a rise of £31.4 million in the active note circulation; and the fiduciary issue has been raised by £50 million to £1,975 million.

Portrait of a man who invested in **SAFETY...**

with **ABBEY NATIONAL** naturally!

He is a man who can relax in comfort, casting his fly with the assured aim that comes of a tranquil mind untroubled by backward glances at the world of stocks and shares. He has invested in Safety with the Abbey National Building Society, with a tax-paid 3½ per cent return — **whatever the state of the market.** That's equal to £6.1.9 per cent where Income Tax is paid at the standard rate.

No wonder our fisherman wears a contented expression! He has plenty to be contented about, with his money safely invested in Abbey National. Any amount from £1 to £5,000 is accepted.

A SAFETY-FIRST INVESTMENT

3½%

INCOME TAX PAID BY THE SOCIETY

This is equivalent to

£6.1.9

per cent where Income Tax is paid at the Standard Rate

ABBEY NATIONAL

WHAT A LET DOWN FOR THE DRUM!

This deflated looking object *was* a steam-heated drying cylinder, 6 ft. diameter, 8 ft. in length. It was used for processing a hot liquid which was poured over the surface at 160°F. Copper constructed, with end-plates of ¼ in. thick mild steel, it was fitted with four equi-distantly-spaced vacuum relief valves.

It was not until after the collapse, which even forced in the stay-supported ends, that it was discovered that steam, condensing within the lightly-built cylinder, had created a vacuum. One faulty valve, and an inadequate steam supply pipe, had not helped matters either.

What **Vulcan** *say about it ...*

The possibility of the formation of a vacuum is frequently overlooked in the design of pressure vessels.

Whatever Vulcan insure, be it boiler or steam-engine, electrical apparatus, crane, lift or any other factory plant, Vulcan inspect. Inspect with an expert eye, pointing out a possible weakness, spotting the accident before it happens.

And if you want to read all about industrial accidents and ways to avoid them, why not write to us now for "Vulcan"? It is a Quarterly Journal for Power users, and it's free. *Write to Dept. 17.*

COMPANY MEETINGS

THOS. W. WARD, LIMITED

MR H. W. SECKER ON A YEAR OF RECORDS

The fifty-third Ordinary General Meeting of Thos. W. Ward, Limited, was held on November 30th, in Sheffield. Mr H. W. Secker, OBE (Chairman of the Company), presided, and in the course of his report, previously circulated, said:

"Before I proceed to review the record results of the past financial year, I wish to refer to the changes that have taken place since our last meeting, both in the Board of Directors and also in certain of the executive appointments.

It is with deep regret that we have to record the death of Mr James Bussey who had been a Director since 1939, also of Mr Herbert Beresford who had been Secretary since 1947. Each had given over 50 years' valued service to the Company and we shall miss the knowledge and experience which they contributed in their respective spheres.

With the passage of time such gaps are bound to occur in our top management, but I am happy in the knowledge that we have some worthy successors coming along, which enables us to continue our policy of promoting men to senior positions who have been trained and proven in their service to the Company. In furtherance of this policy, the Board has been strengthened by the appointment of three Directors, Mr C. Parry (40 years' service), Mr H. H. Mumby (37 years' service) and Mr W. Hall (29 years' service), all of whom have been Local Directors since 1948.

Mr Ernest Robinson, who has been Assistant Secretary for 9 years, and has 40 years' service with the Company, has been appointed Secretary. With the growth in size and complexity of the Group activities, we have considered it desirable to create the new position of Group Chief Accountant to which we have appointed Mr E. M. Dodd, who has dealt with financial matters since 1947.

GROUP RESULTS

The Group turnover of £44,714.000 has increased by some £8 million compared with the previous year. This increase has been contributed in approximately equal proportions by the Parent Company on the one hand, and the combination of Subsidiaries on the other, the Parent Company's turnover of £25,125.000 being an increase of nearly £4 million on the previous year, and the combined Subsidiaries' turnover of £19,589.000 being also approximately £4 million up on the previous year. In making such comparisons it has, of course, to be borne in mind that in the previous year's figures only 7 months' trading results of Wolverhampton and Birchley Rolling Mills were included, compared with a full 12 months in the present year, whilst the Alexander Metal Company, Limited, which was acquired in September, 1955, was not included in the previous year's figures, and the results of that company have been included in this year's consolidation to the extent of 9 months' trading. Although the physical volume of turnover also shows a welcome increase, and along with the sterling volume constitutes an all-time record, the turnover figures are to some extent also a reflection of increase in prices.

Furthermore, to keep the turnover figure in the right perspective, it is advisable to point out that on a broad division of the Group activities £21 million (approximately) arises from transactions of a Merchanting nature, and £23½ million (approximately) from transactions of a manufacturing or semi-manufacturing nature. It will be appreciated that the rate of net profit in the first category is much smaller than that in the second category. The Group trading profit of £2.729,000 before deduction of the Subvention Payment, to which I refer later, also constitutes a record and is approximately £375,000 up on the previous year. Here again the comparison is affected by the fact that a full year's profits are included for the Wolverhampton and Birchley Rolling Mills compared with only 7 months in the previous year, and 9 months profits for the Alexander Metal Company, Limited, which company was not included in the consolidation in the previous year. Although, as usual, we derive a considerable proportion of the Group profit from a nucleus of main departments of the Parent Company, together with certain of the larger Subsidiary Companies, I am particularly pleased by the fact that a steady increase of profits has been contributed by certain of the smaller sections of the Parent Company, and by the smaller Subsidiary Companies, so that the picture I am able to present to you over the past year is one that depicts steady progress by all sections and companies in the Group without exception.

We are fortunate in the good labour relations that exist throughout the Group, and I would like to express my appreciation of the support given to me by my colleagues on the boards, both of the Parent and Subsidiary Companies, and to acknowledge the efforts put forth by Executives, Staff and Workpeople throughout the Group which, in combination, have produced such excellent results.

DELIVERIES OF SCRAP IRON AND STEEL

Although our activities now extend in so many directions, the business was originally founded on the trade in scrap iron and steel, including shipbreaking and dismantling, and indeed this still represents a high proportion of this company's business, so that I am very pleased to report that our deliveries of scrap iron and steel, excluding imports, to the consumer industries in this country have again broken all records by a substantial tonnage.

The forward production and development programme of the steel industry clearly indicates a continuing demand for all the ferrous scrap that can be found in the United Kingdom, and the high cost of imported scrap, much of which is from hard currency countries, emphasises the need for prompt release of obsolete plant and equipment. The efforts of the steel industry to secure better segregation and preparation of scrap, to permit heavier charging-box weights with shorter charging times and increased furnace efficiency, have our strongest support, and developments are constantly taking place at our various scrap works to achieve this.

In shipbreaking, as I reported last year, we have not been working to maximum capacity owing to the shortage of ships for breaking. There are still many old ships retained in service because of the high freight rates ruling at present, and coupled with the Suez situation, it would not appear that we can expect any material improvement in this direction in the immediate future.

RAIL CHARGES

By reason of the tremendous tonnage handled, we are very large users of the Railway Freight services and make direct payment to the British Transport Commission of about £1¼ million a year. We forward a great variety of products by rail from a very large number of stations in England, Scotland and Wales and therefore the British Transport Commission's new Merchandise Charges affect us very closely. Until the Commission has disclosed how it proposes to implement the scheme, which has recently been approved in a slightly modified form by the Transport Tribunal, we shall not know how the rates on our traffic will be affected. The Transport Commission knows our views and we can only hope that the considerable apparent difficulties will be satisfactorily resolved.

RATING ASSESSMENTS

The rating assessments under the new valuation lists in all areas of England and Wales, introduced by the Inland Revenue Valuation Department by powers of the Local Government Act of 1948, will result in a substantial addition to our charges in view of the many properties we occupy throughout the country. Where the new assessments appear to be incorrect or unreasonable, we have taken steps to submit proposals to the appropriate authority.

GROUP TRADING ASPECTS

To provide you with a closer acquaintance of how the main sections of the Group have fared throughout the past year, I think it will prove most convenient to do this under the broad classification which has been adopted in making returns of capital investment to the Board of Trade. In this grouping, the activities both of the Parent Company and the Subsidiary Companies are merged in the respective groups

QUARRIES

Both turnover and profits have increased and our Shap quarries in particular have had a very successful year, both in dry and coated road stone, and in the Concrete Works, where a variety of concrete goods are manufactured, such as paving flags, kerbs, fencing posts, spun pipes and artificial stone for architectural purposes. Providing the weather is not

undulv adverse during the forthcoming winter, I anticipate profits will be maintained during the present financial year.

CEMENT

The Ketton Portland Cement Company Limited had a record output tonnage of 320,516 tons, but the incidence of rising costs was such that the net profit was only slightly higher than in the preceding year. Arising from a revaluation of the Fixed Assets, a Surplus of £517,510 has been credited to Capital Reserve, and the Directors are proposing an issue of bonus shares to the Ordinary Shareholders, subject to CIC consent, in the ratio of one for one, by appropriation from certain of the Revenue Reserves. The main capital projects include an entirely new crushing plant and the construction of a new roadway and plant for the handling of coal. The Ribblesdale Cement Company Limited and its Subsidiary Company the Horrocksford Lime Company Limited in which the Ketton Company holds a 50 per cent interest, both continue to make excellent progress. Mr F. R. Stagg, the Chairman, commenting on future prospects, says the demand for cement is being maintained and prospects for the future appear to be bright, notwithstanding the effect of the credit squeeze.

IRON AND STEEL AND NON-FERROUS MANUFACTURING, INCLUDING SPECIALISED CASTINGS, IRON AND STEEL SECTIONS, ETC.

In this group, which includes Subsidiary Companies engaged in Re-Rolling Steel, Rolling Mild Steel Plates and Sheets, Wrought Iron, Specialised Castings, Non Ferrous Ingot Manufacture, together with the Fabrication of Steel by the Parent Company, the results have been particularly gratifying.

Our Rolling Mills at Wolverhampton and Birchley have had a record production, which has enabled them to absorb all increases in wages and material costs and also the adverse effect of working margins, whilst the policy of specialisation has enabled them to avoid the more competitive type of business, especially that from the continuous mills. Improvements have been effected to accommodate increased output and to improve handling facilities, and the order position shows cover for eight or nine months ahead. Despite the recession in the motor car industry, however, there is still a difficulty in obtaining suitable labour for the mills.

At the Darlington Works, a scheme to mechanise the Foundry is now being undertaken, together with certain other improvements.

Generally speaking, those of our companies engaged in the supply of castings are experiencing a noticeable increase in the degree of competition, prices are very much keener, and there is no doubt that the credit squeeze is taking effect.

Subject to this, the general situation is that the order position is being maintained at a good level and profits so far are similar to the corresponding period last year.

NON-ELECTRICAL ENGINEERING, INCLUDING MACHINE TOOLS, CRANES, EXCAVATORS, ETC.

Although turnover showed a slight increase, net profit was just a shade down compared with the previous year, due mainly to the incidence of rising costs. During the last few months of the financial year there was a marked deterioration in the demand for excavators, but this is considered to be only a temporary lull arising from the credit squeeze and the necessity for many overseas countries to limit their imports. Oversea orders recently booked, include one for the Indian Railways, covering the supply of 30 Steam Cranes to a value of £300,000, and for South Africa to an approximate value of £72,000, for whom an order has recently been completed for nine ¾ yard Excavators. The Canadian market has taken 26 ¾ yard Excavators this year and we now have 129 Excavators working there. Extensions have been completed to the Machine Tool Works at Halifax which increase the area by 10,593 sq ft, whilst improvements have been made in the foundry facilities. The orders received at and following the International Machine Tool Exhibition at Olympia, both for Town Radial and Vertical Drilling Machines and for the Woodhouse and Mitchell Turret Milling Machine, were very gratifying, and approximately 63 per cent of the total value of orders on hand for Fredk. Town & Sons Limited are for export.

The order books for Cranes and Machine Tools are particularly satisfactory and trade should continue at a good level during the present financial year, although there may be some decrease in net profit because of rising costs.

MOTOR ENGINEERING AND WAGON BUILDING AND REPAIRING

Although only a relatively small section of the Group interests, a very satisfactory increase in profits has been shown and a valuable contribution has been made to the Group profit.

WIRE AND WIRE PRODUCTS, PROCESSING AND MANIPULATION OF SCRAP, SHIPBREAKING AND MANUFACTURE OF NUTS AND BOLTS

The overall position shows a satisfactory increase in turnover and profit compared with the preceding year, but there is a slight fall in the rate of net profit. Subject to my earlier remarks on the shortage of ships for breaking, the business in this group should be maintained at a good level throughout the present year.

INSULATING MATERIALS

This is one of our more recent interests and therefore one in which we hope to expand.

Good progress was made by Dick's Asbestos & Insulating Company Limited during the year and a new factory has been erected at a cost of £125,000. At the end of the financial year the factory was in an advanced stage and approximately 60 per cent had been occupied, and full occupation has now taken place. Owing to the continued rise in solid fuel costs and the general aim for increased efficiency of fuel usage, the future prospects for Insulating Contracts are very encouraging, but the industry in general is suffering from an acute shortage of skilled labour.

BUILDING AND CONTRACTING, INCLUDING INSTALLATION OF RAILWAY SIDINGS, ROAD CONSTRUCTION, ETC.

Turnover has been well maintained, but overall profits are somewhat lower due to a fall in the margin of profit. There is no doubt that the credit squeeze is resulting in a deferment of certain projects which would normally be coming forward, and competition in this field is intensifying.

MERCHANTING

In this group are included Subsidiaries engaged in the supply of Industrial and Domestic Coal, Coke and other fuels, Contractors Small Tools and Equipment, Steel Stockholders, and the Parent Company's activities in Merchanting Ferrous and Non Ferrous Metals, Pig Iron and Foundry Supplies, Boilers and Industrial Plant, Machinery and Contractors Plant, Cement and Concrete Products.

Although a material increase in turnover has been achieved, this has been influenced to a certain extent by increases in prices during the year on coal and certain of the other commodities; nevertheless, there has been an increase in physical volume which has been accompanied with a useful increase in net profit. As I commented earlier however, the profit margin is rather small, and it is only by the capacity of our organisation to handle a variety of products in such large volume, that we are enabled to show a profit commensurate with the important service which this section of our Group renders to such a wide field of industry.

The credit and hire purchase restrictions are being increasingly felt in building and associated development, which in turn is reflected in our Contractors Plant and certain other sections.

The overall position is that the level of trade is being reasonably well maintained in the Group, but it is possible that there will be some slight falling off in demand during the course of the year.

THE WAVERLEY RUBBER COMPANY LIMITED

In April 1955 we purchased the property and plant of The Waverley Rubber Company Limited, Russell Road, Edinburgh, together with the right to use the firm's name, immediately prior to its being put into liquidation. The company had a sound business for a considerable number of years in the manufacture of all types of rubber footwear, printers blankets and mechanical insertions, but because of the increasing competition in rubber footwear the Directors had decided to liquidate the company.

We are holding the major part of the property and plant for disposal at a suitable opportunity and this is included in Stock on hand in the Balance Sheet. We are, however, retaining sufficient plant to continue the manufacture of rubber blankets for the printing and allied trades, and since June 30th we have formed a separate company for this purpose, which will continue to trade under the name of The Waverley Rubber Company Limited.

THE BLAENAVON COMPANY LIMITED

Prior to our obtaining control of the above company in January 1954, it had been experiencing difficulties for some considerable time because of the shortage of working capital and essential additional plant and machinery. We acquired the company, however, in the hope that we could build up its business in Tyres and General Engineering, as it was considered that it could be turned into a useful addition to the Group activities. Unfortunately circumstances have proved such, that we have reluctantly come to the conclusion that we are unable to implement our intention, and we have therefore decided to realise our holding in the company at the earliest opportunity. Negotiations are at present in progress which, if finalised, will enable us to dispose of our holding of the ordinary and preference shares in this company amounting to 92½ per cent and 89 per cent respectively of each class of Issued Share Capital.

The Subvention Payment of £100,000, which is featured separately on the Profit and Loss Account of the Parent Company, was made to The Blaenavon Company Limited and was based on a provisional estimate of that company's deficit for tax purposes in order to preserve any rights under Sec. 20 FA 1953.

It is anticipated that even after allowing for the Subvention payment, a satisfactory profit will arise on the eventual realisation of our holding in this Company.

OVERSEAS TRADE

In addition to the specific orders for Cranes and Excavators which I have mentioned, the Parent Company's export sales show a material increase over those of the previous year. Because of the intensive competition that has had to be met, in many cases the margins have been smaller, but the net profit earned is very satisfactory and reflects credit on our Overseas Trade Department who have achieved this result notwithstanding the import restrictions in many countries.

The turnover and results of our French Subsidiary have been very satisfactory, and having regard to the rigidity of the French licensing system, the management are to be complimented on the manner in which they have handled the problems created by this restrictive policy.

The Belgian Subsidiary has kept up progress despite many difficulties, whilst our Scandinavian Company has further consolidated its position despite the restrictions on credit and hire purchase which operate in Sweden, similar to the policy which is being followed at home.

The restrictions on imports have persisted in Australia and the Company has had to operate under difficult conditions ever since we acquired it in 1952, so that our original expectations have not been fulfilled. The results are very disappointing, but so far it has been operating on a relatively small scale and we are considering means of strengthening the company and putting it on a sounder footing for the future.

We are continuing in our endeavours to expand the Group exports despite the many difficulties that have to be overcome.

PROFIT AND LOSS ACCOUNT

Referring to the Consolidated Profit and Loss Account you will see that in arriving at the Profit before Taxation, we have provided for depreciation of £402,718 which is an increase of some £110,000 compared with the preceding year. The Parent Company's provision has increased by £38,000 and the other main contributory factor to such increase arises from the revaluation of the Fixed Assets of The Ketton Portland Cement Company, Limited, as the depreciation charge for that company has been computed on the revalued figures, resulting in an increase of over £40,000 compared with the charge for the preceding year. Whereas, however, it was considered desirable in previous years to implement the charge for depreciation by an allocation to Reserve for Replacement of Fixed Assets, and £40,000 was so allocated in the previous year, in view of the revaluation such an allocation is no longer considered necessary. After deduction of the Subvention Payment of £100,000, the Group Profit before taxation (to the nearest £000) is £2,629,000 of which we have to provide the amount of £1,386,000 for Taxation, leaving a profit after taxation of £1,243,000 compared with £1,136,000 last year, an increase of £107,000.

The incidence of taxation remains a heavy burden on industry and no clearer illustration can be given of this than to consider that after all the concerted efforts of our Group throughout the year to obtain and expand business and all the risks and difficulties that have had to be faced in building up to a turnover of nearly £45 million, the net average reward after providing for taxation per £1 of turnover is 2¾ per cent or 6½d. in the £. After adjustment for Transfers from Reserves, for Minority Interests, and the amount retained in the Subsidiary Companies' own accounts, we are left with a Profit of £776,797 available for Allocation and Appropriation in the Accounts of the Parent Company.

Turning to the separate Profit and Loss Account of the Parent Company you will see that in arriving at the foregoing profit we have deducted £44,034 as a provision for loss in a Subsidiary Company. This is in respect of the investment in the Australian Company, and in view of the difficulties experienced there on which I have commented in my remarks on Overseas Trade, we consider it advisable to make such provision against our investment.

BALANCE SHEET

The main movements in the Parent Company's Balance Sheet, stated to the nearest thousand pounds, compared with the previous year, consist of Increase in Fixed Assets of £170,000, Increase in Shares in Subsidiary Companies of £265,000, comprising the purchase of an interest in Alexander Metal Company, Limited, together with further capital introduced into certain of the existing holdings in Subsidiaries, and increase in amounts owing by Subsidiaries of £60,000. These amounts which are in the nature of Fixed Investment total £495,000. The position of Current Assets and Liabilities is that Stocks have increased by £330,000, Debtors by £615,000, whilst the Cash position has decreased by £294,000 and Creditors have increased by £608,000, so that the net Current Assets have increased by £43,000. The combined Increase in Fixed and Net Current Assets is £538,000. It will be observed that by reason of the amount put into Fixed Investment and because of the cash required to finance the expanded turnover, the Bank position has turned temporarily into overdraft. The Group Balance Sheet shows somewhat similar trends. The increase in Fixed Assets by £989,000 is of course materially influenced by the revaluation of the Fixed Assets of Ketton Portland Cement, which resulted in an increase of £517,000. Stocks have increased by £1,204,000 and Debtors by £934,000, whilst Cash, Investments and Tax Reserve Certificates, have been reduced by £215,000 and Current Liabilities have increased by £1,317,000. The Net Assets of the Group now amount to £10,709,000.

APPROPRIATION OF PROFITS

During the past year we have consolidated our existing interests, and our liquid resources have been extended to the full in financing a record turnover. By various methods including capital outlay on extensions and improvements, we have managed to keep the incidence of rising costs within reasonable bounds. Our Group Capital Investment programme for the calendar year 1956 is in the region of £825,000 and the forecast for the calendar year 1957 is only slightly lower at £725,000. Apart from the increasing needs of the Group it is also desirable, because of the credit restrictions operating, to retain a reasonable measure of liquid funds in the Group. In recommending that the ordinary dividend be maintained at the same level as in the previous year, your Board have also taken into consideration the several requests made by the Chancellor of the Exchequer in recent months for restraint by both parties in Industry at the present time. It is not your Board's policy, however, to maintain an unreasonable period of restraint.

FUTURE PROSPECTS

In my review of Group trading aspects, I have indicated the probable trend for each class of activity during the current year, and I think it is a fair summing up to say that the overall volume of trade is likely to be maintained near the level of the past year but that we shall experience some reduction in profit margins. I am hoping that I shall be able to report another satisfactory Group profit at the next meeting, but it must be realised that we cannot go on creating records indefinitely."

The report and accounts were adopted and the dividends recommended declared. The retiring directors were elected and the auditors reappointed.

KUALA PERGAU RUBBER PLANTATIONS LIMITED

IMPROVED YIELDS MAINTAINED

The twenty-second annual general meeting of Kuala Pergau Rubber Plantations Limited was held on November 29th in London, Mr H. A. Kinney, FCA, presiding in the absence abroad of the Chairman, Mr S. Estall.

The following are extracts from the Chairman's circulated Review: It is encouraging to report that the improved yields mentioned in last year's review have been maintained, and that the total crop of 471,000 lb harvested exceeded the previous year's output by 132,000 lb, an increase of over 33½ per cent. This is to a large extent due to the young areas which are now gradually coming into production, and the increasing yield from this young rubber should more than offset the inevitable fall in output from the older areas.

The net average price obtained for all grades was 28.33d. per lb, whilst the all-in cost of production, including Government rent, duty, and expenditure on upkeep of the immature areas, averaged 19.84d. per lb. After providing £8,455 for taxation, the Board recommend the payment of a dividend of 7½ per cent, which will absorb £3,736, leaving a balance to be carried forward on profit and loss account of £12,069.

Mr H. A. Kinney, addressing the meeting, said: As a Board we remain optimistic as to the future, both commercially and politically. It is unlikely that the current year's crop will exceed last year's, as on the advice of our Visiting Agent, a slightly more conservative tapping policy is being adopted, which will offset to some extent the young rubber which has come into tapping.

The report was unanimously adopted.

BARCLAYS BANK DCO

LARGER DEPOSITS

MR J. S. CROSSLEY'S STATEMENT

The thirty-first ordinary general meeting of Barclays Bank DCO will be held on December 28th in London.

The following are extracts from the circulated statement by the chairman, Mr J. S. Crossley, for the year to September 30, 1956:

Stockholders will know that this Bank operates under its own Act of Parliament—The Colonial Bank Act of 1925. In terms of that Act the authorised capital is limited to £15 million. The paid-up capital today is £12,932,250, and £15 million therefore leaves little margin should it become necessary at any time in the future to issue fresh capital. Your directors, with this in mind, have felt that we should approach Parliament by means of an amending bill to obtain authority to increase the Bank's authorised capital from £15 million to £30 million. Accordingly a bill has been prepared and was deposited in Parliament on November 27th. At an extraordinary general meeting following immediately after the annual general meeting on December 28th you will be asked to approve it. Although we are asking you to approve this bill there is no intention in the immediate future of making an issue of shares.

During the year a further milestone in our history was reached when, on May 15th, at Kapsabet, "the place of the porcupine," in the Highlands of Kenya, the one thousandth branch of the Bank was opened. By an odd coincidence, the opening date fell on the 119th anniversary of the opening by the Colonial Bank of its first branch in Jamaica. Since May 15th, 43 more offices have been opened, making a total for the twelve-month period of 110 new offices, 26 of them being full branches, 14 sub-branches, and 70 agencies; 4 agencies were closed during the period.

BALANCE SHEET FIGURES

Our balance sheet figures when compared with those for a year ago show an increase in deposits, together with a small reduction in advances. The major changes, however, took place only during the last few months of our accounting year. On March 31st, at half-time, our advances to customers were actually substantially higher than at the beginning of the period, while our customers' deposits with us showed practically no change. Our average lendings taken over the whole period were substantially higher than in the previous year. This factor, taken together with the higher rates of interest earned on treasury bills and short term funds, accounted for an increase in revenue which more than offset the further increase in expenses which we have once more had to meet and the additional taxation costs, due to increases in the rate of profits tax. The final result shows that the net profit, after tax, amounts to £1,261,189 or an increase of £109,088.

In future years, I hope we shall be able to provide you with an approximate profit figure each half-year at the time of the declaration of the interim dividend. This will be for us quite a new departure, and it will, I think, be obvious to you that the half-yearly figure will not necessarily prove a reliable guide to the figure for the full year. The rapid changes in the figures, such as, for example, those that have occurred during the last few months of this year, can have a material effect on the Bank's earnings.

VAST FIELD OF ENDEAVOUR

Throughout the Commonwealth there exists a vast field of endeavour which calls for men, as well as for money, if progress on sound lines for the benefit of its peoples is to result. Since the end of the war much has been done to develop the less advanced areas of the Commonwealth and in this way to bring about an improvement in the standard of living of its many millions of people but there are all too few who devote their time and energies to this cause which holds such great promise for the future, and has such possibilities both for good and ill. This is, perhaps, because too many people nowadays are influenced by meaningless clap-trap about "colonialism" which comes mainly from sources which are none too well disposed either towards this country, or to the so-called "colonial" people themselves. When such criticisms come, as occasionally happens, from normally friendly sources, it may just be that they have failed to keep themselves up to date with British policy and methods, or it may, perhaps, result from a little confused thinking. In neither case should they be taken seriously.

It is in this overseas field that our Development Corporation works and continues to make progress.

CAPITAL FOR OVERSEAS

We are frequently asked by our overseas friends why it is that capital should be so hard to raise on the London market at the present time. It is often a source of keen disappointment to us to hear of sound projects originating overseas which are either unable to find money, or can only do so at rates which would impose too heavy a burden on the undertaking. Sometimes this may lead to the complete abandonment of the project in question; alternatively the money may be raised in some other financial centre. In neither event can the outcome be considered satisfactory, from the point of view of this country. This is not to say that there is anything wrong with the idea of bringing foreign capital in to develop the countries of the Commonwealth. There is indeed much to be said for it so long as the terms are reasonable and so long as they are not framed in such a way as to impose too heavy a strain on the borrower; so long also as there are not conditions attached which might have as their object the diversion of orders elsewhere, which, in other circumstances, would unquestionably have come to this country. The point which needs emphasis at the present time is that the amount that we, in this country, are able to spare for the purpose of overseas investment is pitifully inadequate.

If the London market, as the financial centre of the sterling area, cannot in the future play its full part as a banker, then serious consequences will inevitably follow. For it is an essential part of the business of a banker to be a lender as well as a repository of funds. Just as a banker has to be guided by this principle, so does a nation which seeks to play the role of banker to other nations.

FAIREY AVIATION COMPANY

THE YEAR'S ACHIEVEMENTS

The twenty-eighth annual general meeting of The Fairey Aviation Company Limited was held on November 29th in London.

Mr R. T. Outen (the chairman), in the course of his speech, said: I do not think that you will complain if I occupy a few minutes in speaking of the loss sustained by the company, the Board, and the shareholders through the death, on September 30, 1956, of our late Chairman, Sir Richard Fairey, who founded this business over 40 years ago and who gave it such brilliant leadership throughout his life.

The consolidated group trading profit for the year ended March 31, 1956, before providing for taxation, amounted to £2,065,097, which compares with £2,159,568 in the preceding year. There was some reduction in the profits of the Parent Company, but this was largely offset by increased profits from our overseas subsidiaries. The net profit of the Group amounted to £898,322, an increase of some £96,000 over 1955. The board recommend a payment of 1s. 6d. per share upon the increased capital.

FINANCIAL POSITION STRENGTHENED

It is gratifying to be able once more to report a steady strengthening in the company's overall financial position, as the balance sheet clearly demonstrates.

Recalling some of our achievements during the past year, the major item, of course, was the obtaining of the absolute World Air Speed Record for Great Britain, at a speed of 1,132 m.p.h. This represents a major achievement in British aviation. Mr Peter Twiss's record was not a "flash in the pan," for the aircraft continued its supersonic flying throughout the summer with air-line reliability.

You have no doubt read of the successes of our air-to-air Guided Weapon—Fireflash. In fact your company made history by designing, developing and manufacturing the first British Guided Weapon successfully to bring down a radio-controlled target aircraft—also a Fairey product.

THE HELICOPTER FIELD

In the Helicopter field, the Rotodyne, the largest helicopter under construction in the world, is progressing steadily. Considerable air-line interest, both at home and abroad, is being shown in the aircraft, which gives every promise of meeting the needs for short-range economical transport, independent of airfields.

The Gannets continue to give excellent service in the Royal Navy and are spoken of very highly by the Royal Australian Navy. Design work is now proceeding on a new version of the Gannet which is intended to take over the search duties at present performed by the Douglas Skyraider.

Collectively, the subsidiary companies have made a very useful contribution toward the total group profits, and in spite of one or two weak spots you are entitled to feel well satisfied with their continued performance.

I will end by assuring you that this company is fighting fit. Its capacity for inventiveness, the soundness of its engineering, its versatile production organisation, its financial resources, and its management and policy, are such that we can face with confidence whatever tasks and problems the future has in store for us.

The report and accounts were adopted.

THE JERAM RUBBER ESTATES, LIMITED

CHAIRMAN'S STATEMENT

The Annual General Meeting of the Jeram Rubber Estates, Limited, was held on December 6th in London. The following is an extract from the statement made by the chairman, Mr Harold F. Copeman:

The accounts under review give effect to the increase in the issued capital since the last Annual Meeting and to the changes arising from the acquisition of the Seventh Mile estate which was approved at that Meeting. It must be borne in mind, however, that the benefits from that acquisition have accrued for only six months, that is to say, from October 1, 1955, to March 31, 1956, and that the final dividend of fourpence per share is payable on that increased capital. The fact that we have had nine months' crop from Palmlands Division and six months from Seventh Mile makes comparisons with the previous year difficult and somewhat misleading.

The crop of 1,444,376 lb was harvested as to 512,176 lb from Jeram estate, 603,200 lb from Effingham and Palmlands, and 329,000 lb from Seventh Mile. The most profitable estate is, of course, Jeram, with 98¼ per cent of its mature area under modern rubber which yielded over 900 lb per acre at an ex estate cost of approximately 10d. per lb. Seventh Mile, which has just under one half of its mature area in modern rubber, produced about 800 lb per acre at 12d. per lb ex estate, whereas Effingham costs were approximately 14d. on a yield of some 350 lb per acre. I give these figures with some misgiving because, as I have stated above, they tend to be misleading, particularly when affected by a replanting programme, which provides for very intensive tapping of the areas to be cut out. They do, however, give some indication of potentialities. I should add here that in order to effect the utmost economies in working, Effingham and Seventh Mile have now been fully integrated into a single unit with one manager, and that consequently it is intended to consolidate all returns. Jeram estate shows a slight falling off in yield, which arises from the incidence of tapping; it is fully expected that the yield will recover in the normal course. With the present immature areas of replanted rubber coming into bearing in successive years from now on, we look forward to a steady increase in the overall yield per acre, and a consequent reduction in the "all-in" cost.

In dealing with yields I have referred to the percentage of modern mature rubber, but it will be appreciated that that does not present the full picture of our work in rejuvenation. With the completion of the current year's programme, we shall have in all nearly 65 per cent of our area under modern rubber, and shall be well on the way to completing the preparations for planting the first 150 acres of the new land. It is proposed to plant the whole of the land as soon as possible consistent with the availability of labour to ensure the necessary upkeep. The acreage of the new land is not shown in the statement accompanying the report, as the precise area will not be known until the Government survey has been completed; it is however roughly computed at 700 acres. It is hoped that we shall be able to finish the planting in three years.

I now come to the Special business to be submitted at the Annual Meeting. A Resolution will be proposed to increase the Authorised Capital from £175,000 to £250,000. The intention of this is to enable the Company to provide funds, probably by a rights issue to members, for the purchase of Coalfields estate, which is owned by the Remfield Rubber Estates Limited. After the approval of the Jeram shareholders to the increase of Capital the purchase must of course be subject, among other things, to Treasury permission for the issue of shares and to the approval of the Remfield Company's shareholders of the sale. At the time of preparing this statement the terms are being finalised between the companies but it was not thought desirable to postpone the annual meeting. This proposed purchase is in continuance of our policy to extend our interests in modern rubber, a policy so strongly supported by shareholders a year ago when we issued shares for the purchase of Seventh Mile estate.

During a visit to Malaya last February and March, I took the opportunity of seeing our estates and was very well pleased with conditions on each of the properties, subject always to the remarks I have so often made on the need for replanting Effingham. I was particularly interested to see Seventh Mile because, having frequently noted the excellent stand of replanted rubber along the road leading to Effingham estate, I found that the whole area confirmed the impression of good management and sound planting policy. I am more than ever satisfied that we did well to buy that property.

THE BORNEO COMPANY, LIMITED

CENTENARY REPORT

The annual general meeting of The Borneo Company, Limited, was held on December 5th in London, Mr C. R. Akers (the Chairman) presiding.

The following is an extract from the Directors' Report and Accounts:

The Net Profit for the year before taxation is £614,539.

The excess of Current Assets over Liabilities of the Group at March 31, 1956, was £2,680,535, as compared with £2,266,348 a year previously.

Timber and Merchandise Stocks of the Group have risen by £607,459 to £3,603,136. This increase is not out of line with the substantially larger trading turnover achieved during the year.

Sundry Debtors at £1,912,129, up by £215,577 on March 31, 1955, also reflect the bigger turnover, together with the necessity to grant longer credit terms to meet competition.

Siam: Politically the year was uneventful, but trading conditions continued difficult. Our turnover increased, but margins were often poor, and the cost of doing business increased by over 20 per cent. Taxes, both direct and indirect, still tend to rise.

Malaya: An improvement in the world prices of Malaya's two principal commodities, Rubber and Tin, resulted in better trading conditions during the year, of which the Company has been able to take advantage. Both turnover and profits increased moderately and the outlook at present is encouraging.

Borneo Motors, Limited, and Orchard Motor Company, Limited, both had good trading experience, which is so far continuing.

British Borneo: Another year of excellent progress can be recorded, and opportunities for expansion in this developing territory are being actively pursued. The prospects continue favourable.

Canada: We are still unable to make a satisfactory report on the progress of Alexandra Brick and Tile Company (Canada) Limited. Production problems, largely unforeseeable, continue and the operations of this subsidiary give cause for anxiety.

A year ago the Company acquired a controlling interest in the Edmonton Concrete Block Company, Limited. We consider our investment has been fully justified by the steady progress since made.

GENERAL

In this, the Company's Centenary year, it may be of interest to give some details of the Group's trading and other activities during the year under review. They include very important Shipping, Airways, Insurance, Engineering, Technical, Automobile, Provisions, Liquors, Pharmaceutical and other interests. In addition, we extract Teakwood from Siamese Forests, and Ramin in Sarawak; we manufacture Bricks and allied products in Singapore and Canada; produce Rubber in Sumatra, and manage a Plywood factory in Singapore.

Our sales of Timber, Bricks, Rubber, Plywood and merchandise of all kinds, including such varied lines as Motor Vehicles, Cameras, Milk, Fountain Pens, and Watches, totalled approximately £15 million.

In these days of strong competition and political disturbances and uncertainties it is gratifying to be able to record such satisfactory results of the year's trading.

The difficulties with which the Company has had to contend during the last 10 years, are not perhaps sufficiently realised. Unlike many British Companies, to which World War II brought increased activity and, in some cases, greater profitability, The Borneo Company's business was brought to a complete standstill when its Far Eastern territories were overrun by the Japanese at the end of 1941, and we were unable to resume trading for more than four years.

THE ACCOUNTS

The 1946 Accounts show that at that time the excess of Current Assets over Liabilities of the Group so far as could then be ascertained, was of the nature of £375,000. Since then, as stated above, the figure has risen to £2,680,535.

In addition we have had to provide over £4 million to meet taxation and have spent upwards of £2 million on essential fixed assets, including Offices, Godowns, Houses, Workshops, Factories, and various forms of plant, equipment, etc., for the expanding trade of the Group.

All this has been achieved entirely out of our own resources, with some help from our Bankers.

The report was adopted and a total distribution for the year of 20 per cent was approved.

BANK OF MONTREAL

HIGH LEVEL OF ECONOMIC ACTIVITY

The one hundred and thirty-ninth annual general meeting of the Bank of Montreal was held on December 3rd in Montreal.

Mr Gordon R. Ball, the president, in the course of his speech, said:

The year now closing has been a highly eventful one, witnessing, as it has, changes in the Canadian business scene and in the banking field for which it is hard to find precedents. The country's total output of goods and services has continued to climb at a steep slope and may well approach $30,000 million in 1956 as a whole to set a new record at least 10 per cent above 1955.

This is a rate of expansion, for the second year running, that is high by Canadian historical standards, and considerably more rapid than has been experienced in the United States in the two-year period.

Canada's national production in 1980, expressed in physical terms or in dollars of constant purchasing power, may well stagger the imagination. It is clear that in most fields of activity the Canadian economy has for some time been operating full out and under stress. The exchange value of the Canadian dollar, however, far from being depressed by the trade deficit, has been kept at a premium over the US dollar by the strong inflow of foreign capital funds participating in Canadian investment opportunities.

A considerable part of this year's increase in dollar value of the gross national product has represented the shadow of inflation rather than the substance of real growth. Overt inflation, to which I could refer on this occasion a year ago as only a potential threat, I must now report as a reality. So far, it can be said to be in its initial stages and far from rampant. But that is all the more reason why it must be resisted resolutely and vigorously now. The problem of resurgent inflation and the fight against it is a battle that cannot be won either quickly or easily.

Canadians in all walks of life have a vital and continuing interest in preserving the purchasing power of the dollar.

GENERAL MANAGER'S ADDRESS

Mr Arthur C. Jensen, vice-president and general manager, said: Net profits, after providing for depreciation of premises and equipment and appropriations to contingency reserves and after setting aside $7,795,000 for income taxes, amounted to $8,975,940. Out of this, provision of $7,200,000 has been made for dividends equivalent to $1.60 per share, leaving $1,775,940 as an addition to undivided profits. A transfer of $3 million has been made from tax-paid reserves bringing the balance in undivided profits to $6,910,155. We have transferred therefrom the sum of $6,500,000 to rest account, which now stands at $98,500,000.

Current loans showed a sharp increase of $251 million and stood at $1,180 million as at October 31, 1956. The demand for commercial loans has been exceptionally strong. This reflects the very high level of economic activity that has been experienced all through the year and still continues.

Underlying the increase in our loans was a strong upward trend in general business activity in Canada during the past year. This strength was, moreover, well diffused throughout the economy. There were few areas or industries that did not, in some measure, participate in the general growth.

The report was adopted.

THE CHARTERED BANK

(formerly The Chartered Bank of India, Australia & China)

An Extraordinary General Meeting of The Chartered Bank of India, Australia & China was held on Wednesday, December 5, 1956, at the Head Office, 38, Bishopsgate, London, E.C.2, for the purpose of considering a special resolution, shortening the name of the bank to

THE CHARTERED BANK

Mr V. A. Grantham, the Chairman of the bank, presided. After Mr H. F. Morford, the Chief General Manager, had read the notice convening the meeting, the Chairman proposed that "Pursuant to Clause 3 of the Royal Charter, dated June 25, 1956, this meeting hereby resolves that the name of the Bank be changed to 'THE CHARTERED BANK,' and that such change do take effect so soon as The Lords Commissioners of Her Majesty's Treasury shall have signified their formal assent thereto." The resolution was seconded by Sir John Tait, deputy chairman of the bank, and carried.

Subsequent to the meeting, application was made to The Lords Commissioners of Her Majesty's Treasury for their formal assent to the passing of the special resolution, and upon this being granted the name of The Chartered Bank of India, Australia & China was changed to THE CHARTERED BANK, with effect from the bank's opening for business on Thursday, December 6, 1956.

LONDON AND RHODESIAN MINING AND LAND COMPANY

The annual general meeting of this company was held on December 4th in London. Sir Joseph Ball, KBE (the Chairman), presided and, in the course of his speech, said:

The net profit before taxation amounted approximately to £131,000, as compared with £109,000 last year. From this sum falls to be deducted £76,000 in respect of taxation, leaving a net profit of £55,000 as compared with £49,000. Your Directors recommend a first and final dividend of 10 per cent.

Consolidated Accounts: After all charges the sum to be carried forward amounts to £54,600, as compared with £50,400.

The profit from ranching amounted to a sum of over £62,000, as compared with £36,000

Mazoe Consolidated Mines: After paying the dividend, the unappropriated balance carried forward amounted to £6,550, as compared with £350 last year.

Cam & Motor: This company produced 94,476 fine ounces of gold for a mine working profit of £480,400.

Pickstone Mine: During the three months to June 30th last, 3,792 fine ounces of gold were produced for a working profit of £14,200. The Arcturus Mine produced 14,272 fine ounces of gold for a working profit of £61,200.

At the Muriel Mine operations for the year resulted in a mine working profit of £111,300.

Tebekwe, which is approaching the end of its life, nevertheless earned a working profit of £38,500. The report was adopted.

STAVELEY COAL & IRON

INCREASED TURNOVER

The ninety-third annual general meeting of The Staveley Coal and Iron Company, Limited was held on December 5th in London, Mr Thomas A. McKenna (the chairman) presiding.

The following is an extract from his circulated statement for the year ended June 30, 1956:

Much has been written in the Press regarding what has become popularly known as "Automation" and also on the impact of Electronics in industry. One is left with the impression that automation means different things to different people, but it would be agreed, I think, that automation includes, amongst other things, the automatic control of processes and machinery. Developments of this kind, in which your Company is concerned, have been gradually evolving over a long period, but the rate of application has accelerated and the diversity extended in recent years.

The application of electronics to many branches of industry, notably in promoting automatic methods of working and higher accuracy and reliability of manufacture, has been a distinguishing feature in the more recent development of industrial countries throughout the world.

LIQUID POSITION

Net current assets of the Group at June 30, 1956, amounted to £8,279,770 compared with £8,419,269 last year. Although there is no material change in the total of Net Current Assets, your holding in British Government Securities has decreased by £2,013,039, mainly due to the payment of capital dividend in December, 1955, and the necessity to finance increased stocks. Actual commitments of the Group with third parties in respect of contracts for capital expenditure amounted at June 30, 1956, to £373,000. In addition to this figure, further capital expenditure amounting to £330,000 has been approved in respect of which contracts had not been placed at that date.

The total earnings of the Group have fallen from £1,763,826 last year to £1,745,886 this year. The cause of this fall is the reduction in profit margins.

An interim dividend of 4½ per cent was paid in March last and your Directors are recommending a final dividend of 10½ per cent, making a total gross dividend for the year of 15 per cent, which is the same as for the preceding year. Of the net profit after taxation £1,007,108, dividend absorbs 58 per cent (last year 55 per cent) leaving 42 per cent (last year 45 per cent) retained in the business.

LOWER PROFIT MARGINS

The turnover and work-in-progress of your Group have increased substantially over the previous year, nevertheless, profit margins have again narrowed to an extent that results in a slightly lower Group profit whereas normally an increase might have been expected. The Government has exhorted Industry to absorb increased costs, to abstain from raising selling prices and to be satisfied with lower profits.

Over the last few years labour and material costs have risen relentlessly and there is so far very little practical evidence of a halt to this destructive process. Your Group has deliberately done its utmost to absorb these rising costs and will continue to do so, but a real margin of profit is a necessity.

The report and accounts were adopted.

HARTEBEESTFONTEIN GOLD MINING COMPANY LIMITED

LARGE CAPITAL EXPENDITURE PROGRAMME

MR B. L. BERNSTEIN'S ADDRESS

The annual general meeting of Hartebeestfontein Gold Mining Company Limited was held on November 30th in Johannesburg.

Mr B. L. Bernstein (the Chairman), who presided, said:

I wish to add the following to my review of the Company's affairs attached to the Report and Accounts already in your hands.

It is our intention to increase the milling rate to 100,000 tons per month as soon as production from the deeper North Western portion of the mine becomes available to augment tonnage drawn from the shallow area now being exploited. To achieve this increase with a high percentage of waste rock discarded in sorting operations, some 130,000 tons per month will have to be delivered to the sorting station. In order to handle additional tonnage, the hoisting capacity at No. 2 shaft is now being increased.

With reference to the shaft sinking programme, it is anticipated that No. 2a sub-vertical shaft will be in commission within two years. Work has also commenced on No. 3 vertical shaft, which will become the main upcast ventilation shaft. It is anticipated that this shaft will be in commission during the first half of 1959. In addition to the cost of sinking and equipping these shafts capital expenditure will be incurred in connection with the extensions to the reduction plant, additional European and non-European housing, excess development in anticipation of increased stoping, additional underground equipment and other equipment, plant and services for the increased scale of operations. The cost of this programme, including amounts already expended on capital works during the current financial year, is estimated to be £6 million, which will be spread over the next four years.

EXPENDITURE TO BE MET FROM OWN RESOURCES

In view of the Company's high profit earning capacity from gold and uranium, and as full lease and tax payments will not be incurred for some four to five years, your Directors feel that this capital expenditure can best be met by drawing on the Company's own resources. During this period it is anticipated that it will be possible to appropriate the necessary funds from profits to meet this capital expenditure programme, to repay loans on due date and furthermore to make reasonable dividend distributions to shareholders. Naturally these views and the estimates to which I have referred are based on there being no appreciable change in mining conditions and the present levels of capital costs and mining costs.

I have pleasure in advising you that the Uranium Plant is now in production and is already treating some 90,000 tons of slime per month, which represents 90 per cent of its rated capacity. This tonnage is made up of slimes from current gold production supplemented by tonnage from accumulated slimes. Initial testing operations at this plant commenced during September. The usual starting-up and teething troubles and absorption in the new plant were overcome during October and the plant is now operating satisfactorily. The Company will be declaring its first profit from uranium simultaneously with the November gold declaration. It is anticipated that the full production of 100,000 tons per month will be achieved in the near future.

The report and accounts were adopted.

ALLIED BAKERIES LIMITED

CONTINUED EXTENSION OF HOME AND OVERSEAS INTERESTS

The twenty-first annual general meeting of Allied Bakeries, Limited, was held on November 30th in London.

Mr W. Garfield Weston, the Chairman, presided, and, in the course of his speech, said: During the year we extended our interests by the acquisition of a number of old and well-established businesses in various parts of this country that can conveniently be integrated into our activities.

We are following the same policies in Australia, New Zealand and South Africa in regard to the development and equipment of their businesses as we have adopted in this country and I am very pleased that the results which we are getting from those great territories are most satisfactory.

We are satisfied that we should continue to develop our businesses overseas wherever suitable opportunities occur and to this end we are continuing our policy of leaving with the Local Boards all the profits which are earned, in order to finance that expansion.

Our Group Profit at £5,064,000 is £179,000 higher than a year ago, after charging all expenses other than United Kingdom Taxation, which takes £2,647,000 and is more than half of our profit for the year.

Contracts for Capital Expenditure have been entered into amounting to £1,700,000 for the extension, re-equipment and further modernisation of subsidiary companies, and when carried out will greatly add to our productive capacity and efficiency.

I am confident that the Board's policy of broadening the field and basis of the Group's activities so that our investments are not solely confined to the bread and biscuit industry is a wise one. It is the intention of your Board to continue this policy so that a net inconsiderable proportion of our available resources will be utilised as circumstances permit and suitable opportunities occur for further investments in diverse activities within the general scope of the food industry in this country and also within the Commonwealth.

Land and Buildings have, it can reasonably be assumed, permanently appreciated in value. To give effect to this appreciation and enable us to present a Balance Sheet showing a truer present day value of the capital employed in earning our profits, a valuation of these assets is in progress. This valuation has been made by Messrs Wheatley Kirk Price and Co., in conjunction with other well known professional Valuers and preliminary information indicates that our Estate Property which now stands in our books at £11,114,000 will be brought up to not less than £18,500,000 in next year's accounts.

We have maintained our profits so far this year and we can reasonably hope to maintain them at their present level at least until the end of the present financial year.

The report was adopted.

NEW UNION GOLDFIELDS LIMITED

(Incorporated in the Union of South Africa)

LIEUTENANT COLONEL R. L. BROAD'S STATEMENT

The Eighteenth Annual General Meeting of New Union Goldfields Limited, will be held on December 14, 1956, at Johannesburg. The following are extracts from the Statement by the Chairman, Lieutenant Colonel R. L. Broad, MC, which was circulated with the Accounts for the year ended June 30, 1956.

The realised profit for the year, after taxation but before providing for diminution in value of investments, was £225,500. There was a net diminution in value of £527,000, of which £337,000 was covered by transfers from revenue reserves, the balance of £190,000 being met out of taxed profits for the year. The balance of unappropriated profit carried forward to the current financial year was reduced from £69,400 to £26,300. The substantial fall in the value of our Company's share investments reflects, in the main, the more or less steady decline in the market prices of shares listed on the Stock Exchange during the period under review. There were many contributory factors to this decline in prices, not the least important of these being the rise in the general level of interest rates both in South Africa and in the United Kingdom. Moreover, the gold mining industry, which is represented in our portfolio to such a large extent, still faces the dilemma of rising working costs against a fixed price for its product.

RESERVES

It may be taken as a reflection of the basically healthy state of our Company's affairs that it was able to absorb an investment depreciation charge of £527,000, and still show revenue reserves and unappropriated profits totalling £583,200 at the end of the period. At June 30, 1956, our quoted investments had a book value of £2,192,500 (1955—£2,245,600) and a market value of £2,452,300 (1955—£3,238,400).

Drilling is being carried out on a coal prospect in the Carolina District, Eastern Transvaal, where so far some 20 million tons of coal of a reasonably high calorific value have been proved at relatively shallow depth. An interesting acquisition during the year was the participation with the Johannesburg Consolidated Investment Company Limited in portion of the farm "Modderfontein" No. 4, District Vereeniging. This farm constitutes portion of what is known as the "Waterpan Area," where active prospecting operations are being conducted by the Johannesburg Consolidated Investment Company Limited.

CONCLUSION

The difficulties encountered over the past year can be almost entirely attributed to adverse share market conditions, which may well prove to have been transitory in nature. However, our finances should show a steady improvement with the advent of more of our investments into the list of dividend-payers, and with the prospect of receiving increasing dividends from our direct and indirect stake in the new producers. The overall position of our Group is sound, and the outlook for our major investments and for certain of our interests, which are still in the exploratory stage, is certainly not without encouragement.

THE CRITTALL MANUFACTURING COMPANY

CONSIDERABLY INCREASED TURNOVER

The thirty-second annual general meeting of The Crittall Manufacturing Company, Limited, was held on December 5th, in London, Lord Braintree (the chairman) presiding.

The following is an extract from his circulated review:

The trading profits for the year, excluding investment income, amounted to £722,688, as compared with £508,677 for the previous year. The increase in trading profits is primarily due to improvement in the results of the Parent Company, but certain of the Subsidiary Companies consolidated have also shown improved trading results.

There has been a considerable increase in turnover as compared with last year. Against this, however, we have had once again to provide for increases in cost in excess of the amounts which I anticipated in my last report. The actual increases in cost of material, mainly steel, spelter and brass, were approximately £270,000. Increases in wages and salaries amounted to £163,000, which is mainly due to national awards; it is estimated that in the current year the Company will have to bear a further £120,000 of extra cost under this heading.

In pursuit of our policy of absorbing extra charges by reductions in manufacturing costs, a large proportion of the amounts in question has been taken care of in this way, and I am pleased to say there has only been a limited increase in selling prices.

While the total value of business in the period shows an increase against last year, the decrease in housing brought about a falling-off in the sale of standard windows. In the overseas market I reported last year a record sale; I am pleased to tell you that this year's figures show a substantial increase, the figures being £1,650,000 and £1,800,000 respectively. The sale of Crittall Grain Silos, which I mentioned as a new product last year, now constitutes an important part of our turnover.

Your Directors have transferred a further £100,000 to General Reserve, bringing that Reserve up to £800,000, and £25,000 to Provision for Pension Schemes. After providing for Preference Dividends, £43,844, and the interim dividend on the Ordinary Stock of five per cent, £35,937, there remains a balance of £406,459. Your Directors recommend that a final dividend of 10 per cent, £71,875, be paid, making 15 per cent (less income tax) for the year, leaving £334,584 to be carried forward.

The reduction in house building must inevitably affect the volume of standard windows required in the home market. We are making every endeavour to replace the loss of orders at home by overseas sales and are not without hope of a substantial increase. It is extremely difficult to forecast the effect of the credit squeeze on other forms of building, but the volume of business on hand is larger than it was this time last year. However, it does not seem reasonable to expect that the same volume can be maintained. Much will depend on maintaining efficient operation and holding profit margins at a reasonable figure.

We believe that aluminium window production of all kinds can add substantially to our profit-earning ability.

The report was adopted.

SERCK RADIATORS

FULL ORDER BOOK

The thirty-seventh annual general meeting of Serck Radiators, Limited, was held on November 30th, at Birmingham, Mr W. H. Newton, MA, FCA, chairman, presiding.

The following is an extract from his circulated statement to August 4, 1956:

The increase in turnover of the Parent Company forecast last year has been less than anticipated. The recession in the Motor Industry has had the effect of reducing the profit of the Radiator Department. In our Engineering Department we have maintained the same production as last year in spite of the fact that in the early months we had difficulties in material supplies.

In both these departments we have had to absorb increased costs of wages, salaries and other unavoidable overhead expenditure in order to assist our many important customers who are vitally interested in the export trade. The violent fluctuations in the price of non-ferrous metals during the year have added to our difficulties in this connection.

Serck Tubes Limited.—There has again been a satisfactory increase of output in this section of our business—particularly in specialised tubing—and trading results for the year are very encouraging.

Radiator Service Branches.—Our Radiator Service Branches again have had a very satisfactory year.

Audley Engineering Company, Limited.—The Audley Company from April 1, 1955, to August 4, 1956, received the highest level of orders, including more than 48 per cent export, and achieved the highest output and profits in its history. In compliance with the provisions of the Companies Act, however, only profits from November 28, 1955, to August 4, 1956, are included in the Consolidated Profit and Loss Account.

Serck (Eire) Limited.—The severe setback in the Motor Trade in Ireland has adversely affected the new radiator manufacturing factory at Harold's Cross. The Service Branch, however, has been successful and while there has been a setback in profits, the results are not unsatisfactory.

Serck Radiators (South Africa) (Pty.) Limited.—The South African company has had a satisfactory year notwithstanding growing competition in Cape Town.

Accounts.—The additions to Group Fixed Assets amounting to £336,335 include, in addition to the Parent Company (£210,686), principally the expenditure by Audley which has been heavier than usual to meet expanding trade.

Your Directors recommend a final dividend of 6d. per unit less tax, which makes a total for the year of 15 per cent. less tax, the same rate as for the preceding year but payable upon the increased capital.

Future Prospects.—The new year starts with a very full order book in most departments and steps are being taken to increase production capacity to meet this. A new Machine Shop at Newport and a projected extension at Greet will give us those facilities we need for increasing production. However, competition both at home and abroad is becoming increasingly keen, and the tendency must be for profit margins to contract.

Since the end of the year, with a view to developing Audley interests in Germany, we have taken a 47½ per cent interest in a new German company to take over the sale of Audco valves, which are being made in Germany by sub-contract. Our partners are an American company and our German Manager.

The report and accounts were adopted.

LEETHEMS (TWILFIT) LIMITED

The twenty-eighth annual general meeting of Leethems (Twilfit) Limited was held on December 6th at Portsmouth, Mr A. E. Downing, FCA, FSAA (the chairman), presiding.

The following is an extract from his circulated review:

Trading conditions have been and continue to be increasingly competitive, nevertheless we are pleased to be able to present to the members the accounts of another successful year's trading. Home sales have been maintained at a satisfactory level and, in spite of restrictive Import Quotas imposed by certain countries, we are able to report improved Export Sales.

Our policy of maintaining the Plant and Machinery and Factory Premises at the highest possible level of efficiency, out of income, has been continued throughout the year.

The erection of the additional Factory at Fareham (to which reference was made last year) has been completed and in operation since last March.

It is very desirable that the Company's financial position shall be strengthened in order to meet the calls made upon its resources—both in respect of capital expenditure and increased production costs. With these objects in view, appropriations have been made from this year's Profit and Loss Account to Capital Reserve £25,000, General and Contingencies Reserve (including £5,000 re Staff Retirement) £10,000, and Stock Reserve £10,000.

The payment of a final dividend on the Ordinary Share Capital, of 7 per cent (less tax)—making 10 per cent for the year, is recommended. The balance of unappropriated net profit to be carried forward amounts to £12,317 as compared with £13,738 brought in.

The report was adopted.

APPOINTMENTS

UNIVERSITY OF GLASGOW

LECTURESHIP IN ECONOMETRICS AND ECONOMIC STATISTICS

Applications are invited for a Lectureship in Econometrics and Economic Statistics. Salary scale: £650 x £50—£1,350. Initial salary according to experience and qualifications. F.S.S.U. and family allowance benefits.

Applications (six copies) should be lodged, not later than December 31, 1956, with the undersigned, from whom further particulars may be obtained.

ROBT. T. HUTCHESON,
Secretary of University Court.

THE UNIVERSITY OF MANCHESTER

SIMON FELLOWSHIPS

The University offers a number of Simon Fellowships for advanced study or research in the social sciences. This term is used in a wide sense to include not only Economics, Government, etc., but equally, fields such as Education, Jurisprudence and Social Medicine. Values within the range £800-£1,350 per annum (Simon Research Fellowships), or within the range of £1,400-£1,750 per annum (Simon Senior Research Fellowships), according to qualifications and experience. They are open to members of the public services as well as to persons with academic experience.—Applications should be sent by January 15, 1957, to the Registrar, the University, Manchester, 13, from whom further particulars may be obtained, and who will be pleased to answer any enquiries regarding the scope of the Fellowships.

COLGATE-PALMOLIVE LIMITED

seek the services of a

CHIEF ENGINEER,

to be responsible for all engineering services and the further development of their plant, producing Soaps, Toilet Articles, Scourers, etc., at Salford, Manchester.

Applicants should hold advanced technical qualifications, and should have had some years' experience of maintenance and development work on buildings, process plant and high-speed automatic machinery (preferably in the Chemical Industry), together with all the administrative work involved, including the control of a large department, negotiation with suppliers, etc.

A substantial salary is offered. Other conditions are good, and there are excellent prospects for a man of not more than 45 years.

Applications, in writing, should give full details of age, education, experience and present salary, to:—

The Factory Personnel Manager, 371 Ordsall Lane, Salford, 5.

AREA MANAGER (Midlands). — Arising from expansion, a national servicing organisation is rationalising its operations, and proposes shortly to appoint a Midlands Manager to operate from Birmingham. This post will offer great scope for development to a keen executive; he must have a proven successful record in planning and controlling marketing campaigns, in evolving and operating effective servicing methods, and in building and running economically an efficient transport system. Administrative ability is essential. A starting salary commensurate with the responsibility will be paid; as profitable expansion develops it will be reflected in remuneration. An invitation to apply for the post is issued to men with the confidence and ability to think and work in terms of big and rapid expansion. Letters, with full details of age, education, qualifications, experience, should be addressed, in confidence, to the Managing Director, Box 308, R. Anderson and Co., 14 William IV Street, London, W.C.2.

EDUCATION OFFICER required by the Steel Company of Wales Limited (Steel Division).

The successful candidate will be head of the Education and Training Department in the Steel Division.

He will be responsible for a wide variety of training schemes for juveniles and adult operatives, craftsmen and foremen. Initiative and administrative ability are necessary considerations, and a knowledge of engineering and/or technical education will be an advantage.

The salary will be in accordance with age and qualifications.

Those wishing to apply should write for official Application Form to:—

Superintendent, Personnel Services, The Steel Company of Wales Limited (Steel Division), Abbey Works, Port Talbot, Glam.

HOUSING TRUST CHIEF EXECUTIVE DESIGNATE

The Western Region Production Development Board, with the approval and support of the Government of the Western Region of Nigeria, intends to establish a Western Region Housing Trust. The objects of the Trust will be the development of Housing Estates as well as fostering the growth of home ownership. Applications are invited for the post of Chief Executive Officer Designate of the Trust. In the preliminary stages his chief duties will be to assist in drafting legislation and in drawing up plans for the establishment and operation of the Trust. During this period he will be engaged on the staff of the Board but, subject to satisfactory performance, will become the Chief Officer of the Trust when formed. His duties will then include (a) organising the development of housing estates and (b) promoting home-ownership on building society lines.

Applicants should possess wide administrative experience in such fields as planning, development, and financing of housing areas and of home ownership schemes. Academic and professional qualifications will be an advantage.

Salary will be £2,500-£3,500, point of entry depending on qualifications and experience.

Further details of the proposed Trust and of the Board's Terms and Conditions of Service can be obtained from:

The London Representative,
Western Region Production Development Board,
18, Grosvenor Gardens,
London, S.W.1.

to whom applications, giving full details of experience, qualifications, etc., should be addressed; replies to reach him not later than January 31, 1957.

General Terms of Employment: House, with basic furniture, provided at rental of £150 per annum; Provident Fund; Outfit Allowance £60; Free Medical Service; Free passage for wife; home leave at full pay at the rate of five days per month of overseas service. Low income tax.

ASSISTANT SECRETARY required by Insurance Company at its Head Office in the North of England. Applicants should be aged about 35, qualified as Accountant or Secretary. Usual secretarial duties include mechanised accounting.—Box 571.

MERTON COLLEGE, OXFORD

FELLOWSHIP OR LECTURESHIP IN ECONOMICS

The College proposes to proceed shortly to appoint to a teaching post in Economics, which, according to the qualifications of the successful candidate, will take the form either of a (permanent) Official Fellowship and Tutorship, or of a Lectureship for three years. The appointment will date from April 1, 1957, or as soon thereafter as is mutually convenient.

Applicants who must have obtained Honours at a British university, should apply to the Warden not later than January 15, 1957, stating their qualifications for the post, and mentioning the names of three persons to whom reference can be made.

Details of salary and conditions of appointment can be obtained from the College Secretary.

The choice of the College will not necessarily be confined to those who apply.

NUFFIELD COLLEGE, OXFORD

RESEARCH FELLOWSHIP IN ECONOMICS

Applications are invited from men or women for a Research Fellowship in any branch of Economics (including economic history) to start in October, 1957, or at some other agreed date. The appointment will be for three years in the first instance, renewable. Further particulars may be obtained from the Warden.—Applications should reach him not later than January 31, 1957.

NUFFIELD COLLEGE, OXFORD

RESEARCH FELLOWSHIP IN TRADE UNION HISTORY

Applications are invited from men or women for a Research Fellowship in the field of Twentieth-Century British Trade Union History. The appointment will be for three years in the first instance, renewable. Further particulars may be obtained from the Warden.—Applications should reach him not later than January 31, 1957.

SOMERVILLE COLLEGE, OXFORD

Applications are invited for the post of Treasurer, who will also act as Secretary to the governing body. Applicants must be women holding an Honours Degree; qualifications will include academic, as well as administrative, experience. The post may be part-time, or may be combined with another College appointment of academic rather than administrative character.—Further particulars may be obtained from the Treasurer, Somerville College, Oxford, by whom applications should be received not later than January 12, 1957. Consideration will not be limited to those who apply.

HER MAJESTY'S OVERSEA CIVIL SERVICE

Statistician in the Department of Agriculture, Kenya, to advise on the design of field and other experiments conducted by the Department including sampling, investigations and surveys, and to assist in the statistical analysis of results.

Candidates should have a good degree in Mathematics together with some post-graduate training in statistics, and preferably a diploma in statistics; alternatively a good degree in Agriculture and post-graduate training in statistics. Some experience of, or training in, statistical methods as applied to agricultural field experiments is essential. This would if necessary be provided by means of a Colonial Agricultural Probationership. Applications will, therefore, be accepted from recent graduates. Age limits 21-40.

Appointment will be either on two years' probation for pensionable and pensionable employment or on contract terms. Salary in scale £939-£1,863, with gratuity of £25 to £37 10s. for each period of 3 months' service if on contract. Government quarters at moderate rental. Free passages for officer, wife and family. Income tax at local rates. Generous home leave.

Application forms and further particulars from Director of Recruitment, Colonial Office, Sanctuary Buildings, Great Smith Street, London, S.W.1. Quote BCD63/7/03.

MARKET RESEARCH

The Export Market Research Department of a large engineering group invites applications for three vacancies:—

A Senior Post, requiring an imaginative economist, preferably between 28 and 40 years of age, to follow and interpret home and export market trends. He will be responsible for directing and developing the Economic Analysis and Interpretation side of the Department's work. Experience in the application of economics in industry and a flair for short and lucid presentation are essential.

Two Assistant Posts, which also demand a talent for clear and brief exposition in plain English:—

(1) Requiring a male University Graduate to handle the collation and interpretation of statistics produced by subsidiary companies. A good degree in Economics is needed, and a familiarity with the industrial application of statistics.

(2) Requiring a male or female University Graduate to collect information relevant to the Group's activities, and produce a regular Bulletin.

Salaries in all three cases will be commensurate with qualifications and experience.—Application forms should be obtained from the Secretary, Market Research Department, T.I. (Export) Ltd., 58-72 John Bright Street, Birmingham, 1.

THE WHITE FISH AUTHORITY invite applications for a Junior Executive appointment as Research Assistant in the Economics and Statistics Department. The duties of the post will be primarily concerned with the Authority's current programme of research into earnings, expenses and productivity of various sections of the white fish producing and distributing systems.

Applicants should be University graduates, preferably with a degree in economics or statistics, and experience in a commercial statistical office, while not essential, would be an advantage.

Salary scale £625 x £35—£800, the point of entry depending on qualifications and experience. A contributory pension scheme is in operation, and luncheon vouchers and a five-day week are among other conditions of service.

Applications, giving names of two referees, should be sent to the Secretary Solicitor, White Fish Authority, Tilbury House, Petty France, S.W.1, within fourteen days of the date of this advertisement.

MARKETING RESEARCH.—This is a new post in an expanding department, which can be filled by an enterprising person with preferably a degree in statistics and/or psychology. Experience in market research an asset. Age under 30 desirable.—Full particulars to the Personnel Adviser, The Rank Organisation, 11 Belgrave Road, S.W.1.

ALPIN AND BARRETT LTD., of Yeovil, Somerset, require an Assistant Personnel Officer with prospect of succession within three years.—Applications to the Secretary.

FEDERATION OF RHODESIA AND NYASALAND

SOCIO-ECONOMIC SURVEY OF THE URBAN AFRICAN POPULATION OF SOUTHERN RHODESIA

Applications are invited from persons with suitable qualifications and experience to carry out the above survey. The qualifications required are an Honours Degree in Statistics, Economics, Sociology or related subjects, whilst experience in the conduct of sample surveys of family expenditures, housing employment and size of urban populations would be an advantage, even if such experience had been gained in countries outside Africa.

The successful applicant will be appointed on contract for a period of three years at a salary of £1,500 per annum first year, £1,550 per annum second and £1,600 per annum third year. The cost of rail and sea fares to Salisbury and half the cost of similar fares for his wife and dependant children will be met. On completion of the contract, the cost of return fare for the candidate and half the cost of similar fares will be paid, provided the return journey is made within two months of completion of contract. The cash equivalent of Vacation Leave in credit at the end of the contract (accrual rate 3¼ days per month of service) will also be paid.

The person appointed will be attached to the staff of the Central African Statistical Office, Salisbury, but will be required to travel frequently to other towns in Southern Rhodesia.

Application forms and further details from the Public Service Attaché, Rhodesia House, 429 Strand, London, W.C.2.

Closing date December 15th.

COST AND WORKS ACCOUNTANT

BRITISH GUIANA

International aluminium company requires accountant for two- to three-year construction programme. Salary equivalent to £1150 per month for particularly well-qualified man. This job offers an opportunity of saving money, long leave, with good and varied experience.—Write Box X.164, c/o Streets, 110 Old Broad Street, E.C.2.

AN INFORMATION OFFICER

A British firm of management consultants with overseas subsidiaries has reached a point in the rapid postwar expansion of its activities, at which it requires a man between 25-28 to organise and take over the new position of Information Officer in London. The work will be in the very centre of the field of management, and the successful applicant will be one who has a sincere interest in this subject and a strong desire to contribute to its development. Qualifications are a university degree, preferably in engineering, some industrial experience and experience of report writing. Initial salary will be up to £1,100 per annum, and a continuing career with promotion within the company's organisation is envisaged.—Please write, with brief tabulated details of age, education and experience, to Box 576.

RESEARCH: political, social, with statistical basis, including polls. Man 25 upwards; graduate; wanted immediately. Absorbing job.—write Box 575.

FULL-TIME SERVICES of a Senior Solicitor's Managing Clerk required to take control of Legal Department dealing with day-to-day business, chiefly connected with agreements for purchase of rights of plays, films, etc., for services of scriptwriters, artistes, production directors, etc., and general work of a Contracts Department. Commencing salary not less than £1,250 per annum. The Company has a Staff Contributory Superannuation Scheme.—Write, giving full details of experience, age, etc., to The Secretary, Granada TV Network Limited, 36 Golden Square, London, W.1.

JUNIOR EXECUTIVE required in Sales Department of Food and Beverage Company. We need an educated man of common sense and wide general interests who can deal with routine efficiently and can bring enthusiastic and bright ideas into sales promotion. An interesting and rewarding job for the right man, who should be from 25 to 30 years, and must have the personality to co-operate with colleagues and the many representatives he will be controlling.—Send brief details of age, education and career, to Box 574.

CHAIRMEN/MANAGING DIRECTORS

Industrial Top Executive (47), shortly free, whole or part time. Many years at Board level and as Group M.D. in capital/consumer goods. Used to quick detection of weakness, latent strength. Arts Degree, engineer trained, widely travelled/connected, especially in N. America.—Box 572.

YOUNG man seeks post as assistant or trainee statistician.—Box 578.

THE CHARTERED INSTITUTE OF SECRETARIES

Employers requiring the services of CHARTERED SECRETARIES to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute (Dept. D), 14 New Bridge Street, London, E.C.4.

SHELL TRINIDAD LIMITED

The Resolutions submitted to the Extraordinary General Meeting of the Company of November 20, 1956, relating to transfer of Control and Management to Trinidad having been duly passed, the business of the Company is controlled and managed entirely from the Island of Trinidad effective December 1, 1956.

The Head Office of the Company is situated at Point Fortin, Trinidad. A Transfer Office for all matters relating to the registration of share transfers is maintained at St. Helen's Court, Great St. Helen's, London, E.C.3.

R. W. LUCE-SMITH,
Secretary.

Point Fortin, Trinidad.

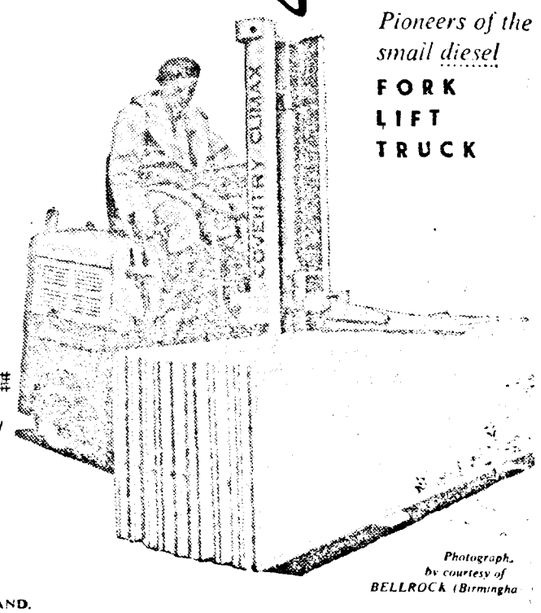
The Coventry-Climax Fork Truck illustrated is fitted with a hydraulic clamp attachment which allows the upper arm (rubber faced) to exercise a controlled pressure towards the two lower arms or forks. This attachment is thus able to pick up all manner of goods by its squeeze-grip-action . . . to hold them securely without need of baseboard, pallet or binding . . . . while the operator manoeuvres the truck, raising or lowering the load to the required height for the next operation.

This is just one of a score of quick-fix or semi-permanent attachments which extend the already outstanding versatility of the fork lift truck to provide the supreme productivity of the special purpose machine.

Coventry-Climax

Pioneers of the small diesel
FORK LIFT TRUCK



Photograph by courtesy of BELLROCK (Birmingham)

The Bellrock plaster panels being handled in these pictures are a good example of organised handling by special attachment leading to :-

SPACE SAVING. Close stacking in multi-unit blocks giving maximum space utilisation.

TIME SAVING. Quantity handling of bulky units in a fraction of the time needed for other methods.

DAMAGE SAVING. Breakages during transit are negligible when organised fork trucking does the job.

Wine exported in CORRUGATED boxes reduces cost, breakage, space

Shipping bottled Italian wine is a problem not greatly different from that of shipping many another fragile commodity: the contents must be protected, yet the cost of the package kept low. Today, many enterprising bottlers have found the ideal solution in corrugated boxes.

Lighter in weight than most wooden crates, corrugated boxes save 5 to 8 lb. each. They cost less to buy, less to pack, less to ship—savings which add materially to the profits in wine.

Corrugated boxes protect the contents better than wooden ones, experience shows, because they are so resilient under impact. Yet they require less space in storage, aboard ship, and at the vendor's shop.

Corrugated has the additional advantage of enabling easy printing on the sides for better brand identification and easy checking of inventory.

Today, corrugated boxes are being used to package all sorts of products—for safety, economy and appearance. Can you use corrugated? Have a talk with your nearby boxmaker and see.

Langston doesn't sell corrugated, only the machines that make it. Since 1902, these machines have led the field in efficiency and dependability. *Samuel M. Langston Co., Camden 4, N.J., U.S.A.*

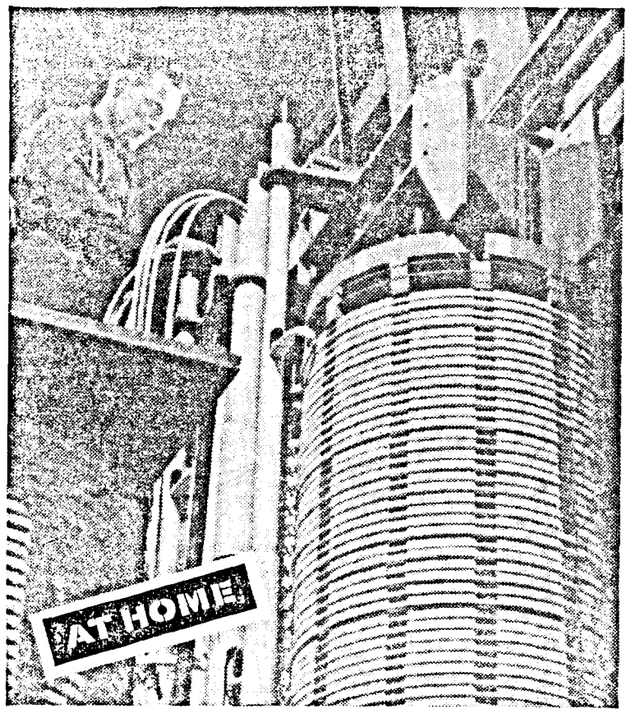
A TWOFOLD JOB...

How The English Electric Company is working for Britain

at home *and* abroad



Power for Industry *To meet the increasing demands of British industries for electric power, the Central Electricity Authority is building more generating stations all over the country. Power output is already 95% greater than in 1948, and generating capacity should be nearly doubled again in ten years.* ENGLISH ELECTRIC *supplies turbo-alternator sets, transformers and other plant for many of the new power stations and switching stations; this picture shows the core and windings of a 7,500-kVA distribution transformer ready to be dried out in a vacuum oven before tanking in warm oil.*

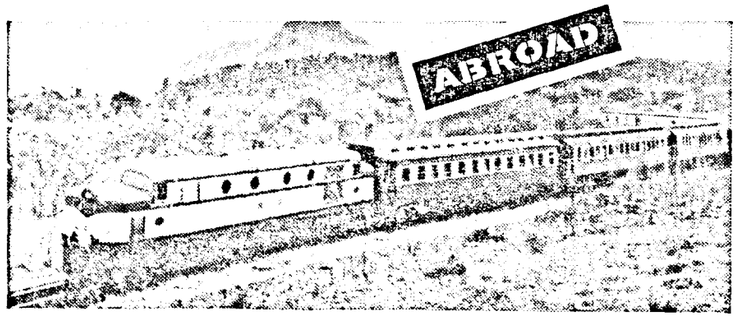
THESE ARE challenging times for Britain. Great strides have been made since the war in rebuilding our economy. The problem is to *maintain* this progress.

From 1949 to 1955 our total industrial output rose by 27%, and the value of our exports by 58%. British industry is busy, and actively developing—there are more jobs than workers. Our standard of living is high. But to ensure *still better living for Britain*, we need still higher production, still more activity in competitive export markets. In both these ways, ENGLISH ELECTRIC is playing its full part.

At home, this company helps to supply the generating sets, transformers, switchgear and other plant needed for Britain's expanding power generation programme; it also makes the electrical equipment by which industry *uses* this energy for production—not only for home demand but for the world.

In addition, ENGLISH ELECTRIC is itself a vigorous and successful exporter; *about half the Group's business is overseas*, earning foreign currency for Britain.

With the world-wide experience of its engineers and technicians, backed by great manufacturing resources and advanced research, ENGLISH ELECTRIC is hard at work, making an important *twofold* contribution to Britain's economic progress.



To young men and their parents

To any boy or young man considering a career in science or engineering, ENGLISH ELECTRIC *offers almost unlimited opportunities—first-class training, and a choice of rewarding jobs at home or abroad. For details, please write to Mr. G. S. Bosworth, Central Personnel Department D.9.*

Currency from Overseas *(left).* Electric and diesel-electric locomotives and other railway equipment form an important element in ENGLISH ELECTRIC's export trade. A contract for twenty-three 2,000-h.p. diesel-electric locomotives has recently been completed for Rhodesia Railways. Here is one of them hauling the mail train between Salisbury and Umtali.

'ENGLISH ELECTRIC' bringing you better living

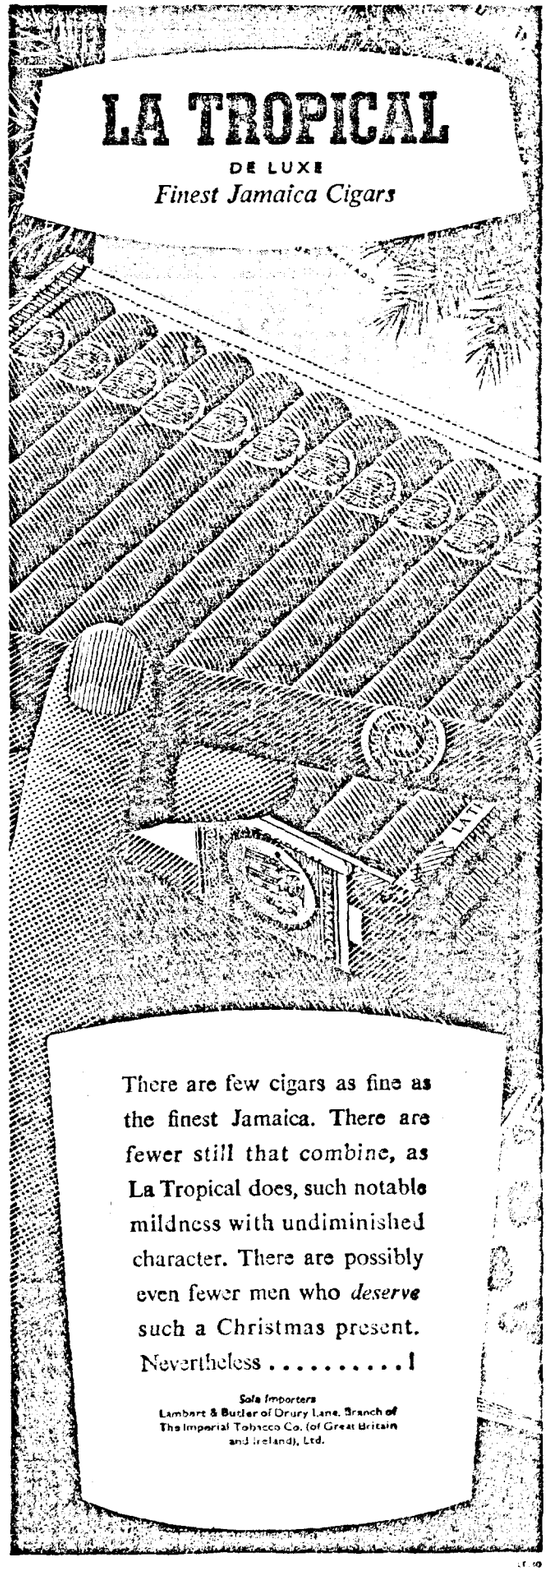
Finest Jamaica Cigars



There are few cigars as fine as the finest Jamaica. There are fewer still that combine, as La Tropical does, such notable mildness with undiminished character. There are possibly even fewer men who *deserve* such a Christmas present. Nevertheless . . . . . !

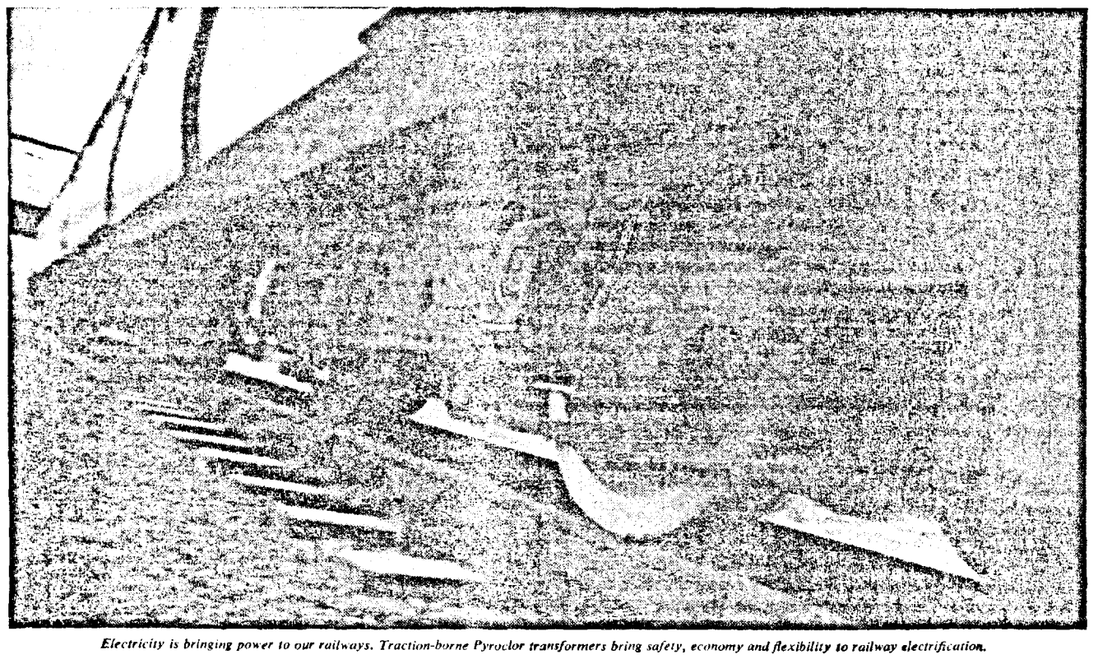
"Boiling" benzene to cool transformers



Electricity is bringing power to our railways. Traction-borne Pyroclor transformers bring safety, economy and flexibility to railway electrification.

YOU MAY THINK IT STRANGE to create heats of over 1000° F. — to keep transformers in trains and buildings at a safe, cool temperature. That, however, is what we do. We find it well worth while. So do the people who buy the transformers.

We use this great heat to condense benzene; react the resultant product with chlorine; and produce a fluid called Pyroclor, which has striking advantages over other transformer coolants.

To begin with, Pyroclor is absolutely *safe:* it's fire resistant and it's chemically inert. This safety brings flexibility and economy to transformer installations: you can put Pyroclor transformers anywhere; no need for expensive long runs of low tension cables; no need for costly fire "protection"— in fact, you will be surprised just how simple a Pyroclor transformer installation can be.

We prefer to leave the more technical advantages of Pyroclor to our — and your — technical experts. We'd just like to make one more point: Pyroclor is the *modern* transformer coolant for the trains, factories, theatres and hospitals of today and tomorrow. It's therefore a typical product of Monsanto . . . bringing a better future closer.

If you (as a manufacturer) are interested in chemicals, it will pay you to get in touch with Monsanto

The Nation's Leadership

THE Prime Minister's general welcome home from Jamaica is widespread, genuine and personal. Everybody is glad of his recovery, if indeed he is fit again. His party in Parliament will cheer him to the echo when he returns to the Commons next week, despite the unease of many at the implications of what has happened before and since he went away. In the country he has the widest support of any Conservative leader; and the farther one goes from London and the centre of things the more steadfast and impressive that loyalty appears.

Every instinct of gratitude for the past services which Sir Anthony Eden has rendered prompts one to join in the chorus. Yet, though the welcome is real, there are other realities. Neatly during his absence the policies which he initiated and pursued have begun to be liquidated. This has no doubt been done with his consent. There has been no palace revolution among his ministers, nor is one likely. The decision as to his future is his own, as it was before his departure. But it must turn on facing two objectives: the efficiency and the direction of the Queen's Government. In their light, two questions must be asked by an independent journal, as by the Prime Minister himself.

The first question, which could easily be resolved, concerns the Prime Minister's state of health. The public has been put in an impossible position by the way in which the news of his overstrain has been handled. No doubt, after recent American experience, there will be a general disinclination to give to doctors the responsibility for any sort of political or constitutional verdict. Even so, the question inevitably remains: how ill, nervously or physically, has Sir Anthony Eden been, and how well is he now? There must be some concern lest the Prime Minister (who is certainly no quitter) and his colleagues (who have their party's prospects to consider) may decide too readily that he is fit enough to take up the reins again on what is, inescapably, a new journey. It is to be presumed that a frank statement will now be made public, declaring with medical concurrence that the Prime Minister is no longer under any remaining sort of strain that might impede him in doing this. If it is not to be presumed, then it is, quite bluntly, to be demanded.

Given reassurance on this score, the second problem, which is a political one, subject to fallible human judgment, will reveal itself. This second outstanding question is whether, though ruled fit again and broadly backed still by his supporters, the Prime Minister will in fact be in a position personally to lead the nation in the new direction. It would be cowardly for *The Economist* to disguise the opinions which it has already stated (to the disgust and anger of very many readers). The national needs are evident enough and not open to much dispute: to rebuild the transatlantic alliance, to create some sort of national (not merely party) unity, to keep a stable but imaginative hand upon the nation's affairs, to serve the national interest by less divisive and more successful means, abroad as at home, and to inspire the necessary

confidence, internationally as well as nationally. The traditional, and too often flouted, doctrine that when policies fail politicians fall can safely be discarded, once more, only if the Prime Minister is both willing and able to meet these requirements.

But the opinion of *The Economist* is not the one that matters. It has to be assumed that, provided his health will stand the strain, the Prime Minister has not considered laying down office. Almost certainly his ministerial colleagues, too, have decided to try to make a success of the Government's task under his continued leadership. The question for them, as for him, is whether this is in fact possible. If not (and they ought to know in their consciences if and when this predicament arises) what do they do ? If factionalism in the Cabinet and in the party, compromise or hasty temper in policy, improvisation and lack of conviction in decision, loss of dynamism and sense of direction about where they really want to go showed themselves as the sequel, only three courses would be open.

One would be to stagger on governing, unreconciled and regardless ; that would be the worst possible course for the party and for the country. The second would be to try to install a new Prime Minister (who, for all his recent deviousness, could surely only be Mr Butler) after a cabinet revolt. Perhaps this could be done relatively painlessly now. But if it were to be done after a time lag from the Suez debacle, and when Sir Anthony was in obviously good health, it is not easy to see how the Conservatives could long survive as a government—and the period of manœuvre before the revolt, together with that of attempted survival after it, would be an appallingly difficult one for the country. The third course, under these hypothetical conditions, would be for ministers to decide that they could no longer carry the burden of government, and make it clear that there must be resort to a general election, which would in such circumstances be hazardous for the Conservative party.

Every argument in the reckoning—party, political and (more important) national—suggests that the time for the members of the Cabinet, and for their leader himself, to ponder these points is now rather than later. At the moment, no doubt, the natural reaction is " perish the thought." But it is more important that what should not perish, in any event, is the long-term future of a progressive Conservative party in this country, the rule of collective responsibility among reasonably like-minded and compatible men within the Queen's Government and, above all, the effective prosecution of the national interest. The hard decision still rests upon the Prime Minister.

Challenge in Europe

THE three great circles—Europe, the Commonwealth and the Anglo-American alliance—whose coincidence, in Sir Winston Churchill's image, gave Britain her special position in the world, have all suffered shocks this autumn. Efforts are being made in Paris this week to repair two of them together. For Britain, the talks between Mr Dulles and the two prodigal foreign ministers—the first stage of reconciliation with the United States—seem the most precious development, but repair of the rift within Europe is vital as well. To put the matter at its lowest, Britain must perform as a " good " European if it is to regain American confidence, let alone its former special status. But, further, the Suez crisis has demonstrated, more clearly perhaps than any other postwar event, that Britain's most real interests demand that the European alliance be cherished for its own sake.

The fact that Britain and Europe are in the same economic boat has been rudely emphasised, and it has become more evident than ever that there are interests in Africa, in the Middle East, on the high seas, in the Suez Canal, which Britain shares much more closely with Europe than with the United States. The western European countries are, like Britain, heavily dependent on Middle East oil. And in retrospect it must seem clear that Britain and France might be much nearer a satisfactory solution to the canal problem today if, instead of trying to force their own solution on the world, they had won their European allies to a common view and pressed it together inside and outside the United Nations. But, as M. Spaak sadly told the Belgian senate, there is as yet no European group in the United Nations to match the power of the Afro-Asians or the two great world powers. Nor, before the present crisis, was there a habit of consultation on high policy between European nations which could have made a UN group effective. The need for such consultation, and for means to make it effective is clear.

The purpose would not be to push European interests against those of the United States ; nor ought the irrational anti-American feeling, which has given a fleeting extra impetus to European ideas in France and Britain today, to have any place. But by speaking and acting together, the European family could influence American policy more than the individual medium and small powers of Europe could influence it separately. Only by playing a leading part in Europe, as in the Commonwealth, can Britain recover a more than local status and influence both in its relations with the United States and with the world at large.

In the economic field, the Suez crisis has itself provided Britain and France with an occasion to take the lead. They led the move to tackle Europe's oil shortage on a common basis through the Organisation for European Economic Co-operation. But this burst of energy in tackling a special temporary problem

is less important than the initiative which Britain has taken to join with Europe in a free trade area, linked with the common market of the " Six." In the shadow of Suez, the schemes for the free trade area and its parent the common market have made swift political progress. Driven by M. Mollet and Dr Adenauer, Germany and France have reached substantial agreement on most of the well-worn issues between them. M. Spaak has just forecast the signing of the common market treaty by the middle of next month, and the OEEC experts who have been studying the free trade area are optimistic, too. The bickering between " dirigiste " France and *laisser faire* Germany on the nature and powers of Euratom also seems to have slackened and the " three wise men " are pushing ahead with the preparation of a concrete western European atomic programme to provide the treaty draftsmen with a factual background for their work. Euratom's swift progress forces a further opportunity on Britain. Hitherto, secure in its ten years' lead, Britain has been able to stand aloof from it, doing its best to establish commercial contacts in atomic matters with individual countries, like Germany. Europe's atomic programme is now likely to be far larger than what was previously envisaged. If Britain is to play the commercial part and exert the political influence in this field which she might, the British relationship with Euratom must have unremitting attention.

*

Yet these great projects are still in hazard from two big problems, the solution of which may require further profound shifts in national policies. The first is the disparity between the strength of the mark and the weakness of the pound and franc. French exchange reserves have dropped by over 60 per cent this year. German reserves are growing rapidly. It is hard to see how the common market can become effective while these trends continue. The negotiators have agreed on formulæ which will allow France to maintain special protective taxes if the payments position is weak, and M. Mollet evidently hopes to slip the common market through in France before the French position becomes calamitous. But even if he succeeds, these special protections may have to be used on a scale that will make nonsense of the common market, unless some other drastic step is taken to restore the balance between the mark and the weaker currencies. There will have to be a much greater moving together of national economic policies than has yet been achieved.

A second question looming over the common market is that of the inclusion of the French territories overseas. In principle it has been agreed that they should come in ; this African market of 37 million people and the other smaller territories will, after all, be a welcome commercial acquisition to German, Dutch and British exporters. But the price which France is asking is the establishment of a $1,000 million annual investment fund to finance colonial development. The proposal obviously has a political colour ; France, aware at least of the need for swift economic (if not political) change in its empire, and already bleeding economically in Algeria, is desperately anxious for financial help from her European partners. These, however, and Germany in particular, fear the commitment to underwrite French colonial policy. A compromise may be reached on the investment fund which will enable the treaty to go through, but continuous further effort will be needed to bring together the different attitudes in Africa of France and her partners. The discussions on the free trade area have come up against a parallel problem of membership—whether to expose to the rigours of competition OEEC's less developed members, like Portugal, Greece and Turkey, or whether to exclude them, which they will resent politically.

Thus the great common economic ventures, on which the European nations are embarking, themselves require a further harmonisation of political attitudes and policies. The need is even more obvious if the military and political shield of the western alliance as a whole is to be repaired. With the threat of military conflict with Russia, which had seemed to die down, now so obviously alive, the perilous nature of the separate policies which have led to the withdrawal of French forces from Europe to Algeria and of British forces for use in Egypt, kept the Cyprus dispute on the boil and slowed German rearmament, is only too clear.

These needs provided an urgent theme of the meetings in Paris this week between the Nato countries. Several concrete suggestions have been made. The powers seem likely to commit themselves to a resolution requiring continuous mutual consultation between ministers, which would exclude separate ventures like the Suez expedition. This at least should help to dispel mistrust. Mr Dulles has apparently had in mind a new policy-making Council for Nato. Signor Martino, the Italian Foreign Minister, has gone much further in the narrower west European field. He proposes to make the Assembly of Western European Union—the alliance of Britain and the Six set up to carry out the Paris agreements—an elected Parliament. Mr Selwyn Lloyd has now suggested an Atlantic Assembly for the western alliance.

Declarations or institutional novelties will not by themselves meet the need to concert the policies of the European and Atlantic powers. Plenty of institutions exist already. But the sustained political will to form policies in common has still to be established. It ought still to be possible to ensure that the European members of the North Atlantic alliance do not frustrate each other needlessly, and that where a course of action by some members is likely to make difficulties for the others, there should be consultation before the course is set, not merely afterwards when the repercussions have to be faced. All recent events have shown how necessary it is to give more weight to the interests they have in common than to the interests they pursue separately. Britain today has a greater incentive than ever to take the lead in this development.

The Pandit and The President

MR NEHRU'S place among the great men of our time is already secure—for a reason that rarely occurs to either his devotees in the West or his fiercest critics there. Both groups have fashioned false images of the man to suit their preconceptions. To the one he is a world saviour, a lonely Daniel taming the snarling beasts by the power of peace and love ; to the other he is either the accomplice or the dupe of communist tyrants bent on world domination. Yet his real place in the scheme of things owes as little to his sermonising as to his exchanges of garlands with Khrushchev and Mao Tse-tung. If no echo of his moral mentorship had ever reached the West, and if the communist empires did not exist, he would nevertheless be a great man ; for he has led the largest democracy in the world through the first decade of its independence.

It is curious how seldom discussion of Mr Nehru turns on the two essentials of his personality: the fact that he is a democrat, and the fact that he is an Indian. No doubt it is an implicit compliment to independent India, and to its Prime Minister, that it should so often be forgotten how heavily the dice were loaded against this combination only a few years ago. The British, to their credit, implanted liberal ideas in the India they ruled ; but, as the plant shot up with the alarming speed of monsoon vegetation, they were increasingly preoccupied with the task of pruning it. The postwar Labour government's success in abandoning power over India while retaining its friendship has led many Britons to forget how much bitterness is mingled with affection in the Indo-British relationship. For all Gandhi's magnanimity, bitterness was inevitable among men who had lain in British jails and had come to see in each British formula for further political progress a new mask for delay and divisive tactics. Disenchantment led many to terrorist violence, and many to embrace totalitarian ideas, of both right-wing and left-wing forms. Yet today India's three hundred millions accept the ballot box, not the hammer and sickle, the fasces or the sword, as their political symbol.

★

Countless men and women, Indian and British, contributed to this end. Mr Nehru would never dream of claiming that he alone had lugged his sprawling, continental country up to full political democracy. Yet his role has been a crucial one, both before and after independence—in its way, a more important role than that of Gandhi, who was no parliamentarian at heart. What if Subhas Bose had survived the hospitality of the Japanese, and Nehru had died in prison during the war ? Again, what if the Indian Prime Minister had shared the inclination of so many leaders of Asian and Arab peoples newly emerged from western dominance ? Chiang, Mao and Nasser each rejected free institutions ; President Sukarno of Indonesia wavers on the brink of doing so ; Dr Syngman Rhee finds them hard to stomach. In independent India, there has been bad feeling between men who had chosen to serve their country in the framework of British rule and those who chose defiance. Mr Nehru himself acquired little respect for the *daftar-wallas*, the officials branded as "collaborators" ; but he has preferred to work with them rather than with the veterans of extremist violence, for he saw that in a free country the revenue official and the judge had parts to play, the bomb thrower none. What if he had thrown his weight into the other scale ?

It may fairly be complained that democracy must be weak in a country where one man can command so much weight. Yet the Prime Minister's lonely eminence and long shadow indicates not the suppression of challengers but the lack of challenges. Sheikh Abdullah lies in jail, but his challenge was on the local, not the national, plane. So, too, in its different way, was Mr Deshmukh's recent break with Mr Nehru ; and there is little sign as yet that the former Finance Minister, whose instincts are technical rather than political, intends to cultivate a following. The Indian communist leaders are abashed and bickering. Mr Jaiprakash Narain, the outstanding socialist personality, seems bent on retiring again into Vinobha Bhave's campaign for redistribution of land, after briefly emerging to assail the Prime Minister's wobbly unconcern for Hungary.

★

One would not wish India too much political turmoil. All Mr Nehru's agility has been needed to get the Congress government through this year's controversy over the new state boundaries. Uncompromising factions—linguistic, communal, and ultra-conservative—abound, and the country is lucky that their leadership is so poor. But it is at the same time a healthy and heartening thing when there are signs of genuinely democratic opposition, such as Mr Narain's recent challenge. The Congress party has not yet gone the way of the Muslim League in Pakistan ; but a fair degree of competition is the only thing that can save it in the long run. And personal competition is just as necessary for Mr Nehru: not because of megalomaniac tendencies such as afflict President Nasser and General Chiang, but because too many Indians have too long looked to him for too many things—and no democracy can take firm root while that habit endures.

Nor can one man carry too many loads indefinitely. It is a sad paradox that Mr Nehru, surrounded by a swarm of ministers, remains grossly overburdened, largely by his own choice. Tirelessly speechmaking around his vast country, he yet keeps a whole tangle of threads clutched in his hand. When Mr Deshmukh resigned, he took over the Finance Ministry for a time (an experience from which, it is said, he showed himself at 67 not too old to learn). In the teeth of considerable opposition he has got Mr Krishna Menon into the cabinet as minister without portfolio, and he relies on his advice in the field of foreign affairs to a degree which naturally alarms those familiar with Mr Menon's devious ways of thought ; but he remains his own Foreign Minister, and worries Indians almost as much as westerners by the volume of comment he pours forth on the affairs of the world rather than of his own country.

Yet the more Mr Nehru uses global phrases, the more he reveals that his heart is not global but Indian. The interest of his own country comes first with him, as with any other honest statesman. (It is an ironic thought that some of his adulators will take as an insult a statement which, if applied to any other great national leader, could be construed only as one of praise.) The Indian Prime Minister, like the American President whom he is meeting next week, is first and foremost a patriot. He is like Mr Eisenhower in that there is nothing narrow about his patriotism ; but it is strong and, like American patriotism, nurtured first on the tradition of a struggle for national freedom.

Moreover, much as Europe, to which Mr Eisenhower twice gave great service, comes second to America in the President's thoughts, so, for Mr Nehru, next to India comes the Asian and African world that has shared India's long experience of western dominance. For him as for most other Asians, westerners are people who can look after themselves, who indeed have to be constantly prevented from trying to look after everyone else ; Asians and Africans are Cinderellas who have to be constantly protected against their ugly white sisters. For him and most other Asians, Western Europe is still the fountainhead of the great wave which broke over Asia and Africa in the past three centuries ; it is not, as its own inhabitants see it today, merely the threatened tip of a huge land mass whose heart is gripped by a frightening tyranny. The western view is right and the Asian one wrong, for the Asians are looking at the past, the westerners at the present. But the Asian view is a fact.

★

Asia, however, is still only second. India comes first. Mr Nehru is a great Asian, but he no more stands for all Asia than Sir Winston Churchill, that great European, stands for all Europe. All great men have their blind spots. Mr Nehru's main blind spot is Pakistan (one of Sir Winston's used to be India). The traumatic shock of partition in 1947 seems to make it difficult for him and his colleagues to face the fact that their country's foremost interest now is to co-exist in friendship with its weaker neighbour. In digging in their heels in Kashmir, they are postponing the day when this friendly co-existence may be possible. In reviling Pakistan's defence alliances at every opportunity (revealingly, no such browbeating from Delhi disturbs the five other Asian members of the Baghdad and Manila alliances), they have fallen into the trap of seeming closer friends of the communist powers than of other democracies. It was the Sino-Soviet alliance of 1950 that first marred Asian non-alignment ; but Mr Chou En-lai is feted in India as an angel of peace while Mr Suhrawardy is charged with war-mongering. It is Chinese and Russian might that now looms along the Himalayas, which may soon prove no stronger a defence work than the English Channel ; but it is Pakistan's military strength, hardly a third of India's, that is treated as a menace in Delhi. And the bellicose Egyptian dictator is *persona grata* to the peace-loving, democratic Indian Prime Minister because both hate the existence of the Baghdad alliance.

★

There have lately been indications that the Indian government was awakening to the fact that its habitual wheedling of the communist powers and nagging of the democracies was losing it sympathy even among the most patient of free men. But the awakening has not got very far yet, and the attack on Egypt interrupted it. The Indian Prime Minister has been sharply criticised, by Indians of the left as well as of the right, for his weathercock postures over Hungary—a development which encourages the belief that at least among well informed Indians there is a new interest in Europe's problems as well as a new scepticism about communist blarney. But among the masses there is much unquestioning faith that the Prime Minister's international policies must always be the best ones ; and, since he has lent his name to the notion that China and Russia are India's brothers, linked with it in pursuit of world peace by way of the mystical *panch shila*, the "five principles" which very few Indians can recite, the personal responsibility that rests on him is heavy.

Mr Nehru has never lacked the courage to denounce the communists of his own country, or to denounce communism itself for what it is—a relic of nineteenth-century bigotry. Suez has now given him proof that the whole western world is not bent on reverting to imperialism: Hungary, that the great communist empires are still as imperialist as ever. With India's second general elections in the offing, he has chosen to risk the loss of a good many votes by visiting Mr Eisenhower. Will he take the further risk of coming round to join the Indian socialists, Pakistan, and the western world in exposing Russia's brutality in Europe, and China's bland approval of that brutality, not in the cautious phrases of diplomacy, but in ringing words that will sound as loud as his denunciations of the sins of the West in the ears of his own people ? The visit to Washington is, in its timing, a test as well as a risk for India's leader.

Judges Summed Up

EARLIER articles in *The Economist* have taken a social statistician's peep at peers and bishops. To continue this survey of the upper crust, judges can now come under appraisal. This article—which, like its predecessors (see *The Economist* of July 21st, July 28th, and October 20th last), is based mainly on research in *Who's Who* and other works of reference—will not discuss the multitude of minor judges and quasi-judges in this country : such as the recorders of boroughs (of whom there are 102), the county court judges (62), the stipendiary and metropolitan magistrates, the masters in lunacy or bankruptcy, members of ecclesiastical courts, of rent and industrial tribunals, and so on. It will be concerned only with the backgrounds of the sixty-nine men at the four pinnacles of the profession. To summarise these pinnacles :

(1) *The Judicial Committee of the Privy Council*, the highest court in the Commonwealth, is manned by eight former holders of high judicial office in this country, and by judges from the Commonwealth countries which bring cases before it (these are getting gradually fewer). The eight English members are half-retired from active life, sit only rarely, and deal with only a very limited number of domestic cases.

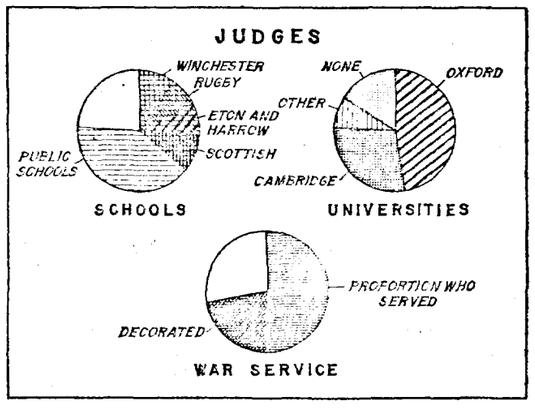
(2) *The House of Lords* is the senior domestic court, equal to but separate from the Judicial Committee. It is manned by ten Law Lords (or Lords of Appeal in Ordinary, to give them their full title). With the notable exception of Lord Radcliffe, they have all been promoted from lower courts, with an average service of 16½ years as judges.

(3) The nine *Lord Justices of Appeal* come next in seniority. They have all been promoted from the three divisions of the High Court, with an average service on the bench of 15 years.

(4) Finally, the benches of the *High Court* proper, with its three divisions of Chancery (8 judges), Queen's Bench (26 judges) and Probate, Divorce and Admiralty (8 judges) are manned by puisne—pronounced puny—judges, who are knights, with the title of the Honourable Mr Justice. Chancery judges, concerned with such abstruse matters as company and contract law, never sit with a jury (which does not displease them) ; on the other hand they do not enjoy the pomp of travelling around on assizes like their brothers of the Queen's Bench, who deal with criminal (and some civil) cases.

The Lord Chief Justice is not the head of the profession : he is the senior judge only within his own division (the Queen's Bench). The senior judge of all is the Lord Chancellor, that anomalous figure who contradicts and completes the strange logic of the British constitution. Although judicial appointments are strictly non-political, the man who is responsible for those appointments is a politician and retires with his Government. As well as being President of the House of Lords, he is President of the Chancery Division, although his judicial experience for the office may sometimes seem slender. The only judicial experience of Lord Kilmuir, for example, was as recorder of a borough ; on the other hand, his predecessor, Lord Simonds, had been a judge, and is now again a Lord of Appeal, but was never primarily a politician. Although judges are non-political, analysis of their records reveals that political activities are no disqualification for promotion to the bench : 23 per cent of all judges have been either candidates for or members of Parliament, 11 per cent as Conservatives, 10 per cent as Liberals, and 2 per cent as Labour. Only on their appointment must they, in public, abandon politics.

Some clue to their politics, however, may be provided by their social background. This can be most clearly seen in their education. Sventy-six per cent went to major public schools (no less than one in five of these to Winchester). Seventy-six per cent also went to Oxford or Cambridge; and 10 per cent to other



universities ; Oxford is well in the lead (and, of the Oxonians, 40 per cent were at Christ Church or New College). These facts do not, to be fair, indicate any deliberate upper class bias in judicial appointments. They are mainly a reflection of the fact that in order to be a barrister at all, a man has usually had to provide himself with prosperous parents, because he needs them to support him during the lean years before he starts earning. A more remarkable fact is the preponderance of university men on the bench. It is possible to become a barrister, as many do, by being a student at one of the Inns of Court in London ; but a university education is evidently a great help in getting to the top.

As might be expected of men of their education and generation, a very high proportion—73 per cent—of judges have served in the armed forces, and 30 per cent of them were decorated. Again typically of the prosperous classes, they have a good record of public service : over a quarter of Queen's Bench judges are members of their local branch at quarter sessions (which must be a bit daunting for the other members), and 20 per cent of all judges are school governors or diocesan

officials. In their recreations and pursuits they seem to belong to the "county" rather than to the intelligentsia. In *Who's Who*, 35 per cent give as their recreation the outdoor sports (hunting, shooting, fishing, yachting, golf). Fifty-three per cent are members of the best-known London clubs, the Athenaeum claiming 26 per cent. Eighty-four per cent are married.

In income, too, the judge belongs to the upper classes, although as an eminent Queen's Counsel he will previously have earned far more than the £8,000 he gets as a judge. The life, however, has its compensations. The high table of his Inn of Court is a pleasant club. He is given a knighthood, and he is in line for promotion to the House of Lords, with a peerage which has the advantage or disadvantage (whichever way your son looks at it) of not being heritable. He gets a pension when, or if, he retires, and so does his widow.

That leads to the final question : how old are judges ? The Judicial Committee of the Privy Council has the phenomenal average age of 79. The Lords of Appeal in Ordinary—excluding those ancients who are also members of the Judicial Committee of the Privy Council —have an average age of 67½. The Lord Chief Justice, Lord Goddard, became a Recorder in 1917, and is still judging hard at the age of eighty. Judges, in short, are allowed to continue in a job which requires the keenest faculties at an age when other men are deemed suitable only for some gentle gardening. Do they in fact go on too long ? One sometimes hears complaints that they are bewigged old fuddy-duddies : complaints based on the remarks they make in court or on their attitudes to parliamentary matters—for example, the abolition of capital punishment. But any such criticisms seem to be directed against their conservatism, rather than against any blunting of their wits ; and it is arguable that conservatism in this profession is an advantage, because it indicates an attachment to precedent.

It seems, indeed, as if practice of the law keeps the mind alert (and it also seems to be true that the moment judges give up they are apt to fall dead, which perhaps helps to account for their unwillingness to retire). In theory, they can be removed only by impeachment of both Houses of Parliament ; in practice, they are not quite as irremovable as that. The Lord Chancellor or the senior judge of the division in question could have a quiet word, and if this were intransigently received, he could simply prevent the old gentleman from getting any more work. Presumably, however, some odd verdicts would have been given by that time. Would it be better if the system were reversed, and judges retired at a fixed age unless they were specifically asked to stay on ? Some of those who would like to succeed the present bench of judges, before they themselves reach the age of eighty, certainly think so. According to rumour, these include at least one prominent politician.

Notes of the Week

The Economic Consequences of Going On

AN article in the Business World on page 987 draws attention to the remarkable speed with which the Treasury has mobilised the additional backing for the gold reserves ; the departmental expedition that has been displayed both in London and Washington in these last ten days has been one of the great administrative achievements of financial history. Now that "operation mobilisation" has succeeded, there is a political point that needs to be made. The United States government, rightly or wrongly, was clearly not going to co-operate so fully in this mobilisation so long as British troops stayed in Egypt. If General Keightley had been told to push on down the canal on November 6th, instead of to cease fire, British troops would still have been in Egypt ; there would have been no point in going on, and then immediately pulling out. Whatever one thinks would have happened about Russian volunteers in those circumstances, whatever one thinks would have been the wider international effects, there is one financial effect that can now be entered into the balance ; and those who believe that "the Government's only mistake was to stop" can fairly be asked to ponder it, whether they think that it outweighs other matters or not. If the cease fire had not been sounded on November 6th, it is really extraordinarily difficult to see what Britain could have been doing now—in mid-December—to avert devaluation of the pound.

Hungary's Fate in the Balance?

THE struggle in Hungary, which had appeared to be approaching the final climax, became more obscure than ever as the week went on, with only one fact standing out clearly : the Hungarian will to resist is as strong as ever. There have been rather more reports of activity by armed

Hungarian patriots and of angry popular demonstrations, sometimes suppressed with bloodshed, than for some weeks.

Over last weekend the new Kadar militia had begun to arrest members of workers' councils on a large scale; although some were later released, others were arrested in their turn. The central workers' council of Budapest replied with a warning to Mr Kadar that if the witch-hunt went on "the end will be a general strike, bloodshed and a new national tragedy." It followed this up with the proclamation of a 48-hour general strike to begin on Tuesday morning. The Kadar regime retaliated with the dissolution of the Budapest central council and all other provincial and district councils (but not factory councils) and the imposition of martial law as from Tuesday evening.

Thus each side threw down the gauntlet. So far the patriots appear to have carried out their threats more successfully than Mr Kadar; it seems that the strike was completely effective except in a few places where workers were forced to work at the point of the gun. The central workers' council may be theoretically dissolved, some of its leaders may be arrested and even put to death, but its writ still runs; according to one broadcast put out in its name, it is the Kadar government that is illegal "because it is kept in power by foreign hands," and "no honest Hungarian citizen" need obey its decrees. As for martial law, it can hold few additional terrors for people who have lived for weeks with the constant fear of a stray bullet, of summary arrest, or of deportation.

In spite of the Hungarians' fantastic refusal to give in, one cannot feel much optimism about their chances of winning freedom in a straight fight. It is true that their passive resistance defeats the Russian tanks; but will not they in their turn be defeated by cold and hunger? Moreover, the Russian army has not yet intervened with all the force of which it is capable. If, losing patience with its attempt to rule through a puppet regime (and there are already indications that Mr Kadar does not enjoy full authority within his own government, as well as unconfirmed rumours he has been thrown over), it resorted to total repression, it might well deprive the Hungarians of the national leadership that the workers' councils now represent. While the decision whether or not to take this step hangs in the balance, delegates at the UN General Assembly have been denouncing the Soviet intervention in Hungary more strongly and unequivocally than ever before. The Assembly is right to persist in its presusre; it may yet influence Soviet policy.

Punctures in Parliament

ALTHOUGH the Tory revolt over the Suez withdrawal was slightly larger than forecast—in the end, fifteen backbenchers abstained after the debate on Thursday of last week—the general pattern was just as expected. Apart from the hard core of the Suez group, the mass of the party, including all the crypto-Suez men, trooped gloomily through the Government lobby. Those who did abstain knew perfectly well, by the time the vote was taken, that their little demonstration would not have any serious consequences for the Government. If they had thought that it would have done, they would not have demonstrated. Captain Waterhouse specifically admitted this, and enunciated the new doctrine that abstention "seems to me to be the clearest and most emphatic way, within our parliamentary system, of showing my disagreement with this particular aspect of the Government's policy." Most constitutional experts would consider this statement to be rather odd.

Last week's vote was the climax of the immediate political war over the Suez crisis. Once it was over, parliamentary tension expired like a punctured balloon. The only early events arousing real interest were the return of the Prime Minister this week-end, and the arrival of the Christmas recess next weekend. The fact that the latter is due to follow so quickly on the former could be of some importance. Even the most dissatisfied Tories seem likely to give Sir Anthony a dutiful cheer on Monday, on the view that their disappointment with him can be discussed at leisure in the New Year. Their sense of duty is going to be mixed with other members' loud defiance, and others' still louder and quite genuine enthusiasm.

The post-Suez political hangover has had one very welcome effect. It has given the House of Commons a chance for a belated return to reasonably courteous normalcy. Spontaneous combustion is occasionally inevitable when tempers are running high, but the Suez crisis has seen the Commons more deplorably rowdy than for just under half a century. Both sides have been to blame: if Labour started it all by its booing, the Tory shouts of "Nasser" every time Mr Gaitskell opened his mouth eventually became equally shocking and (for this previously sober party) much more astonishing. It would be pompous to say that the sight of all these middle-aged gentlemen in a temper has done lasting damage to the institution of Parliament. But it could have an effect in making some of the staider and less impassioned MPs—most of them on the Tory side—feel that a Parliament which gets up to this sort of antic is not a place to which they will want to come back after the next election. There are relatively few members who feel this way; but they include some of the better MPs—and the more the pity.

Wages on Which Track?

THE Railways National Staff Tribunal has recommended a 3 per cent increase in the wages of members of the locomotive men's union. What happens now, not only in the railway unions, but in the wages field in general? The latest news from the railway unions is that the locomotive men are to decide at a delegate conference whether they will accept the award. It is a far cry from the 15 per cent they had claimed, and they have not liked being told that—relative to other railway workers—they are already being paid as much as they are worth. The National Union of Railwaymen will undoubtedly be hoping that they will reject the award. If they accept, the Transport Commission seems likely to offer the same increase to other grades as well; and the NUR, which has had no answer yet to its own claim for 10 per cent, is in its present mood dead against settling for 3 per cent. It would hope to do better at least for those grades (which do not include drivers and firemen) where there is most difficulty in recruiting.

It is therefore too early to say whether the sad, familiar Christmas story of railway wage negotiations, under the mounting threat of an eventual strike, is or is not going to be repeated this year. The atmosphere is against such threats, but it also seems to be against easy settlement. This is therefore the time to say what ought to happen, as distinct from hazarding a guess about what will happen. It seems crystal clear that whatever award is eventually accepted on the railways will set the standard for this year's round of wage increases in general; the argument that railway workers are in a special position to be favoured—because petrol rationing will bring extra traffic and revenue to the railways—just will not wash. The increase of 3 per cent recommended by the Railways Tribunal was worked out exactly to match the increase in the cost of living index since railwaymen got their last increase. This was a very bad precedent to set, since the rise in the cost of living has in fact been mainly due to the last round of wage increases, which last year's railway wage award largely helped to trigger. The tribunal was arguing in an inflationary circle.

It so happens, however—and this is the real criterion arbitrators should adopt in determining general wage awards—that an increase of 3 per cent is just about in line with the increase in real income that the country can expect in a good "normal" year; it is therefore just about equal to the annual increase in wages that the country will usually be able to afford without inflation. The past year has not, in fact, been a good "normal" year; the recommended award is therefore rather too high, but not so much too high that the Transport Commission would be doing the country grave harm by accepting it as a standard. But not one penny more. Already the London busmen are saying that they will not accept a rather similar award, and have demanded that negotiations should be re-opened for a bigger one. As these wage claims go, so goes inflation. The Transport Commission may soon find itself standing at the centre of the battle which is to defend the pound.

Stormy Petrol

AFTER a minor revolt by Conservative backbenchers, the Government introduced a new clause into the Oil Duties Bill on Wednesday: it promises that the increase in the petrol tax will be repealed within one month of the end of rationing. Those who forced through this amendment should now look again at what they have done. The new clause will not, of course, make the tax come off any sooner; it will merely ensure that petrol rationing is likely to go on rather longer. Some time next year some cautious bureaucrat will have to recommend whether and when stocks of petrol seem to be high enough to allow rationing to be discontinued; he will now have to weigh the additional factor that emergency rationing by price must be discontinued at approximately the same time.

The introduction of this amendment came as the crown on a debate in which Mr Macmillan showed that he has begun to think about economics again, but in which everybody else seemed eager to ignore them. The Chancellor presented an analysis of the effect of the tax on industrial costs along much the same lines as were used in these columns last week. To put this analysis in its simplest form. The maximum yield of the 1s. a gallon increase in the petrol tax is going to be about £90 million a year, the additional cost of the 5d. a gallon increase in petrol dealers' prices must therefore be about £40 million a year; the total of £130 million from these two sources is less than 1 per cent of the gross national product of about £17,000 million. If, therefore, the cost of living increases by more than 1 per cent in the next few months (which it quite probably will) this will be for reasons other than the increases in petrol tax and petrol prices.

This is not a "controversial opinion" about the effects of the increases in industrial costs; it is an arithmetical calculation of them. It is true that trade unions and trade associations are already spreading wild inaccuracies about the effects of the tax, in an attempt to justify their demands for higher wages and profit margins (the latter to compensate for falling business). The MPs of both parties who claimed that for "psychological" reasons this tax will "have a much more inflationary effect than the economists think," were really saying that, in their view, these inaccurate statements will have serious and inflationary consequences of their own; since inflation depends much more on the volume of purchasing power (which the tax will help to mop up) than on the particular excuses used in wage negotiations, one need not altogether agree with this view, but one must accept that the MPs concerned hold it. What is much more difficult to understand is why these MPs themselves so deliberately continued to give increased currency to these statistical inaccuracies, even after the Chancellor had done his best to set their arithmetic right.

Mr Dulles in Paris

THE separate interviews which Mr Dulles accorded to the French and British Foreign Ministers in Paris were a limited but adequate first personal gesture towards healing the divisions in the Atlantic alliance. Mr Dulles was unwilling to see the two ministers together before the Council meeting, which he has usually done in the past; and thus in a sense he set aside the fiction that there is a triumvirate of great powers guiding Nato's European counsels. But though the truants were not restored to their prefectships, they have been allowed to sit in the class. Satisfactory personal relationships between Mr Dulles and the two ministers were evidently restored.

They did not, however, go far constructively. Mr Dulles, it seems, gave courage to both ministers by his sensible talk both about the clearing of the canal and about keeping it open later. But there were few detailed signs of the clearer concept of Middle Eastern policy which (as an article on page 969 indicates) is crystallising in Washington. In the Atlantic Council itself Mr Dulles made a rather general policy statement, strongly indicting the use of force.

The main hopes in Paris for the alliance centre on the development of better habits of consultation between the

powers, so that splits can be avoided in future. But already there are widely differing views on the range of subjects such consultation should cover. Some ministers would like consultation on subjects outside the Nato area, the Middle East, for example; but M. Pineau, with some support from Mr Dulles, wants to keep it restricted. If agreement to consult is so limited that it would exclude, for example, the Suez dispute itself, it is difficult to see how it can achieve its aim.

Turkey on Guard

TURKISH foreign policy has kept a level head in the Middle Eastern upheaval. The Turkish prime minister, Mr Adnan Menderes, has come in person to Paris to ask the other Nato powers some searching and possibly embarrassing questions about their intentions for strengthening the Baghdad pact and countering the threat of communist subversion in the Middle East. For the Turks, recent events are a reason to make the pact stronger, not weaker; their efforts have saved it from shivering to pieces on the rock of the Anglo-French intervention in Egypt.

The Turks were as determined as anyone to stop the fighting in Egypt and get the British and French forces out again. They appreciated the extent to which such "colonialist" behaviour strengthened the opponents of the pact in the rest of Asia. But when the four Moslem members of the Baghdad pact met in Teheran early in November, the Turks took the lead in urging that Britain should not be expelled from the pact. No doubt only they could afford to take it; for the others it would have been too great a domestic risk. Since then the Turkish press has favourably compared the Anglo-French compliance with the Assembly's wishes with the Soviet refusal to get out of Hungary; and, far from holding aloof from contacts with the British, the Turkish acting foreign minister stopped off in London for talks on his way to the Nato meeting in Paris.

At the same time, the Turks are determined to show that they have sympathies with the Arab states. They have withdrawn their ambassador from Tel Aviv (but have not broken off diplomatic relations) "until a just and final solution has been found for the Palestine question." And they have been anxious to show that the communiqués issued after the two November meetings of the Asian Baghdad pact powers are in "general harmony" with those of the Arab leaders, whose attitude at the Arab League meeting in Beirut the Turks find "judicious." Still, they are severely critical of the actions by which Colonel Nasser and the Syrians have opened the way for communist subversion in the Middle East. The Turkish press (which incidentally takes a poor view of Egyptian attempts to compare Nasser with Ataturk) has been repeatedly pointing out, often more in sorrow than in anger, the dangerous consequences of Syrian and Egyptian policies. *Cumhuriyet* refused to believe that Soviet officers "are promenading on Syrian territory with the light of peace in their hearts." Turkish estimates of the communist danger are never understated; they are sensitive to the danger that Russian power might outflank them in Syria. But the West has reason to be thankful that the strongest and steadiest country in the Levant is so well on its guard.

Initiative from Teheran

FOR the period that the Baghdad pact members prefer to meet without their British colleague, they are taking decisions which are, presumably, free from that old stigma, "British influence." One of these decisions is to hang together; another—if a project now put forward by Iran is taken up—is to seek a conference of Moslem states and smooth out differences between them. The principal difference is whether to stick to dependence on the West, or to lean on Russia.

A decision which is plain sailing for Turkey, and comparatively so for Pakistan with its antipathy to India, is less straightforward for Iran and Iraq. Both these countries nurture a deep-rooted anti-colonialism as well as a profound feeling of Moslem solidarity; these emotions were quickened by the Anglo-French attack on Egypt, and came near to outweighing the dislike felt by the ruling faction in both countries for President Nasser's way with thrones and for his ambition to rule the Islamic roost. The barometer is still wobbling in Iraq, but in Iran it has steadied.

The form of self-confidence which breeds steadiness is not always an Iranian characteristic, and its emergence arouses curiosity. It must largely be ascribed to the Shah. He gained in stature when he went to Russia in the summer and contrived to come away without ceding to the pressure put on him to slip out of the Baghdad pact. Self-confidence grew when his foreign minister, Mr Ardalan, cut a useful figure at the London conferences on Suez and as one of the Menzies mission to Cairo.

The Shah has put his stake on the West; the stability of his regime hangs on the stake. Can he maintain his course in a country so ridden with mistrust of foreigners that its parliament is even now querying the wisdom of accepting an International Bank loan on terms that are advantageous without precedent? A project successfully launched among fellow Moslems would help him to do so. The conference he suggests would have the advantage of including two powerful members—Iran and Pakistan—who are uninfluenced by the many distortions that affect Arab League thought. What is not clear is how such a display of eastern leadership would affect Egyptian ambitions, and whether a Moslem front—if attained—would hamper British aspirations to be thought a team-mate in the Baghdad pact. Iran and Pakistan, who are both keen for America to join the pact, see no difficulty in belonging to both groups simultaneously.

IRA Strikes Again

THE Northern Irish authorities have been expecting renewed activities by the Irish Republican Army for several months. Although the wide spread of the objectives in the attacks this week put them at a disadvantage, the Royal Ulster Constabulary was therefore able to react quickly. It has long been known that the IRA is running a "staff college" over the border and that Mr Costello's government in Dublin is loath to lay hands on it; but the noise of explosions should not divert attention from the fact that the IRA has for some years been struggling with recruiting difficulties as well as a shortage of funds. There are dark rumours that American sympathisers, using dollar subscriptions to exert pressure, had demanded that the IRA should re-emerge a force at this time and demonstrate that Hungary was not the only country being crushed by the tanks of an alien army.

In this week's attacks the IRA did not entirely keep to the previous rules of the game. These were, broadly, that only the troops and equipment of the alien army should be attacked. These "alien" objectives include the Northern Irish regiments and the Royal Ulster Constabulary; for a long time the IRA has been told not to cause feeling by shooting at the special constabulary, which is somewhat undisciplined, much more vulnerable, but also highly Irish. Injury to specials produces illwill throughout the north. But there is an independent IRA in Ulster itself which does not accept these rules, and it may have contributed to the attacks on civil objectives. Sinn Fein has even spoken of an "uprising." Clearly there has been a lot of careful planning, and the IRA threw its full strength in. But for some time the Catholic youth of Ulster has shown an interest in technical courses and jobs in the new industries encouraged and subsidised by the Ulster government as well as jobs in Britain—a materialist attitude much deplored by southern patriots. The Northern Irish government is indeed fearful that the attacks were deliberately designed to hamper its programme for attracting industry; evidently it sets a low value on the courage of British (or American) businessmen.

Trees Out of the Wood?

PRIVATE forestry in Britain is a neglected industry—the very junior partner of a well-succoured agriculture. Naturally enough, woodland owners look with envy upon the guaranteed prices and marketing monopolies which serve to underpin the farmers' prosperity. In particular, forestry is faced with mounting problems in the sphere of marketing. Private owners are slowly beginning to renew their greatly despoiled woodlands with the aid of small public subsidies; but most of them operate on a very small scale indeed and hardly anything has been done, by co-operation or otherwise, to strengthen the marketing of home produce against the competition of bulk supplies of carefully-graded imported timber. Even the publicly controlled Forestry Commission is increasingly concerned with the problems of harvesting and selling the output of its vast new plantations.

A departmental committee which has been investigating the industry has now reported.* It does not propose that forestry should be given the kind of support which agriculture enjoys. It opposes the idea of a marketing board for forestry, partly on the constitutional grounds that the Forestry Commission (as a public body) could not take orders from such a board and partly because the notion makes nonsense without import regulation (which was outside the committee's terms of reference). These are rather circumstantial reasons for arriving at the right conclusion.

* Report of the Committee on Marketing of Woodland Produce. HMSO. 4s. 6d.

Instead the committee has three main proposals. First, private owners should be helped with increased maintenance grants for woodlands which are kept up to standard. Secondly, they should be urged to join a voluntary association which would provide them with economic information and advance their collective interests. (In other words, foresters are being urged to get themselves the equivalent of the National Farmers' Union—but with a more serious-minded research bias—as a major step towards their own economic salvation.) Finally, a new central consultative body should be created to examine the varying interests of private owners, the Forestry Commission, and the timber trade. (This would replace the present Home Grown Timber Advisory Committee, which acts as a handmaid to the Forestry Commission.) The committee hopes that British forestry might be helped by the development of pulp industries, the negotiation of lower frieght rates and by firmer advance orders for pitprops from the National Coal Board.

It would not be easy to get this machinery to work—particularly as regards the organisation of private owners—but some attempt must be made to raise the collective efficiency of British forestry. From this standpoint, the committee's proposals may be worth a try.

Laying the Wrong Egg

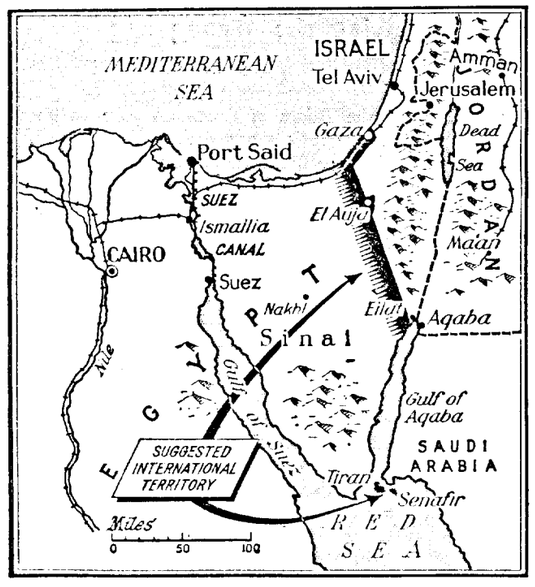
ON Tuesday the House of Commons gave an uneasy approval to the revised egg marketing scheme. The Minister of Agriculture found an ally on the Labour front bench in Mr Tom Williams, who coolly dismissed the record number of 1,200 formal objections registered against the scheme as being quite negligible when compared with the (presumed) wishes of a million producers. But backbenchers on both sides, as well as the Liberals, were less happy about this scheme, which remains an absurd one even after the Minister's amendments. These will introduce some competition by allowing producers to sell under licence direct to consumers or retailers (though not to wholesalers). But the great bulk of eggs will continue to pass through the packing stations, and over these the board will exercise an absolute monopoly—licensing and controlling all the stations, fixing a single selling price for all their eggs, financing its expenses by a levy on producers, and receiving a subsidy from the Exchequer on each egg plus a further guarantee of nine-tenths of its trading losses. Under these arrangements the packers will occupy a privileged position and will profit handsomely; the rest of the egg trade—and consumers—will not.

One of the most interesting features of the debate was to see how the Minister could justify a scheme which runs foul of the very reasons that have just led him to refuse a producers' monopoly for pig marketing. If a pig board could not gauge the market correctly or establish realistic selling prices, why should an egg board (operating in an equally variable market) do any better? If economic competition and adaptability are right and indeed essential for pigs, why are they poison in the case of eggs? Mr Heathcoat-Amory's pleasant argument about variations in supply ("Hens, like Ministers, do not lay the same number of eggs each week") is every bit as true for pigs. Nor does the

Minister's other argument—that the scheme is a way of assuring consumers of sound and fresh eggs—ring any more convincingly. In fact there will be no way of telling how long the board's eggs have been in the shop, and the eggs sought after for freshness will be those which escape its control. Eggs, it seems, are different from pigs mainly because Sir James Turner has made a more effective fuss about them. If (which is fortunately still far from certain) Sir James can get the necessary support in a poll from two-thirds of the producers, a deplorable piece of pressure politics is now going to hatch out.

Cleaning up Sinai

PLANS for preventing a return to the explosive *status quo ante* at the point where Sinai adjoins Israel are too few and far between. The proposal put forward in *The Economist* in August and outlined more fully on November 24th, which suggested creating a permanent international zone in the area marked on the accompanying map, seems to be the only one of its kind as yet. But some of those who have seized upon it as a way out of a vicious situation



have misunderstood its main purpose. They are arguing, as they watch the Israel army withdraw and the United Nations Emergency Force follow north-eastward in its tracks, that the zone could serve as a base for the permanent UN force that they would like to think has been created.

This misinterprets the plan as well as of the purpose of the force, which has been supplied for a limited purpose by governments which mean to recall their men. If it has justified itself, there may be grounds for establishing a permanent UN general staff in New York, capable of conjuring up another such force in another such emergency. The UN members which have provided contingents for the force will not provide them in perpetuity.

The Economist's plan for Sinai was first put forward in the week after Egypt seized the Suez Canal, before the Anglo-French military action was taken and before the Unef was thought of. It envisaged a civilian zone with a multi-national administration of police, currency and customs services, to be paid for out of fees charged to the users of the pipelines and other traffic routes it would provide between Europe and Asia. The main purposes of the zone were two: to eliminate the day-to-day danger of explosion on one whole sector of the Palestine frontier, and to reduce western dependence on bottlenecks in unstable lands of transit. It would be a new territory *sui generis*—simultaneously a buffer and a corridor, demilitarised but internationally run.

Adequate defence of such a zone against a resolute attack could only be provided by a guarantee from the user powers; its strength would depend on the potential support of national navies and air forces on call in the Mediterranean for international purposes.

If Unef empties Sinai of invaders, its task will be to keep the area clear only until the future of the peninsula can be decided. That future hangs on what frontier regime the United States is ready to prod the United Nations into enforcing on two offenders—Egypt as well as Israel. If nothing new is enforced, an explosion worse than the last is only a matter of time.

Kuwait: Bonfire or Beacon?

UNTIL now, the Kuwaiti authority responsible for security in the oilfields and around the Kuwait Oil Company's installations has done an admirable job. This week, under cover of a storm in which a man could not see his hand before his face, saboteurs got at one well and were able to fire it. The motive was no doubt the same as that which has been prompting the bazaar in Kuwait town to boycott British goods and cold-shoulder British custom as a mark of sympathy for Egypt. A good many Egyptians are employed in Kuwait, and naturally they encourage these tendencies.

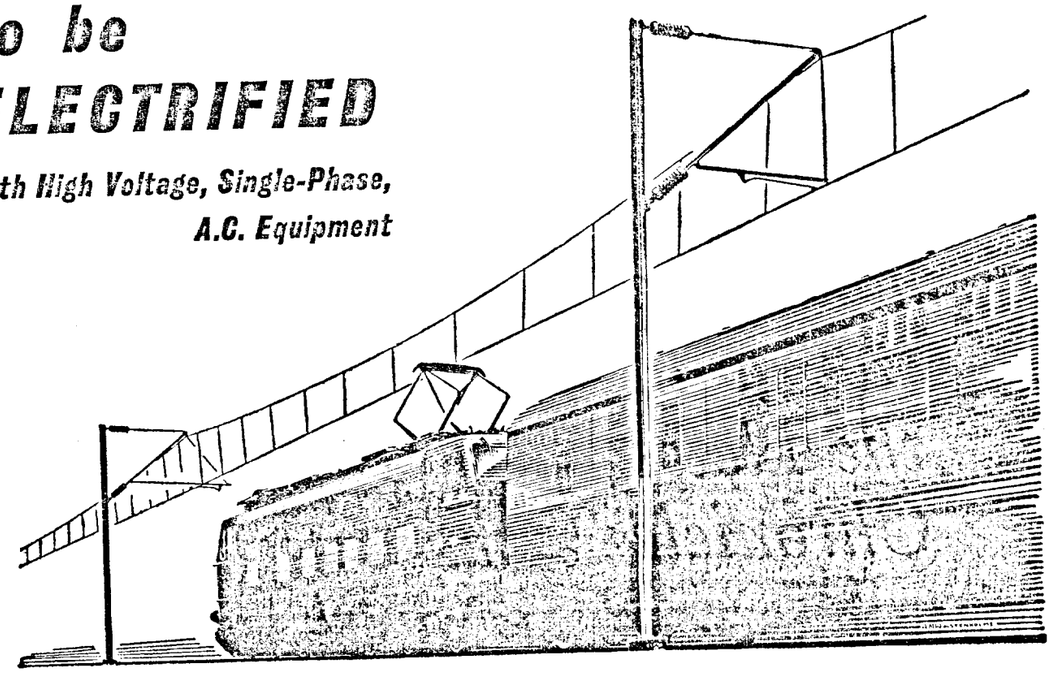
The saboteurs tried three wells and some pipelines, but were successful with only one well out of 180, and their effect on output and revenue will be negligible. The pillar of smoke they raised caused consternation in sheikhly, police and security circles and will breed no love for Egypt in that quarter. But it gave satisfaction to the many Kuwaitis who are learning Arab solidarity in their new schools; it is also a portent that, nowadays, even an absolute ruler has to reckon with public opinion.

A Question of Free Speech

A BRANCH secretary of the Fire Brigades Union, Mr Austin Curran, has been suspended from his union on the grounds that he "acted prejudicially to its interests." His action was to refuse to stop the issue of leaflets attacking the executive of the union for its pro-communist leanings.

270 TRACK MILES of BRITISH RAILWAYS to be ELECTRIFIED

with High Voltage, Single-Phase, A.C. Equipment



DESIGNED · MANUFACTURED · INSTALLED

by the BICC GROUP

The Manchester-Crewe, and Colchester-Clacton-Walton lines are to be electrified with the first 25kV single-phase A.C. overhead equipment to go into service in Britain. Design, manufacture and installation will be undertaken by the BICC Group, who have had more than 40 years experience of railway electrification work. Since 1953, the BICC Group—in collaboration with British Railways—have been making intensive tests in High Voltage A.C. traction under running conditions on the Lancaster-Morecambe-Heysham Line. The new equipment—lightweight and unobtrusive—has been proved by the valuable experience gained here.

The designs employed will form the basis of future overhead work on the railway modernization programme.

BRITISH INSULATED CALLENDER'S CABLES LIMITED
21 Bloomsbury Street · London · W.C.1

...and make sure we go in the News Chronicle

"Is it the right medium for our lines, do you think?"
"If the I.P.A. Survey is anything to go by, it certainly is. We can hardly afford to ignore more than 5,000,000 readers."
"But what kind of readers, long-haired highbrows?"
"Good heavens no. The News Chronicle is a mass market medium. It's read by professional men, managers and artisans alike. But this I'll say, no matter what social or economic grade they come from, News Chronicle readers are pretty intelligent people. The sort of people who like to think for themselves."
"Are there plenty of women readers amongst them?"
"Certainly. 2,215,000 to be precise. And I'll tell you something else about News Chronicle readers. No less than 2,575,000 of them live in the eight major manufacturing regions* (1,156,000 in Greater London). Only two other national dailies have a greater number of readers in these highly industrialised areas."
"And those are the areas where the big salaries and wages are earned, of course."
"That's right. Make sure we go in the News Chronicle, won't you?"
**Central Clydeside, Tyneside, West Yorkshire, South East Lancashire, Merseyside, West Midlands, South Wales and Greater London.*

NEWS CHRONICLE
AND DAILY DISPATCH

This raises such an appalling picture of the way in which free speech may still be prevented in Britain that it has seemed worthwhile to set afoot a special investigation into the case. It reveals the following:

(1) Fortunately, since there is no closed shop in the fire brigades, Mr Curran's suspension does not mean that he is to lose his job. But he is a Labour party member and has been on the executive of his local trades council for eight years; understandably, he is pained by suspension from a union in which he has been an officer.

(2) Unfortunately, it seems to be true that the rules of the union actually (though, to any liberal, almost incredibly) do allow the executive to suspend a member summarily in this way—apparently for no better reason than that he is campaigning violently against the executive's political views.

(3) The question of whether the communists are too much in control of the Fire Brigades Union—as distinct from the point that Mr Curran has a right to say they are, and to campaign against them—is really a secondary one. The present trouble apparently began when Mr John Horner, general secretary of the FBU, sent a telegram to the TUC appealing for a general strike over Suez; this was much resented by many members. Mr Horner was then a communist, but has since resigned from the party over the Russian intervention in Hungary; some other members of his executive have resigned from the party with him. There have been allegations that some of these resignations have been for the purpose of forming a communist "underground," to work with the party without seeming to be in it, and to lead the boys back into the fold at a more propitious time. Most good judges in the trade union movement, however, believe that Mr Horner's own resignation had no such sinister purpose behind it.

(4) Mr Curran estimates that about one-third of the union are actively on his side. But since his suspension, he believes that his supporters have decreased in number. An attack upon the structure of the union, even from within, is apparently regarded by many firemen as an insult to their calling; "my union, right or wrong," is a very general attitude.

The precedent set, the attitudes revealed, and the union rules laid bare by this case are extremely disturbing; it is an accident that, because of the relative weakness of the FBU and its inability to enforce a closed shop, the case is only disturbing and not personally tragic. But there can be no excuse for sitting around, shrugging shoulders, waiting for a repetition of this sort of incident in a closed shop union; something clearly needs to be done. The best thing would be for the TUC to refuse affiliation to any union which impedes a free expression of political views within its ranks; if the TUC is unwilling to grasp this nettle, then interference of this sort is a matter for Parliament to legislate against.

Mr Lim and the Tengku

MR LIM YEW HOCK, the chief minister of Singapore, has arrived in London for informal talks on self-government with Mr Lennox-Boyd; and Tengku Abdul Rahman will arrive over the weekend for talks on the progress of the Federation of Malaya towards independence, for which the target date is next August. There is every possibility that the Tengku, as well, may become involved in the discussions on Singapore. Mr Lim has not denied the report that he proposes to solve the problem which caused Mr Marshall's resignation—the exact composition of the defence council which is to watch over the internal security of Singapore—by having neither a Singaporean majority (as Mr Marshall demanded) nor a British majority (as Mr Lennox-Boyd wished), but equality, with a casting vote in the hands of a chairman nominated by the federation. This scheme will sound the more attractive because when Mr Lim's government had to repress the communist-inspired riots in October he was offered, and accepted, police reinforcements from the federation. It may appear to the Colonial Secretary, too, that as the federation will continue to act, under present plans, as a base for Commonwealth land forces in south-east Asia, a federation chairman in the defence council would no more hesitate to vote to call in British troops to prevent riots than Mr Lim hesitated in calling them in to repress them.

The Colonial Office is anxious to get a settlement in Singapore. The services, in the post-Suez mood, may not be so anxious to press the absolutely vital nature of the Singapore base as they were last year. Mr Lim has shown that a Singapore ministry can effectively prevent disorder, and he has had the best of it in his clashes with the communists and the People's Action Party. But the Colonial Office cannot forget that elections can quickly change the moderate complexion of an Asian country, and that while Singapore may not be vital as a western base, it is vital that it should not become a Chinese one. The Tengku, however, knows this better than anyone else, and the federation's interest in an orderly and non-communist Singapore is perhaps the best guarantee of the security of the British base—far better than paper guarantees or vestiges of power which, while causing local irritation, might not be easily and effectively exercisable. There seems, therefore, reason to think Mr Lim may work out an acceptable formula under which Singapore will be independent, while Britain will hold the base and control foreign affairs. Tengku Abdul Rahman is here for another purpose, to ensure that after full independence he will be able to fulfil expectations, locally engendered, of rapid material progress—for which he is apparently asking a loan of £100 million. In the present condition of sterling and of the London money market he may be disappointed.

South African Political Trials

DURING the trial of 140 South Africans, including the white member of parliament for native interests and the principal of the African university college, who were arrested in South Africa last week under the Treason, Suppression of Communism and Riotous Assemblies Acts, it will be the South African government which stands trial, as well as the accused. The immense powers taken by the Union government under these and other Acts to crush all opposition not only to its racial policy, but to its methods of enforcing it, will receive worldwide publicity. Whether the accused have in fact transgressed the law will be the main issue in South Africa; to many in the world at large the issue will be whether such laws so applied, to such persons, can be regarded as law in

any sense understood by a free and civilised community, or whether they are not the instruments of a police state. South African Nationalists will think this monstrously unfair, and will point to the parliamentary forms and to the observance of legal procedure in open court. But in staging a mass trial at this stage, South Africa has opened its peculiar institutions to a degree of world scrutiny which may have results very different from those intended.

The accused will appear, under South African procedure, before a magistrates' court which will take preparatory evidence from the Crown. It will decide if a prima facie case has been made out, and will give the defence the opportunity to advance or reserve its plea. If the charge is made out, the whole process of bringing evidence is then repeated in the Supreme Court which will actually try the accused. Those charged with treason, sedition or public violence could, at the instance of the Attorney-General, be tried by a special criminal court of two or three judges without a jury; those to be tried on other charges will be tried by jury. South African spokesmen are stressing the scrupulous observance of legal forms—even to the legality of the police searches, which are only undertaken on sworn statements that there is "reason to believe" evidence will be found. The judges are bound by the law, and the world will scrutinise their solemn pronouncements of the law on the evidence adduced: the circumstances and definitions which compel them to pronounce a man a "communist" or a "traitor." Conscious of their wider audience, defence counsel are likely to concentrate on showing the world what law in South Africa means.

Pygmalion and Pitlochry

THE Society of Authors has briefly tried its hand at restrictive practices, like a real trade union. The story of its "ban" on performances of Shaw's "Pygmalion" seems to be this. The society handles the performing rights of the play for the Shaw estate, and earlier this year it was discussing with H. M. Tennent Ltd. various questions arising from that company's intention to put on in London a production of "My Fair Lady," the musical version of the play which is now such a success on Broadway. While these discussions were in progress, the society received requests for licences to perform "Pygmalion" from three or four companies, amateurs and professionals, one of which was the Pitlochry Festival Company. All these requests were refused. The society now says that this was done in error: licences should have been merely deferred while the discussions were in progress. And it stresses the need for some kind of "traffic control," to see that the same play is not put on by neighbouring companies.

This is all very strange. It raises questions on at least three levels. First, on the grounds of expediency. It is charming to think that there is serious competition between Pitlochry (which is in North Central Scotland) and Shaftesbury Avenue. But rival shows much less far apart run side by side. One of the least intelligent plays in London has recently run merrily through the showing of the Film of the Play, while another theatre is doing good business with the Play of the Film of the Book. Might not "My Fair Lady" even stimulate people's desire to see "Pygmalion" and *vice versa*? Secondly, on the grounds of principle. It may be kind to warn applicants for licences that someone else in the vicinity has also applied for one, but surely that is all that is desirable. As for preventing amateurs from performing a play, there could be no excuse for that. Thirdly, on the grounds of theatrical monopoly. The fact that the society held up applications until the discussions with H. M. Tennent and Company were concluded suggests that the question of licences was to be decided according to the attitude of that big royalty payer. The society points out that there is no ban now. There never should have been, and no deferment either.

Free Speech in Turkish Universities

THE cool head that the present Turkish government shows in its foreign policy is not always so evident in its domestic dealings. Mr Menderes's strong intolerance of criticism has often led him astray; the latest example concerns freedom of speech in the universities.

For some time the Turkish government has been irked by the criticisms of its internal policies made by a group of professors and lecturers at Ankara and Istanbul universities; many of these criticisms are published in a magazine called *Forum*, a commendable effort at independent journalism, of which the editors are Professor Feyzioglu, dean of the political science faculty at Ankara, and Mr Aydin Yalçin, a lecturer in the same faculty. Professor Feyzioglu has now been dismissed as dean after a speech in which he apparently advised his students to think for themselves, recommended that the universities should be free from government control, and complained that the Minister of Education had ignored a recommendation that Mr Yalçin should be made a professor. As a result, Mr Yalçin and another member of the faculty have resigned, the students refused to attend their classes, some were taken to police headquarters for questioning and the highest class of the faculty was temporarily closed.

Of course it is true that the ideas of western democracy have not yet had time to strike deep roots in Turkey and that Turkish politicians are bound to find it difficult to accept the barrage of criticism to which western politicians have long become inured. But so long as Turkey turns westwards and strives to identify itself with the West, it must expect to be judged by western standards. Tested by the vital principle of freedom of speech, the Turkish performance is falling far below standard.

Replanning the Deterrent

DEFENCE expenditure, it is widely stated, is being reviewed in the light of the political and military lessons to be learned from the Suez fiasco; cuts are forecast. The defence white paper to be issued in February is being shaped by many hands in many departments, and now, therefore, is the time to think about basic objectives and commitments. There is, however, as Lord Tedder said in the House of Lords debate, a danger that false conclusions may be drawn. Two crucial questions were not answered in last year's white paper; but the lessons of Suez make them still more compelling, and any failure to answer them next February will be unforgivable. They are interrelated. The first is the degree to which we must go it alone in equipping our own forces, and the degree to which, in the interests of economy and efficiency, there can be specialisation in production and interchange of equipment between members of Nato—particularly, between Britain and the United States. The second question concerns the kind of war, or the kind of threat, against which the three types of armaments are being built up—strategic-nuclear, tactical-nuclear and conventional.

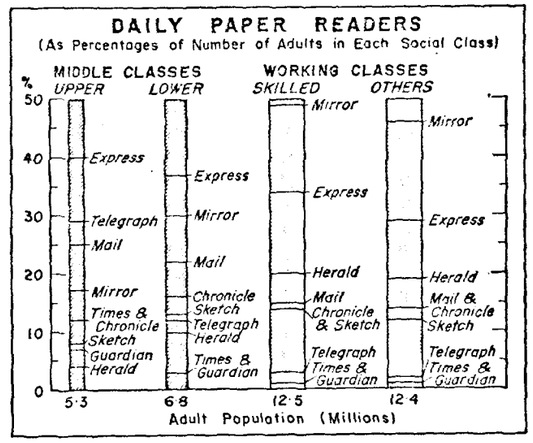
Last year the government appeared still to be taking the view that, apart from purely local outbreaks which could be handled by conventional forces (like the Suez affair), the deterrent was based on "massive retaliation"; the idea of limited wars fought with tactical atomic arms, but not leading to global war fought with H-bombs, had not yet been accepted by official thinking; and as recently as last October Field Marshal Montgomery reviewed the deterrent in terms only of global war fought more or less to a finish. But, as the authors of a new Chatham House study on graduated deterrence point out,* this idea still leaves somewhat unclear why Shape is equipping its forces with tactical atomic weapons which, it may be argued, would be supererogatory in a war fought with hydrogen bombs. The logic of developing tactical nuclear weapons at a time when both West and East have hydrogen bombs, they argue, must be that the scale of the deterrent can be related to the degree of aggression; that policy must be based on the hope—it could only be a hope—that atomic war can be limited.

There is certainly reason to believe that the policy of the massive deterrent against any type of aggression is losing ground in the Pentagon; and if the policy of the graduated deterrent—of limiting retaliation to the force necessary to halt an invasion of the West's territories or spheres of interest and restore the *status quo*—is being studied in the United States, then clearly Britain ought to be studying it here. While, as the Chatham House study shows, the theory in its new and more refined version is attractive, the practical difficulties of defining limited atomic targets are formidable. While it may well be right to plan on such a basis, it still remains arguable whether the West should declare it as a policy. Nor does the theory, even if acceptable, suggest that such a policy will easily permit large economies in defence. Certainly it makes co-operation with allies in defence production still more necessary.

* *On Limiting Atomic War*, by Sir A. Buzzard, Professor P. M. S. Blackett, Denis Healey, MP, and R. Goold-Adams. Chatham House. 2s. 6d.

A New Readership Survey

THE number of copies sold of a newspaper is no measure of the number of people who read it. "Readership surveys" help to show how far publications are shared. From questions put to 10,000 people in the six middle months of this year, a new survey of the Institute of Practitioners in Advertising reckons that nearly 15 million people, or 40 per cent of all adults in this country, read—in the sense of look at—the *Daily Mirror* every day and 34 per cent read the *Daily Express*. This implies that, on the average, each copy of these mass circulation papers is read by three



people. But the quality papers are apparently more thumbed: on the average between five and six people read each copy of *The Times* and nearly as many each copy of the *Manchester Guardian*. The figures for magazines conjure up a picture of tattered copies by the end

The Economist Diary

THE CHRISTMAS PRESENT FOR THE MAN WHO SEEMS TO HAVE EVERYTHING

A week's appointments at an opening; a book that lies open flat on the desk	A diary lay-out specially designed to meet the needs of the busy man
Bound throughout in red leather: title blocked in gold	All information easily found by means of handy thumb-indexes
A memorandum book, an appointments register, and a complete reference book	Facts and figures covering the world always available when required
43/- Price for U.K. only, including postage and purchase tax	Prices to overseas addresses vary widely; a schedule will be sent on request

ILLUSTRATED PAMPHLET FROM DIARY DEPT.
THE ECONOMIST · 22 RYDER ST · LONDON SW1 WHitehall 1511 (Ext. 1)

of their lives: *Lilliput*, for instance, has a readership of fifteen times its circulation and *Punch* one of eleven times. *The Economist* was not included in the institute's survey.

What are these estimates worth? The institute has produced larger readership figures than any previous survey; it says that this is mainly due to improved techniques in interviewing. This correction, however, gives freer play to the suspicion that some respondents may have been influenced in their answers by what they feel they ought to read as distinct from what they really do. But the picture of the kinds of people who read the different publications is probably reasonably accurate. As the chart shows, most of the dailies are one-class papers, but readers of the *Daily Express* come astonishingly close to a cross-section of the population and so, too, in smaller numbers, do those of the *News Chronicle*. One finding in this survey which gives food for thought is that some 15 per cent of men own up to reading the two women's weeklies with the biggest circulations—that is, for every three women readers of these papers one man says that he also takes a look.

An Algerian Reform

THE attempt to solve the Algerian problem by bringing President Nasser down having failed, the French government no longer has an excuse for delaying its search for a political solution. Socialist pressure to get rid of M. Lacoste, the minister resident in Algeria, may have led M Mollet to prod his colleague to assume the posture of a reformer. Whatever the reasons, the government has now announced a reform of local government in Algeria, including the abolition of the existing local councils, which are weighted in favour of the European minority; special commissions will take over and will prepare the ground for municipal elections.

After so many paper reforms, judgment must be suspended until the new scheme has been put into practice. Will representative Moslems agree to participate in the new provisional local authorities? The mild reaction of the spokesmen of the French *colons* gives the impression that they do not consider the threat to their privileges as very real; the move may have been designed more to calm Socialist opposition in France than to capture Moslem imagination in Algeria. To convince the Algerian population that France genuinely desires a change and a settlement, the reform would have to be carried through rapidly and as part of a broader programme to set Algeria on the road towards a new status, whether independent or federated. Time presses, not only in Algeria. This week's budget debate in Paris suggests that the period (nearly a year) of governmental stability in France may be drawing to a close.

Japan's Suez Group

MR HATOYAMA has taken the last hurdle of his political career; the Japanese Diet has ratified the Russo-Japanese declaration which he negotiated, ending the state of war, and instruments of ratification were duly exchanged with Mr Fedorenko, the Soviet deputy foreign minister, on Wednesday. On the same day Russia supported Japan's application for admission to the United Nations in the Security Council, which gave its unanimous approval. It has taken a month of effort to achieve this result because the Diet had to extend the life of a law which restricts strikes in vital industries before it could ratify the declaration. The Liberal Democrats started by trying to push this measure through without having it reviewed by a committee first, so that the Socialists could not delay its progress, and the Socialists replied by moving votes of no confidence in every cabinet minister who tried to make a policy speech. Finally the Liberal Democrats gave way and allowed the Bill, which was eventually passed, to be discussed by the standing committee for a set number of days.

The government was especially embarrassed by this clash because it was relying on Socialist support to get the ratification of the Russo-Japanese declaration through the Diet. Otherwise the ultra-conservative Yoshida group of Liberal Democrats, which has always opposed any treaty that did not recover possession of the Southern Kurile islands for Japan, could have blocked the ratification. As it was, they tried to attach to the declaration a rider saying that Japan still regarded Etorofu and Kunashiri as part of its territory. The move failed; the Russians would probably not have accepted ratification in this form. No fewer than 87 members compromised between their consciences and their party membership by boycotting the Diet on the day the bill was passed. However, Mr Hatoyama will not have the task of restoring his party's unity. He has announced his resignation, an event expected for over a year, and the Liberal Democrats now face the necessity, long evaded, of choosing a successor from half a dozen candidates, each of whom has his own faction and his own strings to pull. It will be an achievement if the party's unity survives this double test.

Dr Hatta Resigns

DR HATTA, the vice president of the Indonesian republic, has at last succeeded in resigning from the office which, except for one year when he was prime minister, he has held continuously since Indonesia became independent. He has tried to resign at least twice before, once in 1954, and again last July, and he only consented to stay on until the constituent assembly, which is to define and revise Indonesia's constitution, was in working order. This has finally been achieved and a delegation sent by the Indonesian parliament could not induce him to postpone his departure any longer.

Dr Hatta will be missed. Like President Sukarno, he is one of the founders of Indonesian independence who stand above the party politicians. He is trusted and respected. The Indonesian press has naturally used its imagination in discovering reasons for the resignation; some papers have asserted that Dr Hatta wished to escape from the trammels of office in order to be free to criticise the President and perhaps become prime minister again. Certainly Dr Hatta has the reputation of being a stiff and uncompromising man, and he has had clashes with the President. But an open political conflict is at present unlikely. Dr Hatta speaks of devoting his energies to the development of the village co-operative movement.

Dr Sukarno's position seems unshaken in spite of the discontents described on page 893 of *The Economist* last week. He is still the idol of the peasantry and the arbiter of policy, while the prime minister, Dr Sastramidjojo, does little but manage the unwieldy party coalition and steer measures through parliament. There is some doubt whether the constituent assembly now sitting will keep the office of vice president in existence in the constitution. If it does not, the President will be quite unchecked. In any case there is not another man of Dr Hatta's stature, who might act as a check on the President, ready to take on the job.

Appeals from the Galleries

THE annual reports of the National and Tate Galleries—published this week and three weeks ago respectively—have repeated their now annual appeals for more money. The trustees of the Tate Gallery are asking for a purchasing grant of £20,000 a year, compared with a grant in 1955-56 of £7,500. Otherwise, they say, they cannot discharge their task of maintaining representative collections of British painting, modern foreign painting and British and foreign modern sculpture; there are many important gaps to be filled. The National Gallery's chief concern this year is the condition of its building. Eight of the war-damaged rooms have now been reopened, but there are still two out of commission; and the basement is crowded with pictures which there is no room to exhibit, and which are deteriorating inexorably because of atmospheric conditions. The trustees also ask for their purchasing grant to be raised from its present £12,500 to £80,000. Last year their report ended with the striking comment (surely from the chairman, Professor Lionel Robbins) that the nation spends 750 times as much as this on the pig subsidy. This year it ends with another arresting thought:

> In 1880 the purchase grant at £10,000 a year was 1/100,000th of the national money income. In 1955 at £12,500 it was less than 1/1,000,000th. Can it be said that this proportionate decline is a true reflection of the movement of the public interest in the growth of its greatest collection of pictures?

Seen in their proper perspective the sums involved are as small as the damage now being done to Britain's artistic heritage is large. Important pictures are lost for ever; they disappear from the country because the state, having fleeced the people who would once have built up private collections, has only partially taken over their function of buying pictures. Moreover, it might be a long-term economy to spend more. The Tate argues that if it is unable to buy the best works of accepted artists while they are still "modern," the National Gallery and the Victoria and Albert, to which such pictures may later be transferred, will suffer in the end. The National Gallery complains that it is more or less helpless until sales have already taken place and appeals for the refusal of export licences have been lodged. Then only is aid forthcoming, by which time the highest prices of the international art market must be paid. The resent position is thus as foolish as it is philistine.

Awkward French Habits

DURING the recent crisis French ministers have acquired the awkward habit of dotting the Anglo-Saxon i's. The reason for keeping the Americans in the dark about the Suez expedition had never been precisely explained until, in an interview this week, M. Mollet told American correspondents:

> If your government was not informed, and this is true, about the last moves [before the Anglo-French intervention] the reason, the only reason, I confess, was our fear that if we did consult it, it would have prevented us from acting.

M. Mollet's British associates in the enterprise have never been so frank; pressure of events and shortage of time have been the reasons given in London.

The Persian Expedition

The English people often take a very common-sense and on the whole a very sound view of questions of foreign policy, when these come before them in the shape of practical action to meet an obvious danger or an immediate necessity. . . . But the public, though in the main intelligent and equitable, is not in the same proportion *foreseeing*, or disposed to give ear to those who are so. It is the duty of the Foreign Minister of England to watch coming events; to be cognisant of all the secret links, imperceptible to the general eye and the untrained mind, which connect apparent trivialities with momentous consequences; to be ever on the alert to detect and check those incipient movements of aggression and injury which can be effectually and easily suppressed only in their incipiency; and to see in a slight and unimportant proceeding on the part of some hostile or rival Power, the first step and indication of a policy which, in its ulterior and logical development, will entail bloody wars and severe struggles for existence or for Empire. . . . These considerations form the justification of that expedition against Persia which so many inconsiderate persons regard, and have not scrupled to represent, as an instance of absurd and mischievous meddling in affairs with which we have no concern. . . . The Shah of Persia, instigated by Russia, thinks that he may venture on his long-desired conquest of Afghanistan, and that we, exhausted by a European war, are in no condition to forbid him or to hold him to his sworn engagements. The arrival of our troops in the Persian Gulf will undeceive him; and the moment he perceives his mistake he will hasten to undo it. . . . No doubt the policy of promptitude to foresee dangers in the distance and to resent aggressions and insults in the outset, is one which must be followed with sagacity and discretion. But our Empire in India is one of our grandest national possessions, and worth every effort to maintain. . . . Now, no one doubts that Herat is the key to Afghanistan, and Afghanistan is the key to the northern provinces at least of India. Persia is the ready tool of Russia; and if Persia possessed Afghanistan, our tranquility and security, it is obvious, would be ever at the mercy of a European rival. This must be prevented by whatever righteous means are in our power. And our best, shortest, cheapest, kindest means unquestionably lie in a policy which shall proclaim throughout the whole East that our vigilance never sleeps.

