Pumps for Atomic Energy

High pressure circulating pumps that never leak, yet run for years without maintenance, are now a reality. They have been designed and developed by Hayward Tyler & Company Limited during the past fifteen years and since 1945 their performance has been proved on La Mont boiler installations.

Such pumps are of special interest to engineers in the Atomic Energy industries where the twin merits, zero-leakage and reliability, are vital.

Building costs slashed. Concrete is poured on forms of CORRUGATED board

It takes a strong man to lift a cubic foot of concrete. But these new pouring forms made of corrugated board, first introduced in the United States, can stand up under nearly six times the weight. Yet they're less expensive and easier to install than any other kind.

Instead of storing and handling cumbersome metal pans or wooden frames, builders can simply staple these pre-cut corrugated forms together at the site and mount them in place. Besides saving time and money, they eliminate the storage problem and effect a sizeable gain in man-hour productivity.

Corrugated forms are being used today in practically all kinds of concrete construction: slab on fill, slab on fill joist, and second story slab on joist. Additional time can be saved by installing conduit and lath in advance—before the concrete is poured—and by leaving the forms in place.

This latest step forward in the building industry is dramatic proof of the

strength and economy of corrugated board. When you need new shipping containers for your products, heavy or light, sturdy or fragile, think first of corrugated.

Langston doesn't sell corrugated; only the machines that make it. Since 1902, these machines have led the field in efficiency and dependability. *Samuel M. Langston Co., Camden 4, N.J., U.S.A.*

LANGSTON Corrugated Container Machinery

MANUFACTURED IN ENGLAND BY MASSON SCOTT & CO., LTD.

A 'Unicorn' Briefcase with yet ANOTHER difference

'Unicorn' Briefcases are expected to be different. Thought behind design, quality of leather, standard of craftsmanship... these things already set the 'Unicorn' apart.

Now comes an overnight briefcase with yet another difference—a most ingenious code lock.★ Thought? Keys are easily lost, mislaid or duplicated. Design? A dignified arrangement of concentric dials offering no clue to the method of opening, or to which of several thousand possible combinations is correct. Craftsmanship? Magnificently engineered, wholly reliable quick action mechanism of watch-maker's precision, with neutralizing clutch accessible only to the owner.

Altogether a superbly convenient, more than useful, and—naturally—impeccable briefcase for the man who matters.

Two interior compartments, plus a 'personal' compartment; handy exterior zip pocket. Size 17" x 11½" (17" x 14" £1 extra). Natural coach hide, £15.10.0; light or dark pigskin, £18.2.6; tan or black cowhide, £15.3.6. Matching folio cases, £3.8.0, £4.10.0, £2.18.0 respectively. Post free and tax free in U.K.

★ Can be fitted as replacement on existing 'Unicorns' (and suitable 'Non-Unicorns') for approx. 5 Guineas.

THE ECONOMIST, APRIL 7,

Finding the right designer

British Industry and Commerce can draw on the services of many first-rate industrial designers. But when a particular design problem arises, how is the right designer to be found?

The Record of Designers exists to bridge this gap. Once the exact nature of the enquirer's problem is known, the Record can suggest a short list of designers drawn from many hundreds—their work embraces everything from industrial machinery to typography—together with some indication of Designers' fees. The manufacturer can then interview the designers, discuss his requirements and make all subsequent arrangements.

Last year, the Record answered no less than 500 enquiries. Its services, which are completely free of charge, are at the disposal of all British business houses.

G.E.C. AND THE CHANGING WORLD 6

Training the engineer of the future

An artist's impression of the study at one of the Company's Halls of Residence. For detailed information concerning the G.E.C. Training Schemes, write to the Controller of Education and Personnel Services.

66 ... we shall need many more scientists, engineers and technicians ... The aim we set before you is to build a highroad that runs from school to the highest positions in industry and commerce; to make it possible for every boy and girl to join that road at the point which suits them best, and to travel on it as far as their talents and perseverance will take them. 99

The Prime Minister, speaking at Bradford, January 18th, 1956.

In the great forward development of nuclear energy, electronics, automation and other important spheres of industry, the G.E.C. is in the forefront. With this wealth of knowledge and experience, the Company has every qualification to prepare the youth of today for the engineering projects that will greatly increase the material wealth of the world of tomorrow.

For some time past, recruits from grammar schools, public schools and the universities have been training in the extensive works and laboratories of the G.E.C. Men are engaged for their personal qualities as much as for academic ability. This combination is all-important because the key to the future is in the hands of these engineers-to-be. They are the men who are destined to become the leaders in the great industrial developments of our rapidly changing world.

Transport that is a
credit
in every sense!

It's not only the prestige of operating Leyland diesel trucks that counts, but the extra cash earnings they bring with every run.

From the moment a Leyland starts working for you, your fuel and maintenance bills begin to drop.

As an example, the popular 7/8 ton 'Comet' (fully loaded) operates on a basis of 16 to 20 m.p.g., according to conditions, and the heavier models average about the same ton-mile ratio.

Generally speaking, no major check-up of any Leyland is necessary before quarter-of-a-million running miles... and 15 years of hard service will still find it in the full flush of perennial youth.

And finally, when you buy a Leyland, you also buy the finest after-sales service in the world.

'FULL BOOST' STEEL PRODUCTION is here!

To-day more steel is urgently needed than at any other time in history.

Butterley, first to realise the importance of oxygen furnace boosting and steel melting in the present production drive, have acquired sole manufacturing rights for this new process in the United Kingdom and British Commonwealth.

Suitable for all types of plants, it is also a proved "cost reducer" and a saving of 20% has been recorded where oxygen furnace boosting is in full operation.

Consult Butterley. Their skilled technicians are at your service with complete data on Butterley Tonnage Oxygen Plants.

This Company is in the

OIL BUSINESS

... which nowadays means we are in the energy business.

You use energy, in living. So does a country. Britain uses energy to the equivalent of 30,000 tons of coal every hour of every day.

She will use more next year, more the year after, perhaps double the amount by 1980.

Where is energy in this quantity to come from? Traditionally, we have relied on coal. So must we still. Every extra ton is needed. But other energy sources must also help.

Oil, for instance. In fact, mainly oil. Nuclear power in any quantity is a generation yet ahead.

That is why the steel industry is already one of the largest consumers of oil, why more homes are heated every year by oil, much of it coming from our refinery at Fawley. That is why this Company will also play its part as the railways convert to diesel, and now has undertaken to fuel eight of Britain's latest power stations with oil.

It isn't only petrol we make - it's energy.

Oil now lights electric bulbs, as once it lit the lamps of China.

Mr. H. Tipping, the Burroughs man (on the left), discusses with Mr. Ambler, Director and Secretary of Schofields, the new system, based on Burroughs equipment, that they worked on together for speeding the preparation of customers' monthly statements.

How one man solved a double problem for a famous department store

To Schofields of Leeds, mailing monthly statements promptly to customers became a pressing problem in their constantly expanding business—moreover, filing space for sales dockets took up large areas of valuable shelving.

They called in Mr. Tipping, of Burroughs, who, with Mr. Ambler, Director and Secretary of Schofields, worked out a comprehensive plan based on Burroughs equipment, including Microfilm.

Now Schofields' statements go out proven, accurate and complete on exactly the right day throughout the month in a regular cycle.

The new statement is as modern as the equipment—instead of an abbreviated extract of debits and credits, the customer now gets the full story of each transaction, together with a summary giving all charges and credits, whilst Schofields have more accurate information on their accounting position, a considerable saving in staff and space, and the great benefit of having satisfied customers paying their accounts regularly and early with the minimum of queries.

Whatever your business, if you have an accounting problem, the Burroughs man can help you. Backed by Burroughs'

world-wide experience, he will make a full analysis and suggest the most economical, *workable* solution. If he thinks no change advisable, he will say so; if he does recommend a change, he will make a detailed plan and help you get it working smoothly. Call in the Burroughs man—you're committed to nothing. His advice is free.

Burroughs make the world's widest range of business machines. You'll find your local Burroughs office in the telephone book. Head Office: Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1.

raw materials : actuation and control : instrumentation
electronics : hydraulics : mechanics

The Plessey contribution to this vast work is largely concerned with control equipment and precision instrumentation. A current example of the vital role these products are designed to play is to be found at Calder Hall—location of the world's first nuclear power plant. The efficiency of this establishment is dependent upon certain specialised detection equipment supplied by Plessey, designed and produced in collaboration with the U.K.A.E.A. Industrial Group at Risley. To cater on a broader basis for the future planning and production of kindred instrumentation, a new company—Plessey Nucleonics Limited—has been formed.

the Wonder of Plastics

In transport and tableware, in foundries and fabrics, plastics today play their part. Their role may be contributory, it may be fundamental, but the wonder of plastics is in their versatility, their infinite possibilities. Types and grades are innumerable, each with its own properties—and limitations—presenting a wide field of choice to the intending user. The leading plastics materials manufacturers maintain extensive consultative and development services and none is better qualified to advise and assist than B.I.P.

This Butlin's waitress is carrying over fifty plates made from MELMEX moulding powder—a B.I.P. product. Light, strong MELMEX Ware is specially designed to speed up service and reduce wastage in large-scale catering.

The Catamaran "Endeavour" built by Proust's of Canary Island is the fastest sailing craft in Britain, having achieved 14.8 knots over a measured mile. The strong hulls are built from veneer strips, glued with Resin Adhesives—a B.I.P. product.

B.I.P. SERVICES

The full resources of the B.I.P. Research, Technical Development and Design services are at the disposal of manufacturers interested in the possibilities of plastics. Advice will gladly be given on any problem concerning plastics applications, irrespective of the type of material involved.

Back Again

BACK again, a little breathless, with our London printers after seven weeks of exile, we owe readers an explanation—as well as our thanks for their indulgence towards our continental improvisations. They will wish to share in the expression of our gratitude for the willingness and workmanship of all those—managers, craftsmen and craftswomen—in three foreign countries who made possible the continued publication of *The Economist*.

Our troubles began when, with the bulk of one week's issue of the paper already set in type, production in London was brought to a standstill by the dismissal by the printing employers of the men whose restrictions had already for some weeks made publication increasingly difficult. The first emergency issue therefore, that of February 18th, had to be very hastily improvised and was, in fact, produced by photographic process in Belgium. In the second week, with no type set and no one to set it, it was necessary to make other arrangements; the issue of February 25th was composed and printed, at very short notice, in Germany. It was not feasible, however, to renew this arrangement. At even shorter notice we made our third and final move, to Switzerland, where for five weeks we were served with admirable efficiency and good humour by the remarkable staff of the Imprimerie Saint-Paul in Fribourg. Our experiences in this notable home of the printing craft are described in an article on page 49. There were, inevitably, shortcomings in our foreign editions. We have apologised for them, and do so again now. These were in no way the fault of those who printed the paper. It is now our intention to repair as far as we can in coming weeks the damage done to our services to readers and to the revenue that makes those services possible.

Certain points must be made quite plain. *The Economist* itself has had no part or voice in the dispute that made these wanderings necessary. When the members of the London Typographical Society were dismissed, because their calculated restraints upon working in pursuit of a wage claim made normal production impossible, we were deprived of our facilities for printing. It was our duty to our readers, and our right as publishers, to find other printers. The conscience of none of those who came so generously and so effectively to our aid need be troubled; ours is not. Whatever the rights and wrongs of the dispute—and the verdict of the Court of Inquiry is clear enough—the cause of the interruption, which has resulted in serious losses to printing workers as well as to London printers and their customers, was the resolve to press the union's case by making nonsense of the normal processes of printing and publication. In the outcome work has been resumed on terms which could, and should, have been agreed without any of this new-style Luddism. The printing industry has been too much plagued by these troubles; and so long as there is no lasting settlement between jealous unions as well as between masters and men the threat to freedom of printing and publication—and to readers' freedom—will remain.

Heirs of Stalin

WITH Marshal Bulganin and Mr Khrushchev on the doorstep, the interpretation of the latest events in Russia—upon which others may ponder for many a long day—is for Britain a task that will not wait. The death of Stalinism was as sensational as the death of Stalin, which the free world greeted with a certain complacency, anticipating a murderous struggle for power among the Soviet leaders. It is now inclined to welcome “the return to Leninism” as a symptom of harmony established among a saner leadership. But the latter judgment is as hasty as the former. Before concluding that the demotion of the tyrant has made the Soviet Union a less evil or the world a safer place, we should scrutinise the evidence.

The campaign for the vilification of Stalin opened by Mr Khrushchev and Mr Mikoyan is indeed probably dictated by more than Machiavellian considerations of expediency. The phenomenon may be regarded first of all as the bursting of a sewer in the Russian nation, comparable perhaps in scale to the revolution of 1905. Russian history is one long, sad tale of burst sewers. From time to time the accumulated extravagances of despotism awake among even the most submissive of peoples a desperate desire for some alleviation of injustice. We may take it that the mitigation of the terror which for decades has reduced the lives of millions of Soviet citizens to the subhuman level is in some degree a response to popular demand. As such, it is a matter for rejoicing, as Mr Gaitskell has said. By its own confession the Soviet Union has not yet achieved a valid system of law. In his report, Mr Khrushchev spoke of “an atmosphere of lawlessness and arbitrariness” and of “fabricated false charges against honest leading workers and rank-and-file Soviet citizens.” His remedies—“proper control by the party and the government over the work of the state security agencies” and strengthening of the state security agencies, the courts and procurators’ offices “by putting in tried and tested people”—hardly smack of an independent judiciary. But they are evidence at least of a temporary desire of the party and the people to establish something called “socialist legality.” In a country which has never had the slightest conception of the rule of law, legality must be a tender plant. But it is possible that the Stalinist experience has imbued a large section of the population with a taste for justice which no future government will be able entirely to ignore.

The attack on Stalin (which undoubtedly took wings from Mr Khrushchev’s personal ebullience) was, however, prompted by purely party considerations as well. The Soviet leaders, who are not as young as they were, have agreed among themselves to live and let live. The

formal denigration of personal rule is the sign of a compact between the members of the new oligarchy. At the same time, by a *tour de force* conceivable only in Slavo-Leninist circles, the Presidium seems to have persuaded the Central Committee that their own sordid complicity and cowardice during Stalin’s reign were a “historical necessity”; that, with a judicious admixture of new blood among the candidate-members, the same presidium should remain in office; and that in some wonderful manner the authority of the central committee itself will be renewed. It is not certain that this manoeuvre will stand the test of time before the millions who may well despise the lieutenants who licked the tyrant’s boots when he was alive. But as a ruling group’s manoeuvre it must rank as one of the boldest conjuring tricks in history.

For reasons of economic organisation, too, there was a certain inevitability about the changes after Stalin’s death. Indeed, some historians, even before he died, were maintaining that “Stalinism contained within itself the seeds of its own destruction,” that some of its most oppressive features designed to mould backward Russia into a modern state had already become superfluous, and that only the conditioned reflexes of the omnipotent ruler insisted on their preservation. Was not Stalin writing his own epitaph when he argued in the history of the party that “apparently great figures can be reduced to nothing if their ideas and aspirations go against the economic development of the country”? Stalin’s heirs now condemn him for having clung to the most shocking features of the regime—the terror, the concentration camps and the repulsive personal rule—when they were no longer necessary, not for the ruthlessness of his collectivisation or the industrialisation carried out at break-neck speed. Their condemnation is strictly limited. *Pravda* has already begun to rebuke those who, under the pretext of joining in the attack on Stalin, are injuring the party itself.

The theory of “collective leadership” has important implications beyond the frontiers of the Soviet Union, too. In Stalin’s day the whole of the European Communist bloc could be controlled from the Kremlin: the tyrant issued his ukases, and his police chief saw to their execution. Without the iron hand some other method had to be found of co-ordinating Soviet and satellite policy. It is probable that the restoration of authority to the Soviet Central Committee will be paralleled by a broadening of the leadership in the satellite states; further that there will be greater equality between the satellite and Soviet leaders in the highest Communist councils. In fact, the “return to Leninism” may prove a more genuine doctrinal tendency outside the Soviet Union than within it. This would be in keeping with the strategy of an oligarchy which wished to retain as absolute a power for itself as possible within the USSR, while

seeking a broader-based loyalty from the satellites than the Stalinist system permitted.

Soviet prestige in the non-Communist world will have been both damaged and enhanced by the disavowal of Stalin. Here the Presidium must have been faced with some nice calculations. The Far Eastern neutrals, and in particular Mr Nehru, will be impressed by the Soviet condemnation of arbitrary violence and henceforward more inclined to regard the USSR favourably as a benevolent economic dictatorship. Peoples accustomed to political democracy or endowed with a proper sense of the ridiculous will be less easily deceived by the precept, “forget the past, it was all Stalin’s fault.” Politicians who for decades have been struggling with the Communists for the leadership of the working class will not suddenly be eager to bury the hatchet. The fact that the Soviet Union is ridding itself of some of its more Mongolian aspects will be perceived as irrelevant to the main ideological issue. The Soviet leaders and fraternal Communists abroad are not democrats but totalitarians who seek to control the thoughts of their subjects by all the means of education and propaganda. With renewed vigour these ex-Stalinists assert that the western democracies are politically outmoded and economically incompetent; that by their cretinous attachment to “formal freedom” they are thwarting the true Historical Development of the planet towards Socialism. Nothing fundamental has changed in this holy war of ideas and systems. The improvement in the manners of Communism does not remove the Soviet threat to the western world, but may even make it more formidable.

*

Responsible democratic leaders in north-west Europe could hardly be expected to swallow whole the new cult of Soviet respectability. But Mr Bulganin and Mr Khrushchev may hope for success among a good number of neutralist and nationalist politicians and intellectuals; for instance among those in France and Britain who are both anti-American and anti-German, and those Germans who are bent on reunification of Germany at any price. The Soviet leaders cannot have much confidence in converting the western populations to the Communist creed; too much blood and nonsense have flowed since 1917 for that. But they still see the chance of seducing enough western politicians to break the American-European alliance, and their simple mass appeal of “Peace”—which the west can take to mean “co-existence at any price”—is a handy tool for the purpose.

Where does the British population stand in this tremendous struggle? In Soviet eyes its allegiance or defection is certainly decisive. In order to shake British-American solidarity the visiting Soviet leaders will do their utmost; Mr Malenkov’s protestations that these are not the visitors’ intentions give the game away too clearly. To achieve their supreme objective,

Marshal Bulganin and Mr Khrushchev will make themselves extremely agreeable: no antic will be too extravagant, no words too effusive. By what standards should we judge their sincerity?

The Prime Minister has assured us that the visit is to be no goodwill parade, but a “serious meeting for political discussion”; but the topics of discussion—or is it negotiation?—remain undisclosed. Perhaps the government has prepared a list of minor grievances, such as the penal pound-rouble exchange rate, but no doubt it has larger matters in mind as well. Among the obvious impediments to good will are the jamming of British broadcasts to the Soviet Union, the exclusion of British publications, and the general policy which those devices serve: the persistent misrepresentation of British life and British policy by the whole totalitarian propaganda machine, ranging from *Pravda* to the English schoolbooks. The establishment of reciprocity in these fields is an elementary test of Soviet good will as well as a clear British advantage. Any communiqué that recorded neither success nor failure in this attempt would be a deplorable failure in itself. But the overriding question is whether the prime purpose of Soviet policy is to remain the creation of disturbance and tension—in Europe, in the lately emancipated countries of Asia, in the still dependent parts of Africa, and in the Middle East. Of most immediate concern to this country is the Soviet policy of disruption in the Middle East, where every situation detrimental to British and western interests is exploited even when—or particularly when—the Soviet Union has no moral or material interests of its own at stake. It can be argued that the reunification of Germany is at this stage too exigent a test of Soviet good will, but can the same possibly be said of precautions against war between Israel and the Arab states? In this connection the Soviet leaders can reasonably be asked to co-operate in a far more honest fashion than they have done in the Security Council yet.

*

Since Marshal Bulganin and Mr Khrushchev are coming, it is necessary to make the best of it, without being beguiled by the hurrahs and the junketing; and this can be done only by specific initiatives of a testing, but intrinsically reasonable, kind. Any vague statement about “profitable *tours d’horizon*” will leave the British people with the stigma of having given open house to these two politicians, with their doubtful intentions and their more than doubtful past, to no purpose. The visitors must be told that the British, at any rate, are willing to “forget Stalin” only if Stalin’s deeds are effaced by different new policies. Without that positive effacement, the Soviet disavowal of Stalin can in the field of international relations be interpreted only as one more shift of an authoritarian regime bent on the destruction of all values and systems inimical to its own.

1938-1956: A Retrospect

By Geoffrey Crowther

IT has become a tradition of *The Economist* that the Editor should break the rule of anonymity once only, and that once when he departs. Tradition is compelling. But what to say? Anyone who for long pursues the calling of a jobber in opinions eventually arrives at the condition of an intellectual slot machine. If the penny is inserted, either by the asking of a question or by the happening of an event, then the wheels will turn and a nicely packaged opinion will emerge. But if the machine is invited to provide some general reflections on a subject of its own choosing, without text, it remains dumb. I must use the first penny that comes to hand, that of retrospect.

I became Editor on the night of Munich, and my introduction to the duties of the office was to sit up the whole of that night, re-writing my leader over and over again as the reports came in. I have thus occupied the editorial chair for 17½ years. This is a long time—I take pride in the fact that it is a longer time than was served by any of the most distinguished of my predecessors. James Wilson, the founder, conducted the paper for just over sixteen years, Walter Bagehot for seventeen years and five months, and my immediate predecessor, Lord Layton, for sixteen years and nine months. Thus four editorships, out of a total of only eight, have lasted between sixteen and eighteen years. It is a long time—and, in my judgment, long enough.

★

It has been a long time, too, in the affairs of the world. From Munich to Malenkov is surely more than an ordinary span. And yet, in looking back, I find it difficult to decide whether it is the changes or the similarities with 1938 that are the most striking. Perhaps it is the similarities that deserve the greater emphasis, if only because there is such a widespread tendency to assume that "everything is different now" and that none of the lessons of the past has any relevance to the present. Certainly, in view of all the tremendous things that have happened in between, it is astonishing how very many people are still doing business of much the same sort, at very much the same stands, as before the war. And when I ask myself what have been the really important changes since 1938 in the content of the public affairs on which *The Economist* comments week by week, I am impressed by how insecurely established they are and how easily they could change back again. Let me illustrate this point by picking out what seem to me to be the two biggest changes, one in the home field, one in foreign affairs.

In domestic politics, by far the most far-reaching change has been the assumption by the state of responsibility for the condition of the national economy. A government today thinks itself responsible, and is

certainly held responsible by the opposition, for the state of trade, both in general and in particular. It may come as something of a surprise to have this classified as a change that has taken place since 1938. But right up to the outbreak of war, the accepted philosophy was that, since the power of governments to determine general economic conditions was very limited, it would be foolish of them to accept responsibility for what happened. Even in the Labour party, daunted by its complete failure in 1929-31 to hold back the waves of depression, there was very little sign of a practical policy to avoid economic fluctuations, beyond a generalised idea that nationalisation would perform this miracle, among the many others that were expected of it.

Now all that is very much changed. Both parties seem to accept without demur their responsibility for maintaining the economic health of the community. They differ on the methods they choose to employ, but not (apparently) in their confidence that they can do it. The new doctrine is so universally accepted that one would be thought very eccentric, and very reactionary, even to question it. Yet the odd thing is that this responsibility has been accepted without the slightest proof that anyone knows how, in fact, it is to be discharged. Indeed, the evidence is that neither party has had, at best, more than the most rudimentary control over the economic climate since the war. It is true that full employment has been steadily maintained, and as that is what matters most to the ordinary man; it perhaps accounts for the general illusion that governments have been successful in their economic policy. But full employment has persisted since the war all over the world, and it has certainly not been due to successful economic planning all over the world. Is it not much more likely that British full employment has been mainly due to this worldwide conjuncture than that the policies of the Labour and Conservative governments have created it? Moreover, when one looks at the specifically British problems, such as inflation and the balance of payments, it becomes obvious that the failure is pretty complete. What real reason is there to suppose that the degree of success will be any greater when, some day, through a shift in the wind, it is once again the forces of deflation against which a government finds itself battling? We may not inconceivably find ourselves back in the position of the thirties, and both sides, when in turn they have broken their teeth on the problem, may be ready to accept much more modest ideas about their ability to control the weather.

★

In foreign affairs, one is tempted to say that the big change since 1938 is the invention of nuclear fission as a weapon of warfare or, linked with that, the emergence

of Soviet Russia as a potentially aggressive great power. But I do not think that either of these has yet made much difference to the conduct of foreign affairs. The problem for Britain has always been how to contain the potential master of the Continent, and the fact that he now speaks Russian, instead of German or French or Spanish, is not a fundamental change. Nor, alas, has the bomb, as yet, altered the nature of the nation-state or the way it conducts its affairs. Mr Molotov is still in the Kremlin as he was in 1938, and Sir Anthony Eden (still) at the Foreign Office.

The important change, to my mind, is neither of these but the emergence of the United States as a full-time great power and its willingness to form and lead a Grand Alliance. That is, indeed, a change. True, the Americans fought in the Kaiser's War, but they relapsed thereafter into the most dogmatic neutrality. It was not, in fact, very difficult, as the second war approached, to foresee that America would again be involved (the curious will find an article in *The Economist* of February 18, 1939, under the title of "What Would America Do?", which was a tolerably accurate forecast). But this was speculation; the European governments laid their plans, whether of offence or of defence, on the assumption that America would stay out. Had the United States been committed to intervene in full strength from the first moment of a European war, the first world war would probably, and the second world war would certainly, never have happened.

It still seemed most unlikely, when the second war came to its end, that the United States would actually accept the obligations and commitments of a permanent formal alliance. But the miracle happened (thanks to Stalin) and the transformation it has brought about in the diplomatic position is revolutionary. It is not simply that Britain, itself so often the balancing factor in Europe, now for the first time has an immensely powerful reinforcement at its back. That would be a great deal, but it is not all. The essential point is that, for the first time in modern history, the defending powers are virtually as strong, and as ready, as the potential aggressors. That is the great, the overwhelming, difference between 1938 and 1956 and, though nothing is certain in this dangerous world, I see in it the best assurance of peace.

★

Yet this change also could be temporary. The Americans could change their minds again and relapse—hardly, indeed, into the indifference of the twenties and thirties, but into a sort of wary disengagement which, in its practical effects, might be almost as bad. What is really astonishing is how many people in the European democracies, and specifically in Britain, seem to be anxious to do everything they can to make the Americans change their minds. Even the Labour party, though its formal and considered policy rests absolutely

on the continuance of the American alliance, can resist no temptation to snipe at it, as if it could be taken so much for granted that it was proof against what anyone said or did. It is true that there is a great deal of foolish talk in America too, some of it in very high places. But it is not easy for any democracy to make subtle distinctions; one has to take the rough with the smooth in any policy. It is obviously better for Britain to have an America strong and allied, even if that means some wild talk, than an America talking the utmost good sense, but indifferent and uncommitted.

It is one of the most egregious complacencies of this very complacent epoch that the miracle of the American alliance should be so often treated in England with a shrug—that we should be able, for example, to invite the Soviet leaders to pay an official visit to London thinking only of the effect on them and on us and not at all (as it would seem) of the effect on the alliance to which we owe our lives. The opinions that *The Economist* has expressed on foreign policy have been based, every week, on the belief that the alliance should be fostered, not indeed by subservience (which is neither expected nor necessary) but by all the loving

The Peace Malcontents

Though the precise terms on which peace has been concluded are as yet unpublished, yet it is known that they are considered fully satisfactory by those who are in the secret, and it is understood that they embody, if they do not extend, the conditions which were agreed upon as the original basis of the negotiations. . . . In the midst of the general jubilee, however, there are several parties, whose views we can well understand and with the feelings of some of whom we can partially sympathise, whose satisfaction is not wholly unalloyed with misgiving and regret. First come those who have lost their best and dearest in the deadly struggle, and who would fain have honoured them by a grander and wider funeral-pile than was furnished even by Sebastopol in ruins and on fire. . . . There are others whose sentiments, though equally natural, are less excusable. There are many who in secret rebel at the sheathing of the sword till we had reaped a far richer harvest of glory; who feel that, as far at least as first appearances go, England has scarcely played a part equal to her vast resources and her hereditary fame. . . . Even to this regret, which is felt more widely than it is expressed, considerable sympathy is due; but those who are conscious of it may derive some counterbalancing comfort from two considerations: first, that it is the very magnitude and grandeur of our preparations that has rendered those preparations needless; that it is precisely because we were so ready and so desirous to strike that the blow was forestalled by the submission of our foe; and that we have gained the victory merely by showing that we were certain and resolved to win it. The second consideration is that the fortunes of war are proverbially doubtful, that the sun might not have shone upon our efforts exactly in the measure we anticipated, and that—though we will not affect a doubt which we do not feel as to our ultimate brilliant and conclusive success—yet that success might have been purchased by the sacrifice of many thousand citizens who will now live to serve their country, instead of dying to illustrate it.

The Economist

April 5, 1956

care that one would lavish on a precious plant now in full flower, but which might yet wither on the stalk.

And the moral of my two examples? Surely it is obvious, and apt to my opening theme. For I have not been trying to do anything so extreme as to argue that there is nothing new under the sun, but only that one should be sceptical of revolutions in human affairs. It is not my case that nothing ever changes, but only that one should beware of its changing back again. *Plus ça change*, if I may modify the old tag, *plus ça pourrait*

redevenir la même chose. Or, if I may take the same liberty with Kipling—

I tell this tale, which is strictly true,

Just by way of convincing you

How very little, since things were made,

Things have altered in the statesmen's trade.

And if that is true, then a journal of opinion which for over 112 years has tried to present a consistent point of view on public affairs still has a part to play. I have no doubt of the quality of its performance under my successor.

The Expanding Commonwealth

ONCE Sir Winston Churchill roundly declared that he had not become First Minister of the Crown to liquidate the British Empire. Since then his successor has been charged by some Tories with doing precisely that. The argument is mostly beside the point. The shift in world power and in national aspirations which has so sharply affected the periphery of Britain's old imperial interests, especially in the Middle East, is part of a larger world-wide transformation; and as the Empire shrinks the Commonwealth expands. The need is not for lamentation but for honest appraisal of the character and survival value of the expanding Commonwealth and of Britain's place and interest in it.

When the Commonwealth Prime Ministers meet again in June they ought to do more than arrange for an extra leaf to be put in the cabinet table as required. The Commonwealth is about to undergo its biggest change since India's determination to become a republic was reconciled with its wish to stay in the club. Nobody cares to define the Commonwealth too closely. Something of its continuing value, it can be claimed, is shown precisely by the efforts the Prime Ministers make, for all their diverse preoccupations and differing political timetables, to meet in person as often as they do. The Commonwealth works, it is said, and that is enough. But as a whole series of colonies on the verge of independence get ready to knock on the door, it is not inappropriate to ask what it now works towards.

The Gold Coast is at the head of the queue for admission; but what is ringing in a new era is the fact that quite suddenly there is a queue. It was thought not so long ago that the Gold Coast would be inducted into the rules of the club a long way ahead of other colonies. Now Malaya is aiming at full sovereignty by August, 1957, and Singapore is looking—less confidently—to the same date. The West Indies, though they have further to go, are now certain of independence as a sizeable federal dominion. The independence of Nigeria is slowed by the unpreparedness of the Northern Region; but the pace might well be hotted up at the constitutional conference next August. The Federation of Rhodesia and Nyasaland cannot change its constitution for another five years, in accordance with

the original bargain struck between Britain and the white settlers; but, when full sovereignty is given into West African and Malayan hands, it is not likely that the Rhodesians will remain content with their anomalous position, poised between the Commonwealth Relations Office and the Colonial Office, which allows their premier to attend the premiers' conferences by courtesy but not of right. When these aspiring members are all in, half a dozen more will be seen hurrying forward (whether really ready or not to stand on their own feet).

At one time it was supposed that the first African candidature would precipitate a Commonwealth crisis; South Africa would veto the Gold Coast's admission and the fat would be in the fire. This does not seem so likely now. A crisis over South Africa may come, but not over the question of the Gold Coast's credentials. In the first place, while Britain cannot force a former colony on the other members of the club, it is not certain that election has to be unanimous. South Africa could of course compel the other members of the Commonwealth to choose between it and the Gold Coast (and other colonies). But this would amount to Britain, Canada, Australia and New Zealand choosing between the Union, on the one hand, and a large part of Asia and Africa and the West Indies, on the other; it is not a choice that South Africa is likely to force. South Africa is increasingly conscious that the Commonwealth is the one club to which it can belong, and when there has been trouble in the United Nations, some if not all its fellow-members have on occasions been very helpful. And the alternative to having Britain's former African dependencies inside the Commonwealth is to have them outside, probably keeping dubious company. The pity is that just as Afrikaner resistance to Dr Nkrumah's joining the group has faded, Ashanti intransigence threatens to jeopardise it again.

But what is the group going to be and do and stand for in future? Setting the bounds of the Commonwealth wider still and wider (though no wider than the bounds reached in Kipling's day and indeed somewhat short of them) is hardly a definition of function. The new members will find it easier to grasp what it is not

than what it is. It is not, of course, the Empire they knew; the CRO will speak in very different accents to them than does the Colonial Office, even in these days. It is not an alliance, even of the loosest kind; to use words used recently in the Pakistan parliament, it does not in any way abridge their independence or curtail their liberty to have free foreign policies of their own. They can espouse policies that bring them into conflict with other members to the verge of war; nobody yet knows whether even going to war with another member requires resignation. But these contradictions form the only conditions in which Canada, India or Pakistan will stay in the Commonwealth, or in which newly-emancipated colonies will join it.

★

What then, it may be asked, is the worth of so negative an association? For Britain, the Commonwealth is a gentle let-down, a featherbed of fine phrases and outward forms, to ease the psychological impact of the loss—now approaching its last phase—of a powerful Empire. Yet the phrases and the forms can still symbolise something positive and valuable that can persist. The new way of parting friends has prolonged Britain's influence in a way Holland might envy and France may soon sadly miss. It has given a short respite in which the adjustment can be made to the real loss of power, the consequences of which emerge nakedly from time to time, as for example, at Abadan. It has preserved the friendship of former dependencies. And it has kept up Britain's stock in America, though at times the consequences of Britain's real loss of power has dismayed Americans.

For the older dominions the Commonwealth has eased a new relationship into being. It can still mean Empire, home and the Crown to Australasians even as realities compel them to enter pacts like Anzus. The same overtones ease Canada's inter-communal problems, strengthen her sense of identity against the American neighbour, give her a springboard into Europe and indeed Asia. The value South Africa derives has been described; it may not even be fanciful to foresee South Africa clinging to the Crown as the time of reaping the whirlwind moves nearer. For the Asian countries the Commonwealth has provided two things—a fund of practical advice on how to be sovereign and influential in the comity of nations, and a springboard to the Western Hemisphere. These are also the advantages of Commonwealth membership to the colonies (there are some in Burma and the Sudan who miss them). When independent, they will at first be weak, undefended, underdeveloped and inexperienced states, though formally sovereign. Under Commonwealth aegis they will be helped to play a more effective part as sovereign states than would otherwise be possible; they will have ready-made backing for their diplomacy and in their negotiations in international conferences, political or economic; there is a Commonwealth associate in every clime.

But is not all this of temporary importance? No doubt it will become less useful as the new states develop. At the same time, the centripetal force of Britain will diminish—partly because so many personal ties will fade as a new generation appears which knew not the Raj (its good side as well as, in colonial eyes, its bad). If the Commonwealth association is to wax not wane in the next chapter but one, new ties must take the place of the Old Boys' Club.

★

Common interests not sentiment or tradition—however strong—will alone keep the party together instead of gradually straggling in diverse directions. What clearly disrupts the Commonwealth community is not disputes among its members, but the adoption of repugnant ideologies. India can stay a member however neutralist and republican—but not if she became Communist. Non-interference in the internal affairs of members is a dogma and necessary condition of Commonwealth. Yet the development of racial discrimination as a culture in South Africa could strain it to breaking point. It is the clear break with a broadly liberal tradition that could be fatal. There is no community of religion, culture, language or race among Commonwealth members. Even the community of forms of law and government is dwindling. The outstanding problem of the new Commonwealth, as indeed at longer range of the world at large, is the problem of racial partnership. This is the plainest consequence of the great forthcoming change in its composition.

The common interests of the Commonwealth, if it is to hold together and thrive, will be found in every field: economic, strategic, diplomatic and political. But first for survival is the need for its races to live together. The Commonwealth, in fact, has become a multiracial association. It is predominantly Euro-Asian in nature, but it will become Euro-Afro-Asian. Its problems are the world's; its dissolution would be the world's loss. The growing points of the new association of equals will be found in its uniqueness in having a window on every part of the world. The task is to exert this cross-cut in human experience. New voices are now heard at the door; perhaps they will bring in with them new ideas about the way the Commonwealth should face its future.

Emergency Issues for Binding

Several of the emergency issues of *The Economist* are too large to be bound into the normal issues. Steps are being taken to reproduce these oversize issues in the normal size and an announcement will be made as soon as possible.

Notes of the Week

The Trials of Sir Anthony

A YEAR ago yesterday Sir Anthony Eden became the Queen's Prime Minister. Leaving aside the recent exaggerated criticisms of his personality as a Premier—and the still more exaggerated speculation about the security of his tenure—it is on the record of his policy that the anniversary deserves to be judged.

In foreign affairs, he has continued the control he exercised in his previous office; the just complaint here is that the continued control has been too detailed. In domestic policy, Sir Anthony's admirers put forward two claims: that he has not been afraid to take unpopular action, and that he has done this without splitting the nation in two. The first claim is justified, but the second is largely a rationalisation of an original campaign that has gone awry. When Sir Anthony acceded to control over domestic as well as foreign affairs, his eyes were on the new industrial and atomic revolution; just as Mr Baldwin's main contribution in the 1920s had been to educate Labour to responsibility in a new political situation, so Sir Anthony envisaged himself educating the trade unions to responsibility in a new economic situation, in which everybody was going to have a chance to advance to a middle-class standard of life. His misfortune is that he was prepared for a missionary endeavour, but instead has found himself having to send out diplomatic missions, to both sides of industry, in a drearily familiar atmosphere of crisis.

In this, he has had about as much success as a practised diplomat can have learned to expect—but no more; all the civilities have been maintained, but nobody he has talked to has yet changed his policy. The danger has always been that he might therefore seek to change his Government's policies in order to keep those civilities going. So far, and again in the tradition of a practised diplomat, he has not in fact done so; his support of the freeze on railway fares may have been an exception, but not a big enough exception to mar the whole year's rule.

A UN Missionary

MR HAMMARSKJÖLD has more than once proved an adept at quiet diplomacy, but his skill will be put to the most searching test yet when he sets out to fulfil this week's Security Council resolution on Palestine. By its terms, he is to go forthwith to the Middle East to survey the present state of compliance with the armistice resolutions between Israel and each of its four Arab neighbours, and to report back within a month on measures for reducing frontier tensions. When disagreements are acute, terms of

reference are important; he will therefore be bound to stick closely to a brief which Israelis and Arabs alike have been keen to confine within the narrow limits of the armistice. But even if he can begin to discuss functional frontier arrangements more efficient than those so far organised under the UN truce commission, he will have restored some lost confidence in the UN's capacity for handling disputes. He will work at one advantage—that of recent familiarity with the area. His fact-finding visit, paid on his way to Bangalore in January, renders him a familiar figure—an important quality in all the Arab capitals.

Unanimous consent to his mission was secured only at the cost of a wrangle in the Council. The instruction to him to act in view of a situation "likely to endanger" peace was contested by the Soviet delegate, Mr Sobolev, who sought to water it down after accusing the western powers of planning armed intervention in the area under pretext of preventing war, and in violation of the sovereign rights of small states. On Wednesday he withdrew his objections and won a clap when he voted for the original proposal, but still contrived to emerge from the contest as the champion of the Arab states. Everyone is pleased that the UN is back on the job; no one has paused to give credit for a useful initiative to the western powers, who, for once, deserve it.

No Sale

THE Government suffered a disappointing buffet last weekend to its more extravagant hopes that this summer's round of trade union conferences may "give a miss" to the formulation of new wage claims for 1957. At the first of these eagerly-awaited conferences, the shopworkers' union, meeting at Margate, told its leaders to start preparing a new claim as usual. The pattern of the conference was interesting because the executive of this union, as union executives go, is at present moving to the right. The successful motion condemning wage restraint was a composite motion culled from twenty or more diffuse resolutions submitted by local groups of activists. The only delegate to vote against the motion said that the Communists had had a hand in preparing it; so they probably had, but once a motion for more money is put forward, the rank and file on the floor vociferously support it. (The shopworkers were not alone in this last weekend, for the teachers' union did just the same thing at Blackpool.)

This motion against restraint bore down on a platform composed of instinctively restrained men. Mr Alan Birch and the other shopworkers' leaders are the sort of trade unionists who visit Downing Street wearing statesmen's hats; but at Margate they were all wearing tin helmets. The professional politician on the shopworkers' executive, Mr Padley, MP, said that acceptance of motions like this

was inevitable so long as the Government was handing out benefits to bankers (sic) and dividend drawers. Mr Birch himself said that he would like trade unions to follow an "ordered wage policy" and to seize the "opportunity to concentrate on the essential function of adapting wage levels to increased productivity"; but he, too, accepted the motion—in a speech that was plainly designed to explain to the outside world that he could not help it.

This experience makes it clear that the most that can be hoped for is that this year's union conferences, while calling for new wage claims, may not specify any figures that would embarrass their negotiators if circumstances change; the shopworkers did not, but as they embrace so many trades and grades, this abnegation was quite usual for them. Mr Macmillan's job in his budget should therefore be to bring about a shortage of money so that employers will not be able to meet excessive claims when they are presented. It would be futile to play with the idea of price freezes and special profits taxes in order to try to stem wage claims one stage further back, at conference level, in order to give union leaders "arguments for restraint" that, by the nature of these conferences, they can never use. Margate has shown that if there are no political talking points to justify formulating demands for new wage claims, then, so long as the over-buoyant economy lasts, even such staid leaders as Mr Padley and Mr Birch feel professionally constrained to invent them.

Books and the Bill

WHEN Parliament re-assembles next week its first task will be to consider the Restrictive Trade Practices Bill in committee. The principal amendment that needs to be made to the Bill becomes more and more plain: every effort should be made to persuade Mr Thorncroft that he should retain the existing powers of the Monopolies Commission intact, even after the new system is introduced. Unfortunately, most of the amendments to be proposed in the committee stage seem likely to be attempts to make the Bill weaker instead of stronger. One of the first claimants for exemption will be the book trade, in defence of its Net Book Agreement.

In form, this agreement is a fairly typical restrictive practice. Under it, a bookseller who wishes to obtain books on trade terms from any publisher is required to undertake to sell books at the net price fixed by the publisher; there is, however, a limit to the period during which a book can be sold only at net prices, and bulk orders from libraries and schools are not subject to the agreement. In return, the agreement allows the bookseller a margin for carrying on his business that varies from 33½ per cent to 25 per cent, according to the type of book and the quantity ordered. Although this margin may seem generous, it is probably only just about sufficient, in present conditions, to save many small booksellers—as distinct from shops that sell books only as a sideline—from extinction. The extinguishing of small, inefficient shops—in other words, the rationalisation of distribution—is, of course, one of the worthiest objects of the attack upon restrictive practices; but books have some claim to be a special case. Experience in other countries suggests that if most books had to be sold at newspaper kiosks and general stores instead of specialised

shops, the more literate type of book buyer would have reason to regret it.

There are therefore solid grounds for suggesting that the net book agreement should be able to justify itself to the new tribunal when the time comes. Unfortunately, however, the trade wants to go further. It is asking for direct exemption from Part II of the Bill, which prohibits the collective enforcement of resale price maintenance in all circumstances. Collective enforcement—in other words, a refusal by all members of the Publishers Association to grant any discount to a bookseller who breaks the agreement—is provided for at the moment; the trade says that it is the only sanction that can maintain the agreement effectively, and that individual publishers have not the resources to pursue an offending bookseller on their own. In this, the trade is almost certainly wrong. Individual publishers clearly would assert their legal rights if competition under the new order threatened to revive the booksellers' crisis of the nineteenth century; the prospect under the new system is merely that a few bargain sales of unsaleable stock might be made which it would not be worthwhile for publishers to stop, and the public has no reason to object to that. The publishers should not therefore be given a special licence for their obnoxious blunderbuss of collective discrimination; later, when other features of the agreement come up before the tribunal, commonsense may be on their side.

Comrades in Conference

A SPECIAL correspondent who attended the Battersea congress writes: It is a pity that there has been so much delighted speculation about what Mr Harry Pollitt may or may not have said at Sunday's private session of the 24th National Congress of the British Communist party; the outsider is always apt to overestimate the difficulty that party stalwarts have in squirming on to a new line. Simultaneously with Battersea, in the April issue of *Labour Monthly*, Mr. R. Palme Dutt wrote in public all that Mr Pollitt needed to say in private—and with engaging cynicism. Mr Dutt compared the new line with Lenin's "retreat" in Russia's new economic policy of 1921 and his temporary concessions to foreign capital:

Where old conceptions, however hallowed, have become an obstacle to the fullest and most unfettered response to the giant new opportunities and needs of the present and the future, such old conceptions have been ruthlessly thrown into the discard.

Mr Dutt concluded that, judged by the test of results, Moscow's new accounts of the past "are already proving themselves in practice." In short, if, by discarding Stalin, the West and the neutrals can be persuaded that Communism is peace-loving, democratic and altruistic, then the faithful will, for the time being, have to swallow this change of line just as they have digested others.

All this publicity served to obscure the most striking feature of the congress: which was the steady parade of evidence contrasting the weakness of the party as a mass electoral organisation and its strength in the factories and workshops. The circulation of the *Daily Worker* has again fallen; party membership is still short of 34,000; at the 1955 General Election the party candidates monotonously lost their deposits; the local government elections showed

losses in some traditional strongholds. In contrast, the shop-steward delegates were able to report successful trouble making at factories throughout the country. (An interesting feature here, incidentally, was the emphasis laid on the accentuation of the Communists' industrial effort in Scotland.)

One of the industrial representatives, in describing how effectiveness is built at the factory level ("For the first four months we did not mention politics"), pinpointed the basic dilemma of the British Communist party: its success depends largely upon hiding its identity. The more successful the disguise, the less the credit accruing to the party and the greater its difficulties in gaining new members. This essential frustration was put to the meeting by Mr Pollitt, but was largely ignored by the delegates—in spite of the fact that the party's national organiser and probable next leader, John Gollan, had previously elaborated the problem in the Cominform journal:

Many of our comrades are working as a ginger group in the trade unions and in the broad Labour movement. Comrades can become so involved with work in peace councils, in tenants' committees, shop stewards' committees, etc., that they have no time for work in party organisations. Working in such a way the party will never be expanded. . . . If we staff with our best people every organisation except our own, how can we have anything but problems in the party?

Mr Gollan's analysis of the danger to the party of excessive conspiratorial infiltration may be correct, but apparently he has failed to convince all his colleagues; when Mr J. R. Campbell, editor of the *Daily Worker*, dealt with the elections to the new executive, he refused to make public the names of some 156 nominations on the grounds that many of them hold influential positions in industry.

Icelandic Crack in Nato

MR KHRUSHCHEV's probing finger has opened the first real crack in Nato's solidarity. A resolution passed by the Icelandic parliament, calling for the withdrawal of American forces because of "the easing of international tension since the Geneva conference," accepts virtually the whole thesis of recent Russian propaganda: that the West can safely relax its vigilance because Communist foreign policy has changed. Mr Khrushchev has already tried the same approach on other Nato countries, notably Norway and Turkey. But there is an important difference between the Icelandic resolution and the twice-given Norwegian promise that Norway will not admit allied troops to its territory. Norway, like Denmark, has armed forces of its own which can run bases for Nato and help to deter an attack. Iceland has none, and the evacuation of American forces would leave only the most theoretical kind of link between it and the rest of the alliance. The Icelanders themselves can hardly maintain the present base effectively, since the resolution renounces all "military activities."

Iceland is valuable to Nato in three ways. It is a staging post on the transatlantic supply route; its three radar stations are part of the early warning chain that protects North America; and the airfield at Keflavik, though

equipped only with fighters now, would become an important bomber base if those in Western Europe were overrun. Its loss would be first blood to Moscow in the war of morale against Nato. Perhaps there will be a change of heart in Reykjavik after the general election in June. But the Communists are already arranging an electoral alliance with the left wing of the Labour party and the tiny neutralist "National Defence" group. If this alliance gains ground, the big Progressive party—which broke with the government on the present issue and swung the vote—is likely to be confirmed in its resolution to remove the allied forces. Moreover, Russia has a powerful economic grip on the island. Since the British importers imposed their boycott it has been one of the biggest buyers of Icelandic fish, and it now also provides most of Iceland's fuel oil. Moscow is unlikely to let pass any opportunity to reduce the effective strength of Nato from fourteen to thirteen *pour décourager les autres*.

A Warning from France

MOLLET's interview in *US News and World Report* shows that the differences and discrepancies in western views to which M. Pineau, the French foreign secretary, drew attention on March 2nd have survived the French premier's week-end at Chequers. The words of the communiqué then were true as far as they went. M. Mollet in his latest interview still emphasises French faith in the Atlantic alliance, the imperative need to keep Nato alive, and the absence of any French intention to go it alone. Such general attitudes do not deprive underlying conflicts of opinion of their importance; M. Mollet echoes all the complaints voiced earlier by his foreign secretary. He is worried by Western policy in the Far East as well as in the Arab world, by the manner of distributing foreign aid, and by the permanent American air of mistrust of all Soviet proposals. On the whole, French politicians still seem to think that the Western powers have not yet brought themselves to revise their strategy to match post-Stalinist Russia.

In a key passage of his interview M. Mollet actually goes further than his colleague. M. Pineau took pains at Bonn to dispel the fear that there was anything "heretical" in the French attitude to the reunification of Germany, but on this M. Mollet's latest pronouncement is anything but orthodox. He thinks it was a mistake at the last Geneva conference not to put disarmament at the top of the agenda, since the road to German reunification must lead through disarmament. The Russians may or may not ultimately accept reunification, but it is idle, in his opinion, to ask them to accept a Germany rearmed, united, and in Nato. The fact that the quota for a German army in a disarmament scheme might be lower than under the Paris agreements does not seem to disturb him. The right of a reunited Germany to enter Nato is for him a bargaining point, not a condition *sine qua non*. Above all, the West must show its good will on disarmament.

Mr Khrushchev's immediate approval will not help the French case much. The reason for this French insistence on the need to elaborate a popular policy, however, can be found elsewhere in this interview, when it is argued that France or Italy is more aware than the United States of

the attraction of the Communists' posture as champions of peace. Precisely because their soil is more fertile for Communist propaganda, the French consider themselves more able to judge the popular mood in Europe or the uncommitted countries of Asia. While these differences of view persist, the apparent quiet on the Western front will be periodically disturbed by bombshells from Paris.

The Disarmament Chessboard

As of a once famous egg, parts of the new Soviet disarmament proposals are excellent. Other parts are obscure, and yet others apparently mischievous. The Soviet idea of an international arms inspectorate has moved closer to the original western concept; but it seems that the Russians still want the inspectors' activity restricted to designated "objects of control," which would make their work futile if Communist regimes treated them as they have been treating the neutral supervisors in North Korea. Again, aerial photography by inspectors, so often denounced by Moscow, is mentioned in the new plan, but only as a "possibility" to be examined at some unspecified stage. The proposal to cut defence budgets by 15 per cent is of doubtful value as long as Soviet budgetary methods remain so secretive; the prohibition of nuclear arms in central Europe would prevent the West from staving off a Communist onslaught by using its tactical atomic weapons; and other clauses in the Soviet plan would obviously prejudice the prospects of both West German rearmament and German reunion. Above all, although the plan purports to be comprehensive, it deliberately sets aside the whole question of atomic disarmament.

But the fact that the latest Russian terms are still unsatisfactory is no reason for refusing to discuss them. Only a careful probing can reveal to what extent the Soviet government now genuinely wants some degree of disarmament, and to what extent it may still be seeking merely to gain credit by making superficial concessions, or to widen rifts in the western ranks. In this last respect the new Soviet statement had a novel effect; the western governments' reactions were indeed confused and divided, but the most emphatic criticism came from the French representa-

tive at Lancaster House, not, as is more usual, from the Americans. The Russians, by putting forward an admittedly incomplete programme, seem indeed to have tacitly accepted at least part of the present American argument—that the prime need now is to agree on specific confidence-building steps—as against the Franco-British preference for a comprehensive programme, each stage of which would begin when the completion of the previous stage had been certified. But this strange, if only superficial, readjustment of positions only makes it all the more necessary to examine the new Soviet terms patiently.

Non-Co-operation

TRANSPORT HOUSE has had an unseasonable, though not very serious, rebuff from what is normally a quiescent corner of its rambling empire. The Co-operative party has shown at its Easter conference that while it may have no yearning for Enosis with the Tories, equally it does not want integration with Labour. The Wilson committee recommended last year that Co-operative Societies should affiliate directly with local Labour parties. At the moment the movement plays its part by financing a selected number of Labour and Co-operative candidates—giving them very plush election organisations and full-time agents—and then relies on those of its candidates that are elected to represent its interests in Parliament. Mr Wilson's alternative suggestion was interpreted by the Co-operators as both a threat to their independence and rather a cynical bid to get more money out of them while diminishing their influence. The idea was thrown out, and the party seized the chance of underlining the distinctive place it thinks it should fill in the empire of the left. It sees itself rather like Nehru's India, always ready with advice, yet free to opt out of the more disagreeable responsibilities of its position, such as German rearmament. Its line on such subjects so far removed from the shop counter is set by eager and usually left-wing political amateurs, who are tolerated by the business interests in the movement because they do a lot of unpaid work.

At last week's conference the business side of the movement was clearly uneasy about its failure to affect Labour policy, but the party as a whole showed little sign of abandoning its hunt for the best of both worlds. At the very moment when Labour leaders are rightly growing more cautious about national service, the Co-operative conference swept aside the qualms of its national committee and passed a straight "abolish conscription" motion. The Co-operative party's superficial approach to so many problems outside its own economic interests provides the obvious clue to its lack of political impact. It would carry more weight if it concentrated on the problems of consumers, of which it should have special knowledge. The delegate who feared that the Conservative and Labour parties might team up to nationalise the distribution of coal, bread and milk—to the detriment of Co-operative interests—was being highly fanciful; but neither of the main parties has shown a particularly tender regard for consumers whenever its own main interests are threatened. The defence of consumers is a distinctive role which smaller parties—and especially the Co-operators, if they want to continue to regard themselves as a separate party—could usefully adopt.

More Dangerous than they Think?

MORE than 900,000 members of the Amalgamated Engineering Union had the right to vote in the recent elections for their new president. Just over 2 per cent voted for Mr R. Birch, the Communist candidate; just under 7 per cent voted for one of the other nine candidates; and more than 90 per cent did not bother to vote at all. The result was that Mr Birch headed the poll. By the rules of the union he will now go into a second ballot with the runner-up, Mr W. J. Carron; most industrial commentators seem to be assuming that Mr Carron will now pick up the votes of the other eight non-Communist candidates, so that there is no danger that the presidency—and with it much of the control—over the largest trade union concerned with the defence and export programmes may fall into Communist hands. Quite probably the commentators are right, but it is surprising that they are so unanimous. The key point that seems to have been disregarded is that 2 per cent was a suspiciously low vote for the Communists to run up in a union such as the engineers; one would have guessed that 4 per cent was nearer to their true strength. A little research suggests that Communist tactics at several recent union elections have been to try to get just enough votes on the first ballot to ensure that their candidate will qualify for the run-off, and then to turn out what the papers call “a surprisingly larger vote” at the second ballot when their opponents have been lulled to sleep.

It may seem fantastic to suggest that a union that is almost certainly 95 per cent anti-Communist may yet deliver its leadership into Communist hands by its failure to counter such tactics; but the answer to this charge is to look at the disproportionate strength that the Communists have built up on the AEU executive already. The reason is not that engineers are much more Communist than other people, but that they are called upon to vote much more often. With even district officials subject to election instead of to appointment—under a system whose origins date back to the 1850s, when engineering unionism started on the same wave of ideas and theories about elections as the Chartist movement of 1848—the ordinary AEU member feels that he is asked to get excited about a ballot practically every other month. It is this tediously repetitive “democracy” that leads to such very low polls and that is liable to give the union the sort of leadership that nine-tenths of its members do not want; the danger is the greater when to repetition is added complacency, as it is being added before this crucial run-off for the union’s presidency.

Still Higher Bill of Health

NEXT year’s estimate for the health service reflects the rise in prices during the year just ended. Twelve months ago, the estimate for 1955-56 was £462 million. The new estimate—£501 million—is thus 8½ per cent higher; but in the past year supplementaries, mainly to cover higher salaries and wages and higher prices, had raised the 1955-56 estimate to £478 million. Of the further increase of £23 million in the new year, just over

£3 million is accounted for by the hospitals’ expanded capital programmes. The hospitals are also estimated to need an additional £13½ million for maintenance, including £8 million for their salary and wage bill. Much of this latter increase is explained by higher rates of pay, but it is also estimated that the hospitals were employing about 7,800 more staff at the beginning of the new financial year than on April 1, 1955.

To that extent at least, therefore, there has been a rise in the real cost of the health service as well as in the financial cost. A new service is also being provided in the polio-

HEALTH SERVICE ESTIMATES
(£ mn.; figures rounded off to nearest million)

	1954-55	1955-56		1956-57
		Original	Final	
Net total cost (excl. civil defence)	437	462	478	501
Of which:—				
Advances to hospital boards	311	332	343	359
For maintenance	299	320	330	344
General practitioner service	59	62	62	63
Pharmaceutical service gross cost	54	55	57	59
Less patients’ payments	7	7	8	8
	47	48	50	51
Dental service gross cost	34	36	41	43
Less patients’ payments	8	8	7	8
	26	28	33	35
Ophthalmic service gross cost	14	15	14	14
Less patients’ payments	6	6	6	6
	8	9	8	8

myelitis vaccination scheme, which is estimated to cost about £1,800,000 in the new year. Small increases in the cost of dentists’ and chemists’ bills also represent a bigger demand for treatment rather than higher rates of pay for those providing it. But it is probably true to say that this year the health service as a whole, as mirrored in these estimates, will be costing about the same proportion of the gross national product as in 1955-56. An uncertain factor is the doctors’ claim for more pay. No specific demand has yet been put forward, and no allowance for an increase seems to have been made in the estimates.

Rakosi Clears Rajk

MR RAKOSI’s admission that Laszlo Rajk and his seven co-defendants were the innocent victims of a “framed” trial is as startling in its way as Khrushchev’s revelations about Stalin. The former Hungarian Minister of the Interior was accused of plotting with Marshal Tito to murder Rakosi and other prominent Hungarian Com-

EUROPE IN PERSchweppTIVE

Let us take you to FRANCE, land of mirth, perpetual on-la-la and the omnipresence of the shocking.

If at first you see nothing but respectable civil servants with civil families dressed in Sunday black, turn at once to our Guide Book where you will learn that France is essentially gay. And (avoiding the three English-looking spinsters in tweed coats sitting on the plage under umbrellas) realise that it is essentially and sunnily Gallic as well. If you are tired of finding, from Normandy to Provence, that everyone is a political specialist with a neatly rational political argument, let us tell you all about the inconsequence, informality and irresponsibility of Gallic wit.

For literature and art, know that France is the

capital of mad experiment and the birthplace of ephemeral fads. Take no notice if you find (see inset) an Academy of professors in seven day session over the correct position of an apostrophe.

Look at the simple Worker, drinking solitary at his table a humble pastis or a double pernod before going to work in the morning, and try, if he seems to you a little blank, to look at him in perschweppTive—For here is France of the softly southern slopes whose grape is warming the responsive palate and feeding the mental resilience of the expert in the art of living.

Look quite firmly; because the Guide Book Cannot be Wrong.

Written by Stephen Potter. Designed by George Hain

SCHWEPPEVESCENCE LASTS THE WHOLE DRINK THROUGH

munists, overthrow the Hungarian government with the help of Yugoslav troops and instal himself as a "Titoist premier."

It is over six years since these and other even more improbable charges were laid against Rajk and his associates. But the Hungarian people are not likely to have forgotten that all the defendants pleaded guilty to everything, that their "defence" counsel eagerly stressed the truth of the indictment, and that after three of the accused had been hanged and the rest sent to gaol, Comrade Rakosi was effusively thanked for the vigilance with which he had exposed the traitors. Naturally Rakosi does not now shoulder the blame as six years ago he accepted the praise; he shuffles it on to Peter Gabor, the notorious chief of the Hungarian secret police who two years ago was denounced as the "Hungarian Beria" and packed off to life imprisonment. Few will be seriously deluded; and it is inconceivable that Rakosi would have risked such damaging admissions without strong Soviet pressure.

In Russian eyes, the rehabilitation of Rajk is designed to remove a serious obstacle to the closer Yugoslav-Soviet rapprochement for which Moscow is angling. For there was a ninth man on trial with Rajk—Marshal Tito; and he was more venomously accused than any of the actual defendants. It is also a logical part of the degradation of Stalin; having decided to wipe the Stalinist slate clean, the Russians can hardly leave the satellites out of account. The process will not stop short in Budapest. The Rajk trial was only the first of a series which culminated three years later in Prague with the trial of Slansky and Clementis. Already there are reports that the trial of Traicho Kostov has been declared a mistake; he was put into the dock in Sofia only seven weeks after Rajk, and, unlike him, repudiated parts of his "confession" in court.

It is too soon to tell where all this leads. Will the purgers be purged in the end? It seems unlikely that Moscow deliberately wants to go as far as this, although the dismissal of the Greek Communist secretary-general Zachariades may be a straw in the wind; he replaced General Markos after the latter had become implicated in the "Titoist conspiracy." But the process that has been set in train in eastern Europe is bound to be deeply unsettling; its reactions may not prove controllable.

Indonesian Prospect

THE programme of Indonesia's first elected government wisely lays stress on education and economic planning. President Soekarno, administering the oath of office to members of the parliament elected last September and only now assembled, said last week that Indonesia was entering a phase of "planning and investment," in contrast to the phase of "revolution" from 1945 to 1949 and of "survival" from 1950 to 1955. The new programme tacitly recognises that the success of this planning phase will be partly determined by the extent of foreign technical and economic aid, which, it is stipulated, should be on a commercial basis and without strings.

While the opportunities for British investment in Indonesia are not yet attractive enough, there is no doubt that more could be done than is now contemplated in providing credit facilities for Indonesian purchases of capital equipment in Britain. On a long-term view, indeed, enlightened self-interest counsels that British industry should not neglect

the huge potential market of Indonesia's 80 million people. Purchasing power goes hand in hand with education and rising living standards. Now that English has replaced Dutch as the foreign language taught in Indonesian schools, it is important that facilities for higher education for Indonesians in the United Kingdom should be made easier.

Politically, the outlook in Indonesia is brighter than at one time seemed likely. Until some weeks ago there was some reason to fear that Dr Ali Sastroamidjojo, the dominant figure in the National party (PNI), which topped the poll in the republic's first general elections in September, would be impelled to invite the Communists to collaborate with him in forming a government. He had accepted parliamentary support from the Communists during his last premiership, and indeed had permitted the party to expand its activities and its membership throughout Indonesia. Dr Ali has again assumed the direction of affairs in Jakarta, but there are signs that he has learnt the bitter lesson of collaboration with the extreme Left. At all events, the Communists are in opposition and the two Islamic parties—Masjumi and Nahdatul Ulama—are in the government.

Tight-fisted Trade Unionists

THE Trades Union Congress published last week a survey of *The Finances of Trades Unions*, based on information supplied by 123 unions with nearly 7 million members—85 per cent of the affiliated membership. It points out that while workers' earnings are on the average three times as high as in 1939, union contributions have risen by only about a quarter in the same period. As many as 25 large unions have not increased their contributions since 1939, and some not since 1920. It pays better now to stay a manual worker than to become a district official, and the security of a union post is no longer a draw in these days of full employment. No wonder that one union complains that the quality of district officials has deteriorated. It would be carrying self-criticism too far to say anything about the leaders at the top, but their quality, too, will shortly be affected—if it is not already.

It is ironical that union members, who argue so passionately that their wages should be adjusted to every point's rise of the cost of living, are so vehemently opposed to any similar adjustment in their contributions and to giving a square deal to their own representatives. One result is that reserves amount to only a little over £8 per member—a good deal less than an average week's earnings. The unions, which continually warn the Government that its policies will produce unemployment, are in no state to meet even quite slight recession.

Short Time on the Dole?

SHOULD workers who are on short time get unemployment pay for the day or days on which they are not working? Two conflicting decisions on this question have been given in Coventry by local tribunals of the Ministry of Labour—strangely enough under the same chairman. Three weeks ago the tribunal refused an appeal by the Transport and

General Workers' Union, on behalf of its members at the Standard factory, against a decision of the labour exchange not to pay unemployment benefit. Last week, in contrast, the tribunal allowed a similar appeal by the Amalgamated Engineering Union on behalf of 700 men at the Lockheed Hydraulic Brake Company. Officials of the TGWU say indignantly that the two groups of workers had identical agreements for a guaranteed week, and that in the past the Standard agreement had always been considered to entitle its members on short time to benefit. The tribunal, however, was guided by a recent decision in the Scottish light castings industry. The muddle must now be sorted out by the National Insurance Commissioner, who has been asked to give a decision as soon as possible.

At present the Government's intention to shake out the labour force is defeated in the Midlands by the fact that it pays a man to earn £12 on a four-day week in a motor factory rather than move to another job where he is paid less for five days. The companies, for their part, are naturally anxious to hold on to their labour until it is possible to distinguish a decline in demand from the return of seasonal fluctuations. But it would make rather a nonsense of the policy if men on short-time are wedded the more firmly to their present jobs by being paid by the State for their day off.

Strydom Reaches the Rubicon

SOUTH AFRICA has come to the moral crisis of *apartheid*. The report of the Tomlinson Commission, which has just been published after being in the government's hands for 18 months, will be a test of the Nationalists' political honesty. It shows how difficult and costly it would be to establish genuine *apartheid*—a system in which whites and Bantu would form separate societies, each inhabiting their own regions but enjoying comparable opportunities for improving their standard of life. Development of industry, agriculture and towns in the proposed native zones would call in the first ten years for a capital expenditure of £104 million, virtually all of which would have to come from "European" sources. White men would have to build up the Bantu industries, too, in the early stages at least, and supervise the redistribution of land that will be necessary if the black population is to feed itself. Yet the Tomlinson report expects that by the year 2000 all these measures would have cut the number of Bantu living in "European" areas by only a third, and that they would still outnumber their white neighbours.

The first Nationalist reaction to the report, to judge from *Die Burger's* comments, is non-committal. Mr Strydom and the apologists of *apartheid* face a difficult decision. If they accept the Commission's recommendations they will lay a heavy burden of subsidies on the white population, while at the same time they diminish the supply of cheap Bantu labour for the white sector. But if they ignore the recommendations, then their only proper course will be to drop *apartheid* altogether. The temptation will be to carry out a few of the report's proposals, but to decline the major responsibilities which it imposes, and to leave the majority of the Bantu where they are now—second-class citizens, serving the white man's society but unable to enjoy

most of its benefits. This will be equally indefensible by the National Party's own professed standards, and by those of the outside world.

"The Apple Cart" in Cambodia

THE resignation as prime minister of the ex-king of Cambodia looks like another of the calculated pranks this shrewd politician is so fond of playing. There has always been method in Prince Sihanouk's apparent frivolity. His self-imposed exile in 1953 gave weight to his demand for independence; his abdication in March, 1955, enabled him to go into politics; and his resignation last January enabled him to demonstrate that he was indispensable. This time, he seems to have resigned in what might be called a fit of extreme neutralism.

Left to themselves, the leaders of emancipated Asia tend to be anti-Communist and neutralist; and Prince Sihanouk has been making it quite clear that he wishes to be left politically to himself. When he visited the Philippines in February, he praised his hosts' armed forces; but on his return he announced that Cambodia would not join the South East Asia treaty (Seato), although nobody had suggested that it should. And when he visited Peking last month, he denounced Seato in the strongest terms. Now it is reported that he has resigned because of the unkind things American newspapers have been saying about his Peking visit. Neutralism could go no further.

His visit to China itself need cause little alarm, though the West might have wished that the Prince had been a little more restrained in his praises for Chinese friendship. It can indeed be argued that Prince Sihanouk's visit clarified Cambodian foreign policy in a useful way. Pnom Penh's relations with Peking were bad after the Geneva agreements of 1954 had recognised Cambodian independence. They deteriorated still further last May when the Cambodians accepted American military aid on a very modest scale. Since then Prince Sihanouk's sweeping success in the general election in September has convinced China and its Viet Minh satellite that the royal regime in Cambodia is there to stay, and that relations with it must be "normalised." Cambodia remains firmly anti-Communist on the home front. And, denunciations of Seato notwithstanding, the Cambodians will continue to enjoy its guarantees whether they join it or not, and whether or not they agree to be "protected."

Dr Salazar's Practice

MANY people to whom Portugal has long been known as a corporative state will have been surprised to hear that only now is its Assembly considering a Bill for the setting up of the first corporations. At first sight this seems as odd as the recent creation of a national health service in Sweden, where socialist ministries have been in power for a full generation. In both cases, however, first appearances are misleading. Dr Salazar has preached his corporative theories ever since he became prime minister of Portugal in 1932; but, in putting his theories into

effect, he has shown a pragmatic attitude not universal among professors of economics. Although he passed straight from Coimbra university to a virtually unchallenged position of power, he has chosen, in all that concerns his dearest doctrine, to persuade rather than to impose. One after another, workers' syndicates and employers' guilds have been brought into being in various sectors of industry, agriculture, fishery and commerce. In some cases these organisations have been charged with abusing their power—and in some cases the charges have been justified. But by and large the Portuguese, who had undergone decades of economic anarchy and insecurity before Dr Salazar was called in to end the chaos, have come to recognise the value of his corporative institutions, simply by watching the syndicates and guilds at work.

In the early years of Salazarism ugly symptoms of infection from Mussolini's very different corporative system showed themselves. These have long disappeared, and the hotheads who wanted to see Portugal a totalitarian state have become politically insignificant. The prime minister's aim is the exact contrary; he hopes that the power of the state will be permanently curbed when the syndicates and guilds are finally fused into corporations, one for each branch of economic or professional activity, and the corporations in turn represented in the upper house of parliament. (The present upper house, although known as the Chamber of Corporations, is no more than a makeshift.) A good case can be made out in support of his belief. In some eyes, however, there remains a danger that the corporative structure might be corrupted into an instrument of absolutism by any future head of the government who did not share Dr Salazar's unusual qualities of humility and pragmatism.

Mr Cox and That Box

MR GEOFFREY COX, the editor-designate of Independent Television News, will not be free to take up his duties for another few weeks; but it already seems clear that he is going to inherit a more stable empire than the one Mr Aidan Crawley renounced. This is another proof of the almost inviolable rule that the right sort of leader for a pioneer movement is a man who has enough money to walk out of it as soon as commercial interests start their counter-attack on his ideas. When Mr Crawley resigned in January he urged that the service should be taken over by the Independent Television Authority itself, at least until the main contractors were thoroughly established. This the ITA has declined to do, but Mr Crawley's *démarche* has secured two important results. It has led Sir Kenneth Clark to declare that, in the interests of the balanced programme called for by the Television Act, there should be at least twenty minutes of news a day on each programme; and there is every indication that it has put some of the people who had been nibbling into the news programmes on the embarrassed defensive.

The question remains whether the ITA's refusal to take over the news company—which now seems to be quite definite—is a good or a bad thing. On the whole, it is a good one. The happiest innovation on the television screen in the past six months has been the ITN's ability to do things that the BBC was formerly afraid to

do: to thrust microphones before the faces of Communist delegates going into Battersea Town Hall, and even to hold interviews with Easter brides that would once have been regarded as below radio's dignity. If the news service had now been directly subordinated to an Authority whose operations are constantly questioned in Parliament, much of this staff vitality might have been lost; and the BBC might also have lost some of its new vitality by emulation. The ITN has had plenty of trouble in its diapers stage, but the remedy is not to thrust it from them straight into official corsets.

Leakages Trial in Paris

FRANCE'S biggest political trial for years has made little popular stir. Some of the most important figures of the Fourth Republic have appeared as witnesses in this affair of leakages of military secrets. But it all happened in the past, towards the end of the Indo-Chinese war, and the mass of conflicting detail is bewildering. It is established that proceedings of cabinet meetings dealing with military matters "leaked," probably through the defence secretariat. The head of that body is accused of negligence and two of his assistants of passing on information, possibly from political motives. The mystery is deepest round the fourth accused, the journalist Baranès, on whom the incriminating documents were found. Did this protégé of the former police inspector and present Poujadist deputy, M. Dides, really get the stuff from the Communists? Was he a tool of the police, a double agent, or simply an informer who worked for the highest bidder? After four weeks of heated argument there is no sign of a firm answer.

The political aspect of the case is somewhat clearer. The leakages are not a key to the French disaster (since those at issue occurred after Dien Bien Phu), but a legend to that effect would suit those politicians who for years prepared neither for peace nor for war. Some of the guilty men undoubtedly tried to shift the burden of responsibility on to the prime minister to whom it fell, at Geneva, to liquidate the resulting bankruptcy. M. Mendès-France has proclaimed in the witness box that such whispers of treason reached Allied ears, too, and that when he came to London in the autumn of 1954 some Western colleagues looked suspiciously at a premier supposed to have "Soviet agents" within his own cabinet. The smearing campaign is not over. Indeed, the counsel for Baranès, M. Tixier-Vignancourt, ex-Vichyite and now deputy of the extreme Right, is using this military court as a stage for it, and impartial Frenchmen regretfully admit that he is getting more scope for his antics than any other counsel in the trial.

It may be natural for a military tribunal to show the partisans of war to the bitter end more sympathy than it shows the peacemakers. Yet the affair holds a warning. Algeria is nearer home than Indo-China. What scapegoats will be sought if new blunders are made, what circuses will be needed to justify new sacrifices? Tempers are rising already, suspicion spreads, and the colonists' lobby claims a monopoly of patriotism. If things are allowed to get out of hand, the advocates of a reasonable peace may be scared into silence—or, if they dare to speak up, the chorus of "the Fatherland is in danger" may drown their voices. It is to such a tune that republics are interred.

Letters to the Editor

Divorce by Whose Consent?

SIR—Although your comment on the report of the Royal Commission on Divorce is more intelligent than the report of that commission, it too fails to ask the fundamental question in this matter: "What is the moral basis for public interference in the private lives of individuals in a society which believes in individual freedom?"

The principles on which our present divorce laws are based and which the Royal Commission would perpetuate derive from the old ecclesiastical courts but as such they are as antiquated as the Lord's Day Observance Acts. It is commonly accepted in England today that the state has no right to prescribe the religious beliefs of its citizens; it should follow from this that it has no moral right either to seek to enforce by legislation standards of behaviour based on religious concepts like "the sanctity of holy matrimony." The only valid basis on which a free secular state can interfere in the right of its citizens to unite and part at will is the protection of the interests of innocent parties: in this case, the children of a broken marriage, who are usually the first to suffer. Childless couples should be free to divorce by common consent, with no questions asked by the court except to ascertain that the material interests of both parties are properly safeguarded.

In the case of couples with children under the age of 18 divorce suits should be heard by special courts of psychologists, educators, social workers and similar persons. Their terms of reference should not be whether one parent, both or neither has committed adultery or other "matrimonial offences," but whether the interests of the children and their right to a proper, stable and happy education require the dissolution of their existing home or its continuance even against the wishes of either or both parents. If the break-up of the home is found to have been due to personality defects in one of the parents the court might well withhold from that partner the right to remarry at least until such time as he has been cured of those defects. Such a procedure would not only be fairer to the children of any threatened marriage, but would also tend to inculcate in people a greater sense of the responsibility they are assuming when having children.

Apart from its irrelevance to the main issue which should be considered in a divorce court, there is another reason why the concept of "matrimonial offences" should be eradicated as soon as possible from English law: like capital punishment, it is a gold mine

for the pornographic Sunday press and does more to bring the institution of marriage into disrepute than any rise in the divorce rate could ever do.—Yours faithfully, F. E. LAMOND
London, S.E.9

He Eats Buganda

SIR—It is necessary to revise the incorrect impression given by your special correspondent on February 25th.

The endeavour to make parallel King Charles II's "I care that for parliament" with the Kabaka's conduct towards a new constitution which he signed under oath is not only malicious but a travesty of the facts calculated to mislead your readers. It is unfortunate that your correspondent appears to quote circles in Entebbe, which gives the sad impression that there exists there dissatisfaction over the implementation of the new agreement and constitution which has only found vent through his pen. Closely following this is the indication that the electors in Buganda did not freely make use of their right to appoint such leaders as they knew had the cause of their country at heart.

It is dismal to think that alleged complaints by the Resident about misunderstandings with the Buganda Ministry should find their way to your correspondent before they are released to public scrutiny.

One cannot fail to see the funny side of the suggestion that the Protectorate government can now back-pedal on its own policy solemnly undertaken on October 18th by tightening the financial reins of Buganda.

The unwisdom of mentioning such a controversial subject as the proper distribution of powers of the Protectorate courts is amazing. At one stage your correspondent presumes to speak for the Government, and states that "direct action" and "correctives" in this year of grace would still deter a people whose objective is in fact self-realisation.

The Kabaka's government welcomes criticism, but constructive criticism. It is to be regretted that so ill-intentioned a correspondent should resurrect the old accusation of separatism against the Baganda which was vented against us when the Kabaka was first exiled in November, 1953. He does not even state in what respect separation has been shown. No one is more anxious than the Baganda that the unity of the Protectorate of Uganda should be preserved and enhanced. In fact it was suggested to Her Majesty's Government by the committee which went to London to draft the constitution that a meeting should be called of the representatives of the different African local govern-

THE ECONOMIST, APRIL 7, 1956

ments so that problems which are peculiar to us as Africans and indigenous inhabitants of the Protectorate should be discussed.—Yours faithfully,

MUSA K. PARMA
Mengo, Buganda Information Officer

What's Cooking?

SIR—Your article of March 10th exposes the folly and menace of the egg marketing scheme. It is significant that the farmers' unions are represented at the inquiry by two directors of packing stations, and have called no independent trade experts or economists to support them. It is remarkable too that the Poultry Association of Great Britain and the Eggs and Poultry Association are completely against the scheme so far as it involves an egg trading monopoly.

Your remark that the Government has accepted the scheme may be misunderstood. The Government has gone no further than to agree that the scheme has enough support to be considered, and in the first instance to be the subject of a statutory public inquiry at which objections may be heard. Whether or not the Government may eventually be forced to accept it, will depend both on the results of the inquiry and on the extent to which public opinion can be mobilised against the proposed egg monopoly before it is too late.—Yours faithfully,

E. M. H. LLOYD
Society of Objectors to Compulsory Egg Marketing, W.C.2

Mr Blundell's Agonising Choice

SIR—Kenya settlers may indeed be blind as your correspondent suggests in your issue of March 10th, but they are not so blind that they cannot see a number of factors which have clearly been overlooked by him.

For instance, in expressing his views on the common roll issue he appears to have overlooked the existence of a large and on the whole prosperous Asian community, and to have ignored the obvious implications. I would suggest that the reason why the Africans have not resisted the communal roll principle contained in the recent legislation is more likely to be due to recognition of those implications rather than to the theory advanced by your correspondent.

I do not intend to comment in any detail on your correspondent's representation of the views attributed to the "Majority Group," because modifications to the Lyttelton Plan are now being discussed and I do not wish to prejudice the outcome. All I can say is that in so far as they are accurate, they have been given an unfortunate twist in presentation. Furthermore, I cannot believe that any member of the "group" would have expressed the view that any particular line of action "would quickly bring Britain to her knees." On the other hand it is common knowledge that when the Lyttelton Plan was introduced the Elected Members were faced with the

THE ECONOMIST, APRIL 7, 1956

alternatives of acceptance or suspension of the constitution, mainly on the grounds that the Government at that time could no longer withstand the onslaught of the united European opposition. So it is perhaps unwise to under-rate the European as a force in Kenya politics and it would be correct to say that the members of the "Group" have no intention of so doing.

Lastly I feel bound to say that I find the omission of Mr L. R. Maconochie Welwood's name from the list of Elected Ministers "who have borne the heat and burden of the day" rather remarkable. Not only was he one of the three to be appointed under the Lyttelton Plan, but since last autumn he has been Minister without Portfolio and a member of the War Council. He assumed these duties when the "Emergency" had ceased to be headline news but when it was by no means over, and he has also had to deal with the intractable problems connected with the post emergency period.—Yours faithfully, L. R. BRIGGS
Naro Moru, Kenya

Growing Pains in Bahrain

SIR—May I draw your attention to two points in your article in your issue of March 24th which, in my opinion, do not represent the facts.

First, it is inaccurate and exaggerated to say that "there are eight hundred Bahrainis being educated in Egypt." The fact, according to a very reliable source, is that the number of these Bahrainis does not exceed twenty. In the light of this fact, therefore, any speculation about the potential influence of these few Bahrainis on the political thought in Bahrain—to be inferred from your analysis—would be out of place.

Secondly, it is misleading to describe the national movement in Bahrain as "anti-British." It is merely a struggle for a democratic government which has been, perhaps unwisely, denied and obstructed by an autocratic British adviser, Sir Charles Belgrave, who has been looked upon as having exercised unlimited arbitrary powers. On the other hand, I believe that the protection of Bahrain by Britain against what you called the "absorption either by Saudi Arabia or by Iran" is not of any importance in this respect. This is because, so far as Saudi Arabia is concerned, the two ruling families of Bahrain and Saudi Arabia are on friendly terms. As for Iran, its claim to Bahrain is imaginary for two reasons. First, there are no international grounds supporting Iran's potential attack on Bahrain. Secondly, Iran's case in Bahrain, which is predominantly populated by Arabs, is without any support.—Yours faithfully,

M. HUSSAINI
London School of Economics, W.C.2

[The source for the figure given was a broadcast from Cairo on March 13th, when Abd al-Aziz Shemlan, a member of Bahrain's Higher Executive Organisation, was heard to say that 800 Bahrainis were attending schools in Egypt preparatory to entering Egyptian universities.—Editor.]

Books & Publications

The American Political Tradition

THE DECLINE OF AMERICAN LIBERALISM.

By Arthur A. Ekirch, Jr.
Longmans. 414 pages. 42s.

CONSERVATISM IN AMERICA.

By Clinton Rossiter.
Heinemann. 340 pages. 21s.

HOW liberal is America? asks Mr Ekirch. More important, how conservative is it? answers Mr Rossiter. The argument is raging along the whole American intellectual battle-front at the moment. These volumes are only the latest in a series of literary sorties of which there are obviously many more to come. Together, they represent ground gained for the conservatives. Some allowance has to be made for the shifting terrain itself, the soft soil of definition which so often gives way beneath the combatants' feet and reveals that they have been trying to advance their theses by an imprecise use of terms. This is particularly true of Mr Ekirch, whose re-examination of the record of American liberalism suffers badly from his failure to state exactly what he understands liberalism to mean. Mr Rossiter is considerably more careful; if he occasionally surprises us by statements such as "the liberal cannot challenge the conservative's peculiar claim to the preference for liberty over equality," at least we can be sure that he has made them with his eyes open. Unlike some American political theorists, Mr Rossiter treats language with scrupulous respect. With affection too; as a result his book, though vilely printed, is a joy to read.

Mr Ekirch's object is little less than to roll back the orthodox interpretation of American history, to refute the view that it has been a liberal evolution, a march of democratic progress. He is not content to settle for the current hypothesis of the disappointed Left, that the evident neglect of liberal values in contemporary America is a passing phenomenon. He sees it as nothing less than the culmination of a process which has been in operation from the moment the ink dried on the Declaration of Independence. The Jeffersonians lost the first great fight for the liberal dream, the Jacksonians won theirs but only at the price of costly concessions to the planter and the mob. The Civil War left behind a permanent legacy of illiberalism, which the Gilded Age invested at a handsome rate of interest. Populists and progressives perverted the liberal faith they professed. The two cold wars exalted military above humane values. The New Deal and its successors substituted the ideals of security

and equality for freedom and diversity.

It is a formidable indictment, and Mr Ekirch marshals a large body of evidence for it—enough to make his book stimulating and rewarding reading. But he lacks the qualities of synthesis necessary to make his indictment stick. It is not hard to itemise the elements of illiberalism in the American story. But the need is to produce some answers to key questions. Why, for example, did the alienation of the liberals from the Republican party of the twenties become so total? Why did the New Deal get involved in such illiberal contradictions of means and ends?

Paradoxically Mr Rossiter's book, though not intended primarily as a history, comes much nearer to giving us the clues to these and similar problems. This is because the author has a clear-cut apparatus at his disposal—a bit too clear-cut the historian may complain—but at least one which enables him to establish distinctions, to trace cause and effect, to make some worthwhile judgments—of both morality and expediency. Mr Rossiter's greatest difficulty is, of course, to establish that conservatism is not un-American. For this he has partly (and frankly) to rely on the paradox that the American "political tradition is so conservative about liberalism that it has made liberalism . . . a national faith." But beyond this he shows that there is an American Right which has some, though not all, of the attributes of conservatism and can lay claim to a respectable share of the American political patrimony. What it lacks is a sense of responsibility, a genuine self-confidence, or a twentieth-century programme.

Mr Rossiter is too good a conservative himself to presume to cover this nakedness by reach-me-down garments from his own intellectual wardrobe, but his sharp and honest book should at least convince some of the Emperors that the time has come to get themselves some real clothes.

Tory Father Figure?

MY FATHER: The True Story.

By A. W. Baldwin.

Allen and Unwin. 360 pages. 25s.

ALIVE and in power, Baldwin was an enigma to his contemporaries. To the Conservative rank-and-file he was a kind of "father figure," dedicated to the comfortable ideal of safety first. Others, nearer to him, often wondered uneasily whether the figure was not stuffed. His lack of response to great challenges, his unwillingness to appear possessed of original ideas, his dislike

of modern methods of communication, all suggested a dullness which was misleading. Yet he had shown unmistakable marks of greatness, and in that collection of moving and beautifully constructed speeches, which is published but now too little read, future generations of Tories may find as much to instruct them as in the speeches and writings of Disraeli.

To many of the present generation Baldwin, dead and discredited, is no enigma at all. How the hatred and disillusionment of panic-stricken people recoiled on him when he was nearing death is horrifyingly described in his son's book. The myth of his duplicity over rearmament at the 1935 election is still widely prevalent. Given immense publicity by Sir Winston Churchill in a passage lacking generosity as well as comprehension, it was revived in Mr G. M. Young's disappointing biography even after it had been utterly rejected by historians who had carefully analysed the evidence. To many people Baldwin is still the politician who "put party before country," whose "lips were sealed" because he was ashamed of the truth, who bought an election victory at the cost of young men's lives in war.

In twenty years from now, a definitive biography can perhaps be written which will establish Baldwin's proper place in history. His son's book does not—and is not intended to—do that; nevertheless, it has provided important foundation material for a later work. Its greatest value is not that it refutes most of Mr Young's errors and misconceptions, for others have done this, but that it provides an invaluable and utterly convincing portrait of Baldwin as a man, together with the family and industrial environment which made him. Apart from an occasional floridity of style, it is a pleasant book to read.

There are two important gaps in the story. This book, of all those about Baldwin, should have given us some clue to the riddle of his extraordinary abdication of leadership between 1930 and 1935. Mr Young attributed it largely to indolence, but this is not wholly convincing. The second omission may be deliberate. But it is essential, in order to appreciate Baldwin's achievement, to emphasise the value and the success of his patient struggle after 1926 to improve industrial relations and to narrow the chasm between Left and Right.

Magyar Antagonists

MEMOIRS.
By Nicholas Horthy, Regent of Hungary.
Hutchinson. 268 pages. 25s.
MEMOIRS OF MICHAEL KÁROLYI:
Faith Without Illusion.
Cape. 392 pages. 35s.

IN these two books the Pope and the Grand Heretic of Hungarian nationalism confront one another, the conformist and the nonconformist. Horthy's original German version has been somewhat diluted, with regard to Károlyi, in the English translation, but the confrontation remains a bitter one. Károlyi accuses Horthy of handing over

the Austro-Hungarian Navy to the Southern Slavs on October 31, 1918, as if the Emperor had not commanded him to do so by his signal of October 28th. Károlyi also asserts that Horthy was the first to declare the non-existence of the monarchy in a protocol referring to "the people of the formerly existing Austro-Hungarian monarchy"; Horthy himself translates the text of the protocol as "the nations hitherto comprising" the monarchy. A few pages later Horthy repeats a traditional indictment of Károlyi: that on March 21, 1919, he "turned 'to the world proletariat for justice and help' resigned from office, and relinquished power 'to the proletariat of the Hungarian peoples.'" Károlyi himself shows how he was cheated into this situation, which he would never have created willingly.

So much for the recriminations of Magyar political antagonists. Horthy's book is smooth with official commonplaces: it is unremarkable, but not uninteresting nor deliberately dishonest. It therefore has its value as a historical document compiled from the seat of authority. Moreover, it expresses the point of view of the class which ruled Hungary until 1944.

Of that class Michael Károlyi was the *enfant terrible* who rejected both its privileges and its slogans. The lord of huge estates in northern Hungary, already in 1919 he gave away his lands to his peasants. For this he repudiates the glory—"it being no sacrifice on my part, as I had no developed sense of property. This is more natural to the bourgeoisie, which had accumulated its possessions by its own efforts. But even amongst my own class I was known for feeling no attachment towards my possessions, and therefore my so-called generosity was no merit of mine." He goes on later to assert that if the rest of the Hungarian nobility had been more benevolent, Hungary might have escaped the Communist regime of today.

Károlyi's belief in a Danubian federation is more convincing. For he discarded the Slavophobia of his compatriots, and, even before the end of the first world war, he desired Hungary to free itself from the bonds that bound it to the two German empires. Instead he believed that Hungary should seek reconciliation with the Slav nationalities within and beyond its prewar frontiers, and enter into a Central European federation of democracies. This was certainly a less sterile policy than the uncompromising revisionism pursued by the representatives of the Horthy regime.

Károlyi's heresy condemned him to long years of exile, which were cruel in many ways, but which stimulated his lively mind. One of his most interesting exploits, most interestingly described here, was his visit with a group of French journalists to Russia in 1931. This was still Lenin's rather than Stalin's Russia, and much that he saw he felt to be encouraging. For Stalinism a man so critical, so humane, so genuinely Socialist, could have little sympathy. Before the trial of Rajk heralded the completion of Stalinist oppression in

THE ECONOMIST, APRIL 7, 1956

Hungary Károlyi served the Hungarian Republic as Minister in Paris. But he admired Tito and would have liked Hungary to follow his example; when this hope was defeated he was bound to set out on his travels again.

Contemporary Chronicles

SURVEY OF INTERNATIONAL AFFAIRS, 1953.

By Peter Calvocoressi. Assisted by Coral Bell.

DOCUMENTS ON INTERNATIONAL AFFAIRS, 1953.

Selected and edited by Denise Folliot.
Oxford University Press for The Royal Institute of International Affairs. 408 and 534 pages. 48s. and 57s. 6d. respectively.

THE Chatham House annual surveys, though often very useful, are seldom easy to read. This is not necessarily the fault of the authors, but rather of the necessary lack of form of their material. Nineteen-fifty-three at least got off to a dramatic start: "Marshal Stalin died in Moscow at ten minutes to ten in the evening of March 5th" is the first sentence of this book, and the most interesting, as well as the most controversial, section of the volume is the one that goes on to analyse the effects of this event. Much of the time, however, the writers of the survey have to content themselves with sentences like "1953 was an inconclusive year in Latin America. By December 31st no peaks or abysses had been reached."

Nevertheless, Mr Calvocoressi has done extremely well within the limits imposed on him by Chatham House. He writes clearly, has an immense range of detailed knowledge and a balanced judgment. He has also tried to overcome some of the disadvantages inherent in the form of the Annual Survey; thus he has a most interesting section on France's internal problems, which deals with far more than just the events of 1953. Mr F. C. Jones has again written the section on the Far East, including a good account of the achievement of the armistice in Korea. There is also an excellent section on Latin America by Mr George Pendle; it reminds the reader how much of the world does not easily fall into the pattern of the cold war, which contemporary historians, like American diplomats, sometimes vainly try to impose on it.

The accompanying volume of documents maintains the standard of scholarship set by its predecessors, and this series is one of the most useful things that Chatham House produces. During the past year the publication of the monthly chronology of international events has had to be stopped. Perhaps it might be possible to replace this by some form of chronology in the volumes of documents.

This is the last volume of the survey for which Mr Calvocoressi will be responsible. One of his greatest merits has been that he has been unpretentious; there are no purple patches and no far-fetched parallels imposed on his plain chronicle. But each year raises again the question of whether this somewhat

TIME—The Weekly Newsmagazine, Time & Life Building, New Bond Street, London, W. 1.

Burma fights disease with clean water

Wiping out typhoid, dysentery and cholera epidemics caused through water taken from disease-ridden rivers is a major aim of Burma's three-year public health plan. To give remote jungle villages a plentiful supply of fresh, uncontaminated drinking water, Burma is drilling as many as 6,000 deep wells. Nearly six hundred of these wells have now been drilled. And it is compressed air that is bringing the water gushing upwards. A number of Atlas Copco portable air compressors are touring Burmese villages pumping newly-bored wells until completely clear water is raised to the surface; water that is aiding the health of a nation.

Solving a pressing problem

Compressed air is versatile. Atlas Copco provide the means for all its many applications—from fighting disease in Burma to operating pneumatic cheese presses in dairies. These are driven by Atlas Copco air compressors which have helped to create a method of pressing cheese that is smoother, faster and more precise than with the old hand-operated machines.

Atlas Copco puts compressed air to work for the world

Atlas Copco compressed air equipment is manufactured or sold and serviced in 50 countries throughout the world by The Atlas Copco Group, which includes:

UNITED KINGDOM: Atlas Copco (Great Britain) Ltd., Beresford Avenue, Wembley, Middlesex; SWEDEN: Tryckluft AB Atlas Copco, Stockholm 1; NORWAY: Atlas Copco A/S, Postboks 94, Oslo; DENMARK: Atlas Copco A/S (C.K. Alling A/S), Puggaardsgade 4, Copenhagen V; GERMANY: Deutsche Atlas Copco GmbH, Postfach Nr. 3, Essen-Kupferdreh; HOLLAND: Atlas Copco Holland N.V., P.O. Box 6056, Rotterdam; BELGIUM: Atlas Copco Belgique S.A., 46, Chaussée d'Anvers,

BRUSSELS; FRANCE: Atlas Copco France S.A., 29, Rue Marbeuf, Paris 8e; ITALY: Atlas Copco Italia S.p.A., Viale Marche 15, Milan; TURKEY: Atlas Copco Ticaret ve Sanayi T.A.S., P.O. Box 490—Galata, Istanbul; SOUTH AFRICA: Delfos & Atlas Copco (Pty.) Ltd., P.O. Box 504, Benoni, Transvaal; AUSTRALIA: Atlas Copco Australia Pty. Ltd., P.O. Box 54, Auburn, N.S.W.; NEW ZEALAND: Atlas Copco (N.Z.) Ltd., Huddart Parker Building, Wellington, C.I.; CANADA: Atlas Copco Canada Ltd., Montreal, A.M.F., P.Q.; U.S.A.: Atlas Copco Eastern, Inc., P.O. Box 2568, Paterson 25, N.J.; Atlas Copco Pacific, Inc., 930 Brittan Avenue, San Carlos, California.

mechanical process is the best way to deal with contemporary history, and whether the subject of volumes such as these should not be topics rather than years. It is to be hoped that the new Director of Studies at Chatham House, Professor Barraclough, a recent recruit to the field of contemporary history from that of the Middle Ages, will attempt to change the nature of these publications. One minor reform at least is overdue: the abandonment of the affectation which inflicts on us words like 'Iraq' or 'Marrakush' instead of their usual English equivalents.

The Cheap Money Era

THE MECHANISM OF CHEAP MONEY.

By Edward Nevin.
University of Wales Press. 350 pages. 25s.

MR NEVIN sets out to explain what happened, and why, in the cheap money era of the nineteen-thirties. His account of this phase in Britain's economic and financial history is necessarily technical to some degree, but it is not unduly so, and the book is perhaps less forbidding than its title.

He starts by stating a strong case against the possibility of any lasting restoration of the international gold standard in the changed world of the 1920s and 1930s. This is followed by an account of the emergence of the cheap money policy after the 1931 crisis—the rise in gilt-edged (which he attributes to a change in the liquidity preference of the public), accompanied by a falling Bank rate as an aid to foreign exchange policy, and finally the conversion of War Loan from a 5 per cent to a 3½ per cent basis, with its consequent budgetary economies. At this point a split appears in the contemporary thinking about cheap money, some seeing it as an indispensable requirement for economic recovery, while others more immediately concerned with its operation appear to have held a position of benevolent neutrality. Such a division is not surprising, in view of the loss of the gold standard criteria for monetary policy and the lack of any clear alternative policy; it showed itself in the Treasury Bill famine of 1933-35 and 1938 and in the significant rise in interest rates after 1936. Mr Nevin deals at some length with the liquidity practices of the banking system through which the bill famine made itself felt, and with the control of the gilt-edged market by the authorities through their manipulation of the public debt holdings of the Departments. He gives good reasons for agreeing with those who believe that the most important source of control was the use of the holdings of the Bank of England's issue department.

The most interesting part of this book is Mr Nevin's view of the channels through which cheap money affected the working of the British economy in this period, when some of the sectors investing in long-term fixed capital (the electricity industry and the railways, for example), which should be most sensitive to interest rate changes, had already

lost a good deal of their sensitivity owing to the strong influence of public policy. In his view the chief effects were realised through the reduction in the interest burden on the national debt and hence the incomes of its holders; this put pressure on certain institutions to pursue more adventurous and remunerative investment policies—for example, insurance companies moved further into equity and preference shares and building societies followed easier lending policies primarily through lower initial deposits and longer loan periods.

Thus the fall in interest rates made more capital available for fixed capital investment, and it is this greater availability of capital rather than its lower cost which Mr Nevin sees as the chief factor behind the rise in investment in these years, although in the important field of housing the lower interest rate did undoubtedly have a considerable direct effect also. The last chapter goes some way in linking Mr Nevin's findings for the 1930s with the current problems of monetary policy—the questions of the role credit rationing has to play, of who should operate it and of the pressures that should regulate the degree to which it operates. The book is well produced, well documented and well written.

Spooks and Spoof

THE HAUNTING OF BORLEY RECTORY.

By Eric J. Dingwall, Kathleen M. Goldney and Trevor H. Hall.
Society of Psychical Research. Duckworth, 195 pages. 16s.

WHEN the Reverend G. Eric Smith, in June, 1929, decided that the uncomfortable reputation of his rectory called for expert investigation, and, at a loss for expert contacts, appealed for information to the *Daily Mirror*, he started something much bigger than he expected. Borley Rectory rocketed into world-wide fame; Mr Harry Price made his fortune; headless men, phantom coaches, two nuns (one medieval, one eighteenth-century French) and innumerable poltergeists enlivened not merely the popular press but some surprisingly staid weeklies over a period of twenty-five years—continuing to produce an impact even after the "most Haunted House" had been burned down and finally demolished.

It was a wonderful story. It still is. The record of cumulative suggestion, embroidery, misinterpretation, practical joking and downright fraud, painstakingly analysed by the authors of this book, is as good in its own way as the ghost story itself. The Borley ghosts were, on the most favourable interpretation, poor creatures. They threw bricks and pebbles, shifted paint-pots and coal-bags, scribbled incoherent pencil messages on walls, rang bells, produced smells of lavender and of cookery, broke a certain amount of crockery, materialised from thin air such varied objects as a First Communion medal, an old serge jacket and a dead frog, and (in general only audibly, but from time to time visibly) walked. Apart from giving the

British public something to think about during the 1930s besides Hitler, and providing Mr Harry Price with a lucrative subject for books and lectures, they achieved nothing whether for good or for ill—unless, indeed, one counts the eventual burial in consecrated ground of some bones discovered, after a succession of hints by planchette and wall-scribbles, under a cellar floor. (The authors have their own ideas about when, how, and by whose agency, the bones got to where they were found.) The after-life, on the ghosts' showing, must be a footling business. But the build-up of the legend and the psychology of the witnesses is a much more interesting affair; and the authors' level-headed and patient unravelling of incident after incident, discrepancy after discrepancy, does the subject full justice.

Entertaining as their book is, it leaves a slightly nasty taste in the mouth. Not because the late Harry Price emerges unmistakably as a rogue, a falsifier and manufacturer of evidence; not because certain other persons, with motives less material, though understandable enough, faked a bigger volume of evidence than he did; but because the whole long drawn-out Borley episode at once constituted and demonstrated a debasement of popular opinion and thought. Everything that was shoddy, muzzy, slipshod, and anti-rational in the public mind responded to, and thrived on, the Borley sensation. It will take more than this antidote to counter so massive and thoroughly assimilated a dose of dope.

Shorter Notices

THE SHOCK OF RECOGNITION.

Edited by Edmund Wilson.
W. H. Allen. 1,307 pages. 45s.