Britons in Sicily

LORD WILLIAM BENTINCK AND THE BRITISH OCCUPATION OF SICILY 1811-14.
By John Rosselli.
Cambridge University Press. 220 pages. 30s.

"THIS book—there is no disguising it—started out as a dissertation," Mr Rosselli admits in his preface. This, the reader feels, is an unnecessary piece of defeatism. For it would not have been difficult, and it would have been well worth while, to have diluted the hard core of research and at the same time to have indulged the reader with a more general picture of things in Sicily, Italy and Europe at the time. Mr Rosselli's scholarship need not have gone by the board.

Throughout the Napoleonic wars Anglo-Sicilian relations were of fascinating interest. From the British point of view the central Mediterranean islands were of great strategic importance. From the point of view of the Sicilians, whose most conscious political aim was to be liberated from the dominion of Naples, Britain was their greatest hope; indeed one of the issues between Naples and Sicily was precisely that between the continental impulses of Naples and the maritime interests of Sicily. French conquest twice drove the ruling Bourbon King, Ferdinand, and his Austrian consort, Maria Carolina, off the mainland to take refuge in Sicily under the aegis of the British. The British established something like a protectorate over the island, and from time to time seriously considered its acquisition.

For some reason which is not quite clear historians have castigated Lord William Bentinck for holding much the same views and pursuing much the same policy as his predecessors, Drummond and Amherst. Mr Rosselli seems faithful to this tradition. "As early as 1807 Sir John Moore . . . had urged that the Queen should be expelled and Sicily annexed to the British Empire," but the diplomatists were, of course, more cautious than the military. Bentinck, who was diplomatist and soldier rolled into one, at last succeeded in getting rid of Maria Carolina and in providing the Sicilians with a liberal constitution. When one considers the difficulties with which he had to contend in this poor and backward island with its inheritance of vendetta and not un-Levantine political tortuousness, it is impossible not to admire his spirit. As for the letter he penned to the Hereditary Prince on December 3, 1813, in which he spoke of his "dream" of the annexation of Sicily by Britain, it has been seen that this idea, if now tactlessly expressed, had been in many people's minds: it was brought up again from the Sicilian side some 130 years later after the fall of Mussolini. The remarkable thing about Bentinck is that—as he wrote to Castlereagh early in 1814—he desired Sicily to become "not only the model, but the instrument of Italian independence."

Some Christmas Books

Herod the King

THE LIFE AND TIMES OF HEROD THE GREAT.
By Stewart Perowne.
Hodder and Stoughton. 186 pages. 21s.

OF few historical personages who are universally known by name is so little known in fact as of Herod the Great. The things commonly ascribed to him should properly be ascribed to other Herods; and many, especially among those who rightly connect him with the rebuilding of the Temple in Jerusalem, not unnaturally assume the powerful King of the Jews to have been of the same race as his subjects. These will learn with surprise that this Asian with the Greek name was by birth doubly an Arab—on his father's side an Edomite (Idumæan), on his mother's a Nabataean from Petra—and a Jew only from having adopted the Jewish faith, apparently with devout conviction.

The story really begins with Herod's Edomite father Antipater, shrewd, patient, a calculating civil servant, a successful go-between and unerring picker of the winning side in the fluctuating struggle between Parthia and other oriental states on the one hand and ultimately victorious Rome on the other. Herod inherited and maintained consistently, in fair weather and foul, his parent's pro-Roman convictions with a loyalty that cannot be questioned. As Mr Perowne shows us, he was ever a staunch friend; he was also, in his prime, a highly skilful diplomat who contrived, without disloyalty to any of them, to win and keep the friendship of Pompey, Julius Cæsar, Mark Antony, Octavian and, last but not least, that righteous statesman, Marcus Vipsanius Agrippa. His loyalty extended even, and that for far too long, to his factious and often traitorous family, especially to his detestable sister Salome, his evil genius.

Even when read under Mr Perowne's lucid guidance, the conspiratorial story of the later Maccabees, a quarrelsome and rebellious lot, is not easy to follow. Equally complicated are the military operations whereby Herod, having received the crown of Judæa from the Roman Senate at the instigation of Antony and Octavian, ousted the last Hasmonean, Antigonus, and made himself the effective master of his kingdom. The same must be said of the squalid plotting by Herod's kin and descendants related in chapters 24 and 25. What dynasties can have confused history with so many homonyms as the Maccabees and the Idumeans? We have actually to distinguish between two Mariamnes even among Herod's wives.

On the other hand, we have illuminating sidelights on the arts and importance of Syria; on the flowering of Roman culture in Beirut, "the most Italian site in the whole of the Levant"; while farther east we see how all-powerful Rome had a healthy respect for the Parthians and their "Parthian shot." We learn why Egypt was so necessary to Rome and why Herod was for Octavian the ideal "client King." There is an eloquent description of the monotheistic wilderness of Edom, cradle of Herod's race. An interesting if scarcely edifying chapter, "Women at War," tells of the murderous intrigues within Herod's own household and their effect on his character: from the "very moment of his triumph as a king, his decline as a man set in." To this discord a sinister obbligato was contributed by Cleopatra, pursuing Herod with her undying hatred.

Above all, there is the intensely interesting picture of the man himself, gradually degenerating from the handsome, athletic Arab youth, attractive of mien and mind, to the macabre and decomposing old man, crippled, stinking, maggoty and finally mad. In his heyday Herod possessed many admirable qualities. He was a brilliant administrator: his famine relief measures, says Mr Perowne, have never been equalled in the Levant. He had an intellectual versatility more often associated with princes of the Renaissance than with those of antiquity. A keen and incessant traveller (he was three times in Rome), he was a generous embellisher not only of his own cities, but of those of others; in a restless and, indeed, tempestous life he actually found the time and energy (this has quite a contemporary sound) to reorganise the Olympic Games.

The author, with his love of archæology and intimate knowledge of the terrain, is ideally qualified to deal with Herod's least ephemeral achievement—his great buildings in Jerusalem, Jericho, Samaria, Cæsarea, Hebron and the Dead Sea fortresses—and he has been well inspired to include photographs of some of these among his illustrations. Some of the portraits he reproduces are startlingly realistic: thus, the length of Cleopatra's nose on the coin shown here makes more sense of Pascal's famous saying than Pascal himself may have suspected; Mark Antony appears as the complete low comedian or racecourse tout.

One of the best things about this book is that it was written at all, for Mr Perowne has filled with notable success a lacuna that has been suffered to exist since the time of Josephus. Its only defect—a regrettable one in a volume of its quality—is the absence of an index.

Humour with the Lid Off

THE GOOD-TEMPERED PENCIL.
By "Fougasse."
Max Reinhardt. 226 pages. 20s.

FEW readers of *Punch* or *The New Yorker* are sufficiently interested in pictorial humour to probe into the mechanics of the craft. And why should they be? A drawing either rings the bell or does not, and no amount of ratiocinative analysis makes a decibel of difference. Most people are aware that joke drawings now come in the cheap economy size, bare of detail and with a minimum of caption, but they neither know nor care why the classical humorous art of Leech, Keene, du Maurier and Dana Gibson has been replaced by the inspired "doodles" of Thurber, Steinberg, Lancaster and Emett.

"Fougasse," himself a pioneer and master of the hieroglyphic approach to pictorial comedy, has written this book for the few—artists, addicts and connoisseurs—who do care. He tackles his subject with immense enthusiasm and surgical thoroughness. He opens up jokes old and new for our inspection, shows why and how they are funny peculiar or funny ha-ha, and then sews them up neatly and returns them almost as good as new to his museum.

He grades pictorial humour "from the top downwards" as:

> Class I.—Drawing that don't need a legend.
> Class II.—Drawing that do need a legend.
> Class III.—Legends that do need a drawing.
> Class IV.—Legends that don't need a drawing but get one all the same.

—which is fair enough provided that one is prepared to leave artists like Giles and Alan Dunn out of the reckoning. Captionless drawings are as much a period convention as the lengthy rigmaroles of Victorian comic art. At their best they are delicious, and wonderfully satisfying to the artist himself, but they are severely limited in range and intensity. We are funny in words as well as actions, and the most risible of human situations, surely, are those in which we are caught off-balance in both image and alphabet.

The central idea of "Fougasse's" thesis is that pictorial humour should always be good-tempered. "The sense of humour," he writes, "is a practical social sense, a corrector of impractical anti-social behaviour," and is "concerned with crime and not the criminal, the sin and not the sinner, the behaviour and not the behaver . . . ." Humour, he says, is not humour when it arouses anger or indignation. But is this really so? Is Low humourless or ill-humoured because he pokes fun at political crooks. Is Lancaster humourless because he takes the micky out of social buffoons? Was Pont less than Pont when he attacked social injustices and made his readers laugh and squirm at the same time?

Finally, in the mood of a benevolent schoolmaster "Fougasse" marks a number of famous examination papers—du Maurier's ". . . nothing darling, only darling, darling," Thurber's "You heard a seal bark . . ." and so on—and here the hand of the expert is brilliantly displayed.

Most modern humorous artists are represented in this fine collection. But where are Giles, Cobean, Mansbridge, Charles Addams, Alan Dunn and Fougasse himself?

"Look Here, Guy!"

GUY BURGESS.
By Tom Driberg.
Weidenfeld and Nicolson. 124 pages. 12s. 6d.

WHEN Mr Maclean said to Mr Burgess at lunch, "Look here, Guy, I think I'm going to clear out and go to the Soviet Union," Mr Burgess answered, "I don't see why I shouldn't come too"; so off they went, leaving Mr Maclean's detectives at Charing Cross station. That is Mr Burgess's story, and the odd thing is that, whether true or not, for him it would not have been out of character.

He may have had no very strong reason either to go or to stay; of the two, it was Mr Maclean who was in the tighter corner. Can Mr Maclean really have supposed that the detectives had been put on to him for nothing more than heterodox remarks about official policy? If that were the custom of the service, three-quarters of the Foreign Office would have had to be tailed in the last few weeks. Mr Maclean is the more important and interesting of the two cases. Unfortunately, he is only a secondary figure in Mr Driberg's unctuous and repellent narrative. Mr Driberg is concerned with Mr Burgess, whom he interviewed, who gave him the scanty material which he has expanded into a thin book by the device of presenting Mr Burgess to the world as a significant political figure.

It is uphill work. Communists at Cambridge, the two young men left the party in the belief that (in their words, February, 1956) "in the public service we could do more to put these ideas into practical effect than elsewhere." On Mr Burgess's part the action was "a calculated strategic manœuvre," Mr Driberg claims; "the whole of his life since then has followed in logical sequence from that action." Let us look at this stern logic as Mr Driberg himself outlines it. Mr Burgess for a time advised a wealthy woman on her investments. ("But this glimpse behind the scenes of the highest plutocracy did nothing to weaken his Marxist convictions.") He had a shot at working for *The Times* for two months; a couple of spells at the BBC, with, in between, some kind of war propaganda work for a secret department; the Foreign Office news department; at the end of the war, an established job in the Foreign Service and the private secretaryship to a minister. A short, disastrous spell in Washington then finished him in the Foreign Service. He was angling for a new job (on the *Daily Telegraph*) which he did not particularly want when Mr Maclean popped the question. It all suggests, not a man with a mission, but a young man slow to grow up, with talent, friends and opportunities but no constant idea of what he wanted to do.

Mr Driberg, to endow this desultory career with gravity and purpose, pulls out all the stops of "slanted" reporting, unrolling the gloomy background of the age in endless digressions: hunger marches; Nazism; Czechoslovakia; the adventures of Herr zu Putlitz. Even at Cambridge there were "spectacular gestures of revolt": did not Burgess boo the Chancellor of the Exchequer, over the claret at a Founder's Feast? Did he not help to bring the Trinity waiters out on strike? Was he not "a historian of outstanding promise"? (He was, in fact, gifted, but, as Mr Driberg could have learnt from the *Cambridge Historical Register*, when he cracked up in his Part II examination in 1933 he was given not a first but a normal *ægrotat*.)

A vast digression on the Spanish civil war is notable for its final transition back to the subject:

> Guy resisted the emotional urge to follow the example of these heroic friends. The task he had given himself in the international class struggle was more complex; for the moment, it took the humdrum form of working for the BBC.

And why not? Poor Mr Burgess; he has been unlucky in his Boswell.

The Journal of Industrial Economics

Devoted to the economic problems of industry and commerce, is becoming increasingly in demand by both economists and business men.

Finding the History Around Us

By ISLAY DONCASTER. Illustrated

Many people are becoming interested in the history of their neighbourhood. This book will help and encourage all those who want to find out more about the past in their own towns and villages.

Ready in December. *12s. 6d. net*

BASIL BLACKWELL
49 Broad St. Oxford

Caste

GALLANT GENTLEMEN: *A Portrait of the British Officer* 1600-1956.
By E. S. Turner.
Michael Joseph. 345 pages. 18s.

"THEIR officers are as good as good can be, because their training begins early, and God has arranged that a clean-run youth of the British middle classes shall in the matter of backbone, brains and bowels, surpass all other youths. For this reason a child of eighteen will stand up, doing nothing, with a tin sword in his hand and joy in his heart until he is dropped. If he dies, he dies like a gentleman." The arrogance and sentimentality of that quotation are unmistakable. Yet can Kipling be blamed? A recorder rather than a thinker he made explicit what many of his generation believed and which earlier generations, substituting "landed" perhaps for "middle," would have been willing to accept. Discard the colouring of the observer and look at the black and white outline left: the British officer did not have to study his profession; he did not need to be intelligent; but he had to show a brave front.

The sketch is accurate. Mr Turner's narrative fills in the coloured details with humour and in good humour. The occasional stupidities and the lack of knowledge are hinted at rather than painted bold, for Mr Turner concentrates upon the mess and the barracks rather than upon the battle. Obliquely, too, Mr Turner points to the need for courage. He spends, for instance, a good deal of time upon duelling in the army in the early nineteenth century. He is right to do so, for between Waterloo and the Crimea the duelling ground was one of the few places where an officer in the long peace could show his "spirit." And the caste to which he belonged demanded above all a show of "spirit." Even in his cups the subaltern had to be drunk as a lord.

The army officer is Mr Turner's main concern, his chapters on the navy being somewhat perfunctory. Again he is right, for the navy and later the air force demanded a professional skill, while the army was content for long to label as pushers those who were psc. Spanning so many years his book could easily have become merely anecdotal. It is indeed full of anecdotes, told with ease and wit, but the analysis is there, though never pushed too far—to the point of cruelty. And seldom have the debilitating evils of "purchase" been so keenly exposed. The ironic flavour of the book is revealed in the opening sentence of the last chapter: "Somewhat whimsically the Army Act requires that a woman officer shall observe the code of an officer and a gentleman."

This perhaps is the secret. The army officer took with him the behaviour of the class to which he belonged, merely emphasising certain aspects of it—the sense of duty and a rough frivolity for instance. He belonged to a caste; otherwise he would not have been commissioned. He did not create a new separate caste, nor did he off parade have to obey the dictates of a hierarchy. His profession, unlike that, say, of many naval officers, did not open the doors of social privilege for him. He was an insider already. The sense of caste was nearly but not quite killed in two world wars. A faint tradition of its vices and virtues still lingers on. Mr Turner deserves congratulations for setting down its essential qualities before it was too late. But perhaps while an army remains it will never be too late.

In the Camera's Eye

PORTRAIT OF OXFORD.
By A. F. Kersting and Marcus Dick.
Batsford. 95 pages. 30s.

THE most pregnant point made in the admirably honest commentary on these lovely and dignified pictures of Oxford is the suggestion that if only the dons had been allowed to marry half a century or more before the late nineteenth century North Oxford, too, "in place of the present jungle of Victorian Gothic might have been as lovely as Bath or Cheltenham." It is, all through, a tale of greatness missed or lost: North Oxford like the worst of West Hampstead; the university precinct of "an astonishing concentration of so many lovely buildings of such different periods and styles" overwhelmed by traffic and turmoil.

This book of beautiful pictures is, in a way, a whimsy. It shows an Oxford that never is: well over a hundred delightful photographs with no more than half a dozen or so showing even a stationary motor-car, and only a few picturesque students breaking now and then the pattern of stone and art and time. Here, indeed, in Mr Kersting's pictures, is the complete answer to the question: what is there at Oxford to compare with the beautiful university at Cambridge which Mr Kersting has already photographed? But this is not Oxford as anyone can in fact see it; it is Oxford in the camera's eye, with the rush, the rash and the industry left out.

Not that Mr Dick, whose comments are frank, forgives the rash of bad buildings, within as well as without the colleges and university. Nor did the despoiling start in the Nuffield age: there are properly hard knocks for the renovators and innovators of the eighteenth and nineteenth, as well as the twentieth, centuries; Balliol and Brasenose men, with others, will hang their heads. But the glories are here—shown or told: the High, of course; Merton chapel and fellows' garden; Queen's library and front quadrangle; the Codrington library at All Souls; Magdalen tower, again of course; the great staircase and chapter house at Christ Church; Trinity chapel and garden; the "Laudian splendours" of Canterbury quad and the vast lawn at St John's; the main quad and the seventeenth-century glass in the hall at Wadham; the provost's lodgings and the garden view at Worcester; the "quiet charm" of St Edmund Hall; and—the problem picture for those who plan to save Oxford from the modern dragon—"Corpus and Merton from Christ Church Meadow."

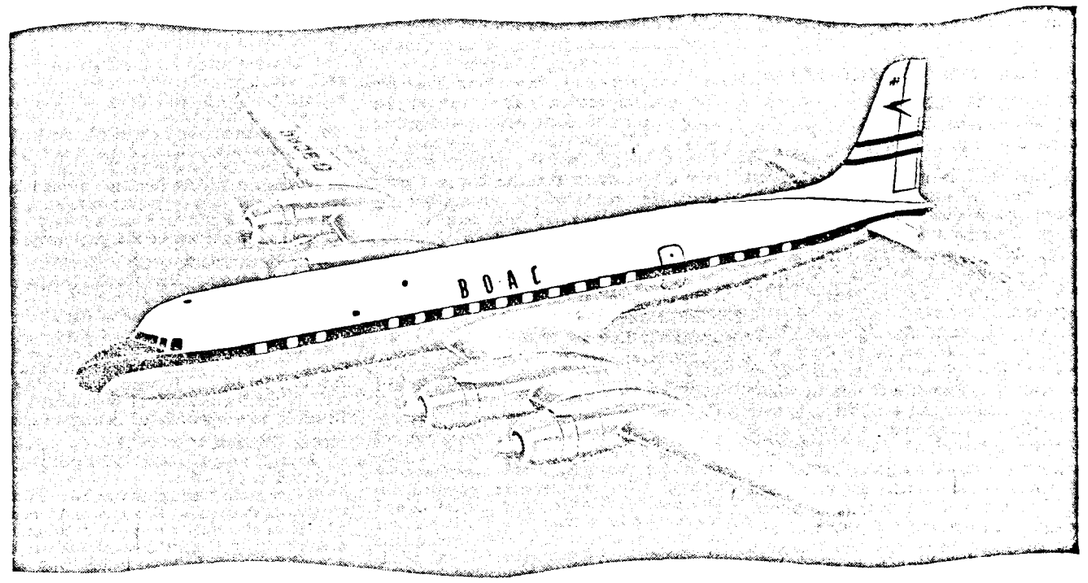
Misplaced Ingenuity

GRAND DECEPTION.
Edited by Alexander Klein.
Faber. 413 pages. 21s.

THERE is something about the history of frauds, hoaxes, and jiggery-pokery in general which strongly appeals to the baser side of human nature. Over and above the pleasure akin to that derived from a finished acrobatic performance, of admiring the perpetrator's ingenuity, daring and impudence, there is the delightful *Schadenfreude* of contemplating, from the heights of superior knowledge, the undignified posture of his victims: the Law, the Experts and the Great Big Gullible Public—from which, of course, the reader confidently dissociates himself. These rather immoral pleasures can be enjoyed in plenty by readers of this delightfully deplorable anthology, which contains no less than fifty-seven tales of variegated phonus-bolonus. Some are perhaps too familiar. Van Meegeren should surely be given a rest; the *Dreadnought* hoax of 1910 is, on this side of the Atlantic anyway, something of a chestnut; and that glorious classic "The Road to En-Dor," lately republished as a paper-back, does not stand up well to sketch-length condensation, even by its original author. Some miss their aim because the victims involve too much sympathy. The man who, in 1826, proposed the remarkable engineering feat of sawing off Manhattan Island would have deserved fame and good will had he merely "sold" New York's City fathers; discovering that he also "sold" a thousand or two hard-up job-seekers and their families, one feels that his activities were in every sense beyond a joke. For the same reason, Samuel Insull makes an unsatisfactory hero; and there are one or two others who leave a dubious taste in the mouth. There are, too, a number of makeweight incidents which, good enough for an after-dinner anecdote, are too slight to qualify for the "grand deception" class.

But even when the less satisfactory material is left out of account, ample riches remain. Here are the Red Bacon of Arizona, the Man Who Took Jay Gould to the Cleaners, and Orson Welles's Martians—the deception that was too good. Here are some fine old antiques: de Rougemont and William Henry Ireland, Riza Bey and Psalmanazar. Here is the splendid story of the Principality of Outer Baldonia—a state whose name, if whispered in the Kremlin, must still cause a few obscure ears to redden. Here are that Köpenick of the Third Reich, Kanonier Schmidt, and Dr Adams with his black box (which still numbers some true believers); and many others. Perhaps the juiciest tale of all is that of the *Bombonne d'Uranium,* which gladdened many people's lives in France no longer ago

STARTING JANUARY!
NON-STOP TO THE U.S.A.



STARTING JANUARY 1957, B.O.A.C. will progressively introduce their magnificent new DC-7C airliners on First Class services London-New York *non-stop.* Soon DC-7Cs will operate on Tourist Class services also. This long-range B.O.A.C. airliner will offer the *fastest* transatlantic travel plus luxury and service rivalling the finest hotels. You'll be delighted with the quiet, vibration-free flying ... the spaciously designed cabins, with their foam-soft seating and handsome furnishings and décor ... the magnificent food and wines ... the friendly personal service for which B.O.A.C. is famous. And the DC-7C is equipped with the latest radar for fair-weather flying all the way. Book "B.O.A.C. plus DC-7C"! First Class single fare London-New York, £157.3.0—return £282.18.0. Tourist Class single fare £103.12.0—return £186.10.0.

Consult your local B.O.A.C. Appointed Travel Agent or B.O.A.C., Airways Terminal, Victoria, S.W.1 (VIC 2323); 75 Regent Street, W.1 (MAY 6611); or offices in Birmingham, Leeds, Manchester, Liverpool and Glasgow (see your Telephone Directory for details).

than 1953. (The organiser of the *coup* passed under the name of General Combaluzier. Why, the examining magistrate asked him, this particular pseudonym? "I had to have some name, and I was in a lift at the time," answered the General.)

This not a scholarly, serious, nor, for the most part, even well written book. But it is very, very funny; and it might just conceivably make gold bricks a little harder to sell.

Diverse Characters

FOUR WORTHIES.
By Wallace Notestein.
Cape. 248 pages. 18s.

WORTHY is not perhaps the best noun of assembly for these four personages of the seventeenth century; indeed, it is hard to think of one that is equally appropriate for such diverse people as John Chamberlain, Lady Anne Clifford, John Taylor and Oliver Heywood.

Worthy is certainly right for Heywood, a Noncomformist minister who preached throughout the second half of the century and kept memoirs in which he expatiated on the evil living among his fellow Yorkshiremen and their unhappy and untimely ends. But it is hardly appropriate for John Taylor, the waterman turned poetaster, who lived by his verse and by wandering round the country, receiving payment and hospitality for his travelogues and good inn guides. Yet he too, remarks Professor Notestein, had "a conventional zeal for morality," which perhaps justifies a claim to worthiness; John Chamberlain was distressed at the prevailing corruption; and Lady Anne was a devout reader of the Old Testament and believed in a speedy visitation on the sinful.

It is these two, Chamberlain and Anne Clifford, who are the most interesting characters of the four. John Chamberlain was a sort of gossip columnist and lobby correspondent combined, writing the news of the court of James I and of the political and social intrigues in a voluminous correspondence, mostly with Sir Dudley Carleton, a diplomat on the continent who wanted to keep abreast of what was going on at home. A Paul's-walker John Chamberlain called himself, for it was talking to people around and in St Paul's that he obtained his information. He lived on the fringe of high society, having his close friends among gentlefolk who themselves did not aspire to high positions in the court.

Lady Anne Clifford, on the other hand, was by birth and marriage—and, it soon appeared, by temperament—one of the grandest of grandes dames. Heiress to vast estates in Westmorland and Yorkshire, she married first the Earl of Dorset and so became mistress of Knole and then the Earl of Pembroke and so to Wilton. But in her married life she was unhappy and it was not until 1649 when, widowed again, she retired to put her northern estates and castles in order that she really came into her own as a most benevolent despot. With her wits still about her she died at the vast age of eighty-six, having been born in the last years of Elizabeth's reign and having spanned by her life three-quarters of the seventeenth century. Of her five castles, two only are not in ruins today, and one of these was recently sold by her descendants. But if to live on in the memory of her countryside is immortality, the indomitable Lady Anne has achieved it.

With scholarship that is as pervasive as it is unobtrusive, Professor Notestein has reconstructed these four lives for the general reader. They can all be studied through their writings—whether letters, diaries or verses—and Mr Notestein has so thoroughly steeped himself in them that he has not only made his "worthies" live again, but has also given us vivid glimpses of the England they lived in.

Shorter Notices

THE BIRTH OF ROWLAND.
By Emily Lutyens.
Hart-Davis. 248 pages. 25s.

This exchange of letters between Robert Lytton and his wife Edith in the year 1865 has been collected by their daughter.

Robert Lytton was the only son of Edward Bulwer Lytton, novelist and politician. Robert's childhood was miserably unhappy; his parents were separated, his only sister died in Germany of typhoid, and his mother he never saw. His father was preoccupied in politics and writing and specialised in a highminded huffiness; it is difficult to understand his son's admiration for him. Edith Villiers's mother was one of those women whose tiresomeness is hard to explain or to forgive. Her three daughters' lives became unbearable by her ceaseless stream of talk and constant interference.

After Robert's marriage with Edith Villiers, they enjoyed some months of unalloyed happiness in Lisbon where Robert was first secretary at the British Legation. When Edith was expecting a baby she returned to England for some months. Hence this collection of letters between husband and wife. It is hard to evaluate them. They deal with few matters of public interest, but they have that freshness and intimacy which only letters not intended for publication can achieve. They should be interesting to the student of the 1860s as there are many vivid descriptive touches of England and Portugal which have escaped the notice of more important biographies.

★

THE COMPLEAT IMBIBER.
Edited by Cyril Ray. *Putnam.* 256 pages. 25s.

Thirty-three well-known writers and some notable artists have contributed to this book, a collection of short stories and of essays, some light and some learned, on the theme of drinking. The best anecdote, perhaps, (told by John Betieman) is about the reverend head of an Oxford college:

> Someone had brought a guest to the high table who was a confirmed teetotaller. At the end of dinner he was offered a glass of port, and proclaimed in a loud voice, "I would rather commit adultery than drink a glass of port." Then that ancient and reverend head of the house broke the silence by saying, "And who wouldn't?"

It is a good bedside book for Christmas.

Other Christmas Books

THE HUMAN AGE: *Book One, Childermass. New Edition.*
By Wyndham Lewis. *Methuen.* 401 pages. 25s. Illustrated by Michael Ayrton.

This is the first book of Mr Wyndham Lewis's series, "The Human Age," of which books two and three appeared a year ago and were reviewed in our Autumn Book Supplement on November 12, 1955. "Childermass" was first published in 1928, and it is now republished in the same edition as books two and three.

THE FIRST COUNTRY LIFE PICTURE BOOK OF LONDON.
Introduction by John Codrington. *Country Life.* 210 plates. 30s.
This book combines in a single work the three previously published volumes. The pictures, mainly by Mr G. F. Allen, form an excellent record for London's visitors and residents. It is only unfortunate that, in some cases, the printing process does not do full justice to the art of the photographer.

POTTER ON AMERICA.
By Stephen Potter. *Hart-Davis.* 160 pages. 12s. 6d.
This is not another volume in Mr Potter's famous series—would it have been called Unitedstatesmanship?—but an illuminating diary of his friendly travels all across America in 1955. It makes an antidote, well suited for the season of goodwill, to Britain's recent surfeit of Americaphobia.

MODEL ODDLIES.
By Paul Jennings. *Max Reinhardt.* 155 pages. 10s. 6d.
Forty-one more Jennings satires, all reprints, nearly all from *The Observer.* Anybody who gives this oddity away runs an about even chance of creating a grateful addict, or else of being regarded (together with Mr Jennings) as obviously mad.

ROUND THE WORLD IN EIGHTY DISHES.
By Blanch Lesley. *Murray.* 196 pages. 18s.
Little Pigs of Heaven from Spain, Moors and Christians from Cuba—these are some of the intriguing-sounding recipes described in this book which, nevertheless, do not ask the impossible of an English cook.

GRANDFATHER'S LONDON.
By O. J. Morris. *Putnam.* 127 pages. 21s.
A collection of old photographs, with accompanying text, taken in the eighties, most of them on behalf of the Reverend Spurgeon, son of the famous minister. The majority were taken in Greenwich and are of characters rather than scenes—pieman, shoe shine boy, chairmender, sweep, etc.

THE CONNOISSEUR YEAR BOOK 1957.
Edited and compiled by L. G. G. Ramsey. *The Connoisseur.* 164 pages. 21s.
Elegantly illustrated, this annual ranges over such varied subjects as English and Scottish country houses, furniture and silver in America, porcelain, paintings, antique garnet jewellery and locks.

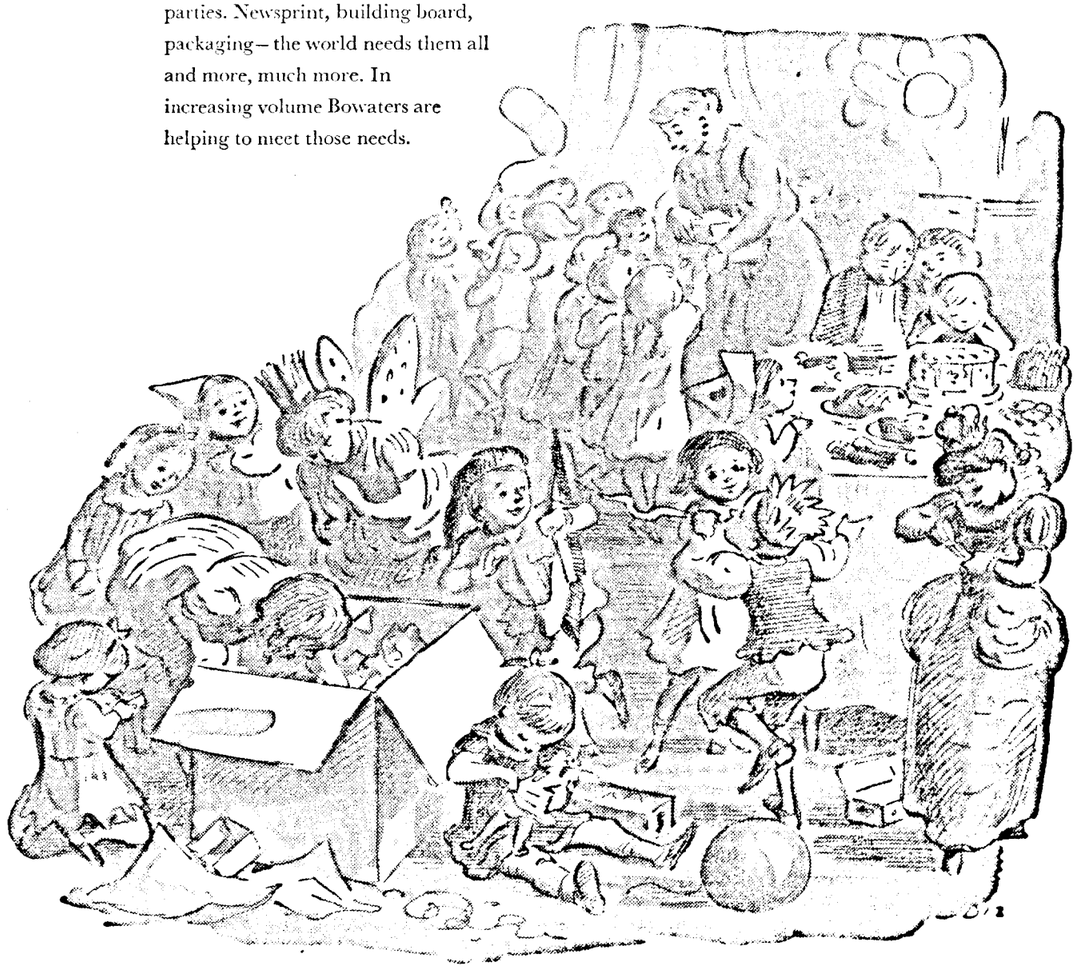
THE NEW SMALL GARDEN.
By Lady Allen of Hurtwood and Susan Jellicoe. *The Architectural Press.* 126 pages. 15s.
This well-illustrated book is a useful guide for those with small gardens and big ideas.

THE POSTAGE STAMP: *its history and recognition.*
By L. N. and M. Williams. *Penguin Books.* 272 pages. 3s. 6d.

ADVENTURE OF THE SEA.
By James Fisher. *Rathbone Books.* 68 pages. 15s.

THE GOLDEN BOOK OF ASTRONOMY: *an introduction to the wonders of space.*
By Rose Wyler and Gerald Ames. *Publicity Products.* 93 pages. 15s.

PARTY POLITICS dictate that every fancy dress must win a prize. Everyone, from the Sugar Plum Fairy to Davy Crockett, must have something to unwrap. Children owe much to the skill of the paper maker: corrugated cases (for presents of too obvious shape), intriguing boxes and, of course, the smooth brown paper, the maker of heavenly parcels. These are only a few of the things that Bowaters make—from timber—for the benefit of all parties. Newsprint, building board, packaging—the world needs them all and more, much more. In increasing volume Bowaters are helping to meet those needs.



The harvest of the forest is given many forms by **BOWATERS**

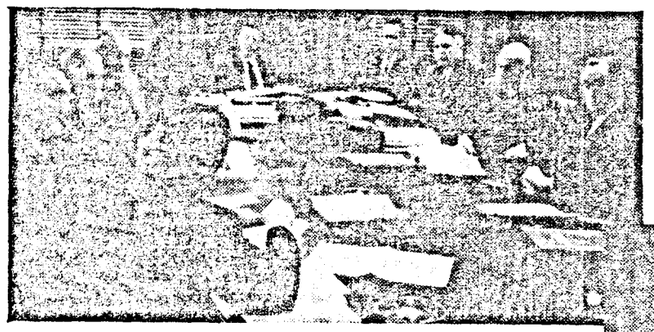
Project: Growth

THE BILLION DOLLAR BOARD



Diversification started . . . and quickly shifted into high gear at the Pressed Steel Car Company in 1948. That's the year John Snyder became President and Board Chairman. The record since? 12 healthy divisions . . . a sales level around $115 million . . . and a new name that fits perfectly: **U. S. Industries, Inc.** And the company turns out nary a freight car – its bread and butter for over 40 years!

This one-company "Industrial Revolution" is the product of the widely experienced men on USI's Board. Leaders of corporations that total billions in assets, they have successfully led USI into making: aircraft landing gears, engine lathes, petroleum pumping and gas-lift equipment, giant metal forming presses, welded steel pipe for water, oil and gas transmission, dairy equipment, cookware, electrical fittings, steel tanks, and components and systems for jet aircraft and guided missiles. And USI is gathering momentum all the time!

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Middle Eastern Experiment

Washington, D.C.

THE United States appears determined to achieve in the Middle East a feat of foreign policy which, if successful, would be virtually unprecedented in the long history of diplomacy. In its simplest terms, this is an effort to impose a settlement, in a situation where interests and attitudes conflict deeply, almost solely by the moral force of world opinion, operating through the United Nations. The key word is "impose." If the future unfolds as the State Department hopes it will, neither the Arabs nor the Israelis will be able to thwart what the United Nations decides is the right solution for their conflicts.

The theory here is that, with the UN police force installed, the tension and hatred in the Middle East will gradually die down. Then at an appropriate moment—presumably early in the New Year—the United States will press in the United Nations for its resolution to form a special committee which would try to find a solution to the Palestine question. This committee, to be made up of very prominent world statesmen, would have *carte blanche* in its search for answers ; the General Assembly would be asked to vote on any plan produced. Meanwhile, the United States would make it clear that it was prepared to offer anything necessary in the way of economic aid to ease a settlement and would also be prepared to offer guarantees of frontiers if that seemed useful.

The important point is that this would not, as now envisaged, be a "US plan" at all. According to the line of reasoning that produced the policy, the worst thing that could happen would be for the countries of the area to believe that the United States was imposing a settlement on them. The theory is that the United Nations has shown in the Middle East that it can get results—that it can end an aggression—and that the United States has shown that it stands by "moral" principles. These two demonstrations together should create a climate in which it would be impossible for any single country or group of countries in the area to frustrate the solution that emerges. As one high American official puts it:

> When a fair solution is agreed upon by the committee and by the General Assembly, we're going to put both sides into a room, as it were, with the understanding that they are not to come out until they have signed on the dotted line.

Signing on the dotted line, needless to say, involves Arab recognition of the permanent existence of Israel—a consummation which the United States is certain any UN plan will envisage and require. It is possible that the same method would be used for a Suez Canal settlement, but current thinking in Washington is that direct negotiations between Britain and France and Egypt are more likely.

★

Two comments must be made on this policy. The first is that many intelligent Americans, including a great number in the State Department, think it is unrealistic and sure to fail. The school of *Realpolitik*, which is not without influence in the United States, believes that the dream of using "moral" force, through an international body that is even less than the sum of its individual members, is naive. Second, this plan is a very different matter indeed from the traditional concept of "filling a vacuum" with military bases, alliances, puppet governments or even economic subsidies. It depends, again, on the "moral" influence of the United States over Israel and the Arab states to create a settlement.

As for keeping out the Russians, this is to be achieved mainly by a combination of the second thoughts of the Arab leaders themselves with the ending of the chaos which invites mischief-making. Always in the background there would be the Sixth Fleet and a firm understanding that the United States, as already announced, would oppose the physical presence of any Soviet forces in the area, and would view "with the utmost gravity" any threat to the "territory or political independence" of the members of the Baghdad Pact.

Although the cast of mind that has produced this vision of a middle eastern future is idealistic, some very hard-headed thinking has gone into the policy. It begins with an assumption that the world today is fundamentally different from any past period, chiefly because the world's backward nations can now insist upon their sovereignty. The very existence of the United Nations is another difference. Finally, there is the hydrogen bomb, with its apparent effect of limiting the recourse to force.

If the consequence is that it is now difficult for great powers to control smaller powers the situation has its advantages, too. It means that a man like Mr Nehru might be able to talk sense to a Nasser where the British Navy could not. It means, especially after Hungary, that smaller nations are wary of becoming puppets, through internal subversion or even excessive reliance on aid from the Soviet Union. The United States has simply never accepted, for example, the British view that President Nasser had become a full-fledged Soviet vassal though, in the case of both Egypt and

Syria, it is feared that their leaders may be too confident of their ability to accept Soviet help without finding themselves in the end in a Soviet grip. Finally, it is also felt that economic self-interest must surely have some impact on Arab policy, and that this leads in only one direction—co-operation and "interdependence" with the West.

It is possible that the Americans may be forced in the end to resort to more traditional methods to keep the Middle East safe and orderly. There are plenty of people in Washington who talk about appropriately-financed internal political coups, new military alliances and the like. Or it may be that the situation in the Middle East will revert approximately to what it was before, minus what little British and French influence remained, but with Israel as fearful for her existence and oil supplies as precarious as ever. Or, at worst, it may be that the Russians will, in fact, work themselves into a political dominance over the Middle East. Few Americans, even among those who have created and backed the current policy, are blithely optimistic. But the President apparently feels, with Mr Nixon, that "we should never underestimate the force of the moral judgment of the world," and that is the horse which American policy has chosen to ride.

Back to the Alliance

THE United States has been as generous in responding to the British and French withdrawal from Egypt as it was firm in demanding it. In the absence of the President it has fallen to the Vice President, who is apparently to play an increasingly large part in international affairs, to make the first major foreign policy speech since the election. Without abating in any way America's claim to have laid the foundations of peace with justice, Mr Nixon conceded that the United States, as well as Britain and France, might have been at fault in the Suez tragedy. He assured Britain of America's economic aid, and recognised that the allies' abandonment of force meant that a vigorous effort must be made to find other means of righting injustices.

These conciliatory words preceded the Secretary of State to Paris where, for the first time since the crisis, he is renewing his contacts with Mr Lloyd and M. Pineau. But the Vice President's reminder that Britain and France, unlike the Soviet Union, had submitted to the verdict of the United Nations, was meant for the ears of the new Congress, one of whose first tasks next month will be to approve the waiver of interest on the British loan. The Administration is losing no time in creating the favourable atmosphere which will be needed in Washington if economic dislocations this winter are not to jeopardise the gains Europe has made under the Marshall plan and strain the alliance still further.

In the task of reknitting the Atlantic ties the appointment of Mr Christian Herter, the retiring Governor of Massachusetts, to succeed Mr Herbert Hoover, Jr, as Under-Secretary of State should be an asset. Unlike the cautious, inexperienced Mr Hoover, who was in charge at the height of the Suez crisis because of Mr Dulles's illness, Mr Herter is more interested in new ideas about the substance of foreign policy than in the details of administration. His creative contribution to the Marshall plan when he was a Congressman is a guarantee of his enthusiasm for collective security. One appointment, however good, does not make a summer in the State Department, and Mr Herter's scope will be determined by the role his chief adopts after his illness. But this first move of the President to strengthen his foreign policy-making team is inspiring confidence among America's allies and is certain to be popular with Congress.

Dollar Aid

LAST week's rumours of a billion dollar "little Marshall plan" for Britain hardly survived for twenty-four hours. In an extremity, the Administration would be prepared, as Mr Nixon suggested, to seek loans or grants from Congress to avoid economic chaos in Britain and on the continent. But it would be reluctant to inflame isolationist sentiment, particularly in a year when dollars may be needed to lubricate a middle eastern settlement. And as Mr Humphrey, the Secretary of the Treasury, hastened to point out, the crisis would have to go on for twelve months for Britain to need anything like $1 billion; half that is Washington's unofficial estimate of the very most Britain and the continent are likely to require.

Aside from the waiver of the $82 million of interest due on the American loan, American aid at this time has consisted of helping Britain to use the financial institutions which already exist, primarily the International Monetary Fund, which this week announced permission for Britain to withdraw up to $1.3 billion in exchange for pounds. This massive credit is for the defence of sterling, to which the Administration attaches great importance. Another line of credit, to pay for dollar oil and other commodities, is being sought from the Export-Import Bank, perhaps using Britain's dollar securities as collateral. An Export-Import Bank loan would not require congressional approval although, unlike advances from the fund, it would affect the American budget and taxpayer.

What may have given substance to the talk of a billion dollar loan to Britain is the United States Treasury's decision to raise this amount in tax anticipation certificates running from the middle of December to March, 1957. Dollars sent abroad either by the fund or the bank have to be obtained from the Treasury, although, in the case of the fund, this is only a matter of exchanging US Treasury notes for cash. The Administration had hoped to avoid further borrowing this year, but the Treasury balance, at $3.5 billion, is below its usual level of from $4 billion to $6 billion; even without Europe's crisis it would probably have needed replenishing until tax receipts reach their flood next spring.

Colour Contempt

THE arrest of sixteen inhabitants of Clinton, Tennessee, on charges of criminal contempt will provide a test of the machinery for enforcing the federal courts' decisions against segregation in schools. The admission of twelve Negro children into the Clinton high school had been specifically ordered by a federal district court for last August. It was accomplished, despite a week of rioting, by the combination of a permanent injunction against interfering in the operation of the school with a show of force by the Governor's state troopers. But a fortnight ago this achievement was jeopardised by assaults on the Negro children and on a white Baptist minister who attempted to escort them to school; these attacks followed the acquittal by a local jury of a demagogue from outside the town who had been charged with inciting the previous riots.

Fortunately the Department of Justice, which has not always been so prompt on matters of civil rights, appears to realise that it cannot afford to show any weakness in a part of the South where it does not face the ultimate obstacle to enforcement of the law, the last-ditch resistance of the state authorities. Indeed the danger to be avoided was a very different one: that local officials would contract out of the unpopular duty of executing the court's will by dumping the whole problem in the lap of the federal government. Last week the municipal authorities impulsively closed the school and informed Mr Brownell, the Attorney-General, that it was "the height of absurdity and wholly inconsistent with reality" that they rather than he should be expected to impose the Supreme Court's obnoxious decisions.

Mr Brownell's reply was a nice blend of political shrewdness and constitutional rectitude. The principal responsibility for helping Clinton to restore law and order was thrown, correctly, on the Democratic Governor, Mr Clement. Since this inordinately ambitious young man hopes to cut a figure on the national stage, everyone knows that he cannot afford to show too much complaisance to the bigots in his own backyard. At the same time the Attorney-General made the most of what his department was doing to help. In particular the local United States Attorney placed his own office's resources and those of the awe-inspiring Federal Bureau of Investigation at the disposal of the district judge, so that the people responsible for breaking his permanent injunction could be identified and charged.

Now that the local authorities in Clinton, emboldened by this degree of outside support, have faced their duty it is not so far proving too difficult. In last week's municipal election, responsible candidates overwhelmed opponents who had been endorsed by a local segregationist group. The school has just reopened; and the local police seem to be managing without the need for state troops.

Tomorrow's Arsenal

FROM A SPECIAL CORRESPONDENT

NEITHER the doctrine of "massive retaliation" nor progress in developing the intercontinental missile to carry it out has blinded the defence authorities in Washington to other needs. This will be apparent in January when the annual military budget, which the Secretary of Defence took to Georgia last week for the President to review, must be presented to Congress. The estimates will then be found to carry authorisation for many new and advanced weapons besides the intercontinental ballistic missile.

These shorter-range weapons have the advantage of being much more nearly ready for the services. In recent weeks several have been brought out of the secrecy of the laboratory. It is interesting to see how many are intended for the Navy, and to note that several intended for the Army are designed for extremely mobile field forces with great flexibility of purpose, rather than for an exclusively atomic, all-out conflict.

The Navy's need to plan for more than one kind of warfare was underlined recently by Mr Garrison Norton, its new Assistant Secretary for Air, who is one of an increasing number who think that massive weapons may deter nuclear warfare without ruling out other kinds of clashes. In his view,

> there is no doubt whatever that we must speedily develop our own alternatives to the "massive retaliation" capability upon which we have concentrated so much of our manpower, time and money. Indeed we must develop alternatives on the social and economic fronts as well.

In a searching study of weapons policy Admiral Arleigh Burke, Chief of Naval Operations, also has pointed out that

> if a potential aggressor concludes, as we hope he will, that all-out nuclear war does not pay, it is reasonable to expect him to examine other ways which may promise better return from the risks involved. . . . Inability to see clearly into the future emphasises the importance of flexibility, diversification, and open-mindedness in future planning.

Under Admiral Burke the Navy has made a vigorous effort to increase its flexibility and versatility. The close attention given to wholly new kinds of arms has not halted improvement of existing types. To a striking degree the Navy has pushed ahead in the development of whole systems of weapons as distinguished from single weapons.

★

The best example is an aircraft-carrier which, while four years from completion, is designed to get maximum value from an aircraft not yet in production, just as the aircraft in turn is designed to make the best use of a particular bomb or other device which also is still being developed. The aim is to foresee potential developments, relate them to each other, and take advantage of a long period of construction or remodelling to introduce improvements not originally contemplated. Among these have been certain innovations by the Royal Navy which have been adopted with great thoroughness by the US Navy—notably, in the carrier category, the steam catapult, the angled (canted) deck, and latterly the mirror-landing.

The Navy also makes an impressive case for its use of the nuclear "big weapons" so sought after by all three services. It is working jointly with the Army on the Jupiter, a ballistic missile which is expected to be able to lay down a nuclear warhead with satisfactory accuracy 1,500 miles away. The Navy argues that such a missile launched from a wholly unpredictable spot on the high seas somewhere near an enemy shore has, in effect, the same range as a missile which can cover 5,000 miles but which would be launched from a distant land base with a whole ocean to cross. It is claimed that the intermediate missile has a proportionately reduced probability of error, that its shorter time in flight and concealed point of origin—and hence its flight-path—reduce the chances of enemy detection and even more important, that it has no fixed base which the enemy might identify at leisure and put out of business.

Admiral Burke (without mentioning some contrary views from the Air Force which is hard at work on its own 5,000-mile intercontinental missile project) suggests that "the ballistic missile will reach its peak of effectiveness when launched from ships cruising the high seas."

Another new device, genially termed "Lulu," is regarded by the Navy as the most important single anti-submarine weapon yet devised. It is the essential element in a weapons-system which includes detector and launcher. Its importance is related to the fact that the Soviet Union is believed to have the largest submarine fleet in the world today, with numerous components able to navigate and operate very far below the surface. This permits a submarine to cruise under a number of those varying thermal levels of sea-water which deflect normal sonar signals as well as visual sightings; during the last war these deflections enabled countless submarines to escape the depth-bombings which overconfident destroyer commanders felt sure would hit the foe.

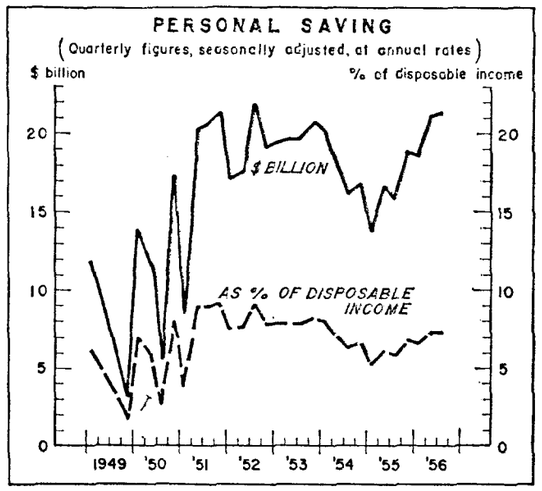
Lulu meets this situation by mounting an atomic warhead whose explosion is effective for a very considerable radius (over a mile). Combined with a materially improved sonar system which permits better detection than ever before, either by aircraft or surface ships, this greatly widened destructive power is formidable against a submarine. The weapons-system includes also, for shipboard operation, a launching device which will throw the missile accurately to a distance sufficient to let the ship itself keep clear of the hull-shattering powers of Lulu.

The Air Force, it is learned, is about ready with a new air-to-air missile, the first of that type with a nuclear warhead. This means that it could be effective, not against the one enemy aircraft to which it is guided, but against a considerable formation of bombers, so wide is the blasting range of any nuclear weapon. It is a marked advance over the present Falcon (Air Force) and Sparrow (Navy) types, which are unlikely to bring down more than a single enemy raider. The new nuclear missile is believed to have a homing device of very great value. It responds to infra-red rays given out by the engine of the raiding aircraft; hence it is not susceptible to the jamming tricks which are effective against a radar-homed missile. It is assumed that the new weapon will prove usable by the naval air arm.

Army Ordnance is producing some advanced weapons of its own, such as a remarkably effective stabiliser for tank-mounted guns and some rapid-fire guns of rather dazzling efficiency. All these developments suggest a widespread awareness in Washington that defence preparations call for a great deal besides the intercontinental missile and its grisly relatives.

Savings in Step

LAST week the federal banking officials allowed commercial banks to lift the interest they pay on savings accounts and on time deposits of more than six months' duration to 3 per cent from the present maximum of 2½ per cent. The increase, which comes in on January 1st, is the first for 21 years and it can affect about $50 billion worth of deposits, three-quarters of them in savings accounts. The change was apparently made primarily in order to bring these rates into line with the general rise in interest charges and, where savings accounts were concerned, to enable those commercial banks which are active in this sort of business to compete with the specialised savings institutions which have been paying 3 per cent for some time. Except on the east coast few commercial banks actually offer the maximum rate on savings at present and many of them are not at all enthusiastic about the permission they have now been given, since such higher interest



charges could increase their operating costs substantially. Nevertheless a number of banks, led by the largest commercial bank in New York, the Chase Manhattan, have announced that they will be paying 3 per cent after January 1st. As a result, many savings associations are in their turn considering whether to put their rates up to 3¼ or even 3½ per cent.

The chief effect of these higher interest rates may be merely to move deposits around between different banks and different kinds of account, rather than to add to the total of personal savings. But the government officials responsible certainly hope that the increase may achieve the latter. Plenty of money is being saved today but, if people saved still more, they would spend less and thus lower inflationary pressure; more important, from the business man's point of view although not from the government's, the lending institutions would then have more money available for capital expansion. This would help to loosen the present tightness of credit, particularly where it is hurting most—in the housing industry; the specialised savings banks are an important source of money for mortgage loans.

Last week, however, the federal housing agency, concerned at the slump in home building, did something to encourage the provision of more money for this type of construction. Government-insured housing loans were brought into step with other types of mortgages and securities by raising the interest allowed on them to 5 per cent from 4½ per cent. But the increase cannot be applied to the government-guaranteed mortgages available for ex-servicemen without authority from Congress, which may not be granted. Unless the rate does go up, funds for ex-servicemen's houses are now expected to be almost unobtainable.

69 OVERSEAS BRANCHES, OFFICES

AND AFFILIATES IN 24 COUNTRIES

3,500 BANKING CORRESPONDENTS

From A to V—from Argentina, round the world and back again to Venezuela, wherever trade flourishes, you will find a branch of the First National City Bank.

The extensive organization of the First National City Bank offers an important service based on a network of sixty-nine overseas branches, offices and affiliates covering the whole globe. Completing the system, and ensuring up-to-the-minute news of world market conditions, are banking correspondents in every major centre of commerce—three thousand five hundred of them.

The experience and resources of such an organization are clearly invaluable to the businessman with foreign interests. Wherever *your* interests lie, it will be very well worth while consulting our London offices. You will find our staff experienced and most anxious to help.

The FIRST
NATIONAL CITY BANK
of New York.

Lubricating and parting media for ALL engineering processes

Hundreds of processes—intricate and simple—in engineering today have been quickened and improved by the use of 'dag' dispersions of colloidal graphite. Their unique properties provide a low-friction wear-resistant "graphoid surface" which solves lubrication and parting problems involving high temperatures, extreme pressures and excessive friction. Consult us about possible applications for 'dag' dispersions in your manufacturing process.

MAN WITH A PATIENT OUTLOOK

SHIP'S SURGEON, *aboard the P & O ship,* ARCADIA.

WHAT'S this he's doing? Looking in on somebody? One of the crew took a bump. Evidently no damage done. But as usual he takes care instead of chances. And that is to everyone's good. Yesterday a youngster turned a somersault from sheer joy . . . sprained her wrist . . . tears . . . then a wonderful smile . . . because he came along to look after her. And that passenger who didn't come to dinner this evening . . . nothing wrong that he couldn't put right . . . couldn't be in better hands.

He's a man with a patient outlook—enjoying the best of health—your health. He is highly professional, and intensely human. And he's not alone in this . . . far from it. He has a fully-qualified assistant, a staff of nursing sisters, a sickbay and even an operating theatre fully equipped for any emergency (if ever one should arise). He is watchful of your welfare . . . ready for anything . . . from a touch of sunburn or an aching tooth . . . to an 'interesting event'. He is Ship's Surgeon aboard the P & O steamship Arcadia . . . as vital to life aboard her as the P & O is to the Commonwealth lifeline.

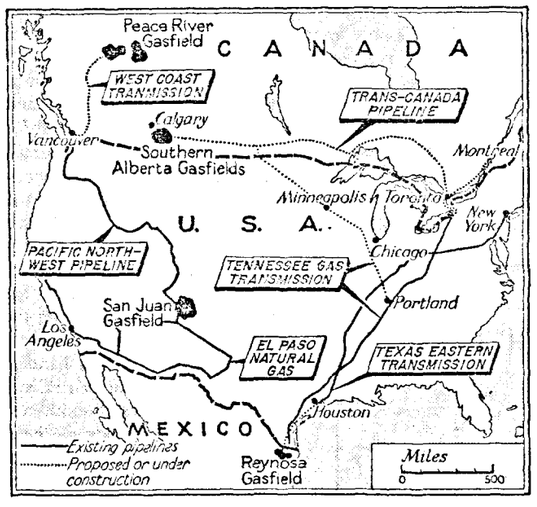
Operating from 122 Leadenhall St., London, E.C.3, the Peninsular and Oriental Steam Navigation Company links Britain and Britons with the Mediterranean, Egypt, Pakistan, India, Ceylon, Australia, Malaya and the Far East.

P & O

A COMMONWEALTH LIFELINE

Gas Across the Border

FOREIGN natural gas, brought in from Canada in the north and Mexico in the south, is now accepted by the American government as a desirable supplement to domestic supplies. In one recent decision the Federal Power Commission, which regulates the operations of the American natural gas pipeline companies, even reversed its previous stand that no American consumer should be entirely dependent on gas controlled by a foreign power. This new attitude will improve the chances of the project to divert to the United States some of the gas which is to be carried by the proposed Trans-Canada pipeline from the gas fields in southern Alberta to consumers in eastern Canada. Some 200 million cubic feet of gas a day would be piped off the main line at a point in Manitoba, southwards across the border into Minnesota, and then south-westwards to join the Tennessee Gas Transmission Company's line at Portland, Tennessee. As part of this scheme more



American gas would be brought into the Toronto area, in order to build up in advance the market in eastern Canada for the Albertan natural gas.

On the west coast the import of up to 300 million cubic feet a day of Canadian natural gas was approved by the FPC last year. This gas will come from the Peace River reserves in northern Alberta and British Columbia by a line which is to be linked into a system which also brings American gas from the prolific San Juan basin near the intersection of the borders of Utah, Colorado, New Mexico and Arizona. The two main pipeline companies supplying the west coast area with natural gas—Pacific Northwest Pipeline Corporation in the north and the El Paso Natural Gas Company in the south—formerly bitter competitors, now propose to merge. If not blocked in the courts, this would result in a single flexible transmission system, supplied by gas fields from Canada to Texas, which would be well placed to invade the rich potential market in northern California.

A third proposal for importing natural gas, this time from Mexico, was approved by the FPC in October. Texas Eastern Transmission Corporation, which operates gas trunk lines from Texas to New England, will supplement its supplies next year by 115 million, and eventually 200 million, cubic feet a day of natural gas piped across the Rio Grande from the reserves owned by the Mexican government a few miles inside the border. Together, these three proposals may eventually bring over 1 billion cubic feet a day of foreign gas into the United States—but this will still account for a mere 3 per cent of all the natural gas used in the country.

Shaky Bases

IN the course of its apparently endless negotiations with the Philippine Republic over the terms on which the American air and naval bases are to be held, the United States must sometimes wish that the Filipinos had cast their constitution in the British rather than the American mould. Last week's indefinite "recess" of the present set of talks sprang largely from the efforts of strong elements in the Philippine Congress to embarrass President Magsaysay in his pro-Americanism in preparation for next November's election. The American delegates prepared to leave Manila in some dudgeon when they discovered that the Filipino negotiating panel considered itself bound to insist on terms laid down by a committee of the Philippine Congress.

These would shake the foundations of the agreement of 1947, which gave the United States the bases at the same time as the United States gave the Philippines independence. The lease of the bases, which would be cut down from ninety-nine to twenty-five years, would be tied to the regular receipt of military aid from the United States, thus giving the aid a strictly contractual character and depriving the American Congress of its cherished right of annual review. The military installations would be kept away from centres of population and Manila abandoned as a military port. At the same time the Philippines would have a veto over the use of the bases in time of war.

Until this point the Americans had been under the impression that the main source of grievance had been removed by Vice President Nixon's announcement on his last visit that the United States would concede the disputed legal title to the bases to the Philippines, so that they could no longer be called "American soil." If the present set of Philippine demands were granted, they would leave American forces, in one of their principal strongholds in the Pacific, in a scarcely less precarious position than they are in at the base they operate on behalf of the North Atlantic Treaty Organisation in Iceland.

So adverse to allied interests did the first accounts of the new terms agreed with Iceland appear to be that there was some questioning in the American press as to whether it would not have been better to accept the original Icelandic request to withdraw. But fuller accounts now show that the reversal of Iceland's position, as the result of economic difficulties and worry over events in Hungary, has been fairly complete. The Americans are to have, as before, eighteen months' notice if Iceland wants them to go; only it has now been made explicit that Iceland is not bound to accept a Nato ruling that they should be allowed to stay.

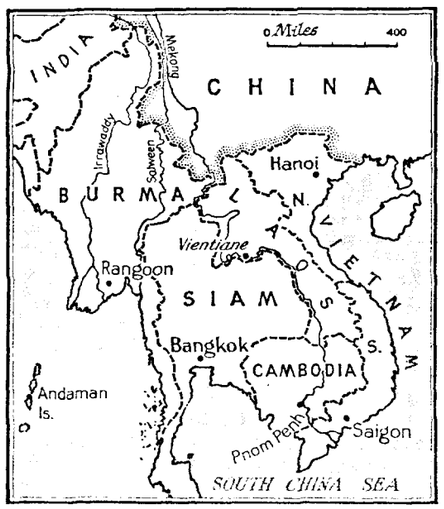
The World Overseas

In China's Shadow

Stable Siam Looks West

All China's neighbours are exposed to the pressure of China both as a great Asian power and as a source of Communist influence. In these articles our special correspondent now visting several countries of south-east Asia attempts to assess the pressure on them of their great neighbour and their reaction to it.

TO reach Bangkok from Rangoon is like stepping from poverty to riches. The arrival at the gleaming modern airport of Siam's capital is like a return to the West from the underprivileged decay of Rangoon's temporary structures. In Bangkok the streets are clean and the surfaces roadworthy ; in Rangoon they are littered and potholed. Perhaps more relevant, you would not see at Bangkok airport the immense Soviet Ilyushin aircraft sent to Rangoon, it is said, merely to collect the body of a dead diplomat, but heavily laden with more and yet more Soviet officials, stolid and herrenvölkisch in their ill-fitting suits. Burma is neutral and the Ilyushin is the symbol of neutralism ; Siam is pro-western and thrives on American aid. Burma, on the other hand, spurned American aid some years ago and is stuck in bartered Russian cement.



In relation to China, both Burma's neutralism and Siam's conscious involvement with the West are individual attempts to solve the same problem—that of remaining independent of the northern giant. The Burmese see no sense in antagonising their powerful neighbour by aligning themselves with the West ; like the Indians, they place their faith—still—in the magic power of the "five principles." The Siamese, on the other hand, see no sense in inviting the tiger into their parlour ; and the South-East Asia Treaty Organisation, much denounced by some of their neighbours, brings them the comforting knowledge that they have powerful friends. In south-east Asia, of course, Burma's approach is the rule and Siam's the exception. One should, however, resist the temptation to conclude that because Siam is by far the most stable country in the area the Siamese method has proved itself superior to the Burmese-Indian one. This would be confusing cause and effect: it is because Siam is more stable than the others that it can afford the luxury of a pro-western policy. It is not necessarily possible for other countries in south-east Asia to follow the Siamese example, though President Diem in South Vietnam is attempting to do so.

The reasons for Siam's stability are nearly all peculiar to Siam among the countries of the region. Siam seems almost infinitely resistant to communism because it has a well-fed and contented peasantry, with a high proportion of smallholders ; because more than two-thirds of its Chinese population of three million, have Siamese citizenship and the other third as a whole is much less interested in politics than its counterparts in Malaya or Indonesia ; because respect for authority and love of the monarchy are deeply ingrained. Even among the small politically active class, communism appeals only to a handful of intellectuals. As for neutralism, alone of the countries of south-east Asia, Siam has never been colonised by the white man ; without any anti-colonial neurosis, the Siamese see no point in neutralism, which, in this area, is an assertion of independence from the West.

But although Siam looks stable, it would be foolish to forget its long tradition of bending like the bamboo rather than snapping like the twig. If ever the Americans withdrew to "fortress America" leaving the Siamese to their own devices, no one would blame them for seeking a *modus vivendi* with China. With this in mind, some observers in Siam have interpreted the marginal change that has marked Siam's attitude to China over the past year as an attempt to insure against a future American change of policy. This is no doubt an element in Siamese thinking, but there could be others, such as the urge to keep the Americans up to the mark with aid, or the desire not to allow Siam to become too isolated from the main current of Asian thought. The symptoms of the marginal change include the fact that Siam is now indirectly trading with China, through Hongkong and Macao (though not in strategic goods) ; the policy of not recognising China *until* it is admitted to the United Nations (the question simply used not to arise) ; and attacks on America in newspapers owned or controlled by powerful members of the government.

Yet the Siamese political leaders have ready answers to any questions that may arise. General Phao, burly and jovial, chief of police, Siam's ablest administrator and still a leading figure in its politics if not, perhaps, the "strong man" he once was, says emphatically that he would resign at once if the government ever changed its policy of friendship with America. But he defends the right of the Siamese press to attack America: "The American press attacks me, so why shouldn't we attack them ?" The prime minister, Marshal Pibul, receives the visitor in the ornate splendour of his residence and, over iced Coca-Cola, explains that even if Siam eventually recognised Peking there would not necessarily be an exchange of ambassadors, for the two countries had never exchanged envoys before the second world war. (There is a Nationalist embassy in Bangkok, but the Siamese say it was foisted on them after the war.) Frail, subtle and civilised, Marshal Pibul remains the real master of Siam.

His former classmate Nai Khuang, leader of the only important opposition group, the Prachatipat (Democrat) party, thinks Marshal Pibul should go further and say here and now that the Chinese communists will not be allowed to have an embassy in Bangkok. But Khuang, an ex-premier, is not in power, and recognises that, owing to a shortage of funds, his party is unlikely to do more than increase its representation at next February's elections. Until a few weeks ago the elections were, indeed, of academic interest: under the existing constitution half the members of the one-chamber parliament are nominated and give the ruling Seri Manangasila party an automatic majority. But now Marshal Pibul has announced that the nominated category of deputies will be abolished next year and that the one-chamber parliament will make way for upper and lower houses. He told your correspondent that elections for the seats now filled by nominated members will probably take place in May. On paper, then, this is an important step forward in the cautious programme of democratisation started by the prime minister on his return from his world tour last year. But it remains to be seen whether the upper house will be elected and what powers of veto it will retain over the lower chamber's legislative projects. It also remains to be seen whether too large a dose of western-style democracy will undermine Siam's enviable stability.

"Merdeka" in Malaya

FROM OUR SPECIAL CORRESPONDENT

IN clear view, and almost rifle-shot, of the ill-omened caves of Batu lies the bustling and agreeably disorderly village of Jinjang, one of the 500 new settlements which have been established in Malaya to salvage, insulate and support half-a-million refugees—mostly Chinese—who were formerly the scattered prey and sometimes the willing allies of the communist jungle terrorists. There are maybe 3,500 Chinese in Jinjang, and most of the families have now improved and extended the simple houses which the authorities provided originally for their unwilling and suspicious arrival five years ago. There are playgrounds and a school, a hospital and a picture theatre ; electric light and refrigeration ; even second-hand cars in lean-to garages.

A local council administers village affairs and authorises free education—presumably for families whose rice-winner cannot afford a car. White-clothed tables with fruit, rice cakes and a glittering display of soft-drink bottles are spread for a village wedding. Bare-bottomed children play in the hot sun amid an Asian riot of hens, pigs, ducks, dogs, cats, turkeys and goats. There seems little need for the high barbed-wire fence which encloses the 800-acre settlement ; but, less than four miles away, baffled and impotent guerrillas are known to be still hiding in the thick jungle above the limestone caves of Batu from which they have been driven.

True, Jinjang is a show village. There are other resettled villages where the former squatters are apathetic, sullen and resentful. But it is impossible to doubt that the ambitious long-range investment in this Malayan resettlement campaign of patient attrition against the jungle menace is paying off handsomely. The bandits are being denied arms, food, supplies and information ; they may not be dead, or even sleeping, but their morale has shrivelled and their shadow has lifted. The names and personal records of most of the 2,500 remaining terrorists are known to the security authorities. They cannot be ignored in some "black area" fastnesses, where dangerous and costly patrols are still needed ; they can even mount lightning raids for guns on the guarded gates of large villages ; but the problem appears at the moment to be a controlled and secondary one.

Should Some Britons Remain ?

The chief problem which confronts the urbane and astute Malayan chief minister, Tengku Abdul Rahman, is the basic one of unifying the new Federation, which, with its printed notices in five languages, is now preparing to dismiss its British advisers and administrators with handsome compensation and to run up the flag of "merdeka" and national sovereignty. The horrible official term is "malayanisation." Perhaps malayanisation may be too swift in its present concept. There are westerners who believe that, in order to avoid a weakening of executive efficiency in the initial stages, Whitehall should match the generosity of the Malayan authorities and ensure that some Britons could remain, at Malayan request, without losing their compensation.

Basically, the Alliance parties remain divided racially—Malay, Chinese and Indian—rather than politically. They are held together by the leadership and personal drive of the 53-year-old Tengku, by the demands and attractions of independence, and by an integrating national sentiment of superiority towards explosive and unpredictable Singapore. Union with the island colony is not in sight. There was a time when the Tengku spoke blandly but vaguely of union within five or six years. Since the latest uproar by the student rabble in Singapore, that prospect has receded into an unforeseeable future.

Malayan suspicion and distrust of Singapore does not merely reflect racial fears of Chinese preponderance and violence in the island. The mainland Malays also dislike the island Arabs, whom they suspect, not incorrectly, of scorning them as backward country cousins. There is a mainland conviction that the island parasite sucks Malayan resources. Why should Malayan tin go to Singapore for smelting ? Why cannot Penang be properly developed

as a Malayan port? Why, indeed, cannot we destroy that unnatural and artificial causeway and cut the rapacious and brawling island adrift?

Let there be no doubt that during the Suez fighting Malaya would have been another bristling, red-hot centre of Moslem anger and resentment if "merdeka" had not been just around the corner of the New Year. As part of the price of sovereignty, British bases are accepted officially with resignation, but privately with satisfaction. The Malayan government shudders away from public talk of the South-East Asia Defence Organisation, but recognises that the amiable subterfuge of a Commonwealth strategic reserve force puts them fairly and squarely in the south-east Asian anti-communist block; in any event, the Tengku's personal ties and close friendship with Siam (his mother was Siamese) underlie and strengthen the new federation's own sense of political and defence realism.

The federation seeks a loan—first and unavoidable action, alas, for every proud new independent nation—and is increasing taxation for quicker development and aerial surveys of mineral resources. Rubber, tin and rice are holding well, coffee is coming back, and the Rural and Industrial Development Association (RIDA) is pushing production and settlement and pinching out the ancient system of *padi kuncha* (under which creditors, among other abuses, become entitled in advance to a portion of a debtor's crop).

The popular, voluntary and successful expansion of collective farming and marketing on the communist pattern in the resettlement villages is richly ironical. No one is compelled to join the village co-operatives—some individualists, indeed, stand aloof and operate on sturdy capitalistic lines—but the blunt fact is that the co-operatives fare better and gain higher prices than the individual operators. The same phenomenon exists in Hongkong's New Territories, where, across the border from communism, Chinese farmers under the British flag are enjoying a benevolent, profitable and voluntary form of collective farming and distribution which the Chinese communist regime is labouring to enforce as a compulsory integral part of its economy.

A coloured photograph of Queen Elizabeth on the walls of the communal halls in Jinjang and other "white area" villages, where these co-operatives are organised and directed, is a final pleasing touch of the incongruous in the current Malayan scene of "merdeka."

Mr Gomulka's Task

BETWEEN revolution and stability lies chaos. Such is the fear of Polish communists. After the exhilarating October days, when they had the new, intoxicating feeling of popularity, Poland's new rulers face the more prosaic, though not less ambitious, task of running the country. They must mobilise the masses, which have been flocking to meetings and tasting power, for the gigantic job of orderly, disciplined production; they have to try to contain the violent forces which have welled up in Poland within the framework of a basically communist regime. But because of all that has happened the government no longer has the will or the power to carry out this process of transition by strict orders from above. Terror and coercion, it argues, must now be replaced by persuasion and enthusiasm.

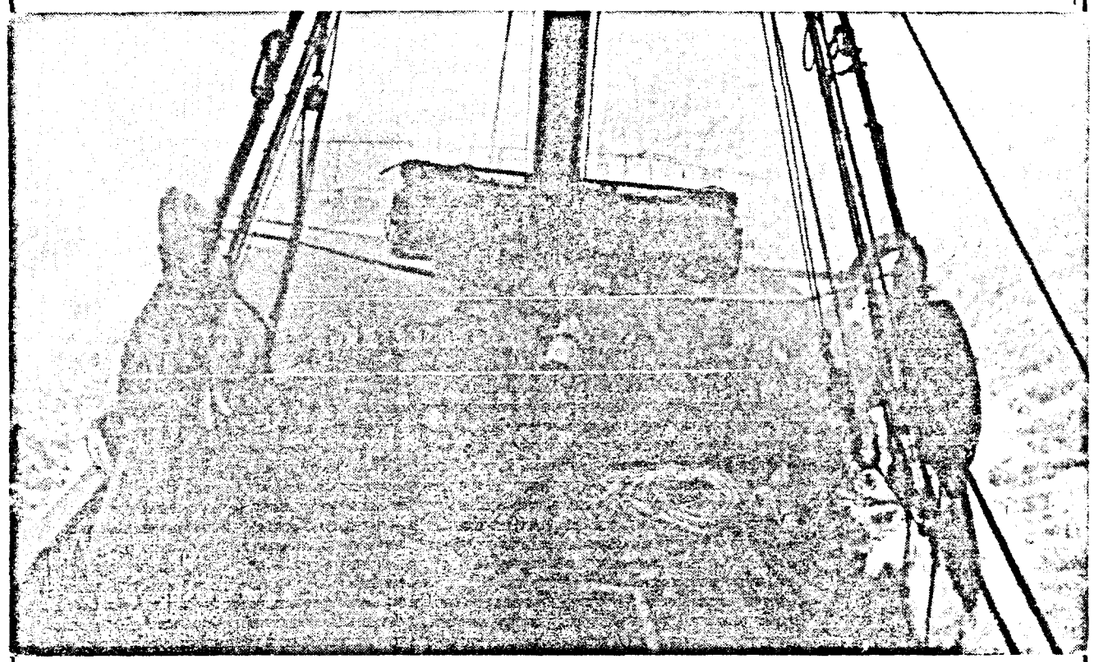
All the ferment and turmoil naturally provoked by this radical change of methods and mood finds an expression in the Polish press. It has shed enough of its fetters to become worth reading. A host of "literary-political" weeklies have cropped up and lack of paper seems the sole limit to their growing circulation. The press is no longer an orchestrated chorus of propaganda. In its columns you will find dissensions and polemics, criticisms and accusations directed to various addresses, discussions about the means and ends of a socialist society; faithful reports of events in Budapest are accompanied by messages of sympathy to the Hungarian people and violent condemnations of western Stalinists. One of these papers, *Po Prostu*, was the mainspring of the movement that has split the former orthodox youth movement into its component parts of industrial workers, intellectuals and peasantry. Such reforms in an unstable period are always liable to turn what has begun as an anti-Stalinist drive into an anti-communist one. But the new rulers, who owe their victory largely to the courage of the press and the backing of mass meetings, will have to be cautious and sparing in the control they still exercise.

Truce With the Church

In eastern Europe the Catholic Church is the natural head of the opposition to communism. In Poland, in spite of being under constant attack for years, it has lost none of its prestige and potential power. Mr Gomulka has opted for a truce. A *modus vivendi* has just been agreed upon by representatives of both sides. Religious instruction will once again be provided in schools to all whose parents want it at State expense. In exchange, the clergy, through the mouth of Poland's primate, Cardinal Wyszynski, have given their blessing to the new government's efforts to give the Poles a freer and more independent life. The truce, based on reason not on feeling, is provisional by the very nature of its protagonists. The appointment of five vicars-general in the formerly German territories of western Poland may be a sign that the Vatican is also moving towards a settlement. This move does not mean a complete recognition of the postwar frontiers—full bishops would have to be appointed for that—but it is a step in that direction, and when Cardinal Wyszynski finally goes to Rome he may ask for further moves towards a compromise.

Mr Gomulka's chief worry at this stage must be to encourage production, to maintain discipline at the factory bench and on the farm. The old methods of compulsion are gone. The police is no longer an all-purpose instrument. Even the party apparatus has been drastically reduced in order to change the nature of the communist movement. Most of the workers' councils, on the Jugoslav model, which have sprung up spontaneously throughout the country, are not fulfilling the function of "overseers of production," which some hoped they would. Some of them cut across central plans by raising wages of their own accord. Above all, they cannot, or will not, calm the angry workers. Grievances accumulated over years provoked a wave of indiscriminate sacking and intimidation of the managerial staff. Mr Gomulka himself has been compelled to issue a stern warning. Speaking in Katowice, the centre of the Polish coal industry, he did not minimise the gravity of the situation in this crucial branch of the Polish economy. Production is falling and exports have to be curtailed (to at most 19.5 million tons this year and 14 million in 1957) at

ATTENTION ALL SHIPPING!



There are Gale Warnings . . .

Now is the Gale Season; the time when delayed liners, shipwrecks, rescues at sea make headline news; when the names 'Sea areas Rockall, Iceland, Forties, Faroes' become household words from the gale warnings on the radio.

As you listen to these warnings think of the men in the Distant Water Fleet. For these men the warnings are a call to battle in the murky vastness of the Arctic night.

Despite the latest and the best equipment, and every possible safety precaution, it is a battle in which men and ships are sometimes casualties as they fight for a precious cargo of fish — fish to make you and your family a satisfying healthy meal, to provide the nation with health-giving cod liver oil, to supply farmers with white-fish meal, the finest source of animal protein for their livestock.

Even when the catch is landed, the rewards are by no means certain. Fish is sold by free auction in a highly competitive market. Neither the trawlermen, nor the trawler companies, have any say in fixing the price. If fish costs more in bad weather it is because the gales have made heavy landings impossible and supplies are scarce.

Next time therefore Cod is twopence or threepence a pound more, ask yourselves, "Is that too much to pay for the battle to bring back fish!" ....

a time when Poland has a desperate need of foreign currency. He quoted instances of managers and other personnel being forcibly removed from the mines on wheelbarrows, in the manner of the 1905 revolution, as well as of foremen who were too frightened to go down the pits.

Mr Gomulka's appeals for more production are likely to get a better response in the towns than in the countryside. When they heard of the October changes the peasants rapidly dismantled most of the existing collective farms and now they wait with traditional caution. Deliveries of grain are now 500,000 tons less than at the corresponding time last year, and even Soviet aid may be too small or come too late to fill the gap. It may be argued that as long as he has the industrial workers behind him Mr Gomulka need not fear a rising comparable to the Hungarian one. But how long will he keep the support of the workers if he has nothing to offer them? Even without any further deterioration, wages will outstrip production next year and Poland will have to live partly on credit. How will it live? The equation has too many variables—Soviet help, Western credits, discipline in industry, co-operation of the peasants—to allow any forecasts of the result. The government is making frantic efforts to prevent economic bankruptcy which could set a match to a political explosion.

Mr Gomulka starts this second and even more perilous phase of the Polish revolution with a tremendous personal popularity. His opponents' awareness that they can obtain their ends only through Fabian tactics, that to ask for free elections, neutrality and so on at once would be courting the fate of Hungary, is a most important asset for him. But there is no telling what will happen once the masses have entered the political arena. If he is to survive on the course he has set himself, Mr Gomulka still has to convince his communist critics that they were wrong in assuming that a popular movement in Poland is bound to be both anti-communist and anti-Russian.

Canada: A Bird's Eye View—I

Growing Pains of a Young Giant

FROM OUR SPECIAL CORRESPONDENT

ONE'S first impression when the plane loses height over Newfoundland is of an unfinished struggle. The Atlantic is reluctant to relinquish its sway, undisputed for so many hundreds of miles, and the countless lakes seem locked in a struggle for supremacy with the land. This feeling of the unfinished grows stronger as the journey proceeds across this continent so vast that the 16 million inhabitants concentrated in a relatively thin strip north of the United States border still seem like pioneers on a bridgehead. The skeletons of new skyscrapers in booming Toronto or Vancouver, the mushroom oil towns in the west, the scarcely tapped resources of the north, all strengthen the impression that this is no mere boom, but part and pattern of an industrial revolution.

The other immediate impression, for an innocent straight from Europe, is of the American-ness of the country. It is not so much the accent which is striking. The little Hillmans, overwhelmed amid the giant North American cars, seem symbols more eloquent than the statistics about foreign investment in Canada (American investments account for over three-quarters of the total, British for only 17 per cent). But this impression becomes blurred. Every third Canadian is of French origin, and for him "Americanism" is a thin veneer superimposed on an outmoded French parochial background. In Ottawa the Houses of Parliament, modelled closely on Westminster, embody nostalgia for the Old Country. In Vancouver, Calgary and many other places a Scots accent is the best possible passport. Every reference to United States influence—even a Freudian verbal substitution of president for prime minister, or state for province—is greeted resentfully; and Canadians' comments on their overshadowing neighbour contain an element of derisive envy.

The trend towards closer integration with the United States is undeniable. Canada has become the fourth trading nation of the world, with a turnover scarcely lower than that of Germany; but three-fifths of its exports go to the United States and three-quarters of its imports come from the same source. Its postwar surplus on current payments has turned into a deficit, balanced (and partly prompted) by an inflow of foreign, chiefly American, capital. By the end of last year its gross liabilities to other countries had reached $14,700 million, double the postwar level, but even more striking has been the steady increase in direct foreign investment in Canadian industry. It may be argued that the deficit is a small proportion of the total turnover and the foreign contribution a small share of domestic investment. Nevertheless it has led to foreign control over important sectors of the economy. Whether because of caution on the part of Canadian investors or because the American giants can spread their risks more easily, it is American capital that has paved the way in oil and postwar mining, thence spreading to manufacturing. As early as 1953 well over one-third of manufacturing and more than half the oil and mining development in Canada was in American hands. Today, two thirds of the large enterprises in these fields are controlled by foreign, predominantly American, capital.

The reactions vary. Mr Manning, the prime minister of Alberta, welcomes the influx of American oil capital into that province. It has brought such prosperity that the Albertans are said no longer to label dates as BC or AD, but speak of BL and AL, in reference to the striking of oil at Leduc, near Edmonton, in 1947. Mr Manning, who has been enabled to reduce the provincial debt while expanding

"Motor Business"

The December issue of this quarterly research bulletin for the motor and allied industries will appear shortly. It will include:
The outlook for 1957.
The French motor industry.
The East African market for motor vehicles and tractors.
The Bulletin is fully illustrated by charts, amongst which are:
Price indices of used cars and vans.
New registrations in Great Britain, and the hire purchase share of the market.
For full particulars of this Bulletin apply to:
THE ECONOMIST INTELLIGENCE UNIT LIMITED
22, Ryder Street, St. James's, London, S.W.1.
WHitehall 1511 Ext. 49.

social services, is content with nominal ownership of the oil and control over its rate of production. But the sophisticated young intellectuals of Ottawa are more perturbed. They argue that the situation will not redress itself automatically through the growth of the country's economy. They point out that many of the companies concerned are beyond the reach of the Canadian investor: some are expanding on ploughed back profits; others are subsidiaries, whose shares are not quoted on the Canadian market and whose parent companies are too big for the Canadians to buy a controlling interest. They complain that tax reliefs offered to American-controlled companies under a double taxation agreement now being revised provide no inducement to bring Canadians into partnership. Some of them also argue that the inflow of American capital may neutralise the traditional fiscal weapons against inflation.

The clash of ideas on this subject took vivid shape in June, when a debate over a pipeline to be built by an American company led to one of the biggest rows in Canadian parliamentary history. Yet, with varying degrees of enthusiasm or reluctance, the trend is generally accepted. The chief argument in its favour is that without this support Canada would not have been able to carry out its industrial revolution while shouldering a heavy defence burden and ensuring a rising standard of life to a fast growing population. The minority of pessimists who complain that "when the United States sneezes, Canada catches flu" are told that this risk is shared with the whole western world and is anyway much exaggerated. Indeed, much of Canada's economic activity seems based on the assumption that the United States has found a vaccine against depression. This faith is coupled with a contagious confidence in Canada's own future. Even a swift flight across this land almost the size of Europe is enough to bring it home that one has had a glimpse of a giant in infancy. It is to the north and to the future that the Canadians look to restore the economic balance of the new world.

(To be Concluded)

Pause Before Recession in France

FROM OUR PARIS CORRESPONDENT

THE French, like the British, had a bad November; they lost $93 million in the EPU. But not only was it a less bad November than for the British, it was also no change on previous months. French output has risen rapidly in 1956, but has been paid for in increasingly heavy trade deficits. The difference in situation is reflected in a difference of attitude to the recession which is now regarded as certain. Mr Macmillan's problem is to rein in a trade crisis which might run away with a fully employed, but not overemployed, country. Some French businessmen and economists, on the other hand, are not far from thinking some deflationary shock might well ease France's troubles.

The force of the expected recession is hard to gauge. Were the oil shortage not to exceed 10 per cent, output could continue to expand—and inflation with it; were it 40 per cent (as it would be without American oil), the recession would obviously be serious. But the more probable, intermediate figure of 20-25 per cent will have less clear effects. There will certainly be a slow-down, notably in building and in the motor-car industry, the pilots of the economy. If industrial output fell in exact ratio to power supplies, a 4 per cent decline might be likely. The effects could be multiplied, however, by the kind of failing consumer demand already visible in the market for larger cars. Nevertheless, the most general hope seems to be that the recession will be a moderate one.

The optimists point out that this will ease the acute shortage of manpower which has stimulated inflation and impel industry to increase exports, and thus be to some extent a "good thing." This thinking ignores the social and political factors (loss of overtime pay can cut by a quarter the wages of bachelors, who cannot benefit from the big family allowances). As for exports, it is true that if industry is to progress, they will, in the words of the official Economic Forecast for 1957, become "as they are already for Britain, the essential problem." But increased exports are not an automatic by-product of a recession. That depends mainly on whether prices fall more in France than in other European countries affected by the Suez crisis. The structure of the French economy is indeed still so rigid there is a real danger that the recession may paradoxically be accompanied by inflation. There is a risk, especially perhaps in January, that rising freight rates and raw material costs lead to the breaking of the ceiling of the cost-of-living index and unleash the automatic sliding scale for wages. The government has been very dexterous recently in this field. But, in general, it would be excessive to expect the ill wind of recession to blow too much good.

Out-dated Budget

It will be easier after the New Year to assess future oil supplies and industry's ability to adapt itself to shortages. The government expects, by adding new deliveries to stocks, to provide industry till February with 70 per cent of its wants and the most affected sectors, like glass, with 90 per cent of them. So far, industry has suffered more in prospect than in performance. Despite the falling demand for large cars, the Engineering Employers' Association claims that only 20,000 out of 620,000 engineering workers in the Paris region have lost their overtime pay—though Simca has laid off 1,100 workers. Some firms are thinking of closing down for Christmas week in order to build up fuel stocks.

This is a transitional month, and the authorities have kept their peace on economic policy. Ironically, the Assembly this week passed in record time the 1957 budget which Suez has partly out-dated—even though the government's narrow majority shows how much its parliamentary position has slipped. (The budget's new form is largely responsible for this unusual speed.) Suez is going to add to the deficit; the Suez landing itself, the loss of oil taxes, the increased subsidies to hold down prices will, among other factors, ensure this. The press is prophesying that the new gap will add up to an extra £200-£300 million; this cannot be entirely covered by fresh loans and taxes. Though this is unhealthy the extra deficit might, in a period of falling demand, shore up production not directly hampered by fuel shortages. All will depend on the context. The government cannot fix its economic policy for 1957 before January or February.

How to recognise fine Brandy
V·S·O·P

V·S·O·P

The finest brandy comes from the Grande and Petite Champagne districts of Cognac. Only Cognac originating from these two areas, at least half of which must be from the Grande Champagne, is entitled by French law to be called Fine Champagne Cognac.

Remy Martin produce Fine Champagne V.S.O.P. Cognac and *nothing less good*. They only offer for sale Brandy which has reached perfection. That is why when you insist on Remy Martin you can be sure of getting a *really fine Cognac*.

REMY MARTIN

Change of Title

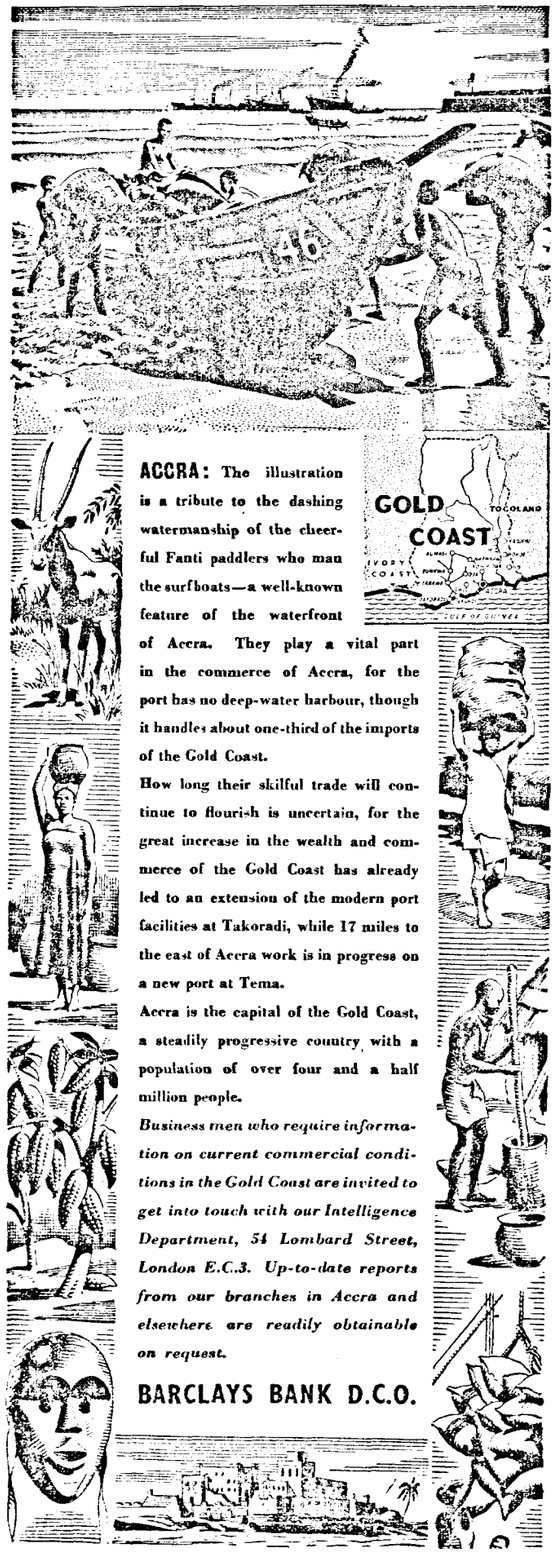
The Chartered Bank of India, Australia and China announces that its title has been shortened to . . .

THE CHARTERED BANK

by which name the Bank has been known informally for more than a century. The Chartered Bank continues to provide a complete range of banking services at its offices in the United Kingdom and throughout an oversea branch system which extends to most centres of commercial importance in Southern and South-east Asia and the Far East

THE CHARTERED BANK
(Incorporated by Royal Charter, 1853)
Head Office:
38 Bishopsgate, London, E.C.2

Branches in: Aden, India, Pakistan, Ceylon, Burma, Singapore, Federation of Malaya, North Borneo, Sarawak, Republic of Indonesia, Vietnam, Cambodia, Thailand, Philippine Republic, Hong Kong, China, Japan. *Agencies:* Hamburg, New York. *U.K. Branches:* London (City and West End), Manchester, Liverpool



ACCRA: The illustration is a tribute to the dashing watermanship of the cheerful Fanti paddlers who man the surfboats—a well-known feature of the waterfront of Accra. They play a vital part in the commerce of Accra, for the port has no deep-water harbour, though it handles about one-third of the imports of the Gold Coast.

How long their skilful trade will continue to flourish is uncertain, for the great increase in the wealth and commerce of the Gold Coast has already led to an extension of the modern port facilities at Takoradi, while 17 miles to the east of Accra work is in progress on a new port at Tema.

Accra is the capital of the Gold Coast, a steadily progressive country with a population of over four and a half million people.

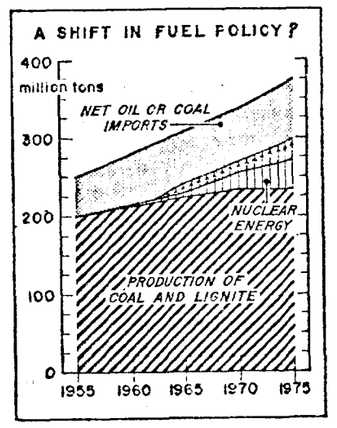
Business men who require information on current commercial conditions in the Gold Coast are invited to get into touch with our Intelligence Department, 54 Lombard Street, London E.C.3. Up-to-date reports from our branches in Accra and elsewhere are readily obtainable on request.

BARCLAYS BANK D.C.O.

THE BUSINESS WORLD

No Retreat From Oil

"IN the last few weeks fuel oil in this country has been set back years," said a man who sells it this week. Having spent most of the year advising industrialists on the equipment they should put in to switch to oil firing, he is now selling them coal to burn in the old plant he persuaded them to replace: his irritation is understandable. So is his customers' feeling of being let down. For the second time in ten years, following an official campaign of exhortation and encouragement to switch to oil, the oil has become scarce and sharply more expensive; official policy, though not reversed, has been slipped into neutral. Many who were ready to make the change are now reflecting that coal, whatever one's opinion of the miners, is at least under British earth and not under some sheikh's oily thumb; and that the longish chance one takes on nuclear electricity is on British ability, not Arab good will. The question becomes inevitable: Do the events of the last few months make some radical shift of emphasis in Britain's energy policy advisable—and if so, how far is any shift practicable?



Existing energy policy was fairly clearly set down during 1955. Broadly, the Government has accepted estimates that the rate of economic expansion Britain should be able to manage in coming years will require about 25 per cent more fuel in ten years' time and about 50 per cent more in 20 years' time: say the equivalent of 310 million tons of coal a year by 1965 and of 375 million tons of coal a year by 1975. The National Coal Board hopes to raise its annual output to 240 million tons by 1965 and to 250 million tons by 1975. The original programme for nuclear electricity looked forward to providing 1,500-2,000 megawatts of nuclear capacity, equivalent to 5-6 million tons of coal a year by 1965; and to some 10,000-15,000 mW of nuclear capacity, equal to say 40 million tons of coal a year, by 1975. As the diagram illustrates, these two sources of primary fuel would fall a long way short of the total fuel supplies Britain might manage to use. The rest would have to be imported. The only fuel that could practically be imported in such volumes is oil—and oil from the Middle East. The accepted energy policy, that is to say, assumed that Britain could nearly double its 1955 consumption of oil between now and 1965, and increase it roughly as much again by 1975.

How much of this has changed? First, the political and strategic instabilities that underlie Britain's (and Europe's) growing dependence upon Middle East oil have been exposed. They always existed. For obvious reasons, the oil companies have never liked too much public discussion of them. In the second half of the twentieth century, international companies do not dispose of enough political and strategic power to guarantee their tenure in hostile territories. Nor, it now appears, does Britain. No ultimate guarantee now exists, therefore, that Middle East oil will continue to be forthcoming—though the commercial self-interest of many parts of the Middle East suggest it should be. The limited insurance policies that the oil industry can take out itself—investment in more transport facilities and in more exploration elsewhere—may, incidentally, imply a slightly more rapid rise in the price of oil relative to other fuels than originally seemed probable. Any more comprehensive insurance is a matter of

international politics. These, too, may inch up oil costs.

The second change since British energy policy was stated in 1955 is rather more hopeful. Technical experience has shown that the heat rating—and hence the potential generating capacity—of the stations it is intended to build in the Central Electricity Authority's nuclear power programme, following the first, may be twice as much as was originally planned. In terms of the number of stations one has to build, this has been called "a painless increase"; financially, the Treasury is bitterly insistent that it is not. This technical bonus of heat means that the nuclear stations it is already intended to build by 1965, for a substantial but not nearly proportionate increase in capital cost, can have double the capacity, say 3,000-4,000 mW. This is a small but not insignificant extra contribution to Britain's fuel supplies in 1965—say an extra two per cent.

Nothing has changed in the coal situation. There is certainly no reason to believe that the National Coal Board can do any better than its cautious promises, or that these promises could be fulfilled with less in the way of capital investment. Rationally, there is no reason to doubt that the £1,000 million that the board now plans to sink into mining capital in the next 10-15 years should bring forth the coal output it hopes for. Viscerally, one remains rather apprehensive about confident forecasts for coal mining in any sustained period of full employment—which is what the estimates of fuel demand are based upon. If the board can attain its 250 million tons a year by 1970, it will have done as much as any outsider can expect.

Technical advances in nuclear engineering, therefore, have already offered a bonus in fuel supplies by 1965 that Britain certainly cannot afford not to buy—the equivalent of an extra 5-6 million tons of coal, or 3-4 million tons of oil, by 1965, and somewhat larger prospects, or cheaper prospects, later. How much more flexibility is practicable in the nuclear programme?

★

Little more can practically be done to increase the capacity that is already planned for the first two batches of nuclear stations, which are due for completion by about 1962-63. For these the limiting factors are key men, construction resources, and supplies of materials. But in the building of nuclear stations to be completed after 1963, more latitude exists—for a limited time. It would be possible, after 1963, to move more rapidly than was intended in the original programme towards making all new generating capacity in Britain nuclear; this, instead of being done in the early seventies, could be done in the mid-sixties. This is an investment decision: the limiting factors are financial rather than physical. It could not be long delayed, at least in principle: supporting investment in electrical engineering and its major suppliers would have to begin within a couple of years.

If such a decision were taken, it might be possible to think of 4,000-6,000 mW of nuclear capacity by 1965, roughly three times the figure of the original White Paper of February, 1955; and of an increase in nuclear capacity after that limited only by the expansion of electricity demand. The contribution of nuclear energy would thus become much more significant:

	1965	1975
White Paper—		
Nuclear capacity installed (mW)	1,500–3,000	10,000–15,000
Coal equivalent (mn. tons, year)	5–6	40
Possible Revision—		
Nuclear Capacity (mW).....	4,000–6,000	25,000–30,000
Coal saving (mn. tons, year)....	12–18	60–70
As % of Forecast *Total Energy Use*.....	6%	17%

This extra capacity could no longer be employed wholly as base load power plant; so the coal saved would not rise quite in proportion with capacity.

★

Such an increase in nuclear capacity roughly marks the limit one can now see upon practicable changes in British energy policy. Enthusiasts are not lacking to argue that electricity demand may in fact rise more than the forecasts; a few even argue that within 20 years nuclear energy can make significant contributions outside electricity supply, as for example in marine propulsion. No account can be or need reasonably be taken of either hope at present. The decision to push nuclear investment further, beyond the "doubling" which will already increase capital costs past the £300 million budgeted for the original programme, would be big enough, in all conscience. Electricity generation, already the biggest single claimant upon the country's investment resources, would become yet more capital-intensive; and massive supporting investment in the production of materials such as steel plate would have to come first. Nobody need scoff at Treasury caution in approaching such a commitment. Yet if it is indeed technically practicable, Britain will hardly be able to find an excuse for avoiding it.

But even that best set of hopes for nuclear electricity—and biggest gamble on it—would still leave Britain needing some 70 million tons of "coal equivalent" a year—say 40 million tons of oil—by 1965. Coal output is inflexible upwards in the sixties; by the mid-seventies it may be on the decline. It would probably be wrong, therefore, to assume any "passing of the peak" in oil demand by 1975, though this demand, on these best assumptions about nuclear power, might then be levelling off. For the next ten years—the practical future—these assumptions offer no major revision of the country's fuel demands; they would leave us wanting far more oil than we were using during the peaceful first half of 1956.

The limits of flexibility in energy policy—at any rate in the short term—are therefore fairly tight. The emphasis of policy can be shifted—but only so far. The need for more economical use of fuel wherever it is burned becomes even greater: but the fuel forecasts already assume continued improvements in this At

a lower level, minor insurance policies can be taken out here for oil supplies; storage capacity can be increased and larger stocks carried, and as a corollary any power station intended to use oil should be equipped to switch to coal at short notice. But the major premise upon which energy policy was based in 1955 remains unaltered. In the medium run, the expansion of the British economy depends upon largely increased supplies of oil—which can come from nowhere at present but the Middle East. And the only way the British economy can do without extra dependence upon Middle East oil in the near future, political risks or not, is to do without most of the expansion.

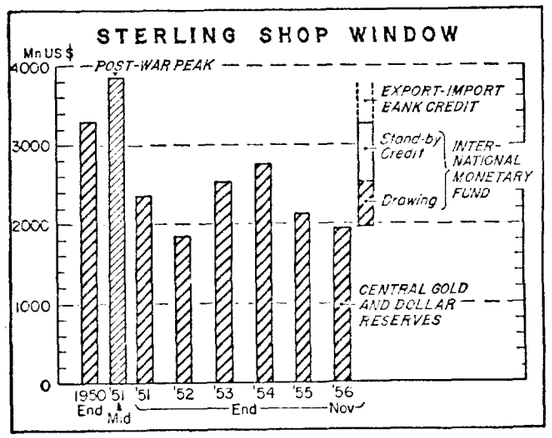
Sterling Fortified

THE eyes of the business community across the world which for many weeks have been focused on sterling, its strains, its bear account, and its expected further burdens, have now been confronted with the massive additional reserves that can be mobilised to defend it. The Chancellor, with swift and efficient American help, has been able to call those reserves on to the parade ground faster and in greater strength than many people believed likely, or even possible; and the Chancellor's prompt action immediately evoked a marked recovery in the exchange markets. When he spoke last week Mr Macmillan had already made applications to invoke the waiver of interest on the North American loans and to draw on Britain's facilities at the International Monetary Fund; he also stated that the Government was prepared to pledge the $750-$1,000 million of its dollar securities as collateral against a loan from the appropriate US government agency.

On Monday night, the Treasury announced that it had made arrangements with the IMF not only for an immediate drawing of the $561½ million that had been generally assumed to be readily available but also for an automatic right to draw within the next twelve months on the whole of the remaining $738½ million of Britain's quota. The Fund has recently interpreted its articles of agreement in a liberal spirit, and it had been expected that it would not insist upon the limitation of drawing rights to 25 per cent of the quota within one year. But the release of the whole quota at a single application is unprecedented—and it makes the Fund a far bigger reserve of international liquidity than it has hitherto admitted itself to be. The agreement to extend Britain's facilities to the maximum must reflect primarily the helpful American attitude.

American helpfulness is equally reflected in the negotiations now in progress in Washington for a line of credit to Britain from the Export-Import Bank. This credit will be available for purchases not only of emergency supplies of American oil but also of Britain's regular imports from the United States; the amount is still under negotiation, but it seems likely to be around $500 million. Although "Ex-Im" does not usually demand specific collateral for its credits, the British Government has offered to pledge its dollar securities, already it is believed physically in the United States.

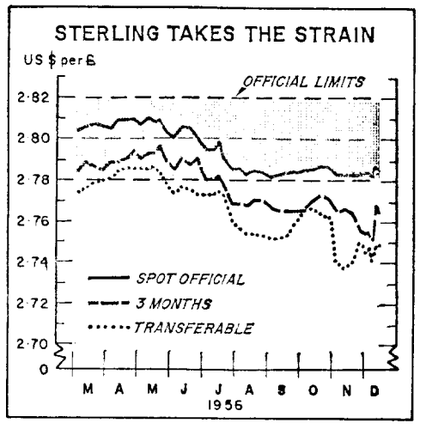
The Chancellor of the Exchequer is thus likely to succeed in showing that, behind the central reserve of $1,965 million, there lies almost as much again at Britain's immediate call. His purpose in assembling loan facilities to such impressive magnitudes has plainly been to put beyond all doubt the ability of the British Government to maintain the value of sterling in face of the dollar burdens that have resulted from the Suez troubles, and those that have still to come. The extent of the expected burdens, particularly the dollar cost of the loss of Middle East oil supplies and the partial switch to Western Hemisphere sources, depends on a host of unknowns, among which the length of the delay in clearing the canal and repairing the Syrian breaches in the Iraq pipeline are outstanding. The Treasury is now attempting a first tentative assessment. But on the worst assumptions, it is clear, the additional



dollar burden could be no more than a small fraction of the reinforcements now called forth for sterling.

Mr Macmillan's bold moves have found an immediate and generally favourable response in the markets. On Tuesday, the official spot rate against the dollar touched $2.78¾, the best rate for two months; previously, the rate had hovered around $2.78¼-⅜, the effective point of official support at which it had been maintained almost continuously since the Anglo-French ultimatum on October 29th. No less significant were the sharp improvements in the forward rates—the discount against the dollar three

months forward fell from over 3 cents to just 2 cents. In the overseas markets, transferable sterling moved up from just under $2.74\frac{1}{4}$ (at which this rate, too, has received substantial official support) to $2.74\frac{7}{8}$. It is significant, too, that the premium over Wall Street prices that UK residents pay to buy dollar stocks in London had by Wednesday fallen below 7 per cent (over parity of $2.80). A week earlier it had been around 10 per cent and at the worst had touched 13 per cent. These encouraging signs were broadly maintained on Wednesday and Thursday. It would be folly to make much of sterling's better performance over so short a period. Time and the reserves must now get to work.



The $2.80 question has all along been whether the British Government could restore the necessary confidence among international bankers and merchants, who often in the ordinary course of their business have occasion to take a speculative view of sterling; the loss of $279 million in gold last month was mainly a pointer to the strength of that speculative force. By bringing into the open the additional reserves available to defend sterling, the Chancellor hopes to repel the attack. If he succeeds, the task of repaying whatever portion of the new credits he has to draw should be eased by the closing of the present short account in sterling. The covering of the bear position, when confidence so dictates, should provide a relief to the reserves of corresponding proportions to the strain it has recently inflicted. This week this process has been prominent among the factors that have given support to sterling, but as yet only a tiny fraction of the bear account can have been covered.

Compared with the size of the sums of money involved, the cost of the Chancellor's mobilising operation is likely to be small. The only immediate actual drawing is the $561\frac{1}{2}$ million from the IMF, representing the gold tranche and the first 25 per cent credit tranche of Britain's quota. This involves a service charge of $\frac{1}{2}$ per cent, or $2.8 million, and a scale of interest charges rising from $4.9 million in the first year to $7.3 million in the second year and $10.6 million in the third; Britain has agreed to repay within three years. The stand-by facility of a further $738\frac{1}{2}$ million carries an annual service charge of $\frac{1}{4}$ per cent, or $1.8 million; if and when these credits are drawn, interest will be charged on the amounts outstanding; if these were to rise above 50 per cent of Britain's quota, the charges would be rather higher than those payable on the present drawing.

The terms of the credit from the Export-Import Bank are still being hammered out. The duration of the credit seems likely to be longer than that from the Fund; most of Ex-Im's lending is for a medium term, up to ten years and even more. Its interest rates have recently followed the general upward trend, and have risen to around 5 per cent. But Britain hopes to pay less; and the charge will be only on credits actually drawn.

Business Notes

A Cautious Rally

STOCK markets have developed that modest rally that the parading of the reserves supporting sterling might have been expected to produce—a cautious advance with jobbers' eyes never long withdrawn from the sterling exchange rate. Industrials have advanced and the *Economist Indicator* shows a rise in the week ended on Wednesday from 176.4 to 185.8. It was a selective but nonetheless widespread rise in which the capital goods shares such as the steel companies now producing their annual figures, the atomic energy shares, and until Tuesday the oil shares, took part. It is not so far an advance based on a great volume of business, but short accounts have been closed; jobbers, still keeping their books as even as possible, have been more careful not to become bears, and the new long Account has opened in good shape.

On the gilt-edged side of the market the advance in prices has been less pronounced; in the week ended on Wednesday the *Financial Times* index of Government securities has risen only from 82.57 to 83.10, but the expansion in the volume of business has at times—particularly on Tuesday when the sterling exchange rate made a sharp advance—been pronounced. Country speculation increased, a little investment buying that the institutions had deferred was allowed to proceed and it is probable that the government broker was able to dispose of more from the official holdings than has been possible for some weeks.

Two other facts complete the market picture. The premium that United Kingdom investors have to pay for dollar stocks has run down steadily and has fallen below 7 per cent over the parity rate of $2.80 to the £1. Within recent weeks it has touched 13 per cent. But the other conventional hedge against sterling—gold shares—has not fallen into disfavour. Kaffirs have been less active than they were in the middle of last week and some prices have eased,

the *Financial Times* gold share index having come down on balance during the week from 77.5 to 76.8. Nevertheless Johannesburg has been a persistent and at times unsatisfied buyer from London, which probably means that French and other Continental investors are buyers of more stock in Johannesburg than London cares to sell. There is a special reason why London should at the moment be a reluctant seller. Many of the dividend paying mines have declared their dividends but the shares are not yet quoted ex dividend. London jobbers would have to pay over the gross dividend on any shares they arbitraged to South Africa.

Atomic Awards

ON Thursday afternoon, the Central Electricity Authority announced the award of the two most momentous contracts that can have been placed by a public utility. It gave orders for the first two commercial atomic power stations to be built in the world to the Associated Electrical Industries—John Thompson group and with the Nuclear Power Plant Company (headed by C. A. Parsons). An even bigger order placed by the South of Scotland electricity authorities with the General Electric Company—Simon-Carves group, was announced at the same time. These were not last minute decisions, as the brusque and cursory method of their announcement might have suggested they were. Teams from the Atomic Energy Authority have been studying the tenders submitted by four competing design groups since they were sent in at the beginning of October. The CEA has already decided that the third English station, to be built in Somerset, will probably be awarded to the group that has been unsuccessful in this first round, namely English Electric—Babcock and Wilcox. It has been plain for some weeks which way the contracts should go and all the more surprising therefore that when the time came to make them public it was done at such short notice that the companies themselves were caught at a disadvantage. The result is that little is known so far of the actual details of the stations. The cost of the biggest, the GEC design with an installed capacity of 360,000 kW and a net electrical output of 320,000 kW, is £35 million, or roughly £97 per kilowatt capacity. The sites chosen for the English stations, with their proneness to flooding, put up costs there by £20 to £30 per kilowatt. For example, the AEI station, with a net electrical output of 275,000 kilowatts and an installed capacity of about 300,000 kW, should cost between £30 and £40 million.

The big increase in the capacity of the stations since the atomic power programme was first announced nearly two years ago means that the bill for each plant is roughly 80 per cent higher than first expected The atomic building programme for the first ten years, which cannot be varied at all substantially before 1962 to 1963 (these first stations will not be commissioned before 1961), therefore promises to cost nearer £500 million than the £300 million first estimated.

Plans for Parking

ALTHOUGH the Samuels committee on street parking in London would like to see at least the whole of the inner area—some six square miles—become a "controlled parking zone," it is content to begin the scheme experimentally only in the north-west front of Mayfair, which is an eighth of a square mile across. Within this area, as in all the controlled parking zones that in time may appear in other congested city centres, daytime parking will be either banned or permitted for only short periods on payment of a metered charge. (Longer waits may be allowed—for a charge—in some of the less busy streets.) To be effective, however, even as an experiment, the first scheme should cover a larger area of parking demand than this, and it is difficult to see why the committee did not plump for the whole of Mayfair—an area four times bigger—since it wants the scheme to be extended there "as soon as practicable" anyway. The reasons for the committee's caution are twofold: the time it will take to recruit and train parking meter attendants and the burden that strict enforcement of no-parking rules over a wider area would impose on the police. Neither reason seems very weighty—if the whole of the inner area is to be brought into the zone eventually.

Enforcement will in fact be one of the prime requisites for the success of these zones—plus adequate signposts telling the motorist exactly where he may not park and where he may, and for how long. The ban on kerbside parking must be complete, if the purpose of the scheme—better traffic flow—is to be achieved; and the parking meters must themselves be properly supervised. The charges and length of permitted stay may vary with local

conditions ; in London the committee proposes 6d. an hour for the first two hours, then an "excess charge" of 10s. for any part of the next two hours, after which the motorist is liable to prosecution and his car in danger of being towed away. But the present procedure for police prosecutions in traffic offences, and that proposed for the collection of the "excess charges" and for prosecutions of motorists that outstay even the second two-hour period, seem unnecessarily complicated for schemes to work smoothly.

But the Ministry of Transport appears to be relying upon the deterrent effect of excess charges to clear kerb-side space of all but genuine short-term parkers and so make these questions about subsequent procedures relatively academic. It may be right, but the committee is worried by the sheer number of motorists who will be displaced from street parking space in the inner London area when the whole of it is controlled—about half the present count of 40,000. Some of these will consider driving in and paying to park too expensive and some should find room in the parks and in streets fringing the controlled zone. But the point the committee appears to have missed is that stringent measures on street parking will restore the inducement to private firms and local authorities in the controlled area to build new garages that pay. And in the last few weeks there seems to be no lack of bright new schemes for extra garages.

Mortgage Rates' New Peak

BOOTLE CORPORATION'S issue—£1½ million of 5½ per cent stock 1961 at 98½—was a miserable failure. Underwriters had to take 90 per cent of it and a discount of 1 per cent on the issue price developed on the opening day. A small disappointment of this kind has no basic implications for the stock market, but it does draw attention to two points of interest. Obviously a stock market pre-occupied with ICI's £40 million issue is ill-equipped to find money for other issues, even if they are small, and obviously the failure of a mere 5 year stock will discourage other borrowers from coming to market to make very short-dated borrowings like Bootle's. Indeed, there may be some semi-official discouragement which will force local authorities to borrow on longer-dated issues.

It is equally clear that more and more local authorities will be obliged to turn to the mortgage market, the temporary money market and possibly, where they have the powers, to the discount market, for their borrowing. Although the rates in the mortgage market are now higher than they have been since that market sprang into activity a year ago, few experts would be surprised if they were to move still higher towards the turn of the year. At the moment 7 day money is 5⅝ per cent and is generally expected to move up at least to about 5½ per cent if there is some calling around the end of the year. A rate as high as 6½ per cent has been paid on a 10 year mortgage, but that is somewhat above the average of the market. The rates in this table are more typical.

	Rate per cent.
Mortgages up to 5 years	6⅝ – 6½
„ 7–10 years	6½
„ 15–20 „	6
„ 25–40 „	5⅝
„ over 40 „	5½ – 5⅝

For the money which they borrow in smaller amounts by public advertisement, the local authorities usually offer appreciably less than the current mortgage market rate. One authority and two public boards, Gloucester County Council and Mersey Docks and Harbour Board and Derwent Valley Water Board, have, however, offered up to 6 per cent by public advertisement, and it is believed they have obtained a fair amount of money. Recourse to the discount market by the few local authorities that have powers to do so, has so far been only moderate. The latest issue of bills was Sheffield Corporation's issue of 500,000 April 5th bills made on December 6th at a discount rate of approximately 5⅛ per cent. It is not normally until the New Year that the English local authorities get much relief from the seasonal inflow of rate payments ; when that comes demands on the market may be eased.

Suez Squeezes the Trade Gap

THE provisional trade returns for November show the initial effects of the blocking of the Suez Canal—a fortuitous drop in Britain's trade deficit. Roughly one-quarter of British trade normally passes through the Canal. Imports fell last month because arrivals of ships from the East were delayed, and exports remained high because the ships to carry them were in or approaching British ports when the Canal was closed. The trade gap benefited but the economy did not. The value of imports fell by £31.5 million to £322.8 million cif. Exports were valued at £291.8 million fob, only £3.1 million below the record figure of the previous month, although the November returns covered a period of 26 working days, two fewer than October. With re-exports £2.1 million higher at £14.8 million, the trade deficit dropped sharply by £30.4 million to the exceptionally low figure of £16.3 million. Next month the export figures will begin to reflect the shortage of shipping.

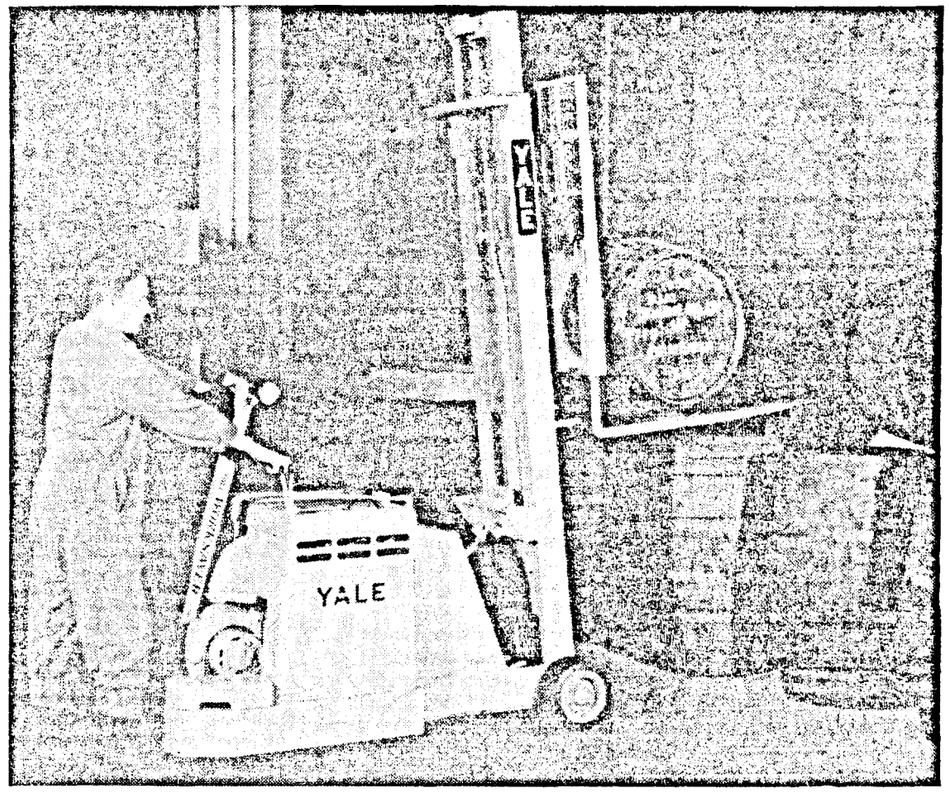
The high rate of exports last month is still a salutary reminder of the success of British exports this year. The average value in the first eleven months was £265.4 million, 10 per cent higher than in the same period of last year ; the increase in volume was probably about 6 per cent. Imports, in contrast, were only about one per cent higher in value than in the first eleven months of 1955, and the volume was probably unchanged. Exports to North America,



This photograph — supplied by The Drambuie Liqueur Co. Ltd., Edinburgh, Scotland — shows Yale Worksaver handling casks.

Yale Trucks mean faster handling and extra storage space

The secret recipe of Drambuie Liqueur hasn't changed since 1745 but the manner in which Drambuie casks are handled today is vastly different. These heavy awkward barrels, once rolled and tilted by hand, are now lifted, carried and stacked by YALE Industrial Lift Trucks with maximum speed, minimum effort.
In industry after industry, wherever materials must be handled quickly and efficiently, YALE Trucks are specified for their smooth and safe performance that helps increase production, saves storage space, speeds shipments . . . reduces handling costs by as much as 50%. Moreover, YALE Trucks effect these savings whether you must handle crates, bags, coils, barrels, or any other type of load. Your YALE representative will be glad to help you meet your specific needs by showing you the complete line of YALE Trucks.

...who me?

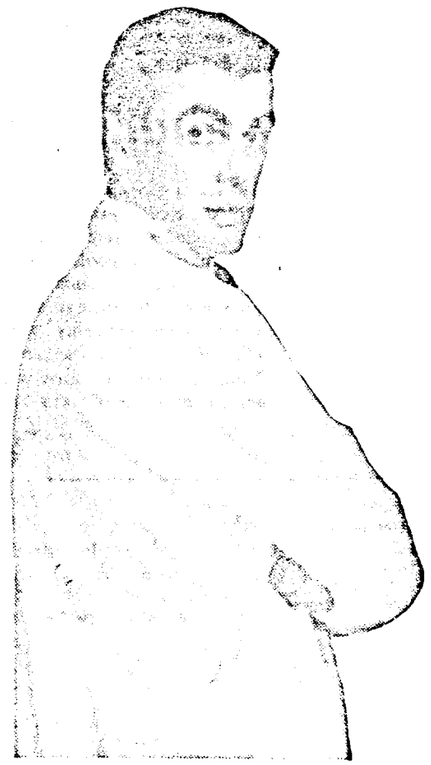
Yes, you. What do you know about your industry's activities or, for that matter, the big problems that confront industry generally? Are you a man who thinks for himself or do you merely repeat what you have heard someone else say?

THE FINANCIAL TIMES helps you to mould your opinions and to understand the big issues affecting industry. Read its industrial news, the techniques your competitors use, the market opportunities that exist in the Commonwealth, in America and elsewhere. Read of the new projects being developed and the articles on economic and financial affairs. They will help you develop a sounder business judgment . . . broaden your vision . . . prepare you for additional responsibilities.

THE FINANCIAL TIMES provides all the facts the business man needs. Try reading it every day for a week. It's the only way to keep up with the man who means business.

Men who mean business read

THE FINANCIAL TIMES



the only region distinguished in the provisional returns, have been particularly high. Shipments to the United States last month rose again by £500,000 to a new peak of £22.4 million, excluding a further repayment of £2.7 million worth of silver bullion (a capital item). Shipments to Canada rose by £1.5 million to £17.8 million. Over the whole eleven months exports to North America averaged £33.7 million a month (again excluding silver bullion), 27 per cent higher than in the same period of last year.

Higher Fares and Freights

THE Chancellor has now written more specifically into the special bill before Parliament his promise to withdraw the higher petrol duty once the need for it has passed. As a result the impost will cease a month after rationing ends whether or not the Treasury have annulled the increase by order before then—as it has the power to do. A fortnight later the emergency increases in bus fares authorised in the bill—up to a maximum of a twelfth of normal revenue (or an eighth in the case of small and rural services)—will also disappear unless a longer period is authorised because the bus company has already submitted an application to cover rises in other costs. The full maximum increase may not in fact be used by all operators. London Transport for example is raising its fares on January 1st by the equivalent of £180,000 a month, which will just about cover the cost of the higher fuel tax, but is £120,000 a month less than the full permitted amount. On the other hand it is likely to have to press for higher fares later next year, regardless of the date on which rationing ends, in order to cover other increases in expenditure. That is one reason, presumably, why the present increase has been made as simple as possible: the minimum fare on all London bus and underground services is to be raised from 2½d. to 3d. at the end of the month.

Road hauliers on the other hand have no procedural hurdles to surmount before raising—or lowering—their charges. But the 7½ per cent surcharge made by British Road Services and the 10 per cent increase recommended by the Road Haulage Association to its members appears to cover more than just the higher petrol duty alone. The increase in petrol duty would add about £40 million a year, or only about 4 per cent, to the outlay of all goods vehicle operators. No doubt they are hoping to make good part, at least, of any losses they may incur from the enforced transfer of traffic to the railways—though there is no sign of any big switch taking place yet. Concern has also been expressed at the heavy cuts in business that the fuel ration will mean for long-distance operators and, on the passenger side, for non-stage firms that run excursions, tours, and private-hire coaches. But it is these services that can best, and should, be transferred to rail during the oil shortage.

Resources for the Canal

OF the two tricky decisions facing the United Nations team that is organising salvage operations in the Suez Canal—"Who is to pay for it?" and "Who should be engaged to do it?"—the second at least cannot be burked much longer. General Wheeler, the technical member of the UN team, has now made a quick, on-the-spot review of his task and the equipment likely to be available, and he has set the nineteen neutral technicians with him to prepare a fuller study. He should soon, therefore, be able to report whether he will want more resources than the United Nations can muster from neutral countries in order to clear the canal within a reasonable time. But this decision must come very soon if the Anglo-French salvage fleets in Port Said are to be informed before they start packing up to withdraw with the rest of the force. The Egyptians are reported to be now less sensitive to the question of subcontractors; but General Wheeler's "solution" of using British salvage vessels without their crews immediately provoked a sharp retort from the First Lord of the Admiralty in Malta and some discussion in Port Said wardrooms of calling for British salvage crew "volunteers."

In the past five weeks the Admiralty has assembled a sizeable force. Seven of the twenty-three wrecks at Port Said have now been raised, thus clearing a passage for ships of up to about 20,000 tons gross, and work is still going ahead on another seven. Altogether eighteen major salvage vessels are now at work (plus a similar number of tugs and salvage pontoons) against the six that arrived with the landing force. Fifteen more could be put in by the end of the month, and another eight (again not counting tugs and pontoons) are on hand in the Red Sea. This is a much larger armada than the resources General Wheeler will be able to draw upon from the neutrals. Before a secrecy ban was imposed upon the force being assembled by the Dutch and Danish consortium that has the main contract, it was known that twenty vessels, of which half were tugs, were moving or making ready. Reinforcements from elsewhere will not be numerous or quick to arrive; nor could they repair the weakness in heavy duty lifting craft suitable for work in inland waters—though the two German lifting craft the Admiralty had on charter in Port Said have now been handed over.

Fortunately the size of the task south of the cease-fire line may not be as immense as the sheer numbers of wrecks may suggest—28 ships sunk and two bridges destroyed. Most were sunk haphazardly and were not specially prepared as blockships. Only nine of the wrecks, plus the two bridges, appear at present to block the navigable channel itself, and only three look like being serious salvage problems. One of these, however, is the tank landing ship "Akka," which was filled with cement and scrap iron and now lies on its side astride the southern entrance to Lake Timsah—where the channel of the canal is at its narrowest. Just what sort of salvage problem this and the other obstructions represent, General Wheeler's technicians are now finding out.

Steel Output Remains High

SINCE steelmakers who use oil appear to have been able to get enough extra creosote pitch to cover their 10 per cent cut in oil supplies without significantly affecting output the November rate of production, 426,400 ingot tons a week, was the highest ever, and the industry ought to be able to produce about 20½ million ingot tons of steel this

year. Extra capacity due for completion in 1957 should give it capacity for about 22 million tons. At present, there looks to be rather more reason than in recent years for the caution that the industry traditionally expresses at the beginning of each year; it takes confidence to feel sure that the economy will be able to use all the steel on offer in 1957; though export prospects remain good.

*Provisional

When the market begins to loosen, as it has this summer and autumn, steel consumers become a little less anxious to build up their stocks, and in the three months to September these stocks declined by about 2 per cent. Nevertheless, they were still nearly 10 per cent higher than at the end of 1955, so the net rise is still much greater than in the first three quarters of last year. Total stocks in the industry, however, are markedly higher than a year ago.

Apportioning Europe's Oil

THREE different committees have assumed the responsibility for co-ordinating the efforts of the individual companies to supply Europe with oil. In the United States, the Middle East Emergency Committee, composed of 15 American oil companies, has made a start with plans for pooling the tanker fleets operated by its members, and has begun to co-ordinate information on the additional supplies available for shipment from the Western Hemisphere. In Europe the oil committee of the OEEC has been given the task of assessing Europe's needs and supervising the allocation of available supplies equitably between the various European countries. Also involved are the economic and maritime transport committees of the OEEC. Advising the oil committee on the availability of supplies, and also acting as its executive arm in carrying out the actual supply operation, is the OEEC Petroleum Emergency Group, on which the British and French oil companies are represented. The American companies operating in Europe, still without permission from the American government to integrate their marketing activities fully with those of their competitors, attended the one OPEG meeting held so far only as observers.

So far, the main achievement of the OEEC oil committee has been an assessment of the adequacy of the oil stocks held in, and the supplies expected by, the various European countries. On the basis of this information, the oil committee has asked the companies to direct extra supplies to countries where stocks are abnormally low or where oil normally provides a very high proportion of the fuel used in industry. In Sweden, where oil provides 40 per cent of the energy used in industry, the need for extra supplies is given special urgency by the knowledge that the Baltic freezes over in January. Both Italy, where fuel oil stocks are reported very low, and the Netherlands rely on oil for over a quarter of their industrial energy, while at the other end of the scale only 3 per cent of the fuel used in German industry comes from oil. Over the OEEC countries as a whole the proportion is about 11 per cent.

The rationing schemes adopted throughout Europe, although similar in many respects, by no means conform to a common pattern, and the diversion of extra supplies to those countries that are worst off is still no more than a stop-gap operation. The OEEC oil committee has yet to formulate and get accepted by governments principles of allocation between its member countries. It must then rely on the voluntary co-operation of the oil companies to ensure that their supply programmes conform to those principles. On this co-operation the committee can no doubt rely, but the whole operation—especially the essential but at present tenuous link between the American MEEC and the European OPEG—would be made more effective if OPEG were designated by the Department of Justice as a body with which the American oil companies could freely associate.

Can Britain Show It?

TWO recent announcements—by the Birmingham Chamber of Commerce of its plans for next year's British Industries Fair, and by the President of the Board of Trade of the formation of a committee to advise him on British participation in trade fairs overseas—look forward to the period when markets will once again be harder to find than shipping space. The BIF, as the Birmingham Chamber of Commerce is at pains to make quite clear, is not dead. Its energetic survival in Birmingham is admittedly limited to the four main branches of industry—hardware, building, electrical and heavy engineering—that formerly made up the Birmingham section when the rest of it was held simultaneously in London.

However successful it may be, the next BIF will still be a mere shadow of the trade fairs run—and run at a profit—on the Continent. These are international fairs, containing exhibits from most of the principal trading countries. Even more successful are the many specialised fairs, devoted to a single industry but maintaining an international character.

Home fairs, if organised on this basis, should be able to pay their way (with perhaps a little government assistance for publicity, and bearing part of the travelling and hotel expenses of overseas buyers). But overseas fairs are another matter, and the sums spent by Britain's competitors show that they, at least, have no doubt where their interests lie. The American government has authorised the spending of $3.7 million this year on American participation in overseas trade fairs; the German government spends twice as much as the British; and, in relation to its size, so does almost every other country in Europe. By these criteria, even the £150,000 a year that the British government is now prepared to spend on overseas trade fairs is pitifully small.

Government aid is not required on a large scale in highly industrialised countries, where trade fairs are usually organised in trade sections. But in less developed countries, where fairs are generally organised on the basis of national pavilions that have to be built, and paid for, from scratch, the cost of exhibiting in any effective manner is prohibitive without government support.

The appalling British display at the recent trade fair at Zagreb, following equally deplorable performances last year at Karachi, Addis Ababa, and New Delhi, shows that prohibitive space rents have been avoided only by the construction of jerry-built pavilions. Even British Overseas Fairs, Ltd., the enterprising progeny of the Federation of British Industries, found, when it built a national pavilion, for the first time at Damascus, that it could not hope to compete with the lavish, subsidised displays by other countries.

The government funds now available, small as they are, should do something to stop the rot. Helped by his new advisory committee, the President of the Board of Trade should be left in little doubt about priorities. But how should the policy, once laid down, be administered? It has been suggested that the government should pay for the construction of national pavilions, and leave the rest of the job to private promoters and exhibition organisers. But if this is done on an adequate scale, how will the government ensure that it obtains value for money without an extensive—and unpopular—apparatus of inspection? Direct administration by government department also has its drawbacks. On the Continent, a third method has won favour—administration through a joint committee of government and industry, with the government providing the funds and exercising a controlling voice. This system has been operating, by all accounts successfully, in Belgium, the Netherlands, France and Germany. It could with advantage be considered here.

Investors Fancy Bermuda

ONE of the highlights of the Stock Exchange this week was the sudden jump on Wednesday of 12s. 6d. in the £1 shares of London and Overseas Freighters which touched a new peak of 175s., following the news that they are to be split into 5s. units. Earlier this year they stood at 56s. 9d. Another of the highlights was the further advance of 3s. to 24s 3d. in the 5s. shares of Harvard Investment Trust, shortly to be renamed Tanker Investment Trust. A mere fortnight ago these shares stood at 5s. 6d. and had not marked on the Stock Exchange for over a year. The explanation seems to be the lure of Bermuda to shipping investors. London and Overseas Freighters holds a 50 per cent interest in its Bermudan offshoot, London and Overseas Tankers. Harvard Investment is the holder of the other half.

It will be recalled that the half-share in the Bermudan Company not retained by London and Overseas Freighters was taken by Philip Hill, Higginson and its City associates. They are using the Harvard Investment Trust which had

an issued capital of only £150,000 in 5s. shares but enjoyed the advantage of a Stock Exchange quotation as a suitable repository into which to put those 750,000 £1 shares of London and Overseas Tankers (half the capital of that company) together with 40,000 £1 shares of London and Overseas Freighters, the intention being to increase the issued capital of the Harvard Trust to 4 million 5s. shares. In due course the older investments of the Harvard Trust will be sold.

Obviously some of the members of the Philip Hill syndicate have been prepared to let part of their holding in the Harvard company go at prices from about 10s. 6d. upwards, and obviously the investing public is finding it an attractive speculation. The oddity is that the whole object of going to Bermuda to build and operate tankers depends on not paying out substantial dividends. If London and Overseas Tankers were to pay early or substantial dividends the objective of building a tanker fleet out of profits that were not repatriated and therefore did not bear British tax would be defeated. In the announcement of the rearrangement of Harvard Investment Trust's capital which Mr Kenneth Keith, the chairman made last week a warning was fully set out. London and Overseas Tankers intends to pursue a conservative dividend policy and is unlikely to pay dividends during its early life. Moreover the Harvard Company's dividend policy in future years will depend to a considerable extent on whatever income accrues to it from London and Overseas Tankers. Nevertheless investors seem content to pay a price that puts a value of over £4 a share on the £1 shares of London and Overseas Tankers.

Britannia Breaks Cloud

THE Bristol Britannia airliner seems at last to be breaking through the clouds that have dogged its career. Its technical troubles have been mastered and the doors to the world's airline markets are no longer closed to Bristol salesmen as they have been in past years. In three days last week, orders were signed for ten Britannias, each costing nearly £1¼ million. The first five made up the long-

Retail Business

CUSTOMER TRENDS

This is a new quarterly bulletin for those interested in the home market for consumer goods. It includes short and long-term forecasts of sales by different outlets and merchandise groups, regional surveys and reports on special investigations.

One man helped Collins the publishers to save time on the "books"

The Burroughs man, Mr. J. R. West, on your right, discusses with Mr. R. A. Jamieson, a director of William Collins, the new Burroughs system that brought them valuable up-to-date sales figures and eliminated unnecessary overtime.

William Collins Sons & Co. Ltd., the well-known printers, publishers, stationers, and diary publishers, sell millions of books and stationery lines every year in Britain and overseas. Management must be kept up-to-date on the position of sales. A long-standing problem, however, was that staff had to put in long hours of overtime in order to get out the required figures. Even then, details were often available too late to be useful.

So Collins asked Burroughs' advice. The Burroughs man who tackled the problem was Mr. West—one of Burroughs' expert consultants on accounting methods. Together with members of Collins' accounts department he made a detailed study of the difficulties. The solution was found in a new system built round Burroughs Sensimatic accounting machines.

This proved so successful in the home market that Collins have also applied it to export sales figures. Now there is no unnecessary overtime, especially on customer analysis. The management, with more comprehensive sales figures available, are making practical and advantageous daily use of this information.

WHATEVER YOUR BUSINESS, if you have an accounting problem, the Burroughs man can help you. He is an expert on modern accounting systems, and well able to work with your accountants or auditors. Backed by Burroughs' world-wide experience, he will make a full analysis and suggest the most economical, *workable* solution. If he thinks no change advisable, he will say so; if he does recommend a change, he will make a detailed plan and help you get it working smoothly. Call in the Burroughs man—you're committed to nothing. His advice is free.

Burroughs make the world's widest range of business machines. You'll find your local Burroughs office in the telephone book.

Burroughs Adding Machine Ltd., 356-366 Oxford St., London, W.1

CALL IN THE Burroughs MAN

postponed order from the American operator Northeast Airlines; two were for the British independent airline, Hunting-Clan; the remaining three for the Ministry of Supply, in addition to ten that the Ministry already have on order. The American order reflects increased interest in Bristol's early delivery dates—before the end of next year. The home orders are the outcome of bitter lessons learned about air trooping during the Suez crisis. Plenty of lip service has been paid to the need to move troops by air, without any steps having been taken to provide the transport system to make their movement possible.

British Overseas Airways Corporation will at last be able to start Britannia services at the beginning of February. Bristol seems to have hit on a foolproof system of relighting the engine flames, the root of the recent engine troubles, by putting a platinum element in the flame tubes that heats up while the engine is running normally and remains glowing and incandescent if the flame suddenly goes out. Fuel spraying past this hot tip into the combustion cans is instantly re-lighted. It would, of course, be preferable to have engines that were not given to "flame-outs," but it is not so certain that Bristol can entirely eliminate the formation of ice pockets along the air intakes which cause the trouble.

Production of Britannias has now reached the stage where finished airframes are waiting for engines, which could not be installed until it is decided how to modify them to meet the flame-out troubles. Where hangar space is limited, as it is in Belfast where Short Brothers are building the aircraft on Bristol's behalf, the empty airframes were about to be pushed outside and stored in the open to clear assembly space for the next in line. It is from Belfast that most of the aircraft ordered last week will be delivered.

British Stockpile Sells Metals

THE non-ferrous metals have now lost nearly all the advance in prices set off by the Suez crisis. Cash tin closed on Thursday at £801½ a ton, nearly £10 below its "pre-Suez" level, and prompt lead, at £114 a ton, is about £1 lower. Copper, which touched a peak of £295 a ton for cash, has fallen to £273, only a few pounds higher than before the crisis, and prompt zinc, at £99½ a ton, has lost roughly half its earlier gain. Some decline in prices was to be expected as political tension eased, but other influences have also been at work. The high premium of £50 a ton for cash tin attracted supplies to the market and the premium has fallen to about £12 a ton. Supplies from the East that had to be re-routed round the Cape are beginning to arrive and some speculative accounts have been closed. In tin, and to a minor extent in copper too, there had been some buying on fears of a devaluation of sterling. Lead and zinc have been particularly affected by the cut in supplies of petroleum and the further cut in output of motor cars. And all the metals save tin have suffered to a varying degree from the British government's announcement of disposals from its strategic stocks.

About 36,000 tons of copper are now being released from the British strategic stock at the rate of about 7,000 tons a month, and in the past week the Board of Trade has announced its intention of releasing up to 2,500 tons of tin and an unspecified quantity of lead and zinc. The news merely interrupted a rally in tin prices; the amount is tiny in relation to world consumption and disposal will not begin within six months, the period of notice required under the International Tin Agreement. But lead and zinc weakened; though traders do not yet know the quantity and rate of disposal, sales may begin after the middle of next month. The outsider cannot assess the merits of the decision to reduce the strategic stocks; he has to assume that Whitehall knows best. The explanation given in the Defence White Paper is that in the light of the new priorities some economies in these stocks could be made without risk. It does not disclose what type of war the stocks are designed to serve. But should the decision have been based primarily on grounds of defence? The present stocks are part of Britain's reserves; stocks of metals at least do not deteriorate and in the long run their monetary value is more likely to rise than fall. The reduction of stocks of metals could prove to be a short-sighted saving.

HOW METALS HAVE MOVED

	Oct. 25	Nov. 1	Dec. 13
Tin, cash, £ per ton.....	810	882½	801½
Copper, cash, £ per ton...	269	295	273¼
Lead, prompt, £ per ton..	115	119	114
Zinc, prompt, £ per ton...	96	100	99¼

Bidding for Rubber Assets

THE stream of take-over bids is now in full spate in the rubber share market. It concerns particularly the Ceylon companies, but to an appreciable extent the Malay companies too. The selective rise in the price of rubber shares on the Stock Exchange reflects buying by potential bidders, buying by the public of shares that they think will be the subject of bids, and protective buying by agency groups defending themselves against the take-over bids that they anticipate. Among others these companies have been in the limelight recently:

St George Rubber Estates (whose rubber is in Ceylon) has been criticised for not informing shareholders of a bid equivalent to £187,500 for the company's estates, equal to £86 per acre and implying a break-up well above the recent price of the shares. The directors retorted that the offer was not worthy of serious consideration and was not one of which it was necessary to notify shareholders.

Kelani Valley rubber estates, whose £1 ordinary shares have fluctuated between 21s. 3d. and 70s. this year until the receipt of a bid, is now resisting an offer of 70s. per share on the ground that the proper value of its ordinary shares is at least £5.

The Garing (Malaya) rubber estate is proposing to accept an offer of 4s. 6d. per 2s. stock unit, the price having fluctuated up to the date of the offer this year between 1s. 2d. and 3s. 8d.

The examples illustrate the problem. Present market prices of the shares do not reflect present market value of

the rubber estates to local buyers in Ceylon and Malaya. Moreover, some of the companies have substantial cash assets for which no immediate use is in sight. There seems every prospect that in Ceylon the move to buy British-owned rubber estates and parcel them up into smaller native holdings must continue. Sir Eric Miller, the chairman of Harrisons and Crosfield, at that company's meeting this week showed how the same tendency is at work in Malaya. Local Chinese-Indian syndicates are endeavouring to buy up small or medium-sized estates, particularly those lying along main roads, and are then breaking them up into small blocks which they sell to Malays on mortgage at extremely high prices. Sir Eric suggested that the Malayan government might release some of its land resources for occupation by peasants on reasonable terms. But whatever the merits of that proposal, it hardly seems a full answer to the problem of under-valued properties and sometimes under-employed cash that at present perplexes many rubber producers.

Shareholders are entitled to press for some return of such surpluses even to the extent of pressing their directors to accept attractive bids. Agency houses will, no doubt, resist the movement. The mere fact that the first ministers of both Singapore and the Malay Federation are visiting London, the latter seeking finance on a scale that may be beyond the capacity of the London market, may make it seem to them the wrong moment to withdraw surplus assets and return them to shareholders. One method by which the agency houses seek to defend their empires is to get rubber companies within one management group to take interlocking share holdings in each other and so build up a solid block of votes to be used against any potential bidder. That system, which has been tried in the tea plantation industry, seems to be extending to rubber.

Troubles in the Tin Scheme

CERTAIN producing members of the International Tin Agreement have again sought an increase in the floor and ceiling prices. The present floor price is £640 a ton and the ceiling is £880, though the manager of the buffer stock, when he is able to operate, will try to maintain the market price within a range of £720 and £800 a ton. At the meeting of the Tin Council this week Bolivia took the lead in suggesting a revision ; the range of prices proposed has not been disclosed. Bolivia is the highest cost producer and is probably selling at a loss at the current market price of about £800 a ton. Other producers, it is understood, greeted its suggestion with varying degrees of enthusiasm ; consumers no doubt were more reserved. It was agreed that delegates should consult their governments, and at the next meeting of the council on March 20th proposals will probably be put to a vote.

The council estimated that a small deficit in commercial supplies of tin this year would be changed into a small surplus in 1957. It took account of the disposal of up to 2,500 tons of tin from the British government's strategic stock ; it also assumed that the Texas smelter, which refines the tin taken into the American government's strategic stock, would close in the New Year and that there would be some delay before the Bolivian ore now treated at Texas was smelted elsewhere.

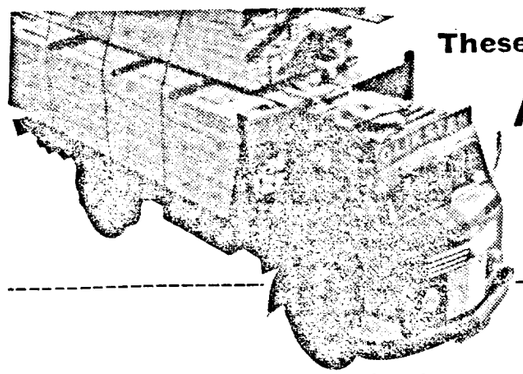
Bank Capital Plans

FOLLOWING the example of Lloyds Bank, its relative, the National Bank of New Zealand announces a scheme for abolishing the uncalled capital liability on the shares and in the process foreshadows a modest increase in its dividend. The bank's present capital is 2,400,000 shares of £2 10s. £1 paid. It is proposed to pay up a further 5s. per share by capitalising reserves, to abolish the remaining £1 5s. of capital liability, and then to convert the resulting 2,400,000 shares of £1 5s. into 3 million £1 shares fully paid. The bank's general reserve, which will be drawn upon for £600,000 in the process, will be restored to £2 million by a transfer from contingency account. The proposed final dividend is 5 per cent on the capital as increased, making a total equivalent to 10½ per cent on the capital in its present form. This seems to foreshadow a modest increase if the intention is to pay 9 per cent for a year on the new capital that would be equivalent to 11¼ per cent (against 10 per cent) on the old.

Television Without a Break

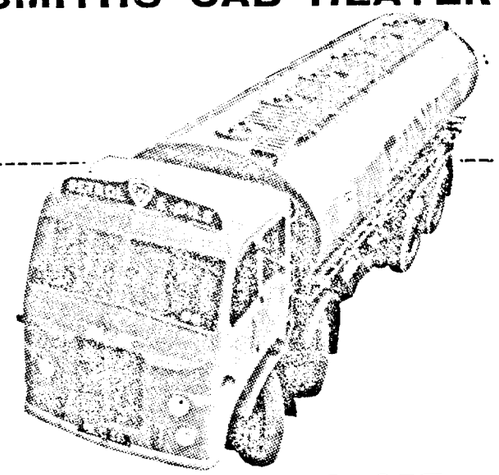
THE Government's decision to allow television transmissions between 6 pm and 7 pm in the evening, an hour during which they had previously been banned, is going to upset the BBC's arrangements for its engineers' supper break during the shut-down period but it will also iron out the irrational system under which programmes were arbitrarily interrupted during the evening just at the time when many people, particularly in the Midlands, were ready to sit down and look at them. The change was made at the insistence of the Independent Television Authority rather than the BBC ; the programme contractors felt that they were losing a potentially large and, from an advertising point of view, a remunerative audience, and would much prefer to use this hour and start their programmes later, at 5 pm instead of 4 pm. The contractors seem recently to have wooed the advertisers only too well. The flood of applications for advertising time in the new season which starts in January has created such a backlog of orders that at least one company has had to take its travelling salesmen off the road to deal with the office work.

But the flood of business also has its embarrassing side. Far too much of it was in the form of 7-second spot advertisements that flash on the screen for an instant. These spots, first introduced for the advertiser who did not want to spend much money, have acquired a nightmare popularity. It is in theory possible to fit nearly 50 of them into the six minutes' advertising allowed in each hour, but the chaotic effect of a rapid sequence of advertisements flashing on and off the screen within seven seconds would be intolerable. The four contractors have therefore announced that they will accept no more bookings for these spots, and have wiped them off their rate cards.



These two have something in common...

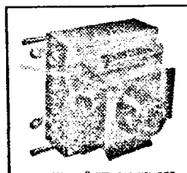
A SMITHS CAB HEATER



Fina Petroleum and J. Gliksten & Son Ltd. are two of many famous companies who have installed Smiths cab heaters in their fleets. They have done so because they believe in making their drivers warm and comfortable; they believe in giving them the safest possible driving conditions; and they believe in helping them to keep fit.

Smiths are Britain's largest producers of vehicle heating equipment and their extensive research and development programmes include the sending of fleets of vehicles to the coldest parts of Europe and Canada where heaters can be tested under the severest working conditions.

Thanks to Smiths research and Smiths production resources, the Smiths cab heater is the most efficient equipment of its kind—yet its price is very competitive.



THE SMITHS 3-KW. CAB HEATER

* Compact and easy to fit, size 8¼" x 7¼" x 7¼".
* High heat output of 67.8 BThU/Hour/°F.T.D. with total airflow of 126 cu.ft./min.
* Maximum forced airflow for demisting of 30 cu.ft./min.
* Sturdy and simple construction ensures reliability.
* Models for 6, 12 or 24 volt operation.
* Retail price £12.10s. 0d. including full kit of accessories.

SMITHS TRANSPORT VEHICLE CAB HEATERS

one of SMITHS *accessories for better transport*

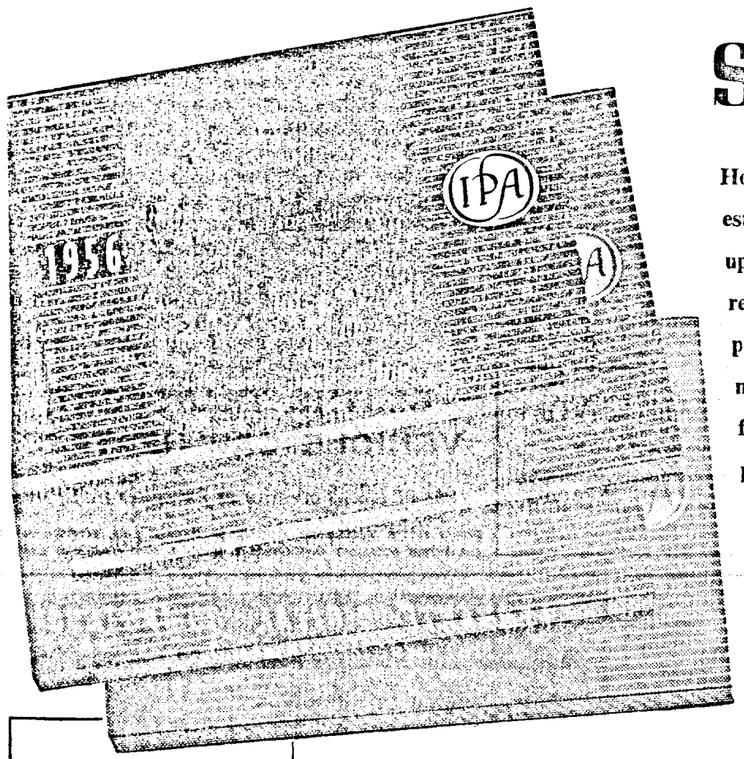
The New IPA CONTINUING NATIONAL READERSHIP SURVEY



However readership is defined, estimates as exact and as up-to-date as possible of the readership of daily and Sunday papers, and of weekly and monthly magazines, are the foundations of every major press advertising campaign. In the new I.P.A. National Readership survey now ready for publication, the work so successfully done in 1954 is carried on in the new continuing form.

FIRST REPORT TO BE PUBLISHED IN 1956

PUBLICATION DATES THEREAFTER ... QUARTERLY

PRICE 10 GNS

per copy, including the present report and the report to be published 3 months hence, the two together covering the period April-December 1956, and including the full yearly quota of 16,000 interviews.

The case for a continuing survey

Previously available surveys have been based on the assumption that readership patterns established over a limited period were valid throughout the year. This assumption has never been verified. The new survey will therefore be carried out continuously, the results being published quarterly. Each quarterly publication will be complete in itself, but obviously will gain enormously in value by allowing comparisons to be made and trends to be noted with a time lag of only 3 months.

Other considerable advantages also accrue, and these are discussed in detail in the introduction to this first report.

Changes in methods following carefully thought-out experiments have resulted in important—and perhaps unexpected—alterations in the figures of readership of some classes of media. These methods are fully discussed in the introduction.

The I.P.A. believes that in starting publication of this continuing readership survey it is assisting advertisers and their agencies to maintain high standards of assessment in the selection of media.

SHORTER NOTES

The Board of Trade's index of new hire purchase sales by retailers in October (December, 1955, equals 100) rose to 88 compared with 77 in September, but with 119 in October last year. The index for the finance houses rose to 90 compared with 77 in September, but with 125 in October last year. And the nation's total hire purchase debt outstanding continued slightly to decline. By the end of October it was 19 per cent below the figure of "at best £480 million" at the end of 1955.

★

Although the Minister of Transport has now fixed May 1, 1957, as the date on which the speed limit on heavy goods lorries will be raised from 20 mph to 30 mph, there is still no sign yet of a solution to the deadlock between road hauliers and the unions on the new driving schedules and wage payments to accompany this reform.

★

The sale of Premium Bonds in November, the first month of their life, came to £46½ million, not far short of the Chancellor's original guess of £50 million.

162855

★

The Ministry of Fuel and Power is sending questionnaires to firms using oil to discover what effects the cuts in supplies may have on their output. Fuel oil supplies have been cut by 10 per cent, and deliveries of gas/diesel oil are to be reduced further to 20 per cent after January 1st.

Company Notes

STEEL PROFITS. The end of September is the common accounting date for all the steel companies. That is one of the more useful legacies of nationalisation, and the preliminary reports of the leading companies in the industry have now begun to appear. Profit margins have been clipped, but most of the companies are reporting earnings higher than in 1954-55 for the massive investment that has gone into the industry in recent years must bring some reward. How much earnings have risen depends largely upon the time when new plant was brought into production. South Durham has, for instance, done better than has United Steel, but then much of South Durham's new equipment came into production this year, while 1957 and 1958 are the key years for United Steel's development programme. But margins are lower and continuing development needs the continuing support of retained profits and, as has been predicted, the directors have done little more than to maintain ordinary dividend payments.

Stewarts and Lloyds has produced the fullest and the most impressive preliminary report so far. It shows that dispatches of steel tubes have gone up by 14 per cent, from 857,000 tons to 981,000 tons, that sales to customers have risen from £98,043,000 to £114,122,000 and that trading profits after depreciation have risen from £13,323,000 to £16,523,000. Of the increase of £3,200,000 in profits, not less than £2,921,000 has come from the operations of the parent company. The British group spent about £3½ million on fixed assets, leaving a balance of £27 million in capital development schemes still to be completed, and at times during the year the group had to borrow from the banks. Hence it is not surprising that the ordinary dividend is left unchanged at 17½ per cent, absorbing only £1,006,000 from a net profit of £8,517,000. Even if the £2 million put to replacement reserve is excluded, the cover on the dividend is fat. That is one reason why the £1 shares gained 3s. 7½d. to 62s. 7½d. (to yield £5 12s. per cent) immediately after the report was issued. One day there must be bigger dividends, or so at least investors argue looking at the 100 per cent free scrip issue now promised by the company. One day, too, there may have to be a rights issue. But for the moment investors should heed the directors' comments that the increase in issued capital should not be taken as an indication of bigger dividends and that though the authorised capital is to be increased they have "no present intention" of issuing new shares for cash.

United Steel has reported a slight decline in gross profits after depreciation. They fell from £12,803,657 to £12,047,330, revealing how the increase in costs pressing against stable prices has squeezed margins. With a development scheme coming to fruition soon, this should give no cause for alarm. The group has put over £5 million to reserves of all kinds while the maintained ordinary dividend of 12½ per cent absorbs just over £1 million. On this dividend the £1 shares yield 7⅛ per cent at the current price of 35s. 4½d. xd.

Dorman Long, another giant of the industry, has reported an even sharper decline in trading profits. Before charging for depreciation, repairs and replacement reserves, they have fallen from £12,150,839 to £10,786,410, thus confirming in no uncertain terms the directors' interim report of last June. The directors then said that trading results were being adversely affected by "increases in wages and transport charges and in coal and fuel oil prices, as well as the embargo on overtime by craftsmen employed on maintenance work."

The group's net profit has declined from £3,764,199 to £2,423,583, but this profit is shown after appropriating £1,250,000 (against £1 million) to fixed assets replacement reserve. The group still has a big development programme to complete and its directors have in the past been even more cautious than other steel company directors in their dividend policy. Inevitably they have left the ordinary dividend unchanged at 8 per cent, absorbing £690,000. On this dividend the £1 shares at 27s. 6d. yield 5.8 per cent.

South Durham Steel Company's £1 ordinary shares were offered to the public at 27s. 6d. each last January. At that time the directors predicted an ordinary dividend of 8 per cent and a profit of £2¼ million for the year to September 30th. They have kept to their promise on dividends but trading profits actually earned have come to £3,222,817, as compared with £2,754,717, thanks presumably in the main to the increase in production following the completion of new plants. The net profit is £1,568,784, from which the ordinary dividend takes £368,000. The £1 shares now stand at 25s. 10½d. to give a yield of £6 4s. per cent.

Thomas Firth and John Brown has not a big development programme in front of it and hence it can afford to be a little less cautious on dividends than those steel companies that have programmes still to complete. Thus its directors' decision to add a final dividend of 6 per cent to the increased interim of 4 per cent, making 10 per cent for the year (against 9 per cent), is not out of tune with the other results so far announced. The increase in dividend follows on a rise in trading profits after depreciation from £2,590,770 to £2,933,071. On the new dividend the £1 shares at 29s. 6d. yield about 6¼ per cent.

★

RALEIGH INDUSTRIES. The preliminary report of Raleigh Industries has pleased investors. Since it was published the £1 ordinary shares have gone up from 35s. to 38s. 6d. xd. It was pleasant reading for two reasons: it contained the news investors like to hear, and it presented the news in a way they like

to see, including, for instance, calculations of percentage earnings and of "times covered."

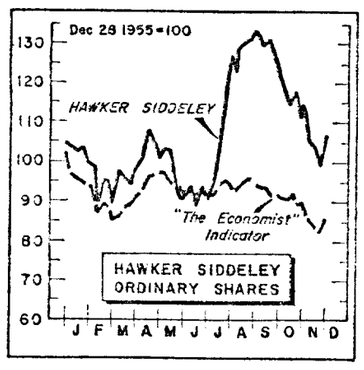
The core of the report was that the ordinary dividend had been raised from 12½ per cent to 13¼ per cent (to give a yield of 7 per cent on the £1 shares) and that in the year to July 31st the group had achieved new records in production, sales and profits. Over 70 per cent of the group's sales were to export markets. Bigger sales and presumably the increase in selling prices announced near the beginning of the financial year led to an increase in trading profits from £2,484,932 to £2,682,879 and in net profits from £1,097,466 to £1,171,033. Ordinary earnings went up from 49.3 to 52.9 per cent and the cover on the dividend remained unchanged at just under four times.

Selling a high proportion of its bicycles abroad, the group is presumably little worried by hire purchase restrictions at home. And next year new manufacturing capacity will begin to make a contribution to earnings. Expansion demands the retention of profits but if earnings go on rising there is a new possibility to be considered. A year ago the directors said in introducing a new profit-sharing scheme that "the amount distributed to employees will have a predetermined relation to the profit earned by the company each year." This year they say the increase in the ordinary dividend "is similar to the increase in the amount allocated for benefits to workpeople under a new profit-sharing scheme." Is it possible—and it would certainly be equitable—that if employees benefit from better profits the directors intend to give an equal increment to ordinary shareholders?

★

HAWKER SIDDELEY. Having secured the increased dividend that had been expected since the 100 per cent free scrip issue of twelve months ago, shareholders of Hawker Siddeley may not feel inclined to delve into some of the accounting intricacies of the preliminary statement for the year to July 31st. Yet apart from the effective increase in the ordinary dividend from 8¼ to 10 per cent, this report is not a satisfying document. Its presentation rather than the group's performance is unsatisfying. The group's net profits are shown to have risen from £5,682,935 to £6,372,884. But the figures are struck after various deductions (including in 1954-55 an appropriation to replacement reserves) and after crediting £616,875 (against £1,191,296) of profits relating to previous years.

The calculation of gross profits from these figures is a tedious exercise but it shows that gross profits for the year have risen from £12,675,537 to £12,847,867, while net profits excluding earnings from earlier years have gone up from £4,491,639 to £5,756,009. But the directors do not say what the charge for depreciation has been. That item must be significant in judging the results, for this year nothing has been put to fixed assets replacement reserve (against £1,000,000 in 1954-55) and the presumption must be that the depreciation provision has risen quite sharply. If it has then the group's trading profits have been somewhat better than the preliminary figures suggest. The full accounts will settle this puzzle. Meanwhile on the new dividend the £1 ordinary shares, which moved ahead rapidly in the summer when investors were attracted to companies with Canadian interests, yield 5.2 at the current price of 38s. 6d. xd.



LONDON STOCK EXCHANGE

Next Account begins: January 2nd

Next Contango Day: January 2nd

Next Settlement Day: December 18th

THE Government's measures to maintain existing exchange rates strengthened the rally in gilt-edged stocks. The recovery of sterling on Tuesday assisted the improvement and on balance most stocks showed reasonable gains, although some prices eased on Wednesday and Thursday; 3½ per cent War Loan rose ⅛ to 69⅜, 3 per cent Gas 1990/95 gained ⅜ to 65⅝ and 2½ per cent Savings 1964/67 ⅞ to 78⅛. Short-dated stocks receded and 5½ per cent Bootle Corporation 1961 offered on Monday at 98½, of which 90 per cent was left with the underwriters, fell in early dealings to 1 discount. The improvement in sterling cut the dollar premium from 9½ a week ago to 6 per cent on Thursday.

Industrial stocks rose steadily up to Thursday when they became dull. Companies likely to be concerned in any expansion of the atomic programme were particularly active. Head, Wrightson jumped 15s. to 116s. 3d., Simon-Carves 4s. 3d. to 27s. 9d., Babcock Wilcox 2s. 9d. to 73s. 6d. and John Thompson 4s. 6d. to 32s. AEI gained 6s. to 67s. 6d., GEC 4s. 6d. to 46s. 6d. and C. A. Parsons and A. Reyrolle rose to the same price of 102s. from 93s. and 96s. 6d. respectively. Banks and insurances improved; Barclays advanced 3s. 3d. to 45s. 9d. and National Bank of New Zealand 5s. 9d. to 33s. 3d. xd. while Eagle Star rose 4s., Sun Insurance 15s. and Guardian 7s. 6d. Bristol Aeroplane gained another 2s. to 19s. 3d., but Hawker Siddeley receded to 38s. 6d. xd. Tate Lyle rose 6s. to 63s. 1¾d. Steel shares bounded up after the Stewarts & Lloyds results were known, Firth Brown rising 2s. to 29s. 6d. on the increased dividend. Shipping shares were active, Donaldson jumping 7s. 6d. to 82s. 6d. and London Overseas Freighters 15s. to 175s.

Oil shares encountered profit-taking after their sharp recovery, but gold mines rallied on Tuesday and Wednesday with the dividend declarations. Coppers were dull, Nchanga declining ⅜ to 12⅝.

(1) Relates to wholesale prices in Athens and Piraeus only for Greece. Figures for Ireland are based on January, 1952=100. (2) July-December. (3) Relates to prices in capital cities only for Austria, France, Greece and Turkey. Belgium and Austria exclude rent. Denmark includes direct taxes. Figures for Ireland are based on August, 1953=100. (4) Including direct taxes. (5) Including trade with Faeroe Islands. (6) Index numbers of unit value which compare the current average value of trade with its value in 1953; they are influenced by changes in the composition of trade as well as price movements. (7) Deposit money and notes and coins held by business, individuals and foreigners. Except for Greece holdings of the issuing authority and other banks are excluded. (8) Holdings of the government and central bank at end of period. Figures for Greece are gold reserves only. Foreign exchange figures for Norway exclude government holdings; Norway and Sweden include foreign investments. Ireland include some long term securities. (*) Beginning May, 1954, a new drachma equal to 1,000 old drachmas introduced.