This is the first time that Mr Edmund Wilson's brilliant collection of documents on American literature is made available in England, although the book was first published in a somewhat smaller version in 1943. Ranging from Lowell's essay on Poe in 1845, to letters of Sherwood Anderson in the 1930s, this anthology—which contains complete texts—presents a history of American literature written by those who created that literature or were personally associated with its development. It is a pity that Mr Wilson has not included some essays by Mr Trilling or himself rather than perpetuate Bayard Taylor's dull "Echo Club" or Amy Lowell's "Critical Fable."

EDUCATION BOOK GUIDE: 1956 Edition.

Compiled by the National Book League.
Councils and Education Press Ltd. 116 pages. 12s. 6d.

This is the first issue of what is intended to be an annual publication listing, with full details and price and a brief description, all the books published in 1955 which are thought to be of use to schools. It is a comprehensive, not a critical guide, and the books are indexed under their subject matter. It should be an extremely useful publication and it is to be hoped that it will lead to the early burial of some of the bewildered textbooks that are still in use in the schools.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Democrats in Doubt

Washington, D.C.

UNDERNEATH the excitement of the present series of primary elections, the factors which will really determine who obtains the Democratic presidential nomination are beginning to emerge. There are three of them: how much support the various candidates have among the voters generally; how much support they have within the party organisation; and the course of the controversy over racial segregation. The way these three interact on one another will govern the final decision when the Democratic National Convention meets at Chicago in August to choose the man to run against President Eisenhower.

As a result of his victories in elections already held, and his likely victories in at least some of those still ahead, the balance of popular support will lie principally on the side of Senator Estes Kefauver, of Tennessee. Officials of the national party organisation, as things stand at present, are expected to put their weight chiefly on the side of Mr Adlai Stevenson, the presidential nominee in 1952. But all candidates will feel the effect of whatever position the party takes in the end on the question of racial segregation in publicly financed schools. If the official platform endorses a vigorous enforcement of the Supreme Court's ruling against segregation, the party will in effect have decided to try to win the election in the North, and to leave the South to go its own way, even if this means a third party as it did in 1948. That decision would favour the nomination of Governor Averell Harriman, of New York, a long-standing advocate of racial integration. Expert politicians dismiss the newspaper talk of "dark horse" candidates such as Senator Stuart Symington, of Missouri, Senator Lyndon Johnson of Texas, and Governor Frank Lausche, of Ohio, with the comment that "the type appears to be a vanishing one."

Senator Kefauver has behind him his victories in the primary in New Hampshire, where Mr Stevenson was not a direct contender on the Democratic ballot, and in Minnesota, where he and Mr Stevenson met head-on. He is now picking up strength in elections in other states—Wisconsin among them—where Mr Stevenson is not entered; and Mr Stevenson is trying to collect some similar victories, in Illinois, for example. They meet again in Florida on May 29th for an important test, and round off their series in California on June 5th in what may be a make-or-break event for Mr Stevenson.

The primary elections, which by any logical standard are a most unsatisfactory reflection of voting opinion, have given Mr Stevenson a vexing problem. They are held in only 17 out of the 48 states; elsewhere the delegates are

appointed in various ways. The rules in each primary are different, but the general purpose is to enable the voters to express their preference among their party's presidential possibilities and to choose delegates to their party's nominating convention. If Mr Kefauver swept all the primaries he has entered (about a dozen) he would collect the votes of only about 275 delegates, while at the Democratic convention, 687 votes, one more than half the total voting strength, are needed for nomination. But a winner in the primaries gains the reputation of being attractive to the voters, while a loser looks like a poor contender against the mass appeal of Mr Eisenhower. The politicians attach great importance to this. So, if Mr Stevenson's support among the party leaders is not to be undermined, he has no choice but to engage Mr Kefauver in the primaries.

In Minnesota, Mr Stevenson tried to do this with one hand, showing his distaste for the contest. Apart from again arguing that farm prices should be supported by the government at high, fixed levels, he offered nothing. He made few opportunities for rubbing elbows with voters, and scamped the opportunities he had. Senator Kefauver shook hands with tens of thousands of people, and advocated even higher farm supports. He gave the illusion, at least, of being ready and willing to do something about every single problem the voters have.

But the flood of votes for Mr Kefauver in Minnesota came from a mixture of sources. Some Republican farmers were protesting against existing agricultural policies. Some Republican voters wanted to embarrass the local Democratic leaders, and some to check Mr Stevenson, who seemed to be the foremost Democratic candidate. If the primary had been restricted to Democrats, with no Republicans allowed to vote in it, Mr Stevenson might have defeated Mr Kefauver. As it was, Mr Kefauver can persuasively claim to have shown great popular appeal. Heeding the warning, Mr Stevenson, on a preliminary visit to California soon after, strolled the streets shaking hands, but his rather transparent imitation did not wholly come off.

In Wisconsin this week Senator Kefauver maintained his vote-getting record but not without blemish. He was unopposed in the Democratic primary and in the Republican. President Eisenhower had no serious opposition. The two elections therefore pitted Mr Kefauver against the President in a popularity test. The President got better than 55 per cent of the total vote cast in the two primaries, compared

with the 61 per cent of the total vote which he won in Wisconsin in the actual election contest against Mr Stevenson in 1952. It is also significant that the Republican vote showed a startling drop in three farm districts, one rich one in southwest Wisconsin and two poor ones in the northwest. But Mr Kefauver showed surprising weakness in the big city, Milwaukee, where the Republican share of the vote leaped upward. This is attributed to the President's personal popularity, and his appeal for the wives of working men as well as for the rank and file of the labour movement. To some Republicans it also meant that trade unionists refused to follow their leaders in opposing the President.

Mr Stevenson's solid strength centres round a dozen Democratic Governors, each of whom heads his party in his state. If each could guarantee his whole state delegation, Mr Stevenson could count on about 400 delegates; but it is here that wavering develops when Mr Kefauver wins primaries. The Governors then have to fight even to keep their delegations "uncommitted," to prevent them from deserting Mr Stevenson altogether. This uncertainty is found on an even larger scale among the hundreds of delegates not yet pledged to either Mr Stevenson or Mr Kefauver.

If Mr Stevenson can win both the Florida and California primaries, or perhaps only the California one, he can still look strong enough as a presidential candidate to attract the uncommitted delegations. If Mr Kefauver wins, it will be hard for the convention, with the whole country watching on its television screens, to deny him the nomination. The party leaders are nevertheless determined to do so. To them, he is guilty of putting his presidential ambitions above the party wellbeing. The Southerners flatly reject him, a Tennesseean, as a renegade who backs the Supreme Court on racial integration. From Mr Kefauver, the convention would turn first to Mr Stevenson. But if he had consistently failed in primaries, it would look further for "someone to win with." It would find Governor Harriman in battle position, bulwarked by New York's huge delegation, with concealed reserves elsewhere.

What happens at such a moment may well depend on the segregation issue. If all or most of the southern delegates have stayed put, the convention will reject Governor Harriman, who believes that the schools should be integrated speedily and with maximum encouragement from the federal government. In these circumstances, the convention would probably come back to Mr Stevenson, since he offers the best hope of unifying the party. But if the Southerners have been driven out by the segregation argument, Governor Harriman would realise the benefits of his calculated extremism.

Small Summit

WHEN he invited President Ruiz Cortines of Mexico and Mr Louis St Laurent, Prime Minister of Canada, to meet him for an informal, neighbourly conference in the last week of March, President Eisenhower was clearly bent on disproving Sir Harold Nicolson's dictum that diplomacy "should be a disagreeable business." He was also demonstrating that his special formula of good golf, warm smiles,

excellent dinners and discourses by Mr Dulles could create a general air of achievement and convince the average American that a gentleman squire with a dispensation from long hours at the White House could nevertheless play an active role in world affairs. Mr St Laurent and President Ruiz Cortines—who speaks no English and appears to have been somewhat puzzled by the whole affair—obviously enjoyed their stay at one of America's most distinguished holiday resorts. On leaving, the Prime Minister said: "It has been extremely nice." But not even the keenest-eyed among Washington reporters have discovered just what was accomplished on the little summit in West Virginia, where there was no agenda and no communique.

There are important problems in American-Canadian relations. Canada is restive in the face of the continually increasing role of American capital in its economic life. Ottawa has long been worried lest the disposal of American agricultural surpluses imperil Canada's traditional export markets. On both sides of the border short-sighted protectionism is making itself heard: Canada is planning to impose a heavy tax on the advertising revenue of American magazines appearing in Canadian editions; and, in the State of Maryland, American brewers are trying to prevent a firm under Canadian control from setting up a new brewery. American and Canadian hydro-electric and fishing interests are at odds over the best use of the waters of the Columbia and other rivers. But the only concrete point to have emerged from the meeting is a re-affirmation of the sharp disagreement between the two countries over the recognition of Communist China and its admission to the United Nations.

The conversations with Mexico appear to have touched vaguely on problems of migration and air traffic, the sale of surplus cotton and the availability of credit. The Mexican Foreign Minister brought with him a copy of Mr Eisenhower's book, "Crusade in Europe," and obtained the author's autograph. Apparently no commitments were made, either in the two-sided conversations or in the general talks on world affairs. But the whole conference may, in its way, have been a rehearsal for a more important exercise in diplomacy without tails—Mr Nehru's visit in July.

Communists in the Red

THE strength of the Communist party of America has declined from 60,000 members in 1949 to some 20,000 in 1956, and the *Daily Worker* sells only 9,000 copies today compared with 14,000 in 1951. It has also been having a most embarrassing time trying to explain the latest attacks on the memory of Stalin. Last week, however, both the party and its newspaper received spectacular assistance from a somewhat unexpected quarter—the Internal Revenue Service. Agents occupied party and editorial premises in New York, Los Angeles, San Francisco, Chicago and Philadelphia. The Communists were accused of failing to pay income taxes and of refusing to co-operate with the Treasury by allowing access to their financial records. The immediate results of this seizure were a dramatic increase in the sales of the *Daily Worker*—whose editorial staff moved in with a sympathetic Yiddish daily—good publicity for the party, protests from some of

America's foremost newspapers and defenders of civil liberties at this threat to the freedom of the press, and disconcerted admissions by the Internal Revenue Service that its senior officials in Washington had been as surprised by the whole affair as the Communists themselves.

The motives of Mr Donald Moysey, the recently appointed Director of Internal Revenue for the Lower Manhattan District, and the legal basis of his action are rather obscure. Claims and counter-claims are now loud and it looks as if the government will be in for long and costly litigation. The *Daily Worker* contends that it has continually operated in the red and is, therefore, not liable to income tax, and the Communist party can argue that other political parties do not pay tax on the ground that they are non-profit organisations financed by individual contributions. The government, on the other hand, can claim that it cannot accept these arguments without seeing the books. These seem to be the real target of Mr Moysey's agents. They have impounded lists of subscribers to the *Daily Worker* and records of donations to the party, and government microfilm units work swiftly.

American fellow-travellers, and many liberals as well, may remember last week as a black one. For in addition to Mr Moysey's action—which proved a boon to Soviet propaganda—the government decided to bring numerous minor Communists to trial. But what will dismay them most is the Supreme Court's decision upholding the validity of the Immunity Act passed by Congress in 1954. This provides that in matters affecting national security a witness can be compelled to answer all questions if he is guaranteed immunity from any criminal prosecution arising out of his testimony. In effect, this means that a witness can no longer invoke the famous Fifth Amendment, which protects a man against self-incrimination, if the court decides that his testimony about himself or his associates is worth more than the chance of convicting him. In their strong dissent, Justices Douglas and Black argued that a witness could be made immune from criminal prosecution but not from social infamy, loss of employment and denial of civil rights: the "right of silence," they said, must be beyond the reach of government. But in their narrow interpretation of the law, the majority of the Supreme Court have probably expressed public sentiment as well as providing the Department of Justice with a powerful weapon against some of the 200,000 Americans who, according to the head of the Federal Bureau of Investigation, continue to aid "the Communist conspiracy."

Battle Secrets

IN the Senate the immediate threat to this year's foreign aid programme comes from a constitutional controversy, arising indirectly out of the Administration's willingness to let its European allies increase their trade with the Soviet Union and thus reduce their need for foreign aid. When in February it became clear, after Sir Anthony Eden's visit to Washington, that the embargo on trade with Communist China was likely to be relaxed, the Senate's Permanent Investigations Subcommittee at once attempted to frustrate this proposal. It opened an inquiry into the earlier easing, in 1954, of restrictions on trade with Russia, designed to

THE ECONOMIST, APRIL 7, 1956

show that this had resulted in strategic supplies being delivered to the Soviet Union by countries receiving American aid; this is illegal under the so-called Battle Act. The allegations concentrated on British shipments of copper wire and metal-working machinery which, it was argued, were potentially of military value.

Soon, however, the committee ran head on into the Administration's refusal to give details, in public session, of the 1954 negotiations and of the changes made in the controls. Then came weeks of hearings, during which leading officials firmly repeated this refusal and leading Senators, including several who usually take a liberal attitude towards other countries, refused in their turn to support the foreign aid programme unless they were given the details they wanted. Just before Easter, however, the committee withdrew and agreed to receive the information in secret session, as other committees had previously done. But to this one member, Senator McCarthy, objected, and for this reason the committee decided that it could not guarantee that the documents would be kept secret. The deadlock therefore continued.

At the root of the argument lies the constitutional separation of powers, the right of the executive to deny legislators access to its day-to-day activities. But there are practical reasons for the denial in this particular case: the details of the 1954 negotiations show that there were disagreements among government officials on the extent of the relaxations; publication of the papers would give the Russians information about allied deficiencies and about allied knowledge of Soviet difficulties; finally, these trade controls depend upon the voluntary co-operation of other countries, which insist on secrecy. To all this the Senators reply that if, as they believe, "astounding" concessions were made by the United States when the lists were revised in 1954, then the American public has a right to know. But so far the American public has taken little interest in the controversy.

Buses Uncaught

Montgomery, Alabama

IN Montgomery, capital of Alabama and first capital of the Confederacy, with an excellent record for harmonious race relations, the Negroes are still boycotting the buses. Nothing has been settled by the conviction of their spokesman, the Reverend Martin Luther King, under an old and forgotten law originally directed against trade unions, for conspiring "without just cause or legal excuse" to deprive the bus company of its business. If anything the case has stiffened the Negroes' solidarity. Before December 5th they provided the buses with three quarters of their passengers. Since then they have gone to and from work on their feet or by using an elaborate system of car pools. The trial has not deprived them of leadership, since Dr King, who was fined \$500 and a similar amount in costs, has appealed and the cases of the 89 other Negroes indicted with him have been postponed until this appeal is settled; among them are 24 other clergymen and many of the most respected people in the Negro community. At the normal pace of American justice it could be a matter of years before the final decision and few doubt that the verdict will be overturned eventually by the United States Supreme Court, if not before.

THE ECONOMIST, APRIL 7, 1956

It was coincidence which brought the case of Miss Autherine Lucy, the Negro student admitted and expelled from the University of Alabama, to a head at the same time as the bus boycott was taken to court, under the pressure of the frustrated whites in Montgomery. The two incidents, which, much to its embarrassment and resentment, have made Alabama the centre of national curiosity, had only one feature in common. The Negroes were pushing demands, backed up by their own legal talent, instead of using what is sometimes called "the old psychology," that is, wheedling boons from the whites. But the bus boycott was not a test case planned, like that of Miss Lucy, to break down the principle of segregation; it was an attempt to get satisfaction from the bus company "within the framework of segregation" for specific, long-resented grievances.

During Dr King's trial there were many moments of pathos as his battery of eight Negro lawyers sought to prove "just cause" for spurning the buses. One Negro matron after another, sad, pert, pretty and wrinkled, told her story of bullying and insult at the hands of the white bus drivers. As segregation is interpreted in Montgomery, the ten seats in the front of the bus are reserved for whites, the ten in the back for Negroes. Riding into town at rush hours from the predominantly coloured district Negroes frequently have to stand, when the centre and rear of the bus are full, yet the front ten seats are left empty. More mortifying still, the driver has arbitrary power over the unreserved centre section; he may at his whim let Negroes sit there but, if whites enter and their reserved seats are filled, he may order Negroes to move to the rear.

The boycott has astonished everybody by its success, Negroes as well as whites. It is true that Negro organisation in Montgomery did not spring out of nothing. For years there had been a network of betterment societies—the Progressive Democratic Association, the Civic Federation, the Co-ordinating Council, the Women's Political League—and that there was a tradition of militancy in some of the Negro churches. This was the case with the Dexter Avenue Baptistry to whose cure Dr King came eighteen months ago, a rather exclusive Negro church, pushing up its distinctive steeple defiantly at the very foot of the Capitol building where Jefferson Davis took the oath as the first and only Confederate President. The main innovation of the young northern-educated intellectual has been his passionate emphasis on non-violence and the creative power of unrequited love. Nevertheless, despite these stirrings, which went unreported outside the closed Negro world, there was little reason for white people to doubt what their cooks and waiters told them, that race relations were serene and that coloured folk were happy as they were.

It is doubtful if this would have changed had it not been for the coming to the boil of the resentment against the northern-owned bus company which, to do justice to other Alabamian cities, seems to have been singularly clumsy in handling its problem of segregation. The arrest of a highly respected Negro woman for refusing to move out of her seat struck an immediate chord throughout the whole community. Mimeographed sheets calling for a one-day boycott were sent out by one of the Negro organisations; the report of this printed in the *Advertiser* brought a mass response that was ninety-five per cent effective. It was the success of this token protest on December 5th which gave the move-

ment its impetus. That night the first of the extraordinary mass church meetings was held; it was decided to give up patronising the buses indefinitely until three demands were met: more courtesy, the seating of passengers on a first come, first served basis, with whites entering at the front and Negroes at the back, and the hiring of Negro drivers for the predominantly coloured routes.

A fresh organisation was formed, the Montgomery Improvement Association, to cut across all previous factions, with the leadership entrusted to the clergy, because they would provide the best educated spokesmen and because they were the most immune from economic reprisals. At first there was some attempt at mediation and negotiations took place. The seating arrangements of the type the Negroes want already operate successfully in Atlanta, Georgia, and even in Mobile, Alabama, which comes under the same state segregation laws as Montgomery. But now communications have ceased between the leaders of the two races. Although there is uneasiness in Montgomery, there is no hint of racial violence. Twice a week, amid spirituals and "pep talks," the coloured masses packing a Negro church are whipped up into intensely emotional dedication to passive resistance, love and calm. "Are you tired of walking?" the preacher will shout, and when the expected "No" floods back, then comes the sought-for reassurance: "We are not walking alone, because Jesus is walking with us." But the leaders are practical men; their people do not have to walk. The car pick-up system, working through Negro churches, shops, parking lots and garages, functions with American efficiency throughout the day.

The cooks and waiters, who shout back "Yes, Lord" as something is released within them by the preacher's words, still tell their white employers that they are against the boycott. Many whites still believe them, confirming their conviction that sinister outside forces must be at work. The best hope is that with the Negroes continuing month after month to display a calm discipline no one had expected of them, people will come to see that when the dialogue between the races is resumed, it cannot be in the language of paternalism. Unhappily, because local politicians are exploiting the issue, things are likely to get worse in Alabama before they get better.

Boom in God's Children

FROM A SPECIAL CORRESPONDENT

THE American tendency to think in economic terms has produced the phrase "religious boom," suggesting that the current religious revival is a factor in the economy of abundance and that consumers' souls are burgeoning at the same rate as their incomes. But the designation does more justice to the vigour of American religion than to its extraordinary diversity and adaptability. Given colloquial expression in juke box hymns and praying dolls, and in a new comic strip, religious themes also monopolise the lists of best-selling books, and are the subject of serious analysis by psychiatrists and theologians. The new spirit permeates social, economic and political life, and adapts itself to the requirements of each. The consequent dilution of the

messages of the Bible and the pulpit brings anguished charges from many of the clergy that the revival has spawned an unparalleled increase in secularism and "rank religiosity." American churches have often been accused of over-eagerness, but it should be remembered that, because of the constitutional principle of separation of church and state, they must depend for both members and financial support on energetic evangelism. This effort results in their acquiring the hues of the American way of life: how much they also shape this way of life is a matter of widespread debate.

The religion of the average American has usually been highly personal and as solidly planted as the grass roots. Neither the statistics nor the din of "tinkling cymbals and sounding brass" of the current revival can be taken as an adequate measure of this basic layer, which continues to show through with remarkable persistence. Some clues to the breadth and depth of the "boom," however, can be found in the annual statistics of the National Council of Churches, the principal Protestant body in America, and in the public opinion polls. Church membership has grown from a mere 20 per cent of the population a hundred years ago to 60.3 per cent in 1954, with an impressive surge after 1940, since when the rate of increase has almost tripled. A considerably larger number of people than are claimed on the church rolls consider themselves affiliated. Still another unmeasurable group holds profound religious beliefs, but is unable to subscribe to the organised doctrine of any particular denomination. If the polls can be trusted, 96 per cent of Americans believe in a God, 90 per cent pray occasionally, and a growing 76 per cent believe in an after-life, although less than 5 per cent admit to having any fear of hell. They are buying a record number of copies of the Bible, which four-fifths of them believe to be divine revelation, but only 35 per cent can name the four Gospels. Their respect for religious leaders has more than doubled since 1942, while the prestige of both political and business leaders has plummeted.

The three major American churches have historically played a part in providing the Americanised grandson of the immigrant with a social identity and heritage, and in the process have been transformed into thoroughly American institutions. Today, the rootless migrant to the suburbs secures an identity through joining a church and simultaneously acquires guarantees of culture, patriotism, and social acceptance. The Protestant church (to which 35.3 per cent of the population belongs) most nearly reflects the class and political structure of American society and the Anglo-Saxon cultural ideal. The Roman Catholic church (16.1 per cent) has a preponderance of working-class members, and the Jewish congregation (approximately 3.5 per cent) of professional and business people. While there are growing rivalries between the three religious communities, together they have the net effect of representing and reinforcing the "American way of life," which has been called the "operative faith of the American people."

This "American religion" has recently invaded a new missionary field: American industry is in the process of "getting religion." Evidence of this is the growing articulateness of businessmen on "spiritual values"—"skyhooks" to give meaning to work and incentives to production—and their practical interest in churches as

institutions. Acting on the thesis that "Standard Oil produces oil and the church produces a way of life . . . and thought, but they both have production problems," the American Institute of Management undertook a "management audit" of the Roman Catholic Church and, in January, reported that its efficiency rating was only two points below the 90 per cent of Standard Oil of New Jersey. Thirty-two conclusions were drawn from this for American business managements to use in promoting both production and morale. An increasing number of companies are employing "industrial chaplains," and young executives are learning to pray before business conferences. In mid-April the National Conference Study on Church and Economic Life will bring together religious and business leaders to examine the problem of "the Christian conscience and the economy of abundance," to try to find out why people who have so much are getting so little real satisfaction from it.

A manifestation of the effect of religion on politics is to be found in the new prayer room recently installed under the dome of Congress. Now every political speech insists on virtue and spiritual values. The religious principle in international relations is recognised by the constant use of the phrase "atheistic Communism," which rouses sympathy in the mid-western Bible belt where those with isolationist tendencies equate Soviet Communism with the Devil. The Reverend Billy Graham has told Congressmen that Christianity is the necessary "intellectual answer to Communism," and the President has urged that from every pulpit should be spread the doctrine that the present struggle is one of "atheism against some kind of religion."

While the average American is taking his religion where he finds it, many people worry that his soul is in jeopardy from the blandishments of the "hucksters" of religion. Dr Graham directs his twentieth-century evangelism quite frankly to the large proportion of the population who have the literacy of a twelve-year-old in religious matters and is sending streams of "converts" back to their own churches. More insidious is the so-called "cult of reassurance," combining religion with the magic touch of psychiatry, and now epitomised by Dr Norman Vincent Peale's "Power of Positive Thinking" (176 weeks on the best-seller list). Dr Peale, in the style of a "lonely hearts" columnist, promises happiness and success in everything from traffic jams to the hotel business by simple rules for prayer and the elimination of negative thoughts—"say 'I believe' three times every morning on arising." He has a powerful attraction for the middle class, many of whom are suffering the pangs of upward adjustment economically and socially. Condemned by the intellectuals for selling a patent medicine type of Christianity, without the essential doctrines of original sin, repentance and salvation through grace, he answers his critics indirectly with the suggestion that "cynics" should "live abundantly." These same "cynics," however, Dr Reinhold Niebuhr, Dr Paul Tillich and an increasing number of enthusiastic followers in universities, particularly in the recently expanded School of Divinity at Harvard, are giving substance to the revival by examining the role of Christian theology in modern life.

An American religion which is to appeal to 160 million people is bound to be vague and often superficial, but it does not follow that it cannot be sincere and even fervent. President Eisenhower, who personifies so much of present-day America, seems also to typify its religion; the simplicity of his faith, though deplored by the sophisticated, is apparently an inspiration rather than an opiate to the people.

It costs no more to fly TCA via Montreal

En route to New York? Why not stop over and see Montreal? It costs no more with TCA!

OVERNIGHT TO MONTREAL AND TORONTO

Travel TCA and you travel in the roomy comfort of luxurious SUPER Constellations—with your choice of First Class or Tourist accommodation. By TCA, Canada is only a night's journey from London or Glasgow—you can fly direct to Montreal or to Toronto. Within Canada, too, you can now enjoy Viscount travel across Canada to Vancouver or the Pacific Coast. And there's no need to change airlines if you are bound for New York and other great U.S. cities.

Ask your Travel Agent for full details.

MOST COMFORTABLE EVER

The First Class accommodation aboard TCA Super Constellations is the most luxurious ever offered to air line passengers. The fully-reclining Siesta seats, the separate Club Lounge—where you can drop in for a change of scene—put TCA comfort in a class by itself.

TRANS-CANADA AIR LINES

27 Pall Mall, London, S.W.1, and Glasgow

Serving Europe, Canada, U.S.A., Bermuda, Nassau, and the Caribbean

2 oz. tin 9/1d

To open, simply remove small rubber seal

Unfailingly fresh

Tobacco at its best. Player's Medium Navy Cut is once again supplied in the familiar pocket tin, vacuum sealed, which means that absolute freshness is retained and enjoyment assured whenever you buy it.

PLAYER'S MEDIUM NAVY CUT TOBACCO

What you should know about Brandy

V.S.O.P

The best brandy comes from Cognac. The finest Cognac comes from the Grande and Petite Champagne districts in the centre of Cognac. All Remy Martin Cognac is made from grapes grown exclusively in these two areas. That is why people ask for Remy Martin and are never disappointed.

REMY MARTIN

THE ECONOMIST, APRIL 7, 1956

This is why the Dictaphone is the world's TIME-MASTER most modern dictating machine

THE DICTABELT record makes the Dictaphone Time-Master the world's most modern dictating machine.

All over the world the Time-Master with its amazing Dictabelt has revolutionized office procedure—saving valuable time, cutting unnecessary costs. By reducing time spent in routine to its absolute minimum,

the Time-Master truly doubles your capacity to get things done!

The Time-Master's unique Dictabelt is available, fileable and virtually indestructible. It gives you crystal-clear and completely visible recording. And in actual use it has been proved to cost only a few pence a day.

Now! The Dictaphone Time-Master with POWER CONTROL

Now the Dictaphone Time-Master makes dictation even more automatic with *Power Control*. Starting, stopping, correcting, playing back—all controlled by a touch of the thumb on the microphone.

Mark length of letter—by pressing button 'L'

Indicate corrections—by pressing button 'C'

Start and Stop—by pressing this bar

Continuous recording—press in and up to lock bar

Automatic play-back—by pressing button 'P'

The Little Sisters of Saint-Paul

BY A MEMBER OF THE STAFF LATELY AT FRIBOURG

BEHIND the last five issues of *The Economist*, which were produced by the Imprimerie Saint-Paul at Fribourg in Switzerland, there lies an experience so rich and rewarding to those who took part that they are in duty bound to try to share it with the paper's readers. Some parts of this story have appeared in the British press and they may have carried the suggestion that we were being printed in an unfamiliar kind of closed shop staffed by nuns and monks. This is only half true (for there were no monks) and it gives a totally wrong impression. "We are not" said *la Mère Générale* "a closed order; we are just a happy band of working sisters." How happy, and how devoted to their work, we were to discover from the moment that *les Petites Sœurs de Saint-Paul* started to compose the first of the five issues, unfamiliar in language and secular in content. To have been allowed to work as guests in collaboration with the Little Sisters was a rare and moving privilege.

The printing works of Saint-Paul was founded 83 years ago by Canon Schorderet, and the modern fulfilment of his act of faith is a block of buildings housing the religious congregation, a composing room splendid in its dimensions and equipment, modern presses for book printing producing the best half-tone and colour work, and the rotary press on which *The Economist* was printed. The Little Sisters, of whom there are about one hundred and thirty, work in the composing room and in the administrative offices; they also serve the bookshop and library which are attached to the works. One of their main concerns is the daily publication of *La Liberté* but there is other newspaper work to do, and much periodical and book printing. Saint-Paul would challenge comparison for efficiency and working conditions with any plant of similar size in the world. It is a revelation of what a good printing works ought to be.

One stresses this physical environment, designed for practical needs and urgent tasks, because it is here that the Little Sisters of Saint-Paul find their fulfilment, as crafts-women dedicated to the glory of God. Their only habit is a simple black gown with a white collar—the dress of working women, but one blessed by the Church as they take up their profession. They work in silence, disturbed only by the chattering of the linotype and monotype machines, and by the simple graces that they sing after their spell of work. But they are in no sense cloistered or withdrawn from the heartening ways of life. Among the abiding memories of the Little Sisters, one must surely include their charm and wit, as well as their dedication to their work.

From the foundations laid down in 1873, the work of Saint-Paul has spread into France, where sister printing houses have been established, and into the Cameroons and Dakar, where printing is combined with missionary work. Girls enter the Order as postulants and proceed to their novitiate, with a number of opportunities to change their mind if the life proves to be one for which they are not fitted. One wondered, with this practical and charitable example before one, why secular training for industry in this country (which ought to be imbued with some sense of vocation) is regarded so often with an air of discovery. There is nothing new about the blending of craft with vocation at Saint-Paul.

But typesetting, for all the skill and tradition that can be claimed for it, is still only part of the total process of printing. And although the Little Sisters devote themselves to this responsibility, three-fifths of the total staff of the Saint-Paul works are of the laity. These include the men in the machine rooms who belong as a rule (though they are under no compulsion) to the Christian trade union, and whose wages are well above the minimum laid down in the agreement, corresponding in fact to the average for Switzerland.

These men (and the Little Sisters themselves) were not prepared to help *The Economist* until they were satisfied on moral grounds that their co-operation with us, as a third party in the recent London dispute, would not prejudice the interests of the London compositors. They would not have lent themselves to any operation that savoured of "strike-breaking" and one of the most serious tasks undertaken by the paper's editorial representatives in Fribourg was to give as honest an account as they could of the complicated pros and cons of the London dispute and leave the decision of conscience to their hosts.

If any regret lingers over an operation which went on happily for five weeks (despite the threat of electricity cuts and despite the loss, fortunately only for a few hours, of printing material carried on over the Alps to Italy) it is that these good people should have been treated with so much less charity by some of their own countrymen than they accorded to us. One could understand the sharp cleavage between the points of view of the secular and Christian unions, if only because it proceeded from a long history of religious difference; but it was the attitude of the socialist union, with its uncritical appeal to "international solidarity," that was based on dogma, while the members of what is often accepted as a dogmatic confession

reached their own conclusion about the propriety of producing *The Economist* after a careful, fair hearing of its predicament. And one should add a private note of distaste for certain unhelpful comments that appeared in some German-language papers, which so far forgot their own political standpoint, and were so little moved by the duty laid on any self-respecting editor to produce his paper if he can, that they were able to bring themselves to refer to the "black" operation conducted by *The Economist* in Fribourg.

The abiding memory of those who had the privilege of working at Fribourg is of warm co-operation, great technical skill, charming hospitality, and graceful manners. The Sisters made our staff humbly grateful by their simple demonstration of patience and service. They taught us, without intending to do so, many lessons about our work that we had failed to discover for ourselves. *The Economist* owes much, after Fribourg, to countless people—to British European Airways and its staff, to Albert with his furniture van who took the copies by road to Geneva, and to many others. But it owes most to *les Petites Sœurs*; and that is a debt they themselves would wish us to requite by praying for a blessing on all their labours.

German Perplexities Over Conscription

WITH eyes on next year's federal elections, all the German political parties are anxious to cushion the shock of compulsory military service. The shadow of their dilemma loomed large when the Bonn Cabinet's conscription bill, calling for eighteen months' service, was debated in the Bundesrat recently. The Upper House, consisting of representatives of the various *Länder* governments, decided that the period should be no more than one year. With this amendment the bill went back to the Cabinet, which has now to pass it on, with the government's comments, to the Bundestag.

Arguments for and against the conscription bill cover more than the length of service. They revolve round Germany's peculiar position as a country divided against itself, the rival technical merits of a professional army and a conscript force, and the damage which industry would suffer from the withdrawal of young workers. The Social Democratic party executive has decided to oppose conscription, in spite of the fact that the party traditionally distrusts professional armies as dangerous to civil government.

The excuse given for this reversal of Socialist policy is that parliamentary control of the new Federal army has been safeguarded. Whether or not the SPD really feels confident that the safeguard will be fully efficacious, it does realise that conscription is unpopular. If East German Communist broadcasts are to be believed, there was strong criticism from the ranks of the SPD against the executive's decision to vote with the government recently in favour of the constitutional changes which paved the way for the introduction of the conscription bill. This may well be so; it is a fact that SPD leaders have constantly to appease members who tend to revert to the left-wing pacifism of Rosa Luxemburg. These elements offer a nucleus for a united front against Nato.

THE ECONOMIST, APRIL 7, 1956

Thoughts of Herr Stoph's Communist-led army on the far side of the Elbe-Werra-Fulda line have underlain much of the opposition's speeches in both Houses in Bonn. The young conscripts, it was urged, would be exposed to an intolerable conflict of conscience by the possibility that they might have to fight their fellow-countrymen. Some impression, it seems, has been made in western Germany by warnings from the Soviet zone that all steps taken in the Federal Republic would be matched in the east, although Bonn government speakers have pointed out that the labour shortage in Soviet Germany is too acute to permit general conscription there, whatever happens in the Federal Republic. At the same time, the apparent improvement in the prospect of disarmament has been seized upon by the Social Democrats as an argument against setting up a large west German force now.

There are some general and some purely German aspects of the military arguments which have been put forward in the controversy over widespread, long-term service. German commentators, like their counterparts elsewhere, reproduce endless debates about the need for mass armies in the atomic age. Herr Weinstein, a former staff officer who has made a name for himself as military correspondent of the *Frankfurter Allgemeine Zeitung*, has long favoured setting up small, mobile, highly trained units. But for various reasons, including the lack of volunteers, Germany's army cannot be wholly professional. In Herr Weinstein's view, which is also that of Free Democratic party experts, it must be backed by reservists who would have to do refresher courses every year after serving for a short term as conscripts. At the same time, he points to the need for a militia to cope with civil air defence and other aspects of the internal situation. Such a force has recently been officially proposed by the German Ministry of Defence. Presumably it would be outside the Nato command. It has been left to spokesmen of the government side to recall that Federal Germany has a treaty obligation to Nato to set up twelve divisions, and that strategy is a matter to be decided at combined headquarters, not in Bonn alone.

Singapore's Sack Race

FROM A CORRESPONDENT IN SINGAPORE

IN the process of gracefully yielding self-government to colonial territories, it is a serious blunder to introduce parliamentary institutions without first making sure that the civil service understands the process. This is the mistake that has been made in Malaya and more especially in Singapore. The theory is, no doubt, that British permanent officials will hold the hands of inexperienced ministers, initiating them gently into the mysteries of parliamentary procedure. The fact is, however, that many of the senior officials of the Malayan Service know little about such procedure, although they are experienced and capable men.

The result is that popularly elected ministers now want to do what should have been done before: they want to replace their permanent departmental heads. The more sensible of them realise, however, that they still need technical and professional help. The tragedy is that some are less balanced than others and fail to distinguish between the now useless administrator and the still necessary electrician. In his calmer moments the politician should be made to realise

that a recently arrived technician is no threat to his political freedom. An English or American expert will show no resentment at receiving instructions from an elected minister or indeed from an elected town council. It is the sort of control to which he has long been sadly resigned. He therefore gives no more offence than he feels. The man actively disliked is specifically the man who knows the country, the language and the people. For he cannot help saying (in everything but words) "This place was governed efficiently in the old days. Just look at it now!" This causes resentment not because the British official is wrong but precisely because he is right. But what he fails to grasp is that the country, under his rule, could never have been fit for parliamentary government at all.

At Singapore the exasperation aroused by senior officials has found expression in the work of a Commission on Malayanisation. Appointed in August, 1955, the Commission sat in public to decide how soon each "expatriate" official could be replaced by a local man. After fifty-eight acrimonious meetings the suppressed emotions of the members have been made to assume a more or less coherent form.* Their report shows that in a civil service with over 20,000 members there are 607 expatriate officers who hold many of the responsible and highly-paid posts. Thus, of 77 posts in the Administrative Service, 45 are held by expatriates; and of the 153 "superscale" posts in all the departments, no less than 138 are filled by expatriates. Members of the Commission, or a majority of them, have sought to show how practically all expatriates might and should be replaced in from one to four years.

Colour Bar in Reverse

In many departments the need to "malayanise" must be generally admitted. To place local men in key administrative, legal and financial posts would seem a logical sequel (or, far better, the preliminary) to self-government. It is strange, therefore, that the majority report should allow up to two years for a hand-over which even the most impartial bystander would have expected to take place immediately. But if hesitant in their approach to the political branches, the local politicians have more than made up for this by wildly assaulting the technical departments which could never have been a threat to anyone. More than that, their emotions have so far triumphed over their reason as to advocate "malayanising" departments which are already seriously understaffed.

Two members of the Commission have had the moral courage to point out these and other anomalies in a minority report which deserves careful study. They show that to fill existing vacancies (352), replace expatriates (596) and fill new vacancies already in the estimates (600) will mean recruiting 1,548 civil servants in the next four or five years. Nor does this allow for the inevitable expansion to be expected in a colony where 151 Division I posts alone have been created since 1950. Charged with the task of making, say, 2,000 appointments in five years, a Public Services Commission would end by interviewing the scarcely literate.

The absurdity and danger of these proposals is most apparent in the education and health services. Of 1,038 government teaching posts, only 71 are filled by expatriates and 82 posts are actually vacant. The known rate of expansion will require 484 graduates in government or

* Colony of Singapore. Interim Report of the Malayanisation Commission. February, 1955. M53,00.

aided schools by 1959. Only 264 applicants are in sight, which implies a shortage by then of 220 graduates as compared with a present shortage of 102. As the teaching of English is a main task in the schools, the removal of English graduates would seem singularly unhelpful. Nor are the recommendations regarding the health service any less mischievous. The hurry to evict fifteen of the top-level medical officers is the less understandable in view of the fact that 12 of the 41 superscale posts are actually unfilled. To throw out 33 physicians and surgeons (plus matrons, sisters and nurses) from a desperately under-staffed service would hardly seem to be in the interests of the sick.

If this majority report is a spiteful and mean-spirited document, penalising school children and hospital patients in order to apply a colour bar in reverse, it must be recognised that the atmosphere in which it was compiled was itself the result of colonial policies and attitudes. Granted that excellent work has been done by the senior British officials, the fact remains that it was under their rule that so many leading Singaporeans grew to a frustrated immaturity.

Second Resource for Kuwait?

THE Ruler of Kuwait is notoriously nervous of pressure from his big neighbours—Saudi Arabia and Iraq. Both have before now cast longing eyes on his property. It is therefore something of an event that he has given permission to the Iraq Petroleum Company to survey a route for an oil pipe-line across Kuwait territory to a point south of Kuwait town. The survey has begun, though neither party has yet taken a final decision.

The reason for the company's application is that the

shallows at the head of the Persian Gulf are not made for modern tankers. The Iraqi port of Fao, which handles the whole export of Iraq's southern oilfields near Basra (7.2 million tons in 1955) cannot take vessels of more than 15,000 tons, whereas the tanker of the next decade is in the 30,000 to 50,000 ton class. A terminal in deeper water is a necessity; whether it will be a marine one or a shore one remains to be seen.

From Kuwait's point of view, the political risk of opening

a door to Iraq is offset by a political advantage, and the economic prospect is altogether advantageous. Kuwaitis are nervous of Iraqi designs on their territory; yet were they to lease land to Iraq for the business end of an oil pipe-line, they might then be in a better position to bargain about the business end of a water pipe-line from Iraq. Their reasons for hesitating over this important project, and for contemplating, instead, payment through the nose for distilled sea-water for their waterless town, were described in *The Economist* of January 28, 1956.

From an economic and social standpoint oil terminals are nothing new to them. They already sport two—one from the Kuwait oil company's huge field and the other coming from the Neutral Zone with Saudi Arabia. But a pipeline coming from abroad might reopen the old pre-1914 notion of Kuwait as an entrepôt for the trade of Mesopotamia. The news that its territory is to become a refining centre through conversion of its present small refinery into the fourth largest in the Middle East adds to this possibility.

At present, the Kuwaitis are rich and busy on the proceeds of a single resource, their oil, and there is contentment because money and assets are filtering down even to the poorest, who are getting compensation beyond their dreams for mud huts destroyed to make way for a boulevard, or free cellophane-wrapped sandwiches for their children at mid-day. No one supposes this one resource is going to vanish, but for social as well as economic reasons, it would be well to develop another, if it is only market gardening thanks to the water pipe-line. But the Kuwaitis were born resourceful; they are good sailors and keen merchants. The pavement money changer just outside the bazaar can give you rupees for your tattered roll of Syrian pounds after a split second of calculation in his head. A lazy life on unearned income has great attractions, but is out of keeping with the Kuwaitis' tradition for enterprise. Any project that offers a chance of turning their territory into an entrepôt trading centre is worth their while.

Belgrade Stays at Arm's Length

FROM A CORRESPONDENT IN BELGRADE

THE wheel has certainly come full circle for Marshal Tito and his colleagues who broke with Stalin nearly eight years ago. They believe that the events of the twentieth Soviet party congress indicate a genuine change in Soviet policies; and they particularly welcome the debunking of Stalin because, as one commentator euphemistically put it, this "removes obstacles that have kept the fighters for socialism apart." But a note of caution can still be heard. The Yugoslav Communists do not intend to be caught out twice; the twentieth congress may facilitate a further rapprochement with the Russians but there must be cast-iron guarantees on the equal status of both parties.

President Tito's warm letter to the Soviet congress, addressing the Russians as comrades, was the most spectacular development in Soviet-Yugoslav relations since the Russian visit to Belgrade last spring. It was, it would seem, a *quid pro quo* for Mr Khrushchev's public recognition of Yugoslavia as a "socialist" country, and of the Yugoslav Communists as true followers of Marx and Lenin. Tito has taken nearly a year to return the compliment. Now he, in his turn, has recognised Russia as a "great socialist country"

as distinct from the "state capitalist" type which the Yugoslavs labelled it after their expulsion from the Cominform. It is said that when last spring the Soviet leaders, irked at Marshal Tito's refusal to call them "comrades," asked the reason why, the Marshal said non-committally, "We shall see about that." Now he has apparently made up his mind, and is accepting the Russians as they accepted him.

The Yugoslavs are convinced that the real purpose of Marshal Tito's letter was to encourage the new trends inside Russia. They argue that the new leaders are trying to rid themselves of Stalinism, that they need encouragement from the outside world, and that every western rebuff to a Russian gesture lends support *a priori*, to the Stalinist diehards. On the other hand, when the letter referred specifically to Yugoslav-Soviet relations it was worded very carefully; Tito elected to talk of "gradual and continuous" improvement as the only way of achieving mutual confidence. In other words, such confidence has yet to be established.

As if to correct any one-sided development of political contacts, the Yugoslav Communists have lately again quickened their efforts to arouse the interest of western Socialists. A number of prominent Socialist leaders from western Europe will visit Yugoslavia in the next few months, and Marshal Tito will himself visit the French Prime Minister, M. Mollet. Thus, for the time being at any rate, party contacts with the west, are to be more pronounced apparently to neutralise any over-enthusiastic impressions that the Moscow congress might make on the Yugoslav Communist rank and file.

But it is in the economic more than in the ideological field that the situation may prove more difficult and Soviet gestures more tempting. Ever since last autumn, when the Soviet Union offered—and the Yugoslavs had no alternative but to accept—substantial loans and credits on highly favourable terms, the eastern bloc generally, and Russia in particular, have been showing frequent and generous interest in Yugoslavia's difficult economic position. Most of Yugoslavia's trade agreements with the Soviet bloc for the current year are twice as big as last year's; under the agreement with Russia, which is for \$35 million each way, Yugoslavia is getting goods that it badly needs.

Prolific Soviet Offers

The Yugoslavs are now introducing their new economic policy, which involves cutting down on new investments and abandoning many cherished projects because of shortage of local funds. Russia has apparently already offered to help in the construction of various projects, notably in the mining and metal industries, and in the development of the rich copper resources at Majdanpek for which the Yugoslavs had hoped to attract foreign capital. The Russians in their anxiety to impress the Yugoslavs have even offered them grain from their "wheat surplus." Moreover, their prolific offers are all of "unconditional" help with no counterpart fund "restrictions" or other "controls."

So far the Yugoslavs have avoided arrangements which would shift their country's economy too close to that of the Soviet bloc, and would thus give Moscow an opportunity to increase its influence. For political reasons they still look to the West for their main economic support. It is significant that the economic agreements recently signed with Italy, giving Yugoslavia \$60 million worth of useful investment credits for equipment, were welcomed by its official press for their political significance as much as for their

commercial value. The same importance was attached to the lengthy negotiations with Bonn over Yugoslav war claims which have now been settled favourably for Yugoslavia.

But the Yugoslavs are not happy about their economic relations with the West. They feel that longer-term arrangements would relieve them of much of the uncertainty which gives their present planning a hand-to-mouth character. Moreover, it cannot be lost upon them that whereas deals with the Russians are quickly closed, those with the West are—however unavoidably, because of normal democratic processes—subjected to long drawn-out negotiations.

Ruhr Coal Prices Freed

THE recent decision of the High Authority of the European Coal and Steel Community to set no new maximum prices when the ceilings on Ruhr coal expired at the end of March means that for the first time in over fifty years the price of German coal will not be formally determined by some controlling body. Before the second world war the cartel, the Rhenish-Westphalian Coal Syndicate, fixed prices. Coal as well as other prices were frozen in 1936 by the German government. After the war, maximum prices were set first by the Allied Control Commission and then by the German government. When the common market for coal was opened three years ago, the High Authority set maximum pithead prices on all coal produced in the Community. Two years ago, when the market situation was relatively easy, ceilings were removed from all areas except the Ruhr and the Nord/Pas de Calais area. Last year only the Ruhr coal was left controlled.

Although the decision to set ceilings rests with the High Authority, the treaty stipulates that before doing so it must consult the representatives of producers, consumers and workers through the Consultative Committee, and the governments through the Council of Ministers. The former group was almost unanimous that prices should be freed; the latter was divided. The High Authority's action came as no surprise, since it had already been largely determined by events. In the first place the High Authority's argument for retaining controls on Ruhr coal alone—that the price would otherwise be set by a cartel—fell to the ground once the protracted negotiations with the Ruhr coal sales agency (Georg) were concluded. From April 1st, Georg is replaced by three separate selling agencies (known as Geitling, Mausegatt and Präsident) which, except in a few specific cases, are to operate independently of one another, but subject to a continuing check by the High Authority. Although the new arrangement is unlikely to produce the competitive situation envisaged by the treaty, the High Authority could scarcely continue to set Ruhr prices on the ground it had previously taken. The choice therefore was between ceilings for all coal produced in the Community or for none of it.

Another development which limited the High Authority's choice was a subsidy arrangement discussed with the Ruhr coal producers by the German government. Last year, Dr Erhard, the Minister of Economics, urged the High Authority to maintain the price ceilings on Ruhr coal, not because he sympathised with the High Authority in its negotiations with Georg, but because of the inflationary effect of any appreciable increase in the price of coal. This

THE ECONOMIST, APRIL 7, 1956

year, a substantial rise in price was generally regarded as inevitable because of wage increases. But Dr Erhard was as anxious as last year to keep any increase in price to a minimum. The German government accordingly told the coal industry that it would be prepared to pay certain bonuses and to modify the social charges normally borne by the industry (the proposed changes would be tantamount to a subsidy of roughly six shillings a ton) if, in return, the industry would agree to limit its price increase to about three shillings a ton. Some increase in price was to be expected. The prices which seem likely to result will probably be below any ceiling the High Authority could reasonably have set if these internal German arrangements had not been made; but the German action raises other still unsettled problems for the High Authority.

Obviously the German government, or any other government, can affect the competitive position of its coal by changing the basis on which taxes are collected from the industry or social benefits given to the workers. The treaty recognises this and contains an outright prohibition against subsidies, state assistance or special charges. But it was clearly impossible to legislate for every action which a national government might take which might affect the conditions of competition in the coal and steel industries. For this reason Article 67 of the treaty provides that any action of a member state which might have "noticeable repercussions" on the conditions of competition in the coal and steel industries shall be brought to the attention of the High Authority by the governments concerned. This the German government has done.

The High Authority has now to decide whether the arrangements made by Bonn constitute a subsidy, in which case they are outlawed by the treaty and presumably the whole price issue is reopened, or whether they fall under Article 67, in which case they can probably be allowed to pass. Probably it will postpone a decision until a joint committee has finished studying the whole problem of the effect on coal prices of the various systems of collecting social charges in the Community. But the situation is a text-book illustration of the difficulties of integration by sector. Six countries can create a single market for coal and steel, and can remove such definable barriers to trade as tariffs and quantitative restrictions, by fiat. To free the common market from all national distortions is a much more difficult task. Basic industries cannot be separated from the social and economic structure of their country by the stroke of a pen.

Spanning the East

Branches of The Chartered Bank of India, Australia and China under British management directed from London are established in most centres of commercial importance throughout Southern and South Eastern Asia and the Far East. At all these branches a complete banking service is available and, in particular, facilities are provided for the financing of international trade in co-operation with the Bank's offices in London, Manchester and Liverpool, its agencies in New York and Hamburg and a world-wide range of banking correspondents. In London and Singapore the Bank is prepared to act as executor or trustee.

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

(Incorporated by Royal Charter, 1853)

Head Office: 38 Bishopsgate, London, E.C.2

Finance for Industry and Commerce

ICFC provides finance in the form of long-term loans on fixed terms, or share capital, to industrial or commercial enterprises established in Great Britain. Amounts range normally between £5,000 and £200,000.

During the present period of credit restrictions, the Corporation will only consider applications for capital from firms concerned in work of national importance. Consideration may also be given to new ventures which are soundly conceived and adequately sponsored.