Financial Statistics

EXCHEQUER RETURNS

For the week ended December 8th, 1956, there was an "above-line" deficit (after allowing for Sinking Funds) of £16,127,000 compared with a deficit of £17,158,000 in the previous week and a deficit of £33,558,000 in the corresponding period of last year. Net expenditure "below-line" last week reached £27,242,000, bringing the total deficit to £700,638,000 (£598,039,000 in 1955-56).

THE MONEY MARKET

The discount market reduced its bid at the Treasury bill tender on Friday last by 2d. to £98 14s. 9d. per cent for the £220 million of 91-day bills on offer and by 1d. to £99 2s. 6d. per cent for the £60 million of 63-day bills. The drop in the market's bid does not appear to have been fully followed by outside applicants, and as total applications for the three months bills rose by nearly £50 million, to £375.3 million, the market's allotment rate fell from 52 per cent last week (high by recent standards) to 24 per cent—the lowest for some years. Its rate on the 63-day bills, however, rose from 77 to 90 per cent. At yesterday's tender, the offer of three months bills was stepped up to £230 million, and that of two months bills was unchanged at £60 million.

Credit conditions in the money market in the week to Wednesday were rather easier than of late; market supplies of funds were adequate for demands on most days, though on Thursday of last week small official help was needed, whilst this Wednesday official purchases were fairly large.

Business in the London gold market has been quiet in the past week. The gold price dropped from 251s. an ounce on Thursday before the week-end to 250s. 3½d. an ounce on Wednesday.

The Bank return shows a further rise in the active note circulation of £38.5 million in the week to Wednesday.

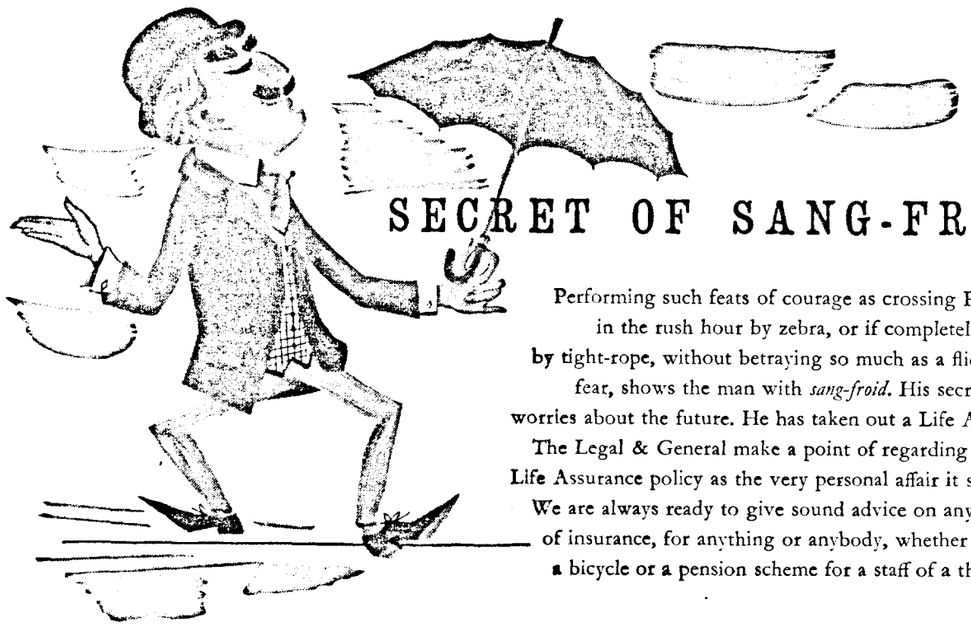
Save? What for? Few of the up-and-coming generation have ever known a rainy day: is it surprising that many do not think to save? Yet the need for saving, *regular* saving, is great—in their own interests and in the Country's.

How best to save? Life Assurance—the greatest single source of regular personal saving—offers protection for the newly married, provision for the newly born, and security in later years. People save for the future through Life Assurance, because of a confidence justified by a long record of integrity and sound management.

Life Assurance *a safeguard of real prosperity*

Issued by The Life Offices' Association, London. Established 1889.



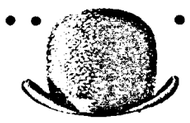
SECRET OF SANG-FROID?

Performing such feats of courage as crossing Piccadilly in the rush hour by zebra, or if completely exasperated, by tight-rope, without betraying so much as a flicker of fear, shows the man with *sang-froid*. His secret? No worries about the future. He has taken out a Life Assurance. The Legal & General make a point of regarding every Life Assurance policy as the very personal affair it should be. We are always ready to give sound advice on any type of insurance, for anything or anybody, whether it is for a bicycle or a pension scheme for a staff of a thousand.

LEGAL & GENERAL
ASSURANCE SOCIETY LIMITED

CHIEF ADMINISTRATION: 188 FLEET STREET, LONDON, E.C.4. TEL: CHANCERY 4444

It seems there was an Englishman, a Scotsman and an Australian



The Englishman wanted to make a capital investment in Australian industry. Naturally he wanted some sound market information.

The Scotsman was thinking of expanding his business and opening an Australian branch. He wanted information and a first-class banking service with offices on the spot.

The Australian, having an eye to business with the Scotsman and Englishman, wanted a Bank with a London Office.

They all went to The English, Scottish and Australian Bank and got exactly what they wanted. So will you, if you have any business with Australia.

COMPANY MEETINGS

ANGLO-TRANSVAAL CONSOLIDATED INVESTMENT COMPANY LIMITED

GOLD MINING EXPANSION CONTINUES REGARDLESS OF DISTURBED FINANCIAL MARKETS

APPEAL TO LOCAL INVESTORS

GROUP'S CONTINUED INDUSTRIAL PROGRESS

The Twenty-third Annual General Meeting of the Anglo-Transvaal Consolidated Investment Company Limited was held in Johannesburg on Friday, December 7, 1956.

Mr S. G. Menell, the Chairman of the Company, presided, and in his address to Members said:

Ladies and Gentlemen,—I have much pleasure in welcoming you to the Twenty-third Annual General Meeting of the Company, and in submitting for your adoption the Directors' Report and Accounts for the year ended June 30, 1956.

The Profit and Loss Account reflects net revenue for the year of £1,041,600 and a net profit of £920,600. The provision for taxation amounted to £144,000 and an amount of £225,000 was written off investments, leaving a balance transferred to the Appropriation Account of £551,600, which with £379,100 brought in at the beginning of the year made a total of £930,700 available for appropriation.

Dividends on the various classes of our Share Capital absorbed £516,300. The amount carried forward on the Appropriation Account at credit is £385,800.

The total book value of investments in subsidiary companies and other concerns amounts to £6.8 million, compared with £5.7 million for the previous year—an increase of £1.1 million due chiefly to the exercise of rights to take up shares in new gold mining companies. The market value of shares and interests in concerns other than subsidiary companies was £4.8 million against a book value of £4.5 million, and the quoted investments in subsidiary companies had a market value of £2.1 million compared with the book figure of £1.7 million.

There was thus a surplus of £740,000 of market over book values, not taking into account the specific provision of £600,000.

In the opinion of your Directors, the unquoted investments in subsidiary and other concerns are conservatively valued.

The Reserve Fund of £3,500,000, together with the unappropriated profits of £385,800, totals £3,886,000, which is over £1 million in excess of the issued capital.

The accumulated revenue reserves of the subsidiary companies in the Group of which Anglo-Transvaal Industries Limited is the principal subsidiary, aggregate £1,753,000. Of this amount your Company's proportion is approximately £1 million.

I will now deal with the Company's principal interests.

GOLD

RAND LEASES (VOGELSTRUISFONTEIN) GOLD MINING COMPANY LIMITED

No. 1 Tertiary Shaft serving the eastern section of the mine below the 36th level was completed during the year, and crosscutting to the reef horizon has been commenced on all levels.

Due to the small percentage payability disclosed in the lower levels of the Main Reef Series in the western portion of the mine, development work in this area will be curtailed in order to concentrate on the zone served by No. 1 Tertiary Shaft.

A programme of intensive sweeping and reclamation has been commenced in the upper levels of the mine. At present approximately 2,000 tons per month are being obtained from this source.

Dividends aggregated 7½ per cent for the year ended June 30, 1956, as compared with 10 per cent for the previous year.

VIRGINIA ORANGE FREE STATE GOLD MINING COMPANY LIMITED

Extensions to the reduction plant to provide a milling capacity of 108,000 tons have been completed.

During November 1956, 95,000 tons were milled at a recovery grade of 5.04 dwt per ton, resulting in a working profit from gold including sundry revenue of £58,773. The working profit from acid production was £24,561, and from uranium production £150,000 (subject to adjustment). The total working profit for November from all operations was £233,294.

HARTEBEESTFONTEIN GOLD MINING COMPANY LIMITED

In November, 1956, the milling rate was increased to 75,000 tons at a recovery grade of 9.90 dwt per ton, resulting in a working profit from the gold operation of £225,759.

The Uranium Plant declared its first working profit of £138,000, for November, 1956.

The Company has recently embarked upon an expansion programme involving the expenditure of approximately £6 million over the next four-five years. In view of the Company's high profit-earning capacity from gold and uranium, it is anticipated that it will be possible to appropriate the necessary funds from profits to meet this capital expenditure programme and at the same time to make reasonable dividend distributions to Shareholders.

In June the Company declared a maiden dividend of 10 per cent.

MERRIESPRUIT (ORANGE FREE STATE) GOLD MINING COMPANY LIMITED

During the year the Kennecott Copper Corporation of New York provided additional finance for the Merriespruit Gold Mine in the form of 3 per cent Registered Unsecured Loan Stock for 4,200,000 dollars.

The production of gold (and of uranium- and pyrite-bearing concentrates for treatment at the Virginia Mine) was commenced in March, 1956, at a milling rate of 75,000 tons per month.

Operations proceeded satisfactorily until a series of inrushes of water, unprecedented in the Orange Free State, culminating in the flooding of the Mine, resulted in all mining operations being suspended as from October 20, 1956.

When the Mine was flooded, a number of men lost their lives in tragic circumstances. We feel most deeply for the bereaved and extend to them our sincerest sympathy.

RIEBEECK GOLD MINING COMPANY LIMITED

The capital of the Company has been increased to £3,500,000 by way of a share issue. The Honourable the Minister of Mines has agreed to grant a Mining Lease to the Company and the lease formula will be $Y = 15 - \frac{90}{x}$.

Preparatory work for the sinking of a shaft has commenced.

The twin haulage from No. 2 Shaft of the Loraine Gold Mines Limited which will accelerate development and which will initially provide the second outlet had at the end of November reached a position approximately 3,700 feet from the point where it will enter the Riebeeck property.

VILLAGE MAIN REEF GOLD MINING COMPANY (1934) LIMITED

The modifications to the reduction plant are nearing completion and these are expected to increase considerably the efficiency of the plant.

Steady progress is being maintained in the reopening of the old workings in the vicinity of the Wolhuter East and Ferreira East inclines.

Dividends aggregated 20 per cent for the year ended June 30, 1956, being the same as the previous year.

BASE METALS

THE ASSOCIATED MANGANESE MINES OF SOUTH AFRICA LIMITED

The net profit for the year ended December 31, 1955, before providing for taxation, was £799,514, out of which a 20 per cent Dividend was paid on the Ordinary Shares. An interim Ordinary Dividend of 20 per cent was paid in respect of the half-year ended June 30, 1956. The capacity of the Com-

pany to deliver ore to its customers is still adversely affected by the continued rationing of railway trucks.

CONSOLIDATED MURCHISON (TRANSVAAL) GOLDFIELDS AND DEVELOPMENT COMPANY, LIMITED

The demand for antimony continued to be satisfactory although there is growing competition from Chinese and Russian sources. Profits for the nine months ended September 30, 1956, amounted to £546,905 before providing for taxation, as compared with £799,000 earned during the corresponding period in 1955. Dividends aggregated 320 per cent for the year ended December 31, 1955. An interim dividend of 100 per cent was paid in respect of the half-year ended June 30, 1956.

COAL

ANGLO-TRANSVAAL COLLIERIES LIMITED

Total sales for the year ended June 30, 1956, amounted to 1,124,893 tons of coal. The Dividend on the Ordinary Shares was 15 per cent as compared with 12½ per cent for the previous year.

RHODESIAN MINERAL PROSPECTING INTERESTS

During the year the Group became interested in various base metal prospects in the Central African Federation. To control these operations we have established the Anglovaal Rhodesian Exploration Company (Private) Limited, with its Headquarters in Salisbury.

INDUSTRIAL

ANGLO-TRANSVAAL INDUSTRIES LIMITED

The main industrial interests of Anglo-Transvaal Industries Limited have shown a gratifying record of continued progress.

The advantages of a rationalised distribution of fish by South Atlantic Corporation Limited following upon the acquisition of National Trawling and Fishing Company Limited, manifested itself during the year and, in pursuance of the policy of delivering fish in better condition to inland distribution centres, new depots with modern cold storage equipment are being opened up at such centres. The profits for the year showed an increase over the previous year.

At Consolidated Glass Works Limited further expansion took place during the year in the completion of the erection of the new factory at Belleville, Cape, which commenced production on July 1st this year. Unfortunately, the fire which occurred at the Talana factory caused a setback in production which, however, will be remedied early in 1957. The profit for the year exceeded the previous year's profit.

National Bolts and Rivets Limited had an increased turnover but experienced a drop in profits due to the fact that, to enable the Company to meet its requirements, it had to import large quantities of steel at higher prices than the price of local steel which was in short supply. Nevertheless, the dividend of 10 per cent was maintained.

In the tobacco business of John Chapman Limited, a half interest was acquired by the Rembrandt Tobacco Corporation (S.A.) Limited. It is pleasing to note that the Company's turnover and profit were the highest on its record.

Since the end of the financial year, Anglo-Transvaal Industries Limited has acquired a substantial interest in the business of Chassay Brothers, makers of the well-known brand of Supersonic Radios. These products enjoy a high reputation in Southern Africa and in certain export markets.

Anglo-Transvaal Industries paid an Ordinary Dividend of 11¼ per cent as compared with 10 per cent for the previous year.

An industrial enterprise cannot stand still, and it is our policy to continue aiming at greater rationalisation of the industrial units so as to reduce the cost structure, and at the same time to increase their productivity by the use of new techniques.

Last year I referred to the introduction of the undistributed profits tax and its effect on young industries and although this tax has not been abolished, amendments were introduced during the year which have alleviated the position.

ANGLO-ALPHA CEMENT, LIMITED

The policy of controlling the price of cement is adversely affecting the operation and financial arrangement of the cement industry to such an extent that it is unable to set aside sufficient funds from its limited profits to build up reserves required by the industry to meet the increase in the demand without having to borrow funds for this purpose.

In the case of Anglo-Alpha Cement, the Company was fortunate in being able to secure from overseas a large proportion of the additional funds which the Company required for its programme of modernisation and expansion to meet the Country's increasing demand for cement.

The 5 per cent dividend was the same as the previous year.

SOUTH AFRICAN TORBANITE MINING AND REFINING COMPANY, LIMITED

The arrangements which the Company effected with the assistance of the Government for the refining of imported crude oil, in conjunction with indigenous supplies, is working satisfactorily and the marketing of the Company's petrol through the Sasol Marketing Company Limited is operating smoothly. The Company was able to record an improvement in the profits for the past financial year under these new arrangements as compared with the previous year's figure.

An Ordinary Dividend of 10 per cent was paid as compared with 7½ per cent for the previous year.

UNION LIME COMPANY, LIMITED

In spite of the additional output made available by the installation of two further kilns during 1955, it was impossible to meet customers' demands for lime and limestone due to the erratic and inadequate supply of railway trucks.

The expansion programme is continuing but this capital expenditure will not yield results until the railways are able to supply adequate transport as promised.

The issued capital was increased from £225,000 to £450,000 and a dividend of 15 per cent on the increased capital was paid as compared with 20 per cent for the previous year.

SOURCE OF CAPITAL REQUIREMENTS

I will now refer to a few matters of general interest.

The recent launching of the Riebeeck Gold Mine, in spite of the present disturbed state of the financial market, is yet another example of the faith that the Rand Mining Houses have in the long-term prospects of their mining ventures. In this instance the underwriters, who are the Anglo-American Corporation, General Mining and Finance Corporation and our Group, proceeded on the basis that the development of the country's Mining Industry is of paramount importance and should not wait on a revival in share market activity.

This brings me to a problem which has been referred to frequently in recent years and the solution of which is still the key to the rate of our economic development in this country. I refer to the capital famine.

While savings in this country have increased enormously, and while the degree of reinvestment of profits on the part of industrial and commercial undertakings has also increased, if we are to maintain even a reasonable momentum of progress such internal capital formation must be supplemented for many years by capital inflow from overseas.

Now, for a variety of reasons, capital is not coming into this country in the volume which is desirable. In the first place, the era of easy money which followed the postwar period has now passed. The creditor countries are faced with strong internal demands for their public utility undertakings and industries which are busily engaged in developing new techniques and products. The welfare state policy has resulted in more and more money being absorbed by public expenditure, calling for higher taxation, and a shrinkage of the amount of private money available for investment.

Finally, there are psychological factors which have operated against investment in South Africa, partly as a result of ignorance of our potentialities and our problems, and partly because certain aspects of our internal problems are unique enough to be dramatised and given a disproportionate significance.

As a country we can but continue to do all in our power to attract capital from overseas. But we must face up to the hard, sober fact that it is unlikely that the volume of the free flow of capital to which we have become accustomed in the past will be available in the future. We will have to depend more on our own resources.

It is unfortunate that at a time when we are forced to depend upon our own resources there should be such a marked apathy on the part of South African investors to invest in South African equities.

With our country's rapidly expanding economy and increased purchasing power the savings potentiality of our population is continually growing. The extraordinary resilience of the Union's cash position has been demonstrated of late when it is noted that there appear to be ample funds in both the hands of the banks and the building societies, whereas the reverse position was in evidence as recently as last August.

It is a matter of national importance to channel a portion of these available funds into mining and industrial equities, and every effort should be made to bring this home to the average citizen.

It is the function of private enterprise to be enterprising, otherwise there is no reason for its existence. It seems unfortunate that the private investor appears to be unwilling to invest in that enterprise which is essential if the country is to continue to progress. It is often said that taking risks is not the function of the private investor, and that is why many prefer to keep their money at fixed

rates of interest in various forms of traditional safe investments, which, with the progressive depreciation in the purchasing power of money results in their exposing themselves to the certainty of capital erosion, as against the opportunities of capital appreciation notwithstanding the uncertainties of equities.

As long as private enterprise is accepted as playing a necessary and important part in the country's advancement and prosperity the withholding of capital for this purpose would be a disservice to the country as a whole.

All around us there are great projects which have been brought to fruition by private enterprise in this country and brought it wealth and prosperity, and in this we see tangible signs of risks well taken. In all aspects of our economy, risks have been taken by the public at large, and the public at large have benefited from the results.

The restoration of a commensurate proportion of private savings for the acquisition of equities will in the aggregate, re-establish the pattern of finance which in the past had started and maintained the turning of the wheels of mining, industry, and commerce, in which pattern the Stock Exchange has played an invaluable part in mobilising the supply of capital needs for the country's economic expansion.

CONCLUSION

In conclusion it is my pleasure to place on record the Board's appreciation of the services rendered during the year by the Executives and Staff of your Company at the Head and London Offices.

The Report and Accounts for the year ended June 30, 1956, were then adopted, the retiring Director, Mr C. H. Leon, was re-elected and the Auditor's remuneration for the year was fixed.

INDIAN IRON & STEEL COMPANY

IMPROVED RESULTS

MR T. LESLIE MARTIN'S REVIEW

The annual general meeting of The Indian Iron & Steel Company, Limited, was held on November 30th in Calcutta.

Mr T. Leslie Martin, the chairman, in the course of his speech, said: Last year I stated that it was extremely unlikely that the production and trading results of that year would be repeated and that the large increase in the revenue and consequent profits could only be regarded as a windfall. Happily, my prognostications have proved entirely wrong and very wide off the mark. From the Report and Accounts for the year 1955-1956 you will have seen that the results of the previous year have actually been exceeded.

PRODUCTION

The Company's total production of 7,06,986 tons of iron fell short of the figure of the previous year by less than 9,000 tons. The output, however, of your Burnpur Blast Furnaces which provide the hot iron for steel making fell from 5,17,899 tons to 4,73,172 tons. This was due to the fact that No. 2 Furnace was off production for periodical re-lining. The loss of production on this account, however, proved to be much less than had originally been envisaged as, by improved re-lining technique, the work was completed in a very much shorter period than on any previous occasion.

With the change over of two of the Steel Melting Furnaces from Producer Gas Fuel to tar firing we were able, and are now in a position, to utilise a greater proportion of steel scrap in our furnaces than was formerly the case. As an offset to the inevitable drop in the availability of iron for steel making resulting from the closure and re-lining of No. 2 Blast Furnace, an intensive drive for the procurement of steel scrap from local sources was launched and carried out with such success that it was possible to make good the anticipated deficit and even to surpass last year's production tonnage of ingot steel by some three thousand tons. A further benefit was received by reason of the fact that the Rolling Mills were able to produce a larger proportion of the output in the form of finished steel commanding a larger margin of profit than semi-finished steel such as billets, blooms and slabs.

The production of iron from your Kulti Blast Furnace was 233,814 tons as against 197,702 tons in 1954-55, since both Furnaces were in full production throughout the year. In addition to the benefit of the consequent increased availability in the sale of pig iron, full advantage was taken of a larger allotment of iron, sanctioned by Government, for use in the Kulti foundries. This enabled an increase in the production tonnage of Spun Pipes and General Castings of some sixteen thousand tons which, again, had a marked effect on the satisfactory trading for the year under review.

PROFIT

Taking these factors into account an increase in profits of some Rs. 70,00,000/- has been realised for the year. From this amount we are required to set aside Rs. 29,47,838/- to a Special Fund to be utilised solely for the purpose of our expansion programme.

As to the future, I can only say, in view of the excellent results for the year 1955-56, that despite the many difficulties encountered your Burnpur Works have worked to full capacity and that until this capacity is augmented by the extensions now in progress, which will gradually come into operation, no appreciable increase in output can justifiably be looked for. Also, it must be remembered that it is not unlikely we may have to contend with increasing difficulties in the operation of the existing plant owing to the disorganisation caused by the expansion works in progress. I would, therefore, ask you to bear this in mind when forecasting possible results over the next year or so.

FINANCE

The Accounts show the transfer of a sum of Rs. 7,00,000/- to General Development Reserve. You may feel some doubt on the necessity for such transfer, having regard to the very large amounts set aside on the other extensions reserves. I would, therefore, like to explain that the sum in question represents the approximate reduction in the normal taxation liability for the year by reason of the Development Rebate allowed by Government exempting from taxation 25 per cent of the cost of the new plant and machinery installed.

The consideration underlying this concession is that the saving in tax should be set aside for development purposes. We count to a large extent on the continuance of this rebate for financing both the 1953 and 1955 extensions and it is very desirable that this position should be recognised by the immediate institution of a General Development Reserve as a separate item of the reserves.

DIVIDENDS

In view of the substantial increase in the amount of profits earned your Directors had naturally wished to mark the position by some increased distribution on the Ordinary share capital. Every endeavour was accordingly made to obtain the approval of Government to the admission of the shareholders to an increased participation in the profits, but Government have found themselves again unable to agree at this stage to an increase in the rate of dividend. Though the position is disappointing to us all and is one which your Directors greatly regret, as I advised you under similar circumstances last year, the orders of Government cannot be ignored nor their legality challenged without serious detriment to the interest of the Company.

It is incumbent upon us, therefore, to accept the decision of the Government with good grace. To the extent that profits earned are retained in the business the finance of the expansion programme and the ultimate repayment of the loans that are being incurred is facilitated. Also, we may derive such consolation, as we may, for the present restriction of dividend from the assurance that has been given by Government in their letter dated September 22, 1956. It has been stated in that letter that the mobilisation of the available resources for the completion of the expansion programme is in the long term in the interests of the shareholders "as ultimately they will have their full share of the increased profits."

FURTHER EXTENSIONS

Particulars of the further expansion to an annual output capacity of 800,000 tons of saleable steel which, at the request of Government, has been agreed to, have been given in the Board's Circular Letter of November 5, 1956. In my speech to you last year I explained that no decision as to the undertaking of this further expansion could be arrived at until the revised sales retention prices of steel to be operative as from April 1, 1955, had been notified by Government and we had thereby been enabled to forecast with some reasonable degree of accuracy the future financial position of the Company.

The revised retention prices were communicated to the Company in February, 1956, and were fixed at a satisfactory level. The further expansion was, therefore, approved by your Board and the necessary financial negotiations for securing the finance to cover the cost put in hand. As you are aware, this programme provides mainly for an increase in the finishing mills capacity. It is scheduled for completion under normal conditions early in the second half of 1959.

The above does not purport to be a report of the proceedings of the Annual General Meeting, a copy of which will be sent to shareholders in due course.

MITCHELLS & BUTLERS LIMITED

LARGE MODERNISATION AND BUILDING PROGRAMME

MR ROBERT H. BUTLER'S STATEMENT

The Sixty-ninth Annual General Meeting of the Ordinary Stockholders of Mitchells & Butlers Limited will be held at The White Horse, Birmingham, on Monday, December 31, 1956. The following is an extract from the circulated statement of the Chairman, Mr Robert H. Butler :

ACCOUNTS

The Trading Profit for the year shows a very small decline on last year. This result your Directors consider satisfactory, in view of ever rising costs and a very bad summer which caused a slight falling off in Beer Sales. The Net Profit shows a larger decline which is due to higher rates of Profits Tax imposed in the Autumn and April Budgets. In fact, Taxation this year takes 11s. 4d. in every £ of our Trading Profit.

I referred last year to the injustice of the Profits Tax to Equity Holders, and this has been still further aggravated by the recent additional imposition ; but another taxation anomaly to which we, as very large owners of retail premises are subject is that there are no initial or wear and tear allowances for these premises, such as there are for industrial buildings.

The result of this, of course, is that instead of the cost of replacement being charged against profits over the years, more and more reserves have to be built up for this purpose and it is with this in mind that your Board are again retaining for use in the business, out of profits of the year, sums larger than the net dividend paid to Ordinary Stockholders.

As I mention later on, we have started on large programmes of building licensed houses and in modernising and improving the Brewery. In fact, during the year, we have spent some £500,000 on new licensed houses. It is very necessary therefore, to maintain a strong liquid cash position.

THE YEAR'S TRADING

The year's trading can be divided into two periods. Until June sales showed an increase, the upward trend we had enjoyed during the previous financial year being well maintained. From that time onwards, however, we suffered one of the most dismal summers of recent years, and it could hardly be expected that this would not affect beer sales as compared with last year, the chief sufferers being our larger On Licences and country type houses. Short time working and redundancy in the Midlands, which led to lower earnings for a large number of workers, and the increase in prices of bottled goods which we were compelled to make to help retailers meet the continuous rise in the cost of running licensed houses, also played their part in reversing the upward trend.

I am pleased to say, however, that the resulting decrease in beer sales was not nearly so great as seemed likely at one time, and was in fact largely offset by the pleasing increase in our Wines and Spirits sales, which constitute an all-time record.

The demand for our Spirits, and in particular for our famous Dumbarton Whisky, continues to increase. It is a testimony to our policy of maintaining the highest possible standard of age and quality, a standard which is unsurpassed anywhere in the country.

The increasing demand for our Wines is another pleasing feature of last year's operations. Personal visits to the Wine producing countries, expert purchasing, and careful supervision right through to the consumer enable us not only to maintain the highest standards, but to ensure a price at which our customers know they are receiving good value for their money.

RECONSTRUCTION IN BREWERY

We are ever conscious of the fact that in order to maintain the high standard of our beer we have to be constantly studying the latest developments in plant and equipment and planning methods, and as a result of the experience gained on the Continent and in America we have been enabled to incorporate in the reconstruction which is now taking place in our Fermenting Block the most recent developments in brewing practice. We are also modernising our Power Station and when this work has been carried out it will effectively help the labour situation and lower the costs of production.

BUILDING PROGRAMME

This year we have embarked on an extensive building programme and altogether we shall have completed more new fully licensed premises than in any comparable period previously in the history of the Company. Fifteen will have been opened during the course of this year. I should like to make it clear, however, that the trade of these new houses is not all new barrelage in spite of the tremendous Capital Expenditure involved. For the most part it replaces the trade of houses which have been closed under redevelopment schemes, etc.

These new houses, which are most attractive, have been well received by our customers and are already established social centres. From the trading results so far achieved, which have been most gratifying, there is little doubt that the provision of these facilities has fulfilled a much needed requirement in each of the districts concerned. They are in and around Birmingham and its neighbouring towns, and Nottingham, Leicester and Derby.

RECENT ACQUISITIONS

We have recently purchased "The Raven" and "The Exchange Vaults," two fully-licensed houses at Ludlow, where we were previously not represented.

Further afield, our interests in North Wales have been extended by the recent acquisition of the Morville Hotel at Rhyl, which we feel will prove a valuable asset to the Company. In addition to its residential facilities it will provide the opportunity for our many friends to obtain their favourite beverage when visiting this popular holiday resort.

In Llandudno, our licensed house "The Parade," which we acquired in 1954, has now been modernised and brought up to the standard we aim at in our houses.

In the Free Trade competition has been steadily increasing during recent years and shows no signs of abating. However, we are well organised to meet it. Our beers enjoy a growing popularity in an ever widening area and to meet this demand and to provide the service for which we are so well known, we have established depots in appropriate areas.

Our Export Pale Ale has been a great favourite with the public for many years, and our customers tell us that our Mild Ale has never been better.

BEER PRICES

Prices of our draught beers, in common with those of the majority of Midland brewers, have not been increased since 1951, although in most parts of the country brewers found it necessary to increase their prices earlier in the year.

The Government rightly include beer in their Cost-of-Living index, and we feel that Midland brewers have performed a public service by keeping prices of their draught beer down in the face of difficulties. It is our intention to hold the present prices as long as possible, but this cannot be done indefinitely if costs continue to rise. As an example of the magnitude of this problem, increased costs in our Managed Houses during the past year of Wages, Fuel, Electricity, Rates and additional purchase tax on a variety of goods, amount to about £200,000.

Added to these still rising costs, taxation on beer still remains at a level which is far too high, and I hope in the interest of all concerned the Chancellor may one day heed our appeals to him for relief.

NEGOTIATIONS WITH ANSELLS

In my last Annual Statement I referred to the discussions taking place between the Boards of your Company and of Messrs. Ansells Brewery Limited. These discussions were carried out on a very friendly basis, but while they proved useful to some extent no arrangement to the mutual advantage of the two Companies was found by the respective Boards to be possible and an appropriate announcement was made through the Press. Such discussions then ceased and no resumption is envisaged by your Board in any form.

OIL SUPPLY RESTRICTION AND PETROL RATIONING

As we go to Press the Suez crisis is far from being resolved, and the resulting difficulties which will be created by the fuel oil and petrol shortages naturally give cause for grave concern. We are, however, taking active steps to minimise the effect of these shortages and we are hopeful that production will be fully maintained.

On the delivery side some reorganisation will be necessary and we shall be compelled to ask for the co-operation and the goodwill of our many customers in any steps we have to take to meet our difficulties.

GLAXO LABORATORIES

SATISFACTORY INCREASE IN VOLUME OF SALES

PRODUCTION OF POLIO VACCINE ESTABLISHED

SIR HARRY JEPHCOTT'S TRIBUTE TO STOCKHOLDERS AND STAFF

The twenty-second annual general meeting of Glaxo Laboratories Limited was held on December 10th in London. Sir Harry Jephcott, MSc, FRIC, FPS, the chairman, presided.

The following is an extract from his review, which had been circulated with the report and accounts for the year ended June 30, 1956 :

The provision of facilities for the continued expansion of the Company's business, both at home and overseas, has necessitated further investment in fixed assets of some £800,000 during the year at home and £500,000 overseas, all of which has been found from the undistributed profits of previous years. As a result, the issued capital is again unrepresentative of the capital invested, and it is proposed to capitalise £1,592,700 of the Capital Reserves and to issue to stockholders one additional 10s. Share for every two 10s. units of Ordinary Stock held. The consent of the Capital Issues Committee has been received.

At the same time, opportunity is being taken to eliminate the formal structure of 1s Ordinary Shares transferable in 10s. units, and to make the Ordinary Share unit one of 10s. converted to stock.

TRADING CONDITIONS

The results for the year were somewhat more favourable than might have been expected from the Half-Yearly Statement. In part this was due to some improvement in prices but more substantially to an increase in the volume of business during the second half of the year. In the finality, the turnover of the Company and its oversea subsidiaries showed an increase of more than 10 per cent over the preceding year. The net profits before tax did not, however, improve to an equal extent.

At home our turnover showed a satisfactory increase, both in volume and value. In some export markets conditions continue highly competitive and, although the volume of our direct exports increased, the value only equalled the preceding year.

On the other hand, our oversea subsidiary Companies contributed substantially to an overall increase in sales. With their manufacturing facilities these Companies are well placed to take advantage of the rising demand for the Company's products. We are now beginning to reap the fruits of the efforts and large investments we have made in developing these Companies.

With one exception, all the subsidiaries have shown a satisfactory net profit this year and their remittances to the parent Company have increased significantly. The increase in income from our oversea subsidiary Companies has not been secured to the detriment of the subsidiaries themselves. We recognise the need to strengthen these Companies, and profits have been retained in their Accounts this year to three times the extent of the previous year.

These favourable results have been achieved in markets which, although developing, are not without problems of their own. Inflationary conditions, leading to continuously rising local costs as well as to exchange shortages and difficulties of securing imported supplies, often enormously complicate the planning of future production.

In some countries, efforts to repress inflation by price control add to the complications. The challenge of competition must always be faced but, here again, the difficulties have increased as our products have had to compete, not only with surplus production from other countries but frequently also with the subsidised production of Government-sponsored local enterprises.

EXPANDING FACILITIES OVERSEAS

In spite of all the difficulties and uncertainties that oversea trading presents, which, indeed, have made us resolve further to strengthen our Exchange Reserve by the allocation of £100,000, the Board remains convinced that the development of our oversea interests is a wise policy. It has been strengthened in its view by the results for the past year.

Further developments are in contemplation or in hand at our subsidiary Companies in the Argentine, India, Pakistan, New Zealand, Italy and elsewhere. In some instances we may need to provide additional capital both for fixed assets and to finance increasing business.

We are well satisfied with the progress we are making in oversea markets. This is best exemplified by the fact that no less than two-thirds of the Company's consolidated turnover is in oversea markets.

Our recently acquired subsidiary—The Murphy Chemical Company, Limited—had a satisfactory year, during which progress was made both in turnover and in profitability. Its technical staff is now working in close collaboration with that of the parent Company and, in due course, the full benefits of co-operation will be secured to our mutual advantage.

NEW DEVELOPMENTS

During the past two or three years the Company has undertaken development tasks of very considerable magnitude. Notable amongst these have been the production of the poliomyelitis vaccine, and a new synthesis of cortisone.

A considerable quantity of poliomyelitis vaccine has been produced answering the exacting standards set by the Ministry of Health and the Medical Research Council, and very many doses have been administered with advantage and without ill-effect. Great credit is due to the staff of our virus unit for the excellence of their work.

Cortisone and other closely related substances are now being manufactured upon a substantial scale, although not to the full extent necessary to meet our requirements. Production is being expanded as rapidly as increased supplies of raw material become available. Here again I wish to express my warm appreciation of the efforts of our staff engaged upon this project. An outstanding piece of research has been developed into a process that has proved to be economic and is being operated on a commercial scale.

The Company has entered into an agreement under which it will manufacture synthetic vitamin A upon a large scale. Construction of the plant is well advanced and supplies are expected to be available towards the end of our financial year.

FACTORS FOR PROGRESS

The good results of the past year have not been achieved without great efforts and have been due to three factors : the consistent support by the stockholders of the Board's policy of ploughing back into the business a large proportion of the annual profits ; the introduction of new processes, and the general expansion of our activities, which this policy has made possible ; and, above all the loyalty and zeal of all grades of the staff at home and overseas. So long as we can continue to enjoy these advantages we may look forward with reasonable confidence, whatever the difficulties ahead.

The report and accounts were adopted and, at the subsequent extraordinary general meeting, resolutions were passed for the reorganisation of the Share Capital of the Company, the capitalisation of reserves and scrip issue, and the amendment of the Articles of Association.

HERRBURGER BROOKS LIMITED

(Manufacturers of Pianoforte Actions, Keys, etc.)

CONTINUED SATISFACTORY PROGRESS

The thirty-sixth annual ordinary general meeting of Herrburger Brooks Limited was held on December 12th in London, Sir Louis Sterling (the chairman) presiding.

The following is an extract from his circulated statement: During the year under review the business of the Company continued satisfactorily. There was a slight reduction in the requirements of the Home Piano Manufacturing Trade which is still largely concerned with export. The volume of direct export sales of the Company to overseas markets was more than fully maintained while new business was obtained by production and sale of articles for kindred types of trades with the result that as a whole there was a considerable increase in the year's earnings.

At the beginning of the current year business showed a reduction but now appears to be regaining a satisfactory level. Costs of Labour and Material, however, continue to rise and although a steady demand for Pianos still exists almost the world over there is a general resistance to price increases. If, however, these matters can be controlled the Directors view the future with confidence.

Last year reference was made to a proposal to raise approximately £50,000 by a "rights issue," but the Directors decided to defer the matter until conditions improve.

The report was adopted.

DEBENHAMS LIMITED

POLICY OF EXPANSION

MR J. BEDFORD ON PROVISION OF FURTHER FINANCE

The annual general meeting of Debenhams Limited was held on December 11th in London, Mr J. Bedford, OBE (Chairman and Managing Director), presiding.

The following is an extract from his circulated statement:

The Consolidated Trading Profit for the year ended July 31, 1956, amounts to £5,244,379 which shows an increase of £219,248 over the figure for last year. After deducting interest and depreciation charges, together with £14,787, against £112,443, in respect of unearned profit on Hire Purchase Debtors, the Net Profit before taxation is £4,622,988, an increase of £256,931. The reduction in the provision for unearned profit on Hire Purchase Debtors arises from the fact that this provision was created for the first time last year.

The major part of the increase in net profit has been absorbed by a higher charge for taxation which totals £2,620,819 against £2,473,929 last year; profits tax itself requires £943,070 against £554,909. Nearly £500,000 of the total charge for profits tax arises through distributions; approximately £160,000 of this amount represents tax at the distributive rate on dividends paid to Preference Shareholders of the Parent Company and Subsidiary Companies. Even now the full effect of the increased rates has not been felt because they were introduced in October, 1955, during the year under review. I do not wish to give the impression that I am unmindful of the difficulties facing the Government in their efforts to combat inflation and consumer spending. I must, however, protest most strongly against the heightening and continuance of a tax which, both within and outside business circles, is regarded as a bad tax and which is borne entirely by the Ordinary Shareholders, thus hitting risk capital upon which industry and commerce depend.

The Net Profit available for appropriation by the Parent Company is £1,175,833. The Directors recommend that, after payment of the Preference Dividends, the same allocations be made as last year, namely, £150,000 be transferred to General Reserve and a Final Dividend of 2s. per share (making 2s. 9d. for the year) be paid on the Ordinary Shares. The balance carried forward to the next account is increased by £17,283.

The Directors are fully conscious of the need for care in the financial field during these difficult days and every project involving cash expenditure is subjected to detailed investigation, but I am sure you will agree that no business can afford to stand still in these highly competitive times. By exercising the strictest control, it has been possible to delay so far a major financing operation; however, I should mention that Treasury permission is still in being regarding the five million pound Debenture Stock Issue which was postponed because of the sharp increase in money rates in February 1955.

Notwithstanding the continuing restrictions on credit in the money market, it is the intention to expand our Group of businesses into towns where we are not represented and to broaden even further the base of the Group as opportunities occur. As the share capital of the Parent Company is at present fully issued, the Directors consider that it would be in the best interests of the shareholders to increase the Authorised Capital so that in the event of the Company deciding to acquire additional businesses and to implement the purchase of such businesses by the exchange of shares, unissued shares would be available. An Extraordinary Resolution will accordingly be proposed at the Annual General Meeting for the purpose of increasing the Authorised Capital by the creation of an additional 5 million Ordinary Shares of 10s. each. Advantage is to be taken at the same meeting of proposing, by Special Resolution, alterations to certain Articles of Association of the Company.

TRADING

We are the only large Group of Departmental Stores with such a high proportion of its businesses in the luxury and middle class trade. The shifting pattern of income groups has resulted in the largest proportion of the spending power of the public being transferred to the weekly wage earners. This trend has naturally benefited our popular stores, the results of which compare favourably with their competitors. During the last few years we have built up a Central Buying Organisation that has enabled our popular stores to compete with the chain store businesses and it is our policy to expand this side of our business and also to enter the chain store field when a suitable group can be acquired.

REVALUATION OF PROPERTIES

We have instructed Messrs Hillier, Parker, May & Rowden and Messrs Healey & Baker to carry out a revaluation of the properties in the Group in order that we may review our insurances and re-assess whether the assets of the Group are being used to the best advantage. If any of our businesses are found wanting in this latter respect, energetic steps will be taken to remedy the matter.

RATING ASSESSMENTS

You will remember that in the report last year your attention was drawn to the increased charge for rates which the Company would have to bear as a result of the new rating assessments; these came into force in April last. The forebodings on this head have, in the event, been proved correct, the rateable value of the Group having been increased by £564,000. On the existing rate poundage, which experience shows will surely tend to rise, but which for the moment has mitigated to some extent the effects of these new assessments, the additional rate cost to the Company for the current year will be no less than £290,000.

The present turmoil of world affairs, the continued rise in expenses, render the task of forecasting the future almost impossible but I am glad to say that our turnover this year shows a satisfactory increase. As our new stores come into trading, so will our position improve, and to that extent the immediate future can be viewed with reasonable confidence.

The report and accounts were adopted and the proposed increase of capital and amendments to the Company's Articles of Association were approved.

HECHT, LEVIS & KAHN

(Merchants in Raw Rubber and Other Commodities)

EXCEPTIONALLY FAVOURABLE TRADING CONDITIONS

The thirty-first annual general meeting of Hecht, Levis & Kahn Limited was held on December 10th in London, Mr James S. Saxby (the chairman) presiding.

The following is an extract from his circulated statement:

Trading conditions in the year under review were exceptionally favourable, and this is reflected in the results. Your Board, therefore, considered it right to propose not only a final dividend of 10 per cent which, together with the interim dividend, gives the same total as last year, but also a bonus of 10 per cent.

For a group such as ours, with associations in many parts of the world, results must depend in part on the degree of co-operation between members of the group. During the year under review we had numerous meetings with the management of our overseas associated companies, both by visits from them to London and from London overseas.

As in past years, our Paris friends, SAFIC Alcan & Cie., have been most successful. Our new subsidiary in Singapore, the Fred Waterhouse Co. Ltd., had a successful year, and in view of this we are strengthened in our belief that the acquisition of this manufacturing business will be of continuing value to us in the changing conditions of rubber trading. Our older subsidiary in Malaya and Singapore, Anglo-French & Bendixsens Ltd., also had a good year and showed considerable initiative in developing new outlets.

Our other subsidiaries in Amsterdam, in Antwerp, in Bremen, in Hongkong and in Saigon have continued to work closely with us and to make their contribution to the business of the group.

Our relationship with the Rubber Corporation of America is developing and we are sure we shall reap mutual benefit from it.

CURRENT PROSPECTS

Conditions during the last six months have been particularly difficult and disturbed. The credit squeeze, the general increase in interest rates, and the falling-off of car sales both here and in the United States, would in any case have hampered us. But the violent swings induced by political events in the Middle East have been a great disturbance. We shall continue to use our utmost endeavours to combat these difficult conditions.

Meanwhile we have been developing our plans for strengthening the operations of the group. Your Board have come to the conclusion that it would be advantageous to separate in the London organisation the function of watching over the general strategy of the group as a whole and that of conducting the day-to-day trading operations in London. We have, therefore, decided to set up a new subsidiary which will take over these day-to-day operations, leaving the parent company, Hecht, Levis & Kahn Limited, to act mainly as a co-ordinator of trading operations, finance and personnel policy.

We have also decided on a change in policy relating to interim dividends. We intend in future to recommend only one annual dividend when the results of the group for a whole year are known and when dividends have been declared by the subsidiaries.

The report was adopted.

AIRE WOOL COMPANY

(Woolcombers and Topmakers)

LORD BARNBY'S STATEMENT

The twenty-first annual general meeting of Aire Wool Company Limited was held on December 12th at Shipley, Yorkshire, Colonel Lord Barnby, CMG, CBE, MVO, the chairman, presiding.

The following is an extract from his statement circulated with the report and accounts for the year to July 31, 1956.

YEAR UNDER REVIEW

From the Consolidated Profit and Loss Account it will be seen that the Group profit for the year before Taxation was £190,860 compared with £204,104 last year. In keeping with many other Yorkshire wool textile concerns, the year's operations have been carried out under very difficult trading conditions. Each succeeding wool trading year certainly incorporates unpredictable price movements. Each result must depend considerably on the closing date.

In our case the Trading year reviewed had to bear much of the brunt of a steep decline in 1955 yet closed just before bringing in any advantage from a sharp advance in 1956. Such movements, of course, iron themselves out over the two year operation. I would here mention that for accountancy reasons consideration is being given to a change of date for our Trading year end.

The early part of the trading year received the impact of much pressure from bearish "forward" wool offerings from origin. This contributed to a widespread state of mind receptive to expectation of a lower level of values. This outlook evidently extended down the line into the retail sphere. A progressive running down of stocks presumably occurred. Buying this Autumn to rebuild these depleted stocks of merchandise gathered momentum as raw wool values began to rise. This has naturally carried commitments from top to cloth many weeks forward. So it can be said, as this is written, that continuing machinery activity is promising.

It was a year of high activity in the Worsted section in general, Home and Export trade both contributing handsomely in volume. Export of Tops in particular attained a high figure. Our own turnover was again a record high in volume but profitability was disappointing.

DIVIDEND

Since my last Statement, the Rights Issue, then foreshadowed, was completed. This added £152,988 to our liquid resources. From your Directors' Report, it will be seen that a final payment of 12½ per cent less Tax on the Ordinary Stock is again recommended making a total of 25 per cent less Tax for the year thus maintaining our former rate of Dividend on this increased Capital.

SOUTH AFRICAN INTERESTS

Our South African Associated concern has enjoyed high activity and its profits have been satisfactory. South African combed tops have now achieved wide acceptance. We feel this venture is fully proving its justification and consider its prospects encouraging.

WOOL POSITION

World Export Trade in Tops for 1955 was reported as 175 million lb. Report for the first quarter of 1956 indicates an annual basis of 192 million lb. Of this total 82 million lb was contributed by the UK, or 43 per cent. It seems debatable whether proposals for the UK to join a Free European Customs Union would be advantageous to us. We in UK currently enjoy—at around 12d. per lb for merino Tops—a relatively high Import Tariff.

Taking a broader survey, machinery activity in the Worsted Industry has now for several years happily remained high. But examination of available statistics seems to indicate that while world wool production progressively increases, we in the UK are barely maintaining our usual proportion of the world wool Clip; also we do not appear to be increasing our percentage of the total. UK installed machinery has probably been little increased in capacity.

As long as Exports of semi-manufactures continue, UK machinery activity, and therefore, employment, should remain high.

FUTURE OUTLOOK

The future course of wool values must in the tangled state of International Affairs continue to be largely influenced by monetary controls and movements. Under any tendency to inflation in any country wool is one of the most convenient "counters" for defensive action. Such demand is outside normal calculable demand against supply.

I have already referred to poor profitability of recent past (apart from luck in bold anticipation of price movements either way which we regard as apart from conventional routine). At current wool values and high money rates, reasonable calculated margins are essential to provide a cushion for unpredictable future movements, as well as a minimum current return on invested capital and written down equipment value.

It seems reasonable to suppose that in more and more countries under the world influences towards Nationalism there will continue a tendency to instal their own productive machinery. Freight rate increases may well increase the export of Tops from Australia.

Japan's supply of sterling can probably continue to be influenced by dollar earnings in supplement of sterling. Her wool-buying capacity must remain a factor to be followed.

Any review of prospects for a commodity of world wide use and mobility like raw wool would be incomplete without reference to the USA. Total consumer income there is reported as running around £660 per *capita* against £310 in UK. The population is increasing by nearly three million per annum, i.e., a gain of say between 40 and 45 million persons since 1939. Such tremendous income might at any time under the stimulus of fashion changes have a powerful impact on wool demand and on prices.

At time of writing our Order Books are satisfactory so we have promise of continuing good activity.

MANAGEMENT AND PERSONNEL

It remains for me on behalf of the Board to convey our thanks to every member of our organisation for their efforts during the year; in particular I would thank our Managing Director, Mr R. P. Pitcher, for his enthusiastic and untiring services.

The report and accounts were adopted.

DICTOGRAPH TELEPHONES

COMPANY'S UNIQUE REPUTATION

The twentieth annual general meeting of Dictograph Telephones Limited was held on December 13th in London.

In his circulated address, the Chairman, Mr Philip V. Summer, states: The net profit of the Group, after taxation of £99,615, amounts to £96,440 (last year £79,777). After writing down the value of goodwill from £50,000 to £1 Group Reserves now stand at £379,758 (last year £339,298).

Today your Company has rental agreements which contract to yield more than £2 million and an annual income from rental and maintenance contracts in excess of £400,000. Thus, if anything other than a nominal figure for goodwill is shown, it should be very much higher than the original cost of £90,004. I said seven years ago "the intrinsic value of goodwill was higher than at any time in the Company's history," and this is much more so today.

The Company's reputation is unique in the intercommunication telephone field and its products are as popular as ever. In addition to the Dictograph Loudspeaking Telephone System, we have installed a further number of Automatic Switchboards in connection with our Dictomatic System. Our "Sound and Time" Department has also attained a new sales record for Staff Location Systems, Clock and Time Recorder Systems.

Grampian Reproducers Limited, as forecast last year, has made a substantial contribution to Group profits. The report was adopted and a final dividend of 10 per cent, making 20 per cent for the year, was approved.

ANTOFAGASTA (CHILI) & BOLIVIA RAILWAY COMPANY, LIMITED

INCREASED RECEIPTS

The sixty-eighth annual general meeting of this company was held on December 11th in London, Mr H. C. Drayton, chairman, presiding.

The following is an extract from his circulated statement:

The net receipts from the operation of our railways and waterworks in 1955 were £682,802, an increase of £14,172 compared with 1954. After adding other income, exchange differences and £297,517 brought forward from 1954, and deducting fixed charges, appropriations for provisions and reserves and the 5 per cent Cumulative Preference dividends there is a credit balance of £943,872 after taking into account a dividend of £876,000 (£677,028 after taxation) received from the Bolivia Railway Company early in 1956 and accrued in our 1955 accounts. The Bolivian Government also received the pro rata proportion to which its 27 per cent Common Stockholding entitled it.

These payments were made largely out of funds which became available as a result of the settlement of United States income tax.

The appropriations in our Net Revenue Account for 1955 include three-and-a-half years' dividends on the Cumulative Preference Stock. This brought payments up to date at December 31, 1955. We have also paid the dividend for the first half year of 1956. The Board recommend a dividend of 4 per cent (less income tax) on the Consolidated Ordinary Stock—the first since 1930. The report and accounts were adopted.

THE WALMSLEY (BURY) GROUP

(Manufacturers of Pulp and Paper Making Machinery and Equipment)

POLICY OF BALANCED EXPANSION CONTINUED

The twenty-fourth annual general meeting of The Walmsley (Bury) Group Limited was held on December 7th at Bury.

Mr Alan Green, MP (the chairman), presided and in the course of his speech said:

The consolidated profit for the year is £632,232, as compared with last year's figure of £579,421. After charging taxation, the profit becomes £287,168 against £271,849 for the previous year. The profit attributable to outside shareholders in the subsidiary companies is £2,051, leaving a profit of £285,117 for the members of The Walmsley (Bury) Group Limited. Of this, £12,856 has been set aside to Pensions Reserves, leaving £272,261.

We are proposing, for your consideration, a final dividend of 20 per cent on the Ordinary Share Capital; this, with the interim of 5 per cent, makes a total for the year of 25 per cent less tax.

The liquid cash position is satisfactory. Total assets exceed current liabilities by £2,595,375, this being the Balance Sheet figure of the capital employed.

THE YEAR'S TRADING

There has been a substantial increase in the volume of work reaching, or on its way to, our customers. This increase is largely the product of our continuing policy of balanced expansion allied to a determination to keep the works well equipped, well maintained and rationally used and partly the fruit of selective sub-contracting.

The expansion in profits has not been as great as the expansion in turnover. I think you will agree that this, to some extent, is a natural result of the increase in sub-contracting. It also draws attention to the real need to restrain cost increases in this country. Increases in costs without a corresponding increase in the efficiency of the product must steadily reduce our ability to be competitive in world markets.

Last year I referred to the difficulties—principally shortage of skilled workers of all kinds—which prevented the speeding up of a contract which looked like being delayed. Those difficulties have continued, and so long as they do continue they will act as a powerful brake upon the deployment of the resources of the Group. It was in these circumstances that we were particularly attracted to the possibilities of co-operation with Millspaugh Limited, following that company's acquisition by Hadfields. We have placed very substantial orders with Millspaugh, and our good relationship continues with them on the basis of supplier and customer.

Since the end of the financial year work has progressed steadily upon our established orders. The flow of enquiries has continued to be heavy, costs have been reasonably stable, and our liquid position has remained satisfactory. There can, however, be no doubt that competition at home and abroad is strong. If enterprise in this country is overtaxed, or if costs at home rise faster than costs abroad, then we shall lose ground in those export markets which we believe are necessary to our stability.

The report and accounts were adopted.

W. & J. LAWLEY

The seventeenth annual general meeting of W. & J. Lawley Limited was held on December 12th in Birmingham, Mr H. J. Gaunt (Chairman and Joint Managing Director) presiding.

The following is an extract from his circulated address:

The Trading Profit amounts to £97,094 compared with £68,852 in the previous year. The Parent Company achieved a record turnover and satisfactory profits during the year in spite of a hardening of profit margins. In this year's Profit is included 7 months' profits of the wholly owned Subsidiary Company, E. Partridge & Company (Old Hill) Limited, which was acquired on January 2, 1956. The Subsidiary Company is doing an increasing trade and its profits are running at a higher rate than at the time of the acquisition a year ago.

Out of the Consolidated Net Profit of £79,986 Taxation requires £46,303 leaving £33,683. The proposed Dividend is £17,250, the allocations to Reserve by the two companies total £15,000 and there is a small increase in the carry forward.

The Directors propose a Dividend of 25 per cent less tax, the same. Revenue Reserves and Surplus total £118,495 compared with the Company's Issued Capital of £120,000 and the excess of current assets over current liabilities is £107,651.

Although we look forward to the future with confidence it is however very difficult to give any firm forecast of future prospects owing to the present complex situation.

The report was adopted.

Company Meeting

ELECTRIC & MUSICAL INDUSTRIES

("His Master's Voice"—Columbia—Marconiphone, etc.)

Mr. J. F. Lockwood emphasises that Britain owes her T/V Leadership to EMI

AT the EMI 25th Annual General Meeting held in London on December 13th Mr. J. F. Lockwood described how, in 1931, foreseeing the failure of Baird's mechanical T/V system, EMI commenced work on electronic high definition Television. For T/V cameras they developed the Emitron tube and for the receivers a revolutionary type of hard cathode ray tube with electron focusing: this gave birth to the present large cathode ray tube industry. By 1936 a complete electronic Television system was installed for the BBC, giving Britain a public T/V service years ahead of any other country. The EMI 405 line system still remains the British standard. The BBC use EMI cameras for their outstanding dramatic productions where high quality pictures are essential. EMI also supply the BBC and others with much specialised T/V equipment such as the Relay Links which facilitate the Eurovision programmes. The acknowledged outstanding brilliance of "HIS MASTER'S VOICE" and MARCONIPHONE TELEVISION RECEIVERS made by EMI is largely attributable to this unique experience in T/V technique.

During his speech Mr. Lockwood said: "We have been honoured in that one of the first Royal Warrants granted by Her Majesty the Queen was to The Gramophone Company Ltd. for the supply of Radio-Gramophones, Records, Radio, Television and Electrical Household Apparatus.

He then gave the following facts on EMI progress in the year under review:—

EMI IS BY FAR THE LARGEST RECORD MANUFACTURING and marketing organisation in the world. EMI sales of records (HMV, COLUMBIA, PARLOPHONE, CAPITOL, etc.) increased by 33 per cent. during the year: the total nearly equalled all competitors added together.

CAPITOL record sales exceeded all calculated expectations; in addition, EMI ANGEL has become one of the four leading classical record companies in America.

The great artists of the world are realising more and more the unequalled scope of the EMI Record marketing organisation.

EMIDICTA and MINIFON DICTATION MACHINES are still in strong demand. EMI MAGNETIC TAPE factory—the largest in Europe—doubled its output during the year, indicating a great future for these products.

The interests of EMI in ELECTRONIC CAPITAL GOODS include an exclusive Machine Tool control system, Computors, Stroboscopes, Oscilloscopes, Telemetry equipment, Radar, Guided-missile equipment, Colour and Monochrome Television transmission gear. EMI research and development resources in these fields are being used extensively by Government Services and large industrial organisations.

TOTAL SALES OF THE GROUP, £53,000,000 were £11,400,000 up on the previous year—the highest in the Company's history. Trading profit of the Group was £2,417,000—an increase of £542,000 over the previous year. The total assets of the Group have increased to £32,314,000.

EMI EXPORTS for the year approximated £4,500,000—a material increase on the previous year. A detailed survey of EMI business through branches and distributors in U.S.A., Canada, Australia, New Zealand, South Africa, France, Germany, Mediterranean countries, Scandinavia, the Far East and South America showed that in almost every country material progress has been registered during the year.

* *A full report of the Chairman's speech has been circulated to all stockholders. Copies will be sent gladly to interested readers on application.*

ANGLO-ECUADORIAN OILFIELDS LIMITED

INCREASED PROFITS

The thirty-eighth annual general meeting of Anglo-Ecuadorian Oilfields Limited was held on December 11th in London, Mr F. C. Bowring, chairman, presiding. The following is an extract from his circulated statement for the year ended March 31, 1956:

Crude oil production for the year was 327,621 tons. This was 1,040 tons less than the peak figure of 328,661 tons recorded last year. There was again an increase in shallow well production, but this was insufficient to offset the decline in production from the deeper horizons.

The Refinery at La Libertad operated at full capacity through the year, the total throughput of crude oil being 241,224 tons. The slightly smaller throughput compared with last year is due to a variety of causes, but mainly to some increase in time spent on repairs and maintenance. Sales of refined products continued to increase, but not as rapidly as in the previous two years.

The gasoline importation by your Company amounted to 15,758,568 gallons compared with 9,819,600 gallons for the previous year. These importations continue to involve your Company in heavy financial losses, which are increasing every year. Despite strong representations to the Government we have not as yet succeeded in obtaining any alleviation of this financial burden which we feel your Company should not be called upon to bear.

SELLING PRICES

The Government has not granted any increase in selling prices of products since those which became effective on March 9, 1955, and to which I made reference last year. The increases authorised at that time were less than those recommended by the Petroleum Commission set up by the Ecuadorian Government. No increase was granted on gasoline.

Representations continue to be made to the Government for an upward revision in the selling prices of all products, and especially of gasoline.

The new Contract with the Ecuadorian Government, referred to last year, was signed on January 4, 1956.

The development of the new pool found on the concession of Carolina Oil Company was continued throughout the year with variable, but on the whole satisfactory results. Nine wells were completed. Of these, three were brought in with initial production of over 100 barrels per day, four were moderate producers, the initial production ranging from 24 to 75 barrels per day and two gave only one or two barrels per day.

Production for the year amounted to 362,221 barrels, compared with 258,182 barrels for the previous year. The increase in crude oil production, together with a reduction of over £20,000 in drilling expenses resulted in a profit of £95,744.

The consolidated net profit of the Group arising from trading activities during the year at £955,551 compares with the net profits for 1955 before deduction of British Taxation of £632,428 (net after British Taxation £334,633). Your Board recommend that £187,500 be set aside for the payment of a dividend of tenpence for each 6s. 8d. of Ordinary Stock of the Company now in issue for and in respect of no specified period.

The report and accounts were adopted.

CROMPTON PARKINSON LIMITED

ACTIVE DEVELOPMENT OVERSEAS

HOME FACTORIES EXPANSION

MR ALBERT PARKINSON'S REVIEW

The forty-third annual general meeting of Crompton Parkinson Limited was held on December 12th, in London. Mr Albert Parkinson, MBE, the Chairman, presided. The following is an extract from his Statement:

Last year I expressed concern at the general economic prospect, which I felt would inevitably face your Company with problems and difficulties not of its own making and largely beyond its own control. Today, I regret that I cannot say that this apprehension was unjustified. I can, however, take pleasure in reporting to you that difficult operating conditions have been met and mainly overcome by your Company in a most satisfactory and successful way.

In keeping with the Company's policy of entrusting greater responsibility to younger men, Mr M. H. L. Lewis has been appointed an Assistant Managing Director, and Mr Michael Parkinson an Executive Director.

The Consolidated Profit and Loss Account shows that while there is little change in the Surplus from Trading, Income from Trade Investments has substantially improved. The increase of £87,000 derives mainly from the receipt of the first dividend from Noyes (Australia) Proprietary Limited, a jointly owned Selling Company formed in 1954. Having regard to our considerable capital commitments and current conditions, your Directors feel it is prudent not to recommend any increase in the distribution of the year's surplus. The Interim Dividend of 4 per cent already declared and paid, together with the Final Dividend of 6 per cent and the Special Cash Bonus of a similar amount now recommended, will again make a total distribution of 16 per cent for the year.

OVERSEAS

In my remarks to you last year I dwelt briefly on our plans to go forward with the expansion of our manufacturing facilities in Australia. At Campbelltown our 250-acre site is now in its first stage of development. In India we are extending our range of manufacture, particularly in the field of Switchgear, and in Canada our new Switchgear factory at Brantford, Ontario, has commenced production and is rapidly expanding its output to satisfy a full order book. I reiterate the belief which your Directors have in the future development of the British Commonwealth and the correctness of their policy of expanding your Company's Commonwealth activities whenever and wherever a suitable opportunity arises. The expansion of your Company's overseas activities in no way reduces or takes the place of our need to improve and expand our facilities at home to as great a degree as is prudent, and we have committed ourselves to a substantial programme of expansion and improvement.

THE OUTLOOK

The economic conditions which surround us, and under which we have to carry on our business, are no better than they were a year ago. Inflation and rising costs affect all our activities and, in spite of our efforts, must invariably tend to reduce our competitiveness overseas and our margin of profitability at home and abroad.

BIRMID INDUSTRIES

SATISFACTORY PROFITS

The annual general meeting of Birmid Industries, Limited, was held on December 11th at Birmingham.

Mr Edward Player (Deputy-Chairman and Managing Director) presided in the absence of the Chairman, The Most Honourable the Marquess of Exeter, KCMG.

The following is an extract from the chairman's circulated address:

In making my usual comments on the Accounts for the Financial Year ended July 31, 1956, I am pleased to report that the level of activity in the Group Companies has been well maintained. Correspondingly profits also have kept at a satisfactory level, despite basic material and wage increases much exceeding any advances in selling prices. For this we have to thank the technical advances made in our methods, and the diligence and foresight of the administration of the various Companies.

I would repeat that any serious fall in demand would depress profit margins, owing to the consequent undue proportion of fixed overheads which would then enter into our costs.

I can assure you, however, that your Directors are constantly alert to adopt whatever new ideas or machinery seem likely to improve efficiency and quality. Much of the capital expenditure now appearing in the accounts is devoted to these ends. I have no doubt that, in the event, our policy will be justified.

STRENGTH OF RESOURCES

The Consolidated Balance Sheet shows that the total of Capital and Reserves now stands at £11,156,337, an increase of £2,954,443 over last year. Thus the Issued Capital is covered some three and a half times and the proposed Dividend of 10 per cent plus Bonus of 7½ per cent represents a return of 5 per cent gross on the total Capital and Reserves employed in the Group.

Demand and output kept at a satisfactory level for most of the financial year. The recession in the motor and other trades later in the year, however, caused a reduction in our activities, mainly in the foundries.

Our Companies' products are in the main semi-finished and thus not available for direct export. The exception is in light alloy wrought goods, in which field Birmetals maintains a valuable proportion of sales.

Additionally, this company now makes and exports an Etching Machine made under licence from the Dow Chemical Company of USA. This machine etches special magnesium alloy plates, producing line and half-tone engravings of a very high order of quality.

As to the foundries, about 50 per cent of their products form essential components of such valuable exports as Motor Vehicles, Aircraft and engines, and general engineering products.

As regards the future, I shall not venture on prophecy, knowing how prophets are regarded in their own country. I must say, however, that for the next year or two we shall face a buyers' market in most sections, with lower demand and keener competition. We believe that, in enterprise, technical knowledge and experience, and in manufacturing facilities, we are well equipped to meet sterner conditions, and to secure our share of available business.

The report and accounts were adopted.

HARRISONS & CROSFIELD LIMITED

INCREASED PROFIT AND DIVIDEND

The forty-eighth annual general meeting of Harrisons & Crosfield, Limited, was held on December 10th, in London.

Sir Eric Miller, the chairman, presided and in the course of his speech said: It is gratifying that the good start which I was able to report to you 12 months ago was sustained to the end of the period, the gross profit for the year to June 30, 1956, before depreciation, taxation, etc., amounted to £1,884,000, an increase of £240,000 on the previous year.

Nearly all the increase in the gross profit is absorbed by taxation, which at £916,000 takes £236,000 more than in the previous year, so that, after deducting this and all charges, the net profit is only £18,000 up at £601,000. The final dividend of 10 per cent will make 15 per cent for the year on £1,500,000 Deferred Ordinary Stock, against the previous year's total of 20 per cent on the then issued Stock of £1 million, equivalent to 13½ per cent on the present Stock.

TEA

Prices in world tea markets during 1956 have not registered such wide fluctuations as they did in the previous two years, but a notable feature has been the very high level to which competitive demand raised prices for the limited quantities of fine tea available.

The price concertina has closed and there is now a much smaller margin between the prices realised by this class of tea and the better liquoring Assams. There are now keen buyers of the lower qualities, which have risen by no less than 1/7d. per lb within the last month.

Such violent price movements are most disconcerting to all concerned in production and distribution. There is plenty of tea to come forward and an easier price situation may be expected to develop in the New Year. World production may be only 10 million lb less than in 1955. Even so, it is running ahead of normal absorption. The future for producers of plain teas is dependent on the wholesome habit of tea-drinking being more encouraged.

RUBBER

A year ago the price of No. 1 RSS was at the inflated level of 40d. per lb. I did not, however, foresee that by the end of May the price would be down to 22d. per lb. More recent events leading up to the blocking of the Canal have brought the spot price for No. 1 RSS up to around 32½d. in London.

World consumption of Natural and Synthetic Rubber during 1956 is running at a rate of around 3 million tons per annum. In the USA the proportion of Natural used seems to be stabilising around 38 to 39 per cent. So long as Natural is available in ample quantities European manufacturers outside the Iron Curtain are using Synthetic on only a moderate scale.

All the indications are that there will be a fairly close balance between production and consumption of Natural Rubber in 1956. As any substantial increase in the production of Natural can at best be gradual and as the world must not find itself short of rubber, some increase in synthetic producing capacity is a wise precaution. These violent fluctuations are most disconcerting to the Industry. Expansion in the use of motor transport in practically every country in the world is a certainty. The report was adopted.

LILLYWHITES LIMITED

RECORD TURNOVER

EXPORTS INCREASED

The twenty-third annual general meeting of Lillywhites Limited was held on December 12th in London, Mr H. J. Benedictus, ACA (the chairman), presiding.

The following is an extract from his circulated statement:

The consolidated net profit for the past year is higher than last year by £4,463, or, after taxation and the deduction of that part of the profit due to shareholders outside the group, by £1,042. Taxation, unfortunately, accounts for £3,600 more than last year. The turnover of your Company constitutes a record but the higher profit resulting has been almost completely absorbed by rising expenses.

The main increases have occurred in the items of rates and wages. In my statement last year I referred briefly to the new assessments on shop property and said that although we had not yet been informed of the proposed new assessments in our case, it was certain that they would be much higher than in the past. This forecast was unfortunately justified. The total burden of rates borne by your Company is 64 per cent higher than last year.

It is proposed to repeat the dividend we paid last year, namely, a final dividend of 20 per cent, making 30 per cent for the year, together with a tax-free distribution of 5 per cent.

MERLIMAU PEGOH, LIMITED

CASH DISTRIBUTION FORESHADOWED

The forty-seventh annual general meeting of Merlimau Pegoh, Limited was held on December 5th in London, Sir Harry Townend (the chairman) presiding.

The following is an extract from his circulated statement: The group working profit before taxation amounted to £284,059 as compared with £166,733 for the previous year. The total crop for the group rose to 7,489,100 lb in the year under review from 7,301,600 lb in the previous year.

It has been the policy of the Board for some time past to dispose of certain outlying divisions where labour is difficult to obtain, and I am pleased to advise you that we have been successful in arranging the sale of Ayer Pa'abas Division of Pegoh Estate. The proceeds amounted to some £28,000. Ayer Tengah Estate has also been sold for approximately £37,000. This estate was owned by Ayer Tengah Rubber Estates, Limited which is a wholly owned subsidiary of Merlimau Pegoh (Eastern), Limited, which in turn is a wholly owned subsidiary of your Company. Merlimau Pegoh (Eastern), Limited also held shares in Alor Gajah Rubber Estate, Limited which Company has also sold its estate.

Ayer Tengah Rubber Estates, Limited and Merlimau Pegoh (Eastern), Limited will, in due course, go into voluntary liquidation. It is anticipated that the amount which will be received as a result of these liquidations will be sufficient to enable your Directors to recommend a cash distribution, not subject to income tax, of not less than 10 per cent on the Ordinary Stock of your Company and to provide the appropriate profits tax.

The replanting programme is proceeding according to plan. During the current year we are replanting some 1,200 acres and next year it is hoped to deal with at least a further 1,400 acres. The total crop for the current year to date shows an improvement over the corresponding period last year.

The report was adopted.

WOLVERHAMPTON DIE CASTING COMPANY

FACTORS AFFECTING RESULTS

The nineteenth annual general meeting of The Wolverhampton Die Casting Company Limited was held on December 12th at Wolverhampton, Mr W. C. Sproson, FSAA, chairman, presiding.

The following is an extract from his circulated statement:

The financial year to June 30, 1956, started with our Order Book very healthy and industry active and optimistic. However, in February the requirements of the consumer goods industries generally, and the motor trade in particular fell off considerably in consequence of a reduction in exports coupled with the Government policy of reducing sales on the Home market. Ours is essentially a "jobbing" business, and our production programme is governed entirely by our customers' requirements. Therefore, your Board felt it unwise to make drastic cuts in the labour force until such times as it had been proved beyond doubt that the set-back to the industries we serve was of more than a temporary nature.

The Group Profit amounted to £146,229 compared with £189,494 for the previous year. The Taxation provisions on the Profits of the year are £63,660. The directors propose a final dividend of 20 per cent, less income tax, on the Ordinary shares.

Since the end of the last financial year our trading position has not improved to any material extent, nor can any great improvement be looked for until there is an increase in the requirements for the motor and other consumer goods industries.

The report and accounts were adopted.

NEW SKI SERVICE

We are continuing the dry ski school, which we have operated now for some years with considerable success. This enables a skier to go immediately on the slopes without having to waste his precious time abroad in getting fit. This year, too, we have introduced a scheme for hiring ski boots. This essential part of a skier's equipment is an expensive item, and by hiring them the novice is enabled to enjoy his holiday at a minimum of expense.

Our Export Department has once more increased its sales, and we like to think that we are helping the nation, in however small a way, by collecting a certain amount of dollars. With the increasing number of visitors to this country it is reasonable to hope that our sales to them will continue to grow. The report was adopted.

APPOINTMENTS

UNIVERSITY OF GLASGOW

LECTURESHIP IN ECONOMETRICS AND ECONOMIC STATISTICS

Applications are invited for a Lectureship in Econometrics and Economic Statistics. Salary scale: £650 x £50–£1,350. Initial salary according to experience and qualifications. F.S.S.U. and family allowance benefits.

Applications (six copies) should be lodged, not later than December 31, 1956, with the undersigned, from whom further particulars may be obtained.

ROBT. T. HUTCHESON,
Secretary of University Court.

A SENIOR LONDON ADVERTISING AGENCY will have a vacancy shortly for a marketing man on an important group of accounts. The job will be to apply market research principles to the client's planning problems. Familiarity with market research methods and their practical limitations is therefore essential, although the successful applicant need not necessarily have become expert in carrying out field surveys in all their practical detail.

The important points are that he should have sufficient business acumen to grasp selling problems as they crop up, and enough familiarity with market research to recognise where it can contribute to their solution.

The Agency is of long standing, and is highly regarded by its competitors.—Box 573.

NATIONAL COAL BOARD, Northern (N & C) Division, invite applications for superannuable appointments in their Organisation and Methods Branch at Divisional Headquarters, Newcastle-upon-Tyne. The successful candidates will be required to undertake studies, within the Division, of office organisation, staff and office methods and mechanisation.

Applicants should preferably have experience in O & M or similar work, a recognised professional qualification or University degree, and experience of position of responsibility in a large organisation. A knowledge of the Coal Industry would be an advantage. Salary within the scale of £1,085 x £35—£1,475, according to qualifications and experience.

Applications, giving date of birth and full details of education, qualifications and experience, to Staff Director, National Coal Board, Northern (N & C) Division, Whitley Road, Longbenton, Newcastle-upon-Tyne, 12, by December 21, 1956. Please quote OM3.

THE WHITE FISH AUTHORITY invite applications for a Junior Executive appointment as Research Assistant in the Economics and Statistics Department. The duties of the post will be primarily concerned with the Authority's current programme of research into earnings, expenses and productivity of various sections of the white fish producing and distributing systems.

Applicants should be University graduates, preferably with a degree in economics or statistics, and experience in a commercial statistical office, while not essential, would be an advantage.

Salary scale £625 x £35—£800, the point of entry depending on qualifications and experience. A contributory pension scheme is in operation, and luncheon vouchers and a five-day week are among other conditions of service.

Applications, giving names of two referees, should be sent to the Secretary/Solicitor, White Fish Authority, Tilbury House, Petty France, S.W.1, within seven days of the date of this advertisement.

MARKET ANALYSIS.—Expanding firm of high-class Woollen Merchants (West End) is establishing new post for initial analysis of full sales potential in many markets (Home and Export), and for subsequent detailed measurement of progress. Candidates, preferably female and aged 23-25, should possess University degree or sound knowledge economics, languages an advantage. Successful applicant must be capable of working alone from published data and of submitting complete analyses to Managing Director.—Box 577.

ADMINISTRATIVE OFFICER required by the N.C.B.'s Marketing Department at London Headquarters. Duties include both general administration and Committee work, the latter requiring the preparation of minutes and papers on commercial and allied technical subjects relating to the Board's marketing operations. Proved administrative ability and a high standard of drafting are essential. Appointment (superannuable) according to qualifications and experience within inclusive scale £1,145–£1,575 p.a. (male).

Write, with full particulars of age, education, qualifications and experience, to National Coal Board, Staff Department, Hobart House, London, S.W.1, marking envelope N.513. Before December 27, 1956.

EDUCATION OFFICER required by the Steel Company of Wales Limited (Steel Division).

The successful candidate will be head of the Education and Training Department in the Steel Division.

He will be responsible for a wide variety of training schemes for juveniles and adult operatives, craftsmen and foremen. Initiative and administrative ability are necessary considerations, and a knowledge of engineering and/or technical education will be an advantage.

The salary will be in accordance with age and qualifications.

Those wishing to apply should write for official Application Form to:—

Superintendent, Personnel Services, The Steel Company of Wales Limited (Steel Division), Abbey Works, Port Talbot, Glam.

APPLICATIONS are invited for appointment of Head of Marketing Research section of the Metal Box Company, Ltd. Experience of market research among manufacturers and retailers is of greater importance than consumer research experience. Apply, quoting reference ISZ/1, to Staff Division, The Metal Box Company, Ltd., The Langham, Portland Place, London, W.1.

ECONOMICS. A. C. Nielsen Co., Ltd., Oxford, require graduate for work on general economic trends, Marketing research experience unnecessary. Write full details, qualifications, experience, etc., to Personnel Manager, 109 St. Aldate's, Oxford.

RESEARCH OFFICER required by market research company to handle statistical side of surveys. Applicants should be under 30 and qualified in statistics or mathematics.—Write full details Box 582.

MARKET RESEARCH

The Export Market Research Department of a large engineering group invites applications for three vacancies:—

A Senior Post, requiring an imaginative economist, preferably between 28 and 40 years of age, to follow and interpret home and export market trends. He will be responsible for directing and developing the Economic Analysis and Interpretation side of the Department's work. Experience in the application of economics in industry and a flair for short and lucid presentation are essential.

Two Assistant Posts, which also demand a talent for clear and brief exposition in plain English:—

(1) Requiring a male University Graduate to handle the collation and interpretation of statistics produced by subsidiary companies. A good degree in Economics is needed, and a familiarity with the industrial application of statistics.

(2) Requiring a male or female University Graduate to collect information relevant to the Group's activities, and produce a regular Bulletin.

Salaries in all three cases will be commensurate with qualifications and experience.—Application forms should be obtained from the Secretary, Market Research Department, T.I. (Export) Ltd., 58-72 John Bright Street, Birmingham, 1.

PETFOODS LIMITED

A new opening exists in the MARKET RESEARCH Department of Petfoods Limited, Melton Mowbray.

The position, which is that of SURVEYS SUPERVISOR, is for women applicants of up to 30 years old.

The scope of the position, which provides an excellent training for work at an executive level, involves participation in coding and editing of surveys, analysis and presentation of results, design and piloting of questionnaires, and general co-ordination of field supervision, together with occasional briefing of field-workers.

The successful applicant will live in Melton Mowbray, but her work will take her to other parts of the country.

Applications from Graduates in the Social Sciences or Commerce would be particularly welcome, and a knowledge of statistical techniques would be a distinct advantage.

Previous industrial experience is NOT required.

This is an important staff position, and a salary commensurate with ability, experience and job responsibility will be paid.

Applicants should write to the Personnel Officer, Petfoods Limited, Melton Mowbray, Leicestershire, giving the following information:

Personal details with educational background and business experience if any.

MANAGEMENT SELECTION LIMITED have been retained to advise on the selection of a

MATERIALS CONTROLLER

for a well-known company of food manufacturers situated in a pleasant country town. Duties include negotiation for commodity buying—mainly meat, fish and cereals—on a world-wide scale. Considerable travel is involved, but where practicable permission may be given on occasions for the Controller to be accompanied by his wife at the Company's expense.

Candidates should have had extensive experience of commodity buying on an international scale, and must have successfully opened up new sources of supply for these goods. Candidates should also have an interest in and knowledge of world affairs—especially as they influence supplies and prices. An Honours Degree, with economics and/or statistics, would be an advantage. Age 35-40. Initial salary not less than £5,000, together with exceptional non-contributory pension, life assurance and sickness schemes.

No information will be passed to our clients without the candidate knowing their identity and giving permission. Inquiries with brief personal details to P. J. H. Erser (S198), Management Selection Limited, 17 Stratton Street, London, W.1.

HOUSING TRUST CHIEF EXECUTIVE DESIGNATE

The Western Region Production Development Board, with the approval and support of the Government of the Western Region of Nigeria, intends to establish a Western Region Housing Trust. The objects of the Trust will be the development of Housing Estates as well as fostering the growth of home ownership. Applications are invited for the post of Chief Executive Officer Designate of the Trust. In the preliminary stages his chief duties will be to assist in drafting legislation and in drawing up plans for the establishment and operation of the Trust. During this period he will be engaged on the staff of the Board but, subject to satisfactory performance, will become the Chief Officer of the Trust when formed. His duties will then include (a) organising the development of housing estates and (b) promoting home-ownership on building society lines.

Applicants should possess wide administrative experience in such fields as planning, development, and financing of housing areas and of home ownership schemes. Academic and professional qualifications will be an advantage.

Salary will be £2,500-£3,500, point of entry depending on qualifications and experience.

Further details of the proposed Trust and of the Board's Terms and Conditions of Service can be obtained from:

The London Representative,
Western Region Production Development Board
18 Grosvenor Gardens,
London, S.W.1,

to whom applications, giving full details of experience, qualifications, etc., should be addressed; replies to reach him not later than January 31, 1957.

General Terms of Employment: House, with basic furniture, provided at rental of £150 per annum; Provident Fund; Outfit Allowance £60; Free Medical Service; Free passage for wife; home leave at full pay at the rate of five days per month of overseas service. Low income tax.

APLIN AND BARRETT LTD., of Yeovil, Somerset, require an Assistant Personnel Officer with prospect of succession within three years.—Applications to the Secretary.

LEADING FOREIGN EXCHANGE HOUSE in the U.S.A. seeks men or women cashiers, experienced in handling foreign currencies. Starting salaries $300 per month, with possibility of improvement twice yearly. Good promotional possibilities. Banking experience desirable. Preference to those with knowledge of Spanish or other foreign languages. Interviews arranged in London.—Write to Deak and Co., Inc., 75 West Street, New York 6, N.Y.

CHAIRMEN/MANAGING DIRECTORS

Industrial Top Executive (47), shortly free, whole or part time. Many years at Board level and as Group M.D. in capital/consumer goods. Used to quick detection of weakness, latent strength. Arts Degree, engineer trained, widely travelled/connected, especially in N. America.—Box 572.

YOUNG man, 31, well educated (Paris Univ.), linguist, previous exp. export, present B.B.C., seeks position public relations or similar with International organisation; publicity, etc.; top refs.—Box 583.

ACTUARY, early 30s, for several years head of stockbrokers' investment department, desires more scope in similar post with larger firm, pension fund or institution. Expert in all aspects of work, including portfolio management, report writing, gilt-switching, etc.—Box 581.

CHARTERED PATENT AGENT, with several years' experience as head of patent department working in close concert with management, research, and development departments, and with experience in negotiating, and advising on, agreements, seeks responsible position in organisation having a live policy on research and development.—Box 579.

ECONOMICS GRADUATE, 27, ex-Colonial Administrative Service, Malaya; experienced committee, liaison work, report writing and editing; widely travelled N. America; seeks post industry, commerce or publishing, preferably as personal assistant, but any offer with prospects considered, London or provinces.—Box 580.

B.Sc.(ECON.) LONDON UNIVERSITY

UNIVERSITY CORRESPONDENCE COLLEGE provides postal tuition for the external examinations without residence), which is a valuable qualification for those seeking executive appointments in commerce or industry, government or municipal posts. The College, established 1887, is an Educational Trust. Highly qualified Tutors. Low fees. Prospectus of U.C.C. Courses for London Degrees and Diplomas, G.C.E. free from the Registrar, 60 Burlington House, Cambridge.

NEW detached contemporary house designed by Lionel Bert in Guildford. Three bedrooms fitted wardrobes. Open plan living space. Separate light lounge. Oak and beech flooring on ground floor. Central heating throughout. Garage. Garden. Glorious views. £5,500 freehold.—Owner: Mrs Isaacs, 142 Norbiton Hall, Kingston, Surrey. KIN 6746.

PRIMAVERA, 149 Sloane Street, London, S.W.1, remind all their busy customers that they will be open until 5 p.m. the following Saturdays before Christmas—December 15th and 22nd. Primavera for exquisite Christmas presents.

THE English and Scottish Joint Co-operative Wholesale Society Limited wishes to thank all applicants for the position of Sales Manager and to say that an appointment has now been made.

COURSE in Work Study. The School of Time & Motion Study's next 6 weeks' course starts January 21st. Fee 150 gns. Enquiries to 29 Cork Street, W.1. REGent 0516.

LEIGHTON PARK SCHOOL, READING

Five Scholarships up to £160 and one up to £240 will be awarded on the result of an examination held in February. Also Exhibitions for Music and Art. Apply to the Headmaster.

CHRISTMAS is all the more cheerful for a few bottles of Duff Gordon's El. CID Sherry. A Christmas Sherry—fine, light Amontillado. Your wine-merchant stocks it. Don't wait till the last minute, though There's a big demand.

SUCCESSFUL TUITION FOR THE B.Sc.(ECON.) DEGREE

Wolsey Hall (Est. 1894) provides Postal Courses in a wide range of subjects for the two examinations for Lond. Univ. B.Sc.(Econ.) (three if Entrance is included). Moderate fees, instalments. Over 1,000 Wolsey Hall students have secured this valuable degree since 1925.—Prospectus from C. D. Parker, M.A., LL.D., Director of Studies, Dept. P.16, WOLSEY HALL, OXFORD.

READ BIBLE THRO' in year—an absorbing serial—20 min. daily. Tables (a unique system) free, post 2½d.—M. Viner Hall, The Institute, Nevard, Weston-s-Mare.

CANADIAN PACIFIC RAILWAY COMPANY (Incorporated in Canada with Limited Liability) DIVIDEND NOTICE, ORDINARY CAPITAL STOCK.—At a Meeting of the Board of Directors held today a regular dividend of Seventy-five cents and an extra dividend of Twenty-five cents per share on the Ordinary Capital Stock was declared in respect of the year 1956 payable in Canadian Funds on February 28, 1957, to shareholders of record at 3.30 p.m. on January 4, 1957. By order of the Board, FREDERICK BRAMLEY, Secretary. Montreal, December 10, 1956.

CANADIAN PACIFIC RAILWAY COMPANY (Incorporated in Canada with Limited Liability) DIVIDEND NOTICE, PREFERENCE STOCK.—At a Meeting of the Board of Directors held today a final dividend of Two per cent on the Preference Stock was declared in respect of the year 1956 payable on February 1, 1957, to stockholders of record at 3.30 p.m. on December 31, 1956. By order of the Board, FREDERICK BRAMLEY, Secretary. Montreal, December 10, 1956.

THE Economists' Bookshop has the world's widest range of books on Economics, Politics, History, Anthropology and the Social Sciences. World-wide mailing service. Second-hand books bought.—11-12 Clements Inn Passage, Aldwych, London, W.C.2.

EXPERT POSTAL TUITION for Examinations—University Law, Accountancy, Costing, Secretarial, Civil Service, Management, Export, Commercial, General Certificate of Education, etc. Also many practical (non-examination) courses in business subjects.—Write today for free prospectus—and/or advice, mentioning examination or subjects in which interested, to the Secretary (Ec/2),

METROPOLITAN COLLEGE, ST. ALBANS
or call at 30 Queen Victoria Street, London, E.C.4.

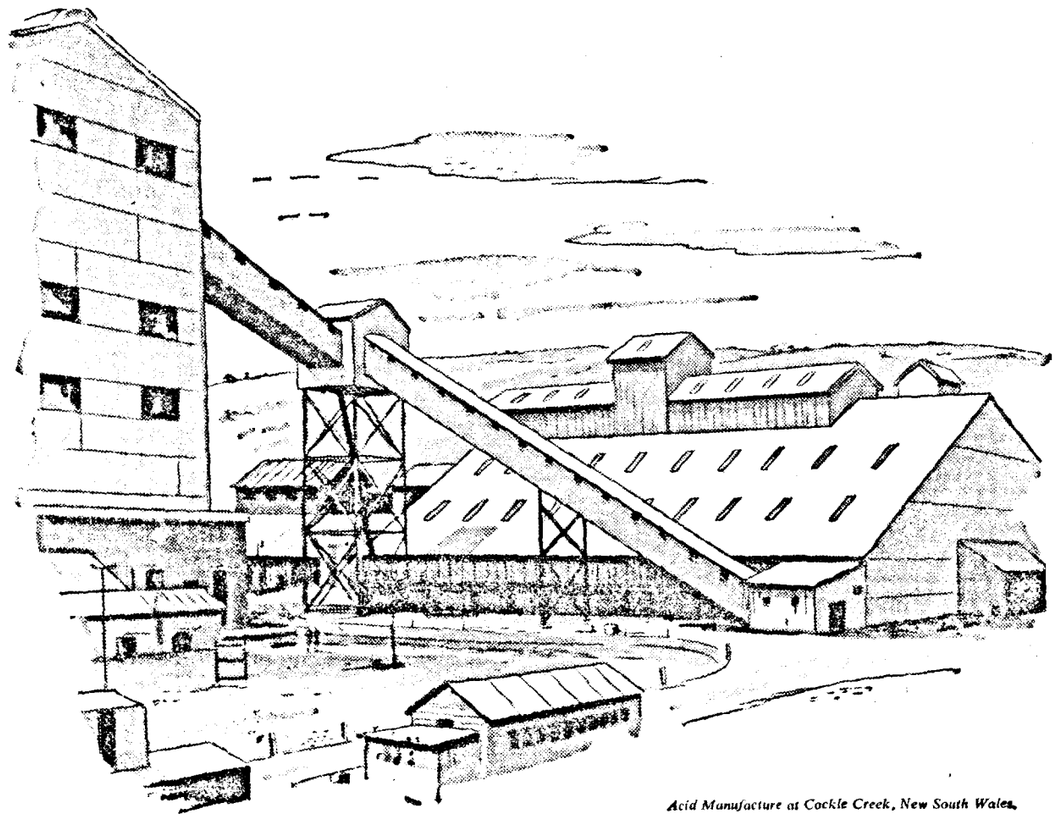
INVESTING FOR THE FUTURE IN

SULPHURIC ACID



Acid Manufacture at Cockle Creek, New South Wales.

The expansion of land under grass in New South Wales and the parallel increase in the demand for fertilisers to enrich the new pasturages, has stepped up the demand for sulphuric acid in the production of superphosphates. C.Z.C. has built this additional acid plant rated at 35,000 tons a year as part of its programme for developing the natural resources of Australia.

Smokeless heat

A careless stoker can waste a miner's daily coal output.
Simultaneously, he pollutes the air. He spreads disease and causes considerable expense to the nation. He dissipates a potential export value.
Yet, he cannot burn coke or gas other than smokelessly.
Engineers at your Area Gas Board have a wealth of information at your disposal on the efficient and smokeless generation of heat. And remember, coal tar products form the basis of our organic chemical industry.
Yes, the Gas Industry certainly makes the best use of the Nation's coal.

WHATEVER YOUR BUSINESS—The Gas Industry appreciates the needs of individual consumers for prompt service and for advice which accords with the customer's special circumstances and requirements. Each Area Gas Board offers efficient service to users of gas-fired equipment and can give expert advice based upon the pooled knowledge of all the Boards and of gas users in other countries.

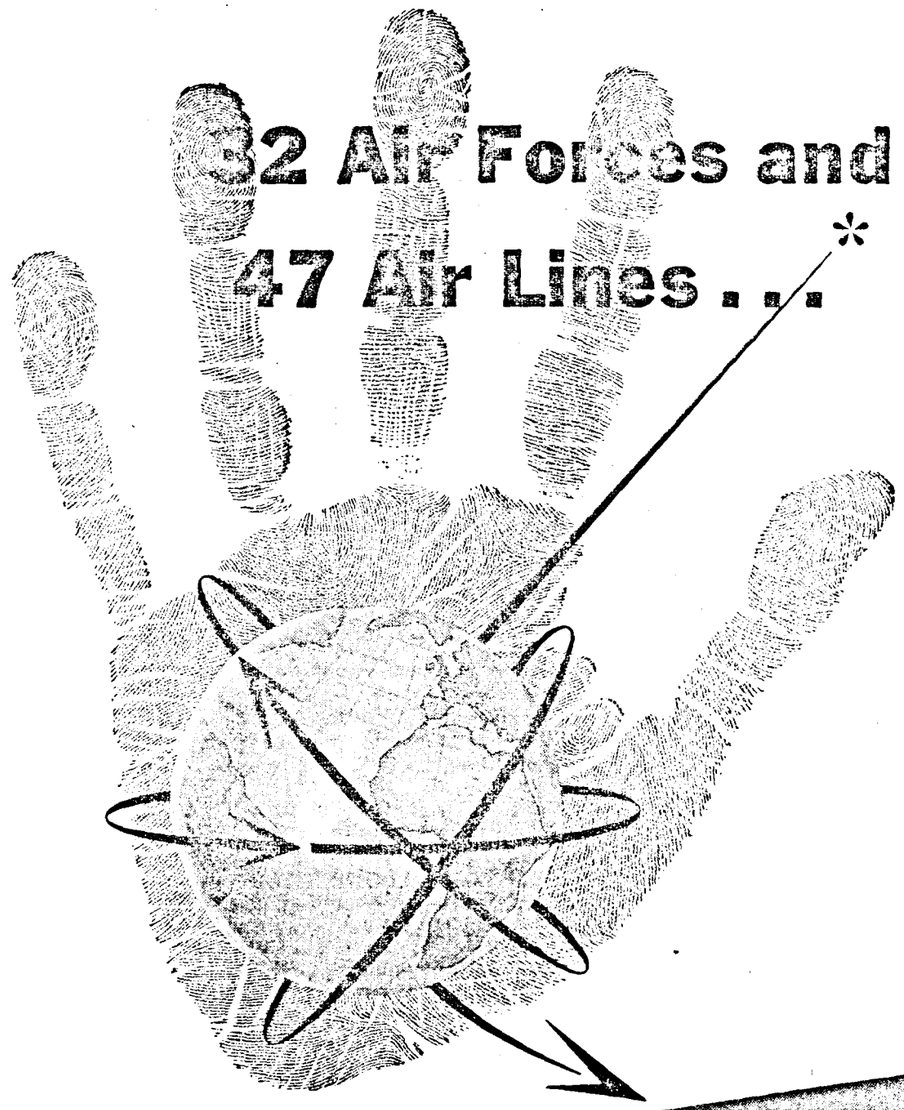
THE GAS INDUSTRY MAKES THE BEST USE OF THE NATION'S COAL



The intelligence on which the swift and complex operation of modern aircraft relies, whether for civil or military purposes, can depend upon Marconi radio equipment, navigational aids and radar. Marconi's experience in ground-to-air radio goes back to 1906 and they were investigating radar principles in 1929.
Marconi's characteristic foresight and enterprise today are making possible still further progress in electronics for aviation, and, thereby, in aviation itself.

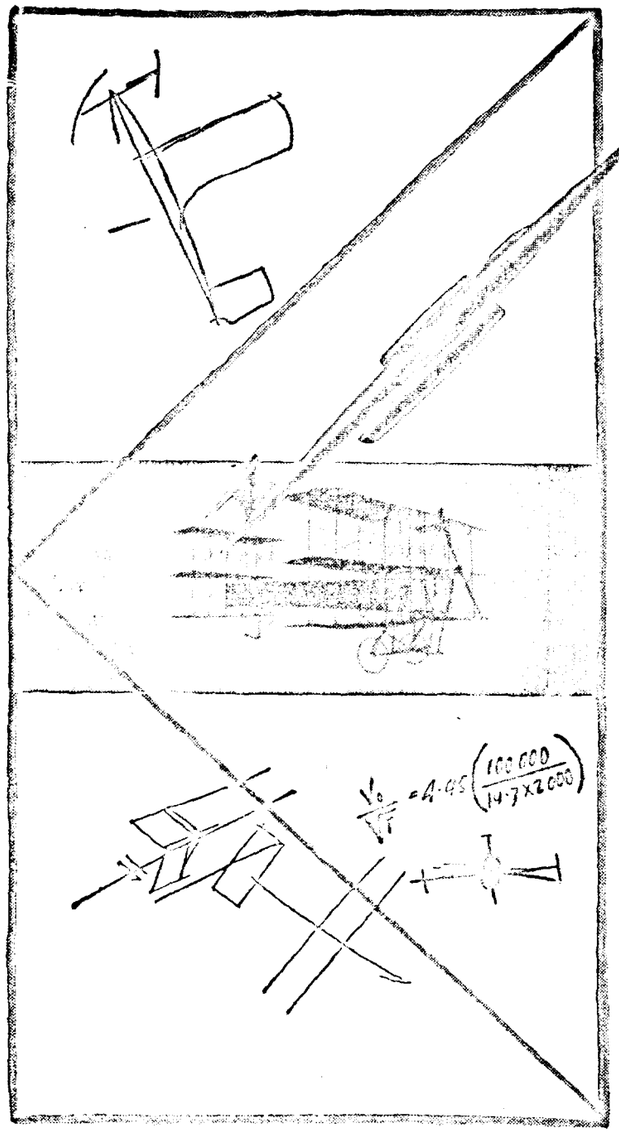
PROBING THE FUTURE OF AVIATION / No. 4 in a series



Once it was the back of an envelope

The days of rough sketches on odd scraps of paper, of design details hammered out over a glass of beer are gone for ever. Today, something like ten years lapses before an aircraft goes into service. Of these ten vital years two are spent in planning . . . another two with wind tunnels learning how the project behaves at different airspeeds—its drag, stability, the effects of shock waves. Drawing and prototype building take another three years. And then comes the big day . . . the day the first prototype flies. There then lies ahead an intensive programme of flying, testing and evaluating, lasting perhaps for two years or more. Then follows a year or so tidying up details before the project is finally completed.

As aircraft fly higher and faster they become more and more complex, and their design and development call for even greater technical effort. Designing the planes of tomorrow and furthering the progress of flight is the work of the aeronautical engineers of the Hawker Siddeley Group . . . men who in the short span of 50 years have progressed from speeds not much greater than that of a fast car to beyond the speed of sound. Achievement such as theirs has twice saved the nation from catastrophe. It is an insurance for our freedom and for our way of life, and a sound investment for leadership in a world at peace.

BELOW. Models are tested at up to three times the speed of sound in a new 10,000 horse-power supersonic wind tunnel. This latest addition to Hawker Siddeley's test facilities is a big asset to research within the Group.

The Happy Science

TRAVELLERS who returned to certain parts of North Africa in the mid-1940s discovered that there had been a social revolution there during the war. Previously, when local Arabs trekked between their villages, their wives had walked twenty yards behind them ; now their wives walked twenty yards in front. Research showed that the change had occurred about 1943, when allied troops were advancing across the country. The reason for the change was that, at that time, there were a lot of land mines about.

At approximately the same period, the more hag-ridden nations of the west were making a rather similar change in the functions of their economists. Previously economists' main job was to analyse what was happening ; now their main usefulness—if they have any—is considered to be that they ought to be able to give some warning of the awful catastrophes that might befall. And, since the role of Cassandra, for Malthus's and Mrs Martineau's heirs, is a gruesomely enjoyable one, economists have taken to this resurrected role with gusto. It is not a difficult role, particularly at this time. The speculation against the pound, the danger of devaluation, the prospect of labour trouble, the possible spread of unemployment, the blocked canal, petrol rationing, Mr Macmillan's hint of higher income tax : all these have to be faced. And that makes quite a lot of land mines. It is conceivable that, in the early part of 1957, a number of people now reading this article may be going to be blown up.

Certainly, let the economists give proper warning of these short-term perils. But in the interests of accuracy, and in the spirit of the Christmas season, they have a second, less grim duty to perform. In the last few weeks, it is politics that has seemed to be the gloomy science ; economics has been the tempering one. It is mainly politicians who have been saying that, because of recent events, the British people may be permanently impoverished. The economic retort to them is simple: the long-term standard of living of a nation depends mainly on its level of, and capacity for, production ; and a few general statistics about the possible outlook for production will show clearly enough, and seasonably enough, that hope need not be abandoned yet.

In the years 1953, 1954 and 1955, Britain's national product—in real terms but in pounds of today's prices—rose by between £500 and £750 million a year. This was because productive capacity was rising by that amount, and because (in the economic circumstances of those years) it was possible for the Government to keep the reins loose enough to allow full use to be made of that expanding capacity. In 1956, because the fruits of the investment boom that started in 1955 began to mature, productive capacity should have increased by some figure near the top of this range—that is, by about £750 million. In fact, however, Britain has not been able to go on making full use of its productive capacity—partly because to do so would have meant the purchase of too many imported raw materials, but mainly because the trade unions were unwise enough (so long as the policy of expansion

lasted) to demand wage increases in excess of even this rate of increasing productivity, and so were pricing British goods out of foreign markets. In consequence, there has had to be a credit squeeze, and the country's rate of production now is barely above the 1955 level.

Next year, because of investment that has already been set afoot, one would guess that productive capacity should expand by about the same amount as in 1956—that is, by another £750 million or so. Once the present post-Suez and trade union troubles can be surmounted, and if Britain can return to a policy of flat-out use of its capacity, then the level of production a year from now could, according to these theoretical calculations, be at an annual rate of some £1,500 million above the level Britain is enjoying at the moment. Even if these figures are sensibly scaled down, to £1,000 million or so, this would represent the greatest national enrichment that this country has ever achieved over any twelve months during a period of peace.

That is the vista just beyond the land mines. Anybody who draws attention to it must immediately hedge his optimism about attaining it. Perhaps the British economy will never get across the minefield. Perhaps, even if it does not get blown up, the Government will decide to play for safety by not advancing; that could be not the least of the misfortunes from an uncertain Government at this time. Britain can sit down in a hole somewhere, resting on its present level of underproduction, because in the open spaces beyond it feels that it has no shelter or protection. Perhaps—even if all goes well about sterling and the clearing of the canal and wage restraint—it is a little optimistic to think that Britain could get back to completely full production by the end of 1957; certainly, in the first part of 1957, production is more likely to go down. Perhaps. . . . But enough of perhaps. This is a week for thinking of pie; next week is the one for resolutions. And the pie is not merely in the sky; anybody who looks at the last two years' investment figures may reasonably conclude that quite a lot of it should already be in the oven. Twelve months from now, with this dynamic just beginning to pulse through the economy, with this call on the bank of stored-up industrial potential still to be made, it is not altogether impossible that we may be looking forward to a bumper New Year. A Happy 1958 to us all.

Russia's Predicament

WHEN the Russian tanks rolled back into Budapest seven weeks ago, most people assumed that the Hungarian revolt against communist rule and Russian domination would be swiftly crushed. They were wrong. General armed resistance has been overcome, but patriot guerrilla activity persists; Mr Kadar's demand for the surrender of arms has been largely ignored; the great majority of Hungarians still reject the authority of his puppet government. The country's mines and factories are still virtually at a standstill. In spite of growing persecution and mounting difficulties, the workers' councils are still the real source of authority. With a courage that must by now be born of despair more than hope, without a Kossuth to rally them, the Hungarians still doggedly pursue the goal of freedom for which they took up arms.

Whatever may now happen to the Hungarians, they have dealt the Russians a damaging blow. If their resistance had been snuffed out in a few days, the free world would have made its protests and turned back to its affairs, while communists in Prague, Belgrade, Rome and Peking would have swallowed the myth of a counter-revolutionary terror nipped in the bud by timely Soviet intervention. But the Hungarians' refusal to submit has rubbed everyone's noses in their struggle for freedom and forced the Russians into a classic demonstration of a self-defeating policy. In the West, it has re-awakened Nato to the need for vigilance and saved it from the waste of time and strength in recriminations over Suez. In the uncommitted countries of Asia it must hinder the Russians' busy efforts to extend their influence and control; the equivocal attitudes of some of those countries towards Hungary become more blatantly untenable the longer the resistance lasts.

In the communist world the resistance to the Soviet army has had, if not yet a disrupting, at least a deeply disturbing effect. As the weeks have gone on it must have become increasingly difficult for a Marxist not to see that in Hungary the Russians are trying to crush not counter-revolution but workers' councils—the descendants of the soviets of 1917. Mr Kardelj cannot be the only communist today who feels that the official communist talk of "counter-revolution" serves only as "an artificial means of allaying . . . socialist consciences." Yet the ability to swallow Moscow's version of recent events in Hungary has become the acid test of a "good" communist. The Poles and the Jugoslavs have failed the test, and Mr Khrushchev's patient efforts to entice Marshal Tito back into the Soviet orbit have received a perhaps final setback. Signor Togliatti has scraped by at the cost of much of his own popularity, and of gravely dividing and weakening the largest communist party in Western Europe. Not since the Nazi-Soviet pact have the discipline and cohesion of the communist world undergone such strain.

The Russian leaders must be aware of these damaging repercussions and must by now be desperately anxious to find a solution to their Hungarian problem. It is hard to see where they are going to discover it. Certainly, they could cut the knot and employ all the force

of which they are capable; indeed, they may still do so; but their hesitations are plain to see. It cannot suit their diplomatic book to be branded formally as aggressors, or to be saddled with the crimes of Hitler. World opinion and United Nations resolutions are not wholly without effect on them. What is more, they cannot but see that total repression will neither produce a workable and self-supporting Hungarian satellite, nor help them to establish a stable relationship with the rest of communist eastern Europe.

★

They are now occupying key factories with Kadar militia in an attempt to force the workers back to their benches at the point of the tommy-gun. But without wholesale massacre they will not get far like this. Surprisingly, perhaps, the puppet government does not seem to be carrying out its threats to dismiss, and thus deprive of cash, the workers who clock in merely to collect their pay packets. It has, however, issued a decree which will mean, in effect, that most workers will get only 80 per cent of the wages due in December and that the miners will only be paid for what coal they dig, generally no more than enough for local needs. This step will tighten the financial screw on the workers. But the key to the industrial problem lies in the mines, and there the Russians are singularly helpless. It is not only that many of the mines have been flooded or in other ways put out of commission. Faced with desperate men prepared to blow up their mines, their enemies and themselves together, the Russians have poor prospects of either driving them back to work, or of introducing forced labour to take their place.

It still does not look as if the Hungarian people will abandon their passive resistance until the Russian army has withdrawn. But even if it does eventually go, the problem of finding a political settlement acceptable both to the Russians and to the Hungarians will be hardly less difficult. No doubt the Russians would be glad to settle for a Gomulka-type solution. But is that still possible? For the time being, the Poles have won their game with the Russians because they were content to play for fairly low stakes. The Hungarians chose to play for very high stakes; they may lose; but if even now a compromise is contrived, will they rest content with an arrangement which, however great an advance on a stalinist regime, still remains only the first early staging-post on the road to freedom? One condition for a Gomulka solution is lacking in Hungary, in any event: there is no Hungarian Gomulka, apart from Mr Nagy, who, to judge from his last utterances before he was silenced, has progressed far beyond the Polish leader's position. Moreover, a Polish solution is possible only where the communist party remains not only in being, but in good trim. In Hungary, communism has been so discredited and cast off that the communist party has considered it prudent to take a new name; and, even so, it is evidently not finding it easy to persuade old party members to rejoin.

Lack of popular support and scarcity of really convinced adherents did not prevent the communists, after the last war, from infiltrating the other parties and finally acquiring power through an electoral swindle. The trick of 1947 does not lend itself to being played twice, and it is unlikely that the Hungarian communists have the strength to do it. The Russians may not agree; their present tactics seem to be an attempt to reduce the political opposition to the communists' own state of ineffectiveness. In the first weeks of the revolt they and Mr Kadar made the mistake of conceding a political status to the workers' councils by negotiating with them on political matters. They are now trying to remedy this error by prohibiting the councils, except those in individual factories, arresting their leaders, subjecting an increasing number of those arrested to judicial murder and, eventually, packing the councils with "yesmen" by means of faked elections.

★

If these tactics should have some success, the Russians may hope that they can impose some form of puppet regime more successfully than in the past—provided they can find someone willing to take over Mr Kadar's thankless task. Independent observers calculate that there are sufficient stocks of food, fuel and consumer goods to keep the Hungarians going for a month or two. Even if at the end of that time they are forced to knuckle under and give up their passive resistance—and this can by no means be taken for granted—the Russians will have achieved no more than an unreliable temporary submission until trouble blows up somewhere else; they will not have reached anything like a solution.

In this predicament, the sensible course for the Russians would be to cut their losses in Hungary, and try to undo the damage they have done to themselves through their intervention by withdrawing and letting the Hungarians order their own affairs. The Nato powers could, and should, help them to reach such a decision by making it quite clear that they have no strategic interest in Hungary, and no intention of trying to establish bases there, but that, on the contrary, they are prepared to accept and guarantee Hungary's neutrality.. Yet for the Russians such a course contains a risk of the gradual loss of all their eastern European system. If they give up Hungary, can they stop the Poles, the Czechs and the rest from seeking their own way too?

The Soviet leaders are faced with a question that admits of no answer that is satisfactory to them. They may argue that, even if they withdrew from Hungary, they could still play their cards skilfully enough to impose a Gomulka solution on those countries where

serious trouble developed. On the other hand they may now feel that regimes intermediate between communism and freedom are inherently unstable—as indeed they are—and that it would be rash to allow them to spread. This is a choice which no one can make easy for them. The risk of upheaval in eastern Europe which a retreat from Hungary would entail is inherent in the system of empire that Stalin set up; and, however much his successors may try to modify the system, the risk remains.

Poland's German Frontier

OF all the changes in the map of Europe in 1945, the most fraught with future trouble was the new frontier between Poland and Germany along the rivers Oder and western Neisse. Poland's gains in east Prussia, Pomerania and Silesia were on such a scale that Sir Winston Churchill wrote later: "For the future peace of Europe here was a wrong beside which Alsace-Lorraine and the Danzig corridor were but trifles. One day the Germans would want their territory back and the Poles would not be able to stop them." The western statesmen at one stage claimed that the eastern, not the western, Neisse river was the frontier under discussion. The truth seems to be that they looked at the map too late.

The victors attempted to make the change more lasting than the territorial grabbings of the past by the twentieth-century expedient of expelling the German inhabitants *en masse*. German minorities had for centuries played a creative part in eastern Europe, building cities and universities, pioneering trade, but they had become in the age of nationalism a source of unrest and the excuse for German aggression. Learning from Hitler, the embittered Slavs, backed by the allies, determined to root them out. "These large transferences," Mr Churchill said of Poland in the House of Commons, "are more possible in modern conditions than they ever were before." And so 12 million Germans, over 7 million of them from the lands taken by Poland, were herded with great suffering into shrunken Potsdam Germany. The map was cleaned up, but the national grievance which might cause a future war was not exorcised. Instead of a large minority within Poland agitating for return to Germany, the expelled German inhabitants have become a pressure group within Germany itself.

The frontier problem has been masked since 1945 by the greater problem of the division of Germany between east and west. Though west Germany legally claims the lost territories, the question has seemed remote to most west Germans, for before it can have any practical meaning, they must regain the Soviet zone—"central Germany," as they are careful to call it—which lies between. The Pankow regime, under Russian orders, has recognised the Polish German frontier as final. But once the Soviet Zone and west Germany were reunited, German feeling would quickly focus on the lost eastern lands; their recovery, as many Germans put it, would be the final stage in "reunification."

But the most unfortunate implication of the new frontier today is for Poland's relations with Russia. Russia, as the only great power to recognise the present line, holds Poland virtually as a political prisoner. Any Polish government, communist or democratic, must feel dependent on the Russian guarantee, and the might behind it, as security against a German *revanche*. The Russians took care to rub this in when Mr Gomulka visited Moscow in November. Poland's dependence on the former German lands was made total by the territorial sacrifices exacted by Russia in east Poland in 1945, which forced it to shift westward the whole centre of its economy and national life. Five or six million Poles now live in the new territory. Many of the heavy industries so important to Polish economic plans are centred on Silesia. Poland is thus utterly committed to the westward move, and consequently to the partition of what is left of Germany.

Nysa (Polish) = Neisse (German)

It is sometimes forgotten how actively the western powers helped to forge this chain. At the Teheran conference in 1943, it was Mr Churchill who, after some discussion, proposed the formula that "in principle the home of the Polish state and nation should be between the so-called Curzon Line and the line of the Oder"; though in retrospect he condemned what was done. Both Mr Roosevelt and Mr Churchill were at that time intent on weakening Germany, above all by destroying Prussia, which they believed to be the home of German militarism; they wished to create a strong Poland, between Russia and Germany; since their powerful Russian ally had claims on Poland it seemed to the great mapmakers that

the solution was to shift Poland westward "like soldiers taking two paces left close," as Mr Churchill put it.

By the time of the Yalta meeting in 1945, the western statesmen were having second thoughts. Stalin had forced on Poland a puppet communist regime and thus opened the breach between east and west. The western statesmen were having growing doubts about the wisdom and humanity of mass deportations, on the scale entailed by the Oder-Neisse line; Mr Eden had discussed with the Americans a Polish frontier which ran mainly to the east of the Oder. "It would be a pity to stuff the Polish goose so full of German food that it died of indigestion," Mr Churchill remarked. But by then Stalin and the Poles were firmly claiming the present frontier, and during the conference the Poles announced that they had taken over the administration of the regions beyond it in the wake of the Red Army. Against the fact of Russian occupation. Mr Churchill's rearguard action at Potsdam could do little to affect the issue; the only concession the western powers could obtain was a statement implying that the new frontier was provisional: its "final delimination should await the peace settlement." The western powers had been accomplices in the great geographical game of shifting Poland westward. Their second thoughts merely tied Poland tighter than ever to Russia, which alone supported it against German claims.

The western powers are today powerless to break Russia's grasp. It has been suggested that a public guarantee by them on the same lines as Russia's might help to free Poland from its yoke; but in practice it might do more harm than good. Its effect in Germany would certainly be dangerous. The west German government would feel itself deprived of a bargaining counter by its friends, and with nothing to show for it; all those nationalist forces which are most intransigent about the eastern frontier, and which have never liked the western alliance, would be stimulated.

Above all, such a guarantee would be ineffective; it would not give Poland itself real security or lay the ghost of German aggressive designs; the French alliance and the British guarantee did not help Poland in 1939. The fact is that to survive at all, Poland must retain the friendship of one of its great neighbours, Germany or Russia; and it would be a rash Polish government which would abandon its Russian alliance today so long as it had no understanding with Germany. The Oder-Neisse frontier problem concerns all the great powers, because its settlement is essential to a stable European peace, but the solution must be found by Germany and Poland. And a western initiative can hardly come from any quarter but west Germany itself.

This does not mean that Britain and the United States should not have a clear public attitude. Their attitude in the past has been too vague and has encouraged by silence the German notion that because the loss of the eastern lands was imposed by Russian force, Germany's capitalist allies might support her in getting them back. They would not, and it does no service to allow it to be supposed that they would. If Britain cannot give unqualified outright support to the frontier as it is, it certainly cannot endorse the quite unrealistic German claim to the 1937 line, and it should make this clear. Poland, bled first by Germany and then by Russia, must not be partitioned again. And on grounds of plain humanity, while the wrong of driving 8 million Germans from their homes can never be condoned, a new expulsion of the 5 million Poles now settled there has to be opposed for exactly the same reason. The western powers should make clear their interest in a peaceful and humane settlement between Poland and Germany, but any western initiative for such a settlement must lie with Germany.

★

Until recently, German attitudes have not given much cause for hope. Refugee leaders agitate continuously for the return of the lost territories. Feeling among the refugees themselves seems fairly moderate. Most have begun to put down roots in western Germany and their children are beginning to feel at home there. Many, it seems, might choose to stay where they are, even if they were given a chance to return to their old homes. But their political leaders have made it their business to keep alive the longing to return. Their first claim is embodied in a principle which they have invented, "the right to the homeland"—that is, the individual refugee's right to return home; in itself, a human and unexceptionable sentiment. But in its wake there follow naturally more dangerous claims to the lands themselves. Maps, sponsored by the refugee organisations and showing the twofold retreat of the German frontiers since 1914, imply that the lands should return to German rule.

Many moderate people in Germany do not share these extreme views, but refugee votes are precious; indeed, they are capable of tipping the electoral scale. Both the Social Democrats and the Christian Democrats have felt obliged to pay lip service, at least, both to the "right to the homeland" and to the more specific claim to the 1937 frontier. These attitudes, however plausible politically and legally, do not help the Poles to trust the German will for a settlement, or the German public to accept realities.

Yet with the thaw in eastern Europe, the hard crust of German attitudes has at last begun to melt. Evidently, the states of eastern Europe are no longer the mummies that they were. Diplomatic representation in Prague and Warsaw is worth more than it was two years ago. The Social Democrats and many other German politicians feel that negotiations there may be an invaluable accompaniment to the talks in Moscow which must precede any general European and German settlement, and it is clear that the main issues which the Germans can fruitfully discuss with the Poles and Czechs will be the Oder-Neisse line and the lesser but parallel problem of the Sudetenland. If the West Germans

can reach an understanding with them on these questions, they will weaken Russia's hold on all eastern Europe. Sudden moves would be unwise while Poland is still a Russian hostage, but a gradual, unobtrusive effort by the Germans to build up an understanding could make it easier for the Poles to edge gradually out of the Russian orbit. Such a rapprochement would reduce still further Russia's diminished political capital in eastern Europe; at the same time, by reducing the Polish and Czech hostility to German reunification, and by reducing the danger that reunification might be followed by trouble in eastern Europe, it would tend to bring a general European settlement nearer.

Diplomatic activity alone will not get far with the Poles, so long as Germany's political leaders continue to pay lip-service to nationalist claims. There have been a few encouraging signs that leaders of both the SPD and the CDU see the necessity of educating their people in political realities. In London last May, Herr von Brentano, the German foreign minister, declared: "I think the German nation may one day have to take a decision whether to renounce the other territories if thereby the 17 million Germans of the Soviet zone can be freed." More recently, Professor Carlo Schmid, a leading Social Democrat, spoke at length on similar lines, attacking the "taboo" which German politicians had erected round the subject of the eastern lands. Both parties have repudiated these utterances, but in the German press there have been growing efforts to explain that reunification with the Soviet zone may have to be bought with a sacrifice beyond. Dr Adenauer himself, though he maintains the legal claim to the 1937 frontier, has gone out of his way to emphasise his willingness to negotiate with an "independent Poland."

Most Germans, including moderate political leaders, still seem unaware how big a price they may have to pay. Dr Adenauer himself cherishes the idea of a condominium rule and hopes that the Poles will eventually allow individual refugees to return and live, if they wish, under Polish or condominium rule; in this way the "right to the homeland" would be preserved. The outlook does not seem particularly good for either of these notions. Limited resettlement might be allowed in certain areas, since their population now is 6 or 7 million, compared with 9 million before the war, but the Poles are unlikely ever to accept unlimited German immigration, with all the dangers of a new minority problem. Germany, it is true, can offer Poland certain concessions—precious capital and, of course, a valuable political friendship if Poland should evolve to real independence in a settled free Europe. But German offers would have to be remarkably firm and attractive to make it possible for the Poles to listen.

The process of educating opinion in west Germany thus still has far to go. Little more is likely to be achieved before the next election; even then, a rare political courage will be needed. It may be a long while, too, before Poland attains a sufficient independence to grasp with safety a proffered German hand. A German move to settle the frontier issue will not take a sudden trick for the west; but it will probably have to precede any general European settlement.

Goodwill Limited

THE makers of Christmas cards need not have worried about "unfair competition" from the tax-free card (designed without charge by Signor Annigoni and produced without charge by Messrs Raphael Tuck), which the Lord Mayor's office is selling in aid of the Hungarian relief fund. So far only a quarter of a million of these Hungarian cards have been sold, compared with some 510 or 515 million other cards that the British people are expected to buy this Christmas. For such a minute fraction of his industry's turnover, it was the more ill-judged for the President of the Greetings Card Association, Mr N. H. Sharpe—who makes his living out of brotherly love—to protest about the "incursion into commerce" by good causes and about the Chancellor's discrimination in relieving the Hungarian card of purchase tax. It is evident that if the Chancellor is not on Mr Sharpe's side, everything else is. The annual total of cards sold in this country rises steadily with each Christmas; over the last six years it has increased by 86 million, or by 6 cards to nearly 40 cards per family. What is the explanation for this monstrous surge of printed bonhomie?

One fact that gives the makers a particularly good wicket is that the Christmas card habit feeds upon itself. Once you have entered a name on your Christmas card list it can be removed only by death or by persistent failure on the part of the recipient to send one back—which requires a ruthless strength of will of which few are capable. Another bull point for this cancerous growth is that the collector's instinct, which in some form exists in almost everyone, makes people take a pride in the sheer quantity of litter on their chimney-pieces and shelves, the more so as this is an index of their popularity. (In the United States this business of popularity rating is taken even more seriously). A third favourable influence is the ever-growing quantity of Christmas cards sent out by business firms; not only are they a way of reminding one's contacts of one's existence, but they also have the great merit of being chargeable to expenses.

All these manifestations of the Christmas spirit make the greetings card industry an increasingly prosperous affair. But there is another profitable influence at work. This is the growing habit of sending cards on other

occasions, which bring the total number of greetings cards sent in a year to 1,000 million. Birthday cards are nothing new; but birthdays, as the manufacturers know, are all too often forgotten, so now you can send a "belated birthday" card, with a drawing, say, of a doleful bloodhound moaning "I forgot your birthday." Having successfully persuaded the British that dutiful children send a card to Mother on Mother's Day, the manufacturers, following the American example, are somehow putting it about that Father will be very sad if he does not have his Day too. This is doubly enterprising, because whereas Mother's Day has some faint religious flavour and is celebrated on Mothering Sunday, Father's Day is fixed not by the church calendar but by commercial interests without benefit of clergy.

There is also a new line in cards to be sent where once one wrote a letter. No need now to puzzle over a new way of saying thank you for a delightful weekend or for the charming dinner party; no need, when a friend goes into hospital, to strike just the right balance between commiseration and confidence; no need even for that fruitless search for words of comfort to the bereaved. There is a card for every occasion. The greatest boon, perhaps, is that the whole business of thanking for Christmas presents can be despatched with a dozen cards. In short, just when the nation is spending ever vaster sums on teaching children to express themselves in writing this is becoming increasingly unnecessary. All one needs is enough reading ability to choose the right card for the right occasion, so as not to send, say, condolences to the newly engaged or congratulations to the bereaved.

On second thoughts, there are possibilities even on those lines. In the United States there is a flourishing trade in "hate" cards. On Saint Valentine's Day you can not only send a card to your current girl friend; you can also send one to the girl who jilted you last year, saying "shucks to you, I've got someone much nicer," or words to that effect. A card with the wish, "I hope you die" is useful for all sorts of situations; it would have been invaluable to some readers of *The Economist* in recent weeks. But these great possibilities the British trade has yet to explore properly.

At present, it seems, the British trade is expanding not by forming public taste but by studying it. One big firm reports a change in taste towards a "contemporary" design; but this does not mean that the stage coach, the cottage or church in the snow, the candles, the fir cones and the robin have been banished. The robin, perhaps, is a bit *démodé*; the others remain, although in designs that are simpler and neater. An ever-growing public exchanges reproductions of the same masterpieces in the Tate and National Galleries. A new development, however, is that apparently people actually read the text inside Christmas cards, which may not presage an improvement in the standard of the poetry but should lead to some de-sugaring of the sentiments. The modern idea is that the verse must strike a more "sincere" note, like this one accompanying a picture of the mad crush round a Christmas card counter:

> I went to get your greeting
> And look what I went through,
> But really it was worth it
> For someone nice as you.

The makers, who are just about to start work on the designs for Christmas 1958, say that the trend is for cards to be even more contemporary and even more sincere. A really sincere verse would read like this:

> I went to get your greeting
> And look what I went through,
> I only send the silly thing
> Since I've had one from you.

Provided, however, that they do not overdo the sincerity, the makers seem safe—unfortunately—from any rebellion by the British people against the tyranny of Christmas cards, or any reversion to the idea that their function is to maintain a contact with absent friends to whom one has not had time to write. A few may have the sense to imitate one pioneer who sends cards only every other year, and those on Christmas Eve, to embarrass friends who sent him cards last year but who will not send them to him this year because he did not then reply. But his unimpeachable system is against the general trend.

President Pierce

Theoretically, perhaps, hereditary monarchy is indefensible. . . . But on a comparison of the actual working of monarchies and democracies, we do not find that the latter avoid the very mischiefs and absurdities which they allege as the special arguments against Royalty. We have had ample proof, in modern as in ancient times, that the choice of a people is no surer guarantee of fitness than the accident of birth. . . . The elected chief magistrate of a republic may be as weak, as foolish . . . as easily led astray by bad advisers, as the first-born of a Royal house. . . . Mr Pierce is an example. Few monarchs in late years have shown less capacity or have done more mischief. Few have brought more discredit on the nation they governed, or excited greater grief and shame among its wise and sober citizens. Few poorer creatures ever wielded the destinies of an hereditary Empire. Few sovereigns, born in the purple, ever fell more completely into the hands of evil men, or were ever used as more pliant and shameless tools. Few, moreover, since the days of Darius, who was chosen because his horse neighed before that of any other candidate—were ever elevated more entirely and strangely by an accident. . . . The President's Message has one considerable merit—it is his last. In other respects it is one of the most undignified, untruthful, and unseemly documents that was ever issued by a great potentate to a great assembly. More than half of it is occupied with clumsy and verbose special pleading in defence of his conduct on the Slave-extension question generally and on the Kansas struggle in particular. His argument consists almost wholly of a misrepresentation of the facts of the case, all the more foolish and audacious that it is addressed to an audience and published among a people who must be perfectly conscious of its incorrectness.

The Economist
December 20, 1856

Notes of the Week

Return from Goldeneye

SIR ANTHONY EDEN must be as puzzled as everybody else about how to interpret his welcome home ; the sense of bewilderment is certainly shared by the Conservative MPs who were supposed to welcome him. When he arrived at London airport, undoubtedly bronzed and arguably fit, he made a long statement before the television cameras which could have been called hearty and confident—but has in fact been widely called (by Tory MPs) a mixture of bluster and bluff about his personal position. There followed an hour and a half with his doctor, who afterwards " expressed complete satisfaction at the beneficial results of his enforced rest " ; after reading this statement through several times, one could interpret it as being almost as non-committal as a speech by Mr. Butler, but it is fair to say that it has not in fact been widely so interpreted.

Then, on Monday, Sir Anthony entered the House towards the end of question time. For the record: one Tory MP stood up to cheer and then sat down again ; Dame Horsbrugh led upwards of a dozen other MPs in waving their order papers, but not for very long ; there was a murmur of applause which threatened to fade away after only fifteen seconds, and then was more widely picked up because it was realised that this would be a debacle. Some commentators have said that between a third and a half of Tory MPs in the chamber did not applaud at all ; but this seems to have been due not so much to deliberate abstention as to the fact that many MPs were already busy discussing with their neighbours what a thin reception the Prime Minister was getting. The discreet manner of Sir Anthony's entry may have had something to do with it. Sir Anthony's reception by the 1922 committee on Tuesday, although still not exactly enthusiastic, is reported to have been rather less confidence-shattering. He seems to have talked there as much about progressive domestic policy as about foreign policy, but attracted more questions than applause.

The Heir Too Apparent

IT is fair to conclude from Sir Anthony's reception this week that the Conservative party in Parliament is not now excitedly enamoured of its leader. It is just possible to argue that it is inclined to treat him as a scapegoat ; but it has adopted so many scapegoats in the past few weeks—and all of them for such short periods—that this might not be as important as it sounds. There are two major factors which suggest that present Tory disappointment with Sir Anthony should not yet be regarded as an incipient revolt. One is that the MPs who are disappointed with him seem to be disappointed for such widely varying reasons. Some criticise him for ever starting the Suez adventure ; more attack him for calling it off. Most surprisingly, many Tory MPs who would otherwise accept what has been done say that they have been outraged by seeing the Prime Minister fly off to Jamaica for three weeks, just when the policy which he had made so personal an affair was nearing the centre of the storm belt. Bournemouth might just have been all right, but Jamaica, it is being said, was disastrously exotic. This surely is the least of the many reasons for criticising Sir Anthony.

The other major factor in Sir Anthony's favour is that a segment of his bitterest critics are even more hostile to his only potential successor. (Most Tories are now at last coming round to recognise who that successor would be ; if Sir Anthony were to lay down the Premiership tomorrow, there is really no doubt that the Queen would be constitutionally bound to send for Mr Butler). Because of this split among the critics, and because of the imminence of the Christmas recess, Sir Anthony seems likely to have an extended breathing space in which to make a determined new start. It is not a happy sign that the only cabinet change he is said to be contemplating (apart from possible alterations in the sub-departments responsible for defence) is the final departure of Sir Walter Monckton, and his replacement by Dr Charles Hill, acting as the Government's high-powered public relations officer. Dr Hill's brand of *bonhomie* has its place, but not at this level. It is to be hoped Sir Anthony does not imagine that fruitier exhortations to keep our bowels open are an adequate substitute for a new foreign policy.

Plan for Cyprus

LORD RADCLIFFE has made a good job of his constitutional proposals for Cyprus. He treats the Cypriots as an " adult people " who, when they are invited to assume political responsibility, deserve as generous an offer as " the conditions of the problem " allow. He has done his best, but within severe limits which make it impossible to feel any confidence that the plan will take the poison out of the Cyprus atmosphere. The Governor is to control not only defence and foreign affairs, but also internal security without a time limit. On other matters the Cypriot chief minister, cabinet and Legislative Assembly would govern with the Governor playing the part of a constitutional head of state.

Lord Radcliffe has been ingenious in devising methods of soothing out possible points of friction. The first concerns the dividing line that will constantly have to be drawn between the powers reserved to the Governor and those

reserved to the Legislative Assembly ; he points out that some matters, such as immigration, will sometimes affect defence and internal security and sometimes not. He hopes that by the device of a Joint Council of Cyprus, in which both the Governor and the Cypriot ministers can fully and freely discuss their plans, it will be possible to avoid the suspicion that largely arises out of " each side's ignorance of what the other is up to."

The second important point of friction is the position of the Turkish minority. Lord Radcliffe rightly rejects the demand that 18 per cent of the island's population should have equal representation with the Greek 80 per cent. But he is confident that the guarantees offered to the Turkish minority are no mere " paper " guarantees. They include a provision that six out of the 24 elected seats in the Assembly will be reserved for the Turks, the consent of four of whom will be necessary for any legislation affecting Turkish laws, customs and institutions.

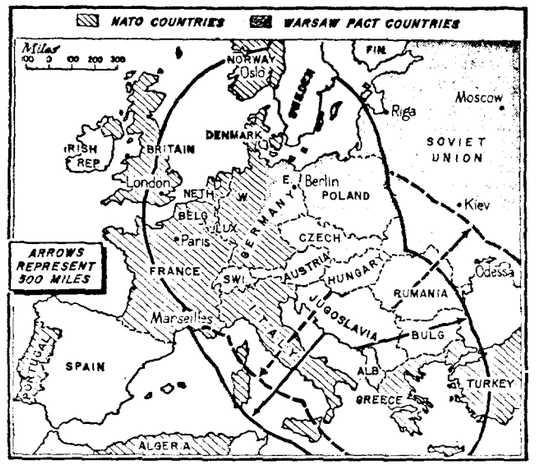
If Lord Radcliffe's constitutional gadgets could have been put to work in a calm and auspicious atmosphere, Cyprus might really be on the way to a solution. The British Government has indeed tried to sweeten the atmosphere. Mr Lennox-Boyd took the trouble to fly to Athens and Ankara to explain the new proposals, and in Cyprus some of the most repressive security measures have been lifted. But will the Colonial Secretary's vague mention of the application of self-determination satisfy the Greeks ? It seems not ; the extent of the reserved powers and the talk of a possible partition have made their first reaction hostile. Will Archbishop Makarios respond to the British Government's gesture of consulting him about the Radcliffe report with the much bigger gesture that is needed to break the deadlock ? If he makes it, will Eoka obey him ? Will the authorities in Cyprus settle for surrender terms that the terrorists will accept ? The answers to these questions will determine whether the attempt to escape from this miserable deadlock can have a chance of success.

"Open Skies" and Open Doors

DISARMAMENT is a seasonable Christmas topic, but this winter there is something strange at first sight about the appearance of new projects in this sphere. The Red Army is now crouched massively in Hungary as well as in east Germany. Soviet supplies of arms to Egypt and Syria have contributed to the alarms of recent weeks. The Atlantic Council has held a nervous session and its European members have obtained an American promise of tactical nuclear equipment, albeit minus the warheads. Russia has given unusual publicity to its nuclear test explosions ; Britain holds to its plan to test a hydrogen bomb early next year. It was a strange background against which the latest American suggestions (discussed at more length on page 1050) were unofficially launched.

These suggestions may now be formally put forward—at the United Nations, or in diplomatic Notes drafted after consultation in the Atlantic Council—or the Americans may pause to study the reactions to their trial balloon. The pause might be quite a long one, for Moscow at least did not hasten to get out a swift retort. But " more haste, less speed " has become the guiding axiom in the great disarmament debate, which has lately taken the form of a leisurely exchange of letters and messages.

In Russia's last contribution to this exchange, on November 17th, the most spectacular element was an offer to accept Mr Eisenhower's " open skies " idea for aerial inspection —but only within a zone extending 500 miles each side of the dividing line between the Atlantic and the Warsaw allies. As the map shows, the proposal left it uncertain just



where the limits of the zone would fall: it has found no favour in the West. The new American suggestions are, however, something more than an attempt simply to offset Russia's last statement in terms of propaganda. Mr Eisenhower and Mr Dulles will not look for early Soviet acceptance of their latest terms ; but they evidently feel that at a time of strain it is more than ever important to keep the disarmament door open—and perhaps the door to a European settlement too.

Clearing the Canal

GENERAL WHEELER, who commands the UN salvage operation at the Suez Canal, has asked for six specialised vessels of the Anglo-French salvage fleet to speed the operation south of Port Said. He had 19 vessels of a fleet of 31, to be provided by E. M. Svitzer of Copenhagen and L. Smit and Company of Rotterdam, already at Port Said, but the Royal Navy has some unique equipment which he needs. There is, in particular, a ship with monstrous jaws which can bite on a sunken vessel and swing it clear of the channel. By such equipment the canal could be cleared from Port Said to Suez within two months for the transit of ships up to 10,000 tons.

He has, apparently, asked that they should be emptied of their British crews and manned by experts he has assembled This looks like an excursion into politics, but it may arise from a well-founded belief that he cannot proceed quickly with his technical job if President Nasser impedes it. If necessary, Britain, being committed to speedy clearance and to support of the UN operation, should agree.

President Nasser should equally be persuaded to forget his prestige. Cares for the economic difficulties of western Europe sit lightly on him (although not all the countries have been his enemies in this affair), but it is surprising that he should be careless of his Asiatic friends. India, for example, believes it suffers proportionately greater than Britain by the closing of the canal. He has some economic benefit for himself, and the credit of reasonableness, to gain by permitting the Anglo-French fleet to reinforce that of the UN. The conditions of co-operation could be arranged with Mr Hammerskjold. In short, he has nothing to lose.

The clearing of the first limited channel, enabling maritime commerce to achieve a degree of normality, is the urgent matter. The second phase, that of freeing the canal for big ships, will take time and General Wheeler's fleet can probably undertake it as well as any other. Smit and Svitzer are highly experienced firms.

The question of Anglo-French vessels continuing the clearance of Port Said harbour with their crews wearing the UN insignia and safeguarded by UN forces, is a separate matter from the clearance of the canal to the south. It will take them another two weeks to complete their work and General Wheeler wants them to do it.

Whose Enemy?

If President Nasser has been able through recent weeks to preserve intact the security of the densely populated Nile delta, he should be able to use his army for effective purposes of security along the canal while British and French salvage ships combine with the United Nations fleet in clearing it. He and his efficient Minister of Interior, Zacharia Mohieddin, have a good record for maintaining internal security.

Battle of the Border

The following report is based on despatches by our special correspondent lately in Northern Ireland and our regular correspondent in Dublin:

After the expenditure of a great deal of ammunition in the past ten days both by the Irish Republican Army and the Ulster forces, several policemen have been wounded; a number of gunmen have been captured and are liable to be interned for long periods; damage to property estimated at £100,000 has been done. But, so far, nobody has been killed; nothing irretrievable has happened to awake the fanaticism from which reprisals and counter-reprisals might develop. Both the Ulster and the Republican governments would deplore anything of the kind. Would the IRA? If so, it is carrying out a risky little exercise in brinkmanship. If not, what would its ultimate objective be, since ineffective violence keeps the two Irelands still more bitterly divided, and bears heaviest on the minorities? Perhaps, after a week of "war," the position of the three parties involved may be summed up as follows:

(1) **The IRA(s).** There are in fact two gunmen groups in operation: the IRA proper—whose headquarters are Dublin, and which may have nearly 1,000 members, mostly non-combatant—and the more ruthless *Saor Uladh*, which operates in Ulster, acquires its bitterness from Belfast, and does not confine its objectives to British military installations. The former has been heavily involved in the latest fighting; at least one "soldier from the front line" has been displayed to an admiring audience in Dublin. There will be more danger of murder of specials and civilians if *Saor Uladh* joins in determinedly. The IRA has threatened to keep up the raids over Christmas, and has appealed for donations. At the moment it can feel that (*a*) it has proved to its American backers that the dollars it gets are earned; (*b*) it has given a nasty jolt to the "supine" Costello coalition in the South. It can scarcely hope to do more than this, unless it wants martyrs in the Belfast courts to keep the propaganda weapon fed with ammunition. On the other hand, the condemnation of its action by the Dublin government gives it an excuse to disengage now. This would enable it to retain its popularity in the South without risking unpleasant consequences for its organisation there.

(2) **The Ulster Government.** This is placed in a predicament. On the one hand, it does not want the IRA outrages played up as a regular war; this would be bad for its industrial plans, and would embarrass the British government abroad. On the other hand, the IRA outrages are naturally bitterly resented by loyalists in Ulster; at least some members of Lord Brookeborough's government must feel that they are good for internal politics, since they harden support for the idea that the often-divided Stormont government basically stands for the survival of the six counties as part of the United Kingdom. Stormont's temptation is to play down the IRA abroad, but up at home; but it must not play it up too much even at home, because, while the B-specials are reasonably in hand, the Orange Lodges can produce ugly bigots with firearms, who could emulate the IRA (and probably more efficiently) if they were roused. It hopes that its recent call for restraint, coupled with Sir Anthony Eden's statement on diplomatic moves, will calm things down.

(3) **The Republican Government.** This comes off worst of all. It longs for a quiet life, as it is falling down on so many domestic issues. Mr Costello's majority is only five. Though nearly all sensible Irishmen realise that IRA violence gets them nowhere, and the IRA would win little support if it put up parliamentary candidates in the South, repression of the "army"—any action in which the Republican government seemed to be acting in concert with Stormont—would be unpopular. (It would also, however, be easy since IRA leaders are known to the Irish police). It is quite possible that Mr de Valera's chances of coming back have already been strengthened (though he is as strongly against IRA action as any Southern politician). But it would be still worse for the South to back a campaign of murder; the statement that unofficial armies cannot be tolerated was the least the government could do.

How far is it a very small least? Police and troops have in fact been sent to the border, with instructions not to hurt anyone but to stop or deflect Eire-based raiders. Attempts have been made to censor press reports of the IRA rally in Dublin, and the government is as anxious as anyone that nobody should be killed and executed. The press is concentrating on Hungary, on Ronnie Delaney's win in the 1,500 metres at Melbourne, and the entries for the Lincolnshire. But, as in Ulster, but for opposite reasons, there is the feeling that these incidents keep the border and the "partition of Ireland" in the public eye.

It is, however, notable that the two periods in which it has appeared to break down have involved British troops. The first was in 1953 when he was putting on the pressure for an Anglo-Egyptian agreement and the second this month when he was presumed to be harrying the departure of the Anglo-French forces. The common view is that he has been scoring a cheap victory by building a claim to have driven out the British by guerrilla action. General Stockwell has wisely foiled him, if that were his aim, by withdrawing into a barbed wire enclosure.

One can reasonably doubt, however, whether President Nasser was either directing or encouraging the recent incidents in the Port Said region. When the time came to stop the trouble in the Canal Zone in 1953, he was by no means sure that he could do it. After imposing security measures which in the event proved adequate, he anxiously warned the British Government that he could not guarantee that "Moslem Brothers and Communists" would not stage another coup against the British troops. The situation is now very similar. President Nasser armed the civilians in the Port Said region to resist the British and French invasion; it is a fair guess that not all those he armed are now under his control.

It may well be that he has armed large numbers of his internal enemies—perhaps those dissidents he disarmed and in some cases gaoled in 1953. Zacharia Mohieddin and his secret police spent many months of 1954 stripping the civilian population of the towns of arms and explosives which the Moslem Brotherhood was prepared to use against the regime. It will now have to be done all over again in Port Said, Ismailia, Suez and Alexandria. (It is notable that he did not arm the people of Cairo or the delta towns.) It is not beyond the bounds of possibility that some of the people who caused trouble for the British troops recently are equally not averse to causing trouble for President Nasser.

Truths But No Dares

In its pamphlet *The Truth About Suez* the Labour party has dexterously evaded the fact that the Suez crisis was the extravagant explosion of the Middle East situation as a whole. Its "truth" concerns the Government's handling of the extravaganza. The facts are argued with cogency but a curious defensiveness, as though the Labour party feels in some way uneasy at standing simply for "the rule of law . . . Britain's obligations under the Charter of the United Nations." The Government's errors are attacked ingeniously enough; but where are the constructive conclusions?

The pamphlet contrives to expound a policy for the Middle East in 139 words at the end of 20 pages. Negotiations over the canal must be resumed on the basis of UN principles; the UN force must remain to police the frontiers; there must be a Middle East settlement; the state of war between the Arab States and Israel must end; the Arab economic blockade of Israel must end, too; the problem of the Arab refugees must be solved; the Arab states and Israel must be guaranteed against aggression; there must be a warning issued against armed intervention by any country. All this, and heaven too.

The pamphlet is evidently intended to persuade an electorate which possibly took nostalgic pleasure in hearing the British lion roar—even if it happened to roar in the wrong place and at the wrong time. It argues rightly enough that Britain ought not to deceive its allies, disturb Commonwealth loyalties and break UN principles. The Labour party has yet to support its case with a reasoned presentation of a Middle East policy. What is called policy here is no more than a statement of aspirations which neither Labour nor the Tories can expect to achieve—unless by the careful execution in concert with other nations of a consistent and carefully constructed plan. Mr Bevan might try his hand at devising it.

Masters of Our House

Primacy is a term which is sometimes applied to Parliament, and sometimes to prima donnas. There fortunately seems to be some force in the recesses of the British constitution, or else of British common sense, which acts as a corrective influence whenever the two meanings of the term appear to be in danger of getting mixed up. Consider the history of the "fourteen day rule." At one period last year the mood of Parliament appeared to be in favour of maintaining—even strengthening—restrictions on free discussion on the radio and television of matters that were soon to be debated in Parliament. This was a case of Parliament imposing restrictions in what it regarded as the interests of Parliament, but against what most outside people regarded as the interests of the public—and of free expression. Despite Parliament's apparently determined mood in the summer of 1955, the restrictions were eventually referred to a select committee. The select committee, debarred from recommending abolition of the restrictions, recommended that they should be reduced to the smallest practicable extent. Now the Government has gone further and suspended the restrictions for an "experimental period" of six months, during which there will be informal arrangements to ensure that the radio and television services "continue to act in a way which does not derogate from the primacy of Parliament as the forum for debating the affairs of the nation." After this six months, the next stage of the retreat to free speech can, one hopes, be guessed.

The way in which the public interest has gradually prevailed about the fourteen day rule is one of two reasons why it does not seem appropriate for *The Economist* to comment too forcefully upon another incident in Parliament this week. The second reason is the desire of the Editor not to be incarcerated in the Tower. To put this other incident in a setting which not all MPs may have appreciated: three years ago (see page 8 of the Report from the Select Committee on Members' Expenses) an official of the inland revenue publicly agreed that on such matters as tax claims "we probably question Members of Parliament rather less than most people." It is therefore not altogether surprising that some popular newspapers, which like to make a fuss about this sort of thing, have suggested or stated that politicians (which MPs take to mean MPs) have not had their claims for supplementary petrol questioned closely either. If this were true, it would

be understandable and—except to people who make a dull fetish of fairness—not very important; but the House has now decided, against the original inclination of the Speaker, that two allegations to this effect (one in what was meant to be a humorous cartoon) should be referred to the committee of privileges, as possible contempts of Parliament. Further comment upon this matter, while the committee is sitting, might itself be regarded as contemptuous; it must be left to MPs themselves to think out where they think they are going.

Nato's European Head

M. SPAAK'S appointment as secretary-general of the North Atlantic Treaty Organisation symbolises the new hope that the Palais de Chaillot can become the political as well as the military hub of the Atlantic community. The farewell tributes to Lord Ismay were well deserved. A distinguished officer and a man of sense, he has drawn on his experience of wartime co-operation and commonwealth statesmanship to establish a feeling of common purpose in Nato's daily work. But M. Spaak will bring a new political weight to the post. At the centre of the efforts by Nato members to evolve common policies there will be a powerful personal drive and political authority. And M. Spaak's stature as a European leader should qualify him especially to bring together the errant policies of the European partners.

Common political attitudes will not be created by one man; and they will take time to evolve. But the meetings last week, whose work and results are discussed more fully in an article on page 1057, produced a valuable new commitment by members to consult together, and revealed, especially in private talks—between Mr Dulles and his British and French colleagues, between the British and Germans—a strong common desire to overcome differences. A strong Secretary-General can do much to keep this alive, to nudge members into fulfilling their commitment to consult, to take the lead in resolving differences and evolving common policies. By the time he takes over in April, M. Spaak hopes, the Cyprus dispute, the worst of Nato's inner differences, will be resolved. But even if it is, he will have plenty of constructive opportunities in other fields. The council, for example, discussed events in eastern Europe with lively interest; but its members have yet to evolve a clear and concerted political policy towards it which will help to shift Russia towards a satisfactory European settlement. Such a common policy might do much to sustain the military alliance, particularly with Germany.

The Defence Partnership

THE most urgent need for the evolution of a common Nato policy lies in defence itself. This Christmas, for example, Britain and Germany are once more settling down to a bout of bargaining over German financial support for the British Army of the Rhine. Both economically and politically, Britain has a strong case for further help next year, and the German Government, with its flush exchange reserves, and aware that it has retreated from the spirit of its military obligations, seems disposed to agree to a further financial contribution. But though agreement may be reached the alliance may first be strained once more by unpleasant national haggling.

The revival of the issue of support costs is a symptom of a wider problem. Partly on military, but still more on political and economic grounds, many Nato powers are reconsidering the fundamentals of defence, seeking to reduce costs mainly by cutting the numbers of the ground forces, and hoping at the same time to evolve forces suited to the exigencies of tactical atomic war. The change in German policy has been the most spectacular so far, but both Britain and the US are also considering reductions in manpower and fundamental changes in military organisation. Until recently this general reappraisal has tended to go on in piecemeal national fashion, punctuated by bilateral bargaining when issues like support costs arise. Much political strain on the alliance could be avoided, and its military effectiveness increased, if common policies based on the new technical military needs, and on what the partners are really able and prepared to pay, can be worked out soon.

A vital first step in this direction is the "political directive to the military" which the Nato Council approved last week, and which embodies the conclusions of three years' study within Nato of the new military needs. But the common Nato policy to implement it has yet to come. Western European Union may have to be given new importance and used as an instrument to produce the European side of that policy.

Magi[3]

THE Three Wise Men who brought the first Christmas presents, 1,956 years ago, rode out of the East; but it is in the West that the cult of the Magi has been most faithfully preserved, and lately it seems to have moved into the field of international politics, if not as a cult,

Derivations of the Day

Far-sighted people who are already worrying about how to use their Christmas book tokens in the year 2056 may appreciate this preview of entries from a dictionary to be published in that year.

anti-americanism, n. (happily obs.). Disease rife in Gt. Britain in mid-20th C., among left-wingers in the early 1950s and among right-wingers in the late 1950s.

anti-semitism, n. (obs.?). Disease rife among Arabs, the principal semitic group, in mid-20th C. (etym. obscure, poss. due to simple error of reversal).

bolshie, a. Awkward, unco-operative. (f. *Bolshoi* ballet troupe, which, it is said, made difficulties about coming to London to perform c. 1956.)

discussion, n. Negotiation, usu. prolonged and wordy. (Etym, dub., poss. f. celebrated international wrangle about a *discus* thrower before 1956 Olympic games.)

eden, n. Legendary abode of peace. (Prob. f. slogan used in Br. election campaign of 1955.)

force, n. Violence; mil. strength; troops; *use of f.*, a right renounced by nations in 1945 and insisted upon in 1956; *when an international f. meets an immovable object,* scientific hypothesis deriv. f. events of 1956.

marxmanship, n. Devotion to obs. system of dictatorship, wh. flor. briefly in mid.-20th C. (poss. deriv. f. role of Russ. tank gunners in Hungary in 1956).

pilot, n. Navigator of aircraft, or (obs.) ship; *dropping the pp.*, dismissing key employees (f. Egyptian government's action in 1956); *jesting p.*, one who speaks irresponsibly (f. claims pp. made at that time that they were indispensable); *Pontius p.*, a navigator who, while steering a ship, disclaims responsibility for its course (see *butler*).

pole, n. Stick used to prod or goad; formerly usu. stuck in mud, now often quite straight and upright; *pp. apart,* independent position; *up the p.*, slogan expressing approval of such a position.

skewer, n. Thin instrument for penetrating a lumpish mass. (Corruption of *scua,* device briefly fashionable in 1956.)

swizz, n. (obs. slang). Effort to confuse or defraud, usu. unsuccessful; esp. in phrase "it's a swizz." (Corruption of *Suez,* scene of several such attempts.)

swizz guard, n. Small body of diehards. (deriv as prec.)

swizzle, n. & v.t. (1) (Make an) effort to confuse or defraud (as prec.); (2) (stir an) intoxicating, frothy drink.

tony, n. Sufferer from schizophrenia. (f. mid-20th C. advertising slogan, "Which twin is the Tony?")

warhead, n. Explosive element in military machine. (Poss. f. name of Br. War Minister in 1956.)

The Other Refugees

AN illogical result of the deep division of feelings over the intervention in Egypt is that even the plight of the British, French, and Jewish refugees who have been cast on the world as a result of it gets a lukewarm response. Hungary has taken up much of the money and the sympathy. The United Nations, not in sympathy with the countries concerned, and engrossed in delicate negotiations with President Nasser, has put no protest on record. But although there are excuses, this disinterest, especially from the refugees' compatriots, is shameful. The threat of mass expulsions has been cancelled, but several thousand people, without money or possessions, have already been arbitrarily pushed out of Egypt and about 50,000 more, the great majority of whom are Jews, are in danger of being squeezed out by economic pressure.

British. At the end of November about 13,000 British subjects were reported in Egypt. Of these, roughly half were Maltese, about 5,000 were Cypriots and 1,700 former residents of the United Kingdom. So far approximately 2,000 refugees have reached Britain; this excludes the many hundreds who are not destitute though they have lost everything they had in Egypt. It is impossible to know how many more will come, especially since several groups are on their way by circuitous routes, but the Swiss Legation, which has been managing the exodus, reports that Egyptian pressure to leave may intensify, and if this is so, the total number of British refugees might be close on 5,000.

On arrival the refugees are met by the Red Cross. They can then get small sums of money from the National Assistance Board or the Anglo-Egyptian Aid Society and about 1,500 of them have been housed in government hostels and camps. The Anglo-Egyptian Aid Society (86 Strand, W.C.2), a small voluntary organisation which for the last 20 years has been helping a trickle of displaced Britishers, is in great need of money. It has been given £100,000 of public funds but this can only be doled out on the inadequate National Assistance scale and anything more than that must come from unofficial sources: so far subscriptions approach £5,000, but more is needed.

The majority of British refugees are Maltese, many of whose families have lived for generations in Egypt, keeping their British passports only for the benefit of the consular or mixed courts. They are in a particularly unhappy position. Apart from the legal ruling that only former residents of Malta can return, the overcrowded island could not absorb them.

The Cypriots, who are regarded by the Egyptians as Greek citizens holding British passports, will probably mostly remain in Egypt (although a good many left with the first batches). But nearly all the remaining 1,700 United Kingdom citizens are expected to return. So far about two-thirds have left Egypt, not counting the 450 members of the Suez Canal Base Contractors' Group who have been interned but whose approaching release has been announced. Some British citizens are told by the police to leave; others are forced out by the sequestering of their firms and property. Nearly all are losing all their possessions, but many of them, particularly the teachers (about 130 of whom have returned), the doctors and the missionaries sorrow less over their material losses than the probable destruction of their life's work.

French. Of the 9,000 French reported in Egypt in November, just under half have so far left. It is believed that a high proportion of those remaining in Egypt have now had notice to quit, and nearly all of them are eventually expected back in France.

Approximately two-thirds of the French subjects are former residents of France. The others are North African, mainly Jews. There are many hard cases, particularly among these latter and also among the many small business men and shopkeepers.

Jews. The situation for the 45,000-50,000 Jews in Egypt is considerably graver than for either the British or French. About half of them are believed to be stateless: former citizens of the Ottoman empire, they have always lived in Egypt but have never succeeded in acquiring Egyptian nationality. Egyptian Jews are estimated to account for between 5,000-10,000; about 6,000 are Italian and the remainder of various European and Middle East nationalities.

To date, about 500 Jewish families have been served with expulsion orders, but another 1,000 individuals are known to be detained or imprisoned and many others are being harassed economically. Israel would take the stateless, but many of them, having lived for generations in Egypt, do not want to go there and are engaged on a desperate hunt for visas. Several countries have offered them visas for transit to Israel: few will take them in permanently.

Economic pressure on the Jews is becoming very tight. Firms are being sequestered and in some cases private property too. Since many of the Jews in Egypt are wealthy, this policy may have the double aim of forcing them out and helping Egypt's revenue. But however impossible their life becomes, their departure from Egypt may be delayed by the elusiveness of visas and the tragic uncertainty of where they should go.

then as a cure-all. Today, whenever statesmen are at a loss, somebody suggests the appointment of a special committee of three. The North Atlantic Treaty Organisation resorted to Three Wise Men almost as soon as it ran into trouble over "burden sharing." The United Nations has often used three-man committees of good offices: sometimes with effect, as in Indonesia, sometimes without, as in the case of the patient efforts of Sir Benegal Rau and two colleagues to mollify Peking's bellicose representative, General Wu, in 1950—an occasion immortalised in the comment that "Rau did all the wooing and Wu did all the rowing."

In current usage, Three Wise Men are a very different thing from a triumvirate, either in the classical, the Muscovite, or the present-day Tory sense of that word. They wield no authority; as Parkinson showed in *The Economist* of November 3rd, five is the smallest practicable membership for a ruling junta, committee or cabinet. The modern Magi are a species of what Mr Colin Wilson would probably call inside-outsiders. They know quite as much about the problem as the politicians who are nominally responsible for solving it, but they are not called in until it has been well fouled up. Then they are told to take it away and produce a report, preferably not until the statesmen have enjoyed a quiet Christmas. So off go Dr Gold, Sir O. Frankincense and M. Myrrh to take soundings, question specialists, and agree on a cautiously non-emotive draft. Months later they come lolloping back on their weary camels and lay their joint offering at the feet of those who sent them into the desert, and who would probably be happier if they had stayed out there a bit longer. They are not in the least surprised when, after each and every statesman has praised the acumen, lucidity and incisiveness of the Frankincense Report, it is tacitly agreed to do nothing whatever about it.

Magi are thick on the ground this Christmas, with three working on Euratom, three appointed by the UN to get the Canal cleared, and Nato's three, who have now completed the task set them in the spring. In the report to Nato there is an ominous hint of a third Parkinson's Law, for this year's Three Wise Men suggest that in the event of future difficulties the organisation should have recourse to—yes—Three Wise Men. Magi to the power of three, in fact.

Nuri Speaks Out

THE Iraqi prime minister, Nuri es-Said, broadcast on Sunday to his people and other Arabs an exposition of his policy and the historical derivation of it. It was, as might have been expected from the one statesman of stature in the Arab Middle East, a convincing justification of his line of action in recent years. There are two causes for regret. Only a small proportion of the Arabs would hear it, and censorships would dilute its effect in print; and the broadcast should have been made often and much earlier.

His condemnation of communist subversion in the Middle East is justified by facts which are well known but have been forgotten in the turmoil of crises and propaganda during the past 18 months. His warning to Egypt that the Czech arms deal, necessary though it might be, could drag Egypt through a dangerous door that Russia was opening for her, has to a large extent been borne out. His description of Nehru's earlier and equivocal position on regional defence shows how mutable "nehruism" can be.

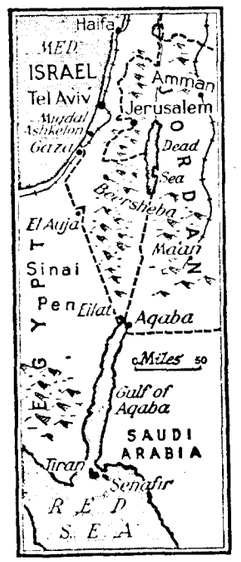
Nuri Pasha's prescience is hardly in doubt. He has been right at very many of the conclaves of Arab leaders ever since 1944, when he advised the nascent Arab League to forget its "national aspirations" until it secured from the West a settlement of the Palestine problem.

Yet—and this is perhaps one of the most significant facts of political life in the region—he has almost always been over-ruled in the conduct of regional policy. Powerful though he is in Iraq, despite the progress and stability he has given to his own country, his influence upon the minds of the Arabs has declined steadily. A Nuri policy may be wise, but it is seldom welcome beyond Iraq's western frontier.

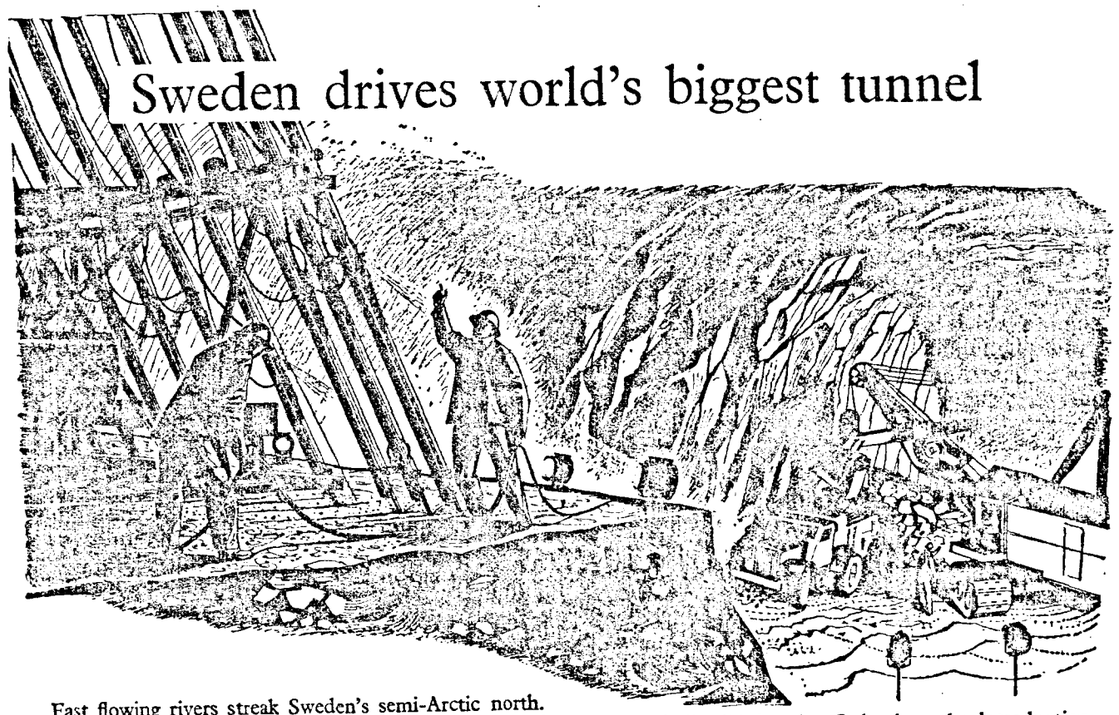
There are many reasons for this, not least the errors of British policy. Judging by reports, the Iraqi prime minister found it inconvenient to mention Britain in his broadcast, because the British attack on Egypt has made his long-standing fidelity to Britain the weakness in his armour. Most probably, the difficulties which now beset him as a result of the Suez affair have led him to defend his policy in public speech. It is a pity that such a crisis was needed to make him explain; his contempt for common opinion is one reason for the decline of his influence.

An Israeli Pipeline?

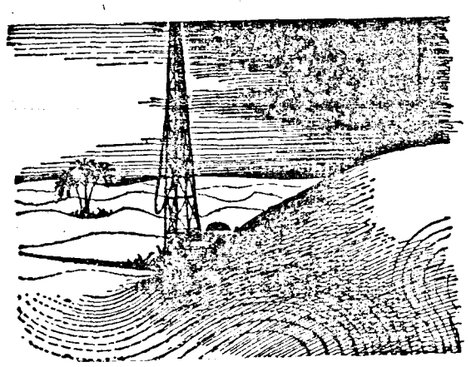
M. PINEAU, in the heat of parliamentary battle, said on Tuesday that work was to begin in a few weeks on an oil pipeline across the Negev from the Gulf of Aqaba to the Mediterranean. Pressed further, he indicated that France would support and assist the project. The idea of a pipeline from Eilat, via Beersheba, to Ashkelon and the Haifa refinery is not new, but has been in Israeli minds for a long time; and the Israeli government has had a survey made. Like other ideas for alternative routes, it was given new impetus by President Nasser's seizure of the Suez Canal; but the crisis that followed made it politically more ticklish than ever. Members of the Arab League would be unlikely to let their oil travel by an Israeli route. Other Moslem states might, but the chances of their doing so will be greater if the scheme is not presented as part of an anti-Arab campaign. This may explain why the Israelis have sensibly been reticent about the scheme. Now that M. Pineau has revealed a French interest, more may be learned about the scale of what is proposed.



Sweden drives world's biggest tunnel



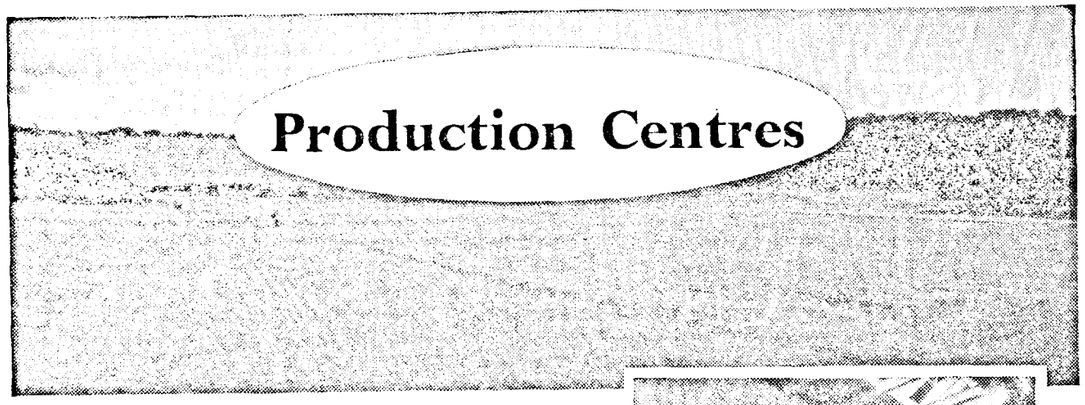
Fast flowing rivers streak Sweden's semi-Arctic north. For a country without either coal or oil, a source of cheap, abundant power. At Stornorrfors on the River Ume, the biggest of Sweden's many projects for hydro-electricity nears completion. It is here that water discharged by the turbines in the underground power house will travel the two and a half miles back to the river through a tunnel 49 feet wide and 85 feet high.
There was a time when a tunnel of this size would never have been attempted. Equipment to do the job fast and economically didn't exist. Only since the introduction of the Swedish Method of rock-drilling, pioneered by Atlas Copco and the Sandvik Steelworks in collaboration with Swedish engineers, has tunnelling on this scale been practical. Today, huge tunnels and cathedral-like power houses below ground are commonplace. Witness Stornorrfors, the world's biggest tunnel, where they are drilling 500 feet per man shift with Atlas Copco rock drills in the excavation of two million cubic yards of rock.