THE BUSINESS WORLD

Clouds over the Motor Industry

THESE are significant weeks, every year, for the motor trade; this year they may be crucial. It is clear that the usual Easter revival of car sales, new and secondhand, has taken place; but nobody can yet tell quite how much of a revival it is, in spite of the professional cheerfulness of the car salesmen. And from Warren Street right back to Longbridge the whole motor business is anxiously seeking to guess from these key Easter sales how much Mr Butler and Mr Macmillan have really restrained effective demand for cars in Britain's home market. For many small dealers, their own credit already tightened, this is a question of survival. For the manufacturers, the question is two-fold. How fully can they hope in coming months to employ the labour force they have had to put on short time during the last three months? And will the level of output that 1956 home sales appear likely to support enable them to operate profitably at present prices?

Even when the full figures of sales this Easter become available, it will be peculiarly hard for the trade to assess them. For the winter's restraints on car buying were imposed during the off season for sales, and it happened that this season was "more off" than it had been for years. As the chart shows, new registrations of cars in Britain never quite lost their seasonal pattern, even in the postwar years when motorists were glad to have a car at any time when a dealer deigned to let them have it. But it is only during the last two or

three years that sales have fluctuated as much between seasons as they did before the war, and it is certainly too early yet to trace a "normal" pattern over the year for postwar car sales.

Until the last few years seasonal variations in sales on the home market have not mattered much to the car manufacturer. Monthly figures of car production are not available for prewar years; the monthly pattern of output since the war, until very recently, appears to have followed mainly the convenience of the production schedule, with no doubt some attention to the convenient times for exporting cars to the Northern and Southern hemispheres. But since 1953, most of the rise in car output has been absorbed by the home market. From being a mere residue of the production that the manufacturers did not export, deliveries to the home market have risen to absorb now about 60 per cent of total car output. Moreover, exports during these years have become the less fluctuating element in output: the tail has begun to wag the dog.

With the whole market already in the process of return to a more seasonal pattern, therefore, it will not be easy to separate out just how much the measures of restraint have begun to affect home sales in 1956. Sales charts do not offer a very clear course for any motor car maker this year. But the internal composition of a home market of this size—525,000 cars a year—is as significant as its total

size, and one aspect of it is particularly important. What are these cars bought for—business or private motoring?

One reason why motor car output in Britain has not been affected by the short time working of the last two months quite as much as is generally assumed may be connected with this distinction between classes of buyer. Although the number of cars produced in February was about four per cent fewer than in January, the volume of motor car output, as measured in compiling the official index of industrial production, was in fact very slightly higher than in January. During their four-day weeks, the production lines appear to have been rolling off, on the average, bigger cars. Clearly, it was output of the smallest models that was being cut most sharply. In part, this may reflect the special circumstances, physical or financial, of the different makers. But it is perhaps not too much to see also in it the industry's hope that business, which broadly buys larger cars than the private motorist, will prove also a steadier customer in 1956.

How many of the new cars does business buy? Nobody quite knows, and nobody has yet devised a statistically respectable way of finding out; but a variety of statisticians, official and unofficial, have had to make some kind of a guess. The best of these (which is still thick with reservations) suggests that immediately after the war business may have accounted for about 80 or 90 per cent of the total value of new cars sold, but that the proportion has declined steadily since. At the beginning of the current car boom, about 1952-53, business may have been taking about 60 per cent of car sales. But by last year, according to this informed guess, its share of home car sales by value may have fallen to much less than half. The actual percentages are not of much significance. What is significant is the drop during the last three years—years in which deliveries of cars to the home market have more than doubled. Whatever the actual proportion of business buying, the boom in home market sales of the last few years has been overwhelmingly a boom in private car buying.

Even if business is a steadier buyer in times of credit

restraint, therefore, its effect on what happens in the marginal market for new cars this year cannot be decisive. It probably is steadier, though this year it is more affected by general credit restraint than the average private motorist; hire purchase restrictions, moreover, affect quite a number of small business buyers. Secondhand values also affect the period that a business finds it commercially worth while to run its cars: the days are gone when premiums on the prices of cars a year or two old made buying new cars regularly (with initial allowance) the most painless of all forms of "investment". This winter, secondhand values fell more than seasonally, and recovered at Easter rather less than seasonally; moreover, the dealers have had to shave the margins between what they will allow for a car on part exchange and the price that they will accept in selling it.

With the Economic Survey's promise that if the present measures of restraint "are slow to produce results they will be reinforced," therefore, it is difficult to be optimistic about car sales on the home market this year. A slip in home sales of 10-20 per cent is quite on the cards, and probably within the Government's intentions. Nor is it likely that such an extra slice of output could readily be sold abroad, shifting the emphasis of the industry with the ease that an official in Whitehall can transfer a wrong figure from one column to another. In recent months exports of British cars to the Commonwealth have been good, allowing for the Australian import cuts; total sales in North America have declined and in Europe they have been almost disastrously lower than twelve months before. Against strong foreign competition—particularly German—the British motor industry will do more than well this year to hold its 1955 level of exports. *The Motor*, in a measured judgment of the Geneva show, said recently "... for any given standard of roominess, performance, and quality of finish, British prices seem already often to be at least 10 per cent above those of our competitors." Yet export prices are already less remunerative than home prices. Certainly the industry needs to exert more of its effort overseas; but at best this will take time.

These greyish prospects affect different firms differ-

ently. Of the big three, Vauxhall produces only two, bigish, basic cars, and cars represent a much smaller proportion of its business than the other two: Ford has two good looking new basic models to top its range, and with the change was able to raise some of its prices less visibly than the British Motor Corporation. According to trade rumour, BMC sales suffered proportionately more than those of some other popular makes this winter; but it did clear excessive winter stocks when its price increases became known last month, and is now comparably priced with its competitors. Competition must obviously become bitter this summer; but no motor manufacturer, at least in public, yet seems prepared to talk about price cuts as a means of competition. Their reluctance is understandable—the relationship between volume of output and cost in the motor industry is such that cuts in production may already have raised unit costs—if production of extra cars at overtime rates from American steel was indeed profitable last autumn. Standard, with its attractive new Vanguard, and Rootes, whose stable of cars retains a characteristic, cosy appeal to the eye of the British motorist, are already talking of initiating a second round of price increases.

The manufacturers regard whatever this summer may bring as a deliberate stifling of home demand, not as any natural decline; and at least in public they are

hedging none of their commitments to long-run expansion. Even if they concluded that the best natural rate of expansion the British economy could now offer were three years' boom and every fourth year through the wringer, they might still think this justified their plans. Such a prospect—and the technical doldrums in which British car design has now, one hopes temporarily, become becalmed—may make them worried about remaining competitive abroad. But within the industry, there is always the feeling that there are still one or two "independents"—or perhaps "not-quite-giants"—that might be driven into the ground, or at least out of this business. Outside the industry, many economic armchair strategists are already complaining that the motor makers are holding on too doggedly to their labour, and suggesting just where redundant motor workers ought to go. They have been premature: until the industry could guess how far the drop in trade was simply seasonal it would have been stupid to let go the workers it has spent two years' disproportionate effort to secure. They could still be wrong. Immediately, some shift towards export may be possible within this industry, by using the resources that have been making cars to make commercial vehicles and tractors. In the medium run, some of the things that have gone wrong with British car design ought to be curable. It is at least prudent to hope so.

Business Notes

Gold Gain in Perspective

THE announcement on Wednesday of a gold gain in March of \$67 million was greeted on the Stock Exchange with modest enthusiasm. Gilt edged stocks that had been better than steady since before the Easter break made another small advance. Though the new Account opened quietly in industrials the tendency was slightly upwards and the *Financial Times* index at 180.9 on Wednesday showed a rise of 1.8 on the week. In the exchange market the news was greeted with an enthusiasm that the rate hardly reflects. Sterling had been bought in anticipation of the figures and had strengthened against the dollar from \$2.80½ to \$2.80½. After the announcement a substantial offering in New York brought the rate back momentarily to \$2.80½. But sterling remained firm in continental markets and closed at \$2.80½. Both transferable and security sterling have reached the lower limit of the range of official sterling (\$2.78—\$2.82).

Official observers however confine themselves to cautious satisfaction. The increase in the reserves follows on a sizeable gain in February, but the total increase of \$157

million in the first quarter of 1956 restores slightly less than a quarter of the loss in the whole of 1955, and the early

months of the year are seasonably the most favourable; the first quarter's gain this year is also smaller than that achieved in the first quarter of 1954. Moreover, the sterling area has not yet quite succeeded in ending the long run of deficits with the European Payments Union. The deficit for March (to be settled three quarters in gold next week) was however less than £0.5 million, whereas the March gold settlement in respect of the February deficit involved a payment of \$16 million; after taking account of receipts of \$5 million in defence aid, the surplus on other dollar accounts came out at \$78 million. Payments during the month included the regular quarterly instalment of \$7½ million on the Canadian loan of 1942.

How Big was the Deficit?

It is impossible yet to see how far the latest recovery in the gold and dollar accounts is attributable to Britain itself, and how far to the overseas sterling countries. Detailed figures of the balance of payments in 1955, published this week,* make it clear that the fall in the reserves in 1955 at least would have been much greater but for the relief provided by the overseas sterling countries. That marks yet another difference between the sterling strain of 1955 and its counterparts of earlier years. In the earlier crises, the overseas sterling countries added to Britain's difficulties. In 1955 they mitigated them.

In 1955, Britain's current balance with the dollar area worsened from a deficit of £87 million to a deficit of £207 million and Britain's net dollar balance (including capital items) from a deficit of £14 million to one of £188 million. This deterioration, however, was exactly offset by a rise in the net dollar surplus of the colonies and the independent sterling countries; their surplus (including a rise from £138 million to £176 million in gold sales in London) reached £188 million compared with £164 million in 1954. The net fall in the reserves last year reflects mainly a major deterioration in Britain's balance with the OEEC countries (settled through EPU). The sterling area's gold and dollar deficit with the non-dollar areas was £229 million (compared with £63 million) and this was the measure of the fall in reserves.

It is evident from the detailed figures that the preliminary estimate of the current deficit in 1955 at £103 million (after crediting defence aid) rests on a more tenuous basis than usual, and that it may exaggerate the size of the deficit significantly. This emerges from the fact that the sum of the two sides of the accounts differ to the extent of no less than £175 million. The Government lent abroad £42 million more than it borrowed or repaid; private long-term investment overseas is estimated at £125 million (down from £200 million in 1954); and identifiable movements of short-term capital, including the running down of overseas sterling balances to the extent of £167 million, are estimated to have involved a further net outflow of £134 million. With a current deficit estimated at £103 million, total outgoings would thus amount to £404 million—which is £175 million less than the running down in the gold reserves. The discrepancy must imply that outgoings have been over-estimated. One obvious

* United Kingdom Balance of Payments 1946 to 1955 (No. 2), Cmd 9731.

source is the inflow of unidentifiable short-term balances to London; but the whole error does not necessarily relate to the capital account. All that can be assumed at present is that the United Kingdom did incur a substantial current deficit last year.

The Exchequer Surplus

THE fiscal year ended last Saturday with an "above-line" surplus that far surpassed last April's estimate and was also a good deal larger than had been generally expected a few months ago. At £397 million, it was only £36 million short of the big surplus attained in 1954-55, and it contrasted with an original expectation of £148 million—an estimate that was raised to £163 million when the effects of last autumn's increase in purchase tax was brought into account. Over two-thirds of this £234 million difference between expectation and performance was attributable to revenue, which bettered the estimates by £168 million, and

† Net deficit included in supply expenditure.

only £29 million of this came from special windfalls (in miscellaneous receipts and sundry loans). The big contributors were income tax, which bettered the estimates by £66 million, and customs and excise, which together exceeded them by £71 million—affording clear evidence of the extent to which this budget buoyancy reflects the effects of inflation. Those effects are discernible too on the expenditure side, since gross expenditure on defence

was appreciably less than in 1954-55 and fell short of estimate by £119 million. Hence, although debt service cost £38 million more than the estimate, total above-line expenditure showed a shortfall of £66 million—though it exceeded 1954-55 expenditure by £191 million.

Net outgoings "belowline" also bettered the estimates, to the extent of £46 million, thanks partly to the receipt of £25 million from steel realisation, for which no provision had been made in the budget estimates. The big influence below the line, however, has been the massive switch of local authority borrowings from the PWLB to the market. Up to end-October, when the new policy was introduced, these borrowings were running far ahead of those for 1954-55, yet in the full year they actually showed a decline of £23 million, at £330 million. Had it not been for this strong relief, belowline expenditure as a whole would have far surpassed that for 1954-55; as it was, the increase was limited to £37 million net. The "overall" deficit thus proves to be only £73 million larger than in the previous year, at £141 million, whereas the April budget had envisaged a deterioration of £368 million.

Output Slackens

INDUSTRIAL output in February appears to have been one to two per cent lower than in January, when allowance is made for seasonal variations: the actual production index is expected to be 142.143, compared with the provisional index of 141 in January, but output generally rises more than this between the two months. The slip downward, if later figures confirm it, has come after nine months of fairly stable high production: the plateau was reached in about May last year, since which time changes in the index of production have been little more than seasonal.

Car output, in volume, was in fact no lower in February than in January—the number of cars produced was down but a larger proportion than usual seem to have been bigger models. Some of the suppliers to the industry, however, probably reduced their output more directly in line with the number of cars produced, and car makers were probably running down materials and component stocks to some extent. Other industries making consumers' durable goods such as radio, refrigerators and electrical appliances, were more affected than the motor industry by credit restrictions. Bad weather, too, reduced work on building and construction—though probably not more than in February, 1955.

Hire Purchase Under Pressure

MARCH was the first full month of hire-purchase trading under the new restrictive rules, and the figures from HP Information show some of the effects of that pressure. The total number of contracts reported shows a drop of about 23 per cent on March of last year at 55,201, compared with 54,750 in February and with 69,256 in March of last year. Contracts for new cars show a smaller drop

of 15½ per cent at 7,053, compared with 6,135 in February and with 8,348 in March last year. The full effect on motors of the new measures has probably been cushioned by the fact that though Easter itself fell just in April this year, the Easter buying rush coincided almost exactly with the

start of the quarterly licensing period. Business that might have been done in April had Easter been a week later, as it was last year, has probably been advanced into the last days of March.

Switch and Transferable Sterling

THE gap between the rates for transferable and security sterling has now all but disappeared. The latest rate for security or switch sterling is \$2.77½-8, while transferable sterling is quoted \$2.78-4. The narrowing of the spread between these rates and the fact that both are now close to the rate for official sterling are evidence of the greater interchangeability of the various types of non-resident sterling. Even the relatively black market for resident sterling, which flourishes in New York, the Middle East and Hong Kong, can quote close rates around a middle price of \$2.76½. The activity of these markets provides a fair measure of the extent to which all types of sterling are now convertible.

The link between transferable and security sterling is now so close that overseas foreign exchange dealers normally hedge between the two, being content to cover a long position in one by a short position in the other. In the recent heavy buying by American investors of certain British oil shares supplies of "switch" sterling have been insufficient and there is evidence that transferable sterling has also been used. There is also a link between the rates for the two varieties through the relatively free markets within the sterling area of Kuwait, Bahrain and Hong Kong. Dollars earned in those territories tend to find their way into sterling through the cheapest route, and usually that has been through security sterling. The operation by which the Middle Eastern holder of dollars transfers into sterling is often devious: it may involve the purchase of dollar securities and their sale against sterling to a non-resident holder of switch sterling.

The buying of sterling from these quarters has been substantial, but the official market rate which should have received its support, has not benefited, while the rates for cheaper types of sterling have been forced upwards. At the same time transferable sterling has been supported by purchases on behalf of certain European central banks in an attempt to minimise their EPU deficits. These purchases may account for the fact that there has been no need for the Exchange Equalisation Account to support transferable sterling for some time past and that the rate

has held firm despite the absence of support. These developments underline the essential homogeneity of the various types of sterling in a world in which it is still widely used for international transactions and in which the growing freedom of commodity and financial markets is constantly pulling against the segregation of sterling into watertight compartments.

The Cotton Board's Case

THE Cotton Board has now published the detailed case it has presented to the government for protection against duty-free imports of cotton cloth. The case—rejected more than once—is now opened to public inspection. It is at its best when emphasising the changed pattern of world manufacturing since 1932, when Britain undertook to continue under the Ottawa Agreements the duty-free entry of cotton and certain other manufactures from the Commonwealth. No one then foresaw the emergence of India as a leading exporter of cotton goods, with major markets in Britain and the Commonwealth. In contrast, the rayon industry is protected by a preferential duty that is five-sixths of the full rate, and the motor car industry by one that is two-thirds of the full rate (33½ per cent).

The case is weakest when it harps on the lower wages in Indian and Hong Kong mills and of the Indian mills' access to domestic cotton at prices below the world level (an advantage which should diminish with the fall in world prices). The board states that it is impossible for Lancashire to bridge the gap between its own and Indian and Hong Kong prices, ignoring that the gap need not be completely bridged for Lancashire to be competitive. Nor does it satisfactorily explain why Lancashire has lost ground in overseas markets to European as well as to Asian competitors. When discussing the fall in production and employment it ignores the decline in business attributable to the fall in prices of raw cotton. The impression is created that the industry's troubles can be blamed entirely on events beyond its control.

How the Boom was Financed

MUCH of the information published last week in the preliminary white paper on national income and expenditure* was "scooped" by the Economic Survey published the day before: but the white paper fills out some details of the national finances during 1955. It traces, for example, the sources from which industry raised the money to finance the heavy investment in fixed capital and stocks that played so significant a part in last year's boom. Trading profits of companies and public corporations rose markedly less than in 1954 (by 8 per cent against 12 per cent). This slackening in the rate of increase in profits had to be contrasted with the considerable increase in industry's needs for finance.

* Preliminary Estimates of National Income and Expenditure, Cmd 9729

Whilst undistributed profits of companies, after tax, rose by only £114 million, to £1,496 million, their fixed investment rose in value by £206 million (very nearly one quarter), and their stocks by £285 million, so that for once they were investing substantially more than they ploughed back. The decline in corporate liquidity was apparently mitigated in part by finance from other sectors, notably the central government. Gross fixed capital formation by persons, companies and public corporations rose by £369 million; that of the central government rose by £4 million, while local government investment fell by £79 million. Physical stocks held by the non-government sector rose by £471 million which was £226 million more than in 1954; and £236 million (an increase of £156 million) was needed to provide for the increased cost of stock replacement.

In total, the net extra needs for finance amounted to almost £700 million. Of this, £308 million was provided by the transformation in the balance of payments (to a deficit of £103 million) and a further £233 million by an increase in the Government's current revenue surplus. Savings by persons, life offices and unincorporated businesses are also estimated to have increased, by £70 million, to £962 million. While this is always the least reliable of the estimates of the statisticians, since it is calculated as a residual, it seems to support the evidence of a marked recovery in savings in the personal sector since 1951.

Better Control for DSIR

POSSIBLY the hardest decision in any single research project—and probably the most important in successful administration of any continuing research programme—is to know when to stop. This, according to an interim report published this week by a committee of inquiry, has been the main weakness of the Department of Scientific and Industrial Research. Organised as a government department whose secretary has the responsibility to "co-ordinate, guide, serve and in some respects to control the centres where the research is done," the DSIR, the committee thinks, has been unable to secure the most efficient use of these research resources in the national interest. As a result, many research projects have been started: too few stopped. The committee suggests, therefore, that the work of DSIR should be under the charge of an executive council rather than the present purely advisory council: and this change is being made in a bill now before Parliament.

The importance of getting full value for its money is accentuated by the small amount DSIR has, in all, to spend. It operates on a budget of £6.5 million a year, out of which sum it supports 14 research establishments and makes grants totalling £1.3 million to 45 separate co-operative research association that also receive some support from industry. It is hardly surprising that to the DSIR the money never seems to go far enough. In its annual report for 1954-55, the department complains that it has received from almost every research section "pleas that the resources available for particular purposes are in fact inadequate or likely soon to be inadequate."

This was the first year in which the DSIR was working to its new 5-year plan which assured it of a steady annual

THE BRILLIANT

PATHFINDER

for Magnificent Motoring

Drive the brilliant Riley Pathfinder and... almost at once... you are aware of remarkable road-holding qualities; stability with surging power.

Fast cruising in luxurious comfort; fast cornering in perfect safety; fast climbing with ample power in reserve.

The traditional Riley virtues are all there with a plus. This masterpiece of engineering combines with other exclusive Riley features to emphasize the Riley reputation for Magnificent Motoring.

Thrilling to drive - wonderful to own

Here is a car far ahead of its price-class for brilliant performance, distinguished appearance and spacious luxury.

Simon resources and experience are brought
to bear on many industrial developments of
national and international importance.

SULPHURIC ACID

Many Simon-Carves sulphuric acid plants are used in oil production at great overseas refineries. Others in Britain and abroad help to increase world harvests by supplying acid for fertiliser manufacture: among these are two important new plants in Australia. Also in Australia are plants operating in the vital field of Uranium production. At home the output of acid is significantly increased—and payments for imported materials reduced—by two great plants at Billingham and Widnes which make sulphuric acid and cement clinker from British anhydrite.

income of rather more than £6 million in place of a sum fixed annually. For the first time, this enables the DSIR to plan on the long-term basis essential to research, but it also means that as costs rise, the number of projects supported has to be trimmed to fit the confines of the 5-year budget. If all its sections are to discharge their responsibilities the department hints that it may soon have to invoke special clauses in the five-year plan that allow for adjustments when rising prices outstrip its income.

Monopoly Inquiries Shelved

ANY suppliers of sand and gravel in central Scotland who were alarmed by the Monopolies Commission's recent conclusion that their price fixing arrangements operated against the public interest and ought to be discontinued had their fears quickly allayed, if perhaps only for the time being. At the same time as he announced the Commission's conclusions in the House of Commons Mr Thorneycroft said the Government proposed to do nothing about them. This was in accordance with the policy already announced of taking no action upon matters that would become subject to the jurisdiction of the proposed new Restrictive Practices Court. Last week he added that for the same reason nothing would be done about the recent report on the tyre industry. This decision was rather more significant. A majority recommendation of the Commission in the tyre report was that individual resale price maintenance—which the Commission felt was the main instrument by which tyre manufacturers carried out their "gentleman's agreement" to quote common prices—should be made illegal. The new Restrictive Practices Bill, on the contrary, will in fact strengthen individual firms' power to enforce resale price maintenance. Mr Thorneycroft, however, did indicate that in his opinion this quite unwritten gentleman's agreement might fall within the definition of "arrangements" that will have to be registered and may be investigated by the Restrictive Practices Court.

The Monopolies Commission has also recently reported to the Board of Trade on the linoleum industry, but this report has yet to be published. Its inquiries into rubber footwear, industrial and medical gases, heavy electrical plant, tea, and standard metal windows and doors are nearing completion, and these reports will be published. At the suggestion of the Board of Trade it is shelving its inquiries into electric batteries, street lighting equipment, steel frames for building, common prices, and agreed tendering; when he obtains the power to do so under the new Bill, the President of the Board of Trade proposes to withdraw these references. The Commission will then be left with an inquiry into the single firm monopoly aspects of chemical fertilisers and with an inquiry into the supply of electronic valves, which Mr Thorneycroft contemplates converting into a "factual reference"—i.e., with no conclusions about its relation to the public interest. Until the new Restrictive Practices Court comes into existence, therefore, monopoly investigation in Britain will be to some extent in abeyance. Under the subsequent "two-tier" method of monopoly investigation and control, the Commission will be concerned with investigating single firm monopolies and agreements relating exclusively to export markets.

Credit Insurance Lends a Hand

IT is fitting, as the purse strings tighten and as the pace of competition in exports quickens, that the Export Credits Guarantee Department should cut its profits and reduce premiums. The reductions announced on Tuesday cost about £250,000 a year on the basis of last year's business. The effective cost will be less if the reductions stimulate more exports or if a larger proportion of British exports than the present 13 per cent comes up for insurance. Fortunately the need for concessions has come at a moment when the department can afford them. Mr Low, the Minister of State at the Board of Trade, disclosed this week that for the financial year just ended the department came out with about £3 million surplus whereas it entered the year with £610,976 deficit on commercial business. Since the premium income for 1954-55 was £2,900,000 and was probably similar in 1955-56, the profit last year was greater than the premium income. That was because the year 1955-56 included a "claw back" of more than £4 million out of the £23 million that the department had paid out on debts in Brazil. There is now a genuine surplus in the department and no one should argue that British export insurance is subsidised.

The concessions have been applied to those markets where stable conditions exist; in the less stable markets rates are by commercial standards low enough in relation to the risk. But the areas of fiercest competition are those where more than 80 per cent of Britain's total trade is done. These are the main concessions:

- (1) Premium rates are cut by 10 per cent to 20 per cent in 110 out of 170 markets. The present average premium on business up to 6 months with all markets under Section I of the Act is 11s. 7d. per £100 for 85/90 per cent cover against "risk on buyer," transfer and political risk. The prewar charge for 75 per cent cover against insolvency only was 12s. 6d. to 25s. according to spread. Thus even before the present cut, the cover was greater and the cost less.
- (2) Limitations are removed from the extended short-term cover introduced a year ago. Facilities for the lighter semi-capital goods such as tractors, heavy commercial vehicles, and light industrial machinery were then limited to 20 per cent of the exporter's insured turnover. That limitation is removed; moreover the maximum period of credit is ex-

42s. net.

Oxford University Press

tended from two years to a total (including pre-shipment credit) of three years.

(3) Insurance facilities for stocks held abroad are improved. Insurance is to be more generally available; it is to cover the risk of action by the overseas government preventing re-export of the stock; and it is to start from the date of shipment instead of from the date of taking the goods into stock. Moreover if the department decides to withdraw cover it must in future allow six months on existing stocks in which the exporter can dispose of his stock or ship it back.

These are substantial concessions, and they apply to substantial markets including the Commonwealth markets (of which Australia is the most important) and to some, but not all, the Middle Eastern markets.

Self-Generation for AEI

IN his second annual speech as chairman of Associated Electrical Industries this week, Lord Chandos again demonstrated his knack of raising wider issues without digressing from the affairs of the company. A year ago he raised the question of the supply of graduates in industry and other company chairmen followed him. This year he nailed his faith in long-term industrial expansion to the masthead and showed that to achieve it a high level of profits will be essential.

This is the thesis he propounded: the chemical and electrical industries must be among the leaders in the second half of this century; since 1900 the use of electrical energy has doubled itself every decade; since electrical devices amount to about 10 per cent of the cost of a nuclear power station and conventional equipment such as turbo-generators, switchgear and transformers to about 30 per cent, and since the demand for diesel-electric and electric traction is growing enormously, he expects the upsurge to continue. Indeed in some countries, of which Britain is one, it would not surprise him if the rate of growth was more than 100 per cent each 10 years.

In relation to that expected expansion he believes that the market's inability to supply the great amounts of finance needed will be increasingly felt. The needs of the big oil companies are already far beyond the capacity of the market; Lord Chandos believes that other big industrial companies will increasingly have the same experience. He regards legal or artificial dividend limitation as wholly unsound, but retained earnings "on at least the present scale" must be the main source of future finance. That to some shareholders may seem a bleak prospect, but to Lord Chandos it does not seem so. He hopes to maintain profits at a level sufficient both to carry out that capital development and at the same time to hold out hopes "over each decade of increased dividends."

Another Try in Wheat

AFTER nearly six weeks of bargaining in Geneva the International Wheat Conference has not been able to agree on the vital matters of the guaranteed quantities and maximum and minimum prices in a new wheat agreement.

In an understatement as disarming as it is masterly, the conference announced that it had adjourned, having agreed on a draft text, leaving to be decided *only the issues of prices, quantities and duration*. A final attempt to reach agreement will start in London on April 16th, when the conference will also consider further the proposals of Britain (which did not participate in the negotiations) for regulating the disposal of surpluses and rationalising wheat production.

There was general, though informal, agreement between importers and exporters on a new minimum price of 150 cents a bushel, five cents lower than the existing one. The importers suggested a new maximum price of 190 cents a bushel, compared with 205 cents now. After consulting the importers the chairman of the conference put forward a compromise of 195 cents, but the exporters stuck at 200 cents. Will the conference founder for the sake of 5 cents in the maximum price? The exporters would no doubt be readier to compromise if the importers could increase their guaranteed purchases.

Smokes and Drinks

PERSONAL spending on tobacco and alcoholic drinks rose markedly last year. From just under £1,700 million in 1954 total expenditure jumped to about £1,760 million, double the rate of increase of recent years and all of it was represented, moreover, in increased physical consumption. In real terms, smoking went up by 2 per cent, as the industry had expected, though the extra sales were captured by only two of the firms. The breweries, however, sold about 3 per cent more, and the distilleries and wine merchants marked up an increase of ten per cent or more so that drink sales in all rose 4 per cent. Drink sales, alcoholic or otherwise, owed a lot to the summer weather: the sun brought at least a temporary halt to the slow decline in beer consumption.

Whatever the budget may have in store for these heavily-taxed habits it is difficult to see a similar expansion coming this year. But expenditure on smoking and drinking has often proved inelastic to changes in total spending power or in customs and excise duties, and with the possible exception of the breweries all the industries concerned are privately hoping to do at least better than last year. The Board of Trade's figures of retail sales do not as yet yield many clues. But the impressive gains recorded in sales of drinks and tobaccos by the larger retailers came to an abrupt halt in January, and off-licence shops and tobacconists amongst the independents turned in some minuses during that month.

A Blow to the Gold Clause

MUCH of the time of the Council of Foreign Bondholders is spent in upholding the "gold clause" in foreign loan contracts. It forms part of the security of many foreign bonds and gives the bondholder protection against currency devaluation. Those efforts are not affected

THE steel AROUND YOU

The United Steel company supplies raw materials to all those industries which provide and maintain the comfort and security of the home. In this sense you depend upon United Steel for your light, heat and power, your water, telephone, furniture and equipment for your house itself.

Because United Steel manufacture the most comprehensive range of iron and steel products in the country, the markets of the company are stable, a diversity that offers a secure future to all concerned in the enterprise.

the things they say!

I might have begged a lift of that tanker driver.

Why should he stop for you?

Well, I took the plunge some time ago, and bought some I.C.I. stock.

I.C.I.? Rubbing shoulders with the big brass, aren't you?

Not a bit of it. Most of the stockholders in I.C.I. are small investors like me.

That's hard to believe.

I used to think the same — until I checked the facts. The truth is, 85% of the stockholders hold, on the average, less than four hundred £1 units of stock each.

But the rest hold a nice little packet, I'll bet!

Wrong again. There are surprisingly few large holdings and most of those belong to life insurance companies, pension funds and investment trusts.

So the money is spread throughout a very wide circle, when you work it out.

Yes, but somebody must hold a controlling interest.

The business is too big for that to happen.

There are over 200,000 stockholders.

How are you so well up on your facts?

Well, my own son works for them, you know. There's another thing — he's a stockholder himself now! With the new profit-sharing scheme in full swing, more than 80,000 employees like him now have their own stake in the company.

by the legal decision in the case of Treseder-Griffin and another versus the Co-operative Assurance Society Limited. But the gold clause in purely domestic contracts received a blow from that judgment which will, if it is upheld by the House of Lords be fatal to landlords seeking to protect themselves by inserting gold clauses in their leases.

The case concerned a lease of shop premises given in the 1930s which included the words "paying either in gold sterling or Bank of England notes to the equivalent in gold sterling the rent of £1,900 . . . by equal quarterly payments." The majority judgment found the gold clause unenforceable because "no one shall buy, pay, or receive any gold coin for more or less than the true lawful value which it did by its denomination import" and because it is unlawful for a creditor to stipulate for the payment of a money debt in any other way than in normal currency.

Landlords who have used various methods of protecting themselves against currency depreciation still hope to be more successful with some of the "inflation clauses" by which rents of business premises on long leases have been linked with various statistical indices. Amongst yardsticks which have been suggested for this purpose are (1) the cost of living index, (2) weekly wage rates for all industries, (3) cost of consumers goods and services, and (4) the wholesale price index. It is believed that at least one important property company has linked its rents to the index of weekly wage rates published in the Monthly Digest of Statistics, altering the rate when there is an increase of not less than 10 per cent compared with a datum figure. It remains to be seen whether this method will be challenged in the courts.

Searching for Whales

SEARCHING for whales in the Antarctic is less chancy than looking for a needle in a haystack, but the margin for error is still uncomfortably great. For once the fleet of Hector Whaling, Ltd., appears to have been unlucky. Its catch in the season which ended last month was roughly half that of 1954-55. Production of whale oil fell to 11,600 tons from 24,800 tons, and production of sperm oil fell to 5,933 tons from 6,492 tons. Its competitors fared better. Salvesen and Company of Leith, a big private company, is believed to have done well; the Japanese and Dutch fleets caught rather more than last season, the Norwegian a little less and the Onassis fleet about the same. Allegations that his fleet has contravened international regulations have again been made by the Norwegians, who successfully applied to a Hamburg court for the seizure of about 9,000 tons of oil from an Onassis tanker. The total reported catch was a little below the permitted figure of 15,000 blue whale units, and production was probably in the region of 300,000 tons.

Sales were unusually late this season. Fairly small quantities were sold in advance last October at £85 a ton; then came a long pause while buyers and sellers haggled. Early this year between 30,000 and 40,000 tons were sold to a number of buyers at £87 10s. a ton, and early in March Unilever took about 110,000 tons at £84 to £85 a ton; Norwegian consumers took about 40,000 tons at the same prices. The bulk of last season's catch was sold at £75 to £80 a ton. Sellers have been helped by the shortage of

olive oil, which has led to a sharp advance in prices of other edible oils. But there is still something like 70,000 tons of whale oil unsold. The Japanese fleets have sold very little so far, and Mr Onassis has not yet been tempted.

New Twist in Synthetic Fibres

AMONG the important advances now being made in textiles is the development of "bulked" yarns; this promises to make synthetic fibres attractive over a wider field, one in which they will be more competitive with natural fibres and natural and synthetic mixtures. Hitherto, if a light, thin and smooth-surfaced fabric was required a continuous filament yarn would normally be used. But fullness, softness, warmth and a varied texture have generally called for spun yarns, and spun yarns of such synthetic fibres as nylon lacked the warmth, resilience and surface interest of cotton or wool, though they had other advantages of their own, notably superior strength and speed of drying. The process of bulking gives to a continuous filament yarn such as nylon properties that have hitherto been peculiar to the natural fibres, while retaining its original advantages. Some processes impart bulk only, some bulk and stretch, and some twist as well.

The Taslan process, which gives bulk but not stretch, was developed by du Pont. A nylon yarn treated by this process retains its strength and will dry almost as quickly as before. It gives a warmer feel and a more resilient fabric. Ban-Lon, a process developed in America by Joseph Bancroft and Sons, imparts bulk and stretch by permanently crimping a multi-filament yarn. Several British firms are now licensed to make both these yarns. British Nylon Spinners are introducing Agilon, a nylon yarn having bulk and stretch; each filament looks like a coiled spring. Bulk yarns are more expensive than ordinary types, but cheaper methods of processing are being developed. As the cost of bulking falls it can be expected that the application of these yarns in hosiery, apparel and fabrics will steadily increase.

The Youngest Public Corporation

UNTIL the South of Scotland Electricity Board published its first report and accounts last week, no financial details had been given of the assets that it took over when it was separated from the Central Electricity Authority a year ago. This new nationalised board was established by the Electricity Reorganisation (Scotland) Act 1954, which amalgamated the two area electricity boards and the two CEA generating divisions in South Scotland as an independent entity. It took over twelve steam and seven hydro power stations with a total installed capacity of 1,221,645 kilowatts, including the Portobello high pressure station, which is the most efficient thermal generating station in Britain, with a thermal efficiency of roughly 32 per cent. The two authorities have finally agreed to value the assets taken over by the new board from the CEA at £69,485,029; in its first nine months of operation, the new board spent another £10 million on capital expenditure, borrowing funds

to do so partly by an issue of stock to the National Debt Commissioners and partly through bank overdrafts. Its income from sales of electricity, some £20 million during the nine months, was about 10 per cent higher than that of the corresponding area boards in the last nine months of 1954, and it made a surplus after paying interest of £588,824, about 7d. in the £ of revenue.

The new board has taken over the programmes of extensions of generating capacity in its area that the Central Authority had already prepared for the years up to 1960 and has extended these to cover the loading conditions it expects up to 1963. Its development is broadly based on the principle that plant in South Scotland, plus the surplus power that the North of Scotland Hydro-Electric Board expects to be able to export there, ought to meet demand in the area under normal conditions. In practice, however, the board's system is run continuously interconnected with the CEA system in England, and generating stations on both systems are loaded and taken off load in the correct order of running costs per unit to ensure that power is generated at the lowest cost irrespective of whether it is made in Scotland or in England. The motives behind this separation of the two Scottish boards from the former British Electricity Authority, other than some gesture towards Scottish nationalism, have never been thoroughly explained. But the operations of this comparatively small nationalised authority derive an added interest from the suggestions of the recent Herbert Report that responsibility in the electricity industry might usefully be more decentralised.

Cans under Pressure

THE fivepence "per basis box" added to tinplate prices last week may not by itself have much effect upon sales of canned goods. The increase was well under one per cent and tinplate forms only a small proportion of the cost of a filled can in the shop. But any factor that may help to slow down the boom in this item of consumers' purchases this year will be welcomed by the steel industry, since about £7 million was spent last year on importing tinplate to meet rising home demand. It is too early to detect any slackening in spending on canned goods yet: the weather of the last few months and some shortages of fresh vegetables have made sales exceptionally brisk. But a number of the newer packs that are bought more as luxuries rather than as necessities for the larder may feel the pinch of the Chancellor's cuts.

Additional capacity at Richard Thomas and Baldwin's tinplate mill at Ebbw Vale and the new plant of Steel Company of Wales at Velindre should be contributing to tinplate supplies this year but not until the summer canning season is over. As these mills may draw some labour from the existing mills, home production may rise in 1956 by only 40,000 tons or so to about 870,000 tons. This ought to permit a cut to be made in imports. But the companies have arranged to ship only 35,000 tons against 80,000 tons last year; no doubt some of their customers will be ordering for themselves as they did last year when they purchased about 7,600 tons. Since home consumption has lately been growing at more than 10 per cent a year and direct exports could be pushed above last year's 317,000 tons, supplies could become very tight for a while during the summer.

A Pound of Clean Potatoes

IT is about three years since fresh fruit and vegetables began to be sold on any significant scale in Britain in pre-packed form—that is, already wrapped up before the customer buys them. About 100,000 of these packages—usually transparent sealed bags of cellulose or polythene film, containing fruit and vegetables that had generally been cleaned—were sold in 1954. By the end of 1955 turnover had reached about 2½ million packages a month, and during 1956 growers hope to sell about 60 to 70 million separate packages in this form—with a total retail value of perhaps £2-£3 million, compared with total fruit and vegetable sales of perhaps £600 million a year. The firms that have taken up this system—growers and manufacturers of packaging materials who are at present selling to a very large extent through self-service shops—think that eventually they may be able to sell ten times as much. In the United States about one-fifth of all fresh fruit and vegetables is put into packages before the shopper sees it. Enthusiasts for prepacking in this country hope to be able to sell about 5 per cent of the kinds of produce that it is possible to pack; but this modest ambition would secure them between a quarter and a third of the turnover of the canning industry.

At present, pre-packaged fruit and vegetables cost 1d. or so a lb more than the same produce loose, but growers argue that the quality is generally better and that the dirt and waste are usually removed before the customer gets the goods. The packaging—a net or transparent bag, with sometimes a cardboard stiffening—costs perhaps 2d. or 3d. per lb of fruit and vegetables. But the growers hope to offset this by making savings in distribution and by packing on a large scale at central factories in growing areas. It intends to guarantee the margin of higher quality by using brand names and probably by dating fruit and vegetables inside the package. About 100 growers are now co-operat-

How Automatic Can You Get?

In modern production processes it is normal to control automatically a number of related variables. The eventual product is analysed. If it is found that there could have been a more effective setting of the process controllers, they are changed for the next day's run.

But imagine that, as the product comes off the production line or out of the pipe line, it is immediately analysed and the process controllers *automatically* re-set to the optimum settings to produce an even better product.

Although this cannot yet be realised, it is no pipe dream. It is something which Sunvic Controls have been working on for many years—and is just one example of the extra facilities they will be offering in the course of time towards increased production efficiency in industry. This kind of research naturally attracts some of the best brains in industry, and there is always room at Sunvic for younger men with scientific or technical qualifications who are interested in joining a fast-expanding Company engaged in absorbing and important work.

Today Sunvic takes control

Advantages for the Location of New Industry

RAW MATERIAL SUPPLY.—World-wide shipping services and direct access to inland waterways.

LOCAL SUPPLIES—Chemicals, solvents, pigments, adhesives, oils (mineral and vegetable), chalk, cement, leather, engineering services, fish, grain and wood products, packing material.

LABOUR—Immediately available.

MARKETS—HULL serves an inland population of 14,000,000 and exports to all parts of the world.

There's plenty of room up top!

If your volume of production is creating a storage problem—here's your answer. When you cannot spread, go roofwards. Up into the CUBIC spaciousness, leaving more space below for production and movement. Your gain will be threefold; Storage cost—per-unit will plummet; Freed floor space will increase production. Conditions of free movement will stimulate production per man per machine. "Mechanised Muscle" can effect this transformation for YOU now.

Lansing Bagnall, Pallet and Stillage Trucks, Tractors and Trailers are designed especially for your lifting, stacking, towing and carrying. The result of their labours is money saved and money made. It could be YOURS. Write at once to Survey Department.

ing with packers or packing themselves; some of them, operating on a fairly large scale, are using bulk imported produce to balance their own growing seasons—though this may raise difficulties in guaranteeing quality.

Obviously any considerable development of this way of selling fruit and vegetables would mean significant changes in the normal distribution system. More than 1,000 retailers are handling pre-packed produce at present, including co-operatives, multiples and chain greengrocers, and some of the larger retailers have begun to pack the fruit themselves. The development is as yet almost too small to have much impact on the wholesalers and on the whole transport and distribution system which works through the fruit and vegetable markets. Most of the growers at present using it are by-passing the markets, and think of continuing to do so when they start packing on a much larger scale—possibly in co-operative packing factories. But larger deliveries of this pre-packed produce might involve significant investment in transport and handling facilities. It would be very early to assume that the fruit and vegetable wholesaler—who will in any case handle in bulk most of the fruit and vegetables sold—will not have a role to play in distributing this packed produce.

SHORTER NOTES

Mr Molson, Parliamentary Secretary to the Ministry of Transport, made it quite clear in an adjournment debate before Easter that the government were in no way inclined to subsidise the cost of street and off-street parking in

towns. If any doubt—or hope—still lingered about this in motorists' minds after Mr Watkinson's statement a week before, this categorical statement should finally remove it. But one factor still needs clearing up. A clause has been written into the Road Traffic Bill to forbid the use of the net proceeds of parking meter charges for anything but helping to meet the cost of off-street garages. Whose garages will this money now subsidise?

Following the confirmation that Britain's first general purposes synthetic rubber plant is to be built at Fawley, where it will be near to the Esso oil refinery, a goodwill mission of British rubber manufacturers has left for Malaya for talks with the rubber producers. The British delegation's view is that Malayan fears about British synthetic rubber plans are exaggerated. The delegation includes representatives of the Dunlop Rubber Company, the British Rubber and Allied Manufacturers' Associations, Firestone Tyre and Rubber Company, and Goodyear Tyre and Rubber Company (Great Britain).

Since the increase in Australian bank interest rates last month, the interest factor in the sight and after sight buying rates of Australian exchange in London has been raised from 4½ to 5½ per cent. The new rates at sight are £A126 13s. 3d. seamail and £A126 1s. 6d. airmail; at 90 days, £A128 7s. and £A127 15s. 3d., respectively. The telegraphic transfer rate remains unchanged at £A125 10s.

Company Notes

UNITED DRAPERY. The preliminary statement of United Drapery Stores for the year to January 28th is satisfactory in composition and in content. The ordinary dividend for the year, equivalent to 32½ per cent on a capital of £6,932,108 as doubled by the free scrip issue, is well up to expectations, and it compares with the 1954-55 dividend of 50 per cent on a capital of £2,946,054. On this dividend the 5s. shares at 22s. 6d. yield 7.2 per cent. The group's trading profits rose from £4,550,778 to £6,091,144, and although the latest profit includes for the first time the earnings of Alexandre the increase cannot be wholly attributed to the acquisition of this new subsidiary. The preliminary statement also includes a draft balance sheet, showing that the revaluation of the group's properties, excluding leaseholds valued at £2,038,000 which expire before 2000, has resulted in a surplus over book values of £4,076,134. Sensibly £3,360,042 of this surplus has been used to write down goodwill to £1. As a result the net assets of the group are shown at £21,364,889, compared with £13,350,094 at the end of January, 1955.

The company in 1955 was discussed in *The Economist* of March 24th. The full accounts show that profits for the year, after depreciation but before taxation, fell from £19.3 million to £17.9 million. Of this nearly £11 million (£3.5 million in depreciation and £7.4 million in reserves) was put straight back into the business. These retentions and the running up of trade creditors (from £21.5 million to £28.2 million) enabled the group not only to spend £9.5 million on fixed capital but also to add £5.3 million to stocks and work in progress and about £2 million to liquid assets. Total liquid assets at the end of last year came to just over £47 million but during the year the directors, attracted by high interest rates, switched out of cash and tax reserve certificates into British and Irish Government securities, and British and American treasury bills.

The company has to keep a high proportion of its assets in liquid form to meet the costs of capital development and it is sound sense to make these assets earn their keep in the most profitable directions. Twelve months ago the chairman said the company's expansion programme would cost about £60 million in the next few years. The company was already rich in liquid assets and it has been estimated

that it needs to hold back about a further £7 million a year in depreciation and reserves to finance its development programme. That was achieved easily last year; it should be achieved again this year though, perhaps, with less ease. But outstanding capital commitments are estimated at nearly £16 million, compared

£1 ordinary share at 32s. 9d. x d. yields £4 11s. per cent.

with £4.3 million at the end of 1954, and the inference must be that Ford Motor will have to draw upon its liquid assets this year to keep up the present rate of capital expansion. The moral from this and the decline in profits for ordinary shareholders is obvious. Last year they had to be content with an effectively unchanged dividend. Dividends will have to be conservative for some time ahead.

FORD MOTOR. The decline in the profit margins of the Ford Motor Com-

ALBRIGHT AND WILSON. Traditionally the chemical industry works on low profit margins on its established basic products. The report from Monsanto Chemicals suggested that though sales were still rising these margins were being squeezed last year. The preliminary statement from Albright and Wilson confirms the impression. Six months ago, in the half yearly statement, the directors of Albright and Wilson looked forward to "a further expansion of turnover" but then drew attention to "mounting costs." Their latest statement, showing that gross trading profits advanced only from £3,133,575 to £3,199,914 over the whole of 1955, strongly suggests that higher costs did indeed trim profits.

The fall in profit margins, rather than the decline in net earnings from £881,616 to £780,551, is the significant fact for ordinary shareholders. They will receive, as foreshadowed in November when the company bought Marchon Products and made a rights issue, a dividend of 18 per cent, compared with the equivalent of 15 per cent, for 1955. The new shares issued as rights do not rank this time. In the coming year dividends on the present £4,563,639 of capital will be payable. Earnings from Marchon Products and Solway Chemicals will also be brought into account. On the assumption that those two facts together with the squeeze on profit margins point to the maintenance of the 18 per cent dividend, the 5s. ordinary shares at 18s. 10d. yield 4½ per cent.

REYROLLE. The preliminary report of Reyrolle, the electrical engineers, for the year to December 31st is sketchy. But the brief news it contains should please shareholders. Gross trading profits appear to have risen for taxation is up from £1,519,294 to £1,690,587 and the net profit after tax has gone up from £1,647,017 to £1,986,296. The latest net profit includes a special credit of £232,372, representing a surplus arising from a revision of the basis of valuing work in progress made at the request of the Inland Revenue.

That Reyrolle has enjoyed another good

year of trading seems to be confirmed by the decision to raise the ordinary dividend from 15 to 16½ per cent. The announcement sent the market price of the £1 stock units up to 92s. xd. The yield as is usual in companies with atomic interests is low. At only 3½ per cent it is slender enough even allowing for the big earnings cover.

BRITISH OXYGEN. The consolidated balance sheet of British Oxygen Company was drawn up to September 30th, only two months after the rights issue of ordinary shares had brought £8,117,698 into the company's coffers. The injection of new money has raised the issued ordinary capital from £8,117,698 to £11,364,777 and the share premium account from £1,977,476 to £6,718,863. The first purpose of the new issue has been accomplished with the repayment of the £4 million of 3½ per cent unsecured loan stock. The rest of the new money was needed to finance capital developments but at the date of the balance sheet it was still largely held in liquid assets. Over the year the total of cash, treasury bills and tax reserve certificates rose from £3,458,565 to £5,097,236. This money will soon be absorbed for outstanding capital commitments on September 30th were estimated at £4,300,000.

New money was needed if British Oxygen was to keep up the pace of capital development. In the year to September 30th the gross book value of fixed assets increased from £36,165,726 to £40,063,035 and their net book value from £20,585,116 to £22,917,132, absorbing the money the company was able to tuck away in depreciation and reserves. At the same time the need for working capital grew, with stocks and work in progress rising from £7,757,515 to £9,461,399.

Another aspect of the growth of the share premium account and of other reserves is the decision to make a 50 per cent free scrip issue. On the assumption that the 15 per cent ordinary dividend will be reduced in proportion to this issue, the £1 ordinary stock units at the current price of 56s. 6d. ex-dividend, but not yet ex-bonus, yield 5.3 per cent.

LONDON STOCK EXCHANGE

Next Account begins: April 18th
Next Contango Day: April 18th
Next Settlement Day: April 10th

THE improvement in gilt-edged prices has been maintained since Easter by the recent strength of sterling, reinforced on Wednesday by the disclosure of a further rise in the gold and dollar reserves. War Loan rose to 74½ and on Thursday Old Consols gained ½ to 54. The new 5 per cent Surrey stock, issued at par, fell to a discount of ½ on Wednesday, while the similar 5 per cent Edinburgh stock, issued 10s. per cent cheaper, eased to ½ premium.

Berlin bonds rose rapidly to 106½ on hopes of a settlement, and the new Peruvian Transport scrips all advanced in early dealings. The 5 per cent convertible debentures reached \$195½ before receding to \$192½. Insurance shares responded to the announcement of higher dividends; Equity and Law Life jumped 1½ to 5½ and Alliance rose to 76s. 3d. and Legal and General advanced to 22. Stores improved with GUS "A" rising to 37s. Dealings in industrial shares on Thursday reflected the greater optimism which followed the announcement of the gold reserve figures. Associated Portland Cement gained another 4½d. to 94s. 10½d., Rolls Royce 3d. to 95s. 3d. International Nickel were firm at \$168½ and Turner & Newall at 102s. 9d., Unilever at 73s. 9d. and Borax after the exceptional rise to 9½, all found support.

The oil market under the influence of substantial American buying proved the greatest attraction of the week. Originally the sharp rise in Shell dominated the market, but on Tuesday British Petroleum rose 10s., carrying with it Burmah which advanced 4s. 1½d. The market turned dull again on Wednesday but in early dealings on Thursday Shell rose 2s. 3d. to 149s. and British Petroleum and Burmah were firm at 115s. and 72s. 6d. respectively. Hudsons Bay rose 3s. 6d. on Thursday. Coppers failed to hold their recent gains; Nchanga fell ½ on Wednesday to 15½ and Rhokana lost ½ to 41½. Kafirs also turned dull, Vaal Reefs losing 9d. to 30s. 1½d. Tea shares have had a steady rise.

⁽¹⁾ Electricity production for New Zealand represents about 87 per cent of total generation. ⁽²⁾ Copper and tin refer to metal production. ⁽³⁾ General trade (including re-exports) except for Canada, which is special trade only. Imports are c.i.f. except for Australia, Canada and S. Africa which are f.o.b.; exports are f.o.b. Trade for India and Pakistan includes that going by land, except for Pakistan in 1948 when figures are for trade by sea and air only; annual figures for India are for 12 months beginning April 1st of year stated and for Australia and Pakistan 12 months ended June 30th. ⁽⁴⁾ Gold and foreign exchange holdings are those of the government and central bank; only figures for Australia include holdings of commercial banks. Cost of living for S. Africa and S. Rhodesia relates to Europeans only and for S. Africa includes direct taxes. ⁽⁵⁾ Including some long-term securities. ⁽⁶⁾ Including semi-processed gold. Beginning January, 1955, including South-West Africa. ⁽⁷⁾ In July, 1948, part of holdings was transferred to the State Bank of Pakistan. ⁽⁸⁾ April, 1948—March, 1949.

⁽¹⁾ Figures calculated on the basis of a new and larger sample. ⁽²⁾ 1939 figures not strictly comparable with rest of series; stocks are at end of period. ⁽³⁾ All commercial banks. ⁽⁴⁾ Annual figures are totals for the fiscal year ended June 30th. ⁽⁵⁾ Average for third quarter.

Financial Statistics

EXCHEQUER RETURNS

In the financial year ended March 31st ordinary revenue was £4,893,143,000 compared with £4,737,892,000 in the previous year. Ordinary expenditure amounted to £4,459,551,000 compared with £4,268,659,000 in 1954-55. The "above-line" surplus (after allowing for Sinking Funds of £36,489,000) was £397,102,000

compared with £433,166,000 in the twelve months before. Ordinary revenue exceeded the revised Budget estimate by £167,993,000 while ordinary expenditure fell below the estimate by £160,392,000. Consequently the Exchequer was left with a surplus which was £328,385,000 larger than had been expected.

COMPANY MEETINGS

THE CHARTERED BANK OF INDIA, AUSTRALIA AND CHINA

LAST YEAR'S RESTRAINED OPTIMISM JUSTIFIED

LARGER NET PROFITS DESPITE INCREASED COSTS

MR V. A. GRANTHAM'S REVIEW OF FAR EAST CONDITIONS

The One Hundred and Second Ordinary general meeting of The Chartered Bank of India, Australia and China was held on April 4th at 38 Bishopsgate, London, E.C.

The following are extracts from the statement by the chairman, Mr V. A. Grantham, which has been circulated with the report and accounts for the year 1955:

INTRODUCTORY

The report I have to present will be found to justify the note of restrained optimism upon which I concluded my statement last year. Political relations between the Peoples Republic of China and the Atlantic countries are less strained but fundamental differences remain unsolved. The volcanic situation in the Formosa Channel continued surprisingly quiescent and towards the end of the year its menaces were obscured to some extent by new crises in the Levant and the Middle East. The tide of Asian nationalism continues to flow strongly and it is inevitable that this should follow emancipation from colonial rule. No harm can emerge from this provided that as the new Asian regimes become more mature politically they realise that in the modern world no country, however well endowed in material resources, can live in isolation.

Since the end of the War it has been assumed that the achievement of political independence would liberate hitherto submerged reserves of zeal for the public good and impart a new sense of responsibility to labour. To some extent this has happened but the redistribution of power, both political and economic, may be gravely imperilled by the pressure of population. It is useless to attack poverty by political and economic measures if hardly-won improved living standards are submerged by an infinite multiplication of mouths to feed. This is not a problem which can be remitted to the third and fourth generations; in several eastern countries it already exists.

ANSWER TO COMMUNISM

It is often said that the answer to Communist propaganda and infiltration in the East is largely to be found in the granting, by the Atlantic countries, of generous economic assistance. Aid must be given, however, in ways which do not affront national pride or damage the national economies, particularly those which are necessarily still based upon agriculture. No constructive purpose can be served by unloading upon Southern and South Eastern Asia export surpluses of agricultural produce and of consumers' goods that the recipients wish to grow or manufacture themselves.

The eastern lands need technological assistance most of all and of that there would not appear to be a large export surplus in the United Kingdom. Of the making of five-year plans there seems no end. Some

of them are soundly conceived and they should do much to provide productive employment in countries where large reserves of man-power are dissipated in endless divisions of labour. But there is a limit to what the world can consume in relation to its population and the ultimate success of these plans must depend upon a balanced economy where the increase in population, which is bound to take place, is more than matched both by increased production and internal consumption.

THE CONSTITUTION OF THE BANK

A year ago I said that the Directors felt that in consequence of the closing down of the branches in China which had for many years constituted an important part of the Bank's overseas establishment there must be expansion elsewhere. To facilitate expansion when opportunities offer it is desirable to obtain a revision of those provisions of our Royal Charter which circumscribe our overseas organisation. The Court of Directors have accordingly petitioned Her Majesty the Queen for the grant of a consolidating Royal Charter. I am pleased to say that Her Majesty's Treasury have intimated that they approve of the changes proposed. In a letter to the stockholders which accompanies this report I have explained in detail the constitutional and administrative changes proposed by the Court of Directors.

THE CBI DEVELOPMENT CORPORATION LIMITED

For many years the business transacted by the Bank was related almost wholly to the financing of overseas trade and to the provision of banking facilities and services for a clientele which consisted mainly of merchants. Between the wars the merchant communities became increasingly associated with local enterprise throughout the East and the industrialisation of hitherto undeveloped countries was accelerated. These tendencies have been accentuated by the upsurge of Asian nationalism since 1945.

The Bank has achieved a good deal of success in adapting its operational technique to changed political and economic conditions and during the past ten years an increasing proportion of its resources has been employed in the financing of infant industries and new public works. Many of the credit operations that the Bank is now being asked to undertake are likely to extend over periods longer than those for which banking accommodation is usually granted. I am sure that the Bank's continuing to operate in the East can be justified only for so long as it is willing to associate itself with the economic development of the territories it serves.

EXPANSION OF CREDIT FACILITIES

Nevertheless, it is not possible, from the ordinary banking point of view, to expand

the dispensation of what may be called medium-term credit, that is to say, the granting of accommodation for periods extending from two to ten years, and it has become apparent that a new type of credit institution is required to finance development, both agricultural and industrial, and to sponsor, and perhaps underwrite, the raising of capital from the public. To meet these requirements within the Bank's sphere of activity the Directors have formed The CBI Development Corporation Ltd., which has been registered with an authorised capital of £2 million, of which £500,000 has been paid up.

The new company is a wholly owned subsidiary of The Chartered Bank of India, Australia and China and I am pleased to say that Sir John Tait, Sir Henry Richards and Sir Arthur Bruce are associated with me as Directors. I am hopeful that the new institution will be able to play an important part in assisting those countries with whose prosperity the Bank has been so long identified to modernise their economies. Medium-term credit institutions have been formed under the aegis of the governments of several of the countries of Southern and South-Eastern Asia. It must be presumed that these government-sponsored institutions will undertake the financing of major industrial enterprises and public works schemes but there are likely to be many projects on a smaller scale which the Bank's development corporation could effectively support.

COURT OF DIRECTORS

I record with deep sorrow the death on May 26, 1955, of Mr James Leslie Milne, who was elected to the Court of Directors in 1942 and served as Deputy Chairman from April 5, 1950 to 1954.

In the place of Mr Milne the Directors have elected to the Court Sir Charles Watt Miles, OBE, a partner in Messrs R. G. Shaw and Company. Mr Cecil Robbins Cherry who became a Director in 1948 resigned in July last on his retirement from business in the City of London. Mr Cherry has been succeeded by Sir Kenneth Brand Harper, Chairman of the Burmah Oil Company Limited.

THE STAFF

At home and abroad the Bank is served devotedly by the staff of all ranks and it is impossible to speak too highly of the work they do in their various capacities and in their different spheres.

THE BANK'S BALANCE SHEET

The total of the Bank's Balance Sheet has this year risen to £223,968,987, an increase of £20,283,292 over last year's figure. This is due partly to an increased volume of international trade in those Eastern countries in which the Bank is represented and partly to the higher prices of some of the staple Eastern commodities, notably rubber and tin.

On the left hand, or Liabilities side of the Balance Sheet, Current and Other Accounts, Fixed Deposits and Bills Payable show increases of £127,828,807, £10,175,189, and £485,423 respectively. Inflation has undoubtedly contributed to these increases. Acceptances on account of customers are down by £3,282,066, which is accounted for by the higher Discount Rate in London compared to other centres and partly due to the larger holding of sterling by Japanese Banks.

On the right hand, or Assets side, Cash in Hand, at Call and at Bankers shows the substantial increase of £6,591,069, the ratio to our "demand and time" liabilities, excluding Notes in Circulation against which security has been lodged, being 21.86 per cent against 18.54 per cent last year. The figure for Government and Other Securities apart from those lodged against Note issue, is lower by £3,898,420. As usual these have been taken into account at Market Value and we have made full provision for depreciation out of our internal reserves. Stockholders will be glad to know that all holdings are dated and in large proportion mature within ten years. Bills of Exchange and Advances to Customers and Other Accounts show increases of £2,439,731 and £17,133,312 respectively, once again indicating the extent to which we are assisting our customers and taking our share in financing World trade with Eastern countries.

Considerable expenditure continues to be incurred in meeting the cost of expansion and modernisation of our offices in the East. Without suitable premises and accommodation for our staff it is clear that our business cannot operate and we must expect to have to continue to set aside substantial amounts each year in the writing down of this item.

PROFIT AND LOSS ACCOUNT

The net profits for the year at £759,340 are higher by £36,193 than last year, in spite of increasing working costs in all countries where we operate. Fortunately these increased costs have been more than covered by increased business.

The scale on which world trade has increased during the last two years is due partly to the intense effort being made by each country to become self-supporting and partly to inflation. On either count it is vulnerable and liable to setbacks, and I would ask Stockholders not to lose sight of that fact.

The Bank paid an Interim dividend in September last of 7½ per cent, less Income Tax, absorbing £150,937 10s. and it is proposed that out of the balance now available a final dividend of 7½ per cent should be paid, costing £150,937, making the total distribution for 1955 15 per cent.

It is proposed to repeat the allocations made in each of the past five years to the Pension Fund and Widows' and Orphans' Fund of £125,000 and £20,000 respectively. The sum of £200,000 has again been applied towards writing down Bank Premises and Furniture Account. It is proposed to transfer £100,000 to Contingencies Account and to carry forward the increased balance of £405,375.

ADEN

Our branches in Aden, in highly competitive conditions, have continued to extend their connections with the commercial community.

INDIA

It is satisfactory to record that the country has continued to progress in the economic

field during the past year. Since the first five year plan was drawn up in 1951 the Indian economy has steadily gained strength and it now seems likely that whereas the plan was originally designed to expand the national income by 11 per cent over the period 1951/1956, the actual increase will be about 18 per cent. This increase is a result of the expansion of both agricultural and industrial output.

India's capacity to increase production of cereals and industrial raw materials such as cotton and jute has brought about an improvement in the country's balance of payments in the last few years, since food imports have virtually ceased and there has been a substantial reduction in imports of raw cotton. The rise in agricultural production owes much to favourable monsoons, but is also due to the wise planning of development expenditure in extending irrigation, to the increased use of fertilisers and to the general improvement which is gradually being effected in agricultural technique. In the industrial field production has also expanded following increased investment in industry and a more efficient use of existing productive capacity.

FALL IN PRICES

It is a remarkable fact that increased national income and substantial government expenditure in connection with the first five year plan has not been accompanied by inflation. Indeed, prices have tended to fall during the past year and the decline has been sufficiently marked to cause the government to support agricultural prices in certain areas. Fears have been expressed in the past that to implement the plan the authorities would be forced to resort to deficit financing on a considerable scale.

In fact it has not proved necessary to adopt this potentially inflationary expedient to anything like the extent envisaged when the plan was first drawn up, and there has been little difficulty so far in maintaining the country's foreign exchange reserves at a comfortable level.

SECOND FIVE YEAR PLAN

We now have the draft outline of the second five year plan. The Government's proposals are to stimulate rapid economic development and to create employment, commendable objectives which it is not easy to reconcile in a predominantly agricultural country like India, where an improved agricultural technique may cause unemployment rather than create jobs.

It is clear that the resources available fall far short of the expenditure envisaged under the second five year plan, viz., Rs.4,800 crores in the public sector and Rs.2,300 crores in the private sector.

Consequently a far larger measure of assistance from abroad will be necessary than has been the case under the first five year plan. Although foreign capital has been entering India in recent years, it has been doing so only on a modest scale. The Indian Government has received grants and loans from abroad and there has been investment from abroad in co-operation with Indian capital in particular industries. A substantial proportion of the foreign investment that has been made has been in the form of profits ploughed back by British firms already established in India. It is hoped that these sources of foreign funds will continue to assist the Indian economy but investment in particular must largely depend on confidence in the future of private enterprise. Export earnings will no doubt help to swell the country's foreign exchange resources but even so it is not clear how

sufficient foreign exchange is to be found to implement the new plan.

NEED FOR FOREIGN CAPITAL

In this connection I expressed hope last year that nothing would be said or done which would have the effect of discouraging individual effort or frightening away potential investors. Notwithstanding ministerial assurances it must be admitted that certain trends are disquieting. The nationalisation of all Life Assurance companies, many of which are shareholders in the private sector of industry, is not a happy omen, and from the point of view of overseas firms that employ specialised foreign staff the rates of taxation on income, which are in no sense discriminatory, do pose a major problem.

There are still many fields in the private sector of Indian industry where the capital, skill and enterprise of foreign firms could be of invaluable assistance to the Indian economy, but continued foreign investment in India and the promotion of industry with foreign help must necessarily depend not only on confidence but also on the ability to employ foreigners on terms that make overseas service attractive.

PAKISTAN

The outstanding event in the banking field in Pakistan during the past year was the devaluation of the Pakistan rupee to parity with the Indian rupee last August. When the United Kingdom devalued its currency in terms of dollars in 1949, Pakistan was the only country in the sterling area that did not follow suit. At that time Pakistan's balance of payments was in a favourable position owing to strong international demand for its staple exports, cotton and jute. Subsequently, and in particular since the collapse of the Korean war boom, the country's exchange reserves have been on more than one occasion under severe strain and the competitive power of the country's exports was not assisted by the over-valuation of the currency. For these reasons it had been expected for some time that the authorities would take advantage of a favourable opportunity to devalue the currency to a more realistic level.

In previous Statements I have referred to the aim of the government of Pakistan to change the basis of the country's mainly agricultural economy by pressing forward with a policy of industrial development. Efforts to accelerate this process have been intensified during the past year.

BURMA

Last year I mentioned that Burma's exchange reserves were being drawn upon at a rapid rate to finance government purchases of capital goods and equipment required for the country's economic development schemes. From their peak in the middle of 1953, when they stood at K.114 crores the external assets drained steadily away until last June when they totalled K.40 crores (£30 million).

They have lately increased slightly, a reflection of the drastic steps taken by government last March to restrict the volume of imports and of better overseas sales of the current rice crop.

CEYLON

Ceylon has enjoyed a prosperous year and the island's overseas trade surplus in 1955 reached record figures. Month by month throughout the year exports exceeded imports and in consequence, except for a small deficit in April, the external reserves continued to rise once again to the levels at which they had

stood at the height of the boom which followed the outbreak of the Korean War.

The measure of the progressive improvement that has taken place in the economic situation in Ceylon is that little more than two years ago, as a result of changes in the terms of trade following the collapse of the Korean War boom the external assets had been reduced to their lowest level since 1943, whereas during the past two years a combination of sound financial policy by government and the effective exploitation of remunerative markets abroad for rubber and tea has had the effect of almost doubling the external assets.

In order to assist development in the private sector of the economy the authorities are anxious to encourage foreign capital to enter local industry. Assurances have been given that nationalisation is not a general aim of government policy and that overseas investors will enjoy the same tax concessions as are extended to local capital entering new industry in Ceylon as well as unrestricted facilities for the remittance of profits and repatriation of capital. The stability of the balance of payments during the past two years strengthens the country's chances of obtaining additional capital from abroad at a time when it is on the threshold of an important phase in its economic development.

MALAYA

The past year has been a notable one for both the Federation of Malaya and Singapore. In the economic field, rubber and tin have fetched remunerative prices in the international market and both territories have enjoyed considerable prosperity. Great interest has been aroused by the publication of the long-awaited report of the World Bank mission on the economic development of Malaya, a report which, since it recommends the establishment of a central banking system, is of particular concern to this bank and the exchange banks in general.

Politically, 1955 has seen the accession to office of the first governments to be elected by popular vote under the new constitutional arrangements in both territories. In Singapore a succession of strikes caused much trouble and concern following the election but the new government showed commendable firmness in dealing effectively with a dangerous situation. In the Federation the Alliance party gained an overwhelming victory at the polls and the new government felt its position sufficiently strong to declare an amnesty for all those who had taken up arms against the Federation government.

COMMUNISTS IN INVIDIOUS POSITION

Although the amnesty failed to have the desired effect in bringing the Emergency to an end, the meeting which took place at the end of the year between the Chief Ministers of the Federation and Singapore and the Communist leader has put the Communists, in view of their decision not to surrender, in the invidious position of deliberately choosing to continue a revolt, directed now not against the British authorities but against a government which has been freely elected by the people of Malaya and to which, as far as can be judged from reports of the recent constitutional discussions in London, virtually complete control of its own affairs will be transferred within a comparatively short time.

The governments of both the Federation and Singapore have accepted in principle the recommendation of the World Bank mission that a central banking system should be established and it was recently announced that inquiries were being hastened forward with the object of implementing the proposal. It is a source of satisfaction that, in

connection with the project, the two governments have sought the assistance of the Bank of England which has made available the services of a senior official to help with the preliminary inquiries.

SELF-GOVERNMENT

Any review of Malaya, however short, would be incomplete without mention of what may be the outcome of self-government and independence. It seems to me that economically it would be to the obvious advantage, of both the Federation and Singapore, to unite. The World Bank report on Malaya is based on the assumption that the Federation and Singapore will be one economic entity with one Central Bank and one currency. At the moment I fear the indications are that such is not to be, and it seems not improbable, should both the Federation and Singapore proceed with the idea of a Central Bank, that they will have separate currencies. Should this be the case, and I sincerely hope it will not be, it is difficult to foresee the future of Singapore, which, with its labour troubles in no way facilitating its industrialisation plans, may have only its entrepôt trade to maintain its large and growing population.

It was reassuring to hear from the High Commissioner for the Federation of Malaya, when he spoke on the budget for the present year, that it remains the present government's policy to encourage investment from abroad and to foster conditions in which the overseas investor can continue to assist the Federation's economic development without fear of discrimination or unfair treatment.

NORTH BORNEO

Although trade figures are not yet available for the year there are indications that the aggregate value of North Borneo's exports increased substantially during 1955. This is mainly due to the prosperity enjoyed by the territory's principal industry, rubber. Shipments of rubber from North Borneo rose in volume by 17 per cent to 20,068 tons during the year and owing to the remunerative prices ruling in the international market for this commodity, have been of more than proportionately greater value compared with 1954. The rise in the aggregate value of exports has been reflected in increased imports but it is likely that there was a comfortable trade surplus for the year as a whole. In any case the additional expenditure overseas was largely concentrated on capital equipment and other necessities and should thus prove beneficial to the territory's economy in the long run.

As you are doubtless aware the currency in British Borneo is the Malayan dollar. With self-government, independence, and central banking on the Malayan peninsula it is possible that Borneo may not desire to have a currency outside its control and a solution may have to be found in having Currency Commissioners for a British Borneo dollar. A different dollar will in no way facilitate the large trade existing between the three colonies and Singapore and, indeed, unless transfers are free and the separate currencies kept at the same level, it may be positively detrimental.

SARAWAK

The rise in rubber prices in the international market has been of benefit to the economy of Sarawak. Shipments of rubber from the colony show an aggregate increase of approximately 50 per cent in volume and although final trade figures are not yet available for the whole of last year all indications are that rubber exports have more than doubled in value.

THE ECONOMIST, APRIL 7, 1956

Exports of timber have almost certainly reached record levels and the timber trade has continued to have the benefit of remunerative markets in the United Kingdom, Australia and on the Continent of Europe. On the other hand, pepper, which, excepting refined petroleum, was Sarawak's most valuable export in 1953 and 1954, had a less favourable year.

INDONESIA

It is gratifying that the underlying optimism which has sustained our operations in Indonesia and our faith in the Republic's ability to overcome its economic and other troubles are seemingly more warranted now than at any time during the last two years. The deterioration, almost continuous during that period, has been halted and the process of recovery has started and bids fair to continue.

This recovery, which is evidenced in financial, economic and political fields, dates from the replacement in July of the communist-supported coalition government by a strong Masjumi-led caretaker government determined to suppress malpractices, combat inflation and restore governmental authority.

THAILAND

The successful outcome of Thailand's decision last year to restore the rice trade to private hands paved the way for one of the most interesting postwar experiments in the Far East—a country returning to a free economy. When it was seen that private traders would succeed in disposing of the whole of the previous season's rice crop, the government, who are to be congratulated on the smooth and sensible manner of the transfer, introduced further measures to remove unnecessary restrictions on exports and followed this by freeing imports.

It is expected that adjustable customs duties will make luxuries expensive and keep imports generally within an acceptable pattern.

VIETNAM

Seldom can there have been more divergent views on the political and economic future of a country than those existing in Vietnam at the moment. Nevertheless, following the initial confusion resulting from the withdrawal of the French and the handing over of power to young and inexperienced administrators, order and stability have begun to appear.

To that extent conditions have improved but stability, economic and political, is dependent upon American aid, which will have to continue on probably an undiminished scale if the nation is to survive and make progress.

CAMBODIA

Cambodia is celebrating its independence with marked restraint and the young country's cautious approach to its monetary and economic problems has much to commend it.

Our own business in Phnom Penh has received fair treatment and encouragement from the authorities and the newly formed central bank and is developing along sound and conventional lines.

THE PHILIPPINES

For some years now in these reports I have been able to point to the Philippines as one of the few countries in South-East Asia having political and economic stability and I have more than once cited the Republic's successful struggle against inflation and its achievement in maintaining its international

THE ECONOMIST, APRIL 7, 1956

reserves at about U.S.\$300 million, or roughly equal to its note issue. Unfortunately 1955 has seen a very rapid deterioration in these key factors and at the end of the year the foreign holdings had dropped to a figure close to U.S.\$200 million.

As there were, too, no signs that exports, including the invisibles from American aid, were sufficient to cover imports it is not surprising that distrust of the peso was generated. Business circles for the most part are of the opinion that only the determined stand of the Governor of the Central Bank has prevented devaluation, and fears are expressed that unless a substantial loan is obtained from the United States there is the possibility of a change in the external value of the unit of currency.

HONG KONG

Although the external trade of Hong Kong during 1955 increased by almost five per cent in value from its level in the previous year, the figures indicate no fundamental improvement in the position of the entrepôt trade, which has always been the mainstay of the colony's economy. Exports to the China mainland declined drastically in value, a depressing indication that China prefers to import the limited range of goods and commodities which it is able to obtain from the free world direct from the countries concerned rather than through the entrepôt facilities of Hong Kong.

On the other hand Hong Kong's imports from China increased substantially, particularly in respect of textile yarns and piece goods, in the international markets from which China shows signs of becoming an increasingly important competitor.

CHINA

During the year we finally vacated our premises in Shanghai and transferred outstanding accounts and securities, as called for under the agreement with the representatives of the People's Government.

JAPAN

In commenting last year on the encouraging results in Japan following the introduction of the deflationary policy and other austerity measures I said that the country was by no means out of the wood, as much of the improvement was due to artificial restrictions and stimulants rather than to genuine economic improvement. It is with pleasure, therefore, that I am able to report that a further twelve months have seen such continuous improvement in industry and overseas trade that the Japanese economy is now nearer to achieving genuine stability than at any time since the war.

NEW YORK

The value of our New York office in our branch system has again been apparent this year, although we did not reap all the advantages which might have been expected from our having branches in countries receiving American Aid and an office in New York. In fact, as imports under aid programmes usually cause an equivalent reduction in imports through ordinary trade channels, our turnover in some Eastern countries is adversely affected. Nevertheless, this is often more than offset by the stability brought to those countries, and in the areas in which we operate the generosity of the Americans is most marked.

CONCLUSION

The money markets of the Sterling Area are of necessity highly sensitive to policy

pursued in the City of London and we have therefore to pay close attention to the policy of credit restriction now in operation in this country.

While it is obviously proper for us to observe the official directive so far as it applies to customers who deal and trade exclusively in this country, it will be clear that our operations overseas must, in the end, be related to the policies and needs of those countries in which we operate, where we have obvious responsibilities to the governments concerned, some of which are outside the Sterling Area.

The rates of interest imposed in the United Kingdom must to some degree affect the cost of finance of new projects in the undeveloped countries, but the extent to which finance for those projects should be provided is properly a matter for the countries themselves to determine and our main concern must be to see that our own operations are carried out on sound lines in each country in relation to local conditions.

The Sterling Area has far-flung ramifications and it is only too clear that uncertainties as to the results of the Credit Squeeze in this country could have far-reaching results not only in this country but also in the many countries in which we operate. It must be hoped that the policy that is now being put into effect will counteract those uncertainties without undue delay.

Copies of the full text of the Statement will be sent on application to the Secretary of the Bank at 38 Bishopsgate, London, E.C.2.

MARCONI'S WIRELESS TELEGRAPH COMPANY LIMITED

YEAR OF PROGRESS

The fifty-eighth annual general meeting of this company was held on March 15th at Marconi House, London.

Sir George H. Nelson, Bt, chairman, said: I am pleased to report a record turnover. The group profit is £907,122 and the net profit £485,614, an increase of £65,241. The dividend is 10 per cent, less tax.

The year has seen the introduction of Commercial Television, for which our company has been entrusted with the entire responsibility for designing and equipping three stations. Complete studios and outside broadcast units have been supplied to the Programme Contractors. Our Colour television equipment has been supplied to the BBC.

We have obtained a million dollar contract from Ecuador for an extensive radio telephone system, to link a number of the more important centres in that country. The outstanding event of the year in the communications field was the opening of the new Rugby Radio Station, into which have gone no fewer than 28 of the Marconi high-power transmitters.

In the Aeronautical field a novel airborne navigational aid of greater accuracy has been introduced in conjunction with the Ministry of Supply. Very significant progress has been made in many fields of research.

The name of Marconi's has never been held in higher esteem throughout the world than it is today. With our increasing productive capacity and with unrivalled research and development facilities, we face the future with confidence.

The report and accounts were adopted.

CABLE AND WIRELESS (HOLDING)

ENCOURAGING THE SMALL INVESTOR

SIR EDWARD WILSHAW'S SPEECH

The twenty-seventh annual general meeting of Cable and Wireless (Holding) Limited was held on March 9th in London.

Sir Edward Wilshaw, KCMG, DL, JP, LLD, FCIS (the Governor), presided and, in the course of his speech, said:

Again we have had a most successful year. Our gross income from Investments at £1,334,406 shows the appreciable increase of £274,893, and the value of the Investments has risen from £20,319,577 to £22,621,159, an increase of £2,301,582; our expenses are lower and the dividend is maintained at 10 per cent or 2s. in the pound.

The most important antidote to inflation is savings and still more savings. It is my determination to conduct this Company so as to give the greatest possible encouragement to the small investor; I want to be able almost to guarantee him a regular and reasonable income from his investment; I want him to feel that by retaining any earnings in excess of that reasonable income we are assuring that the value of his savings shall not only remain intact but is likely to appreciate. I also want to be able to demonstrate to the new and small investor that there is nothing wrong about a scrip issue and that any additional Stock so received is merely an acknowledgment of his title to his own savings which have been retained and re-invested for him by the Company.

In pursuance of our policy of "popularising" Investment Trust Companies we are arranging for the Ordinary Stock to be transferable and quoted in units of 5s. instead of in £1 units as at present. We are now in a sufficiently strong position to assure the maintenance of the annual distribution, for as far as we can reasonably foresee, at the rate of 2s. per £1 unit of Stock or, as it will be after March 27th, 6d. per 5s. unit of Stock, and this will be paid each year by four equal quarterly dividends of 1½d. per 5s. unit of Stock. It is our present intention that any excess earnings shall be used to give further advantages to stock owners from time to time by way of scrip issues or by the issue of additional shares on advantageous terms.

We have given much thought to methods by which the officials and staff may share with you in the prosperity of the Company. We intend that they shall be paid a bonus at a percentage rate on their salaries equal to the percentage of the dividend paid to the stock owners; also that a scheme be evolved whereby, after a specified period of service, their present pension arrangements should be improved to the extent that they will receive on retirement a pension of up to two-thirds of their final salary inclusive of present benefits.

We also have in mind that in the event of further issues of capital, arrangements may be made whereby some of the new shares can be offered to members of the staff. In addition, we hope to be able to afford facilities to the staff whereby they may, up to a certain percentage of their salaries, purchase the Company's stock and pay for it by agreed deductions from salary.

The report was adopted.

THE IMPERIAL TOBACCO COMPANY (OF GREAT BRITAIN AND IRELAND), LIMITED

ANNUAL GENERAL MEETING

SIR ROBERT SINCLAIR'S REVIEW

The Fifty-fourth Annual General Meeting of The Imperial Tobacco Company (of Great Britain and Ireland), Limited, was held on March 20th at Bristol.

The following is a report of the Chairman's Statement to Stockholders:

The Directors' Report records the resignation of Mr H. Barlow. Mr Barlow, who was formerly Manager of our Ogden Branch, had been with the Company for 50 years. His wide knowledge and experience of the trade were of great value to our business, and we are all very sorry—both on business and on personal grounds—that the time for his retirement has come.

The Explanatory Statement issued with the Accounts deals with the main features. I can, therefore, make my review of the financial position comparatively brief.

SUMMARY OF THE YEAR'S RESULTS

The broad picture shown by the Parent Company's figures is this. The Trading Profit increased by £308,000, and other income by £479,000, while Taxation was less by £292,000. The result therefore is an increase in Net Profit after Taxation of £1,079,000. The capital employed in Trading operations increased by some £20 million or 10 per cent, while Trading Profit increased by 14 per cent.

The Group Accounts show an increase of £677,000 in Consolidated Trading Profit and of £1,213,000 in Consolidated Net Profit after taxation. The Revenue Reserves of the Group are increased by over £6 million, of which nearly £5 million is provided in the Parent Company's Accounts.

TRADING PROFIT

The Trading Profit of the Parent Company amounted to £19,872,000—an increase of £308,000 or 1½ per cent. The rising tendency of costs in 1954 to which I referred a year ago was continued and in some cases accelerated during 1955. Before the year was out we were forced to increase prices—of pipe tobacco and cigars in June, and of cigarettes in October. Inasmuch as the increases in prices came towards the end of the year their effect on the Accounts now before you is slight. It was, of course, because of higher costs that our percentage increase in Trading Profit was appreciably less than our percentage increase in turnover.

In January 1955 we were able—by virtue of the improved leaf supply position—to lift all restrictions on the supplies of our leading brands of cigarettes. The effect on sales was both instant and marked, but it was by no means uniform. As was to be expected, the sales of brands of which supplies had for years been rationed rose sharply while the sales of other brands decreased. In total, however, our turnover throughout the year rose appreciably. Our manufacturing capacity was severely strained, and later in the year one of our Branches had again to restrict

supplies for a time. Supplies are now completely free again, and I should like here to pay tribute to the efficiency with which our Branches dealt with the many problems to which the changed situation gave rise.

The Group Trading Profit of £23,310,000 includes the profits of our Subsidiary Companies, most of which are engaged in the paper and board trade. The four principal Companies are—St. Anne's Board Mill Company, Ltd. (carton board manufacture), Mardon, Son & Hall, Ltd. (printing and packaging), Ashton Containers, Ltd. (fibre-board packing cases), and Robert Fletcher & Son, Ltd. (cigarette paper and other fine tissues). Each is a substantial Company in its own right, and each has an extensive trade outside the Group. These Companies again had a satisfactory year's trading, and made an increased contribution to the Group's profits.

STOCK-IN-TRADE

The Parent Company's Stock-in-Trade showed an increase in value of £14,603,000. This was attributable partly to an increase in average cost, but mainly to an increase in quantity; and larger leaf stocks are required to support the expansion of our turnover.

In the USA the flue-cured tobacco crop last year was the largest ever grown, and although it called for highly selective buying it contained much tobacco that was well suited to our requirements. We are very satisfied with the quality as well as the quantity of our purchase. We were able to take advantage of these favourable buying conditions to purchase a quantity in excess of a year's requirements; and if, as I hope, this supplementary purchase can ultimately be paid for in sterling it will be a very useful addition to our stocks and therefore some insurance against a short or a poor crop in future years.

The 1955 Canadian crop was somewhat reduced by early frosts, but the quality was good. Having made a relatively large purchase from the previous crop, we were able to avoid pressing the market unduly in 1955.

The Southern Rhodesian crop last year again slightly exceeded 120 million lbs. This was greater than first indications had led us to expect. Considering the somewhat adverse growing conditions that were experienced the quality of much of the crop was good, and on the whole we were pleased with our purchase. Certainly, there was again too much poor tobacco in the crop, but the fact that despite inadequate sunshine and overmuch rain a substantial quantity of the middle and better grades was produced is an encouraging omen for the future. It reflects, I think, a real improvement in the standard of cultivation aided as it undoubtedly has been by the work of the Research Board. The tobacco growing industry of the Rhodesias and Nyasaland is an important factor in the expanding economy of the Central African Federation. The growers

there will not, I hope, take it amiss if I say two things—firstly, that, as they would themselves acknowledge, they have been materially assisted in the success they have achieved by the help and encouragement of United Kingdom manufacturers; secondly, that their continuing success must rest on their capacity to produce tobacco of really good quality at a reasonable price.

CAPITAL AND RESERVES

The Explanatory Statement shows in detail how the additional capital of rather more than £20 million employed in the business has been provided. The issue in the autumn of 1954 of the £20 million 4 per cent Loan Stock 1975/80 and the replacement of £10 million 3 per cent Notes which expired in April, 1955, by £15 million 3½ per cent Notes were in the light of the position today satisfactory financing. In the year under review, £5 million Acceptance Credits were not renewed. The outstanding balance of the 4 per cent Loan Stock issue—£14,072,000—was received; and the remainder of the increase in our capital requirements has been met by the transfer to Reserve of nearly £5 million from our own resources and by an increase in deposits by Subsidiary and other Companies.

TAXATION

The charge under this heading amounts this year to £12,840,000 in the Parent Company's Accounts and to £14,420,000 in the Group Accounts—in each case a small but welcome reduction from the previous year's charge. This is attributable to the decrease in the standard rate of Income Tax last year. The increased Profits Tax with effect from November 1st last will, of course, apply to the profits of the current year.

GIFT TO EMPLOYEES

As announced in the Directors' Report, we have again decided to make a Gift to Employees in recognition of their efforts to promote the Company's interests during the past year. The rate of the Gift will be 13 per cent of earnings in the year ended October 31, 1955. This is the same percentage as was paid in each of the three preceding years.

A Gift of this kind has, as you know, been paid for many years. It is, we believe, greatly appreciated, and it is tangible recognition of the good relations which undoubtedly exist among all ranks in the Company's employ.

NET PROFIT AND DIVIDEND

After providing for Taxation, for the writing off of the discount and expenses in connection with the issue of 3½ per cent Notes, and for the appropriations to Reserve to which I have referred, the net profit of the Parent Company available for distribution amounts to £7,937,000. It is proposed to pay a Final Dividend on the Ordinary

Stock at the same rate as last year, namely, 12½ per cent. This, with the Interim Dividend and the Preference Dividend, will absorb £7,747,000, leaving £190,000 to be carried forward.

Having regard to present and prospective commitments, and to the still rising tendency of the cost of capital replacement, we have not felt it prudent to do more than maintain last year's rate of dividend. I am conscious of the fact that we have not yet entirely restored the cut that we were compelled to make in our Ordinary dividend a few years ago, and that our total gross distribution is still slightly below the prewar level. The Tobacco Trade, however, has had its share of postwar difficulties—if one includes the exorbitant rate of Tobacco Duty perhaps more than its fair share—and it is, I think, no small achievement that the Company has come through those difficulties with unimpaired strength. The substantial transfers to Reserve that we have made this year are in the light of our own needs, present and prospective, and in the light of the general economic situation, not only appropriate but necessary. The first concern of your Directors is to maintain the financial strength of the undertaking, and thereon to build for the future.

Turning now to matters of more general interest:

TRADE PRACTICES

The publication of the Government's Restrictive Practices Bill brings into prominence a number of questions which have been the subject of controversy, both inside and outside Parliament, in recent years. In the Tobacco Industry there are no agreements between manufacturers on prices such as are referred to under Part I of the Bill. The Industry is, however, directly concerned with Part II of the Bill which deals with resale price maintenance and which, *inter alia*, seeks to prohibit the collective enforcement of resale prices. Until there has been more time to consider the implications of these measures it would be premature for me to speculate on their likely outcome or on their effects on the distributive trade. I would, however, say that in our judgment the system of collective enforcement of resale prices, as operated for many years in the Tobacco Trade, has worked fairly and well; and that while on the one hand it has protected retailers and wholesalers against price-cutting it has not on the other hand been used to restrict new outlets and it has helped materially in building up an efficient distribution service for the public. Moreover, the public will remember that even in the days of most acute shortage when "black markets" flourished for many things there were very few instances of higher than minimum prices being charged for cigarettes and tobacco. On the whole, I think, the system of collective resale price maintenance in the Tobacco Trade has been to the advantage, rather than the detriment, of the public interest. For these reasons I shall be sorry if it has to go—even though I would not expect the Company's trade to be significantly affected by its going.

DISTRIBUTION

Consideration of the problem of resale price maintenance leads me to refer to the question of distributors' margins of profit on the Company's products. When we increased the retail prices of tobaccos and cigars last June, and again when we increased cigarette prices in October, we took the opportunity to improve distributors' margins because we recognised that their costs, like ours, had risen appreciably. I need hardly assure you

that we endeavoured to hold the balance between all the interests concerned as fairly as possible.

Some distributors, I know, take the view that the increases made in their margins last year did not go far enough; others are by no means dissatisfied. It must, however, be recognised that while the discontinuance of the quota system that had been made necessary by the restriction of leaf supplies has created problems for some classes of distributors, these problems are inevitable corollaries of a return to normal conditions in the trade.

The situation at the moment is somewhat clouded by uncertainties which surround the whole question of resale prices—a subject to which I have already referred—but we will continue to watch the position closely. Ever since this Company's formation it has been our endeavour to deal as fairly as we could with our many thousands of distributive trade customers; and in consequence we have a long record of friendly relations with them which has redounded both to their benefit and ours. Stockholders will, I am sure, agree that fair dealing and friendly relations with our distributor customers, so far as we can ensure them, must continue to be our policy.

SMOKING AND HEALTH

Further publicity has recently been given to suggestions that excessive smoking may have harmful effects upon health and should therefore be officially discouraged. It is, of course, difficult for us as a Company to make any comment on this subject without incurring charges of bias. As I have said on a previous occasion, it is not our policy to make exaggerated claims for smoking or to put its benefits higher than the pleasure and peace of mind it undoubtedly brings. But there are several things on the health aspect that, I think, need saying or bear repetition at the present time. The first is that quite obviously excessive smoking—like excessive eating or excessive drinking—cannot be good for anyone; but equally obviously what is excessive to one person may be harmless to another. Secondly, while I do not wish to say anything which could conceivably be construed as seeking to minimise the general concern felt about lung cancer, it is a fact that only a small proportion of smokers contract the disease, and it is also a fact that the disease occurs among non-smokers. Moreover, there are a number of other factors—such as the much greater incidence of the disease per head of the population in urban than in rural areas—to the evaluation of which statistical and scientific attention is being directed.

A further point which is not without significance is the variation in the apparent incidence of the disease in different countries—a variation which appears to bear little relation to variations in tobacco consumption. And here I would emphasise that the level of per capita consumption in this country is by no means high. This may seem to some surprising in view of the fact that, as recently reported in the Press, £880 million was spent on tobacco in this country last year; but the reason for this large expenditure lies, of course, in the Tobacco Duty, which is now over six times the 1938 Duty and accounts for three-quarters of the retail price and for some £660 million of the total expenditure of £880 million. Statements suggesting that average consumption in this country is in any way excessive are therefore quite unwarranted. The truth is that, compared with prewar, after allowing for the increase in population, consumption has shown only a comparatively small increase, and is well below the per capita

consumption in a number of other countries, including the USA, Canada and New Zealand.

I ought also, I think, to dispose of one bogey. Statements have recently been made implying that substances such as saltpetre are used by United Kingdom cigarette manufacturers either in the tobacco or the paper to assist burning. Such statements so far as we are concerned are completely without foundation, and we confidently believe that to be so as regards all other manufacturers in this country.

I would remind you that in 1954 we joined with other leading tobacco manufacturers to place a fund of £250,000 at the disposal of the Medical Research Council in order to hasten research into the cause or causes of lung cancer. The reason, of course, was the very direct interest we have in getting at the truth of this matter. Meanwhile, we have continued and expanded our own chemical research into the constituents of tobacco and tobacco smoke, and the results of our research work are freely at the disposal of the medical authorities. We have also followed every phase of research on this subject in this country and abroad. Neither tobacco nor atmospheric pollution nor anything else can be entirely free from suspicion until medical science has established how lung cancer is caused; but that position has not been reached, and what is wanted is more research and fewer premature conclusions.

THE OUTLOOK

As I have said, our leaf stocks have been improved and although there is still some way to go before we can be satisfied with the position we are certainly better placed in this respect than we were a few years ago. The USA flue-cured crop is expected this year to be appreciably below the 1955 record level, but I am hopeful that both in the United States and in Canada we shall be able to purchase approximately twelve months' usings. The Rhodesian crop, combining Southern and Northern Rhodesia, seems likely on a first estimate to exceed 155 million lb, which represents a substantial increase over 1955 production; and we shall be very disappointed if we do not succeed in making a good purchase this year. The present position and immediate prospects as regards leaf supplies are therefore not unsatisfactory.

We shall, of course, have the full benefit in the current year of the increases in price that were made in the latter months of last year. I must, however, emphasise that these increases were primarily required to meet rising costs, including increased costs of distribution; and I should also explain that when we increased cigarette prices last October we took the opportunity at the same time to increase the size and weight of our cigarettes.

As I have said earlier, the Tobacco Duty accounts for about 75 per cent of the retail price of our main brands of cigarettes and tobacco. On numerous occasions in the past I have called attention to the danger to Revenue prospects from a protracted maintenance of the Duty at its present high level. A reduction in the Retail Price Index would be secured by a substantial reduction in the Tobacco Duty—and that is perhaps not unimportant in times such as the present. For the sake of the Industry and the Revenue which the Government derives from it I would again urge with all possible emphasis that the sooner a start can be made in lowering the very high rate of Duty the better.

As to the volume of our trade, I said a year

ago that following the removal of quota restrictions there was evidence that the basis of our trade was being broadened and strengthened. That judgment has been confirmed by the events of the past year. Indeed, the restoration of consumers' freedom of choice has demonstrated very clearly the great strength of the Company's leading brands in public favour. This strength

undoubtedly rests, as it has always done, on the value offered to the public in our brands as a result of highly skilled leaf buying, blending, and efficient manufacturing practice; and I can assure you that we shall show no disposition to be complacent in this respect. We have increased, and are in process of further increasing, our productive capacity; we are constantly exploring fresh

improvements in manufacturing technique; and it can, I believe, be fairly said that we are well equipped to meet the fully competitive conditions that once again exist in the industry. Taking all in all, and judging by the experience of the year to date, I would confidently hope that the trading results for the current year will be at least as good as those of 1955.

THE MESSINA (TRANSVAAL) DEVELOPMENT COMPANY, LIMITED

LARGER PROFITS AND DIVIDENDS

COPPER PRODUCTION INCREASED TO RECORD FIGURE

EXPANDING INTERESTS IN RHODESIA

COMMANDER H. F. P. GRENFELL'S SURVEY

The sixth Annual General Meeting of shareholders in The Messina (Transvaal) Development Company, Limited, was held in Johannesburg on March 13, 1956, Commander H. F. P. Grenfell, DSC, RN (Ret'd), presiding.

The Chairman addressed the meeting as follows:

Ladies and Gentlemen, it gives me great pleasure to welcome you to the Sixth Annual General Meeting of your Company, and, on behalf of the Board of Directors, to present for your approval their report and the Audited Accounts of your Company for the financial year ended September 30, 1955. Both these and the Notice convening the meeting have been in your hands for some time and with your permission I propose to take them as read.

You may remember that in my speech last year I suggested that we might expect frequent, and at times violent, fluctuations in the price of copper to continue, but that, as a result of having sold forward a large part of our production, we could look forward to final results as good as those presented at that meeting. You will have seen from the Report and Accounts now before you that our profits for the year before distribution not only equalled but exceeded those of last year by a margin of £152,105.

SUCCESS OF NEW CAPITAL ISSUE

Unfortunately, during the year we were called upon to pay £103,249 as owner's liability under the Silicosis Act. We had also to write off £82,967—expenses of the New Capital Issue, which, I am glad to report, was well received and has been a great success. However, these two large expenses came to be charged against this year's profit available for distribution, whereas last year's total was increased by windfalls of £252,488. The net amount available for distribution this year, including unappropriated profit of £44,078 brought forward from the previous year, was therefore £149,613.

The payment of increased dividends for the year, in Dividend Numbers 10 and 11, absorbed £1,254,000; the sum of £200,000 was transferred to General Reserve, and the balance of £42,131 carried forward to next year.

Since the end of the financial year we have continued our policy of selling forward as

an insurance against any downward trend which may develop in the fluctuations of the market. These must be regarded as permanent features of the copper industry under present conditions.

I am glad to tell you today that I have every hope the profits for this year will show yet another record for your Company.

OPERATING COSTS

Our operating costs at Messina again rose slightly during the year from 34s. 1d. to 34s. 8d. per long ton of ore produced. The equivalent figures per long ton of copper were £108 9s. 10d. and £114 11s. 4d.; that is to say, an increase of approximately £6 per ton. On a short tonnage basis costs amounted to £102 5s. 9d. per ton of copper, as against £96 17s. 4d. for the previous year.

As mentioned by the General Manager in his report, this rise in costs was almost entirely due to the employment of extra Europeans in place of Natives working underground necessitated by the withdrawal of the exemptions referred to in my speech last year.

GRATIFYING SERIES OF ACHIEVEMENTS

However, a most gratifying series of achievements in the smelter increased the production to a record figure—over 14,200 long tons of copper—despite an interruption caused by the emergency request of the Union Government at the time of the African strike on the Copper Belt, which necessitated a sudden change of production from ingots to wire bars.

Capital expenditure at Messina, of which details are given in the summary of the General Manager's report, amounted to £296,740. To keep pace with this and with an eye to future commitments we intend—so long as we continue to make good profits—not only to pay good dividends, but also to make substantial allocations to our reserves.

RESERVES A SOURCE OF STRENGTH

The present strength of our Company is due to our declared policy of always building up our reserves in good times: it is a prudent policy that has paid us well in the past, and I am sure Members will agree that it is one

that we should continue to follow in the future.

There is nothing of particular interest to tell you this year about our mining operations at Messina except the fact that our ore reserves again showed a substantial increase, and, despite a slight fall in grade, the copper content was about 3,000 tons higher than last year.

I have already referred to the excellent results obtained by the smelter, and I am also glad to report that all the other departments operated smoothly and efficiently.

UMKONDO PROPERTY

Our property at Umkondo was brought into production in May last year, and since then regular weekly shipments of concentrates have been arriving at Messina for final treatment in the smelter. We have experienced, as so often happens, the usual teething troubles associated with a new undertaking, but operating results are improving month by month, and I am sure this small but valuable property will make a useful contribution to our fortunes under the direction of Mr C. H. Chandler, the new manager.

With Umkondo in operation and our interests in Southern Rhodesia expanding, we have formed a Group Headquarters Staff composed of a number of Senior Officials, under the General Manager of the Company, who will act as consultants and advisers and generally supervise the many affairs of the Company at our various properties.

Mr W. I. Spence, who rendered excellent service in bringing Umkondo up to the production stage, has been appointed Resident Manager at Messina. We have also been fortunate in securing the valuable services, as our Salisbury Representative, of Mr Frank Elliott, who was for many years Chief Government Mining Engineer of Southern Rhodesia.

It gives me great pleasure to report that the harmonious relationship with our employees, which has been a constant feature of the history of our Company, continues, and that our labour supply, both European and African, has been satisfactory during the year.

PROGRESS AT MANGULA

Our expanding interests in Rhodesia to which I have referred include, of course, Rhodesia Copper Ventures, Ltd., which has

now been renamed MTD (Mangula), Ltd.; this indicates in part the name of the parent Company, while Mangula, a native word for copper, will be the name of the new township.

I have already reported that the capital issue to raise funds for the development of this property and to bring it into production was a great success. We have assumed responsibility for the management and working control of Mangula, as I may now call it, and I am glad to tell you that our plans and designs are being translated with ever-increasing momentum into a new mine and a new township.

In this connection I wish to record our appreciation of the unfailing help and co-operation we have received from the Government of Southern Rhodesia.

We hope that this new settlement will be a model of its kind in every way, and all our endeavours will be directed to this end.

SITE FOR NEW TOWNSHIP

Since the close of the year the problem of obtaining a freehold site for the township, referred to in the managers' report, has been satisfactorily solved, and the housing programme, both European and African, is now getting under way. The new main shaft is being sunk, the headgear is in course of erection, and, generally speaking, all the work is proceeding according to plan.

Members were advised by a circular sent out with the report and accounts of certain resolutions to be submitted at the annual general meeting of Rhodesia Copper Ventures, Ltd. on February 22, 1956. These resolutions were all adopted and the capital of the company has now been increased to £2,500,000 of which £1,200,000 will be issued to Mangula shareholders at once.