Oil drilling in the Sahara

Compressed air is versatile. Atlas Copco provide the means for all its many applications. In the Algerian Sahara, where large-scale drilling operations are in progress, compressed air is being used instead of water as a bore-hole scavenger. Atlas Copco CT air-cooled compressors, mounted on trucks, provide the air needed to blow pulverised rock, sand and dust to the surface.
The Atlas Copco Group of Companies is responsible for the manufacture of compressed air equipment and its distribution and servicing in 90 countries throughout the world. Group Headquarters: Atlas Copco AB, Stockholm 1.

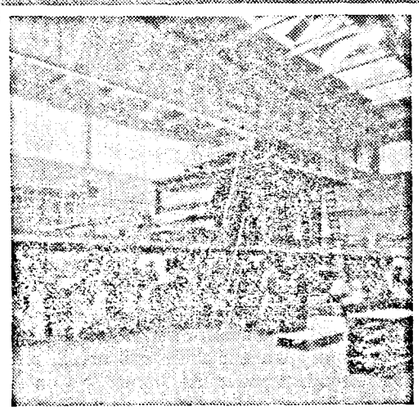
Atlas Copco puts compressed air to work for the world



Site Clearance at East Kilbride, June 1955

From Site Preparation to Production in 14 months

This factory, designed for the printing of the "Radio Times" in Scotland, was built by Cubitts' Scottish Company on behalf of the East Kilbride Development Corporation for Messrs. Waterlow & Sons Limited. The building, which has a ground floor area of 58,000 sq. ft., was ready for occupation only 14 months after site clearance began. Cubitts are pleased to acknowledge the efficient teamwork of their own and their sub-contractors' men who made this result possible.



First Press in operation, August 1956

Aid for Hard Pressed Schools

THE Minister of Education announced this week that he would reopen, on conditions to be announced later, the list of direct grant schools, which has been closed to applications for the past eleven years. A direct grant school is so-called because it gets its grant from the Ministry of Education, and is not maintained by the local authority. The grant amounts to £36 for each pupil of secondary school age, or £40 for those doing advanced work in the sixth form; and there is also a contribution towards teachers' superannuation. In return for this help the school must get its fees approved by the Ministry; must include local authority or other approved people on its board of governors; and, most important, must put the first 25 per cent of its places each year at the disposal of the local authority (which pays the fees), and a further 25 per cent if the local authority wants them. For the rest the school can charge fees, which are usually about £40 a year nowadays, but which must be graduated according to ability to pay—the Ministry making up the balance for those paying less than the full amount.

★

At present there are 164 direct grant schools, containing 75,000 pupils, and including some famous schools such as Manchester Grammar School, King Edward's, Birmingham, and the Royal Grammar School, Newcastle, as well as some whose academic distinction is not at all clear. In these days of rising costs there are probably several independent schools, particularly girls' schools, which might be glad of the generous help of a direct grant. Some of these may be among the seventy schools that used to be on the list, but were turned off in 1945. On what principle they were turned off, and four others admitted, is not quite clear, but the late Ellen Wilkinson, who was then the Minister, seemed sometimes to refuse a grant and so force a school into the arms of the local authority so that all, and not merely a maximum of half, its places should be free. Other schools, however, may not have wanted to apply for fear of a greater encroachment on their freedom; this fear should have diminished in the last eleven years.

The direct grant system is well worth extending, because it allows schools with a fine tradition to maintain their character in spite of all the economic pressures that now bear down on them. It has probably, indeed, an even more important future: in some adaptation of it may lie the answer, financial and social, to the problems which sooner or later will beset the public schools.

Belgrade-Moscow Fusillade

THE battle of words between Jugoslavs and Russians over the Hungarian revolt shows no sign of abating. Mr Kardelj's analysis of the Hungarian crisis to the Jugoslav parliament last week has provoked an angry rebuttal in *Pravda*. This week's visit by a Jugoslav delegation to Warsaw to discuss the problems of "socialism in the contemporary world" will hardly make the Russians any more tolerant of the Jugoslavs' independent and critical attitude, or still the Russian fear that the Jugoslavs may pour dangerous thoughts into receptive Polish ears.

For Mr Kardelj beat about the bush a good deal less than did Marshal Tito in his Pula speech last month—and in Russian eyes that speech was bad enough. Mr Kardelj said bluntly that the heart of the matter in Hungary was that a majority of the working class rose against "a regime which proclaimed itself to be socialist" and that this revolt provoked the intervention of another socialist country. He pointed out that "the belief that a party, by the very fact of calling itself Communist, ensures that its rule is progressive and democratic is a grave anti-Marxist blunder." Hungary, he said, needed "radical changes in the political system, not a change of personages and the correction of individual errors." On the Soviet intervention, Mr Kardelj was thoroughly scathing. He said it could play "no decisive role whatsoever in Hungary" and was really due to "the relationship of forces in the existing international situation"; it had nothing to do with socialism.

It is not surprising that the Jugoslavs should be growing more outspokenly critical of Soviet policy, quite apart from the disenchantment with Mr Kadar caused by Mr Nagy's abduction. They have never lacked the courage of their convictions, and in Hungary today their cherished belief in the vital part of workers' councils in socialist development seems in danger of being trampled underfoot. But Mr Kardelj does not appear to realise that his suggestions for putting Hungary straight again on the socialist path are based on a false assumption—that the Hungarian people want to go on living in a one-party Marxist state, with or without the latest improvements.

Army Efficiency

MANY people, reading the report and recommendations of the committee headed by Sir John Wolfenden into the use made of national service manpower in the army, will be tempted to hope that the abolition of national service will dispose of the entire difficulty. This would be shortsighted—first, because even substantial reductions in army commitments would probably still leave the country with the need for some sort of selective obligation to serve; second, because some of the committee's recommendations bear upon the possibility of increasing the attractions of professional soldiering; and third, because the committee offers some suggestions towards improving the efficiency of the army as a whole. Yet, undoubtedly, the main problem revolves round the national serviceman's universal feeling (common in all conscripts everywhere) that his two years of service is "an infliction to be undergone rather than a duty to the nation." What the professional soldier will do cheerfully (sometimes blasphemously cheerfully), the conscript tends to regard as "bull."

The committee urges that during training the national serviceman should as far as possible be given a sense of progressive development of his skills, both as soldier and tradesman, rather than one of meaningless repetition; this

should become easier as the forces are equipped with more complicated modern arms. On the other hand, the committee proposes to reduce soldiers' chores by extending civilianisation—which is already proceeding apace—though, as the Army Council retorts, it may tend to ignore problems of accommodation for civilians. But it makes a strong point with the argument that three civilians could do the work of five national servicemen on supply work and save a lot of money. It is also right that the use of civilians in bases overseas should be explored. This is a common sense, not a sensationalist, report. There is everything to be said for improving army public relations with the national serviceman. The army's quite proper reply is that its main job is to make him into a soldier; and even a modern soldier, in his psychology—indeed in his spiritual condition—is something different from a comfortable, well-trained, uniformed technician. The further from this latter state, however, the more—in general—the pity. Are all apostles of the "soldier-like" yet fully seized of that?

The Melton Mood

Our special correspondent visited Melton Mowbray last week-end, to report on the mood at the by-election caused there by the resignation of Mr Anthony Nutting (Conservative majority last time 10,780) because of his disagreement with the Government's Suez policy. The result of the poll—which was a straight fight between Miss Mervyn Pike (Conservative) and Mr Ted Masters (Labour)—was to be announced just after "The Economist" (printed early this week because of holiday transport arrangements) went to press.

AN ancient in a Melton pub-cle mistaking a stray journalist for the Labour candidate, croaked repeatedly, "We'll beat them this time, Sir." No doubt, as ignorant of electoral law as of electoral personalities, he was hoping for a free drink: in any case, he was one of the only Labour voters to show himself so sanguine, and one of the few in either party to show very much interest in the whole election. In the village halls and schools used by both parties for their meetings the tentative Christmas decorations on the walls showed one good reason for a lack of interest, and the drenching rain outside showed another. Both parties, however, seemed satisfied with the sizes of their meetings in the circumstances; both also agreed that questions from those audiences were few and far between. The candidates worked their way through the common topics, which were roughly as follows:

(1) **Rent Control.** A damp squib in a country area where those who are not owner-occupiers mostly live in farm cottages or council houses.

(2) **Farm Supports.** Miss Pike claimed credit for them; Mr Masters said they were merely a continuation of more successful Labour measures. Neither view drew many questions.

(3) **Education.** Miss Pike declared her attachment to small village schools. Mr Masters, himself a London schoolmaster, wanted improvements and rationalisation on a larger scale. No questions.

(4) **Inevitably, Suez.** Contrary to some reports that have appeared elsewhere, this issue still seemed to your correspondent to put all others in the shade; the impression that the electorate was bored with it arose partly because some professional politicians and commentators are bored with it, and partly because people found it hard to recapture at a political meeting the careless rapture of those endless arguments at home and in the pubs in the last few weeks. But those who asked questions on this topic *did* so more to air their own information or prejudices than to find out the candidates' viewpoints; on other subjects the questions were negligible.

★

More alive than the political issues were the personal ones. Rightly or wrongly, many Conservatives felt that the local party association had behaved shabbily to Mr Nutting over his resignation: he is a popular figure in the district. Many Conservatives also felt that it was wrong that this very conservative constituency should be represented by a woman, and not a local woman at that. Those who saw Miss Pike must have realised that she is the equal of any man at handling a meeting (she is tired of being referred to as a "hockey type" in the papers). Mr Masters also made a good impression at meetings, although he, too, is not a local—there were some mutters of its being a carpet-bag election. But Mr Masters was certainly at a disadvantage in arousing indignation, righteous or otherwise, while Miss Pike was good at this. "Be enthusiastic," she would cry. Her main slogan was that the best Christmas present the electors could give to Sir Anthony was an increased majority.

Her *élan* was such that nobody noticed the past tense when she claimed "Our policies were working": even Mr Masters's quotations from Lord Tedder had no moral impact to compare with that aroused by Miss Pike on the subject of British greatness as manifested in Calder Hall—although she did not make it plain just what this state project had to do with her election platform. This approach was undoubtedly more effective than Mr Masters's careful condemnation of the Suez action: Miss Pike's meetings at times took on the atmosphere of a good Church of England service, with the squire and his lady in the front row, and a solid backing of girls recently graduated from the Pony Club—somehow bearing an uncanny resemblance to Lady Eden.

For what it is worth, the local expectation last weekend of a cut in the Conservative majority seemed to be based on anticipation of Tory abstentions rather than of Labour conversions. Three main points were made about this: (*a*) most of the liberally inclined voters (a Liberal candidate got 5,518 votes at the election in 1950 and 9,510 in 1945) are also property-owning democrats who were not expected to vote Labour, although it was felt that some might not vote at all; (*b*) it was argued that the ranks of the abstainers might be swelled not only by personal supporters of Mr Nutting, but by some "gunboat Tories" who were angry with the Government for not going on with their action (it is perhaps significant that Captain Waterhouse was due to speak for Miss Pike, but did not because of a reputedly diplomatic cold); (*c*) one of the most important questions of all was whether some outlying Conservatives would be reluctant to use their precious petrol in voting for a Government which had just rationed it. This constituency may not be a very significant guide to opinion in the country, because of the lack of impact of the Rents Bill, which could well be the main bone of political contention at the much more marginal North Lewisham by-election next month (Conservative majority there last time 3,236). One left Melton expecting Sir Anthony to get his Christmas present; whether it was as generous as Miss Pike hoped the reader will by this time know.

Letters to the Editor

Cleaning Up Sinai

SIR—You do not do justice in your last issue to the proposal to make the whole Sinai peninsula "world territory" under the United Nations. Of course, those nations which have provided contingents for Unef will not provide them in perpetuity; nor would it be desirable for them to do so. If the UN General Assembly has any grain of sense, it will keep in being the officers directly recruited by General Burns and replace the present troops of Unef with individually recruited personnel, selected on the same basis as members of the United Nations secretariat. Such a constabulary should be stationed permanently, not in New York, where it would be little use, but in the Sinai Peninsula, where it could maintain a strategic territory in a demilitarised state.

Secondly, the Gaza strip, whether Egyptians, Israelis or UN are in control, is not large enough for the permanent settlement of 218,000 Arab refugees who inhabit it; whereas the coastal strip of the Sinai Peninsula and the eastern side of the Suez Canal, if developed, could provide a permanent home for those refugees.—Yours faithfully,

House of Commons HENRY USBORNE

[The purpose of the Note "Cleaning up Sinai" last week was to clarify *The Economist*'s proposal for Sinai, not to criticise Mr Usborne's, which, as he makes clear, is different and politically more ambitious.—EDITOR.]

No Retreat from Oil

SIR—Your article on our fuel prospects certainly indicates, with alarming clarity, the cost in terms of capital resources, dollar expenditure and political uncertainty of our future fuel requirements. The basis of your calculation is that "nothing has changed in the coal situation" and that this is the best we can expect in the future.

The cost is so high that it seems worth while itemising a few of the assumptions which underlie your expectation of a static coal output:

(a) It is assumed that we know the location of the easiest coal to mine. Not a great deal of effort has or is being spent in surveying or drilling, although the inadequacy of our knowledge is well illustrated by the continuing discovery of new opencast sites—the easiest to locate.

(b) The estimates of new coal-face capacity which can be brought into production is based on existing rates of shaft sinking and mine construction, despite the fact that these rates compare most unfavourably with the US, South African, and Scandinavian achievements.

(c) A labour and staff shortage is accepted as inevitable in a full employment society. Presumably it is assumed to be impossible, now or in the future, to get the industry to accept foreign workers, or German or American mine managers and technicians.

(d) Advances in mine mechanisation and the developments of new techniques are apparently expected to add little or nothing to the total output of the industry. This appreciation of their efforts must be rather discouraging to the people involved in developing, for example, the hydraulic transport of coal from the face to the pit head, or the underground gasification of coal.

Considering the stakes involved, it would surely be worth while to review these assumptions.—Yours faithfully,

London, S.W.7 B. H. WORMSLEY

The Bill that Got Away

SIR—I notice in your issue of December 1st you repeat the assertion that "cash bets by post" might be legally accepted ("as they already can in Scotland") under new legislation in England and Wales.

May I point out that this is a misstatement. The confusion is due to the fact that the provisions of the Betting Act of 1853 (making postal ready-money betting illegal) were not implemented in Scotland till 1874. But thereafter the illegality of ready-money postal betting applied to Scotland as well as England and Wales.—Yours faithfully,

J. CLARK GIBSON

The Churches' Committee on Gambling

Press Standards

SIR—The "sensible new code of press relations with hospitals" was neither "negotiated" nor "suggested" by the Press Council, as you say in your Note of December 1st. It was evolved by a joint committee of the medical profession and the press, held under the auspices of the British Medical Association, on which all the major newspaper organisations were represented either directly or through observers. Invaluable as Sir Linton Andrews's personal contribution was to the success of this committee, I am quite sure that he would disclaim any monopoly for his council in the committee's "achievement."—Yours faithfully, JOHN PRINGLE

British Medical Association

Appeal from Keele

SIR—The University College of North Staffordshire has recently launched an appeal for £500,000 for building funds. May we draw the attention of your readers to the College's urgent needs for undergraduate accommodation, facilities for scientific research, and for a library? The College is wholly residential, but nearly 400 of the 600 students are still housed in 15-year-old army huts. The College plans to expand to a total of 800 students in the next five years, so that new hostels are required, not only as replacements for the huts, but to accommodate the increased numbers: hostels for 600 students in all. The scientific laboratories are badly in need of extensions in order that research programmes can be carried forward without competing for space with the teaching of undergraduates. The College has as yet no separate library building and more than half its books are still in store.

We hope that the special features of the college have now become widely enough known and appreciated for the response to this appeal to be generous. Contributions should be sent to the Registrar, University College of North Staffordshire, Keele, Staffs, who will be glad to supply further information.—Yours faithfully,

JOSIAH WEDGWOOD
GEORGE BARNES

University College of North Staffordshire

Petrol Rationing

SIR—The obviously equitable way of dealing with the petrol shortage would be for the supporters of the Prime Minister's policy to forego, in loyalty to their leader, the pleasures of private motoring, and for ration-books to be issued only in exchange for certified copies of letters of protest written to members of Parliament on or before the date of the ceasefire. It could surely be assumed that it would become a point of honour for members, regardless of their party affiliations, to return the originals of all such letters to their authors, and also that there would be no danger of the emergence of a black market in forged documents, since it would become socially precarious for known supporters of the government to be observed in public at the wheel.—Yours faithfully,

London, SW.1 ROLAND OLIVER

Trade with America

SIR—The British Association for American Studies has commissioned us to make a thorough survey of sources, both printed and manuscript, in this country which relate in any way to the history of our political, social and economic relations with the United States. There must be many business firms and trade associations who have records or archives on trade with the United States or on investment there in the nineteenth century. Such archives, however small, can often be of great importance to the economic historian. May we ask any of your readers who are the owners, trustees, or custodians of such archives to be kind enough, as a service to scholarship, to write to us about them?—Yours faithfully,

H. L. BEALES
B. R. CRICK

Institute for Historical Research, Senate House, Malet Street, London, W.C.1

though nothing more substantial than the Queen's compliments rewarded him. But her godson Harington, leaving his well-loved wife and Somerset manor to seek an appointment at court which eluded him till James's reign, had to walk warily; Elizabeth praised his Orlando Furioso (after she had made him improve it) but was incensed by his pseudo-classical satire on the water-closet he invented. Although she relented, and called him a "merry poet," she purloined his design for palace use. Mary Frith is, perhaps, the happiest of the five: she sought no royal favour; indeed, she became by professional skill and reliability a Queen of the London underworld. She wore male attire, enjoyed strong drink and tobacco, lived till 1659, proved her royalism by robbing General Fairfax, and when she died was preparing a rousing welcome for Charles II.

Anglo-Florentines

THE GOLDEN RING.
By Giuliana Artom Treves. Translated by Sylvia Sprigge.
Longmans. 232 pages. 21s.

THE title of this book is a quotation from the tablet erected by the municipality of Florence in 1861 in memory of Elizabeth Barrett Browning, "whose poems forged a golden ring between Italy and England." She and Robert Browning belonged to the [illegible] of "Anglo-Florentines," who lived in Florence around 1848 to 1859 and who wholeheartedly espoused the cause of Italian independence. They watched the Tuscan contribution to the "false dawn" of the Italian *Risorgimento* in 1848-49—the flight of the Grand Duke Leopold II and his return, accompanied by white-uniformed Austrian soldiers, a few months later. Ten years later they cheered from the sidelines Tuscany's final liberation from Austrian control and in their writings pleaded passionately that England should unequivocally support the cause of Italian unity.

The Brownings were only the most distinguished of the group. There was Walter Savage Landor, whose quarrelsome nature was a sore trial to the Florentine authorities; he brought Cavour, Mazzini and Garibaldi, among other Italians of the period, into his Imaginary Dialogues, and he loosed his thunder on behalf of Italian liberty in the English liberal magazine, *Examiner*. There was Thomas Adolphus Trollope, who studied Italian history and whose literary output was considerable (it was 56 volumes), although far less than that of his famous brother. And there were many others, American as well as English, whose names are now largely forgotten.

At this period, Florence was not only a home for many voluntary English exiles; it was also a great centre for English tourists. (Signora Treves records that the Grand-Duke once "let it be known that, in the interests of tourism, his Court receptions were intended to attract quantity rather than quality.") Some of these visitors were famous, others not; most of them were amusing, and some were distinctly eccentric. Not many of them took much interest in Italian politics. A few, like Charles Dickens and George Eliot, came to gather material for their books. Most did the round of the churches and galleries. Very few had any real contact with the living Italian people. Ruskin positively disliked them; to him they were, in the author's words, "unworthy guardians of unappreciated treasures." Nathaniel Hawthorne simply ignored them and was quite taken aback by their friendliness.

Even the *Italianissimi* Anglo-Florentines moved little in Italian circles. But their contribution, through the influencing of English public opinion, to the success of the Italian *Risorgimento* was later recognised in Italy. This book is a further tribute. It is both scholarly and lively, and Signora Treves has been so fortunate in her translator that one hardly ever realises that the book is a translation.

Shorter Notices

THE BUSINESS ENCYCLOPEDIA AND LEGAL ADVISER: *Volumes I-V. Sixth Edition.*
BUSINESS CORRESPONDENCE.
Edited by Thos. H. Lewis.
Caxton Publishing Company. £11 17s. 6d.

This large work will already be widely known; for it was first published in 1903. But the previous edition appeared as long ago as 1932, and the many changes that have taken place since then in the world of business make this, the sixth, edition especially valuable. The contributions are distinctly uneven in quality, but the encyclopædia as a whole contains a vast amount of useful information. It not only defines such phrases as "marine-store dealer," "set-off," "allonge," but also gives the legal position of parties to various transactions. Further, it contains a considerable amount of legal and other advice—for instance, on packaging as an aid to advertising. All the items are arranged alphabetically, with plenty of cross-references, so that any subject can be quickly looked up.

The volume on business correspondence, which gives a collection of specimen letters for business people, will not be so widely used; but it has the virtue of being refreshingly free from "insts.," "ults.," and their like.

★

THE PRESIDENT OF THE UNITED STATES.
By E. B. Fincher.
Abelard-Schuman. 192 pages. 15s.

Here is a simple, popular and trustworthy account of the American Presidency by an American author who adds nothing to Messrs Hyman, Corwin, Laski or Binkley, but who admirably digests them. It should attract many readers in what is, after all, a short life. And while remaining properly dispassionate, Dr Fincher does not make the sad mistake found in many American popular writings of mistaking objectivity for neutrality at the expense of life and relevance. Only once does his simplification collapse into lack of clarity: the early history of the electoral college is indeed irredeemably complicated.

"No one may share his power, no one may share his loneliness"—the book gives a very good picture of the vast possibilities for variation in the meaning, power and conduct of the office according to the character of the man who holds it. Written at an American "Junior College" level, it would be an admirable gift for a sixth former interested in current affairs, to be covertly read by the donor. Perhaps Dr Fincher has restrained himself too much in the amount of the familiar folk-lore of the American Presidency which he gives. Should not every schoolboy know that Garfield was assassinated by a "disappointed office-seeker" and McKinley by an anarchist? But such restraint is at least enviable. The book has a large number of the proper period illustrations.

THE FABER ATLAS.
Edited by D. J. Sinclair.
Faber. 32s. 6d.

Most atlases follow a traditional pattern of maps to which we have been long familiar from childhood. Mr Sinclair has tried to improve upon traditional methods and in so doing has lost continuity. Nevertheless students will find this one extremely useful for geographical or economic studies.

Great Britain has received plenty of coverage, too much perhaps. Apart from physical maps, which also include railways and canals, the atlas gives, among other things, examples of geological structure, industries, power, land use and population. In all thirty-three pages have been devoted to these islands. The section of ten maps of various industrial and agricultural areas on 1:200,000 scale is of doubtful value, since they show little else other than contrasts in relief and size between one area and another. Two new features which might be of interest to the agricultural student are types of village and types of farming.

The continents are illustrated with physical, political, economic and vegetation maps accompanied by smaller scale maps of the continent covering such details as climate, population, religion and peoples. These are additional to the political and physical maps of areas within the continents. Plans of London, Paris, New York, Moscow and Canberra are interspersed throughout the atlas on easily convertible scales (as are all the maps) and they offer a clear picture of the comparative size and layout of these cities.

The atlas, which has been produced in Vienna and printed in England, is a fine example of a combination of good cartography and printing.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Middle of the Crossroads

Washington, D.C.

THE record of President Eisenhower's political leadership during his first term does not suggest that either the pressing moral issue of ensuring civil rights to Negroes or the complex political dilemma which that issue poses for his party is likely to be resolved in a clearcut or decisive fashion during his next four years in office. This prospect is not encouraging for those Negro voters who shifted, often in spectacular numbers, from their normal Democratic allegiance to support Mr Eisenhower in the November election, or for those students of political science who dream fondly of a national two-party system, neatly and coherently organised.

The recent election made plain the terms of the Republican dilemma. Although Mr Eisenhower won a great victory, his party for the twelfth time in the last fourteen biennial congressional elections failed to gain control of either House of Congress. Having been unsuccessful in all their efforts for the last twenty-six years, except in 1946 and 1952, the Republicans are in danger of sinking, at the congressional level, into a chronic minority. How is the party to cure this persistent weakness in the future when it has not been able to overcome it in the recent past, even with the help of its hero candidate, Mr Eisenhower?

Since the party is already entrenched in the farm belt of the Midwest and is sufficiently strong in the new suburbs and in the Rocky Mountain and Pacific Coast states for those areas to offer only marginal prospects for improvement, it must make converts in the present Democratic strongholds: the large northern cities and the solid South. Mr Eisenhower made deep inroads in both, but Republican candidates for lesser offices, with scattered exceptions, did not. But, in the northern cities and even more in the South, the Negro voters demonstrated in the presidential contest that they can be detached from the Democratic party.

Logically, the Republicans have two alternatives. They can emphasise their support for civil rights and thereby consolidate their new strength among Negro voters in the North and also, if the voting rights of Negroes in the rural South can be protected more adequately by federal law than at present, extend their gains in the South. Or they can write off the President's popularity among Negroes as ephemeral and concentrate on building for the first time a real Republican organisation among the conservative white voters in the South who are restless in the Democratic party. Politicians resist the claims of such logic, however, for their natural wish is to have their cake and eat it.

Although the Republican party, for more than half a century, has been of divided mind on whether to rely in the South on Negro Republicans or on what was formerly known as "the lily white" faction, this question has only become acute in the last dozen years as the Democrats have proved themselves to be the new majority party in the country. Mr Eisenhower might have formulated the question precisely and resolved it consciously; instead, however, his contribution has rather been to blur the issue and to postpone a decision. The political part natural to him is that of the moderate, the conciliator, the man above partisan strife and factional pressure. He has been rewarded with enormous political dividends, for in the last election he drew the support, for quite different reasons, of many conservative white southern voters and of Negroes as well.

★

BUSINESS EXPENDITURE

Mr Eisenhower rejected the advice, given by former Governor Byrnes of South Carolina after the 1952 election, that the "Eisenhower Democrats" should be drawn into a revitalised Republican party organisation in the South. The President's political advisers were undoubtedly wary of taking into the Republican organisation the very conservatives whose dissidence has long plagued the Democrats. Instead, they adopted a passive policy, and the result was evident on election day this year. Mr Eisenhower again carried Texas, Florida and Virginia by handsome majorities, but his party took only one out of 22 house seats in Texas, one out of 8 in Florida, and two out of 10 in Virginia. Had the Republicans won half of the seats in these three states, they would now control the House of Representatives.

If the President has not moved actively to broaden the party's base in the South, neither has he adopted an aggressive position on behalf of civil rights which might permanently consolidate for the Republicans his own personal popularity in the Negro community. During his first term, Mr Eisenhower sustained the general principle of equal democratic rights in his pronouncements at press conferences and advanced it in practice wherever, as in the District of Columbia and the military establishments, the federal government had direct responsibilities. Beyond this he did not go, even in the controversy over racial integration in the schools, and not until the spring of this year, his fourth year in office, did his Administration submit a programme of civil rights legislation to Congress. On the basis of this record, last November's swing of the Negro vote to him seems to be not an expression of thanks for tangible favours conferred but rather a protest against Senator Eastland of Mississippi, Senator-elect Talmadge of Georgia, and other extreme racists whose Democratic

allegiance burdened Mr Stevenson. "A vote for Stevenson is a vote for Eastland" was a persuasive Republican battle cry in Negro neighbourhoods.

The present Republican strategy is to mark time, if developments in the South allow it, in the belief that over the next decade gradual integration in the South will ameliorate racial bitterness and accelerate the speed at which the once solid South is becoming politically fluid. Thus the party can hope to gain support among younger white voters in the South without bringing reactionary Democratic irreconcilables into its own house or estranging Negro voters.

This cautious policy, so much in harmony with the President's own inclinations, may prove wiser than either of the present seemingly logical alternatives, for the situation in the South is probably too complex and too knotted with emotion to yield to any calculated political direction. The same policy, however, does not afford much hope of revising the Senate's "filibuster" rule, which makes the passage of civil rights legislation virtually impossible. Only almost unanimous Republican support could bring about revision and this unanimity is not likely unless the President intervenes actively. In the circumstances, the Republicans may content themselves with compiling a relatively better record than the Democrats in Congress on test votes and exploiting the divisions within the opposition. These partisan tactics have served well in the past but they are not likely to hasten either a reformation of the party or the passage of civil rights legislation.

Wooing the Uncommitted

MR NEHRU has gone to Washington, to build a bridge with Mr Eisenhower between East and West, at a time when both he and the President are in a more constructive mood than they would have been last summer when the meeting was originally supposed to have taken place. For recent events in Hungary and Egypt have made Mr Nehru less attached to the Soviet Union and Mr Eisenhower more ardent in his wooing of the uncommitted countries in Africa and Asia—and elsewhere, too, it would seem, from his readiness to be visited by Marshal Tito.

Whether or not the timing was intentional, nothing could have been better designed to put the mind of the peace-loving Mr Nehru in a suitably sympathetic frame for meeting that of Mr Eisenhower than last week's calculated and detailed "leak" to the press of the new American proposals on disarmament. According to the stories published simultaneously by a group of the best-informed Washington correspondents, these have been under consideration by the National Security Council for some time and are to be presented at the resumed talks on disarmament at the United Nations. It may be, however, that the proposals, as they have now appeared in the press, are merely those which Mr Stassen, the President's adviser on disarmament, who is said to have been responsible for the leak, would like to present to the United Nations, not those with which he will in fact be charged. Meanwhile the scheme seems to be at least a background paper for the President's reply to Marshal Bulganin's letter of November 17th; coupled with the tensions in the satellite countries, this letter is new thought in Washington to offer some promise of breaking the deadlock which has been strangling any hope of a mutual reduction in armaments.

According to the story, the President, prepared to take a risk for the sake of progress towards peace, has insisted on this new, flexible, approach to disarmament against the advice of his military experts. The most novel proposal is for a limitation on long-range missiles and other new weapons, but this would depend on a full system of inspection being set up. The United States would now, however, be willing to reduce its military manpower, in step with other countries, while the inspection system was still only in the process of being established. Moreover, the United States would no longer insist on aerial inspection alone, but would accept ground inspection. A further suggestion, that priority be given as Marshal Bulganin has proposed to exploring the possibility of a considerable withdrawal of American and Russian forces from the areas covered by the North Atlantic and Warsaw Pacts, was firmly, although perhaps only temporarily, squashed by Mr Dulles on his return from Paris. In his view no reduction in Nato's strength is justified as long as the potential Soviet power in Europe is as large as it is today.

Out of the Frying Pan

PRESIDENT EISENHOWER'S rejection of higher duties on fish puts him back on the liberal trade policy lines to which he naturally gravitates unless domestic pressures are too strong, as they were just before the election in the case of woollens. The higher tariff on fish fillets unanimously recommended by the Tariff Commission would, in his view, have done less for New England's fishermen than the measures for greater efficiency already approved by Congress, while it would have done demonstrable harm to Canada, Iceland and Norway, three allied nations whose economic strength, the President said, "is of strategic importance to us in the continuing struggle against Communism."

Conceivably foreknowledge of the President's decision was a factor in Iceland's agreement to allow the United States to continue to use the base at Keflavik. In any case, it would have been costly shortsightedness, in view of Iceland's economic straits, to make it even harder for the islanders to earn a living and even more necessary for the United States to come to their aid. America has been taking over a quarter of Iceland's fish fillets, its main export. Soviet Russia takes most of the rest, an economic tie which neither Iceland nor the US State Department wish to see tightened.

Before he eats his Christmas turkey, Mr Eisenhower must make up his mind on another tariff issue—the doubled duties on velveteen recommended by the Tariff Commission which are a symptom of the insistent demand for protection against textile imports from Japan and other low-wage countries. Japan's willingness to limit its cotton exports voluntarily is conditioned, however, on the Administration doing what it can to avert other restrictions. The risk the government must weigh is that too liberal a trade policy may stiffen congressional resistance to the President's determination to press once more for American membership of the Organisation for Trade Co-operation.

Boom or Growth?

FROM A CORRESPONDENT IN NEW YORK

THOSE who fear a downturn in the American economy claim persistently that the present boom in capital goods must inevitably be followed by a collapse in this type of spending. Business expenditures for new plants and equipment have now been rising since early in 1955; this year they are exceeding the 1955 total by 22 per cent, and the latest survey by the McGraw-Hill Department of Economics indicates that there will be another increase of 11 per cent in 1957. Moreover, the plans reported in the survey—conducted in November and early December—did not include many last-minute additions that will be made later, nor, apparently, did they allow for the coming impact of the Suez crisis on oil and other industries. There may, therefore, actually be an increase of as much as 15 per cent in 1957, which would make this by far the largest, as well as the longest, boom in capital goods on record.

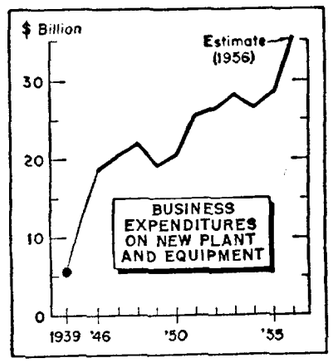
In fact this may not be a boom in the usual sense, but a continuing upsurge that does not have the usual cyclical perils. The most interesting result of the McGraw-Hill survey is not the predicted increase of 11 per cent or more in 1957 spending; this had already been foreshadowed in the surveys of the Department of Commerce, and in the financial reports of most producers of capital goods. What is new in the McGraw-Hill survey is that it shows continuing strength through 1958. About two-thirds of the companies surveyed plan to maintain or increase their spending again in that year. Only 30 per cent plan to spend less than in 1957—even though the capital goods boom should by all conventional signs reach its peak then. Throughout the postwar period, capital expenditures have shown a definite cycle—less violent than in the preceding decades, but nevertheless quite discernible. It has been a pattern of three good years and one lean year; following the boom of 1955 to 1957, many forecasters have assumed that 1958 might be the usual off year. In fact, certain leading indicators, such as orders for durable goods, rising interest rates and the trend of new capital issues, have suggested that there would be some downturn before the end of 1957, although, on the other hand, backlogs of work on order have shown no decline. Practically no one had expected that the capital boom would continue for another two years, but that is what now seems to be the prospect.

★

To be sure, the rate of increase is slowing down. In the key area of manufacturing, the rise next year will be only 14 per cent, compared with 34 per cent this year. Moreover, some of the increase in 1957 will undoubtedly represent a deferment of work that could not be completed in 1956 because of shortages of steel and other materials. But the dollar figures for 1957 are still most impressive: $14.4 billion worth of new plant and equipment is to be installed by manufacturing industries, and outlays of $40.2 billion are planned by all private business. McGraw-Hill asked companies how much higher they expected prices for capital goods to go in 1957, and the answers averaged 6 per cent for business as a whole. This still leaves a gain of 5 per cent in planned physical volume.

What is the explanation of this steady increase, with no sign of a downturn, in a type of expenditure which in theory is held to be inevitably unstable because a few years of heavy capital spending are supposed to increase plant and equipment to a point at which demand must become less? One answer is the terrific pace of research in manufacturing industry; over $6 billion is to be spent on this in 1957. It is surely significant that among the largest increases planned in spending for 1957 are those of the chemical, aircraft and electrical machinery industries, which lead all others in spending on research. On looking at the statistics, the petroleum industry would seem to have little need for more refining capacity; it produced a surplus in 1956. But expenditures on new plant are being increased by 50 per cent next year, to instal new processes that will result in higher quality fuels for cars and aircraft, and to make scores of new chemicals which, research has shown, can be derived from oil. Capital spending will evidently be down next year in some of the industries that are little touched by research—textiles, clothing, lumber, furniture and retail trades—but these account for only a small part of total investment.

Another answer, at least in the present situation, is that manufacturing industry has been outrunning its resources of fuel, power, transportation and raw materials. Typically, these take longer to develop than new manufacturing capacity, and the companies in such basic industries are just beginning to catch up—or to try to catch up—with the tremendous expansion of the past two years in manufacturing. The electric power industry plans a 25 per cent increase in its capital expenditures for 1957, and there are to be large increases also in the mining, petroleum, railroad and other transportation fields. It seems entirely possible that in all these supporting industries investment may continue to rise for years to come. The United States is only one country in a world which is scrambling for raw materials, and its domestic supplies depend increasingly on tapping difficult areas—such as the offshore oil deposits—or developing substitutes that require heavy capital investment, as do the plants to extract oil from shale or to convert low-grade iron ores into usable metal. All this requires more transportation for materials, and finished goods, too, are moved around more and more as the population spreads out.



Source: US Department of Commerce and Securities and Exchange Commission.

Finally, there is confidence in the future, in the growth of population that statisticians are charting for the nineteen-sixties and the growth of incomes that spokesmen of both political parties claim as a national goal. Companies do not want to be caught short by this future. They have had some experience in recent years of trying to expand capacity in a hurry, and most feel that they have lost sales while cursing the building contractor. If the economy is to grow as it is expected to do, it seems worth while to build new capacity in advance. This sort of gradual expansion may be what is changing the pattern of capital investment from one of ups and downs to a steady rise.

Steel's Banns

AFTER two years of hesitation the Bethlehem Steel Corporation and the Youngstown Sheet and Tube Company have taken the plunge towards a merger and landed, as the Department of Justice promised they would, in the courts. Bethlehem is the second largest company in the steel industry, Youngstown the sixth. Together their assets total $2.6 billion, compared with $3.6 billion for the giant US Steel Corporation. If the courts allow it, the merger will be one of the largest in American industrial history. The anti-trust suit to prevent it is, in terms of the assets involved, the biggest ever undertaken. Bethlehem, which plans to exchange its shares for the assets of the smaller company, would have a capacity of nearly 26 million tons of steel; with US Steel's 39 million tons, the two companies would control about half the country's output.

The Department of Justice contends, however, that such a merger violates section 7 of the Clayton Anti-trust Act, as amended in 1950 to bring it abreast of the newest corporate tactics in the march towards bigness. This forbids the purchase of assets, as well as shares, when the effect would be to lessen competition or to tend to create a monopoly. The government asserts that already four companies produce 60 per cent or more of most steel products. Bethlehem and Youngstown's case is that they are competitors to only a small extent. The Youngstown plants are in Ohio and Illinois, while those of Bethlehem are on the east and west coasts. A merger, they argue, may well intensify rather than reduce competition and enable Bethlehem to meet US Steel on more even terms.

The companies are anxious for a speedy decision—that is in something over a year rather than the five years many anti-trust suits last—and they may get it. The government is eager for a judicial test of the Clayton Act amendments and both sides have had enough warning to be well prepared. Under an expediting law an appeal would go straight to the Supreme Court whose ruling may be a landmark in the shifting and never-ending battle over bigness in industry.

Atomic Olive Branch

MR LEWIS STRAUSS, chairman of the Atomic Energy Commission, is holding out a sheaf of olive branches to the new Democratic Congress in the hope, presumably, that it will look more favourably than did its predecessor on him personally and on the government's programme for the industrial development of nuclear energy. Without this peace offering, criticism of Mr Strauss would have been stepped up rather than down, as a result of recent evidence that Britain is far ahead of the United States in producing electric power from atomic plants. But now he has practically admitted that his critics were right when they charged that America's atomic development was being held up by his insistence on leaving it to private enterprise and by the government's over-strict security regulations.

Mr Strauss has announced a personal plan, which the other commissioners are expected to approve; it is a relation of the "crash programme" for government construction of atomic power plants which the Democrats tried to force on him during the last Congress. The primary purpose is to get another five reactors, of various new types, into operation during 1962; eighteen plants should be working by then under existing plans. The additions would be built by the government if private industry failed to undertake them promptly but, in order to help private companies to do the job, Mr Strauss wants the AEC to assume a greater share of the research and development costs, to reduce its charges for nuclear fuel and to ease its licensing regulations. In return for all this, Mr Strauss hopes that Congress will at last allow the government to supplement private insurance against damage claims if there is a serious accident in a nuclear plant.

The next day, as a result of revised classifications agreed with Britain and Canada, the AEC announced that it was in the process of releasing a large amount of hitherto secret information. This includes details of the first full-scale civilian atomic plant in America, of various experimental reactors and of the manufacture of heavy water, all of which should speed the development of nuclear power for civilian purposes. The immediate effect of the relaxation was the release for the first time of figures on America's production of uranium since July, 1955; earlier figures have not been given. Output of both raw ore and of uranium concentrate has been going up steadily since then, with 3 million tons of the first and 6,000 tons of the second being produced this year. The commission also reported that there are 12 uranium mills in operation in the United States and that known reserves of uranium are about 60 million tons, two-thirds of it in New Mexico.

Election Day

LAST Monday, it is presumed, Mr Eisenhower and Mr Nixon were re-elected as President and Vice President of the United States for a second term. For the first Monday after the second Wednesday in December is the day on which the 531 members of the electoral college, for whom the voters actually cast their ballots on November 6th, meet in their various state capitals to choose the President and Vice President. It is almost unheard of nowadays for the electors to exercise their right of free choice—although in 1948 one Democrat from Tennessee did desert Mr Truman, the candidate who had won the state's popular vote. It is therefore nearly certain that 457 electoral votes were given to the Republican candidates on Monday and 74 to Mr Stevenson and Senator Kefauver. But it will not be absolutely certain until January 7th, when the sealed lists are opened before a joint session of Congress by Mr Nixon in his capacity as President of the Senate.

Even the final, or almost final, figures for the popular vote on November 6th are only just available. Rhode Island has not quite finished counting its absentee ballots (as a result, the governorship is still in doubt) and therefore the figures are not yet official. But they are put at 35,575,420 votes for Mr Eisenhower to 26,033,066 for Mr Stevenson. President Eisenhower, with the largest majority ever obtained by a Republican candidate—Mr Roosevelt's was

Better Lighting—Better Production

What is the lighting in your factory like? Have you recently checked the lighting level round the works with a light meter?

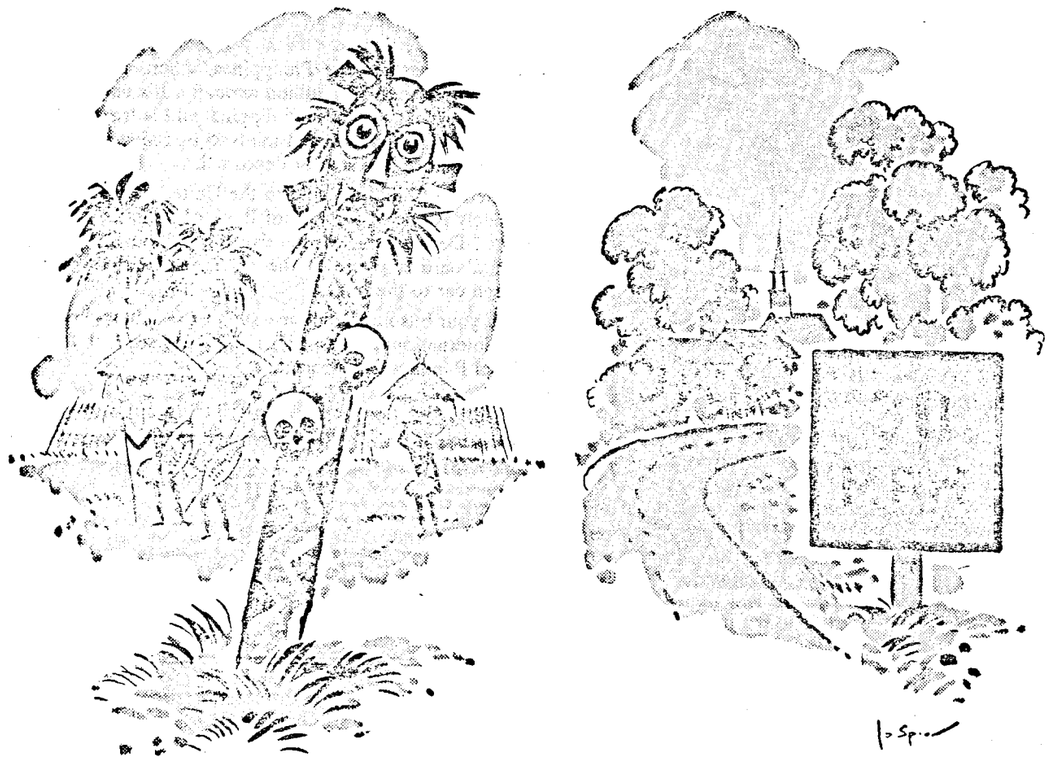
The *right* lighting has a significant effect on the speed and accuracy of production. When its strength, position and type is suitable for each job the craftsman can give full play to his skill, and the works engineer can do full justice to his shop.

Good lighting is only one of the many ways in which electricity is playing a vital part in the drive for higher productivity.

Electricity for Productivity

Ask your ELECTRICITY BOARD for advice and information, or get in touch with E.D.A. They can lend you, without charge, films about the uses of electricity in industry. E.D.A. are also publishing a series of books on Electricity and Productivity. Titles now available are: Electric Motors and Controls, Higher Production, Lighting in Industry, Materials Handling, and Resistance Heating. Price 8 6, or 9/- post free.

Issued by the British Electrical Development Association, 2 Savoy Hill, London, W.C.2



PROTECTION

11 million in 1936—had 1.6 million more votes than in 1952, while Mr Stevenson had 1.3 million less. He also had about 3 million less than the total given to Democratic candidates for the House of Representatives this year, according to the calculations of *US News and World Report*. Mr Eisenhower, on the other hand, was given about 8 million more votes than were Republican candidates for the House. In the presidential election 417,090 votes were cast for candidates other than those of the two major parties; three-quarters of these votes went to the various branches of the states' rights party. The total popular vote came to 62,025,576, breaking 1952's record by 500,000. But only 60 per cent of the people of voting age went to the polls, compared with 63 per cent in 1952.

Not So Merry Christmas?

MANY shopkeepers entered the last week before Christmas seriously worried that their stockings were not going to be stuffed nearly as full by the customers as had been expected. If these fears are justified, January will bring even more sensational price reductions than usual, in order to clear overloaded shelves for the new spring stock. They were piled high with goods—a growing proportion of them from abroad—in the autumn in the belief that Christmas trade this year would break the 1955 record by about 10 per cent. But already in November there was disquiet because the shoppers were not coming in to buy as fast as they should. In the last few weeks, with sales running several points below the comparable period of 1955, the figures have definitely been disturbing for merchants who often do as much as a quarter of their annual business at Christmas time.

There is plenty of money to spend, although for some people instalment payments on new cars and other things bought on credit may leave little ready cash. Personal incomes have been rising for months and in October reached the record annual rate of $332.6 billion, $3.1 billion above the previous month. Ordinary retail trade has been running ahead of last year and, when they spend, consumers seem to be spending lavishly; according to most reports, they are "up-trading," buying better quality goods and luxury articles. But the Suez crisis, perhaps because it shook optimism about the future, seems to have kept people out of shops instead of rushing them into panic buying, and the mild weather has discouraged interest alike in fur coats for mothers and skates for children. The main hope of the shopkeepers now is that customers have also been discouraged by the plentiful supply of attractive gifts from buying as early as they used to do and that they will be crowding in to push up the records this week — and particularly next Monday, an extra shopping day when many offices will be closed.

Another change in the pattern of retail trade may also have something to do with the depressing statistics. The most recent and easily available of the figures—the only ones for December—cover only department stores and it is questionable whether these figures are as good a guide to the general trend of trade as they once were. For more and more buying is now done in suburban shopping centres, spread among a number of neighbouring shops rather than one large store, in the supermarkets which often carry substantial quantities of Christmas goods—toys and presents as well as food—and in the cut-price discount houses. Some of these traders are quite happy about their Christmas business and, when the figures are finally added up, the total gains may be much nearer the forecasts than are the results of some individual stores.

Disney's Kingdom

FROM A CORRESPONDENT IN CALIFORNIA

THE Christmas holidays will provide precisely the right excuse for thousands of parents who themselves want to visit Disneyland, one of California's most flourishing tourist attractions. For, whatever the intentions of its creators, Walt Disney's magic kingdom clearly fulfils the fantasy wishes of grownups. Of nearly six million visitors since Disneyland opened in April, 1955, three-quarters have been adults. The battlements, towers and lights of Disneyland—far more golden to their owner than the orange groves they displaced—lie a few miles outside Los Angeles. And the fame of this private enterprise has penetrated even the iron curtain. It was the one place that a group of Russians, on their way home from the Olympic games, wanted to visit during a fifteen-hour stopover in Los Angeles, outranking in attractiveness even a trip through the Hollywood studios.

As many as 29,678 visitors have paid their admissions in a single day. Some come by air, for airline tickets to Disneyland can be bought anywhere in the world; it has its own heliport and helicopter service from Los Angeles. But most come, not by air, train, or bus, but by private car. The parking lot, at 100 acres, is nearly twice the size of the 60-acre amusement park and can accommodate 12,500 automobiles. At the nearby Disneyland Hotel, guests have space reserved for another thousand cars, each one, according to a hotel brochure, "treated like a guest, too, every service right at hand."

Combining the atmosphere of a world's fair, a commercial exhibition, and the Festival Gardens, Disneyland offers five extremely ingeniously created areas of illusion: Main Street, USA; Tomorrowland; Fantasyland; Frontierland; and Adventureland. Fantasy is blended with good business and the whole is dedicated, in Walt Disney's own words, "to the ideals, the dreams and the hard facts that have created America."

Once inside the great wall, the visitor finds himself on Main Street, USA, which recreates "the carefree era of the 1890s on a typical small town Main Street—cornestone of the American Way of Life." Here those seeking "fond memories of the past" may climb aboard an old-fashioned fire engine, ride in a surrey, see old, silent movies, or wander, free of charge, into an antiquated pharmacy, sponsored by a drug company.

In Tomorrowland, there is the "Rocket to the Moon," a ten-minute trip sponsored by an airline. For fifty cents space adventurers are seated in circular tiers looking down at a large screen, showing a changing view of the earth as the "rocket" leaves. Another screen shows the moon as the "ship" approaches it. Hidden film projectors, blasts from the "rockets", and tiny air hammers under

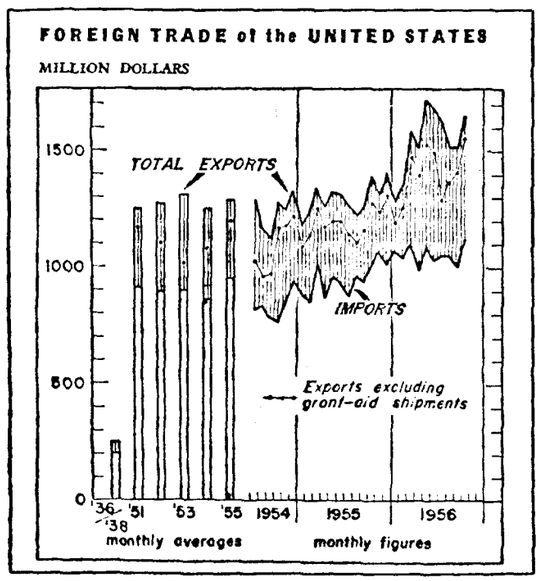
the seats combine to create the illusion of interplanetary flight, under very comfortable conditions, except perhaps for the occasional small child who bursts into tears at the loud noise of the " blast-off." Not quite so educational are Tomorrowland's " astrojets " which give everyone the thrill of piloting his own jet plane, with the safety of attachment to a central turning tower. It is in Tomorrowland that most of the commercial exhibits are situated. Here a dairy association extolls the virtues of drinking lots of milk. Hard by are displays of automobiles, oil products, aluminium, paint and chemical supplies.

From the world of the future, the eager visitor may be carried, by Swiss funicular, high over the park to Fantasyland, where a miniature canal boat winds its way through " Storybook Land," a creation, in miniature, of many fairytale settings. On the " Peter Pan Ride " he is whisked into the air, in a sailboat, into the story of Wendy and Peter. Little trains, sedate flying elephants and small cars, together with a Mickey Mouse movie theatre and a variety of other amusements complete all the fun of the fair in Disneydress. And for the hungry, there is the " Pirate Ship " restaurant, sponsored by a tuna fish company.

In Frontierland, rides in covered wagons, stagecoaches, Indian war canoes, mining trains and river steamers are offered to those seeking to " meet the challenge of wilderness and desert." Amiable guides deliver good-natured and jesting commentaries on the wonders of the miniature deserts, mines, caves and islands crossed by the visitors.

One of the most popular attractions in the park, the " Jungle River Boat Ride," draws thousands to Adventureland. Here, in a small river boat, manned by a helmsman-guide, dressed in a bush jacket, the tourist-explorers are taken through African and South American jungles. Authentic vegetation lines the river banks, a waterfall sprays the boat and, in the water, models of hippopotami charge the passengers, only to be driven off by blank bullets fired from the stage gun of the guide. In the jungle itself, realistic models of lions roar, elephants trumpet, giraffes nibble and natives poise blow guns, close to the ruins of a Cambodian temple. It is in this technical area of creating illusion that Disney's genius shows most clearly. The noises of the jungle are there along the river ; the smell of the mine is in the train tunnel.

Disneyland also demonstrates another gift of its creator—that of coining money. Soft drink and food concessions pay handsomely ; so do the commercial exhibits. With the economy of the true artist, Mr Disney has turned even the sets of his old films into assets ; they can be seen for ten cents. Disney painting books, caps, and souvenirs are all on sale. Nor is a day in Disneyland cheap. For an adult to go on all the rides would cost more than $10. In fact the average visitor spends only $2.29, but even this helps to explain why there are three adults to every child on Mr Disney's magic carpet.



Coming Out in the Wash

THE way in which the household appliance industry is being put through the wringer has been hung out on the line for all to see by the announcement that the Avco Manufacturing Corporation has stopped making its Bendix laundry equipment and its Crosley products, mainly refrigerators and radios. The company had been losing money on both and now prefers to concentrate on its profitable operations in other fields, particularly on work for the government. But the further announcement that the Bendix name and facilities have been acquired by the Philco Corporation, another big maker of electrical appliances, shows how the industry's difficulties may eventually be ironed out—provided the anti-trust division of the Department of Justice and the congressional friends of small businessmen do not crumple things up again.

During the past year the industry has been going through a period of cut-throat competition, caused by too much output rather than by too few sales, which has curtailed the profits of manufacturers and dealers alike. The outcome is expected to be the concentration of production in a few large companies, as has happened in the automobile industry ; Avco's withdrawal from the appliance field and Philco's expansion are only the latest example of something which has been going on for some time. These large companies are likely all to make a full line of electrical household appliances ; this practice enables a firm to advertise all its products under one brand name and to cancel seasonal declines in demand for one article by making more of another.

For this reason Philco began to manufacture laundry equipment some time ago and found itself in a field where the demand is far from saturated, as it very nearly is for such things as refrigerators and electric cookers. Output of these has fallen substantially this year, while far more washing machines and clothes driers are being produced—and bought—than in 1955. In taking over Bendix, moreover, Philco obtained more than much-needed, additional manufacturing facilities and a famous name which to many women is synonymous with " washing machine." It also gained extra distributors and dealers for its products. Many of these are reluctant to carry more than two or three makes of any particular appliance and some manufacturers are therefore short of retail outlets.

The World Overseas

Nato's Watershed

FROM OUR PARIS CORRESPONDENT

BEFORE the Nato Council met last week, Lord Ismay told a press conference that " this would be the most important Council meeting since Lisbon." On the whole, the grand diplomatic week in Paris seems to have justified him, and the ministers have gone home fairly well satisfied and certainly happier than they came. The urgent need was to restore the feeling of belonging to the same clan and not, as recently, to a collection of feuding families ; the opportunity was to make the best of the reconciliation and put the alliance on a firmer footing. Progress on both scores has made this the most successful Nato meeting for a long time.

The amount of restored cordiality between Mr Dulles and Messrs Selwyn Lloyd and Pineau should not be exaggerated. But the American agreement to press Mr Hammarskjöld to get Colonel Nasser to accept the use of British and French salvage ships in clearing the canal has improved the outlook whatever the mental reservations on both sides about further policy. In fact, Mr Dulles, summing up the achievements of the council meeting gave first mention to the contacts outside the conference room. The lunch between the British and German ministers was another success of the same order, and has improved the chances of agreement on the German financial contribution to the upkeep of British forces in Germany. In the council meetings, the tone of discussion seems to have been franker than usual—and except over Cyprus, when the Greek foreign minister compared Archbishop Makarios's confinement to Cardinal Mindszenty's, " frank " does not seem to have been a euphemism for " angry." The very dangers of disunity led this time to effective discussion on the Middle East and Eastern Europe even before the council, on the last day, accepted the " three wise men's " proposals for increased political consultation.

It depends on one's temperament whether one sees this reform as possibly historic, or probably a facade. The principle of political consultation is not new in Nato ; the careful observance of it would be. At least, as one observer put it, " the Nato treaty would not originally have been signed if these provisions had been included." The reform not only extracts from the governments a promise to inform each other about " any development which significantly affects the alliance," it also strengthens the obstacles to breaking it. The Secretary-General, who becomes chairman even of the ministerial council meetings, has " the right " to raise " any subject which is of common Nato interest " (i.e., " consultation "), and " the right and duty " to bring up problems which " may threaten the solidarity and effectiveness of the alliance " (i.e., " conciliation "). He cannot impose conciliation ; but if his good offices are accepted, he can choose any three national heads of delegations to form a conciliation tribunal. Finally, there would, as the Germans suggested, be an " annual review " of political consultation as there already is of military performance, to make it embarrassing for a country to default.

This is no rape of national sovereignties. But, henceforth, a country's failure to consult becomes a sin of commission, and not just of omission as in the past ; and the Secretary-General and the other governments are there as watchdogs to raise unpleasant questions. After Suez, the small countries especially will be so sensitive about the principle of consultation that this will be an incentive to consult.

What of the countries that have most interests outside the Nato area ? Mr Dulles's reservation of America's right in urgent cases to act without asking Nato, and his reminder of his country's treaty responsibilities to thirty other nations, are said to have brought smiles to the faces of Mr Selwyn Lloyd and M. Pineau, and have been interpreted in the French press as undermining the reform. But most of those who heard him took him to mean that America would consult to the maximum, except in the understandable cases where its published treaty arrangements (for example, the defence of Formosa) commit it to the same kind of automatic or priority actions as exist, to Europe's advantage, within Nato. Even Mr Selwyn Lloyd's " cautious welcome," which appeared to equate consultation with the duty of the members of the alliance to back up the governments that consult them—and was doubtless influenced by the difficult dialectic of the Anglo-French diplomatic position after Suez—seems to have been chiefly a plea for the necessary alignment of policies, which must obviously be the normal aim of consultation.

The opinion of M. Spaak, whose view as the future secretary-general is particularly relevant, seems to be that there is almost more danger of an abuse by too much consultation than by too little, and that the new system must not be depreciated by needless use. Yet if it is to work, civil servants must get into the habit of considering other member countries when preparing plans—always a troublesome business. A delicate balance will have to be found. A critical time for the new system will no doubt come when consultation has become common enough to be a nuisance but not to be normal procedure.

The other important achievement of the council has been

the flowering of three years' thought on atomic warfare into the "Political Directive to the Military" which the ministers have now approved. For the first time, in this document, two of the basic facts of atomic warfare—that it is fantastically costly to prepare and catastrophically short in the act—are fully worked into Nato defence planning. The reliance on the ultimate deterrent of thermo-nuclear war, the "forward strategy" and the stress on the need to make limited enemy attacks impossible by being strong enough to nip them in the bud or turn them into general actions, all remain. But the remnants of last war conditions that still affected thinking a few years ago are dropped. Large manpower reserves mobilisable only some time after the battle has begun; great supply depots; and the large World War Two divisions they served—all these are gradually becoming obsolete. The new concept increases the importance of the radar warning system and reduces the role of the navy, which, with its carriers, retains functions in attack but little in the long defence of sea lanes traditional in British history. One can imagine that if this new directive were carried to its ultimate limit on land, it would point to professional armies (composed as the latest American and German theory tends to favour, of self-supporting combat groups supplied by air) with huge fire-power and great mobility but relatively few men. The maximum force would go into the front line army: this is no doubt why Shape remains so anxious to have the German contingent and, even though it is now prepared to have fewer men, wants as many—though smaller—divisions as before.

More Expensive Weapons

That is the prospect. The immediate reality is more modest. For, if the directive is addressed to the military who must prepare the detailed plans, the power to make it work lies with the governments. How they react to it in the next year will be more important than the directive itself. As no one at Nato ever tires of repeating, the situation is "evolutionary." It will take several years to work gradually towards an army effectively embodying the new concepts. This is partly because there are many special problems. There are those of countries like Britain and France, which have other places than Europe to worry about (though the French have promised to return two crack divisions to the central front next year); and there are those of countries like Turkey, where the conscript army is not only a social tradition, but the main instrument of primary education. But above all the problems will be of cost and of production.

Though it is true that the savings in reserve manpower and in scrapped weapons and supplies will be significant, they will be more than compensated by the ever-rising cost of new weapons. It is probably a snare and delusion to hope, as the British Government has seemed to do in thrifty moments, for both more efficient and cheaper defence. And no one sees defence spending rising in Europe in the near future. This situation is likely to create important new pressures, first of all in production. For the Americans, the alternative to greatly increasing aid (their decision to supply to allied units "dual purpose" rocket launchers and guns, without the atomic warheads, was announced in the Council) seems to be to help finance the production of these weapons in Europe itself. But these weapons could hardly be produced indiscriminately everywhere. So that Mr Wilson, the United States Defence Secretary, saw a "co-ordinated and integrated" arms production programme in Western Europe as the only long-term solution. Second, and partly following from this, there will be financial pressures. As the cost of arms rises, and it becomes more and more prohibitive for smaller countries to pay for up-to-date Nato equipment, the stronger appear the advantages of introducing for the new weapons the system of multilateral financing already used for the "infrastructure" of roads and bases, and by which each country pays a share of the common cost.

This Nato council meeting thus shows every sign of being a watershed in the development of the alliance. Perhaps the best guarantee of its future is the general feeling that it must grow and is not to be sapped by the pressures of divergent national interests. "Can a loose association of sovereign states hold together at all without the common binding force of fear?" asked the "three wise men" in their report, without staying for an answer. Beneath the reconciliation of recent days, there has been a certain unease, due partly to the fresh wounds of Suez, but partly also to the new sense of the disproportion between the power of the United States and that of all its allies, including Britain. What would happen should American interest one day diverge from that of the rest of Nato? It may have been a sense of this, as well as unwillingness to be sold on Signor Martino's plan for an elected Western European Union Assembly, which prompted Mr Selwyn Lloyd to formulate his rather woolly "grand design" of a "strong European community" functioning within the Atlantic community, and to envisage "one Atlantic Assembly." A "strong European community" does seem necessary in the long run to balance the alliance and therefore to increase its cohesion. It is perhaps more than coincidence that the *main issue of foreign policy in France in the next two* months is expected to be European integration.

No Cheer for Togliatti

BY A CORRESPONDENT

THIS is a bleak mid-winter for Signor Togliatti. A blood red cloud obscures the Moscow star; there are no good tidings and little goodwill for him this Christmas. He has been a communist since the birth of the Italian party in 1921, and won many victories: perhaps he accounts the recent eighth party congress as another, but none can have been so hollow. In his main aim, the prevention of a split in the ranks, he succeeded: he succeeded, too, in suppressing any effective challenge to his leadership. Discontented though it is, the party was cajoled into sending conforming delegates to Rome, and these then had no option but to vote in his list of candidates for the central committee. The most that dissenters could do was to cancel names from that list. ("This seems to me," said Signor Amendola, one of Signor Togliatti's lieutenants, "to be the most democratic way. To allow a choice between many names would create a deplorable confusion among the comrades.")

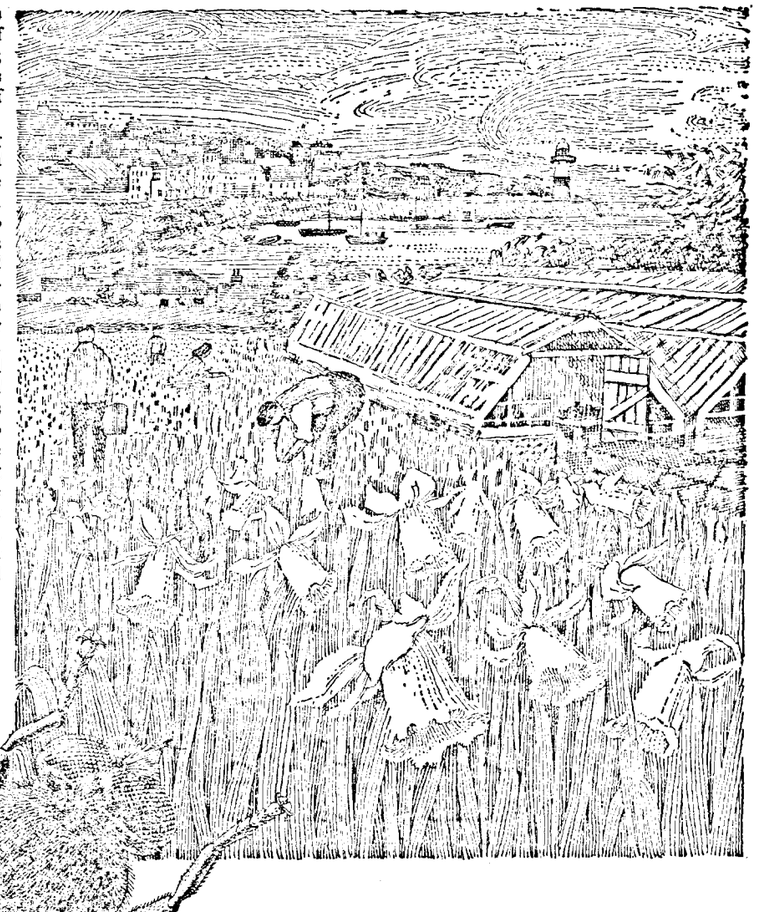
Out of the 1064 voting delegates some 40 dared to cancel Signor Togliatti's name—sufficient to give him only the

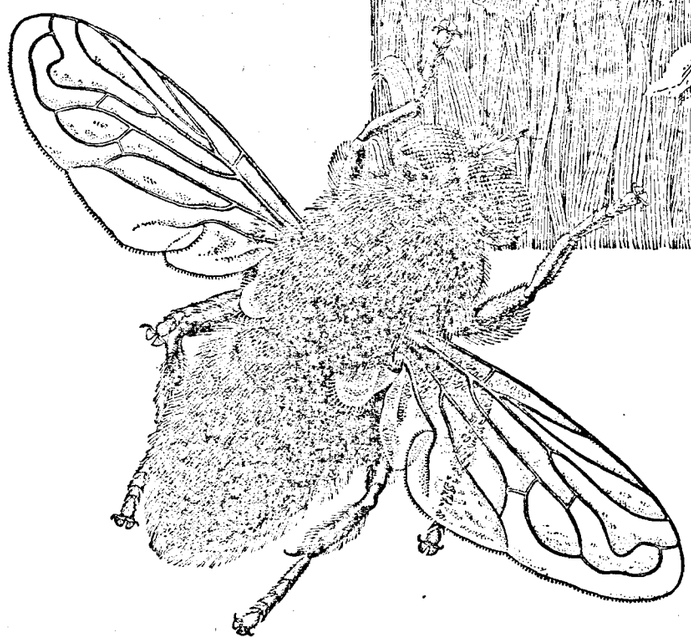
The case of *Merodon equestris* . . .

In England's south-western counties of Devon and Cornwall the growing of Spring flowers is an important industry; but one which, for many years past, has suffered considerably from the attack of the Narcissus bulb fly, *M. equestris*.

The flies lay their eggs in late Spring at the base of the withering leaves and the young larvæ burrow through the soil and enter the bulbs from below. Destruction is often complete. If a bulb survives, its growth the following year is restricted to a few spindly leaves and the flower crop is lost. The larvæ overwinter in the bulb and then pupate in the surrounding soil. A few weeks later the adults emerge to repeat the life cycle.

The long-standing problem of control has now been solved by using the Shell insecticide aldrin. The method is simple: add 1 pint of 30% aldrin to 20 gallons of cold water and immerse the bulbs for 15 minutes. Trials lasting through two seasons have proved the complete efficiency of this treatment which has become standard practice, not only in Devon and Cornwall, but also in other areas where narcissi and daffodils are grown commercially.





Aldrin, dieldrin, endrin . . . these three advanced insecticides developed by Shell are complementary to each other. Between them they control most of the major insect pests which menace agricultural production and public health throughout the world. Have you an urgent pest problem in your area?

aldrin

aldrin, dieldrin and endrin are SHELL insecticides for world-wide use

twenty-fourth out of the 110 places available. But he can shrug this off, just as he can make light of the vote in the Roman federation where, presented as head of the list, he was voted into fourth place. Neither vote is more than an affront to his pride: he is still solidly in control of the apparatus of the party with young men faithful to him both at the centre and the periphery. His more outspoken opponents, such as Signor Onofri and Signor Giolitti, have been excluded from power, and isolated: his two heirs-apparent, Signor Amendola and Signor Pajetta, conveniently cancelled each other out in the vote, well behind even the twenty-fourth place.

The bastions of internal power appear therefore to be still secure: but the question is whether, in shoring up his own power, he has not destroyed that of his party. For a long time the two have appeared to be synonymous. There is no doubt that hitherto Signor Togliatti's firm control of the Italian communists has been a condition of their success. He devised a policy that could appeal to the idealism of the intellectuals, the class interest of the industrial workers, and the primitive needs of the agrarian labourers, and at the same time provide an organisation more powerful, pervasive and skilful than any of those of his rivals. Signor Togliatti has been more than the party's boss: he has also been its myth maker, its theologian, its ideological tightrope walker. But now, buffeted by events in Moscow, Warsaw and Budapest, he has been forced into too many contortions on the sagging wire. He could balance the body of Stalin—just; he could even stand on his head to Marshal Tito, and keep his balance; but his tricks have become too frequent. Although he still clings to the wire (and it was significant that he refused to commit himself to the positions of either the French or Jugoslav parties whose representatives approached him recently) his theology has been exposed, and his myths destroyed.

The Party's Fading Zeal

Until recently the Italian communists could claim with some appearance of truth that theirs was a democratic party. It had fought the Fascists, helped to bring in the Republic; co-operated in the making of the constitution, and pressed for its observance. The spell it wove on this theme was sufficient to overcome doubts among its intellectual élite. But now the spell has been broken. Even its own journalists have revolted, and at the congress both the young men like Signor Giolitti, and hardened campaigners like Signor Gullo and Signor Terracini, as well as Signor Di Vittorio (the trade union leader who revolted over Hungary) protested at the party's treatment of dissenters. Signor Togliatti paid lip service to their cause, but hastened to add that fractional groups were not to be tolerated; that democratic centralism was to remain, that "we are not a party which discusses, but a revolutionary party." And he justified the repression in Hungary in terms of the necessities of the Revolution. As one of the party hierarchs said at the congress: "A real communist must not have doubts or crises of conscience. His temper is measured by his loyalty to the Soviet Union." Such is the reality of Signor Togliatti's latest invention—"polycentric" communism.

It is a hard doctrine, and not one which many of the industrial workers in the party now find easy to stomach. Their revulsion was evident in the force of Signor Di Vittorio's initial outburst, and although in the meantime he had been forced to retract, it was reflected again in his insistence at the congress that the trade union movement should be allowed autonomous development, and not merely harnessed to abstract schemes, acting as a "conveyor belt" for the party. On the other hand, for the many agrarian workers who form so large a part of its base (especially in the south) the present crisis may not at first sight seem so severe. The communist party for them is still the party which promises (literally in its election symbols) a plough and the "rebirth of the south." In such areas ideological doubts are almost irrelevant—but not quite, for in some cities such as Naples and Taranto, there was a pre-congress revolt, and at the congress itself the communist hero of the south, the Calabrian deputy, Signor Gullo, made one of the most critical speeches. Even there the ranks begin to waver.

Evidence that the rank and file are suffering from the collapse of the party's ideology is afforded not only by the criticisms that have been made in local meetings, and the widespread failure to renew membership, but also by the absence from the pre-congress elections of more than half the nominal members. Internal zeal is fading—and as it fades, by so much more will the party's electoral pull. Signor Togliatti struggles to keep alive the pretence that the party remains the guarantee of unity of the working classes in the country, but here Signor Nenni and the spectre of socialist reunification cast an ominous shadow. The two socialist parties are still in the toils, and it may well be that reunification when it comes will only be partial. Even so Signor Togliatti must fear it. And as he looks across the road from his party headquarters to the building occupied by the Christian Democrats he must fear, too, Signor Fanfani's known desire to precipitate a general election. For although Signor Togliatti may be secure for the moment in his own party, he has no army to help him through his troubles, and no answer to free elections.

Japan After Mr Hatoyama

FROM OUR CORRESPONDENT IN TOKYO

THE long uncertainty about the identity of Japan's new prime minister, with its accompanying intrigues and sudden enthusiasms for the chances of obscure outsiders, ended last week with the election, after an open vote, of Mr Tanzan Ishibashi as president of the Liberal-Democratic party. The divisions within the party had made it impossible to reach agreement by negotiation behind the scenes as has always been done before; since it was formed only a year ago after a merger of the two conservative parties it has developed no fewer than ten factions.

As successor to the ailing Mr Hatoyama, the factions were offered their choice of Mr Nobusuke Kishi, the party secretary, who modestly described himself as "a fourth-grade *go* player"; Mr Mitsujiro Ishii, who claimed a sea-green incorruptibility by revealing that he had never in his life given a *geisha* party; and the far more vigorous Mr Tanzan Ishibashi, who declared, "I don't want to brag, but my policy is the only salvation for Japan." Behind the arras of those three figures there constantly skipped an agile Polonius in the person of Mr Ichiro Kono, who is heartly disliked by all ten factions but who has his hands firmly on the financial lever of the American food loans counterpart funds, and who has become Mr Hatoyama's

soothsayer and, for all practical political purposes, the prime minister's keeper. It was rumoured that Mr Kono had promised to give Mr Kishi his full support in return for his own appointment as party secretary, if Mr Kishi should be successful. This appointment, combined with his financial power would have enabled Mr Kono to dominate the party and perhaps stand as president himself in a few years' time. But the hostility which he has aroused during the past year outweighed his influence and destroyed the chances of his nominee; after an inconclusive first ballot his opponents combined to vote for Mr Ishibashi, who thus gained the necessary clear majority by seven votes.

None of the three candidates could hold out any real prospect that his election would put an end to the party's grievous state of civil war. All three offered, however, to keep the Liberal-Democrats in power, each hinting that under any other leadership than his own the party was bound to go down in defeat at the hands of the Socialists. And, asked what the Liberal-Democrat party ought to do to keep the rising Socialist tide in check, all three contenders for the premiership returned remarkably similar answers. Their near unanimity on the point was far more interesting than their claims as individuals; for, in fact, the Japanese Socialists, while growing in strength, are not yet ready to govern, and the Liberal-Democrats, with all their internal schisms (the Socialists are not without their own), are almost certainly going to stay in power over the next two or three crucial years. Thus the shape of Japanese politics after Mr Hatoyama could be inferred with reasonable safety even before his successor was finally chosen.

The Cost of Nationalism

It is not a prospect calculated to give much comfort to the United States or, perhaps, to the West as a whole. Japan's weakened conservatives, for the first time since the Pacific war ended, are trying hard to read the mind of the Japanese voter, and especially the new, postwar generation voter, instead of the mind of Washington. What they believe they see there is a distinct trend towards socialism (or national-socialism) at home, and neutrality in foreign affairs. Mr Kishi said the younger generation regarded the Liberal-Democrats as "out-and-out American stooges": he and his two rivals alike demanded "readjustment" of Japanese-American relations, through "revision" of the United States-Japan Security Pact. And it is noteworthy that, though American officials in Tokyo tend to regard Mr Ishibashi as the man most likely to be "unco-operative," with Mr Ishii as the most co-operative, and Mr Kishi somewhere in between, it was in fact Mr Ishii who talked outrightly about the Japanese-American pact being finally abolished, once it had been "revised," while Mr Kishi talked about "restoring Japan to a leading position in Asia."

Hand in hand with these strictures on the present defence arrangements with the United States went proposals for a new Japanese economic policy. Mr Ishibashi was foremost in talking about the need for the United States to "mend its ways," by which he clearly meant American trade policies—he is an enthusiast for increased trade with China, deplores COCOM, and is highly critical of America's (and also Western Europe's) attitude to Japanese goods. He also made a bid to steal at least the right-wing Socialists' clothes, by pooh-poohing State ownership of industries but urging the "socialisation of capital," and offering Japan's unemployed a Keynesian policy of providing more jobs through increased government spending.

Fighting to hold its own against the Socialists, Japan's Liberal-Democrat party is clearly being urged along new paths. But Japanese conservatism is a much stronger force than the weak group of conservative-minded men who compose that party. The new paths may turn out after all to be old channels, already dug and simply waiting for the tide of revived Japanese political feeling to flow into them. The new Japanese voters who have been hearkening to the Socialists may listen even more avidly if the cry for less dependence on America—which has so far been the Socialists' winning card—is transformed into a more positive cry for a strong Japan getting ready to regain a position of leadership in Asia. The Socialists cannot utter it, for their insistence on neutrality is rooted in pacifism, while the Japanese Communists would clearly make Japan a mere appendage of Russia or China, and being an appendage of anybody is just what the Japanese mind is now revolting against. But in postwar Japan the old card of nationalism has still to be played. Mr Ishibashi may either find it or have it forced upon him: it is clearly back in the pack.

In China's Shadow

Diem's Way

FROM OUR SPECIAL CORRESPONDENT

To return to Saigon after four and a half years is to find a country transformed, and not merely by the advent of peace. In mid-1952, the dominant impression was perhaps the apathy of the Vietnamese shadow administration that was the façade of "independence in the framework of the French Union." Today the apathy has vanished, with the faces of the French citizens of Vietnamese blood who ran Bao Dai's successive governments. The ministers and civil servants of the new Vietnam do not merely work hard—fourteen to sixteen hours a day is common—but also with will, enthusiasm and brimming confidence.

How far is their confidence justified? The first essential of success—stability—has certanly been achieved. There are still isolated acts of terrorism in the villages, but the point is that they are isolated. Out of a situation that seemed desperate eighteen months ago, President Ngo Dinh Diem has produced an order and calm that must be envied in Burma and Indonesia, and even in Malaya. No one in the government is naive enough to believe that all the thousands of ex-Viet Minh guerrillas who have "rallied" to the government in the past year and a half are irrevocably lost to communism. But many are, and the others can be watched.

To President Diem and his supporters the way ahead may well seem less perilous than the treacherous shoals already traversed. Yet it could be disastrous to underestimate the protracted and arduous job still to be done. But whereas the past job was political and military—the consolidation of power—the work now to come is economic and social. Economically, the country has to be made able to stand on its own feet and dispense with American aid; socially, it must be given order without resorting to communist-type repression, and a new set of social values and incentives. In the long run, the price of failure is communism and colonisation of the whole country—instead of only the northern half of it—by China.

The measure of the problem is that the Americans still provide about 70 per cent of the Vietnamese budget. They pay Vietnamese soldiers and civil servants. This will not go on for ever, and the drive for viability has been launched after fifteen years of war or civil war, after generations of tolerated corruption, and with a serious, though not desperate, shortage of trained administrators and technicians. It would be foolish to expect spectacular results within a year of the proclamation of the republic, and indeed, the government has made a slow and cautious start. But a start has been made. Last spring there were 27,000 importers, most of them small, in South Vietnam, all of them taking advantage of America's dollars and collectively clogging the administrative machine. Now there are fewer than 2,000, the others having fallen by the wayside by failing to deposit with the government 350,000 piastres (£1,750 at the free rate) as a guarantee of solvency. The Chinese community, more than a million strong, has long had a stranglehold on Vietnamese internal trade, specialising in usury and, like other Chinese communities in south-east Asia, a law unto itself in matters of accountancy and tax evasion. The drastic decrees of last autumn, forcing them to take Vietnamese citizenship or go out of business, are designed to retain Chinese skill while abolishing Chinese extra-territorial privileges (and also, politically, to prove that the Vietnamese worm can turn against its traditional oppressors). Until recently, the streets of Saigon and of Cholon, its Chinese twin, were clogged with "barrow-boys," officially regarded as æsthetically offensive and economically superfluous. In good time for the celebrations of the first anniversary of the republic on October 26th, a decree requiring stallholders to open proper shops drove thousands of them into the villages, leaving Saigon cleaner, perhaps, than any other Asian city. In the villages, land awaits those who want it. The tentative agrarian reform programme launched in the early days of the Diem regime has proved a failure. But under a new decree published in October, absentee landlords are to be dispossessed, with compensation, and landless peasants are to have an opportunity to buy their own plots.

Unpopular Measures

Such measures are making the government unpopular, and indeed their immediate effect is to make matters worse. Mr Diem himself makes no attempt to disguise the unpopularity of his measures, and considers it a risk that has to be taken. In his quiet voice, with his occasional gentle smile, gazing into a far horizon, lighting cigarettes and stubbing them out less than half consumed, he explains to the visiting correspondent the abuses that have handicapped Vietnam's development and the methods he feels he must adopt to overcome them. Until further notice—how many years hence, nobody knows—Mr Diem will continue to exercise his paternalistic rule. That it is authoritarian cannot be denied: opposition politicians are closely watched, and security measures would seem excessive if one forgot for one moment that this is a country that was nearly lost to anarchy or communism. But although Mr Diem creates conditions under which recalcitrants cannot flourish, he does not liquidate the recalcitrants themselves.

In strictly economic terms, the government's methods cannot, of themselves, produce a solution. Positive measures are needed. It is intended that these should be enshrined in the forthcoming five-year plan, which is to be launched some time in the new year. Power resources are to be increased; a firm of Italian consultants is making a survey. Small manufacturing industries are to be set up. There, again, something of a social revolution has to be accomplished. Neither Vietnamese nor Chinese of affluence have the habit of investment; usury and speculation are traditional. Mr Diem has set himself to encourage local investment and, to do so, is prepared—to the dismay of some of his American advisers—to set up joint enterprises in which the government would hold 50 per cent of the stock. But he does not propose to imitate the example of the Burmese joint ventures, for he intends the government to contract out after stability has been achieved.

In tackling their difficult problems the Vietnamese have enviable resources of energy and intelligence. It is certainly within their power to solve them—given a guarantee against aggression from the north, American aid for at least five more years, and at least ten more years in office for the tireless Mr Diem.

Ghana's Difficult Birth

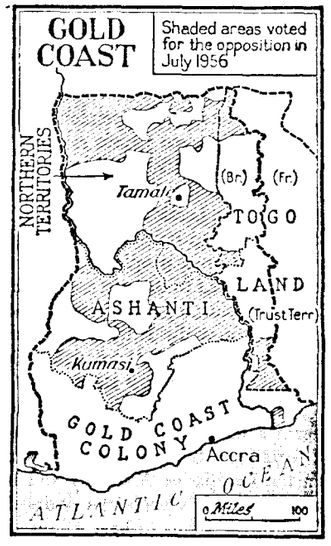
On the eve of independence, the new state of Ghana has shown some serious cracks. The country's politicians, who, after only six years' apprenticeship in self-government are in a position of exceptional responsibility, know that if those cracks break open it would be not only a tragedy for their 5 million citizens, but also a grave set-back for other African colonial peoples whose progress towards independence is geared to the success of the Ghana experiment. But the two political parties have reached so complete a deadlock that it is now the British Government which, despite principles of non-interference, will probably have to try to patch the fabric of the new state.

The Ashanti threat to break away from the colony and form a separate state was the last weapon of the National Liberation Movement, an opposition badly out-numbered in the Legislative Assembly and bitterly mistrustful of the majority party's intentions under the proposed constitution. The threat seems to have bounced off the shoulders of the Convention People's Party, but has made its mark on its second target, the British House of Commons. During the second reading of the Independence Bill, and on Tuesday when it was considered in committee, Members of Parliament tempered their good wishes for Ghana's independence with anxiety lest the country should not be united to receive it. Although time is getting very short (independence day is on March 6th), Ghana's constitution, which may not follow quite as closely on the Gold Coast government's proposals, as was originally expected, will be discussed again in Parliament. In addition, a visit to Accra by a parliamentary delegation or the Colonial Secretary himself, if he can find the time, will probably be necessary.

The trouble between the two Gold Coast parties stems from the CPP's over-confidence in the power of their two-thirds majority and the opposition's mistrust of government promises. Dr Nkrumah's party has felt secure enough to make almost no firm concessions to the opposition, who, on their side, put no faith in expressions of good intent. The NLM's two most important demands are for a greater degree of regional devolution, including regional assemblies with authority to raise revenue, and for safeguards against changing the constitution. The government's point of view is

that at present it is after no more than a working constitution which will carry it through independence until such time as (perhaps in three years) it appoints a constituent assembly to work out a final and sovereign constitution. This makeshift constitution should be simple, especially as, in the view of the more cynical members of the government, any concessions agreed to now could be changed at will under the present amendment laws.

The opposition are well aware that unless the amendment law is tightened, any concessions obtained now are precarious, but they also know that it is more difficult to take something away than to refuse its granting. Unable to make any impression on the CPP's solid front in the Assembly, they announced in a resolution to the Colonial Secretary their intention to secede. They could never have expected that this resolution would be accepted: their object was to convince the British Government that they were not bluffing.



Ghana's constitution will be written in the form of a British order in council, consolidating earlier constitutional instruments, amending clauses which are outdated by Ghana's new status, and making some additions. It had been thought that the order in council would follow very closely the lines of the Gold Coast government's proposals, but in last week's debate Mr Lennox - Boyd, speaking of the regional assemblies, only said that "the highest possible regard" would be paid to the views of the Gold Coast government, adding: "But it might be desirable to define the scope and continuance of these regional bodies a little more precisely." This could only be done by writing it into the order in council.

Members of Parliament on both sides of the House doubted the wisdom of several of the Gold Coast proposals. In particular they urged that some securer way should be found of making the public service and judiciary independent of political influence, and that the process for amending the constitution should be made more difficult. They also pressed for a chance of debating the constitution before it became law, and since a draft order in council is technically impossible, Mr Lennox-Boyd promised to try to produce a White Paper containing the constitution proposals which could be discussed again both in Westminster and Accra. He has not yet said who will be laying the British Government's proposals before the Gold Coast government.

Although, with the hope of new negotiation, the threat of civil war has receded, Dr Nkrumah's government must have been interested in the Colonial Secretary's statement on the position of the British officers and NCOs commanding the Gold Coast troops. Although after independence day they will come under direct Ghana command, the British Government reserves the right to withdraw them from service.

Colombo Plan Progress

THE twenty nations which make up the Colombo plan organisation finished their conference in New Zealand with an encouraging communiqué. National income in the area has continued to rise slightly faster than the population has increased, and efforts have been made to balance increases in capital investment with increases in consumption so that financial and social stability have been maintained. Next year, it is hoped to raise public investment in all the member countries by 25 per cent to nearly £1,000 million; most of this will be provided by their own efforts.

Apart from the chronic lack of capital, the greatest need of these countries is for trained technicians; the need increases as the development programmes unfold. Training schemes, however, are expanding rapidly and there is an encouraging increase in the number of trainees sent from one Asian country to another for specialised education. This enables the individual concerned to learn his job in conditions not too different from those in which he will later have to work. Nepalese tuberculosis nurses are training in Ceylon. The Malayan Federation is training Burmese forest officers in timber production and Ceylonese experts in rubber research and canning. Pakistan is training a Burmese port administration officer and te[illegible] Indonesian agricultural officers, and is teaching thirty junio[illegible]xecutives from various Asian countries railway signalling and organisation. India has provided 462 training places in the last year and a considerable number of experts for managerial and advisory work. Including training given by the western countries, 1,552 places have been provided during the past year and 180 experts sent out. Progress has also been made in establishing training institutions of all kinds within the countries of the area. The western nations have given many kinds of assistance from electronic apparatus for the University of Peshawar to handwork tools for a North Borneo primary school. Britain is sending a senior income tax officer to teach in the Lahore Finance Academy. The United States has promised to contribute $20 million towards a regional nuclear centre in the Philippines. The technical and human problems to be overcome are still immense, but the development of the Colombo Plan countries is gathering momentum.

"Motor Business"

The December issue of this quarterly research bulletin for the motor and allied industries is now available. It will include:
The outlook for 1957.
The French motor industry.
The East African market for motor vehicles and tractors.
The Bulletin is fully illustrated by charts, amongst which are:
Price indices of used cars and vans.
New registrations in Great Britain, and the hire purchase share of the market.
For full particulars of this Bulletin apply to:
THE ECONOMIST INTELLIGENCE UNIT LIMITED
22, Ryder Street, St. James's, London, S.W.1.
WHitehall 1511 Ext. 49.

BIG INCREASE IN USE OF FULL-COLOUR ADVERTISING

Since 1950, in Britain's three great weekly colourgravure magazines, the use of full-colour advertising has increased by over 400 per cent! Every product selling to the mass market should include in its national advertising the realism and tremendous impact of full-colour to sell to the combined audience of 19,500,000* people who regularly read

Progress in Electronics
Fusing the Extra High Tension connection to the bulb of a television picture tube.

Which is the end product?

The great new Mullard TV Tube factory at Simonstone in Lancashire is probably the most advanced in the world. In it is machinery and equipment so revolutionary in conception that visitors are startled by its Wellsian appearance.

The greater part of this machinery was designed, developed and built by Mullard's own engineering department. It is, in effect, an end-product in itself.

Plants such as this are typical of the Mullard attitude towards production. Constant research into manufacturing techniques and progressive development of plant and machinery are among the reasons why Mullard products enjoy a world-wide reputation for performance and reliability.

* See a Mullard factory one day, and you'll see the end-products of industrial team-work—from research to manufacture.

** If you are interested in visiting a Mullard factory, and if you belong to an organisation concerned with the application of electronics, write to the address below on your official letter heading mentioning your position in the organisation.*

THE BUSINESS WORLD

The Price of Steel Expansion

STEELMASTERS in Britain have long been convinced that the price of steel is too important to be left to the market, and governments in Britain that it is too important to be left to the steelmasters; so it is now left to the Iron and Steel Board. This is, indeed, perhaps the board's most important single job; certainly the one through which it can most generally fulfil its responsibility of "promoting the efficient, economic and adequate supply under competitive conditions of iron and steel products." For economic growth in Britain depends fairly crucially upon the expansion of steel capacity here; and the expansion of steel capacity depends ultimately upon the price Britain is prepared to pay for its steel. The responsibility is obviously heavy, and the job is complex. The rules the board uses to "determine" maximum prices for iron and steel products are clearly important. And in deciding upon the price increases that came into force on Monday, which average 6 per cent but include much greater increases for certain products, the board has made at least one significant change in those rules.

This price increase followed a review, not only of the industry's operating costs, but of its "standard margins" for depreciation and profit on capital employed. The board last reviewed these margins at the end of 1954, and it could not have delayed doing so again very much longer. It has been the review of these margins that has accounted for the larger than average increases allowed on plates, heavy sections, and foundry iron, which have gone up by more than 10 per cent.

The board collects regular details of operating costs from iron and steel producers. In covering these operating costs in the price, it takes the average costs for the producers making any group of products, leaving out the most inefficient plants. The worst plants, therefore, pay part of the cost of inefficiency; and plants with more than average efficiency get more than average profit, though not nearly as much as they would in periods of high demand in a free market. The last price increase it allowed, in May this year, covered certain increases in the prices of scrap and imported raw materials, but left the industry to absorb other increases in cost that had arisen from paying higher wages and transport charges. These outstanding increases, plus the rise in coal prices this summer and increases in local rates, probably amounted to something over £30 million a year, which the industry has had to absorb until this week.

In allowing for margins, the board uses two different definitions of "capital employed" in steel. For the purpose of covering depreciation provisions, it reckons the industry's capacity at replacement costs, the price of putting up the same plant today. The formula it originally used was to allow depreciation upon the reducing balance system applied to a plant at replacement cost, written down halfway through a 25-year depreciation life. In its latest review of margins it appears to have simplified this depreciation formula somewhat, but the actual proportion of plant cost allowed seems to be much the same.

In allowing the "standard margin" for profit, the board values the industry's fixed capital at its historical cost, written down by Inland Revenue rates of depreciation, and allows for whatever capital a company expects to spend on plant that will come into production in the next two years (hence the need for a review of margins at least once every two years). It counts in stocks and work in progress, and a proportion of liquid assets; then allows a percentage for profit based upon "normal" working of the plant in relation to its capacity. At higher rates of operation, as for example in the recent upsurge of steel demand, this of course gives a rather better return on the steelmakers' capital. The rate of profit allowed has never been published; by standards in other industries, it is probably fairly frugal.

The board, incidentally, concerns itself with home costs, margins and prices only. The industry is welcome to make what export premiums it can get on the steel it sells abroad, but the quantity it exports is limited by informal agreement. So the rates of profit that steelmakers have been able to show in their accounts for good years such as 1954-55 include a good deal more than the profit on home sales of steel. Apart from exports, many steelmakers have been extending their activities further into fabrication, turning the steel upon which their selling profits would be regulated into goods outside the net of price control. There is no reason why steel consumers at home should get the benefits of these extra elements of steel enterprise: they want more steel here, and ought to pay the full price here.

★

These are the rules by which steel prices have been set for a good many years now; the board, like earlier authorities who have had the job, has revised and refined them only in detail. The pattern is at least familiar to the industry, though there may be arguments over detail. The main argument that the industry launches against it is concerned with results, not with method; that these prices do not give it the rate of return on home sales of steel that would be reasonable for an industry expected to continue such rapid expansion. This is almost certainly true, and in the latest review the board has made one significant concession to the argument—though not nearly as much as the steelmakers are convinced they require.

In addition to calculating the prices according to these normal rules, the board has made a study of what might be called the "ideal costs" of producing a range of iron and steel products. It has gathered data upon the best existing practice both in Britain and abroad, enabling it to estimate broadly what might be the total costs, running costs plus all capital charges, of producing the major products at a new integrated steelworks, built at today's prices, but also incorporating all today's operating improvements. And it has used these estimates of "ideal costs" to see what kind of margin the prices calculated by the existing rules would give a new and efficient steel plant today. In cases where the margin looked hopelessly inadequate, it has revised the prices upwards—bringing the return that could be achieved on putting up, for example, a new plate mill more into line with what the prices would offer on new plant to make other products.

These further adjustments have been moderate. They go only part of the way towards making it about as profitable to put up new plants in one section of the industry as another; the industry would probably say "not much more unprofitable." But they do represent a first step towards tackling one of the industry's most awkward problems of expansion: the kinds of steelmaking where existing plant is comparatively efficient and technical changes since it was put in offer no radical reductions in cost. In such sections of steelmaking, the much higher capital cost of a new plant would more than offset the economies it offered in operating costs; at the existing level of prices it would simply not pay to put up a new plant. The adjustments in the latest prices set by the board at least begin to face the problem that until recently it has been unprofitable to build new plant to make several of the steel products of which the shortage is now greatest and for which demand is rising most sharply. Where existing plant is much less efficient than the best up-to-date practice, the reductions in running costs offered by new plant go much farther to offset the higher capital costs of new capacity: so prices calculated on the existing formula give a more reasonable return. This may explain why billets, for example, get less than the average increase under this new set of price increases: it had often been argued that these too were priced too low to make expansion pay.

These adjustments have shifted the balance of the new prices, not raised the total amount of the increase. This looks to be slightly under £50 million a year: a sizeable ridge across Mr Macmillan's plateau, but one which most consumers seem to have accepted as inevitable. They might well count themselves lucky—in immediate prices, though not in future supplies of steel. The steel producers have not yet commented upon these prices in any detail; but it is no secret that the amount they have been allowed is only about half of what they believe they need.

★

This is not yet an "expansion price" for steel, which would allow steelmakers to finance their heavy future investment from internal resources or distribute dividends that would attract the new capital from outside. But it may have opened the road towards such a price, which Britain ought to be paying. Theoretically, there is not much doubt about the way to set a price for steel in an industry that has to expand as Britain needs this one to expand—assuming the industry and the Government go on disbelieving in a free market. It would be to set a price that would cover running costs and depreciation at a new and up-to-the-minute plant and give a profit comparable with that earned in other highly capitalised industries—a price that would make it worth the industry's while to expand where it saw the demand rising, or even for newcomers to start in steel. The introduction of such an idea, even if at present only as a means of adjusting the existing average-cost formula, is a significant beginning; the industry, as well as the board, ought to consider how such an "ideal cost" formula could practically be strengthened to bear the whole weight of price determination. And the quicker the better—if British steel is to get the capital that it needs to underpin Britain's future.

Economics of Milesmanship

THIS is a sorry Christmas for the motorist, and sorriest of all for the man who won't be able to get as much as the standard 200 miles a month from his ration of petrol. If he has a prewar car in poor condition—or a car of very high horsepower—it will be difficult. In each of the petrol rationing ranges, on the other hand, a number of unusually economical cars will score much higher mileages (as Standard and BMC have not been slow to declare). But apart from these, any owner of a postwar car of moderate horsepower and in reasonable condition, should have only himself to blame if he cannot get at least 250 miles a month from his ration. And he can do it fairly economically, if he counts his ordinary motoring worth while.

If a motorist has a 1500 cc car of fairly recent origin, he must reckon that, writing off his car over seven or eight years, he must allow £100 a year for interest and depreciation. Insurance and tax will add £35-£40 to this; and, with the cost of those repairs that are a function of time rather than mileage, his standing costs will be about £150 a year—and that is assuming he has not to pay the rent of a garage. With petrol at 6s. a gallon, his fuel bill, if he can do 30 miles to the gallon, will be 2.4d. per mile; and the cost of tyres, lubricants, and of those repairs which are a function of mileage rather than of time, will make his running costs a full 3d. a mile. On 200 miles a month, his standing charges of £150 a year would be 1s. 3d. a mile; so, under rationing, his motoring is costing him 1s. 6d. a mile in all.

★

Few motorists count their motoring costs so coldbloodedly; and it is fair to assume that most of them would hold that, even in this present stringency, motoring gives them their money's worth and more. It is not stretching things unduly to assume that, for most, the value of each extra mile over and above the standard 200 a month might be reckoned as at least half the cost of each of these standard miles a month. These motorists, then, might put the gross value of "marginal mileage" at about 9d. a mile—which is roughly what he ordinarily paid per mile if he was doing say 6,000 miles a year before petrol prices and duty went up. This gives the basis of an economic calculus on which to figure out the cost of this and that, and the value of doing what one can to help oneself.

The first thing a motorist could do to get all the mileage he could was to start the period of rationing with the best liquid position he could. If his tank was full at the beginning of rationing, that, at eight gallons, or 240 miles, was worth, say, £9 to him. While so accurate a reckoning may not have been vouchsafed to all motorists, there seem to have been few motorists to whom the principle had not—no doubt in a dim and cloudy way—been clear, to judge from the queues at the pumps. It was lawful also to have in store two metal containers, each containing two gallons with a gross "marginal mile" value of £4-5, less the cost of the petrol, and of the rubber siphon—lawful, that is, if the containers were in a brick-built garage and clearly marked "Petroleum Spirit—Highly Inflammable." An important point in the management of the liquid balances is, of course, to ensure that its consumption is spread to give the optimum return over the period of rationing. The motorist must contrive not to find himself, at the end of rationing, with more than enough petrol to drive his car to within walking distance of the nearest pump. He must not be in the condition, that is to say, which the authorities report most shipwrecked mariners are rescued—ravaged with the pangs of thirst and hunger and with hardly any of their stores of food and water consumed.

★

After fitting a lock to the petrol tank, the next important point in milesmanship is to ensure that the car is in as good shape for the purpose as reasonably can be. The carburettor is the point at which improvement can most readily be achieved. If a car has done 25,000 miles or more, it may well pay to fit a new carburettor "detuned" in the trade phrase, or with smaller jets. An improvement in mileage of 10-15 per cent is a reasonable expectation, or, say, 30 miles a month, which the calculus values at 15s. to 22s. 6d. If rationing lasts for four months, the cost of replacement, say £6 10s., will have been about half covered, and in subsequent running—with more gallons a month—the balance will easily be justified. But if his carburettor is already in good condition, the modest cost of fitting smaller jets will certainly be justified.

Another step which can hardly fail to yield a profit is—for the winter months—to remove the fan. In general, the higher the water temperature, the more economically a car will run; but the designer has to arrange his cooling so as to make sure that the car will not boil in summer in fairly severe traffic conditions. Thus, there will be some gain from running the engine at a higher temperature. On top of this, and to greater advantage, is the saving of the power consumed by the fan. This varies with different cars and different speeds, but at high speed the fan may take up to 10 per cent of the engine's power; at the speed at which the petrol-thrifty driver goes, it may save 4-5 per cent of fuel to dispense with it. In driving, the three enemies of milesmanship are the brake, the gear box and the accelerator pedal. All the energy lost when a car is braked has to be given back—if the *status quo* of speed is to be restored—by consumption of petrol. Thus, for

milesmanship, the less the driver has to slow down the better ; and this can be accomplished by keeping down his maintained speed, and, on corners, dropping it as little as the exigencies of traffic permit.

A measure of the cost of speed and, above all, of acceleration, can be taken from figures of petrol consumption established in the road tests by *The Motor*. Taking ten typical cars in the range between 1,100 cc and 1,600 cc, whose ration is 7½ gallons a month—the petrol consumption at a steady speed of 30 miles an hour is 44.1 miles per gallon ; at 40 mph it is 39.7, or a reduction in mileage of 10 per cent ; and at 50 mph it is 35.3, a further reduction of 11 per cent. And the average mileage per gallon over the period of test for those cars, which will certainly have included a great deal of running with more generous speed and acceleration than the petrol-thrifty motorist under rationing would allow himself, was 30½.

★

There is one point in the combination of milesmanship with the achievement of reasonable journey times that is perhaps not generally appreciated. The accomplishment of good average speeds depends very little on covering parts of the journey at 80 miles an hour, rather than at 60 mph. A few simple calculations will show that the time saved in covering miles at 35 mph rather than 25 mph is apt to be much greater. The motorist who wants to get reasonably quickly from A to B, but at the same time to achieve a proper standard of milesmanship, must keep this constantly in mind. We all know by now that to storm up hills in second or third gear will be grossly extravagant in petrol ; but if the aim is to make reasonable journey times thriftily, we need not eschew a reasonably high speed up not very severe hills. The good milesman approaching a slope can often, without heavy penalty, afford to increase his speed from 30 to 40 mph, and without using his throttle too much, allow his speed to fall off gradually to, say, 35 or 30 mph by the time he reaches the crest. This will give him better fuel economy than he will get by restraining his accelerator foot to the point where he has either to suffer a labouring engine or to change gear—and give him time in hand to allow of lower speeds on the level.

The volume of traffic on the road in these restricted days is going to be a help to good milesmanship. Most of it in the open country will be travelling at a more uniform speed than in happier days, and there will be less of it. Already experience is showing eager drivers who in normal times expect to get from A to B in 85 per cent or 90 per cent of the time taken by less eager types, that in present conditions they can make accustomed journeys within 5 per cent of their accustomed time, while still observing quite a high standard of milesmanship—and perhaps saving 15-20 per cent on their consumption.

Business Notes

The City's Christmas Box

COULD investors find £5 million for the City Corporation's own loan ? As this edition of *The Economist* goes to press it seems clear that they did, though without excessive enthusiasm. Lists closed at 10.05 on Thursday. The terms of the loan were to Investors' liking, but not to their delight. The coupon (5¼ per cent), the date (1976-79) and the price (£97 per cent) all fit neatly into the present market pattern. The flat yield is £5 8s. 3d. per cent compared with £5 8s. 9d. currently obtainable on the London County Council 5¼ per cent stock and the yield to redemption on the latest date is £5 9s. 8d. per cent, compared with £5 8s. 9d. on the LCC stock. Most important among the loan's features is that the City Corporation has been persuaded to break the stream of ultra-short issues and placings by which local authorities have been lately raising money. Those five and seven year stocks fulfilled a useful purpose and had a special appeal to a select class of investors—the Trustee Savings Banks. But some recent results show that the appetite for them can soon cloy. Wisely the City has gone for a twenty-year stock, which should enjoy a wider appeal.

The City Corporation's borrowing operation and the success just announced of the offer by Leyland Motors of its offer of 2,478,161 ordinary shares to stockholders fit in well enough with the prevailing tone of the markets, which have been running into the Christmas holiday steady without being boisterous, active or even particularly confident. Those who make issues over this period incur the additional calculated risks of running in competition with the ICI £40 million issue and of having chosen a time of year when money is liable to become scarce. But the general behaviour of the markets—particularly of the gilt-edged market—has not—for a pre-Christmas week—been discouraging. Only the smallest of declines in the level of industrial share prices has on balance occurred over the week. *The Economist* Indicator on Wednesday stood at 183.3 compared with 185.8 a week earlier. Gilt-edged have fared a little better, gently rising in a broadening market. One point of Christmas cheer that the markets provide is the evidence of slightly

greater confidence in sterling. The premium that dollar stock command over Wall Street prices has calculated on the rate of the day shrunk a little further—to 6 per cent compared with 6¼ per cent.

Oil on the Ration

THE Minister of Fuel and Power is still hoping not to have to cut industry's fuel oil supplies by more than 10 per cent, but this is a calculated risk. If a bigger total cut has to be made, it will mean an allocation scheme, and presumably this is being made ready: but he hopes it will not be required. The present flow of fuel oil will be sufficient to cover 90 per cent of industry's normal supplies only for the next two months. Mr Aubrey Jones promised that he would give as long a notice as he could of any further restriction—at least a month. And he suggested that industry should reckon on the shortage lasting six months, purely "as an estimate for planning purposes"; whether it does last that long depends of course upon the speed of clearance operations at Suez. Allocation of fuel oil would probably be preferable to the appeals machinery the Ministry has set up to tackle complaints about the further cut in diesel supplies to industry—which will be 20 per cent from the end of this month.

Administrative factors, however—the time and staff available, and the vastly greater number of vehicles on the road than at the time of the last petrol rationing scheme—set the practicable limits to the present rationing system for motor fuels. Most of the current barrage of complaints seem to arise from a failure to appreciate this—and that a cut of 25 per cent in oil supplies, when only 20 per cent of petrol consumption goes on private motoring, must mean somebody getting hurt. The case for this kind of rationing has not been explained too well. The decision to allow a basic car ration of 200 miles a month, equivalent to roughly half the present normal average consumption, and also to the old basic ration of 90 miles plus the innumerable special compassionate allowances, was intended to free the administrative machine for applications for supplementaries from the more essential business purposes—such as the firm whose block basic ration for all the cars it operates is inadequate to keep production going. (Even so, applications for supplementary petrol have already arrived for almost half the cars in the country.) But this decision, as against one that might have set a lower basic ration, inevitably meant that the "pleasure motorist" was not treated too badly: and without a fuller explanation of the reasons for this choice it has not helped business acceptance of this fact.

The basic ration for goods vehicles was set to allow a larger grant of supplementaries, mainly for lorries that move essential traffic—such as feeder services to the ports—and goods that could not be shifted to railways. But dealing with applications for supplementary rations from among half a million operators of over a million goods vehicles was bound to take some time. Although the Ministry of Transport was foolish to delay disclosure of its policy for supplementaries until a fortnight ago, and to stipulate at first that half the basic ration had to be used before supplementaries could be even applied for, the only alternative rationing scheme would be a flat rate ration with no supplementaries and no flexibility.

A Tip for 1957?

DETAILS of Imperial Chemical Industries' offer of £40 million 5½ per cent Convertible Loan Stock 1977/79 at £96 were posted over last week-end. Stockholders (who alone can apply) will have the Christmas break in which to consider whether the stock does not rank among the best market prospects for the new year. Applications (with £10 per cent deposit) have to be in by January 2nd. Two features stand out clearly in the full announcement: first that the expansion schemes of the group are so massive that this issue, though it is the biggest company issue ever attempted on the Stock Exchange, can only cover part of them ; and second, that the new stock offers investors a most attractively protected two-way option—either equity or fixed interest investment at they prefer to regard it.

ICI's capital investment in the ten years up to and including 1955 was approximately £300 million. Of that total £210 million was provided from internal resources and only £90 million from the investing public (from the total previous issues of loan stock). There seems no reason to suppose that that sort of proportion in the company's financing will be much altered in the future. Capital projects already sanctioned by the Board amount to £85 million and it remains the company's policy "substantially to finance capital expenditure from internal resources." Continuous investment means new plants continually coming into production. That perhaps explains why, the directors who agree that their policy of stable prices "is having its effect on profit margins," they can still report the value of the group's sales in the first nine months of this year as ahead of those of the same months of 1955.

Considered as a fixed interest stock of 20-22 years' life, yielding £5 14s. 6d. per cent flat and £5 16s. 3d. to redemption on the final date the new stock can boast a fine cover ; interest service is more than eight times covered on the average profits of the last three years, and principal more than four times on net assets. The other way of regarding the loan stock is as a protected interest in the group's equity. The company seems likely to be far more fortunate in the timing of its issue than was apparent when the directors sanctioned it three weeks ago. At 37s. 3d. the price of ICI Ordinary is now within striking distance of the first conversion option price (40s. in July, 1950). It seems hardly believable that this conversion option or one of the other two (41s. 9d. in July, 1959, or 43s. 8d. in July, 1960) will not be worth exercising. There is naturally the appropriate guarantee to adjust the option scale proportionately if there should be a capitalisation issue during the option's currency.

The Institute and the Society

PROPOSALS have been put forward to integrate the Society of Incorporated Accountants, which had 10,945 members at the end of last June, with the Institute of Chartered Accountants, which had 19,112 members at that date. The need for unity in the accountancy profession has been under discussion for years ; these proposals may turn the discussion in a new direction, but they will not

still the debate. The essential details of the proposals are these:

(1) The national groupings, England and Wales, Scotland and Ireland, are to be retained. No single body for the whole of the United Kingdom is to be set up, though a joint standing committee is proposed to discuss matters of common interest.

(2) Those members of the Society whose qualifications include practical experience in the offices of public accountants (including the "bye-law" candidates of the Society) will become fellows or associates of the Institute.

(3) Those members of the Society whose qualifications do not include such experience will form a new class of members called "Incorporated Accountants" with the opportunity, on satisfying certain conditions, of becoming Chartered Accountants. Most of these Incorporated Accountants will be members admitted to the Society through service with the Treasurer's department of a public or local authority.

(4) Existing students will be able to complete their training with a view to becoming either Chartered Accountants or Incorporated Accountants.

(5) No new students will be accepted for training to become Incorporated Accountants. Thus, after a transitional period of many years, this body will consist only of Chartered Accountants, one of whose essential qualifications is a period under articles with a member of the Institute. To provide for this, a member of the Institute will be allowed to train four pupils (and at the discretion of the Council a greater number) instead of two—a step more welcome in the biggest offices than in the small firm.

Thus it appears the Institute has set the pace, notably on qualifications. One reason why it favours integration seems to be a fear that the Society would broaden the base of its recruitment to accept service in industry as a qualification. Fierce discussions about these proposals are likely to occur in the profession—and should be welcomed there, though members of both organisations must avoid being stiff-necked or up-stage. The new proposals, if they go through, will establish one body, demanding high standards of training and of qualification, with a massive—and even a dominant—voice in the profession. Yet in the past the friendly rivalry between the Institute and the Society has been good for both and for the profession as a whole, and the experience of other giant authoritative institutions suggests that without care voices, especially those from the lower ranks, can be muffled. That and an unthinking devotion to tradition should be avoided. This integration cannot avoid having an effect on the standing of other accountancy institutions, especially the Association of Certified and Corporate Accountants, and it should not be forgotten that these bodies have their value in training men who are not able to take up articles.

Sterling Steady

CONFIDENCE in sterling has not slipped back after the boost it received early last week from the Chancellor's grand measures to reinforce the reserves. That is the fundamentally reassuring conclusion of this week's second thoughts in the exchange market. The initial lift has admittedly not been carried further, and on a number of fronts there has been a little weakening; the closing of the short accounts has not been carried far. The predominant attitude is to wait and see. But that in itself is a big improvement. Before Mr Macmillan's show of strength the disposition was to sell.

The best performance in the market has been made by the vital rate against the US dollar. On Tuesday of last week, on the news of the grant of credit facilities of $1,300 million at the International Monetary Fund, this jumped from $2.78¼-⅜, at which it had been supported by the authorities on most days since the Anglo-French ultimatum of end-October, to $2.78⅜-½; and early this week, following a slight easing around the weekend, this level was regained. Transferable sterling too has maintained its rise, to around $2.75, and security sterling has shown a smaller further advance to just over $2.60.

On the other side of the picture, the rates against Continental currencies have fallen back rather sharply, though in a thin market. Many Continental dealers were apparently preparing to keep short over the holidays. The continued caution is reflected also in the widening again of the forward discounts on sterling, against the dollar to 1 cent one month forward and 3 cents three months. The height of these discounts—equivalent to nearly 3¼ per cent per annum—and of that still placed on security sterling (which in the early summer was quoted within 1 per cent of the official parity) reflect the extent to which full confidence in sterling is still lacking.

Bank Advances Still Falling

THE underlying trend of bank advances to the private sector of the economy is still downwards. This conclusion emerges from the latest quarterly classified return of advances made in Great Britain by all members of the British Bankers' Association, which modifies the impression given by the two latest monthly statements from the clearing banks. Between August and November total advances dropped by nearly £72 million to £1,930 million, but £29 million of this decline was attributable to net repayments by the public utilities group and £2 million to the local authorities. Private-sector advances thus declined by £40 million, to £1,750 million; this is a somewhat larger contraction than occurred in the preceding quarter (£31 million), though it falls far short of the major movement experienced in the corresponding period last year, when the first response to Mr Butler's squeeze was being felt. Over the whole period of fifteen months, the contraction amounts to 8.6 per cent. Total advances made within Great Britain by the clearing banks alone—their "true" totals are now separately noted in the BBA return—fell during the quarter by £65 million, to £1,683 million; the monthly statement from the Treasury shows that £24 million of this decline was caused by repayments by the state boards out of the proceeds of their borrowings from the Exchequer under the new system started last August.

The decline in the BBA total occurred in spite of additional borrowings by a number of the classified groups, but in none of these was there any large expansion. The big engineering group, now almost as large as agriculture, has absorbed an additional £6 million, at £213 million; its growth since the credit squeeze began amounts to £47 million. By contrast, the retail trade group, which also rose slightly during the quarter, shows a fall of £20 million over the year, at £163 million. The largest declines, proportionately, in the industrial groups occurred in "other" textiles (cotton and wool are shown separately, and the latter rose), down by £6.7 million; leather and rubber, by £2.6 million; and building materials, by £2.4 million. Agriculture's decline of £5½ million was smaller than that in the corresponding period last year, but the £3 million decline in food, drink and tobacco contrasted with substantial increases both in 1955 and 1954.

The squeeze upon the personal sector shows no sign of easing: personal and professional borrowings declined by £14 million, to £315 million; since their peak in May, 1955, they have contracted by 21 per cent. Advances to hire-purchase finance houses declined by only £2.2 million; but, at £23 million, they have been almost halved since the summer of last year.

Television in the Red

THE sheer size of the losses made by Associated Rediffusion during its first two years of commercial television have a breathtaking quality about them. In a year when most observers believed that the company was about a million pounds in the red, it actually lost close on £2 million; between the end of April and the end of September this year another £1,250,000 went the same way. Associated Rediffusion has a capital consisting of £500,000 in ordinary £1 shares, a further £500,000 loan stock and £3 million in advances from shareholders; its two biggest shareholders are Associated Newspapers and Rediffusion Ltd. Its losses from November, 1954, when it was formed to the end of last September have been put by the chairman at "nearly £3,250,000." This carries the company somewhat beyond the period covered by the accounts, which ended on April 30th when the loss was £1,950,000, of which slightly more than half has been charged to goodwill. Capital expenditure during the period came to £1,600,000 and in addition the company has considerable stocks of filmed programmes. The auditors said that "we have been unable to satisfy ourselves" that the market value of these programmes amounted to the £800,000 with which they are credited; but the secretary, Mr A. W. Groocock, points out in his report that the figure represented the cost of the films, which had been bought by A-R, after deducting sums "in respect of showings during the period and the proceeds of sales effected. Pending greater experience of the markets than that which it has yet been possible to gain, it is the view of the directors that it is reasonable to include the films at that figure."

The cause for losses on this scale were partly circumstantial, but partly also due to errors in policy. Associated-Rediffusion faced the most difficult task of any of the four programme contractors of the Independent Television Authority, that of putting on five days of programmes every week on the London transmitter when there was no other commercial station with which to share their cost. Associated Television, providing only two days of programmes during the weekend, was not under the same pressure. The services were also started before the two pioneering contractors had time to set up their organisation, equip their studios, train their staffs or even find their programmes. But when all this has been said, Associated-Rediffusion cannot claim to be entirely the victim of circumstances.

Too Many Programmes

WHEN commercial television began, the two London contractors set themselves the task of putting on five hours of programmes a day, which for Associated Rediffusion meant 35 hours of entertainment a week. It is this haste that caused the losses. The BBC, with its huge organisation, had taken several years to build up to this number of hours' transmission a day. A company starting from scratch has to pay highly for sometimes inferior material and artists in order to have something to keep in front of its cameras. Waste, inefficiency and extravagance were inevitable. The quality of the programmes in turn was reflected in the viewing figures, and advertising revenue began to falter. Many of these difficulties might have been avoided if Associated Rediffusion had set itself a more modest target and had been content with, say, three hours of programmes a day at the start. The subsequent elimination of waste and over-staffing, streamlining the business organisation and mercilessly culling the programmes has been painful and cannot have been helped by a bewildering number of top-level staff changes. But Associated Rediffusion is now a leaner and healthier organisation because of it.

It was doubly unfortunate that the company's reorganisation was taking place during a period when the advertisers were making their own re-appraisal of commercial television. Advertisers melted away with the snows, so that not only Associated Rediffusion, but all four contractors, were offering them a good deal of what amounted to free advertising time. This explains why, in spite of drastic reorganisation, the company lost a further £1,250,000 in the next five months after the ending of the present accounts. Only now, with the publication of the winter schedules and the new advertising charges for the coming year, has television advertising really got under way, and the chairman said on Tuesday that the company was now operating at a profit.

These are the first accounts to be published by any of the four contractors. They are not, however, likely to set the pattern for the rest, partly because of the special circumstances that are likely to affect only Associated Rediffusion and partly because for two companies at least, Granada and Associated British Cinemas, a late start meant that they could buy programmes from the London stations. The development of networking is the one factor, more than any other, that is setting commercial television financially on its feet.

Help for Lead and Zinc

BEHIND the lead and zinc mining industries in America and other countries stands the many-sided role of the United States "strategic" stock. For some time now the American government has used that stock to absorb the

surplus output of domestic mines; it has also used it to absorb the metal obtained from foreign producers in exchange for surplus American farm products. Both operations have had the effect of bolstering world prices of lead and zinc. Recently the original goals for purchases from domestic mines seemed in danger of being reached, and future purchases were in doubt. Those doubts now appear to have been removed. According to a report from New York, an official of the Office of Defence Mobilisation has said that purchases will continue during the immediate future; the stockpile goals have been "adjusted." Other officials have indicated that the bartering of farm products for foreign metal will continue. Prices strengthened further on the news, with prompt lead closing in London on Wednesday at £116 10s. a ton and prompt zinc at £102 15s.

Northern Assurance Scheme

IT is always difficult in a capital reorganisation to be fair to all classes of shareholders. In the proposals for straightening out the highly complex capital rights of Northern Assurance, and at the same time for raising new capital, the company and its financial advisers, Helbert Wagg and Company, have had a difficult wall to scale.

1. The company will raise about £3,850,000 by an issue of between 1,400,000 and 1,700,000 ordinary shares of £1 each at between 45s. and 55s. a share according to market conditions. One fifth of this issue will be offered to participating preference shareholders and the balance to ordinary shareholders.

2. The existing ordinary capital is £401,661 in £10 (£1 paid) ordinary shares, quoted in the market at £32 each. By what is in effect a nine for one free scrip issue this will be replaced by 4,016,610 ordinary shares of £1 each, fully paid. On the present ordinary capital the 1956 dividend will be 140 per cent, compared with 120 per cent in 1956.

3. The existing £502,500 of £7 10s. participating preference shares will be exchanged into ordinary shares of £1 each. In 1955 these shares received a fixed dividend of 6 per cent plus a participating dividend of 8.9552 per cent. The participating dividend is calculated by a complicated formula which in effect is to make these shares a low geared equity rather than a fixed interest stock. The market price is £28. The £502,500 of preference capital will be exchanged into 502,500 of £1 ordinary shares, plus a one for three free scrip issue of 167,500 of £1 ordinary shares. Thus in exchange for each £1 of preference capital holders will get £1¼ of ordinary capital. In lieu of the 1956 participating preference dividend (and slightly exceeding it in value) a special dividend of 12 per cent will be declared on the 502,500 shares that are being converted—not on the additional shares being issued to preference shareholders. For 1955 the income of the owner of 20 preference shares was £22 8s. 7d.; for 1956 through the special dividend it will be £27; for 1957, assuming no effective increase on the 1956 ordinary dividend, it would work out at £28.

Thus for a higher income, the preference shareholder is asked to give up his preferential rights on liquidation. Ordinary shareholders might regret the reduction in their gearing as the price of getting rid of a complicated preference capital but both classes should benefit from the better marketability of the ordinary shares, for the big scrip issue will make the price far less "heavy." And there is the possibility of a higher income and better dividends on one class of capital when the new funds are put to use in expanding the company's business at home and overseas.

Coal Payout Finished

WITH the issue on Saturday of £325,000 of 3½ per cent Treasury stock 1977/80 taken at the market price of £75¼ per £100 stock, the state finished paying for the coal mines. Just a fortnight short of ten years after nationalisation (on January 1, 1947) the amount of the bill is known and paid. In round figures it was £292 million, of which £242 million has been discharged by the issue of about £262 million (nominal) of the Treasury 3½ per cent stock, taken at various prices according to the market at the date of issue, and about £50 million in cash. In addition, during the ten year period the dispossessed coal owners have drawn £63.4 million of interim income.

In retrospect, thanks to inflation, the state has obtained the coal mines and their ancillaries at a price that may have been fair in relation to 1947 values, but must be modest compared with those of 1956. The price of the "assets of coal industry value" was settled by arbitration at £164,660,000 (under £1 of investment per ton of annual output), the balance is made up of £126.7 million for the ancillaries and of £700,000 for severance payments.

Nylon's Strength

SINCE the Suez crisis, customers for nylon yarn have begun in many cases to double their orders, even though nylon uses no petroleum chemicals. This has been a sharp reminder that although there is no actual scarcity of yarn, output is only barely able to keep up with demand. Production is limited by the capacity of Imperial Chemical Industries to produce the polymer out of which the yarn is spun. At present this is 15,000 tons of polymer a year; new plant now under construction will add a further 10,000 tons. The spinning plant of British Nylon Spinners at Pontypool has a capacity of 30 million pounds of yarn a year, with additional plant working in the Bemberg factory it now owns. Assuming that about a million pounds of polymer goes to the plastics industry, this leaves something between 32 and 33 million pounds for yarn production.

Nylon stockings have now been on the market for ten years, and their production is running at 17 million pairs a month, but the developing markets for nylon are elsewhere. There has been a remarkable increase recently in the use of nylon overalls in industry and the development of knitting techniques using yarn almost as it comes from the spinarette (eliminating the expense of intermediate processing) has cut the cost of knitted nylon cloth to a level where it is a serious competitor of rayon for cheap underwear. Nylon has not before been regarded as one of the cheaper

"Therefore choose life"

"I have set before you life and good, death and evil... therefore choose life"

NO MORE CRUCIAL CHOICE was ever presented to men than the use to which they put the unimaginable power of the atom. The same raw material can be made to produce electric power for the business of peace, or bombs capable of destroying great cities in a blinding moment.

The companies whose names appear here are not the arbiters in this matter. They are contractors concerned with the peaceful development of atomic energy. Indeed, they have just been instructed to build a nuclear power station for the Central Electricity Authority on the Severn estuary.

These companies form a skilled team of artificers in a new industry of immeasurable importance to this country and the world. As Britain becomes laced with threads of ever cheaper and more plentiful electricity they will turn their attention elsewhere, so that industrial development springing from the use of nuclear power may bless the lean places of the earth. The power for creation now in our hands is beyond the dreams of a generation ago.

THE SIGNAL

that keeps all lines clear

Chart your course—and you can see exactly where you are going: whether it be towards increased production, bigger sales or any other form of progress. That is the reason why Graphdex has long been accepted as the master-plan of successful management.

Its slotted panels and coloured signals form a chart on which you can see, plainly and simply, every aspect of every process and situation. The more complex the problem, the more you appreciate the flexibility and versatility with which Graphdex clarifies it.

Graphdex is merely one of the many modern methods devised by Remington to stream-line the day-by-day efficiency of business operations. The Man from Remington Rand will gladly call upon you to discuss their application to your own problems—without obligation.

6 *Good Reasons for choosing*

SOUTH AFRICAN SHERRY

1 Because South African Sherry is very good sherry: *real* sherry, most carefully matured, expertly selected—genuine in every way.

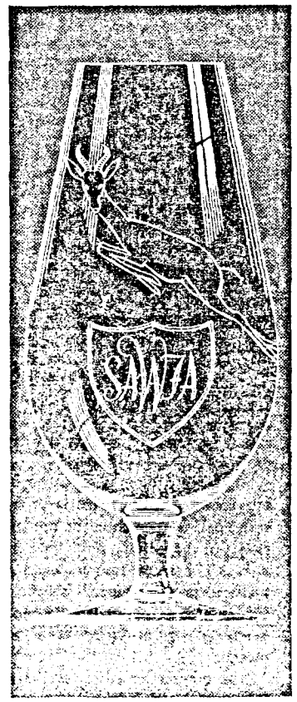
2 Because South African Sherry costs *you* less: as it benefits by a preferential import duty.

3 Because you can count on a South African Sherry to suit your personal taste—from light and very dry to full, rich and sweet.

4 Because the wonderful climate and soil of the Cape makes South Africa one of the finest wine producing countries of the world.

5 Because there is a guarantee of quality in South Africa's 300 years of wine-growing experience.

6 Because once you've chosen South African Sherry you'll choose it again.



SOUTH AFRICAN SHERRY

textile fibres, and this welcome prospect of a mass market accounts for the mood of buoyancy that characterises British Nylon Spinners in spite of competition from both ICI's "terylene" and from new nylon producers.

Attempts have been made this summer to break the exclusive hold of nylon on the stocking industry by using highly twisted "terylene" yarns. These feel warmer than nylon but have the admittedly disconcerting habit of, wet or dry, never losing the shape of the wearer's leg. It is too early to say how strong a hold "terylene" will gain as a stocking yarn. But British Nylon Spinners have also taken the step this year of licensing two producers, British Enka and British Celanese, to spin nylon yarn in this country. This opens up quite a different type of competition. It is not clear yet where these companies are intended to get their polymer. They may have to rely largely on imports, but before these licences were given the only competition that BNS had to fear was from imported yarn spun abroad. With three producers it may now be possible to stop the irritating habit of issuing monthly production figures for synthetic yarns in which nylon, rayon and "terylene" are all lumped together under one umbrella.

New Plans for BSA

DESPITE the crowds and the camera men, Tuesday's meeting of the Birmingham Small Arms Company was but a pale reflection of the great row of last August. A meeting at which the only mention of Lady Docker's dress bill came from Lady Docker herself, at which no one called for a poll, and which though contentious ended in a vote of thanks to the chairman, is certainly an improvement for that unhappy company. Naturally the breach resulting from Sir Bernard Docker's dismissal is not healed. Naturally Sir Bernard and Lady Docker opposed the re-election of the retiring directors (though the re-election was carried on a show of hands). Equally naturally Sir Bernard felt obliged to express his doubts both about the reduction in the dividend from 10 per cent to 8 per cent, and the ability of the board to make profits for the shareholders.

Real interest, however, centred around the account which the new chairman, Mr J. Y. Sangster, gave of the board's decisions on the recommendations so far put forward by Lazard Brothers and Deloitte, Plender, Griffiths & Company. Finality has not been reached, but this much Mr Sangster disclosed. The group is to be rearranged with BSA as a holding company controlling wholly owned operating subsidiaries, and some sections of these, particularly the Small Heath (motor cycles) group, are to be reorganised. The board of the parent company is to be reconstructed so as to consist of senior executives drawn from the subsidiaries plus experts from outside, and will supervise broad policy and control finance. The profit-earning sections of the group are to be strengthened, and the board promised "to take whatever steps are necessary to eliminate losses."

So far so good. Some shareholders must have felt that Mr Sangster, despite his tactful and courteous handling of the meeting, might have gone further. All attempts to draw from him any breakdown of the relative importance of BSA's wide range of interests—machine tools, steel, motor cycles, cycles, and motor cars—brought little more information than had been disclosed in the report, namely that steel and machine tools had done well but that the motor car section had incurred heavy losses. Shareholders may have felt that even if turnover and profits could not be broken down by sections, they might have been given some rough idea of the extent to which the group leans on each of its sections.

Whither House Prices?

Two events in prospect must cause house buyers to think about prices, though they will not find it a simple matter to form a new view. Mr Sandys's Rent Bill should soon go on the Statute Book. Many rents must go up and therefore house purchase should become relatively more attractive. Moreover, it is the general view in the building society movement that the societies will have more money available for financing house purchase in 1957 and if that happens the effective demand for houses for sale should also be increased. On the face of it the prices of existing houses, which rose by approximately 9 per cent during 1955 and the first half of this year according to the Co-operative Permanent Building Society's indices, might go on rising and the slight fall shown in the third quarter of 1956 might, as expected, be no more than seasonal. The movement of house building costs is also still upwards and may continue in that direction, pulling the prices of older houses along with it, despite the reported increase in productivity in the house building industry. Material costs are still going up whilst building operatives whose wages are adjusted to the cost of living index can expect automatic increases next February; a claim for an additional 4d. an hour is also pending.

It would be far too simple to assume that the Rent Bill plus the hope for greater availability of loans from building societies would automatically speed an increase in house prices that was to be expected anyhow. The greater availability of funds should be moderate—not big enough to outstrip the already heavy demand for mortgages; and the landlords, though they have been kept on short commons for many years, will not overplay their hand. The first increases in rents are expected to be moderate and to impinge mainly on those houses with abnormally low rents at present. Meanwhile, in terms of numbers the supply of houses is approximating more closely to the demand, so that scarcity value is being eliminated. And rent increases may produce useful by-products that will further enlarge the prospective supply. Some people, particularly single persons living alone, may be tempted to seek cheaper and smaller quarters and thus to make more accommodation available. It is certainly also possible that a proportion of the properties freed from control will be put up for sale, and finally a proportion of the extra rents will be used to make overdue improvements in the properties. The higher rents may thus in part represent better value for money and some people who would otherwise have bought houses may continue to rent them.

To that complex of influences must be added the effect both long term and short term, of the Suez affair. The first effect of dearer oil should be to raise prices; the longer term effect may be to act as a brake on industry, to cause unemployment or under-employment, and therefore to damp down house prices. On balance these contending factors seem to experts in housing to point towards a continuing rise in house prices over the next few months. Further ahead the results may for a time be in the opposite direction.

Retail Business

CUSTOMER TRENDS

This is a new quarterly bulletin for those interested in the home market for consumer goods. It includes short and long-term forecasts of sales by different outlets and merchandise groups, regional surveys and reports on special investigations.

Treasury Bill Tactics

The Treasury bill allotment rate for 91-day bills last week eased by ⅛ per cent, carrying it below 5 per cent—actually £4 19s. 1.54d. per cent—for the first time since early November. The immediate cause of this movement was a reversal of tactics by the discount houses, which, after cutting their bid price for 91-day bills by 2d. per cent in the previous week, raised it again by 6d., with the object of making good a recent depletion of their portfolios of these bills. Such tactics as these, although they arise from an increase in the general appetite for bills, seem to have been largely technical.

Since the end of October, following the precedent set at the same time last year, the Treasury had been diluting its borrowings against the standard 91-day bills by offering also 63-day bills, with the object of securing a greater build-up of maturities in the weeks of heavy tax collections (and thus of Exchequer surpluses) early in the new year. These bills are of little interest to "outside" tenderers for Treasury bills, so that almost all of them have been allotted to the discount houses; and in their market dealings these houses have found, moreover, that clearing banks have preferred to buy from them longer bills. Given the increase in its portfolios of 63-day bills the market had not found it necessary—or even practicable—to compete strongly for the 91-day bills; but by mid-December its holdings of these were becoming severely depleted and it therefore deemed it expedient to make sure of a good allotment.

This particular technical influence has now run its course. The 63-day issues were started a week earlier than in 1955 (with the result that the first maturities actually fall on December 31st) and were made in considerably larger amounts—to a total of £560 million in eight weeks, compared with £380 million in seven weeks last year. The maturities of them will now extend until February 23rd, by which time the peak phase of tax-gathering will have ended; at yesterday's bill tender, accordingly, no more 63-day paper was offered. During the first four weeks of the new year total maturities will be some £200 million larger than in the similar weeks of 1955, at £1,420 million, but, in consequence of this heavy concentration, in the ensuing four weeks they will generally be less than in 1955.

How flexible is YOUR transport?

ALTHOUGH the fuel position will necessitate some alteration to their nationwide road services, British Road Services will continue to do their utmost to meet the requirements of traders in close collaboration with British Railways, and where traffic is beyond the capacity of available trunk road services they will hand it to the Railways for the trunk haul.

British Road Services are a highly organized and nationwide concern, with the vast resources of the British Transport Commission behind them. They possess an enthusiastic staff, sound technical knowledge and are equipped to carry your most ordinary and your most extraordinary loads with speed, safety and punctuality, and moreover they have the *flexibility* needed to serve your interests well during the continuation of the fuel rationing period.

Great advantages to you

A fleet of vehicles, of all kinds, ensures the provision of those best suited to your requirements. Or, in emergency, vehicles can be rapidly adapted to meet your special needs. Constant research provides equipment of the most up-to-date design, and the B.R.S. nationwide engineering service keeps it in peak condition. A teleprinter network linking all depots, and radio control vans operating at ports, facilitate control and increase efficiency. These are remarkable advantages which only a great organization can offer. They are of special advantage during the present difficulties.

Sound planning

With the current need for fuel economy, greater care than ever must be taken to ensure that there is no unavoidable wastage of transport resources, and B.R.S., in close collaboration with British Railways, will be exerting all their efforts to meet the national needs to the very best of their ability. To this end, the keen and experienced representatives of British Road Services are eager to discuss your transport problems with you, to advise on the best way of despatching your traffics and on the types of vehicles available for your special requirements, and to co-operate with you in improving methods and promoting all possible economies. Just telephone your local man. Action will follow immediately.

Cheaper Woodpulp

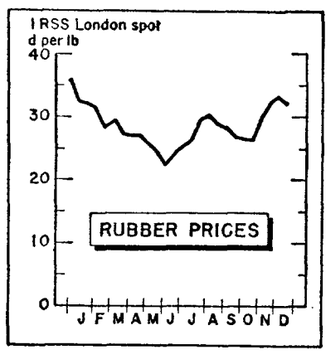
FOR the first time in 3½ years paper manufacturers are paying less for woodpulp, which accounts for roughly half the cost of making paper. During that period there was a massive growth in world output of paper and in demand for woodpulp, and Scandinavian woodpulp prices rose by an average of nearly 20 per cent. Now the various chemical grades have fallen by between 15s. to 30s. a ton for shipments in the first half of 1957; bleached sulphite, used mainly for printing and writing paper, will cost £59 a ton cif UK and unbleached sulphate, the most important grade for wrapping paper, £48 a ton. Supplies of mechanical pulp, the chief constituent of newsprint, are still rather tight and the price has fallen by only 5s. to £33 a ton. The reductions have occurred despite the rise in oil prices and in shipping freights; many Swedish and Norwegian mills depend on oil for power.

There are several reasons for the weakening in the market. Productive capacity in Scandinavia has steadily expanded—in 1956 alone by roughly 300,000 tons or 8 per cent—and Scandinavian mills export as much as two-fifths of their production. The expansion of the North American pulp industries has been far more impressive, and even though the bulk of their output is absorbed at home the exportable supply has increased. Traditionally a net importer of woodpulp from Europe, the United States has become a net exporter to Europe during the past two years, and Russia has emerged as a small exporter. Scandinavian producers are experiencing increased competition. American and Russian pulp is occasionally offered at a discount of up to £2 a ton on Scandinavian prices.

While supplies of pulp have grown, demand has lately tended to ease. With a few exceptions the leading paper industries in Europe are still forging ahead, but the pace of expansion has slackened. The exceptions include the british paper industry, which takes over half of Scandinavia's exports of woodpulp. Although the industry has more machines running this year than in 1955, total output has not exceeded the 1955 rate of 3½ million tons a year; latterly, indeed, some mills have had to reduce output. The slackening in activity is reflected in a fall in imports of chemical woodpulp for paper-making; imports amounted to 1,028,000 tons in the first ten months of the year, 57,000 tons less than in the same period of 1955. The next two weeks may reveal whether the fall in pulp prices will lead to cheaper paper.

Rubber Growers' Good Year

THE natural rubber growers can scarcely complain of the prices obtained this year. Prices have as usual fluctuated sharply, but they have never been what a consumer would call cheap. In the first eleven months of this year the spot price in London for the top grade of sheet rubber averaged 28½d. a lb, only 5½d. less than the unexpectedly high average realised in the whole of 1955. The current price of about 31½d. a lb is not far below the highest point reached since the fighting in Egypt. Lately the strength of the market has been partly technical. To make up for the delay in sending rubber round the Cape consumers bought substantial quantities for December shipment from the East, and then Russia entered the market for 10/12,000 tons, also for December shipment. The top grade usually bought by Russia is often rather scarce, and sellers in Singapore who had failed to cover their sales were squeezed.



But there is no doubt that natural rubber is at present basically sound. This year world production and consumption have once more been closely balanced, at just under 1.9 million tons. The sharp fall in consumption in the United States and Britain has been offset by heavy buying by Communist countries, particularly Russia. Imports into Russia this year are expected to amount to about 120,000 tons, nearly 100,000 tons more than in 1955, and imports into China are expected to show an increase of 30,000 tons to about 100,000 tons. Total imports into Communist countries are put at about 300,000 tons, twice as high as in 1955. The rubber trade would dearly like to know how much of these imports are going into consumption and how much—if any—into stock. Accounting as they now do for about 16 per cent of world consumption of natural rubber, any marked change in the Communist countries' purchases in 1957 could have an appreciable effect on prices.

SHORTER NOTES

Syria has refused to accept sterling for any exports to the United Kingdom made under contracts signed after November 4th; it has demanded that payment shall be made in dollars, Swiss francs or Belgian francs. As British exporters are not free, under the exchange control, to make payment in such currencies it is likely that this demand will bring trade to a standstill.

★

On December 14th the effective export quotas in the International Sugar Agreement were increased by five per cent of the basic tonnages, to 4,573,375 tons, and the initial export quotas for 1957 were raised (by 222,000 tons) to the same figure. The Sugar council will meet in London again on January 29th.

★

Ranks, the flour milling group, announces a sharp increase in profits for the year ended September 1st. Group net profit rose from £2,381,000 (which included non-recurring credits of £467,000, but was struck after charging £250,000 for construction reserve) to £2,536,000. The final dividend, maintained at 6 per cent and the bonus of 5 per cent, again made a total distribution of 20 per cent for the year. The first interim dividend for the current financial year is, however, raised from 4 per cent to 5 per cent.

Company Notes

STEEL PROFITS. The latest batch of results from the steel companies presents the same picture as did those of the steel companies discussed in these columns last week. Bigger outputs, thanks to the coming into production of new equipment and plant, have usually been achieved so that total profits have sometimes risen. But margins of profit (with higher costs pressing against stable prices) have generally been reduced. And shareholders are to receive the same dividends as in 1954-55.

Colvilles has reported an increase in production and its profits, before all charges, have risen from £8,095,735 to £8,759,923. The ordinary dividend has been left unchanged at 11 per cent, absorbing £632,500 out of a net profit of £2,786,263 (against £2,552,271 in 1954-55). On this dividend the £1 shares yield 6.7 per cent at 32s. 9d. Finance, as promised in the prospectus, is coming from the Iron and Steel Realisation Agency. The company has arranged to call up the balance of 15s. on each of the 4 million £1 preference shares owned by the agency and arrangements have been made to defer the date by which the balance of the debenture stock requires to be subscribed by ISHRA. Commenting on the year's results the directors say that "during the later part of the year, increases took place in the cost of coal, wages and transport for which no adjustment was made in the selling prices of steel products. The effect of these increased costs is only reflected to a limited extent in this year's accounts."

The Steel Company of Wales is still owned to ISHRA, to which it has again paid an ordinary dividend of 6 per cent. Its trading profits in the year to September 29th fell from £18,313,299 to £14,228,057 and its net profits from £6,052,662 to £4,000,397. "The reduction of £4 million in trading profits," the directors explain, "was due to loss of output caused by an embargo on overtime by the maintenance workers at the company's principal works, to increased costs not recovered by appropriate increases in controlled selling prices and to the incidence of the heavy cost of bringing large new production units to an economic level of output."

ARTHUR GUINNESS. There is nothing to startle investors in the preliminary statement of Arthur Guinness for the year to September 30th, the traditional financial year of the brewers. The total ordinary distribution has been left unchanged at 25 per cent, as had been foreshadowed by Lord Iveagh six months ago when, in announcing the higher interim dividend, he said an increase in the total payment was unlikely. On this dividend the 10s. stock units yield £6 1s. per cent on the current price of 41s. 3d.

The whole of the increase in the group's profits seems to have come from brewing. Again this is not surprising, for many of the brewers this year, despite the wet summer, have reported higher profits and many of them have again found that the most profitable end of the trade is the sale of bottled beers on a national scale—a market in which Guinness has for many years been strongly established. The profits earned by the group from its non-brewing interests—that is largely the confectionery interests it has through William Nuttall—have fallen from £786,000 to £699,000. But the consolidated trading profit has risen from £6,371,000 to £7,097,000, so that trading profits from brewing must have advanced from £5,585,000 to £6,398,000—a handsome increase.

★

TURNER AND NEWALL. Slowly and cautiously, as profits have continued to rise, the directors of Turner and Newall have raised the ordinary dividend. This year, following on an increase in profits before tax from £12,494,817 to £13,343,819, the dividend was raised from 25 to 27½ per cent. Even granted the conservative policy of the board, it must have been an easy decision to take, for the group has massive earnings and substantial liquid resources. Thus the announcement by the chairman, Sir Walker Shepherd, that the group will spend at least another £12 million on development, in addition to its immediate capital commitments of £3,800,000, will not disturb investors who buy the £1 units (yielding 5½ per cent at the current price of 103s. 1½d. xd.) as long term growth stocks. The group has about £31½ million in liquid assets.

Why this the biggest of the British asbestos companies continues to think in terms of expansion when the immediate prospect is of slightly lower profits is set out clearly in Sir Walker Shepherd's statement. His remarks show why the £1 units class themselves among the growth stocks of the unspectacular kind. He said: "The trading for the second half of the past financial year was at a somewhat lower level than in the first half, but the difference was not significant, and a modest decline in volume obtained in the United Kingdom was more than offset by increased prosperity in our overseas companies. We anticipate that the group will remain prosperous but at a level which, so far as we can see at present, is likely to be rather lower than that which we have experienced during the past two years. It is not possible to be more specific, but we are continuing to expand wherever an appropriate opportunity presents itself, and we have no fears for the future, which should give us good results even though somewhat below the record levels of the past few years."

Investors may draw two conclusions. First, expansion of the group's overseas interests is likely to be bigger than developments at home. Secondly, the directors are not likely to throw their bonnets over the windmill and to replace a conservative dividend policy with a really generous one. For equity shareholders the advance will remain at a walking pace.

★

TANGANYIKA CONCESSIONS. The accounts of "Tanks" are a fascinating jigsaw. Often in recent years the result of the piecing together has also been instructive. It is so again in the accounts just issued for the year ended July 31st. Shareholders already know the net result—a net profit after tax of £3,982,612, against £3,000,830, and a total ordinary dividend for the year of 90 per cent, against 70 per cent. For that result the riches of the Belgian Congo represented by the holding of about 14 per cent of the capital of Union Minière du Haut Katanga plus a mining royalty on that company's area are far the most important element. Out of a total revenue of £4,340,931, dividends from Union Minière (which paid 2,200 Belgian francs per share, against 1,600) plus the mining royalties accounted for £3,578,325 (against £2,596,269 out of £3,253,207). The other main source of income, the holding of 90 per cent of the share capital and all the debenture stock of the Benguela Railway yielded a mere £642,504, compared with £582,292. The results from that important westward outlet from central Africa were, however, a little better than the figures suggest; the net working revenue of the railway was up by £237,000 and the parent company has found it convenient to hold the railway's ordinary dividend at 11 escudos per share and to use the available resources for the advance redemption of £404,900 of the income debentures.

Shareholders may also find intriguing the possibilities of one of the group's interests that does not so far contribute to group revenue at all—Tanganyika Holdings, owned as to 50 per cent by "Tanks" and 50 per cent by Zambesia Exploring Company. Tanganyika Holdings is a 30 per cent partner with Rio Tinto in prospecting in Northern Rhodesia, and it has subscribed for 50,000 £1 shares and has an option over a further 50,000 in Rhodesia-Katanga, which in turn owns 35¾ per cent of the Kanshansi Copper Mining Company now busy equipping its mine.

Doubtless the Belgian Congo investment will remain much the most important single revenue producer for Tanganyika Concessions, and that despite that company's multiplicity of minerals it is primarily a copper, cobalt and zinc producer. It may surprise some shareholders to find that in 1955 uranium was only 1.5 per cent of Union Minière's mining revenue. A new and more favourable contract has since been negotiated, but the conventional base metals must still be decisive and Tanganyika Concessions must share the fluctuations of other copper mining shares.

★

HAWKER SIDDELEY. In the preliminary statement Hawker Siddeley

published profit figures without showing the charge for depreciation, though nothing had been put to replacement reserve (against £1 million). The full accounts now reveal that the depreciation charge has risen sharply (from £2,853,493 to £3,935,856) and that gross trading profits have advanced more sharply than the preliminary statement suggested. Before all charges, trading profits have gone up from £15,641,289 to £16,894,056.

The consolidated balance sheet reveals the importance of the group's new Canadian interests. The fixed assets of the Canadian Car and Foundry Company have been included at their original cost to that company, at £10,838,744 with an accumulated depreciation provision of £5,556,553. The value of the Hawker Siddeley group's land and buildings, at cost, has risen from £18,432,272 to £25,640,260, and of plant and machinery, etc., also at cost, from £12,679,958 to £28,822,512. Outstanding capital commitments on July 31st were estimated at £3,700,000. Over the financial year stocks rose from £27,047,256 to £39,840,498. This increase in physical capital left the group short of cash. Bank and cash balances fell from £8,665,098 to £2,152,501 and the group had to borrow £6,341,885 from the banks. On the new dividend of 10 per cent, against the equivalent of 8¾ per cent, the £1 units yield 5¾ per cent at the current price of 37s. xd.

★

RADIO RENTALS. An effective increase of 2½ per cent in the dividend and a jump of 28 per cent in gross profits from a radio and television renting concern is more than enough to make investors blink with surprise. Yet when Radio Rentals published these results, its 5s. shares gained only 6d., to stand at 23s. 9d. An explanation can be found to fit both occurrences, though shareholders will have to await the chairman's speech for confirmation of it.

In the year to August 31st after charging £1,533,901 for depreciation, the gross profit was £1,028,586, compared with £802,286, after charging £1,254,685. After tax, the net profit was £570,163, against £533,045, and the net ordinary dividend absorbed £116,195, against £98,972. Allowing for the recent 100 per cent free scrip issue, the dividend rate has in effect been raised from 20 to 22½ per cent.

The explanation may be this: in the first six months of the latest financial year the company did extraordinarily well out of the boom in rentals on radio and television sets which followed in the train of the first set of hire-purchase restrictions. So well, in fact, that the continuing inflow of rents may have more than offset in the profit figures the decline in new rentals which followed on the new set of restrictions last February. Then, for the first time, rentals as well as hire-purchase agreements came under control and a nine months' rental in advance was required from a new subscriber. If there has been a decline in business since February, it would be mainly reflected in the results of the current financial year.

★

BRITISH INSULATED. The maintained interim ordinary dividend of 4 per cent from British Insulated Callender's Cables points to a maintained total payment of 12½ per cent. So, too, do the interim profit figures for the six months to June 30th and the comments the directors make upon the figures. Strictly comparable figures between the first six months of 1956 and of 1955 are not available; earnings between January and June this year are compared with one half of the year's figures in 1955. This comparison suggests that profit margins have been trimmed for in the first six months of this year the group earned a profit before tax of £3,983,000 on a turnover of £68 million, as compared with £4,813,000 on a turnover of £59 million.

In the last half of this year, the directors add, the results have run at a "satisfactory level" but "due to present disturbed conditions and the increasing difficulty of passing over higher costs, it is anticipated that whilst satisfactory results will be achieved for the full year they will not reach the record level of 1955."

LONDON STOCK EXCHANGE

Next Account begins: January 2nd

Next Contango Day: January 2nd

Next Settlement Day: January 8th

Although gilt-edged stocks declined early in the week prices quickly recovered and after an all-round improvement on Wednesday most issues closed higher on balance. The improvement extended to the shorts, 4 per cent Conversion 1957/58 gaining ¼ to 97⅛, and 2 per cent Exchequer 1960 and 2 per cent Conversion 1958/59 gaining ⅛ and 3/16 respectively. New corporation stocks weakened on the announcement of further loans; 5½ per cent LCC 1977/81 fell ½ to 1⅛ premium and 5¼ per cent West Ham 1966 slipped back to 3 discount. The list for the 5½ per cent City of London closed at 10.5 a.m. on Thursday. The seasonal decline in business chiefly affected the stocks which rose spectacularly last week, but Clarke Chapman jumped 7s. 6d. to 126s. 10½d. and GEC gained 1s. to 47s. 6d. Head Wrightson lost 1s. 3d. to 115s. and AEI 1s. 9d. to 65s. 9d. Most stocks were steady; *The Economist* indicator was slightly lower at 183.3.

Banks were stronger, Lloyds rising 2s. to 48s. 3d., but insurance shares declined. Northern Assurance gained 1½ to 34 on the capital reorganisation plan. Ford advanced to 29s. 6d. last Friday, but fell back to 28s. 1½d. this week. BSA dropped 1s. 3d. to 20s. 10½d. following the meeting. Steel shares receded, particularly Dorman Long, which declined to 24s. 9d. following the results. Land Securities gained 2s. 3d. to 22s. 6d. xd on the property deals.

Oils were subdued, but Royal Dutch improved on Wednesday to 15⅝. British Petroleum was lower, Burmah rose 1s. 6d. to 83s. and Shell recovered to show a small gain by Wednesday. Kaffirs were a good market, due to the expected disclosure of further information about their uranium interests. Klerksdorp gained 1s. 6d. to 6s., Dominion Reefs 1s. 6d. to 18s. 6d. and Luipaards Vlei 1s. 9d. to 13s. 3d. Coppers recovered, Nchanga regaining ⅝ to 12⅝ and Rhodesia-Katanga spurting 6s. 3d. to 52s.

(1) This covers mining, manufacturing, electricity and manufactured gas with the following exceptions: Denmark excludes mining; Greece, mining and manufactured gas; Ireland and Sweden, electricity and manufactured gas; and Austria, manufactured gas. Germany excludes West Berlin. (2) Special trade (excluding re-exports) with the exception of Ireland which covers general trade with exports seasonally adjusted. Belgium includes Luxemburg. Italy includes Trieste. (3) New drachmas introduced May 1, 1954 (1 new drachma=1,000 old drachmas). (4) Thousand million drachmas. (5) Bizonal area. (6) Average for second quarter.

Financial Statistics

EXCHEQUER RETURNS

For the week ended December 15th, 1956, there was an "above-line" deficit (after allowing for Sinking Funds) of £48,087,000 compared with a deficit of £16,127,000 in the previous week and a deficit of £17,943,000 in the corresponding period of last year. Net expenditure "below-line" last week reached £29,211,000, bringing the total deficit to £777,936,000 (£742,885,000 in 1955-56).

THE MONEY MARKET

THE market made a sharp cut in its discount rate at the Treasury bill tender on Friday last. It raised its bid for the 91-day bills by 6d. to £98 15s. 3d., marking the lowest discount rate since May, and by 5d. to £99 2s. 11d. per cent for the offer of £60 million of 63-day bills, the last in the current series. The market's tactics were designed primarily to secure a larger share of the bills; at the preceding tender, following the reduction in its bid by 2d. per cent, its allotment rate on the 91-day bills dropped to 24 per cent; last week this jumped to 55 per cent. Although the offer had been raised by £10 million, to £230 million, it was under allotted by this amount. The market succeeded in taking outsiders by surprise in the extent of its adjustment, though applications fell by £13.4 million to £361.9 million. At yesterday's tender, the offer was £280 million of three months' bills.

Credit conditions in Lombard Street turned unusually easy on Saturday, and throughout the first three days of this week funds have been abundant, and some remained unlent. Dealing rates in February and March securities have fallen to $4\frac{21}{32}$ per cent, and some overnight loans from outside sources have been reported at rates down to 1 per cent.

The London gold market has this week received some of the Soviet gold recently sold in Switzerland against transferable sterling.

COMPANY MEETINGS

JOSEPH LUCAS (INDUSTRIES) LIMITED

INCREASED DEMAND FOR AIRCRAFT EQUIPMENT

SIGNIFICANT CHANGE IN MOTOR TRADE

RECORD EXPORT ACHIEVEMENTS

The fifty-ninth Annual General Meeting of Joseph Lucas (Industries) Limited was held at the Queens Hotel, Birmingham, on December 17th. Mr A. B. Waring, the Chairman of the Company, presided, and in his statement to the shareholders said:

The Consolidated Profit and Loss Account of the Company and its Subsidiaries for the financial year which ended on July 31, 1956, is presented in a more simplified form than in previous years. It will be seen that, after making adequate allowances for Taxation, Depreciation and other charges, the result of the year's activities is a Net Profit of £1,519,722 compared with £2,207,087 in the previous financial year.

DIVIDEND

The Directors recommend that appropriations be made from this Net Profit by the payment of a final dividend on the Ordinary Shares and on the Redeemable Preference Shares of 1s. a share, which with the Interim Dividend of 6d. a share already paid makes 1s. 6d. less Income Tax for the year and by confirmation of the dividends already paid on the Preference Shares. The net total of these dividends amounts to £614,736 (1955 £614,563). It is further recommended that £70,000 be allocated to Employees' Funds and £500,000 to the General Reserve, both as last year. Of the balance, £237,336 has been retained in the books of Subsidiary Companies and £97,650 has been carried forward by the Parent Company.

In the Statement accompanying the 1955 Accounts reference was made to representations concerning the small proportion of the total Dividend on Ordinary Shares distributed as Interim Dividend and accordingly the Directors recommended in March last an Interim Dividend of 6d. a share, which compared with 3d. a share in previous years. In the notice accompanying the recommendation it was explained that this increase would have no influence on the total Dividend for the year and in the event it has been set off against the Final Dividend with the result that the total Dividend for the year is the same as for the previous year.

THE MOTOR TRADE

During the year covered by the Accounts a most significant change overtook the Motor Car Industry which resulted in its demands on the Company being substantially reduced. On the other hand the Heavy Vehicle Industry remained stable in its requirements and there was an increase in the demand for Aircraft Equipment. Service requirements for both vehicle and aircraft equipment, spares and accessories were fully maintained throughout the year.

The mood of the Motor Car Industry at the outset of the financial year was one of optimism and expansion of the kind that had prevailed almost without a break since the end of the war. The principal manufacturers had embarked on expansion schemes designed to increase the total productive capacity of the industry by a further 50 per cent over the previous year's record total and half of this increase was expected to materialise during the year. The first six months did indeed show an improvement of 15 per cent over the first six months of the previous year, but then came the change and in the second half of the year production in fact fell to 12 per cent less than in the corresponding period. The reasons for the change are well known. Firstly, import restrictions imposed by Australia and New Zealand—the British Motor Industry's best overseas customers—reduced overseas shipments. Then at home came the higher rate of purchase tax, credit restrictions and increased hire purchase deposits. It is not possible for large factories engaged on making complicated engineering products like modern motor cars and employing many thousands of people, to change direction as rapidly as Governments can issue restriction orders or raise Bank rates. Over-production was inevitable during the period of re-adjustment and the position was made worse by uncertainty as to the eventual level of demand that would arise under the new conditions. Manufacturers of motor cycles, the equipment for which provides an important section of our business, were similarly affected.

Our own factories producing motor car equipment were working at record levels of output until January and schemes of expansion were under way to provide the capacity that our customers anticipated they would need later. By the end of July, however, our output had been reduced by no less than one third, due to the lower demand from the vehicle manufacturers and to the necessity for reducing our own stocks which, while only adequate for the previous high level of activity, suddenly became quite disproportionate to the contracting demand. The period of re-adjustment was not completed within the financial year and the current year opened in August with a rate of output for motor car equipment only half that of January last. The consequence of the change has been most unfortunate. It was necessary to give notice to large numbers of workers in the factories and offices and to discontinue all overtime working. We believe that those workpeople who had given loyal service to the Company but were now unhappily affected, appreciated the efforts we made to minimise any hardship involved.

Another unfortunate result of the fall in demand has been the worsening effect on our manufacturing costs. We were already finding difficulty in meeting the rising costs of materials and wages, which had increased at a rate which could not be offset by improved methods or other manufacturing economies. Only the growing volume of output in the early part of the year enabled us to trade profitably without seeking price increases of a substantial nature. The fall in demand in the second half of the year led us immediately into a trading loss in this section of the business. Recourse to major increases in our selling prices would be violently resisted by the Motor Car manufacturers for whom further increases in the costs of materials or wages would have the most unfortunate repercussion on their fortunes particularly in the export markets. Our manufacturing activities have now been contracted and rigorous economies are being instituted while, at the same time, we are continuing to raise the productivity of materials, plant and people so that we can continue to give the fullest possible support to our customers in the face of present-day difficulties.

The immediate outlook for the future of the Car Industry, apart from any short term effects of petrol rationing, is clouded by the increase in purchase tax to 60 per cent and the restrictions on hire purchase transactions together with the credit squeeze. All these measures were taken with the object of reducing home sales and in this they have certainly succeeded. In 1955 there were over 6½ million vehicles on the roads on which £485 million was paid in purchase tax, petrol tax and licence fees. In 1956, with the increase in purchase tax, more still will be paid and the owner of a new car must anticipate paying on the average nearly £2 a week in taxes; nevertheless, the possession of a motor car is a well recognised index of a family's standard of living and it has been said that the ownership of a car ranks higher than almost anything else on the priority list of most families. Even in June this year despite all restrictions there were 40,000 new registrations in this Country. This is remarkable when it is realised that a private purchaser of a £400 car has to find an additional £200 for purchase tax and if he wishes to use hire purchase has to find half the total cost in cash for the initial payment.

Whilst on the subject of taxation we cannot help but remind ourselves that, in spite of this penal taxation on road vehicles, we still remain the only industrial country, large or small, that does not possess a single inter-city trunk road worthy of the name capable of reducing the cost and improving the efficiency of road transport.

In spite of all the difficulties that assail the Motor Industry due to the struggle against inflation at home and the increasing competition abroad, which comes particularly from Germany with France and Italy also taking advantage of any opportunities that arise, there are nevertheless very good grounds for optimism when we look further ahead. The Industry has complete confidence in its future. It has always been vigorous and adaptable and it has never lacked confidence. Effect is still being given to its major schemes for expanding and providing for more efficient production; these additional facilities will become fully effective when restrictions are eased at home and overseas demands increase.

COMMERCIAL VEHICLE INDUSTRY

The Heavy Commercial Vehicle Industry has established an extremely good name in export markets for the quality and performance of its vehicles and as a result it has maintained its position and trade overseas. In the Light Commercial Vehicle field there has been still further extension of the use of diesel engines, bringing increased demands

on us for fuel injection equipment. We also supply fuel injection equipment, lighting, starting and brakes for tractors and although the production of these vehicles fell during the year, this was due in part to a change-over in models. Two-thirds of all the tractors made in this country are exported and it is anticipated that overseas demands will increase in the coming year.

It is remarkable that in spite of the adversities met in the second half of the year and the changed conditions that these brought, the export achievements of the British Motor Industry were a record, the value of total exports of vehicles, components for assembly, spare parts and accessories being 14 per cent higher than in the previous year. This Company's own direct exports were fully maintained. Our overseas Subsidiaries engaged on manufacture, distribution and servicing of our products now employ more than 2,000 people and we are represented in all parts of the World.

AIRCRAFT INDUSTRY

In the Aircraft Equipment field, in which we employ more than 10,000 people, the demands on us have been more than maintained in spite of the reduction in the armaments programme. This has been in part due to the success of British aircraft and British turbine engines which power the great majority of Commonwealth, American and Foreign civil aircraft.

The experience that we have gained in the application of combustion and fuel control to aircraft engines is now also being directed, as mentioned in a previous report, to marine, industrial and domestic purposes. In order to further this development, a subsidiary sales Company has been formed with the title of Joseph Lucas (Hydraulic and Combustion) Limited. While it is not anticipated that the growth of this new activity can be other than slow, some promising applications have already been made. In particular, work has been carried out in conjunction with the Admiralty for naval vessels and an oil-burning installation using our equipment has been fitted on H.M. Yacht *Britannia*. We have been informed that the cleanliness of combustion and the absence of smoke attained by this vessel when fitted with our equipment have set an entirely new standard.

The various activities of the Company are supported by well established development, design and research groups staffed by 2,000 engineers, draughtsmen and laboratory personnel. The greater part of the work of these groups is in improving and adapting the design of existing products but much has been achieved in developing entirely new devices for the aircraft and road vehicle industries and in this connection it will be seen from the Notes to the Accounts that during the year over £150,000 was received for Royalties and Foreign Manufacturing Rights. An insight into the range of activities in which one of our groups is involved can be gained from the brochure entitled "Into the Jet Age" issued with the Accounts.