This will provide sufficient money to repay all advances made to date by your company, and enable Mangula to meet progress payments which will arise during the next few months on its construction programme. A further issue will be made when more funds are required.

Concurrently with construction on the surface, the Molly Section of the mine is being prepared for production, and further exploration work is being carried out by diamond drilling on other parts of the property. We have already found what appears to be an extension towards the south of the Molly East ore body, and although I am not yet in a position to give you positive confirmation on this point, the indications are that we may expect a considerable increase in tonnage of ore reserves in the Molly section.

ORE DEPOSIT AT BUKWE

Another of our interests in Southern Rhodesia is the large and valuable deposit of high grade iron ore at Bukwe, which I described in my speech the year before last.

Here, the results obtained from our development programme indicate proved and probable ore reserves of at least 82 million tons, with a further 80 million tons classed as possible. On the basis of these figures we exercised our option to buy the property at the end of March last year.

The ore appears to be of excellent physical and chemical quality and, according to our consulting engineers, compares well with some of the best ore deposits in the world.

If this is so, we have at Bukwe an asset which cannot fail to be of the greatest value not only to ourselves but to Southern Rhodesia and the Federation.

Steel, as you will readily appreciate, is one of the linchpins of modern industry,

and an assured supply is obviously of fundamental importance to the future of a young, vigorous and growing country such as Southern Rhodesia.

APPROACH TO GOVERNMENT

For these reasons we decided to approach the government to explore ways and means of linking this vast new ore deposit to the country's existing iron and steel undertaking.

The government welcomed our approach and during the past months—in full consultation with them—we have been investigating the possibility of reorganising and expanding the present undertaking in the light of the ever growing needs of the Federation.

Our discussions are still going on and it would be both unwise and improper for me to anticipate our conclusions in my speech today. I can, however, assure you that we will inform you fully at the appropriate time.

GENERAL EXPLORATION WORK

As you will have seen from the general manager's report, our geologists continue to be actively engaged in general exploration work in the field, and in the examination of properties submitted to us. At the present time we have a number of promising base metal prospects under investigation but I am not yet in a position to give you any useful information about them.

We are also carrying out a drilling campaign for coal in a concession adjacent to Wankie, but here again sufficient data on which to assess the potentialities of the area are not yet to hand.

THE COPPER MARKET

Turning now to the copper market, during the year we saw the price on the London Metal Exchange reach a peak of over £400 a ton under the impact of a succession of strikes at the major copper mines in the United States, Chile, and Northern Rhodesia.

As a result, approximately 200,000 tons of production were lost, and, although this gap was partially filled by the diversion on to the market of about 145,000 tons from the British Government's stock and the United States stockpile, the rise in consumption of some 190,000 tons during the year kept the market in a tight position. This condition still prevails and we have recently seen a quotation of £434 per ton.

THE OUTLOOK

As regards the future, there has of course always been the possibility that the additional tonnage from large new mines now being developed in various parts of the world might temporarily cause production to outstrip consumption. But this is unlikely to happen as long as the industry continues to suffer serious interruptions to output due to labour troubles.

In any case I have no doubt at all that, despite a certain amount of substitution by other materials, consumption will continue to grow at a rate that will ensure in the long term a good market for whatever copper the world can produce.

THANKS TO GENERAL MANAGER AND STAFF

In conclusion, on behalf of the board and myself, and I am sure on your behalf also, I want once again to thank our general manager, Mr Frost, and all who serve under him, and the staff of our London office, for their continued loyalty and hard work, with-

out which none of our undertakings would be possible.

The directors' report and balance sheet and accounts for the year ended September 30, 1955, were adopted.

The retiring directors, Mr D. E. Cox and Mr P. U. Rissik, were re-elected and the remuneration of the auditors for the past year's audit was fixed.

There being no further business the chairman declared the meeting at an end.

HASTINGS AND THANET BUILDING SOCIETY

GREAT RESERVE STRENGTH

The Annual General Meeting of the Society was held at Hastings on March 22nd, and in moving the adoption of the Directors' Report and Statement of Accounts for 1955, the Chairman, Mr H. J. D. Fuller, said:

The Society had had a most satisfactory year. New savings totalled £3,451,780 and house purchase loans amounted to £4,103,926; both record figures. Assets now stood at nearly £20 million. Reserves exceeded the satisfactory figure of £1 million and Liquid Funds totalled £2,335,631, being above the minimum proportion of liquidity recommended by the Building Societies' Association. Critical students of Building Society affairs were recognising more and more the strength of Societies like the Hastings and Thanet which possessed adequate Reserve Funds, a good degree of cash and readily realisable securities, and which pursued a cautious lending policy.

The past year was one of strain and difficulty in the Nation's affairs; a year of changes in money rates, when Building Societies could not remain immune from economic disturbances which necessitated changes in their own interest rates. Whilst Building Society rates were not tied to Bank rate, they were nevertheless affected by long-term alterations in money rates, and when in August last year it became evident that share, deposit and mortgage rates were out of harmony, the Directors had no alternative but to make requisite changes to investors and borrowers. Building Societies were not, however, profit-making organisations, and the increased cost to the borrowers was broadly the increased cost of the money to the Society. The process of such changes in 1955 was costly to the Society because the alteration in investors' rates became effective immediately, but for borrowers a period of notice was required. What was sometimes not realised was that the whole of the Society's capital was affected by such changes, necessitating the altered rates being passed on to old borrowing members. In a concern which was in effect a co-operative organisation it was proper that all members should be affected by any change.

In present circumstances people should try to spend less in order to save more. The Society offered a most attractive investment to the small and large investor, with Income Tax paid by the Society, no depreciation of capital and withdrawals which were easily arranged.

The Deputy Chairman, Mr E. Barber, LRIBA, stressed the need for the nation and individuals to defer unnecessary spending, so as to pave the way to greater tranquillity in the country's affairs.

The report was adopted, the retiring Directors were re-elected and the Auditors were re-appointed.

THE ENGLISH ELECTRIC COMPANY

OUTSTANDING ORDERS IN GREAT BRITAIN £163 MILLION

SIR GEORGE NELSON ON GROUP'S OUTSTANDING ACHIEVEMENTS

Sir George Nelson, Bt (Chairman), presiding at the Thirty-seventh Annual General Meeting on March 15th in London, said:

From the Consolidated Accounts you will see that the trading surplus before charging depreciation, taxation and other charges is £8,791,696 and that, after charging depreciation, loan interest and provisions and crediting dividends on trade investments, there is a balance of £6,570,601 compared with £5,371,281 in the previous year, an increase of £1,199,320 over 1954.

Taxation has risen by £337,539 to £3,471,954 and, after transferring £242,015 taxation relief on Investment Allowance to Capital Reserve, the Group profit is £2,856,632.

The increase of £1,200,000 to £6,570,601 in profits, before tax, is due to a substantially larger turnover, the inclusion for the first time of the Vulcan Foundry earnings and a reduction in the loss by the Canadian Subsidiary, John Inglis. This increased profit did not arise from a higher rate of profit but arose from a lower rate of profit on extra capital.

POLICY OF THE COMPANY

We believe the Company has been successful in its policy which has been based on providing stable employment, the giving of efficient service to customers, the payment of reasonable dividends and the strengthening of the national economy by exporting a substantial portion of our output. I am convinced that the principles we have tried to apply will bring advantages to employees, shareholders and the country at large, provided that none of the beneficiaries sought undue reward to the disadvantage of the others. The most severe handicap in the export market is the inability to quote fixed prices owing to rising costs. Export orders showed an improvement on the previous year, but this work was increasingly difficult to obtain and much of it was unattractive; we are still firm believers in the expansion of world trade in electrical products and will continue our intensive efforts in that direction.

The volume and value of production, orders received and outstanding orders has substantially increased. Outstanding orders of the Company and its wholly-owned subsidiaries in this country now amounted to £163 million.

Successive governments have repeatedly warned the nation of the danger of inflation. On many occasions the TUC have themselves referred in a most statesmanlike manner to the dangers of rising costs and have given appropriate advice to their member Unions but many of them have not yet realised the far-seeing wisdom and importance of this advice in the interest of their members as well as the nation as a whole. We welcome the TUC's realistic approach to the problems. We are entitled also to look for some support from our British suppliers of materials, with whom we spend annually about £50 million, as we often find today, that their prices prevent our offering competitive prices in export markets.

Two recent publications may be of great importance to the Heavy Electrical Industry. They are first, the Restrictive Trade Practices

Bill which presages possible changes in trading conditions at home and abroad, and secondly the Herbert report on the Electrical Supply Industry which contains certain recommendations about tenders from foreign competitors which if implemented might have far-reaching consequences for the nation. The latter, incidentally, ignores the fact that we have been consistently pressed by the Government to increase our manufacturing capacity to match the needs of the CEA as well as to supply export markets. I hope that those who are called on to deal with these subjects will not overlook either the history or the achievements of the Heavy Electrical Industry.

GROUP'S ACTIVITIES

The two prototypes of the Company's P.1 fighter have now completed some 300 flights, most of which have been supersonic. We hope this aircraft will play a great part in the defence of our country in the future and we are pursuing its development energetically. Our pilots who have flown the P.1 report that it is an aeroplane without any vices and is very pleasant indeed to fly.

During the year the Canberra has added to its reputation by establishing more world records, including a new altitude record for aircraft, of 65,876 feet. A squadron of Canberras has completed a tour of West Africa and took part in fly-pasts during Her Majesty's visit to Nigeria.

An outstanding achievement last year was the construction of the Deltic Locomotive of 3,300 hp, a new application of the Napier Deltic engine, which was loaned to British Railways for trial; this locomotive, a private enterprise development, is the most powerful single diesel electric locomotive in the world.

You will have read in the papers of the intention on the part of the British Railways to adopt the AC system as a national standard and your Company is well placed historically and technically to meet the needs of the AC programme. Our manufacturing capacity, our experience, our technical knowledge and our advanced research and designs are important not only to your Company but to the nation and we hope and believe that we shall receive orders placed commensurate with what we have created and achieved in traction over decades.

The output of 537,000 kW of Steam Turbines and their associated Alternators from our Rugby and Stafford Works is the highest so far achieved by the Company, and I am pleased to record that we have now received orders from the Central Electricity Authority for a further two 200,000 kW sets.

One of the most important contributions to this Company's future is a regular supply of able qualified men, and for that reason we have devoted considerable resources to training and education. We welcome the Government's recent White Paper as a recognition of the value of many of the ideas which we have pioneered.

Sir George concluded by saying that 1955 was a memorable year for him personally as it marked the completion of 25 years' service as their Managing Director.

The Report was adopted and a final dividend of 8½ per cent (making 12½ per cent for the year) was declared on the Ordinary Stock.

BROWN BROTHERS LIMITED

ANOTHER YEAR OF RECORD • TRADING

The fifty-ninth Ordinary General Meeting of Brown Brothers Limited was held in London on Monday, March 26, 1956.

Sir Richard Yeabsley, CBE, FCA, the Chairman, said: For the second year in succession I am pleased to report the sales of the Company and its Subsidiaries at a record level. The trading profit of the group amounted to £1,059,043, compared with £805,403 for the previous year.

The net profit for the year carried to the profit and loss appropriation account of the Parent Company, including dividends received from subsidiaries, after provision for taxation, is £328,389, compared with £256,798.

Appropriations recommended are a transfer of £165,345 to General Reserve, and an allocation of £5,000 to the staff benevolent and welfare fund.

The Directors propose a final payment of 10 per cent (less tax) on the issued Ordinary capital, which has been increased during the year by the issue of one fully paid share in respect of every two shares previously held. An interim distribution of 2½ per cent (less tax) was made on the Ordinary capital prior to this increase, and the total distribution on the Ordinary shares, amounting to £131,569, represents a rate of 11½ per cent on the present issued Ordinary capital of £1,961,280, or 17½ per cent on the former Ordinary capital of £1,307,520.

TRADING CONDITIONS

The normal expansion and development which has taken place in the various trades we serve, and the tendency throughout the year for prices to increase, resulted in the record sales to which I have referred. Towards the end of the year, however, there were signs that the steps taken by the Government, to bring about a reduction of personal consumption, were having the effect of checking the rate of increase in certain departments of our business.

We are today rendering a comprehensive service to the Motor Vehicle repairing industry by having available the vast range of accessories and components at our 31 branches throughout the country.

Our tyre departments have again shown a substantial increase, not only in sterling sales, but in the number of covers and tubes supplied.

In the cycle section of our business sales of components and accessories have been maintained.

I am also pleased to report considerable progress in our radio and electrical departments. Our metals division has again had a very successful year, and we have experienced an increasing demand during the year for the products of our aircraft subsidiary.

OUTLOOK

At this stage it is obviously too early to make any reliable forecast of our prospects for the current year. Sales in the first two months of the year have certainly shown further increases over the opening months of 1955, but there are positive indications that the action taken by the Government, to restrict spending, is having its effect. It may well be that we shall have the utmost difficulty as the year progresses in keeping up with the very high and possibly exceptional standards set in 1955.

The report was adopted

STANDARD LIFE ASSURANCE COMPANY

TRIENNIAL INVESTIGATION

INCREASED BONUSES IN NEW FORM

MR ALEXANDER HARRISON'S ADDRESS

The one hundred and thirtieth Annual General Meeting of the Standard Life Assurance Company was held in Edinburgh on March 20th with Mr Alexander Harrison, CBE, CA, in the chair.

The General Manager and Actuary having read the Auditor's report, the Chairman said: My Lord, Ladies and Gentlemen,

May I take it to be your wish that the Directors' Report, which is in your hands, be held as read?

In the first place I have to report some changes among our overseas Directors. Mr S. H. Banning, who had been a member of our West Indies Board since 1947, resigned on his retirement from active business life in Trinidad. We are very grateful to him for all the help he has given us and we wish him many years of happy retirement. In his place we welcome Mr George Wright, whose business experience and sound judgment will be of much assistance to us. In Uruguay our Board has been strengthened by the appointment as a Director of Dr German Rubio, who has already given us much valuable guidance in his medical capacity and whose closer connection with the Company will be greatly to our advantage. I should like to take this opportunity of saying how highly we appreciate the assistance we receive from our Local Directors both in the West Indies and Uruguay in dealing with the special problems which arise through our organisations there being so distant from Head Office.

RECORD FIGURES

For the tenth successive year we have transacted a record amount of new life assurance business. As you will see from the Report, the net total is £46,316,000, an increase of almost £6½ million over last year's figure. Included in this year's total is a sum of £18,059,000 of Group Life assurances.

Our premium income increased in 1955 to over £21,800,000, which exceeds by almost £2 million the figure for the previous year. In spite of the additional expense incurred by the larger volume of new business transacted and by the general rise in costs, we have succeeded in maintaining our expense ratio at last year's record low figure of 8.5 per cent.

The income from investments in our Life Assurance and Annuity Fund, which was £5,600,000 in 1954, exceeded £6,550,000 in 1955 and the net rate of interest which it represents has risen from 4 8s. 4d. per cent to 4 10s. 8d. per cent. In my remarks last year I pointed out that almost the whole of the increase in the rate of interest then reported was due to higher dividends on the Company's holdings in Ordinary Stocks. The same can be said today, and this cannot but be satisfactory in so far as it reflects greater efficiency and prosperity in industry generally. It is to be hoped that more and more will come to be realised by all sections of the community that industrial prosperity is something for which all should strive as all have a very real interest in it and, indeed, are ultimately dependent on it.

The figures I have quoted tell a story of vigorous and successful expansion to which all branches of our organisation have contributed. In the United Kingdom and the Republic of Ireland we have transacted a substantially larger volume of business in the face of keen competition without materially increasing our field staff and without in any way relaxing the high standards which we have always set in the selection of risks. I particularly wish to mention the excellent work done by our Staff Schemes organisation, not only in introducing new schemes but in arranging for the smooth running of those already in force. Many employers have paid tribute to the friendly and efficient service which our Staff Schemes Superintendents provide.

EXPANSION OVERSEAS

In Canada, not only were excellent new business results obtained, but further progress was made in building up our organisation for the future. In particular it gives me great pleasure, following upon my remarks a year ago, to report that in October a French-Canadian Branch was opened in the City of Montreal and a very encouraging start has been made in reviving our old connection with the French-speaking people. To accommodate our increasing staff, two new floors have been added to our handsome Canadian Head Office in Montreal, which now provides adequate modern office accommodation without sacrificing the appearance of dignity and age appropriate to an old-established Company. Our assets in Canada now amount to \$150 million and we are greatly indebted to our Canadian Board of Directors for their expert guidance in the management of this large fund which is suitably spread over enterprises covering all aspects of the Canadian economy, including mortgages on residential and business properties.

In the West Indies, our organisations in both Trinidad and Jamaica have made excellent progress during the past year. In Trinidad we have recently built, and in Jamaica we have purchased, new and well-equipped office accommodation to enable our staff to operate with greater efficiency and comfort. If, as is expected, the West Indian Islands achieve before long a satisfactory system of federation, we may see great developments in their economy in which this Company will be ready to play its part.

Our branch in Uruguay is smaller than in the other overseas centres, but it is no less efficient, and, in spite of the economic difficulties through which Uruguay has been passing, its results have been highly satisfactory. Here too our organisation has now been housed in new and more spacious offices.

The continued expansion of our activities throughout the world has resulted in an increase of £20 million in our assets which, as you will see from the Balance Sheet, now exceed £163 million. Last year I was able to report that at November 15, 1954, there was a substantial margin between the market value and the book value of our assets. In common with other institutions we have seen

during the year a considerable fall take place in the market values of certain categories of our holdings. It is therefore a matter not of formal statement only, but of real satisfaction, to be able to repeat to you the assurance which I gave you a year ago that the aggregate market value of our assets at November 15th last was again substantially in excess of the Balance Sheet total and this is still true despite the further fall in prices which has since taken place. In the meantime, our rapidly growing funds enable us to take full advantage of the opportunities for remunerative investment available in the changed conditions of today.

SAVINGS ARE ESSENTIAL

It is to be hoped that the measures which the Government has taken in recent months to combat inflation and to assist in restoring the balance of foreign trade will achieve their aims. In brief the Government has sought temporarily to reduce present consumption and to restrict new capital expenditure to projects of immediate national importance—or, in other words, to insist that, as a community, we must save more and temporarily slow down investment in new buildings, plant and machinery. It is assuredly in the interest of everyone to help the Government to defeat inflation now and one of the main ways of doing this is to increase the volume of savings set aside. In the long run, too, it is universally accepted that an increased level of savings must be achieved in order to finance the investment in modern machinery and equipment which will enable this country to maintain, let alone improve, its position as a great trading nation. Life Assurance, through individual policies and pension schemes, is such an important savings medium, that our outside representatives and agents can be satisfied that in selling our policies they are also carrying out a task of vital national importance.

LARGE SURPLUS AVAILABLE

From this general survey, I pass to the Triennial Investigation and the Actuarial Valuation of the Liabilities, the basis of which you will find set out in the Report. Without entering into technicalities, I may perhaps explain that, in its essentials, this basis is the same as that adopted three years ago. The financial changes which have taken place during this period make it an even more stringent measure of the Company's liabilities now than it was then, and the Directors are satisfied that it makes full provision for all the Company's contractual liabilities and that there remains a large surplus available for distribution.

BONUS DECLARATION

A year ago, the Directors, in fixing the rate of intermediate bonus, were able to revert to the rate of 42s. per cent with which the name of the Standard was associated so firmly and for so long before the last war, and it was then hoped that the results for the whole triennium would justify a declaration at the same rate now. When, however, the

final figures came before them, the Directors took the view that a declaration, even at this generous rate, would not give a sufficient share of the Company's prosperity to those of our members whose policies have been in force for a considerable time. They therefore decided to declare for each year of the triennium a reversionary bonus at the rate of 42s. per cent on the sum assured and attaching bonuses plus an additional 42s. per cent on bonuses attaching prior to the present declaration.

The longer a policy has been in force the more reversionary bonus will in general be attaching and under this method of distribution the greater will be the amount of additional bonus now allocated. This can best be illustrated by actual examples—

A policy for a sum assured of £1,000 effected fifteen years ago had £210 11s. of reversionary bonus attaching prior to the present declaration. The amount of bonus now added to this policy will be £89 11s., which is equivalent to an ordinary compound reversionary bonus at the rate of 49s. 4d. per cent per annum.

Similarly, a policy effected twenty-five years ago will now receive a sum equivalent to an ordinary compound reversionary bonus at the rate of 55s. 5d. per cent per annum and a policy effected thirty-five years ago, at the rate of 60s. 5d. per cent per annum.

IMPORTANT CHANGE IN METHOD OF BONUS DISTRIBUTION

I wish to emphasise that this declaration marks an important change in the Company's method of bonus distribution. Just as in 1927 the Standard changed its bonus system from a "simple bonus" to a "compound bonus," so now we are changing from

a "compound bonus" to what might be called a "compound compound bonus." The Directors have decided that intermediate bonuses will be on the same basis as now declared, and it is their intention that future declarations should be made in similar form, although it should be noted that, under the new system, there is no necessity for the "additional" rate to be the same as the "basic" rate.

Each year from 1927 to 1938 the Standard declared an annual compound bonus at the rate of 42s. per cent and my predecessors in the Chair were accustomed to state that they saw no reason why this rate should not be maintained for many years to come. The sequence of declarations was in fact broken, but only by the major upheaval arising from the second world war which brought many well-established orders to an end. As a result, it is even more hazardous now than formerly to assume the mantle of the prophet and, accordingly, you will not, I am sure, expect me to make any definite prediction regarding our rate of bonus for the future. I shall only say this, that the financial position of the Company is such that a declaration of bonus in the new form and at the new rate is well within its present profit earning power.

We are greatly indebted to all the Officials and Staff of the Company who have assisted in producing these excellent results; to our New Business Organisation for the excellent new business figures and to the members of our indoor organisation who have handled the increased volume of business with efficiency and skill. All have played their part in contributing to the results which I am happy to have been able to lay before you this afternoon, and I am sure you would wish me, on your behalf, and on behalf of the Directors, to express our warmest thanks.

ONE HUNDRED YEARS AGO

At the Annual Meeting of the Company held one hundred years ago the Chairman of the day presented the results of a quinquennial investigation into the Company's affairs. After he had reported, as I have done, expanding business, increased profits, and higher bonuses, he concluded with the words "Brilliant as has been the past career of this Company, the future on which we enter is still more encouraging and propitious." I can think of no better description of the financial position of the Company today.

I now move the formal adoption of the Report, Revenue Accounts and Balance Sheet submitted.

Mr J. C. Stormonth Darling, MC, WS, in seconding this motion, said:

My Lord, Ladies and Gentlemen,

We have just listened to a most remarkable story of success, a story which is all the more welcome as it is a reflection of the prosperity of British industry. The success of this Company is something of which we should all be proud and in which people from all walks of life can have a share. I could wish that the Chairman had been tuned into every office and factory in the country so that as many as possible would know that here in the Standard is the means of consolidating personal prosperity and safeguarding the family unit.

On behalf of the with profit policy-holders I should like to congratulate you, Sir, and your colleagues, on the evident success of the Company, and I now have much pleasure in seconding the adoption of the Report and Accounts for the past year.

The report and accounts were adopted.

ALUMINIUM LIMITED

INDUSTRY'S RECORD YEAR

GROUP'S RESULTS AFFECTED BY TWO UNEXPECTED ADVERSITIES

FURTHER EXPANSION PROJECTS TO MEET UNABATED DEMAND

The annual meeting of Aluminium Limited will be held on April 26th in Montreal.

The twenty-eighth annual report of the Board of Directors has been submitted to the shareholders by Mr Nathanael V. Davis, of which the following is an extract: The aluminium industry as a whole had a record year in 1955, reaching new high levels of production, sales and profits.

Aluminium Limited and its subsidiaries in Canada and abroad participated in the high levels of activity both in the fields of primary and semi-fabricated products. Consolidated earnings were above all previous years.

The company's production of primary aluminium in 1955 again increased and all available ingot and semi-fabricated products were readily sold. Throughout the year all markets served by the company were strong and aluminium products were often in short supply. Sales and operating revenues were \$412 million in 1955 compared to \$328 million in 1954.

Net income for the year 1955, after depreciation and dividends on preferred shares of subsidiaries, was \$48,193,952 or the equivalent of \$4.83 per share on the 9,975,690 shares outstanding at the end of the year. For the year 1954 on the same basis, net income was \$34,970,025 or the equivalent of \$3.87 per share on the 9,036,382 shares outstanding at the end of that year.

The results for the year were adversely affected by two occurrences which caused loss of production. The first was an interruption of power deliveries to the Kitimat smelter in the early part of the year and the second, a severe water shortage in the Saguenay area of Quebec in the latter part of the year.

The full impact of these adversities on the company and its markets cannot be precisely. Had operations been at capacity levels throughout 1955, production and sales would have been approximately 6 per cent above their actual levels with a corresponding or slightly larger increase in profits.

From the important viewpoint of serving our markets, the loss of production came at a time when demand from customers was exceptionally strong and the company was anxious but unable to meet their full requirements.

Unfortunately, the curtailment of production and deliveries has extended into the current year. Production in 1956 has been sharply cut as a result of the water shortage but it is expected that after the spring break-up in April, operations will return to normal.

Having regard for the lag between production and sales, the financial results for the first six months of the current year will be burdened with the loss of production sustained during the months before the spring thaw. The tonnage loss is estimated at 10 per cent of this year's previously planned production.

In spite of the company's record earnings last year, profits in relation to the assets now employed in the business are not large and leave room for improvement if the construction of new facilities is to be justified. Today the small production of aluminium at Kitimat cannot earn a return on the large investment

made in the hydroelectric facilities which have been, in large part, designed and built to provide for higher levels of production.

This is the natural result of the type and scope of the integrated programme undertaken at Kitimat. By the end of this year, with new and enlarged aluminium facilities coming into production, the Kitimat development is expected to reach a position where it will begin to justify the investment.

OPERATIONS

The company's principal subsidiary, Aluminium Company of Canada, Ltd., produced a record 607,700 short tons of primary aluminium during the year, an 8 per cent increase over 1954 and 11 per cent greater than 1953.

During the year the company authorised successive increments of expansion of primary production facilities. As the year closed the company's expansion programme in Canada embraced a total of 262,000 tons of new annual capacity.

Subsidiary and affiliated smelting companies outside Canada operated at highest attainable levels in 1955, and several expansion projects were advanced.

This year's bauxite production of various grades by the company's mining subsidiaries amounted to 2,450,000 tons in British Guiana, 544,000 tons in French West Africa and 518,000 tons in Jamaica.

The strong demand for semi-fabricated products noted towards the end of 1954 continued throughout 1955 with the result that the company's fabricating facilities, while restricted by the availability of metal supplies, had a satisfactory year with their total earnings substantially above previous years.

Concurrently with its investment in smelting facilities, the company has continued to modernise and expand its fabricating activities. In the United Kingdom, the modernisation of the sheet rolling mill at Banbury by Northern Aluminium Company, Ltd., has already made substantial progress.

Following the pattern of recent years, the consolidated sales of semi-fabricated products were about one-third the tonnage of sales of primary aluminium.

MARKETS AND SALES

In the aluminium industry as a whole, the year 1955 was characterised by widespread and heavy demand for aluminium and new record levels of production. Primary aluminium production in the Free World reached an estimated total of 2,852,000 short tons, an increase of 7.5 per cent over the 1954 rate.

This supply, coupled with some relaxation of stockpiling purchases in the United States, permitted consumption in the Free World to rise by an estimated 20 per cent over 1954, but large areas of demand in North America and abroad could not be entirely filled. This large demand was particularly apparent in the latter part of the year and has carried over into the current quarter of 1956.

Sales of aluminium in all forms and from all sources by consolidated subsidiaries of

Aluminium Limited amounted to 681,310 short tons last year and were 15 per cent above 1954. As in previous years, the principal markets served were the United Kingdom, the United States and Canada.

EXPANSION PROGRAMME

With continuing pressure of demand, the company announced during 1955 a further series of expansion projects which, if carried to completion in 1959 as presently planned, will increase its effective capacity in Canada to 912,000 tons of aluminium per annum, compared with 650,000 tons at the end of 1955.

At Kitimat the installed smelter capacity is planned to reach 330,000 tons in 1959. Of this amount, 180,000 tons are expected to be in operation by the end of 1956 as a result of smelter units with total capacity of 90,000 tons entering production successively in March, June and December.

Construction plans are well advanced, and sites are being prepared at Kitimat for the addition of approximately 30,000 tons of capacity in 1957, 60,000 tons in 1958, and 60,000 tons in 1959. In the latter year the installed generator capacity at Kemano would reach 1,200,000 hp, or the equivalent of the company's Shipshaw power plant in the Saguenay district of Quebec.

FINANCING

The creation of important new facilities has meant a heavy investment in fixed capital assets, amounting to \$554 million in the period 1951 to 1955 inclusive.

The implementation of the Kitimat expansion programme on an integrated basis, supplemented to provide certain additional ancillary facilities not previously included, is presently expected to call for capital expenditures of approximately \$180 million in British Columbia in the period 1956 to 1959 inclusive and a further \$55 million for related bauxite and alumina facilities.

Current expansion of smelter facilities in Quebec will require \$10 million in 1956. Expenditures on the foregoing major projects in British Columbia, Jamaica and Quebec are expected to be approximately \$95 million during 1956.

GOLD COAST ALUMINIUM PROJECT

The Preparatory Commission, appointed by the Governments of the Gold Coast and the United Kingdom in 1953 to study all aspects of the Volta River Project for the production of aluminium in the Gold Coast, completed its work in 1955. The Commission's reports are expected to be published shortly.

This project envisages the development of the power of the Volta River to support the production of an eventual 230,000 short tons of primary aluminium per year through the treatment of locally-mined bauxite.

Tribute is due to our personnel, all of whom—directly or indirectly—had an active and often trying year in dealing with the many facets of our business at a time of rapid expansion, production cutbacks, and heavy demand for the company's products.

A COMPLETE BANKING SERVICE FOR TRANSACTIONS WITH KUWAIT

SCOTTISH EQUITABLE LIFE ASSURANCE SOCIETY

A VERY SUCCESSFUL YEAR

The One Hundred and Twenty-fifth Annual Meeting was held on March 15th in Edinburgh.

In the course of his remarks Colonel The Honourable David Bruce, Chairman of the Board of Directors, said:

The year under review has been not only an exceedingly busy one but also a very successful one. We have by a handsome margin achieved yet another record in new business. Net new Sums Assured completed in 1955 amounted to £5,918,983, an increase of more than £1,180,000 over the previous year's total. This increase represents a quite outstanding performance and reflects great credit on our outside staff. Our thanks are also due to our Agents for their continuing loyal support.

Our premium income in respect of the Life Assurance Fund again shows a substantial increase, being more than £225,000 above the 1954 figure. The net sums received in payment of purchase prices of annuities amounted to just over £280,000. It is very gratifying to be able to report that our gross interest income exceeds £1 million for the first time. The gross rate of interest calculated on the Life Fund was £5 19s. 5d. per cent and the corresponding net rate was £4 15s. 1d. per cent. The figures for the past three years are as follows:

	1953 Per cent	1954 Per cent	1955 Per cent
Gross rate ...	£ s. d. 5 8 0	£ s. d. 5 14 11	£ s. d. 5 19 5
Net rate	4 5 0	4 11 0	4 15 1

We can regard the steady increase in our rate of interest with considerable satisfaction. I feel, however, that I should sound a note of warning. You are all aware of the measures which the Government has taken in an endeavour to curb inflation and to help to solve the country's balance of payments problem. We have the "credit squeeze" and the exhortations to trading companies to adopt a policy of restraint as regards dividends. It is impossible to say to what extent these factors will affect our interest earnings, but we must, I think, anticipate some slowing down in the rate of improvement in future.

FAVOURABLE MORTALITY EXPERIENCE

Claims by Death paid during the year at £389,851 are some £70,000 more than the previous year. Despite this increase our mortality experience has again been very satisfactory—the results are only slightly less favourable than those of the two previous years which were extremely good. The sums paid under maturing endowment policies were about £50,000 less than last year's total.

Expenses and Commission together amount to approximately £335,000 and are some £18,000 more than last year, but, taking into account the increase in our new business and

the fact that inflation is still with us, the total can be regarded as reasonable.

As a result of the year's working the Life Assurance Fund has increased by over £1,440,000.

The principal changes in the Balance Sheet are, in round figures, an increase of £270,000 in Mortgages on Property in the United Kingdom and an increase of £280,000 in loans to our associate the Standard Property Investment Company Limited. Preference and Guaranteed Stocks have increased by £189,000 and Ordinary Stocks by £381,000. The total assets exceed £20 million for the first time.

Last year witnessed a general increase in the level of interest rates and in common with other similar institutions we experienced depreciation in the values of our fixed interest bearing securities. We have also seen since the beginning of the year some further depreciation, particularly in the values of Ordinary Shares. However, the margin between the market value of the Society's investments in Stock Exchange Securities and the amount at which they appear in the Balance Sheet is still substantial.

I have commented sufficiently on the Accounts to show that the Society continues to prosper. With a record amount of new business, a high rate of interest, favourable mortality experience and strong reserves, not only has this been a successful year, but the Society is well equipped to face any problems which may arise in the future.

The adoption of the Report and Accounts was carried unanimously.

Members from all parts of the world. In addition to our established products we exhibited equipment for use in the photo-lithographic field. There was also on show our "Rotomaton" simplified offset machine and the "Monophoto" photo-typesetting machine.

This latter machine has taken more time to reach the market than we would have liked, but we are determined to uphold our high reputation for quality and reliability in our equipment, and we have withheld "Monophoto" until we are convinced that this will be found to be in keeping with our earlier products.

I am happy to report a steady increase in the number of new installations both at home and abroad. The re-arrangements in Australia have now taken effect and our business there is being handled by our subsidiary company The Monotype Corporation of Australia (Pty) Limited. In the Near East we have been successful in obtaining a share of the business now available through development in an area where there is considerable scope for expansion.

In Western Europe, competition is increasing, but we have maintained our position with a steady flow of business. In Eastern Europe, we continue to supply such countries as Czechoslovakia, Poland, Hungary, Rumania and East Germany, where our products, for many years, have enjoyed a high reputation.

In India, the proposals by the States Re-organisation Committee to re-draw the boundaries, dividing the country into Linguistic States, should, if accepted, widen the demand for print. The resultant demand for vernacular scripts emphasises the need for a wide programme in the design and manufacture of matrices. We are prepared for this and, indeed, the number of new founts produced during the year was the highest in the history of the Corporation.

To meet growing demands in West Africa, we have established a branch in Lagos. This

THE ECONOMIST, APRIL 7, 1956

has resulted in a marked increase in sales in that area.

For the first time since the war, we have sent machines to Japan.

Our sister company in the USA—The Lanston Monotype Machine Company of Philadelphia—has now been under stable management for some twelve months, following the difficulties to which I referred in my last statement. The business there has already benefited considerably from these more settled conditions.

ACQUISITION IN LITHOGRAPHIC FIELD

Last year I referred to our increasing interest in the development of equipment for use in the lithographic field. In furtherance of this policy we acquired, in October last, the whole of the Issued Share Capital of Pictorial Machinery Limited, manufacturers of photo-lithographic equipment for the printing trade. Its products enjoy an excellent reputation.

Development work continues in patenting and developing improvements, including simplified offset machines. We have now ready for marketing a multiple-headed stitching machine known as the "Monotype" Boston Multiple Stitcher. This has developed from the successful "Monotype" Boston No. 7 Stitcher.

We are very conscious of the importance of holding our lead in technical progress and of maintaining the highest standards of design and manufacturing skill. We are building up our research and development organisation to ensure that prototype machines can be assembled expeditiously without adversely affecting the output of the factory and the service we give to our customers.

CURRENT YEAR'S PROSPECTS

In my view the current prospects of the Corporation are reasonably good. In making any forecast, however, we must not ignore the possibility that we may not be able to recover future increases in costs solely by increasing prices. The margin between costs and selling prices must be sufficient to cover an adequate appropriation to reserves, and a fair and equitable return to those who provide the capital needs of industry. Without this margin failure to meet the demands of buyers both at home and abroad must inevitably follow, to the detriment of everyone engaged in British industry.

The difficulties are mainly superimposed by outside conditions and are often due to the interplay of policies, economics, nationalism and currency problems. There is an urgent need for everyone to make more effort to combat existing inflationary conditions with their increasingly harmful effect on the country's economy. We, on our part, are doing everything we can to maintain our position in the export markets, and in fact approximately two-thirds of our production went overseas last year. For the first few months of the current financial year, I am glad to say, our level of orders is being maintained.

In the present difficult economic conditions, to which I have already made reference, we are fully alive to the requirements of our customers for equipment which can operate to best advantage with economy of effort and money, allied to excellence of product. We have this very much in mind in the development work which is going on.

The report and accounts were adopted.

THE VULCAN FOUNDRY LIMITED

SATISFACTORY RESULTS IN PERIOD OF TRANSITION

FUTURE PRODUCTION: EMPHASIS ON MODERN TRACTION

SIR GEORGE H. NELSON ON CHANGING PATTERN OF DEMAND

The ninety-third annual general meeting of The Vulcan Foundry, Limited, was held on March 15th in London. In his statement to the meeting, the Chairman, Sir George H. Nelson, Bt, FCGI, MIMechE, MIEE, said:

In my statement to Stockholders at the Annual General Meeting last year, I referred to the change which had then taken place in the control of the Company, by which we effectively became a member of the English Electric Group of Companies in March, 1955. In completion of this operation later in the year, by the English Electric Company transferring to The Vulcan Foundry their holding in Robert Stephenson & Hawthorns, the latter became a wholly-owned subsidiary of The Vulcan Foundry, Limited. I am glad to report that both Vulcan and Stephenson, as members of the English Electric "family," are already playing an important part in the activities of the Group, particularly of course in the field of traction, in which their long experience and tradition of craftsmanship is known throughout the world.

ACCOUNTS

I am pleased to be able to report that the trading results for the year under review show an improvement over those of the previous year. The group trading profits, after charging £54,350 for depreciation, amount to £628,502, an increase of £121,493. The provision for taxation on the profits of the year amounts to £294,397. The net profits, after transfer to Capital Reserve of taxation relief on investment allowances, and provision for contingencies, amount to £302,290.

The revenue reserves and unappropriated profits at the date of acquisition of the ordinary stock by the English Electric Company Limited have been transferred to Capital Reserve. Consequently, the profits available for appropriation amounting to £251,568 after deducting £50,722 retained by Robert Stephenson & Hawthorns Limited, are those of the year 1955 only. After allocating £100,000 to General Reserve, and providing £2,875 for the dividend on the Preference Stock, there is an available balance of £148,693. The Directors recommend that a dividend of 10 per cent less Income Tax be paid on the Ordinary Stock, absorbing £48,593, leaving a balance of £100,100 to be carried forward.

The Consolidated Balance Sheet shows an increase in fixed and current assets, and a reduction in current liabilities. This reflects the Board's policy of continual replacement of the fixed assets in order to improve the Company's competitive power. At the same time the liquid position has been strengthened, the net current assets having increased during the year by £202,654. The total Share

Capital and Reserves rose by £424,502 during the year to the figure of £2,757,444 at December 31, 1955.

PRODUCTION

The practical effects of the change in control have been manifest by the introduction of the manufacture of diesel engines at Newton-le-Willows to enable us to meet the world change of demand from steam to diesel locomotives. To this end, considerable alterations have been carried out in workshop layout and equipment, and production of these engines is now at an advanced stage.

There was little change in the pattern of locomotive production during the year as between steam, diesel, and electric types, but membership of the English Electric Group enables Vulcan's production potential to be closely integrated with that of other English Electric Works, to the undoubted advantage of customers. Steam locomotive production for the year included orders, all for export, for the East African Railways and Harbours, India and North Borneo. Electric locomotives were built for India and Spain, and diesel-electrics for the Gold Coast, Nigeria, Holland, and New Zealand. In addition, diesel mechanical locomotives were supplied to British Railways, New Zealand, and a number of other customers, through The Drewry Car Company Limited. I am proud to report that, during the recent visit of Her Majesty the Queen and HRH the Duke of Edinburgh to Nigeria, the Royal Train was hauled by two English Electric diesel electric locomotives, the mechanical parts of which were made and built at Newton-le-Willows.

FUTURE PROSPECTS

The demands of the future will be largely electric and diesel electric locomotives, but both at Vulcan and Stephenson we have retained capacity for the manufacture of steam locomotives, boilers and spares, for which orders continue to be actively sought in the face of very severe competition. The fact that few steam orders were booked during the year resulted, not from a deliberate change in policy on our part, but from our inability to compete with Japanese and "Iron Curtain" countries in our traditional markets such as India, where very substantial numbers of steam locomotives are still required. The volume of steam locomotive orders generally is of course affected by the increasing tendency of railways all over the world—including our own British Railways—to swing away from steam and towards diesel and electric traction.

As a member of the English Electric Group of Companies, the Vulcan Foundry has special facilities immediately available to enable the Group to meet with ease on time deliveries of any foreseeable demands that

THE MONOTYPE CORPORATION LIMITED

TURNOVER MAINTAINED IN COMPETITIVE MARKET

REPUTATION FOR QUALITY AND RELIABILITY

SIR GEORGE HARVIE-WATT ON NEW DEVELOPMENTS

The forty-eighth Annual General Meeting of The Monotype Corporation Limited was held on March 13th at 43 Fetter Lane, London, E.C.

Brigadier Sir George Harvie-Watt, Bart, TD, ADC, QC, MP (the Chairman), presided, and in the course of his speech said: Turnover has been maintained in a market which is increasingly competitive. The trading balance, however, shows a reduction of approximately 15 per cent and results in a net profit for the group of £130,932, after provision for all charges, including taxation, compared with £154,666 for the previous year. This difference resulted largely from (i) wage increases which raised not only our own direct labour costs, but indirectly put up the cost of the materials and the services we use, (ii) an increase in research and experimental work, and (iii) the International Printing Exhibition.

A large part of the increased costs was absorbed during the year. The engineering industry, however, has been subject to eight wage increases in the past ten years and this, coupled with recently renewed pressure, can only bring about an increase in prices. The serious effect on the national economy of these wage increases is the subject of constant reference by those concerned with the well-being of the country. This problem of rising costs, and the search for means to combat them by greater efficiency, is common to the whole of British industry, particularly that

part engaged, as this Corporation is, in competition in world markets. It is regrettable that repeated warnings on the current economic situation, necessary as they are, appear to be without effect.

The profit for the period dealt with in the Parent Company's accounts, together with the amount brought forward from the previous year, results in an available balance of £216,383.

CONSOLIDATED BALANCE SHEET

Turning to the Consolidated Balance Sheet, fixed assets, before depreciation, at £1,457,942 show an increase of £191,011 compared with the previous year. The larger part of this increase was spent on the building and equipping of our premises at Monotype House, 43 Fetter Lane. Notwithstanding this, our net current assets, at £1,548,742, are only £90,350 lower than the previous year. Our General Reserve now stands at £518,366 as a result of the proposed allocation of £50,000.

The Board recommends for your approval the payment of a final dividend of 7 per cent less tax, making 9 per cent less tax.

NEW PRODUCTS

The Corporation played an active and important part in the Tenth International Printing & Allied Trades Exhibition held in London last July when we welcomed custo-

are likely to be made upon them. These facilities are in existence with skilled and trained men available now. British Railways placed orders during the year with our parent Company in connection with their modernisation plan, but we have not so far been given any of this work. We feel sure, however, bearing in mind these facilities, and the trained and experienced people associated with them, which have been closely linked with locomotive building since their earliest days, that orders will be received at no great distant date.

WORKS PENSION SCHEME

To mark the 25th anniversary of my becoming Managing Director of the English Electric Company, in October of last year, certain improvements in the Pension and Life Assurance Schemes operated by that Company were introduced. I am pleased to say that at the same time, the opportunity was taken to initiate similar schemes for the hourly-paid workpeople of The Vulcan Foundry and Robert Stephenson & Hawthorns, from the beginning of the year. Their introduction will help to strengthen the stability and security in their later years of the workpeople which is the constant aim and desire of us all.

Finally, I would like to pay a sincere tribute to the Company's employees who, under the leadership of our Managing Director, Mr Collingwood, and the General Manager, Mr Rigby, have, by their readiness to adapt themselves to changing circumstances, and their hard work for the Company generally, produced such satisfactory results in a period of transition which might have otherwise presented many difficulties.

The report and accounts were adopted.

THE POWER-GAS CORPORATION LIMITED

The fifty-sixth Annual General Meeting of The Power-Gas Corporation Limited was held yesterday at Parkfield Works, Stockton-on-Tees, Major W. R. Brown, DSO, presiding in the absence through illness of the Chairman, Mr N. E. Rambush, DSc(Hon), MChemE, FRSA, and the Vice-Chairman, Captain A. H. Cowap. The following is an extract from the circulated Statement to Shareholders.

The Group profit before providing for Depreciation and Loan Stock Interest is £827,933, compared with £760,289 last year. This moderate increase is attributable to the expansion of our business. There is also a fortuitous addition to profit occasioned by a change in the accountancy date of the Rose, Downs & Thompson companies.

The total value of orders received during the year amounted to £10½ million. This is almost double the figure for last year and is a record in the history of the Group.

During the year three blast furnaces were completed and orders for three more were received.

A notable event was the setting up of a British record by the latest furnace to be built by the Blast Furnace Division for the Appleby-Frodingham Steel Company. Using a specially prepared burden of lean home ores, this furnace produced 11,160 tons of iron in one week, so surpassing by a large margin all previous records in this country.

The Report and Accounts were adopted.

At the subsequent Extraordinary General Meeting new Articles of Association were adopted by special Resolution.

THE SCOTTISH PROVIDENT INSTITUTION

MUTUAL LIFE ASSURANCE

REVIEW BY THE CHAIRMAN,

In presenting the Report and Accounts for 1955 to the 118th Annual General Meeting held in Edinburgh on March 13th, the Chairman, Sir Hugh Rose, Bart, TD, said that the usefulness and scope of the business continued to grow satisfactorily, the total net new sums assured at £9,672,383 being again a record and the number of new ordinary policies issued being 12 per cent greater than in 1954. Net premium income and net interest had each increased by nearly £1 million and the gross rate of interest earned on the funds, £5 16s. 3d. per cent, was 6s. per cent above that of 1954 and the highest in the Institution's long history.

Although claims by maturity had increased, death claims were lower than in the previous year and the mortality experience continued to be most favourable. The funds had increased during the year by over £2½ million and now amounted to £38,693,417. The assets comprising the funds were shown in the Balance Sheet at amounts which in the aggregate were substantially below their market values and the Directors were well satisfied that the portfolio was suitable in present circumstances.

INTERIM BONUSES INCREASED

In view of the very satisfactory results for 1955, and indeed for the whole period since the last quinquennial investigation, the Directors had increased the rates of intermediate bonus. Under the Institution's distinctive

System of very low rates of premium for whole-life assurances, the rates had been increased to 23s. 6d. per cent per annum, compound (Old Series) and 21s. per cent per annum, compound (New Series). For with profit endowment assurances the rate had been fixed at 42s. per cent per annum, compound, which was a most satisfactory rate when the very moderate premiums charged were borne in mind. He had no hesitation in claiming that such a policy afforded one of the most attractive propositions available at the present time.

Passing to a consideration of present economic conditions, the Chairman stated that the root cause of our troubles was undoubtedly that individuals had not been saving enough. Life assurance companies had been noted throughout the years for their constant emphasis on the need for saving. Saving through life assurance was as valuable to the State as any other form and its importance had been recognised by the tax relief allowed on life assurance premiums. The investment of funds arising from such premiums was not inflationary as the funds had been built up from voluntary savings which, but for the existence of life assurance policies, might well have been spent on consumer goods.

In closing his remarks, the Chairman made it clear that it was the constant endeavour of the Board to afford maximum facilities for effecting and maintaining the most suitable types of policies for members of this old-established mutual office and extended a special invitation to those with estate duty problems to inquire about a new form of policy recently devised by which, in the simplest possible way, full advantage might be taken of the means provided by law for minimising the duty payable. The report and accounts were adopted.

THE ECONOMIST, APRIL 7, 1956

THE ECONOMIST, APRIL 7, 1956

SCOTTISH AMICABLE LIFE ASSURANCE SOCIETY

RECORD LEVEL OF NEW BUSINESS

SOCIETY'S LONG RECORD OF STABLE BONUSES

The 130th Annual General Meeting of the Scottish Amicable Life Assurance Society was held in Glasgow on March 21st, Sir ynden Macassey, KBE, QC (President of the Society), presiding.

In moving the adoption of the Report and accounts, the Right Hon. The Earl of Elgin and Kincardine, KT (Chairman of the Ordinary Directors), said that the year's net new business under individual assurances had exceeded £10 million for the first time and had shown an increase of more than 1,500,000 over the corresponding figure for 1954. Over the year, group life sums assured had increased by £4 million and deferred pension benefits by £1,500,000 per annum. Premium revenue, which amounted last year to almost £6,500,000, had increased during the year by £800,000 and, over the last quinquennium, by £3,750,000—an annual average of £750,000. Gross investment income had passed the £2 million mark and provided a gross return of 5 0s. 4d. per cent and a net return of 4 9s. 5d. per cent on the Society's funds,

which amounted to £44,500,000 at December 31, 1955. These funds had increased during the year by more than £5,250,000 and, during the quinquennium as a whole, by £20 million. The greater part of the past year's increment in the funds had been invested in fixed-interest securities on a long-term basis and on first-class security at very remunerative interest rates.

QUINQUENNIAL VALUATION

The quinquennial valuation as at December 31, 1955, had disclosed a surplus of £3,222,995 in the Life Assurance and Annuity Fund—after strengthening the basis of valuation of annuity contracts. A comparison of this figure with the surplus of £1,372,381 for the previous quinquennium provided another indication of the growth of the Society's business—and equally of the increase in profit-earning capacity—during recent years. The compound bonus of 42s. 6d. per cent per annum in respect of the past quinquennium was the highest ever declared by the Society—equalled on only one former occasion (1926-30). In respect of every year since the Society's foundation in 1826, a compound bonus of at least 30s. per cent had been declared—while, over the past half-century, the average rate had exceeded 35s. per cent. This long record of stability, combined with the Society's present prosperity, justified a high degree of confidence in its future bonus earning capacity under all the varied conditions encountered.

INTRODUCTION OF NEW POLICIES

A notable feature of the past quinquennium had been the introduction of several new types of policy designed to meet the changing requirements of the times. The Pension Assurance policy had been launched to meet the demand for schemes for the benefit of senior executives. This policy provided on retirement a pension in units of £100 per annum, guaranteed to be paid for at least ten years, and on death before the pension age a cash sum of £1,000 in lieu of each £100 of pension—with bonus additions to both the pension and death benefit, if effected on the with-profit basis. The Double Bonus policy had also been introduced—offering in effect two units of profit-sharing for each unit of basic assurance to any member wishing to double his participation in the Society's bonus prospects. The most recent innovation had been the with-profit group pension and life assurance scheme. The outstanding feature of this scheme was that the with-profit group policy was entitled to share in all the distributable profits of the Society, compound bonuses being added at the Society's normal rate of bonus. It thus enjoyed all the advantages of the Society's traditional bonus system—advantages which, as the result of the recent bonus declaration, had quickly become apparent in relation to the with-profit schemes already arranged with the Society.

The Report and Accounts were adopted.

BRADFORD EQUITABLE BUILDING SOCIETY

The annual general meeting of the Bradford Equitable Building Society was held at the Mechanics' Institute, Bradford, on March 5th.

Presenting the annual report and statement of accounts for the year ended December 31, 1955, the President, Sir A. Maxwell Ramsden, gave the following report:

The year 1955 has been one of many sharp contrasts. The income from savers and investors in shares and deposits has totalled £6,176,000, a figure higher than ever previously recorded. The peak period of the year was the first three months, but since that time the income from this source has been maintained month by month at a very high level. Withdrawals at the commencement of the year were normal, but they increased very considerably in the middle of the year, and continued throughout the year at a high figure, although not so high as during the months of June and July.

The continued high income shows that Building Society investments during the year continued to attract very substantial numbers of investors. The high rate of withdrawals shows the effect of the "credit squeeze," and the desire on the part of many to speculate on the Stock Exchange, and also an urge to indulge in private spending. There can be little doubt that inflation, or the fear of inflation, played its part in the Stock Exchange "boom" and in private spending.

Turning to mortgages, the removal of building restrictions late in 1954 opened up a strong surge of competition amongst Building Societies for mortgage business, and added some aspects which your Directors were not prepared to entertain. In the middle of the year the Society was in danger of being inundated with mortgage applications with which it could not possibly cope. Accordingly, restrictions on the acceptance

of new mortgage commitments had to be instituted, with very great regret, but your Directors were determined at all times to conduct the Society's affairs well within its capacity and this they claim to have done. Withdrawals were invariably paid out promptly, all mortgage commitments were completed promptly, and at the end of the year the Society was in a very sound position.

TOTAL ASSETS

The total assets of the Society at December 31, 1955, were £30,308,000, being an increase of £1,817,000 on the previous year. The principal items making up the figure of total assets consisted of Mortgage Balances £25,741,000, Investments and Cash Balances £4,360,000, and Office Premises £175,000.

On the other side of the Accounts, Shareholders' and Depositors' balances amount to £28,616,000, an increase of £1,711,000; Sundry Liabilities and Provisions £351,000 and Reserves, including Carry Forward, £1,340,000.

The total number of open accounts at the end of the year was 69,644.

SHARES AND DEPOSITS

A record number of 6,100 new accounts in the Investment Departments were opened during the year, and the number of accounts in these departments at the end of the year was 40,523.

In conformity with the change in interest rates during last year, the rates of interest to shareholders and depositors have been increased with effect from September 1st last, by ½ per cent, the new rates now operative being 3 per cent to Paid-up Shareholders and 2½ per cent to personal Depositors. The new rate to Monthly Subscription Shareholders is 3½ per cent. You will be asked to approve at this meeting a bonus of ½ per cent to

Paid-Up Shareholders Class I and to Monthly Subscription Shareholders. This is in addition to the rates of interest I have mentioned, and is the reward and incentive for regular thrift.

MORTGAGES

Mortgage activity has been somewhat restrained during the year, advances having been made to 3,502 borrowers. The total amount advanced was £4,853,000, a decrease of £903,000 on the previous year. The repayment of advances and interest amounted to £4,908,000, a slight increase on the figure of the preceding year, and the net increase in mortgage balances is £1,212,000.

Consequent upon the increase in rates of interest to investors, it was necessary to increase the rate of interest to borrowers.

INVESTMENTS AND LIQUIDITY

The total liquid funds of the Society in Trustee Securities and Cash at Banks and in Hand amount to £4,360,000, representing more than 14 per cent of the Society's assets.

PROFIT AND LOSS

The balance of revenue profit for the year was £107,281, after providing in full for interest and bonus on shares and interest on deposits, and also for the Society's liability for income tax and profits tax to the date of the Balance Sheet. Your Board recommends that £3,500 be appropriated to the Staff Superannuation Fund, £90,000 to the General Reserve Fund, £15,000 to Reserve Fund No. 2, and carry forward a balance of £14,995 to next year.

Management Expenses have increased slightly to nearly 11s. 2d. per cent of the total assets as compared with 10s. 11d. per cent of a year ago.

RESERVES AND UNDIVIDED PROFIT

The total reserves and balance carried forward, including Post War Credit reserves, amount to £1,340,000.

The Report was adopted.

READY NOW... first complete data on PLANT SITE LOCATIONS in New York State's SEAWAY LAND

For the first time, detailed plant site data is now available covering the Nation's newest and most promising industrial frontier—New York State's Seaway Land. Created by the St. Lawrence navigation and power projects... Seaway Land comprises an area that pulses with opportunity.

Within three years, completion of the Seaway navigation project will give to New York State's many Seaway ports—and the areas they serve—the ready and economical access to the world's raw materials and the world's markets. Trade routes to the seven seas will connect, in Seaway Land, with the great and smoothly efficient system of railroad, highway, air and inland waterway facilities already functioning in New York State.

The St. Lawrence power project now being built by the New York State Power Authority will be the largest hydroelectric power installation east of the Mississippi. Its power will start flowing in 1958. And the expansion of Niagara power in the near future will add more power than that generated by the St. Lawrence. Add to these the constantly growing generating capacity of the private utilities, and Seaway Land becomes the nation's power center.

This, then, is the time to examine this area with an eye to your particular requirements. Our industrial location experts are prepared to recommend specific sites in Seaway Land to meet your manufacturing and marketing requirements.

Ready to serve you...

NEW YORK STATE'S INDUSTRIAL LOCATION SERVICE

Our Industrial Location Service stands ready to give you the Seaway Land facts on which you can make a fully-informed selection of the right location for your individual plant.

The data we submit is gathered, organized and interpreted for your particular benefit by a staff of experts. It costs you nothing... a free service of the State of New York.

To get your free copy of our booklet—"Industrial Location Services"—write New York State Department of Commerce, Room 380, 112 State St., Albany 7, N.Y.

Movers to Industry

"Moving house" for industry has long been the concern of Wards' Factory Planning and Installation Department. No job is too small or too large for them to handle, from the re-siting of a single machine to the planning and installation of a complete new factory layout.

In those cases where it is necessary to maintain the flow of production, Wards' planning ensures the minimum interruption. When tricky handling problems are involved, Wards' "know-how", plus the resources of a mighty industrial group, are available to solve them.

Factory planning and installation is only one aspect of Wards' service to industry.

The scope of the Ward Group of Companies is as broad as industry itself.

What's this all about **RANK PRECISION INDUSTRIES**

WITHIN the Rank Organisation is a number of world famous Companies, including G.B. Equipments Ltd., G.B.-Kalee Ltd., Taylor, Taylor & Hobson Ltd., and A. Kershaw and Sons, which manufacture and distribute many high-quality products.

These products are probably familiar to you—they are widely known in many markets. This group of Companies offers the greatest range of cine equipment to enthusiasts; provides industry with the finest precision measuring instruments and is the largest manufacturer of Cinematograph equipment in Europe.

What is perhaps not so well known is the close connection these Companies have with one another and the Rank Organisation. Formerly members of the British Optical & Precision Engineers' Group, they will now be clearly identified as **RANK PRECISION INDUSTRIES**.

From henceforth products which stem from this great organisation will be identified by the world famous "man-with-the-gong" symbol . . . it is your guarantee of superb workmanship, of precision in manufacture, of prompt and efficient service . . . in short your guarantee of satisfaction.

2 machines by **Olivetti** designed especially for the busy small business

The Studio 44 typewriter and the Summa 15 hand operated adding-listing machine have both been designed particularly to provide for the needs of the busy small business. In their capacity to stand up to the hardest work and in their ability to serve the most exacting up-to-date needs, these machines lack nothing in performance compared with much larger and more expensive machines.

The completeness and compactness of the Studio typewriter and the Summa adding-listing machine have been achieved by the skilled engineering design for which Olivetti are so famous.

Studio 44

86 character keyboard - Full-length platen - Carriage on roller bearings - Key-set tabulator - Personal touch-tuning - Standard size ribbon spools - Half-spacing

Summa 15

Hand operated - Capacity 10/11 columns - Automatic printing - Operates both in sterling and whole numbers - Sterling cut-off device - Direct subtraction and credit balance - Prints the proof of its balance.

THE HIGH FASHION LOOK IN SELF-WINDING WATCHES

So very tiny, so very chic, your Mido is ready to sparkle brilliantly on the most gala occasion. Yet, Mido is a watch that wants no pampering. Shock-protected, anti-magnetic, 100% waterproof, your Mido is a faithful companion through a full day of bustling activity into an evening of starry glamour... without once losing its fashion-right look. And the beauty of it all - Mido gives you the widest choice of self-winding watches in the world. See these fabulous miniatures at better jewellers everywhere.

The Watch You Never Have to Wind

● SELF-WINDING ● 100% WATERPROOF ● SHOCK PROTECTED ● ANTI-MAGNETIC ● UNBREAKABLE MAINSPRING

Mido watches are sold and serviced in 69 countries throughout the world.

Mido Watch Company, Bienna, Switzerland

Petroleum Chemical Leadership...

Once again the Kellogg organisation is privileged to announce its participation in another ethylene-from-petroleum plant for Montecatini of Ferrara—the largest Chemical Manufacturing concern in Italy. In the manufacture of ethylene, process engineering by the Kellogg organisation offers many advantages over conventional systems and guarantees optimum yields and purity from economically available feedstocks. The key is the Kellogg steam-pyrolysis process. Used successfully in this country for the cracking of heavy naphtha, it permits ethane and propane pyrolysis plants to be designed for higher yields; makes possible the economic production of ethylene and other olefins from primary flash distillates, residuals, and other low-value products. The Kellogg organisation has accumulated considerable cost data on ethylene manufacture. Interested firms are invited to review these data with Kellogg International Corporation.

BUILDING WITHIN A BUDGET

The most successful building operations today are the fruits of collaboration—the closest possible partnership of owner, architect and a widely experienced firm of builders and contractors. Wates are such a firm.

Wates believe in pre-planning, the scrupulous examination of all possible means of achieving the client's aims with maximum economy and at maximum speed. And the final drawings are those which crystallize optimum solutions to every aspect of the building problem. The Wates method invests the owner with complete control of costs: he gets his building at a price within his budget, and he gets it on time.

Architects and building owners find that Wates' building operations are both economical and successful because they make full use of the latest mechanical equipment, and because they co-ordinate men, materials and machines to the maximum advantage.

These services are offered either on a fixed fee basis or at a fixed inclusive price. Consult Wates or put them on your tender list—it pays.

Wates Offer:

The advisory service of their experienced engineering, surveying and pre-planning departments.

Efficient and highly economical building to precise programmes.

It is an accepted fact that the life of paintwork on steel is dependent upon the surface treatment of the metal before painting. In an exposure test* on structural steel in an industrial atmosphere, paint on a weathered and hand-cleaned surface lasted only 2 years, but the same paint lasted *nine* years on steel from which the mill-scale had been removed by pickling. *Reference: "The Prevention of Corrosion" British Iron & Steel Research Association.

Black Monday!

The 2,800,000 women in our readership of over 6,750,000 have never heard of Black Monday! Magic detergents and washing machines have long made a museum piece of the scrubbing-board. But far more than freedom from household drudgery has been won by DAILY HERALD wage-earners. With the considerable and necessary advance in their living standards has come new purchasing power, the complete force of which has yet to be felt in the home market. And that purchasing power is topped up by the fact that over one half of DAILY HERALD families have two or more pay packets every week! *The money will be spent shrewdly.* Better food, better clothes, and more of both. Modern furniture, kitchen and labour-saving equipment, radio and TV. Motor-cycles, cycles, and even cars. Yes, a mighty fertile market; the cream of the wage earners, buying-minded, and brand-conscious. *Who will sell most to them and most often? Only the advertisers who speak to them regularly in their own paper—the DAILY HERALD—whose every word they follow because it represents their interests. It is their friend and they believe in it.* In fact, the HERALD is the only way to contact 40 per cent of the 6,750,000, for it is the only paper they read. The other 60 per cent? Well, wouldn't you prefer products which were introduced to you by your best friend!

33% floor space saved 25% more desk area

If you are "pushed" for space... if you have to get more people in the same space... if you need functional office furniture designed specially for your business—then you should consider "Eight-for-Six" furniture.

Why? Well it seats eight where six used to be. It gives more desk area in spite of reduced floor space. It is "hand-tailored" to fit each job, i.e., with desks, pedestals and fitments as you need them. You can start with one or two work stations (or hundreds) and add

as you expand. And each work station will be planned to give maximum output with minimum movement.

Your business can have this "time and motion" studied "Eight-for-Six" furniture—with or without noise-repelling partitions. And the cost is very similar to ordinary office furniture.

May we send you further details please? (We will submit a plan without obligation for your offices.)

● Send for this fully illustrated free booklet showing wide variety of seating plans.

phenol

Telephones of phenolic resin are more functional and durable, plywood adhesives for boats more dependable, quality of motor oils improved at low cost—all through one common ingredient, Dow phenol.

... Another example of Dow at work with industry to make better products for you.

Though you won't always find Dow chemicals identified in the products you use each day, they are often the important basic ingredient that makes possible higher quality and lower price. Agricultural chemicals help the farmer make his land more productive—help him in his fight against weeds and insects. Magnesium by Dow is the lightweight metal that subtracts many pounds from power tools, luggage and ladders. These are but a few examples of Dow's contribution to progress through chemistry.

For more information about Dow products, contact your representative in England, or write to Dow, Dept. 309-N.

SEE THIS MAN

Here's a way to export *more*—at much less risk. The E.C.G.D. man will tell you about it: see him when he calls. He'll explain E.C.G.D. insurance and credit management—covering you against many risks that aren't insurable commercially, setting you free to expand your trade. You go ahead and sell more goods—

HE'LL SEE
YOU GET PAID

★
Pigment maker sees him—
exports seventy times as much!

Export turnover up by seventy times in two years—that's the record of this pigment firm. In 1951 they did under £5,000 worth of export business: then they saw the E.C.G.D. man, and in the second year of their policy exports topped the £350,000 mark.

What's behind this remarkable increase? First and foremost the exporter's own enterprise. But E.C.G.D. had a hand in it—providing, for premiums totalling under £5,000, the security the firm needed for expansion. Judge the extent of that security from this: in one market alone, where the buyer's government blocked payment, E.C.G.D. paid a claim for over £21,000.

E.C.G.D.

You can start your business trip at Southampton ...you're in America the moment you step on board

IN THE PERFECT ATMOSPHERE FOR BUSINESS CONTACTS★

★ IMPORTANT! Memo to a businessman

GO OVER the fifty feet of gangplank on to the famed "United States" or her running-mate the "America," and immediately—you're in America; the glitter, the glamour, the heart-warming friendliness and awe-inspiring efficiency of a sister nation enfold you.

And if you're a businessman, here is the perfect atmosphere to lay the foundation of a really successful business trip. In informal, friendly surroundings, you meet the men who might make all the difference.

There's fun aboard, too, lots of it. You'll find the few days that separate you from New York pass all too quickly.

Make sure that the next time you go to the States (or to Canada), you sail United States Lines.

There are great advantages to be reaped by British businessmen if they travel by United States Lines. You have time, first of all, to adjust yourself to the American atmosphere and the American tempo before you arrive in New York.

And, most important, a fresh contact is more easily made under the sociable conditions aboard ship than over an office desk; the people you meet may turn out to be more than just good friends—they may be useful friends.

United States Lines

A TWOFOOLD JOB...

**How The English Electric Company is
working for Britain at home and abroad**

Power generation. The top half of the compressor casing is lowered over the rotor of a 20,000-kW gas turbine built at the ENGLISH ELECTRIC Rugby Works. Besides gas turbines such as this, ENGLISH ELECTRIC is also pioneering in the development of atomic

energy to supplement the conventional steam and hydro-electric means of power generation. This company is supplying equipment of every type for the C.E.A.'s long-term programme of power station construction, which will double Britain's generating capacity in the next 10 years

Wealth from the earth. Four of these ENGLISH ELECTRIC twin AC hoists have been supplied to Freddie's North and South Lease Area Mines in the Orange Free State, where they bring the gold-bearing quartz to the surface. ENGLISH ELECTRIC exports are earning for Britain all over the world.

Britain is busy now, more prosperous than for decades past. Full employment, active industries, advances in science and technology, plenty of opportunities both for firms and for individuals... this is progress to be proud of. The challenge—the need—is to maintain it.

All depends on production—and exports. From 1949 to 1955, our total industrial output rose by 27%, and the value of our vital exports by 58%. But still higher production, still more export activity, are needed to ensure *still better living for Britain*. In both these ways, ENGLISH ELECTRIC is playing its full part.

At home, this company helps to supply the generators and other plant needed for Britain's expanding power generation programme; it also makes the electrical equipment by which our industries use this energy for production—production not only for home demand but for developing export markets.

In addition it is itself a vigorous and successful exporter; *about half the Group's business is overseas*, earning foreign currency for Britain.

With the world-wide experience of its engineers and technicians, backed by great manufacturing resources and advanced research, ENGLISH ELECTRIC is hard at work, making an important *two-fold* contribution to Britain's economic progress.

To Young Men and Their Parents

To any boy or young man considering a career in science or engineering, ENGLISH ELECTRIC offers almost unlimited opportunities—first-class training, and a choice of rewarding jobs at home or abroad. For details, please write to Mr. G. S. Bosworth, Central Personnel Dept., D.I.

A Middle Class Budget?

WHEN the Chancellor of the Exchequer opens his budget next Tuesday he will face both a political and an economic problem; it is important that he should be clear about the nature of each. His first need, on both grounds, is to play safe with the economy. This has got to be a budget to end all budgets for another full twelve months; neither economically nor politically could Mr Macmillan afford in 1956-57 yet another presentation of the sibylline books. In terms of hard cash this means that he should use this budget for further tightening up unless he feels quite convinced that his emergency measures of last February are sufficing to restore balance to the economy. All that need be said now on this central issue is that, although it still looks as if Mr Macmillan will be doing enough by leaving his likely budget surplus intact, there will be no criticism in these columns if he decides to add to it.

But if his first need this year is to play safe, his second is not to lie doggo; whether or not he can afford a budget of no net change, he cannot afford one of no changes at all—even though the temptation to let sleeping political dogs lie will evidently be strong. His aim on Tuesday, if he is to produce a budget which, as well as coping with immediate economic necessities, is also to be the expression of a positive and stimulating policy, should be to take a number of existing burdens off, and then to put on an equal—or perhaps a slightly larger—number of new burdens in their place. What should these changes be?

It is easy to detail the burdens that ought to be taken off. The Royal Commission on Taxation has compiled a first list of them. Many of its more technical recommendations—which should make this Finance Bill fat with clauses—have the advantage that they would cost relatively little to implement; and the same is true of the more important "Millard Tucker proposals" for extending tax relief to the pension schemes of the self-employed (these reliefs would stimulate savings, not spending) and of the commission's own recommendation for assimilating the taxes on distributed and undistributed profits, together with company income tax, into a flat rate corporation tax. The third important piece of outstanding business from the commission's report, however, would cost the Chancellor a little money. This is the unimplemented part—what might be called the "middle class part"—of its recommendations for restoring the prewar balance of taxation in favour of the family man as against the bachelor or spinster.

The concessions that Mr Butler gave a year ago have more or less made good this balance for the poorer family taxpayers, but not for families with incomes above £1000 a year. The recommendations that remain to be implemented for them are that income tax allowances for children should increase with income (on the ground that the children of the better off have a greater part of net income spent on their upbringing); that the lower limit at which families

start paying surtax should be raised above £2,000 (the commission suggested by £160 for each child); and that earned income relief should continue on incomes up to £2,500 a year instead of stopping at £2,025 a year, with a new and graduated relief on incomes between £2,500 and £3,000. The details of the commission's proposals are not sacrosanct, and for this reason it is difficult to estimate their precise costs, but a significant step in the right direction could be taken at a net cost to the Exchequer of under £50 million a year.

These reliefs for the £1,000 to £3,000 family taxpayer should be the first priority for the budget—not solely or even mainly on grounds of equity, but because it is absurd to talk of a dynamic and expanding economy while keeping in being the most rigid barrier against incentives to work within precisely those income ranges into which the most dynamic elements of the working population should now be preparing to expand. If the Chancellor's view of the economic outlook is really sombre, it may be sensible to confine his reliefs to this royal commission limit, without introducing incentives lower down; for both political and economic reasons, however, it will be a pity if he does. The politics of such a "middle class budget" would be easier, and its economic impact would be smoother, if the changes appeared not as a mere gift to the salariat but as part of a more embracing idea; and the embracing Conservative idea that Mr Butler spawned, and that Mr Macmillan urgently needs to foster, is that of shifting the tax burden further and further away from a direct impost on work and towards an indirect impost on spending. For this reason, the Chancellor should consider adding to these "royal commission reliefs" at least one bold and generalised advance on the income tax front, even though he would certainly have to raise other taxes in compensation. Four years ago Mr Butler publicly proclaimed his desire eventually to raise the earned income allowance from two ninths to one quarter; it is estimated that to do this next Tuesday would cost about £80 million a year.

So far this article has been concerned with giving away more than a hundred million pounds which the Chancellor has not got. How could he get it? One's first inclination is to say that he should cut or abolish the remaining Government subsidies; but he is not likely to take a second bite at bread, milk or council house rents (and he has refrained from annoying the farmers already). One promised step towards realism, however, remains possible. Just as the most important and sagacious feature of Mr Butler's autumn budget was his announcement that the Minister of Housing was at last ready with a policy for council house rents, so Mr Macmillan could change the shape of this budget if he could say that the Minister of Housing has now decided what to do about private rents. If rent control is amended, but only if it is, it will be sensible to make householders pay more on Schedule A.

The easiest way of doing this would not necessarily be merely by levying Schedule A upon the new rating values, for these still assess private houses at 1939 values; the simplest statement is that at present rates Schedule A brings in £100 million a year, and it ought to be made to bring in at least half as much again. Although the gain from both rent reform and adjustment of Schedule A would not be immediate, their eventual impact would probably more than suffice to pay for the tax reforms recommended by the Royal Commission.

But Mr Macmillan would still need some immediate additional grist, and it is to indirect taxation that he must presumably turn. The field here is wide and complicated. An increase in the duties on tobacco or beer might lead to a more than proportionate fall in consumption—and thus actually give less revenue than before; although tobacco remains a candidate for consideration, there is probably a better case for raising the duties on wine and (possibly) hard liquor. The petrol tax is popularly supposed to enter into the cost of everything sold in the country; that, of course, is another way of saying that the burden of it is very widely spread—which means that it might be a very good tax to raise, though the Chancellor is not likely to appreciate this logic. If he wants to keep up the squeeze on the motor industry it has been suggested that he might rearrange the pattern of licence duties, but a more effective step here would be to withdraw the initial allowance on the far too many cars now bought on business account; it is surprising that this has not been done already.

*

The biggest question mark over indirect taxation, however, is clearly the future of the purchase tax; some passages in the Economic Survey have suggested to some people that the Chancellor might want to use this weapon to take further action against spending on consumer durables. This would be a step diametrically in the wrong direction. The discrimination between products that the pattern of differing purchase tax rates embodies, and that Chancellors periodically try to accentuate, has been one of the fiscal banes of the last ten years; the goods that are said to be in over-demand today always seem to be those that are said to be in under-demand tomorrow. It was as a result of his recognition of this that Mr Butler let fall some wise words last autumn about his eventual desire to move from the discriminatory system of purchase tax to a flat rate and wider-based sales tax; although it would be impossible to do this in one bound, this may be the moment to take some preliminary steps in that direction—by putting on to the schedule of indirect taxation some things that are not taxed but ought to be. One obvious new candidate for the tax would be sweets, the last great item of sumptuary expenditure of which the Exchequer has so far failed to take note; if these were put on even the lowest rate of purchase

tax, and if the Chancellor adopted a wide definition of confectionery (including soft drinks), the Exchequer should benefit by over £50 million a year.

Two broad questions remain. The first will take time to answer; a White Paper on the Government's proposals for the reform of local government finance has been promised for the summer, and Mr Macmillan would be able to present a more coherent budget next week if he could announce that the implementation of this—it should aim at inducing local authorities to raise more of their own money without Exchequer grants, and should certainly include industrial re-rating—is to be hurried along. The second question is immediately urgent. It is how Mr Macmillan can encourage private savings. As a small contribution to this he should certainly increase the interest on post office saving banks deposits and announce a new issue of national savings certificates; the idea of a lottery element in the latter appears to have run into political veto. As a bigger contribution, however, might not new tax incentives, over and beyond the Millard Tucker proposals for the self-employed, be

devised for employee superannuation schemes? The object here should be to try to persuade employers and trade unions that the next round of wage claims might be concerned more with deferred benefits of this kind and less with immediate cash; if this campaign included encouragement for share issues to employees and other co-partnership concoctions, the Prime Minister would presumably regard it as none the worse for that.

It is clear that the Chancellor need not be short of ideas; the question is whether he is going to be short of courage. If his emerging budget surplus looks sufficient, he will be tempted to introduce a very quiet budget to avoid annoyance. It is important to urge upon him that he cannot afford this; he cannot afford it because this Parliament has now reached its psychological crux. Next Tuesday, or never, confidence that the Government has a sense of economic purpose will be regained and its reputation for imaginativeness revived. And here is a slogan for that sense of purpose in the Parliament of 1955-60: the earning of money is a good thing, and needs to be encouraged; the spending of it is the trouble, and that ought to be taxed.

Beyond Gaza

THE Egyptian-Israeli gun duel at Gaza last week was a display of the quickened tempers that prevail across the frontier now that the rate of armament of the two sides is unequal. Only a few hours before, the Security Council had voted unanimously to send Mr Hammarskjöld on a mission to get "improved compliance" with the armistice terms. The bombardment caused more civilian casualties than at any time since the Palestine war. Yet there is still no war. Mr Hammarskjöld's preventive mission is still of value, and long-term thinking about the Middle East continues to be worth while.

Until lately, there have been two deterrents to full-scale attack on the Palestine border. One has been the sprinkling of United Nations observers hurrying from danger point to danger point in their white jeeps; the other, the system of rationing arms on a basis of needs for legitimate self-defence, operated by the three western powers under their tripartite declaration of 1950. Today only the first survives. To be effective, the three-power arrangement presupposed the absence of any alternative source of arms. It was always liable to collapse as soon as someone adopted a policy that upset the balance; it grew shaky when larger supplies were offered to members of the Baghdad pact; it collapsed utterly from the moment when Moscow blessed the Czech arms deal with Egypt. Though the possibility of a Russian intrusion always existed, the three powers were thrown into such a flurry of consternation when control left their hands that they have since been unable to agree on a tactical course which, in 1950, they were ready to envisage quite calmly—"action," if need

be "outside the United Nations," to arrest permanent frontier violation. Nor, because they claim to fear an unending "arms race," have they seen their way to reinforcing Israel in face of the strengthened Arabs. They have therefore fallen back on Mr Hammarskjöld and his observers.

This resort will probably be adequate for the moment. Though the Secretary-General's mission started in such gloomy and inauspicious circumstances, neither side wants a war just now. (The Egyptian army, though trigger-conscious in the possession of new weapons, is not yet well trained in their use; for the Israelis, a victory in the Sinai desert would produce no spoils worth the price.) Mr Hammarskjöld believes in mending matters, patch by patch. By means of better frontier demarcation, followed, perhaps, by delimitation of a ribbon of demilitarised land along the frontier and a reduction of frontier forces, he hopes to produce a less stormy climate. But his mandate is limited; so, therefore, are his prospects. Given the tempers generated by the one-sided injection of new arms, it is doubtful whether his technique can produce any improvement on what UN effort has so far yielded: the limitation of activity to the level of perpetual skirmish, but short of war.

This objective is too limited to be lasting. What other deterrents are there? No doubt the Russian visitors to London next week will be asked whether, as earnest of their better intentions, they are willing to co-operate in controlling the flow of arms to this troubled area; for the moment it can only be recorded that trouble there is a Soviet interest. One possible move in the

same direction would be an attempt to transfer the arms rationing system from a tripartite to a United Nations machine. Such an arrangement, though likely to be only partially effective, would be better than what is happening now.

But if the Palestine situation reaches the point at which one side definitely wants war, then the one discernible deterrent that would be effective would be the certain knowledge that in the event of serious frontier violation a multi-national force would take the field on the side of the victim, as surely as it did in Korea. This is the importance of President Eisenhower's statement on Monday that the United States will "observe its commitments" to oppose any aggression and to help its victim. The statement could have been stronger and more precise; it ought to be a step towards asking Congress for the powers sought and given in the case of Quemoy and Matsu, but the old constitutional issue between the power of the President to order military action and the power of Congress to declare war still stands in the way. Action might in any case be hampered by doubts about who provoked the aggression or by delaying tactics in the Security Council. And the President is evidently walking warily for fear of the criticisms and hesitations in Congress.

Even so, it must be recognised that, provoked by the gunning at Gaza, he has gone a distinct way to jolt the west out of a phase of defeatism and passivity, by giving a lead (muted though it may be) that only the United States can give. It is again proof, in a region where proof is badly needed, that, however much the English-speaking peoples may bicker and seem to offer openings for Russian or Arab diplomacy to exploit the breaches between them, they cannot fail to be of like mind in a Middle Eastern emergency. The key question is the old one: Will the ground for common action be reached in time to avert an explosion?

★

The foundation stone of Anglo-American agreement once set, it is reasonable to look beyond Gaza to the wider and longer-term problem of how to meet and parry Soviet advances into the Middle East in the civilian, social and economic field. A blissful era of non-competition ended in 1955. The new phase, which is likely to last, is one in which Moscow is ready to proffer Middle Eastern states all the advantages which up till now the West has provided exclusively—investment, grants in aid, long-term credits, technical assistance, construction at cut prices, training in universities.

The purpose of the campaign is obvious. Its twofold aim is, first, to surround the West with embarrassments and uncertainties in the area on which it depends for 80 per cent of Europe's oil supply; and secondly to protect the soft underbelly of Caucasian Russia against danger from neighbouring western alliances and bases. The only mystery about it is why it did not start sooner.

At least for the present, its strength lies in the fact that, offering a bounty, it asks a *quid pro quo* which is much more attractive in most local eyes than that traditionally asked by Britain; it requires, so far, mere neutralism, instead of alliances and military facilities.

Until now, the western reaction to this Soviet drive has been based on the assumption that economic penetration of underdeveloped countries by Russia must spell unadulterated disadvantage for the western competitor. Fear of the Communist propaganda that will inevitably accompany it, and of the political motives which are certainly at its back, have caused the West to think in terms of outbidding it everywhere, whatever the cost.

But this course is, in the long run, out of the question, even for the long purse of the United States. There are no means of preventing a Soviet commercial and economic drive, even if there were justification for trying. Measured in economic terms, the drive is negligible as yet; its significance is political. But behind it lies an economy that is expanding fast and that can already produce surpluses for export by dint of pegging and retarding the rate of improvements at home. Its ultimate expansion is inevitable, and the only course for its western rivals is to look on the bright side and to lay early plans for resilient competition, ranging from better goods for the money to a better welcome for the Asian trainee in Birmingham than in Tashkent. May not the West even derive some advantage if the Soviet Union, called upon to fulfil some of its offers, is forced out of the glittering role of *princesse lointaine* and into that (before the war reserved for Britain, but now also shared by America) of visible, detested benefactor?

Naturally the outlook would be much more pleasant if the long Soviet hibernation of 1946-55 had proved eternal. But it is not and could not be so. Developments that cannot be avoided must be lived with, and the western world must comfort itself with some pieces of reckoning that have yet to be proved wrong. One is that the capacity of Asia and Africa to absorb aid is inexhaustible; and that if Soviet roubles are for the first time to be sunk in investments far removed from the Soviet border, they may turn (as corresponding western investments have turned) into a guarantee that the new investor will become as interested in tranquillity and security as is the old. The other is that should the Soviets foot even a part of the enormous bill, the western powers may be free to invest their contributions more generously in the territories of people who share their view that Soviet totalitarianism is a threat to independence. Here is good news for the Colombo plan countries, for Latin America, for the British dependencies drawing on the Colonial Development and Welfare fund and, last but not least, for this week's meeting in Teheran of the economic council of the Baghdad Pact states.

Speeding the Paying Guest

AN American gentleman of means, who recently enquired what formalities were necessary to enable him to retire in Britain, was surprised to find that he could do no such thing. He could show that he could maintain an adequate bank balance regularly refreshed by dollar drafts, that his health was good, and his character impeccable. He was told that all this qualified him merely to come as a visitor for three months, with an extension at the immigration authorities' discretion; that such extensions would be virtually indefinite if he started a business approved by the Board of Trade or took a job which his employer could prove to the Ministry of Labour no British subject could fill; but a *permis de sejour* on the basis of a private income—certainly not! Unless, indeed, he could give or invent reasons why such a residence would benefit Britain; perhaps, it was tactfully suggested, he could submit a memorandum pretending that his residence here would aid Anglo-American relations. If he did not think up any such excuses, if he wanted simply to live on his dollars, he could be a transient and no more. Had he, of course, been a Canadian he could have stayed till death parted him and his dollars, and no questions asked.

This ludicrous story—not an isolated one—is the *reductio ad absurdum* of British immigration policy, as codified in the Aliens Order and administered by the Home Office. The basic philosophy behind it is that the country is over-populated, and that alien settlers compete for sustenance and house-room with the natives. It has several roots and a long history. The first impulse to closing the "open door" came from the working class; the first legislation in 1905 originated from agitation over the influx of Galician Jews into the east end of London. The Alien Acts of 1914 and 1919 followed; they give the Home Secretary the powers to make the orders which now control aliens in this country. They were last debated by Parliament in 1954, and MPs criticised the vast powers they confer on the Home Secretary, but failed to criticise their basic principle.

★

Aliens knocking on our doors appear in various guises. They may be roughly classified as (a) the tourist or visitor; (b) the jobhunter; (c) the business man; (d) the political refugee; and (e) the *rentier*. The tourist, of course, is fairly welcome; at any rate a million now come annually, and the authorities are steadily reducing visa requirements. There is trouble over tourists in only two ways. The first is when the tourist proves to be a communist attending a "phony" type of peace or other conference; this, to the Home Office, is sneaking, and he is apt to be turned back at the ports. It is also sneaking to come ostensibly as a

visitor (or student) and then to try to get a job, thus edging into category (b); this also risks refusal of an extension of the visit. A visitor turned employee must prove that the job offered has come clean out of the blue; otherwise he will not be allowed to stay on in employment or to come back to take it up. Aliens may not come to Britain to spy out the land.

The rules about aliens taking jobs in Britain conform to the basic philosophy already described. Very broadly, to employ an alien, an employer must have a permit; to get it he is supposed to prove that he has tried to find a native who can do the job and has failed to find one. In practice, however, this means that the decision about employing an alien in a closed shop firm or industry is taken by the trade union concerned and is counter-stamped by the Home Office. It is a matter for the unions to decide even if Britons are unavailable (as with Italians in the mines). Most alien employees are in domestic service.

The foreign business man is treated as a visitor for business trips; if he wants to operate a business here, it must be of a kind approved by the Board of Trade as "adding something" to the country's economy, and on that basis the Home Office extends his visit regularly (though he must still abide by the conventional rules about reporting to the police at intervals). The political refugee is, of course, an exception to this demand for economic justification; perhaps for this reason the Home Office is thankful that such people can only get here by boat or plane. "The right to asylum," as now interpreted, is only the sovereign right of Britain to accord asylum to those who escape here direct from their persecutors; there is no obligation to absorb those who would rather take asylum here than in Western Germany, for example, in search of a better job. On this Home Secretaries are particularly firm.

If the special case of students is excluded, this leaves the *rentier*, like the American in our example. The formal rule laid down here is that Britain is not a country of settlement; as the March Hare said to Alice, the Home Office says to the foreign *rentier*: "No room! No room!" In theory, only those who can plead special hardships are allowed to settle here—usually only the indigent or sick relatives of aliens who are married to British subjects or who have jobs or businesses here. Those who have money to support themselves in comfort are not supposed to come, and fairness compels the Home Office to apply the formal rule to American (as to Arabian) millionaires; it would be wrong, Home Secretaries feel, for people to "buy themselves in." In consequence, the would-be settler with a desirable bank balance is asked—and some times helped—to prove that he is "adding to" the British economy in some other way. You may not buy yourself in; but you may fudge your way in if you have money and are of the right social group. The Home Office

does not make much secret about the reasons for this subterfuge. What it apparently fears is that a lot of Italians or Levantines might join their relatives, and batten on the country in some way. Even though the Home Office could catch them up if they should ask directly for public assistance, it is said that they must be kept out, for when living with their relatives they consume without producing. But this argument, once uttered, is then often immediately stood on its head; these people, it is said, are also constantly tempted to break the law about taking jobs, or getting the Board of Trade's permission to trade.

It is surely time that these arguments were subjected to proper examination. As they stand, they are often dangerous nonsense, when they are not pure humbug. They are dangerous because the law as it stands puts the decision on who shall stay and who must leave almost entirely in the hands of officials, without power to appeal to the courts. They are nonsensical because every case which is not settled on grounds of character seems to be settled on strange economic grounds, based on the obsession that a *rentier* living on his money here adds to the import bill, rather than to invisible exports. In fact, a large population of foreign millionaires living permanently in Bournemouth rather than Mentone would help Mr Macmillan appreciably. But the argument (if it really is seriously held) is also humbug be-

cause the door is wide open to the Commonwealth and colonies with a combined population of 600 million, a full quarter of mankind. If a few *rentiers* represent such a danger, that door should surely be closed too—and perhaps some politicians, even Tory ones, wish it was.

Despite the Aliens Order, and the bureaucratic scrutiny at the ports, Britain is, in truth, a hospitable country. The political refugees run into hundreds of thousands, and 35,000 aliens take up jobs and residence here annually. This is the more reason why the law, and its administration, should be re-examined. As it happens, the opportunity will soon arise. Britain is to ratify, as a member of the Council of Europe, a "Convention on Establishment," which binds signatories to give reciprocal rights to each other's nationals in matters of visits and residence. The vital article is hedged with the qualification that residence is subject to local "social and economic conditions"—a let-out which plays into the hands of the Home Office. But the Convention also sets up a standing committee to watch over its working; and if British MPs will not voluntarily face the illogicality of the present British immigration policy, it may be a good thing if the standing committee demands to know more about the "social or economic conditions" which Britain may invoke. It is welcome to any of the arguments offered here.

Rain and Shine for Finland

THE Finns must be reflecting ruefully that fate sends bad luck hard on the heels of good. In foreign affairs, the past winter has given them notable successes. Moscow's new determination to ingratiate itself with the free world has brought a shower of favours upon Finland. For the first time since 1939 the Finns can feel that the oppressive threat on their eastern frontier has been at least temporarily lightened. Dr Urho Kekkonen, who has been Prime Minister five times and was installed as President last month, may well be pleased with the policy carried out by himself and his predecessor, the venerable ex-President Paasikivi.

But while the sun has shone from Moscow, the barometer on the home front has been falling steeply. The grumbling quarrel between Finland's two ruling parties, the Agrarians and the Social Democrats, came to a head at the end of January; and this crisis was swiftly overtaken by the much more important crisis of the general strike, which broke out on March 1st—the day of President Kekkonen's inauguration—and lasted twenty days.

This was a gloomy omen for the new Presidency. True, it was possible to carry on some work in the forests, on which four-fifths of Finnish exports ultimately depend; horse transport—the most important way of moving timber in the winter—was not

affected by the strike. In any case, Finland's ice-locked harbours were able to handle very little traffic, and some exporters probably found that the stoppage of work brought welcome relief to their hard-pressed storage space. The effect of the strike on foreign trade would have been greater at almost any other season. But it will still have a serious effect on the year's production. Mr Fagerholm, who was runner-up to Dr Kekkonen in the Presidential election and has succeeded him as Prime Minister, estimates the loss to the national income at some £24 million. This is more than half the increase in consumption that might have been enjoyed if there had been no strike.

The damage goes deeper. The unions fought the strike on two claims: a flat increase of 4½d. an hour—or about seven per cent—to cover the recent rise in the cost of living; and further large rises, in some cases between 15 and 30 per cent, which they claim to be justified by the growth of productivity. In the end they got their 4½d., plus some additional increases which will on average probably come to only about three per cent. Yet the bulk of this extra burden is to be borne not by industry but by the treasury, which will cut company taxes and reduce the amount employers have to pay towards children's allowances. The result will be to swell the budget deficit still further. Since it would be asking too much of Mr

Fagerholm's political courage just now to expect him to increase other taxes, or to cut government expenditure drastically, this is bound to give a stimulus to inflation.

The settlement is likely to have a double effect on the economy. Some Finnish exporters already have a struggle to sell abroad; rising costs will push a number of them to the wall. Bigger wage packets will also mean a bigger import bill, although Finland still keeps half its imports under physical controls. The modest export surplus that the country has enjoyed in the last three years seems doomed to vanish. The upward pressure on prices at home will continue, particularly towards the end of the year, when Mr Fagerholm's temporary price control powers are due to expire. The Finns have not yet devised a satisfactory way of damping down inflation by monetary measures. Bank rate stands at 11 per cent, and the Bank of Finland last year took a number of special steps to tighten the credit market. Yet, in spite of these, advances by the commercial banks grew, and investment rose no less than 13 per cent over the previous year's figure.

All this has a disruptive effect on the country's political stability. The Agrarians and Social Democrats have been working together in coalition for 18 months, *faute de mieux*, but inflation lays bare their conflicting loyalties. The Social Democrats are chiefly interested in keeping down prices in the shops or, failing that, in seeing that the workers get compensatory wage increases. The Agrarians are more concerned to keep farmers' incomes in line with those in the towns; this tends to push up the price of food periodically. The alliance almost dissolved in January, when food prices went up sharply. Mr Fagerholm now heads a patched-up coalition; but the patches seem too skimpy to stand the strain if prices start to rise again.

When everything at home is so insecure, the Finns turn with some sense of relief to the international scene, governed for them by the new benevolence of the Russians next door. Moscow in the past half year might almost have set out to be the ideal good neighbour. The most obvious example is the sudden decision to evacuate the leased base at Porkkala, just outside Helsinki; but another gesture that appealed almost as much to Finnish hearts was the intimation, while Mr Paasikivi and Dr Kekkonen were in Moscow last autumn, that Russia would no longer object to Finland's joining the Nordic Council. The Finns have also been granted the privilege of being the first western country to fly an airliner service to Moscow, and have been given the benefit of an agreement under which Russian scientists and technical information will be made available to them in a number of subjects. A final titbit is the offer of television sets to pick up Communist programmes broadcast from Tallin on the Estonian coast.

Not even the ebullient Dr Kekkonen believes that

all this is tribute to Finland's own bright eyes. Moscow has its gaze on wider fields: on western bases, on Swedish neutrality, on the possibility of winking Iceland, and later perhaps Denmark or Norway, out of their Nato connections. But the campaign is being conducted with a delicacy unknown in Stalin's day. Except for the extension of the Russo-Finnish friendship pact to 1975, no obvious price label has been tied to the Communist concessions. Two or three times the Russians have informally suggested that Finland should recognise the East German regime "as a fellow Baltic state," or should join in joint sea-rescue arrangements with the Soviet Union; but the Finns have politely declined, and Moscow has made no complaint. There has been no repetition of the earlier attempts to draw Finland into the Warsaw Pact, or of the hints in favour of some kind of "Baltic peace pact" with Sweden.

No doubt the Russians hope to improve the Finnish Communists' prospects of one day taking part in the government again. One Agrarian paper recently mused on the notion of a popular front with the Communists; but this is still anathema to most Agrarians, as well as to the Social Democrats, whose trade unions kept the Communists completely out of the leadership of the general strike. By and large, Moscow is content to stay on its best behaviour and hope that all the Nordic countries will be duly impressed. This has important consequences for Finland. Diplomacy is confined to the limits of the possible, and during Stalin's time the Finns had to tread a very narrow path. But so long as the Russians choose to treat their country as the shop window of coexistence, they have far more room to manoeuvre.

It is now possible for the Finns to reaffirm the solidarity with the free world that most of them feel at heart. This had inevitably to be played down in the years when the most important thing was to appease the Russians. Dr Kekkonen is chiefly thought of in the West—and by many of his fellow-countrymen—as a man who "gets along" with the Russians, who goes frequently to Moscow and makes flattering speeches about the Soviet Union. Now that he is President, and the Russians are all smiles, he might consider turning his attention more to the free world. An invitation to pay a state visit to Britain, for example, would give him an opportunity to tap the great reserves of good will this country has for Finland.

The Finns are unlikely to forget that every silver lining has its cloud. They are still militarily impotent, should Moscow's mood alter; their engineering and shipbuilding industries still depend almost entirely on Russian purchases, though this factor grows less important as trade with the West expands; they must necessarily move with caution. But it is one of history's more pleasant twists that the tiny country which stood up to Stalin in 1939, and paid its reparations with such honourable promptness after the war, should be the first to gain real benefit from the Soviet change of front. Its main task now is to put its own house in order.

Notes of the Week

Arms and the German Question

ALMOST any form of thinking aloud about the future relations of the great powers is liable to stir up a ferment of opinion in west Germany, where political feeling is in a disturbed and sensitive phase. M. Mollet has aroused a controversy there with his thesis that the road to German unity may lie through an agreement on general disarmament. Did this mean (many Germans asked) that German unity no longer came first in the aims of western policy in Europe? If this were admitted, the pressure for an independent German foreign policy, pursuing the national aim of reunification by national means, would receive an extra impetus. Dr Adenauer called a meeting of his foreign policy advisers at Ascona in Switzerland, where he has been on holiday, and it was decided to approach the French Government with a view to talks. Dr Adenauer and M. Mollet are to meet, but not, as it turns out, until after the French prime minister has been to Moscow; in the interval there are to be talks between officials and between the two foreign ministers.

If M. Mollet's interview with *US News and World Report* (discussed in *The Economist* last week) is examined, his ideas on this particular point do not appear so different from some which Dr Adenauer has expressed on occasion himself. Thus the German Chancellor told foreign journalists in Bonn last February that the Russians would want some inducement to give up their occupation of their zone of Germany, and he found it hard to believe that anything less than a general agreement on disarmament would be inducement enough. Such a general disarmament would have to start with atomic disarmament and the control of atomic weapons, but it would include a reduction of the effective strengths of the Western European Union, which in turn would mean a reduction of the west German forces.

Naturally Dr Adenauer did not mean that disarmament ought to precede a settlement of the German question in point of time, but M. Mollet did not necessarily mean that, either: M. Mollet, like Dr Adenauer, was discussing the chain of negotiation, persuasion, and inducement by which the powers might hope eventually to regulate their relations, and with them the status of Germany. The Germans find other ground for concern in the Soviet disarmament proposals, which offer Germany an armed strength of 200,000—and do so without mentioning Germany by name at all; it is included by implication among "other states." The Soviet plan thus succeeds in leaving it obscure whether it envisages a single German state subject to that limit, or two German states, the Federal Republic and the German Democratic Republic, with armed forces of 200,000 each, cancelling each other out.

An Asian Switzerland

CEYLON's "swing to the left" is yet another demonstration of a well-documented phenomenon: in the absence of outside influence the leaders of Asia's former colonies tend to be both socialist and neutralist. The leader of the victorious People's United Front, Mr Bandaranaike, has indeed shown both tendencies in his election speeches: he has preached nationalisation and non-involvement, and has declared his desire to turn Ceylon into a republic.

Even if Mr Bandaranaike carried out his threats or promises without delay, he would not be breaking new ground. India and Pakistan, the other Asian members of the Commonwealth, are both republics, and India—which invented "non-involvement"—has made nationalisation one of its instruments of policy. In fact, as soon as his victory was evident Mr Bandaranaike began to make reassuring sounds. There would be no precipitate action, he said, to institute a republic; and he had no dogmatic views about membership of the Commonwealth. The government would buy out "foreign" owners of tea and other plantations; but he would not move too fast and full compensation would be paid. (The effect on London share values is discussed in a Business Note on page 177.)

From the international point of view, the neutralist side of Mr Bandaranaike's policy is even more disturbing. Ceylon's new premier sees his country as an Asian Switzerland and intends to raise with Britain the question of the British naval and air bases at Trincomalee and Katunayake. In themselves, these bases are not of the first importance, but their loss must increase dependence on Singapore—the future of which has begun to appear still more perilous than Ceylon's. The spread of neutralism in Asia is indeed a challenge to western policy-makers; and it is ironical that comfort has to be sought in the fact that Mr Bandaranaike's electoral allies are trotskysts and not Moscow-brand communists.

Whose Favourite Son?

THE Labour Party treasurership is becoming the main annual battle ground between Left and Right. Although nominations do not close for another four months, and the ballot itself is six months away, there are already three candidates in the field—Mr Bevan, Mr George Brown and Mr Charles Pannell. Mr Pannell has been nominated by his own Amalgamated Engineering Union; after being split so long and so often on the Bevan issue, the AEU has

apparently decided that the easiest road to internal peace lies through the American device of the favourite son. Although Mr Pannell will certainly not win, his entry is by no means derisory; he is a salty wit with wide contacts among the older members of the Labour movement, and as a party spokesman on local authority finance can at least claim to recognise a balance sheet. He will probably pick up a few more votes both from unions and constituency parties and in all he may get between 15 and 20 per cent of the total poll.

Which of the two bigger candidates will benefit from the diversion? Mr Pannell is personally well right of centre, and his constituency votes will come from Mr Brown. But these will not be more than 50,000 or so. The 635,000 he is picking up from the AEU would otherwise almost certainly have gone to Mr Bevan. The other big unions have still to declare themselves but Mr Brown will presumably get the votes of his own Transport and General Workers, together with the Municipal and General Workers. Against such a Right Wing opponent, Mr Bevan is expected to get the votes of the miners, the railwaymen and the shop workers, together with the lion's share of the constituency votes. On this reckoning the engineers would have made his victory certain; without them the result is bound to be still in the balance.

Much of the centre, as well as the left, of the party would like to see Mr Bevan get the job. He is currently passing through one of his spells of good behaviour. His recent speeches on colonial affairs have been restrained, even mellow. Mr Brown's precipitate dash to get his constituency to nominate him is seen by many as a brash and unnecessary move to reopen the party breach just when it showed signs of mending. At the moment Mr Brown is probably doing his long term prospects more harm than good, but no doubt he is betting that sooner or later Mr Bevan's halo will slip; on all past performance, Mr Brown is on a good thing here.