In a year when industrial problems of exceptional difficulty were faced the Company has had reason to be most grateful for the loyal and consistent support received from employees and particularly from those of its workpeople who were among the first to suffer from the change in fortune of the Motor Car Industry.

Finally, the Shareholders will be pleased and honoured to know that by command of The Queen, the Company has been appointed, by Royal Warrant, suppliers of Electrical Equipment to Her Majesty.

The Directors' report was adopted.

HEENAN GROUP LIMITED

RECORD OUTPUT ACHIEVED

MR CHARLES HILL REPORTS ANOTHER GOOD YEAR

The fifty-fourth annual general meeting of Heenan Group Limited was held on December 17th at Worcester Engineering Works, Worcester, Mr Charles L. Hill (the Chairman) presiding.

The following is an extract from his circulated statement:

It is my pleasure to report that for the first time in the Company's history the profits have passed the half-million mark. The Group net profit, before taxation, of £505,900 compares with £449,485 last year. After deducting taxation of £282,369 against £232,449 and outside shareholders' minority interest of £22, the net profit of the Group is £223,509 which, at the same level, compares with £217,009 in 1955.

In 1955 the balance of orders increased by one-third to £5,750,000; at the close of this year the Group order books stood at £5,450,000. This is no mean achievement having regard to the record output of the Group and to the inclusion in the previous year's figures of two very large contracts.

Commenting on why relatively large sums were appropriated to General Reserve each year, Mr Hill said that inflation was the reason and was in effect a provision against the fall in value of the £. He continued: Any other policy would result in the works of the Group being left in due course with worn-out and obsolete plant and machinery.

SCRIP ISSUE PROPOSALS

The General Reserve with this year's appropriation of £150,000 now stands at £860,000. On previous occasions I have referred to the policy of the Board of financing the Group's high level of trading out of its existing resources and it remains the intention of the Board to continue this policy for as long as circumstances permit without recourse to the raising of further permanent capital for that purpose. The Reserves are, however, fully tied up in fixed assets or in providing essential working capital and, with a view to bringing the issued capital more into line with that employed in the business, your directors propose to capitalise part of the Reserves by the issue of new Ordinary Shares of 5s. each, credited as fully paid up, on a one-for-one basis. Treasury consent has been given to these capitalisation proposals.

I must make it clear that this issue does not in itself imply an increase in the effective rate of dividend; your directors will consider next year's profit on its merits with regard to all the circumstances at the time.

In this respect I add a word of warning. It is becoming increasingly evident that the continuous rise in costs over a number of years is now having its effect on profit margins; buyers in overseas markets and at home are resisting price increases and it is frequently the case of a sale at a low profit or no sale at all. The operating subsidiaries in the Group have been making every effort to reduce costs of production by all possible means, including the redesign of products, improved methods of manufacture and the installation of new machine tools, as it is only in this way that they can maintain their position in the world's markets.

SUBSIDIARIES

All the operating Companies have contributed to the Group profits.

Heenan & Froude Ltd. The Engine Test Plant Section has made further progress in its development programme and, in particular, the prototype of a new streamlined dynamometer of entirely novel design has been built which will eventually replace the existing range of the smaller hydraulic dynamometers. Plant completed during the year included a Helicopter Engine Test Plant of unique design, an advanced type of Chassis dynamometer which should prove of wide interest to the motor and oil industries, and eight electric dynamometers to operate at a very high degree of accuracy. Deliveries of, and new orders for, engine test plant of all types have been at high levels.

Sales of Eddy Current Couplings have again increased substantially. Automation calls for more complex methods of control and synchronisation which these couplings with their electronic control equipment are well able to satisfy. Water-cooled Couplings have been added to the range.

With a view to facilitating production and increasing efficiency, the Automatic Machine Section has reduced the range of Automatic Wire and Strip forming Machines from eighteen to six standard types by revising and producing new designs.

The Municipal Engineering Division has been fully engaged on existing contracts and in preparing new schemes for refuse disposal and incinerator plants for Municipal authorities and in the industrial field.

IMPROVED PRODUCTION

Fielding & Platt Ltd., have improved their production during the year under review and continue to receive valuable orders both for the home and export markets. The Company is making a very useful contribution in the field of special purpose equipment associated with the industrial applications of Atomic Energy and recent orders in this field have been encouraging.

The record tonnage output achieved last year by Court Works Ltd., has been maintained.

The Stafford Works of W. G. Bagnall Ltd. have concentrated during the past year on the design and production of Diesel mechanical shunting locomotives. Seventeen have been ordered by New Zealand Government Railways and seven are now being built for the National Coal Board.

Orders received by Morton Machine Co. Ltd., during the year were the highest in the history of the Company and equipment has been exported to sixteen countries.

Orders received by Industrial Waste Eliminators Ltd. during the year were not far short of the previous year.

A satisfactory year has been recorded by Associated Locomotive Equipment Ltd., for whose precision equipment there has been a continuous demand from home and overseas railways.

The report was adopted and the capitalisation and scrip issue proposals sanctioned at an Extraordinary General Meeting.

OK BAZAARS (1929)

(Incorporated in the Union of South Africa)

SATISFACTORY TRADING RESULTS

SUBSTANTIAL INCREASE IN TURNOVER

NEW BRANCHES OPENED

The twenty-seventh annual general meeting of OK Bazaars (1929), Limited, will be held on December 31, 1956, at Johannesburg.

The following is an extract from the circulated Report of the Directors on the accounts for the year ended June 30, 1956:

CAPITAL

During the year under review, the Authorised Capital of the Company was increased by £520,230 by the creation of 300,000 6 per cent Redeemable Fourth Cumulative Preference Shares of £1 each, 495,920 Ordinary Shares of 5s. each, 100,000 "A" Ordinary Shares of 5s. each and 285,000 "B" Ordinary Shares of 5s. each. The Issued Capital of the Company was increased by £493,656 comprised of Preference Share Capital £300,000 and Ordinary Share Capital £193,656. Of the increase in the Issued Share Capital, 190,396 Ordinary, 66,666 "A" Ordinary and 236,733 "B" Ordinary Shares were allotted pursuant to the offer made on February 4, 1956, to Shareholders to subscribe for one new Ordinary, "A" Ordinary or "B" Ordinary Share for each six Shares held in the respective classes. The 300,000 Redeemable Fourth Cumulative Preference Shares and 140,415 Ordinary and 140,415 "B" Ordinary Shares were issued in exchange for the Preference and Ordinary Shares respectively in CTC Bazaars (South Africa) Limited in terms of an offer made on February 7, 1956. The revised Capital structure is set out in detail in Note 2 attached to the Accounts and the above-mentioned allotments are subject to the qualification referred to in Note 1.

PROFIT

The net profit of the parent Company for the year under review after providing for all expenses and taxation was £943,800 as compared with £847,906 for the previous year. The amount available for allocation and appropriation in the accounts of the parent Company has been dealt with as set out below:

1955		£	1956 £
2,174,168	Balance brought forward from previous year		2,114,257
847,906	*Add:* Profit for the year		934,800
3,022,074			3,058,057
	Deduct: Preference dividends	57,400	
	Interim dividend of 20 per cent declared June 19, 1956, since paid	168,870	
	Interim dividend of 5 per cent declared November 20, 1956, payable December 29, 1956	42,218	
187,539			268,488
2,774,535			2,789,569
400,000	*Deduct:* Transfer to capital reserve		350,000
2,374,535	Balance which your directors recommend be dealt with as follows:—		2,439,569
	For the payment of a final dividend of 35 per cent on January 31, 1957, (making a distribution for the year of 60 per cent) to holders of Ordinary, "A" Ordinary and "B" Ordinary shares		295,523
2,114,257	Balance to be carried forward		2,144,046

The interim dividend of 5 per cent payable on December 29, 1956, was declared to avoid the incidence of Undistributed Profits Tax.

CONSOLIDATED ACCOUNTS

Shareholders are referred to the Consolidated Accounts of the Company and its Subsidiaries, which show the position of the Group as a whole. The Consolidated Net Profit, after deducting all expenses, taxation, interests of outside shareholders and preliminary expenses of certain subsidiary companies, is £1,153,283, which compares with £1,109,165 for 1955. The 1955 figure included an amount of £133,682, being a capital profit realised on the disposal of certain fixed assets. The net addition to Capital Reserve of £294,676 is explained in Note 3 on the accounts. The Capital and the Reserves which represent the interests of Ordinary Shareholders have been increased from £7,604,441 in 1955 to £9,547,096 in 1956 and the total shareholders' interests from £8,644,441 to £10,887,096. The increase in the value of fixed assets is due to the purchase of land, the erection of buildings, the equipment of new branches and the modernisation of existing stores. The provision for replacement and renewal of fixtures and for modernisation and maintenance of shop premises and equipment has been increased from £139,908 in 1955 to £241,758 in 1956. Trading stocks are £5,349,789, a decrease of £248,783 on the 1955 figure, notwithstanding the opening of new branches and a substantial increase in turnover. There has been no change in trade investments during the year.

CTC Bazaars (South Africa) Limited.—Your Company now owns the entire issued share capital of CTC Bazaars (South Africa) Limited, being 300,000 5½ per cent Cumulative Preference Shares of nominal value £1 each and 3,099,240 Ordinary Shares of nominal value 5s. each. The premium arising from the exchange of shares in CTC Bazaars (South Africa) Limited not previously held by the Company has been credited to "Share Premium" account. The trading results of CTC Bazaars (South Africa) Limited for the year ended June 30, 1956, showed a slight improvement on the previous year, but as that company is now a wholly-owned subsidiary, no dividend has been declared on the ordinary share capital.

DEVELOPMENT

Since the last Directors' Report, new branches have been opened at Worcester in the Cape Province, Virginia in the Orange Free State and Springs in the Transvaal; the last-mentioned branch replaced the small store in which we have traded for many years. In October, 1956, the extensions to our Vanderbijl Park, Transvaal, branch were completed and the trading area doubled. A new branch was opened in November, 1956, at Kimberley in the Cape Province, where previously we operated in leased premises which were inadequate. The Company has also purchased a number of building sites for future expansion and development and special reference is made to the purchase of the quarter acre corner, known as Heath's Buildings, adjoining the Johannesburg premises, which will enable the Company to expand the store at a later date to cover the entire acre block.

The modernisation of our shops continues to be an important part of our trading policy and accordingly additional provision has been made in the Company's accounts. Sites have been purchased at Port Elizabeth, Salisbury and East London adjoining the properties that are on long term leases from Federated Stores Limited, with the intention of enlarging the branches at those centres. Arrangements have been made with Federated Stores Limited for the acquisition of these sites, for the erection of buildings thereon and for leases to run concurrently with the existing leases. In the Welkom area of the Orange Free State we have enlarged our store premises. One of the native trading stores in this area which was leased has, since the close of the accounts, been sold at a profit.

MANAGEMENT AGREEMENT

In terms of the Agreement approved by shareholders at an Extraordinary General Meeting held on October 5, 1951, Federated Stores Limited was appointed Manager and Consultant to the Company for a period of five years from July 1, 1951, and made available to the Company the services of Messrs M. Miller and S. Cohen as Joint Managing Directors. The Agreement has been renewed by mutual consent of the respective Boards for a further period of five years from July 1, 1956.

DIRECTORS

The retiring Directors are Messrs A. Schwarz and L. M. Miller, who being eligible, offer themselves for re-election.

GENERAL

We again take this opportunity of complimenting South African manufacturers on the

continued improvement of their products which constitute the major portion of our requirements.

Steps are being taken to bring the Company's Articles of Association up to date and a notice convening an Extraordinary General Meeting for this purpose will be sent to shareholders at a later date.

The progress of our organisation and the satisfactory trading results could not have been accomplished without the co-operation and the efficient services of our employees. We continue to give attention to the improvement of staff amenities and we take this opportunity of extending to all members of the staff our thanks and appreciation for their services. This year, as in previous years, bonuses were paid to the staff.

THE BRITISH MOTOR CORPORATION, LIMITED

POLICY OF EXPANSION

SIR LEONARD LORD'S STATEMENT

The fifth annual general meeting of the British Motor Corporation, Limited, was held on December 18th at Longbridge Works, Birmingham, Mr G. W. Harriman, CBE, deputy chairman and joint managing director, presiding in the absence of Sir Leonard Lord, KBE, chairman and joint managing director.

Mr Harriman, addressing the meeting, said: I am sure I can speak for everyone here today if I say how much we miss Sir Leonard Lord. I am pleased indeed to tell you that he has been at one or other of our various factories every day, but he is not undertaking any public duties at the present time.

The following are extracts from his statement circulated with the report and accounts for the year to July 31, 1956:

I bid you welcome to Longbridge in these new attractive surroundings. This building became essential to enable us to exhibit on one floor the great range of products from our factories, and as a fitting place to entertain visitors from home and overseas.

Conditions have changed radically during the past year. The sky has become overcast with restrictions designed to discourage customers. Viewed against this sombre background our results are far from disappointing.

Production for the year was 439,558 vehicles. Of these 252,412 were for the Home market, and 187,146 were exported. In our previous financial year we produced 418,705 vehicles.

The effects of the credit squeeze began to be apparent in January. From then we had to reduce the rate of production.

It is a tribute to the resilience of the Corporation's structure that we were able to continue until the end of June without any reduction of the labour force. When we came at last to the regretful decision that redundancy was unavoidable the majority of the employees faced the situation with understanding and loyalty, for which I now wish to express gratitude.

OVERSEAS ACTIVITIES

Progress in Export markets was hindered by widespread credit and import restrictions. In New Zealand we suffered a one-third cut in import quotas for 1956. In Australia, successive reductions of quotas have reduced the value of our exports by 52½ per cent since March, 1955.

Fortunately there is another side to the picture. Our factories at Sydney, in which we have an investment of £5 million, have begun the manufacture of "B" type engines and transmission units. We have planned for an output of 1,000 cars a week in Australia, and as soon as the presses are installed for the production of body panels in the new Sydney factory, our locally produced vehicles will be almost 100 per cent Australian.

In South Africa the plant is operating most efficiently. Output for the year was 3,053 units. South Africa is one of the few markets where there is an increase of import quotas for 1957.

To the USA and Canada we exported 22,756 cars, an increase of 22.7 per cent. Our cars secured over 56 per cent of the total registrations of British vehicles in the USA for the eight months to the end of last August.

SUCCESSFUL NEW MODELS

In the year under review we introduced two new models which have proved very successful. The first was the Austin "105," a high performance version of the popular A.90 with many desirable extra features including overdrive. The second was a light commercial vehicle of 15 cwt capacity, known as the J.2 in the Morris range and A.152 in the Austin range. This model enjoyed instantaneous success and our production resources are straining their utmost to meet demand.

We have made real progress in supplying Replacement Parts. We have been involved in the major operation of consolidating the entire Parts organisation in a new building at Cowley. With this centralisation almost accomplished I am confident of our ability to meet all demands from anywhere in the world.

FUTURE DEVELOPMENT

With the present political and economic uncertainties, it is neither easy nor wise to predict the course of events. We may ask whether we have been wise in embarking on a programme of further development. The Report shows a capital expenditure for the year of £9,157,000 and a further commitment of £6,820,000.

Never in the past, viewed over a reasonable period, have we been wrong in pursuing a policy of expansion.

We have had a very successful Motor Show, and are leading the British motor industry and the Continent in the adoption of 2-pedal control on popular models. We have greatly improved the small cars by equipping them with larger engines of higher efficiency, which will enable them to surpass the performance of their Continental rivals.

Another notable event was the opening in April of our new Training College near Warwick. We are optimistic that in this development we have the means of ensuring that there will be, for promotion from within our organisation, the right type of executive ability to shoulder the responsibilities of the future.

The report and accounts were adopted.

HARRIS LEBUS LIMITED

SATISFACTORY RESULTS

The ninth annual general meeting of Harris Lebus Limited was held on December 18th in London, Sir Herman Lebus, CBE, JP (chairman and managing director), presiding.

The following is an extract from his circulated review for the period of 52 weeks to July 13, 1956:

The accounts show a profit of £607,724 after providing for all charges, including depreciation, compared with £653,501 for the 52 weeks to July 15, 1955. The proposed Ordinary dividend is 9 per cent, less tax.

The difficulties which have beset the furniture industry have had some effect on the activities of your Company which have suffered as a result, although, in the light of the general experience of the industry, the results shown must be considered most satisfactory.

In October, 1955, purchase tax at the rate of 5 per cent was imposed on furniture. In February, 1956, the Chancellor increased the bank rate from 4½ per cent to 5½ per cent. The minimum deposit required in respect of hire purchase agreements for furniture was increased from 15 per cent to 20 per cent with effect from February, 1956, no deposit having been required prior to February, 1955. Thus, in the space of one year furniture has been subjected to both purchase tax and hire purchase restrictions.

These restrictions should be accepted for the time being as in the national interest and, accordingly, for the ultimate good of the furniture industry itself. We do hope, however, that the time is not far distant when the Chancellor will feel justified in taking steps towards the gradual relaxation of these restrictions.

INCREASED TURNOVER

Although the industry has suffered considerably, the high standard of value and reliability of LEBUS FURNITURE has ensured that, in spite of a decrease in the total furniture market, the turnover of your Company in the year under review has increased, as has its share of the available market.

Development and construction of machinery to our own design and specification in our own engineering shops to suit the needs of improved methods of production have continued. Research into the latest techniques of the use of materials and methods of construction has been stepped up. In both these ways your Company maintains the lead in the technical side of furniture manufacture which it has enjoyed for many years.

Your Board decided that until contemporary furniture of outstanding design and value could be produced by your Company in adequate quantity, it would refrain from entering this rather specialised market. During the year a range of furniture, bearing the Company's trade name "LINK," was introduced and advertised in the national Press. The results of this campaign have been gratifying.

In a year characterised by increasing costs and increasing Government restrictions on consumption, I am gratified to report the results shown by this year's figures and that we have been able to maintain the dividend and to make provision for developments that the Company has in hand in the long-term interest of stockholders and employees alike.

The report and accounts were adopted

TURNER & NEWALL LIMITED

HIGH LEVEL OF TRADING AND MANUFACTURING ACTIVITY

INCREASED VOLUME OF EXPORT BUSINESS

SIR WALKER SHEPHERD'S REVIEW OF WIDESPREAD OPERATIONS

The Annual General Meeting of Turner & Newall Limited will be held on January 8, 1957, at the Chartered Accountants Hall, Manchester, when it is expected that, in the absence of the Chairman of the Company, Sir Walker Shepherd, on business in North America, the Deputy Chairman, Mr H. Hanson, will preside.

Sir Walker Shepherd's Statement to the Stockholders has been circulated to them with the Report and Accounts and, after dealing with the Accounts of the Company, it contains a detailed review of the Company's operations during the year to September 30, 1956, both at home and abroad.

The following are extracts from the Statement:

I wish to refer to the death of Sir Samuel Turner, LLD, JP, which took place in December of last year at a date subsequent to the issue of our last year's report, but before our Annual General Meeting in January 1956. Sir Samuel Turner was an original Director of this Company on its formation in 1920, and was its Chairman from 1929 until 1944, when he retired from executive duties. During the whole of his very lengthy connection with the business, he was outstanding in ability and devotion to duty, and was a wise and skilful leader, inspiring all those with whom he came into contact. Even after his retirement from executive work, and later during the long period of his final illness, he continued to take a lively interest in our affairs. The Board have lost a great friend, and we shall miss him for a long time.

ASBESTOS TEXTILE PRODUCTS

On the Asbestos Textile side a high level of trading and manufacturing activity has been maintained at the Rochdale factory of Turner Brothers Asbestos Company Limited for the greater part of the year, although a slight downward tendency became apparent towards the end of the period. In view of encouraging indications of increasing demand in various directions, this may be reversed during the current year, but much depends on international developments, as this Company has an important stake in export markets. Demand for the Company's belting products also fell away to a limited extent during the latter part of the period, but the results for the year as a whole in this field have been satisfactory, while prospects for the current year have been enhanced by a substantial contract from the National Coal Board for fire-resisting conveyor belting.

Good progress has been made with the modernisation and enlargement of the factory at Rochdale, the benefits of which are now beginning to be felt. In addition, the new asbestos textile and plastics factory at Hindley Green is coming into commission, with the planned transfer of various processes from Rochdale and from the Leeds factory of J. W. Roberts Limited. There will be increased production of "Durestos" resinated asbestos moulding materials from this factory early in 1957. Production of asbestos textiles and processed fibre at the Leeds factory of J. W. Roberts Limited has been pressed throughout the year to the limit of its capacity, which has been temporarily enlarged. Progressive relief will, however, be afforded by the above-mentioned transfer of manufacturing processes to Hindley Green.

Further progress has been made with the development of Sprayed "Limpet" Asbestos, notably in overseas markets, and also (despite transitional difficulties) with the "Ferobestos" range of technical plastics taken over from Ferodo Limited. The construction of new premises for J. W. Roberts Limited, near Bolton, is now well in hand. In both these Companies, much effort has been devoted during the year to related research and development activities, which are of crucial importance to their future growth. Further attention has also been given, with success, to the application of work study methods to factory operations.

RECORD "FERODO" SALES

It is gratifying to be able to report that the sales of "Ferodo" brake and clutch linings were the highest ever recorded, increases being shown in both home and export markets. There was, however, a reduction in demand during the latter part of the year due to the lower output of motor vehicles, and profit margins were affected by rising costs which were not passed on to customers. The immediate outlook in the home market is still uncertain, but research and development work have continued very actively and new materials have been developed which it is confidently expected will help to strengthen the position of the Company. The increase in exports is especially satisfactory in view of the transfer of the "Ferobestos" range of technical plastics to J. W. Roberts Limited. In spite of import restrictions in certain countries there are good prospects of further expansion. Sales of "Ferodo" stairtreads and railway brake blocks showed satisfactory progress, and a large three-year contract for the latter has been obtained from the New South Wales Railways, which is the first time that non-metallic blocks have been used by any Commonwealth railway.

ASBESTOS CEMENT CO.

The six factories of Turners Asbestos Cement Company Limited have operated at a high level of activity and the results reported by this member of the Group compare favourably with those for previous years. This Company manufactures a wide range of products for the building and civil engineering industries under the trade marks "Everite," "Turnall" and "Poilite," and for the electrical industry under the trade marks "Sindanyo" and "Silluminite"; products carrrying these marks have an excellent reputation and demand for them has been well maintained both at home and abroad. As was expected, conditions in overseas markets became progressively more difficult and in these circumstances the fact that export turnover increased once again is noteworthy; included in this turnover is an order for over five hundred miles of "Everite" asbestos cement pressure pipes for water mains in Egypt, which was completed and despatched during the year. Improvement of plant and methods of production is one of the main objectives of the Company, with the result that expenditure under these headings will continue as new developments are translated from research to manufacturing processes. Current trading is being affected at home and abroad by many factors which are outside our control, but the Company is in a good position to take full advantage of every available trading opportunity.

WASHINGTON CHEMICAL CO.

Whilst the results achieved by The Washington Chemical Company Limited were on the whole satisfactory, there was a temporary decline in the consumption of some of its products by certain industries in the home market. Trading conditions overseas remain very competitive but, nevertheless, the sale of the Company's chemical goods almost attained the level of the previous year. Newalls Insulation Company Limited has again experienced a lively demand for its services and products, with the result that the record figures reported last year were exceeded. The Land and Marine Departments completed many large contracts during the year, and were again entrusted with important insulation work on several power stations, an atomic power plant, passenger liners and tankers. In the export field the sale by Newalls of its well-known magnesia and asbestos insulations exceeded very substantially the figures of the previous year.

INCREASED VOLUME OF EXPORTS

As our manufacturing companies located in the United Kingdom export to so many widely differing overseas territories and industries, their experience during the year has naturally varied in detail but, regarded as a whole, the volume of export business was in excess of the satisfactory figures of the previous year. Continuation of this favourable position will depend, in part, on the political situation which, in certain circumstances, could result in the cancellation of some of the contracts and orders already received.

DIVIDEND RECOMMENDATION

This year your Board recommend a final dividend of 22½ per cent on the Ordinary Stock making, with the interim dividend of 5 per cent already paid, a total distribution of 27½ per cent for the year. This compares with last year's total distribution of 25 per cent and your Directors consider it to be satisfactory. Trading profits are slightly up on those of a year ago but prevailing National conditions counsel restraint in many directions. Your Board have, nevertheless, felt justified in recommending this modest increase in dividend after taking all relevant factors into account.

THE OUTLOOK

In my statement of last year, I indicated that we expected that for the first half of this year our organisation would remain highly prosperous, but that we could not see clearly, at that time, what was likely to happen in the second half of the year. The trading for the second half of the past financial year was at a somewhat lower level than

the first half, but the difference was not significant, and a modest decline in volume obtained by our companies operating in the United Kingdom was more than offset by increased prosperity in our overseas companies. As regards the immediate future, we anticipate that the Group will remain prosperous but at a level which, so far as we can see at present, is likely to be rather lower than that which we have experienced during the past two years. With so many uncertain factors at the moment, both nationally and internationally, it is not possible to be more specific, but we are continuing to expand wherever an appropriate opportunity presents itself, and we have no fears for the future, which should give us good results even though somewhat below the record levels of the past few years.

KENDALL AND GENT LIMITED

(Machine Tool Makers)

SATISFACTORY VOLUME OF ORDERS

The ordinary general meeting of Kendall and Gent Limited was held on December 14th at Victoria Works, Manchester.

Mr F. C. Mosley (Chairman and Managing Director) presided, and in the course of his speech, said: The net profit is £78,239. We are again making full provision for taxation by reserving the sum of £37,000, and your Directors recommend placing £10.000 to General Reserve Fund. With regard to the Subsidiary Company, we are glad to report another successful year.

This year the 5 per cent interim and total 20 per cent dividend is paid on the whole of the new capital of £200,000.

TRADING CONDITIONS

This year was one of the most difficult, and results were seriously affected by the non-ability to obtain the skilled labour which is essential for our products. We also suffered severely from a shortage of materials which was most pronounced in the early part of the year.

Had we been able to keep up deliveries against orders "on hand," instead of having the machines still as "work in progress," the results would have been much happier.

Your Board is pleased to report that in spite of increased trading difficulties due to foreign competition, the order book has been maintained at a satisfactory high level. Increasing costs, due to annual wage awards are, however, making it difficult to meet competition, particularly in overseas markets.

I referred last year to the difficulties we were experiencing in overseas markets, and though these difficulties are still with us, we are glad to say that the present position is slightly better than a year ago. We must not forget that we are members of a very large selling organisation, which is most ably represented in all overseas markets, and your Board feel confident that, if we can only obtain stabilisation of costs, we shall receive our fair share of overseas business.

Regarding the balance of orders "on hand," I am glad to say that the orders received during the year have exceeded the Works output, and since the close of the financial year the Board, having regard to all the circumstances, consider the orders received to be satisfactory.

The report was adopted, and the total distribution of 20 per cent for the year was approved.

J. GLIKSTEN & SON

(Timber Producers and Importers)

EXPORT TRADE EXPANSION

The fifty-first annual general meeting of J. Gliksten & Son, Limited, was held on December 19th in London, Mr S. G. Gliksten (chairman and managing director) presiding.

The following is an extract from his circulated statement:

The Group's revenue from trading amounts to £855,933 compared with £972,051 last year. The net profit remaining after taxation is £261,630 which is adequate, after meeting the Preference Dividend, to provide substantial transfers to reserves and to maintain the dividend on Ordinary Stock at 35 per cent, as last year.

Consolidated Balance Sheet: Current Assets exceed Current Liabilities by £2,221,905 which is a ratio of nearly 2½:1. There is no substantial alteration in stocks and debtors but current liabilities have been reduced by nearly £300,000. Bank overdrafts have been reduced and further reductions have been made since the close of the financial year, which achievement in present circumstances may be regarded with considerable satisfaction.

Despite the credit squeeze we have been able to finance and develop our business and yet comply with the Government's expressed wish that bank accommodation should be reduced by 10 per cent overall. A careful review of our known and estimated requirements during the next year indicates that the resources at our disposal should be adequate to finance the Group's business.

GENERAL SURVEY

Trading conditions during the past year have again been difficult and highly competitive, although the Group turnover in terms of money and volume of goods was approximately the same as during the previous year. The fall in Group profits was mainly accounted for by a disastrous fall in the price of imported plywood by upwards of 25 per cent. As a result stocks and goods arising from forward contracts had to be sold or written down to prices considerably below cost. I feel that this market has now reached stability, although it is understood that producers' prices are hardly sufficient to cover the cost of production.

In the Gold Coast production of logs and lumber was 20 per cent in excess of last year's record figures, and with our plant and equipment there in excellent condition I anticipate an even greater production during the coming year.

Our Mahogany and Pine operations in British Honduras were also extremely satisfactory, although the Pine production was somewhat lower than in the previous year owing to inclement weather conditions. With the demand for this lumber in the Caribbean areas constantly increasing, we hope to step up our production to meet our customers' requirements.

Our export trading continues to grow and sales to overseas territories during the last year were considerably in excess of £1 million, whilst sales to the dollar area were in excess of $1 million.

During the period since the close of the Accounts turnover has been in accordance with expectations and trading results continue to be satisfactory.

The report was adopted.

CALOR GAS HOLDING COMPANY, LIMITED

INCREASED TURNOVER

The eighth annual general meeting of the Calor Gas Holding Company, Limited, was held on December 17th, in London, Mr W. L. M. O'Connor, CBE, chairman, presiding. The following is his circulated statement for the year to July 31, 1956:

You will see from the Consolidated Profit and Loss Account that the profits amount to £486,853 after charging £418,354 for depreciation as compared with a profit of £543,187 after charging £374,328 depreciation for the previous year. Taxation on the profits for the year amounted to £209,772.

The Directors have transferred £61,800 to Special Reserve in respect of Investment Allowances and an explanatory note is given on page 10 of the report. The Directors have also transferred £125,000 to General Reserve, and this together with the transfer to Special Reserve and taking into account the increase in the Profit and Loss balance carried forward, namely £377, makes a total of £187,177 retained in the business out of the year's profits.

Our turnover has again increased in England and Wales, Scotland and Ireland, but in common with most businesses our expenses have also risen. During the year to July 31, 1956, the cost of new cylinders amounted to £563,760, making the total expenditure during the eight years to July 31, 1956, £3,107,000.

Our outstanding commitments for Capital Expenditure at July 31, 1956, amounting to £345,000, are considerably less than at July 31, 1955, and the reduction is due to the greater part of the cost of our new filling station and equipment at Millbrook, near Fawley, having been incurred during the year. In order to provide additional cylinders for the Company's continuing expansion it is always necessary to place contracts well ahead for their manufacture and this item accounts for the greater part of the Capital Commitments at July 31, 1956.

DIVIDEND 37½ PER CENT

The transfer of £125,000 to General Reserve brings the General Reserve Account up to £475,000, and a final dividend of 25 per cent is recommended, making with the interim a total of 37½ per cent for the year.

Turning to the Consolidated Balance Sheet you will see that the Current Liabilities and Provisions have increased by £335,900 and that they exceeded current assets by £72,199 as compared with an excess of current assets of £340,836 at July 31, 1955. This position has been brought about by the heavy capital expenditure during the year on new cylinders and on the new filling station at Millbrook.

With regard to the current year, our new filling station at Millbrook which commenced filling in May, is now in full operation. Sales since July 31, 1956, compare favourably with the corresponding period of last year, although adverse credit conditions and hire purchase restrictions have made the task more difficult.

I do not think we shall feel the full benefit of our exceptional Capital Expenditure during the current financial year but in the absence of any unexpected change in trading conditions, I anticipate that we can again look forward to another satisfactory year.

The report and accounts were adopted.

AUSTRALIA AND NEW ZEALAND BANK LIMITED

SATISFACTORY RESULT OF YEAR'S OPERATIONS

SIR GEOFFREY C. GIBBS'S REVIEW

The annual general meeting of Australia and New Zealand Bank Limited will be held on January 9th in London.

The following are extracts from the statement by the chairman, The Honourable Sir Geoffrey C. Gibbs, KCMG, circulated with the report and accounts:

AUSTRALIA

Rapid national development continues in Australia and the past year has been one of buoyant business conditions accompanied by full employment and a high level of investment. The difficulties arising from an adverse balance of overseas payments, a high rate of private and public expenditure and the reappearance of inflation, to which I made reference last year, were accentuated in the current period. As a result, the resurgence of inflationary forces has been the dominant feature of the Australian economic scene during 1956.

One of the most encouraging features of Australia's economy in recent years has been the substantial capital imports, estimated to total nearly £A150 million during 1955-56.

The provision of capital to finance the current rate of national development remains one of Australia's greatest problems. This problem is very closely linked with inflation, and stresses the need for appropriate measures to reduce expenditure on current consumption and stimulate savings at home, while steps are taken to borrow abroad as much capital as can be obtained on reasonable terms.

Under the direction of the Central Bank, monetary policy has been designed to offset inflationary trends, and a broad objective of credit restraint has been followed by the trading banks. The liquid resources of the banking system declined under the influence of the adverse balance of payments. The Central Bank, in pursuing its policy of credit restraint, has not made any substantial releases from Special Account. Moreover, as a further measure of credit control, a liquidity convention has been introduced under which the trading banks are to maintain a certain agreed minimum ratio of liquid items (cash, including deposits with the Central Bank, treasury bills, and government securities) to total deposits. This is in addition to Special Account lodgments.

Advances of the major trading banks declined by £A44 million between September, 1955, and September, 1956, compared with an increase of £A88 million in the preceding 12 months. Deposits declined by £A11 million in the same period, compared with small increases of £A9.5 million in the preceding 12 months and £A87 million between September, 1953, and September, 1954.

In accord with the objectives of the monetary authorities, the trading banks have maintained a selective advance policy, endeavouring to channel advances particularly to those industries which would help to correct the adverse balance of payments by expanding exports or replacing imports. In addition, every effort has been made to direct borrowing of a long-term nature to sources of finance outside the banking system. It is clear that in existing conditions this general credit policy must be maintained.

NEW ZEALAND

Considerable progress in reducing inflationary pressures and in restraining excess demand for imports was made in New Zealand in the year under review, and the greater stability of prices and wages achieved in the previous year was maintained. Trade and business conditions nevertheless remained very active and capital expenditure reached new record levels.

There is cause for satisfaction that greater stability has been achieved without reversion to a greater measure of direct controls, but care is necessary to ensure that restrictive credit policies are not pushed too far.

Overseas assets of the New Zealand banking system were reduced to an uncomfortably low figure last December by the high level of imports which followed the removal of exchange control upon imports at the end of 1954, and by additional requirements to finance meat and dairy exports following the reversion to free marketing. These assets made a good seasonal recovery in the first half of 1956, and, at the end of September, were at about the same level as they had been twelve months previously. In response to more restrained demand, private imports were running at a rather lower level, although the reduction was not so great as had been hoped for. Nevertheless, adequate stocks of imported goods were held and it was felt that a continuation of current trends would restore a satisfactory balance in overseas accounts without recourse to direct controls.

New Zealand's record in gradually dismantling import controls in recent years has been outstanding, and although some difficult re-adjustments have had to be made in consequence, the move towards greater freedom is of major benefit to the community as a whole. In recent months an examination of remaining import restrictions has been undertaken as part of a complete overhaul of the tariff system.

In seeking to contain demand within currently available resources, the authorities have continued to favour overall strategic controls acting through the level of bank credit, the structure of interest rates and the composition of the national Budget as against the tactical and piecemeal physical controls which had formerly dominated the economy. Budgetary policy, however, and the structure of controlled interest rates, did not lend adequate support to the policy of credit restraint, so that a greater burden was carried by the latter than need otherwise have been the case. Better co-ordination is expected in the present year, for although government expenditure is to remain high, the trend in savings accounts has improved and the substantial oversubscription to a government loan floated in July indicates that the higher rates of interest now offered, ranging up to 4¾ per cent per annum for an 11-year term, have a public appeal.

ACCOUNTS

The significant improvement in our liquidity position, when compared with last year, is reflected by an overall increase of £A9 million in the aggregate of the first four items on the Assets side of the Balance Sheet. Investments show an increase of £A4 million, but the restriction in Advances which has been imposed in line with Central Bank policy has brought a reduction of £A20 million in Loans and Advances to Customers and it is unfortunate that we have to direct some of our energies to the unprofitable task of reducing this asset item. During the year under review import restrictions have taken effect as indicated by decreases in Bills Receivable and Remittances in Transit and Liabilities of Customers for Acceptances and on Confirmed Credits. Our Bank Premises figure has gone up by £A1 million as we continue our branch extension, but as I mentioned last year we are, in response to the Australian Prime Minister's appeal, slowing down our expenditure under this head for the time being.

On the liabilities side we show a reduction of £A11¼ million in Current, Deposit and Other Accounts, although fortunately this is more than offset by the amount of the broadly comparable item Depositors' Balances and Other Accounts in the Australia and New Zealand Savings Bank Accounts.

The profit (after taxation and transfers to contingencies accounts) amounts to £A1,005,909. Your Directors have felt justified in recommending a final dividend for the year of 8 per cent less tax, which, together with the interim dividend of 4 per cent already paid, enables us to maintain last year's increased distribution of 12 per cent less tax. We think there is no little cause for satisfaction in the year's results, especially in view of the considerable increases in expenses, in particular the salary increases in Australia and New Zealand which are due largely to award increments.

At the time of writing this statement it is even more difficult than usual to forecast the trend of profits during the current year, owing to the crisis in the Middle East. We can only hope that a satisfactory solution may be found to this issue and that there may be laid the foundations of a lasting peace in that area which is so vital to this country, Australia and New Zealand.

SAVINGS BANK

A wholly owned subsidiary company was registered to operate a savings bank under the name of Australia and New Zealand Savings Bank Limited, repayment of deposits being guaranteed by the parent company.

The response since the opening of the Savings Bank in January, 1956, is very gratifying. At the end of September last total deposits were £A22 million spread over some 135,000 accounts and satisfactory progress continues.

THE STANDARD MOTOR COMPANY, LIMITED

(Manufacturers of Standard and Triumph Cars, Ferguson Tractors and Standard Commercial Vehicles and Diesel Engines)

RESULTS REFLECT YEAR OF CONSIDERABLE DIFFICULTY

LORD TEDDER ON LABOUR AND COST PROBLEMS

The fifty-third annual general meeting of The Standard Motor Company was held on December 19th at Coventry, Lord Tedder, GCB, Chairman of the Company, presiding.

The following are extracts from his statement which was circulated with the Report and Accounts: The Group Profit for the year, before taxation, is £806,788, compared with £3,474,797 in the previous year. In addition, provisions made in earlier years, now no longer necessary, amounting to £518,000, have been brought into credit. After deducting taxation, and £105,117 for profits retained in the Accounts of Subsidiary Companies, the balance to be added to the Company's Revenue Reserves is £573,004.

The Accounts presented to you cover a year in which the Company, in common with the rest of the Motor Industry, has faced considerable difficulties arising from the Government's limitation of credit, increased purchase tax on motor vehicles and restrictive legislation introduced in our largest export markets—Australia and New Zealand. All these factors caused a recession in sales and, therefore, reduced volume-production, resulting in increased manufacturing costs, this position having been further aggravated by rising costs of materials resulting from continuing wage awards.

The Company has also had a major domestic problem due to the changeover of tractor production to a new model. Last year I referred to the dislocation of production which would result from this changeover, and to the consequent loss of output. I also referred to the considerable capital and revenue expenditure involved, and I emphasised the need to conserve our resources accordingly. The changeover of tractor production was, however, further complicated and delayed by labour disputes.

DIVIDEND REDUCED

The combined effect of the national and domestic situation has been to denude the Company's resources. Bearing this in mind, therefore, together with the fact that we are not able to visualise any substantial relief during the next financial year from restrictions both at home and overseas, the Board is of the opinion that it would be undesirable to adhere to the dividend policy which they have followed for the last five years, and they therefore recommend that the dividend be reduced from 12 per cent to 8 per cent.

During the year we sold 79,360 Cars and 52,869 Tractors, a total of 132,229 Units, a reduction of 37,327 Units compared with last year. Of these sales, the Cars exported by ourselves and the Tractors exported by the Massey-Harris-Ferguson Organisation have totalled 77,279 Units.

NEW MODELS AND ACHIEVEMENTS

In 1956 Standard and Triumph Cars once again distinguished themselves in the field of International motoring, and added to their reputation for high performance, reliability and economy. Many successes have been recorded, the most outstanding being: the Safety and Comfort Prize for the Vanguard III in the Monte Carlo Rally; the first three places in the Circuit of Ireland 1,000 Mile Trial won by Triumph Sports Cars—thus repeating their successes of the previous year; the Tulip Rally of Holland, where Standard Family Eight Saloons took 2nd, 3rd, 4th and 5th places and the team award, and—the greatest success of all—the Alpine Rally, with Triumph TR3's securing the most sweeping success in the history of the event by gaining five Alpine Cups, the first five places in the Class, the much-coveted Team Prize and many other awards.

At this year's Commercial and International Motor Shows at Earls Court the Company exhibited the new version of its Vanguard III de Luxe; the new Vanguard Estate Car and the Sportsman; its full range of 8/10 hp cars and commercial vehicles, and the new and considerably improved Triumph TR3 Sports Car incorporating disc brakes. All these new models have been very well received. Considerable interest, also, was shown in the Newton Two-Pedal Control which we have so far incorporated in our 10 hp saloons, estate cars and vans. As you know, this eliminates the clutch pedal and brings those vehicles into line with modern practice, which is developing towards completely automatic transmission.

OVERSEAS INTERESTS

Our Overseas interests in Australia, Brazil, Eire, France, India, New Zealand and South Africa continue to operate satisfactorily, and fully justify the Directors' policy of progressive development in those countries. In addition, we have Marketing Organisations in the USA and Canada. In spite of many difficulties, the Company has, in the last twelve months, increased its exports of motor cars by 7.3 per cent—our exports to the USA have increased by 50 per cent during the first six months of this year.

LARGE BUYER OF COMPANY'S SHARES

For several months there has been considerable speculation as to the identity of the large buyer of the Company's Shares, culminating in an application to the Board of Trade, to which we gave our support, for the appointment of an Inspector to reveal that identity. Since then, the identity of the buyer has been made known to me in confidence. I am, therefore, not in a position to disclose this identity, but I have no reason to regard the buyer as being other than friendly or as likely to interfere with our plans to continue aggressively in the car and tractor business. This being so, the Directors have withdrawn their support to the Application to the Board of Trade.

EFFORTS TO STRENGTHEN COMPANY'S ECONOMY

In the year ahead we shall reach maximum production of the new tractor. We shall complete our installation at Beans Industries for a new Government contract, and put to full utilisation the new facilities available there. We have also planned to effect more intensive utilisation of the total floor area in certain sections of our Organisation by exercising control over a greater proportion of the prime cost of our products. Although these plans cannot make a full contribution in our current financial year we are satisfied that, as they come into operation, they will progressively strengthen the Company's economy.

TRADE UNIONS' UNREALISTIC POLICY

To sum up, I am sure that you will expect me to say something about the labour problems which have faced the Organisation during our changeover of tractor production. You will recollect that, last year, I referred to the need for improving production methods and to the apprehension with which this form of progress is viewed by some people—the fear of unemployment never being far from the introduction of new techniques.

We planned that the tractor changeover would take place in the spring, when car production normally reaches its peak, so that, by the redeployment of labour from tractor to car production during the changeover, redundancy might be kept to a minimum.

However, the restrictions introduced by the Government, which could not have been anticipated, completely disrupted this aspect of our planning. The increase in purchase tax, together with the drastic credit restrictions, seriously affected our car sales and we were faced with the unpleasant task of declaring a heavy redundancy.

We always have in mind the human problems involved in a redundancy of this description, but we had to consider the future wellbeing of the Company and, therefore, of its employees, in deciding the action which was ultimately taken. In order to alleviate hardship, we paid what we considered to be adequate compensation in the circumstances.

Almost overnight we found ourselves at variance with the Trade Unions. These differences did not arise through lack of consultation; in fact, consultations regarding this problem had been in progress for several months. The focal point of difference with the Trade Unions was their unrealistic policy at that time of "no redundancy under any circumstances."

Although we were unable to reach agreement with the Trade Unions, it is worthy of note that the methods we adopted have since been used by the Unions as a basis for negotiating agreements with employers both locally and nationally.

Arising from these troubles many lessons have been learned, not the least important being the ultimate recognition by the Trade Unions that it is economically impossible for employers to bear the cost of retaining employees and paying wages without the income from production.

If we are to maintain our position as a great trading nation, everyone must pay greater regard in the future to the impact of the cost of wages on the cost of our products. We are justly proud of our products but we must bear in mind that ultimately it is the price factor which will determine our progress in the markets of the world.

The report and accounts were adopted.

BRITISH OVERSEAS MINING ASSOCIATION

URGENT NEED FOR TAX RELIEF

HOPES FOR EARLY INTRODUCTION OF "OVERSEAS TRADE CORPORATIONS"

The eleventh ordinary general meeting of British Overseas Mining Association was held on December 19th at 49 Moorgate, London, E.C.

Mr S. E. Taylor, DSC, the president, who was in the chair, in the course of his speech said:

My predecessor as President of the Association, when addressing last year's general meeting, referred to the recommendation made by the Royal Commission on the Taxation of Profits and Income that a new category of companies should be established under the style of "overseas trade corporations," which would be liable to UK taxation in respect of distributed profits only.

The Chancellor of the Exchequer informed the House of Commons on June 19th last in the course of a debate on the Committee stage of the Finance Bill that he had a great deal of sympathy with this recommendation and promised to give careful consideration to the possibility of introducing legislation to give effect to it in the 1957 Finance Bill.

I sincerely hope that my successor may be in the happy position next year of reporting to you that legislative effect has been given to this recommendation and that the efforts of this Association over a number of years to secure adequate recognition of the tax problems of the overseas mining industry will have been thus rewarded.

VARIETY OF COMPANIES IN THE INDUSTRY

The mining interests represented by this Association fall broadly into three classes. The first class consists of companies which operate in overseas mining fields and are managed and controlled in the United Kingdom. Some very important operating companies have already ceased to be managed and controlled in the United Kingdom, but a number of valuable overseas mineral deposits still remain under the direct control of UK companies. It must be to the advantage of this country's economy to create tax conditions under which that control can be retained.

The trek of British mining companies overseas has been due, of course, to other factors besides taxation, but a liberal and progressive policy in the UK tax field would at least provide good argument for countering the strong non-tax factors pulling such companies out of the UK tax jurisdiction.

The second class consists of holding and co-ordinating companies which hold share control of, or have substantial investments in, mining companies managed and controlled overseas. The growth of the UK holding company, with widespread interests in mining companies overseas, is in part a necessary development in giving local participation in overseas mining ventures and in part an attempt to minimise the UK tax burden. UK taxation on the dividends receivable by the UK holding company is an obstacle to the reinvestment of its funds in new exploration and development projects in overseas territories.

The third class consists of mining finance houses which explore, develop and finance overseas mining fields, setting up operating companies overseas to exploit and operate successful mines. These operating companies are closely associated with the sponsoring UK company, but are not necessarily subsidiary companies, though the operating and managerial links may be very strong.

Both the holding companies and the finance houses are concerned with all aspects of mining, from the location of new deposits, the search for which under modern conditions demands continual expenditure on a scale which only companies with large capital resources can support, to the ultimate exploitation of such deposits.

It is the usual practice to form new companies to work the deposits when the stage of exploitation is reached, but the shareholdings, both of the holding companies and the finance houses, in such operating companies are of a nature far removed from the "portfolio investments" which, in the view of the Royal Commission, ought to be excluded from the scope of "overseas trade corporations."

The first class of company, namely the UK operating company, falls clearly within the narrowest definition of "overseas trade corporations." In the opinion of this Association, the second and third classes of companies should also be recognised as falling within that category, and it is of the greatest importance to the future of the British overseas mining industry that the legislation introducing "overseas trade corporations" should be so drafted.

"OVERSEAS TRADE CORPORATIONS" IN RELATION TO "PIONEER INDUSTRIES RELIEFS"

In his speech on the Committee stage of the Finance Bill, 1956, the Chancellor promised to introduce legislation with retrospective effect in the following year's Finance Bill to deal with the frustration by the UK tax system of "pioneer industries reliefs" granted overseas. He expressed the view that the bigger question, namely "overseas trade corporations," would settle the smaller one, namely the frustration of "pioneer industries reliefs," but the Association ventures to suggest that this assumption is not accurate.

It is true, of course, that the introduction of "overseas trade corporations" would confer tax relief over a wider range than the granting of reciprocal relief in respect of pioneer industries, however widely such industries might be defined in the promised legislation.

The Association suggests, however, that UK companies, which might not fall within the definition of "overseas trade corporations," would be eligible for reciprocal "pioneer industries reliefs," and that it would seem unfair to deprive them of the promised benefit under the latter heading merely because they cannot qualify for benefit under the former heading.

In the Association's view, the correct procedure would be to grant reciprocal "pioneer industries reliefs" to all companies eligible for them and, when the company falls within the definition of "overseas trade corporations," to take the "pioneer industries reliefs" into account in calculating the rate of UK tax at which the company would account to the Revenue in respect of its dividends.

The Association has already outlined its views to the Government on the subject of "pioneer industries reliefs" and "overseas trade corporations." Whatever may be the financial difficulties next spring, the Government is committed to the introduction of new legislation to end the frustration of overseas tax concessions, and I venture to hope that it will also recognise the urgency of introducing the concept of "overseas trade corporations" in order to retain and stimulate the important contribution which the British overseas mining industry makes to the economy of the United Kingdom and the Commonwealth.

The report for the year ended September 30, 1956, was unanimously adopted.

Mr A. M. Baer was elected president and Mr Clifford Waite vice president for the ensuing year and the proceedings terminated with a vote of thanks to the retiring president.

SECOND INDUSTRIAL TRUST

RIGHTS ISSUE

The forty-fifth annual general meeting of the Second Industrial Trust Limited was held on December 13th in London.

The following are extracts from the Chairman's speech which was read by Sir Norman Touche, Bt.:

Our total revenue again showed an increase; at over £249,000 it was some £17,000 more than in the previous year. Our liability for Income Tax and Profits Tax is, of course, larger as a result of the increase in revenue. Our net revenue was £108,000. We now recommend a Final Dividend on the Ordinary Stock of 20 per cent, making 28 per cent for the year.

During the course of the last financial year your Board has frequently found itself unable to take advantage of favourable opportunities for investment through lack of liquid resources. To overcome this difficulty, your Board sought the permission of the Capital Issues Committee to issue the balance of Authorised Ordinary Capital. This permission has been granted, and we are proposing to make a rights issue to Ordinary Stockholders of one new Ordinary Share of £1 at 80s. per Share for each £4 nominal of Ordinary Stock held on November 26, 1956. These new shares will rank *pari passu* with the existing Stock. We hope, always providing, of course, that conditions do not materially alter meanwhile, to pay a dividend for the current year of not less than 25 per cent on the Ordinary Capital as increased.

We are also proposing that the Capital be increased from £1 million, to £1,500,000, so that the Board shall have Shares available for future issues if they so wish.

It has never been more difficult than now to see what lies ahead. I still have faith in the future of this country, and, if my faith is justified, then there can be no doubt that this Trust will share in that future.

The report was adopted and the increase of capital was approved.

VOKES LIMITED

GROUP ACTIVITIES CONTINUE TO EXPAND

SATISFACTORY ORDER BOOK POSITION

SIR IAN STEWART-RICHARDSON ON LOWER PROFIT MARGINS

The Nineteenth Annual General Meeting of Vokes Limited was held on December 18th at the Albion Hotel, Woking, Surrey.

Sir Ian Stewart-Richardson, Bt, chairman of the company, presided. The following is an extract from his statement, which had been circulated with the report and accounts:

It will be noted that whilst there has been a reasonable expansion in the trading surplus earned prior to taxation, that after deducting the tax payable—which incidentally absorbs some 54 per cent of this surplus—there is only a small increase in the amount available for distribution as compared with the previous year. This increase in taxation is mainly due to the higher charge for Profits Tax caused by the increased rates of Profits Tax and the considerably greater Ordinary shareholding to be serviced. This latter arises from the rights issue made to the Ordinary shareholders in June of this year which increased the capital by 250,000 4s. Ordinary Shares, and the placing in October, 1956, of a further 500,000 4s. Ordinary Shares.

To enable the most satisfactory price to be obtained for the shares and avoid having two classes of Ordinary Shares on the market at the same time, it was agreed that the new shares should rank *pari passu* in all respects with the then existing Ordinary Shares.

The activities of the Group have continued to expand both as to the Parent Company, and the Subsidiaries, and the Associate Company.

Considerable work has been and is still being done on new designs and development in all branches of the Group's products, and whilst this type of work is costly it is highly necessary to enable the Company to keep in the forefront in an industry which is becoming increasingly more competitive.

By August of this year the further building programme mentioned in my last statement was completed, and the occupation of these new buildings was effected immediately after the holiday period. It is not anticipated that there will be any further major capital expenditure on new buildings in the near future.

STREAM-LINE FILTERS ACQUISITION

Referring to my previous observations on the placing of the 500,000 Ordinary Shares in October of this year, these shares were utilised to finance the purchase of the business of Stream-Line Filters Ltd., exclusive of its Subsidiary and Associated Companies, and this business is now operating as a wholly-owned subsidiary of Vokes Ltd. I would like to point out that the business of Stream-Line Filters Ltd. is old and well established and is complementary to that of Vokes Ltd., and its acquisition should considerably broaden the field of the Group as a whole. I would further point out that as the acquisition was not completed until October 5th this year it had no effect on the trading surplus for the year under review, although it materially affected the amount of dividend and taxation payable. Its trading results as from October 5, 1956, to June 30, 1957, will be incorporated in the figures for the Group next year.

It is proposed to increase the Nominal Capital of the Company to £900,000. The Directors consider it prudent to have the necessary capital available should opportunity arise for further expansion of the Group's activities.

THE OUTLOOK

At the date of writing due to world conditions it is impossible to make a useful forecast as to the results of trading for the current year. All I can tell shareholders is that results for the period from July 1st last to date have been satisfactory and the order book may also be considered satisfactory. Had conditions remained normal I would have forecast another favourable year's trading but with the proviso that profit margins are definitely decreasing and that the price factor is becoming increasingly important in obtaining orders. Shareholders will no doubt have noticed this trend from the reports of other business concerns.

Therefore as a natural corollary it is only by increasing our production by widening the scope of our sales that it will be possible to maintain the satisfactory ratio of profit to capital which has been achieved over the past years. It is for this reason that the increased rate in the recommended distribution per share is to be made by way of a bonus payment.

I would like to conclude by thanking all employees of the Company for their excellent efforts to date and especially those who were responsible for the very smooth changeover into the new buildings effected immediately prior to and during the holiday period.

The report was adopted; and the recommendations of the Board were unanimously approved.

CONSOLIDATED GOLD FIELDS OF SOUTH AFRICA

LARGER NET PROFIT

The annual general meeting of this company was held on December 13th in London.

Mr Robert Annan, chairman, in the course of his speech, said: The accounts of the operating Company show a working profit for the year of £1,936,000. The principal contribution is made by dividends and interest on our investments, which at £1,862,000 again constitute a record. The net profit for the year is £1,072,000, an increase of £123,000.

It is essential to the life of our business that we should continue to find, and bring to production, new mines to replace those now being worked out. The world demand for metals and minerals is increasing so much that the discovery of new sources of these raw materials is a matter of urgency if the present rate of industrial expansion is to be maintained. It is our desire not only to expand our business but also to broaden its basis both geographically and by turning increasing attention to base metals and to the many minerals now required by industry as well as to those sources of power on which all industry depends. With these objects in view we have kept up a steady programme of exploration which has recently been intensified.

On August 27th last a circular was sent to members of this Company and of The Central Mining and Investment Corporation, Limited, announcing that the two companies had started discussions with a view to a merger of their interests. These discussions are continuing. The report and accounts were adopted.

THE TANJONG MALIM RUBBER COMPANY, LTD.

CHAIRMAN'S STATEMENT

The annual general meeting of the Tanjong Malim Rubber Company, Limited, was held on December 18th, in London. The following is the statement by the chairman, Mr H. H. Facer, CBE:

It is gratifying to record another successful year's working and an advance in gross profits from £113,327 for the previous twelve months to £156,194 for the period under review. On the other hand it is very discouraging to have to find from that profit no less than £93,045 or 56.6 per cent to meet our tax commitments.

The enhanced profit is due mainly to a more favourable average price for the commodity this year which has enabled us to sell our produce at about threepence a pound more than in the previous year. Another factor, and one which is cause for congratulation to all those concerned is the increase of crop from 3,119,000 pounds to 3,319,000. This increase of 200,000 pounds from rubber in bearing, of which two thirds is made up of old seedlings, is a remarkable achievement. It is the more creditable in that the result has been achieved under circumstances of stress to which our staff have had, perforce, to become accustomed. Although there were no serious incidents on the estate during the period, reports of terrorist activities have continued to be received from time to time.

As a result of this increased prosperity your Directors are pleased to be able to recommend to you that a dividend of 2s. per share free of tax, shall be declared in respect of this year. The fact that our labourers have participated in this increased prosperity is evidenced by the fact that our estate costs have risen by 20.5 per cent on an increased crop of about 6.4 per cent. The increases in wages have been the result of negotiations between the Employees and the Workers' Unions, and although there was rather serious trouble in May of this year, it can be said that the negotiating machinery as between employers and employed in the rubber producing industry runs much more smoothly than in other undertakings in Malaya.

When I addressed you last year I laid emphasis on the urgency of our replanting programme, and expressed our intention of stepping up the programme in future years. Effect is being given to this intention and this year we are replanting 370 acres of our old rubber. In spite of this the Manager is confident that there will be no noticeable loss of crop. During the second half of 1957, we expect to take into tapping the first of our postwar replantings and from then onwards have a steadily increasing crop from new areas coming into bearing. The crop from these areas should make up for the loss from the larger areas scheduled to be replanted in following years.

Not only are we modernising our plantations, but we are at the same time carrying out a programme of replacing our out-of-date accommodation and improving amenities on the estate for our working labour force. Standards which found favour in the early part of the century are no longer permissible nor desirable, and any measures designed to improve the living conditions of those on whom the success of our efforts depend, are important as factors in smooth and economic working. Last year we erected 32 units of new lines and during the current year we have budgeted to put up a further 48 units. This programme will be continued until we have modernised the whole of our living accommodation.

THE ALUMINIUM CASTINGS COMPANY LIMITED

RECORD TURNOVER AND PROFITS

VITAL NEED TO CONSERVE RESOURCES

The Fiftieth Annual General Meeting of the Aluminium Castings Company Limited was held on December 14th in Glasgow, Mr . K. Calder, chairman and managing irector, presiding.

The following is an extract from his tatement:

It is particularly fitting that in this—the arent company's fiftieth year of operation —I am able to report both record turnover nd profits.

Trading profits increased by just over 141,000 to £508,450, an increase of some 8 per cent, and net profits before taxation ncreased to £342,901, against £264,200 last ear, after charging increased sums of 81,523 against £56,810 for depreciation nd £51,917 against £19,281 for interest.

The taxation charge of £157,211 was ower than the profits should normally bear, ue to the fact that no Canadian income ax was payable consequent upon the pplication of accelerated depreciation llowances.

The net profit after tax was, therefore, he very satisfactory figure of £185,690, an ncrease of £55,267 over the previous year.

After deducting appropriations totalling £10,088 and £23,228 for the servicing of the Preference share capital and bringing in the balance of £257,193 from last year, the available balance was £409,567, which your directors recommend should be carried forward.

The consolidated balance sheet now reflected the addition to the group of the Canadian subsidiary and the purchase during the year of new factory premises in the United Kingdom and as a result net fixed assets had increased during the year from £448,247 to £817,725.

The directors in May last repaid the loan of £112,500, which was repayable by 1965. This was financed by a temporary loan at call of £120,000—to be converted into 6 per Cent Redeemable Preference share capital—but in the interval market conditions deteriorated and the directors had decided to postpone the projected conversion operation.

Opportunity was taken, however, to reissue for cash at par, over a period, a total of 30,000 6 per Cent Redeemable Preference shares.

SUBSIDIARY COMPANIES

Since the close of the year the group has acquired Trent Foundries Limited, which specialises in sand casting and non-ferrous alloys.

At Aluminium Bronze Company Limited output advanced by over one-third, with a more than commensurate increase in earnings, but towards the close of the year it fell away as a result of the recession in the motor trade.

Atkinson's Agricultural Appliances Limited and its subsidiary, Atkinson-Hacker Tractor Company, Limited, showed an overall increase in output, but in the current year there has been a noticeably reduced demand from the agricultural industry.

The Bright group of companies again increased output, but profit margins declined. The full impact of the decline in the motor trade has been felt only in the current year.

Negotiations are in hand for the manufacture of the Bright patented products in Germany and for an expansion of the activities of the French licensee.

Burnley Aircraft Products Limited, again had a successful year, although there was a slight reduction in output due to difficulty in obtaining supplies of certain raw materials.

Renfrew Aircraft and Engineering Company Limited, made a very satisfactory contribution to group profits in its first year of operation and in the current year output has continued to advance, and with more than a corresponding improvement in earnings.

I am sure that members will join with me in expressing our very real appreciation of the success which has been achieved by the Canadian company under the able direction of its president, Mr G. E. Woods-Humphery.

Scottish Aluminium Ware Limited, succeeded in increasing output and while a loss still arose this was materially reduced. The company is now producing "Luxaflex" venetian blinds.

Trent Foundries Limited is showing satisfactory progress.

The Verichrome Plating Companies at Walsall and Larkhall both had satisfactory years and, while output showed a small decline, earnings improved.

Despite the record profits, it is with very real regret that the directors feel unable to recommend a dividend but the need to conserve the company's resources is still a paramount necessity.

The consent of the Capital Issues Committee has, however, been obtained to the capitalisation of reserves and undivided profits to the extent of £225,000 and details of the proposals will be circulated within the next few weeks.

I am sure that members will join me in expressing thanks to my co-directors and to all employees of the group, both in the United Kingdom and overseas, for their hard work in achieving these record results.

In the current year, which started off well, we are now beset with most difficult conditions and the most that I can say is that the wide diversification of our interests should assist in maintaining a reasonable overall picture provided that no further unforeseen adverse developments arise.

The report and accounts were adopted.

SMITHS

S. SMITH & SONS (ENGLAND) LTD.

ANNUAL GENERAL MEETING—FINANCIAL YEAR 1955/6.

OPERATING DIVISIONS:

Motor Accessory:	Instruments for Cars, Motor Cycles, Commercial Vehicles and Agricultural Tractors; Car Heaters; Fluecol Anti-Freeze; K.L.G. Plugs.
Clock and Watch:	Mechanical Alarms; Sectric Clocks; Strikes; Chimes; Pocket, Wrist and Stop Watches; Clock Systems; Time Recorders; Timers.
Aviation:	Automatic Pilots; Engine Flight and Airframe Instruments; Aviation Systems (Fuel Contents, Jet Temperature Control).
Industrial Instruments:	Revolution Indicators; Hand Tachometers; Counters; Pressure Gauges; Railway Speed Indicators; Remote Indication.
Kelvin & Hughes:	Marine, Aircraft & Industrial Instruments.

Extracts from the Speech of Mr. Ralph Gordon-Smith, Chairman and Managing Director.

PROFIT MARGINS: Profit margins generally continue to reduce, particularly in the mass production sections of the Group, due to increased wages and competition. The trend in the Group has been towards an increase in total sales volume but with smaller margins—the overall result being a continuing increase in total capital employed but with a smaller net profit return.

MOTOR ACCESSORY DIVISION: We are diversifying our products both inside and outside the automotive industry and expanding our research and development resources. This policy will provide a "cushion" against reduced calls for our traditional automotive products.

CLOCK AND WATCH DIVISION: The turnover of the division reached a record level, but sales of various timing and switching devices for domestic electrical apparatus were adversely affected by the credit squeeze. It is hoped that this setback will be temporary.

AVIATION DIVISION: Our policy of expanding our technical and productive resources is enabling us to play a leading part in our sphere in the aviation industry. Examples of this are the successful introduction of the Smiths integrated flight system, where the most promising results have been achieved, and, in association with Bristol Aero Engines Ltd., a contribution to the solution of the "flame out" trouble experienced in the engines of the Britannia aircraft.

INDUSTRIAL INSTRUMENTS DIVISION: Greater manufacturing and development facilities have been provided to meet the ever-growing demand for the products of this division.

KELVIN & HUGHES: Diversification of products continues, not only by the introduction of new lines, but by developments in existing fields. Two new Echo Sounders, a new miniature radar set and a miniature Asdic have been marketed and further progress has been made in developing equipment in the field of non-destructive testing of materials.

FUTURE PROSPECTS: Aircraft, Industrial and Marine activities are continuing to expand and order books are very large, but the demand for Clocks and Watches is now at a slightly lower level. The immediate prospects for the Motor Accessory division are obscure, being affected by factors outside our control, but we are confident that, given normal conditions, the motor industry should soon re-establish itself at a reasonably satisfactory level.

BERKELEY PROPERTY AND INVESTMENT COMPANY

SATISFACTORY RESULTS

MR J. H. HAMBRO'S STATEMENT

The thirty-second ordinary general meeting of The Berkeley Property and Investment Company Limited was held on December 18th in London, Mr J. H. Hambro, CMG (chairman), presiding. The following is an extract from the chairman's circulated statement:

The results achieved by the Group for the year to June 30th last will, I hope, be regarded as satisfactory.

Freehold and Leasehold properties now amount to just over £5 million, an increase of some £700,000 on last year. This increase is largely due to development in Canada, but during the year under review our policy of selective modification of the property portfolio has been continued and this also is a contributory factor.

Against this, on the other side of the Balance Sheet there is an increase of £138,000 in our mortgages and a bank overdraft of £290,442. This bank overdraft has now been extinguished and represented temporary finance in Canada pending completion of Berkeley House, Toronto. It has been replaced by permanent mortgage money in accordance with the arrangements made before the start of the construction. Thus the liquid position of the Company has been improved to this extent.

INCREASED PROFIT

The profit for the year before taxation is £286,263, an increase of some £32,000 on the previous year. The earnings of our trading subsidiaries show some slight falling off, but as a whole these continue to show a very satisfactory return on the capital employed. Revenue from properties and investments is increased by £41,000.

Increased income entails increased demands from the Inland Revenue, and this year income tax, profits tax and overseas income tax take £151,587 against £136,910 last year, leaving us with a net profit after taxation of £134,676. This is an increase of £18,000 over the corresponding figure for last year.

A substantial sum (£42,036) has again been provided out of taxed income for depreciation of freehold properties, this is largely attributable to our policy of obtaining the full benefit of the more favourable attitude of the Canadian Tax Authorities who do not subscribe to the view held by the Inland Revenue here that buildings constitute non-wasting assets.

An Interim Dividend of 3 per cent has already been paid on the Ordinary Stock, and provision has been made in the Accounts for a Final Dividend of 5 per cent, making a total of 8 per cent for the year. After providing for these dividends and the Preference Dividend we carry forward a balance of £174,289, an increase of some £27,500 over last year's carry forward.

During a recent visit to Canada I had an opportunity of inspecting the Company's properties in the Dominion. I am very pleased to be able to tell you that these and our other investments there are all of a high order. For the time being it is necessary to balance the claims of revenue and liquidity as credit availability in Canada is at present very restricted, although directed more by the operation of natural economic laws than by governmental regulations. It is our aim that the Company should be well placed to take advantage of any attractive opportunities which present themselves.

The report and accounts were adopted.

THE BIRMINGHAM SMALL ARMS COMPANY

REORGANISATION OF GROUP'S STRUCTURE

The ninety-fifth annual general meeting of The Birmingham Small Arms Company Limited was held on December 18th in London, Mr J. Y. Sangster (the Chairman) presiding.

In his speech the Chairman commented on the factors which had contributed to the drop in profits, and in the course of a detailed review of the Subsidiary Companies' activities he said:

The Tools Division has continued to expand and has made a most important contribution to Group Profits.

The Steel Division has achieved an all-time record of sales amounting to an increase of almost 25 per cent over the previous year.

The new Titanium Plant laid down at Jessops a year ago is now in operation. Titanium is forecast as being of major significance in the aircraft world and substantial orders have already been placed with us by some of the leading aircraft firms.

Very severe losses have been sustained by the Subsidiary Companies engaged in the Motor Car Industry. The outlook is anything but favourable.

BSA Motor Cycles Limited, and Ariel Motors Limited, both experienced a falling-off in demand in the Home Market. In the export field sales have been well maintained despite strong competition. Triumph Engineering Company Limited enjoyed another successful year. Sales of Triumph Motor Cycles both in numbers and in value exceeded the sales of the previous year.

Our bicycle business has incurred losses for several years past and your Board have this most unsatisfactory position constantly under review.

BSA Guns Limited.—An important scheme to modernise our production facilities is now nearing completion.

The Redditch Factory engaged on the production of Jet Blades for Aircraft Engines as well as a number of other smaller manufacturing units, have all made valuable contributions to Group Profit.

FUTURE ORGANISATION

The Board asked Lazard Brothers & Company Limited and Messrs Deloitte, Plender, Griffiths & Company in July last to investigate and advise them on the structure and organisation of the Group. The work is not yet finished. But it has progressed far enough to enable your Board to take certain decisions. The structure of the Group will be rearranged so that the Parent Company becomes a Holding Company with a series of wholly owned operating Subsidiaries.

As an essential part of this rearrangement, some sections are being regrouped in a more natural form. The Board will be reconstructed so as to consist of leading executives and outside Directors of wide technical and business experience.

The report was adopted, and the total dividend of 8 per cent for the year was approved.

ASSOCIATED BRITISH MALTSTERS

SUBSTANTIALLY IMPROVED RESULTS

SIR NUTCOMBE HUME ON EXPANSION OF EXPORT BUSINESS

The thirty-fifth annual general meeting of Associated British Maltsters Limited will be held on January 14th, in London.

The following is an extract from the statement by the Chairman, Sir Nutcombe Hume, KBE, MC, circulated with the Report and Accounts:

My forecast of a more satisfactory trading year has been realised and we can report profits in the twelve months ended July 31, 1956, of £381,494 by comparison with £311,540 in the preceding 11 months, but you need no reminder from me that last summer's barley harvest had to be gathered in worse conditions than for many years. We cannot, of course, face such an event with impunity, but today we are able to handle a wet harvest far better than would have been possible before we spent so much money on modernising many of our maltings and increasing our drying facilities. Nevertheless you must expect next year's accounts to show lower profits.

It gives your Directors no sense of satisfaction to spend so much out of retained profits on capital expenditure, but we are still convinced that this is necessary to maintain our profit-earning capacity in the changing trade conditions. It is obvious that, except in a year of exceptionally fine hot weather, beer sales in this country cannot be maintained whilst the enormous weight of taxation is laid upon them. In the struggle to do so Brewers are amalgamating and seeking, as we are, to maintain profits by economies and increased efficiency.

POLICY OF "STREAMLINING" THE GROUP

Your Board is served by a number of committees which specialise on the several aspects of the Group's activities—for instance, Raw Material supplies, Production and Research, Sales, Transport—and guided by their advice the Directors keep under constant review the improvement of our organisation. From being at first a rather loosely knit amalgamation of 15 separate trading companies we are adopting methods of "streamlining" the Group.

To that end we built the big, highly efficient and successful malt factory at Louth and are well forward with another in Yorkshire, which we expect to be in partial operation in 1957 and to be complete in 1958. This will enable us to give up using a number of old maltings, with a consequent gain in all-round efficiency and a saving in the high cost of maintaining them. By integrating our transport we are saving expenses whilst giving our customers a better service; and in the field of research we are constantly devising improved methods of manufacture.

Our Export Company has again expanded its trade and developed all over the world, and its products are being progressively accepted as part of their standard blends by a large number of overseas breweries. Expressions of appreciation reach us continuously about the high quality of our material and services.

We therefore feel we can face the future with some degree of confidence. We have a good team of individuals at the Board and every other level in the business, and our gratitude is due to them for the hard work they do. We have good and improving equipment which we are putting to better use as time goes on. It will only be circumstances outside our control which could prevent us from maintaining our position in the forefront of the malting industry.

NETHERLANDS BANK OF SOUTH AFRICA

FURTHER SATISFACTORY EXPANSION

The Sixth Ordinary General Meeting of Shareholders of Netherlands Bank of South Africa Limited was held on December 19, 1956, in Pretoria, Mr J. P. Kakebeeke (the Chairman) presiding.

The following is an extract from his circularised statement:

The results for the financial year 1955-56 were again favourable. The figures demonstrate a further satisfactory expansion of the bank's activities.

POSITION OF THE BANK

It is pleasing to note that although the net profit was slightly less than last year's figure, the total income was again higher, even after taking into consideration a certain increase in cost for maintaining a higher liquidity which was considered advisable in prevailing circumstances. Mainly as a result of the improvement which was introduced last year in salary scales and the initial expenses connected with the opening of new branches, expenditure showed a higher level than last year.

As customary, all additions to furniture, office equipment and stationery were written off. Adequate provision has been made for taxation, possible bad and doubtful debts, depreciation of bank buildings and for the usual strengthening of the Staff Pension Fund.

During the year new branches were opened at Windhoek (SWA), Pietermaritzburg, Klerksdorp and Gwelo (Southern Rhodesia). A sub-branch was established at Pinetown. To improve the service to customers agencies were opened in various centres. I like to mention especially the Motor Bank service, recently introduced in Johannesburg, which endeavours to meet parking difficulties of clients. In November of this year a branch in the new shopping centre of Wynberg was added to our offices in the Cape Town area.

The activities of our London office were maintained at a high level and the expansion of our offices in Southern Rhodesia continued in a satisfactory way.

With reference to your Directors' report, I wish to mention that the Directors recommend to strengthen the Reserve by a further amount of £100,000 which Reserve will then reach the figure of £800,000. Your Directors also recommend a dividend of 8½ per cent (1s. 9d. per share), the same as last year. It is further proposed that a special depreciation of £25,000 be made on bank buildings.

The continued favourable development of the Union and the Territories where our bank operates permits us to look to the future with confidence. However, it would be imprudent to neglect the warning of the recent international events. The instability of the international political scene has to be reckoned with as a disturbing element that may present itself unexpectedly and suddenly.

The Report and Accounts were adopted.

THE SCOTTISH AUSTRALIAN COMPANY

A HEALTHY STATE OF AFFAIRS

The annual general meeting of The Scottish Australian Company Limited was held on December 14th in London.

Mr J. Norman Eggar (Chairman and Managing Director) presided, and, in the course of his speech, said:

There never was a year which better illustrated the ups and downs and vicissitudes of our industry than that under review. When I last addressed you conditions almost everywhere were reasonably good. Then came a period of severe floods on many properties in Queensland and New South Wales, and the shearers' strike which lasted for ten months in Queensland and for six months in New South Wales. The strike in New South Wales came to an end early in July with an uneasy sort of truce, but in Queensland continued until October.

Consolidated Profit and Loss Account: Wool proceeds are up by £106,022, but sales of livestock less by £14,536, so the net increase over the previous year is £91,486. The wool clip taken to account reached 10,973 bales, 1,510 bales more than in 1955, and the average price was slightly higher. Very good wheat and other crops increased our revenue from that source by £16,109.

United Kingdom and Australian taxation absorbed £285,806, a very small increase on last year. The amount available for distribution is £411,304, which compares with £484,012 at June 30, 1955.

After payment of the dividends on the Guaranteed Preference Stocks, the interim and, if approved, final dividends on the Consolidated Ordinary Stock, £246,587 is carried forward as compared with £204,881 brought in.

The Balance Sheet reveals a very healthy state of affairs, and I feel that we can face the future with confidence. Indeed, I have great faith in the future of the Australian Pastoral Industry and of our Company in particular, provided we are allowed to pursue our policy without let or hindrance.

BOARD'S POLICY

Before closing, I want to say something about that policy. During the last ten years we have spent on new properties, i.e., freehold land, leasehold and improvements, and on working plant, £1,143,083, and on improving our older properties, buildings, fencing, water supply, etc., clearing, pasture improvement and working plant, £626,976, a total capital expenditure of £1,770,059. All this we have managed out of our own resources. We often hear appeals for more outside capital to be invested in Australia. We have not been backward in investment. I submit that we deserve commendation from Commonwealth and State governments alike. Is it too much to ask that we shall not be further dispossessed? In the last five years we have lost to Soldier and Closer Settlement and from Government leases falling in and not being renewed, 280,000 acres, and we know that we are to lose over 300,000 acres in the next two years. Our constant preoccupation is, therefore, how to maintain and increase the earning capacity of your Company, by losing no opportunity to acquire new properties. These are far more costly than they were ten years ago, and we consider that it is essential to keep our position liquid so as to have funds available to embrace opportunities when they arrive.

The report and accounts were adopted.

BETTS AND COMPANY

IMPROVED PROFIT POSITION

The seventy-sixth annual general meeting of Betts and Company Limited was held on December 14th, in London.

Sir S. Harold Gillett, MC, FCA, the Chairman, in the course of his speech, said: The results show marked improvement over the previous year. The Trading Profit increased from £59,571 to £93,631, following an improvement in output of about 14 per cent and despite the lack of a dividend from our former Subsidiary Company, Etablissements Betts et Blanchard, S a RL, as I forecast last year, the Net Profit before Taxation showed a satisfactory increase from £15,083 to £42,232. The net earnings, after Taxation, were £14,713, as against £8,752.

With this improvement, your Board recommends an increase in the total dividend for the year from 5 per cent to 7½ per cent.

There has been a definite improvement in the liquid position of the Parent Company for the Bank Overdraft has been eliminated, and the excess of Current Assets over Current liabilities has increased from £188,938 to £203,166.

Betts and Company Limited has sold 7,050 Shares in Etablissements Betts et Blanchard at a very satisfactory price, and now only holds 47½ per cent of that Company's Issued Capital.

As regards the outlook for the current year, our order book is satisfactory, our factories are producing at an improved rate, and the estimated profits to date are appreciably higher than they were at the corresponding date a year ago. The report was adopted.

STERLING ESTATES

The twenty-ninth annual general meeting of Sterling Estates Limited was held on December 19th in London, Mr Douglas Overall, JP, FAI, chairman, presiding. The following are extracts from his circulated statement:

I concluded my statement last year by informing Shareholders that a large percentage of anticipated expenditure in the then current year would be invested in new developments on which there would be no immediate return, the effect of which developments would not be apparent until the year ending September 30, 1957. Certain of the developments, then referred to, however, have been completed earlier than was expected, contributing to a substantial increase in rental income which for the year under review totals £214,782.

The Gross Rental Income of the Group at £214,782 shows an increase of £22,208 over that of last year. Income from the Associated Company has also increased and this, together with Compensation received under the Town and Country Planning Act, 1954, and interest thereon, gives a total income in the year of £233,015. Outgoings —apart from higher interest charges—remain consistent, leaving a net income, subject to taxation, of £122,511. Your Directors recommend a final dividend of 7 per cent, making a total of 10 per cent for the year.

Group expenditure on developments and purchases during the year totals £372,085 and capital commitments at the close of the year amounted to a further £105,080.

Notwithstanding present day difficulties and subject to no further increase in taxation, interest rates, or other adverse conditions, I am confident that the company should continue to show steady progress.

CORONATION SYNDICATE LIMITED

(Incorporated in the Union of South Africa)

The annual general meeting was held at Johannesburg on December 14, 1956. Mr J. H. Mitchell, OBE, presided, and in the course of his speech said:

The steady improvement in group mine working profits, which has been a feature of the annual report for the last three years, has continued, and the total working profits amount to £219,790, in comparison with £191,561 in respect of the previous year.

Your directors feel that the profit record of the company justifies a further increase in total distribution of 2½ per cent, and you will, therefore, be asked to sanction a final dividend of 12½ per cent, making a total distribution for the year of 22½ per cent.

Operations at the Arcturus mine have yielded excellent results. The working profit was £61,166 before charging depreciation in comparison with £37,918.

The Muriel mine continues to play an important part in the success of your company. The working profit for the year before charging depreciation was £111,307 in comparison with £124,229 for the previous year.

Last year I said that the life of the Tebekwe mine was drawing to a close and I must now report that the payable ore reserves were depleted during the year. The profit before charging depreciation amounted to £38,509 compared with £16,332.

The Butterfly mine, I regret to say, has also had to close down. A gross working profit of £497, before charging depreciation, was made. The report was adopted.

J. BROCKHOUSE & COMPANY

The fifty-ninth annual general meeting of J. Brockhouse & Company Limited was held on December 19th at West Bromwich, Mr J. L. Brockhouse, MA (chairman and managing director), presiding.

The following are extracts from his circulated statement:

I am able to report a further substantial improvement in profit for the Group and it is particularly pleasing to note that the Overseas Investments are now beginning to make a contribution.

Your Company is engaged exclusively in the engineering field, and the guiding principle of the Board is to see that its equipment and facilities for those specialities in engineering for which we feel we are best suited are maintained at the highest efficiency possible, and if this is done successfully, both the long and short term interests of the Company will be best served.

Four years ago I spoke of reorganisation, the principal factor of this reorganisation was to limit our endeavours within the compass of our facilities; facilities of finance, and more particularly trained personnel. We are beginning to reap some benefit and should continue to see improvements as this policy develops.

In common with most Engineering Companies, we are seeing a slight falling off in the order book, but I do not anticipate any serious fall in output, at least for the first six months of the current year.

The report was adopted and a total dividend of 7½ per cent on the Ordinary Stock was approved.

HECTOR WHALING LIMITED

FACTORS AFFECTING RESULTS

The twenty-eighth ordinary general meeting of Hector Whaling Limited was held on December 17th in London, Mr R. de B. Trouton (the chairman) presiding.

The following is an extract from his circulated statement: Your Directors regret having to submit such disappointing accounts. The lack of success in the whaling operations was, in the Directors' opinion, due to a normal hazard of the industry in that relatively few whales were found in the particular areas searched by the *Balaena* expedition.

We have examined our methods of operation with special care and as a result have made many modifications to the *Balaena* expedition. Owing to these modifications and since there are no special grounds for anticipating a repetition of the poor catch of the past season, we should look forward to the coming year with reasonable confidence.

The trading profits for the year amounted to only £97,969, a decrease of £834,024. This was attributable to our very much reduced production as a result of catching many fewer baleen whales—a total of 1,296 compared with 2,642. Our operating costs for the year show a small decrease.

Our tankers and our refrigerated vessel show greatly improved earnings since the end of the whaling season, but these by no means reflect the high level of freights now current in the tanker trade. After careful consideration your Directors are recommending the payment of 10 per cent for the year on the Ordinary shares which, with 7½ per cent paid on the Preferred Ordinary Shares, will leave a balance of £107,688 to be carried forward in the Consolidated Profit and Loss Account. In reaching this decision your Board have taken into consideration the prospects for the coming whaling season and for tanker earnings.

Production last year was the lowest ever recorded by the *Balaena* expedition.

Owing to the great scarcity of whales in the areas in which she was fishing and the wide dispersal of those whales, the distance moved by *Balaena* during the baleen season was nearly twice that in the previous year. The additional speed involved resulted in a steam shortage which interfered in the production of by-products and also made the ferrying of meat to the freezing vessel *Bransfield* and of meat meal to our tanker *Thule* far more difficult. Our tonnage of meat and meat meal was thereby seriously reduced. To guard against a repetition of this occurrence we have installed two additional boilers in *Balaena* thus giving her a much greater reserve of steam.

SALES

Last season's whale oil was sold at prices averaging £87 per ton. The only sales as yet completed by us for the coming year are those of frozen meat of which we have sold the entire 1956-57 season's production at an advance in price of nearly £20 per ton over the average price secured last year.

CURRENT OPERATIONS

In the 1956/57 season there will be an additional Japanese floating factory, bringing the total number of expeditions operating in the Antarctic to 20. The number of blue whale units permitted for the pelagic floating factories as a whole has been further reduced by the International Whaling Commission from 15,000 to 14,500. We expect the *Balaena's* catch will exceed the unfortunate results of last year, but because of the reduction in blue whale units and the increased competition with which she has now to contend, it must not be expected that she will produce as big a total as in former years.

The future of the whaling industry is obscure. There is good reason to believe, however, that the tanker trade, in which the company is also engaged, has much more assured prospects. Your Directors have therefore decided to expand this side of the company's business. The tankers will be owned and operated by wholly owned subsidiaries which we have formed in the Bahamas. We have adopted this course since we believe that by so doing these vessels will be able to compete with fleets that secure the advantage of trading under a "flag of convenience." We are under obligations to provide funds to enable these subsidiaries to fulfil their obligations under their building contracts and I am glad to be able to inform you that the Company has made satisfactory financial arrangements to enable us so to do.

The report was adopted.

BROWN BAYLEY'S STEEL WORKS LIMITED

CAPITAL REORGANISATION FORESHADOWED

MR J. W. GARTON'S STATEMENT

The thirty-eighth ordinary general meeting of Brown Bayley's Steel Works Limited was held on December 14th at Sheffield, Mr J. W. Garton, JP (the chairman), presiding.

The following is his circulated statement: I mentioned in my report last year that your Directors had asked their legal and financial advisers to consider the possibility of a scheme to reorganise the Company's capital.

Your Directors had in mind that such a scheme should:

(a) Reduce the "top heavy" quotation per share.

(b) Bring the capital of the Company more into line with its net asset position.

(c) Render the dividend expressed as a percentage of the issued share capital more realistic. Whilst (a) above could easily be met by sub-dividing the existing shares into shares of, say, 6d. each, this would not meet points (b) and (c).

Your Directors are now considering a scheme which will meet all three points, but they have been advised that before recommending it they should obtain a ruling from the Inland Revenue that it will not involve your Company in the loss of the relief from profits tax in respect of retained profits which it has received in the past, and which amounts to approximately £160,000 (i.e., over 10s. per share). The necessary submission has been made to the Inland Revenue, and as soon as possible after its outcome is known further information will be given to the Shareholders.

ACCOUNTS

The Profit and Loss Account, after tax, shows a balance of £90,767, to which has been added an excess taxation provision of £1,260, giving a total net profit available to shareholders of £92,027. As it is the intention of your Directors to distribute all the dividends received from the subsidiary companies, less administration charges, they

recommend that £93,750 (6s. 3d. per share) be paid as Ordinary Dividend for the year, out of which an interim Dividend of £37,500 has already been paid.

SUBSIDIARY COMPANIES

The Hoffmann Manufacturing Company Limited: The Accounts of this Company for the year to December 31, 1955, are published as part of the Directors' Report. These accounts show a net profit, after taxation, of £536,688, which compares with £509,280 in 1954. The amount distributed by way of dividends was £116,667, compared with £112,500 in 1954.

Brown Bayley Steels Limited: The first set of accounts since this company became denationalised were published in February of this year for the year ending October 1, 1955. These accounts are also published as part of the Directors' Report. In the Prospectus issued, the Directors estimated the profits for the year ending October 1, 1955, to be in the neighbourhood of £650,000 after charging depreciation but before charging Debenture Interest. The profit shown in the Consolidated Profit and Loss Account for the year was £654,618, after charging depreciation but before charging Debenture Interest. A final dividend of 5 per cent, less tax, was made, making the total for the year 8 per cent, less tax.

Farnley Housing Association: No dividends were received from this Association, but the interest-free loan to this Association has been decreased during the year from £5,300 to £5,000.

The Report and Accounts were adopted, and the retiring Director, Mr E. Lawrence N. Tuck, LLB, was re-elected.

APPOINTMENTS

THE UNIVERSITY OF MANCHESTER

SIMON FELLOWSHIPS

The University offers a number of Simon Fellowships for advanced study or research in the social sciences, this term is used in a wide sense to include not only Economics, Government, etc., but equally, fields such as Education, Jurisprudence and Social Medicine. Values within the range £800-£1,350 per annum (Simon Research Fellowships), or within the range of £1,400-£1,750 per annum (Simon Senior Research Fellowships), according to qualifications and experience. They are open to members of the public services as well as to persons with academic experience.—Applications should be sent by January 15, 1957, to the Registrar, the University, Manchester, 13, from whom further particulars may be obtained, and who will be pleased to answer any enquiries regarding the scope of the Fellowships.

THE INCORPORATED NORTHERN RHODESIA CHAMBER OF MINES, LIMITED, KITWE, NORTHERN RHODESIA

Applications are invited for the post of Secretary to the Chamber, which is expected to become vacant shortly. The duties of the post, which is of a highly responsible and confidential nature, include the following:—

The Secretary is responsible to the Chamber's Director and Executive Committee for the provision of efficient clerical and secretarial services to the various departments and committees of the Chamber, and for their co-ordination and supervision. He is personally in charge of high level committee work, and of certain of the more specialised of the Chamber's functions. He is responsible for the maintenance of the Chamber's property, including buildings and houses, and for the administration of subordinate staff. In addition, he acts as Company Secretary of the Incorporated Company.

QUALIFICATIONS

Applicants must have a good education and record, and recent and substantial experience in responsible positions in industry entailing duties of a similar nature to those outlined above.

The possession of secretarial and accountancy qualifications will be an advantage, but is of less importance than character and experience of the right kind preferably in a mining industry.

Maximum age 45, but this may be relaxed in the case of applicants who are otherwise exceptionally well qualified.

A medical examination will be required before appointment and applicants must be in first-class health.

TERMS

Starting salary will be according to experience, but will not be less than £2,150 per annum, basic. In addition, the post carries the following benefits:—

Cost of living allowance, at present amounting to £5 4s. per month; a "Copper bonus" which fluctuates with the price of copper, and currently amounts to 60½ per cent of basic pay; a house with basic furniture at a sub-economic rent; generous leave; pension and medical benefit schemes. The Company will provide first-class fares for the successful applicant and his family from his home to Kitwe.

APPLICATIONS

Applications (in duplicate and preferably typed) should be forwarded by air mail to the Secretary, Northern Rhodesia Chamber of Mines, P.O. Box 114, Kitwe, Northern Rhodesia, marked "Confidential—Secretary," so as to arrive not later than January 15, 1957.

They should contain the following particulars in the order given here:—

1. Name, age, family, nationality and religion.
2. Full details of education, degrees and professional qualifications, with dates.
3. Positions held since leaving school/University, including war service, if any, in chronological order.
4. Full particulars of present position.
5. Names of two referees (for possible future use, with applicant's permission).
6. Date when services can be made available.
7. General information regarding eligibility and regarding outside interests.

Applications will be treated in strict confidence.

Applicants may be called for interview either in London or in Africa, at the expense of the Company.

Applicants who are employed in the Copper-Mining Industry of Northern Rhodesia should submit their applications through their mine management.

COOPER BROTHERS & CO. require a qualified accountant with wide experience and fluent French for a tour of two years in Central Africa. The post is a permanent one leading to exceptional prospects either in Africa or in Europe at the conclusion of the tour. Apply in writing to 14 George Street, Mansion House, London, E.C.4.

RESEARCH IN ECONOMICS AND FINANCE

HOUBLON-NORMAN AWARDS

THE TRUSTEES OF THE HOUBLON-NORMAN FUND invite applications for FELLOWSHIPS or GRANTS in aid of RESEARCH into the working of industry and finance in Great Britain and elsewhere and the economic conditions affecting them.

FELLOWSHIPS, which are intended for experienced research workers, are awarded for full-time research for one year, which may be renewed for a second year. GRANTS are awarded for either full-time or part-time work. The amount of the awards, which will take effect from October 1, 1957, will depend upon the circumstances of the candidate and the probable expenses of his work.

Candidates must be British subjects normally resident in the United Kingdom.

Forms of application, which may be obtained from the Secretary of the Fund, c/o the Bank of England, London, E.C.2, should be returned not later than March 1st.

FINANCIAL DIRECTOR

A.P.V. Company Ltd., manufacturers of specialised equipment for the Chemical, Dairy and Brewery industries at home and abroad, require qualified accountant and experienced executive to join the Board immediately with a view to succeeding present Financial Director who is reaching retiring age shortly. Duties to include responsibility for the Accounting and Secretarial Departments, advice to the Board on formulation of financial policy, and responsibility for its implementation in the parent company and its U.K. and overseas subsidiaries. Preferred age 35 to 45 years. Experience in the engineering industry desirable. Good commencing salary according to age and qualifications. Future prospects unusually good for applicant of real ability.—Write, giving full particulars of qualifications, experience and present remuneration and responsibilities, to the Managing Director, The A.P.V. Company Ltd., Manor Royal, Crawley, Sussex.

HOUSING TRUST CHIEF EXECUTIVE DESIGNATE

The Western Region Production Development Board, with the approval and support of the Government of the Western Region of Nigeria, intends to establish a Western Region Housing Trust. The objects of the Trust will be the development of Housing Estates as well as fostering the growth of home ownership. Applications are invited for the post of Chief Executive Officer Designate of the Trust. In the preliminary stages his chief duties will be to assist in drafting legislation and in drawing up plans for the establishment and operation of the Trust. During this period he will be engaged on the staff of the Board but, subject to satisfactory performance, will become the Chief Officer of the Trust when formed. His duties will then include (a) organising the development of housing estates and (b) promoting home-ownership on building society lines.

Applicants should possess wide administrative experience in such fields as planning, development and financing of housing areas and of home ownership schemes. Academic and professional qualifications will be an advantage.

Salary will be £2,500-£3,500, point of entry depending on qualifications and experience.

Further details of the proposed Trust and of the Board's Terms and Conditions of Service can be obtained from:

The London Representative,
Western Region Production Development Board,
18 Grosvenor Gardens,
London, S.W.1,

to whom applications, giving full details of experience, qualifications, etc., should be addressed; replies to reach him not later than January 31, 1957.

General Terms of Employment: House, with basic furniture, provided at rental of £150 per annum; Provident Fund; Outfit Allowance £60; Free Medical Service; Free passage for wife; home leave at full pay at the rate of five days per month of overseas service. Low income tax.

AN EXECUTIVE DIRECTOR is required by a large group to take charge of a small number of manufacturing companies within the United Kingdom. Position carries a salary of £5,000 upwards, with excellent pension provision and bonus on profits. Applicants, within 42-55 year age group, must have superior engineering qualifications with emphasis upon production of electrical equipment. Only executives with top ranking responsibilities and outstanding administrative achievements covering fields of finance, sales and the production of capital equipment should apply. All replies held in guaranteed strictest confidence. Apply with complete details age, education, personal background and experience to Cooper Brothers & Co., Chartered Accountants, 14 George Street, Mansion House, London, E.C.4.

A TOP LEVEL EXECUTIVE

A large, prosperous and expanding British Company engaged in a vital process industry wishes to strengthen its top level management as most of the present Executive Directors are due for retirement at varying times during the next few years.

Over a period of more than 50 years the Company has attained a unique position in its industry by generous personnel policies, by the introduction of modern plant and production methods and by competitive marketing.

Applications are invited from Executives within the approximate age group 38-48 who have already had Board level experience and who after a short introductory period could assume full Director responsibilities. Consideration would also be given to outstanding applicants who for special reasons have not yet attained Board level.

The position available can be approached by way of Sales, Accounting, Finance or Production experience, but candidates must be top level administrators possessed of highest personal qualities and with proved ability to direct, maintain and develop a successful management team. The salary offered will be fully commensurate with the applicant's qualifications and abilities, but a commencing level of from £5,000-£7,000 per annum is envisaged.

Candidates should submit full details of age, education, qualifications, experience and salary to Box 584. Applications will be completely confidential as initial scrutiny will be carried out by an outside professional firm.

NATIONAL COAL BOARD invite applications for a superannuable appointment in their Organisation and Methods Group at London Headquarters, to undertake studies of office organisation, staffing and office methods and mechanisation. Applicants should preferably have experience in O and M, or similar work, a recognised professional qualification or University degree, and experience in a position of responsibility in a large organisation. Salary within inclusive scale £1,159-£1,575 (male) according to qualifications and experience.

Write, with full particulars of age, education, qualifications and experience, to National Coal Board, Staff Dept., Hobart House, London, S.W.1, marking envelope X.517F, before December 27, 1956.

GENERAL MANAGER

required by
COOPER, McDOUGALL & ROBERTSON LTD.

for the DIVISION now being formed to take charge of their commercial and production interest in the United Kingdom. Responsibilities of the post include planning and management of all marketing and production of the Division and the profitable development of new products. Candidates should have wide administrative and sales experience, with proven ability as a senior executive in a large manufacturing Company. Age 35 to 45. Salary according to experience and qualifications, but not less than £3,000 p.a. on appointment. The position is pensionable and carries with it a seat on the Divisional Board. To the right man, this post offers opportunity of early promotion in an old-established and world-famous Company. Applicants should send details of age, education, experience, present position and remuneration in strict confidence to: The Divisional Chairman, Cooper, McDougall & Robertson Ltd. (U.K. Division), Cooper House, Berkhamsted, Herts.

WORKS MANAGER required urgently to take charge of production and general management of one of the largest electrical manufacturing units in South Africa. Must have wide and sound experience of Works organisation and production systems as applicable to the manufacture of motors, transformers and switchgear.—Box 586.

THE CO-OPERATIVE WHOLESALE SOCIETY LIMITED invites applications from proved leaders of Organisation and Methods teams for the position of Head of an O. and M. Department soon to be commenced at the Headquarters of the Society in Manchester. The inception of such a Department, recruitment of supporting personnel, training and direction of assignments will require to be undertaken by the successful applicant. The position is an important one and a commensurate salary will be paid.

This position is being re-advertised. Any candidate who applied previously is eligible to be considered if they repeat their application.

Intending candidates should write for an application form to the Secretary and Executive Officer, Co-operative Wholesale Society Limited, 1 Balloon Street, Manchester, 4.

LADY graduate (Dublin) Sept. 1956. First class Honours B.Comm. degree seeks progressive opening in London—preferably market research or personnel—as trainee or assistant.—Box 587.

ATOMIC POWER FOR PEACEFUL USE.

[some more facts of interest

▸ IS NUCLEAR FUEL EVERLASTING? The closed-circuit boiling water type of reactor, which Mitchells believe to be ideally suitable for use in remote areas and for Commonwealth development, consumes very little fuel. A reactor producing 60 megawatts of electric power 'burns up' *230 lb* of fuel per annum out of the charge of 50 tons. The equivalent consumption of coal would be *275,000 tons*. Limited renewal is, therefore, necessary, but this is a routine job presenting no difficulty.

▸ IS NUCLEAR POWER SAFE? The boiling water reactor is inherently safe and self-regulating. A nuclear explosion cannot occur in it. Any faulty operation which might cause over-rapid heating would also create pockets of steam which would automatically reduce radio-activity and heat production.

▸ IS NUCLEAR POWER COSTLY? Nuclear fuel has to be processed and is at present expensive, but such efficiency has already been achieved in converting it into electric power that operating costs are in every way competitive for small-load units and for remote areas. These costs will be lowered progressively as nuclear fuels are themselves developed more cheaply.

MITCHELL DEVELOPMENTS in the field of atomic power are the logical outcome of 35 years' exceptionally wide experience in all branches of engineering and electrical supply. The agreement between Mitchell Engineering Ltd and AMF Atomics Inc of New York, will undoubtedly have far-reaching effect in applying atomic power for the benefit of mankind.

MITCHELL COMPANIES are at present engaged on three important contracts for the United Kingdom Atomic Energy Authority.

Five years ago a firm making building components had an annual export turnover of under £2,000. But they had a plan for increasing this—and their plan included E.C.G.D. They saw the E.C.G.D. Man—took out a policy—and in their first year of insurance their turnover went up to £14,500. Figures for the next three years were: £92,000, £250,000 and £275,000. And then last year, £468,000—a two hundredfold increase over their original turnover! Give them all the praise that's going for this remarkable expansion. But E.C.G.D. had a hand in it too, providing for premiums of just over 15/- per cent the security the firm needed to build up this credit business—much of it on terms exceeding 6 months.

If you're an exporter, the E.C.G.D. man will be calling on you. It will pay you to see him—and listen to what he's got to say.

● This is a true story, but because business between E.C.G.D. and exporters is strictly confidential any details which could identify the exporter have been left out.

E·C·G·D

E.C.G.D. is a Government Department set up to help exporters. Its services are fully explained in the booklet—'Payment Secured'. Write for a free copy.

Ring in the New

THE turn of the year, it seems, has become the season for casting Prime Ministers' horoscopes. It is just under a year since it was solemnly announced from No. 10 Downing Street that there was no truth in the rumour that Sir Anthony Eden was going to resign in favour of Mr Butler. Presumably, if the Prime Minister's public relations arrangements had not been put for the time being into cold storage, the same announcement might be expected any day now. The circumstances, however, are very different. Then the puzzle was to explain the Tory campaign against Sir Anthony Eden so soon after he had taken over, and when on the home front at any rate his Government was doing reasonably well. Now the question is whether the present Government, in its post-Suez mood, is still capable of governing.

Let it be frankly confessed that we do not know the answer; *The Economist's* widening ambit has not yet embraced astrology. But it is possible, indeed it is a duty, to indicate before the Old Year is out the reasons for disquiet, and the principles upon which a new look at national policy ought to be based. In purely party terms—and *The Economist* does not disguise its independent view that progressive Conservatism is still, all things considered, the best medicine for the country at this stage—the out-swing in the Melton by-election is added evidence that the Government will have to regain impetus and resolution if disillusionment, and abstention at the polls, are not to set off a series of Conservative reverses. Rightly or wrongly, the impression is that the Government, its breath knocked out of it by the Suez debacle (which its leader does not admit), has reached a dead end; and that its supporters, whatever their earlier views and whatever their loyalty now, are at a loss when faced with the bill for what has happened. The rather pathetic gestures of the Government before the Christmas break to propitiate shopkeepers and the purchasers and producers of cars—with even the suggestion of a retreat from the thawing of rents—spring from weakness and irresolution, not principle. There is no fresh start this way for a Conservative Government; and there will be no fresh start in any way until the Cabinet has recovered its self-confidence and Parliament its confidence in the Cabinet.

A year ago it was both reasonable and just to defend the Prime Minister from the critics behind him. His Government was obviously more business-like in its daily doings than that of his predecessor. In economic matters, and especially in the fight against inflation and in the advance against monopoly and restriction, it was still travelling the right road, as indeed it went on doing until the demon king in Cairo came to loom larger than life. It seemed necessary, however, even in January to add two saving clauses to the testimonial: one was "leaving aside the larger issues of Middle Eastern policy"; the other was to record the uneasy feeling that, while the current Tory criticisms were absurdly exaggerated, "just such a campaign might be justified

and necessary before the end of 1956." This is one of the instances where the role of the successful prophet, however unwitting, is entirely distasteful.

For the moment, with the uneasy ranks closed, the recipe is apparently no change; and the risk, inevitably, is drift. The first need is for a coherent Government with a coherent policy, open eyes and an open mind; and the proper prescription is easy enough to determine. Put most simply, it is that policy, at home and abroad, should be, at all points, related to resources. The Conservatives have the opportunity, if they now learn their lesson aright, to do for foreign policy what Mr Butler has done for home policy: a liberal, two-way partnership with American, Commonwealth and European allies; a resolve to see, without either rancour or the false sense of prestige that has too long dogged our diplomacy, that this country plays with its friends its appropriate part, no less and no more, in the world's affairs; and the decision to recognise always that the measure of Britain's ability and influence abroad is the state and strength of Britain itself. The accumulation and release of native resources to the best advantage : this is the core and test of all sound policies.

Moscow and the Middle East

AMONG the strangest features of the recent strange weeks have been the announcements that Soviet arms, technicians and advisers—in short, Russian influence—have been "discovered" in the Middle East. This discovery has more in common with Columbus's trick with the egg than with his voyages; it was a glimpse of the obvious, not an unveiling of the unknown. Almost all the evidence of Russia's growing activity in this area was available beforehand and had actually been reported in considerable detail by western chanceries and newspapers.

The remarkable thing about the Soviet campaign in the Middle East is not that it has begun, but that it did not begin earlier. Soviet aspirations in the Mediterranean and in the Arab world do not date from yesterday. One of the first moves made after the 1917 revolution was the calling of a congress of eastern peoples at Baku, at which the Moslems were exhorted to embark on a *Jehad*, a holy war against the British Empire; and subversive activities of this sort were one of the main obstacles to the establishment of normal relations between the young Soviet republic and the western powers. Although the prewar plan to foster national revolutionary movements in Asia failed, the age-old Russian dream of access to the warm seas of the south was not abandoned. During the abortive negotiations for a division of spoils between Russia and Nazi Germany between 1939 and 1941, Mr Molotov specifically insisted on Soviet control over the Black Sea Straits. After the war, Russia made several attempts to spread its influence southward through Iran and Turkey. There were many reasons why these attempts were half-hearted and came to nothing. A Russia exhausted by war had little to offer its southern neighbours. Stalin feared that too much Islamic propaganda might find an awkward echo among the Moslem populations of the Central Asian republics. Even more he wanted to avoid the risk of precipitating a world war.

His successors inherited a much more favourable position. Nuclear stalemate made western atomic threats less likely. Economic recovery at home enabled them to put some prizes into the diplomatic bag. The Bandoeng conference of the Afro-Asian states early in 1955 encouraged them in the belief that a neutral third force could be used with the greatest profit in the Middle East to deprive the western powers of control over vital areas of oil supply. Whether the formation, under British auspices, of the Baghdad alliance prompted a shift in Soviet policy or was merely a pretext for bolder action, may be debated; but undoubtedly it did contribute to determine the shape of Russian strategy. Since Egypt or Syria were hostile to the Baghdad Pact, they could be made to serve as the nucleus of a movement which would undermine the influence of Britain and of the West as a whole.

So a full-scale campaign of blandishment, pressure and incitement was developed stage by stage. Mr Shepilov's journey to Cairo in the summer of last year opened the way for a larger two-way traffic of all sorts of missions, delegations and "VIP" guests. The idea of spreading revolutionary ferment in the Arab world was shelved for the time being, and priority was given to the encouragement, by any means, of anti-western nationalism. This became the only test of Soviet favours; and thus communist Russia has come to be seen making gestures of the warmest friendship and approval towards the rulers of countries where the mildest agitation for socialist reform is a punishable crime. Some of the world's most reactionary potentates have, for the same reason, been given the red-carpet treatment in Moscow.

The Arab-Israeli dispute fitted perfectly into this grand design, and the Russian attitude towards Israel provides an excellent illustration of the changing line. At the birth of that new state, with Britain still uncertain about its future, Russia and the United States were its godparents in the United Nations. Yet, during the past two years, the Arab countries have been able to bank on Soviet support in the UN or anywhere else in their campaign against Israel. This support did not merely take the form of votes; arms as well as economic offers from the Soviet block soon became an important element in the new strategy. Previously the western powers, enjoying a virtual monopoly of the supply of

arms to the Arabs and to Israel, had sought to "ration" it in such a way as to avert an explosion. But once the Russians decided to break this monopoly, there was no way of eliminating their competition, while to have formally admitted them to the "ring" of suppliers would have meant admitting their right to a voice in deciding the affairs of a part of the world hitherto considered as a western preserve.

Nothing was done to resolve this dilemma, and so Czech and Soviet arms, including tanks and jet fighters, became trumps in the Middle Eastern game. That they were being shipped in large quantities to Egypt and that Syria was also getting a share was everybody's secret (fairly accurate figures were published early in July). It is by no means certain, however, that the Russians ever intended these munitions to be used to annihilate Israel, for that would remove the only interest which links communist Russia with Arab nationalism. It is tension and continued frontier violence, not a war that might settle matters once for all, that seem to suit the Russians' aims in this area. Admittedly, they spoke with a bellicose voice when British and French troops landed in Egypt. But this was not a situation of their own choosing. They had to serve notice that they would not willingly watch the reassertion of western power and influence in the Middle East.

Mr Khrushchev and his colleagues can now contemplate the balance-sheet of the Suez crisis with real satisfaction. They have made great gains in prestige and popularity. Scarcely an Arab doubts that the Anglo-French forces were halted by the skilfully worded Soviet "ultimatum." Russia has advanced its claim to be the true champion of the struggle against imperialism. The loss of Soviet equipment abandoned by Colonel Nasser's troops in Sinai and of planes destroyed on the ground may seem to the Russians a comparatively small price to pay for such gains—and they may well learn the lesson that in future it will be wise not to place too many weapons in the inexperienced hands of the Arabs, but to concentrate on training them, sending them more "experts" and expanding their own Middle Eastern cadres.

It will not be easy to halt the advance of the Russians, let alone to dislodge them from their newly acquired positions. They have one great advantage in the Middle East—the fact that none of their vital interests is at stake there. True, they have stepped up their trade with the Arab countries, particularly with Egypt, which last year sent them a quarter of its exports. But none of the commodities involved is really indispensable to them. Middle Eastern oil, which is a life-blood for the West European economies, would merely be an extra for the Soviet Union. Thanks to the exploitation of the "Second Baku" fields in the Ural region, Soviet oil production has been rising rapidly, reaching 83 million tons this year. Together with the Rumanian output, it should top the 100 million mark for the first time next year, and supply seems to be keeping up with the growing demand. The Russians' objective is not to gain control over the oil of the Middle East, but to jeopardise the West's access to it. To keep the area in turmoil and to foster antagonism to the West is success enough for them for the time being.

Only one thing mars this bright outlook for the Kremlin. The western powers may also have learnt something. A new western policy co-ordinated under American leadership and disposing of the resources of the United States would prove a much tougher proposition for the Russians. They must be aware of this, for they have taken great pains in their propaganda, especially to the Arab world, to put the blame for intervention on the western powers as a whole and not only on France and Britain. The United States has been represented as an imperialist wolf in anti-colonial sheep's clothing, covertly backing and even inspiring the Anglo-French intervention in Egypt, and standing apparently aloof merely for tactical purposes.

But the Russian attempt to tar America with the Anglo-French brush seems unlikely to succeed while Mr Eisenhower holds to his United Nations line—and this may prove the weakest point in the apparently strong Soviet position, particularly if the United States now comes forward with new offers of economic help for the Middle East. Moscow has been thunderously silent on the question of aid for the Arab world since the Aswan dam scheme collapsed in July. Can it afford to remain silent? But can it compete against America in a straight contest for Middle Eastern goodwill?

The Desire for Wealth

Do not let us give way to the notion that our limited space and great wealth are the causes of our pilfering habits. . . . Our increasing wealth is the necessary result of increasing skill and knowledge. It was promoted by the greater knowledge of free trade and by the improved commercial policy which began to be very conspicuous in 1842. It is promoted by every increase in productive power, whether in the agriculturist, the manufacturer, or the merchant. It is increased by the opening of new markets as well as by the taking of new land into cultivation. Our wealth has increased faster than our population, and its increase facilitates further increases. It is now a worn-out error "that the progress of society in one age impedes its progress in the succeeding age." The reverse is the fact, and the progress of all Europe, especially of England, has latterly been in an accelerating, not a retarding ratio. The progress in skill and knowledge, and wealth, is what we emphatically call by one word civilisation, and it is a contradiction or an absurdity to regard this as a cause of criminality. We must go on in this career, it is obviously the ordained course of society, and with it increased criminality is incompatible. Let us, therefore, dismiss from our minds the hackneyed and false creed that the multitude of people and the great amount of wealth within the physical confines of England are the causes of the intensity of the desire of gain, which leads to such an increase of criminality.

Population Marking Time

SPECULATION about future trends of the population of these islands is a recognised diversion for the alarmists. Fears of under-population now jostle out the Malthusian fears of over-population. That the population is an ageing one is an all too familiar fact, that a decline in it is probable is widely accepted, and it is but a short step for the gloomy to see in this the eclipse of the British people. Can we, in fact, wars and plagues apart, make any reasonable assumptions about our future numbers ?

The Royal Commission on Population, reporting in 1949, foresaw three possible future trends—with widely differing implications—but were reluctant to declare one more likely than another. Now, with ten years of postwar experience to draw on, the official demographers chance their hand more boldly. Their recent forecasts, summarised in Table I, should dispel gloom :

TABLE I
HOW THE POPULATION IS EXPECTED TO CHANGE
(Millions: United Kingdom)

	Ages			Total Population
	0–14	15–64	65 and over	
1955	11·7	33·8	5·8	51·2
1965	11·0	34·7	6·5	52·2
1975	10·8	34·4	7·8	53·0
1985	10·8	34·2	8·3	53·3
1995	10·4	34·1	8·3	52·8

Source: Government Actuary's Department and Registrars General.

they depict a gradual addition to our numbers of up to two millions over the next thirty years, and then a gentle turn of the tide. But by the end of the century there should still be rather more people in the United Kingdom than there are today and, in spite of the larger proportion of the old among them, just as many of working age. The population prospect for the rest of the century is a surprisingly stable one.

What lies behind these figures and how speculative are they ? Three factors determine whether a population shall increase or decrease—births, deaths and migration. Predictions ahead are based on how these factors have been behaving in the past and what changes seem probable in the future. Let us look first at some of the familiar facts about birth and death rates given in Table II. In the first three decades of this century the natural increase—that is, the excess of births over deaths—was high; it well exceeded the net loss through emigration of 2½ million people in the thirty years. When the birth rate fell in the 1930s, the smaller natural increase was bolstered up by a net immigration into Britain of about half a million people during the decade. Now, after the abnormal influences of the war years have subsided, birth and death rates are much the same as in the 1930s, but once again there seems to be a loss on the turnover of people arriving in and out of the country ; recent trends from Jamaica and elsewhere, however, make conjecture about the future rather hazardous.

These general birth and death rates—the crude rates as the demographers call them—are the measures that matter most in counting the change in numbers, but they gloss over what is really happening to the fertility and the mortality of the population. The rate at which people have children is determined in the long run by the proportion of the adult population who get married and by the average size of family they have. To relate births to the total size of an ageing population, in which a smaller proportion represents women of child-bearing age, produces a less favourable picture of fertility than is justified. More people are marrying today and marrying younger than in the 1930s ; in the real sense fertility is higher. The death rate is influenced by the age distribution of the population ; other things being equal, an older population will naturally have a higher death rate than a young one.

★

In forecasting changes, all these factors have to be taken into account. The marriage rate can be predicted with some certainty and the mortality rate within reasonable limits. We are left with migration and family size as the big question marks. What have the crystal gazers to say ? They conjecture that there will be a net outward migration in future of 32,000 persons each year, and that births will decline from their present annual level of 74 for every thousand women of child-bearing age (a measure reflecting both marriage rates and fertility) to 69 in 1980 and subsequently remain unchanged at 67.

The hazards in these forecasts now become apparent. If it turns out that there is an outward balance of migrants but it is twice the size assumed, the population in thirty years' time will be a million less than predicted; if, on the other hand, emigration is no more or less than immigration, the population will be a million more. Again, the average family of tomorrow might be much bigger or much smaller than that of today : nobody can really say. Nevertheless, the assumptions made are the most reasonable ones available. One can go so far as to say that it will be surprising if this century sees much change in the size of the population in Britain.

But if it is agreed that the population is likely to be a stationary one, this still leaves plenty of room for variations in its age structure. The likely errors in forecasting future mortality will not affect the total population very much, but can make a big difference to the numbers of old people at different dates in the

future. Demographers, like most people, believe that the further progress of medical science will reduce premature mortality ; they think that deaths at ages under 45 will decline over the next twenty-five years down to about one-half their present-day rates, with progressively smaller improvements at older ages.

Halving a death-rate within any age range sounds staggering, but Table III shows how relatively small the chance of death is for younger people, once they have survived the first year of life, and how these rates have, in fact, been pared away even since the 1930s. The figures look so small, indeed, that it is hard to grasp their significance, but Table IV shows the striking effect on longevity. Much of the improvement has been in infant mortality : boy babies born today have a reasonable hope of living nine years longer than those born twenty-five years ago, girl babies ten years longer ; but even for a 25-year-old, the expectation of life has been lengthened by three years for a man and five years for a woman.

What are the main risks to life and which have been reduced ? One of the worst risks, oddly enough, is birth itself. By far the greater part of the continued fall in infant mortality is accounted for by fewer deaths at ages four weeks to twelve months ; deaths in the first four weeks of life, particularly in the first week, tend to remain persistently high and account for two-thirds of the total number of infant deaths. This so-called neonatal rate should be regarded in association with a stillbirth rate that also refuses to come down,

TABLE II
THE PAST RECORD
(United Kingdom)

	Millions	Per Thousand Population

for it is often a matter of chance whether a baby is born dead or is born alive only to die shortly after birth. In both cases, death is often associated with toxæmia of pregnancy, and further improvements in antenatal care may reduce this risk to child life.

It is in childhood and adolescence that preventive and curative measures have achieved their most striking success. Deaths from common infectious diseases—measles, whooping cough and diphtheria—have fallen to about one-thirtieth of the figure they were twenty-five years ago. There has been a big fall, too, in deaths from bronchitis and pneumonia, which used to take a large toll of young children, and which are still a common cause of death among the old. Tuberculosis, formerly regarded as the chief danger to the younger age groups, and indeed an important cause of death up to middle age, shows a dramatic decline in mortality.

Is there a black side to the picture? Obviously as more people survive the risks of childhood and youth, there will be an increase in the total number of deaths from illnesses to which the older age groups are more susceptible. Cancer, as Table V shows, is thus a much more important cause of death that it was in 1930-32, and the rise in deaths from lung cancer has offset much of the fall in deaths from tuberculosis. Mention should also perhaps be made of the increase in deaths from leukæmia. Although small in total, they have doubled in the last twenty-five years to 2,224, and about a third of these were of younger people and children. As the population grows older, there is also bound to be an increase in deaths from heart disease and strokes. A more important question is whether there has been a real increase in all these more intractable diseases in the middle-age groups—in, that is, people aged 45-64. The difficulty here is that in trying to compare deaths from certain diseases now and twenty-five years ago, one comes up against questions of classification and diagnosis that make comparisons invalid. For instance, coronary thrombosis as a cause of death was not recognised until this century, and it is not therefore surprising that registered deaths from disease of the coronary arteries were only about 6,000 in 1930. But by 1940, they were still fewer than 19,000. Some of the big rise since then must represent a real increase, and now the death rate per million men living in the 45-64 age group is two to three times what it was at the outbreak of the war. Up to now it has been a predominantly male disease.

Cancer and coronary disease are therefore, as Table VI shows, the hazards of middle age. They account for nearly one-half the deaths between the ages of 45 and 64. They have rightly been called the twentieth-century killers, and it is not surprising that a vast amount of medical research is now being devoted to them. Only if it bears fruit are we likely to find new cohorts of the middle aged living to enjoy their pensions.

Notes of the Week

Canal Blackmail

EGYPTIAN permission for canal clearance is still grudging and piecemeal. Although salvage operations have started at Suez, President Nasser, by not yet giving the United Nations *carte blanche* to clear the canal, is reserving his ace. Although the original agreement with Mr Hammarskjöld only specified the departure of troops from the canal area, the Egyptians' delaying tactics show that they are dissatisfied with their bargain. Having speeded the departure of the Anglo-French force by making its withdrawal a prerequisite of canal clearance, President Nasser now shows signs of wanting to repeat this manœuvre against the Israelis.

Although the Egyptian government has agreed that salvage should begin, it is still holding out over the use of British and French salvage ships. General Wheeler, the United Nations salvage chief, who has already signed contracts for two British and one French vessel, was believed on Thursday not yet to have got permission to move the six ships he particularly needs from Port Said harbour. This is clearly stalling on Nasser's part. After stripping the British navy of their uniforms, and accepting their help in clearing Port Said harbour, he could have allowed them to go further down the canal without losing any face. But Israeli intentions over the Gaza strip will soon be crucial and until then Nasser wants to hold his hand. United Nations patience with Egypt so far seems to have been drawn from a widow's cruse, but if complete permission for salvage is really made conditional on Israeli withdrawal from Gaza, President Nasser may find that he has overplayed a good hand.

Two of Mr Hammarskjöld's lieutenants have been sent off to Egypt with canal clearance and the Israeli withdrawal on their briefs: Mr Katzin, a South African in charge of the administrative side of canal clearance; and Mr Cordier a history professor from Ohio, who is executive assistant to the Secretary-General and manager of the Assembly. Last month, when he discussed the preliminaries of canal clearance with Mr Hammarskjöld in Cairo, President Nasser could still profit by the Anglo-French disgrace. In these new talks, he will surely bring up the changeable attitude of the British over their salvage vessels and the bellicose utterances of the Admiralty, both of which are believed to have caused the UN secretariat considerable irritation. But the First Lord's comments at Port Said two weeks ago, when he said that his advisers "greeted with total incredulity" the United Nations' claim about the way the canal could be cleared without use of the Anglo-French fleet, now seem to be justified, even if their expression was ill-timed. Lord Hailsham was widely criticised for his remarks (and all the more because of his earlier anti-American speech at Oxford), but the deadlock which has been reached over the six Anglo-French salvage vessels shows at least that General Wheeler is anxious to have these ships. President Nasser may find that in the coming bargaining session he will have to give as well as take.

Rating Plan—or Scuttle?

MR SANDYS'S decision to apply a 20 per cent relief to the rateable values of shops, offices, and other commercial properties in England and Wales can be defended up to a point on grounds of proportionate equity. The recent revaluation rated houses on the basis of 1939 rentals, and continued the 75 per cent rebate for industry and freight transport together with complete exemption for agriculture. By contrast, it left shops and offices with the unenviable liability of paying full rates on full current rental values, with a consequent considerable increase in their share of the total rate burden. Mr Sandys's last-minute concession embodied in the Rating and Valuation Bill, will go a very long way to restore the *status quo ante*, so far as shops and commercial premises are concerned. It appears that their share of the total rate burden (after allowing for the revaluation of Crown property) will now drop to around 35 per cent, not much higher than the 32 per cent which they bore before revaluation.

This might seem fair. But what is so ominous is that this concession appears once again to take valuation practice one step away from its proper goal—which is the full and equal rating of all kinds of property on the same basis of current rental values. It was the virtue of the recent revaluation, with which the Minister is now tampering, that it represented a long stride forward in the right direction. If, instead of derating shops and offices, the Minister had rerated industry and agriculture, the end of the road would have been in sight. Moreover, he would have drawn the shopkeepers' sting by transferring their extra burden to industry and agriculture. Everything would then have been ready for putting housing valuations too upon a current basis—which could have been done at the next quinquenial review or, at the very latest, at the one after, depending upon the speed with which the easing of rent restriction takes effect.

It is possible that the Minister is planning to move towards the right goal by devious and subtle means. He has promised, early in the New Year, to make a statement about local government financial reform and this may include provision for some degree at least of industrial and agricultural rerating. Perhaps Mr Sandys's idea is to aim at giving commerce and industry and (if he dares) agriculture a rather similar degree of rating relief. Then the concessions could be withdrawn at the same time as housing is eventually revalued upwards—a timetable which would make this final step a great deal easier politically than it will otherwise be. If this indeed is Mr Sandys's plan, he deserves credit for prescient wisdom. But, alas, it seems far more likely that he may be giving in to the shopkeepers' insistent clamour—which after all must have been foreseen when the basis for revaluation was settled. Otherwise why delay an announcement about industrial rerating which could have eased his task and averted the charge that he is milking the householder to appease the shopkeeper? There were good grounds for appeasing the exasperated small shopkeeper by the withdrawal of the restrictive and grandmotherly Shop Hours Bill; there are no such grounds for appeasing the embattled shopocracy over rates. Mr Sandys's next statement will show whether he is launched on a sensible rating plan—or playing a badly rehearsed part in an ill-conceived electioneering one.

Athens Hangs Back

THE British Government's effort to get the Cyprus question off to a new and more promising start does not seem to have turned out well as yet. The Greek government, led by Mr Karamanlis, has been behaving as if it were anxious to reach a reasonable compromise solution; but now that the British Government is showing some willingness to meet it half-way—and it must be remembered that it is not easy for the present British Government to make political concessions in the eastern Mediterranean just now—the Greeks are holding back and making difficulties.

Mr Lennox-Boyd could have made matters easier by being more specific about self-determination, to the extent of stating that the islanders could choose their future status so many years afer the introduction of self-government. Since the emergency is by no means over, this would still have been pretty vague. It was also unfortunate that the Colonial Secretary should have found it necessary to mention the possibility of partition. In itself, it is unlikely that partitioning the island would provide a permanent solution, however attractive a sop it may be to the Turks; self-determination is a concept that can easily be reduced to absurdity. But it will be a great pity if the Greeks use partition as a red herring to divert attention from the real merit of the Radcliffe proposals. It is true that these leave extensive reserve powers in the hands of the Governor. But it is nonsense to say that the proposed constitution is neither liberal nor democratic. Naturally a great deal would depend upon the spirit in which it was worked in practice. But it is reasonably clear that it would be difficult for the Governor to flout the wishes of the democratically elected Assembly unless the elected majority and the ministers were engaged in subversion themselves.

The Greek government's attitude may be determined by the need to keep up with the opposition parties, which lost no time in expressing their disapproval of the Radcliffe proposals. But if it persists in opposition—it is reported that it has even threatened Washington with a change in the "orientation" of Greece—then the suspicion will inevitably arise that it is afraid of the consequences of putting the

Radcliffe constitution to work. In other words, it will look as if the Greeks are afraid of the possibility that the Cypriots may end by finding self-government more attractive than enosis.

The Law and the Union

In the Chancery Division last week damages of £500 were awarded against members of the West Hartlepool district committee of the Amalgamated Engineering Union, in an action brought against them by Mr Huntley, an engineer and member of the union. Because Mr Huntley had refused to take part in a one-day stoppage of work which he believed to be illegal, the district committee had done their best to expel him from the union, had stopped him getting any work in their district, had even gone so far as to persuade another district committee, in whose area Mr Huntley tried to get work, to prevent him from doing so there. The defendants pleaded that they were protected under the Trades Disputes Act of 1906, which prevents those engaged in trade disputes from being sued for civil conspiracy; the judge held that they were not so protected, because, although they may have begun their machinations against Mr Huntley in the belief that they were acting in such a dispute, the way in which they conducted them showed that they were really motivated by a personal grudge. They had been expressly told by the general secretary that they had no powers and no right to expel Mr Huntley, and that reprimand or at the most a fine would fit the case of his departure from the orthodox path. Thus in purporting to act in the interests of the union they were acting against it, and were engaged in a conspiracy to injure Mr Huntley.

This verdict does not dispose, unfortunately, of all cases where a union member is expelled or sent to coventry, or otherwise victimised, for taking part in a strike of which he does not approve. Much depends on whether the defendants can or cannot claim that they were acting in a "trade dispute," and so claim the protection of the 1906 Act; they were not so protected in this case because they themselves had no powers of expulsion and because they had failed to get their executive to sanction it. But this case deserves to rank with three others that have lately somewhat modified the tyranny that union members may suffer at their leaders' hands at various levels: the Bonsor case, which established that a man wrongfully expelled can sue his union for damages, and two cases which have established that a man cannot be expelled from the union of his choice because the TUC disputes committee says he should belong to some other. It is worth two cheers for the freedom of the individual.

Red Peril

Mr Woodrow Wyatt has for some time been conducting a campaign against communist infiltration into the trade unions—a campaign which is the more effective because he is known to be a Labour party man. His most spectacular success was a television broadcast in which he pointed out the possibility that another communist might be about to be elected to the executive council of the Amalgamated Engineering Union; largely as a result of this, the poll went up from 9 to 12 per cent of the union's membership, and the communist was roundly defeated. Some articles of his in *Illustrated* have now been reprinted as a pamphlet, "The Peril in Our Midst."

He neatly sums up the tactics whereby communists so often gain their positions as "the skilful use of apathy." Often they are the only people who can stand listening to each other's (deliberately?) boring speeches at meetings; when they have filibustered everyone not on their side into the nearest pub, they elect each other to office and pass their own resolutions. Often rank-and-file members who have no desire for communist leaders are too little interested in elections to find out the political views of candidates—and in case they should try to do so, some communist-dominated unions have deployed rules preventing candidates for office from mentioning their policy.

Mr Wyatt mentions as an example of communist activity the case of the Briggs motor bodies works where, with a communist shop stewards committee, there were 289 stoppages of work for trivial reasons in 15 months. His error, perhaps, is to paint too highly coloured a picture of communist plotting, so that trade unionists may not recognise in these portraits the leaders whom they know and respect. Mr Arthur Horner, General Secretary of the National Union of Mineworkers, for example, is a communist who is widely admired as an able negotiator and as one who has done much for his union. To deny that many communist leaders are sincerely convinced that they are acting in their members' interests, long-term or short-term, is to underestimate their real strength. This pamphlet sensibly suggests that the unions should pay their officials better. If they did this and took legal and financial advice as the American unions do, they might find that communists were no longer the only people prepared to give up their time to such poorly rewarded service.

Lieutenant Moorhouse

Lieutenant Moorhouse, it now appears certain, is dead. "It is a difficult situation," President Nasser is reported to have told the MP to whom he gave the news, "when civilians have arms." Such an admission will do nothing to mitigate the anger in this country. Many hundreds of men have died in the Egyptian adventure, and there is no excuse to be made for their deaths; but the stealthy killing of a captive, alone and helpless, is an act of a different kind from killing in battle in the codes of most men, Christian or Muslim. Anger and disgust are natural and right.

These justifiable emotions ought not to lead the British public to jettison its sense of proportion or to forget the order of events. Neither President Nasser nor his people, wrong-headed as both can be, can have had any conceivable ground for supposing their interests to be served by the murder of Lieutenant Moorhouse. Nor could it be President Nasser's interest to admit that he cannot control all

the irregulars whom he has armed, unless the admission were true. Repulsive as the crime is, it comes at the end of a chain of violent actions, which, once started, could not be controlled or kept within ethical bounds. The guilt for this young man's death lies on his kidnappers, but the responsibility for it is more widely spread; shame, as well as anger, ought to be among the emotions felt in Britain.

Resurrecting Malenkovism

The central committee of the Soviet Communist party sat in conference for five days until Christmas Eve. To judge by the official report, for the first time since Stalin's death Mr Khrushchev was not a principal speaker and the directing body of the ruling Soviet party did not discuss international affairs in its plenary session. Economic problems at home apparently filled the agenda. The draftsmen of the current five-year plan (1956-60) came under fire for underestimating the available resources and the perspectives opened by technological change. The savings which it should be possible to make in a revised version will be used to bolster the consumer industries and, particularly, to step up the building of houses, by far the greatest worry of the average Russian. Criticism must have been violent and the changes may be important, since on the morrow Mr Mikhail Saburov, Russia's chief planner since 1949 (after the elimination of Voznessensky), was dismissed from the section of the *Gosplan* dealing with current planning.

Further reports may reveal that foreign affairs did also come under discussion, but even if they were not debated directly, the events in Poland and Hungary must have influenced the internal economic decisions. It was an easy lesson to draw from recent upheavals that the best way to avoid their repetition, or their spreading to Soviet territory, would be to shift the emphasis of "liberalisation" from the political to the economic field, to precede further measures of relaxation by steps to improve the standard of living. Though the communiqué still repeats the orthodox formula about the absolute priority of heavy industry, this week's meeting might well mark a shift in Soviet policy towards greater concern for the consumer. A real housing drive would play a key part in such a new programme.

During the short premiership of Mr Malenkov, this seemed to be the pattern of liberalisation. The explosive failures of Mr Khrushchev's methods may have put his predecessor in a new light, but the revival of a policy does not necessarily mean the return of its author. A special session of the Supreme Soviet, to be held early in the new year, should show how strong are the echoes of the Hungarian rising and how important are the changes they have precipitated in Soviet policies and leadership.

Mr Chou on Tour

Mr Chou En-lai's tour is not at an end; he is to visit the capitals of the Soviet Union and Poland in January. This part of his peregrinations emphasises the importance China has acquired in the communist world. Russian papers are at pains to stress Chinese approval of the second Soviet intervention in Hungary. On the other hand, the rumour has it that Peking encouraged the Poles in October in their defiance of Moscow's blind orders. Polish delegates at the congress of the Chinese communist party were apparently prodded by their Chinese colleagues to follow their own road without undue respect for Russian advice.

Recent tendencies to question Moscow's position as the Rome of the communist movement strengthen China's hand. Untroubled by peripheral revolts, and with no Stalin to bury, Peking can play the role of arbiter in the communist councils. During his short stay in Russia Mr Chou En-lai may well ask, in exchange for his country's moral backing, not only for more economic aid, but also for a more liberal policy towards the former satellites. A trip to Warsaw will provide him with an excellent opportunity of showing his country's natural liking for Signor Togliatti's idea of "polycentrism" within the communist world. Peking, though anxious to preserve the strength of the communist movement, may see the present as a good occasion to break Moscow's monopoly of power.

The Mental Hospitals

The Royal Commission on the lunacy laws is now preparing its report and presumably making up its mind whether the present system of certifying mental patients should be abolished or at least greatly modified. In the meantime, the Ministry of Health's latest report* gives some information on the numbers concerned.

At the end of last year there were 150,572 patients in hospitals approved under the Lunacy and Mental Treatment Acts, that is, about 35 per cent of all patients in all hospitals, and nearly three-quarters of them were certified. But for admissions to mental hospitals the proportions are reversed; three-quarters of the 78,586 patients admitted last year were "voluntary" patients, which does not necessarily mean that they were less ill than the certified but rather reflects current policy to avoid certification wherever possible. The report also throws some light on the proportion of new patients who become chronic. In the younger age groups —under 55—80-85 per cent are discharged within twelve months of their admission. Over the age of 55, the percentage falls and fewer than half of the over sixty-fives are discharged; but if allowance is made for the large numbers of the old who die soon after they are admitted, it is probably true that the proportion of mentally ill patients who become chronic is roughly 20 per cent at all ages. Unfortunately, the report does not distinguish between new admissions and new cases; many patients are admitted and discharged several times in one year.

The prospects for the chronic mental patient are not so bleak as they were, though the hospitals are still handicapped by difficulties in recruiting the right sort of staff, particularly for their male patients. Another difficulty is that even chronic cases could often be discharged if they had somewhere to live, while others do not need full hospital care but only some hospital supervision and treatment. A section of the report describes the interesting experiments that are being carried out to provide facilities outside the mental hospital walls—day hospitals, day centres, night hospitals,

* Annual Report, Part II. Cmd. 16. 9s.

psychiatric units in general hospitals. The Royal Commission is not concerned with accommodation or treatment. But any radical change in the laws relating to mentally ill patients is, in the long run, inextricably bound up with a greater variety in the resources for caring for them.

Curbs for the Club?

PRIVATE bills introduced by members of the House of Lords do not usually get very far ; it is to be hoped that Lord Merthyr's Licensing (Amendment) Bill will be no exception. The aim of the bill is to curb the part played in the evasion of existing licensing laws by clubs, a proportion of which have come to be retail outlets for liquor in competition with public houses and outside the control of the licensing magistrates. This, apparently, is very irritating to the magistrates ; for if this bill meets with their general approval—and Lord Merthyr is the chairman of their association—it is plain that their main concern is to administer the law as it stands even more onerously and with even more powers to interfere with the liberty of the subject, rather than to use their influence to have a thoroughly bad law, sustained by minority pressure groups, brought into line with the needs of an adult and generally sober-minded community which has many other ways of spending its time than in a gin-palace.

The licensing trade will welcome the bill. As custom for the pubs (thanks partly to out-of-date restrictions on the amenities they can offer) declines, the clubs have grown—from 6,000 in 1900 to 22,000 today. Their hours are more flexible ; they can offer music, games, dancing and fellowship besides the stimulus available from the bar ; and families with their children can go to them in the convenient Continental way. No doubt some of them are " continental " in a less desirable sense ; it might be right, as part of a wider law, to restrict the sale or supply of liquor to persons under 18. But the basic point about Lord Merthyr's bill is that it would give magistrates immense powers to interfere with people's rights to get together in their own way on private premises—laying down all sorts of rules about the premises, the antecedents of the club conveners and so on. All this is seen wholly in the context of competition with the pubs—but is it to end up with rules about the circumstances in which one gives a bottle-party or invites the neighbours in to beer-and-TV ? It will, if the magistrates, the publicans and the temperance idealists get half a chance. And if it does not end up there it will fail in its main aim—to stop evasion. So long as some freedom remains, some other means of evading a bad licensing law will always be found. Lord Merthyr should drop his bill ; and the Government should turn to licensing law reform.

Naval Discipline

THE Select Committee on the Naval Discipline Act has done a seamanlike job in preparing a draft bill to bring the present Act little changed since 1911 and indeed still substantially the Act of 1866 into line with modern ideas and such new developments as Commonwealth navies, communist infiltration, conscription, the Wrens, flying-machines, and a more expressionist attitude to profanity—as well as with the disciplinary codes in the other services. The death penalty remains, though it has been removed for some offences. As it has been imposed only once in the last 100 years it now exists mainly as an awful warning of the eternal verities behind the Articles of War ; and in the navy's view it is also a salutary reminder of the heinousness of such offences as mutiny, even non-violent mutiny, which can endanger life in ships or submarines at sea. A number of new offences have been added, of which perhaps the most significant is " aiding the enemy, whilst a prisoner of war " ; it is clearly intended that the penalties shall take account of the degree of torture or brain-washing employed.

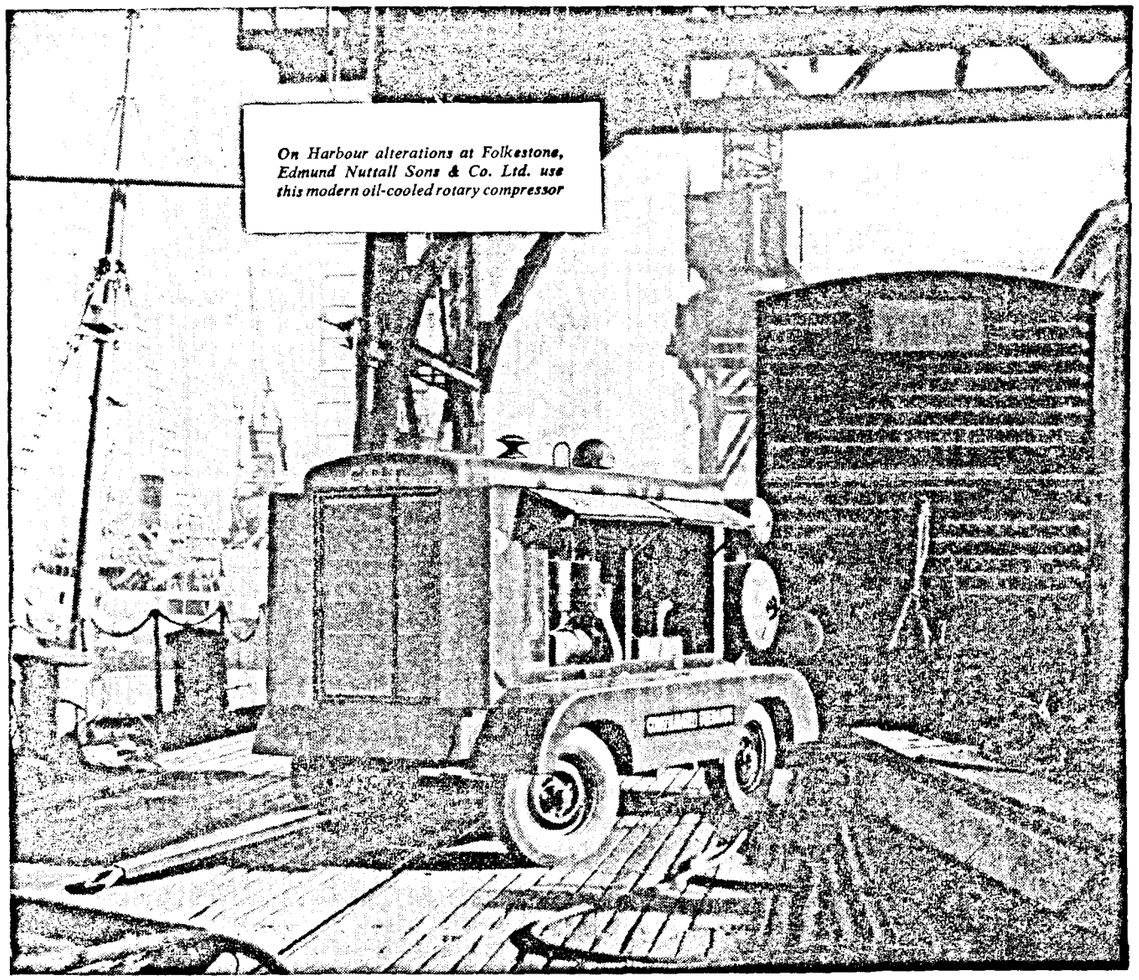
Sensible changes are suggested for the conduct and staffing of courts martial (the provision that the entire ship's company of a ship sunk by enemy action must be court martialled has long disappeared); and the committee deals in detail with the apparently unfair differences between naval and army discipline. It points out that it is possible for the army to enforce its code rather differently in peacetime and wartime ; but whether in peace or war a ship at sea is always in risk of hazard besides being a dangerous box of tricks. Discipline of a high order can alone prevent accidents. Perhaps there is some departure from the admirable logic of this approach in the committee's judgment that it would not be " fair " to operate the naval code more laxly in shore establishments than in ships ; this, at any rate, is a point that Parliament should argue about.

Any sort of discipline is irksome ; and modern warships are shorter than ever of " swinging space." But since the Act of 1911 was passed a warship no longer contains 300 or 400 stokers in a complement of 800 ; naval discipline is now essentially related to the teamwork of educated men operating a scientific but dangerous mechanism in conditions of great personal responsibility. On the whole, the authors of the draft bill have understood this ; if the bill becomes law it will not change the essential character of naval discipline, but may make it easier to maintain in an unstuffy and sensible way.

Germany's Foreign Policy Initiatives

DR ADENAUER'S meetings with Mr Nehru and with Mr Smirnov, the new Soviet ambassador in Bonn, reveal a growing animation in German foreign policy. The meeting with Mr Smirnov, the first which the Chancellor has had with the new ambassador, took place after Dr Adenauer had made it clear that he would at last like to use diplomatic relations between the two countries to discuss reunification. It had been encouraged on the Russian side by the gesture of handing the German ambassador in Moscow a copy of the latest Russian disarmament proposals. The German Chancellor's meeting with Mr Nehru was hastily improvised and more general in scope, but it may be related to these moves.

The two meetings are but the latest of a number of tokens of fresh thinking in Bonn, particularly about Eastern Europe. At the meeting of the Nato Council it was Herr



The Compressor without maintenance problems

More and more contractors are turning to the Power Vane rotary compressor, a simple two-stage vane type rotary machine having none of those moving parts most subject to maintenance problems i.e. pistons, valves, crankshaft and clutch. The entire unit runs in oil and is oil cooled. Other desirable features which put the Power Vane well to the fore include fully automatic safety devices centralised instrument panel, non-detachable folding side shutters and radiator doors. Power Vane rotary compressors are available in a range with outputs of 120, 175, 210, 365 and 600 cu. ft. Certainly this is something every Plant Engineer should know about. Ask for Catalogue 58C.

the things they say!

Did you see in the press the other day how short of engineering technologists we are becoming? Every year, it seems, there are more than 50,000 new technologists in Russia, and more than 20,000 in America. But the figure for Britain is only 3,000!

Yes, it's a big problem, all right.

What I want to know is: Why doesn't industry do something about it? After all, it's industrial firms that need the technologists — they should help the Universities to produce them.

Many do. For instance, I.C.I. gives over £200,000 to the Universities every year for a variety of purposes, including research fellowships and grants to their scientific departments for the materials and equipment needed in research.

That's quite something — I.C.I. seems to be alive to its own vital interests.

Yes, and that's not the whole story, for I.C.I. recently started, at several Universities, a new scheme of Transfer Scholarships. These will enable young men who haven't studied Science at school to prepare themselves to take it at the University. This scheme will do something to help us get the *extra* technologists that Britain so badly needs.

ICI

V

von Brentano who expounded the problems which would arise for Nato and the world if violent unrest should spread from Hungary or Poland to East Germany. West Germans would be presented with the cruel alternative of watching their countrymen crushed, or intervening and risking a third world war. For a German it required great courage to conclude, as Herr von Brentano did, that West Germany and its allies should do everything they could to discourage an East German rising—a sharp reversal of many of the vague suggestions which have come from western broadcasting stations and politicians in the past. Herr von Brentano also made the first efforts by a Nato statesman to suggest the principles for a wider Nato policy in Eastern Europe. Eschewing grandiose diplomatic propositions, he suggested that the Nato powers should support five principles for the East European nations—the rights to self-determination and self-government; national sovereignty; freedom to decide their own social order; freedom from foreign pressure by military, economic or political methods; and the inviolability of human rights.

These principles are an encouragement to the peoples of Eastern Europe, but the moderation with which Herr von Brentano stated them seems designed to still Russian fears of western ambitions. Evidently he feels that an attempt by the west to prod Russia into making big concessions because of its present difficulties would defeat itself. Eastern Europe must be allowed to evolve unurged; the west must maintain its strength and unity, but await, cautiously yet with alertness, any opportunity to shift the diplomatic log-jam in Europe.

Pegs for Holes

Too much vague talking is done about youth and its problems, particularly in regard to national service: two new documents may help to dispose of some vague anxieties, but will certainly substitute some real ones. The first of these is a detailed study,* by the Nuffield Foundation, of the careers of 568 Glasgow boys who left school in 1947 at the earliest permitted age of 14, and have now finished their national service. The circumstances of this group are perhaps unusually depressing, and the brightest boys of their age-group are excluded as they presumably stayed on at school after the minimum leaving age. But none of this alters the most disturbing point made by the study: 41 per cent of those who had been apprentices at the age of 17 and then went off to national service were not in skilled work at the age of 22; among those who had been rejected as unfit for national service, 64 per cent remained in skilled jobs. Yet those who were accepted for service generally had the advantages of both physique and brains over those rejected. This drain of potentially skilled men is a waste both for the men and for the country.

One trouble is that, on coming out of the army, a strong young man can so easily pick up good money in unskilled work that he does not bother to finish his training in the hope of longer-term rewards. There are not enough specialised jobs to employ the skilled men when they are called up, and they are too often put to work below their capacity with the inevitable loss of morale and of practice in their skill. This seems an insuperable problem for as long as national service is necessary; but the second document, the report of the National Youth Employment Council for 1953-56, has some good ideas.

The council, which has placed some 40 per cent of school leavers in their first job in recent years, has as its practical aim to help young people to find work which will be of permanent interest to them; and so to attract them back into their old jobs when they leave the forces after the inevitable break. It is by finding young people jobs in which they are interested (and by doing more to persuade them to be interested in suitable jobs) that they can be prevented from falling into crime—as 15 per cent of the group studied in Glasgow had done. The council does its best—perhaps greater interest should be taken in suggestions about how it could do more than its present best—to combat the ignorance and apathy from which restlessness and crime spring. Its work will become more and more necessary as the numbers of those leaving school rise in the next few years. In an age when successive governments look too eagerly to such unpublicised social services for economies in expenditure, it is worth protesting loudly that there should be no cuts in this department, please.

* *In Their Early Twenties*, by T. Ferguson and J. Punnison. Oxford. 12s. 6d.

The French Version

M. MOLLET has mustered his majority at the end of the foreign affairs debate in the French Assembly. When historians one day ponder the rights and wrongs of intervention, the postcript which the debate added to the Egyptian affair will be significant. M. Pineau, the minister of foreign affairs, after asking what "collusion" meant, argued that France and the United Kingdom knew about "Israel's intentions and Egypt's threats" and, naturally, consulted each other. He was in a semantic mood, too, about American knowledge of the Anglo-French action. It all depended on what one meant by "keeping informed." The United States government knew about the feelings, disillusions and military preparations of its allies; all it did not know was what they were going to do.

Though the French prime minister asserted that France could not wait for an American change of heart, as it had done until 1917 and 1942, his appeals to jingoism or to Munich carried little weight. The French verdict may in the end be that of M. Edgar Faure, that the expedition was ill-conceived and badly carried out. Other considerations caused the Assembly to treat the government leniently—as M. Reynaud put it, to view it as an administration that was down, not to be kicked now but to be judged later on its subsequent performance. The French judgment will tend to grow in severity as other subjects are added to the Suez indictment.

M. Mendès-France in Opposition

BREAKING the uneasy silence he had kept for a year, M. Mendès-France has attacked the French government in open parliamentary debate. At the beginning of the year the Republican Front of Socialists and Radicals

emerged from the general election with increased strength, but without an absolute majority in the Assembly. After an unsuccessful bid for the ministry of foreign affairs, M. Mendès-France reluctantly accepted a vice-premiership without portfolio in M. Mollet's cabinet. He remained there until the end of May despite a growing distaste for the government's policy, particularly in Algeria. Even after he resigned he remained a prisoner of the dead electoral alliance. Trying hard not to break ties with the Socialists, he could express his opposition only by abstaining, as he did in the vote on the Suez expedition. In this week's foreign affairs debate, however, such inhibitions did not restrain him from delivering a strong indictment of the government.

The balance sheet of the Suez affair which he drew up contrasted violently with the dressed-up versions produced by the French ministers. France, in his opinion, had unnecessarily undermined the Atlantic alliance and had lost the affection of its friends, as well as the good will and moral prestige it still had in the Arab world. It had stopped its own oil supplies and strengthened Russia's position in the Middle East without achieving anything, not even a loss of face by Colonel Nasser. Western ships sailing to break the Egyptian blockade of the Gulf of Aqaba would not have provoked the same indignation in the world as did the Port Said landing.

More important still, in the long run, was his declaration that France cannot have an effective foreign policy until it has solved the Algerian crisis. He expressly gave his backing to the idea of a North African federation—consisting of Algeria, Tunisia and Morocco—linked with France. He did not say just how this could be achieved and there will probably be no opportunity in the near future to test the new tricks this supreme gamesman has in his bag. The cold reception which greeted his speech was symptomatic. He has few supporters in the Assembly beyond a handful of faithfuls who have survived the series of purges and splits in the Radical party since he took over the leadership. The Right, and many "Europeans," hate him; the Socialists are imprisoned in their party discipline. But M. Mendès-France is used to crying in the wilderness and, in the general whitewashing mood, it is no bad thing that he has regained his voice.

Mr Lim Returns

If Mr Lim Yew Hock, the Chief Minister of Singapore, is taking back with him a Chinese New Year present to his country, he is keeping it well wrapped up, and evidently marked "not to be opened till March"—when the plenary constitutional conference over Singapore's future will open. Yet Mr Lim's talks with the Colonial Secretary have left him in good spirits about his preliminary mission, and there is reason to think that his formula for solving the vexed problem of security of the Singapore base after independence has been accepted as a working basis by the Colonial Office. The formula is that while there should be a security council to watch political developments in Singapore which might threaten the base, the council should have equal British and Singapore representation, but with a chairman from the Federation of Malaya who would have the casting vote. The Colonial Office's final view on this formula is evidently being held back until it can assess how long after independence for the federation the Tengku and this moderate government can be expected to retain power.

There is more resistance, curiously enough, to Mr Lim's second request—that not only should the chairman of the security council be Malay, but the Governor-General of the new city-state should be Asian. Mr Lim urges that a British governor-general would suggest to the people that the old colonial system continued; he argues that loyalty to the Queen over and above local (in Singapore often municipal) politics could better be secured by an Asian representative of the Crown. The Colonial Office is understandably holding out for at least a "Soulbury interlude" on the Ceylon pattern; but Mr Lim can urge the precedent of Pakistan, where Mr Jinnah became the King's representative immediately upon independence. The cases are widely different, yet what really matters to the British is the smooth functioning of the base. If an acceptable Asian governor-general could be found, the Colonial Office would be well advised to take the cash and let the credit go.

Egypt's Sterling

By its agreement with Egypt, the British Government is committed, if Egypt so requests, to release £20 million of Egypt's blocked sterling on January 1st and transfer it to current account. The Government may allow the transfer rather than repudiate its word, although the act may arouse some severe criticism. Those who believe that the money will be poured freely into President Nasser's purse should, however, bear in mind the sterling restrictions which were imposed on Egypt immediately after the nationalisation of the Suez Canal Company. These removed Egypt from the transferable account area and brought its sterling transactions under British exchange control. Egypt will not be free to shop where, or when, it likes with the £20 million. The money will merely be transferred from one blocked account at the Bank of England to another.

Roughly speaking, the releases of 1955 covered the deficit on Egypt's balance of trade with Britain; in other words, they bought goods from Britain, which were unrequited exports but which oiled a few cogs of British industry and commerce. At the moment, there is no opportunity to trade with Egypt, but one must assume, or at least hope, that during the year relations will reach the stage when trade can be done again. In that case the coming releases could play the part in Anglo-Egyptian trade which they played in 1955 and 1956.

The temptation to withhold the release on January 1st may nevertheless be acute. The Egyptian government has sequestrated nearly £200 million of British capital, and President Nasser has admitted (or boasted) that he has used the contents of the British military depots in the Canal zone to make up the losses he suffered in Sinai. The Egyptian foreign minister, Dr Mahmoud Fawzi, has already raised the question of compensation to Egypt for the damage done by the bombing and invasion, and what British assets the Egyptian government hold will clearly be counters in the ultimate bargain.

There are, naturally, those in Britain who say that the sterling balances, which are now about £103 million, should be held doubly secure against the final settlement. But it seems imprudent to break an agreement which has lasting value for British credit, when other restrictions already provide an effective control on Egypt's sterling assets in London. The decision surely depends on the calculation of future relations with Egypt and on the general credit of sterling. It would be unwise to behave as though the present Anglo-Egyptian enmity is perpetual.

A Global ICS?

Some of the ideas mooted by the Secretary-General of the United Nations in the introduction to his last annual report had a refreshingly controversial character. Admittedly, he made a theoretician's error when he argued that much larger international funds for economic development ought to be provided before there is any general disarmament rather than after; any taxpayer could demolish this logic with a few terse words. Another proposal, however, deserves to get the attention of the Assembly. Mr Hammarskjöld again sent up a trial balloon which he first released in Montreal in May. He then urged the creation of "a career service under international responsibility for qualified men and women of any nationality" prepared to "devote a significant part of their lives to work in the less developed areas of the world as public officials, integrated in the national administrations of those countries while maintaining their international status."

There is a very sound point here. The UN programme of technical assistance for under-developed countries suffers from two particularly severe limitations; it is matched neither in capital nor in administrators. Even when the capital is available to finance the projects advised by a foreign technical expert, they often remain unfulfilled because the country concerned lacks competent administrators. Some newly independent countries recognise this lack and employ foreigners in their civil services, but others are more sensitive about alien influence. They might, however, readily obtain administrative talent from the "neutral" United Nations. That, in a nutshell, is Mr Hammarskjöld's idea.

Delicate problems would arise, no doubt. How could an international official's oath of loyalty be reconciled with loyalty to one government? The Charter stipulates that UN staff shall neither seek nor take orders from any government; and, if this difficulty can be overcome, an international civil servant working in a national administration would still risk getting both himself and the UN involved in local political turmoil. Among other problems would be the usual one of differentials in pay.

Mr Hammarskjöld's idea has engaged little attention at the UN Assembly so far. Since it was first put up, some shift in emphasis has been noticeable; there is now less talk of the need to create a whole new agency, and it is being suggested that the United Nations might begin by acting as an employment bureau, keeping records of vacancies and offers of service, but leaving actual negotiations to be handled by the government and the prospective international civil servant in each case. A sizeable tree might grow in time from this acorn.

Ceylon Swings Back

The municipal elections recently held in Ceylon show a startling swing away from Mr Bandaranaike's party, the People's United Front. Out of 181 candidates only 65 were successful (5 out of 28 in Colombo), while the United National Party won 51 seats out of 88 contested. Mr Bandaranaike explains this defeat by saying that his party depends for support more on the rural than the urban areas; Sir John Kotelawala, the UNP leader, attributes his success to the "prevailing chaos" caused by the Bandaranaike government.

> The police have been rendered ineffective . . . the life of the individual is in danger. Each extremist is encouraged by the government, not because it agrees with the agitators, but because it is afraid to stand up to them. There is no cabinet responsibility. Each minister is a prime minister unto himself.

Mr Bandaranaike's government, which achieved a sweeping and unexpected victory against the UNP in April, must be having to learn administration by trial and error; some confusion is only to be expected.

The Prime Minister also seems to have found it easier to criticise Sir John Kotelawala's efforts to cope with Ceylon's vast problems than to do better himself. The population is increasing at a rate of 2.8 per cent a year; unemployment, according to a Central Bank Survey, stood at 500,000 last year—a seventh of the labour force; economic prosperity is dependent on the plantation crops. None of these problems can be solved quickly and they would only have been aggravated if Mr Bandaranaike, following his election programme, had nationalised passenger transport, excluded foreigners from the tea and rubber plantations, and turned the British out of their bases at Trincomalee and Katunayake. On these issues he has behaved with caution and moderation. His minister of transport is studying the effect of nationalisation in India, and has said that "he will not rush into a scheme which will not be 100 per cent successful." It has been made clear that the foreign-owned plantations will be left alone for the time being.

This caution, together with administrative inexperience and the unpopular decision to compromise on the language question, may have lost the government the voters who had been won only temporarily from the UNP. At any rate there is evidently no tendency to drift still further left. The pendulum is swinging back the other way.

Radiating Ignorance

A full year ago, the United Nations set up a scientific committee to study the effects of atomic radiation. This move was inspired by widespread anxiety about the effects of radiation, particularly those caused by the uncontrolled testing of nuclear weapons. No progress having been made while the problem was dealt with as a political issue, several governments—that of India, in particular—urged that it should be transferred to the scientists. It was hoped that

men who based their conclusions on objective scientific fact would be able to agree on recommendations more quickly than politicians and diplomats.

The committee has now issued its first report, and an uninformative document it is, too. It would seem that it has elected officers, recruited a small staff, discussed the scope of its work, and invited governments to submit information to it. The committee has received more than fifty reports on natural and artificial radiation and radioactivity, but has not been able to announce even tentative conclusions on the hazards of atomic radiation. Indeed, the committee noted "the need for more research and data before final conclusions can be reached." The international community did not expect the UN committee to reach "final conclusions" in a year, but it was not unreasonable to look for some tentative recommendations. Has the belief that "taking it out of the politicians' hands" leads to speedy results been exposed as just another optimist's fallacy?

Poland Prepares for Elections

WARSAW must be getting used to exalted Soviet visitors. Last week was the turn of Mr Shepilov and Marshal Zhukov. Unlike their illustrious colleagues who took the same road (Mr Khrushchev and company), the new guests did not come to bully the Poles into obedience. Their visit was a sequel to the amicable negotiations in Moscow, in which the Poles agreed to have Soviet forces on their soil, while the Russians agreed that these troops should not be moved without prior Polish consent. Mr Shepilov's and Marshal Zhukov's ostensible purpose was to settle the details and endorse the agreement. Were two senior ministers needed for so modest a task? They may have seized the occasion to consult the Poles on east European events and foreign affairs in general as well as to warn them against too much political initiative or against the disruptive effect which a Warsaw-Belgrade axis might have on Polish-Soviet relations. Mr Shepilov played one chord which finds a ready echo in Poland: he spoke of the German threat, about to be increased, he said, by the supply of atomic weapons to the growing West German army.

Mr Gomulka's friendly but firm handling of the Russians is approved by the bulk of his compatriots, though for a variety of conflicting reasons. Indeed, most observers maintain that if a personal plebiscite were held at this stage Mr Gomulka would probably win an absolute majority. But next month's elections will not provide a real test. No opposition will be allowed. Only the national front of the United Workers' party and its satellites, the Peasant and Democratic parties, can present candidates and local electoral committees of that front will supervise the selection.

The voting and the electoral campaign should, however, give some insight into the prevailing mood. Voters will have a degree of choice, since the number of candidates will exceed the seats available by about a third. Besides, out of 700 candidates only 70 or 80 will be nominated at the centre. The regional committees, which choose the rest, will find it hard to ignore entirely the pressure of popular opinion and particularly the views of workers in big factories. It is also to be wondered what test is to be applied to judge past performance: a general bar on "former Stalinists" would exclude almost all prominent political figures. It will be interesting to watch next month how Poland sets about instilling some life into its moribund parliamentary institutions.

Modern Times

A REPORT entitled "A Study of Attitudes Towards Factory Work" (HMSO, 10s.) was published last week under the auspices of the Medical Research Council. This is based on a survey carried out between 1946 and 1950 in three factories, two making cars and one comprising metal mills, and it deals not only with attitudes towards the job itself, but also to group payments and bonus schemes. It lays no claim to anything but the most tentative conclusions, but some of these are worth studying, and certainly point the way to further investigations.

One such tentative conclusion seems to be that the smaller and more repetitive the tasks into which the work has been divided, the less the satisfaction that the workers get out of it; and the smaller the groups into which the workers themselves have been divided for the purpose of incentive schemes, the greater the interest such schemes will arouse. This, however, as far as the first conclusion is concerned, is true only very broadly. As the report shows, there is a shifting borderline between contentment due to familiarity and the absence of strain on the one hand, and boredom due to repetition on the other. The figures and comments cited suggest that it is above all the younger workers who find excessive repetition trying; as they get older they tend to relapse into complacent apathy. The conclusion about the need for small groups for incentive schemes is true more generally, partly because the feeling of fellowship which they encourage is an important factor in morale. Very important too is the way the scheme itself is administered, and the skill with which the time study engineers have arranged a work programme that satisfies both the keen and quick worker on the one hand and the slow and steady one on the other.

We regret that we can no longer accept orders for the 1957 edition of The Economist Diary. The size of the edition was substantially greater than for 1956 but it was, nevertheless, insufficient to meet the heavy demand from home and overseas.

We suggest that you may still be able to obtain a copy from one of the leading bookshops and stationers. If you wish to ensure that you are not too late next year you can instruct us to notify you when the 1958 edition is ready. All you need do is to write your name and address on the back of a postcard and send it addressed to:

1958 DIARY, THE ECONOMIST, 22 RYDER ST. LONDON SW1

Books & Publications

A Landmark in Scholarship

DOCUMENTS IN MYCENAEAN GREEK.
By Michael Ventris and John Chadwick.
Cambridge University Press. 452 pages. 84s.

MICHAEL VENTRIS'S announcement in 1952 of his interpretation of the script then known as Minoan Linear B, and of his discovery that it is an archaic form of Greek, was a major event. Since that time scholars in many countries have been working on his results and extending them, and this sumptuous book is the first general report on their results. It is written in terms which can be followed, with an effort which is well worth while, by anyone who has had an ordinary classical education.

Ventris's achievement was one of pure logic, in the best tradition of cryptography. He started with one reasonable assumption, that the script was a syllabary. He did not assume at the start that the language was Greek: in fact, he did not believe it. But by comparing his material he was able, bit by bit, to fit most of the characters into a grid where all the vertical columns had the same vowels and all the horizontal lines the same consonants. The clue was found when he realised that five groups of three similar words, given certain assumptions for the value of their characters, would yield three Greek derivatives of the names of five of the principal Cretan towns. From that moment onwards further proof poured in. Of course it has not been plain sailing, and there are still disbelievers. The material is thin; beside proper names only 650 words have been identified so far. The syllabary is grossly inappropriate to Greek and yields many ambiguities. The documents are terse and obscure, and much remains uninterpreted. But the general thesis is convincing, and few would deny that we have before us Greek documents which antedate Homer by many centuries.

The first third of the book, including a foreword by Professor Wace, contains a very thorough introduction, covering the archæological background, the process of decipherment, the nature of the script, the language used, and a summary of what emerges from the documents. Then follow three hundred of the documents, transcribed and translated with copious notes. Finally, there are a vocabulary and a name-list. The whole is written with admirable clarity; it is a model of style and exposition.

And now that we have them, what are these documents? The simple Englishman, with his classical education, must cast aside his preconceptions, or rather recognise them for the first time. The scholar draws on archaeological evidence, but the ordinary man thinks of Greece primarily in literary terms; he knows the epithets better than he knows the dull machinery of Greek life; Mycenae is a backcloth to the Oresteia. But in the real Mycenaean world, if we may trust the surviving evidence, writing was used only for bureaucratic purposes. What we have left is a sample, selected by the accidents of time, from the registry of the Crown Estates Commissioners and similar bodies. The main interests of this heroic age, as disclosed to posterity, were land registration and rationing. Doubtless they had poetry, and we know that they were interested in the visual arts. But writing was for the civil servant. The civilisation described was fairly elaborate, far more so than that described by Homer. They had no money, but they got on remarkably well without it. There were dozens of trades, and every tradesman got his monthly ration of food. It is not clear how far they were slaves. There are indications of some differentials for skill, but not very high ones. In short, it appears that some of man's earliest instincts were those of the National Union of Railwaymen; the first flowering of civilisation was a controlled economy; and, when one turns to the name-list, one finds without surprise among the surviving names *pa-ro*, which, according to the rules of spelling which the authors give, could stand for Balogh.

No personal documents remain, not even legal ones such as contracts between individuals: nothing but lists of men and women (for rationing and military purposes), of livestock and agricultural produce, of tribute and offerings, and of royal possessions such as furniture and arms. One or two names of oxen survive, remarkably like those which cows are given today. There are also a good many land registers, of the greatest obscurity; the system of land tenure is not yet convincingly explained. But, for all the dryness of their content, the documents are fascinating, not least because the names of so many gods and men are familiar. We do not meet the heroes whom one has known from childhood, but humbler characters bearing the same names and living their queer, elaborate, authority-ridden lives, which, though hardly glimpsed, seem so familiar.

Two things remain to be said. First, the highest praise is due to the Cambridge Press for the production of a very difficult book; it is a joy to look at and to handle. Second, and most important, it was in print and bound before Ventris's lamentable death in a motor accident last September. Young though he was, he had made his great contribution to scholarship; and this admirable book, more fascinating than anything comparable for many years, serves as a noble memorial to him.

Modern Egyptology

A FAMILY IN EGYPT.
By Mary Rowlatt.
Robert Hale. 232 pages. 18s.
THE SPHINX AWAKES.
By Gerald Sparrow.
Robert Hale. 217 pages. 21s.

THE difference between these two books on Egypt is not just that one looks back and the other ahead, but that the first is like an elegant, meticulous water-colour and the second like a series of snapshots so hastily taken that there was not time to give the film a proper turn between the clicks of the shutter.

Miss Mary Rowlatt comes of a family that has lived in Egypt since its great-great grandfather sold corn to Wellington in the Peninsula. To the question: "Do you speak Arabic?" generations of its children have answered: "Oomaal" ("What do you take me for?"). She did the rounds that young girls did between the wars—the sight-seeing, the first-aid classes and the parties—as often in Egyptian as in European company.

As a result, her book is a monument to a relationship that vanished when modern airlines began to transport Britisher and Egyptian apart at all moments of human joy or stress—when hot weathers and holidays, illnesses and even honeymoons were no longer spent within eye and earshot of one another. Other links snapped when two world wars introduced into Egypt a British population able and keen to live an exclusively British life. The book reveals much in the tale of a picnic party assaulted by a peasant with a mattock, but saved because a Rowlatt was there to explain that no one had recognised that particular piece of desert as his seed-bed; the party left with "a present of several cucumbers."

Family diaries of the kind that survive when the same house is lived in for forty-seven years make an agreeable start to the story; its interesting end tells of recent visits during which Miss Rowlatt tries to assess what caused the revolution as well as what it is trying to do against the ancient odds. In a simple, pleasant way, she shows Egypt as a land of laughter as well as of needs and ambitions.

Judge Sparrow flew to Cairo under an April sky "frowning like a spoilt debutante" and was back in time for the tulips (presumably in the same year; he leaves his reader guessing about dates, even to the extent of uselessly mentioning huge sums lost or earned on crops without giving the period to which they refer). His slapdash book is interesting only because, being based on what he was told by young men in power but with little experience of other countries,

it reveals how the junta sees the world. His trip convinces him that "in the not too distant future a new flag will fly over the desert Arab lands"—the flag of a united Islam under Egyptian leadership. To his mind, Egyptian plans are "more mature, more detailed and more practical" than most people imagine. (He does not specify the only really practical one, which is the export of teachers.) His perspective shows Iraq dwarfed by middle distance into "one of the smallest of the good companions"; and, beyond it, Iran and Pakistan included in the target area. His estimate will flatter Egypt's vanity, but mar its repute in several capitals of whose likely reactions he and his Egyptian informants are ignorant. He prints, but never draws the lesson from, a perspicacious reckoning by President Nasser which states that "the word 'positive action' may on paper be sufficient to solve the problem. But in life . . . it is not sufficient."

Scrappy surveys of the armed forces, land reform, industry and the high dam scheme are marred by being brought up to date in some particulars but not in others, with no indications which facts relate to 1956, and which do not. Some of the sweeping assertions are already falsified by events that would have been allowed for with a writer with a better knowledge of the rest of the Middle East. The hackneyed comparison with Ataturk is made without remembering that—in a century and a region geared to combat imperialism—the Turk was closing down an empire and the Egyptian apparently wants to found one.

The Living Past

ATLAS OF THE BIBLE.
By L. H. Grollenberg.
Nelson. 116 pages. 70s.

IN the Middle East the past lives long. Father Grollenberg's superb book helps ordinary people to understand why this is so. The work of a Dominican priest who is a Biblical scholar by profession, has travelled all over Palestine, and has visited the neighbouring countries, the "Atlas of the Bible" uses text, maps and photographs to bring the biblical background to life. The text skims the cream of biblical scholarship to describe the geographical setting and trace the history of the ancient Hebrews from the earliest days to the destruction of the temple by Titus. The maps in the text and two end-papers show on various scales the ancient world from the Aegean Sea to the Caspian (with the sites of forgotten capitals and of modern oil wells shown cheek by jowl on one of them), giving special attention to the historical geography of Palestine. The index of places and persons contains the name of every town and village, every mountain and valley, every region, river, country and people mentioned in the Bible. Finally—and the special glory of the book—more than 400 photographs convey an idea of the country, the cities, ancient peoples, cultures and religions which must bring to life much of the Bible story which is otherwise hard to understand. At their political, moral, and religious core many of our modern problems are as old as time. Not least among the merits of this splendid work is that it helps us to see them in perspective.

Shopkeeping Nation?

LIFE IN BRITAIN.
By J. D. Scott.
Eyre and Spottiswoode. 286 pages. 25s.

MR SCOTT has undertaken a difficult task and in one respect has succeeded. His guide to British life is very readable. He tells a good deal about British social life, religions, politics, the machineries of government and of law, politics, education, the welfare state, the press and the BBC. All this could be as dry as dust were it not treated by a lively mind, were it not for comments such as that on Lloyd George's insurance scheme: "The days were not so very long gone when ladies had slapped their footmen's faces; and now they were to lick their stamps," or on how you behave if you are a social climber from Coventry:

> Naturally you do not know an oak from an elm and can hardly tell a fox-hound from a Borzoi; but with care you need not give yourself away, and if you have occasion to mention it you will—without actually lying—give your place of birth as Warwickshire.

But is this guide written for people inside or outside Britain? Trying to please both, Mr Scott seems to flit from the needs of one to the needs of the other; many of the little side-thrusts will certainly be lost on the foreigner, amusing though they will be to the British reader. Some of the treatment is too slick: the terms of trade, for instance, shed all their complications as they emerge as an all-powerful factor in the country's prosperity. What many readers, however, will criticise in this book is that it has found no room for literature, music or the arts. No mention is made of any British author or musician, of ballet queues or the popularity of modern art exhibitions at galleries such as the Tate. We have to agree statistically that it is "the Light Programme audience, that immense public of working people with an increasingly bourgeois outlook, which is the emergent class in Britain." But numbers are not everything in these matters. Need Mr Scott make us out more uncivilised than we are?

Artful Aid to Advertisers

THE TYPOGRAPHY OF PRESS ADVERTISEMENT.
By Kenneth Day.
Benn. 320 pages. 70s.

THE layman, if he thinks about advertising at all, may be mildly surprised that a book called "The Typography of Press Advertisement" should run to over three hundred pages. What Mr Day in fact has to offer is a book that covers not only typography but many other aspects of advertising.

The only previous comparable work, Sir Francis Meynell's "The Typography of Newspaper Advertisements," appeared in 1929. Now, nearly thirty years later, a revaluation of the subject is called for. Changes in type styles and fashions and completely new techniques are displayed in a "gallery" of some one hundred and fifty advertisements reproduced on newsprint; it is fascinating to trace earlier trends to their culmination and to detect the start of new ones.

Mr Day begins by relating the press and the copy to the typographer and establishes those commonsense principles underlying the tackling of a specific job, such as the questions: "What is to be advertised and to whom is the appeal addressed?" "What size of space and where is it to appear?" "Is there a continuity to be maintained?" and "What trade rivals have to be competed with?" From this sound start and with his feet ever on the ground, Mr Day expounds on type, stressing legibility, distinctiveness, suitability for reproduction, and follows with chapters on typefounders and trade-setters, layout, illustration. He describes the pioneer work of Meynell, Morison, Johnston and Gill; the dynamic effect on layout of the asymmetric conceptions of Gropius and Bayer at the Bauhaus; "scientific" American approaches; the stimulus of the introduction of "Sans" and the present vogue for nineteenth century revivals. After presenting many comparative text-settings and more than two hundred display faces, he ends with an important chapter on type measurement.

Mr Day's book is obviously the product of most careful research and he has consulted a formidable list of specialists in their various fields. The cross-referencing has been painstaking and a useful book list is appended. This will become a standard work on the bookshelves of advertising agencies—and even of their clients.

An Unsatisfactory Device

DELEGATION IN LOCAL GOVERNMENT.
By Peter G. Richards.
Allen and Unwin. 184 pages. 20s.

DELEGATION in local government refers to the county councils' growing practice of delegating some of their functions (relating, for example, to house planning or health) to smaller authorities on an agency basis. The growth of this practice is less the result of its intrinsic merits than of the need to appease the major local authorities, who have lost so many of their direct powers, and to guard against "remote" administration. Mr Richards's book is timely, because the local authority associations are now pressing for a considerable extension and strengthening of delegation arrangements—largely, once again, as a means of soothing the vanity and increasing the vitality of the smaller local authorities.

Mr Richards's account brings out the intrinsic difficulties of working delegation satisfactorily. The right principles are easy to state; these are that the county council should lay down general policy, and approve broad estimates annually, leaving considerable administrative discretion to the smaller authority. But the fact that the county foots the whole bill is an inhibiting factor—especially since the smaller authority, having been made to contribute to the county rate, is anxious to capture as much of the total expenditure as possible. Delegation works best with a function, such as town planning control, where little money is involved save that repaid by the central government.

It also seems to work best in the largest counties, like Lancashire and Surrey, where delegation is intrinsically more necessary and where there is less rivalry between the county itself and the larger county districts. It is noteworthy that two-thirds of the 158 divisional executives for education are concentrated in seven large cities, and that half the counties have not set up divisional executives at all. In most counties, delegation is patchy in character and a potent source of delays and disputes. Mr Richards defends the system by arguing that it has reduced the otherwise excessive power of such bureaucrats as the county education officer. But this is hardly an adequate reason for extending an intrinsically unsatisfactory device. It would be much better to regroup the smaller local authorities in a way that would enable them to administer more functions in their own right.

Saints and Sinners

SAINTS OF SIND.
By Peter Mayne.
Murray. 200 pages. 18s.

THERE is little of serious interest, but plenty to amuse, in this account of Mr Mayne's meanderings around the shrines of Sind, his encounters with some of the *pirs*, and adventures in the company of their rather disreputable hangers-on. The reader is left with the impression that so accomplished a writer might have been better employed than in the observation of these pinchbeck "saints" whose contribution to society is of such doubtful value and who are not usually, in themselves, particularly interesting characters. Nevertheless it must be recognised that the *pirs* do occupy an important position in the rural society not only of Sind, but of West Pakistan in general; and if they were worth a book Mr Mayne, with his sardonic eye resting affectionately on saint and sinner alike, was the man to write it.

Yet at times one suspects that Mr Mayne found a good deal of all this rather boring. It is only when he looks back to the thirties and forties and recounts the fantastic story of the Pir Pagaro—sixth in the line—that the reader becomes really wide-eyed. This monster of depravity was regarded as God, no less, by about half a million followers, most of whom belonged to the fanatical sect known as "Hurs." Their reverence for him was in no way abated by the revelations in the ghastly "Boy in the Box" case, which took him to prison for six years. He was finally, and most deservedly, brought to the gallows in 1943, but not before he had established a reign of terror over vast areas of Sind. The story, briefly but pungently told, provides a commentary on the dangers inherent in the system of hereditary "saintship," and on the mentality of the rural Sindi.

Books Received

THE UNITED STATES IN WORLD AFFAIRS, 1954.
By Richard P. Stebbins.
New York: *Council on Foreign Relations.* London: *Royal Institute of International Affairs.* 498 pages. 48s.

LLOYD'S CALENDAR, 1957.
The Corporation of Lloyd's. 756 pages. 10s. 6d.

Letters to the Editor

Bravado

SIR—I disagreed with your early strictures on our action in Suez, so I appreciated your likening the United States to Achilles remaining in his tent.

I recall that Achilles had been openly advocating that his fellow-in-arms, Agamemnon, follow his (unsolicited) advice over a certain matter of more concern to Agamemnon than to Achilles. Agamemnon finally complied, but was in the happy position of being able to impose a small penalty on Achilles—to couple responsibility with principle.

Achilles promptly retired to his tent in a pique; whilst he sulked, his side was hard pressed and came near defeat. Your simile is a good one.—Yours faithfully,
M. D. WOOLLEN

"Who Wouldn't?"

SIR—Before the mists of legend distort beyond recognition one of the best stories of my day at Oxford, may I seek space in your columns to correct and amplify Mr Betjeman's version of it as quoted in your review of "The Compleat Imbiber" on December 15th?

As both the principals are now dead, I can see no reason for withholding their names. The "reverend head of an Oxford college" was the very Rev. Lancelot Ridley Phelps, Provost of Oriel, under whom I had the privilege to sit for the last two years of his tenure. The other party to the affair was Ernest Edward Jenner, who had been imported by the Provost in 1927 in a laudable (and successful) effort to improve the classical knowledge of those of us who were reading Honour Moderations. The point of the story as related by Mr John Betjeman is largely lost if one does not recognise the two personalities involved; Jenner was not a guest at High Table but a classical tutor of the college, and his views in the matter of indulgence in drink and tobacco were very well known to the Provost, who took occasion to tease him about them from time to time. The story also loses yet more of its pith if from it is omitted the Provost's habit of triplicating his utterances. The incident is reputed to have occurred over coffee in the Provost's lodgings, and the actual dialogue, as credibly reported at the time, went as follows:

> *Provost:* Mr Jenner, Sir, may I press you to a glass of port, a glass of port, a glass of port?
> *Jenner:* Mr Provost, on no account. Sir, I would rather commit adultery.
> *Provost:* My dear Sir, who wouldn't, I mean to say, who wouldn't, who wouldn't?

The whole incident was enshrined in memorable Homeric hexameters by the present Camden Professor of Ancient History in the University of Oxford, whose lines were circulated, like Shakespeare's sonnets, to his private friends. I regret that the passage of nearly thirty years has left only two words of them in my mind, but they are perhaps worth recording, for those who knew and revered the Provost—κερδαλεοδ φελψ.—Yours faithfully,
DENIS O'NEILL
Savile Club, W.1

Petrol Rationing

SIR—Your notes on this subject prompt me to call attention to the advantages of a pedal cycle as a means of urban travel. As a middle-aged professional man who cycles into London daily from his home some nine miles out I can vouch for the considerable saving in time each week, apart from the 14s. 2d. in fares (or much more if a motor car is used). Once the muscles have become used to the exercise, the daily journey becomes a great pleasure, inducing a feeling of well-being and ridding the mind of worries. And the parking problem disappears. It would be a beneficent outcome to the present troubles if cycling to work became recognised as respectable. At present I am at pains to conceal my bicycle from my colleagues.—Yours faithfully,
J. P. H. WALTON
Merton, S.W.19

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Christmas Spirits

Washington, D.C.

THE publishers of one of America's glossier magazines, in an attempt to explain why the Christmas issue is "different" from the other eleven issues, concluded that people themselves are different at Christmas. But it can equally be argued that people are just more intensely the same. The early birds are earlier, sometimes with cards addressed and parcels wrapped in July, and the procrastinators are later and may even be caught at the post office on December 26th, which is not a holiday in the United States. Collectively, Americans at Christmas are more charitable and acquisitive, more sentimental and cynical, more harried and devil-may-care, more guilt-ridden and joyous, more hostile and loving, in infinite combinations, than at any other time of year. From the tawdry glare of Main Street to the costly shimmer of Fifth Avenue, the crowds have an abstracted look, partly because of the difficulty of finding a plain, non-mink-covered fly-swatter for Aunt Julie, but also because, by emphasising the ideals while reflecting the shortcomings of the American way of life, the Christmas season precipitates a state of national ambivalence, magnified this year by heightened concern with the uneasy state of the world.

As the benevolent spirit of Christmas, Santa Claus (Father Christmas) often gets tangled in the contradictions of the American scene. Demonstrating his versatility as a symbol of peace, he recently appeared on an Air Force base with his sleigh drawn by four Nike guided missiles and led by a fifth, smaller one, with a blinking red nose, named Rudolph. Though America's only "saint" is castigated for fostering too much "getting" commercially and too much "giving" politically, most Americans approve of him as a representation of love for children, generosity, and faith in an abundant future. In spite of much hard-headed scorn for fantasy, they show real ingenuity in the art of encouraging young children to "believe in Santa." Even such an institution as the Post Office, not usually noted for its contribution to mythology, harbours letters addressed in wobbly writing to Mr Santa Claus, North Pole, instead of returning them stamped with a chilly "unknown." That children have a right to a happy Christmas is an unspoken tenet of the American creed. Scrooge, as the evil spirit of the holiday season and a term of opprobrium, has just undergone the final phase of Americanisation and become the star of a TV musical, and the ghost of Marley can still occasionally be heard clanking in both commercial and charitable appeals.

Most people, who begin to wonder in December whether they will be able to "survive" Christmas and emerge triumphant on January 2nd from the welter of paper and tangled ribbon to "start the New Year right," are driven not only by commercial pressures but by the accumulated obligations of the year; they feel they must catch up with their correspondence, mend social fences, give to charity, and become reacquainted with their children. There are few excuses for the millions who are caught unawares by the onrush of the Christmas season. It is heralded in October when catalogues swirl through the mails to fall in gaudy piles in the living room; it looms in November when Sunday papers and slick magazines swell with tidings of jewellery and toys; but "Christmas is at our throats" in December, when cities and towns disappear under blankets of synthetic snow and public address systems shatter the quiet with "Silent Night" in wavering legato.

★

It is a popular theme at Christmas to blame advertisers and promoters for foisting more and more extravagant items on an unsuspecting public by the unscrupulous manipulation of its better nature. It is seldom noted that the public, trying out its new affluence and unprejudiced tastes, is sometimes far ahead of the unsuspecting hucksters in its enthusiasm for expensive and foolish baubles and, with little sinister manipulation, can clean out a shop's supply of such luxuries in a day. This year there has been special enthusiasm for imported items like perfumes and embroidered bed sheets. "The man who has everything" is increasingly an object of charitable concern, and his wants occupy pages of advertising. Each year produces a collection of new gadgets, catering to the never-even-dreamed-of whims of such as he, and giving nightmares to harried sales clerks called upon to help decide whether a certain parakeet would really like a "xylophone for birds." The poor shopper, exhausted by the strain of pairing up ordinary friends and relations with the glittering array on the counters, may be overwhelmed with nostalgia for the good old days when children gave home-made pen wipers and adults home-baked fruit cakes. Meanwhile, both adult and juvenile enthusiasms, and possibly frustrations, are reflected in the toys, particularly all kinds of electronic gadgets and dolls who wear ermine, get sick, or can be rescued from bedraggled waifdom.

The most depressing feature of the commercial Christmas spirit is that it spreads a synthetic sugar coating over a genuine occasion, covering sincere sentiments with viscous sentimentality and sticky coyness almost impossible to rub off. Underneath all the ballyhoo lies a complicated pattern of group and family observances and expressions of the Christmas spirit as varied as the structure of the United States. Church attendance has risen and the churches are fighting against the "paganisation" of Christmas. Christmas Eve and Christmas Day see the revival of family traditions and rituals of tree decorating and carol singing by which each family is linked to its past and to each other. Undistorted by commercial glare, the accumulated gifts and thoughts of the last few weeks are unwrapped and exposed to view and people have a fleeting opportunity to take a secret second look at themselves and beyond. This year relief organisations were swamped with requests from families who wanted to take Hungarians to live in their homes, and the growing acceptance of Christmas as symbolic of the unifying principles in the world was re-emphasised when President Eisenhower, by lighting a Christmas tree, opened a pageant of peace to which fifty-one nations and all forty-eight states contributed.

Mission to the Refugees

MR NIXON'S dramatic Christmas eve trip to the refugee camps in Austria and Germany is further evidence of his determination, and Mr Eisenhower's, that the Vice President should play a larger and more active role in the second Eisenhower Administration than he did during the first. Cynical commentators see his journey as part of a continuing effort to build himself into presidential timber by 1960. But it is hard to imagine anyone—aside from the President himself — who could carry a more authoritative promise of help to come, both to the refugees and their overwhelmed Austrian hosts; or who, having convinced himself, as Mr Nixon evidently has, of the need, could do more to persuade Congress that America must shoulder a larger share of the burden.

The Hungarian crisis has shown that the United States, the great traditional land of asylum, is so strangled in restrictive legislation that it has been unable, with the best will in the world, to do as much, proportionately, as many poorer and smaller countries. Of the 21,300 Hungarians expected to come into the United States by the time Congress reassembles, only 6,300, admitted under the three-year Refugee Relief Act, which expires next week, have been accepted as immigrants. The remaining 15,000, moving under the greatest transatlantic air and sea lift in history, are being smuggled in through the "parole" loophole in the McCarran-Walter Act which was intended only for individuals seeking asylum. They can be given permanent refuge only by Act of Congress. Financial aid has been more generous: in all, the President has allocated $5 million to the United Nations, and private generosity has provided more than $9 million in cash and kind. But these private contributions are slackening, although with more than 70,000 Hungarian refugees still in Austria, and the flow over the border continuing, the need is greater than ever.

The first fruits of Mr Nixon's trip may be the announcement that the processing of refugees will continue; the expectation is that more Hungarians—perhaps as many as 50,000 in all—may be admitted. But what the Vice President has recommended to the President this week and will discuss with congressional leaders next week almost certainly will include, beside immediate financial help to Austria, and perhaps to other small nations whose generosity has outrun their resources, some permanent standby authority for the President to open America's doors to other refugees from oppression. This is the least America can do. But the Administration also has high hopes that the tragic flood of Hungarian refugees may sweep Congress toward the liberalisation of the immigration law for which both President Truman and President Eisenhower have pleaded in vain.

Scrooge at the Fed?

REPRESENTATIVE Wright Patman chose the season of goodwill for yet another of his attempts to brand the Federal Reserve Board as the Scrooge of the American economy. Nor, since Mr Patman will be chairman of the Joint Economic Committee in the new Congress, can the board expect a peaceful New Year. At Mr Patman's latest examination of the tight squeeze which the Federal Reserve is keeping on the country's supply of credit in the interests of economic stability, the board's chairman, Mr Martin, naturally refused to accept the suggestion that its policy had been proved ineffective by the continued rise in the cost of living. He contended that this inflationary pressure would have been much greater if interest charges had not been allowed to reflect the growing demand for money. Mr Martin pointed out that the discount rate at the Federal Reserve Banks, the interest they charge on money borrowed by other banks, had not led the market but had followed it. In fact, in the last few weeks the discount rate, held at 3 per cent since August, has lagged behind the market; the rate on short-term Treasury Bills has been well above 3 per cent and touched new peaks regularly until December 18th, when it reached 3.331 per cent. This week the yield fell a little and is likely to drop still more now that the Christmas demand for money and the Treasury's special financing operations are both over.

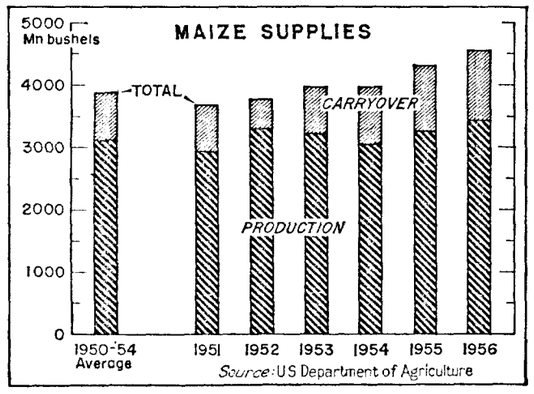
To Mr Patman's most telling argument, that the high cost of borrowing was delaying essential public works, particularly schools, Mr Martin replied that cheap money would inflate the prices of materials and labour and thus delay the building of schools even more by making them prohibitively expensive. But on this point Mr Patman found a surprising ally—Mr Elliott Bell, editor and publisher of *Business Week*, who, it is said, would have been the Republican Secretary of the Treasury had Mr Dewey been elected in 1948. Mr Bell believes that the present reliance on monetary controls to check inflation is distorting the economy in many ways. He agrees with Mr Patman that the credit squeeze is not only diverting money from social needs but also restricting small businessmen unnecessarily, and that rising interest rates present no obstacle to the main driving force of the boom, capital expansion by large corporations, since for them interest paid is a tax-deductible expense.

Mr Bell did not press his earlier suggestion for a National Economic Council to co-ordinate the basic economic policies of government agencies and of the Federal Reserve—a pro-

posal which was widely criticised as threatening the independence of the central bank. But he did advocate a special presidential commission to conduct a comprehensive long-range study of the country's monetary system, comparable to the one which led to the establishment of the Federal Reserve System in 1913. Since then lending has ceased to be a preserve of the banks and many new agencies, such as savings associations and consumer credit companies, are also involved in monetary operations. Mr Patman agrees that a study is necessary but thinks that it should—and obviously intends that it shall—be carried out by Congress.

Maize in a Muddle

UNLIKE producers of other basic crops, maize farmers this month had to choose between two complicated schemes for reducing their surpluses and qualifying for price supports. When they failed to muster quite enough votes to extend into 1959 this year's temporary soil bank scheme for controlling their production, they did themselves a bad turn and gave the Department of Agriculture a headache. Under the old acreage allotment scheme, which comes back into force, permitted plantings are automatically determined by the size of the surplus. This year supplies of maize, after the second largest crop on record, are so big that acreage will have to be cut to 37 million from the 51 million allowed for 1956 under the soil bank scheme ; no farmer who exceeds his share of the total will



be entitled to the price support of $1.36 a bushel for the 1957 crop. Past experience shows that the tighter the acreage restrictions on maize, most of which is fed to stock where it is grown, the less likely they are to be observed.

The soil bank scheme would have permitted production on 51 million acres, with a slightly lower price support next year of $1.31 a bushel for farmers who co-operated with the soil bank by withdrawing at least 15 per cent of their maize land from use. Increases in the compensation paid to farmers who retire their land in this way have been announced, but only since the vote was taken. Even so, over 60 per cent voted for this plan. But enough were fearful of the power it gave to an "unsympathetic" Secretary of Agriculture to fix support prices at his own discretion in 1958 and 1959 to deny the plan the required two-thirds majority. With acreage allotments, supports may vary only between 75 and 90 per cent of parity, a calculated figure which is meant to represent a fair return to the farmer.

The minority, led by the left-wing Farmers' Union, was counting on Senator Humphrey's promise that he would persuade Congress to let maize farmers have the best of both worlds by raising the acreage allotment to 49 million acres. Now the Secretary of Agriculture has announced that the Administration will take the initiative in asking Congress for a "workable plan"—presumably a version of the rejected scheme. This may mean reopening a political Pandora's box. But unless some new plan is forthcoming, many maize farmers may reluctantly decide to forgo their right to price supports and their participation in the soil bank for all their crops. This would be a heavy blow after a year when crop production, on the smallest acreage in twenty years, has equalled past records. The Administration's inclination is to move away from restrictions and subsidies, but not so fast that the result is further over-production, falling prices, and an end to the hope that farm income next year may continue its gentle rise.

Entertainment's Stepchild

FROM A CORRESPONDENT IN LOS ANGELES

LIKE the heroine in one of its own films whose husband is away on a dangerous mission, Hollywood is today trying to keep a stiff upper lip about its current troubles while anxiously searching for signs that its worries may be over. Unfortunately, there is no assured happy ending to the economic plot in which the film makers are now involved, although there is indeed good cause for worry. The industry is one in which statistical information is rarely available or accurate but at least it is clear that, since the last war, the costs of film production have increased while annual attendances have dropped sharply.

No one knows exactly why cinema attendances slumped from an estimated average of 82 million persons a week in 1946 to as low as 46 million in 1955. The counter-attractions of television are no longer accepted as the only explanation. Bad films certainly account for much of the lessened popularity of the movies, since there is a great deal more competition for the consumer's entertainment dollar now than there was during the boom years of the war when the armed forces represented an enormous, willing captive audience for almost any film. The tremendous postwar shift to suburbia has also greatly affected America's cinema-going habits. It is this movement to the outskirts of the cities from their overcrowded centres that accounts for the sharply increased popularity of open air drive-in theatres. They are concentrated in the suburbs where more land is available than in the cities ; in 1948 there were only 800 drive-ins while today there are more than 5,000 and the peak season for cinema-going is now summer, not winter.

Just as the conditions in which motion pictures are being seen have changed tremendously, so too has their making and distribution. The Hollywood studios no longer control, as they once did, the theatres where their products are shown. Forced by the courts to give up their ownership of the theatres just as television was cutting into their audiences, film studios found it necessary to change their selling methods and to look for substitute markets abroad. Fifteen years ago, foreign sales represented only 20 to 25 per cent of a film's total income ; today they bring to the studios 45 per cent of their returns. Without this overseas market, Hollywood might easily have been involved in a collapse as spectacular, colossal and stupendous as one of its own productions. And it is because Hollywood casts such covetous eyes on the foreign market that more films with "international" appeal are being made, often starring actors and actresses from Britain and the Continent.

Film production today also reflects the industry's attempt to adapt itself to its new role as the stepchild of the entertainment world. Rising costs—it required $50 million more in 1955 to produce 225 fewer films than fifteen years earlier—and a marked increase in the number of films made by independent producers have changed the whole character of the major studios. No company today keeps a large number of highly paid stars under long-term contracts and the number of films made abroad on foreign locations by major studios has tripled since 1946. More and more studios are also making films for television.

★

Many of the films produced this year came from independent companies using, in most cases, the facilities of the major studios for production and distribution, with the majors usually putting up part at least of the money. To the actors and actresses, directors, writers and producers, independent production through a corporate entity offers great tax advantages: they do not draw large salaries but instead they share the profits ; these are considered as capital gains and are taxable at a substantially lower rate than are salaries. In some cases, the independents do not even use the services of a major studio and there is one major company—United Artists—which no longer owns any production facilities, restricting its entire activity to the distribution of films made by independents. A recent announcement by the government that it intends to impose a much less favourable and more costly tax structure upon such operations has aroused vigorous protest from trade unions, producers' organisations and the agents', actors', directors', and writers' guilds. Fearful that such tax changes will result in still more films being produced abroad, these groups have formed a committee to oppose the proposed changes at congressional hearings expected late in January. The current shifts in management at the Metro-Goldwyn-Mayer studios underline the general movement towards more decentralised operations in the film industry. Dissatisfied with its financial progress, the company has got rid of its head of production by settling his contract for a substantial sum. MGM is now expected to rely increasingly, like other studios, upon independent producers for its future output of films.

There is no necessary correlation between the cost of a film and whether it is made by a major studio or by an independent although, as a general rule, independent productions rarely cost as much as those of major studios. While many expensive films flop, nevertheless a cheap film is never a smash hit financially. For some of the major companies a few high budget films with popular appeal have turned a loss into a profit for the year: without the box-office success of "From Here to Eternity," "The Caine Mutiny" and "Picnic," for example, Columbia Pictures might very well present a much more gloomy financial picture than it does at present. Other studios, not so fortunate, have had to meet their financial problems by selling their backlog of old films to television interests ; this year almost all of the major studios have made their pre-1948 pictures available for television.

If, in the next few years, the entertainment seeker can choose between seeing a not-too-old film without cost on television, or paying an admission fee of as high as $2 to see a new film, he may very well remain comfortably seated in his chair at home, getting up during the commercials for another bottle of beer from the refrigerator. The sale of old films for showing on television screens has been bitterly attacked by some exhibitors who complain that not enough good new films are being produced now to bring adequate audiences to the theatres. For their part, the producers argue that the movie theatres are dirty, that more attention is paid to selling popcorn than to projecting the films properly and that rowdies are allowed to disturb the performance, so that the neighbourhood cinema has changed from a family theatre to a resort for juvenile delinquents.

Already the explorers of the industry are reconnoitring various experimental schemes which would enable movie fans to select and pay for the newest picture of their choice without moving from their homes. It seems certain that the film industry, which has undergone a whole series of sharp changes in its fifty years of life, will make every effort to adapt itself to showing movies under whatever conditions the viewers demand. If these conditions require the disappearance of the present cinema theatres and their replacement by open-air drive-ins for the late spring and summer and pay-as-you-view television for the autumn and winter months, the producers will attempt to meet the demand. With or without theatres, there will always be films.

Emergency Oil

IT is nearly two months since the first emergency supplies of American oil were shipped to Europe, and nearly three weeks since the Middle East Emergency Committee in Washington began to co-ordinate the redeployment of the American tanker fleet. Partly because a large number of tankers were temporarily available for loading in the Gulf of Mexico, and partly because the first flush of emergency supplies could be taken from existing stocks, shipments of American oil to Europe reached an average rate of 650,000 barrels a day during the three weeks ending on December 12th. This easily exceeded the minimum target of 500,000 barrels a day subsequently set by the MEEC. But this initial success, which was achieved by the oil companies acting individually, cannot yet be taken as a guarantee that Europe's emergency supplies are assured at a level of 75 to 80 per cent of normal consumption until the Suez Canal is open again. For the co-ordination of tanker movements, although freed from the shadow of the anti-trust laws, has been made more difficult by renewed uncertainties about the extent of the additional supplies expected to be available for export in January from the Gulf of Mexico, and especially from Texas.

The companies which purchase oil from Texas fields have asked the Texas Railroad Commission, the state regulatory authority, to raise permissible output in Texas in January by about 300,000 barrels a day—nearly 10 per cent —above the December "allowables." But the producers, particularly in West Texas, which has most of the state's reserve capacity, fear that the inadequacy of existing pipelines would make it impossible to move additional output on this scale off the field. Some crude oil buyers, admitting that pipeline facilities are insufficient in parts of Texas, claim that the additional quantities could be moved to the coast if the commission could be persuaded to depart from its usual practice and allot specially large allowables to wells in fields where some spare pipeline capacity still remains. This suggestion is strongly opposed by the producers in the less well-connected fields in West Texas, who urge that, even if it causes delay, they should be assisted to market all of the oil which they are already permitted to produce (but cannot transport and sell), before the allowables for other producers are raised. A decision by the commission on this point, postponed until after Christmas, is urgently needed to enable new routing instructions to be given to tankers now arriving in Europe.

Mothballs Go to Sea

THE American government's "mothball" fleet, which at one time seemed likely to be left rotting on the shelf indefinitely with its cargoes of surplus grain, has suddenly become the belle of the ball. Twenty-eight shipping companies which have been petitioning the Federal Maritime Board to release a total of nearly 150 vessels are being allowed to commission 40 of them, in addition to 30 which were authorised earlier, for the express purpose of carrying government sponsored cargoes of grain and other perishable commodities. In the hard-pressed coal trade, where applications have been made for the release of another 150 ships, a Federal Maritime Board examiner has recommended that 69 should be released, in addition to the 30 or so Liberty ships already freed. But even if the Board accepts this recommendation, and all of these ships, totalling nearly 200, are in fact taken out of the reserve fleet, it will be a long time before many of them can be put into service. It takes several months to recondition a mothballed vessel, and even when the ships are ready, there is some doubt whether sufficient crew, and particularly engineering officers, can be obtained without a further delay.

Although the American government has this widow's cruse of dry-cargo freighters, it has had to scrape the barrel to add anything to the oil tanker fleet. Only 18 have been taken out of reserve, and there are very few more tankers to spare. Here the shortage can be met only in the longer run, when new tankers now on order or being built come into service. Every day brings more announcements of plans by the oil companies and independent operators to build tankers, but the government's part has so far been largely confined to insuring mortgages and permitting operators to transfer their vessels from the American flag to foreign flags (under which it is possible to make larger profits) on condition that they undertake to build new tankers in American yards. In spite of anguished pleas by the shipbuilders the government has definitely refused to give any priority to the supply of scarce steel plate for building tankers, on the ground that this would lead inevitably to full scale controls over the distribution of all steel supplies.

No New Year for *Collier's*

TWO of the oldest and most popular American magazines made their last appearance this month as the Crowell-Collier Publishing Corporation decided to discontinue both *Collier's* and the *Woman's Home Companion*, each with a circulation of over 4 million. Their earnings had been falling almost continuously since 1946 and this year their losses totalled $7.5 million although the company as a whole lost only $2.5 million. The decision to throw *Collier's* and the *Companion* overboard in order to keep the profitable book-publishing subsidiary afloat was taken by a group of Manhattan and Chicago industrialists who last year put new capital into the enterprise. More light may be thrown on the methods by which they gained control by a coming investigation by the Securities and Exchange Commission of the sale in 1955 and 1956 of $4 million of debentures as a private offering.

Great efforts had been made in the past three years to save the 68-year-old *Collier's* from the consequences of earlier mismanagement. Mr Paul Smith was brought in in 1953 to build a new *Collier's*—a "magazine in depth," and a more fitting successor to the *Collier's* which in the early days of the century made a crusading reputation and published writings by Henry James, Kipling, Conan Doyle, and Richard Harding Davis. Nearly $10 million in new funds was raised for the company's three magazines before a tight money market cut off further finance. Finally, last summer, the *American* was abandoned to lighten the load. The circulation of *Collier's* reached a new peak, but advertisers remained unimpressed, although for magazines as a whole advertising revenue is at record levels. The *Woman's Home Companion* has been losing money since 1953, unable to keep up with the more enterprising women's journals.

Three big magazine publishers, the Curtis Publishing Company, the Hearst interests and the McCall Corporation, are now negotiating to take over the *Companion's* subscription list. That of *Collier's* has been taken over by *Look*, the Cowles' picture magazine, but in this picking up of the pieces 2,400 employees had little to hope for as the new year began.

SHORTER NOTES

The next United States Ambassador to the Court of St James is almost certain to be Mr John H. Whitney, a 52-year-old financier who is also interested in racing, a liberal Republican, who went to Oxford.

★

Rhode Island has finally finished counting its absentee ballots and the Republican candidate for Governor, Mr Del Sesto, has won by over 500 votes. The Democrats, who have held the Governorship for 18 years, are challenging the constitutionality of absentee voting in the state; without these votes, their candidate had a majority of 190.

The World Overseas

China's Collective Miracle

FROM OUR SPECIAL CORRESPONDENT IN PEKING

"GO slow at first but fast at the end." This, they say, in Peking, is the mainspring of the Mao Tse-tung regime's policy in general, and the secret of the peaceful revolution in farming collectivisation in particular. When spring sowing starts next year, 90 per cent of China's 500 million peasants will have been successfully merged into collective farming units. This is a tremendous achievement. It has evidently been accomplished without compulsion or threat. It is the terrifying result of sweet but implacable comradely reasonableness, of organised persuasion, of illimitable discussion, of unrelenting pressure. It is a feat to make Stalin's old Ukrainian wounds ooze in the Red Square Mausoleum.

No Chinese, it seems clear, has been compelled by law to join a co-operative or to turn over his production to a higher level collective unit. There have been no heads on poles. In theory, a peasant can still resist or reject the State's embrace. It would be hard for him, of course; but it would be hard for him in the sense that he would be ostracised as a leper rather than shot as a rogue elephant. The sturdiest individualist has been talked, rather than forced, into compliance. And, in the payoff, the evidence suggests that the peasant will be better off under collectivisation. True, this may be as much a condemnation of the appalling conditions under which he laboured before "liberation" as a tribute to the superiority of applied socialism in farming *per se*. But it becomes a demonstrable fact, nonetheless.

For six years the party seemed to tinker with land reform and collective farming. There were mutual aid teams and technical advisers and hot-gospelling cadres and mild but persistent propaganda campaigns and a leisurely-spreading infection of co-operativism. The seed was being sown—but slowly. By the beginning of last year, the process even seemed to be halting and lumbering into reverse in some districts; small landlords were re-emerging; some peasants were paying others to till their land and actually buying the rights to others' land.

Then, in July, 1955, Comrade Mao, the father figure and the Marxist reincarnation of a benevolent and omniscient Emperor, struck; he called an end to the softening-up and fixed apparently impossible targets for collectivisation. The "go-slow" phase was over; the "fast-at-the-end" spurt was ordered. A horde of inhumanly articulate activists, who seemingly never slept or maintained a moment of silence, descended on the peasants. There was unending argument, irresistible discussion, eternal self-examination and self-criticism. Reports suggest that some recalcitrants succumbed through sheer physical exhaustion to talk, talk, talk, to tireless repetition of party chapter and verse, logic and promise. All the aims have been won, even surpassed. The philosophic westerner may well sweat over the nightmarish prospect of an Asian world surrendering wearily but inevitably to the superhuman persuasion and talkathon reasonableness of these blue-uniformed robots.

Having pledged the goods, the regime must now deliver them. In the curious fashion in which news seeps out in Peking, it has become known that Comrade Mao has decreed that, come what may, the peasants must be better off under collectivisation this year and next year than they were in transition last year. It is generally agreed that, in concentration on the basic crops of grain and cotton, there has been partial and calculated neglect of subsidiary farming in pigs—especially and riskily, pigs—poultry and peasant handicrafts. These subsidiary farming lines once represented 30 per cent of China's peasant income. The regime will have to compensate for this deficiency, whatever the success in increased grain and cotton output. The word is that the provisional second five-year plan will be unhesitatingly revised, at the expense of heavy industry and even defence, if the peasants' lot can only thus be improved.

Meanwhile, there is strong evidence that, with benign official approval, the limited free market for certain products is flourishing. The visitor may daily note the crowds around individual pedlars of fish, pork, mutton, beef and other produce at Peking street corners, selling in capitalist rivalry to the State stores. The onward rolling tide of collectivisation can still tolerate eddies and shallows. While this degree of flexibility continues, the regime must presumably be confident of its strength and ultimate success.

The headlong population multiplication proceeds awesomely. There is now a natural increase of one million a month. "Six hundred million Chinese are not too many," the Chinese experts insist in interviews. "Not even 700 million—so long as we can feed and clothe them all, keep them employed, healthy and happy." The Welfare Department is emphatic that there is no birth control "campaign" as such: contraceptives are "available" but are not being "popularised." The only suggestion of official interest in this prodigious fecundity is a hardening tendency to discourage early marriages—not so much to reduce the size of families as to delay the appearance of the first born. Some western observers believe that the regime may go slow on mechanisation of farming to avoid a fearsome

problem of displaced labour. An objection to this logic is that mechanised farming has become a symbol of progress: the buxom girl at the tractor is proof of emancipation. However, no one can doubt that if Comrade Mao decides that the time has come to counsel birth control, a similar miracle in restraint will be decreed as has been achieved in collectivisation — with, presumably and frighteningly, the same success. "Go slow at first and fast at the end."

(*Footnote*: During the ten minutes taken to skim this fragmentary report, the population of China has increased by more than 230 head.)

The Case of Otto John

BY A CORRESPONDENT

WHEN the head of the West German Federal Office for the Protection of the Constitution went East on July 20, 1954, and soon after began to utter communist propaganda, his friends were at a loss for an explanation and his foes were delighted. The Federal Ministry of the Interior—to which his office was subordinate—considered that he had been abducted. This theory was received with almost universal ridicule. When Dr John returned to the West seventeen months later, he too said that he had been kidnapped, and indeed the fact of his return might have been taken as proof of this. But it was certainly not taken as conclusive proof ; *prima facie* his activities in the Russian zone were treasonable and he was put under arrest.

His trial, which began on November 12th, has just ended in a sentence of four years' penal servitude from which the year he spent in custody while the case was being prepared will be deducted. The prosecution had only asked for a term of not more than two years on the grounds that what mattered was the verdict and that the Federal Republic could afford to pass a light sentence. The judges, however, found that one could not let off lightly a man who had held such a high office.

He had been accused of betraying real official secrets and communicating invented ones, and of aiding a government whose aim it was to overthrow the constitution of the Federal Republic. Publishing faked secrets may be thought harmless or even laudable unless it is realised that they were most effective communist propaganda and that the gravamen of the charge is the propaganda aid he gave to the communists. The prosecution held that he had gone to the Russian sector of Berlin voluntarily and decided to stay there after talking to Soviet officials. The defence stated that he had been taken there after being drugged and that, once in the power of the Russians, he had to pretend to co-operate in order to win their confidence without which he could neither have escaped again nor avoided death, deportation or brainwashing. This defence was not accepted although it could not be conclusively disproved. The effects of the drug as he described them were unusual, its administration could not be established, and the length and nature of his collaboration struck the court as excessive. For seventeen months he had consistently acted the part of a sincere defector. The court could not believe that he was playacting all the time or that the Soviet authorities would have risked producing a kidnapped collaborator at a press conference a mere three weeks after his abduction.

Be that as it may. With his worries about Germany's re-militarisation and about the re-emergence of the Nazis he was, as a high official in the Federal Ministry of the Interior said, in good company. As Dr John himself stressed at his trial, such worries do not prove that he went East of his own free will. But it was his mere presence and apparent co-operation with the communists that did the harm. Indeed one of the most puzzling aspects of his trial was his inability to appreciate this. The presiding judge would slowly, by patient persuasion, wrest an admission from him that a public announcement by the chief guardian of the Federal constitution at the height of the battle for the European Defence Community treaty (which in fact the accused favoured) that its opponents were right, that there were secret understandings connected with it and that the Gehlen intelligence organisation was getting more active in France, harmed the policy of the Federal Republic and the unity of the West ; then the defendant would claim that the harm was confined to those who believed communist propaganda. There was never a clear admission that by his person, by the office he had held, by the consistency and apparent spontaneity of his performance he lent that propaganda a weight which it had not had before. It is, of course, very difficult to assess the damage. But it is wrong to deny it. (It should, however, be kept in mind that the accused was a sick man, had been advised to undergo an operation before the trial, and was probably not in good form.)

As for the danger of brainwashing, there had, in fact, been deliberations in his office on what a member of it should do if he found himself in the power of the other side. It was decided that he should pretend to collaborate and give away small secrets in order to preserve the important ones. But no provision was made for propaganda. It was propaganda the Russians wanted—and got—in his case, far more than his secrets. One of the aims in this propaganda was, as Dr John himself put it, to make the Germans "reunification addicts." The progress of German opinion in this direction is shown by the way the trial was reported and commented on. The defendant got a fair hearing in court, but the hearing he got in the public mind was unfair. Obviously there has to be selection in reporting, but the credulity of some serious German commentators struck one as somewhat selective. They appeared to believe what fitted in with their ideas ; and what did not sometimes hardly seemed to register. This was apparent not only among his old detractors and those whom they had influenced, but also among those who felt cheated of a martyr to the cause of German reunification. In 1954, much of the German press had indulged in an orgy of libel against the man who could not answer back. In 1956, it was all more decorous and restrained, though still colourful enough to amount to contempt of court by British standards. There is every reason not to add British contempt by lightly suggesting that the trial was unfair.

"Motor Business"

The December issue of this quarterly research bulletin for the motor and allied industries is now available. It will include :

The outlook for 1957.

The French motor industry.

The East African market for motor vehicles and tractors.

The Bulletin is fully illustrated by charts, amongst which are :

Price indices of used cars and vans.

New registrations in Great Britain, and the hire purchase share of the market.

For full particulars of this Bulletin apply to :

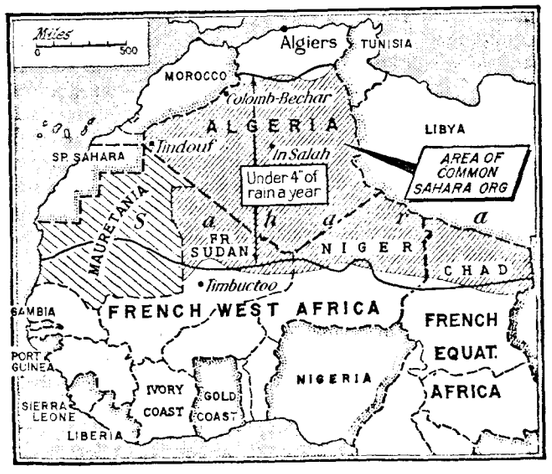
Developing The Sahara

GREAT wealth is believed to lie beneath the Sahara. Preliminary surveys have indicated the existence of iron ore deposits near the Moroccan frontier, of uranium in the extreme south of Algeria, and of copper in Mauretania. Deposits of coal, tin, chromium and manganese are also reported. But in these days the most tantalising prospect must seem the hope of striking oil near the Libyan border. Such a vision of riches in the desert was outlined to the French deputies this month, when they debated the future status of the Sahara.

Politically the Sahara is not a unit. Its bulk lies in southern Algeria, while the rest is divided between Mauretania, the Sudan, the Niger and the Chad. In order to facilitate the exploration and exploitation of its vast resources the French Assembly has now approved the creation of a Common Organisation of the Sahara. Economic unity will not be extended to the political field, largely because such a territorial reorganisation would have looked too much like an attempt to save what could still be saved from an Algerian debacle. The new economic region will be run by a special delegate of the French government assisted by a technical committee and a control commission.



The scheme is as attractive as it is big. French capital and skill will not be enough to carry it out, and France will have to interest foreign investors in this venture. Will they be keen on sinking their capital in the desert if the success as the rear is threatened by chronic civil war ? The success of the desert seems to be one of many problems solution for of which is tied to the finding of a solution of a French Algeria. If none is found, the dazzling mirage from the Sahara will economy enriched by raw materials turn out to be yet another

Birds' Eye View of Canada—II

Where Malthus Is No Prophet

BY OUR SPECIAL CORRESPONDENT

TREES looked like shrubs in the spacious countryside ; the small houses were set at wide intervals along the lake. The Hudson's Bay Company's store was stocked, necessarily, to supply all wants. Yellowknife is a man's town, built on gold. The nearest big shopping centre, Edmonton, lies 700 miles to the south.

To a tourist on a fleeting visit this solitude has a romantic appeal. People compelled to live there all the year round feel differently ; so do the mining companies, faced with the difficulty of getting manpower. Higher wages and the refunding of fares after a certain period of work are two methods used to keep this multilingual labour force fairly stable. People go so far north to get money quickly. Some actually do go south again after a year or two with substantial savings ; others cannot stand the loneliness for long ; still others drown it in whisky.

Yellowknife presents in a nutshell the problem of the unconquered North, a question of distances even more than of climate. The North-Western Territories of Canada, lying above the 60th parallel, cover an area of about 1.5 million square miles, equivalent to one-third of continental Europe, but Yellowknife, with its 3,000 inhabitants, accounts for nearly one-fifth of the total population. A few thousand Eskimos, dependent on the vagaries of the fur trade ; a few thousand Indians, fitting uneasily into the new pattern of life ; and less than 6,000 white people in key positions—these are the only inhabitants of this vast area. It is potentially one of the richest in the world. Furs and gold are no longer the only lure. Pitchblende extracted at Port Radium yields radium salts, uranium and cobalt, while no longer territory is apparently a geologist's paradise. But the major shift of population northwards lies in the future. For the meantime, each new strike by the pioneering explorers will help the growth of the secondary industries in the more hospitable and populated South.

Canadians lag far behind the Russians in developing their "Siberia." Hitherto neither shortage of materials nor pressure of population have been a sufficient incentive. Indeed, Canada has to look for foreign labour to maintain its pace of expansion. Immigration is no longer controlled by the land available. The bulk of newcomers are entering

other branches of the economy. Though the birth-rate has risen appreciably from the depressed level of the 'thirties—it averaged about 2 per cent in the last five years—the Canadian government seems sufficiently confident in the future to continue encouraging immigration on a large scale. During the postwar decade the population of Canada was swollen by 1.2 million newcomers, of whom more than half were men of working age.

No random sample can give an accurate picture of the life of these new Canadians. Reactions vary from place to place and from person to person. Two young Londoners who reached Vancouver at the time of a seasonal recession described the rough time they had to begin with. Several professional people also complained that the first steps were difficult. It seems generally agreed, however, that once settled the newcomers enjoy a higher standard of life than they had in their country of origin.

To say that the average weekly wage in Canada last year was over £20 means little, because exchange rates are deceptive. Migrants, who stick to a similar job, however, confirm that their real wages are much higher. A pattern-maker—admittedly a skilled workman—who had moved from an English foundry to Edmonton may serve as an illustration. We drove to his spotless bungalow in a big American car. The drawing room was dominated by a giant television screen. In the kitchen stood a man-size refrigerator (he was still just below the " deep freeze class "), a washing machine, a special ironing device and all sorts of other gadgets. He thought it would have taken a life-time back home to acquire everything that he had collected here in a few years. He, for one, was glad of the change and spoke nostalgically only of his *Daily Mirror* and the League soccer game on Saturday.

More sophisticated expatriates from London risk finding Canada's cultural life somewhat provincial. This may be the price of its industrial revolution. Fast growing countries tend to have little time for cultural luxuries. But by now wealthy Canada should be able to develop its own distinctive voice from out of its mixed heritage. Some people wonder whether the American-inspired passion for more and different gadgets is not hindering such a development.

People do not, however, emigrate in search of culture. They leave Europe in order to seek better living conditions overseas. As long as its extraordinary postwar boom lasts, Canada, with its higher wages, lower taxes and greater opportunities, will attract men, particularly young men, from Britain and the European continent. Each time clouds gather on the economic or the political horizon in Europe this flow of migrants will quicken, as it is doing now.

Seasonal Hangovers for Swedes?

FROM OUR CORRESPONDENT IN SCANDINAVIA

IN Sweden, the festive season has had a darker side since the end of liquor-rationing in October, 1955. Alcoholism has increased alarmingly, although the government has used all publicity media to combat drunkenness. This November it rushed a law through the *Riksdag* increasing the retail price of spirits by 30 per cent. There are no signs, however, that either exhortations or higher prices have altered the habits of normal consumers, still less those of confirmed drinkers.

The Swedes' reputation for stiff formality when sober, and noisy hilarity in their cups is not altogether without foundation. Strangers to Swedish restaurants are often disconcerted to find themselves transfixed by a basilisk glare from the head waiter, who is liable to prosecution and fining if guests become obstreperous. During the period of partial prohibition in Sweden, Danes would avoid Elsinore and the Nyhavn area of Copenhagen at weekends because hordes of Swedes came over to drink and brawl. Various explanations for the Swedish tendency to tipsiness have been given. The long cold winters with short daylight hours probably enhance the attractions of the bottle. Moreover, Sweden is a new-rich country, where prosperity sometimes outdistances habits of restraint.

For 36 years before October, 1955, Swedish consumption of alcohol was regulated by a system devised by Dr. Ivan Bratt. Only monopoly stores, privately run under strict government supervision, retailed strong liquor. When controls ended, two million persons over 25 held a *motbok*, or ration book. Men were limited to three litres of spirits per month and women to two litres per quarter. Sales of wine and weak beer (of 2.8 per cent alcohol content) by these stores were unrestricted. Strong beer (of 4.5 per cent alcohol content) was obtainable only from chemists on a doctor's prescription. In restaurants, the sale of drinks unaccompanied by food was forbidden. This gave rise to the unkind saying: " Norwegians eat to live, Danes live to eat, but Swedes eat to drink."

Unlimited and Cheaper Drink

In 1944, a parliamentary committee, including teetotallers, recommended the lifting of controls. Fourteen months ago, its recommendations were implemented, and the sale of spirits and strong beer by the stores was unrestricted to customers over 21. Restaurant sales of strong beer became legal, but the *mattvang*, or obligatory snack, remained. Drivers suspected of drunkenness are still subjected to a compulsory blood test, and a minute proportion of alcohol in the blood brings Draconian penalties.

The new regulations have spelt ruin for many restaurateurs, since Swedes can now drink without restriction and more cheaply at home. A number of " SARA " state-owned restaurants have been forced to close, despite the provision of improved food and service. The overall consumption of liquor, however, has risen steeply during 1956, and drunkenness has increased with startling suddenness. In the holiday month of June, there were 10,364 cases—6,000 more than in June, 1955, and an all-time record. In the first six months of 1956, consumption of alcohol rose by 36 per cent, and over the last twelve months the average amount drunk per head of population has risen from 3.9 to 4.6 litres. Higher retail sales accounted for the entire increase ; restaurant sales declined by 32 per cent in the first half of 1956. Expenditure seems to be overwhelmingly on spirits, with only about one-seventh on milder tipples.

This alcoholic tendency presents a real danger for Sweden, which in many ways is so enlightened and progressive. But it must be remembered that the end of prohibition in Norway and Finland had equally alarming results which, however, turned out to be only temporary.

MANAGEMENT SELECTION LIMITED
have been retained to advise on the selection of a

COMMODITY BUYER

who, at a starting salary of £5,000 and an appropriate expense allowance, will spend a great part of his time travelling the world negotiating large-scale buying of meat, fish and cereals. Where practicable, permission may be given on occasions for him to be accompanied by his wife at the Company's expense.

Candidates should have had extensive experience of commodity buying on an international scale, and must have successfully opened up new sources of supply for these goods. Candidates should also have an interest in and knowledge of world affairs—especially as they influence supplies and prices. An Honours Degree, with Economics and/or Statistics, would be an advantage. Age 35-40. There are exceptional non-contributory pension, life assurance and sickness schemes.

No information will be passed to our clients without the candidate knowing their identity and giving permission. Enquiries with brief personal details to:

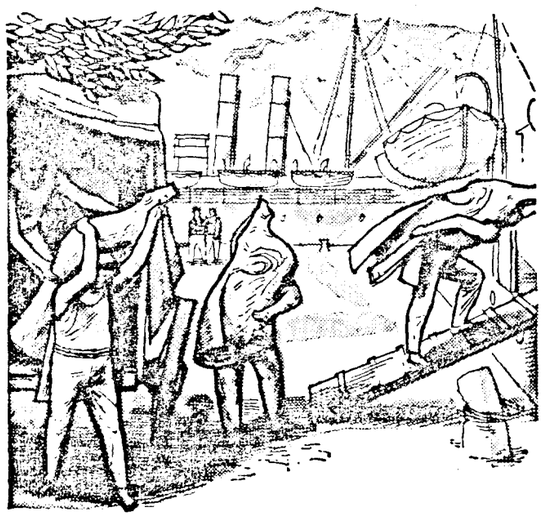
Fifteen years before Frozen Meat



Frozen meat was first shipped from the Argentine in 1877—fifteen years after the Bank of London & South America had opened its doors there.

Since then, Latin American trade of all kinds has increased enormously, and with it have grown the influence and interests of the Bank. Today, the Bank holds a unique position as the *only* British bank in Latin America. It has branches in most of the important trading centres of that vast continent.

Up-to-date reports on local markets, trading regulations and general economic conditions are received regularly from branches overseas and are summarised in the Bank's *Fortnightly Review*, which is distributed to customers and made available to those who have business in Latin America, Portugal or Spain.

BANK OF LONDON & SOUTH AMERICA LIMITED

HEAD OFFICE AND LONDON OFFICE:

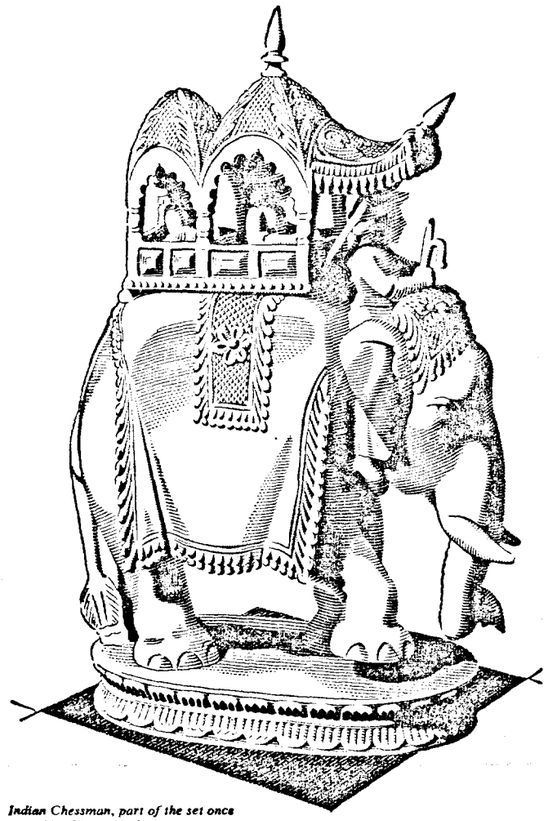
MANCHESTER: 36 CHARLOTTE STREET. BRADFORD: 55 WELL STREET.
CONTINENTAL REPRESENTATIVE'S OFFICE: TALACKER 35, ZÜRICH.



Indian Chessman, part of the set once owned by Clive of India.

Chequerboard of the East

So many races . . . so many needs . . . so many markets extending over a vast area of the earth's surface. And there The Chartered Bank operates with knowledge and experience sustained by more than a century of close and intimate contact. Branches of The Chartered Bank are established in most centres of commercial importance throughout Southern and South-East Asia and the Far East. At all these branches a complete banking service is available and, in particular, facilities are provided for the financing of international trade in co-operation with the Bank's offices in London, Manchester and Liverpool, its agencies in New York and Hamburg and a world-wide range of banking correspondents. In London and Singapore the Bank is prepared to act as executor or trustee.

THE BUSINESS WORLD

Stockpiling Scotch

WHISKY, whisky, everywhere ; but not enough to drink. At least, there are 190 million proof gallons in casks cramming the Scottish distilleries, and only 6 million gallons a year are allowed the thirsty British drinker.

The end of the whisky famine has been approaching for some years. In recent weeks the prophecies of plenty have been intensified ; and hopes have run high in the licensed trade. But the voice of the sceptic keeps breaking in ; licensees and merchants complain bitterly that the distillers raise false hopes by advertising which stimulates demand that cannot be satisfied. The best-known brands must be better known than ever: but they are not readily to be had at every off-licence.

Those who have foreseen an end to the long parched years since 1939 were right to have been optimistic. Scotch whisky production and stocks have been increasing rapidly since the end of the war. By 1949 production had climbed back to the 1938 level of some 28 to 30 million gallons a year. By 1952 stocks were as large as in 1938, and they were still growing. Of course, they were ill-balanced: much of the whisky was young. But it looked as if there would be enough by 1955 or 1956 to meet demand at current prices.

What upset this nice calculation was an unforeseen increase in demand, which roughly kept pace with increasing supplies—but some distance ahead of them. In 1951-52 (April to March) overseas sales were 11.2 million gallons, more than in 1939-40. Since then they have risen to 15.4 million in 1955-56. Few people in the trade had foreseen such an increase ; moreover, they also failed to anticipate the expansion in home demand. As recently as 1952-53 home consumption was only 3.8 million gallons, barely more than half the 7 million a year immediately before the war. Yet some in the industry could see little hope of the home market expanding to much beyond 4 million gallons unless the price could be reduced by a cut in the duty. The duty has not been cut ; it is still £1 4s. 7d. a bottle ; moreover, the retail price has gone up from £1 15s. to £1 16s. Yet consumption had risen to 5.8 million gallons in 1955-56, and it will probably exceed 6 million gallons in the year ending next March. It is true that many young people who knew not Scotch went over to gin, and that rum saw its chance and took it. But the population was some eight per cent greater than before the war. The new wave of emancipation of women with wages and salaries of their own increased the demand for short drinks. Public houses have been going over from beer licences to full licences. And increased brand advertising, inhibited though it is and self-frustrating as some of it may be, probably helped a trend that would have come anyway. But the great mistake was to overlook the continuing effects of inflation and overfull employment.

★

And what now ? Has success gone to the distillers' heads ? They have stepped up production and piled up stocks. Annual production has grown from 29 million gallons in 1949-50 to nearly 39 million in 1954-55. Stocks have soared from 138 million gallons in 1952 to 181 million in March of this year, 186 million in September, and around 190 million today, a third more than before the war. This promises higher saleable supplies in the next few years. How much higher, it is not easy to calculate. About two per cent is lost each year by evaporation and in the blending and bottling of the whisky. A less calculable determinant of supplies is the period of maturing. When is Scotch mature ? The law says it may not be sold under three years. The industry says it is not generally ripe for sale under seven years. What does the consumer say?

Whisky is certainly drinkable under seven years: distillers are in fact plagued by the export of "immature" whiskies, mostly to South America, where it is mixed with local spirits and sold under Scottish names. The industry is jealous of the reputation of Scotch, and would shudder at the suggestion that it

sell younger whiskies. Whether there would be a demand for lighter-bodied whiskies, as there is in the USA, and whether lasting damage is being done to the home market for whisky by the continuing deprivation, are pertinent questions. Can maturing be accelerated? The process itself is fey. It is known that whisky matures more quickly in smaller than in large casks, and (it is believed) faster in oak than in other casks and in damp than in dry warehouses. Attempts have been made to hasten maturation artificially; but it is said there is no substitute for the cask. Yet if more grain whiskies, which mature in four years, were added to blends, the average age would come down and supplies go up.

Whatever the issues here, if the figure of seven years is applied to annual output since 1950, the amounts of "mature" whisky available for sale in the next six years appear to be:

	Million gallons		*Million gallons*
1957	24	1960	22
1958	22½	1961	27
1959	25	1962	32

These figures must be read not as annual forecasts but as points on a trend, for in each year it may be possible to draw on stocks left unsold from previous years. The sharply upward trend is clear enough. Will this flood of whisky find ready buyers at current prices?

Since overseas markets account for nearly three-quarters of total sales, it must be said at once that no safe assessment of future demand can be made except within very wide limits. The export trade has certain attractions over the home trade. It is more profitable; it is simpler; sales are generally made to two or three import agents instead of hundreds or thousands of wholesalers and retailers; and there is no tax to finance. Yet it also has its headaches of political, financial and sociological complexities. The silly squabble with the USA which threatened to harm Scotch exports to that market (8 million gallons in 1955 out of total exports of about 16 million) has been sensibly resolved: not only was the limit of £2,500 on whiskey imports from North America to Britain removed last month, but whiskey imports from all countries were placed on the Open General Licence. For the first time the British drinker is to be offered Old Grand Dad Kentucky whiskey, imported by Gilbey's.

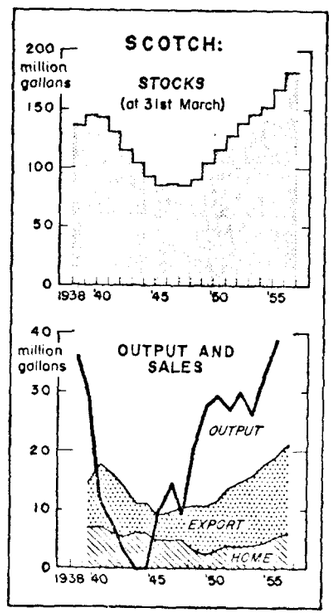
The second largest buyer of Scotch is Europe, with about one million gallons last year. In Norway, Sweden and Finland, State monopolies fix a high price; in France, Norway, Denmark and Spain quotas restrict imports. Some of these restrictions would be abolished in the European common market. The third largest buyer, Canada (850,000 gallons), restricts imports through the higher mark-up fixed by the provincial Liquor Commissioners for Scotch than for Canadian whiskies. New Zealand (700,000 gallons), Australia (600,000 gallons) and South Africa (570,000 gallons) have also imposed restrictions of various kinds.

If overseas markets remain unpredictable, it is in the home market that plans can best be laid. Here, gin and rum will not yield their gains easily. "Smirnoff" Vodka has been introduced by Gilbey's, and "Czar Alexander" is to be publicised by J. & W. Nicholson. American bourbon and Canadian rye have an open field. Wine is racing ahead. The trend towards soft, sweet drinks must not be underestimated. And there is hardly much chance of a cut in the whisky duty. But Scotch advertising can become more imaginative: it will need to be if it is to influence people who have rarely touched it. There will be scope for more such innovations as Grant's triangular bottle, heralded with a wealth of Gaelic literary talent.

On a long view, a continuing upward trend in incomes may be safely assumed. Yet for the next few years the movement in income may not be so favourable, and this may direct attention to lower-priced drinks. The greatest problem remains that of ensuring that demand continues to keep pace with increasing supplies.

So far this year sales have been good. Home sales for the six months, April to September, were 2.54 million gallons, against 2.34 million; overseas sales for the seven months, April to October, were 10.06 million gallons, against 9.22 million. For the year to the end of March, total sales may reach 22.5 million gallons. If consumption goes on rising at this rate, the sellers' market may continue till perhaps 1960.

There is a chance, however, that the sellers' market may end quite soon. High interest rates and the annual loss must in any case discourage hoarding. Increasing supplies would then depress prices below current levels unless demand were maintained. Lighter whiskies, and more variety in what Scotch has to offer, might help by tapping new levels of demand. If this failed, prices would have to ease. The collective maintenance of maximum prices through the Scotch Whisky Association has been abandoned. But the power given by the Restrictive Trade Practices Act to the individual distiller to maintain prices might be unavailing, even if he wanted to use it. Even now localised price cuts cannot be ruled out, when sales are seasonally low. To stop them spreading, the emphasis in the next few years would have to be on persuasive selling.



Sugar Roundabout

The last of Britain's prewar terminal markets will be reopened next week, when futures trading in raw sugar will be resumed after an interval of seventeen years. Trading will take place in the London Commodity Exchange, Plantation House. The contract is for raw cane sugar, cif London/Liverpool, and prices are quoted in shillings and pence per cwt. The minimum trading unit is 50 tons, and March is the first delivery month. Commonwealth and foreign sugar will be deliverable. The complicated scheme that has been devised for the resumption of private trading is described below.

ON January 1st the British Government and sugar trade start to play at make-believe. The game is to pretend that a free market in sugar exists. The prizes, which are not competitive, are these: the Government, for seventeen years the sole importer of raw sugar for home consumption, will nominally rid itself of one of the last vestiges of state trading; the private trade, with all Britain's imports of raw sugar then in its hands, will reopen its terminal market and should be able to exert more influence on the world price; finally, industrial users of refined sugar will have rather more freedom of choice than before.

The rules of the new game are designed to give Britain the best of both worlds. The British market in sugar remains as sheltered and exclusive as before, but the semblance of freedom is there. The imports to be returned to private hands are of three kinds. There are the 1½ million tons of Commonwealth sugar that Britain undertakes to buy each year, at a fixed and annually negotiated price; about 200,000 tons of Commonwealth sugar that find a market here at the world price, plus the preference; and a smaller quantity of foreign sugar, also sold at the world price. (Imports of raw sugar for refining and export were completely returned to private hands at the beginning of 1954.)

As the fixed price of Commonwealth sugar is usually higher than the world price some means had to be found to induce the private trade to buy it. The method adopted in the Sugar Act 1956 was to set up a Sugar Board to buy fixed-price sugar from the producers, and re-sell at the (lower) world price, the board recovering the loss from the consumer by a surcharge on all imports of sugar, molasses and goods containing sugar. The surcharge will equate that loss over a period and thus enable the board to balance its accounts "taking one year with another." The consumer will continue to pay a price that averages out the cost of fixed-price and world price sugar, but it is expected that the refiners' price will generally move with the world price and that changes in the surcharge will be made only at infrequent intervals.

As events have turned out the initial fixing of the surcharge will be difficult in a way that was not foreseen. The Act did not exclude the possibility that the world price might rise to or above the fixed price but it seemed unlikely. In recent weeks it has actually happened. The world sugar market is always sensitive to political news, and the Suez crisis found it exceptionally vulnerable. For the first time for years the market was free of burdensome stocks; it faced a smaller harvest of beet sugar on the Continent and the likelihood that the East European exporters would have little to spare. Buyers rushed to assure themselves of supplies and the spot price quickly shot up by 15s. to a peak of 48s. 6d. a cwt cif UK; it has since dropped back to about 47s. a cwt. That figure is almost the same as the fixed price of Commonwealth sugar for 1957—nominally 42s. 2d. a cwt, which includes an allowance for freight at 1939 rates. Adding about 8s. to allow for present rates of freight, and subtracting the value of the preference, 3s. 9d., the real fixed price is about 46s. 6d. a cwt.

If the board could assume that the world price would remain at about its present level there might be no need to impose a surcharge. (If the world price rose again, and stayed there, the board would make a profit, the surplus would be distributed to the persons paying sugar duty and the domestic price could be reduced.) But the price is now liable to change sharply, and the likely average over the next few months is anyone's guess. If the board considers it prudent to assume that the price will weaken, it may recommend a modest surcharge and hope for the best.

★

Though the board does not formally start its work until January 1st, it has already had to make some sales to keep the pipeline full. Some sugar already afloat under the Government's contracts has been sold and some not yet shipped. Sales are made through the brokers, acting either as the board's agents or as principals. The board is not normally allowed to store or transport sugar; it has to sell free at side in the country of origin, "at the best price reasonably obtainable, having regard to the date of delivery and other terms and conditions of sale."

That leaves the board little freedom to withhold offers, and as there is only one major buyer in this country—Tate & Lyle—the board appears to be a potential weak seller. But the weakness may be more apparent than real. The board's yardstick is the world price, and Britain's imports do not play a dominant part in determining that price. If the board were considered to be under undue pressure the Minister of Agriculture and Food could exercise the ultimate sanction of directing it to store or transport.

Moreover the board will offer to the market little

more than half the 1½ million tons of fixed-price sugar it has to sell. About 700,000 tons a year is to be sold under a " block " contract to Tate & Lyle. This refiner buys a large tonnage of foreign sugar (for its export trade in refined), under contracts that allow it to price the sugar at an average of market values over a period, and presumably it wished to have a similar contract with the board. It so happens that this kind of contract suits the board as well.

Between November and February deliveries of sugar to the British market are far in excess of current requirements, partly because arrivals of Commonwealth sugar are then seasonally high, but mainly because the home beet crop is refined in the autumn months. Hitherto the Ministry has stored the excess, at an appreciable cost. In future, Tate & Lyle will take up the excess by accepting deliveries under its block contract at an agreed rate each month. The company has two compensations for the costs incurred. It will have a measure of flexibility in pricing that should usually enable it to price that sugar against its sales of refined, thus eliminating the risk of changes in the fas price. As it is assured of a large portion of its needs for the home trade, it will have more freedom of manœuvre in buying the remainder.

Trading in the futures market will no doubt be small at first but there seems to be no reason why the market should not become firmly established in time. The physical turnover in London is not directly related to the turnover in futures, but it should be big enough to give the futures market adequate support. In addition to just under two million tons imported for home consumption each year the refiners import 6-700,000 tons of raw sugar for their export trade in refined, and London has international trade of about one million tons. The market should also attract business from foreign producers and refiners even though their physical transactions do not pass through London. It may seem a pity that the resumption of futures trading has been delayed until now. Had it begun two months ago the trade and speculative interest provoked by the sharp rise in prices might have given the market a flying start.

The complicated system set up under the Sugar Act has two divergent aims : to fulfil Britain's obligations towards Commonwealth sugar and to re-establish the London market. The obligations to the Commonwealth will be fulfilled. This round-about method of fulfilling them will be judged by whether London is able to create a market that offers the sugar trade here and abroad a realistic index of spot and future values and satisfactory facilities for hedging. The New York market, which trades on a free on board Cuba basis, is criticised for being unrepresentative at times ; London now has the opportunity to show that it can do better.

Business Notes

Ex-Im Joins the Parade

THE negotiations for the loan from the Export-Import Bank have been concluded with that same expedition that has marked all the other exercises in which the Chancellor has been engaged for the " parading " of the reinforcements for the gold and dollar reserves. A joint statement on the eve of the holiday from the Bank and the British Embassy in Washington reported the granting of a line of credit for $500 million, against the pledging of an undisclosed amount of the British Treasury's portfolio of dollar securities (which Mr Macmillan recently stated to be now valued at between $750 and $1,000 million).

As expected, the credit is available to finance British purchases in the United States, not only of oil, but of other commodities normally purchased, including tobacco. Presumably, in consideration of the special purpose of the operation, and of the fact that specific security has been deposited, the interest charge on drawings will be substantially less than the Bank's customary lending rates ; it will be 4½ per cent. The facility is available for drawings at any time within the next twelve months, but if necessary it could probably be re-negotiated, to the extent of any amount unutilised, at the end of that period. Repayments will be spread over four years, in nine half-yearly instalments, starting three years after the date of each drawing.

Given the big reinforcement of the reserves by the purchase of dollars from the International Monetary Fund—the $562 million comprising the gold and first credit tranches will figure in the end-December gold statement—there is no real need for any drawings to be made on the Export-Import credit. But the Treasury apparently intends to finance American purchases in this way so as to leave the maximum display of cash in the till—and thus to impress international speculators with the strength of the reserves held by Britain in its capacity as banker for the world's users of sterling. Together with the IMF " stand-by " facility of $738 million and the $104 million saving achieved when the waiver is sanctioned by Congress, the total special reinforcements paraded and immediately available will be equivalent to only $60 million less than the amount actually in the till on November 30th.

Russian Gold Sales

STERLING and the British reserves have received some relief from the renewed sales of Soviet gold. Russian sterling balances had fallen to a point at which immediate reinforcement was needed, and during the first three weeks of December some $30 million worth of gold was sold in Europe. About half of it was sold in London and most of the balance eventually found its way there. With the proceeds of their sales the Russians bought transferable sterling, thus securing the most favourable price for their metal. The Soviet gold sales must be given part of the credit for the recovery in transferable sterling which has moved up to $2.75 compared with a low point of $2.73½ at the end of November.

It is not the only cause of the recovery in the transferable rate, nor has it yet gone far. Official sterling has risen (following the Chancellor's mobilisation of the reserves) to $2.78⅜, whereas before the Chancellor's action it was hanging around the support point of $2.78¼-$^{3}/_{16}$. But there is little evidence yet of covering of the substantial bear accounts outstanding in the forward market. Some of these have been built up by foreign concerns with subsidiaries and other interests in the sterling area. These firms do not normally cover their commitments in the sterling area by forward sales, but now think it advisable to hedge against devaluation. In consequence the discount on forward sterling has widened to a point at which in terms of dollars it represents an interest rate of about 4 per cent per annum. This is about twice the figure indicated by the margin between short-term interest rates in London and in New York. The renewing of short accounts in sterling is therefore becoming expensive. With the reinforcement of the published reserves and the dismissal of early expectations of a devaluation of sterling, it is reasonable to expect substantial covering operations in the forward market.

Egypt's Currency Moves

THE mobilising of the second line of defence behind sterling has absorbed public attention and the efforts of Egypt to mobilise the reserves of credit behind the piastre have passed with less attention. The Egyptian moves are nevertheless significant. A second credit of 20 million Swiss francs has been arranged for Egypt by communist China. As in the previous operation in August the francs have been provided by selling sterling in the transferable market in Zurich. The two credits amounting together to the equivalent of £4¼ million are to be ultimately repaid by exports of Egyptian cotton. Moreover, following the drawing by Egypt at the end of September of $15 million from the International Monetary Fund, it has become known that £5 million worth of gold has been bought on Egyptian account. It was bought on the Continent but indirectly it came from the London market. The strong presumption therefore is that Egypt has converted the dollars drawn from the IMF into gold. Already any risk of having the dollars blocked had been astutely evaded by requiring the drawing from the IMF to be made in Canadian dollars. Reports now come from Washington that Egypt is negotiating a further withdrawal of $15 million from the IMF. That sum would be well within the 25 per cent of the Egyptian quota that can be withdrawn within twelve months. But unlike the first drawing (which was from the gold tranche) it would not be automatically granted: the demand would have to be justified on grounds of temporary balance of payments difficulties. Under the Anglo-Egyptian agreement of 1955 Egypt should also have the right on or after January 1st to transfer £20 million sterling from its No. 2 account to its No. 1 account at the Bank of England. Such a transfer, however, would for the moment be merely a pointless moving of £20 million from one blocked account to another, because since July 27th the No. 1 account has been as effectively blocked as the No. 2 account.

Profitable Year for the Banks

THIS past year, it seems safe to assume, has been a satisfactory one for the big joint stock banks, from the point of view of current earnings. Interest rates through the year have been at their highest for a quarter of a century ; and, except through its impact upon gilt-edged values, dear money has not thrust upon the banks any such strains as were its normal accompaniment in former times. In particular, they have not had to face any burden of bad debts. The average volume of resources employed through the year has, it is true, contracted significantly, even when judged by the standards of prewar phases of deflation. The average level of net deposits of the clearing banks during the eleven months for which figures are available was fully 3 per cent less than the similar average for 1955. The steep fall in fact took place during 1955 ; in the past twelve months there has been little further decline. From the point of view of bank earnings, however, the effects of this decline have certainly been more than offset by the rise in interest rates.

Slightly more than two-thirds of the decline in average deposits has its counterpart in the contraction of average advances ; these have fallen by nearly 7 per cent, but the average rate of interest earned on them must have risen by fully one-fifth. Average investment portfolios have contracted even more sharply, by about 8½ per cent, partly in consequence of writing-down, but mainly because of outright sales and redemptions at maturity. During the past twelve months this last factor has been by far the most important, affording scope for reinvestment at the higher yield level. Even so, the average rate earned on the portfolios cannot have risen as much as has that on advances. Total interest receipts from investments probably declined, but any such decline must have been small beside the

substantial increase in earnings from money market assets. The average volume of these assets expanded by roughly 6 per cent, and the average rate earned on them rose by rather more than the increase in Bank rate. Total earnings from this source may have increased by as much as 40 per cent—or by just about enough to offset the big increase in the cost to the banks of the interest allowances on balances on deposit accounts. From the interest accounts as a whole, therefore, the banks have evidently secured a considerable net gain—against which there has to be set a further increase in the bill for salaries and pensions, and the continued rise in general charges. Though the revenue accounts look stronger, present conditions of uncertainty at home and abroad are hardly propitious for any further general move towards increased dividends.

Modifications for Motor HP

THE Board of Trade has gone back more than all the way on the additional restrictions it imposed on the hire purchase of cars, light vans and motor cycles in February. The minimum initial deposit then went up from 33⅓ per cent to 50 per cent; it now comes down to 20 per cent. At the same time the Control of Hiring Order that required the deposit of nine months' rental in advance where these motors, vans and cycles are hired—not hire-purchased—has been revoked, but the hiring order, which prohibits rebates of rentals based on the value of the goods, remains in force. These temporary changes apply to these goods only. The reasons for them are obvious. The impact of the hire purchase restrictions, the credit squeeze and the prospect of petrol rationing has been cumulatively drastic. The growth in hire purchase trading in motor cars had already been brought to a halt before petrol rationing. The ration now can be trusted to do much of the work of the hire purchase controls, and it will cause no surprise if the number of contracts for December shows a sharp fall.

Whether the turn about was wisely thought out, and whether it will bring much relief to the motor trade are quite different questions. Some hire purchase finance houses have their doubts. A maximum deposit as low as 20 per cent (on a 24-month contract) seems to some of them intrinsically risky. They would have preferred between 25 and 33⅓ per cent, but they fear that competition will force them down to the new Government minimum, because hire purchase houses are now well supplied with cash. That may be irrational, for it is not the business of the Government to prevent the finance houses from trading on unsound terms.

A second doubt concerns the inconsistency of removing entirely the provision that nine months' rent must be put down in order to obtain a car on hire. The finance houses see little virtue in this since they feel that if deposits under hire purchase contracts are as low as 20 per cent few people will be obliged to use hiring as an alternative. The form of hiring agreement that many finance houses now use calls for a deposit of about 25 per cent at the beginning of the hiring agreement. Under the new rules they could dispense with this. It is doubtful whether many of them will do so; it is more likely hiring business may slow down.

Baby Aspirin for the Car Trade

THIS has been a brutally disappointing year for the motor industry, and 1957 may be as bad or worse. The oil shortage will probably continue to affect demand for cars in Britain well into the peak spring period of sales—and demand for extra cars in quite a number of Britain's most important export markets. At the moment, the industry is working a great deal of short-time, and dismissals are still going on. Motor output in November was down nearly 30 per cent, compared with 12 months before. The industry never expected to be busy now, but by mid-January it would have been raising its schedules in anticipation of the rise in sales at Easter. Nobody now counts upon those sales rising as usual, and unless oil supplies are restored to full volume by April or so a large part of the early summer sales cannot be counted upon either.

It is not very clear whether the Government's sudden measures to assist the industry to sell cars at home and abroad "for the time being" will make much difference; these might be described as doses of baby aspirin rather than shots in the arm. Certainly there is no need to restrain car sales by requiring large hire-purchase deposits when the cars are not going to be sold anyway; but whether the chance of more credit will help sales of new cars seems doubtful. It might assist a margin of second-hand purchasers, who can get some quite impressive bargains from the showrooms today; and since the car market is broadly one whole, this must assist dealers over some very lean months. Similarly, the Export Credit Department's new readiness to stretch its insurance of credit given by manufacturers here to distributors overseas may give some assistance to marginal exports; the department is going to work much more closely with the makers on these transactions.

Post-Suez Trade

THE detailed returns of overseas trade in November reveal the extent of the fall in imports from the East caused by the blocking of the Suez Canal. (Exports were not affected last month because the ships to carry them were already in or approaching British ports when the Canal was closed.) In total, imports fell by £34.7 million to £319.6 million cif, of which roughly £20 million is attributable to the delay in arrivals from the East—delays that were especially severe because many ships were nearing Suez when they had to be turned back round the Cape. Arrivals from Australia, exceptionally, were actually higher than the average for the previous ten months, partly because some ships on the Australian run had been rerouted before the canal was closed. From other countries east of Suez, however, imports fell by about two-fifths.

Arrivals of oil were naturally the hardest hit. Imports of oil and products from the Middle East and Sarawak fell by over one-half between October and November, to a value of £10½ million. A rise of £2 million in imports from the United States and Venezuela was offset by a fall in imports from the West Indies, so that total imports fell by £10.7 million, or nearly 30 per cent, to £26.2 million.

In volume, crude oil fell by nearly 40 per cent to 419 million gallons, motor spirit by 10 per cent to 46.8 million gallons and gas, diesel and fuel oil by nearly 50 per cent to 61.7 million gallons. Among other commodities, arrivals of rubber from Malaya and Indonesia dropped by nearly 60 per cent to 10,000 tons, and arrivals of tea from India and Ceylon dropped by 25 per cent to 28.7 million lb. The December figures should show some recovery in imports. The worst of the post-Suez delays are past, and the fall in imports of oil from the Middle East will be partly made good by heavier shipments from the American continent. The converse applies to the export figures in December, which will be affected more severely than in the following months.

There was little change in the composition of exports last month. The total of £291.9 million fob was only £3 million less than in October, and the daily rate was easily the highest ever. Though shipments of engineering products remain high, the upsurge from the low average of the third quarter is largely attributable to increased shipments of other goods—steel and non-ferrous metals, manufactures other than engineering products, coal and petroleum products, food and beverages; and to a revival in cotton and wool textiles. Export prices as a whole remained at 107 (1954 = 100) in November, but prices of imports rose again by one point to 107, and the terms of trade worsened by a further point to 100.

The Vulcan Report

IN his statement to the House of Commons on the crash of the Vulcan bomber at London Airport three months ago, the Secretary of State for Air said that the immediate cause was failure by the ground controller who was "talking-down" the aircraft to warn the pilot that he was well below his proper glide path. The last message given to the pilot was that he was 80 feet above, not below, the glide path. Seven seconds after this message the wheels of the Vulcan hit a cabbage field at a point 700 yards from the threshold of the runway. This is no doubt factually correct, but the investigator who carried out a separate investigation for the Ministry of Transport at the end of the RAF inquiry questioned whether there was time in those last few seconds for the pilot to regain height, whatever warning he received from ground control. This report of Dr Touch, but not the RAF's own inquiry, will be made public as soon as it can be printed and will give more technical background than Mr Birch was able to include in his statement. Long before this last rapid loss of height, the pilot had, according to Mr Birch, made the twin errors of deciding to fly as low as 300 feet in bad visibility before he finally made up his mind whether to attempt to land at London Airport, or divert to another, clearer airfield. And having made that decision, he then flew below even this dangerously low ceiling.

Responsibility for the accident is therefore divided between the pilot and the controller on the ground. In the rain an official reception committee was waiting for the Vulcan. The pilot decided to attempt just one landing at London, intending to divert if it failed. It remains to be explained why London airport was chosen as the terminal for a military flight. Mr Birch's answer that hundreds of military aircraft have landed at London Airport hardly covers the special case of the Vulcan, which cannot be classed with essentially conventional aircraft like Canberras. The Vulcan is the first big aircraft to be built with a delta planform, and the only one to have no tail—features that cause its handling properties, especially during landing, to differ from conventional aircraft. As Dr Touch has said in his report, the unusual speed of the aircraft and the number of corrections in azimuth (as distinct from elevation) made during the talk-down are extenuating circumstances so far as the ground control staff is concerned.

Not a Capital New Year?

EVEN before the canal was closed, and the economic effects of closure realised, the manufacturing firms that regularly supply the Board of Trade with information about their investment plans were thinking of spending very little more on capital equipment next year than they had expected to do this year—only one per cent more, in fact. This was slightly better than their first forecasts of one per cent less, which they made last summer. They now expect their outlay on new plant, machinery and vehicles to rise by three per cent in 1957 instead of by one per cent, and their expenditure on new building work to fall by only seven per cent against nine per cent. But events at Suez may have caused some businesses to think again; the motor industry, which was intending to spend about the same on plant and machinery and a third less on buildings, will almost certainly be revising its intentions.

INVESTMENT BY MANUFACTURING INDUSTRY

	Actual 1954	Changes		
		1954–55*	1955–56†	1956–57†
	£ mn.	%	%	%
Non-metalliferous mining	25·2	+21	+ 7	+ 9
Chemicals	94·9	+13	+31	+13
Metal Manufacture	71·3	+13	+41	+14
Iron and steel	61·6	+14	+40	+15
Metal using (excl. vehicles)	128·5	+25	+10	− 8
Vehicles	48·9	+75	+33	− 5
Motor vehicles	29·3	+95	+22	− 5
Textiles and clothing	79·9	+16	− 7	−12
Food, drink and tobacco	76·1	+25	+21	nil

Other manufacturing	27·3	+36	+18	− 8
Total	592·4	+27	+21	+ 1

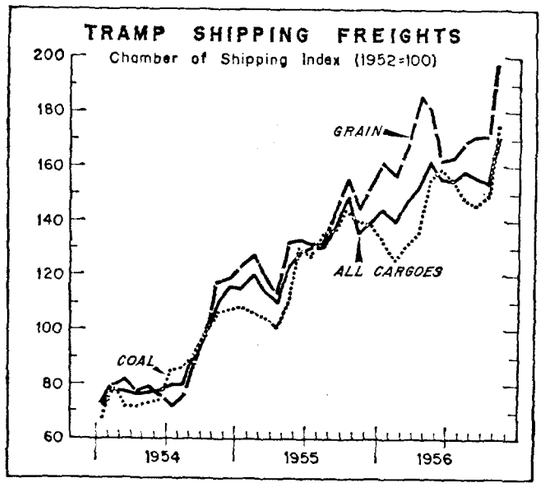
* Actual. † Comparing forecast for coming year with forecast for previous year.

But the tempo of manufacturing investment was quite clearly slowing down well before October. In 1955 it rose by 27 per cent—to about £750 million if the expenditures of the firms in the Board of Trade's sample are grossed up to cover all manufacturing industry. They had expected to spend rather more than that, about £800 million. This year a further, but smaller, advance was forecast—an in-

crease of 21 per cent on that forecast for 1955, or about £960 million altogether. Up to September total spending on investment was just about 21 per cent above what was actually spent in the same period of 1955, but the rate of increase had been falling steadily with each quarter. When the full year's figures are available the total will probably be somewhat less than the forecast, and this year's investment will probably amount to £880-£890 million. Next year's total, it seems, will be about the same.

Shipping Freights Ease

EUROPE'S winter requirements of coal and grain would have pressed heavily upon the tramp tonnage available for bulk dry cargoes, even without the closing of the Suez Canal and the Middle Eastern pipelines. As it is, this additional pressure of demand quickly forced freight rates above Korean peaks, and the rise went on without interruption until a fortnight ago despite the arrival of the first of the cargo ships to be released from the United States reserve fleet. By the second week of December 119s. 6d. a ton—the highest rate ever—was paid for a prompt vessel for coal from Hampton Roads to Antwerp. But since then



tramp freights for all commodities, apart from sugar, have slipped back a little and business in time charters has all but come to a stop. Just before Christmas coal freights had dropped to 100s. a ton for March loading and to 103s. for prompt vessels—but this was still well above the prices of about 70s. a ton that were paid in July.

Charterers have been helped in their efforts to keep the rise in freights in check by the return of most of the 70 merchantmen requisitioned in August by the British Government and by the arrival of more ships released from the American "mothball" fleet. So far 112 vessels (including 18 tankers) have been marked for "re-activation" and the Federal Maritime Board examiner has recommended that another 69 be released though it will be some time before all these extra vessels can be put into service and manned.

US Cotton's Come-back

NO one would have believed a year ago that the United States could dump abroad 6 million bales of cotton without wrecking world markets. Yet its sales have exceeded that figure, prices are firm, and it now expects to sell over 7 million bales. In November the American government's agency, the Commodity Credit Corporation, added a carrying charge of 0.25 cents a lb to its selling prices, and is adding a further 0.15 cents in each subsequent month. The CCC has always levied carrying charges on its domestic sales, but this was the first time that it felt it could pass those charges on to export sales. In fact buyers have been prepared to pay the carrying charges and something more for middling inch cotton; at the latest sale the average price realised was 26.88 cents a lb, showing a net gain of about 0.3 cents since carrying charges were introduced. The CCC will shortly have to retire from the market. Since April it has sold 6,180,000 bales, and is now virtually sold out. The 6 million bales that are surplus from the 1955 crop will become its property on January 1st, but they may not be ready for sale before the middle of February. Only some 2.2 million of the 6,180,000 bales sold by the CCC has been exported so far. Shipments could not begin until the 1956-57 season opened on August 1st, nor could foreign markets have absorbed the cotton so fast. As buyers had up to one year in which to ship they sold a large part of the cotton to domestic mills and replaced it later from the free market when they made their sales abroad. Private guesses are that roughly three-quarters of the cotton sold by the CCC has been re-sold for export.

The United States lost its export markets because its prices were too high; it is winning them back by becoming the cheapest seller. The basic export price is about 8 cents a lb below the domestic level, a subsidy amounting to a massive $250 million on its sales to date. But though under orders to meet the market the CCC, helped by the fact that there has been little selling pressure from foreign producers, has used its price-cutting powers with restraint. With confidence in prices re-established, and with stocks in consuming countries low, American expectations of total exports of over 7 million bales this season—compared with only 2.2 million last season—do not look unrealistic.

Surprise from Lancashire Cotton

GOOD cheer for investors in the cotton textile industry is seasonable and in recent times uncommon. Lancashire Cotton Corporation has raised its ordinary dividend from 12½ to 17½ per cent. The stock market was taken completely by surprise and the £1 stock units were immediately marked up from 30s. 3d. to 35s. 9d. To explain this decision the directors say that for many years the corporation has ploughed back profits and utilised them in the purchase of modern plant and machinery and that the time has now come when an increase in the return to ordinary shareholders should be made. It is a commendable decision.

Not less unexpected is the news that in the year to October 31st trading profits rose from £2.8 million to £2.9 million; after a bigger tax charge the net profits were £1,574,188, against £1,583,511. So the increased dividend is buttressed not only by a conservative past but also by a more prosperous present, though the industry has not as a whole been prosperous. The directors in their own minds must also have made some estimate of the future and their decision seems to imply favourable expectations.

An Expert on Aircraft Development

IT was a pity Sir Arnold Hall had to be speaking as far away as Washington when he delivered the Wright Brothers lecture last week. He was talking about aircraft development from the standpoint of one who was until fairly recently the director of the Royal Aircraft Establishment at Farnborough, and whose office became a clearing house for the difficulties of the British aircraft industry. Time after time Sir Arnold's lecture touched as lightly and revealingly as a spotlight on the main weaknesses of the system that has governed the development and procurement of aircraft in this country. What he said no doubt applies equally to other countries, but a British audience would have had the most to learn from it.

He stressed a point that the services are always reluctant to accept, namely, that the Mark I in any series is almost always disappointing. "They form, however, the essential foundation for development; it is usually the Mark II design—an amended version of the first—which brings the exploitation of the scientific foundation within full view." Aircraft designers are clever but not clairvoyant; they cannot visualise on the drawing board all the modifications and improvements the design requires. Nor can they possibly foresee whether experience in using the aircraft will not suggest a change in emphasis, such as faster climb at the expense of reduced endurance in flight, of heavier armament or greater range at the expense of speed. Measure this statement of Sir Arnold's against aircraft development in this country during the past few years and it begins to look as if the services, because they always feel short of money, are trying always to obtain the Mark II without the Mark I, never realising that they cannot have one without the other. So much is said in the service ministries about waiting for improved performance, so little about the principle hammered out by Sir Arnold, that aircraft development is made up of the front legs of a tortoise and the back legs of a hare. Every so many years a radical advance is made, from piston-engined speeds to jet speeds, from subsonic to supersonic. But in between times, aircraft evolve as gradually as anything else in nature. This is a lesson learnt by the Americans, Russians and French, but not, apparently, by the British, although there are one or two exceptions.

Retail Business

CUSTOMER TRENDS

This is a new quarterly bulletin for those interested in the home market for consumer goods. It includes short and long-term forecasts of sales by different outlets and merchandise groups, regional surveys and reports on special investigations.

Strong and Mild in Beer Profits

THIS year the trading profits of breweries have been mostly higher. But the increases have rarely been large; and there have been reductions here and there. In spite of the cold winter and the wet summer, beer production from January to October was fractionally higher than in 1955, but while firms in the industrial North-West, North-East and South Wales generally did better, many in the South and in the Midlands did not do so well. Increasing wine and spirit sales seem to have helped brewers everywhere; so have rising sales of soft drinks, not least of perry. The catering and hotel trade helped some brewers, particularly those with managed houses. The good harvest of 1955 reduced barley and malt costs. Some, but not all, brewers are benefiting from the continuing changeover from draught to bottled beer. The modernisation of brewing and bottling equipment of the past few years is being reflected in lower overhead costs. There has been a general tightening all round, including the closing of redundant houses and the transfer of licences to more populous districts.

Higher profits have often come through reductions in costs following amalgamations and mergers. These have varied causes—the small firm's lack of funds for development and its difficulty in finding death duties and the growing firm's desire for additional retail outlets. But the industry is plainly trying to "rationalise" itself by concentrating its production into the most efficient units. Often, neighbouring firms have combined to strengthen each other. Usher's Wiltshire Brewery, for example, has closed Arnold & Hancock's Taunton brewery and Crewkerne maltings.

Brewers' profits would have been higher if their expenditure on public house improvements ranked for tax relief; brewers claim that this outlay is necessary to maintain trade in changing social conditions. In some cases development has been held up by the credit squeeze, but breweries with reserves have been able to go ahead. The increases in the price of bottled beers here and there throughout the year have helped to offset higher wages, fuel costs, rates, and purchase tax on materials and equipment.

The outlook for brewing profits is not clear. Beer sales may be reduced by industrial dislocations; or there may be a return to lower-priced (and less profitable) draught beers. Costs look like increasing in many directions; higher rates will particularly affect brewers with managed houses; the poor harvest this year will probably raise hop and barley prices, and the cost of new houses is rising.

Rhodesia's Western Outlet

THE railway agreement reached between Rhodesia Railways, the Congo railway (Compagnie du Chemin de Fer du Bas-Congo au Katanga) and the Benguela Railway company has now been ratified by all the authorities concerned and will operate as from January 1st. For the mining and other industries of central Africa it may prove an important step in relieving central Africa's transport bottleneck; for shareholders of Tanganyika Concessions, which owns the Benguela railway it has a more personal interest, and for the ports of Beira and Lourenço Marques it introduces an element of competition that may in the end prove healthy. The agreement permits traffic inwards and outwards from the Rhodesian copperbelt to go at equalised through rates of freight either eastward to Beira or westwards through the Congo and Angola to Lobito. The low rail freight on copper from the copperbelt to the ports has been almost doubled, rising from £8 a ton to £15 a ton. So the spare capacity of the Benguela railway, one of the few railways of the world that makes a profit and pays an ordinary dividend, can now be used. So can the fine natural port of Lobito which is some 2,600 miles nearer to London than is Beira.

There is a limitation on the tonnage of copper that may go westwards to Lobito. For other commodities both inwards and outwards there will be for twelve months at least free choice. The details of the maximum amount of copper to be carried by the Benguela system and the division of the freight income between the three railway systems have not been disclosed. Shareholders wishing to make estimates may find it useful to assume that the Benguela railway with its long stretch of line will get about half the freight income on the through traffic. That railway is known to have about 15,000 tons a month of spare inward capacity which it should now have a fair chance of using. Its outward copper traffic is likely to start small and rise gradually though it is likely always to remain a fairly small fraction of the total. The company's ratio of gross receipts to net receipts at present about 50:50 should improve as its spare capacity comes into use.

Selection Trust Copper Issues

DESPITE the timing of the announcement of the free scrip issues from the Selection Trust group of copper companies—just before Christmas and not long after a warning from the chairman Sir Ronald Prain, that dividends may be reduced—sensible shareholders will not regard the capitalisation issues as an unexpected Christmas box. The two mining companies, Roan Antelope and Mufulira, are each to make four for five free scrip issues. The holding company, Rhodesian Selection Trust, which draws the bulk of its income from its holding of just under two thirds of Mufulira's capital is to make a one for one issue. The decision is a logical sequel to the growth of these undertakings financed largely from retained earnings.

When the companies emigrated to Rhodesia in 1953 capitalisation issues followed. Since then the mines of the copperbelt have prospered, their investment has proceeded at a great pace and their wealth has not passed unnoticed either by the politicians or trade unions. The shares went up on the announcement: Roan 5s. units by 9d. to 25s. 9d. and Rhodesian Selection Trust 5s. units by 1s. 6d. to 45s. In terms of percentage on nominal capital, dividends are "heavy"—Roan 62½ per cent, Rhodesian Selection Trust 75 per cent and the privately held Mufulira 78⅛ per cent. Those figures are reason enough to explain the decision to capitalise share premiums and reserves.

Kaffir Dividends

BY the end of this year the South African gold mines will have produced about 16 million fine ounces of gold, compared with 14,600,000 ounces in 1955. Working profits before tax from gold this year will approach £63 million, compared with £44 million last year, and from uranium about £24 million, against £17½ million. A good number of the older Rand producers are near the end of their life, though for some of them life has been extended by uranium production. Hence the whole of the increase in production and in profits has come from the mines in the Orange Free State and the Far West Rand while production on the Rand has been declining. Costs, whether they are measured per ton milled or per fine ounce produced, have fallen for the new producers and this is due mainly to bigger throughputs. Costs at the older mines have risen, though the rise has not been unusually steep, and most of them are still short of native labour.

This is the background to the Christmas Kaffir dividends shown in the accompanying table. These dividends were up to expectations and there were no startling surprises, either good or bad. The market in Kaffir shares was climbing slowly until the middle of this year, but since then it has fallen into the doldrums and despite the recovery in prices after the Suez crisis prices now of the OFS and Klerksdorp mines are generally slightly lower than they were twelve months ago. The possibility of some recovery in Kaffirs has been talked about in the City. Whether those hopes are fulfilled depends only partly on the rising profitability of the new mines; it will also reflect the desire that investors in some countries may feel for a currency hedge.

Montague Burton's Better Profits

THE full accounts of Montague Burton for the year to August 31st add a few more details to the preliminary statement, showing a little more clearly the improvement in earnings that has been achieved. In the last financial year the gross trading profit of £2,799,280 was actually better than the profit of £2,748,017 earned in the previous 17 months. The new management of this group of multiple tailors seems to have made its impact. Soon after its arrival many building restrictions were removed and this has enabled the group to carry through a programme of modernising its shops. Twelve months ago Montague Burton was also acutely short of ready-to-wear garments; but that has now been corrected, with a consequent growth in stock values from £5,704,691 to £6,718,047. The chairman, Mr Lionel Jacobson, says that sales since the beginning of September have given "cause for satisfaction and reasonable confidence in the future." Such sentiments must have been in the minds of directors when in effect they raised the dividend from 14.1 to 17½ per cent.

Competition in Whaling

THE main whaling season in the Antarctic, for baleen whales, starts on January 7th. The game has always been risky and now it is becoming more competitive. The total catch is limited by international agreement, but there is no restriction on the number of expeditions taking part. The number this season has risen from 19 to 20, with the entry of another Japanese fleet, and the permissible total catch has been reduced by 500 to 14,500 blue whales or the equivalent in oil (it was 16,000 in 1953). As each expedition tries to catch the maximum number before the limit is reached, the number of catching vessels tends to expand; the season becomes shorter and costs go up. This season all the whaling firms except the Russian agreed to revive restrictions on the number of catchers; that will bring some relief, but evidently it is not enough for some firms. The Union Whaling Company of South Africa has recently sold its factory ship and eight catchers to Japanese owners, and now Chr. Salvesen and Co. of Leith, one of the major firms, is negotiating the sale to another Japanese concern of one factory ship and seven catchers, roughly one-third of its fleet. Hector Whaling, another British firm, is maintaining its fleet, but is prudently enlarging its interests in the tanker trade.

The Japanese have an advantage in costs; they pay lower wages and have a profitable home market for whale meat. Some time ago the Japanese bought the Onassis fleet, and when the present negotiations are completed their fleets will number six, a three-fold expansion in almost three years. Salvesen's view, and it is shared by Norwegian and some other firms, is that costs should be kept down by restricting the number of expeditions taking part. They are aware that Russia is contemplating the building of another four fleets, the first of which is believed to have been ordered. The Norwegians have even pressed their government to withdraw from the International Whaling Convention if expansion goes on. The convention forbids the restriction of expeditions and the allocation of the catch by quota and it would be extremely difficult to persuade all the member governments to change those rules. The convention was drawn up to preserve the stock of whales; it is not concerned with the economics of whaling. Whether restriction of entry is in fact desirable is open to doubt.

Research Seeks the Dollar

AS the Dollar Exports Council has recently pointed out, British exports still represent a much smaller share of the United States, Canadian, and South American dollar account markets than they did before the war. The United States has at last surpassed Australia as the largest single market for British exports—but there are 167 million people in America, and only 9 million in Australia.

The Council has recently been emphasising the need for more and better market research in North American markets. The latest effort has been sponsored by the Institute of Incorporated Practitioners of Advertising, at its own expense. Six market surveys are now nearing completion, and as the advertising firms responsible for them are in most cases closely associated with American companies, they should not lack local colour. One survey, on the North American market for toys, points out that American and Canadian parents together spend more on toys alone then they spend on all British goods. Another looks to the American trend towards the construction of new houses with fitted wall-to-wall carpets to provide a useful market for the British broadloom carpet industry. Other surveys deal with quality foods, children's footwear, sports goods and biscuits. No one who has been exposed for long periods to the American "cookie"—the word "biscuit" has another meaning in America—will doubt that British biscuit makers could penetrate a far larger segment of this American market than they have so far.

SHORTER NOTES

The note circulation reached a new peak on Christmas eve, at £1,997.7 million, but was only £700,000 higher than at the date of the previous Bank return. Since the third week of October it had expanded by £123.6 million, or by fractionally less than in the corresponding period last year. By comparison with the 1955 Christmas peak it has climbed by £108 million, whereas at the August holiday peak (£1,979 million) its expansion over twelve months was £118 million. In the calendar year 1954 its rise was £131 million.

★

The Corporation of the City of London's issue of £5 million 5¼ per cent stock (1976-79) at £97 was oversubscribed. Applicants for up to £5,000 received full allotment and above that amount 69 per cent of their applications with a minimum of £5,000. The stock opened at ⅛ premium.

Financial Statistics

LONDON STOCK EXCHANGE

Next Account begins: January 2nd
Next Contango Day: January 2nd
Next Settlement Day: January 8th

THOUGH a reduced amount of business was done on the Stock Exchange up to the start of the holiday, it was done in the main at rising prices. Helped by the higher tender for Treasury bills, gilt-edged continued to improve and short-dated stocks rose sharply, 2 per cent Conversion 1958/59 jumping ½ to 94⅜ xd and 2 per cent Exchequer 1960 ⅛ to 91⅝. The new Corporation of London loan started at ⅛ premium and rose to ¼ premium. The *Financial Times* index of industrial ordinary shares improved from 174.3 last Wednesday to 177.8 at the close on Monday. The advance in the shorts continued on Thursday.

Motor shares were firmer on the cut in deposit requirements; Ford rose 10½d. to 29s. and BMC improved to 7s. Standard recovered to 6s. after easing following the chairman's statement. Stores improved on the proposed reduction in the rateable values of shops; Woolworth gained 3s. 6d. to 60s. 10½d. and Marks and Spencer "A" 2s. 1½d. to close at the same price. Cotton textiles were boosted by the unexpected increase in the dividend of Lancashire Cotton, which subsequently leapt 6s. 4½d. to 35s. 7½d. English Sewing Cotton gained 2s. 7½d. to 32s. 3d. and Fine Spinners 1s. 6d. to 18s. 6d. On the projected expansion of Terylene production ICI rose 1s. 9d. to 39s. The industrial market, however, was a little easier on Thursday.

Oil shares rose, British Petroleum reaching 133s. 9d., Burmah 85s. 7½d. and Shell 148s.; but the recent political unrest lowered South African gold mines, although some shares recovered on Monday. The capitalisation proposals led to a rise of 1s. 3d. to 45s. in Rhodesian Selection Trust and a rise of 7½d. to 25s. 9d. in Roan Antelope. Rio Tinto gained 3s. 1½d. to 88s. 9d. On news of the bauxite development Consolidated Zinc advanced a further 5s. to 74s. and British Aluminium rose 1s. 6d. to 68s. 6d.

THE MONEY MARKET

THE discount houses raised their bid for 91-day Treasury bills still further at the pre-holiday tender, by 3d. to £98 15s. 6d. per cent, and thereby achieved an increase from 55 to 68 per cent in the proportion of their applications allotted. On the whole allotment of £280 million the average discount rate accordingly fell from £4 19s. 1.54d. to £4 18s. 1.43d. per cent, its lowest since Bank rate rose to 5½ per cent in mid-February. At yesterday's tender the offering was £270 million.

Tighter conditions ruled in the short loan market—before the week-end chiefly on account of tax transfers on the Thursday, when the authorities gave substantial aid; and on Christmas Eve because of the market's unusually heavy payments for bills. Official assistance on that day was on a small scale, as on Friday, but rates for new money generally did not rise above 4½ to 4¾ per cent, and on both days eased towards the close. Since the bill tender "hot" bills and March dates have been sold at 4⅛ per cent (and occasionally 4⅛ per cent), compared with 4⅞ per cent last week.

In the last four working days before the holiday the note circulation expanded by only £0.7 million, to £1,997.8 million.

Sterling in New York eased ¼c to $2.78⅜ on Thursday of last week and held steady until Christmas Eve, when it closed at $2.78⅛. Gold then rose by ½d. to 250s. 7d. a fine ounce.

THE NATIONAL BANK OF SCOTLAND LIMITED

FIGURES SHOW ENCOURAGING INCREASE

ANOTHER GOOD YEAR FOR SCOTTISH INDUSTRY

NEED FOR ECONOMY IN PUBLIC EXPENDITURE

LORD ROWALLAN'S VIEWS

The One Hundred and Thirty-first Annual General Meeting of the Proprietors of The National Bank of Scotland Limited was held in the Bank's Head Office, Edinburgh, on December 20th, the Right Honourable Lord Rowallan, KBE, MC, TD, DL, the Governor of the Bank, presiding.

The Governor said: I have to report that during the year we lost the services of Mr Cyril E. Lloyd, MInstCE, who had been an esteemed Member of the Ordinary Board since 1934. Mr Lloyd's resignation, which followed his retiral from the Board of Lloyds Bank Limited, was accepted with much regret, and our good wishes attend him in the wider leisure that he now enjoys.

To fill the vacancy thus created, the Directors were fortunate in securing the services of Mr Hugh Fraser, DL, JP. Mr Fraser's record is too well known to call for repetition here. I will only say that in him the other Members of the Ordinary Board have found an agreeable colleague, whose wide experience and expert knowledge of the intricacies of modern business will greatly assist their deliberations. In due course you will be invited to confirm Mr Fraser's appointment, and meantime I welcome him heartily to his first Annual General Meeting.

MR W. H. FRASER'S RETIREMENT

The Proprietors will learn with deep regret that Mr W. H. Fraser, the present Chairman of the Board, has intimated that he will not be seeking re-election to that position in the New Year. As you know, Mr Fraser has served the Bank with marked ability and distinction for a long period. It was in 1925 that he first joined the Board, over which he has presided most acceptably since 1942, and we are indeed sorry that he finds it necessary now to ask to be relieved of the duties involved in the Chairmanship. We are, however, happy that he has agreed to continue as a Member of the Ordinary Board, and we trust that he may long be spared to give his colleagues and the Executive of the Bank the benefit of his wise counsels.

It is proposed that Mr Fraser's place as Chairman should be taken by Sir Wilfrid Ayre, who has been an ordinary Director since 1946 and during the year succeeded Mr Fraser as this Bank's representative on the Board of Lloyds Bank Limited. Sir Wilfrid will bring to bear on his new office a wide knowledge of men and affairs, and I am sure that you would like me to wish him well.

THE BANK'S ACCOUNTS

Although still short of the record 1954 figures, the totals of the Balance Sheet now submitted show an encouraging increase on those of last year. Doubtless part of this can be attributed to the creeping inflation that unfortunately still continues, but on the other hand there have been some notable additions to the Bank's business, and these are partly reflected in the Deposits, which, at £106,600,000, are higher by £1,300,000. Notes in circulation have gone up by no less than £1 million to a new record of £12,900,000, and here again we have evidence of increased business. To set against these liabilities to the public totalling nearly £120 million, we had cash resources of £48 million, representing a liquidity ratio of 40 per cent, which, although very full in more normal times, is nevertheless, as I am sure you will agree, desirable in these uncertain days.

Advances to customers and Bills Discounted together came to £24,700,000. This figure, which is practically identical with that for 1955, might at first glance suggest there had been some slackening in the policy of Credit Restriction, but that is not the case. You will recall that a year ago I indicated that because of future lending commitments it might be difficult to hold the whole of the reduction in advances then seen, and the fact that we have been able to meet these commitments and to undertake fresh ones, equally justifiable in the national interest, is the measure of our success otherwise in trimming our sails to the economic winds.

GOVERNMENT SECURITIES

Investments in British Government Securities at just over £51 million show little change on the year, but due to causes of which you are all too well aware, the depreciation has increased and now stands at nearly £3,700,000. That is a formidable sum, but since all these investments have fixed maturity dates, the majority falling due within ten years, it is still a reasonable assumption that the whole depreciation will be recovered in due time and in the ordinary course of business. In arriving at this figure, no transfers have been made during the year, either from Inner Reserves or from Profits, to write down the book value of the securities. The other major item in the Balance Sheet relates to Acceptances, Endorsements, Guarantees and other Obligations, which again show some expansion at £6,200,000.

The Profits at £343,000 are £7.000 higher than last year. It is proposed that Dividends should be repeated on the same basis as for 1955, and the other allocations from Profits are £125,000 to the Contingent Fund and £90,000 to the Trustees for the Officers' Pension Fund, the increased allocation for Pensions being designed to meet the additional liability for past service resting on the Fund through successive salary increases. The carry forward of £136,000 shows a modest increase.

TRADE CONDITIONS

Broadly speaking, Scottish trade and industry has had another good year, although there have again been complaints of shortages in certain types of steel, a matter perhaps not unconnected with the difficulty of obtaining adequate supplies of coking coal. It is unfortunately the case that despite large sums poured into the pits in recent years, the output of coal shows no sign of a return to prewar levels. Coal is still this country's main raw material. It remains—and according to the experts will for many years remain—essential to our economy, because expanded supplies of power from other sources are barely sufficient to keep pace with increasing demands, and it is lamentable that for one reason or another we seem unable to get it out of the ground in sufficient quantities.

In Scotland, the position is particularly bad, because deep-mined coal output, expressed as a percentage of total United Kingdom production, declined from 13 in 1939 to 10¼ in 1955, the actual fall being 8¼ million tons. To what extent, one wonders, does this tie up with Scottish unemployment, which at the end of last September was more than twice the average for Great Britain as a whole? And when, with home requirements fully met, are we likely again to see our Scottish ports astir with the loading of "black diamonds," which on balance have now become a net import although in a single year before the war we exported no less than 6 million tons?

NOTABLE PART IN EXPORT DRIVE

Most of our other industries, in particular heavy and electrical engineering, shipbuilding, woollen manufacturing and distilling, have played a notable part in the export drive. They have suffered the draining away through penal taxation of funds needed for capital expansion: they have battled with shortages of all kinds, including that of skilled labour: they have been beset by strikes: and still they have produced the goods of a quality and at a price which have enabled them not only to meet but to overcome severe overseas competition. Being private enterprises, they have had no apparently bottomless national purse to draw from: they covered their own overheads, or went out of business. Yet they have beaten, hands down, that great basic industry of coal-mining, from which under public ownership so much was expected.

Surely there is something sadly amiss here? We scrape and struggle to meet our foreign commitments, while all the time a substance for which many nations of the world are clamouring lies under our very feet. If we could only bring it to the surface, the impact on that forward-looking and adventurous spirit that still exists in Scotland could literally be tremendous. It could transform our national life. By assisting Britain to regain economic stability, it could help remove the shackles that meantime hamper general business activity, and in the resultant upsurge of production the Banks would be free to play their full and normal part.

I cannot leave the Scottish scene without reference to the American concerns now setting up new factories here, as well as others that have recently tabled plans for expansion. Let us see to it that our friends from across the Atlantic are made to feel at home, that they get the goods and services they require as and when they need them, and that their experience of Scottish brawn and Scottish brains is such that others may yet follow. And let us not forget the debt we owe to the Scottish Council (Development and Industry) for all it has done to attract new industries to Scotland.

FINANCIAL SITUATION

Last year I said that however unpleasant the consequences might be, this Bank would do its best to apply the policy of Credit Restriction, not because we liked that policy, but because we regarded it as an essential part of the various measures designed to bring the country back on to an even economic keel. We can, I think, reasonably claim that we have honoured our promise, and a glance at the Advances figures published quarterly by the British Bankers' Association suggests that our banking friends on both sides of the Border can probably say the same.

What, however, of undertakings given in other quarters? For example, has the Government drastically cut its own spending which is by far the biggest single factor having a direct bearing on the country's economic health ? We know it is easy for Governments to find reasons for failing to prune expenditure exactly as planned, and we are fully aware of the fact that additional outlays, undreamed of a year ago, have had to be faced, but we think there is still room for economy : and economy, particularly in Public expenditure, is what, more than anything, this country needs.

Again, last year I suggested that our people had developed the habit of expecting a standard of living not always justified by national production. Is there any evidence even yet of a proper appreciation of the fact that a country's real wealth consists, not in wages and salaries paid, but in the goods and services produced ? I personally take leave to doubt it, and my views are supported by the new wages claims recently granted and still pending.

GOLD & DOLLAR RESERVES

Critics may point to the record export figures for the month of October. In reply, I ask them to take a look at Britain's Gold and Dollar Reserves. At the end of October, 1955, our Gold and Dollar Reserves were, in round figures, 2,300 million dollars. A year later they had fallen to 2,240 million dollars, and that despite the record exports referred to, as well as a fortuitous intake of nearly 180 million dollars through the Trinidad Oil deal.

Consider these facts, and you have the measure of the limited success that had attended our efforts before the impact of Suez began to be felt. It is true that we had arrested the rake's progress of 1955, but we were still a long way from achieving the comfortable surplus on overseas payments that would enable us satisfactorily to build up these Reserves. We had tried the orthodox methods, in particular higher interest rates : we had experimented with unorthodox methods like Credit Restriction, but we had failed to tackle the root problem which—let us be honest—is embraced in one word, " production."

GRAVE INTERNATIONAL EVENTS

This speech was prepared in the shadow of grave international events, the full consequences of which no-one can foresee. Already there have been ominous signs, such as the 279 million dollar drain on our Gold and Dollar Reserves during November, the decision to seek a waiver of the United States and Canadian Loan interest payments and the application to withdraw a proportion of our dollar quota from the International Monetary Fund.

It is not for me to argue the rights and wrongs of the Government actions underlying these developments, or indeed to criticise the measures so far proposed to counter them, although I must say that I view with considerable misgiving the increased duty on fuels for road transport. Clearly, however, the interruption of our Middle East oil supplies is going to place a heavy additional strain on our economy. It is therefore absolutely essential that we should close our ranks, forget party differences and divergencies of view as between capital and labour, and stand shoulder to shoulder economically as we did militarily at the time of Dunkirk. The realisation is at last being borne in upon a nation reluctant to face facts that there are in this world dark forces, whose avowed intention it is to humble in the dust the important remnant of a once invincible British Empire, a remnant that still stands as a bastion for freedom, honour and truth.

These forces are not in the least particular how they gain their ends: on balance, they may prefer to work through " peaceful " penetration, because they know, none better, that economic chaos is the perfect forcing bed for their devilish doctrines. Until quite recently, they probably had reason to congratulate themselves. Now, I sincerely believe, they will find a Britain resolute in its determination to work out its own salvation in face of all adverse factors, both at home and abroad. If this should prove to be the case, there is no doubt that we shall ultimately win through.

TRIBUTE TO STAFF

Finally, I desire on behalf of Directors, Shareholders and customers alike to acknowledge once more the loyal and efficient service rendered to the Bank by the officials and staff at Head Office, London and Glasgow and at the Branches throughout the country. A year ago I acknowledged the marked ability with which Mr Alexander had guided the affairs of the Bank and upheld its prestige during his first and very difficult year of office as General Manager. The past year has been no less difficult and his conduct of the Bank's affairs no less distinguished.

The Report and Accounts were adopted.

McCARTHY, RODWAY LIMITED

(Inc. in the Union of S. Africa)

AN EVENTFUL YEAR

MR J. B. McCARTHY ON FURTHER ACQUISITIONS

The twentieth annual general meeting of McCarthy, Rodway Limited was held on December 21st in Durban, Mr J. B. McCarthy (the chairman) presiding.

The following is his circulated address:

The financial year which ended on June 30, 1956, was an eventful one for your Company and the Balance Sheets and Accounts which you will study before the Annual General Meeting on December 21st reflect many changes from last year's figures. In my review of this year's activities, I will deal mainly with the Group undertaking as a whole.

The results shown by the Group may be considered satisfactory in relation to the Capital employed, although operating costs have increased, while taxation is naturally greater.

The Board decided to increase the dividend as you are all by now aware, and they were influenced in making this decision by the fact that they felt that some return should be given on the employment of profits retained in the past.

In the Holding Company's Accounts, it was decided to merge the specific Dividend Equalisation Reserve of £100,000 into the more general Revenue Reserve, the title of which denotes that it has been built up from revenue profits set aside. This reserve provides capital in the meantime for the general expansion of business and could, if the need arose, be drawn upon for distribution to Shareholders.

RAPIDLY INCREASING COMPETITION

Shareholders' Funds have advanced and it is pleasing to note that this has been possible in spite of increasing costs and the now rapidly increasing competition which is being met in all branches of the Motor Industry. To achieve this improvement it has been necessary to mortgage some property and to use some short term loan money, in addition to Bank overdraft facilities, at some cost to us.

A glance at the totals of the Consolidated Balance Sheet will show that it is a very changed document. You will see that the figures dealt with are very much greater than you have been used to seeing in it and I must tell you that this is the result of further acquisitions of Subsidiary Companies.

The details of the acquisition of Forsdick Motors Limited have been set out in the Directors' Report, and also the manner in which Motor Assemblies Limited became a Subsidiary.

I would like to explain that the purpose of acquiring Forsdick Motors Limited was to achieve economy of operation by the eventual merging of servicing and spare part operations common to the vehicles marketed by both Companies, as well as to offer to the public a fuller range of types and models of passenger and commercial vehicles produced by overseas manufacturers.

It will also be possible, by pooling the resources of both Companies' selling organisations in the country districts, to create economic distribution centres throughout our territory.

In assessing the purchase price of the shares acquired, it became necessary to revalue the land and buildings of the Subsidiaries and it was decided to re-value the land and buildings of the Holding Company in conformity, to show a true reflection of this asset in the Consolidated Balance Sheet.

IMPORT CONTROL

As I am sure you are all aware, imports of vehicles into this Country are governed by a rigid system of import control. It is pleasing, however, to report that within the past few weeks additional allocations of exchange have been made to certain importers of cars selling in South Africa at £700 or less.

Although your Company was not, at first,

included when these additional permits were granted, I am glad to say that after pressing representations, the Director of Imports and Exports has agreed that we will be given our share of these additional permits for the import of Nuffield products.

It is obvious that relaxation of import control in this lower price field will result in increased competition, but I am confident that the products we import will still be in short supply, due to their popularity and the new models now available, when the Director again reviews the import position in April next.

In view of the unsettled state of world affairs, it is not possible to predict what the future holds for us, but suffice to say that providing we are guaranteed supplies from overseas on the basis of our present imports, I see no reason why your Company's progress should not continue.

I offer my sincerest gratitude to all members of the Board and staff whatever their particular vocation may be. They have all contributed their efforts towards yet another successful year and you will wish me, I know, to thank them on your behalf.

The report and accounts were adopted.

THE STRAND HOTEL LIMITED

The forty-ninth annual general meeting of The Strand Hotel Limited was held on December 20th in London, Mr S. I. Salmon, the Chairman, presiding.

The following are extracts from his statement which had been circulated with the Report and Accounts for the year ended September 30, 1956.

The Trading Account balance together with loan and other interest received amounts to £264,393, an increase of £17,797 over that of last year. The net profit of £68,806 is slightly less, due mainly to the higher amount required for taxation. We are still having to contend with rising costs, and although we have increased our charges we have only kept pace with the higher costs of wages, food and many of the other items of expenditure.

It has been mentioned before, and we make no apology for repeating it, that the hotel industry is particularly hard hit by purchase tax which adds substantially to the high costs of replacing equipment and the rise in the rates of the tax this year has meant a further material increase in our expenditure. By the withdrawal of the investment allowance on the purchase of plant we have lost a very welcome but short lived tax benefit.

We are constantly reminded of the industry's value as an earner of foreign currency. The hotels of this country have the major responsibility of creating a favourable impression on an ever-growing number of tourists. The potentiality of earning foreign currency through the tourist trade is almost limitless, and hotels should be given encouragement to play their full part in developing their attractions so as to compete successfully with other European countries. In present conditions the industry is not financially able to do all that is necessary without receiving some consideration from the Government. Hotel buildings represent very costly fixed assets which, because of changing demands, depreciate far more quickly than industrial buildings. Yet the latter qualify for an appreciable tax concession on the cost of their buildings, whereas hotels are specifically excluded and are expected to expand and to modernise their property and equipment at high cost out of a restricted revenue without any such tax allowance. The report was adopted

SAMUEL OSBORN AND COMPANY, LIMITED

RECORD TURNOVER

HIGHER COSTS LARGELY ABSORBED

MR FRANK A. HURST ON EXPORT TRADE ACHIEVEMENTS

The fifty-first annual general meeting of Samuel Osborn and Company, Limited, was held on December 19th at Sheffield.

Mr Frank A. Hurst (chairman and managing director), who presided, said:

The fifty-first Annual Report and Accounts are in your hands and will be taken as read. (Agreed.)

The Manufacturing and Trading Profit for the year ended July 31, 1956, amounted to £1,256,122, which is considerably higher than the corresponding figure in the preceding year.

The Company, now in its one hundred and fourth year, has had the busiest year in its long history, and, in view of the restraint we have exercised by absorbing many of the increases in the costs of supplies and services rather than increase prices, the financial result of the year's trading must be regarded as most satisfactory. Naturally, absorbing these higher costs has made the ratio of profit to turnover lower this year, but that we expected.

RISING COSTS CAUSING CONCERN

The seemingly prevalent idea that industry can carry on absorbing increased costs, wages, rates and the charges for water, gas, fuel and electricity is a matter which causes grave concern, particularly is this so in regard to the country's ability to export, but, even in domestic supplies, these continuing advances can only result in increases in the cost of living. It is industry's experience that greater output lowers percentage overheads, but in national and municipal undertakings the overheads seem to increase proportionately, no matter how high the sales' value, and require to be met by raising prices to users and consumers.

Skilled labour is still in very short supply and outputs could be increased if suitable labour were available as we have good order books in most of our departments.

Increased turnover means greater amounts locked up in working capital. The Consolidated Balance Sheet shows a higher proportionate increase in Debtors than in Stocks and, as this does not result from an extension of the period of credit, it is a good and a healthy sign. In the months to come additional money will be locked up because it will take longer for our products to reach many of our overseas customers while use of the Suez Canal is denied to mercantile shipping ; delays will also occur in deliveries in this country because of lack of the full use of road transport. It is impossible to gauge the effect of current events on our future trading but it seems clear that supply and distribution will present difficult problems.

It is of interest to note that about a year ago we, as a company, were threatened by the Arab countries and told that either we must abandon our vigorous young subsidiary in Israel, erect a factory of equal size in Egypt or be boycotted by all the Arab countries. We told them then—a year ago—that we had no intention of abandoning our Israeli company and that they could carry on and blacklist us.

RECORD EXPORT SALES

Included in the record turnover referred to in the Directors' Report is a record value of direct export sales. We cannot estimate with any degree of accuracy the value of indirect export sales, but we know that the total value of our export sales—direct and indirect—forms a substantial part of our turnover. That is an achievement of which we are justly proud, but in the light of present international events, you will understand that we view the immediate future with some apprehension.

I stated last year that the Low Moor companies had been able to supply the parent company with billets which enabled the mills and forges to work to the fullest capacity the labour situation would allow. I am pleased to report that this help has continued and, in addition to that, I am glad to say that the Low Moor companies showed a profit as the result of the year's trading. The purchase of the Low Moor companies has been amply justified in that it has profitably employed funds surplus to our previous requirements.

It was stated in the Directors' Report that the first buildings to be erected on the land recently purchased at Holbrook, a few miles outside Sheffield, would house a specialised steel foundry. The contract for these buildings, which will cost approximately £200,000, was placed a few days ago.

NEED TO CONSERVE RESOURCES

You will have seen from the Statement of Accounts that taxation for the year under review is a very large sum, namely, £640,691. That such heavy amounts have to be paid out indicates the need for building up the liquid resources of the Company, and, apart from that, the further need to be in a position to pay for extensions and replacements, keeping in mind that annual replacements are not nearly covered by the capital allowances granted in a year by the Inland Revenue.

Our organisation has been free of any labour trouble during the year and in every direction our relations are excellent. We are indeed proud of our staff and workpeople in our home as well as in our overseas factories and houses, and to all I have pleasure in recording my very sincere thanks for the splendid services they have rendered; thanks also are due to my co-Directors for their unfailing co-operation.

Lord Chandos has spoken of those who work for an organisation as having invested their time and their lives in the industry, and of the necessity for the employer to do all possible to give continuity of employment. I can say with full assurance that such is the great aim of the Board of this Company.

The report and accounts were adopted and a final dividend of 20 per cent, making 32½ per cent for the year, was approved.

THE MIDLAND TAR DISTILLERS LIMITED

IMPROVED RESULTS OFFSET BY HIGHER TAXATION

FURTHER DEVELOPMENT PROJECTS IN HAND

The thirty-fourth annual meeting of The Midland Tar Distillers Limited was held on December 20th at the registered office, Springfield Chemical Works, Oldbury.

Mr Stanley Robinson (the Chairman) presided and, in the course of his speech, said:

The trading profit for the year at £416,589 shows an increase of £25,000 compared with the previous year. The increase in interest rates is reflected in the figure of Bank Interest and Interest on Short Term Loans, which has almost doubled during the year to a figure of £22,700.

Unfortunately, these increases are more than offset by an increase of nearly £40,000 in taxation based on the profit of the year. Since the rate of Profits Tax has been increased I fear that a still higher proportion of our profits will be taken in taxation in the year to June, 1957.

From the surplus available your Directors recommend that the Dividend on the Ordinary Shares be at the rate of 10 per cent, less tax, as in the last two years and that appropriations of £50,000 each be made to the Reserve for Obsolescence and Increased Replacement Costs and to the General Reserve. So long as prices continue to rise we must continue to set money aside for the replacement of our assets at enhanced costs.

BALANCE SHEET FEATURES

As I told you last year we have closed our Birkenhead and Wolverhampton Works. The Birkenhead site is now cleared of plant and most of the plant has been dismantled at Wolverhampton. Moreover, we have done quite a lot of work at Oldbury in demolishing plant which has been superseded by the new plant at Four Ashes.

On the Balance Sheet of The Midland Tar Distillers Limited the item "Amount due from Subsidiary Company" has increased from £86,000 to £295,000 for two reasons. In the first place we had built up an abnormally large stock of Acid in view of the probability of a dock strike in America. In the second place, Midland Storage Inc, a new Company, has been incorporated in the United States of America, to buy and operate a storage installation in New Jersey. This was done primarily with the object of facilitating the shipping, loading and storage of our own Tar Acids exported to America, but there are also a number of storage tanks on the site which are not required for Tar Acids and these are being let for the storage of other products. So far the purchase of this installation has been financed by the retention in America of the proceeds of the sales of Tar Acids, but we are hoping to raise loan capital in America. You will, I am sure, be interested to know that since The Midland Tar Distillers Inc was incorporated in America in March, 1953, nearly 2¾ million dollars have been remitted to this country—the proceeds of the sales of Tar Acids.

RECONSTRUCTION OF NECHELLS WORKS

Finally, I must draw your attention to the Commitments for Capital Expenditure shown on the Balance Sheets at £120,000. This was the amount of our actual commitments at June 30, 1956, but we are planning to do more than that. By a readjustment of the intake of Crude Tar at our Nechells Works a large proportion of which is delivered by pipeline, we can increase the throughput considerably. The Works is due for reconstruction and we are, therefore, embarking on this project. The chief item in our programme is the replacement of the pot stills by a continuous tube still, which we have in fact ordered. This is a major operation involving many ancillary projects and will take about two years to complete. The capital cost seems likely to be not less than £400,000 but the servicing of this (plus the depreciation both of which are provided for in our Tar Agreement) will be more than offset by greater throughput and improved yields, etc., and will also give us a much needed reserve of spare capacity.

I should like to refer once more to the fact that under the terms of our Agreement with our Tar Producers a very large proportion of any benefit obtained by higher prices, or increased efficiencies, is passed on in the price we pay for Crude Tar, so that the increased profit arising from this expenditure will go largely to the Producers of Tar.

WORKS COMPLETE

Our Four Ashes Works is now complete and working up to designed capacity, and in the case of several of the units the yields are in excess of those anticipated. This is due to the excellent design and to the capable handling by the personnel concerned.

Our Oldbury Works where the bulk of our Crude Tar is distilled in continuous stills continues to make very satisfactory progress.

The Managers of our small Works have all done a very good year's work, and I am sure you are grateful to them for their labours.

During the emergency of the last few weeks one of our basic products, Coal Tar Fuel, has come very much into the limelight and an unprecedented demand has arisen to replace oil cut off by the closing of the Suez Canal.

We are doing everything in our power to meet the demand, but supplies available are strictly limited. In this matter we are of course co-operating with our friends in the industry.

I must point out, however, that quite apart from emergencies Coal Tar Fuel has established itself as a first-class fuel, particularly for use in steelworks where its low sulphur content and other qualities make it invaluable. It is no new product and we have sold large quantities for years, and I have no doubt we will continue to do so.

So far as products generally are concerned there is no significant change to report.

The report and accounts were adopted and a dividend of 10 per cent on the Ordinary shares was approved.

THE INDUSTRIAL CREDIT COMPANY LIMITED

At the twenty-third Ordinary General Meeting, in Dublin, on December 13th, the Chairman, Dr J. P. Beddy, in the course of his speech, said: Assets have increased by £55,451 during the year. Though the increase in Investments shown by the Balance Sheet is £15,717, additional Investments of approximately £120,000 were acquired. The Balance Sheet does not reflect this increase, mainly because transfers from Reserve for Contingencies and Loans and Advances Reserve increased the Investment Reserve and, consequently, reduced the Balance Sheet figure for Investments, which are shown at net cost after deducting Reserve.

The Gross Profit for the year is higher by £11,087. The Net Profit at £78,907 is little more than that of the previous year because of additional expenses, which almost offset the increase in the Gross Profit. Of total expenses of £67,653, Bank Interest accounted for 63 per cent.

Deducting from the Net Profit the provision for Income Tax, and adding the balance of profits brought forward £8?,004 remains available for allocation. Your Directors recommend a dividend of ? per cent per annum. This would absorb £43,750, and, of the remaining £38,?54, they recommend a transfer of £12,?00 to Investment and Other Reserves, which would leave £25,754 to be carried forward to the next Account.

The capital requirements of your Company will be implemented in so far as immediate requirements are concerned by the calling up of the remaining part of the Company's Issued Share Capital. The extent and form of the future financing of the Company have yet to be settled.

LAKE VIEW AND STAR LIMITED

SIR JOSEPH BALL'S REVIEW

The Forty-Sixth Annual General Meeting of Lake View and Star Limited was held on December 20th in London.

Su Joseph Ball, KBE (the Chairman), in the course of his speech, said: There was a slight overall decrease in the working profit. The amount available for appropriation from mining operations this year was £444,166, as against £447,454 last year.

An interim dividend of 9d. per share was paid during the year, and a final dividend of 1s. 3d. per share is now recommended.

Total development footage for the year at 28,163 feet showed an increase of 305 feet over the figure for the preceding year. Ore reserves at July 1, 1956, amounted to 3,668,000 short tons, at 4.77 dwt per ton. Tonnage milled during the year was 740,518 tons (an increase of 8,909 tons), averaging 4.71 dwt.

The Australian Government has freed altogether from Australian taxation the profits derived from gold mining, but in the case of companies operating in Australia, but registered in this country, this concession has been frustrated by the UK tax system.

The Chancellor of the Exchequer undertook to consider introducing legislation in 1957 to deal with this. Since then the financial situation of the UK has deteriorated, and the budgetary and balance of payments positions may well rule out the introduction of reliefs in the next Budget. Your Directors have therefore decided to prepare an application for the transfer of the Company to Australia. The report was adopted.

APPOINTMENTS

INIVERSITY COLLEGE OF THE GOLD COAST

Applications are invited for Lecturership in Agricultural rganisation and Economy. Post-graduate research xperience in Agricultural Economics essential. Salary cale £950 x £50 to £1,600 p.a. Entry point determined y qualifications and experience. Family allowance £100 a per child (maximum £500 p.a.). Outfit allowance. S.S.U. Passages for appointee, wife and maximum of ve children, on appointment, normal termination and eave. Part-furnished accommodation at rent not exceedng 7.5 per cent of salary.

Detailed applications (10 copies), naming three eferees, by January 31, 1957, to Secretary, Inter-University Council for Higher Education Overseas, 29 Woburn quare, London, W.C.1, from whom further particulars ay be obtained.

MANAGEMENT SELECTION LIMITED have been retained to advise on the selection of the

MANAGING DIRECTOR

of a large and well-known public company with world-wide connections manufacturing and distributing abrasives and refractories. The position carries full responsibility for the Company which is split into divisions on a product basis with a top functional group including well equipped central research laboratories. The present Managing Director has evolved a successful policy of delegating decisions to men able to use their opportunity. Considerable capital development and expansion is planned.

Candidates must have wide industrial and general management experience, preferably with a practical production background. Experience in abrasives, paper or similar process industry helpful. A degree, preferably in chemical engineering or other technology, would be a Salary recommendation. Probable age 45-55. Salary subject to negotiation but would be of interest to men earning £4,000 and upwards.

Enquiries, from earning £4,000 and upwards, be addressed to brief personal details. Should Selection Limited, H. E. Roff, Management W.1, quoting reference Stratton Street, London, will be passed to our client[s]. No information being aware of their identity without candidates permission after personal discussion.

ECONOMIST

A management vacancy exists in the Statistical Department of a company engaged in the manufacture of branded consumer goods on mass production lines. The services of the department are available to all divisions of the company, and the members work as a team on a wide range of interesting topics.

The present vacancy calls for an applicant, man or woman, under 30 years of age, with a good degree in economics with statistics, as the work immediately envisaged lies mainly in the fields of consumer demand and commodity analysis.

Commencing salary will be dependent on qualifications and experience in the specified fields but will be not less than £1,000 p.a.

Applications, giving in the first instance brief particulars of qualifications, experience and salaries earned, are invited for this pensionable appointment from candidates determined to make a rewarding career in this work.—Box 585.

TRAINING OFFICER required by The Steel Company of Wales Limited (Steel Division), Port Talbot.

The successful candidate will be responsible to the Education Officer for the selection and training of potential foremen and for the administration of development projects for existing foremen in a large integrated and expanding Steel Company.

An honours degree in social subjects such as psychology, sociology or economics would be an advantage.

Those wishing to apply should write for official Application Form to:

Superintendent, Personnel Services,
The Steel Company of Wales Limited
(Steel Division),
Abbey Works,
Port Talbot, Glam.

IMPORTANT British mining company with increasing Commonwealth interests requires a male economist aged 25-32 to work as assistant to their economic adviser in London. A degree and some practical statistical experience is essential. Commencing salary not less than £750 per annum dependent on age and experience. Contributory pension scheme.—Applications, stating experience and qualifications, should be addressed to Box X.257, c/o Streets, 110 Old Broad Street, E.C.2.

A LEADING firm of Stockbrokers has a vacancy for a graduate economist to undertake investment studies of particular companies. Industrial experience in finance or accountancy essential. Age about 30. Good Prospects for man with suitable personality. Initial salary, according to experience, up to £1,250 per annum with participation in a bonus scheme. Interviews mid-January.—Reply Box 588.

COOPER BROTHERS & CO. require a qualified tant with wide experience and fi[rst] tour of two years in Central Afr[ica] permanent one leading to exce[llent] in Africa or in Europe. Apply in writing to 14 London, E.C.4.

WORKS MANAGER requ[ired] urgently to take charge of production and general management of one of the largest electrical manufacturing [units] in South Africa. Must have wide and sound experience of Works organisation and production systems as applicable to the manufacture of motors, transformers and switchgear.—Box 586.

UNIVERSITY OF LONDON

LEON FELLOWSHIP

Applications are invited for the Leon Fellowship for Research (preferably in the fields of Economics or Education) for the Session 1957-58. The Fellowship is of the value of not less than £500 a year, and is tenable in the first instance for one year. It is not essential that candidates should be members of a University, but they are expected to put forward a programme of research of an advanced character and to produce evidence that they can carry it out. Selected candidates will be required to attend for interview.—Further particulars should be obtained from the Academic Registrar, University of London, Senate House, London, W.C.1, and applications for the Fellowship must be received not later than February 1, 1957.

CHIEF MECHANI[CAL] ENGINEER

Leading [manufacturing] Group of Compan[ies] Mechanical Engineer. [He] should have universit[y] degree or equivalent, and associate membership of one of the senior professional institutions.

Site or shop experience essential with approximately ten years post graduate design, with proved ability in the design of mechanical handling machinery, pipe layouts, pressure vessels, heat exchangers, pumping installations, and associated electrics and instrumentation. Candidates must be knowledgeable in industrial economics and estimating applied to plant design. Experience of modern construction methods essential. Should be able administrator. Substantial four-figure salary, bonus, pension plan and assistance accommodation, etc.

Responsibilities include development of mechanical handling machinery, designs for industrial plants, and management of team of design engineers and related personnel.

Apply in GUARANTEED STRICTEST CONFIDENCE in accordance with professional ethics, giving details of date and place of birth, education, background, names of firms, positions held with dates and salaries to

DR P. S. de Q. CABOT,

P. S. CABOT & COMPANY,
37-41 BEDFORD ROW,
LONDON, W.C.1.

THE INCORPORATED NORTHERN RHODESIA CHAMBER OF MINES, LIMITED, KITWE, NORTHERN RHODESIA

Applications are invited for the post of Secretary to the Chamber, which is expected to become vacant shortly. The duties of the post, which is of a highly responsible and confidential nature, include the following:—

The Secretary is responsible to the Chamber's Director and Executive Committee for the provision of efficient clerical and secretarial services to the various departments and committees of the Chamber, and for their co-ordination and supervision. He is also personally in charge of high level committees work, and of certain of the more specialised of the Chamber's functions. He is responsible for the maintenance of the Chamber's property, including buildings and houses, and for the administration of subordinate staff. In addition, he acts as Company Secretary of the Incorporated Company.

QUALIFICATIONS

Applicants must have a good education and record, and recent and substantial experience in responsible positions in industry entailing duties of a similar nature to those outlined above.

The possession of secretarial and accountancy qualifications will be an advantage, but is of less importance than character and experience of the right kind preferably in a mining industry.

Maximum age 45, but this may be relaxed in the case of applicants who are otherwise exceptionally well qualified.

A medical examination will be required before appointment and applicants must be in first-class health.

TERMS

Starting salary will be according to experience, but will not be less than £2,150 per annum, basic. In addition, the post carries the following benefits:—

Cost of living allowance, at present amounting to £5 4s. per month; a "Copper bonus" which fluctuates with the price of copper, and currently amounts to 6½ per cent of basic pay; a house with basic furniture at a sub-economic rent; generous leave; pension and medical benefit schemes. The Company will provide first-class fares for the successful applicant and his family from his home to Kitwe.

APPLICATIONS

Applications (in duplicate and preferably typed) should be forwarded by air mail to the Secretary, Northern Rhodesia Chamber of Mines, P.O. Box 194, Kitwe, Northern Rhodesia, marked "Confidential—Secretary," so as to arrive not later than January 15, 1957.

They should contain the following particulars in the order given here:—1. Name, nationality and religion.

2. Education, degrees and professional states.
3. Present position, leaving school/University, including any, in chronological order.
4. Date when services (for possible future use, with applicant's [illegible] consent).
5. Date when [illegible] can be made available.
6. General [illegible] regarding eligibility and regarding outside [illegible].

Applications will be treated in strict confidence.

Applicants may be called for interview either in London or in Africa, at the expense of the Company.

Applicants who are employed in the Copper-Mining Industry of Northern Rhodesia should submit their applications through their mine management.

THE UNIVERSITY OF LEEDS

DEPARTMENT OF ADULT EDUCATION AND EXTRA-MURAL STUDIES

Applications are invited from candidates with a good honours degree for an appointment for three years from April 1, 1957, as Administrative Assistant in the Department of Adult Education and Extra-Mural Studies at a salary on the scale £500 x £25 to £800 a year, according to qualifications and experience. The Administrative Assistant may be asked to undertake a small amount of extra-mural teaching.—Applications (three copies), stating date of birth, qualifications and experience, together with the names of three referees, should reach the Registrar, The University, Leeds, 2 (from whom further particulars may be obtained), not later than January 26, 1957.

THE UNITED KINGDOM ATOMIC ENERGY AUTHORITY

NUCLEAR REACTOR PLANNING

Applications are invited from ENGINEERS AND SCIENTISTS for a senior appointment in the Technical Policy Branch of the Industrial Group at Risley, near Warrington, Lancs.

The Industrial Group is now planning reactors of an advanced type and will be responsible for building the prototype stations. Plans will be based on technical and cost information from the design offices and research establishments of the Authority and will involve consideration, not only of the merits of the reactors themselves, but also of the related plans for producing fissile material and the appropriate use of plutonium from the power stations about to be constructed. The candidate selected to fill the post in question will be the leader of a small team at headquarters which will advise on the various schemes now under consideration.

The work will offer opportunities to the energetic and keen engineer or scientist with a leaning towards long-term aspects of nuclear technology and an interest in industrial economics and policy planning.

Candidates should hold a good honours degree in physics, mathematics, chemistry or engineering and have had production or research experience, preferably in heavy industry.

Salary will be assessed within the range £2,000 to £2,500 per annum. There is a contributory pension scheme.

An Authority house for renting by the successful candidate, if married, may be available in due course, or alternatively, substantial assistance may be given towards legal expenses incurred in private house purchase.

Application forms may be obtained from the Chief Recruitment Officer, Industrial Group Headquarters, United Kingdom Atomic Energy Authority, Risley, Nr. Warrington, Lancs.

Closing date, January 18, 1957.

AN EXECUTIVE DIRECTOR is required by a large group to take charge of a small number of manufacturing companies within the United Kingdom. Position carries a salary of £5,000 upwards, with excellent pension provision and bonus on profits. Applicants, within 42-52 year age group, must have superior engineering qualifications with emphasis upon production of electrical equipment. Only executives with top ranking responsibilities and outstanding administrative achievements covering fields of finance, sales and the production of capital equipment should apply. All replies held in guaranteed strictest confidence. Apply with complete details age, education, personal background and experience to Cooper Brothers & Co., Chartered Accountants, 14 George Street, Mansion House, London, E.C.4.

EX-RAOC officer, 26, going to New Zealand early 1957, wishes to have interview with businessman desiring representation or assistance there.—Box 590.

THE REPORTER. America's brilliant fortnightly, which you can now buy or subscribe to in this country, makes an ideal New Year's resolution for those who care about world affairs. This week's issue is principally devoted to "The Wrecking of the Alliance," a perceptive analysis of the underlying causes of the Suez crisis by British, American and French writers.—Order your copy or subscription from your newsagent, or direct from Transworld Circulation Company, Park Royal Road, London, N.W.10. Price 2s. each fortnight.

BRIGHT YOUNG MEN offer their guests Duff Gordon's EL CID Sherry. Even brighter young men wait till their guests have gone before decanting. After all, the best is not for everyone, is it?

COURSE in Work Study. The School of Time & Motion Study's next 6 weeks' course starts January 21st. Fee £50 gns.—Enquiries to 29 Cork Street, W.1. REGent 0516.

COMFORTABLY FURNISHED bed-sitting room, with separate kitchenette. In quiet street—Kensington/Olympia. £3 13s. 6d. per week, including service, linen, hot water and light.—FUL 1062 after 6 p.m.

READ BIBLE THROU[GH] in year—an absorbing serial—20 min. daily. Tables [illegible] unique system) free, post 2½d.—Mr Viner Hall, The Institute, Nevard[a], Weston-s-Mare.

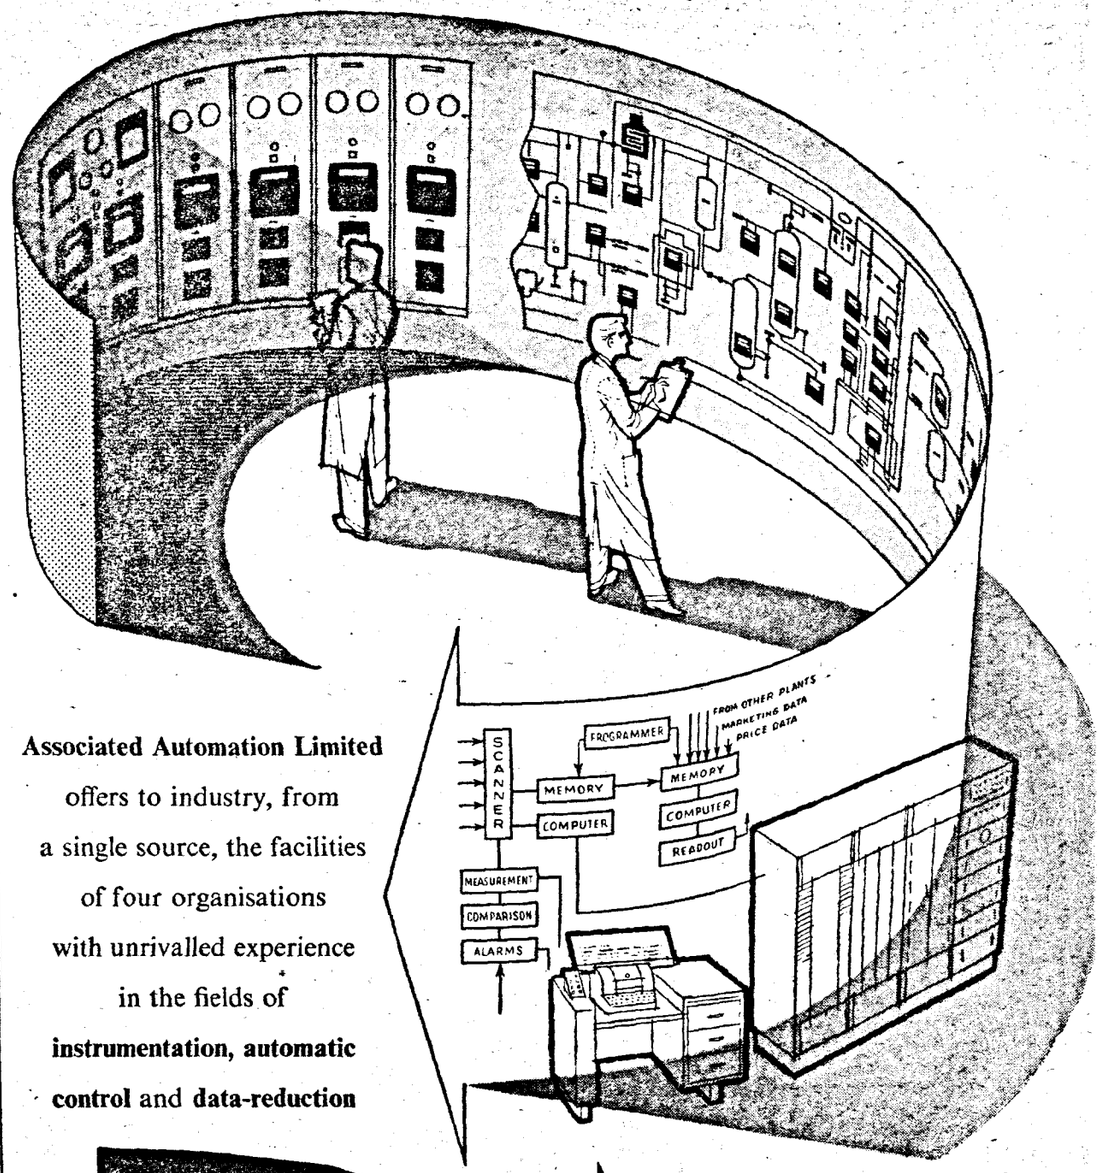
AUTOMATION IN PERSPECTIVE

No sensible man today would pretend that he has answers to all the questions that throng in about the complex and curiously exciting set of technical developments hidden behind this vague vogue word. But any sensible man needs some rough working impressions concerning some of the broad questions about automation:

What is it? (and what it isn't): Where is it to be found in industry now, and where is it likely to go forward fastest? When does it pay? Does it seem likely to affect employment so much as to hurt labour? How does it seem likely to suit Britain's ambitions for the future?

This is an attempt to clear away some of the confusion now blurring those questions.



Associated Automation Limited

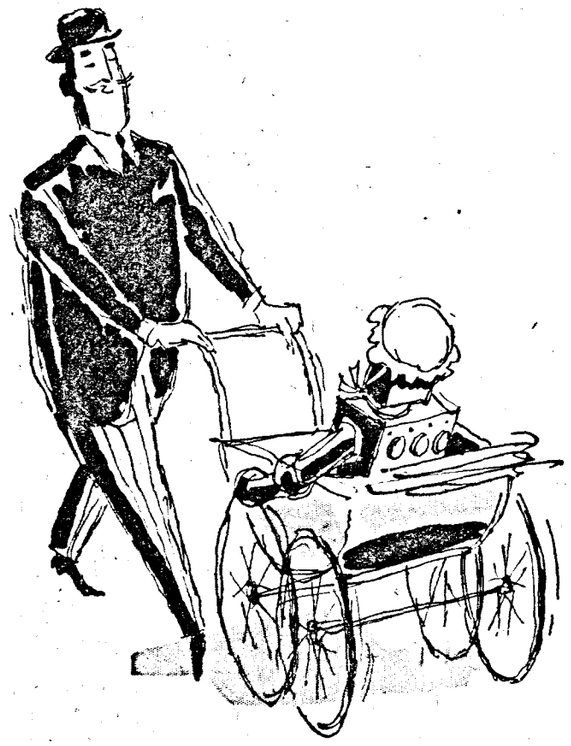
FLOWMATIC PRODUCTION



The answer to progressive automation

Full automation is still in the cradle for the majority of industrial concerns. Many will need to develop fully automatic methods as production requirements grow.

Flowmatic production is the answer to progressive automation. It is a logical development of FISHOLOW conveyors and equipment. It means that a basic conveyor system can grow step by step—by the addition of standard units and equipment—from simple conveying to a fully automatic, electronically controlled production system.

Whether your problem is large or small, simple or complex, makes no difference. The Flowmatic system is infinitely flexible. The savings it can produce are vital to the manufacturing industries of this country.

Before you turn this page, decide to 'phone or write—or ask your production engineer to do so—for an appointment to visit the FISHOLOW CONVEYOR DEVELOPMENT CENTRE. It is at your disposal—with over twenty different working conveyor systems for demonstration—to design, discuss, develop and demonstrate your own individual requirements.

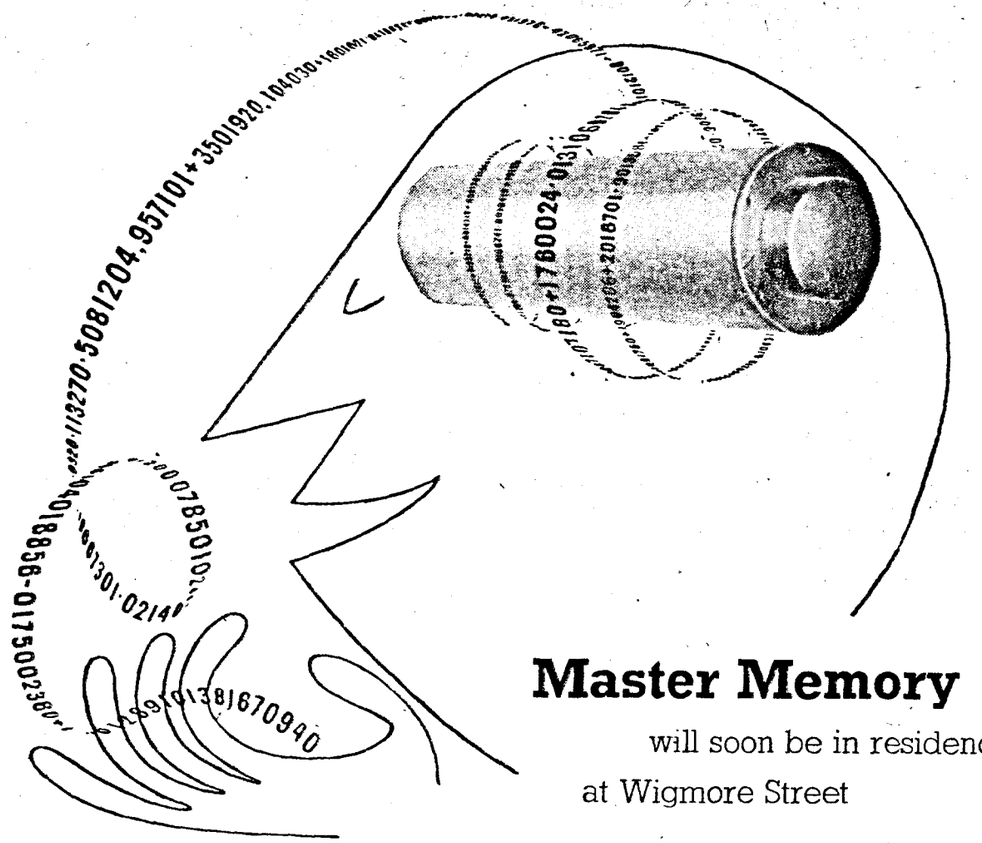
MATERIALS HANDLING FISHOLOW SERVICE TO INDUSTRY

FISHER & LUDLOW LTD.

MATERIAL HANDLING DIVISION

BORDESLEY WORKS, BIRMINGHAM, 12. Tel: VIC. 2371.

Also at London, Manchester, Cardiff Glasgow, Newcastle-on-Tyne, Bristol, Belfast and Dublin.



IBM's new computing centre, which is due to open later this year, will be based in the first instance on a type 650 high speed digital machine. Data and programmes are stored in its 'memory'—a magnetic drum measuring only 4 ins. by 16 ins., which spins at 12,500 revolutions per minute. Ease of programming, reliability and speed make this equipment a powerful tool in research, accounting and management, thus enabling the industrialist, the accountant and the scientist to adopt a revolutionary approach to their many vital problems.

If you would like to know how computers have been used in the type of work in which you are interested, and how our computing, consultant and training services can help your organization, we shall be glad to provide further information.

What Is It?

Machinery for Judgment

IT was once said of a servo-mechanism, which is a rather artful device that plays a key part in automation, that "It is nearly as hard for the practitioners of the servo art to agree on a definition as it is for a group of theologians to agree on sin." The same could certainly be said of "automation" itself—a word that was coined to describe certain automatic handling devices, but which has been extended to the whole range of automatic controls in industry.

This word is bandied about so loosely today in popular discussion of almost any new machine put in anywhere that some of the irritated experts have tried to produce sharp, exactly limited definitions of what automation is and what it isn't. Their definitions, unfortunately, seldom coincide: the subject is still in the stage where restrictive definition simply isn't useful.

For the most satisfactory "definitions" one can find of automation tend to be of the portmanteau kind. Take, for example, Lord Halsbury's:

> a contemporary group of independent advances in the field of mechanisation which characteristically employ discriminatory devices and automatic controls . . . including transfer machining, automatic assembly, the whole field of control engineering and that part of communication engineering concerned with data processing, accountancy, and calculation involving the use of electronic computers.

That may sound more like a list than a definition. But these techniques do have enough in common to deserve linking by a label. And what they have in common does answer the plain man's inevitable question: "How does automation differ from the other mechanisation that's been going on for centuries? What's new about it?"

Perhaps this answer can best be put in terms of the human activity in industry that these two machine processes can ease or replace. Mechanisation can usefully be thought of as replacing men's physical effort by mechanical energy; one can reserve the label "automation" for machinery which goes further and tends to replace men's judgment—the discrimination still required for the precise adjustment of a process from most "machine minders." Already mechanisation has hopelessly outclassed human brawn in most industrial processes as a source of physical energy. To apply automation to such mechanised processes dispenses with much of the operator's mental activity in controlling the machine's performance.

What's new about it? Certainly it is not hard to discover examples of automation early in the history of mechanisation. James Watt's early steam engines, for example, clearly illustrate the difference between the two. The engine, using steam to convert the heat from a fire into mechanical energy to drive a shaft, is a prime example of mechanisation to replace men's physical effort. But the familiar fly-ball governor that Watt devised for his engine in about 1788, in which balls spinning out from a shaft revolving at the speed of the engine are used to regulate the steam pressure, is a perfect example of automation. Elements of what would now be called automation, too, existed in many other early industrial processes—such as the auxiliary vanes that blow a windmill round into the wind, the Jacquard loom that weaves a pattern according to the directions of a punched card, and the copying lathe that machines metal following the contours of a pattern.

Whether or not it is profitable to define automation, engineers and managers should find it fairly easy to distinguish from other forms of mechanisation; and from now on they are going to get plenty of practice. Other people, however, may care less about the label. It is not much use explaining to a man whose job is being taken over by a machine whether that is an example of automation or merely of simple mechanisation; and it may not be much use telling an accountant or an economist either.

In a period when conventional mechanisation has still a long way to go in many fields of industry and commerce at the same time as automation has appeared on the scene, it would certainly be unprofitable to try to disentangle the social and economic consequences of the two. Of necessity, rather than by choice, one must relax the finer technical distinctions in considering the social and economic effects of machines replacing people in jobs, in the coming years, to a greater degree than ever before.

Where Is It?

Automation in Being

ONE of the essential ideas behind automation, more important than the mechanical devices that translate it into hardware, is the notion of linking a sequence of industrial operations into a continuous process without manhandling the workpiece between operations. Among the industries where this began first, and has been most widely developed, are precisely those where the very nature of the materials concerned made manhandling difficult.

A man cannot hold a liquid in his hands; he cannot encompass and may not even be able to see or smell a gas. So the chemical process industries, from the first, required the operator to work from outside the vat, the retort, the pipe—turning taps, opening valves, watching levels, looking at the colour or thickness of a mixture.

In the newer continuous processes, such as oil refining, the material flows through a succession of stills, columns and reactors, undergoing a sequence of separate metamorphoses until it emerges as a new product or a selection of new ones. The condition of the material at any point in the continuous process becomes more critically important. The changes are taking place simultaneously as the product flows along the line, not successively in one place. So at any single point in the continuous process the condition of the material has to be kept constant. At these points, instruments are required to keep the operator informed of the condition of the material and enable him if necessary to adjust this by altering conditions at an earlier state of the process. The use of automatic devices which carry out these adjustments by feeding back signals to correct the deviations from the required level has followed naturally.

Most units of modern continuous chemical processes contain a wide variety of instrumentation and automatic control devices, often recording or indicating plant performance electrically but actually gauging and readjusting it pneumatically or hydraulically; electronics is used comparatively seldom. Instrumentation and automatic control, plus the need to handle vast volumes of liquid and gas, have brought about the huge capital investment per head often instanced in oil refining and chemicals. Costly units of plant may be operated continuously with no more than two operators on duty to keep an eye on the dials and re-set control instruments if major disturbances take place: two, quite simply, because one might drop dead.

To the ordinary man "process industries" generally mean oil refining and chemicals. In fact, they include other industries such as glass, metal manufacture, and paper making, where materials undergo chemical as well as physical change and pass from the liquid to the solid state. In some of the food processing industries and in packaging hygiene as well as technical considerations make it profitable to offer the product "untouched by human hand."

Continuous processes in engineering began in about 1910, when Henry Ford installed a moving conveyor for the assembly of fly-wheel magnetos. Shortly afterwards the assembly line principle was extended to complete motor-car bodies: the result was the famous "Model T" Ford. Thirty years later Ford's successors extended his idea of production as a continuous flow into machine shops, press shops and foundries that feed the assembly line. It was to describe this second technical break through that a Ford executive, Mr D. S. Harder, first coined the word automation.

Detroit Automation

Similar methods of mechanical handling and of "transfer machining" have been adopted in greater or lesser degree, in the motor industries in Britain, in France—where Renault has been described as the most highly automatic motor plant in the world—in Russia and more recently in Germany. Similar techniques have also been adopted on a more limited scale in other engineering industries. But because of the stimulus given to the development of automatic methods in the metal goods industries by the sheer size of American automobile output, these developments in automatic machining of separate solid articles are generally called "Detroit automation."

This began with the linking together of separate standard machines by mechanical handling devices to eliminate slow and laborious manual handling between operations. Parts may be transferred from one machine tool to another on a conveyor line, or the machines may be grouped in a circle so that the part can be presented to each in turn by a single rotary transfer table. In more highly integrated shops the parts may be loaded into the machines, accurately positioned for machining, machined, and then moved on to the next stage all in one automatic operation, even if the part has to be rotated or turned over for the next machining stage.

In the pressed metal shops where body parts are made, some of the American plants are beginning to use automatic loading devices to speed up operations. The pieces of sheet metal are automatically inserted between the dies, and as they come into position actuate the press. After the press stroke has formed the part, it is raised and extracted by a device known as the "iron hand"—one of the few instances where automatic machinery comes anywhere near the cartoonist's idea of the "robot in the factory."

"Detroit automation" at its peak involves the use of mammoth special-purpose machines, containing a long line of different machine tools that perform successive operations on each part as the part is moved from one to the next by transfer mechanisms built into the machine. One such machine which makes V8 engine blocks is 350 ft long and performs 555 successive machining operations. But although this allows even greater speed and precision, and saves factory space and labour, there are comparatively few companies, even in the United States, where such huge machines can be economically employed. Though an American car engine, or its basic parts, may outlast several generations of body styling, not all makers, even during this longer "life" of the engine, can sell the huge quantities of cars required to make such equipment pay.

Automation in Detroit came from the concept of the assembly line. But today, paradoxically enough, much less automatic machinery and much more manual labour is used in assembly than in the machine shops which feed it with parts. Elaborate systems of mechanical handling are used in all motor factories to feed the assembly line—for example,

ELECTRONICS IN INDUSTRY

Balanced Policy

EVOLUTIONARY RATHER THAN REVOLUTIONARY

The British Tabulating Machine Company Ltd has marketed Hollerith punched card equipment for half a century. The Company's view, in applying electronics to its business, was that the impact of electronics in the office machinery field would be evolutionary, not revolutionary. Research and development were accordingly directed along three channels, and the progress achieved to date in each is considerable.

1 Electronics have been employed to develop the range of Hollerith punched card machines.

The Electronic Multiplier, introduced in 1951, is now used in a large number of punched card installations. It performs at high speed the three common arithmetical functions—addition, subtraction and multiplication, and embodies a special feature for P.A.Y.E.

The 550 Electronic Calculator includes division in its operations, and has storage and increased capacity for more complicated calculating and checking.

These two machines are now being followed by the 555 Electronic Calculator, with magnetic drum storage and capacity for still more involved calculating. Pre-determined programming enables it to deal with variable conditions arising in the main flow of calculating.

2 The Hec 2M Electronic Computer, designed for resolving scientific and mathematical problems, was introduced in 1953. These Computers are now being used by Government and Industry, mainly for research and scientific data processing. Here jobs tend to be those involving a comparatively small amount of original data, requiring an extensive and prolonged degree of calculation, with complex programming.

3 To meet demands from business and industry, the Company designed the Hec General-Purpose Electronic Computer. This Computer will process large quantities of data and exercise considerable discrimination during calculating. It features ample storage and programming. Hec General-Purpose Computers, while satisfying all the needs of large business, meet economically the requirements of smaller undertakings. Many of these Computers have been ordered, and deliveries commence this year.

Punched cards, themselves a form of storage, are the input to the machines described. Output may be in punched cards, or it may be printed.

FUTURE POLICY

The British Tabulating Machine Company Ltd is alive to the fact that higher speeds of operation, larger and more flexible memories, and alternative forms of input and output, such, for example, as magnetic tape, will be required in certain circumstances. As one step towards satisfying this trend it has recently formed, in association with the Laboratory for Electronics, of Boston, Mass., the International Computer Corporation. The immediate purpose of completing the design and development of a computer with certain novel features, is already well ahead.

The Company's interests now extend beyond the purely business and office machinery field—into the application of computers to process and production control in all its forms. As was recently announced, B.T.M. have entered into an association with the General Electric Company in forming a new Development Company, whose interest will cover the whole field in which computers and like devices can be employed, including the field of automation.

Austin's automatic marshalling system that brings all the component parts to the assembly line by conveyor in exactly the right sequence. Moreover, men on the assembly line have all the power tools and lifting devices they need close to their hand. Mechanisation is feasible, too, in sub-assembly. But cars are still finally put together by hand.

Where automatic assembly has begun to become economic —outside the motor industry—this has happened only after the entire process and product have been re-designed. The best example of this is the introduction of the printed circuit into electric and electronic equipment. The "rat's nest" of wires in a conventional radio set, for example, was far too complex to be connected and soldered to separate components by machine. But when all the necessary wiring circuits are "printed" on to a baseboard by printing circuits on to a plastic board coated with metal foil and then etching the surface clean so that the metal remains only in the circuit "wires" thus formed, it offers a simpler basis for automatic assembly.

The printed circuit was originally developed in Britain, and shortly after the war an automatic production line was designed here that would turn out baseboards with the required electronic circuits printed into them, ready for components to be plugged in. Much of the American radio industry has now gone over to a further elaboration in which the components themselves are inserted by automatic machines and automatically soldered. In Britain printed circuits are used, but not, so far, automatic assembly.

Computers in Commerce

If the "electronic brains" that first awed and then amused American television audiences by predicting election results had been nicknamed "electronic digestive systems," the popular conception of the role of computers in factories and offices might have been a little nearer the truth. For the electronic computer cannot operate outside closely defined limits. It can do only what it has been programmed to do; that is to say it has to be given precise instructions about what to do with every piece of information it receives, and how to do it.

The *forte* of any computer is a phenomenal ability to remember what it has been told (and to recall facts when they are wanted) and the amazing speed—often as many as 8,000 calculations per second—with which it can perform mathematical and logical operations (in accordance with its instructions) using this store of knowledge and any new information it is given.

The use of large computer systems in Britain is still mainly for calculations in research, but in the United States several score are already employed on a commercial scale. They can be most easily justified in large organisations where large volumes of relatively simple routine work have to be done. Typical tasks that can be undertaken economically by the computer are the preparation of payrolls, sales accounts and dividend cheques in any large firm, the handling of cheques in banks, and the preparation of premium notices in insurance companies. In Government departments, such as a census bureau, the computer can greatly assist the statisticians to collect and collate more information and make it available more quickly.

One limit to the use of computers in offices is at present set by their high initial cost—the complete American systems, for example, may cost as much as $1 million to buy or $30,000 a month to rent.

Another limit is set by the time consumed in converting original information into a form in which it can be used by the computer. This is still done by typists or punch card operators, many of whom have to be employed to keep the machine going at its full capacity. Methods of recording original information in a form in which it can be fed directly into the computer are already in use on a limited scale, especially in banks. But to enable these methods to be more widely applied, complete re-arrangement of routine office procedure may be necessary.

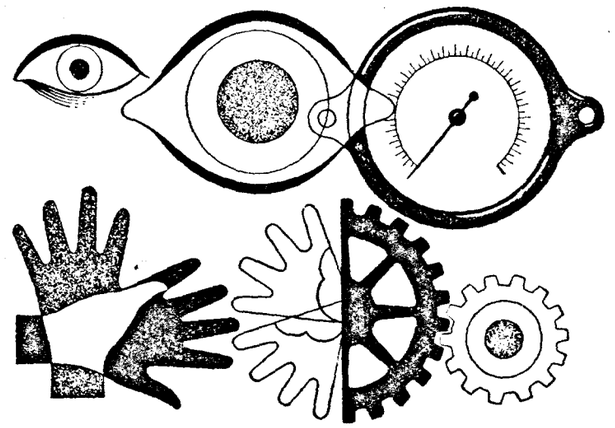
Where Is It Going?

Tomorrow's Technology

FOUR main forms of automation are already in practical use—process control engineering, transfer machining, mechanical assembly and communications engineering. What further advances can be expected in the near future in these and possibly other fields? One cannot look purely at technical possibilities; technically, if costs could be disregarded, it is hard to think of an industrial operation that could not, with existing devices, be made automatic. Transfer machinery, for example, could reach a point that would outdo Heath Robinson. What limits the use of transfer machinery, as it does of Heath Robinson's inventions, is not the physical impossibility of doing the job by machinery or mechanical linkage, but the inability to do it as cheaply as a man. One must consider the technological developments that are in the immediate foreground, within sight of paying, not the limitless technical horizon.

First, existing automatic equipment may be widened by standardising it so that it can be produced in quantity. Much transfer equipment is still "custom built" for a single application. If factory layout can be redesigned so that the same piece of standard transfer equipment can be used by a number of different firms, and possibly in a number of different operations within the same factory, it can be made more cheaply. It will never be possible to get long runs of complete machines; but the use of standard sub-assemblies such as cutting heads in several types of machine tool, or standard vessels in process plant, may allow cheaper production in the capital equipment industries.

Secondly, anything that will increase the volume of work done by a machine will make it cheaper to run. This means either running more of a single part through the machine, or making the machine adaptable enough to deal with a number of different parts. Redesign of the whole range of products produced in a factory, so that several different products can use the same standard components may greatly increase the volume of output of each component and make the installation of more automatic methods worthwhile. And if a piece of transfer equip



How Automatic Can You Get?

In modern production processes it is normal to control automatically a number of related variables. The eventual product is analysed. If it is found that there could have been a more effective setting of the process controllers, they are changed for the next day's run.

But imagine that, as the product comes off the production line or out of the pipe line, it is immediately analysed and the process controllers *automatically* re-set to the optimum settings to produce an even better product.

Although this cannot yet be realised, it is no pipe dream. It is something which Sunvic Controls have been working on for many years —and is just one example of the extra facilities they will be offering in the course of time towards increased production efficiency in industry. This kind of research naturally attracts some of the best brains in industry, and there is always room at Sunvic for younger men with scientific or technical qualifications who are interested in joining a fast-expanding Company engaged in absorbing and important work.

Today Sunvic takes control

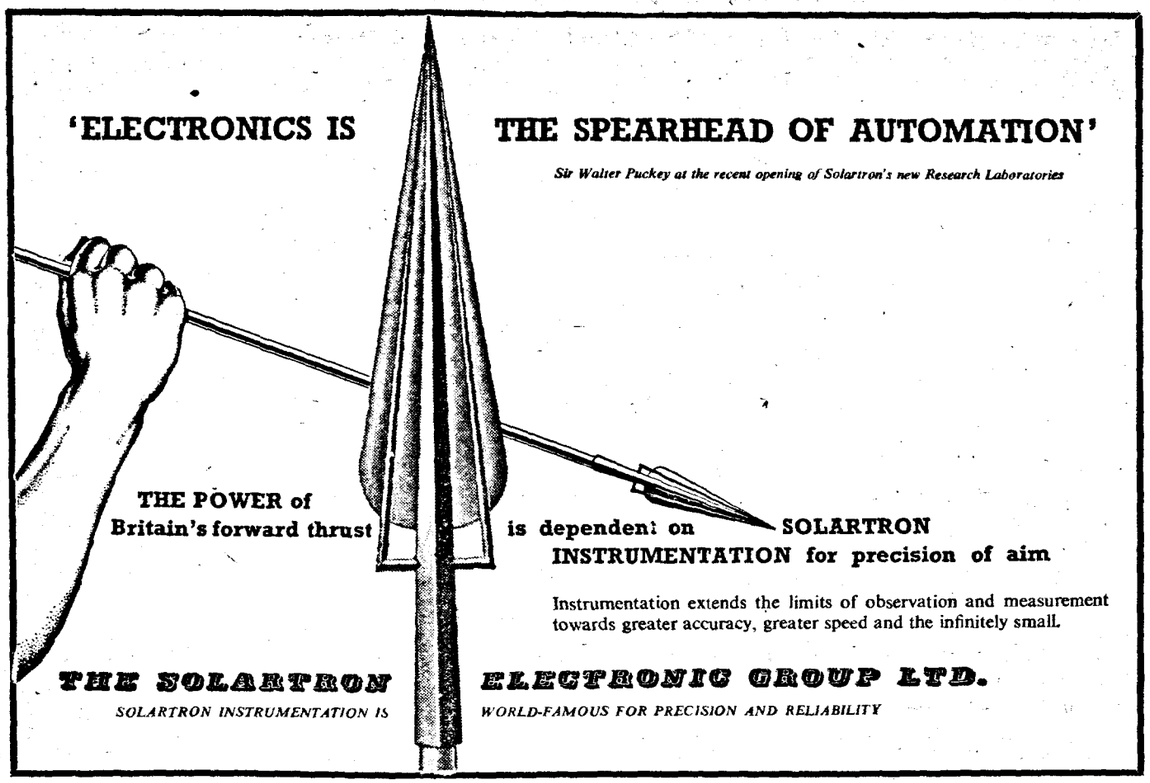
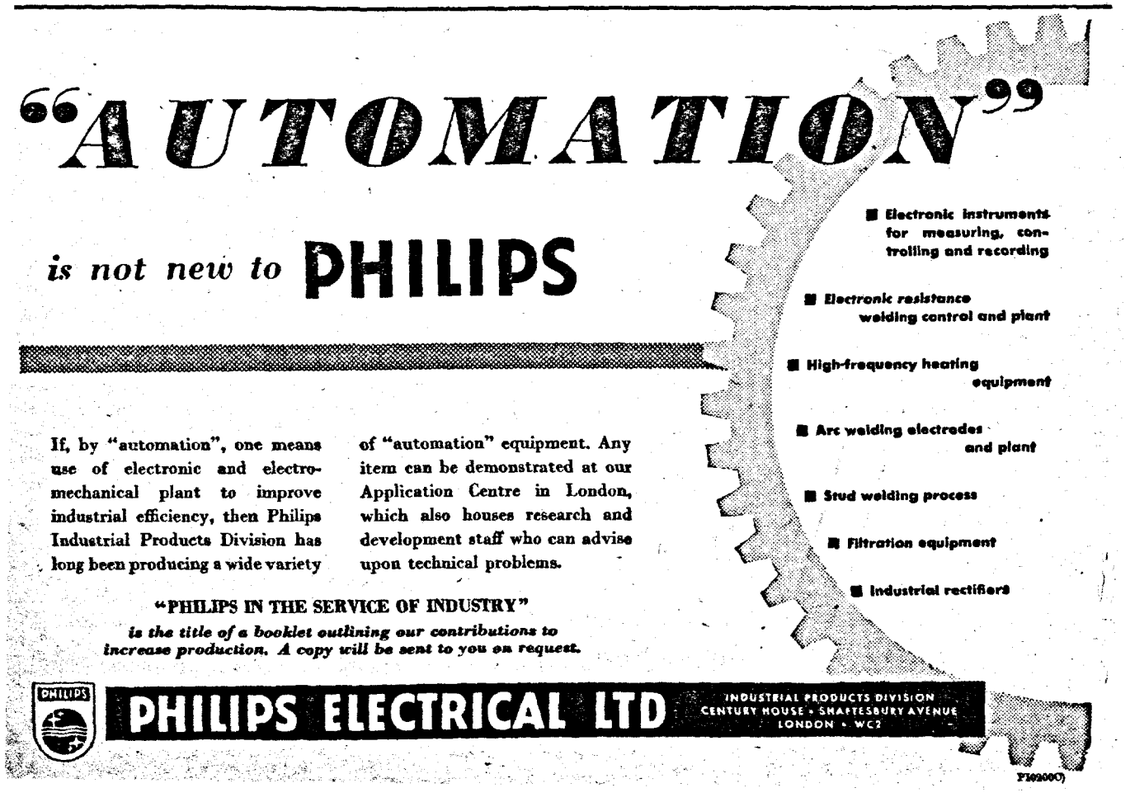
SC/14





ment can be adapted without excessive cost to changes in the design of the product, its life can be prolonged. Such flexibility can sometimes be achieved by constructing the transfer mechanism in several sections, only some of which need to be replaced when the design is changed.

Tape Control of Machines

At the other end of the scale—the use of more automatic equipment for very short runs, as in prototype production—the much publicised computer-controlled machine tool may have a place. In such a machine, the design to be milled by the machine tool is first translated into the mathematical "language" in which it can be transferred to punched tape and fed into a computer. The computer in turn produces instructions on magnetic tape which can be used to control the movements of the machine tool. If more than 50 of the same part are required, it would probably be cheaper to set up an automatic tool by hand, for example making a master pattern for the machine tool to follow. But if only small quantities—as for example in making aircraft prototypes—are required it does not pay to set up standard automatic tools, and prototype parts are today generally machined out by hand-controlled tools.

Tape-controlled tools, together with the computer, may cost ten times as much as the hand-operated tool; but the computer prepares the instructions on tape ten times faster than the tools can carry them out, so that one computer can "set up" ten machine tools. In cases, therefore, when about ten tape-controlled machine tools can be kept in full operation or programmes prepared for other firms' tools on a rental basis, they may be more economic than hand tools. But how often will there be enough work at any one time in the production of prototypes or job lots to make tape-controlled tools fully economic? Once an operation has been "set up" on tape, repeat orders could be filled without resetting the machines. But the price of both tool and computer will have to be considerably reduced before this technique can be widely applied outside the toolroom or prototype work.

Tape control of machine operations, however, might have a considerable future in the field of automatic assembly, where little has so far been achieved outside the field of electronics. The key point in automatic electronic assembly has been the redesign of the product and the process, in order to perform the function of the original product by a new one of a shape that can be automatically assembled.

This entire re-thinking of the problem of production, by considering alternative radically changed designs which might suit automatic assembly rather than looking for some way of producing the existing product automatically, is the essence of further technological advance. Kitchen equipment such as the refrigerator, for example, contains fewer components, of simpler shapes, than the thousands that go into a car, and undergoes fewer radical changes in shape through fashion. In making such goods automatic assembly might pay sooner.

In the process industries, to the outsider, plants already in many cases seem to approach "the automatic factory." There appears to be no major technological barrier to further extension of the use of feedback controls, though instruments to make continuous analysis of the final quality of products, which exist, have still to be fully linked into control systems. Controls can be made to operate with extreme accuracy, though the problem of maintaining that accuracy over a long period and securing against breakdown is still a real one. But much control equipment is expensive: this, plus lack of engineering talent, is still limiting the rate at which existing control systems are being applied in more conservative sections of these industries.

In theory, it is now possible to design control systems for a whole integrated plant, in which a master controller, taking into account the optimum possibilities of the plant as well as the quality and rate of its final products, would either continuously reset other controllers throughout the plant to bring about the best results or would control all the variables itself. In practice, none yet seem to be operating. Here again, redesign may be the answer—perhaps of the process rather than the product. As yet, not all chemical plant designers quite grasp the possibilities, for example in speed of operation, that the degree of automatic control now practicable may offer them.

From the jobs of research and routine clerical work where it is now being gradually applied, the computer seems likely to enter much more directly into the production field. Both in the control of series of processes and perhaps in co-ordinating the work of different "automated" departments in engineering, it may be used to work out the optimum programme of operations, taking account of stocks of material and work in progress. How this would be applied might vary. A workshop full of separate hand-controlled machines turning out several products might gain real benefits of "automation" by employing these machines according to a programme, which could be worked out in a short time rented on a computer, that made the optimal use of their combined capacity.

Could a Computer Run the Plant?

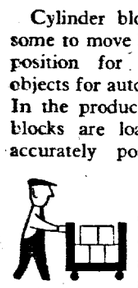
But the same ability of the computer may be used to maximise the output of a complex continuous plant, by finding the best possible combination of the many variables that may affect plant operation and controlling the plant to achieve this continuously. Such master controllers might even take into account not only the internal factors affecting the rate and quality of final output, but conceivably some data from outside as well, for example on stocks.

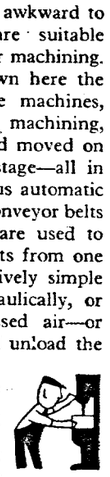
There are fascinations but also massive problems for management in the idea of a computer constantly receiving and digesting masses of information on sales, stocks, prices and costs at all levels of production and sifting out only what variances really matter. The further notion that such a computer might not be far from controlling operations in all parts of a plant at their most profitable rate might be less practicable. For even the most advanced computer can do only what it has been programmed to do. And there are many important variables, especially in interpreting the significance of market trends in order to look forward and plan operations, where no machine could even approach the quality of good human judgment.

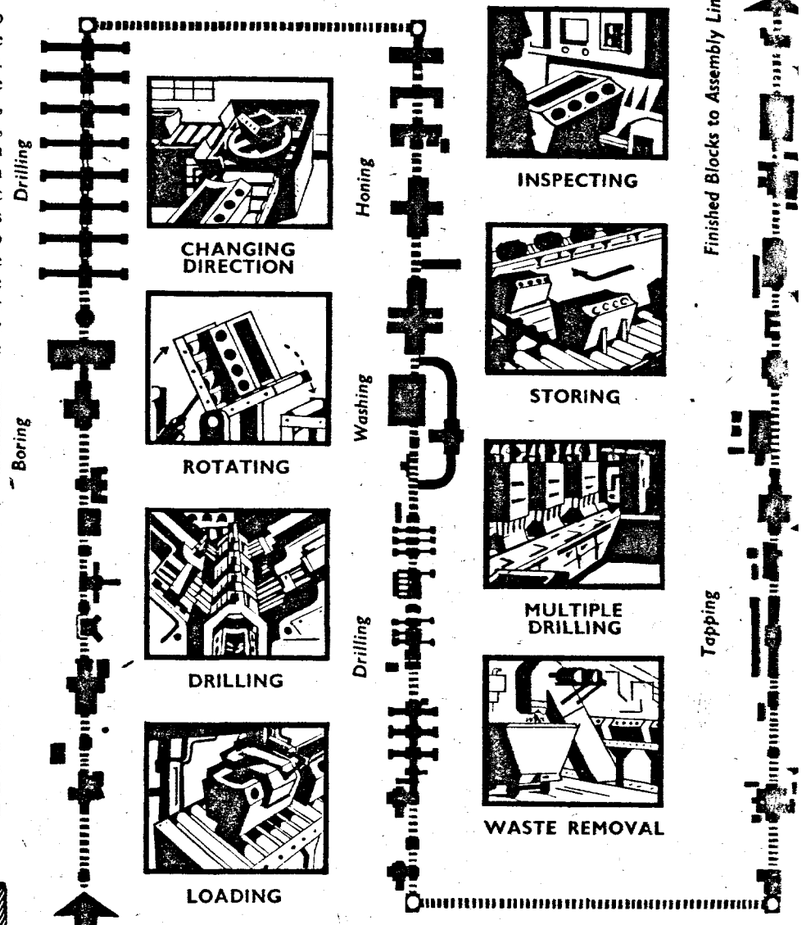
Supplying data for the commercial computer, incidentally, may present huge problems for conventional accountancy; in order to serve management properly, the machines will require a continuous flood of costing estimates and information. In narrowing the spark gap of managerial decision either in the plant or in the office, the role of the computer has its limits. But as an aid to management, digesting information with a speed of selection and computation otherwise unobtainable, it is certain to have wide repercussions throughout many branches of industry.

THREE APPLICATIONS OF AUTOMATION

Cylinder blocks, heavy and cumbersome to move by hand, and awkward to position for machining, are suitable objects for automatic transfer machining. In the production line shown here the blocks are loaded into the machines, accurately positioned for machining, machined, and moved on to the next stage—all in one continuous automatic operation. Conveyor belts and shuttles are used to move the parts from one machine to the next. Relatively simple mechanisms, operated hydraulically, or electrically, or by compressed air—or merely by gravity—load and unload the machines, rotate the parts and turn them over where necessary for the next machining stage. Some of the loading and unloading equipment, and the machine tools themselves, are actuated by interlocking electrical systems in which the switches and relays are set off by the moving parts themselves. The angle of the cutting tools may be automatically adjusted to allow for tool wear. Storage links on the conveyor system are provided to enable production to be maintained if a machine breaks down. Under-floor conveyors remove the metal chips from machines for disposal as scrap, and some machines have their own apron conveyors and magnetic separators to collect and reclaim the cutting oils.



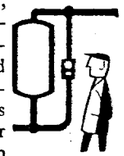


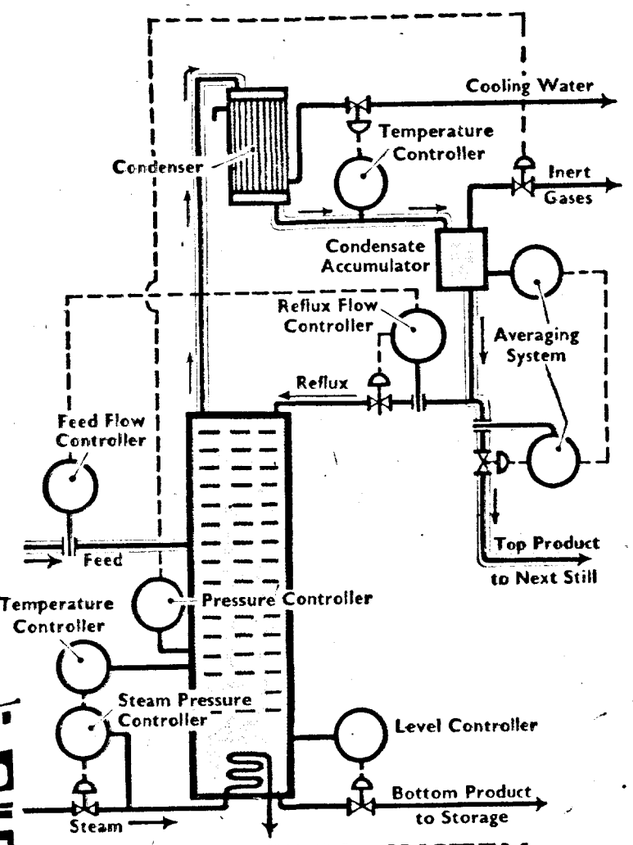


CYLINDER BLOCK PRODUCTION LINE
Simplified Layout

Chemical plants, where the product is usually a liquid or a gas, are most readily operated by automatic controls. In a simple process the operator may look at a temperature gauge and then use his own judgment in deciding whether to adjust the valve controlling the rate of flow of the liquid into the vessel. As a further step the rate of input may be automatically modified whenever the temperature in the vessel reaches a pre-set level.

The distillation column shown here is part of a plant using more advanced automatic controls. The temperature controller, for example, at the bottom left of the diagram, measures the temperature inside the distillation column and compares it with the desired temperature. If the actual temperature is too high or too low, the controller automatically changes the steam pressure until the temperature in the vessel has reached the desired level. Sometimes several separate control systems are linked together into an "integrated" system. Thus in this example (redrawn from one described by Mr A. J. Young of ICI to the Institute of Production Engineers' conference last year, the temperature controller is aided by a steam pressure controller, which has the sole function of adjusting the steam pressure and keeping it steady at the value demanded by the temperature controller. Output fluctuations, if they cannot otherwise be avoided, can be smoothed out for the benefit of the next still by an averaging system which keeps the flow of the top product fairly constant by varying the level in the condensate accumulator.

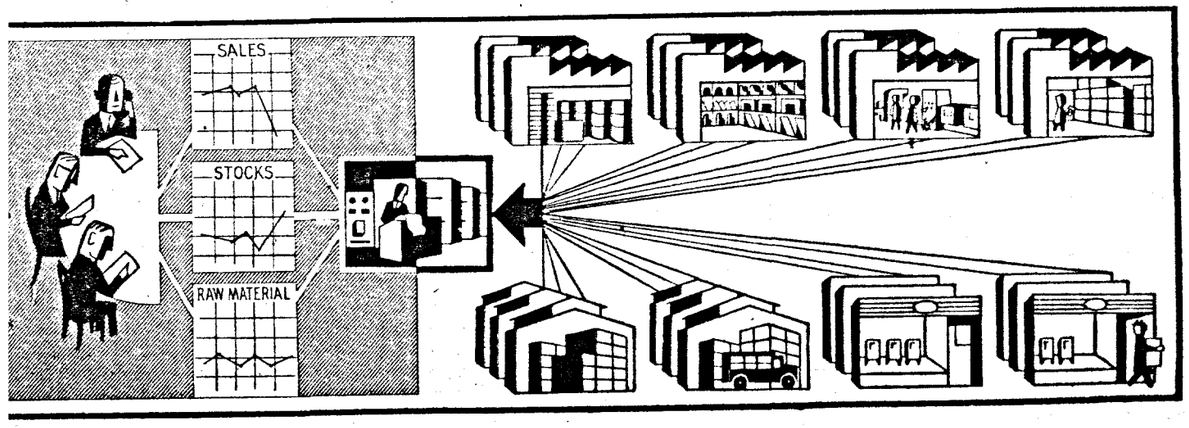




CONTROL SYSTEM FOR A DISTILLATION COLUMN

COMPUTERS IN COMMERCE

Electronic computers, or data processing systems, cannot take the place of management, but they can enable managers to make quicker and better decisions. In this diagram, a computer system is shown collecting information on sales, stocks and work in progress at each stage of the business, from the factory floor to the retail outlet. After collating all these figures, it processes them to show up significant changes and trends which may call for fast decisions on production or marketing policy. In this role the main advantage of the computer is its speed. If the same job were done by hand the market information might well be out of date before it could be acted upon. The computer reduces to a minimum the time lag between marketing decisions and the changes on which they are based.



Will It Pay?

Accounting for Automation

CONSIDER two examples of automation drawn from actual practice:

A year or two ago, the works manager was taking an English visitor round the justly famous "automated" Ford engine plant in Cleveland, Ohio. Reaching a point where a worker—most unusually—was actually putting certain small liner bearings into the engine block by hand, he turned defensively to the visitor and almost snarled. "Go on, now ask me why we haven't put in a machine to replace *him*?"

His visitor, taken aback, said mildly: "All right, why haven't you put one in?"

"We did," retorted his host with the air of a man bitterly inured to this particular silly question. "We did. We costed it. And then we took it out. He does the job cheaper."

★

At Ardeer in Ayrshire, Imperial Chemical Industries' Nobel Division has recently put in a new continuous plant to make nitro-glycerine, that soupy, fearsome brown liquid that is the basis of practically all non-nuclear explosives, where the whole of the operations will be remotely controlled from a concrete blockhouse 80 feet away on the other side of a hill. The operator watches flowmeters and temperature gauges that give him constant and instant control over this simple but terribly dangerous process. He will eventually watch one vital characteristic that it would be hard to meter, the "interface" between two liquids where one is swirling on top of another, through the visual monitor of a closed-circuit television link.

This plant already incorporates an automatic arrangement by which any major disturbance would cause the continuous process to stop and dump its dangerous contents into a drowning tank. Later, some use of feedback controls by which input of materials might continuously be adjusted according to the state of the mixture may be introduced. But this new plant has not reduced the number of men on the process, nor increased the throughput. Its capital cost was considerably higher than that of the plant it replaced. "It gives us no significant improvement in costs at all," said a director at Ardeer recently. "What it gives us is extra safety. That justifies the investment."

A businessman's decision whether or not to invest in automation, as these two cases illustrate, may arise from the closest costing of every single operation where a machine can do a man's job; at the other extreme, the savings that automation offers may not be easily measurable in financial terms at all. It is certain that a large proportion of the investment that some industries have put into automation so far, has been decided upon with only the sketchiest calculation whether it could be justified on cost grounds. In this early stage, when the new techniques are emerging, development teams have been able to proselytise the new doctrine, and sell their esoteric wares, partly on the basis of technological emulation—"keeping up with the Robot-Joneses." For the big companies, generally conscious of rapid change and inclined to emphasise research and development much more now than in the thirties, the need to keep abreast of innovating competitors is a very real managerial incentive.

The close costing of more automatic against less automatic single operations implied in the above anecdote from the Cleveland engine plant is in practice, so far, seldom in evidence when automation is being demonstrated—more's the pity. Often the savings are indirect. For example, an automatic unit is nearly always more consistent in the quality of its output than one controlled by a human operator. For a time, the man can probably control a machine's performance as well or better than instruments; but his performance fades as he gets tired. This steadiness of operation close to standards often may save raw materials, and may well save more energy than the automatic controls consume.

Such indirect savings, properly considered, are clearly economic. So, in a cold-blooded but very real sense, is safety, which protects property as well as people; any company wants to take care of both. But they may not be easy to explain in terms of pounds, shillings, and pence when, for example, an engineer is trying to justify the installation of automatic control into an existing process plant.

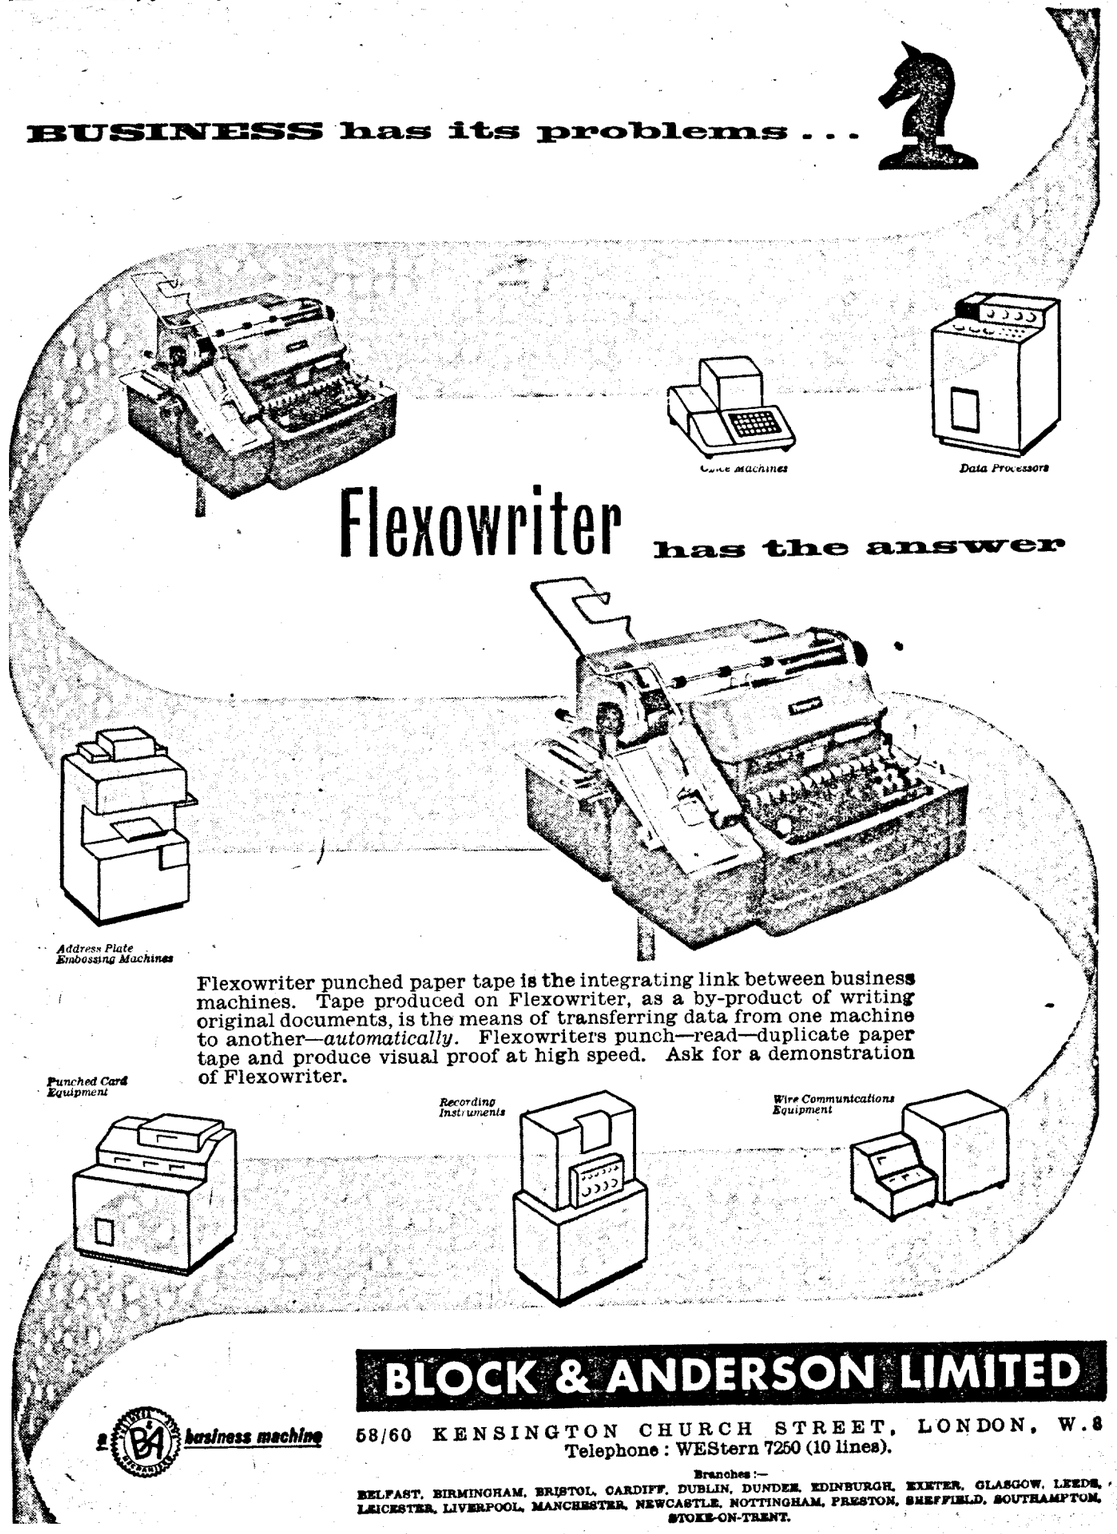
There are examples, mainly in the process industries, where certain forms of production simply could not be achieved with manual control. Certain complex operations in oil refining and chemical engineering—polyethylene is an instance often cited—require control to be maintained within critical limits at different points in such constant interdependence that no team of human operators could work together smoothly enough. In other plants, the higher speeds that automatic operation makes possible enable equipment to be worked closer to its theoretical capacity.

The Price of Automatic Plant

In physical terms, such advantages of automation might be classed as capital-saving. How far are they offset in practice by the extra investment required to make plant automatic? The answers, even from companies that count their investment in automation to be successful enough to warrant publicity, vary considerably. Automation in the Ford engine plant in Cleveland, for example, is said to have raised the total capital investment in the plant, taking account of savings in space, by about 25 per cent. On the other hand, in the process industries the installation of control instruments that are not cheap themselves has sometimes been said to have made no difference to the total capital investment, or even to have reduced it—by eliminating, for example, storage tanks between processes that cost much more than the instruments.

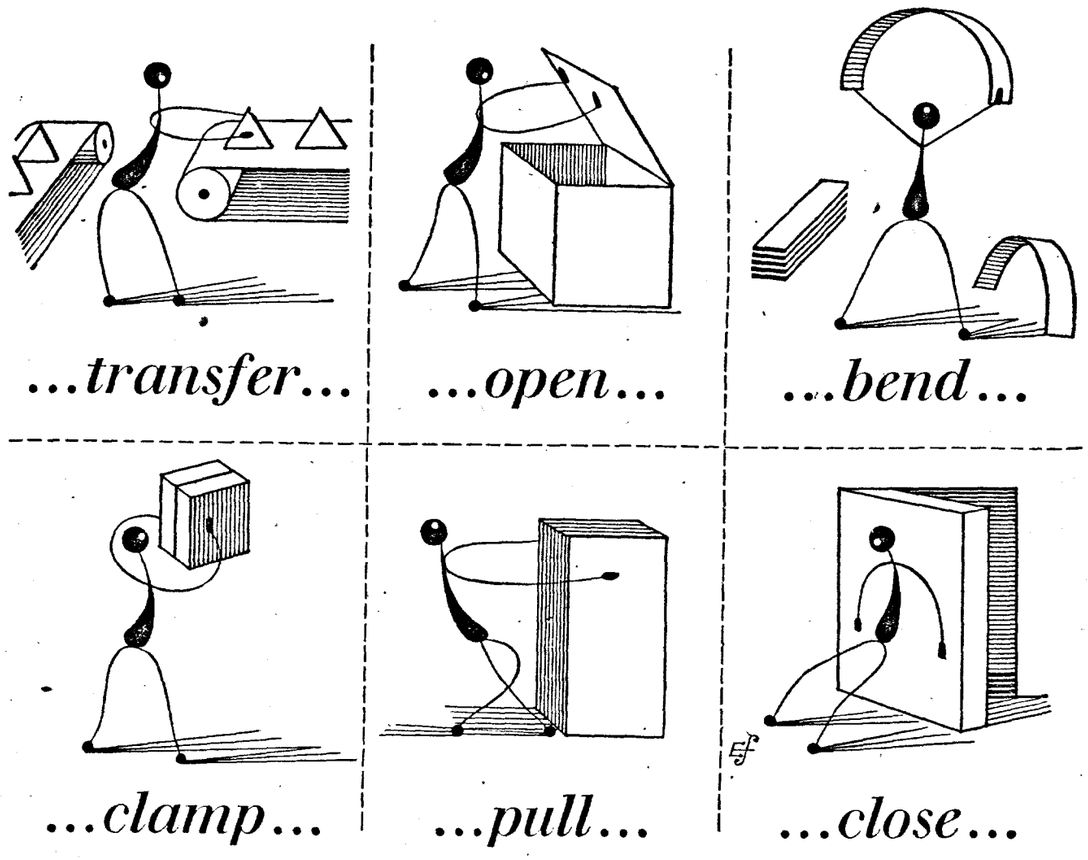
But it would be optimistic to count on such offsetting savings in the total capital cost of automation very often. Moreover, where they do occur they may be associated with the loss of flexibility that is a real economic disadvantage—though a hard one to cost—of certain automatic processes. One ought generally to allow for a somewhat higher capital investment in automatic than non-automatic processes. But very often output rises much more than in proportion, so that "per unit of output," automation is capital-saving in a cost sense too—particularly when multiple-shift working is introduced to justify the investment. In other cases, capital costs per unit may rise, but offsetting savings in other elements of cost, materials or labour, may justify investment in automation.

The main incentive for industrial investment since the



Hymatic Automation

IS THE NAME FOR MACHINES THAT



. . . roll, clean, sort, lift, turn, grasp and shelve. Hymatic Automation is thus invaluable in the automatic and selective transfer of parts from one process to the next, from conveyor to conveyor; in unloading one machine and loading the next; or in quick clamping to hold parts during machining. All designs of Hymatic Automation are made for specific tasks but are readily adaptable to others.

Hymatic Automation covers the whole problem—the design of the circuit—the machine—the means of control.

Hymatic Automation, therefore, has a place in your programme of productivity improvement.

Perhaps in your Works, too, there are jobs where it is possible for people to burn or cut themselves, strain or crush themselves, lose fingers or even a hand; or perhaps there are jobs for which you just cannot find people.

In all events CONSULT

Hymatic Automation

THE HYMATIC ENGINEERING CO. LTD. DEPT. HA.104 · REDDITCH · WORCS.

war has been a growing confidence that demand will keep on expanding. The cost savings that automation offers—and in particular the savings in labour costs per unit—have presented themselves as the most economical way to meet that larger demand, often in the face of a shortage of labour. Many business men might certainly agree that it would be a worthwhile exercise in itself to reduce labour costs per unit of output even if demand were stable, if only to get more reliable performance. How much they might be prepared to invest in automation simply to do so is less easy to guess.

Come rain or fine, expansion or deflation, the installation of automatic equipment is certainly likely to cause significant changes in the nature of industrial costs. Capital charges will tend to bulk larger in total costs. Even when initial capital costs per unit are reduced by the higher rate of production, accelerated wear and faster obsolescence during a period of accelerated innovation may require higher depreciation charges. As workers directly on production are reduced, wages will be related more to the time spent in tending expensive plant than to a rate of output that they can hardly influence. More of the people in the plant may be upgraded into technical and minor management jobs that carry salaries; and the guaranteed wages or severance pay that trade unions may be able to wring from management as the price of labour's co-operation will tend to blur the distinction between a wage and a salary. Even the labour costs of an automatic process, therefore, may tend to become much less variable with output.

Investment in automation, almost inescapably, therefore, tends to be investment in stability of output, employment and demand—at least over the life of the equipment. This need for stability may be offset by the technical flexibility that it may later be possible to achieve by building alternative product mixes and designs into a plant or factory that embodies automation, but not wholly removed. This sets two alternative limits to the degree of automation that any given company can afford. Either one must be able to assume steady demand—as one can, perhaps, in industries such as flour milling, or in companies making standard engineering components that change very seldom—or automation can only be chosen if the cost advantages it offers are so great as to allow the equipment to pay its initial cost off faster. Such economic factors associated with automation, as well as technical considerations, do suggest that its effects upon output—and on employment—may be concentrated in particular sectors of the economy.

Will It Hurt?

Changing Men's Skills

"The machine had about 80 drills and 22 blocks going through. You had to watch all the time. Every few minutes you had to watch to see everything was all right. And the machines had so many lights and switches—about 90 lights. It sure is hard on your mind."

MR TYLACK, a 61-year-old job setter, who after 27 years in a Ford foundry machine shop found he could not stand the pace on a new transfer machine, had met automation at first hand. Not many workers, even in the United States, really have; but throughout the world the idea of automation "sure is hard" on workers' imaginations. Major savings in labour by automation, clearly, are technically possible. But they are commercially feasible only when they offer a cut in total production costs. It is from this perspective, and not through rosy (or menacing) clouds of theoretical possibilities, that the probable impact of automation should be assessed. And it suggests that there are two main fields within which its effect, certainly on the kind of employment and possibly on the numbers employed, might be significant in one way or another—on the factory floor in manufacturing, and in offices throughout the economy.

Manufacturing in Britain accounts for about 40 per cent of the country's employed population. Within it the groups where automation is already advancing and may be impending are a substantial but not very large slice. Oil and chemicals together employ only about 6 per cent of the manufacturing labour force; but other process industries, if one includes those in the building materials, food, and packaging fields, would probably add another 10 per cent; and metal manufacture another 6 per cent. The motor industry, where in Britain automation is already fairly advanced considering the present scale of output, employs some 500,000, and electronics, where it could arrive rapidly, perhaps 200,000 people—together another 8 per cent.

Many of the two million other people employed in electrical and general engineering are employed on capital goods and jobbing work where the scope for automatic control of production is much smaller, but automation might be expected eventually to be possible in some proportion of the firms in the metal-using industries that produce components and small metal sub-assemblies. The number of people in industries where automation might significantly affect total employment on production—not the number whose employment would in fact be affected—might thus be close on 40 per cent of manufacturing labour; perhaps 15 per cent of the people employed in Britain.

These are the industries in which automation offers significant savings in cost and will promote changes in the labour force. It does not follow that it will cause significant cuts in their total employment. The effect of automation on labour is often pictured as a comparison between say 10 men producing a given output with existing equipment, and a new automatic process that will produce the same output with only one man to supervise it. A displacement ratio of this order is not impossible, though it is seldom achieved in practice. Even when it is, the comparison ignores the manhours spent in redesigning the process and in designing, producing, programming, and above all maintaining the new automatic equipment.

Moreover, there are two ways of reducing labour costs: producing the same output as before with less labour, or using the same amount of labour to produce more output. So far, automation has almost always been installed to produce more. In many cases it would not be economic

except at higher production rates — which often means employing as many, or almost as many men as were employed before. Moreover, automation is likely to affect only certain departments. One may cite the experience of the Ford company in the United States, where automation has been carried as far as anywhere in engineering. Out of the company's 146,000 hourly workers in 1955, no more than 10,000 were employed in the plants where automatic production lines were installed.

Some 30 per cent of Ford's production workers were, however, employed on assembly, and if the experience of the electronics industry in redesigning products for automatic assembly can be repeated in other areas, the effect on labour could be much more significant. In the American electronics industry, automatic assembly, when it has been applied, has apparently brought striking reductions in labour costs per unit—but during a period in which the total output of television sets has been increasing, so that employment has not declined in full proportion.

This year's redundancies in Detroit—and in Britain—have been because the industry has been unable to sell its cars at the rate for which it planned its production facilities, not because of automation. Clearly, investment in automation equipment calls for more critical assessment of the sales forecasts according to which the installation can be expected to pay off. But it is in the interest of management, as well as labour, to use such expensive equipment at its optimum rate as long as possible.

Computer versus Clerk

There are roughly 2½ million clerks and typists in Britain spread right across the economy. Many are in manufacturing, so the two totals of workers in sectors where automation may soon arrive overlap to some extent. In the few places where computers have so far been introduced, particularly in the United States, their introduction has not interrupted a steady rise in the office labour force. The introduction of punch card systems and other office equipment on a large scale during the last decade in both Britain and the USA has coincided with a rapid rise in the number of office workers. These are encouraging trends for the office worker who fears that the machine may take away his livelihood, but it is rather too early to be confident that they will continue. The productivity of routine office workers can be increased immensely by large-scale data processing systems. If the initial cost of computers can be cut, and if the bottleneck now caused by the need to translate all the original data manually into the punch cards or punched or magnetic tape that the computer can cope with, can be eliminated, a very considerable degree of labour-saving might become practicable in the office.

These are the points in the economy where automation may offer significant savings in labour—which could be taken out in cutting employment, raising output, shorter hours, or some of all three. What of the effect on the individual men and women concerned? Will all of those displaced from their present routines and skills be able to fill new vacancies that may be offered in their stead?

Within the metal-using industries the skilled man most affected by automation is the skilled craftsman who sets up and operates machine tools. His work has already changed in important ways during the last two decades with the development of standard automatic lathes, milling and boring machines and other faster single and multi-purpose tools. In cases where automation has arrived his place will

be at the control board, supervising a series of operations where his former tasks are carried out automatically.

More Skill or Less?

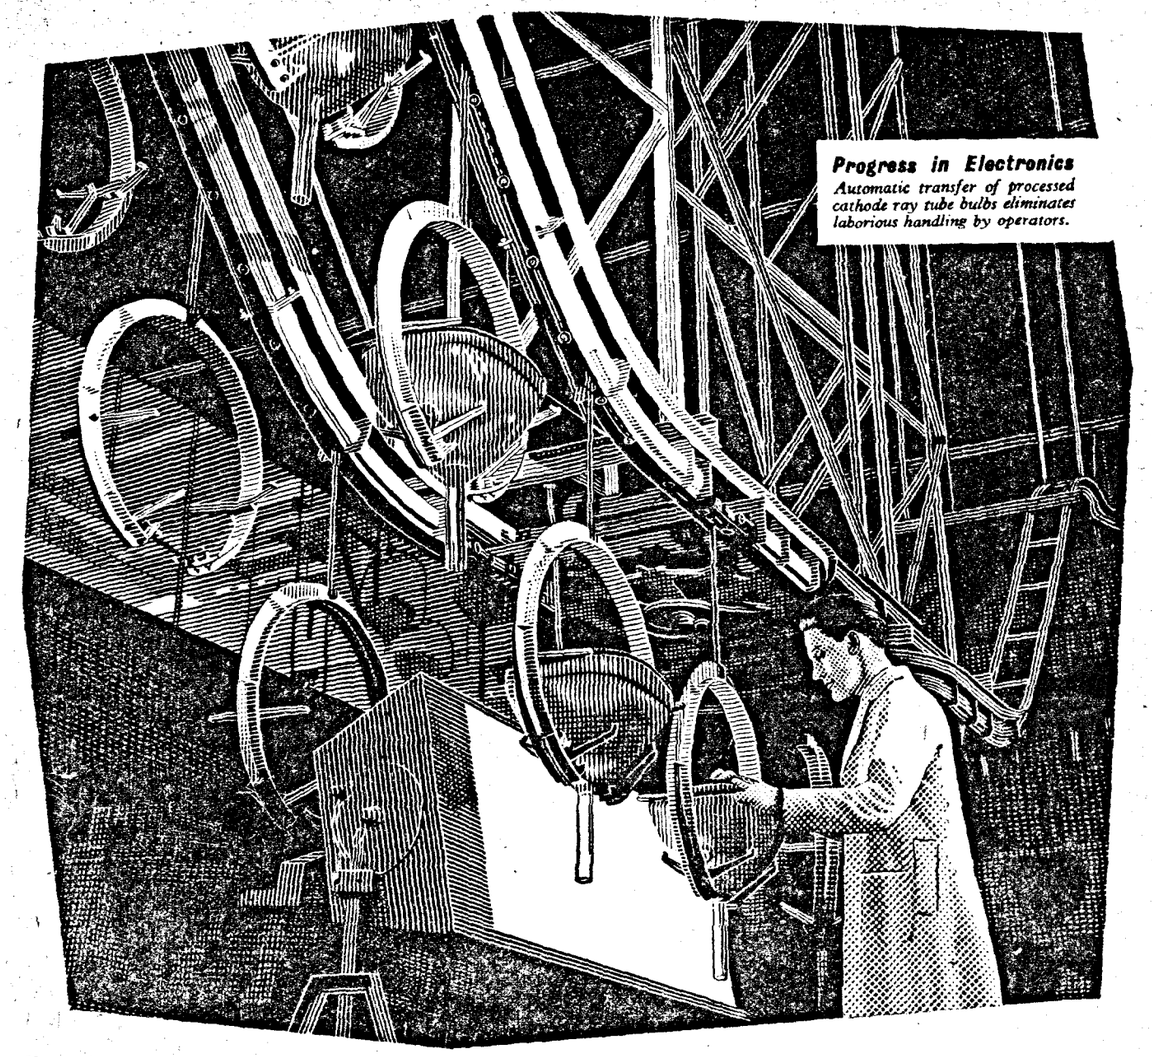
Whether these new tasks call for more skill or less is a moot point. The machines will have taken over much of the craftsman's manual dexterity. They certainly place on the fewer remaining operators the heavier responsibility of controlling a much larger and faster series of operations. The supervisor of a huge automatic tool or of a large distillation process appears to do little but watch a bewildering proliferation of coloured lights and dials on his control panel and, in machining, occasionally to replace tool bits according to a maintenance schedule. But if something goes wrong he must take immediate action; a breakdown will cost far more than it used to. In the experience of most companies, provided that a comprehensive re-training course is given to skilled machinists and foremen, this changeover to the new forms of skill, or of patient alertness, can be made fairly smoothly. But the older man, who is faced with a change of this sort quite late in his working life, is likely to find the strain of adapting to the new machine a heavy one.

Demand for electricians and maintenance engineers of all sorts seems certain to increase as control mechanisms become more complex to instal and repair. How far the extra demands of automatic machinery on maintenance men may offset cuts in production workers, and how skilled the extra maintenance men need be, is difficult to assess. The maintenance of actual control systems may well require a higher standard of skill, but "planned maintenance" of the mechanically operated automatic machinery—which reduces the need for diagnosis by the maintenance men—can be carried out by not very skilled labour.

The extra technologists and technicians required—systems engineers and designers, and perhaps mathematicians—can be met only by higher education and professional training. Though they are not wholly encircled by trade unions, these professions for the most part cannot be entered in mid-career. The only way in which the new balance of skills can be achieved is by training more of the students and apprentices of today to be the technologists and technicians for tomorrow's automation.

But for the unskilled and semi-skilled—and for older people less able to learn new tricks—automation does raise more real fears. Unless these types of worker can learn enough new skill to tend automatic machines or do the simpler maintenance jobs, there seems little doubt, they will have to drift out of the factories in which automation has come. First, they may gravitate into less automatic factories in similar fields: later, perhaps into industries in which automation is making least headway—in mining, transport, distribution and service trades of all sorts. If total output is rising in the economy—and it is unlikely that much progress in automation will occur unless it is—more goods will have to be moved and sold: moreover, there seems little doubt that the demand for services will continue to rise.

It would be painting a falsely rosy picture to suggest that the semi-skilled labourer or mediocre clerk who has not the mental capacity to re-train for more demanding jobs will be able to hold his place on the job ladder. The displaced office worker may be as well paid elsewhere, though with less social prestige. But the unskilled worker in a production shop, is at present, for various reasons, exceptionally well paid. That makes him expensive to use—and liable to be displaced by automation.



Men and machines

Over the past ten years the machinery on which Mullard electronic valves and tubes are manufactured has been completely revolutionised in design. This has been achieved through intensive research into manufacturing techniques and by a bold productive investment policy.

To-day's machines produce more and better valves and tubes because many processes are automatically controlled, and the unavoidably erratic element in human intervention largely eliminated.

This trend towards increased mechanisation and automatic process control has accompanied the great development of the Electronics Industry. Since 1950, the number of men and women employed in Mullard factories alone has increased by more than 110%.

The Mullard attitude towards production takes heed of the welfare of the employees and the prosperity of the towns in which Mullard factories are situated. Above all, it recognises the responsibility of a leading organisation in a vital industry to produce efficiently in the national interest.

Knife-edge profit margins

leave no room
for error margins!

Despite faster, more automatic production methods, profit margins are all too often precariously narrow — too narrow to withstand accounting and costing errors.

Successful management insists on all-round efficiency — in the office as well as the factory — in methods of accounting equally with those of production.

Powers-Samas punched card accounting machines and methods reduce errors to the irreducible minimum; slash the time and cost of doing the work, and conserve staff.

POWERS-SAMAS

Will It Suit Britain?

Automation for Success

AUTOMATION is an emerging and rather special kind of technological change. And technological change—innovation plus the fuller application of improved techniques—is the prime mover of further growth in a mature industrial economy such as Britain's. Since the war it has contributed to a sustained growth of the national income that has been faster than at almost any other time this century. But if such a rate of expansion is to be kept up, on the average of good years and bad, technology—including automation—will have to contribute yet more in future.

Now it is fairly clear that the working population in Britain cannot go on expanding as fast as it has since the war—about 5 per cent in the last seven years, for example—for very long. The population of working age, between 15 and 64, is indeed likely to have grown rather less than the total population in 25 years' time—though for a period in the sixties it will be rather bigger in relation to total population than it is now or will be in 1980. On the other hand, the labour force has recently been growing much more than calculations about those age groups would have suggested, mainly because more women have been going out to work. It might be fair to guess that the actual number of people in jobs might rise as much as total population or indeed slightly more: in 25 years' time it might well be 5 per cent higher. That means an average annual rise of only about a quarter of one per cent per year over the long haul, though in the earlier years of the period the growth will certainly continue a good deal faster than that.

The recent expansion in "gross domestic product," it should be noted, has been based on a much more rapid growth of output in industry and, in particular, in manufacturing, where output rose between 1948 and 1955 by almost exactly 5 per cent each year. This is the dynamic element in national output: its remarkable rate of growth has come mainly from a rise in productivity per head of about 3½ per cent each year, but also from a rise in its labour force of about 1½ per cent each year, which is a good deal faster than the working population as a whole has been rising. Manufacturing has been drawing in people from other industries and services.

Almost certainly the main impetus in economic expansion must continue to come from manufacturing, which is certainly the sector that offers the widest front for technological advance. But it can no longer count on a growth in its labour force at the recent rate. The question therefore seems to be not whether automation may displace large numbers of employees from manufacturing, but whether it can make up for a much slower rate of growth in the labour force of this industrial group.

The Arithmetic of Optimism

If expansion of national income of the order of 3 per cent a year should "require" a rise of 5 per cent yearly in the manufacturing section of national output, the arithmetic is simple. Even if automation meshed in with other technological change to offer an average rise in productivity in the manufacturing industries of about 4½ per cent per year, much more than has been achieved recently, then these industries would still need to increase their labour force more than the average to support economic expansion at its recent rate—taking in some of those clerks who can't stand up to the computer? Five per cent per year from technological change—right across manufacturing—certainly, would offer the desired support for total economic expansion with no increase in the manufacturing labour force beyond what it is now: and if any enthusiast for automation likes to bid six per cent a year, then one might have to reckon with a decline in manufacturing employment of about one per cent every year—or double the standard of living in 20 years, not 25. Somewhat slower rates of total growth might be all that Britain could achieve in practice—in which case the great improvements in manufacturing productivity which automation may offer might leave some slack in the manufacturing labour force. But the working week today, held up by overtime, is as long as before the war. Some reduction in working hours—since overtime is less useful on the shift work that automatic equipment may require—is surely on the cards in future.

Moreover, the rise in their combined productivity that the British manufacturing industries as a whole have been able to achieve, 3½ per cent, has in its turn derived largely from much faster increases in productivity in industries such as chemicals and oil, paper and printing, and the engineering group, and from transferring labour to them from industries where productivity has risen more slowly. The achievement of much higher average rates of growth in manufacturing as a whole postulates much faster growth yet in such industries.

The Price of Productivity

The crudest arithmetic of current trends in economic growth, therefore, seems to offer automation plenty to do without throwing workers on the scrapheap. Such mechanical extrapolation should not be pushed too far, and in a non-technical journal there is no use in taking it beyond the broadest of industrial groupings. But in the present anxious ferment about the displacement of labour through automation it does perhaps offer an idea for a piece of what might be called "public relations research."

It is an open secret that a body of official economists and statisticians have recently been engaged in an exercise or, the "long term prospects"—taking 5-10 years rather than 25 as "long"—for developments in the major sectors of the British economy and what these might imply. There has also recently been no obvious shortage of eminent scientists and technologists in these main industrial fields willing to prophesy about technical change. The linking of what productivity the technologists expect will—not "could conceivably"—be achieved, with how the economic pundits expect the main industrial groups and the labour available to alter in size, might offer some broad guesswork about employment trends in future which could be no worse, for example, than that in which the Ministry of Labour was indulging a few years ago. This might be an exercise for the Government, the FBI, or the TUC: if it were clearly an honest job within its limits, it could be politically useful.

Such a survey would need, as this pilot one does, to be equally honest about the fact that if automation need not throw workers on the scrapheap, it will certainly need a

lot of them to change what they do in their jobs, where they work in their industries, and for some of them the industries and areas where they work. The price of steadily increasing comfort for most people, on these optimistic economic ambitions, would be, at any time, considerably increasing discomfort for some; for everybody, perhaps, more change during their working lives than they might choose. This is a real cost, which will have to be paid if Britain is to hold the pace of technical advance that its competitors certainly will; some monetary elements in it might well be repaid to the individual. Unemployment and retraining pay more realistically geared to current earnings, severance pay, transferable pensions systems—all require study by the Government as well as employers and trade unions. Britain does not need to follow Russia with a Minister of Automation; but it could well do with a Minister of Labour Mobility.

This optimism about fitting automation into Britain's hopes of economic growth is not in any sense intended to scout deeper questions about whether these hopes are practicable: first, the big question whether such a rate of growth can be achieved in such a way as to pay Britain's way internationally, and secondly the interlocked and hardly smaller one whether it can be achieved without a debilitating rate of internal inflation. Automation will only be worth having if it can help answer those questions, but it is only part of the answer: and if Britain cannot afford such a rate of growth, it will probably not be able to afford much automation either. The same applies to the possibility of a slump that is always there to hedge every economic bet. But if these things happen, in the short run we are all poor anyway.

Automation, admittedly, displays some tendencies that will take ingenuity to fit into Britain's future. In an economy that must always be more widely deployed in the world than the American or the Russian, serving always a broader variety of customers to earn its living, some of the dinosaur engineering of Detroit will never be worth while. Against every mechanical advance in productivity the British engineer will have to reckon flexibility more than his American counterpart needs to. But it is perhaps not too much to hope that he will display some ingenuity in doing so. Every highly industrialised nation—Germany as well as Britain and America—will have to reckon its own advantages and disadvantages in making use of this chance of much greater productivity. But it is a fair guess that none of these nations will be able to compete without it, and that Britain's major competitors will certainly stay in the forefront of technical innovation.

Obstacles to Automation

What are the main obstacles to Britain's staying in the front rank, too? First, perhaps, the fears of trade union rank and file, and to some extent the structure of these unions. As regards automation, the restrictive practices of labour are more hampering than the restrictive practices of business. Demarcation lines between skills that need to be merged or changed, the instinct to featherbed a new machine with men left over from jobs that die, the levelling process of the general unions that cuts down the value of skill, the age limits on entry into skilled trades and sometimes the unrealistic apprenticeship ratios—all of these, as sensible men in the unions know, clog technological drive. The constant pressure for higher wages which, sensibly applied, is the proper business of unions, does not; indeed, it plays an important part in driving management to accept even more efficient machines, and in offering industry the expanding demand that makes heavy investment worth while.

Obstacles from the side of management, in a period of economic growth, may impede automation less. Cartel arrangements are used less in a climate of economic expansion, whether or not official disapproval and investigation discourages them. And business concentration cannot at present, in all honesty, be said to be holding back automation in Britain; it is mainly in the concentrations that one finds it, or its earnest missionaries, because bigger business has the pick of the technological talent and has caught the taste of innovation. It is difficult to avoid the suspicion that bigness and automation, in practice, may develop together.

One may regret that not many industries in Britain are big enough for competition between giants, and hope that many smaller businesses will apply automation more ingeniously, though a good deal of what is said about this is soothing syrup. One of the areas of small-scale enterprise that could obviously affect the rate of automation is the instrument industry itself. A few years ago, this industry had some major weak points in research, and was perhaps overreliant on its customers' ideas. Today, it is more strongly based, scientifically as well as commercially; indeed, the need is perhaps for more capital and business acumen to buttress a few of the liveliest companies. The machinery industries, again, are devoting less attention to automatic control than some of their foreign competitors.

Training the Talent

But immeasurably the most important brake on automation and the other technological change Britain needs to keep its place in the world lies in training the talent. There is no need to repeat the flesh-creeping figures of Russian output of scientists and technologists, or to suggest the emulation of America's massive output of fairly well-educated human beings. These are the constant refrains of the fifties, and perhaps they are being plugged hard enough. They remain inescapable—and incidentally much truer, in any sense that matters yet, than that insidious argument about automation being much too complex for more than a fraction of the population to cope with.

It certainly seems likely that industries in which automation plays an increasing part will have less and less use for the person who cannot hope to be more than an unskilled labourer. These people must expect to be sifted down into less demanding occupations, and at best to benefit less than the average from any general rise in the standard of living. But educational standards in general ought to rise over the years, making fuller use of the nation's reservoir of intelligence: is the standard required for employment in industries using automation likely to exclude so large a proportion of ordinary people?

The technologist may claim that it is conclusively proved that not more than 20 per cent of the population have the intelligence to become technologists (to which the response of the average sensual man is liable to be "Goodness, isn't that enough?"). It will perhaps be time to worry about that when Britain is training all the young people who have the intelligence to achieve that honour—saving a few to interpret their esoteric languages to the stupid rest of us. It will require the common intelligence, the human understanding and the *nous* of many men outside the laboratories and workshops to make technology, and the automation that is the latest of its advances, the basis of Britain's future.

MINDING THE TRAFFIC

You will not find ponderous red buses queuing nose to tail at Port Louis . . . or taxis jockeying for position among the palm trees. The traffic here is in words, for this is one of the many cable and wireless stations owned by Cable and Wireless Limited. Here tens of thousands of words are received and transmitted every day . . . court news, commercial news, social news, sports news.

Cable and Wireless Limited provides vital facilities for Commonwealth communications. It owns a world-wide network of 150,000 miles of submarine cable which it maintains with a fleet of 8 cable ships. It also owns and maintains wireless relay stations on the trunk routes, operates the overseas telegraph services of most of the colonial territories, and cable services in various other countries throughout the world.

This great organisation, although it does not accept or deliver cables in this country, is always at your service overseas. It is set in motion whenever you send a cable from any Post Office which accepts telegrams, or from your telephone or Telex installation. Cabling is very easy, very swift and very sure. A Greetings cable to anywhere in the Commonwealth costs as little as 6s. 8d.

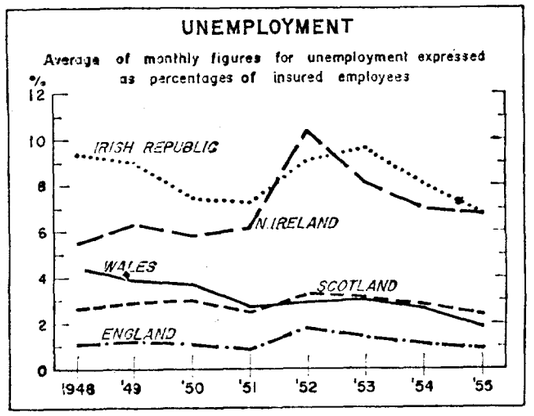
One More Heave?

As the Irish Republic faces the prospect of a declining population and cuts back its imports to meet an economic crisis, Ulster anticipates an increase in its population of ten per cent by 1979 and has formally been exempted by the United Kingdom Treasury from the credit squeeze. The only welfare state benefit which Ulster people do not share equally with English, Welsh or Scots is legal aid—and Ulster's thousand pulpits could not but oppose subsidies for divorce. In other benefits, whether for unemployment, health or education, Ulster is nearing parity with Britain—the school-leaving age goes up next year ; where facilities lag behind United Kingdom standards, the leeway is being made up by the British taxpayer. Wage rates are mostly maintained at mainland levels by the trade unions whose headquarters are in London. It has been necessary to put a pale round the province to keep out job and welfare hunting citizens of the Republic in the form of the Safeguarding of Employment Act.

Never, in fact, did the border divide two ways of life so satisfactorily to Orangemen as today. For twenty years Ulster stuck to the British connection when there seemed little but the dole and neglect to show for it. Now Orangemen can work up the argument that not only would freedom of religious conscience be forfeit if the Unionist party ever lost an election, but half the wages packet and freedom from doctors' bills as well. It is true that between 1946 and 1950 Unionists opposed at Westminster, in loyalty to the Tory whip, socialist measures which subsequently Unionists at Stormont, out of loyalty to the Imperial Parliament, voted for. But then Unionists opposed home rule itself ; when they duly discovered that so far from encouraging separatism, it necessitated keeping in close step with Britain, they realised its merits. So with cradle-to-grave social services: a thing so repugnant to the Catholic Hierarchy cannot but find favour in the eyes of even an old-fashioned non-conformist Ulster radical. And now that the Republic is forced to tighten its belt in step with Britain, while Ulster is free to continue priming the pump, the cup of Northern Irish pleasure is nearly full.



But not quite full—for Ulster's unemployment, at 6.8 per cent, conforms to the Irish rather than the British level. After thirty-five years under home rule, Ulster, it is claimed, is really beginning to bear comparison with the other parts of the United Kingdom; the formula, "equal burdens, equal benefits," is bearing fruit in a new buoyancy. New industries, diversifying the traditional pattern of "linen and ships," have created over 30,000 new jobs ; the impact of the social services may be measured in the death rate, which by 1955 was down to 11.1 per 1,000 compared with 11.7 in England and 12.6 in the Republic—and 15.4 in Ulster in 1923 ; the rate of house building exceeds that of Britain. Yet full employment does not go with these things so far. For a country which between the wars had an unemployment rate of 20 per cent, the present level of 6.8 per cent, however, does not look unduly discouraging. On a working population of 470,000 it amounts to not much more than 30,000. Would not one last heave—perhaps by the attraction of four or five large British or American firms—sop up this puddle of joblessness for good and all ?

Ulster, however, is not a development area nearing its full complement of new factories. To think of it in that light is to misconceive its economic problem. Besides being the remotest British province, it is also a state—and a state whose whole policy turns on the determination of the majority to remain part of the United Kingdom and separate from the rest of Ireland. It is true that Ulstermen do not think of it as a state. Belfast has not the air of a capital, as Dublin has—elegantly and authentically. Belfast is all too grimly a British industrial provincial city, with a parliament house in bad taste unconvincingly set in a suburb at the end of a trolley-line. And this is exactly what the Ulsterman wishes it to be—a provincial centre. London is his capital. But Ulster is a state nevertheless—even if a state within a state—determined to preserve itself. To the dominant Protestant majority, remaining part of the United Kingdom means paying the same taxes, obeying the same laws, possessing the same liberties, fighting the same wars, receiving the same social services and enjoying the same standard of life as any other six counties of England or Scotland. Remaining separate from Ireland means not only remaining the majority, but also means being strong compared with the south, not depopulated. There must be enough Ulstermen, both as voters and as "specials," to vote Ulster British and keep out the IRA. The difficulty is to achieve both these objectives, since in strict economic terms they are contradictory. Either you can have the standard of life—which means full employment—*or* you can have the population. But not, in a fringe province, both.

The effort made in the last ten years to jack up the province's standard of living is not however a by-product of postwar British social policy. It was a political necessity. It was possible to tolerate the big lag in Ulster levels of employment, earnings and amenities behind British before the war because jobs on the mainland were hard to get by anybody ; it became risky when too many jobs in Britain were chasing too few English workpeople. Too many Ulster Protestant voters might have joined the chase. But to raise standards to the Ulsterman also means raising costs to the Ulster industrialist, and perpetuating the shortage of jobs that drives the Ulsterman abroad. Ulster, enjoying full British standards, cannot agree to find its own level in the British economy like the Scottish highlands. Its policy is to seek from Britain not merely "development area

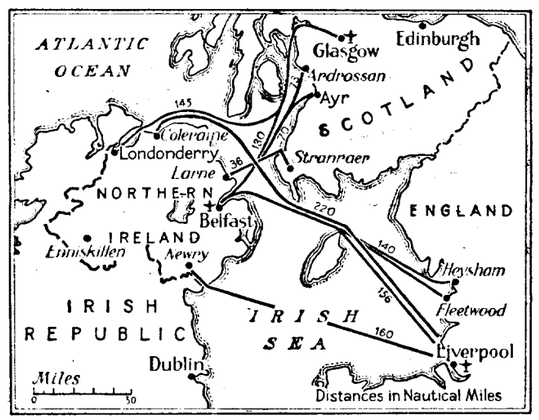
treatment" but a broad range of financial and economic adjustments which will give full employment in Ulster at British living standards for a rising Ulster population.

Almost from the first days of devolution Ulster politicians have pressed Britain for such adjustments. The most important step was taken in the twenties in the change of the role of the "imperial contribution"—the agreed proportion of Ulster's revenue earmarked as Ulster's share in shared United Kingdom overheads like defence. Clearly if taxation is uniform, and the imperial contribution forms a fixed proportion of national overheads, the balance of Ulster revenue may fluctuate and may be inadequate to provide services in Ulster of the same quality as in Britain. This was originally envisaged; but it was not long before the formula was stood on its head—and for many years the cost of Ulster services has been the first charge on Ulster revenue, and the "imperial contribution" has become a residuary item, which has at times fallen near zero, and (as a separate analysis shows) is more than offset by other payments from Britain to Ulster.

The principle has in fact been tacitly accepted that Ulster can be a deficit or "subsidised" area. The real problem raised by the rate of unemployment is not whether one more heave will end it, but whether it can be ended at all; what measures, at what cost, can so neutralise the province's natural disadvantages that both the indices which Ulster politicians must watch—the rate of unemployment and the rate of emigration—will drop towards safe levels.

Salt Water Fallacies

ULSTER'S economic handicaps are not easily to be overcome. Its main if not the only indigenous source of wealth is its grassland fed by an abundant rainfall. Its location is a handicap to the growth of industry based on resources drawn from elsewhere, and its small population—2.7 per cent of that of the United Kingdom—provides too limited a market for industries to produce for local use, other than building. In 1935 half Ulster's output of manufactures was for export compared with a quarter of the United Kingdom's. Linen and shipbuilding incurred no competitive disadvantage in the cost of delivery of the finished product (1 per cent on the value of linen), and in raw materials linen was partly, though decreasingly, based on a home grown fibre, while the shipbuilding industry was able to arrange that steel should be delivered to Belfast at the prices ruling at other shipyards in the United Kingdom. Linen and shipbuilding fit well into Ulster's economy—linen in the country districts provides work for rural female labour, and in the Belfast area for the womenfolk from households whose main breadwinner is in shipbuilding or engineering. But it was Ulster's misfortune (and still is) that linen is a luxury article and ships are capital goods—the demand for which is liable to periodic slumps. Both were hit by the recession in 1952-53.



Other industries have been attracted naturally to Northern Ireland, but they have a narrow range. Other textiles assort well with linen, using much the same skills and often similar processes; and the transport disadvantage is also little more than that experienced by linen. Cotton textiles, which can import their raw material direct, probably add no more than 5 per cent to their cost through transport. The manufacture of carpets, both for export and the mainland market, is also favoured to some extent as it can import wool direct. Processes based on textiles, like tyre fabrics, can also stand the transport burden; so can some light industries producing goods whose value is great in relation to their bulk and cost of raw materials, and a large proportion of whose output can be shipped directly overseas. All these, of course, mainly employ female labour; and the favourable labour cost indeed may permit them to operate in the rural areas despite the high cost of Ulster road transport. But it is far more difficult to attract the heavy industry which employs men; it must be able to follow the example of BTH at Larne, which will export heavy alternators overseas. Country towns suffer from male unemployment; which however is persistent for more reasons than the purely economic. "Are you married—or working?" is the unkind question asked of men in Londonderry; but the balance might be restored if the breeding of whippets could be put on a regular commercial basis.

Nor are the prospects for the expansion of Ulster's established industries very hopeful. Shipbuilding is confined to a single firm—Harland and Wolff—and capacity is booked far ahead; but it is not very likely to employ more men—indeed the switch from liners to tankers involves the redundancy of craftsmen in the fitting out trades. The linen industry shrank steadily between the wars and the decline recommenced in 1951. Founded on cheap labour and cheap flax the industry now enjoys neither, and though the fabric itself is unrivalled for many purposes, it also now has many competitors. It suffers from an archaic wages system, although this problem is being tackled; labour turnover is high. It is often alleged that it ought to re-equip faster, but linen looms, unlike cotton and other looms cannot be easily modernised, and much of the modern machinery lately installed produces poorer cloth. Experiments with the mixing of linen with other fibres were disastrous and did great harm to Irish linen's good name. Linen, in fact,

must stand on its own, as something unique. This requires research not into blends, but into improved quality, methods and wider uses in industry than clothing or napery. To hold its consumer market good and determined publicity is vital. In fact both research and publicity are inadequate; firms are out of date, managements tired. But when a firm is efficiently run and its linen imaginatively marketed it often finds difficulty in coping with the press of orders. It may be that the industry is now nearing bedrock; but competition from the Continent, where more scientific research is being done, promises to become troublesome, and it is not easy to feel great confidence about the future.

Every attempt to broaden the range of industry in Ulster thus comes back in the end to transport costs. How serious is this today, quite apart from the cramping effects it has had in the past? No single measure or index can be offered; and special rates are legion and secret. The Irish sea involves Ulster firms in both direct and indirect additional costs. The direct cost is the sea freight, in which the cost of loading and unloading at the docks may be the most serious component; it is paid both ways—on materials inwards and goods outwards unless the latter are for export. Sea freight requires, in addition, heavier packing, which puts an extra cost on materials and sub-assemblies inwards and goods outwards—unless for export. Additional indirect expenses are the losses incurred in breakage by dock handling. Another, perhaps the most important of all, is the delays caused by shipping. Delays are costly enough in Britain; but there is the alternative of road and rail, and individual firms can run their own fleets of lorries to any part of the island if marketing conditions make it advisable. Except in the rare cases when it can use airfreight, the Ulster firm is at the mercy of the shipping bottleneck. There is, too, a certain managerial disadvantage in operating a branch factory so far from the mainland.

The cost of the sea link, moreover, is raised to Ulster by the inefficiency of port facilities. At Heysham, for example, sidings are inadequate and the hold up of trucks may make it longer to deliver cloth to Burnley than to New York. Dockers work so slowly that only 600 tons can be loaded on to ships of 1,500 tons capacity; even before the war they could load only 1,100 tons. Knocking off on Saturday afternoons for football often means that goods loaded on Friday night in Belfast return to Belfast on Monday morning before being offloaded finally in Liverpool on Tuesday. Freight rates tend to be raised to Ulster by rates agreements between Coast Lines and the Transport Commission. There is also solid reason to believe that profits by merchants in the coal trade are higher than those ruling in Britain.

All this is the natural result of a lack of competition. Competition is, however, now provided by the cross-channel container and vehicle ferry services between Larne and Preston; but they are still relatively dear, except for goods

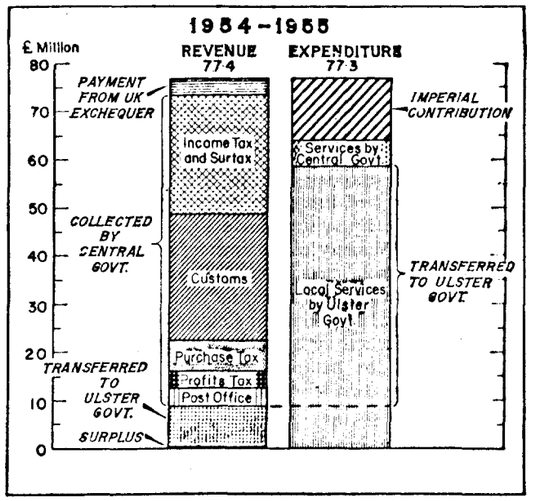
Finance Under Devolution

THE accompanying diagram illustrates the "federal" system of Ulster finance. On the revenue side, the Central government in London collects nearly 90 per cent of the taxes, direct and indirect and at United Kingdom rates—only the remaining taxes, described as "transferred," which are collected by the Ulster authorities can be varied locally (and are—for example, estate duties are lower than in Britain). In addition to the taxes collected in Ulster the Central government adds from the United Kingdom exchequer a small sum, treated as a receipt by Ulster, to equalise the cost of the social services, which cost more to apply in Ulster conditions than in Britain.

On the expenditure side, the Central government retains from the 90 per cent of the Ulster revenue which it collects (*a*) an amount to pay for Ulster services run from London—such as the post offices, the Supreme Court, etc., and (*b*) the "imperial contribution" which is the amount agreed between the two governments as representing Ulster's share of defence and other United Kingdom overheads. This sum is in theory agreed by the Joint Exchequer Board, which, however, meets very rarely; and its procedure is obscure. Less these sums, Ulster receipts are handed back to be added to taxes locally collected to meet expenditure in Ulster.

But this equation does not include all transfers between the governments. There are agricultural and food subsidies which in 1954-55 amounted to about £10 million, but are now less; and the tax on undistributed profits of British companies owned by Ulster residents must be added. Professor C. F. Carter of Queens University calculated that these sums, with the exchequer contribution, amounted in 1952-53 to £21 million against an "imperial contribution" of £19 million. In 1954-55 the imperial contribution of £12 million was similarly offset, and perhaps negative also. In 1956-57 the imperial contribution is also estimated at £12 million, but agricultural subsidies have fallen.

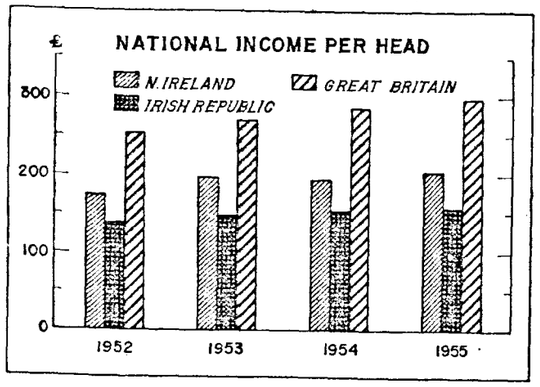
But it must be emphasised that financial relations between the two countries are never fully explained and are the result of confidential discussions between the two sets of officials dealing with finance in London and Belfast. In any case, it is not fair to accept the figures entirely on their face value—for even now in some respects Ulster is spending less on social services per head than Britain, and not giving fully equivalent services. This point is overlooked by Mr Labras



O'Nuallain's analysis which simply on the figures showed that between 1921 and 1939 there had been a net "contribution" from Britain of £2.7 million, and between 1946 and 1950 one of £5.1 million (he does not dispute that the imperial contribution in the war years aggregated £80 million). When there is no parity of services, Ulster under devolution is entitled to claim that it is overtaxed compared with other "deficit" areas—such as the Scottish highlands.

of high value. Their great advantage is that they cut down packing costs and losses. The clearest measure of the heavy disadvantage of sea transport is shown in the subsidy of 17s. a ton which the Ulster government makes to industrial users of coal, costing the exchequer £750,000 a year. Without this subsidy, steam coal which is delivered to, say, Birmingham for £4 13s. a ton costs £6 1s. a ton in Belfast.

The transport handicap, by narrowing the range of industry and keeping the Ulster cost of living up, has impoverished the entire economy. Salt water is no barrier to money, and Ulster's savings, denied local opportunities, have flowed to Britain in search of higher yields and wider variety of stocks. Over £400 million has been invested by Ulstermen in Britain, against a mere quarter of this sum invested by British capitalists in Ulster. Local firms are smaller and a higher proportion are private companies than in Britain. Business enterprise depends rather on the family tradition than on the professional manager and the public company. The average capital of the Ulster firm is barely 75 per cent that in Britain, and 60 per cent of industrial capital is in private companies against 36 per cent in Britain. Remoteness, limited capital, and family firms in modern Ulster have meant only too often lack of enterprise; unemployment and cheap labour have discouraged modernisation of plant as well as of management and of marketing techniques. While the return to the Ulster investor is thus often unattractive, the rate of gross profit has to be much higher. Contracts acceptable on a ten per cent margin in Britain must offer 20 per cent to the Ulster contractor.



These disadvantages are reflected in Ulster's lower income per head—£205 per head in 1954 compared with £299 in Britain and £159 in the Irish Republic. The predominance of agriculture is partly responsible for this figure; but industrial earnings are also lower than in Britain corresponding to the fact that net output per worker averages only 75-80 per cent of the British level. But since 1939 both income and earnings have been rising faster in Ulster than in Britain—before the war, national income per head was only just over 50 per cent of British. Clearly this means that the possibility of setting lower labour costs against higher transport and production costs in Ulster is diminishing. When profit margins are everywhere getting narrower and price competition in home or export markets more severe, this must tell against location of operations across the Irish Sea.

Bringing the job to the Ulsterman

NORTHERN IRELAND began its attempt to counteract these cost disadvantages, and to diversify its narrow industrial base, before the war; by making substantial grants it pulled in over 50 firms employing 6,000 workpeople in the thirties. There are now two kinds of subsidy, one to encourage the modernisation and re-equipment of established firms, the other to attract new manufacturers. These provisions leave a great deal of discretion to the Ulster Ministry of Commerce, and great enterprise has been shown in meeting every "prospect" in a down-to-earth business spirit; the spearhead of the effort is the Northern Ireland Development Council. There is, however, some dissatisfaction with the way in which the Board of Trade in London has presented Ulster's claims when a British firm was considering the relative merits of the various development areas.

Under the Re-equipment of Industry and Capital Grants to Industry (N.I.) Acts outright grants have been made to meet a third to a quarter of the cost of improved buildings or new plant; about £21 million has been spent or earmarked. It amounts in effect to an extra investment allowance and recognises the perennial shortage of capital which causes small Ulster firms to lag behind. The industries development acts make the initial establishment of firms cheap and easy; both standard and specialised factories are built and let at subsidised rentals, and grants are made towards new machinery. The government usually builds approach roads and, for large factories in new locations, housing estates. In theory, it seeks manufactures that employ mainly males, and it offers bigger concessions to firms that will go to remoter areas where unemployment is heavy, such as Londonderry. Nor are these the only inducements. At a time when shortage of labour, associated with soaring labour costs, curbed the expansion of firms in Britain, Ulster offered an "overspill" area where labour was readily available. Now that labour difficulties in Britain have been eased, but working capital is harder to find, Ulster offers not only a cheap factory and plant; the removal of CIC restraints on bank advances for Ulster development makes it possible to raise money to cover the rest of the cost of expansion despite the credit squeeze in Britain.

To examine these measures critically is in no way to denigrate them. If Ulster is not to remain largely a breeding reserve for factory labour in Britain they were necessary. It is fair to say, too, that if they leave Ulster's basic disabilities untouched, they are doing something to impart new momentum in the economy. The narrowness of Ulster's industrial base created a shortage of skilled labour—whose wage rates often exceed the British level—which these new industries may correct, perhaps attracting back some of the skilled men who have left. They are certainly extending the range of semi-skilled employment and training new skills, thus creating new labour resources locally. Nor is all expansion government-sponsored; some firms have opened up

No C.I.C. squeeze on factory development in Northern Ireland

Unused resources to be developed—

SAYS THE CHANCELLOR OF THE EXCHEQUER

In a letter to the Chairman of the Capital Issues Committee the Chancellor of the Exchequer said of Northern Ireland—"There, in contrast to the rest of the U.K., are unused resources which might be developed for the benefit of our economy as a whole. I am therefore writing to let you know that the Treasury will be ready in principle to consent to proposals to raise money exclusively for investment in Northern Ireland . . ."

NOW . . . Northern Ireland offers you

GENEROUS FINANCIAL ASSISTANCE
Capital grants for plant, machinery and new buildings. Grants toward transfer of machinery to Northern Ireland. Grants for training and services. Coal rebate.

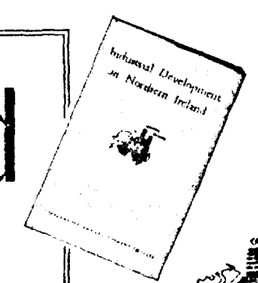
FACTORIES
—12 planned or building
Government-built factories to meet your needs on rental (from as little as 9d. per sq. ft. per annum) or on repayment.

PLENTIFUL LABOUR
Plentiful labour supply. Possibility of multiple shifts. Little absenteeism: low labour turnover. High output per man.

AND . . . the opportunity to raise money in Great Britain for investment in Northern Ireland.

FULL INFORMATION
The Council (Chairman, Lord Chandos) has prepared a practical Memorandum of the facts a businessman wants to know. Write for it in strict confidence to the NORTHERN IRELAND DEVELOPMENT COUNCIL, DEPT. E1, 13 LOWER REGENT STREET, LONDON SW1 (Tel: WHI 0651) or to the Ministry of Commerce, Dept. E1, Belfast.

Northern Ireland
—centre of growing industry



114 new firms have opened up in Northern Ireland since the War, including: BRITISH THOMSON-HOUSTON CO. LTD. COURTAULDS, LIMITED · BRITISH TABULATING MACHINE CO. LTD. · METAL BOX CO. LTD. · HUGHES TOOL CO. LTD. (U.S.A.) BEHR MANNING LTD. (U.S.A.) · PYE, LTD. · BERKSHIRE KNITTING (ULSTER) LTD. (U.S.A.) · LINES BROS. LTD. · LOTUS LTD.

in Ulster on their own, on an assessment of cost advantages. But the question is still whether these measures are enough —whether, to put it crudely, the subsidy is even now adequate.

It is one thing to attract new firms as the result of "overspill" in a time of expansion in the United Kingdom; it is another to correct a permanent disadvantage in operating costs which in the end must tend to overhaul reduced capital costs and inhibit further growth—as well as secondary growth in the form of service and sub-contracting industries. It may be assumed that the greater number of firms attracted to Ulster fit the traditional pattern of making goods for export whose value-to-weight ratio is high—and for those "out west" in Londonderry and Enniskillen very high indeed. This leaves Ulster as dependent as ever on the sensitivity of export trades—pulling more than its weight in the export effort. The province remains largely cut off from manufacture for the mass British market, yet its local standard of living is chained to the United Kingdom level by its having to import, at extra cost, most of its consumable goods from Britain (and if resale price maintenance goes, Ulster prices might be raised above the British level to carry the full extra transport cost). As it is, a council house in Ulster costs up to 12½ per cent more to build than in England and Wales.

★

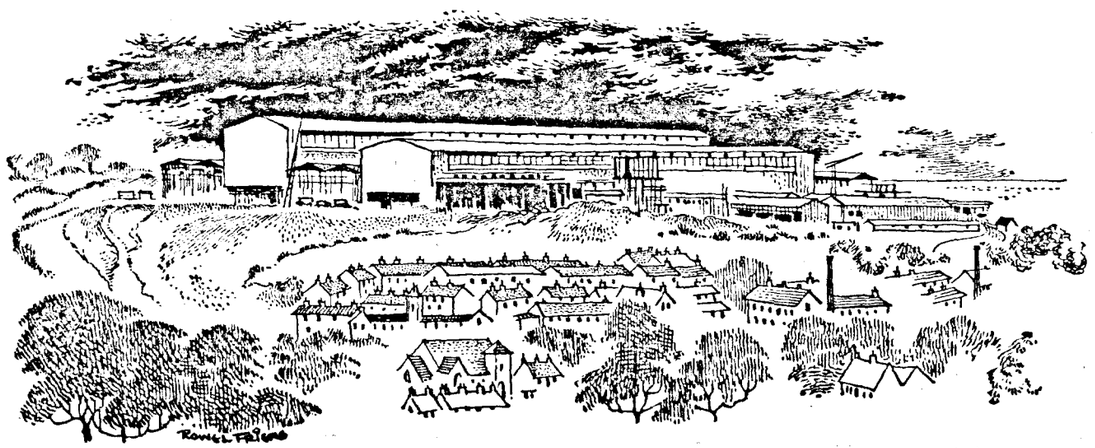
There is also a dilemma over wage costs. Parity requires that if the cost of living in Ulster is as high as on the mainland, wages should also be around the British level; but one of the attractions held out to Ulster manufacturers is that labour costs are lower. This is undoubtedly true. Average weekly earnings (as opposed to rates) are rather over 80 per cent of British. This, however, is partly because the proportion of unskilled and female labour in Ulster is far higher than in Britain—and the proportion of "non-productive" or administrative workers is lower. Labour costs, on the other hand, are at present lower because labour turnover is less, less overtime is worked, and all sorts of special wage payments are unnecessary in a region where unemployment discourages the blackmailing of employers, even in shipbuilding. But wages have been rising fast compared with their prewar level; as in Britain the differentials between skilled and unskilled work have

narrowed and women's wages have risen steeply. Statistics show that trade disputes have been as frequent and lengthy in Ulster as in Britain, though since 1953 have been less.

The older industries are in fact bitterly complaining of this. Linen manufacturers declare that the new factories do not take the unemployed, but cream the best of the women workers at higher wages; and that firms originally established on an undertaking to employ men, quickly turn over to women and even juveniles to reduce their labour cost—a common experience in the British development areas. These complaints are echoed by many of the newer industries whose managers say "We don't want any *more* factories round here anyway." The risk of pushing up earnings and employment with one hand, therefore, is that unemployment is being created elsewhere in the Northern Irish economy with the other.

It is not easy to assess the extent to which this has happened, because the definition of insurable workers has changed. But between 1948 and 1955 the insured labour force in work fell by 3,000—from 444,000 to 441,000; but those employed in agriculture fell by 11,000 and those in the linen industry fell by 7,000 while other declining industries put another 10,000 out of work; in the same period 5,800 were added to the unemployed. The number taken on by industries assisted by the government in those seven years was about 14,000. Services took on another 3,000 in that period and building (mostly government-subsidised) 4,000 more. Therefore it would appear that government-generated activity did little more than help to offset adverse changes elsewhere in the Ulster economy.

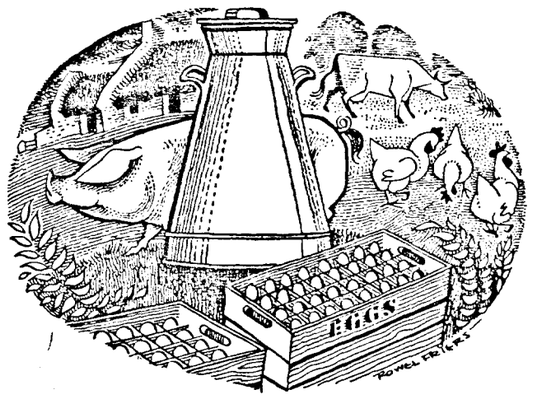
Looking ahead, the industrial working population is expected to increase (at the present rate of migration) by about 16,000 by 1961. If the present rate of expansion by government assisted firms is maintained—both those already established and new ones that are expected to provide 500 new jobs a year—another 10,000 new jobs will be created. These figures hardly suggest that unless non-assisted industry expands more rapidly, there will be any great improvement in Ulster unemployment. Clearly a further decline in linen would make things worse—and it is badly squeezed between rising costs and the competition of synthetics. So would a further fall in insured agricultural employment. And what happens if there is a drift from the land by the self-employed—the peasant or, more probably, his children?



Life on the Milk Cheque

THE decontrol of food in 1953 was a heavy blow to the Ulster peasant farmer. For twelve years he had suffered no competitive disadvantage against the English or Scots farmer in the transport of his beef, pigs, eggs and mutton to the English market, as all prices were the same guaranteed prices, whether in Londonderry or Sussex. Milk is now the only product paid for at full English subsidised rates. Indeed it is more heavily subsidised. Eighty per cent of British production is liquid milk for consumption, the balance going to the processer, and the whole bought at 3s. 1d. a gallon, even though the processer pays only 1s. 6d. In Ulster farmers also get 3s. 1d. a gallon, though only 55 per cent is for liquid consumption, and the rest goes to the processer. Milk production has been rising by about 3¼ million gallons a year since the war; in 1956 it began to increase even faster.

This concentration on milk is the inevitable resort of the small farmer who cannot do chancier lines in a big way. Apologists for Ulster agriculture argue that it is intensive agriculture. The Ministry of Agriculture's analysis of the financial results of a sample of farms shows—inevitably—that the smaller the farm the higher the profit per acre; but the sample also tends to be weighted in favour of the efficient small farmer, if only because it relies on ability to keep detailed and accurate accounts. No less important, the profits of the small farms do not take into account the value of the labour of the farmer and his wife. In fact, the average undercapitalised small farmer in Ulster survives by immensely long hours and a very compressible standard of living. The average holding is under 30 acres; of 90,000 "farms" a third are beween 1 and 15 acres. The number of owners is increasing; but since 1945, mainly because so much land has (rightly) gone back to pasture, 17,000 full-time agricultural workers have left the land, 8,000 part-time workers, 14,000 farmers' sons and daughters.



Pigs are, with milk, the most profitable line to small farmers, but the guaranteed market which the farmer gets for his milk deprives him of any incentive to feed skim to pigs, so production is based on imported feeding stuffs. A 200 lb pig which fetches £19 10s. in the market costs an average farmer £17 10s. to grow; a devoted pigman may sell for £20 against costs of £16. A well-capitalised 15 acre farm with 8 sows and 100 pigs on hand, will produce 200 pigs a year for a profit of £800; the ordinary Ulster pig-keeper will have but two sows and earn £200 from them. In eggs, the other small farmer's stand-by, saturation point has been reached.

Ulster beef is now a gamble. The cost of transport on fat cattle and the wastage in weight fall on the farmer. The Ulster farmer complains that when his opposite number in Scotland makes a handsome profit, at £6 a cwt he can hardly break even. In 1953-54 the average profit per acre of a cattle farm in the Ministry's sample—on a farm of 100 acres—was half that on a pig-and-poultry holding. The Ulster cattle farmer has more reason to be discouraged than the British, and herds have shrunk further in the past two years. Clearly incentives for beef and milk are the wrong way round.

There are, therefore, all the portents of a severe agricultural depression. This, however, is not because farming is basically unprofitable. Ulster is magnificent cattle country, and an efficient farm can make large profits at present prices. A well-run 100-acre dairy with 60 cows shows a clear profit of 1s. a gallon on milk. The country is well adapted to balanced units of 400-500 acres, which could produce milk at 2s. a gallon and make a profit on beef. Such farms can make full use of the grass growth in summer, much of which is now wasted, because small farmers, despite generous improvement grants, cannot make silage, fail to drain land properly, and even now retain many inferior beasts. But such farms are rare because capital to mechanise and stock them is lacking, and land is still absurdly dear—often selling at £100 to £120 an acre. The reason is, of course, that the small peasant, who came into existence as the result of the generous provisions of the Irish Land Acts, is reluctant to sell out—and understandably, since in the past there has been no industrial job to go to; the alternative to sticking it out on a subsistence level was to emigrate overseas. Though so many farm-workers have left the land, the small farmers cling grimly to their uneconomic holdings, which are, in the ultimate resort, a family insurance against a renewed industrial depression. Even when efficient farmers can buy land, its high price exhausts their resources, and it is hard to acquire in convenient parcels.

In the past there has certainly been much concealed unemployment on the land, and there may still be some. It now seems certain that most of the natural increase of the rural population, which totals about 500,000 will want urban jobs. If so, industry would have to absorb not merely the natural increase of the present industrial labour force population, about 4,500 a year, but nearly the entire natural increase, which is about 13,500 a year (less emigration—now about 5,000 a year). These figures assume that the bulk of the peasantry will stay on the land. They may if subsidised—and they are vital to the balance of political power in rural constituencies. On the other hand, if consolidation of holdings brought a really efficient agricultural economy based on grassland management into existence, as profitable as in New Zealand or Denmark, the present agricultural labour force of about 150,000 could probably be cut to

100,000 or less—50,000-70,000 operating large and medium farms and the remainder on highly capitalised smallholdings producing pigs intensively or operating poultry farms round Belfast. The rest would need industrial jobs.

This, reduced to its simplest, and indeed to over-simplified terms, is Ulster's agricultural dilemma. The subsidies needed to bolster an inefficient agriculture will subtract from what could be put into industry. Left to find its own level unsupported by subsidies, agriculture will throw a mass of green labour on the labour exchanges; unless somehow the starveling peasant clings to his holding this could shake the political balance to its foundations.

The Art of One-Party Rule

THE Unionist party in Ulster has enjoyed a monopoly of power to a degree unrivalled in any British country except perhaps by the Labour party in Queensland; and a change in Ulster is even more unthinkable than in Queensland. The Republic is now ready to offer Ulster generous terms for its adherence—apparently the same degree of political devolution within a united Ireland as it now has within the United Kingdom (Stormont, English law, no compulsory Erse and *The Observer* on Sundays). But what may now be acceptable to Dublin at a time when tributes are being paid to the memory of John Redmond, the moderate home-ruler, is no longer acceptable to Belfast; it would mean leaving not only the United Kingdom but the Commonwealth. Besides, the border does not only divide Protestant-dominated Ireland from Catholic-dominated Ireland, or welfare-for-all Ireland from sink-or-swim (across the channel) Ireland; it is the unifying principle of the Unionist party.

The political clock stands at 1921; and to cross to Belfast is to make contact once again with religious attitudes which have been long overlaid elsewhere in Europe. Playing for one's own side forces people whose Sunday observance would be perfunctory in Britain to go to kirk or chapel, convinced that the solidarity of the other party in going to mass is making a political point against partition. Belfast's bookshops seem each to be the propaganda office of a missionary sect, in depressing contrast with those of Dublin which are catholic, civilised, charming—and censored. Graffiti on Belfast walls have doctrinal force. One by-product of this bigotry is Ulster's low rate of juvenile delinquency, illegitimacy and vicious crime. On the other hand, personnel managers of the new factories have to make it clear that arguments developing on the production line over the validity of Anglican orders or the claims of the Roman curia must be settled—on pain of dismissal—off the firm's premises.

But there are other issues; and to the thankful delight of a hopelessly fragmented opposition in Stormont, they usually split the Unionist party. There is first the perennial need to reconcile British legislation, re-enacted in Ulster to maintain uniformity, with provincial interests. Secondly, there is the conflict between left and right wing viewpoints, often at war in the person of the same Unionist MP sitting for a working-class constituency. Thirdly, there is the chasm between urban and rural interests—the latter being far stronger in Stormont than in Westminster.

Thus, for example, when family allowances were increased for the third and succeeding children in Britain, the Ulster government, mindful that Catholics have large families, tried to confine their own provision to the third child only; and great was the glee in Orange circles until protestant parents set up a howl that they would have, for their taxation, exactly what Britain had, and made common cause with the outraged Hierarchy in Belfast. The principle of uniformity prevailed. Only when there is no conflict of social interests can Ulster easily diverge from the British pattern, even when this is a socialist one. Thus the government has been able to make minor concessions in taxation; in the interests of the family firm, estate duties are somewhat lighter in Ulster. Again, a Unionist backbencher's revolt secured very big modifications in the Statistics of Trade bill, though clearly it is desirable to have statistical uniformity between Britain and Northern Ireland; but Unionist conservatism saw a chance at last of asserting its principles without danger, and forced the government to emasculate the bill.

On the other hand a perfectly sensible Rent Derestriction bill brought forward earlier this year by the government to prevent Belfast housing declining faster and give conscientious landlords some justice, caused the resignation of the Attorney-General and the revolt of several other MPs under pressure from their working class constituency organisations. A hint that closure of the uneconomic railway system had been decided in principle brought roars of protest from the west, which declared it was being abandoned, as well as from a column of railwaymen which marched on Stormont.

Such splits never lead to defeats in the House—though the government came within an ace of it on a clause in the Dog Licence bill this summer. Normally, the government measure is pushed out first; then opposition and lobbying develop; then the party splits; then a compromise is

BRITISH OXYGEN in Northern Ireland

In the present industrial resurgence which Northern Ireland is enjoying, oxygen makes an outstanding contribution. At the new British Oxygen works at Castlereagh Estate, Belfast, plant has been installed to produce oxygen and other gases to meet the present and future requirements of the Country.

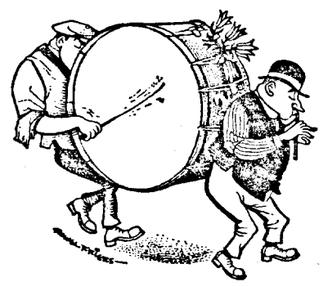
Complementary to meeting the needs of industry is the supply of medical gases essential to the continued efficiency of Ulster's hospitals for whom British Oxygen maintain a 24-hour service.

To-day, Northern Ireland can claim a rise of 25% over the pre-war figure for industrial employment, and takes pride in the lowest figure ever recorded in the country for infant mortality. As "The Times Weekly Review" Survey of Northern Ireland recently put it, "These are two boasts of Northern Ireland today and a share of the credit in both is claimed by the British Oxygen Company Limited."

BOC

reached privately at a parliamentary party members' meeting; finally the government measure is withdrawn or amended and passed with the usual Unionist majority. Sometimes a minister falls in this process; it is indeed the one means by which the Prime Minister can progressively change the cabinet—though in the Derestriction bill crisis the Attorney-General, Mr Warnock, was apparently somewhat surprised that, even under the Ulster rules of the game, he could not remain in the cabinet and lead the opposition to the bill. The Prime Minister can himself only be eased out of office by a palace revolt staged by backbenchers.

Behind the party works the Orange order with the twofold task of keeping the protestant electorate fervent on the basic issue and the government aware of threatened splits on class issues. Perhaps its most important purpose is by means of mystical rituals to maintain the solidarity of capitalists, shopkeepers, artisans and unemployed. At election time and at the tribal festival on July 12th it takes the populace back to 1689 and is grateful for an IRA raid to lend verisimilitude to the proceedings. Jokes at its expense are most frequently heard among the graceless Unionist MPs at Stormont.



The real work of an opposition is, in fact, done inside the Unionist party. The official opposition does not call itself an opposition, and on day-to-day affairs often does not bother to oppose. It does not recognise Stormont as a legal parliament and feels it has to be careful not to build up any impression of doing so. It is left to the individual members whether they will take their salaries and attend, and record their opposition in speeches and votes, or record an even more implacable opposition by not attending at all. The latter are mainly Sinn Fein; all, of course, are anti-partitionists. Those that attend fight on issues that rouse the Church, such as financial provision for catholic schools (higher than in Britain), or for the Mater Infirmorum Hospital in Belfast, which on religious grounds has contracted out of the health scheme, but in taking protestant as well as catholic patients expects state support without the secular inquisition of the Ministry of Health.

★

But this does not amount to a policy. Protestants in Ulster argue that the weakness of the anti-partitionists in politics reflects the fact that the catholic voter is being won over to Union by the social services, as well as by a growing suspicion that life in free and theocratic Ireland is not all it might be; that, indeed, the opposition would be reborn if it would only accept Union and fight the government as an alternative, but loyal, government. The opposition members do not agree; even if they did, they say, the British system of single-member constituencies puts them in a permanent and hopeless minority. Where they might hope to gain some limited power—in the field of local government where in particular areas Catholics heavily predominate—they say they are cheated of it by gerrymandering. The local government electorate, which has property and residential franchise, not adult suffrage as in Britain, is weighted in favour of the more prosperous protestant community. Where that is not enough, as in Londonderry, Nationalists point out that though Catholics are in the majority, the curious pattern of constituency boundaries confines them to one-third of the seats in the council. (In Londonderry, the Protestants retort, as they show the visitors round the walls that stood the siege of 1689, "We built this town; it is asking human nature a lot to hand it over to people who didn't build it.") Catholics allege not only electoral discrimination, but a good deal of discrimination in business and in the civil service. Where secular passions run high, it would be naif to think that they do not affect a man's chances of promotion; but there are Catholics in leading positions in Belfast, and it is freely said that they fill their establishment with—Catholics. The opposition comforts itself with the fact that though Catholics are only 35 per cent of the whole population, they are 43 per cent of the population under one year old. There has, in fact, been no increase in the proportion of Catholics in the population since 1921; a higher birth-rate may be offset by a higher emigration rate. This balance, if full employment is achieved, may not remain; even so, demographers think it will take fully 100 years for the catholic electorate to exceed 50 per cent of the total—by which time, Protestants suggest, the south will be so depopulated as to present no danger.

The Ulster Labour party was extinguished by the election of 1949, but it may regain two seats in the next election. It does not thrive because catholic Labour cannot be socialist and protestant Labour is easily accused of splitting the partitionist vote. Unionists claim to have put through all the socialism any protestant working family can want, and so far it is a valid, if slightly hypocritical, claim; it remains to be seen what would happen under another Labour government.

★

Deadlock thus persists, and this takes the serious interest out of provincial politics. This in turn does not make for an able type of provincial MP; finding cabinet ministers of any calibre is becoming very difficult indeed—so much so that the progress made by Ulster in the past ten years must frankly be largely credited to its intelligent and knowledgeable provincial civil service. In fact the average Ulsterman thinks of Stormont as essentially there to keep Ulster in the United Kingdom—all the more so since the Government of Ireland Act, 1949, gave to the Northern Irish parliament, and took away from Westminster, the right to decide on the status of Ulster. This, so to speak, is the casket in the white mausoleum which is Stormont. For the rest, the Ulster public considers that its provincial MPs are well paid to pass on the changing British way of life as laid down progressively by Westminster legislation with as little variation and as few vapours as possible. The Catholic sees it simply as the headquarters of a highly-organised one-party state in which he has no chance at all.

This is bad for Ulster, because clearly Stormont has an important task besides that of keeping Irish politics out of Westminster. Devolution, as this analysis shows, is not a rubber stamp. It is still, economically if not politically, an unsolved problem. The Ulster parliament needs to be free to assess Ulster's situation in the light of facts rather than religious passion. For a time is coming when solutions will have to be faced more radical than any yet tried.

Underpinning Ulster

THE logic of the foregoing analysis is that full employment at a high and rising level of earnings and income is only attainable if the rate of migration is allowed to increase, and a smaller Ulster population is grouped round a highly efficient labour-saving agriculture and specialised export industries. In such an Ulster "the west" would be thinly populated, the country towns shrunken, the railways abandoned. It might even be too thinly populated to hold politically.

To this there is only one alternative: to accept the obligation to keep Ulster going as a general overhead and responsibility of the United Kingdom on a point of principle—upholding the right to self-determination of the protestant majority (so long as it is a majority) and on a point of national expediency: the unquestioned use of the Ulster ports in the event of another battle of the Atlantic.

At this point, the solution of "returning" Ulster to Ireland may be shelved. The result would be a heavy fall in Ulster's living standards, catholic and protestant alike, unless—probably even if—the Republic returned economically as well as politically to the United Kingdom. The two Irelands are not complementary but competitive in their relation to Britain. In fact, Britain is lucky to have to worry about parity for only six counties—not for 32. The south has muffed the chance of a first-rate grievance here.

★

Another possibility, however, which has been canvassed in the past, would be for Ulster to have dominion status, which would give it complete control over its own internal finances and its external trade. As a dominion, Ulster would be in a position to impose a much lower rate of income tax than the United Kingdom, which would in itself do much to make the location of the country for industry—even more for shipping lines—more attractive; and it could impose protective tariffs. It could also keep its defence expenditure extremely low—on the pattern of some other dominions—in the certainty that in the last resort it could rely on Britain for defence. The difficulty of reconciling United Kingdom taxation with growing industries has in the past caused some Ulstermen to think along these lines. But if it is true, as seems most probable, that over the years Ulster has on balance been subsidised to the extent of the "imperial contribution" from Britain, dominion status would not enable the country to lower taxation without lowering social services, which would simply mean that population would be drained to Britain in exactly the way that it is in Southern Ireland; nor does it follow that even tariffs and lower taxes would bring enough industries to Northern Ireland in view of its very small internal market. On balance the advantage of remaining completely integrated with Britain seem vastly to outweigh the disadvantages.

If this is agreed, one is simply left with the practical problem of adjusting the economic relations of the province with the mainland under the existing system of devolution. On this basis, it may be accepted at once that much of what the Ulster government is doing to attract new industries is inevitable. But the fact must be faced that it is not a temporary expedient; in one form or another Ulster will have to continue to be treated as a development area. The hunt for new industries whose cost-structure fits reasonably into Ulster conditions will have to go on. The view that Ulster needs to attract the manufacture of some of the new instrumentation processes connected with automation has much to recommend it—for clearly the final cost is extremely high in relation to the cost of raw materials and their transport. Computers and calculating machines are already being made in the province. The Ministry of Supply could help by its allocation of defence contracts, specifically by extending atomic and other research to Ulster. This might increase the cadre of highly trained workers; but the danger is that it would tend to draw more upon the female than male working force and once again this would further force up labour costs for the province as a whole.

★

Sooner or later it will be necessary to take the shorthorn by the horns and rationalise Ulster's biggest industry—agriculture. If industry is diversified through the rural areas this need not be disastrous to them. But it is a fair criticism of Ulster agriculture that too few processing industries are based on it. More liquid milk should be processed and the pigkeeper relieved of his feeding-stuff bills by adequate supplies of skim milk to add to potatoes. But the most obvious gap is an industry based on Northern Ireland's meat, which is potentially by far the most important product of its agricultural land. At present almost the only fat cattle slaughtered in Ulster is the small proportion used as fresh meat locally. Traditionally, all export of meat is on the hoof. If this export was in the form of carcase meat, it would provide raw materials for leather and other industries, and would greatly economise in transport.

At present the Ministry of Agriculture in Northern Ireland is not convinced that this is possible, and points out that efforts along this line have failed in Southern Ireland; but it seems eminently a case for providing just those favourable conditions for private investment which have been used to bring in industry under the Grants for Industry Acts. It remains economic nonsense that Ulster beef if delivered live to the English market fails to provide the producer with a fair return, and if delivered in carcase (when it is commonly fresher in London than Scotch beef) receives only Argentinian prices. Vested English interests are part of the trouble—and what are 12 Ulster MPs in Westminster for if not to fight them?

Undoubtedly something has been gained by the new principle that United Kingdom fiscal policy should be flexible enough to be applied differently in Ulster than in, for example, the Midlands; but it has yet to be seen how effective the CIC "exemption" will prove in the long run. While there may be no check on bank assistance to industry in Northern Ireland, there is a limit to the extent that Ulster banks can allow their local advances to rise without running down their London balances too far.

Another question is how the chronic tendency of Ulster to lose capital to the mainland can be reversed. The diversification of local industry should help. But there is a strong case for some sort of finance and investment corporation which would attract small savings and assist small

and medium-sized firms, especially the preponderant family firm, to expand and modernise. If it could enable more family firms to become public companies this in itself would widen the opportunities for local investment.

These possibilities, however, leave untouched the problem of rising labour costs. If the policy of the trade unions is to oppose any "deviation" of wage rates in Ulster from the British norm, while the policy of the government is to achieve full employment, clearly the present advantage of "relatively cheap and abundant" labour in Ulster will disappear—and it is the one advantage which effectively offsets the extra transport costs. It is, however, an advantage which can, in fact, only continue to the extent that both the government's and the trade unions' policies fall short of achievement. But the trade unions show no disposition to make any concessions to the province's special difficulties.

★

But all such considerations in the last resort turn on the improvement of the transport position. This is recognised in the existing coal subsidy; but it leaves the vested interests of the shipping companies and the dockers and the state of the ports so comfortably undisturbed that it is an argument against further subsidisation. Yet all logic suggests that if, failing all else, subsidies there must be, a subsidy at the point of transport is the best way of equalising the position of the province and the mainland; of diffusing the subsidy through the economy, agriculture with industry, the Ulster consumer with the Ulster manufacturer.

The multiplicity of cross-channel rates and arrangements offer formidable difficulties. No subsidy could be contemplated until inefficiency is weeded out; indeed the first step is to revive competition. (There were once two rival shipping lines between Londonderry and Glasgow, whose rate war ended when one was offering a single fare at 6d., and the other at 6d. with a complimentary bottle of Guinness.) The growth of cheap air freighting will help. In theory, an enterprising Ulster government might provide its own competitive service; at present, though the country whose affairs it regulates is utterly dependent on the efficiency and cheapness of cross-channel transport, it has no control whatever over rates or facilities. Yet it has nationalised—beginning as far back as 1935—internal transport. Its record under nationalisation is not a happy precedent, for the cost of road haulage is twice that in Britain—in effect industrial transport is having to subsidise common carrier services and private lorries are pirating the cream of the traffic. The Ulster government has the

chance to buy a controlling interest in the Larne-Preston road vehicle ferry service but lost this to the British Transport Commission. There now seems little to be done except to seek to acquire the Coast Lines Anglo-Ulster service. It would be *ultra vires* for Stormont to introduce a bill to do this—but again what are 12 Ulster MPs in Westminster for? Perhaps, however, the best Stormont can do is to press for re-equipment of the docks.

Thus a reduction in the cost of cross-channel sea transport alone seems to go to the heart of Ulster's economic and political needs. But subsidies are a solution from which the British government would shrink, for fear that every other fringe area would demand the same assistance. Even if it were confident, as it should be, to shipping, all outlying islands might think themselves eligible. It could also make trouble with the Republic, for Belfast would infallibly become its entrepot—and the border would heat up.

Any set of subsidies, of course, are paid for by the British taxpayer. Even if they are paid for out of the Ulster exchequer, their burden is, or should be, passed to Britain via the reduction of the imperial contribution. It is probable that the cost of extra sea transport burdens Ulster industry and agriculture by at least £10-12 million a year directly; and if a large part of this were carried by Britain, the "contribution" would have to be converted into a deficiency payment from London. The omens are that in any event the rising cost of parity in social services will make it ever harder for Ulster to balance its subordinate budget. But there is nothing unreasonable about such a deficiency position given agreement on the political objectives. Even today, when the imperial contribution is a mere contra-entry in Anglo-Ulster accounts, the cost per head to Britain for paying Ulster's share of defence overheads is little more than 10s. a year; and the relief to the Ulster economy is at least £10 per head. There are no moral objections to stepping it up—provided that what is being done, and why, is quite clear.

★

The only alternative is for all Irishmen to look upon their island, in its economic relationship with the factory over the water, quite differently. An undivided Ireland, most of which lived in Britain and which amounted to little more than Britain's factory farm, efficiently producing dairy produce and meat for highly paid workpeople in both of John Bull's islands, and preserving for them a countryside in which to take holidays from a "subtopian" Britain, might make economic sense—but it would be the total negation of Irish history and temperament.

Expansion in Check

A YEAR ago, the motor car industry was enjoying the final stages of a boom which, with little intermission, had lasted since the end of the war. While there were clouds to be seen, there were few who would have predicted that by the time of this year's Motor Show, the change in the weather would have been so complete. The measure of the change is given by decreases, compared with last year, for July and August, the last two months for which figures are available, of 30 per cent in production and in home registrations. For an industry that for the four years 1951 to 1955 had averaged annual increases of 17 per cent in production and of 38 per cent in home registrations; an industry with plans for expansion involving the investment of many tens of millions of pounds; an industry which depends for its profits very much on the last 10 per cent of full output, and on the proportion of its sales in the home market—for such an industry, the impact of decreases of this order is very severe.

For the first half of this year, fall in demand was greater, both absolutely and proportionately, in the export markets, and especially severe in the Australasian markets which were taking more than 15 per cent of the total output; though exports to the unprotected markets—i.e. those outside the Commonwealth—are holding up reasonably well. Up to the end of June, the fall in sales to the home market was less than 10 per cent. But it has since increased sharply, and it is undoubtedly this which must be causing the greatest anxiety in the board rooms. These are the sales to which the manufacturer must look for the greater contribution to overheads and profits. And the state of the home trade seems likely to become worse, and to stay worse for some time, before it becomes better.

The fall in home sales is due partly to the change in the general economic climate, but perhaps mainly to those parts of the Government's anti-inflationary policy that weigh particularly heavily on the motor car industry, namely the increase in purchase tax and the more stringent limitations on hire purchase. The influence of the latter, the hire purchase restrictions, has been exaggerated; it has operated much more in an indirect way, that is, through its effect on the used car market, than directly. The reduction in HP contracts for new cars for the nine months up to the end of September was only 7,500, representing no more than a fifth of the fall in total new registrations up to the end of August, and probably no more than one-sixth of the figure for the first three-quarters of the year. The effect on new car sales of HP restrictions is much more felt by their influence on second-hand car prices. The influence of the fall in the latter has been that the allowance against a new car that can be obtained for a two- or three-year-old car is today much less than it was a year ago. Since the increase in tax, and the small price increases in most models, will have put the new price up by roughly 10 per cent, it means that a purchaser of a new car at, say, £700 trading in a similar car two or three years old will have to find something like £150 more cash than he would have needed a year ago. With unrestricted hire purchase the number of additional motorists, the prices of second-hand cars, and the sales of new cars, would certainly all have been much higher.

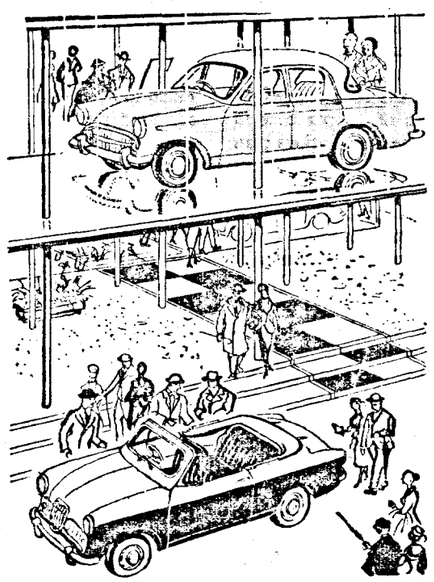
The effect on earnings of the motor car manufacturers

of the changed position is well illustrated by the figures published by Ford last week, showing that for the first half of 1956, the net profit before tax was half that for the first half of 1955. From Ford's figures, it seems likely that their output of cars for each half year was about 100,000 units, so that the other manufacturers' output may have shown a fall of between 35,000 and 40,000 units, or 10 per cent. For the third quarter, against last year's output of 200,000 units, this year's total is likely to be nearly 30 per cent down ; and for some of the manufacturers the fall may well be as much as 40 per cent—a level which must approach the vanishing point for net profits.

It is clear enough that the Government's policies have weighed more heavily on the motor industry—more heavily than on any other major industry, except for the radio trades. The discomforts of the motor car manufacturers have certainly played a big part in reducing the fevered conditions of the economy as a whole, and will have helped to change the attitude of both employers and employees in the engineering industries to wage increases which threaten our competitive position. But it does not follow from this that all the effects have necessarily been of net advantage to the country.

One of the major effects aimed at by official policy has been, by softening the home market, to increase the pressure on manufacturers to export. The motor car industry since the war has been as export-minded as any industry. In the early postwar years, Government action was unquestionably a very effective stimulus to that attitude ; and the industry's economic characteristics make it certain that that state of mind will not change. In the first place, the potential volume of sales in the home market—even with a much more enlightened attitude on the part of the authorities to the treatment of motoring than can be expected—is unlikely to be large enough to absorb year by year the full output of its expanding productive capacity. In the second place, the structure of its costs—the big difference between average production cost per unit, and the marginal net cost at which the last 20 per cent of output can be made—makes it attractive to add export sales even though the net price obtained for exports ex-works is significantly less than in the home market. The additional cars that have been exported this year as a result of restrictions in the home market could probably be numbered in thousands rather than tens of thousands.

The effect of the recession in the motor car industry on the availability of labour, particularly in the Midlands, has probably been marginal rather than really important. The reduced labour requirements have led much more to a reduction of overtime, and to three- or four-day working weeks, rather than to actual redundancy, patent though the latter has been among the car manufacturers and their suppliers. The labour that has become redundant has obviously eased the problems of some under-manned sections of the economy—road or rail transport, the post office, and other services. But little contribution can have been made to the skilled labour required by, for example, the manufacturers of electrical plant ; for the motor car manufacturers make relatively little use of such skilled labour, and will have made every effort to retain such men as they have.



In the long-term interests of the economy as a whole, it is probably to be hoped that the present deliberately assisted motor recession in the home market need not last, let us say, through the whole of 1957. It is essential to the economy that this industry should be able to keep a really substantial share of the Continental market and of other unprotected markets—such as the South American. British motor costs can only be competitive if the increased manufacturing capacity to which present expansion plans lead is, in fact, laid down and if a substantial proportion of it, when installed, is operated at somewhere near a full load factor. Without a buoyant home market, that will not happen. This applies not only to the motor car manufacturers themselves, but also to their various component suppliers, whose costs make up a very substantial part of the total cost of the finished product. Both Germany and France at the moment enjoy a larger home market than this country. In the long run this is probably the most important single determinant of manufacturing costs.

If too long a continuation of the present restrictive measures is likely to impair the industry's power to contribute to the strength of Britain's economy, there are other effects that will in the long run contribute to its efficiency. No industry can grow as fast as the motor car manufacturing industry has grown since the war without grave danger of extravagant practices developing ; and in a period of constantly rising profits, all sorts of items of overhead expenditure are apt to be allowed to pass unchallenged which would be cut out in leaner times. The motor car industry has shown less signs of extravagance in the lush booming years than might well have been expected ; but since the tide turned, there have been welcome symptoms of tighter control of spending. In direct costs, too, the bracing effects of enforced frugality are showing themselves.

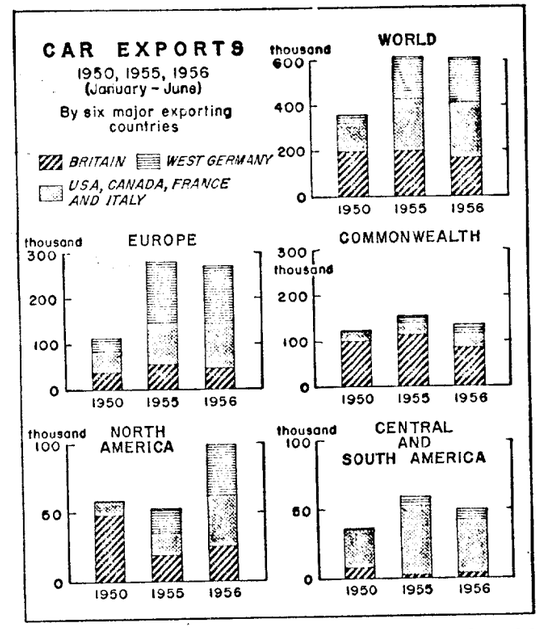
In all sorts of ways, the general sharpening of competition must bring benefits in the long run. In respect of finish, and of design, the more bracing atmosphere should bring improvement, both large and small. When there are three avid customers for each vehicle which can be produced, minor modifications that involve loss of output are deferred. This year when the greatest problem is to increase sales, rather greater boldness has prevailed in modifying models for the coming season. And in the longer run major innovations that may involve serious changes in production equipment are more readily considered by manufacturers who are either not so prosperous that they have no need to consider them, or too short of resources to be able to afford them.

Weakness Abroad

THE background to the 15 per cent fall in British car exports this year contains few excuses for the car manufacturers. The total world trade in cars has certainly not kept up its recent rate of increase—between the first half of this year and last it has stayed virtually stationary at just over 100,000 vehicles a month, after an increase of a third between 1954 and 1955 and an overall growth of 60 per cent since 1952. But the present sharp drop in British (and American) overseas shipments has been almost wholly offset by a further growth in the foreign sales of West German, French and Italian manufacturers.

The predominance of Commonwealth markets in Britain's total efforts, and the consequent vulnerability to frequent import cuts by Australia (still this country's biggest single car market) and New Zealand, is the first and perhaps rather obvious explanation for this abrupt change in fortune. Despite popular belief, moreover, these markets have not since the war been those with the fastest rate of growth. World shipments to all Commonwealth countries (other than Canada) this year are still only 10 per cent higher in volume than in 1950, and are likely to be actually lower than in 1951. In contrast, the expansion of the Continental car markets over the same period has become almost proverbial.

But this cannot be the whole of the story, for the present one-third drop in British exports to sterling Commonwealth markets has been accompanied by a decline of an eighth in our exports to this prosperous European market and a rise of more than a third in Continental shipments to sterling Commonwealth markets. Nor can tariffs account fully for this sharp discrepancy even though the different rates and bases of import and sales duties can have a most complex result upon final prices in comparable markets, as is shown in the table at the bottom of the page.



The cut this year in British exports to the preferential Australian market, for example, has taken place while other exporters have increased their sales. Similar divergences can be seen in the South African market, where there are no preferential rates for British cars, and in the depressed American market where British sales have just about held their own compared with 1955 whereas German sales, principally of Volkswagen, have jumped by 150 per cent. In the last resort, sales in these free markets depend on the designs makers have to offer.

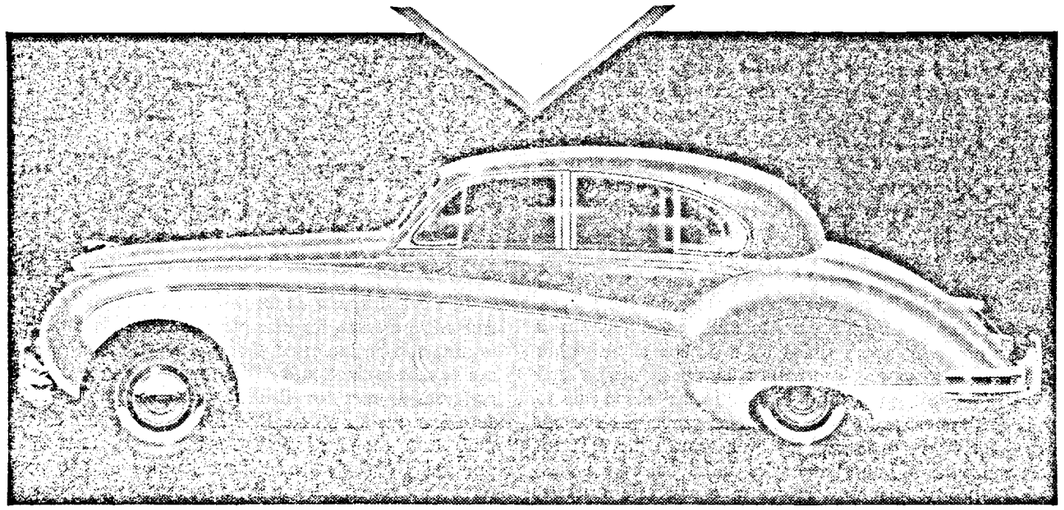
JAGUAR ANNOUNCE THE

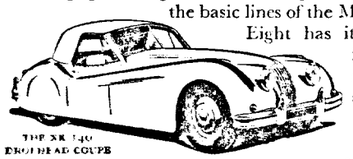
mark eight VIII



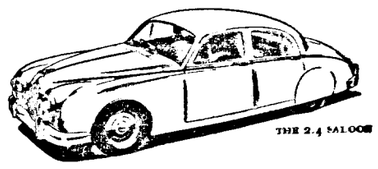
A new luxury model now joins the Jaguar range

Here to join the world-famous Mark VII, XK and 2.4 litre models, is the Mark Eight—one of the most luxurious models ever offered as a series production car. Interior furnishings, cabinet work, fitments and accessories are in the tradition of refinement and craftsmanship usually associated only with the art of specialist coachbuilders, whilst a degree of mechanical refinement has been achieved which stamps this car as outstanding even amongst the distinguished Jaguar range which it now joins. Whilst preserving the basic lines of the Mark VII, the Mark Eight has its own distinctive frontal appearance and is offered in a wide range of two-tone exterior colours. It is available either with Automatic Transmission or Overdrive, or with normal manually-operated gearbox. Amongst the many interior refinements are flush-folding occasional tables in the rear compartment, hand-finished polished walnut fittings, deep pile rugs and extra-deep luxurious Dunlopillo cushions upholstered in specially selected fine grain soft-tanned leather.

MECHANICAL ADVANCES *include new cylinder head and induction system with type HD6 SU carburetters and twin exhausts. An important advance in the operation of the Automatic Transmission system is the fingertip control which enables the intermediate gear to be held indefinitely, and a new brake pedal layout permitting the use of either left or right foot.*



THE XK 140 DROPHEAD COUPE



THE 2.4 SALOON

The current range of models continues for 1957:—
The Mark VII 3½ litre Saloon, with Automatic Transmission (*now* with new fingertip control as Mark Eight), Overdrive or normal gearbox.
The 2.4 litre Saloon, Special Equipment and standard models.
The XK140 3½ litre Open Sports. The XK140 3½ litre Fixed Head Coupe. The XK140 3½ litre Drophead Coupe.
The 'D' type 3½ litre Competition Model.

VISIT STAND 152 EARLS COURT

Cars for 1957

THIS year's emphasis at Earls Court has gone into a steady tidying-up of existing models rather than designing new ones, so far as outward styling is concerned—plus the offer of extra power and the elimination of the clutch and the gearbox. Even where a designer deems it less expensive or more palatable to the driver to retain the old-fashioned "box of cogs" he usually arranges for an overdrive to be available, if only as an optional extra.

Of Britain's big combines, **Vauxhall** has contented itself since last year with minor styling changes and slight increases in power from its car engines; BMC, Ford, Standard and the Rootes Group have made more significant changes of detail.

Austin, following high-speed endurance tests on the German motor roads, has put an enlarged engine into the former A30 economy car, which increases the horsepower by six and justifies retitling this model the Austin A35. The compression ratio of the A50 has been stepped up, while a six-cylinder has been substituted for the former four-cylinder power unit in the sports Austin-Healey. In addition, Austin has altered its styling: the A35 has a wrap-round back window not found on the A30 and smaller wheels have altered the appearance of the A50. The extra power increase on the A35 is obtained by using a compression ratio of 8.3 to 1, which may be a debatable step to take with an economy car that will be driven by many unskilled owners who want the cheapest of motoring. The Austin-Healey 100-six possesses 12 more bhp than the earlier four-cylinder car, but as the weight of what is now a 2/4-seater has increased, the performance increase may not be so great as the the gain in horsepower. New Austin models are the high-performance two-carburettor A105 saloon and the interesting Princess Mk.4 luxury saloon and limousine: the Princess has power-assisted steering, Borg-Warner automatic transmission and a two-carburettor engine in a revised chassis with vacuum-servo brakes, and offers dignity and luxury for a price that is notably lower than that of most competitors in this limited field.

The same enlarged high-compression engines and certain styling changes have gone into the 1957 **Morris** range; the Morris Minor sharing with the Austin A35 the 950 cc, 8.3 to 1 compression ratio engine. The sports MGs are unchanged except for a bigger back window on the Magnette saloon and a hard-top for the MGA. Similarly, Riley and Wolseley exhibit no major changes, a Wolseley 15/50 of greater power and floor gear lever having recently been introduced.

Ford brought out revised examples of its Consul, Zephyr and Zodiac models shortly after the 1955 London Show and these well-established cars, with larger engines, more rearward weight to improve wheel grip, and minor but important mechanical changes such as more powerful brakes, render the bigger Dagenham-built Fords best-sellers in the family-car and "lower middle-class" markets. There is still no sign of overhead-valve power units for the smaller Fords: the Anglia, Prefect, and Popular are unchanged.

Standard has a promising medium-sized car in the Vanguard III, which it offers in de luxe form and as the Vanguard Sportsman, with an engine of increased power that has borrowed features from that very successful sports car, the Triumph TR3 (to which disc brakes have now been fitted). Unlike any other major maker, Standard has been prepared to reduce the price of the small 8 and 10 hp Standards and has made a significant step forward by offering two-pedal control (an automatic clutch) as an optional extra on one of its small models.

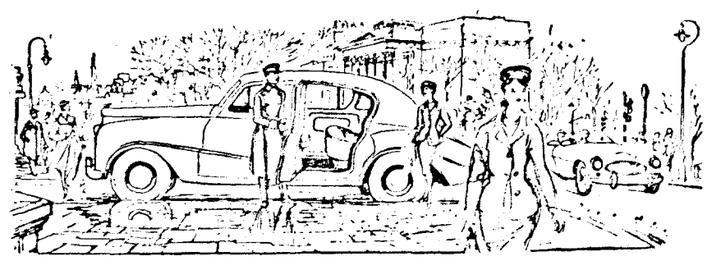
Rootes produce a wide range of cars to meet many needs, of which the adoption of automatic transmission on the comparatively inexpensive **Humber** Super Snipe, the introduction of a two-carburettor engine of greater power for the 1.4-litre **Sunbeam** Rapier, and the recent addition of the new **Hillman** Minx, a family car of outstanding performance and good appearance, constitute the group's contribution to the year's changes. In addition, Rootes have extended gay-look colour schemes to the utilitarian Hillman Husky and have settled the fate of **Singer,** which now emerges from a period of rumour and counter-rumour as the de luxe Gazelle, retaining the well-known Singer single overhead-camshaft engine in the same unitary body-chassis structure as serves the Minx and Rapier.

Away from the mass-produced cars of the Big Five progress is less apparent, and some manufacturers, like **Bristol, Armstrong-Siddeley, Alvis, Morgan, A.C., Aston Martin, Lagonda** and **Daimler** are expressing themselves as content with their 1955 designs. Aston Martin, however, have a beautiful Spyder export model, an open sports two-seater styled by Touring of Milan on the DB2/4 chassis, using a revised cylinder head to achieve greater power.

In the field of high-performance cars **Bentley** has a raised compression engine with larger inlet valves and carburettors to further enhance the 115 mph performance of the Continental; **Rolls-Royce** also is introducing power-assisted steering and refrigerated air-conditioning on the export models. The plastic-bodied Jensen 541 makes a notable contribution to better braking by the adoption of Dunlop disc brakes on all wheels, and the sports Triumph TR3 now has Girling disc brakes on the front wheels.

Jaguar basks in the success of its recent 2.4-litre high-performance saloons, but offers as something even more recent a Mk.VIII version of the 3½-litre saloon, a better-looking and better-equipped edition of the popular Mk.VII. **Rover** has cleaned up the external appearance of the three saloons that comprise its luxury range, offers further increase in performance of the "90" in the 105S and its own design of automatic transmission as an alternative to a manual gearbox in the 105R.

On the Continent the same theme prevails of styling changes being the only ones, made for the sake of change. **Renault** have a much-needed simplified gear shift and slightly higher gear ratios on the Fregate, DKW have found two more horse-power and revised styling for their three-cylinder two-stroke, and BMW are in production with their handsome V8 507 sports model. **Mercedes-Benz** have introduced a convertible on the 220S chassis and **Volkswagen** looks like being able to bridge another year or more without major design change by reason of the anticipated demand for the Ghia-styled Karmann coupe, which is perhaps the world's smartest car using production components.



On the Commercial Side

IN autumn 1956, the state of affairs in the British commercial vehicle industry presents a very different picture to that of the passenger car manufacturers. The further one gets from the light vehicles which have so much in common with passenger cars, the greater is the contrast between the business being done in commercial vehicles and the present troubles of the passenger car industry. In vehicles of over 6 tons carrying capacity, the production for export in the first half of 1955 was about the same as that for the whole of 1953 ; while the corresponding figure for the first half of 1956 shows a further increase of almost 20 per cent above 1955.

The British industry does not produce nor does British commerce use the numbers of small powered trucks that are so common in any continental town and countryside—often based on power plants and other components of motor scooters or light motor cycles, more often with three wheels than with four, with air-cooled engines more often than water-cooled, and two strokes more common than four strokes. It may be that the higher minimum standard of living makes such units relatively less economical in a country where youths are not available at such low rates of wages to drive, or rather, to ride, them.

Vans and the Car Maker

In the field immediately above this minimum class of vehicle, the market is dominated by the five large motor car manufacturers, chiefly Ford, BMC, and Rootes. Standard does not seem to have exploited as much as it might have the opportunities of small commercial vans offered by its 8 and 10 hp cars, though they have lately shown more interest in the possibilities of commercial versions of these and of the Vanguard, and have broken new ground in offering two-pedal control made by Newton & Bennett—to whose system reference is made on page 16. Vauxhall, producing no engine of less than 1,500 cc, can hardly offer an economical vehicle below the 15 cwt carrying capacity, though in sizes above this, going well up into the range of carrying capacities covered chiefly by the specialist manufacturers, the strength of the Bedford challenge is greater than that of the other passenger car makers.

For commercial vehicles which can use the mechanical components of mass-produced motor cars—engines, gear boxes, steering gear, axles, and so on—the low cost of these components makes it almost impossible for other manufacturers to compete. But outside the range where these low-cost components rule the roost, the pattern of manufacture is quite different to that characteristic of passenger cars.

There is effective competition to the passenger car manufacturers down to carrying capacities as low as 25 cwt, owing to the economy of the diesel engine. For commercial vehicles, the average number of hours of utilisation per year is much higher than for the average passenger car, so the annual fuel saving is greater ; while the high weight and noise level of the diesel are less disadvantageous than with a passenger car. Thus such a small maker as the Trojan Company, and a moderate-sized company such as Seddon, both making use of the ubiquitous and low-priced Perkins diesel engines, can compete in the 20-30 cwt capacity range with petrol-engined vehicles of the passenger car makers. The latter, however, are not letting this particular market go by default, for BMC, Standard, and now Rootes, have produced diesel engines of about 2¼ litres to power similar vehicles.

The difference in pattern between the structure of the passenger car industry and the commercial vehicle industry is shown by the large number of separate manufacturers, and the great difference in size between the smallest and the largest producing unit, in commercial vehicles. In the passenger car field, the manufacturer with a production rate of 100 units a week cannot hope to compete in price with similar models whose production rate is ten times as great. But in the commercial vehicle field there are firms building, and apparently making both ends meet by building, a very small number a week of lorries or buses of a type similar to those made, at ten or even twenty times the rate of output, by the largest manufacturers.

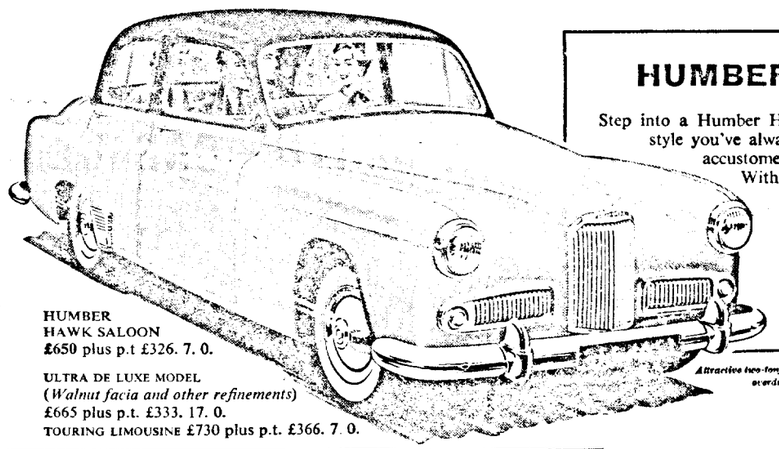
No important motor car manufacturer buys engines for his more important models from outside ; but in the commercial vehicle field there are a number of proprietary engines available. F. Perkins of Peterborough is probably the largest, and lowest cost, builder of diesel engines in the world: its products power most of the vehicles of, for example, Seddon, and have been offered in some of their vehicles by Ford, Vauxhall and other of the giants, and also of some of the medium-sized manufacturers such as Dodge (a division of Chrysler Motors) and Guy. Diesel engines by Gardner of Patricroft are used by ERF, by Foden and others. Henry Meadows of Wolverhampton supplies engines to several builders ; and vehicles recently announced by ERF are powered by Rolls-Royce oil engines.

The Heavy Builders

In the bus field, also, a pattern emerges very different from that of the motor car manufacturers. One of the largest passenger road transport undertakings, the Birmingham Midland Motor Omnibus company, actually builds its own vehicles, while the number of firms building bus and coach bodies are as numerous, and as varied in size, as the firms building goods vehicles. It is a remarkable fact that, while there are in the heavy-vehicle field so many more manufacturers building non-specialised vehicles than in the passenger car field, the proportion of the total output coming from the factories of the largest producers is greater than in the passenger car field. It is probable that the Leyland group does more than half the total business in the classes it covers, roughly from five tons capacity upwards, with an annual output that is probably nearer 15,000 than 10,000 vehicles ; in the smaller range, down to the 20 cwt capacity limit, Bedford's may have an equal hold. In the heavy range the Leyland group is perhaps the biggest manufacturer in the world. Its output in the top weight classes may well be greater than that of any of the American manufacturers, such as GM or White, with the probable exception of International Harvester. The parent works at Leyland have a history going back to before the days of the petrol-engined motor-car—their

Humber

for luxury and value



HUMBER HAWK

Step into a Humber Hawk and drive in the style you've always wanted to become accustomed to! *It's great motoring.* With its performance-packed engine... its roomy interior and low cost—under a thousand inclusive—the six-seater Hawk is today's finest big-car value!

HUMBER HAWK SALOON £650 plus p.t £326. 7. 0.

ULTRA DE LUXE MODEL (*Walnut facia and other refinements*) £665 plus p.t. £333. 17. 0.

TOURING LIMOUSINE £730 plus p.t. £366. 7. 0.

Attractive two-tone colour schemes (Standard Saloon), overdrive, white-wall tyres and chromium rimfinishers available as extras.

HUMBER SUPER SNIPE

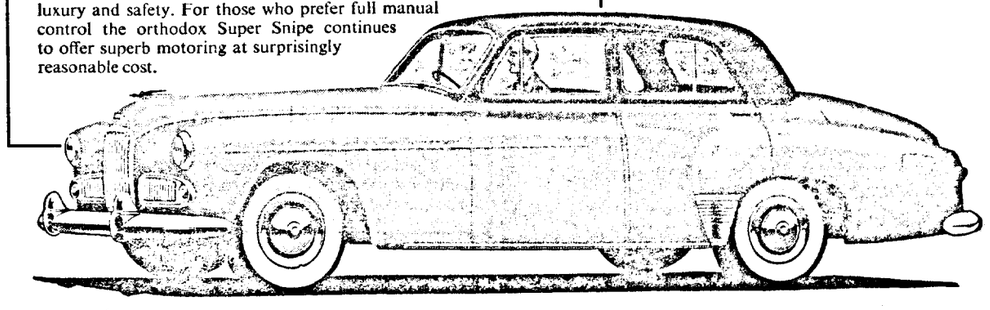
The Lowest-price Luxury Car with Fully Automatic Transmission

No car more aptly named than the handsome *Super* Snipe. Now—fitted with the world-proved Borg-Warner fully automatic transmission (as an extra)—it is still further advanced in performance, luxury and safety. For those who prefer full manual control the orthodox Super Snipe continues to offer superb motoring at surprisingly reasonable cost.

• HUMBER SUPER SNIPE SALOON £950 plus p.t. £476. 7. 0.

With automatic transmission £1,075 plus p.t. £538. 17. 0.

• *Available with overdrive £45 extra, plus p.t.*



They're safe and fast-built to last!

How Leyland enterprise is helping national stability

EXPORTS are the life blood of our national economy! Of course we all *know* how vital is the need to export, but here is what Leyland is *doing* about it.

By making surveys of the post-war transport needs of the world, and pursuing a vigorous policy of developing and producing the right types of vehicles for those export markets, we have now built up the largest export business in heavy-duty road vehicles in the world.

Not only does 30% of the entire British heavy vehicle output to overseas come from the Leyland factories, but taking a conservative estimate, at least 10% OF THE ENTIRE WORLD EXPORTS in this class are designed, built and sent overseas by Leyland! Despite the heavy demands for Leyland products in this country, figures for the last 12 months show that 70% of our entire output goes abroad.

That is how we are contributing to the national need today, and current orders indicate a substantial increase in the future.

By raising the reputation of British trucks and buses to the highest pinnacle and providing an unequalled service to transport everywhere, we at Leyland link our own well-being with the greater prosperity of the nation both now and in the future.

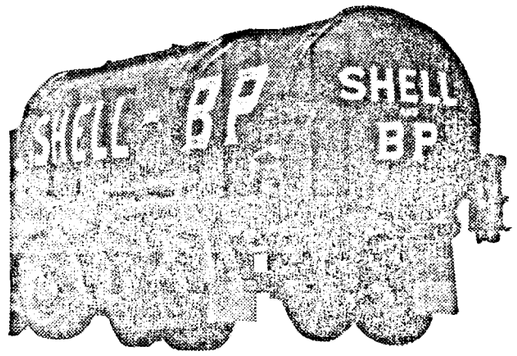
Leyland

World leaders of economical transport

LEYLAND MOTORS LTD · LEYLAND · LANCS

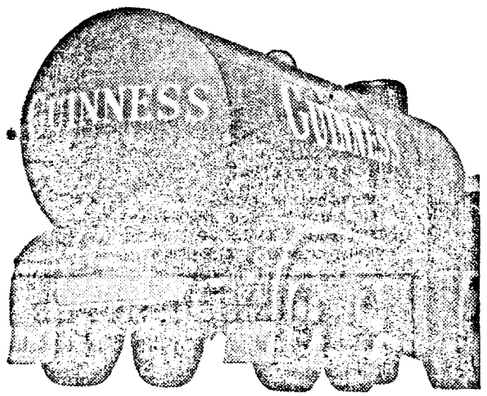
ALBION MOTORS LTD · GLASGOW · SCAMMELL LORRIES LTD · WATFORD

Sales Division: HANOVER HOUSE, HANOVER SQUARE, LONDON, W.1



These two have something in common . . .

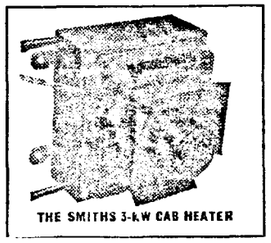
A SMITHS CAB HEATER



Shell-Mex B.P. and Guinness are two of many famous companies who have installed Smiths cab heaters in their fleets. They have done so because they believe in making their drivers warm and comfortable; they believe in giving them the safest possible driving conditions; and they believe in helping them to keep fit.

Smiths are Britain's largest producers of vehicle heating equipment and their extensive research and development programmes include the sending of fleets of vehicles to the coldest parts of Europe and Canada where heaters can be tested under the severest working conditions.

Thanks to Smiths research and Smiths production resources, the Smiths cab heater is the most efficient equipment of its kind—yet its price is very competitive.



THE SMITHS 3-kW CAB HEATER

* Compact and easy to fit, size 8¼" x 7¾" x 7½".
* High heat output of 67.8 BThU/Hour.°F.T.D. with total airflow of 126 c.ft./min.
* Maximum forced air flow for demisting of 30 cu.ft./min.
* Sturdy and simple construction ensures reliability.
* Models for 6, 12 or 24 volt operation.
* Retail price £12.10s.0d. including full kit of accessories.

SMITHS TRANSPORT VEHICLE CAB HEATERS

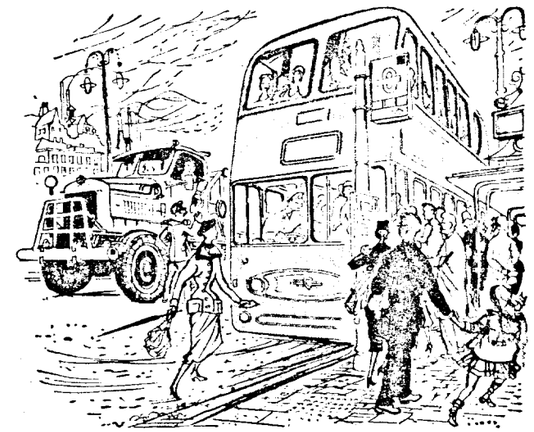
SMITHS MOTOR ACCESSORIES LIMITED, 50 OXGATE LANE, LONDON, N.W.2
THE MOTOR ACCESSORY DIVISION OF S. SMITH & SONS (ENGLAND) LIMITED

predecessor, the Lancashire Steam Carriage Company, was formed in the 90s. In recent years the group has absorbed the Albion Company in Scotland, which has extended the output of the group into a smaller size of vehicle than Leyland make, while the recent absorption of Scammell's of Watford, extends its interests in the heaviest field. With these extensions to the range of the group's vehicles, Leyland can very reasonably claim to be the leading British manufacturer by every important criterion: the volume of its output; the range of its products; the geographical diversity of its operations, with licensees in the USA and arrangements of one sort or another for vehicle production



in all the important countries of the Commonwealth, as well as Belgium, Denmark, Holland, Israel and Spain; and also, most judges would allow, in technical progressiveness.

The most serious competitor to Leyland, and the only unit which in any way approaches it in size or in range, is the Associated Commercial Vehicles group. The old Associated Equipment Company, which a quarter of a century ago was part of the Underground group and still builds three-quarters of London's buses, was the most important component of this group. It was expanded by the addition of a couple of firms of vehicle builders who, in retrospect, hardly seem to have added strength to the group, and by the addition also of Park Royal Vehicles, a builder of bus bodies, acquired some seven years ago, which has certainly brought it strength, both in the manufacturing capacity added, and in the reinforcement of the group's top management.

Diesels in the Lorry

In the field of goods vehicles the most striking recent development is the continuing growth in the dominance of diesel-engined vehicles. Among the real "heavies"—the vehicles of six tons carrying capacity or more—the proportion of petrol-engined vehicles has for many years been no more than five per cent; as one goes down the range to the smaller commercial vehicles, the proportion of petrol engines grows, but each year witnesses fresh gains for the diesel. On the record of new registrations this year, diesels outnumber petrol engines by 2 to 1 in the class immediately below 3 tons, and much more heavily in every group above this limit. The 2¼-litre diesel engines made by BMC, Rootes and Standard referred to above are likely to accelerate the trend to diesel power in the smaller goods vehicles. As this goes on, the increasing volume of production of such engines will reduce the excess cost of the more economical power plant. The time is now in sight when the extra cost of a diesel plant for small vehicles will be of the order of £20 or so, not much more than a tenth of the figure that applied a few years ago.

Another tendency which continues to gather momentum is the use of light alloys for commercial vehicle bodies. The increasing use of aluminium on passenger cars is measured in a few lbs per vehicle; but in a growing number of commercial vehicles aluminium is being used for the decking and for other major structural parts in such quantities that the amount of the metal used and the weight saved are both to be reckoned in hundredweights per vehicle. The tendency to light alloy bodies has hitherto been most pronounced in the heavier class of goods vehicle, and been particularly strong in vehicles near the 3-ton unladen weight limit, for which the economies of a 30 mph speed can earn a handsome dividend on the cost of weight saving.

Britain Catches the Bus

These two developments in haulage vehicles constitute a strengthening of tendencies already prevalent for some years. Among the buses and coaches more important changes in design are occurring which will give the public service vehicle of the future more of the comfort and of other characteristics of postwar passenger cars. The important changes in public service vehicles are well shown in three examples. The first is the bus developed by the Birmingham and Midland Motor Omnibus Company for manufacture in its own workshops for use on its own routes. The second is the Routemaster, developed by AEC in collaboration with London Transport: the prototype was put in service last year and is understood to have proved satisfactory. The third, and probably the most important in respect of its technical features and its export potentialities, and from the point of view of the generality of transport operators—and users—in this country and abroad, is the *Atlantean* 78-seater bus announced last month by Leyland. In terms of technical innovation and styling, this is perhaps the most impressive vehicle that has come from any section of the British motor industry since the war. It uses a rear engine and semi-automatic transmission: unitary body construction, taking a leaf from the book of the passenger car builders, with independent front suspension; and a floor line lower by several inches than bus passengers have been accustomed to in conventional vehicles. The *Atlantean* admits its passengers at the front, through doors power-operated by the driver, who is well placed to see the whole of the lower platform. It is a vehicle that seems to be as practical functionally as it is distinguished æsthetically. Taken as a whole, the *Atlantean* shows that the British heavy vehicle industry has a technical mastery which need fear no comparison with its overseas competitors. The figures quoted above show the liveliness of this industry, and the success it is achieving in the world markets. One can have little doubt that if the English passenger car industry were in its own field as efficient, British motor cars would by now have a more secure grip on the world's markets.

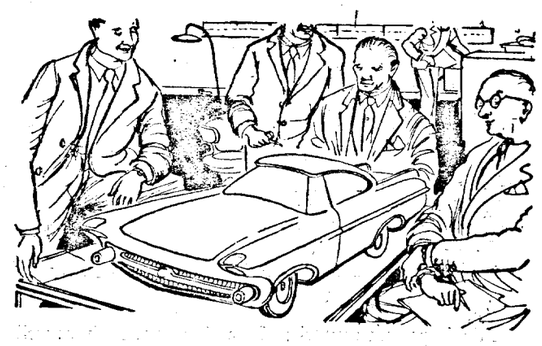
The Design Problem

IF a moralist desired to illustrate the uncertainty and unpredictability of human affairs, he could hardly find more apt material than is furnished by the design of a motor-car for large-scale production and sale. The finished product will be the outcome of some five years of thought and effort by a great many people. It will be the result of the interaction of the various personalities in the sales, design and manufacturing departments of the motor-car manufacturers' own organisation and of a number of outside suppliers. The amount of money committed before the first production car is supplied to a customer is liable to be more than £10 million. But until the customers have started to buy, it is hardly more possible to judge whether or not it will be a commercial success than it is possible for a theatrical impresario to be certain of the success of a play or a publisher to be certain of the success of a book. Indeed, the parallel may go further ; for just as a play or a book may seem to be a failure in the first weeks of its public opening but in the longer run be a great success, so there are cases of motor-cars which at their first appearance seemed unlikely to yield a profit but in the long run have been highly profitable.

There is no more dramatic case history than that of the design of the Volkswagen, which in the outcome has been the most successful design in the history of the European industry. The original project was conceived in 1930 by Dr Porsche, already one of the most famous designers in the world, as the most economical transportation possible for a family of four. Within a year Dr Porsche and his team had crystallised their ideas into a design which was very close to that of the present-day Volkswagen, except that the engine was a radial three-cylinder instead of the flat four-cylinder. But no private German manufacturer could see sufficient merit in his project to back it. Eventually Hitler became interested in its possibilities, and insisted that manufacturers should build and test a large series of prototypes. Even then none of them thought the design worth adopting ; and it was left to Dr Ley's Labour Front to take the necessary steps to arrange its production. After the war, when the success of the military version of the VW had proved some of the merits of the design, the British industry was offered the opportunity of taking over the design and what remained of the manufacturing plant. They took the same view as their German counterparts before the war.

The history of the VW shows how uncertain is the judgment of those who should be best qualified to judge of the prospective success of a new design. The effect of it can be traced in the postwar history of the continental automobile industry. There is now a far greater readiness than before the war in the major factories to allow designers of proved ability to work out their ideas on unorthodox lines and to find the best answer they can to the problem, without being too closely trammelled by the view of the sales staff or by the limitation of existing manufacturing facilities. The results are manifest in the range of unorthodox vehicles produced, with such outstanding success, by factories on the Continent. The 4 cv Renault followed Dr Porsche's course in locating the engine at the rear. The Fiat 600 did not pioneer any particular innovation: its strength lies rather in using features developed elsewhere in a supremely practical combination of "minimum motoring," though Fiat is said to have in mind something more unconventional.

Citroen did not need the example of VW to prove that an unorthodox design could be a commercial success. Its own unconventional front-wheel-drive vehicle, of which the original was introduced in 1932, were until last year the only medium-size passenger cars it made. Citroen have continued to exploit the possibilities of front-wheel drive with two radically unorthodox vehicles: the 2 cv Citroen, which is the smallest vehicle produced by any major manufacturer in the world and the DS19, the impressive postwar successor to its larger front-wheel drive saloons. In these important examples of advanced Continental design, the originality displayed consists rather more in the boldness of the engineering conception of the vehicle as a whole—the disposition of the weights, and so on—than in any great mechanical ingenuity in detail ; though the



Citroen DS19 has this in plenty. And the appearance of the vehicle has in every case been subordinated to other considerations.

Styling in Detroit

In the design of American automobiles, on the other hand, the order of procedure is entirely different. Design proceeds from the outside inwards, and the stylist is quite as important in the hierarchy as the engineer. The stylist knows fairly accurately what volumes he has to allow to house the mechanical components of the car, and what spaces will be required for the passengers and their baggage. His task is to provide an envelope for this package which will appeal to the public taste of the moment, as he and the commercial side of the factory interpret it, and which will lend itself as readily as possible to the changes which can be seen in the future. If the stylist and those who direct him foresee that in three years' time the public will like the bodies of their cars to be longer, wider and lower, and that thereafter there is likely to be some reaction towards more moderate dimensions, he must make sure that the automobile he designs will lend itself to modifications in accordance with those trends. The working-out of the design of the automobile within the envelope for which primarily the stylist has been responsible is broken up between various specialist groups—the specialists in power plant, in transmissions, suspensions, and so on. All these specialists work closely with the production engineers.

(*Continued from page* 10)

The pattern of American design strategy depends, of course, on the general acceptance of one particular shape and size of automobile by the great majority of its customers —a roomy six-seater, with a large trunk ; a V8 engine with maximum power ranging from a little below 200 bhp upwards ; automatic transmission ; independent suspension in front and a beam axle behind ; a structure in which most of the strength is concentrated in a frame below the body, and comparatively little contributed by the body itself.

This generally conservative attitude in Detroit to the design of the car as a whole is, however, accompanied by great ingenuity and skill in the various engineering sections. For example, the development of automatic transmissions has shown a boldness and a soundness that deserves the highest praise.

Just as history has encouraged the European designer in unorthodoxy, so has history discouraged unorthodoxy in the American market. The last major single adventure in automobile design by any American manufacturer was the Chrysler Airflow car of the middle thirties, which was several jumps ahead of contemporary American design ; which used the whole body to obtain structural strength in a way which Continental and British engineering opinion would hold to be in advance of today's American practice ; and which gave the customer obvious advantages in the way of riding comfort and performance. Yet the car as a whole was not acceptable to the American public ; and in the final outcome must have been accounted a serious money loser to Chrysler. Since then the American industry as a whole, and in particular Chrysler—which is generally considered to be fully able to hold its own in engineering ability with the much larger GM and Ford organisations—has been exceedingly conscious that the dangers of being too far ahead of the public thinking are nearly as great as the dangers of being behind.

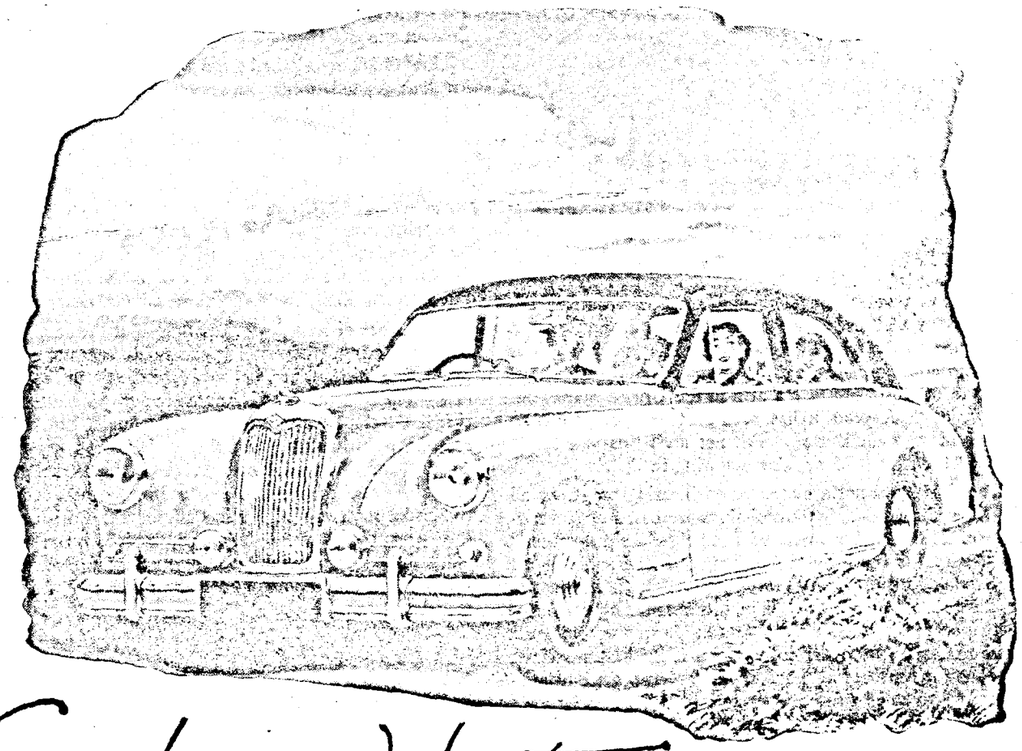
Britain's Design Strategy

Design strategy in Britain has been much more akin to that of the American industry than of the Continental. In the case of Ford and Vauxhall, the thinking that has dominated their design policy has rather been the thinking of Detroit than of Dagenham or Luton. There is in both cases a partnership in design between the British organisations and their parents in the USA, and the impact of individual personalities plays its part. The balance of power in design in the Ford organisation has certainly shifted of late ; in the designs of the future, Dagenham will have greater initiative than it has had in the past. At Luton, on the other hand, as in other European parts of GM, the degree of local autonomy has probably in recent years become less rather than more. But in both organisations there are now in senior design positions men of less than middle age who are primarily vehicle designers—on the Continental pattern, rather than the specialised engineers, power plant specialists or what have you met in Detroit.

One of the partners who came together to form Britain's largest motor producer, the British Motor Corporation, Morris, has behind it what is probably the most distinguished piece of all-round motor engineering to be achieved by any major British manufacturer since the war, the Morris Minor. Since BMC was formed, this outstanding small car has already been once re-engined with the same 803-cc power unit as the small Austin A.30 ; and this year both have been given a more powerful 950-cc engine that takes them into a rather different class of performance —perhaps at the cost of economy. But in recent years the design of BMC cars, particularly in the medium range and particularly in body styling, has undoubtedly made a weaker impression than that of the American-controlled factories. The same should perhaps be said of Standard, if not of Rootes—though the smaller Standard cars have proved highly successful in their various versions. The new Hillman Minx shows that unerring ability to style a car for its own rather cosy, middle-class market that Rootes have often displayed.

It is probably fair to say that the main engineering effort of BMC in recent years has gone into the improvement of production methods rather than into the design of the cars produced. In last year's motor boom, BMC increased its output much more than any of the other producers, drawing further ahead ; this year, perhaps inevitably, it is generally believed to have suffered more in sales than its main American-controlled rivals. The production side of BMC is technically first rate ; but the design side has certainly been inhibited by the fact that in this organisation developments have for the most part had to be fitted into the straitjacket of a programme primarily conceived in terms of production facilities. Nor have BMC car bodies on the whole been outstanding examples of styling—in spite of the fact that since the war there have been more changes in the body panels of the Austin range than any other major motor car manufacturer on this side of the Atlantic has felt able to afford. The BMC, with the largest total unit rate of output in Europe, should have been able to keep the cost of body tools per car produced to a lower figure than any of its competitors: whether it has is doubtful. But the value for money that it has achieved, in terms of eye appeal, must have disappointed it.

It is to be hoped that with the return to BMC a year ago of Issigonis, the designer—before BMC days—of the Morris Minor, vehicles of greater distinction are to be expected. But two or three selling seasons are likely to pass before any radically new vehicle from his drawing board can be expected to be coming off the end of the assembly line. Even if he is capable of wiping the eye of every individual designer in Europe—a large assumption—it would be more hopeful to expect that he will be able singlehanded to equal the efforts of designers in other factories, whose work is supported by an apparatus for the most thorough possible exploration of the requirements of the market and the prejudices and desires of the customer—such an apparatus as Ford International, for example, commands.



Go far and fast

Here is the rich, rare comfort you have always desired.
In this car you are completely relaxed.
And let's admit it, one feels proud of the way
the PATHFINDER is singled out and admired.
But the worth of this car—*the best of all Rileys*—goes deeper
than the sweeping grace of its brilliant styling.
You *must* drive the Pathfinder. It is the only possible way to
appreciate its performance. Visit your
Riley Dealer and see for yourself what he means when
he says "Riley for Magnificent Motoring".

The famous Riley 2½ litre O.H.V. engine
110 B.H.P. at 4,400 r.p.m.
12" Hydraulic Brakes
Independent Front Suspension
Coil Springs at the rear
Telescopic Shock-absorbers
Real Leather Upholstery
Seating for Six
Borg-Warner Overdrive
is available as an optional extra.

The brilliant Riley Pathfinder

Two-Pedal Motoring

ONE of the earliest constructors of a successful motor car, M. Panhard of Panhard and Levassor, declared of the original sliding gear-box, "C'est brutale, mais ça marche." If M. Panhard were alive today he would find it difficult to believe that for all the improvements in speed, power, suspension, and low production cost that have taken place in 50 years of development, most cars outside the United States still use a mechanism to transmit power from the engine to the wheels that apart from synchro-mesh is the same brutal one he knew. Automatic transmission took until the late forties to take a grip in the United States, but for two or three years it has been standard equipment on most vehicles from Detroit. But not until this year has it touched the fringes of popular motoring in Britain.

The time-lag is not a matter of engineering progress: all the American automatic transmissions are based upon variations of fluid couplings, derived from the "fluid flywheel" first devised by Fottinger in Germany and further developed by Sinclair in this country. Nor, necessarily, is it a matter of drivers' conservatism. When the automatic gear-boxes first appeared in the United States, American motorists there raised all the expert objections that British enthusiasts now do; nevertheless, most of them have since wholeheartedly accepted two-pedal motoring. Drivers who used to pride themselves on their gear-changing skill have found that after a brief experience on automatic transmission they would not be without it.

The obstacle here has been the cost of making an automatic transmission for European cars. These are complex mechanisms, and comparatively heavy. In the United States, mass-produced in very high volume, they can nowadays be had for no great increase in price, and the 250 lb they may add in weight is easily lost in the massive, powerful automobiles of Detroit. European motor engines are far less powerful; but the weight of the transmission cannot be scaled down in direct proportion, and the far lower volume of output has so far meant that each individual transmission costs more than in the United States. Only Rolls-Royce, among British makers, has been prepared to invest completely afresh in the expensive plant required to build these transmissions here. It is now making the General Motors Hydramatic box for its own Rolls-Royce and Bentley cars, and for the Armstrong Siddeley Sapphires.

Some years ago Jaguar began to fit Borg-Warner automatic transmission in its larger models for the American market, and to try out a few with this transmission on selected customers in Britain. Borg-Warner has now begun to produce this box in a plant run by its British subsidiary at Letchworth. The heavy capital investment required to produce automatic transmission equipment appears in this factory to have been partly obviated by the liberal use of machinery shipped from the parent American factories—equipment now made obsolescent by the much larger production runs for this equipment that the American market now requires, but still efficient enough for the much lower rates of output needed for British requirements. At Earl's Court this year, the Borg-Warner transmission is offered upon the Jaguar Mark VIII, Daimler, Austin Princess, A.95 and A.105, the Morris Isis, the Wolseley 6/90, the Ford Zodiac, and the Humber Super Snipe.

How much extra weight and cost automatic transmission involves depends upon the structure of the car into which it is fitted and the gear-box it replaces: on the Ford Zodiac, for example, it adds about 150 lb. And even when built by equipment that has partly earned its keep elsewhere, it is also costly—about £170-£190, including purchase tax. The first British automatic transmission to challenge these well-tried American designs is a torque convertor offered by Rover on its new 105R model, though Standard is known to be interested in the Salerni box that has been fitted to Mr Ferguson's experimental vehicles.

A number of British devices that offer the motorist two-pedal motoring, while falling somewhat short of full automatic transmission, are, however, appearing in the 1956-57 cars. These include the Manumatic automatically operated clutch developed by Automotive Products, Ltd, which is available on the Sapphire, the Wolseley 15/50, and the Austin A.50, Morris Oxford, and MG Magnette; this adds about £60 to the price of the cars. But the most economical two-pedal motoring innovation offered the British motorist this year comes from Standard, which is offering the "Standrive" automatic clutch made by Newton and Bennett for only about £20 extra upon one of its 10-hp models.

Improving the Ride

IN the early thirties, a high proportion of the cars manufactured in all the producing countries showed a similar pattern of suspension systems; beam axles front and rear, each supporting the hull through a pair of fore and aft "semi-elliptic"—which came to mean, more or less flat—leaf springs. The first major breach—measured in quantities—in this uniformity came when Buick introduced independent front-wheel suspension under the title of "knee-action." The basic mechanism of this was originated by Mercedes-Benz, and consisted of two wishbones mounted one above the other—the upper being shorter than the lower—on axes roughly parallel to the axis of the car. This is still by a long way the commonest form of front wheel suspension throughout the world; in most cases coil springs are used though in some cases it is found more convenient to use fore and aft torsion rods, usually with the lower wishbone attached to a torsion rod.

Though much is talked about the virtue of independence in front springing—because the movement of one front wheel does not directly affect the movement of the other—the real virtue of it is the much greater range of movement that it permits. A comfortable ride demands long slow movements, not short jerky ones; and this in turn demands a range of spring movement of six to eight inches rather than two or three inches. A comfortable ride also demands widely spaced weights; too great a concentration of weight leads to undesirable reactions between the front and the rear axle. Thus for a comfortable ride, the axis of the front wheels has to fall within the fore and aft limits of the engine block, so that with a rigid beam from one wheel to the other, it could only be achieved, either by reducing ground clear-

nce, or raising the centre of gravity of the engine, beyond what is desirable. If the rigid beam goes, a much more omfortable ride becomes practicable.

The second important factor after the need for a omfortable ride is the need to reduce the unsprung weight f the wheel and what moves with it, so that the wheel can nore easily follow the contours of the road without disurbing the hull of the automobile. (The tendency to maller wheels, incidentally, helps this: and with the saving n first cost, and the many advantages smaller wheels give o the designer seeking the most intensive use possible of very cubic inch of space, this tendency is likely to coninue.) For the rear axle, this reduction in weight is better chieved with independent wheels, and with the crown wheel and differential mounted on the hull rather than as part of the axle. Such an arrangement is nearly unavoidable on a rear-engined car; and on the Continent its merits from the point of view of road-holding has led to its widespread adoption on front-engined cars. It involves greater cost, however, and makes it less easy to insulate the hull—with its sounding potentialities—from the vibrations set up by the gear teeth in the crown wheel and differential. In the USA, where freedom from noise and vibration is at a premium, and where most roads are so good that road-holding is at a discount, compared to Continental requirements, independent rear springing has made no impact at all. In this country it is fitted only on expensive, high-performance cars, such as the Lagonda.

Further refinements in suspension called for are to eliminate or reduce fore and aft pitch, and to make suspension adjust itself to varying loads in the body. Pitch can be reduced by inter-connecting the front and rear wheels on each side in exactly the same way as an anti-roll bar reduces roll; but there seems to be no case of the application of this until the recent adoption by Packard of its "level ride" suspension, in the front and rear wheels are connected to arms, one on each side of a (roughly) fore and aft torsion rod. This suspension makes use of a second parallel torsion rod on each side; one end of this rod is connected by levers to an intermediate point on the main torsion rod, and the other end is attached to the chassis through a mechanism which applies greater or less twist to it so as to compensate for any variation in the proportion of total weight carried respectively by the front and the rear axle. Variations in weight are usually, of course, due to extra passengers in the rear seats or load in the boot; the effect of the Packard mechanism is that such extra weight, instead of putting the car, say, 3 inches further down on its rear wheels, puts it down 1½ inches alike on the front and rear wheels.

The Citroen solution to the suspension problem is bolder still and achieves still more. In its 2 cv car the suspension is arranged to carry the load by a system of bell cranks to coil springs, the front and rear suspension on each side being inter-dependent in operation. This very successful design has been followed by the DS19, in which a hydraulic power linkage is employed to activate the suspension system. The final element in this system is air compressed by a diaphragm in a metal hemisphere, the other half of the sphere being filled with oil on the other side of the diaphragm. The oil leads back to a lever connected to the road wheels; and the reservoir adds or subtracts oil from the inter-connecting column so that the height above the ground of the vehicle at rest is the same, whatever the load carried. The pneumatic element, which is the last stage in the suspension, has the very desirable characteristic of progressiveness, so that each pound of added load gives a smaller displacement. This allows soft springing over small bumps to be combined with hard springing under more extreme displacement, so that, with a limited range of total movement, softer springing than would otherwise be possible can be had over a fairly wide range of bumps.

The Influence of Racing

MOTOR racing today is a business proposition—for the race organisers, for the specialised builders of *Grand Prix* cars, and for the world-famous drivers who can demand substantial fees before they appear. As a public spectacle, a *Grand Prix* race can attract 80,000 spectators in Britain, up to a quarter of a million abroad. Only intense competition between the leading exponents—Ferrari, Maserati, Vanwall, and Connaught—maintains the technical status of these high-speed machines, which otherwise might deteriorate into mere circus apparatus. But apart from this entertainment aspect of motor-racing, how far is the construction and operation of competition cars of any real value to a practical motor industry that has to sell cars for the ordinary driver on the ordinary road? This is a recurrent question, to which different makers have given varying answers since motor racing first appeared on the scene—not long after the motor itself.

In those early days the open roads of Europe and the United States had an obvious and direct significance to the horseless carriage, both as advertisement and as "research," in that they increased the incentive for ingenious mechanics all over the world—but particularly in France and America—to get better performance out of their creaking buggies. Emile Levassor won the first race on record, from Paris to Bordeaux and back, in a 4 hp Panhard in 1895 (732 miles at 14.91 mph); 1898 saw Charron win the Paris-Amsterdam-Paris race (901½ miles at 27.3 mph) in a Panhard of 8 hp. These early races stimulated engineers to seek greater power from primitive petrol motors, focused attention on pneumatic, as opposed to solid rubber, tyres and, perhaps as important, drew public attention to the possibilities these new-fangled vehicles possessed for fast travel over long distances.

Such long-distance road races came to an end in Europe only on account of the appalling disasters (as they seemed at the time, with the Le Mans catastrophe 52 years distant) that marred the Paris-Madrid race of 1903. Gabriel's streamlined 70 hp Mors had averaged 65.3 mph when the contest was stopped by the authorities at Bordeaux because so many accidents had resulted, due to hundreds of thousands of unpoliced spectators encroaching in the path of the cars. Tragedy did not stop racing; it merely transferred races to closed circuits where spectators could be properly protected. But the purpose of racing underwent a change. Whereas the trans-Continental contests had been a crucible for experiment and demonstration, confined almost exclusively to the French industry, the increasing efficiency of the motor vehicle and its growing sales to

the public called for races in which different nations' industries could compete.

In the early Gordon Bennett competitions, each country fielded a team of cars, the next race in the series being held in the country that had produced the winning car the previous year. These races were not wholly successful, because the competing cars were not nationally-built machines but the best cars of particular manufacturers, chosen to represent their country after eliminating trials had been held. At first competition was keen as firms built larger and larger-engined cars of more and more flimsy construction in an attempt to hold the honour of representing their country—France won the 1905 race with a car of 96 hp—but when one make proved superior even before trials were run, and because France dominated the contests, other makes and countries lost interest.

The *Grand Prix* Formulae

The *Grand Prix* race held in France in 1906 to replace the Gordon Bennett race had a more lasting appeal: this race, and the various formulæ set down to limit the cars allowed to race in it, have indeed dominated motor racing in Europe for many years, just as the Indianapolis races, with their very different demands upon peak design for one particular circuit, have dominated American racing. It became a race of manufacturers, each keen to build winning cars for the resultant publicity; as the rules changed each year, many valuable technical lessons were learned in consequence.

This period of racing crystallised the whole principle of the *Grand Prix* contest, which has continued from that day on: different fixtures were arranged for cars limited first to 3-litres, next to 2-litres, then to 1½-litres engine capacity. European manufacturers adopted different policies. Some entered half-heartedly, merely to have cars something akin to their catalogue models in the race. Others, such as Peugeot, formed separate racing departments and built racers of very advanced design and fabulously expensive construction, concerned to secure victory at all costs. In Britain, Sunbeam copied openly the victorious cars of other nations, because they considered it vital for their name to be on the winning car, no matter how far removed its design from the production Sunbeam models. The different formulæ in Britain and the United States partly inhibited any "cross-fertilisation" of design, though Duesenberg came across the Atlantic in the twenties to register notable successes with a basically different pattern of racing car.

The car-buying public may have been confused by these varying attitudes, yet undoubtedly in Europe and in the United States the cars it bought benefited from racing. Fuel restrictions and weight limits led to highly efficient small engines, with twin-overhead-camshafts to promote good breathing through the valve ports. Rising speeds called for front-wheel-brakes, shock-absorbers, and detachable wheels to counter the strain imposed on tyres. The post-1918 engine-capacity limits which brought the supercharger to perfection also taught designers how to build reliability into minute power units running at very high crankshaft speeds from which stemmed the "over-square" dimensions which spell long engine life in modern everyday usage. These racing cars, too, along with aircraft, were offering ordinary motoring the by-product of advances in metallurgy, as they have continued to do.

After the first world war, purchasers of motor vehicles, although far more numerous than before it, were less affluent, buying mass-produced and competitively priced vehicles that showed only a small margin of profit—and certainly left no surplus for the construction of costly racing cars in whose victories the public was in any case scarcely interested. Racing survived for two reasons. One was the turn to sports-car racing, in which the competing cars had to bear a reasonable resemblance to the catalogued product, and to race with lamps, windscreens, mudguards and even hoods in place. The series of Bentley victories at Le Mans and the revival of the TT race in Ireland in 1928, when Kaye Don won with a Lea-Francis, caused widespread interest in this class of racing. The other thing that saved motor racing was the realisation, first by Mussolini and then by Hitler, that success in *Grand Prix* contests held enormous political propaganda value. Alfa-Romeo for Italy, Auto-Union and Mercedes-Benz for Germany were encouraged to build world-beating cars from 1934 until the outbreak of war, competing jealously in some of the most fabulous motor-racing of all time.

After the second world war, spectator interest in racing enabled specialised manufacturers, notably Ferrari and Maserati, to build *Grand Prix* cars, paying for the effort from starting money paid by race organisers (recouped in turn by big takings at the gate) and also by bonuses from petrol, oil, tyre and accessory companies, who saw valuable publicity for their products in racing's prevailing popularity. In England, moreover, the building of *Grand Prix* cars became a hobby of industrialists, particularly those associated with the motor components industry.

Racing Sports Cars

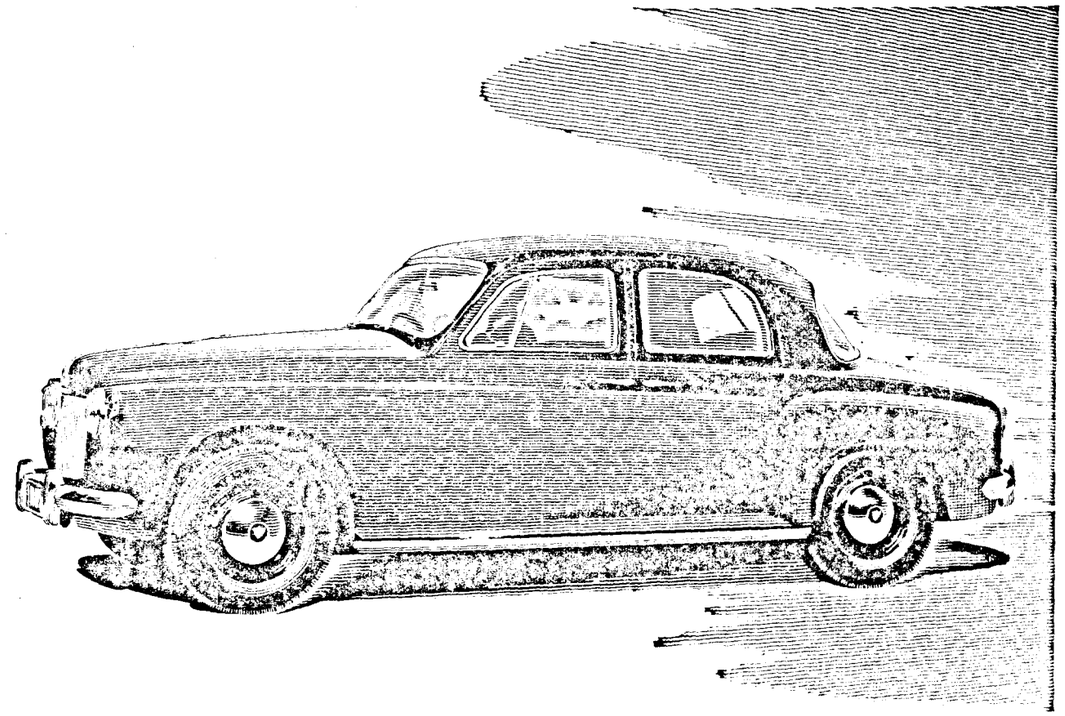
But *Grand Prix* racing since the war has become too costly for the big motor manufacturers: in 1955 the last major maker still concerned with it, Mercedes-Benz, withdrew from racing, stating that it had reached the limits of development with its postwar range of "Formula I" racing cars. The next step in racing cars, to many, seems to be the use of a gas turbine power unit, and there remains some conjecture whether Mercedes-Benz might come back to racing with such a car.

Sports-car racing, however, has until now continued to interest specialised makers, notably Jaguar and Aston Martin, in this country and, more recently, makers in the United States. Freedom in the rules for such racing has resulted in the development of road-equipped sports-racing cars parading as prototypes for the showrooms of tomorrow: to such machines we owe research into aerodynamic bodies, fuel injection and disc brakes, all of which are soon liable to benefit the ordinary motorist. Jaguar, which this week decided that it would retire from sports car racing—though its announcement left the door open for a return in a couple of seasons or so—has reaped considerable advantages. Whereas the Sunbeam that won the French *Grand Prix* in 1923 bore not the slightest resemblance to production Sunbeams of that era, the Jaguar that won this year's Le Mans race possesses an engine virtually identical with that under the bonnet of any Jaguar Mk VII saloon. The engine of the Aston Martin that finished second in the same race is not dissimilar to that in the Lagonda car built by the same company, one of which has recently been supplied to the Duke of Edinburgh. Both of these British power units employ the system of valve location and actuation that emanated in the minds of the Peugeot engineers back in 1912 from a desire to win the *Grand Prix* for their company.

This is a ROVER year

By Appointment
to Her Majesty Queen Elizabeth II
Manufacturers of Land-Rovers
The Rover Co. Ltd.

The new Rover programme introduces a 5-car range... gives every motorist the chance to own a Rover that exactly meets his needs. All models from the economical 2-litre 60 to the 100 m.p.h. newcomers — the 105R, with automatic transmission, and the exciting 105S — have a look and feel of quality that few cars on the road can match. Overall design is greatly improved by a new front contour which gives bolder, cleaner lines.



THE NEW FIVE-CAR RANGE

● **THE 2-LITRE 60** Like all Rovers, a lively performer and superb to handle, with exceptional economy.

● **THE 75** This famous model combines the smooth power of a 6-cylinder engine with surprisingly low fuel consumption.

● **THE 90** For high-spirited performance with Rover smoothness, silence and comfort. Fitted with power brakes.

Automatic overdrive is available as an optional extra on all the above models, taking the place of the free-wheel on the 2-litre 60 and the 75. This gives a higher maximum speed and sustained fast and silent cruising at low engine speeds with a consequent reduction in petrol consumption and engine wear.

● **THE ROVER 105R** A new luxury car fitted with ROVERDRIVE — fully automatic, 2-pedal transmission with built-in automatic overdrive. Here is a high performance car for effortless driving in town traffic or on the open road.

● **THE ROVER 105S** Powered by the same twin carburetter engine as the 105R, this model has a conventional transmission system with automatic overdrive. The result is the liveliest Rover in the range, with superb acceleration to 100 m.p.h., and an inspiring all-round road performance.

'ROCKET' to ROENTGEN*

* Unit of Radiation Dosage

Since the earliest days of railways, locomotives' boilers have been wrapped snugly in quilted waistcoats or "mattresses" of pure asbestos, carefully tailored to conserve and concentrate all the heat within the steam-raising area.
Asbestos can conserve other things besides heat. In atomic energy research establishments, where all risk of radio-active particles escaping into the air must be prevented, the air is purified by special filters made from Blue Asbestos and cotton. Both these uses owe much of their success to the superior properties of a certain type of asbestos from the Cape Asbestos Company's own South African mines. The Company's activities however embrace much more than mining. "Cape" today is an important group owning factories in several countries and producing a number of well-known products such as the range of CAPOSITE thermal insulation materials, CAPASCO brake and clutch linings, and ASBESTOLUX non-combustible asbestos insulation board.

How Much Smaller?

IN building the smallest range of conventional cars to seat four adults, the British industry has not kept up with its competitors on the Continent. Apart from the ubiquitous Volkswagen, which is perhaps a little above the range, foreign competition has come chiefly from France, with the 4 cv Renault and the 2 cv Citroen, and from Italy, whose 600 cc Fiat is perhaps the best answer yet to the design problem of cars of this size. But a number of manufacturers on the Continent are now seeking to exploit the possibilities of even smaller cars, and are achieving serious volumes of sales.

The greatest success so far in this microscopic field is the Lloyd, made at Bremen by a branch of the Borgward organisation. Initially this car was produced with a two-stroke twin cylinder engine of 250 cc, which was later supplemented by a similar 400 cc engine, the engine and gear box being mounted at the front and driving the front wheels. The success of these cars led to the addition of a version with a 600 cc engine; and the total output of the different versions is now reported to be in excess of 200 a day. No other motor car manufacturer has yet tackled this market, but the German Auto-Union, whose smallest car at present marketed is the DKW, are reported to be exploring the possibilities, and it is rumoured that Fiats intend to make a small (450 cc) car on a large scale.

With these exceptions, the motor car factories of Europe seem to have thought the possibilities of such very small vehicles not sufficiently interesting, or the manufacture to be unsuitable for their own facilities. But other manufacturers, in the aircraft, motor cycle and other fields, have had more impelling reasons to seek new products. The Isetta, of Italian origin, is probably in larger production than any other miniature except for the Lloyd, though not so much in Italy as in Germany, where the BMW motor cycle factory at Munich is said to be building nearly 200 a day.

Heinkel, the aircraft manufacturers, of Stuttgart, have begun this summer to produce a very similar vehicle, with a smaller engine (174 cc, developing 9 bhp), but with a single rear wheel and with accommodation behind the front seats for two children. This probably represents the ultimate in economical transportation for a small family; the performance seems to be less than is likely to be generally acceptable. Messerschmitt have tackled the problem with a three-wheeled vehicle, also powered by a 174 cc engine, which can seat only two passengers and those in tandem, so that its amenities are rather to be compared with those of a covered-in motor cycle than those of a car. It is, however, reported that this company will shortly produce a four-wheeled car with side-by-side seating.

Probably the most promising of all the designs that have so far been marketed comes not from an aircraft factory or a motor cycle factory, but a firm of agricultural machinery makers—the Goggomobil, made by the Hans Glas Isaria company of Dingolfing in Bavaria. This has a body that looks like a two-door saloon, with every dimension reduced to the minimum consistent with reasonable space for two adults in the front seats and two children behind them; so that with a rack on the roof, a small family can be accommodated. Road holding and general behaviour are excellent, and an enterprising driver can achieve average speeds which one would hardly believe possible.

Such a vehicle obviously will not offer family transportation in the class of an Austin A.35 of today; but it offers much more than the original Baby Austin used to, at all events before the latter was equipped with a saloon body. In volume comparable to the A.35, the cost of production of the Goggomobil should be less than two-thirds as great, and the running costs should bear approximately the same relation. It is not surprising that, with production starting only 18 months ago, 25,000 units were made and sold in the first 12 months, and extensions to the works are to give a capacity of 200 units a day. Three other important German motor cycle manufacturers are preparing to produce small vehicles for the same market. The NSU company of Neckarsulm, whose products include the "NSU Quickly," a 25 cc powered cycle, of which increasing numbers have been imported into this country, expect to be producing within a year a vehicle which will be a little bigger than any of the "miniatures," and almost in the class of the Renault 4 cv. Zundapp of Nürnberg are to produce the "Delta" car designed and exhibited by the Dornier aircraft firm. This is perhaps the most original in design of all these vehicles: the engine is placed in the centre of the wheel base, with the two front passengers facing forward and the two rear passengers facing backwards—an arrangement which harks back to the dog-cart, and would seem likely to encounter rather serious sales resistance.

★

Development and production of miniature cars in this country has so far been on a very modest scale. The largest production has been of the Bond Minicar, a three-wheeler with a front-mounted Villiers engine of 197 cc and a single bench seat. A more advanced and original design is the Berkeley, designed by the originator of the Bond; this is a four-wheeler with a two-cylinder air-cooled British Anzani two-stroke engine in front, developing 15 bhp, with a total weight of the order of 6 cwt. The construction is a clever combination of a steel and light alloy frame with fibre-glass plastic body, resembling a modern open sports car. Fibre glass construction has never yet been developed as a really low cost way of making body panels in large quantities; but if this could be done the Berkeley might be capable of production in quantities at a low enough price for marketing on a substantial scale—which can hardly be said of any other British vehicle in this class.

AUTUMN 19 BOOKS 56

Chapmanship

BOOKS were the first consumer goods to be mass produced. But today they are so far from being considered a mass product that no normal advertising agency would think it worthwhile to go out after publishers' accounts. Pushing consumer goods, from scent to soap and from cars to kitchen equipment, is lucrative business for advertising specialists, who buy for that purpose advertising space by the acre, and even TV time by the hour, and on a service fee of twelve and half or fifteen per cent do well enough for themselves. But books must be advertised title by title, and few if any have runs long enough and a turnover large enough to justify an advertising allocation of more than a few hundred pounds.

This is not even peanuts to an agency. The average expenditure per head on books in Britain is now 17s. 6d., the price of one long novel or one not-so-long non-fiction work, and it compares with the £2 a head spent on newspapers and magazines by adults and 17s. a head spent by children on periodicals. If it were possible to start a campaign to buy books, as it is to drink milk, there might be something in it for the skill of the space salesman, the copywriter, the artist in "media"; but to spend 7½ per cent of the estimated receipts of a 15s. book with an expected sale of 5,000 provides an advertising appropriation of £187. There would be £312 for a 12s. 6d. novel with a sale of 10,000; about £1,500 for one with a sale of 50,000 —virtually in the best-seller class. When it is considered that a single "six inch" in a Sunday paper, on the book page and displaying maybe three titles, costs around £80, the publisher's problem begins to emerge.

It is at any rate clear that every penny spent on advertising a book—and, more important, winning free publicity for it—must tell; and it is timely that a book has now appeared, aptly entitled "Sales on a Shoestring,"* which suggests in some detail how this may be done. It is aimed, of course, primarily at publishers, but anyone with the welfare of books at heart, and certainly anybody interested in the looking-glass economics of book-publishing, will find it good reading. It reveals, for example, how the late Mr Chester Wilmot's "Struggle for Europe" was launched by Collins upon its victorious career as a best seller for £2,923. But it did not achieve sales of millions on the publicity purchasable directly by that sum; the publicity which it achieved, and which sold it, was worth hundreds of thousands. The difference between the maker of soap and the maker of books is that the former must buy virtually all his publicity—and is only too delighted when by chance his product is favourably mentioned by a disinterested and prominent person. The maker of books normally regards his advertising outlay as the first stage in a two stage propellant mechanism. It ignites the charge which really sends sales soaring. What matters to a book's sales are the reviews it gets, the feature articles it inspires, the discussion it provokes, its own capacity to become (as soap never does) straight news. It must please its public when it homes on to it; but it needs enough bought advertising to make sure that it will home to its public and there start the gratifying process of "snowballing" sales and publicity together.

As the author of "Sales on a Shoestring" points out, advertising can sell a book, but it can never sell a book in the way it sells soap—a given expenditure producing a given sale. It is also, *per contra*, true that a book may delight the reviewers, and even be mentioned by a prime minister, and still not sell. Textbooks can be made known to their whole market for an advertising appropriation of less than 5 per cent of the expected sale—and when this is spent either it captures that market or it does not. But for the general run of general books, the publisher's art lies in compounding just that explosive mixture of advertising and publicity in the various simple media he can afford which will send the book off to find its own friends and create its own publicity. With average luck, a worthy book creates enough to ensure sales that pay for itself; but here and there it does much more, and the excitement of publishing is to pick the winners that will rocket to best sellerdom.

First there are the notices in the booksellers' trade papers; then there comes the preparation of other simple "promotion material"—show cases, leaflets, and the like; then comes the sending out of review copies; then the normal press advertising—and occasionally a special stunt, which may range in kind from a superb lecture by a man like Chester Wilmot to an invited audience of booksellers and experts to watch the heaving of a brick through a book-

shop window by an actress (Mr Hyde describes both kinds). It is all very simple, inexpensive and indeed amateur; and then, once in a hundred or a thousand times, comes the moment described by Sir Allen Lane in the introduction to this book, when a book like "Nineteen Eighty-Four" is adapted for television and sells 27,000 copies in three days.

But this is, in large part, the art and gamble of selling one book against another; what can be said of the possibility of widening the market for books as a whole, for selling books against washing machines or cinema seats? On this point, Mr Hyde has much less to offer. "Read a good book" has never conquered a new reading public from countless hoardings or tube posters. Co-operative ventures among publishers have not been successful and "book festivals" and suchlike are hard to evaluate. The state teaches its citizens to read, though only a smallish proportion actually to read a book; some publishers wish that all council houses were fitted not only with a boiler but a shelf marked "space for books." But Sir Allen Lane is stating the simple fact when he declares that "the public at large is not book conscious."

Is it, however, certain that the traditional method of making books news, and so winning news page as well as feature page headlines for them, has reached its limit? Is it certain that the time-honoured search for lower production costs and prices—if not absolutely, at least relatively to other goods—can go no further? Television has evidently created a new medium of free advertising for books—and especially for authors. But there are other methods too. It is reported that before long a new company will be distributing a prefabricated double page of book reviews, publishers' advertisements and literary notes by reviewers and authors of the first rank to a chain of non-competing provincial newspapers. It is clear from what Mr Hyde says, moreover, that booksellers themselves could do far more, even on a shoestring, to make the public "book conscious."

The great achievement of the paper-backed editions, led by Penguins, was to create a new market for books, which, contrary to predictions, has not harmed the book between stiff boards, or the specialist bookseller, but has helped both. The next question which the book trade should ask itself is whether even the sacred net book agreement is still necessary. Is not the real need to create as many outlets for books as possible—even between the sweets and smokes counters—at any cut prices which the efficient demi-chapman can afford, in the faith that this will bring even more customers to the efficient specialist book shop with its big stocks and its sound service and publicity methods? There is no reason why doubling the standard of living in 25 years should merely double the average purchase of books, at present prices. There is every reason to hope that a much larger part of that higher standard can be taken out in the ownership of books. Surely some of the millions of man-hours of new leisure that are prophesied will be devoted to reading? They will be if the book trade sets itself to the task of ensuring that they are.

Mr Gladstone's Wife

MRS. GLADSTONE.
By Georgina Battiscombe.
Constable. 263 pages. 21s.

MR GLADSTONE'S appearance was so terrifying in old age, and the style of his speeches could be so prolix, that it is sometimes hard to remember that he was the most friendly and genial of conversationalists, master of a family language of outstanding terseness, and a man who could only with difficulty be prevented from riding on a roundabout at a country fair while Prime Minister. This delightful portrait of his marriage to Catherine Glynne is valuable for the light it throws on him as well as on her; and Mrs Battiscombe writes of both with wisdom and insight.

Mrs Gladstone, a lively, untidy, impulsive aristocrat, often caring little for her time's conventions, made a strange yet effective foil to her equally lively and far more methodical husband. His energy was fabulous, but her own was remarkable; she thought nothing of travelling round the outskirts of London all day and entertaining at a great dinner in the evening, although she hated the fuss of great entertainments. Much of her life, and almost all her money, was spent in charitable work of various kinds; and she insisted on actually getting out into the homes of working people, instead of restricting her charity to drawing-room committees. Splendid generosity and lovable character made her adored by hundreds of children and cripples; and she managed her own large family, by a series of brilliant improvisations, at the same time. The mainspring of her life, through nearly sixty years of marriage, was profound love for her husband. "I feel so incomplete without you," she once wrote to him when they were apart; and in the seventies she told her niece that to sit in the gallery of the Commons "is almost my only real relaxation. . . . I can look at him and be at peace." She was little interested in politics, but so entirely devoted to him, and so convinced of his rightness, that she was the most powerful factor in keeping him active (because she knew he really wanted to be active) in the front rank of party strife long after prudence would have taken any more ordinary couple into final retirement.

Mrs Battiscombe brings her characters vividly alive, and succeeds in conveying the essential goodness of the Gladstones without a trace of sanctimoniousness. She concludes that

> He had been four times Prime Minister of England, one of the most famous figures of his age and generation; she had simply been his wife, but those who knew them both might judge that she too was not unworthy a place in Westminster Abbey.

"A Most Contentious Figure"

FEAR GOD AND DREAD NOUGHT: *Volume II, The correspondence of Admiral of the Fleet Lord Fisher of Kilverstone.* Edited by Arthur J. Marder.
Cape. 521 pages. 35s.

THIS second volume of Professor Marder's cullings from Lord Fisher's voluminous correspondence is even more fascinating than the first (published in 1952); and it is good news that, rather than curtail his selections, the editor has decided that a third and final volume is to follow. The period here covered falls naturally into two phases, the first from 1904-10, when Fisher was First Sea Lord and at the height of his power and influence, and the second from 1910-14, when he was out of office, but still wielded great influence over naval (and sometimes wider) affairs through his close friendship with Reginald McKenna and Lord Esher, and his more intermittent admiration for McKenna's successor at the Admiralty, Churchill.

It was a period of revolutionary changes in the navy, for almost all of which Fisher was responsible; and the new fleet which he created was the one that fought and defeated the central European powers in the first world war. By no means all Fisher's reforms were adopted at the time, and many of them aroused savage opposition, both in and outside the Navy. But the list of his accomplishments is only less remarkable than the fact that many of the reforms which he advocated, but failed to get accepted, have since been adopted. The big-gun battleship, the water-tube boiler, the turbine, the redistribution of the fleet to meet the German menace, the Naval War College, oil-fired boilers, the reforms in the entry and training of officers, and many measures to improve the status and ameliorate the lot of the lower deck were all in great measure due to his imagination and fiery energy. He failed to gain equality for the engineer officers, or to widen the basis of selection for the navy by state-paid education ("this democratic country won't stand for an aristocratic Navy"); but both these measures were introduced quite recently.

His vision and prescience were astonishing. In 1911 he foretold the autumn of 1914 as the date of Armageddon; when flying was in its infancy he foresaw the revolution that maritime aircraft would achieve ("Stamp out protected cruisers and hurry up aviation"). Tolerance and moderation were as foreign to his nature as dishonesty and self-interest were abhorrent to him. His enemies were all "skunks," "pimps," "sneaks" (or worse), and his friends were invariably "beloved"—unless or until they opposed him.

In his judgment of people Fisher was, however, too prone to base his opinions only on how far they helped or hindered his own designs. Thus his repeated strictures on Haldane certainly show a lack of appreciation of a fine administrator's brilliant mind. Nor was Jellicoe, whom Fisher ensured should command the fleet in war, "the best officer since Nelson." He was, however, the right Controller to push through the First Sea Lord's technical reforms. In wanting Hankey as the new secretary of the Committee of Imperial Defence, however, Fisher made a splendid choice. Much light is here thrown on the long-drawn quarrel with Lord Charles Beresford, and it is impossible not to feel that the greater right was on Fisher's side. After all, Fisher did agree to Beresford being given the Channel command, in spite of previous intemperate criticisms of his policy; but his magnanimity produced no response, and the final breach came when, at a levee, Beresford refused the proffered hand and turned his back.

This correspondence reveals a warm-hearted, devoted and unselfish character. And what delicious reading his letters now make—not least for their outrageous indiscretions. Indeed, the period might be called "the age of indiscretion." Lord Esher sends him "all the most secret news," and the Admiral writes to Mrs McKenna, "Now for some secrets." Moreover, Fisher himself sent his innermost thoughts to journalists like Arnold White, W. T. Stead and, for a time J. L. Garvin. All of which was, no doubt, as reprehensible as the leaks from the Naval Intelligence Department and the CID here described. It seems true to say that Fisher's lack of restraint encouraged others to imitate him—sometimes with unfortunate consequences for the Admiralty and the navy. Nearly all his letters bristle with injunctions that they are to be burnt when read; but fortunately for the historian, these injunctions were regularly disregarded by the recipients. Fisher himself destroyed all but a dozen of the letters he received from Edward VII; yet the warmth of the friendship between the Admiral and "the greatest friend I ever had" stands fully revealed in those that he kept. Towards George V, however, he felt quite differently, probably because, as Prince of Wales, he was too friendly to Beresford.

Professor Marder has edited the collection with exemplary care and skill. His explanatory introductions to each phase give exactly the background needed by the reader; he traces all of Fisher's allusions—many of which, like the description of Haldane as "Napoleon B. Fosco," are highly obscure; he corrects the Admiral's many misquotations, and the footnotes provide the links needed to turn sporadic correspondence into historical narrative. This is a book of great value to everyone interested in the political and diplomatic events of the Edwardian era; and Fisher's own reputation is certainly enhanced by the publication of his correspondence. His epitaph may justly be the remark made by Sir Robert Arbuthnot in 1914: "All that is best and most modern here [that is, in the fleet] is the creation of Lord Fisher."

The Life of Lady Mary Wortley Montagu

ROBERT HALSBAND

This is the first fully documented biography of the famous eighteenth-century letter-writer. From new material the author throws fresh light on Lady Mary's eventful private life and on her public career as poet, friend of the Augustan wits, traveller to Turkey, propagandist for smallpox inoculation, and literary patroness and combatant. *Illustrated* 30s. *net*

Memoirs from the House of the Dead

F. M. DOSTOEVSKY

Translated by JESSIE COULSON

Thinly disguised as a novel, this is the story of Dostoevsky's four years' penal servitude in Siberia. It is as remarkable for its detachment and freedom from bitterness as for its vivid pictures of prison life and its understanding of the 'unfortunates' who were his fellows. 12s. 6d. *net*

Also Translated:

Crime and Punishment 16s. *net*

Trade Unions

ERIC L. WIGHAM

'In the last chapter of this admirable book are packed several pounds of political dynamite. . . . The thesis is that it is time for the birth of a new unionism. The pangs have begun—but that is all . . . . There are plenty of facts—as there should be in a Home University Library volume—but they are readably and shrewdly presented.'
DAILY TELEGRAPH 7s. 6d. *net*

The Challenge of Change

LAURENCE THOMPSON

Well known as *News Chronicle* feature writer, Mr Thompson had special facilities to report H.R.H. The Duke of Edinburgh's Study Conference at Oxford. This book is a stimulating discussion of the Conference theme: the impact of industrialization on society and the need to keep society's human values. *Laminated paper cover* 5s. *net* 22 NOVEMBER

Readable Russia

RUSSIA WITHOUT STALIN.
By Edward Crankshaw.
Michael Joseph. 287 pages. 18s.

"WHEN there are no pretty girls, and when he does not have to make a speech because Mr Khrushchev is doing all the talking, he has the quietly purring air of a cat that has been at the cream." That is Marshal Bulganin, the Soviet premier. "I have watched him, in Belgrade, making mistake after mistake in his determination to charm Marshal Tito and the Jugoslavs; and I have seen him each time registering the fact that, without knowing why, he had said or done the wrong thing—and never after that making the same mistake again." That is Mr Khrushchev. What a pleasure to find a book on Russia written with the wealth of knowledge that is Mr Crankshaw's, but well written: penetrating but lively, free from the deadweight of dubious statistics and Marxist jargon, picturing the Russian people and their leaders as human beings, neither robots nor supermen. Experts on Soviet affairs seldom see eye to eye (and thank goodness for that; it will be a sad day when western political analysis sinks to the dreary level of *Pravda*'s strict conformity). Mr Crankshaw's judgments will not command complete approval among his fellow pundits, nor will the general reader necessarily accept as gospel some of his more sweeping statements. But he has made a further welcome contribution—his fourth in book form—to the study of modern Russia, and a book which ought to be widely read is none the worse for being highly readable.

Mr Crankshaw's last visit to Russia was at the time of Dr Adenauer's mission there a year ago, and events have overtaken both him and his publishers in some respects; for example, Mr Khrushchev's now world-famous "secret" speech was still wrapped in mystery when this book was written. Yet it is written in such a forward-looking manner that there is nothing musty about it. The description of the contemporary Russian scene is undated as well as vivid: the clash of puritanism and cynicism, the racketeers, the young idealists, the rival cults (equally nauseating whether they are religious, political or pure snob); the problems symbolised by the headshawled peasant women snoring among the ghastly grandeurs of Moscow airport; the secret, withdrawn lives of the ruling cliques, their voluntary isolation from the world of less privileged beings, the scandals repeatedly set off by the antics of their pampered offspring; the hesitations and defiant gestures of writers and others who yearn to let off steam but are unsure how far they dare go. This is a convincing picture of Russia as Stalin has left it, with its new industrial might and its old, maddening, occasionally charming, more than Irish fecklessness; its vast material resources, its cumbrous bottlenecked mechanisms for exploiting them. Mr Crankshaw's testimony to the still acute scarcity of dependable and skilled manpower is perhaps a healthy corrective now that we are constantly being told that Russia is turning out hordes of scientists and technicians; the human element is as important here as the statistics, and Russians are very human.

Mr Crankshaw's main theme can perhaps be summarised like this. The human spirit survives in Russia despite the inhuman pressures to which Stalin subjected it; the "1984" technique has proved a failure, even when applied to young minds that have known nothing but "conditioning" propaganda. Yet, because Russians are Russians rather than because they are communists, this spirit is not the individualist one familiar to the western world: "communal effort, the subordination of the individual to society, is in her [Russia's] blood." And, while this makes the task of Mr Khrushchev and his colleagues an easier one, there is much reason to suspect that, now that Stalin's relatively simple aims and methods are a thing of the past, his successors are not at all clear how to define their task.

German Martyrs

DYING WE LIVE.
Harvill Press. 224 pages. 16s.

IT is sometimes good to be reminded that, when all is said and done, men are moved to face torture and death for other than material motives. At bottom, the Germans who opposed the Nazi regime were individualists moved by the fundamental spirit of humanity rather than by politics. Their conflict was essentially one between Christian ethics, unconsciously imbibed in childhood even by agnostics, and a deliberate return to pre-Christian barbarism, in which the worst human instincts were raised to patriotic virtues. It took the Hitlerite experiment in atavism to bring home the ease with which civilised Europeans can become scientific barbarians once a leader and propaganda inculcated the creed that it was high treason to follow the basic tenets of Christian behaviour.

This is the lesson behind this collection of letters written from the condemned cell by the most varied group of opponents of Nazism. It is less obvious, and a more fruitful warning, than the lesson that the spirit cannot be quelled, and that martyrs face death calmly, trusting in God and a future life, without hatred towards their persecutors, troubled only by the suffering caused to their wives, mothers and children. It is not only priests and pastors who transcended their mundane natures in this way. The book contains letters from young workmen (the opening note from a farmhand who died for refusing to join the SS is a classic of its kind), Prussian landowners and officers, with other representatives of "materialistic" professions. The same spirit runs through them all, and it is as moving as it is inspiring.

Melancholy Ministry

THE CHATHAM ADMINISTRATION, 1766-1768.
By John Brooke.
Macmillan. 414 pages. 36s.

TWENTY-FIVE years ago Sir Lewis Namier published his "England in the Age of the American Revolution," a book which completed his decisive destruction of many myths long propagated by historians and which began a detailed reconstruction of the political history of George III's reign. That reconstruction was carried out, not in terms of parties and principles, but through a minute analysis of shifting interests and connections; and it ended with the promise of a further volume on the rise of party. Since then Sir Lewis's teachings have been generally accepted and his methods adopted by other historians in other fields. Now, with the help of the scholars collaborating with him on the "History of Parliament," he is able to redeem his old promise. Mr Brooke's volume is the first to appear in a series designed to provide a political narrative of the years 1754-1784. It is both fitting and fortunate that Sir Lewis, whose early work so largely destroyed the credit of the old narratives, should inspire and direct the writing of the new narrative.

Mr Brooke describes his subject, Chatham's last ministry, as "curious and melancholy." Chatham formed an administration designed to ride above faction and to achieve loyal unity; he succeeded only in alienating opinion and in hardening the party groups. It is with the composition and manœuvres of these party groups that Mr Brooke is concerned. He leaves the reasons for Chatham's failure to the biographer; and he warns the reader expecting a discussion of great political issues that "all other questions—the American problem, relations with the East India Company, or foreign affairs—were subordinate to party conflict." Mr Brooke's instrument is the microscope. He remarks of his work that "to read through these documents is a tiresome experience: the mind wearies with trying to follow the intricacies of time, place, and action." Some readers may feel the same lassitude when following the shifting intrigues and combinations in a narrative which follows not only the days but also the hours; for the eye kept close to the microscope is easily tired. Much of this is historian's history, admirably exact but demanding professional knowledge if the allusions are to be understood.

But Mr Brooke introduces wider perspectives in two splendid central chapters of analysis. In particular his chapter on "Party in the Age of Grafton and Chatham" stands out as combining a brilliant summary of Sir Lewis Namier's teaching on the structure of politics with an aerial survey of the whole ground which the new series of volumes is designed to cover. Throughout, the severity of the scholarship is relieved by the quiet pungency of Mr Brooke's writing and by deft character sketches. He compares the vivid and uncontrolled imagination of Horace Walpole with that of Burke, the one expressed in a sham Gothic romance, the other in the political myth of the "Double Cabinet" and the "King's Friends." Of Rockingham he observes that he "has shone in history with the reflected light of other men: the friend of Saville, the patron of Burke, the ally of Fox."

Chatham, Mr Brooke concludes, was the last English statesman to attempt to rule without the aid of party. Mr Brooke tells us in one of his forward glances that the most significant development in the history of party lay in the petitioning movement of 1780, which arose outside Parliament; and it is to be hoped that he will soon give us his second volume.

Andean Indian

THE ANDES.
By Claude Arthaud and François Hébert-Stevens.
Thames and Hudson. 208 pages. 50s.

IT is the Andeans, rather than the mountains, that fascinate these two photographers; and that is fortunate, for they are photographers who can also write. Choosing to turn their cameras on to the twenty million Indians who chew their coca, grow their corn and potatoes, drink and dance and mate at roughly the altitude of Mont Blanc, they have accompanied their beautifully reproduced pictures with text as charming as it is perceptive. In two pages, for instance, they give us the Uru, who live on floating, artificial "islands" of reeds on Lake Titicaca, 13,000 feet above sea level, and deny that they belong to the human race. The authors dismiss the Incas summarily—"like the Spaniards, but a moment in the history of the Andes." Their concern is with the slightly incredible, apparently everlasting Indian of the great ranges, who from time to time has acknowledged other masters but in reality serves only the mountains and their sinister deities.

The Andean Indian is no beauty to European eyes, and the occasional garish splendour of his feast-day clothes is often blighted by borrowings from Europe such as a black bowler hat for women. But his dancing has other qualities than beauty; it has more meaning than anything else in his life. "The dance is the only literature of illiterate peoples, their only means of reliving the past." This statement might be challenged by Homer's Greeks or by other peoples with a treasury of recited saga and precept; but the authors may fairly apply it to the Andeans, and they have done well to focus on dances and festivals, devil masks, processions, weddings, and the brawls that accompany such events. Each group of photographs is interpreted in light and delicate prose, which owes much to the translation of Eric Earnshaw Smith.

British Railways in Action

by O. S. NOCK This book provides an answer to the many complaints about British Railways; it will also provoke controversy. It shows the varied problems faced—traffic congestion, gradients and alignments, the sheer weight of business—by giving chosen examples. The 46 photographs were specially taken for the book 25s

Modern Rhododendrons

by E. H. M. COX and P. A. COX A useful work by two experts in which comprehensive advice is given on all aspects of cultivation and on the various methods of propagation, with information on the difficult task of selection. Four colour plates and 23 line drawings. 21s

Theatre in the East

by FAUBION BOWERS A survey of Asian dance and drama—lively, entertaining, comprehensive and up-to-date. Traveller, linguist, scholar and professional musician and choreographer, the author deals in great detail with his subject, covering fourteen regions: India, Ceylon, Burma, Thailand, Cambodia, Laos, Indonesia, the Philippines, China, Vietnam, Malaya, Hong Kong, Okinawa and Japan. With 73 half-tone plates 42s

36 PARK ST. LONDON W1

Frock Coats at Grips

MEN AND POWER: 1917-18.
By Lord Beaverbrook.
Hutchinson. 448 pages. 25s.

LOOKING back on the 1900s from the turn of the twenty-first century, some literary critic can well exclaim at this book as a curiosity. "Lord Beaverbrook (he will write) let a quarter of the century elapse between the volumes of his memories of the first World War." The first instalment of "Politicians and the War" appeared in 1928, the second in 1932. This is the third: serial readers have had a long wait.

What difference does it make to performance when an author writes at seventy-five instead of forty, at long range instead of when memory is fresh? Not much to the punch and the highlights, provided that he was wont, as Lord Beaverbrook was, to write down a good deal while still tingling from the impact of events. The phrase or comment that carries the reader right into Kitchener's den, or Cherkley, or No. 10 are unimpaired ("It flashed across my mind 'This will put his pipe out.' And it did"). The big change wrought by time is the availability of other men's memoirs and papers. Lord Beaverbrook is an ardent collector of these. By gift, legacy and purchase, he now controls the world's most important private collection of papers on the first world war, including Lloyd George's, Bonar Law's, Lord Bennett's, Lady Lloyd George's and his own. As a result, the third volume of his story is endorsed by quotations, whereas the first two stand mainly on his word. The extracts chosen are so pungent that the tale gains, not loses, from the switch from single to multiple pairs of eyes and ears.

The purpose of the three volumes was to show "the immense importance of the civilian aspect of war direction" and the tale seldom leaves London. The stupendous backcloth is only mistily seen —Passchendaele, the all-out submarine war, the American entry, the Russian revolution, the near-miss scored by the German offensive in March, 1918. Against this, the frock-coated Titans clash and coalesce. Times, however bad, are never constantly desperate, and blackish news is the optimum cause of recrimination and struggles for power. Therefore, the two dangerous years covered are punctuated by battles in Whitehall almost as grim as those in France. The contestants are politicians on one side, technicians on the other. Bonar Law at the Treasury v. Cunliffe at the Bank, Lloyd George v. Jellicoe, Rothermere v. Trenchard, and Ll. G. v. the Generals. Will Lord Beaverbrook live long enough to write other projected books and to say whether the ballast and technical competence of Churchill reduced this element of struggle during the second world war?

Owing to the wealth of published memoirs on the period, it is only here and there that figures stand out in a new light, though the book includes many documents hitherto unpublished. The personal appraisal of Lloyd George, both at his zenith and over the short period of his decline in office, is the most interesting in the book. Too often, perhaps, Lord Beaverbrook's apparently balanced estimates are weighted, selectively by his prejudices; and a chapter that could well have been left out, since it is unimportant and less dignified than the rest of the book, is that on Lord Curzon's foibles; they have been revealed too often. The book is improved by illustrations that really illustrate, since each man is summed up in the photograph chosen; first prize goes to that of Lord Northcliffe, addressing (in an unusual sense of the word) his golf ball.

Lord Beaverbrook reveals himself chiefly as a go-between until he comes to the tale of the first Ministry of Information, which will move all who toiled in Malet Street in 1939-1945. He invites judgment, not as a participant, but as an author, and by this standard he ranks high. By the other, he must be rated—with Churchill—as a member of the worshipful company of men who recover from bites while dogs die.

New St Paul's

REBUILDING ST PAUL'S AFTER THE GREAT FIRE OF LONDON.
By Jane Lang.
Oxford University Press. 280 pages. 42s.

OLD St Paul's, "That sacred pile, so vast, so high," dominated Tudor London. Architecturally it became the dominion of an exacting cripple. From 1561, when lightning destroyed the tall spire, the building was a problem. Elizabeth contributed to the repair of the roof. Charles I and Inigo Jones did much to turn the fabric into a renaissance church. But complete repair could only be prodigiously expensive and Charles II, after the destruction wrought during the Interregnum, had barely set the work on foot again before the Great Fire of 1666 engulfed city and cathedral alike. For a while Charles's commissioners struggled to produce out of the ruined nave a place for services, only to discover in April, 1668, that the damage was irreparable. Later in the year they appointed Wren as surveyor—that is, architect. Thereafter their visions of repair were gradually replaced by Wren's visions of a great new cathedral, not in the outmoded Gothic desired by the clergy, but in the new style of contemporary European taste. For the next half-century the story of St Paul's became the story of Wren's struggle to evolve and achieve the present cathedral.

That story is largely available in the mass of original documents printed (1924-43) by the Wren Society. Miss Lang has taken the relevant parts of those twenty volumes and from their difficult pages produced a clear-cut narrative. Writing with vigour and enthusiasm, she has made it a fascinating tale—the tale of the cathedral as seen by Wren. Nephew of a bishop, son of a dean of Windsor, Savilian professor of astronomy at Oxford, modest, good humoured, a balanced man of genius who found his greatest fulfilment in architecture yet remained an inquirer after truth in many fields—this admixture produced in Wren a Surveyor General of His Majesty's Works whose achievements in England are still unsurpassed. Before the Fire he had been the boldest of those consulted by the Commissioners considering the cathedral. In 1669 he is shown proposing a modest building, complete in itself, rather than a vast project for which funds might never be available. Overruled, and with 1670 providing a small regular income from a duty on coal imported into London, he designed a splendid domed cathedral approved by Charles, but rejected by the clergy when a scale model had been made. In 1675 the "warrant" design was accepted and the foundation stone of the present building laid. This time there was no scale model and the architect was able to develop his plans as the building grew. Its progress was slow, for funds were small—perhaps £6,000 a year—and Wren determined to build as a whole and not, as many of the clergy wished, in sections. Throughout the history of the venture, there was this uncertainty. Finance depended on parliamentary extensions of the coal dues, Wren's own post on the vicissitudes of politics. A Whig ministry meant danger, war an interruption of the vital stone convoys from Portland. A new reign might even bring a set of commissioners averse to Wren or to his ideas, and the construction went on through five reigns and one revolution.

All this, the author brings out, heightening the dramatic effect by placing St Paul's in the foreground of events. She makes clear how craftsmen spent their working lives on the building and that gifted men of many crafts contributed to its success—Gibbons, Cibber, Pearce, Tijou and Father Smith, as well as building contractors of the first rank in their own day. If the cathedral was only one of the notable building projects of the period, it was, for Wren, the greatest, and its progress is faithfully chronicled: in 1697 a formal thanksgiving service in the choir; in 1699 the opening of the north-west chapel; in 1708 the completion of dome and lantern, followed by the slow years of detailed finishing, including the anxious work of tackling settlements. A young man when he dealt with old St Paul's, Wren was ninety-one when the new was finished.

The tale of the work is timely and should be read by many. Good illustrations and an excellent format enhance it. If a table of dates would help, errors are few. The specialist will mark places where further research is needed, or a footnote should indicate that an alternative view is possible. Yet he, like the ordinary reader, will enjoy his reading, his respect for architect and building both enhanced.

The Unoriginal Part

THE FABULOUS ORIGINALS.
By Irving Wallace.
Longmans. 311 pages. 21s.

MR WALLACE has written a readable book about the real life people on whom a number of characters in fiction were based. He gives five a chapter each: Dr Bell, as the original of Sherlock Holmes; Claire Clairmont ("The Aspern Papers"); Lady Ellenborough (Balzac's "Lys dans la Vallée"); Deacon Brodie, as the inspiration of "Dr Jekyll and Mr Hyde"; Mary Rogers, the undoubted original of "The Mystery of Marie Roget"; and, inevitably, Alexander Selkirk. Mr Wallace ends up with a chapter of shorter studies.

The author is at his best when the connection between the two lives, fictional and real, is close. The stories of Mary Rogers and of Claire Clairmont's last days are fascinating; but Mr Wallace does not resist the temptation to stray away from the episode that inspired the writer. Lady Ellenborough was Balzac's mistress for two months of her youth, and nothing of the long story of her later life, which Mr Wallace gives in potted form, is relevant to the *Comédie Humaine*. Nor does a superficial account of Claire Clairmont's youth help to illuminate "The Aspern Papers."

However interesting the models for these fictional characters may be, they are the unoriginal part of the novel; the important part is what the author adds to them. One suspects that Mr Wallace's passion for these origins has driven out most of his feeling for the creative side of the novels; they are only source material for his investigations. Furthermore, this concentration of interest falsifies his judgment: he picks on one human model, and regards that as the only important factor. For example, he regards Deacon Brodie, a hypocritical Scot who led a double life in the dullest sense, as the sole inspiration of "Dr Jekyll and Mr Hyde." Certainly Brodie played a part: Stevenson was deeply interested in his life. But Mr Wallace's concentration on this dullish feature leads him to underrate Stevenson's personal contribution and to ignore the thread of double character which, as a morbid by-product of Calvinism, runs through Scottish life and literature. He never mentions Lord Grange or the "Justified Sinner," which were certainly as familiar to Stevenson and far more significant to his theme.

A book of this kind is hard to steer between pedestrian learning and journalism. Mr Wallace runs straight for the latter. In spite of a bold reference in the preface to "basic research" there is little original in it beside the word in the title, and his British personalities are seen through the spectacles of Los Angeles, whence he writes. He is not an inspired biographer and his touch is rather vulgar; but his subjects are good ones, he is a competent journalist, and his book is fun.

Georgian Vice and Virtue

THE FIRST FOUR GEORGES.
By J. H. Plumb.
Batsford. 188 pages. 21s.

ALMOST a century ago Thackeray drew his lively and telling sketches of the first four Georges. Whig principles and severe moral standards combined to make him unsympathetic to these monarchs. George I was forgiven as preferable to worse alternatives. George II "tainted a great society by a bad example." Of George IV he wrote: "our eyes turn away, shocked, from this monstrous image of pride, vanity, weakness." Only to George III was he kindly disposed, since that monarch, despite his political wrongheadedness, "was pure in heart, honest in intent." Now Mr Plumb, who has recently given us a first masterly volume of his life of Walpole, has painted a conversation piece of the four Georges and their times with the vitality and frankness of a literary Hogarth. For Whig principles Mr Plumb substitutes historical understanding; for Victorian disapproval of moral laxity and extravagance he substitutes the psychological approach and an aesthetic appreciation of artistic achievement.

Using Hervey's memoirs which so repelled Thackeray, Mr Plumb tells with zest the story of the pathological quarrels that envenomed the court of George II. In contrast, he finds no virtue in George III's dreary domesticity. George's fifteen legitimate children constituted a record for a British king, but Mr Plumb considers this fidelity to an unattractive wife a possible contributory cause of his recurrent insanity. George IV's unpopularity is attributed chiefly to his unlucky marriage to a woman whose manners "were largely of the farmyard and the taproom." And his passion for building appeared the more outrageous because it was one to which the British royal family had not been addicted since the days of William III. Thackeray would have been shocked by Mr Plumb's plea that "regal self-indulgence, particularly in building and in the decorative arts, is almost always to the public advantage"; and he would have been extremely surprised by the suggestion that George IV, with his sense of theatre and fondness for public progresses, "was showing the way that the monarchy would have to go if it were to survive into an industrial and democratic society."

But Mr Plumb is interested in the political role of the Georges as well as in their personalities. The monarchy was still the centre of political life, and the heirs-apparent provided a natural rallying point for the opposition. Here Mr Plumb is on ground made familiar by Sir Lewis Namier and his followers; but he is never dull or merely derivative, and he gives us a superb portrait gallery of the leading politicians. He is also able to look beyond these to the more general forces of political change, to the economic effects of war and conquest and to the changes in taste and opinion. He enjoys being provocative. "Rarely," he says of England in this period, "has the world known a more aggressive society." And, despite his warm appreciation of the greater artistic achievements of the time, he is no enthusiast for the Georgian period generally. "Half the attraction of Georgian art," he tells us, "is due to the absolute poverty of what came before and what came after."

"The First Four Georges" is a short book, wonderfully compact but never didactic, and written with an enjoyable verve and stimulating informality. It is admirably produced and illustrated, though with one irritating slip: George III is shown on horseback at the battle of Dettingen, an action which should be credited to his grandfather.

Pour Encourager

CONQUEST OF DISABILITY.
Edited by Sir Ian Fraser.
Odhams. 224 pages. 15s.

WARS disable heroes and make heroes of disabled men. This collected testimony of the ways in which crippling disabilities have been conquered, sometimes almost miraculously, is not intended to glorify the few—though some famous conquerors give evidence—but to encourage the many. The brief tales are, inevitably, uneven. Most of them are more successful in telling, often movingly and sometimes dramatically, what individual men and women have been able to achieve than in telling how they did it.

But all the tales have the same message, direct or implied, both to other disabled people and to their friends and neighbours, whose part is decisive in the process of coming to free terms with life and livelihood. The obstacles, even more than the disability itself, are "self-pity, misplaced sympathy, false sentiment." The goal, at whatever the balance of activity that can be won, is independence, without selfishness. The conditions of success are acceptance of the facts (but not of needless limitations), hard work, patience and "nerve."

It is in peacetime that the heroes have to make their terms, with the glamour gone; and peace has, unendingly, its own casualties. Some of the testimony may seem out of ordinary reach; above all, perhaps, the blind and dumb or deaf who make do with the touch of their fingers; the blind who, robbed of even that touch because they have no hands, none the less win out; and the limbless who walk and work and play.

But there are really no classes, no frontiers, of disability. "For the war-disabled," one maimed contributor writes, "the way back to usefulness is relatively easy, particularly in the middle of a war, and if your disability is obvious." Especially in youth, the disability that is not seen may be hardest to conquer. The blind men in this book rate deafness worse. The tribute (and the encouragement) here is not to heroes, but to ordinary men and women.

Speed and Manoeuvre

THE RACING CAR: *Development and Design.*
By Cecil Clutton, Cyril Posthumus, and Denis Jenkinson.
Batsford. 288 pages, 105 illustrations. 25s.

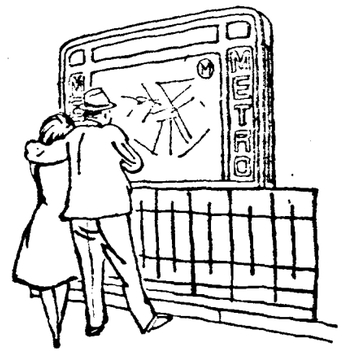
THIS is primarily a book for the enthusiast, but outsiders whose devotion to motor racing amounts to less than thraldom will find in it a good deal of information on the two questions that so often divert the non-initiate. How much has motor racing contributed to the development of the ordinary motor car? And why, when speeds of about 100 mph were being achieved in races nearly fifty years ago, are races still being won today at speeds that do not appear much faster, in spite of the intense technical expertise that has been lavished on racing car design in the meantime?

The three authors of this book—Mr Clutton deals with racing cars from 1895 to 1915, Mr Posthumus with the classic years from 1919 to 1933, and Mr Jenkinson with the period of German dominance in the thirties and the revival of *Grand Prix* racing after the war—answer the first question roundly in their joint preface. The adage that the racing car of today is the touring car of tomorrow, they think, had considerable truth up to 1900 (when, indeed, the racing car as such had hardly emerged, but developments put into cars for the great road races steadily advanced the mechanical art). "It has subsequently been true only to the extent that tomorrow never comes." The ordinary car, certainly, has benefited by lessons of design learned at least the more rapidly because racing cars have continued to press upon the frontiers of engineering technique—and particularly of metallurgy. But the demands of the racing car, during the fifty years in which it has been capable of manœuvre at speeds and in conditions that are seldom possible with the ordinary cars—and roads—of today, have been utterly different; and research for the two breeds of car has run on parallel lines, occasionally interconnected by contributions in both directions, rather than along the same one. The technical lineage of racing is admirably traced and illustrated here.

The second question, why speeds have not advanced in accordance with the growing complexity of racing car design, is based in part on the simple confusion of maximum speeds then and average speeds in our own time. But it is true that speed in itself, for many years, has ceased to be the primary object of European racing car design: repeatedly the complaint of "too fast" has been raised, and successive *Grand Prix* formulæ have been designed to rule out (successfully or not) the pursuit of sheer speed through brute engine power in massive and almost unmanageable vehicles. This restraint has been imposed partly because such machines were often associated with the pre-eminence of one nation or marque and the withdrawal of outclassed competitors; but also because of the strain upon the drivers, who have to manœuvre them over difficult courses. The giant Mercedes-Benz and Auto-Union cars of 1937, capable of close on 200 mph, were perhaps the most powerful and fastest *Grand Prix* cars ever made; but only a handful of drivers could cope with them.

This book closes with the end of an era in postwar motor racing, after the retirement of Mercedes-Benz from racing at the end of 1955. This left Ferrari and Maserati as established marques in the field (assisted by Lancia and Fiat, in different ways), with the British Vanwall, BRM and Connaught cars (all backed by firms outside car manufacture as such), and from France, back in racing after about seventeen years, the famous name of Bugatti.

Chinoiseries



THE SILENT TRAVELLER IN PARIS.
By Chiang Yee.
Methuen. 285 pages. 30s.

PARIS has been sung by poets of all countries and scrutinised and described by observers from most distant lands. Now it is the turn of a Chinaman to pay tribute to the *Cité Lumière*. Mr Chiang Yee, the silent traveller, has moved across the Channel, with his pen and sketch-book, attracted by the glittering city. The result of his peregrinations is most fascinating when it keeps its oriental originality. The thought of Chinese artists worrying because they cannot easily grow beards in imitation of their colleagues of "Man-pa-la-su" (Montparnasse) is one of the book's many astonishing associations. The comparison of the *Buttes Chaumont* to famous Chinese gardens has poetic undertones. Mr Chiang's occasional verse is fresh and the sketches (one of which is reproduced here) are at their best when they are most Chinese.

Paris is as inscrutable as a Chinaman's face. Each one sees in it a different image: the capital of art, the birthplace of revolutions or an entrancing old courtesan. Each writer also adds to it something of his vision. After so many stereotyped conducted tours it is a pleasure to explore Paris, and to rediscover some of its aspects, in the company of such a cultured and yet unspoilt Oriental guide.

'a splendid achievement'

Cell 2455 Death Row

was the story of the criminal path that led to the condemned cell he has occupied for eight years.

Trial by Ordeal

is the story of the fight for life—a legal fight that still goes on. 18/- net

LONGMANS

A Word in Search of a Meaning

WHAT the ordinary reader needs to know about automation is probably a good deal less than he may have been led to believe in the last year or so. In recent months this roaring bandwagon of "informed discussion" in 1955-56 has slowed down somewhat; some of the more inveterate riders, indeed, have climbed off. Lord Halsbury, for example, who must have delivered as many papers and speeches about automation in its prime as any man (one of them is included in the collection edited by Mr Hugh-Jones), now denies that the vague word has any independent meaning at all, or that the subject as such really exists. Not all his collaborators, or the authors of the other volumes listed at the bottom of page 11, would be so ready to aver that they have spent so long arguing about nothing. But in the carefully inconclusive conclusions that several of them reach it is possible to sense the same feeling of going out by the same door wherein they went.

If this were merely the waning of a pretentious verbal fashion, so much the better; and certainly if some of the exaggerated fears about the immediate effects of automation on employment subside with the public discussion, that will be a positive gain. But there seemed reason to hope that this was one of the rare subjects about which physical and social scientists might have been able to say something useful together; if so, any economist must regret that so far they have not.

One reason for the grip that automation took on the public mind centred on precisely that point. It seemed obvious that the economic and social implications of a rate of technological change that might become far more rapid than anything we have known might be large ones: but that was the only thing about them that was obvious. The public looked to the engineer and the economist, primarily, to explain broadly what those large implications might turn out to be. In vain: it has received no explanations, though it has heard a few disturbing and many reassuring noises.

It would be easy to put this failure down to the steadfast reluctance of most economists to think in quantitative terms; but this time unfair, because for once the engineers have been equally reluctant. Out of the comparatively few and not always consistent things that economic theory has to say about the reasons why industry invests in more productive equipment, most economists have picked one reassuring generalisation: that automation, like all other mechanisation, will create more jobs than it destroys. That generalisation seems to have held good not only over the long history of man's development of hand tools but during the last two hundred years of accelerated development of mechanical equipment. Nevertheless, it is based upon extrapolating the economic effects of a rate of technological change that neither economists nor engineers have yet devised any way to measure—which does not necessarily warrant its application to some new and much faster rate, if that is indeed what automation means.

The few disturbing noises that have been made about the economic effects of automation have come precisely from economists and engineers who have attempted, in some vague way, to envisage an entirely different rate of change. Thus one economist, assuming that in general automation will fairly quickly offer economies of about three-quarters in labour input per unit of output, feels that automation may greatly increase inequalities of income and bring about an increase in the numbers of domestic servants; and one engineer, considering a mechanised operation in open-cast lignite mining that gives the operator some 40,000 times the productivity of an average underground miner, foresees a vast lack of purchasing power. Thus Dr Einzig is concerned to hammer home his point that "The Economic Consequences of Automation" are not just the economic consequences of *mechanisation continued* as before; and Mr Soule to see in the "Do It Yourself" movement the first stirrings of the natural man reasserting his right to do as a hobby what the machine has now made it quite uneconomic for him to do for pay (or to pay some other emancipated labourer to do). There is plenty of naivety here, and loose thinking: Dr Einzig, having cut out and saddled his hobby-horse from the corral, proceeds to ride it off "every which way," and Mr Soule ends in a romantic glow. Neither would claim to have measured the rates of technological change implied in "ordinary mechanisation" and "automation" (which would inevitably, however measured, shade one into the other); but they have at least conceived the possibility that a much faster rate might shift the timing and the emphasis of economic development.

These, the most speculative of the books listed below (with one significant exception), are notable less in themselves than in emphasising the shortcomings of the more "practical" approach which some of the others make very competently to this subject, at several levels. Mr Macmillan's Third Programme talks are by far the best (and the cheapest) outline of the subject for the educated non-technician, better written than the creditable but rather disjointed short survey produced this summer (in a last-minute hurry) by the Department of Scientific and Industrial Research. Mr Cleator and Dr Pyke are writing at a more popular level: the first more attractively, because of a genuine knack for describing actual machines and saying what they do. Mr Williams and Mr Levin both write practically about a sector of industry where automation may make more changes more quickly than on the factory floor, the office. Mr Levin considers the subject more widely, but for this country his book is expensive.

No reading about automation, and the wider background of theory from which its developments stand out in highly publicised relief, would be complete without some taste of the writings of Norbert Wiener: and that ordinary reader whom one advises not to get immersed in too much automation might even take "The Human Use of Human Beings" and let the rest above go by. Many first-class minds have been devoted to cybernetics, the theory of control in organic and inorganic systems, and its application in automatic machines and elsewhere: only one genius, equipped with compassion as well as lucidity, has happened to write about it. Dr Wiener's discussion replaces automation in the background that indeed gives it some of its public appeal—in among speculations on the wider possibilities of machinery that can perform some of the functions of man's brain as well as his muscle, on the computers that can calculate far faster than thought and on the smaller, more complex analogue devices that can "learn" by their own errors, and indeed "choose" between alternative courses of action. Most people's instinctive hankering after some unifying concept of general application in the sciences may well explain part of the uneasy fascination that automation, the computers, and the vaguely-glimpsed theory of cybernetics, have exercised over the public mind and may continue to do, even if the economists and engineers remain unable to measure and interpret them. This is a recurrent, and usually a vain hankering, but not a naïve one: it seems indeed to be built into the human brain, as a tendency towards "problem-solving" may be built by that brain into man's latest, most complex artefacts.

Books about Books

CRITICAL APPROACHES TO LITERATURE.
By David Daiches.
Longmans. 404 pages. 25s.

DR DAICHES has organised his material in three parts. Part One ("The Philosophical Inquiry") surveys, more or less on historical principles, the problem of the nature and function of literature. Part Two ("Practical Criticism") watches representative critics at work. Part Three ("Literary Criticism and Related Disciplines") maps the frontiers of criticism proper with scholarship, psychology and sociology, and concludes with a discussion of "criticism and the cultural context." The book is thus formidably comprehensive. On page 9 we learn that "the *Ion* is the most elaborate presentation in the ancient world of the notion of poetry as pure inspiration," and on page 372 that "Bateson divides the history of English poetry into six consecutive schools." Between Plato and Bateson not much is left out, although Dr Daiches is himself a little worried lest he has not done justice to the "Chicago school." For critics as well as poets form schools in Dr Daiches's world—a fortunate circumstance making it possible to marshal them in an orderly way for expository purposes, each appropriately equipped with so many pages or sentences in the way of *loci critici*. The whole performance is highly professional and up to date; it will be regarded by many hard-pressed students as quite enormously convenient.

Yet some misgivings suggest themselves. The teacher is really doing too much of the job—with more and more expertness as it grows increasingly difficult with the centuries. "One can illustrate Plato's view of literature by a quotation of half a dozen pages," Dr Daiches says. But with Mr Edmund Wilson it is another matter: "the reader . . . must go to these essays himself." It is to be doubted whether every reader will. And indeed the simple if quite industrious student, thus masterfully catered for, is perhaps to be forgiven if he concludes that one book on the books about books will see him through. Again, Dr Daiches is comprehensive rather than catholic; his bias is analytical; he seldom directs attention to qualities such as taste and zest. Hazlitt is always a touchstone here. Dr Daiches allows him to have been (in a significant word) "salutary," but he scarcely kindles to him. Hazlitt will be found to make a poor show in the index—even although he seems there to be credited with some rather celebrated pages by Matthew Arnold.

But these strictures must be qualified by the observation that Dr Daiches himself is far from regarding his own book as self-contained. He is constantly dropping hints of further explorations and comparisons that may be made. The reader who goes into a library and prosecutes these will emerge grateful for the guidance he has received.

CHATTO & WINDUS

Exposition of Mr Nehru

JAWAHARLAL NEHRU.
By Frank Moraes.
London and New York: *The Macmillan Company*. 521 pages. 35s.

CONVERSATIONS WITH MR NEHRU.
By Tibor Mende.
Secker and Warburg. 144 pages. 10s. 6d.

MR MORAES has written what should for long remain the standard reference work on Mr Nehru. Any foreign minister, diplomat, banker, or overseas trader ought, with the aid of this exposition of Mr Nehru's aims, views and record, to be able to make a reasonable forecast of what to expect from New Delhi. Hasty reading of Mr Nehru's speeches suggests that in world affairs he is an idealist of the Gilbert Murray era and temperament, but, interspersed with the noble, strikingly phrased and utterly sincere aspirations, the more leisurely reader will find *obiter dicta* that reveal Mr Nehru's feet to be well planted on the earth.

Many people will interpret the facts adduced by Mr Moraes as implying that India's foreign policy assumes three things. First, were either power block to violate India's sovereignty, the other would come to India's aid; therefore, secondly, there is no point in forming an alliance with either as this would merely provoke the hostility of the other and commit India to additional armaments expenditure better diverted to economic development. Moreover, as long as it is uncommitted to either block, India will be wooed by both for its vast potentials and, therefore, thirdly, can hope to exercise influence out of proportion to its present small physical power. Although the thought does not occur to Mr Moraes, India's record towards its neighbours suggests that Indian policies are orthodox: attempts by any foreign power to influence events in the "spheres" of Nepal, Bhutan or Kashmir are regarded as hostile acts ultimately to be met by force, if necessary. As for Pakistan, India's sense of the balance of power impels it to maintain (what is reported to be) a threefold superiority in arms. The statement of these facts should evoke neither resentment in India nor criticism elsewhere, since they confirm that the principles of India's foreign policy differ neither in the expression of idealism, nor in the application of realism, from those accepted in London and Washington, Moscow and Peking.

In economics, Mr Moraes insists on Mr Nehru's "scientific Marxianism" and a superficial reading suggests that he is an orthodox socialist of the old school, but when Mr Nehru's officially proclaimed policy to achieve a society of "Socialistic pattern" in India is studied in detail, it is clear that he is eclectic and practical rather than Marxist or doctrinaire. Provided, for example, that private enterprise accepts a secondary place in the national economy, Mr Nehru is ready not merely to tolerate it but actively and positively to encourage it (even by means of credit grants where necessary), which is more than can be said of socialists in many other countries. Lastly it is clear that Mr Nehru is a sincere democrat, seeking socialism not by secret police, forced savings or labour, but by persuasion and voluntary sacrifices.

Mr Nehru is a willing conversationalist. As Dr Radhakrishnan once said of him "He knows a good deal about a good many things." Unfortunately Mr Mende was so anxious to avoid any crudity that the tactfully diffuse expression of his questions encouraged Mr Nehru's amiable weakness for thinking-aloud rambles over vast horizons, leaving a trail of cosmic verities punctuated with cheerful handfuls of "—and so on and so forths." Nevertheless a tidy minded reader will pick up valuable litter scattered about Mr Mende's little book.

Connoisseur's Guide

THE TUDOR PERIOD 1500-1603.
LATE GEORGIAN 1760-1810.
Edited by Ralph Edwards and L. G. G. Ramsey.
The Connoisseur Period Guides. 192 pages and 96 illustrations each. 42s. each.

IT is tempting to draw parallels between one age and another and it is easy to say that the reigns of Elizabeth I and George III shared an exuberant vitality. Perhaps it is fortuitous that they are featured in the first two volumes to be published in a series of six designed to describe the arts and crafts in Britain, period by period, from 1500 to 1860. But reading the two volumes together makes a fascinating comparison.

The Elizabethan age was the first great period in our domestic architecture, a peculiarly English compromise between the splendid and the homely. It was an age which first saw refinements such as comfortable chairs, feather beds, tablecloths, pewter instead of wooden spoons, plaster ceilings and pictures hung on the wall. The reign of George III saw the culmination of all this; it was the heyday of a society that rested upon the country house basking in the delicacy of the designs of the Adam brothers, in the elegant craftsmanship displayed in furniture and ornaments.

All this and much more is depicted in these two handsome volumes. Each contains chapters from different contributors on the different facets of the artistic side of living—architecture, furniture, painting, pottery, glass, metalwork, costumes, jewellery—to take a selection. Each contains lovely photographs. In recapturing the past by bringing together the arts of a period these books make their own contribution to social history although the emphasis is inevitably, although not entirely, on the stately ways of living, for this is a connoisseurs' guide. Even so, it is strange that a chapter on Tudor architecture, condensed though it had to be, finds no room for the black-and-white half-timbered style of the time. But generally these guides are authoritative as well as delightful to look at.

A Village Rediscovered

ASK THE FELLOWS WHO CUT THE HAY.
By G. E. Evans.
Faber. 250 pages. 25s.

THE title is facetious and misleading, for this is a serious book about an agricultural community, one of the best of its kind. The author—a stranger and unarmed with previous knowledge of the locality—went to live in the small Suffolk village of Blaxhall. He became interested in the old parish, from traces still recognisable beneath the social and technical changes of the present generation, started to investigate and has now recovered a familiar and fascinating story. But his work is far more than a patient academic exercise. True, he has studied the documents—the contents of the parish chest, the tithe map, the school registers. More important, he has translated the experiences and memories of a group of old people, each one associated with some distinctive aspect of the life of the community.

There was Robert Savage, shepherd and smuggler, and Priscilla his wife, an authority on cottage and household crafts. There were George Rope and John Goddard, two old farmers, whose combined lives spanned a hundred and forty years, wherein methods of husbandry altered from the medieval to the modern. In George Rope's time, they used the flail and the sieve on the open barn floor, aided by the through-draught from the open doors on both sides of the building, a practice descended from biblical times and even earlier. John Goddard saw the introduction of the reaper-binder and the threshing machine, which have now given way to the combine harvester. Henry Puttock was parish clerk and bell-ringer, and had acquainted himself with all the administrative history of the village. Katherine Messenger remembered the early days of the church school, and Mr Evans reproduces some interesting examples of lessons in elementary mathematics given at the time, all couched in agricultural terms and conforming with the latest modern practice. There was, lastly, Joseph Row, farmhand and malister, a source of information about the village inn, about home-brewed beer, and also about smuggling, which seems to have been as popular and respectable an occupation as in Cornwall—all classes took part in it except the squire.

The presentation of the subject is therefore original, arresting and always human. Although a stranger, Mr Evans understands both consciously and instinctively these old Suffolk country people and the things they remember: instinctively, because he catches all the hints about customs and attitudes that no longer apply; consciously, because he troubles to define briefly but accurately the technology and terminology of all the crafts and trades and traditions, which he could so easily have left unexplained to bemuse the romantic reader. The book is a mine of information, but this is offered so unpretentiously that it reads as easily as a quiet book of memoirs. The photographs are of great interest, and it was a happy idea to reproduce some of Bewick's engravings, one of which is given here.

View from a Giant

PICASSO.
By Frank Elgar and Robert Maillard.
Translated by F. Scarfe.
Thames and Hudson. 315 pages. 25s.

"THE painter makes paintings in the urgent need to discharge his own emotions and visions." The words are Picasso's. The turbulence of his emotions, the infinite variety and originality of his visions exist for everyone to see in an output as bewilderingly vast as that achieved by any artist at any time; and the urgency of the process cannot be doubted. For Picasso, one is aware, art is a weapon—a weapon for attacking every manner of artistic convention and for enlarging the frontiers of art itself; a weapon to be turned against tyranny and brutality (Guernica is only one, though probably the finest, example); a weapon, too, it must be admitted, for brandishing in shock attacks on critics and the public. No wonder the critic, confronting the need to classify the still unclassifiable, to interpret and understand the frequently unintelligible, has felt baffled. No wonder the public, the plain man (and where modern art is concerned, most men find it most restful to be plain) has felt that Picasso was not to be trusted—"the man is trying to make a monkey of me."

But now, at 75, the lineaments of the giant are becoming more clearly discernible—a process that, for English readers, will be greatly speeded up by MM. Elgar and Maillard's admirable book now translated from the French and replete with some 450 illustrations, many in colour of a generally high standard. M. Elgar's study is a model of expository writing, and is full of real understanding; his admiration for Picasso's work, though enthusiastic to a degree, is far from being wholly uncritical. M. Maillard contributes a brief biographical background and a good many penetrating sidelights into the bargain. The two essays, both organised chronologically, run through the book side by side. This method has much to commend it, though the inevitable difficulty of fitting the 200 or so illustrations that appear in the body of the book (one of which is printed in reverse) into the same strict pattern makes cross-reference unnecessarily slow at times. Page references should surely take the place of the chronological ones throughout the text. But this is a very minor fault in a book which is both excellent in itself and excellent value for money as well—a worthy addition to the already immense literature on Picasso. By showing how much of his work is "representational" and by elucidating so much that is not, the authors provide an ideal introduction to a "jack of all trades of genius"—painter, potter, lithographer, sculptor and etcher—whose outlook is not only larger than life but also, in Mr Bernard Berenson's phrase, truly "life enhancing."

Escape to Germany

THE ONE THAT GOT AWAY.
By Kendal Burt and James Leasor.
Collins with *Michael Joseph*. 255 pages. 16s.

OBERLEUTNANT VON WERRA was a German fighter pilot who was shot down during the Battle of Britain. He distinguished himself by escaping twice from prisoner-of-war camps in this country, although he was recaptured on each occasion. His third attempt, made during a train journey across Canada while he was being transferred to a new camp, was successful. Von Werra, persistent, courageous and tremendously self-confident, was a line-shooter *par excellence*. This, combined with his capacity to speak reasonably fluent English, enabled him during his second British escape attempt to brazen his way through all manner of difficulties on to a RAF station and actually into the cockpit of a Hurricane. His luck, though phenomenal, was no greater than his effrontery deserved. The circumstances of the whole episode are a trifle obscure, but perhaps inevitably.

Readers of the many excellent accounts of escapes by British prisoners-of-war will enjoy this book, which offers, apart from anything else, some interesting comparisons between German and British interrogation methods, security precautions, tunnelling and escape techniques and so on. But all good adventure stories depend primarily on excitement: can the hero overcome impossible odds and outwit his diabolically clever opponents? There is no shortage of excitement in this book, and the authors cope successfully with the minor difficulty that the diabolically clever opponents are just ordinary, likeable British people in a Britain at war, while the hero is an enemy fighter pilot—and a far from wholly likeable one at that. One's sympathies are predominantly with von Werra—which is entirely as it should be. In short, the two authors, and their two publishers, can be complimented on a successful combined operation on a modest scale. Von Werra, after finding his way back to Germany, died unspectacularly on active service.

Fleet Street Long Ago

THE NEWSMEN OF QUEEN ANNE.
By William B. Ewald, Jr.
Blackwell. 243 pages. 22s. 6d.

ALTHOUGH millions of people read the *News of the World* every Sunday, the proprietors of that and other similar journals know better than to print a paperful of news of the world. They know that their customers are not passionately absorbed by the world, but are instead gripped to exclusion by the flesh.

Mr Ewald reveals that the proprietors of two hundred and fifty years ago were no less perceptive. He has compiled extracts from twenty-seven newspapers published during the reign of Queen Anne. By 1702 newspaper publishing was already as fiercely competitive as it would ever become, and these extracts demonstrate how steadfastly the human mind retains its interest in gambling, bloody crime, sexual love, patent medicines and superstitious religion. Of the twelve headings under which Mr Ewald has grouped his material, two only relate to news of events at home and abroad. By this method Mr Ewald reflects a picture of life, as seen by the reporters and advertisers, in the early eighteenth century. So much for those who may take up the book for pleasure. For others, the book offers specimens of newswriting as it was then practised, and much that illustrates the history of public taste.

Newspapers seeking to entertain rather than to instruct are the creation of publishers and printers. Because the newspaper is printed it can be published with frequency; but must be sold at the lowest possible price. Hence, the number of copies sold has always been the criterion of success, and few proprietors have ever been willing to jeopardise sales. There is this to be said, however, for the restricted paragraphs given to newspaper readers in Queen Anne's reign. Printed news was censored by the Government, and Mr Ewald's selection demonstrates how tepid and trivial were the items that filtered through. Those who sought uncensored news existed then as now, and by subscription to a bookseller could obtain manuscript news-letters, written by journalists whose services were private, laborious and expensive. Grub Street was not the province of scribes so employed. They provided the solid fare of home and foreign politics, adjusted to the subscriber's profession or rank.

Public taste, longer lived than official censorship, has always deformed the printed newspaper. Thus it is that the manuscript newsletter is the true ancestor of the serious, "class" newspaper such as the fourpenny sheet known to us. Hence the recent loss to the British Museum or the Bodleian Library of the twenty volumes of the Newdigate newsletters, sold in July and destined for America, is crippling to British historians. Mr Ewald draws only on printed material, but he found already no less than five collections in America, and but one in this country—which he admits, rightly, as the principal, the Burney Collection in the British Museum. He might, nevertheless, have found it worth while to cite from the Hope Collection in the Bodleian Library.

★

Recognition of the newspaper and newsletter as a historical source is more readily appreciated by American scholars and students than by their colleagues in this country. The documentation of British journalism having been begun by Muddiman's *Handlist*, succeeding British scholars proceed far too slowly with the subject, and meanwhile the tools are vanishing across the Atlantic. The present book has not the detail substantially to benefit scholarship in this country. But the introduction usefully collects information on the range, typography, printing, and the circulation and finance of the twenty-seven newspapers surveyed. Biographical details, compiled from authoritative sources, of journals and journalists are included in an appendix.

MARCEL PROUST AND DELIVERANCE FROM TIME.
By Germaine Brée.
Chatto and Windus. 256 pages. 21s.

LIKE a long and complex orchestral work, like a vast piece of architecture—the similes recur in the novel itself—Proust's masterpiece is impossible to appreciate at all fully on a first reading, and goes on yielding fresh insights, on repeated acquaintance, to the limits of the reader's intelligence and sensibility. Intelligence, sensibility, and on the practical level mere leisure and energy to explore the Proustian labyrinth, fail for the vast majority of readers far short of what is needed for full appreciation; and what is likeliest to escape attention and understanding, far more so than subtleties of individual character, acuteness of social observation, or psychological penetration, is precisely the architectural quality, the main organising principle, of the "Recherche du Temps Perdu."

It is on architectural quality that Professor Brée concentrates in this illuminating essay; in the words of Mr Angus Wilson's introduction, on the total statement and structure of the novel. While she has much that is enlightening to say about particular situations, characters, implicit or explicit theories, her main concern is with the contribution of each of these to a central process; that by which all the themes stated or latent in the child's-eye vision of Combray are developed or orchestrated through subsequent "discontinuous blocks of experience," and at last triumphantly harmonised when, in "Le Temps Retrouvé," the narrator rediscovers his vocation. To the ordinary reader of Proust—the reader who knows "Du Côté de Chez Swann" pretty well, "A l'Ombre des Jeunes Filles en Fleur," "Le Côté de Guermantes," and "Sodome et Gomorrhe," rather less, who has either just managed or just failed to struggle through the obsessive aridities of "La Prisonnière," has recovered a little breath with "La Fugitive," and has reached the end of "Le Temps Retrouvé" in a state of awed exhaustion—Mlle. Brée's book is like an aerial view of a particularly tortuous maze; except that in this maze there are, contrary to the unguided reader's impression, no blind alleys.

There are moments when Mlle. Brée, insisting on the architectural relevance of this or that almost self-contained essay, bravura passage or historical disquisition, is something less than convincing. Proust was a genius, his novel is a masterpiece of construction—yes. But even under Mlle. Brée's guidance it is almost impossible to feel that every leisurely digression into literary or artistic criticism, etymology, strategy, or fashion-commentary really belongs, with the inevitability of great art, to the "main statement and structure"; that "they are never gratuitous, never included merely for decorative effect," nor, in the posthumously published volumes, relics of an experimental mood, which later consideration would have discarded. Setting Mlle. Brée's confidence alongside the agonising indecisions of the Gallimard editors before Proust's snowstorm of loose sheets, pasted-on marginal extensions, erasures and, still worse, lack of erasures, one is reminded of that brilliant essay in which Mr Lionel Trilling ascribes to one of Mr E. M. Forster's novels a splendid structure of Goethean symbolism which Mr Forster regretfully denies ever having intended. Yet perhaps it is one of the marks of a work of genius that the interrelations of its parts are more complex or deeper-rooted than even its author is aware. Whether or not she proves too much, Mlle. Brée's book is the best companion to Proust ever likely to be written.

Unity in Diversity

ADONIS AND THE ALPHABET.
By Aldous Huxley.
Chatto and Windus. 285 pages. 18s.

"LUCIAN, Astarte, the alphabet, sparrows in church, St Dominic, the Albigenses. . . ." And also Renaissance polyphony, also Eckhart and Zen, tunny-fish, Mormon architecture; also the Great Mother and sewage disposal, Mallarmé, etymology, Toulouse-Lautrec, and Male Continence. Some of Mr Huxley's verbal rhythms are highly infectious; if only the essential quality of his mind were equally so. That quality is made up of a rich variety of characteristics. Erudition is one; freedom to range through diverse worlds of art, literature, history, philosophy, science and metaphysics. Sensitivity to the nature of words, their undertones and overtones, connotations and associations, is another. But above all Mr Huxley's mind is one to which no fact out of its vast store of facts is isolated or inert, in which everything illuminates and cross-fertilises everything else. No memory-tight, emotion-tight bulkheads deny the relevance of the alphabet to Adonis, of sewage to "Les Précieuses Ridicules," or of the education of the kinæsthetic sense to the Divine Ground.

This characteristic makes him the most consistently and delightfully stimulating of contemporary writers; but it is one for which he pays a heavy price—that of a constant and agonising awareness of incongruity. Leakproof mental bulkheads, after all, serve a useful psychological purpose. Thanks to them the mass of mankind can quarantine those facts and feelings which, tolerable in isolation, jar intolerably on contact. It is common enough in adolescence to feel a sense of despairing outrage because idols have feet of clay, because the most magnificent human body is a *saccus stercoris*, because history past and present is studded with ghastly cruelties and destructive stupidities, because the loftiest sensations can be analysed into physiological tricks. In time a variously proportioned mixture of callousness, discriminating forgetfulness, humour and resignation anaesthetises the normal adult. Mr Huxley has never

from the Government Bookshops or through any bookseller

developed a protective callous; he forgets nothing; he has, for all his brilliant and pervasive wit, no sense of humour; and he refuses to resign himself. Beginning with "Eyeless in Gaza"—perhaps indeed earlier—he appears on the contrary obsessed with the need to feel and convey every incongruity as excruciatingly as possible.

On the human level, the lesson is conveyed, all harmony and wholeness are an illusion. Reconciliation can only be achieved at the mystic's level, where "all things shall be well and all manner of things shall be well"; a comfortless message for those lacking the mystic's gifts, a merely irritating one for those who erect an automatic defensive barrier at the first mention of the Not-Self or Suchness. Mysticism or no mysticism, Mr Huxley has not found reconciliation easy. To love mankind is one thing, to get over hating mankind's guts, in the literal sense, is another; and Mr Huxley, unable to quarantine the notion of guts behind a mental bulkhead, can forget his disgust for them no more than did Swift. Hatred was dominant in the deliberately atrocious "Ape and Essence" and "Devils of London." Here, the goal of detachment is nearer. These essays can be read for intellectual enjoyment of their richly various orchestration, for the delight in sheer virtuosity, for their occasional wisdom, for their courageous crankiness; in the corpus of Mr Huxley's work their lasting role is to mark a stage in a spiritual autobiography.

A Prodigy Grows Up

YEHUDI MENUHIN.
By Robert Magidoff.
Hale. 286 pages. 21s.

BOOKS about world-famous executive musicians written during their lifetime, however full of good stories, are seldom worth much as serious biographies. Mr Magidoff's biography of the violinist Yehudi Menuhin is a striking exception. He manages most skilfully to combine the story of Menuhin's phenomenal career as a musician with full-length portraits not only of Menuhin as a person, but also of his parents and sisters, the remarkable "Biblical Family Menuhin," as his teacher Enesco called them: his beautiful, tyrannical, high-principled mother Marutha, whose iron will governed all her son's actions till after he reached adulthood; his solicitous father Moshe, who accompanied him at all his lessons and on all his concert tours all over the world till he married; and his two gifted sisters Hephzibah and Yaltah. In this way we get a vivid idea of the background that formed his personality.

The domination of the mother and the loving care of the father protected Yehudi from many of the dangers of his astonishing career as child and boy prodigy; but they shielded him so effectivel from the real problems of life that as an adult he was faced with serious psychological difficulties. Later there came technical musical problems, the delayed results of his amazing virtuosity as child and boy. It is clear that Mr Menuhin has been remarkably candid with his biographer and the result is an account which rings true throughout.

The book is full of amusing and revealing stories of the musicians whom Menuhin encountered: his teachers, Louis Persinger, Georges Enesco and Adolf Busch; Toscanini, who, interrupted by the telephone while rehearsing with Yehudi, tore the telephone wire out of the wall and then, much relieved, continued the rehearsal; Elgar, who when the 14-year-old Yehudi had played the first thirty bars of his concerto to him stopped him to say, "Enough, it cannot be done better, let's go to the races"; Bartok, who after hearing Yehudi play the first movement of his concerto said, "I thought works were only played that way long after the composers were dead."

Mr Magidoff has a true knowledge of music and a clear insight into the joys and difficulties of the executive musician; he has penetrated deeply into the inner character of the boy and the man; and he is also a skilful and entertaining writer. One need not be a musician to enjoy and profit by his book.

Aborigines and Convicts

JOHN GRAHAM: CONVICT, 1824.

New Edition.
By Robert Gibbings.
Dent. 129 pages. 15s.

MERCILESS sentences, the hulks, the floggings, the prison ships and exile to an empty land are a part of Australian and imperial history which it is comforting to forget. We are reminded of it by Robert Gibbings's woodcuts and narrative, which has been out of print for some years.

John Graham is the hero—a true hero, for, cast in a different mould than that of the statesman or the soldier, he displayed heroic qualities. For stealing six pounds of hemp he was sentenced to seven years' transportation. After two years in the penal settlement he disappeared into the bush and became a member of an aborigine tribe, being claimed by a woman as the spirit of her dead husband. Impulsively, he gave himself up to the authorities six years later. As a prisoner he was able, through the trust the aborigines had in him, to rescue a Mrs. Fraser from their hands and earn his ticket of leave. The extraordinary story is brought boldly and vividly to life in this vignette.

Fair Stood the Wind . . .

THE AGINCOURT WAR.
By Alfred H. Burne.
Eyre and Spottiswoode. 359 pages. 35s.

IT is not easy to pierce the romantic haze surrounding Agincourt—the haze created by the drab history books of childhood and later by the rhythm of Drayton's ballad and Shakespeare's ringing, shouting poetry. The legend was re-created brilliantly in the film of *Henry V*: the gathering momentum of the charge of the French knights and the riderless white charger cantering across the field of dead.

The illusion is shattered when Colonel Burne reminds us that the French knights and men-at-arms charged on foot. In the place of illusion he sets a calm reconstruction of what probably happened. In its way his reconstruction is just as exciting as the romantic lie. Agincourt is set in its place—the actual battle occupying only a few pages—in the Hundred Years War. Following up his excellent book on "The Crecy War" by one equally as good, Colonel Burne has written a military history of the whole of the Hundred Years War which should long remain the definitive account. Using the sober eye of the staff officer, going back to the original sources and blending reason with imagination he exposes the war, not fancifully but convincingly. From Henry V at Harfleur to St. Joan at Orleans and to the death of Talbot at Castillon, the narrative moves at a round pace until the English are finally ousted from France.

At Crecy, Poitiers and Agincourt the long bow reigned supreme, the missile weapon, as so often in military history, blunting the edge of shock tactics. But better defences were devised, in this period armour being thickened, and the pendulum swung back again. By the end of the war cannon had begun to dominate the siege, though not as yet the battlefield. And by its end the feudal levies had disappeared and armies were made up of soldiers who fought for pay and loot. The twilight of the middle ages had begun.

Perhaps only two criticisms can be made of Colonel Burne's analysis of this absorbing war. He concentrates his attention on the set pieces of the battle and the large siege, dismissing in a few sentences the gradual erosion of English power as the French occupied one fortified town after another. In doing so he seems to do such a Fabian strategist as Bertrand Dugueschn less than full justice and to emphasise the tactical reasons for the English defeat at the expense of the strategical ones. And in his discussion of tactics, relying on his favourite weapon "Inherent Military Probability," Colonel Burne makes the campaigns and battles almost too tidy. Muddles and mistakes are as much a part of war as an eye for ground. Perhaps because he has such a good eye, Colonel Burne does not give quite enough weight to the possibilities of miscalculations and errors.

The First Four Georges

J. H. PLUMB

This reassessment—as entertaining as it is shrewd—of the personal roles of the Hanoverian monarchs is by a writer described by Raymond Mortimer in the Sunday *Times* as "one of the most enjoyable of living historians, a scholar with a lively mind."

UNIVERSITY PRESS

Non-Philosophic Historian

ENGLISHMEN AND OTHERS.
By A. J. P. Taylor.
Hamish Hamilton. 192 pages. 18s.

FEW contemporary historians can rise so high as Mr A. J. P. Taylor as witness, in this latest volume of offprints, a masterly little essay on "The Outbreak of the First World War"; few can sink so low, not merely in the occasional unworthy gibe, but in sustained attempts to argue against the evidence, as in his account of the motives of the powers in the Moscow negotiations of the summer of 1939. He himself is content to claim that he is not a "philosophic historian" and has "no system, no moral interpretation."

This does not tell us much—why then write so much and with such passion and power? Is it really only to clear his own mind, as he claims? Perhaps what he writes of others might help. He describes a contemporary in a well-deserved tribute as "a man of confident judgment, anxious—as every great historian must be—to reach a wide audience and capable of giving events their true historical setting." Of a nineteenth-century worthy he says, "As an essayist his subjects were chosen for him by the books which he had to review. He took a theme; made up his mind about it; and wrote his ideas fast, in time to catch the press. He had not time to hesitate; and there has never been a historian who doubted so little." Mr Taylor would like to be Mr Hugh Trevor-Roper; but it is the latter description that fits him. He is, in fact, the Macaulay of our own day, and like Macaulay thinks liberty "supremely important." But this may not be enough. For much of history, particularly the history of war and peace which is Mr Taylor's chosen theme, demands judgments which, if not strictly philosophic, do at least demand a coherent set of values; otherwise the reader is going to be let down with a bump.

THE PHOENIX BOOK OF MODERN AMERICAN HUMOUR.
Edited by Michael Barsley. *Phoenix House.* 256 pages. 12s. 6d.

The most carefully finished essay in this book is one on "John Bright and the Crimean War"—two favourite subjects come together. It ends: "The Munich settlement of 1938 was implicit in Bright's opposition to the Crimean War. I am not sure whether this condemn's Bright's attitude or justifies Munich." Should not a historian know where he stands on such an issue? The result of a failure to find what ground one is standing on is that one cannot hold on to the sympathies of others; and since Mr Taylor always states conclusions and never argues cases, one finds oneself now sympathising, as with his attacks on the extraordinary obscurantism about historical sources still maintained by British officialdom, and now dismissing as wilfully provocative, for instance his announced preference for either revolution or conservatism as against moderate reform.

Occasionally we even get an error of fact. Colonel Robins was not American military representative in Russia at the time of the Bolshevik Revolution; his colonelcy was in the Red Cross. When Mr Taylor writes of the Crimean War, "The Danube, not the Suez Canal, was the only waterway involved," he belabours the obvious. The first spadeful of sand was not turned (by one of those Egyptians, no doubt, whose mythical fate has provided such excellent oratorical stuff for Colonel Nasser) until three years after the war was over.

Lyrical Realist

HEINRICH HEINE.
By E. M. Butler.
Hogarth Press. 303 pages. 21s.

"ON Heine, of all German authors who survived Goethe, incomparably the largest portion of Goethe's mantle fell." It is almost a century since Matthew Arnold set Heine thus before English readers. In Goethe's "profound, imperturbable naturalism . . . absolutely fatal to all routine thinking" Heine had his share; he destroyed an obsolete romantic convention; all his power as a writer, proceeding largely from the union of "so much wit with so much pathos," was thrown into "a life and death battle with Philistinism"; he has a just claim to be accounted, as he wished, "a brave soldier in the Liberation War of humanity."

Professor Butler is agreed that liberation was decidedly needed. "Of all the periods of the past and of all the countries in the world," she declares roundly, "Prussia between 1813 and 1848 wears the heaviest and dreariest aspect." And she sketches, incisively and with authority, the largely disabling climate of opinion in which Heine grew up, and in which he remained alive and effective only at fearful cost. The ambivalence of his attitude alike to his native country and to his race, his rootlessness, the many faults of character and errors in conduct upon which Arnold, with his emphasis on "eternally needful moral deliverance," comes down so heavily: all these are presented fully and dispassionately in the present narrative, taking their place in a life which is at once individually fascinating and of the greatest documentary significance for its age. And there is perhaps in Miss Butler's concluding paragraphs some implicit comment upon the judgment to which Arnold eventually comes. "To pursue Heine with moral questionings," she writes, "is like chasing a will-o'-the-wisp and landing in a psychological bog; to abandon the pursuit is to become aware of radiance in the air."

But Heine's final radiance resides in his poetry. It is easier now than in Arnold's time to distinguish that poetry's importance: Heine is the first lyrical realist, perhaps the first modern poet to deny the existence of "unpoetical" themes. Yet to render something of the quality of his verse into English is difficult, and Professor Butler cites Mr George Rylands as declaring that, along with Horace, he ranks as the most untranslatable of the poets. Undeterred by this, she has herself supplied translations of a number of the poems in the original metres, and has, moreover, availed herself of versions of others by Mr F. L. Lucas. A substantial body of verse, for the most part directly relevant to the biographical purpose of the book, is thus made available to English readers.

BAYERISCHE STAATSBANK

Established 1780

Head Office: MÜNCHEN

KARDINAL-FAULHABER-STRASSE 1

Telex: 052 3921 *Cables: Staatsbank*

The BAYERISCHE STAATSBANK is a government institution. Besides being the bank of the State of Bavaria it is also a bank of private enterprise. A feature of the last years is the steady increase in business relations to private firms in Bavaria, where the Bayerische Staatsbank, too, is one of the leading banks in foreign trade. A law passed on October 25th, 1950 upheld the full state guarantee for all liabilities of the bank and restored the former capital of DM 40 millions. The balance sheet for 1955 shows figures exceeding DM 1370 millions. Branches of the Bayerische Staatsbank are to be found in all principal towns of Bavaria and the Palatinate.

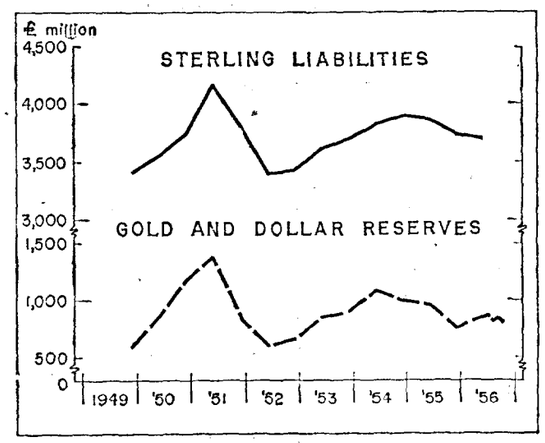
NATIONAL PROVINCIAL BANK LIMITED

How Vulnerable is Sterling?

THE Middle East crisis has inevitably thrust a new burden upon sterling, obliterating almost overnight the modest improvement that had just begun to show itself after the political and seasonal strains of the summer and early autumn. As yet, it is impossible to frame any dependable estimates of what this new emergency may mean for sterling and for Britain's balance of payments. Since the future strains defy estimation, the only reliable way of assessing the resistance that may be offered to them is to take stock of sterling's health as it was on the eve of the crisis. Among overseas observers it is widely assumed that the difficulties of recent years have had an almost continuously debilitating effect, reducing sterling to a condition of exceptional vulnerability to any new shock such as this. That, however, is too superficial a view. Vulnerable sterling may be, but it is not exceptionally so. If all factors are taken into account it can be shown that there has been a net strengthening in recent years, notwithstanding the new sources of pressure—actual or potential—that have been opened up by the various steps to liberalise Britain's trade and payments.



During the past year, admittedly, many of the superficial appearances have favoured the pessimistic view. Through the greater part of 1956, sterling's valuation in the exchange markets, not only in terms of dollars but also of most Continental currencies, has been below par and somewhere near the lower gold point. If the capital windfall from the sale of the Trinidad Oil Company to the United States is left out of account, the gold and dollar reserves suffered a net loss of $230 million in the twelve months to the end of October. Again, during the greater part of the year, the market for sterling has been subject to a succession of adverse rumours. Continental bankers and exchange dealers have been intoning an almost unanimous chorus on the theme of sterling devaluation—regarding that, if not as imminent, then at least as something that is bound to happen sooner or later.

Hence the year's pressure on sterling has been due very much more to psychological than to commercial factors. The fear of devaluation has involved a substantial running down of working balances in sterling held by many overseas countries; and it has also caused the "leads and lags" in international payments to move adversely. Most traders in the sterling area with foreign currency payments to provide for have covered their commitments at the first possible opportunity; conversely most traders in the non-sterling area having sterling payments to make have postponed the exchange operation until the last possible moment and have, so far as was possible, attempted to live on sterling credit.

It has been authoritatively estimated that the total swing of the pendulum of "leads and lags" in sterling payments throughout the world can affect the gold and dollar reserve by no less than £400 million. That, it should be emphasised, represents the extremity of the possible swing; there is no suggestion that during the past year the adverse movement has been of any such magnitude. By the beginning of 1956 sterling was already technically "short." The balances maintained here by traders outside the sterling area had for the most part been reduced very close to their practical working minimum. Nevertheless, the psychological influences continued to play against sterling, especially after Colonel Nasser's nationalisation of the Suez Canal at end-July. It would be reasonable to estimate that, through a further reduction of working balances and by the use of every conceivable device to raise credit in terms of sterling, the "leads and lags" in international payments during this year moved further against sterling to the extent of some £100 million. After this movement the pendulum may indeed be at or near its extreme point; this means that, when eventually a return of confidence permits a swing back to the neutral position, the balance of payments as a whole will benefit not only from the relief from the previous strain but from the closing of the short positions. Naturally, this hidden reserve cannot be mobilised unless and until confidence in sterling is restored to the point at which all fears of a devaluation are dispelled. Until such time the world outside the sterling area will continue to live from hand to mouth in its sterling requirements.

A judgment on sterling cannot, however, be based on the events of the past year; it requires a longer sweep back. If that retrospect goes back to 1952, i.e. to the beginning of the policy of economic freedom and the end of the Korean eddies in the balance of payments, it can be claimed that the position of sterling has improved. The United Kingdom has over this period repaid a substantial part of its debt to the non-sterling area, though over the same period it has increased its short-term debt to the overseas sterling area. On December 31, 1951, the United Kingdom's sterling liabilities to non-sterling area countries totalled £1,018 million; by the end of 1955 they had been reduced by £248 million to £770 million. Over the same period the sterling liabilities to sterling area countries had risen from £2,791 million to £2,972 million, this rise being wholly attributable to the growth of the balances of the colonies, which rose from £928 million to £1,281 million. Britain's debit balance in the European Payments Union was reduced from £166 million to £121 million. In these four years,

therefore, the increase in the debt to sterling area countries was appreciably less than the reduction in liabilities to non-sterling area countries. This trend has continued in the first half of this year. On the basis of the adjusted figures given in the latest White Paper on the balance of payments (which amends the series, from end-1952, by excluding overseas loans to the UK government expressed in sterling), it appears that during the first six months of this year the sterling holdings of non-sterling countries fell further, from £693 million to £649 million, i.e. by £44 million, while those of sterling area countries increased by £22 million only, from £2,879 million to £2,901 million.

★

Once again, virtually the whole of the increase reflected the balances of the Colonies. To keep this problem of the rapid growth of these balances in perspective, it is important to remember that the Colonies have only rudimentary currency and banking systems, so that the expansion of their trade and prosperity tends in the first instance to be reflected in the growth of their external reserves, rather than in an expansion of their own domestic currency and credit. That tendency has been encouraged by the policy of the commodity boards, which have sterilised some of their export income, and this sterilised income has been kept in London—as the only place in which it could be kept. Another reason why the colonial balances in London have grown so consistently is that the United Kingdom has continued to lend to these territories on long term. The fact that long-term capital exports by Britain to the Colonies proceed side by side with short-term capital imports from them suggests that the relationship is not a stable one; in particular it threatens difficulties for Britain and for sterling as the territories achieve independence and, in any case, as the pace of their development quickens. But it provides at least a partial riposte to the familiar accusation that the United Kingdom has in fact been living on the backs of the Colonies for some years past.

The growth of net indebtedness to the Colonies partly explains Britain's ability to reduce, over these past four years or so, its indebtedness to non-sterling countries. But the fact remains that, if these non-sterling debts had not been repaid, the gold and dollar reserves would have been correspondingly stronger. The net decline of £77 million that occurred in those reserves from end-1951 to end-1955 would have been replaced by a significant net gain. It is interesting to note how close has been the correlation between movements in the United Kingdom's sterling liabilities and the fluctuations in the gold and dollar reserve. The accompanying chart, which shows these two curves since end-1949 (taking sterling liabilities on the old basis of coverage) suggests that the changes in the gold and dollar reserve have been much more a function of Britain's activities as an international banker than of fluctuations in its own balance of payments.

By the beginning of 1956 the United Kingdom had repaid all the surplus balances held by countries outside the sterling area except those of Egypt, certain Middle East countries, China and Japan. The Egyptian special balances were being released under a long-term agreement and since the emergence of the Suez crisis all Egyptian balances have been immobilised. This year the Chinese and the Japanese have been running down their sterling balances and there has been some tendency towards reduction on the part of the Middle East countries outside the sterling area. These movements account for a good deal of the strain that sterling has suffered. The pressure may have been costly to the reserve, but it is well to bear in mind that it has involved an equivalent reduction in current liabilities. The net condition of the capital account remains unaffected.

To this consolation there can be added the fact that, in the first half of the year at least, the trend of Britain's balance of payments on current account was notably better than was suggested by experience in the exchange markets. In that half-year, it may be recalled, current payments as a whole showed a surplus of £144 million, compared with only £18 million in the first half of 1955 (and a deficit of £107 million in the second half). Moreover, during the first half of this year the rate of improvement in the gold and dollar reserves and sterling liabilities, considered together, was better than for any six-month period since 1950. Over this period the United Kingdom gained £95 million of gold and at the same time reduced its total sterling liabilities by £22 million. During the third quarter, although the gold losses must have been largely a consequence of the adverse swing in the "leads and lags," there was evidently a net deterioration—if only because of the impact of substantial outward capital payments on oil account, payments that may have swamped the contrary effect of the Trinidad Oil sale. Now, in the final quarter, there is the threat that to this deterioration there may be added a recrudescence of strain on the current account. Yet there is still a fair chance that, over the year as a whole, there will have been a perceptible improvement in the net short-term balance of non-sterling assets and liabilities—through a reduction in the excess of those liabilities over the total of gold and dollar reserves.

★

No less noteworthy is the fact that during the year sterling has shown no sign of declining in importance as an international currency. Despite the adverse psychological atmosphere in which it has had to play its part, all the evidence suggests that it has been used more widely than ever as the currency in terms of which international trade is transacted. Dollars and Swiss francs still tend to be regarded as reserve currencies and not as trading currencies; and in spite of the difficulties the movement towards greater freedom in the use of sterling has made further progress. Quite recently, too, there has been a further annihilation of exchange control forms—no less welcome for the fact that these new procedural concessions extend only to small transactions. The use of sterling in the various commodity schemes has expanded steadily and, thanks to the experience that has been gained, these schemes are now working with admirable smoothness. The main threat to them in their first phase came from the discount at which transferable sterling was quoted before the Exchange Equalisation Account was given authority to intervene in this market. Ever since that intervention began in February, 1955, the margin between the rates for transferable and for official sterling has kept well within the 2 per cent discount that roughly marks the point at which shunting becomes possible. In this particular context, the most disturbing consequence of the Middle East crisis has been the tendency in recent weeks towards a widening of this discount; by the end of the first week of November it had exceeded 1¾ per cent, though in the subsequent week it narrowed slightly.

The Bank that conducts the Largest Banking Business in New Zealand

●

Since its establishment nearly 100 years ago, the Bank of New Zealand has kept pace with the country's development. Information supplied by over 370 Branches and Agencies provides current data on all aspects of commerce and industry, which is freely available to all with present or projected interests in the Dominion.

You are invited to contact the London Office or the Head Office

CORRESPONDENTS IN ALL PARTS OF THE WORLD

At the same time the discount on security sterling and the parallel premium on dollar securities quoted in London have risen to about 10 per cent. These rates for switch sterling should not directly affect the use of sterling in international trade as such; but the loosening of the links of exchange control within the sterling area, and in particular at its Middle East peripheries, has caused so many acknowledged leaks between the four main types of sterling—official, transferable, switch and resident—that they are in fact to be regarded as different but interconnected parts of the same currency, so that weakness of one must drag down the others. It was the recognition of this fact that led to the official intervention, first in the market for transferable sterling and later (indirectly through sales of dollar securities in London) in that for switch sterling. That intervention was prompted by the sharp rise in the London premium on dollar securities that was touched off in early August by the uncertainties following the Suez nationalisation. So far, however, the damage to the non-official types of sterling has not been such as to bring the official parity into question.

★

The fact that despite the forces arrayed against it sterling has not slipped from its supremacy as an international currency during the past year is due to negative as well as positive causes, namely the absence of any real competition from other contestants for the world title. The currency often regarded as the hardest of all, the Swiss franc, is essentially the hoarders' currency and the refuge for capital fleeing from the perils of devaluation and of excessively harsh fiscal treatment in its home country. Switzerland, for that reason, remains the one country in the free world where credit is still abundant; and the country has in recent years become one of the most important long-term lenders in the international capital market.

The German mark is acquiring virtues of transferability and the "Beko" mark (limited convertibility mark) is being widely used in the multilateral settlement of trade with Western Germany. But it is not an international currency. There is no German money market and banking system that could be used for financing the international trade of third party countries. The rate of the Beko mark has, rather surprisingly, followed very closely that for transferable sterling—suggesting that the German transferable currency has very little individuality of its own. The German balance of payments remains in persistent and large credit, and evidence of this may be seen in the virtual abandonment recently of all restrictions on German travel allowances and in the liberalisation of imports not only from OEEC but from dollar countries. Far-ranging relaxations have also been made in controls on capital movements; the chief restriction now indeed is on incoming movements. But, partly because the German mark has been firm to the point at which it has attracted rumours of up-valuation, this strength of the balance of payments and of the currency has militated against the wider use of the mark in international transactions. No trader wishes to be short of a currency that may appreciate—and in any case the interest cost of being short of marks has been almost prohibitive. The unrelenting policy of credit restraint pursued by the Bank deutscher Laender is an effective deterrent to the achievement of a world role for the mark.

Moves towards greater freedom of payments have also been made in such countries as Belgium where gold transactions and capital movements have been virtually freed, and in Italy where the freeing of the foreign bank note market has been linked to a lifting of restrictions on capital remittances. But at no point can this advance towards greater freedom be said to have aroused any challenge to the position of sterling, backed by the banking machinery of the City of London, as the most important currency in international commerce.

Federal Reserve Faces its Critics

BY A WASHINGTON CORRESPONDENT

MONETARY policy in the United States during the past year has been active, tough and mostly successful. Though the extraordinary pace of business has been sustained and even increased, prices have risen only slightly. Yet, as the year draws to its close, voices of discontent with monetary policy have been heard, and the Federal Reserve System itself appears to be facing some potentially baffling problems in 1957.

The United States, it deserves to be recalled, is almost alone among major industrial powers in having a central bank authority that is effectively independent of the executive branch of the Government. This much-reassured independence—asserted in 1951 after a bitter struggle with the Truman Administration, though previously technically affirmed by law — has been dramatically illustrated and dramatically challenged this year. It was illustrated when, in April, the Secretary of the Treasury, the Secretary of Commerce and the chairman of the President's Council of Economic Advisers all opposed the increase in the rediscount rate—from 2½ to 2¾ per cent at most Reserve banks. The difference of views broke into print and was, in the end, conceded publicly by the three Government spokesmen in answers to a questionnaire submitted by a Congressional committee.

The striking result of all this was not so much that even a Republican Administration had difficulty in swallowing the degree of monetary restraint thought proper by the central bank, but the position of the President in backing the Federal Reserve. Shortly after the dispute Mr Eisenhower was asked about it at his news conference. He indirectly confirmed the difference of view and then proceeded, with an unexpected familiarity with the issue involved, to state unequivocally that he thought it best for the country that the Reserve System should not be subject to his command. Three times later in the year the question came up in one form or another at news conferences, and on each occasion the President took the same stand. In the stately marble building on Constitution Avenue that houses the Board of

Governors of the Federal Reserve there was, needless to say, much rubbing of hands.

Nonetheless, in this election year, the challenge to the "Fed's" independence could not be dismissed as readily as that. In the first place, it was indeed a year of very tight money—the tightest since the panic period of 1933. The trend of the Treasury bill rate was steadily upwards, until by October it reached a shade over 3 per cent, compared with as little as 0.6 per cent at the low point of the 1954 recession. In the Truman and Roosevelt days, the critics repeatedly recalled, a 3 per cent rate had been considered grossly excessive even for long-term bonds. The Reserve System's rediscount rate has risen in six steps, from 1½ per cent in 1954-55 to 3 per cent. Even more significant than the actual rise in rates was the tension in the supply of credit, largely because the "Fed" open market operations kept the banks pinched for funds. It is widely believed that more borrowers have been turned away or had their needs less than fully met this year than ever before in history, though there are no statistics on the point. What the statistics show is that bank loans mounted steadily, and a near-record number of borrowers was being accommodated. But cries of anguish were soon heard. As always, that elusive entity called "small business" was to be, and believed itself to be, the chief victim of the squeeze, though farmers and homebuyers, too, found themselves constricted.

★

As a result of this noisy outcry, hard money inevitably became an issue in the election. Mr Stevenson did not labour it, but he used it frequently. Of course he blamed hard money on the Republicans—even though the Republicans he was blaming had been, at least for a while, nearly as unhappy about it as he was. What was perhaps worse from the viewpoint of the Federal Reserve, some public commentators revived the argument that it was wrong to charge an Administration with responsibility for the economy—as all American administrations are charged by the Employment Act of 1946—while denying it any control over the crucial weapon of monetary policy. Several of Mr Stevenson's chief economic advisers were known to believe that the law should be rewritten in order to make the Federal Reserve more responsible to the President, and this view was publicised by some commentators that have never been numbered in the soft-money school.

Finally, following the familiar course in such controversies on both sides of the Atlantic, criticism mounted against the allegedly unjust effects of the "bluntness" of general monetary restraint as distinct from restraint confined to the places where restraint was supposed to be most needed. Thus the mortgage market was said to have suffered far more drastically than any other sector, while hire-purchase financing was scarcely affected at all. Again, large business borrowers were said to be able to find finance easily by one means or another, whereas the small man, who has to rely on the commercial banks, was supposedly always turned away empty-handed. Yet again, since the cost of borrowing not only to the Federal Government but to State and Local government bodies was rising, would not taxes rise too? Especially for the State and Local authorities, was this not an ironic and unfortunate blow to governments desperately short of funds to build much-needed schools, roads, water supply systems, and the like? This whole barrage of half-baked but popularly appealing criticism reached Congress,

and for the first time since the Federal Reserve broke free in 1951 the attack on its policy was loud enough to be taken seriously. Next month the indefatigable Representative Patman of Texas will launch still another inquiry into the hard money situation by his sub-committee of the Joint Economic Committee.

Through it all the Federal Reserve has maintained a dignified calm. It has tried to present its case simply, to explain that too many people want to do too many things, and that any looser strings over bank lending and investing would simply inflate the money supply and eventually prices. There was need to avert the danger, of which the Federal Reserve discerned some signs, that the economy might launch into another speculative orgy—with an inevitable aftermath of collapse. But if the "Fed" patiently explained these home-truths, it still seemed to relish its role of grumpy sobriety at a time of exuberance almost everywhere else. It was studying, at the request of the Administration, the usefulness of selective credit controls over such things as hire-purchase and mortgage credit, but there were few signs that it would recommend their adoption. In a word, the Federal Reserve felt that in an imperfect world the American economy in 1956 was doing very well indeed, and that inflation would be much more cruel than hard money could ever be.

Assuming that the "Fed" manages to withstand the onslaught, and assuming no serious move is made in Congress to alter its independent status, it will still be likely to face a difficult problem in the year ahead. Up to now restraint has been cushioned in its specific effect upon bank lending by the vast backlog of investments possessed by the banking system as a result, largely, of World War II. Ever since the tighter credit policy began early in 1955 the banks have been selling investments in order to make loans. The figures are striking. In the last year alone the so-called "reporting" banks—the leading banks of 94 cities—have increased total loans by $5.9 billion and reduced their holdings of government securities by $4.6 billion. More and more banks have crept up past what some consider to be the checkpoint in their assets structures—that is no more than 50 per cent of deposits in loans, the rest in investments and other assets. The net result of the shift in bank assets has been a firm check on the growth of the money supply and hence a restraint on prices, though an inevitable concomitant of such a shift in assets is some increase in the velocity of the turnover of the existing money supply.

★

The question at the moment is whether the banks some day soon are going to decide that they will sell no more investments or have none left that they can sell without undue loss. At that point, if it comes, a squeeze on business loans might no longer seem avoidable. The Federal Reserve, in such an eventuality, would have to strike a very delicate balance between two extremes—on the one hand to supply reserves to the banking system to enable it to expand loans without making offsetting sales of investments, thereby increasing the total money supply, and, on the other hand, to continue its policy of restraint which, if too severe, could thrust the economy into a new recession. Recent experience encourages the hope that the judgment of the "Fed" will be equal to the delicacy of the task—but much will turn upon the circumspectness of the economic policies that lie beyond its sphere of action.

THE NATIONAL BANK of NEW ZEALAND Ltd

has a complete information service concerning current business conditions and trading possibilities in New Zealand. This service is freely available to manufacturers or merchants contemplating business development in the Dominion.

Please write to:

Head Office : 8, Moorgate, London, E.C.2.

Manager : G. L. Davies,

or

Chief Office in New Zealand : Wellington.

General Manager : H. W. Whyte.

Knowing where to look

is half the battle. If you need information on business conditions in Australia and New Zealand, you will direct your enquiries to the Bank of New South Wales—oldest and largest joint-stock bank operating in those countries.

Over 950 branches and agencies spread throughout Australia, New Zealand, Fiji, Papua and New Guinea keep the Bank of New South Wales up-to-date on every local business, industrial, and rural activity.

Consult and use—

BANK OF NEW SOUTH WALES

HEAD OFFICE—SYDNEY, AUSTRALIA

(INCORPORATED IN NEW SOUTH WALES WITH LIMITED LIABILITY)

Brazil and the Hague Club

BRAZIL in these past two years has experienced a notable improvement in its balance of payments, enabling the country to break away from some of the rigid bilateralism that had constricted its external trade and payments since the collapse of the post-Korea commodity boom. This loosening of the bilateral bonds has been achieved by a system of limited convertibility operated through what is known as the Hague Club, and it extends to Brazilian trade with the currency areas of the members of the Club. At present there are eight member countries, all in Western Europe, but the membership may soon be increased. This system merits examination not only because of its importance to Brazil and its trading partners and creditors, but also for the lessons it offers to other countries that may hope to progress by easy stages from bilateral to more liberal trading practices.

In the calendar year 1955 Brazil's balance on visible trade (with imports valued cif) swung from the deficit of US $68 million experienced in 1954 to a surplus of $117 million. A Working Party appointed by the Brazilian government to investigate problems of the balance of payments had forecast a deterioration this year; but in fact, in the first half of 1956, there was a further improvement. During that period the visible surplus was running at an annual rate of $290 million. The recent strength of the free cruzeiro and the rise in the Bank of Brazil's gold and foreign exchange holding suggest that the improvement has so far been maintained, and President Kubitschek has publicly forecast a favourable trade balance of some US $250 million in the current fiscal year.

The major reason for the improvement is not far to seek: it is the firmness of the New York price of coffee. Brazil's dependence upon coffee has diminished slightly in recent years, but that commodity still accounts for over 60 per cent of Brazil's exports. At the beginning of this year most experts predicted that coffee prices would drop; the Working Party based its forecasts on the assumption that New York coffee prices would average 10 cents a pound less than in 1955. So far they have been proved unduly pessimistic. The New York price has hovered stubbornly around its 1955 level of 60 cents. Brazilian shipments have been larger, so that the country's total export receipts have held up well despite a decline in earnings from cotton and cocoa, its other staple exports.

★

This welcome improvement in export earnings, however, hardly touches the fundamental problem of the balance of payments. Like any other primary-production economy that is passing through a phase of industrialisation, Brazil suffers from a chronic tendency for imports to outstrip exports—a tendency that is severely aggravated by the country's almost pathetic dependence upon the outside world for supplies of fuel and other basic materials. The recent firmness of the coffee price and the current revival of foreign investment in Brazil cannot be regarded as affording more than a respite from this perennial problem.

The respite has sufficed, however, to enable Brazil to establish a wider convertibility of the cruzeiro, and this has greatly facilitated trade, especially with Britain. The initiative was taken by Brazil early last year and the mechanics of the new system were agreed at a series of meetings with representatives of three of the country's main creditors—Britain, Germany and the Netherlands—at the Hague and Rio de Janeiro between May and July, 1955. The key to these arrangements was the fact that, under the bilateral regime, a dominant and indeed privileged position in the Brazilian market had been acquired by Germany. As a result of earlier strains in Brazil's payments with Germany, the cruzeiro had a differentially low valuation in terms of the Deutschmark, giving Brazilian exporters a special incentive to sell to Germany, and giving German merchants scope for profitable entrepot business in Brazilian produce for re-sale to other European countries. Brazil's earnings in the currencies of these other countries, and especially of sterling, suffered correspondingly, and British exporters were hard hit. Brazil's annual sterling earnings were never large and after £15 million of them had been earmarked for oil purchases and £6 million for repayments of arrears of commercial debts, there was little available for the purchase of British goods. The practice of the Brazilian authorities was to offer the available foreign exchange, in its several watertight bilateral categories, for sale to Brazilian importers by auction; towards the end of 1954 no sterling at all was on offer at these auctions, so that Anglo-Brazilian trade dropped away sharply.

★

Brazil soon saw the disadvantages of this situation and in the spring of last year the authorities increased the bonuses on exports to the sterling area. This lessened the differential advantage enjoyed by German traders, but no satisfactory solution was possible so long as Brazil's export proceeds, under the bilateral agreements, were spendable only in the currency areas in which they were earned. The next step, therefore, involving a concession by Germany, was to arrange a limited convertibility of export proceeds. This step was formally taken in August, 1955, when the "Hague Club" began operations. It was agreed that Brazilian earnings of the currencies of the three initial participants—sterling, marks and guilders—should be pooled in a single account that could be used for purchases from any of the three countries. The pooled exchange is known as "pool dollars"—a unit of account, not an actual currency, analogous to the EPU "units." This arrangement considerably relieved Brazil's sterling shortage. The marked increase that has taken place this year in Britain's exports to Brazil—in the first nine months of this year they totalled £10.5 million against £4.8 million in the same months of 1955—owes much to it. The success of the Club may be judged from the number of new members admitted. Belgium, Luxemburg, Austria, Italy and France joined during its first year of operations, thus widening the area of convertibility, and the Scandinavian countries and Japan are at the moment discussing membership.

While the new arrangements favoured British exporters they also materially benefited German creditors—possibly at the expense of British creditors. This effect arises in two

ways—partly by the repercussion upon the plan for dealing with Brazil's commercial debts to Britain, and partly through a new arrangement directly affecting the German creditors. Under the Debt Agreement with the United Kingdom negotiated in 1953, Brazil agreed to repay its British creditors by annual instalments of not less than £6 million; a larger sum, computed on a sliding scale, was to be paid in years in which Brazil's sterling earnings exceeded £35 million.

Under the new arrangements, however, it is impossible to calculate precisely what the sterling earnings are, so that this latter undertaking cannot be enforced. On the other hand, the settlement of Brazil's debts to German traders has been speeded up, in consequence not so much of the Hague system as such as of a parallel agreement whereby British and Dutch, and not merely German, purchases from Brazil could be financed by drawing on the cruzeiro balances in the German-Brazilian clearing account. These balances, saleable only at a discount, comprise Brazil's arrears of indebtedness to German exporters. The discount at which these so-called "clearing dollars" were obtainable —representing, of course, a corresponding sacrifice by the creditors—provided a strong incentive to use them in paying for imports from Brazil, thus accelerating the repayment of the indebtedness to Germany. It is believed, indeed, that most of this indebtedness, which in August, 1955, totalled about £20 million, has now been liquidated. Brazil has kept to the strict letter of the debt agreement with Britain; since 1953, thanks partly to a drawing of £10 million in sterling from the IMF, the country has reduced its indebtedness to British exporters from £60 to £26 million. Brazil's dollar debts have been successfully funded, and since then the inflow of American capital has been notably stimulated.

★

While the adoption of the pooling system has necessarily established uniform valuations for the cruzeiro in terms of each of the European currencies concerned, it has not been accompanied by any dismantling of Brazil's system of differential rates for different categories of payments (and exports). These rates are still determined by the auction system which is the means by which the Brazilian authorities ensure that foreign exchange is available for all imports licensed. At the weekly auctions the importers bid not for actual exchange but for an exchange certificate that confers the right to receive an import licence for goods of the category concerned and the right to purchase the appropriate foreign exchange at the official (import) rate. The prices bid and paid for the certificates are, therefore, premia over that uniform rate.

Imports are divided into five categories according to their degree of essentiality, and the differential exchange premia are in effect determined by the amount of available exchange allotted by the Bank of Brazil to each category for the purpose of the auctions. The "essential" food and raw materials of the first two categories get the biggest allotments and thus command the lowest exchange premia, so that they enter relatively cheaply, while the higher rates of premium that obtain for the competitive manufactures and "luxuries" of categories IV and V push up the cruzeiro cost of those imports (the volume of which is limited by the block allotments). The exchange premia thus operate as a varying tariff to protect domestic industries.

The official import rate is, therefore, completely artificial, and its artificiality is measurable by the size of the premia. A recent auctions the ACL or pool "dollar" certificates (conveying the right to buy any of the currencies of the Hague Club—the "Area of Limited Convertibility") for category IV imports have been fetching around 156 cruzeiros to the pool "dollar," the official exchange rate for which is 18.82 cruzeiros. When an exchange tax of 10 per cent of the official rate has been added, this represents an effective rate of 177 cruzeiros to the dollar, so that for this category of imports the cruzeiro has a value equivalent to barely a tenth of the official rate.

★

Export exchange rates are equally artificial. Here the effective, and also differential, rates are determined from commodity to commodity by means of a series of varying export bonuses. For non-trade transactions there is a free market in cruzeiros. The free cruzeiro fell sharply in the early months of this year reaching 240 to the pound in May, but it has since recovered strongly and now stands at about 184. This recovery, however, is probably largely the result of widespread evasion of the Government's exchange regulations. The cheapness of the cruzeiro when bought for the making of financial transfers to Brazil is a temptation especially to the coffee exporters, who are required to sell on the basis of a high-value cruzeiro; but if they under-invoice their shipments and, by arrangement with the overseas importer, receive payment for the undisclosed balance in the form of a private remittance exchangeable into cruzeiros at the free rate, they can make a surreptitious profit (which the importer of course will share).

The artificiality of the whole system of multiple exchange rates has been freely admitted for many months, but the oft-promised currency reform never materialises. In May, after rumours that a radical reform was imminent, the Government contented itself with increases of up to 33⅓ per cent in the export bonuses on certain minor commodities; these changes, while achieving yet another *de facto* devaluation, did nothing to rid the system of its glaring defects. The great obstacle to a radical reform of the currency appears to be the coffee price. Since coffee receives the lowest of the export bonuses, a devaluation of the cruzeiro that did away with the whole bonus system would certainly establish the cruzeiro at a lower exchange value than the present effective rate applicable to coffee; hence the price of coffee in terms of cruzeiros would certainly rise. The extent to which that rise might be offset by a consequential fall in export prices would depend on the strength of the coffee market at the time. If export prices fell correspondingly, Brazil's dollar receipts would suffer a sharp fall and the main immediate benefit of devaluation would be lost.

The Government at the moment seems to be pinning its faith upon the success of its industrialisation programme, but despite the high level of interest rates enforced—commercial bank overdraft rates range from 12 to 15 per cent—inflation still appears to be gaining ground. The next move is likely to be on the trade front and to take the form of a far-reaching recasting of the customs tariff, with the object of obviating discriminatory exchange rates for imports and thus paving the way for a substantial simplification of the exchanges. Brazil's progress towards multilateralism in the past year has been appreciable; but it is only the first step on a very long journey.

In service to prosperity

Specialists on the Staff of the National Bank of Scotland are at the service of Scottish Industry and Commerce. In their day-to-day application to business problems they are able to draw upon financial experience accumulated over a period of 130 years.

The National Bank can provide information about current overseas markets and conditions, and has banking contacts throughout the world.

Belgium Tackles Banking Reform

BY A BRUSSELS CORRESPONDENT

BANKING in Belgium has in recent months been subjected to a number of important reforms: and the possibility of further important and controversial changes has been publicly aired. The topic of reform is not a new one; the Belgian banking system has experienced a number of difficulties in recent years, and the banks themselves have not been reticent in asking for some of their shackles to be loosened. The significant point at the present juncture is that the reforms under discussion have recently involved recommendations by the National Bank, promises by the Finance Minister, and positive (though undefined) action by the Banking Commission, which is effectively the policeman of the law by which banking is regulated.

The Belgian franc has long been among the hardest currencies of the world, convertible in all but name and quoted against the dollar at the official parity, or even at a premium. There is, therefore, nothing sensational in the promised "return to gold," to the extent of fixing a statutory price for the metal and defining by law the minimum gold cover to be held by the National Bank against the note issue. All this has the air of a dignified formality, but a formality none the less. In this context, the one really significant feature is the promise of M. Liebaert, the Finance Minister, to include a provision that the gold parity may in future be varied only by Act of Parliament.

More important, though less tangible, is the reform in commercial banking already effected by the Banking Commission. The reform in question has been carried through without legislation; the Commission itself is the sole judge of its effectiveness; and it has not actually stated of what it consists. The reform is an attempt to repair, on the basis of existing legislative powers, the shortcomings of the Banking Order of 1935, which was designed primarily to prevent the banks from controlling industry but which, in the enthusiasm of the moment, forgot to prevent industry from controlling the banks.

★

The ground for reform was prepared by the conflict of loyalties that seemed for some time to be shaking the structure of the Banque de Bruxelles, the second largest of the Belgian banks. The details of the conflict never became public, and it is not possible to put them together from the stormy Annual General Meeting held last June. The conflict seems to have been between the view on credit policy taken by the responsible head executives of the bank and that put forward by the industrial finance group that is the bank's principal shareholder. The controversy engendered a great deal of heat and a major lawsuit, and eventually culminated in the group in question putting forward a nominee for a vacancy on the bank's board. The fact that this nominee was M. Paul van Zeeland who, as Prime Minister, had borne a major share in the responsibility for the 1935 Order, lent the situation a certain piquancy.

The Banking Commission seized on the nominee directorship and focused its attention anew upon the problem of ensuring that bank policy is not subject to influence from any outside source. Though, in doing this, it was doing only what many other nations have already done in their own way, the attack was an important one. Belgium is not a banking country; bank accounts are not conventionally held by the small man. For ordinary business the banking system of the post office is cheap and efficient, and every tradesman and business house prints the number of its postal account on its letter-heading. The banks are, first and foremost, bankers for the companies associated in the groups that are their main shareholders; and the recent case marked the first time that the effectiveness of the control held had been seriously questioned.

The liquidation of a large part of the concentrated holdings of bank shares is now expected. There is, however, every reason for doubting whether this in itself will suffice to mitigate the control. The Commission evidently shares the doubt, for it insists that what really counts is a change of heart. The spirit of the law is clear enough; banking decisions are to be taken by banking men in the light of banking principles. In most countries this sounds like old stuff; but in Belgium, where the banks grew up as appanages of the industrial finance groups, it will be a reform indeed.

★

Meanwhile, a further measure of official reform has been promised by M. Liebaert in a rather cryptic passage in a luncheon speech. He is preparing, he said, a series of measures "concerning deposits in the Caisse d'Epargne [the post office savings bank], public credit and the system of banking coefficients, with a view in particular to creating conditions that will make it possible, by the operation of an open market policy, to adapt monetary circulation to the needs of the economy, taking account of trade cycle fluctuations."

The reference to the Caisse d'Epargne is probably no more than a project to raise the ceiling beyond which individual accounts are no longer entitled to the maximum interest rate payable. The reference to the banking coefficients seems intended to imply, at least in the first instance, a more subtle use of the compulsory cash ratio than is made at present. The ratio, which is fixed by the Banking Commission without obligation to consult anybody else, has remained at six per cent for a number of years; and the National Bank, in its report for 1955, pointed out that the opportunity of raising or lowering the ratio would be a potent instrument of credit control. Such manipulation would be outside the present competence of the Banking Commission. One of the measures now contemplated may be the provision of machinery for an official review of the ratio.

The references to public credit and to open market policy appear to have wider implications. Another passage in the National Bank's report pointed out that the absence of any scope for pursuing an open market policy, by the buying and selling of Government bills, was a serious gap in the Bank's armoury. The point here is that the National Bank's

holding of Treasury paper and Government guaranteed paper is limited by statutory convention to frs. 10,000 million. The Treasury treats this limit as an overdraft sanction ; and the National Bank cannot buy bills in the market for the simple reason that Treasury borrowing, habitually almost to the stipulated limit, has usually left it with pretty well as much of this paper as the law allows it to hold.

The scope for open market operations by the central bank is limited in another way. The National Bank cannot go into the market as a seller of Treasury paper, for the simple reason that there are no buyers. The commercial banks, which would normally constitute the main market, are always holders of as much in short-dated Government securities as they can conveniently hold, and are therefore unlikely to want any more. This results from the so-called cover coefficient, another obligation imposed on the banks by, or through, the Banking Commission, requiring them to keep 65 per cent of their deposits in the form of Government securities. Moreover, the banks are obliged to keep half their short-dated deposits in the form of maturities of twelve months or under, yielding a maximum return of less than two per cent. Whatever may have been the pretext for the introduction of this regulation, its obvious function now is to bolster up the Treasury's borrowing capacity. In doing so, it creates a false set of interest rates. If the banks are compelled to lend so much of their money cheaply, it follows that overdrafts must cost more.

At this point the public credit, the banking coefficients and the open market policy are inextricably mixed. Governor Frère of the National Bank has always been

hostile to long-term debtors, however privileged, who masquerade as short-term ones for the sake of borrowing cheaply. It is significant that M. Liebaert, very shortly after his speech—in which he made much of the check to the growth of the national debt—launched another public loan. It may be that the forthcoming new arrangements will include a funding of the Treasury's overdraft embodied in the National Bank's bill holding, thus giving the National Bank scope to buy Treasury bills if it so desires. It may be too that an effective relaxation of the cover coefficient is contemplated, so that the banks may be enabled to choose their own maturities when deciding what to do with depositors' money. These are two possibilities ; and it is difficult to see how either could be usefully attempted without the other.

It seems, then, that there is a real possibility that Belgian banking will now be freed from its strait-jacket, and that the financial system will be reformed to enable the franc to maintain its status by orthodox means. It does not, however, necessarily follow that M. Liebaert, if he contemplates reforms on the lines he has seemed to imply, will necessarily be able to get them as far as the statute book. He is a liberal in a socialist-dominated Government, and he is a financial technician among laymen. Increased freedom for the banks may run counter to the ideas of his socialist colleagues, and his detailed proposals may fail to command approval if they are not fully understood. It was certainly surprising that so little of the scheme found a place in the Government's recent announcement of measures to counter the dangers of inflation. It would be a pity to have to conclude that this was because they were lacking in popular appeal.

Battle of the Bundesbank

BY A FRANKFURT CORRESPONDENT

THE forthright and independent policy pursued by the Bank deutscher Laender has won much admiration (and evoked not a little envy) among central bankers and their friends in other countries. Yet within Germany the Bank has long been under fire from a number of directions. Plans to replace the "Bank of German States" by a *Bundesbank* (Bank of the Federal Republic) have been under discussion for many years, and in the late summer the Government at last published its bill. This confirmed the fears of many of the staunch advocates of continued autonomy of the bank vis-a-vis the Federal Government, and also threatened to diminish the influence of the States. Last month, indeed, the Government's bill was rejected by the *Bundesrat*—the second chamber that represents the State governments.

The Bank deutscher Laender was established in March, 1948, by the Western occupation powers. There was at that time no central government in Western Germany ; the federal structure of the central banking system resulted primarily from the desire of the US authorities to introduce a principle resembling that of their own Federal Reserve System, thus ensuring an adequate "deconcentration" of power. Central banks were set up in each of the eleven States or *Lands* (subsequently reduced to nine), and these provided the capital and the board of directors (*Zentralbankrat*) of a central institution at Frankfurt. However, the German Parliamentary Council convened in September, 1948, to draw up the constitution quickly expressed its desire to amend the central banking system established by the Allies. Accordingly the Basic Law for the Federal Republic incorporated a provision requiring the legislature to "establish a Bank of Currency and Issue as a *Bundesbank*."

★

Towards the end of 1952 the Federal Cabinet approved a draft Federal Bank law prepared by the Ministry of Finance. As a general principle the draft provided for the retention of the federal system. The Minister of Finance, Herr Schaeffer, was not anxious to take over the large unredeemable equalisation claims given to the Land central banks in the course of the currency reform ; and a further pressure for a federal solution was provided by his Bavarian constituents. On the other hand, Herr Schaeffer's draft law would have established an influence on the part of the central government that could hardly be brought into line with the principle of independence of the central bank. Indeed, the plan originally envisaged an arbitration body which, with the Federal Chancellor in the chair, was to resolve any differences of opinion arising between the Government and the Bank.

With us SERVICE is a Tradition

WE PROVIDE a skilled and comprehensive service in every banking field, and behind this is nearly a century of tradition of association with the commercial and industrial development of South Africa.

Today, we continue to uphold this tradition by providing finance and information services to meet every need of the merchant, manufacturer and tourist alike, through some 725 offices in South, East and Central Africa.

SWISS BANK CORPORATION

(A company limited by shares incorporated in Switzerland)

1872

The CORPORATION was founded in 1872 in Basle, Switzerland, where the General Managers have their headquarters.

In SWITZERLAND there are Offices in Basle, Geneva, Zurich and all the principal centres.

In LONDON the City Office is situated at 99, Gresham Street, E.C.2, and there is a West End Branch at 11c, Regent Street, S.W.1.

In NEW YORK there is an Agency at 15, Nassau Street, and a Branch at 10 West 49th Street.

In CANADA the Bank is represented by an affiliated company, the SWISS CORPORATION FOR CANADIAN INVESTMENTS at 360 St. James Street West, MONTREAL.

CAPITAL AND RESERVES S.Frs.268,000,000

It was public knowledge that this plan, which was approved by the *Bundesrat*, was strongly opposed by Professor Erhard, the Minister for Economics, to whom responsibility for monetary policy had repeatedly been granted by the *Bundestag* (the chamber of deputies). Dr Erhard was at once anxious to maintain the independence of the central bank and to move towards a more centralised system. The alternative draft prepared by his Ministry was not put to the vote in the Cabinet, but a similar draft was placed before the *Bundestag* by the Free Democratic party. This provided for a centralised system that in many respects was reminiscent of the structure of the former Reichsbank. By the time the two competing plans came before the *Bundestag* in 1953, the Parliamentary term was nearing its end, and both drafts were shelved.

Since then, the centre of controversy in the debate has moved from the issue of the structure of the new central bank to that of its status. The relationship between the German Government and the Bank deutscher Laender is legally as follows:

> The Bank deutscher Laender shall be bound to give due consideration to the general economic policy of the Federal Government, and to support such policy within the scope of its [the Bank's] task.

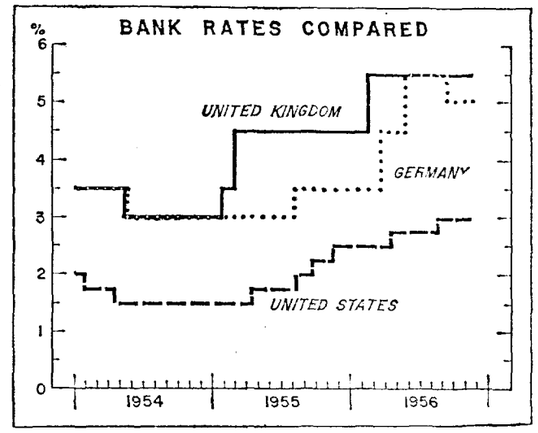
The Minister of Finance and the Minister for Economics, or their permanent deputies, are entitled to take part in the meetings of the board of directors of the Bank, as representatives of the Government. They may also request the convention of a meeting. They hold no vote, but may propose motions. And if one of the Government's representatives should hold that a resolution proposed by the Board of the Bank is in conflict with the general economic policy of the Federal Government, he may demand suspension of the resolution for a period not exceeding eight days.

★

These well-balanced provisions have enabled the Bank, under the vigorous leadership of Dr Vocke, to follow consistently and irrespective of political pressures its task of maintaining the stability of the currency. In this the Bank has been highly successful, to the evident benefit of the German economy. But in the process the Bank has clashed openly with the Government.

A certain tension first made its appearance about a year ago, when full employment had been almost reached and additional expenditures on armaments and social services seemed imminent. It was no longer possible to contain the demands by further expansion, until then so much favoured by Dr Erhard; and both he and Herr Schaeffer agreed with the Bank deutscher Laender that a shift in cyclical policy had become imperative. The two Ministers and the Bank closed their ranks; for in many other quarters—in the Cabinet, in trade and industry, in trade unions—the necessity of applying the brakes was not recognised. Many people could not easily accept the fact that the miracle of extraordinary increases in production had run its course.

In early March this year the Bank Deutscher Laender duly raised the re-discount rate from 3½ to 4½ per cent. In May, it made a further increase to 5½ per cent. In a speech delivered in public shortly afterwards, Dr Adenauer sharply criticised the increase and disclaimed the sanction of the two Ministers in whose presence the Bank had taken its decision.



The Bank, protected in its independence by reference to its constitution — Dr Adenauer himself had described the Bank as "a law unto itself" — upheld its policy, which succeeded in slowing down the pace of the boom. By September, consequently, the Bank was able to feel satisfied that the state of the domestic economy permitted a reduction in the re-discount rate to 5 per cent, a reduction that was needed to check the large and unwanted inflow of foreign funds that began in the summer in response to rumours of an upvaluation of the deutschmark.

The recent conflict of opinion has naturally sharpened the controversy about the degree of influence to be accorded to the Government in the new central bank. A few months ago a new draft was submitted to the Cabinet by the Federal Ministry for Economics, which is now in charge of monetary and credit policy. The plan, formulated by the Government into a bill, is intended to be a compromise, making some concessions to the federalists.

This solution, however, is not satisfactory. It proposes a mammoth board of directors, comprising a central group appointed by the Federal Government and directors of what are to be more or less branch offices appointed by the *Bundesrat*. In the Bank deutscher Laender, it may be recalled, the directors of the board at Frankfurt are themselves the presidents of the Land banks, who are in turn appointed by the Land governments.

The Federal Government is thus now seeking to extend its influence over appointments in the central banking system; and in addition, it is seeking powers to offset a major instrument of the Bank's armoury—its open market operations. Under the bill, the central bank is given powers to purchase or sell Federal Treasury bills or bonds to a total of DM 4,000 million—but at the same time the Minister of Finance is empowered to transact reverse operations on the open market to a total of DM 2,000 million. The representatives of the central bank have strongly opposed the inclusion of this provision. Another feature of the plan that has met with considerable opposition from the Bank and from most financial circles is the provision for a marked increase in the ceiling on credit granted by the Bank to the State.

The deficiencies of the new draft, however, are at the moment not the main source of concern of bankers and the public; this is focused rather on the haste with which, now that next year's election campaign is already beginning to take shape and that the differences between Dr Erhard, Herr Schaeffer and Dr Adenauer are still apparent, the Government is trying to push the law through during the present sitting of Parliament. It is widely feared that the Chancellor may be inclined to draw the central bank closer into the

Chequerboard of the East

So many races . . . so many needs . . . so many markets extending over a vast area of the earth's surface. And there The Chartered Bank operates with knowledge and experience sustained by more than a century of close and intimate contact. Branches of The Chartered Bank of India, Australia and China are established in most centres of commercial importance throughout Southern and South-East Asia and the Far East. At all these branches a complete banking service is available and, in particular, facilities are provided for the financing of international trade in co-operation with the Bank's offices in London, Manchester and Liverpool, its agencies in New York and Hamburg and a world-wide range of banking correspondents. In London and Singapore the Bank is prepared to act as executor or trustee.

political atmosphere of Bonn. Some observers maintain that the Chancellor desires in future to extend his right under the Basic Law, to determine "the directives of policy" to embrace action in the monetary field. This interpretation may be mistaken; but mistrust has recently been increased by the deletion from the draft law, at Dr Adenauer's request, of the provision that the legal seat of the central bank should continue to be at Frankfurt.

★

The long constitutional dispute about the degree of centralisation in the new central banking system is thus still rife; but the division of opinion is no longer clear-cut. Thus many centralists who also have the independence of the Bank at heart are today convinced that, in view of the political tension, the best course is to retain the existing central banking system, which, although federal in form, functions in practice as a centralised institution. While the commercial banking system deals exclusively through the Land banks, the operations of these banks—their re-discount rates, their minimum reserve requirements and their open market policy—follow strictly the lines laid down by the Bank deutscher Laender. And as the board of the central institution is made up by the presidents of the Land banks, there is little scope for friction. Many observers now hold, therefore, that discussion of the Federal Bank Law should be deferred until it can be kept reasonably free from political considerations.

When the *Bundesrat* recently rejected the Government's Bill in its present form it affirmed that, if necessary, it would not hesitate to bring the dispute before the Federal Constitutional Court. The Federal Government quickly retorted by repudiating the objections of the *Bundesrat*, declaring that the Basic Law prescribes a *Bundesbank*, and that in its opinion there is no need for the law to be approved by the federal chamber. Whatever the outcome of this conflict, the chances that the Bill may become law in the present Parliament seem to be diminishing.

In retrospect over this long debate, one remarkable element of progress is clearly discernible. The plan to restrict the independence of the central bank by the establishment of an arbitration body has been completely discarded, and none of the other original proposals curtailing the autonomy of the central bank has come up for further discussion, at least not in the open. It appears that in Germany today the independence of the Bank is generally accepted as both natural and desirable. The German nation, experienced as it is in inflations, knows that the stability of the currency is best assured only so long as the Bank is capable of acting of its own accord and is directed by independent and expert personalities. Indeed, the confidence that is today placed in the central bank by all sections of the population derives largely from the Bank's independence of action and its isolation from the whims of day-to-day politics. It is the strength of this foothold that the Bank deutscher Laender has gained in German public opinion and in the German press that provides the best safeguard that the Government will be forced in any new law to retain, openly, the status of autonomy for the new central bank.