A Lead from the Post Office

THE Post Office is Britain's senior nationalised industry; it has experience in handling political situations that might make its junior sisters—not least British railways—mouths water. Faced with an increased bill of costs of £20 million, £15 million of it resulting from successful wage claims, it has jumped in with a proposal for increased charges without prompting. It has also evolved two principles of charging which, if they are logically followed, can do nothing but good: costs should be remitted to the consumer at once and the services that are incurring the loss should bear the increase if they can.

The new charges to take effect in July should be measured by those sound standards. The letter post at 2½d. has been left unchanged. It would have been simple to charge 3d., but the service shows a profit of £10 million a year on an outlay of £44 million at 2½d.; on paper it would break even at 2d. Postal orders have been spared; they yield a profit of £750,000 a year. The Post Office has thus set about collecting from everything else except the telegraph, which cannot make a profit at any scale of charges. Printed papers, newspapers, the registra-

tion fees, registered envelopes, inland money orders, and inland parcels all bear an increase. Telephone charges for local calls for subscribers will go up from 2d. to 2½d., while the call-box charge will rise from 3d. to 4d. next January, once a machine that will distinguish between four light pennies and three new ones has been introduced.

	Cost £m.	Deficit £m.	Extra Revenue £m.
Inland Printed papers.....	29.5	3.6	3.9
Inland Newspapers.....	2.0	1.7	0.2
Inland Registration.....	6.4	3.5	1.7
Inland Money orders and COD Fees.....	2.4	1.1	0.3
Inland Parcels.....	Not Fixed		1.0
Local Telephone Subscribers..	37.6	6.3	4.9
Local Telephone call office ..	9.6	3.9	2.1
Trunk Calls.....	In surplus		Not Stated.

The table shows the amount to be raised and the current loss on the services affected. The incidence of the new internal newspaper rates will be uneven; it appears at first glance that, while *The Times* on present size will be little affected, *The Economist* in most weeks will incur a penny of extra postage. Nevertheless newspapers are still in receipt of subsidised postage, and it should not be forgotten that the empire press cable rate of one penny per word has not been altered and is subsidised even more heavily. If there is ground for criticism it lies in the decision to raise sharply the charge for trunk calls (including the cheap evening rate) when these are still showing a profit and to leave telephone rentals alone because they have recently been moved but are still showing a loss. The Postmaster-General did not disclose the trunk call costings as he did most other parts of his charges, but it seems clear that trunks (thanks to the coaxial cable) still yield a profit, probably of the order of £13 million a year.

The net result of the whole operation is moderately logical. On an incomplete year the post office (after making its £5 million contribution to the Treasury in place of taxation) aims to save £3 million by economies, to cut its estimated working surplus from £5 million to £3 million, and to raise £15 million from extra charges. Those charges should raise rather more in a full year and the surplus should be comfortable again in 1957-58. But on the basis of £15 million of new revenue the posts should show a deficit of £1 million, the telegraph a loss of £3½ million and the telephone a profit of £7½ million.

Talks on Singapore

IN a week's time the all-party delegation from Singapore led by the Chief Minister, Mr David Marshall, will arrive in London to work out a new constitution to give the island what is described as "independence within the Commonwealth." It looks like being a trickier conference than most of those held recently on colonial advancement. One reason lies in the inherent difficulties of the proposals which form the common measure of agreement between the Singapore parties, in which Mr Marshall's Labour Front is a minority coalition. Another is the deterioration in law and order in the island since Mr Marshall came to London in

December to discuss the agenda for the approaching negotiations.

He professed himself at that time highly satisfied with the assurances he received, which in some cases went beyond his hopes. He conceded that he met readiness everywhere to grant self-government that would satisfy Singapore's aspirations. But after a triumphal return he suddenly detected a "cooling" in London's attitude, began attacking the local European "colonialists," and launched himself on a campaign of demonstrations and mass-meetings which boiled over at last into rioting. He must have known that in all this he was playing the game of the extremists, and notably of Mr Lee Kuan Yew, the leader of the People's Action Party, who disavows Communism, but whose relationship to the Communists has been felicitously defined in the observation that he has more friends among his enemies than anybody in Singapore.

A sense of insecurity now pervades all the communities in Singapore, even many of the Chinese; yet the preservation of internal security is the crux of the forthcoming discussions and is the key to the formula which Mr Marshall has evolved to reconcile British (and Seato) interests in the naval base with *merdeka* on the Malayan model. This is that Britain shall have "concurrent but paramount" responsibility for Singapore's defence and external relations—other than in trade—and that this shall carry with it powers to restore law and order in the city if the otherwise independent local administration should lose control of them. The local government would control the police and the local gendarmerie which Mr Marshall wants to raise, and be responsible for law and order in the normal way. This safeguard in the last resort might commend itself if the local administration had shown itself capable of calming and controlling local passions in the last few months. But it has, rather, demonstrated the danger that

the safeguards might have to be invoked soon—especially if there were a change of government towards the left. The example of Ceylon will be in the minds of the British negotiators when they discuss the security of the base with Mr Marshall and his colleagues. The base is useless if there is no internal security; but a safeguard which might amount to permission only to try to reconquer a well-organised and hostile Chinese city is not a very reassuring prospect.

Morocco Bursts More Bonds

It is a long way from exile in Madagascar to the point on the boundary between French and Spanish Morocco at which the Sultan Mohammed V symbolically cut a boundary ribbon last week, yet he has covered the ground in under six months. His way led through Paris and Madrid, in each of which he secured "mutual declarations" that the two Protectorate treaties of 1912 are out of date, and that Morocco is a sovereign and independent state. Even in this age of speed, the wheel of fortune has seldom spun faster.

As if to show that General Franco has not simply copied a French precedent, the Spanish agreement signed last week is slightly different from its French counterpart of March 2nd. It is a little less specific and does not mention a word

of French coinage—"interdependence." Both the Sultan and the cabinet took French advisers in the large delegation that accompanied them to Madrid; of the two ex-protectors, France will play the senior role.

Both declarations provide in protocols for a sequel in the shape of detailed negotiations between equal partners on the many outstanding points at issue. Those with France are in progress; those with Spain will begin on May 7th. Some of the matters outstanding are so delicate as to have escaped mention: for instance, what is to happen to the *Presidios*—the five almost purely Spanish towns on the African coast, of which Ceuta and Melilla are the largest, over which Spain enjoys complete sovereignty? What is to happen to the Moroccan troops in the French and Spanish armies? What is to happen to Ifni, the small coastal enclave within south French Morocco which Morocco ceded to Spain in 1860? Lastly, what is to happen to Tangier? This third, neutralised and demilitarised, zone of the Moroccan empire presents wider problems because it is managed by a committee of control under a statute to which nine powers are party. There is a hunch, amongst its heterogeneous population, that here too the Sultan will soon burst from the cocoon of treaties that limit his independence. An indicator of local expectations is the figure for gold deposits in Tangier banks; Tangier is a free gold and money market. In 1953—the year the French exiled the Sultan—there were 52 metric tons of gold there; by the end of last year the figure had dropped to 30 tons. Export to safer havens continues.

Eggs Before the Public

THE public inquiry into the egg marketing scheme is due to end this week. The commissioner's report will now be submitted to the Minister of Agriculture, but nobody except the Minister will be allowed to read it. If this report were decisive or even important, there would be reason to get very worried about the rules under which this sort of inquiry is conducted. The National Farmers' Union with its battery of counsel sat in the body of the court, well primed to defend its proposed monopoly; the organisation of the courageous but scattered objectors—almost unprecedently, there was some organisation—was bound to be amateur by contrast, and some of the objectors inevitably made rather fools of themselves. The revelation during the hearing that the impartial commissioner who was to judge the case was himself a former member of the NFU—although he had resigned in order that he "should not be subject to the receipt of any literature from the union during the course of the inquiry"—was not, of course, as

alarming as some newspaper stories have tried to hint; but it does serve as a wry comment on the whole system behind these hearings.

But all this, in the immediate context of the egg scheme, does not really matter. The bald fact is that the commissioner's report is not going to be a major influence on the Government's decision; politics will be more important. Even if the NFU honestly believes that the way to cut costs is to cut out competition, and even if the commissioner should swallow this, the Ministry of Agriculture has known the uncomfortable economic truth about this scheme from the start. It has recognised all along that if the subsidised eggs sent through the NFU's packing stations prove to be better value than the fresh and unsubsidised farm egg, then the union will not need a monopoly to get the public to buy them; and that if they prove worse value, the monopoly will be a dangerous and expensive restrictive practice.

Why, then, has the Ministry allowed the project to proceed thus far? The answer, of course, is a political bargain, explained partly by the low price of eggs just before the general election, and partly by the Ministry's established policy of countenancing certain economic peccadilloes in return for NFU co-operation (well, something rather less than co-operation) in other matters, particularly the free market in fatstock. That is why the surprising publicity aroused at the public hearing of objections to this tentative bargain, a hearing which was originally envisaged as a mere legal formality, has been so important. The Minister has been given reason to wonder whether what the Government had regarded as a political expedient would be politically expedient in fact, and this is a point of wider importance than this mere matter of eggs. The Society of Objectors to Compulsory Egg Marketing, however comic its name and some of its allies' antics, may yet prove to have struck a reverberating little blow against pressure group bargaining within a democracy. It deserves thanks and congratulation, and a widespread hope that its immediate objectives will be attained.

Of Caucuses and Cranks

THE need for more democracy in the Labour Party is such a good tune that it is a pity it is being left only to very left wing MPs; they are, however, making rather a hash of it. Their latest organ is the "Victory for Socialism" movement, with which upwards of half a dozen Bevanite and near-Bevanite MPs are associated. The aims of this movement, as set out in a pamphlet and amplified at a public meeting last weekend, are to "reform" both the Parliamentary party and the annual conference. The pamphlet suggests that the Parliamentary party's meetings on policy (but not on tactics) should be thrown open, and that Labour MPs should have to report back to their constituency parties on how they vote. At the annual conference it proposes that trade unionists should be able to vote in their constituency parties as well as in their unions, and that block votes should be split so that minorities could be counted in.

The idea of offering trade unionists two votes is adroit, but the general theme reveals all the usual left wing misconceptions. "Victory for Socialism" would, in effect,

turn a Labour MP into a delegate of his constituency party. The logical extension of that would be a Labour Government answerable, not to Parliament, but to the party conference. There is, in fact, nothing wrong about private party meetings in themselves. Where they have become dangerous is when major decisions are taken in private and all Labour MPs are bound to silent acceptance.

The other genuine ground for complaint about lack of democracy in the Labour party lies against the caucus mentality of Transport House. Transport House's initial reaction to "Victory for Socialism" was to "warn" party members to boycott its assembly. This had the inevitable result of giving the movement its biggest boost. When it became clear that a group of Labour MPs was going to disregard its edict, Transport House explained that to "warn" meant to "urge." This incident typifies all the weaknesses of Mr Morgan Phillips's bureaucracy. It was permissible to "urge," it was pompous to "warn," and downright silly to pretend that the two words mean one and the same thing.

The Fretful Philippines

THE hot wind of nationalism that is blowing through Asia has touched even the Philippines, that stalwart outpost of the West in the Far East. The Filipinos are disgruntled with the Americans over a number of things, and they have been voicing their complaints with a robustness that is traditional in Manila but has clearly disconcerted Washington. The criticism overflows party lines, and has been joined by many members of President Magsaysay's ruling Nationalist party as well as the opposition Liberals. The Mayor of Manila has talked about an "army of

UNEMPLOYMENT IN GREAT BRITAIN [THOUSANDS]

occupation" in the 14 American bases on the islands, and the Speaker of the Philippine house of representatives has told a gathering of college graduates that their country is under "the heels of a new oppression." The Nationalist and Liberal leaders in the lower chamber of parliament have combined to issue a joint statement urging the President to reconsider the agreements with the United States.

In most countries these would be fighting words. The Filipinos' grumbles can, however, be reduced to a number of specific points. They have long been fretful over the Americans' claim to hold proprietary rights over the land on which the bases stand. The Americans have often been a little authoritarian. They have nominated mayors for Filipino townships, and have imposed their own taxes; and a party of Filipino miners was arrested last month for working a manganese mine in the area of Clark airfield in central Luzon. There is bitterness, too, because 15,000 Filipino labourers employed by the Americans on Guam are not covered by the American minimum wage law.

And, as always, there are economic undertones. The powerful sugar lobby in Manila is furious because an American Congressman has suggested cutting the import quota for sugar from the Philippines in retaliation for Manila's restrictions on the import of American tobacco. Some Filipinos want to experiment with trade with Communist China, and there have been complaints about the size of the recent \$65 million American loan in comparison with the help given to other Asian countries. It is too simple to blame all this, as Washington tends to do, on the manoeuvres of local politicians eager to discredit President Magsaysay. The new American Ambassador, Mr Nufer, has scope for diplomacy in settling the Filipinos' grievances. But the strong ties of history and economics that link the two countries are likely to prevent this outburst of nationalism from ripening into neutralism.

The Kashmir Tiger

THAT well known tiger, the Kashmir problem, is back in the lap of the United Nations. Mr Mohamad Ali, the Pakistani prime minister, has announced that Pakistan is to ask the Security Council to consider the dispute once again. His intention is clearly to keep it as prominently as possible before the world's gaze, lest India take advantage of the stalemate to consolidate its hold on the territory it occupies. For the Pakistanis realise that time, as well as military and economic strength, are on the Indian side.

Mr Nehru made this plain at a press conference last week. He advanced a new legal argument to support India's claim to Kashmir—the theory that all the states in the sub-continent automatically became part of India in 1947 unless they specifically chose to go to Pakistan. In Mr Nehru's eyes this seems to get round the need for holding a plebiscite among the Kashmiris themselves. It was the Indians who originally suggested a plebiscite; now Mr Nehru admits that he is no longer in favour of one. Instead, he offers a constitution drawn up by the Kashmiri Constituent Assembly, which Pakistan naturally does not recognise, followed by general elections on the basis of the Indian-approved constitution. Mr Mohamad Ali can see the sands running out.

But it is doubtful whether taking the matter back to the

Security Council will do much good. Both sides can stall legal claims until shrimps learn to whistle; but a solution will only be possible through some sort of political compromise between them, and the Security Council cannot enforce a compromise. The most it is likely to do is to counsel moderation and patience, and perhaps throw the footsore Mr Hammarskjöld once more into the breach. Meanwhile, the Russians are given another opportunity to undermine the free world's unity. They can, if they choose, espouse the Indian case in the Council as zealously as they espoused that of the Arabs last week, before showing their good will by voting for some unanimous and innocuous resolution. Kashmir is as good a lever for opening a gap between India and the rest of the free world as Palestine is for prising away the Arabs. The pious indignation with which *Pravda* greeted the Seato Council's recent comments shows that Moscow will bend itself to the task with zest.

Tax Off the Theatre?

A MAJORITY of MPs has already presumed to tell the Chancellor one of the things it thinks he ought to do in his budget. A motion stands on the order paper in the name of 357 members of all parties asking him to give his early attention to the tax difficulties of the living theatre. To remove tax from this altogether would cost barely £2 million a year.

This is a matter about which neither taxpayers nor theatre-lovers need get too excited. The extent of the theatres' difficulties was outlined in the answer to a Parliamentary question on Tuesday:

It is estimated that about 45 to 50 places of regular theatrical entertainment have ceased to be used for dutiable entertainment during the past two years.

It is possible, however, to exaggerate the extent of this calamity, and, still more, to exaggerate the extent to which entertainments tax is responsible. Some of the theatres may have been turned over to non-profit making programmes, on which tax is not paid. Many were music halls, providing a type of entertainment which a better educated public has outgrown. Against the competition of cinema and television many would have failed even if they had not had to pay entertainments tax; their share of the £2 million really would not go very far.

One of the arguments sometimes used against remission of the tax, however, is really an argument on the other side. It is sometimes said that any worthwhile theatre can win exemption from tax by producing a reasonable number of good plays, and subsequently convincing the Customs and Excise that its programme as a whole was "educational." In practice, however, this leads to unfairness and anomalies, and it does not aid the search for "angels," who under this system cannot win but can make a very large loss. (The fate of the Oxford Playhouse under non-profit making management is the most recent warning of what can happen.) It seems illogical that there should be three kinds of theatre—one that the state assists through the £600,000 a year grant to the Arts Council; a second towards which it is neutral, taking only the ordinary company tax; and a third which it penalises with a large additional burden. On grounds of pure tidiness, if on none other, there may be a case for the Chancellor to please those 357 MPs.

BONUS DECLARATION

FOR THE THREE YEARS 1953, 1954, 1955

A REVERSIONARY BONUS of

50/- per annum, and upwards, has been allotted per £100 assured under all with-profit policies in force at 31st December, 1955.

TOGETHER WITH

A SPECIAL REVERSIONARY BONUS of

7½% on the sum assured and bonus additions existing at 31st December, 1955, policies of shorter duration participating proportionately to the number of years' premiums due in the triennium 1953-55.

The words go out in polyglot profusion. Translated in language and form, they appear as print on a newspaper. Paper is an impartial recorder. It takes the news of a world conference, the football results, the names of the ladies who served tea in the village hall and makes history of them all. But paper does more, even, than that. In magazines and books it entertains and instructs. Converted into its many other forms, paper protects your groceries, brings supplies safely to farmers, takes precious goods abroad, wraps sweets for the children. Timber—the raw material of all these varied products—appears in the home in other guises; in kitchen fitments as hard-board, on the dressing-table as face tissues. On a world front, Bowaters are making an increasing contribution to people's knowledge, health and general contentment.

Rents in Ulster

JUST at the moment when speculation is mounting whether the British Government will dare to move towards rent reform, Ulster has shown how explosive this issue is. Slates are still falling in Belfast, rocked by the Northern Ireland Government's Housing (Miscellaneous Provisions) and Rent Restriction Law (Amendment) Bill. The Attorney-General, Mr Warnock, has been blown clean out of office; greatly to his surprise his Prime Minister, Lord Brookeborough, asked for his resignation when he explained that the threatening attitude of his constituents prevented him from supporting the government on the Bill. Another minister teetered on the verge of voluntary resignation, while the Minister for Local Government, Dame Dehra Parker, incurred unpopularity when she declared that the opposition was communist inspired and that all the post-cards in protest were in the same handwriting. In the general excitement, the Ulster parliament found that it had given the Bill its second reading before debating it. This happened from the mishandling of the opposition amendment, and the government has had to introduce a new but identical Bill.

It may be doubted if it will remain identical with the old, which was, however, really a very modest measure. It was designed solely to counter the steady dilapidation of Belfast housing as a result of rents having stayed almost unchanged since 1939. Belfast rents are low, though building costs have risen as in Britain. Under the Bill, landlords of houses of less than £40 annual value would be permitted to raise rents by 50 per cent or so, conditionally on houses being in good and tenantable repair; in addition, all new and newly converted houses would be decontrolled, as would be all houses of more than £8 annual value after the expiry of the existing tenancy.

The opposition, largely of Unionist backbenchers gathered round Mr Warnock, argues that the increase is too great, and that in any event landlords will be able to evade their responsibility to use the extra rent to repair houses, because the provision under which a tenant has to get any "certificate of disrepair" from the local sanitary authority is inadequate and clumsy. It is true that when rents were raised—by a mere 5 per cent or so—in 1951, out of 92,000 houses affected, there were 28,000 appeals and 21,000 got certificates; but Mr Warnock says that many tenants had to do their own repairs and that the increase would be made on tenants' improvements. With both sides vehemently protesting their basic loyalty to Ulster above all else, the most likely outcome is some compromise under which rent increases are tied more closely to expenditure on improvements; the danger is that the whole principle of the Bill will be rendered nugatory if at the same time the permissible increases are slashed to a derisory level.

Second Phase in Argentina

THE death of General Lonardi, who led the successful revolt against the Perón regime and was later replaced by a somewhat more liberal and anti-clerical group of officers, symbolises the beginning of a second phase in the

new Argentina. Difficult times lie ahead for General Aramburu, the National Advisory Council with which he governs and the military junta on which his real power is based. The recent troubles in the province of Mendoza, and the measures taken against influential army officers such as General Bengoa and General Sonorana, suggest that right-wing elements—ranging from Peronistas to pro-clerical conservatives—are still looking for chances to overthrow the present government. Its survival depends less on its military strength than on its ability to halt inflation and satisfy the working classes who look back to the days of rocketing wages and paid holidays under Perón.

The government's economic measures have been courageous and, on the whole, sensible in the situation for which they are designed. All wages and salaries were increased in February by 10 per cent, and collective labour agreements were extended to the end of 1956 to allow time for separate re-negotiation. At the same time prices in many industries were frozen so that the cost of the wage increase would not be passed on to the consumer. The government has told manufacturers that they must increase their profits by producing more. The discovery of new oil wells near the Bolivian frontier, and the construction of an integrated steel mill on the River Paraná (a project financed with the help of the Export-Import Bank), should help Argentina's industries to get new wind in their sails. In order to restore the confidence of foreign buyers and investors, the government has decided that it will try henceforth to conclude multi-lateral and not merely bilateral trade agreements, it has resumed remittances from the earnings of foreign companies operating in Argentina, and is doing much to simplify the rules governing foreign exchange. (See Business Note on p 174.)

But the cost of living has continued to rise, and in terms of real wages some of the population are worse off than under the Perón regime. The government has, therefore, a slow and difficult course to steer between the progressive interests, demanding more political freedom, and its right-wing supporters—many of whom, though they opposed Perón, are not prepared to see genuine democracy in Argentina.

A New Fancy Franchise?

LORD MALVERN, prime minister of the Federation of Rhodesia and Nyasaland, has carried a stage further the search for a franchise for a plural society. He has spoken—a little vaguely—of a two tier system, under which the majority of Federal members would be elected on a common roll with a high set of qualifications, while a minority of members would be elected by a common roll with a low qualification; the idea is that the electors who qualified for the first roll (almost all of whom would be Europeans) would also be eligible to vote on the second, and would thus have two votes.

There need be no instinctive opposition to this; if the Coultts principle for plural voting in Kenya had been adopted, in a way that made possible common roll constituencies, it would have been a wise advance. But two questions need to be asked. First, how high does Lord Malvern envisage the qualifications should be on the high qualification roll? At present, on the recently raised

property franchise in Southern Rhodesia only about 400 Africans appear on the register, though it is believed that 2,000 or more could register. Would all these be excluded by raising the property qualification yet again? If so, the possibility of re-registering on the low-qualification roll would hardly assuage African disillusionment. Africans already declare that they are, by means well understood in the Southern states of America, discouraged from registering in Southern Rhodesia; and if they organised to get on the roll, the franchise would quickly be made more difficult for them. Is Lord Malvern's scheme designed to provide an excuse for a new breach of trust?

Secondly, and perhaps immediately even more important, how low does Lord Malvern think it would be politically possible to set the qualifications for the lower roll, for electing the minority of members? Would he agree to a scheme that would lead to a significant shift of influence away from the white electorate? If the lower qualification enfranchised even a quarter of the African population over 21, this would put a third or a quarter of the Federal House in the hands of African electors. In a narrowly divided House (such as may emerge at the next general election) this would give Africans the decisive influence at times. The result of the recent by-election at Sebakwe, which the Federal Party failed to win, hardly suggests that European voters would accept this. No doubt Lord Malvern's plan is designed to provide a *quid pro quo* in return for which Britain might concede early independence to the Federation and abdicate the Colonial Office's control in Northern Rhodesia and Nyasaland. If so, its details will demand close scrutiny.

True Optimism

Probably there never was a war which in its course presented so little that was humiliating to the character, or in its termination so little that was mortifying to the *amour-propre*, of any of the belligerents. . . . On the whole, too, and in the long run, we are inclined to think that this discomfiture will prove a real service to Russia. Her failure may be "a blessing in disguise." Compression from without was probably indispensable to force the cultivation of her powers within. As long as she was pertinaciously bent on an extension of territory, she was sure to neglect in some measure the development of the resources of the vast districts she already owned. As long as her statesmen had their eyes fixed on foreign policy and the augmentation of their influence abroad, it was inevitable that their attention should be diverted from the rich harvest which awaits industry and wise government at home. Now that she knows that her boundary is fixed, and if altered can only be altered for the worse; now that she has had startling and painful proof that any attempt at aggrandisement will arouse against her a combination of nations against which even she must be powerless—she will almost of necessity begin to look to those other sources of wealth, grandeur, and predominance which she can cultivate without despoiling any neighbour, or offending any rival, or incurring any risk. If we had not so long been accustomed to the sight, it would seem little short of madness for a nation embracing half Europe and Asia and numbering 60 million of inhabitants, to wish for more land and more subjects—when half her acres are lying waste and half her people are destitute and wretched.

Negotiation by Ultimatum

THERE has been some confusion about the meaning of the resolution that the rank and file of the National Union of Teachers forced upon an unwilling executive at their Easter conference, declaring that the teachers' demand for a basic salary of "not less than £500 to £1,050, with the appropriate additions, should be the aim of negotiations and not assumed as a purely bargaining figure." Apparently, however, the interpretation of "aim" is to be the rigid one of "commitment," and this seems bound to produce a large stumbling block for the Burnham Committee.

NUT members do not form the whole of the teachers' panel of the Burnham Committee, but they are in a majority there, and if they must persist in a demand that the authorities' side is surely bound to reject, there is no possibility of an agreement. Without an agreement in the committee there can be no increase in teachers' salaries. The prospect is therefore that at the next meeting on April 25th the NUT representatives will present a flat demand and be met by a flat rejection. Presumably the authorities will then announce their offer, and it seems clear that the rank and file of the union will sooner or later have to untie the hands of its sometime negotiators. That can be done only at a special conference of the union.

The effect of the fighting spirit at the NUT conference will therefore be to delay any agreement for at least three or four weeks; and the delay will affect not only the teachers, but also those whose pay scales are closely allied to the Burnham scale—inspectors, and teachers in technical institutions, farm institutes, training colleges and Home Office schools for delinquents. This is no doubt only a temporary setback, but it is a pity that the rank and file of the NUT had to indulge in this display of seasonal union militancy before they had even heard what the local authorities were prepared to offer. The pity is the greater because some of those who voted for the resolution do not seem to have known exactly what they were voting for.

Ferment in Eastern Europe

THE anti-Stalinist campaign is sweeping across Eastern Europe. After the rehabilitation of Rajk in Budapest and of Kostov in Sofia, the Bulgarian premier, Mr Chervenkov, has been rebuked for having indulged in the "cult of personality." In Poland Mr Gomulka, one of the few disgraced leaders whose rehabilitation need not be posthumous, has been cleared of charges of treason or subversion, though his line is still condemned as Right-wing deviation. The movement is gathering momentum and this official admission that people confessed to trumped-up charges leads by a macabre thread through the Slansky case in Hungary and the "doctors' plot" in Russia to the future revision of the Moscow trials directed in such ghastly fashion by the ill-famed Vyshinsky.

Events actually seem to be moving faster now in parts of Eastern Europe than in Russia itself. Voices within the communist parties of these countries are heard demanding steps to make the repetition of such tragic errors, and a

Starch does surprising things...IN SUCH SURPRISING PLACES

Example:

STARCH IN CARPET MAKING

There are two main parts to a carpet: the wool pile and the backing. After the carpet has been woven, the backing is sized with one of a range of speciality starches, depending on the sizing equipment in use and the type of carpet being made. This operation is called back-sizing. It strengthens the backing and assists in anchoring the base of the pile into the backing. It also prevents curling and improves the handling and wearability of the carpet.

Brown & Polson Industrial Division produce 200,000 tons of starch products a year: more than 400 products, which are helping more than 80 different industries to reduce production costs, to make better products, or even to make products that could not otherwise be made at all. We have spent more than 100 years in building up this large and varied business. We have learned a lot about the industrial uses of starch products, and our advice is freely at your disposal.

CAN STARCH HELP YOU?

When you read in these advertisements how starch products are helping other industries you may see new possibilities of turning them to account in your own business. We shall be glad to discuss them with you.

Ugly Duckling into Supersonic Aircraft

When the builders of the Canadian Pacific Railway struck the great Sudbury deposits of Nickel ore in 1883, the metal still bore the stigma of "be-devilled copper", existing uses were small and extraction was difficult. Then, world demand for the metal was given a tremendous impetus when it was found that Nickel could be used for the strengthening of steel. Dr. Ludwig Mond's discovery that Nickel would combine with carbon monoxide to form a gas led to still further progress through improved refining techniques.

To-day, uses for the metal have grown to such an extent that Nickel and Nickel-containing material touch industry at every point from food manufacturing equipment to electronic tubes, machine tools to giant excavators, jet-engined aircraft to ocean liners.

Our technical service is freely
available to advise on any use of Nickel.

return of Stalinism, impossible. A correspondent in the Polish *Trybuna Ludu* asks that debates on all important issues should be fully reported, with an indication of the views of the overridden minority. While recognising the need to implement decisions once they have been reached, she actually claims for the party member the right to dissent and for the party the duty to discuss openly. Such cries for inner party democracy are still much fainter in the Soviet Union.

The ferment now coming to the surface is also much more dangerous for the satellite regimes. In Russia only tiny vestiges of private property have been left and Communist leaders had decades to mould their society. But in Eastern Europe peasant smallholders still form everywhere a substantial part of the population. Many town dwellers, too, are deeply hostile to communist rule. Who next will ask for more freedom? Party leaders are already applying the brakes and uttering warnings that the "class enemy" is waiting for an opportunity.

Hard Times for Suvorov

SOVIET historians have a busy time ahead. The destruction of Stalinist myths will offer them new scope for writing about more than recent history. Glorification of the past, the blurring of the line which divides Tsarist Russia from the Soviet Republic, had become features of historiography in Stalin's time. The tsars and their servants had to be whitewashed so that Stalin could appear as the glorious heir not only of Lenin, but also of Ivan the Terrible and Peter the Great, Kutuzov and Suvorov. This jingoist line was boosted in the nineteen-thirties to prepare Russian people for a "patriotic war." The shift from revolutionary to nationalist traditions was symbolically illustrated by a Soviet film which sympathetically represented Marshal Suvorov as trampling the flags of the French revolution.

Now this cult of tradition is to be abandoned again. Tsarist generals are to be taken off their pedestals and put back in their historical perspective. At a recent conference of Soviet historians many speakers insisted that while Kutuzov and Suvorov may have been good soldiers, they were not fighters in a progressive cause but defenders of Tsardom. Soviet historians are already clamouring for a new light on the Crimean war and for a partial rehabilitation of Shamil, the Caucasian national hero who until recently was being dismissed as a "British agent."

Another symbolic change took place this week: Mr Lysenko resigned from the presidency of the Soviet Academy of Agricultural Sciences. For years before Stalin's death this practitioner turned oracle dominated Soviet genetics. The trouble was not that he was wrong, or that he was right, but that, with the blessing of the party, he cowed all opposition, so that the orthodox geneticists were branded as heretics; Michurin was god and Lysenko his prophet. With Stalin's death came also the end of Lysenko's infallibility. Mr Khrushchev attacked him for poor practical results. The theoretical discussion was reopened; it goes on still. Mr Lysenko is not disgraced, since he was allowed to address the party congress, but his

resignation may be taken symbolically as the end of one attempt, at least, to determine scientific truth by party ukase.

Dispersing Offices

MR SANDYS recently voiced his alarm at the rapid growth of office employment in central London. In the City alone 6 million square feet of office space is under construction and a further 4 million square feet has been approved. A similar growth is taking place in and around the West End, although the authorities are working hard to squeeze the offices out of Mayfair. Already employment is growing rapidly in Greater London (it has increased by 100,000 over the last two years) at the same time as the resident population is steadily declining. This has meant a large increase in the number of long-distance commuters who come into London daily from places beyond the green belt. On present trends, the size of this daily influx will go on rising very rapidly, and London's traffic congestion get steadily worse.

Mr Sandys's sensible prescription is that all London firms should consider locating at least part of their staffs outside the congested central area—and preferably outside London altogether. In many cases the top management needs to be in central London; but it is certainly feasible for the more routine office operations, which as a rule occupy most of the staff, to be performed elsewhere—provided a modern system of inter-office communications is set up. But if the Government is going to sponsor this prescription, there are at least two things it could do to help it along in practice. One useful step would be the extension of the London dial telephone exchange, to take in if possible the new towns which have potential advantages for offices that have not yet been realised. The other point is that the Government could afford to set a more direct example. It has dispersed 25,000 civil servants from London (partly as a result of wartime stimulus) and has plans for moving out another 14,000, but there is no reason why these plans should not be hastened and extended. The amount of routine work done in the civil service is much greater than this.

Letters to the Editor

Non-Co-operation

SIR—The Co-operative party is always grateful to have the advice of its friends and even of those who are not. In "Notes of the Week," you write that the Co-operative party "would carry more weight if it concentrated on the problems of consumers, of which it should have special knowledge." You are surely aware that in the last ten years the national committee of the Co-operative party has produced a series of policy statements which deal directly with consumer problems. These were summarised in an appendix to "Challenge of Our Time," which was presented to and approved by the Easter conference of the party this year. This recent statement, like most others, is open to criticism, but no one who has read it will accuse the committee which issued it of not being interested in consumer problems. It is an attempt to apply co-operative principles and experience to the problems of our time. In fact it does precisely what you suggest the Co-operative party should do.

As for your comment that the party is "always ready with advice, yet free to opt out of the most disagreeable responsibilities of its position," this is inconsistent with the suggestion that the Co-operative party should "concentrate on consumer problems" and, presumably, have nothing to say upon general political questions. What you appear to be saying is that only those who agree with your views on conscription and German rearmament are willing to face the disagreeable responsibilities of modern politics. I envy you your cocksureness.—Yours faithfully,

JACK BAILEY

Co-operative Party, Westminster, S.W.1

Pruning Nationalised Investment

SIR—Your article in your issue of March 17th draws attention to the share of gross capital formation claimed by the nationalised industries and asks whether this share is not excessive. After outlining the administrative process by which the investment needs of these industries are now determined, you conclude that "few would pretend that this annual exercise compares in efficiency with the impersonal criteria of the market."

Administrative decisions may well go awry, but whether "the impersonal forces of the market" offer a more satisfactory method of allocating capital to these industries seems open to doubt. The price mechanism—providing income is equitably distributed—is an effective

way of ascertaining the current preferences of consumers and the ability of producers to meet them. When it comes, however, to estimating consumption requirements and cost levels in the more distant future—and that is what investment decisions ought to be concerned with—we are all guessing; and when the Government takes a big hand in determining the shape of things to come (the level of production and demand) and, in addition, has, or should have, exceptionally complete information on what others are planning to do, then one might assume that its guess would be no worse than anyone else's.

Moreover, the market's judgment of the profitability of an investment project is strongly influenced by what it knows, and that, in the main, is current price relationships. Where major structural changes in the economy are in the offing current price relationships are bound to alter and must offer a shaky basis for long-term investment decisions.

Even if the foresight of the market were such that it could predict impending changes with minute accuracy, the case for entrusting to it investment decisions in the nationalised industries might not be very strong; for the profitability of a project from the national point of view does not depend solely on the financial returns accruing to the investing authority. Public utilities may confer on other industries benefits for which charges cannot conveniently be levied; these benefits do not therefore add to their returns and the market thus cannot, but the Government ought to, take them into account when allocating capital. Few would criticise the Government's recent action in earmarking substantial amounts for investment in training facilities for technicians even though the required capital could not have been raised by an appeal to the criteria of the market. A case for investment in better transport facilities will often have to be argued along similar lines.

In industries where capital output ratios are high (and your charts demonstrate that most nationalised industries belong to this group) average costs are liable to decline as output rises. It is a familiar proposition that in this situation public welfare will sometimes be best served if prices are set below cost and losses recouped by subsidy. Not all national industries fall, of course, into this category, and it certainly does not follow that it is always desirable for these industries to run at a loss. Your plea for a careful reconsideration of the pricing policies of nationalised industries should for these and other reasons command widespread support.—Yours faithfully,

G. O. GUTMAN
Nuffield College, Oxford

Cypriot Deadlock

SIR—In your report on Cyprus (in your issue of March 10th) you very rightly mention the "question of the elected majority" of the future Cypriot Assembly as one of the stumbling blocks to an agreement between the British Government and Archbishop Makarios. However, you seem to condone the vagueness in which this most important point was left.

You mention that "Mr Lennox-Boyd felt that a wide measure of self-government having been promised, the details must be left to be worked out in consultation with all the interested parties on the island and with the special commissioner, who would draw up a detailed constitution." And you suspect that the rejection by Archbishop Makarios of this British offer may be due to his being "an ambitious prelate."

I should like to be allowed to point out that the refusal of the British clearly and unambiguously to guarantee an equitable representation of the island's two main national groups (83 per cent Greeks—15 per cent Turks) is the main reason for the Archbishop's rejection of the offers. Without such a guarantee being given in advance, the Greek majority would for a long time to come, perhaps for ever, be deprived of its right to self-determination.

On the other hand may I congratulate you for your humane and fair conclusion that it is the duty of HM Government to start a new "constructive" effort in view of a final settlement of the question.—Yours faithfully,

The Restrictive Practices Bill

SIR—May I add on behalf of the hundreds of thousands of small traders represented by my committee, some observations on your recent comments on the Restrictive Trade Practices Bill.

Price maintenance of branded goods by collective action is our main interest; we do not operate price rings or indulge in private courts, but we are seriously affected by the proposal to ban collective enforcement of manufacturers' prices. We regard with doubt and scepticism the effectiveness of the cumbersome and costly machinery which, under the Bill, is to be set up for upholding, through the courts, the individual manufacturer's prices. If the qualities of personal enterprise and continuity of service associated with the small shopkeeper are to be preserved, the section of the Bill relating to collective enforcement calls, in our view, for most careful scrutiny and just and reasoned amendment. Our fears are very real indeed; by driving small traders to the wall the sweeping prohibition of collective enforcement may in fact lead to the diminution of genuine competition.

It is regrettable that you should adopt a consistently hostile attitude to the

enforcement of price maintenance by collective action. In what I believe was his last paper (Resale Price Maintenance, *Journal of Industrial Economics*, December, 1954) Sir Henry Clay said: "Uncontrolled individual bargaining among retailers may lead to lower prices to the consumer for a time; but if it leads also to irregularity of prices and sales, which deters manufacturers from extending the mechanisation, and other methods of rationalisation, of their processes, it will prevent lower prices in the long run. As with the settlement of rates and conditions of wage-labour, the collective procedure is needed for stability and long-run economy, and to avoid endless alterations to suit the transient changes in the bargaining position of individuals. It requires the only effective sanction, the right to withhold supplies collectively—the strike; a monopolistic producer can enforce his terms by withholding supplies individually; but most producers could not enforce an agreement without the right, and it is inconsistent to accord the right to protect a producer's goodwill while denying him the only effective means."

Nor do you show the respect it seems to merit to the statement of Sir Thomas Barnes and Professor Goodhart, in the Monopolies Commission's Report:

"We regard the greater effectiveness . . . of collective enforcement, as distinct from individual enforcement; as a powerful argument in its favour. It seems to us illogical that, if it is lawful for individual manufacturers to prescribe the prices at which their goods must be resold . . . they should be debarred from enforcing the maintenance of the prescribed prices in the most effective manner consistent with the general law."—Yours faithfully,

Chairman

Fair Prices Defence Committee,
Gordon Square, W.C.1

Babel in Singapore

SIR—I fear that the problems of bilingual education in Singapore, indeed throughout Malaya, are more formidable than your article of March 17th—though not its title—would appear to suggest. As far as Chinese-speaking inhabitants are concerned, a dual school system has evolved. Pupils, or rather their parents, are faced with the choice between an English education, which will alienate the children from the Chinese cultural heritage, but open the way for a career under British auspices, and Chinese schooling which will not fit them for government service but help to orientate them towards China—with the jungle as a possible intermediate course. Surely, the attempt to "marry" both systems by providing tuition in Chinese for English schools and vice versa is basically sound. That, for Chinese children, this involves learning an additional language is a complicating factor, but not more than that.—Yours faithfully,

The Man on the Tiger

YEARS OF TRIAL AND HOPE, 1946-1953.

By Harry S. Truman.

Hodder and Stoughton. 597 pages. 30s.

THIS second half of the Truman memoirs is more absorbing and satisfying than the first. The President (who says he soon discovered that being President is like riding a tiger; one must go on riding or be swallowed) was more in command of the issues and of events by 1946. And what events they were, as, under Russian pressure, America swung inexorably away from isolation into its present position of world leadership. The great story gets under way, after several miscellaneous chapters, with General Marshall's mission to China. General Marshall did not "save China," but he displayed the qualities of patience, far-sightedness and realism which, with courage and imagination, were to characterise the Truman Administration at its best. There is much in these pages to reassure the world about the quality of American leadership.

To make up his mind comes easily to Mr Truman. Yet even he admits that the decision to intervene in Korea—a radical departure from American policy that provided the turning-point in the cold war—was the most difficult he had to take. This was not because he had doubts of its rightness, but because he was aware of the constant risk of precipitating a wider war and had to remind himself that Korea, for all its symbolic importance, was only one of many danger points. Compared with this harrowing and continuing anxiety, the decision to relieve General MacArthur caused Mr Truman only a day or two's "worrisome thought." He had too much respect for the constitution not to know that the civil power must be made to prevail.

The magnanimity with which he treats this troublesome military prima donna, who constantly threatened to engulf the world in war, contrasts strangely with the harsh arraignment of President Eisenhower for exploiting the Korean war for political advantage during the 1952 campaign. The explanation may be that Mr Truman considers military life more likely to lead to a narrow mind and swollen head than to the humility and responsibility required of politicians. General Eisenhower, however, was a special case. He had been in the Administration's confidence and knew what was at stake: "No man had less right to use this crisis for political purposes." Of course, Mr Truman may also have found it hard to forgive

General Eisenhower for being captured by the Republicans and winning their battles.

Mr Truman finds it hard, too, to forgive Mr Stevenson. In general, he is not much interested in personalities or recriminations, and his narrative suffers from a certain flatness. But he was exasperated by Mr Stevenson's coyness (the Democrats narrowly escaped having the amiable Barkley as their candidate) and hurt by Mr Stevenson's clear desire to dissociate himself from the "Truman record," which the Republicans were proclaiming to be one of softness to communism and corruption. Mr Truman pays a tribute to Mr Stevenson's eloquence and moral courage, but the diagnosis of his political errors—the only point at which Truman the politician steps completely out of the robes of Truman the statesman—is candid.

Late in the campaign Mr Truman was called in to "give 'em hell"; he did his vigorous best. But it is typical of his brisk realism that when the "disappointing but not surprising" results were in, he at once offered to brief the new Administration so that the national interest should not suffer during the transfer of power. It is probably also typical that Mr Truman should have been puzzled by the coldness with which his offers were accepted. For the student of American politics these revealing final chapters alone would make the memoirs worth while.

Unpleasant Reflections

REFLECTIONS ON HANGING.

By Arthur Koestler.

Gollancz. 193 pages. 12s. 6d.

THE CASE OF TIMOTHY EVANS: An Appeal to Reason.

By Lord Altrincham and Ian Gilmour.

The Spectator. 26 pages. 1s. 6d.

MR KOESTLER'S reflections on hanging are not pleasant ones. Indeed, many abolitionists will feel that now that the tide of opinion is turning in their favour (as it undoubtedly is turning, whatever the Home Secretary may say), this labouring on the horrors of hanging is not the right attitude for their champions to take. Let them state their case calmly and they will find it becoming all the more forceful as their opponents, now on the defensive, become the more shrill.

Mr Koestler's book is, therefore, unlikely to be so effective as that of either Sir Ernest Gowers or Mr Gerald Gardiner, who between them recently covered much the same ground as he, but much more quietly and coherently.

If the abolitionists' cause can be helped by reflection on the technique of executions, then they have not been better served than by the Home Office itself. For the official account of a hanging, given to the Royal Commission and expressed in impersonal matter-of-fact Whitehall prose, is much more likely to convert waverers than Mr Koestler's gloss upon it. Similarly, the Home Secretary's own recent statement on what actually happened at Mrs Thompson's execution in 1923 was much more damaging to the official case than the horror story presented in Mr Koestler's book.

Nor does the Home Office come out well from the other controversy arising from the publication of extracts from the book in *The Observer* two months ago. For thirty years it has tacitly allowed an incomplete version of the official instructions to prison governors on what should be said in execution bulletins to be accepted as complete; even now it has left the history of these instructions, and the question of when and under what circumstances they may have been changed, deplorably vague. It presents an even sordid figure in the Evans case. One does not have to be so completely convinced of Evans's innocence as are Lord Altrincham and Mr Gilmour to realise that the Scott Henderson report on the case was much less convincing in purporting to establish his guilt. The authors of the pamphlet do not cover much new ground, except for showing how untenable is the thesis of Sir Lionel Meald (Attorney-General and prosecuting counsel in the Christie trial); he stated in the February debate in the Commons that though Evans may have been hanged on false evidence, he was still guilty, for he was concerned with Christie in the murder of Mrs Evans and their child. So long as the Home Secretary refuses to have a fresh inquiry, people will continue to believe that he is refusing to face the truth.

A Victorian Anarchist

THOMAS HODGSKIN.

By Elie Halévy. Translated by A. J. Taylor.

Benn. 197 pages. 18s.

THOMAS HODGSKIN (1787-1869) is known today as one of the clearest thinkers and strongest arguers in that diverse body of generous, impetuous, warmhearted, and often muddleheaded men, the English nineteenth-century radicals. Yet Hodgskin himself was so modest, and so genuinely doubtful of his own powers, that he never pushed himself forward into notice; when he died, no London newspaper noticed his death; and he does not figure in the "Dictionary of National Biography." He served for a while as a naval officer in the Napoleonic wars; soon after the peace, he travelled much, on foot, in Central Europe; then he worked for forty years as a free-lance journalist and reviewer—a list of his contributions to *The Economist* from 1844 to 1857 fills five pages in the book under review.

Above all, Hodgskin was an inquirer, with a passionate belief that "No Holy Alliance can put down the quiet insurrection by which knowledge will subvert whatever is not founded in justice and truth." He criticised his friends the Benthamites, and the economics of Ricardo; and wrote two economic textbooks of his own. In them he anticipated some of the cardinal features of Marx's theories of labour and value, and emphasised the importance of the economic factor in history; hence, he is often referred to as one of the early socialists. But he detested state activity in any form; at heart, he was an anarchist: he wrote once that "all law-making, except gradually and quietly to repeal all existing laws, is arrant humbug."

The seminal importance of Hodgskin's work was first revealed by Elie Halévy, one of the greatest historians of nineteenth-century England, who found out much about him when preparing his "Growth of Philosophic Radicalism," and published this short life of him in French in 1903. The book summarises his obscure career, and analyses and illustrates the development of his thought; many of its most telling passages are drawn from Hodgskin's letters to the radical organiser Francis Place. The brief concluding chapter discusses, with all Halévy's acumen, the relation between Hodgskin's thought and Marx's and points out that the two men may well have met while Marx was writing "Capital." This important study is at last made available in English by Mr A. J. Taylor's apparently effortless translation. The translator has gone to much trouble to restore the original wording for the large part of it which first came from Hodgskin's own pen.

Occupation Policies

DOCUMENTS ON GERMANY UNDER OCCUPATION, 1945-54.

Selected and edited by Beate Ruhm von Oppen.

Issued under the auspices of the Royal Institute of International Affairs.

Oxford University Press. 687 pages. 63s.

THIS collection of documents opens with a report of the press conference given by President Roosevelt and Mr Churchill in January, 1943, at which they announced the policy of "Unconditional Surrender," and closes with the protocols on the termination of the occupation regime in the Federal Republic of Germany which were issued by the Conference of Ministers in Paris in October, 1954. It is not a comprehensive survey of the German problem in all its aspects in this period. Documents dealing with Germany as an international political issue, as the centre of the chief divergences between East and West in the struggle for advantage in the new balance of power, are excluded on the ground that they are fully covered already in other publications, notably Chatham House's "Documents on International Affairs." For the same reason, even when these international disputes were intimately connected with,

or had their origin in differences of occupation policy between East and West, there has been no attempt to cover them. Thus the volume does not deal with the quarrels that culminated in the Berlin blockade or with the continuing battle of wits between the powers on the question of the reunification of Germany. As is made clear in the preface to the book, the aim has been to document only the administrative aspects of the problem, to illustrate only the implementation of the occupation policies of the different powers.

Despite its restricted field, the volume is to be welcomed. Even in its duller and more administrative aspects, the occupation of Germany, a unique episode in international relations, raised unusual and important problems. How complicated they were, and how they received different solutions in the zones, is better illustrated in this collection of documents than in any other publication at present available. In particular, the volume represents the first attempt in English to deal with all four zones, the Russian as well as those in the west, as fully as the evidence will permit. The type of evidence available for the developments that have taken place in the Russian zone is naturally different from that which exists in Western Germany; and, equally naturally, the amount of evidence available for that zone is less than in the west. The Soviet authorities have not only adopted different policies and followed their own methods of putting them into effect; those methods and policies have not always been consistent with the full publication of evidence, even on administrative questions. But as far as the evidence can be collected, and in so far as it can be trusted, English readers are now enabled to study some of the developments during the past ten years in the Soviet Zone, of which they have so far been ill-informed.

New Light on Advertising

THE SELECTION OF ADVERTISING MEDIA.

By J. W. Hobson.

Published on behalf of the Institute of Practitioners in Advertising by Business Publications Limited. 201 pages. 15s.

THE bibliography of advertising in this country is not very extensive, but this book, written by John Hobson, and sponsored by the Institute of Practitioners in Advertising, is a notable addition. It makes what is perhaps the most workmanlike approach ever to be published in this country to a difficult and controversial subject.

For a great many people, the whole question of media is still almost entirely subjective and, therefore, difficult to discuss within a scientific study. Mr Hobson in no way denies the importance of subjective judgment in assessing media for advertising, but he does show how objective judgment can augment the subjective considerations that lead to the decision to use this or that medium in an advertising campaign. He first outlines the principles of media

TGA FFSOA

THE ECONOMIST, APRIL 14, 1951

Nothing more accurate than Electronics

If at some stage in your process you require high operating speeds in sorting, batching, counting, computing, accurate and wide speed control, or non-destructive testing and inspection, electronic equipment can do it. If the appropriate equipment does not already exist it can be designed and made for your job.

Once installed it will last as long as your machines and need little maintenance or attention. It will consistently raise the standard of your products.

Because it does its work so quickly and so well you will find production rising while overheads are reduced. This is only one of the many ways in which electricity is playing a vital part in the drive for higher productivity.

Electricity for Productivity

Ask your ELECTRICITY BOARD for advice and information, or get in touch with E.D.A. They can lend you, without charge, films about the uses of electricity in industry. E.D.A. are also publishing a series of books on Electricity and Productivity. Titles now available are *Electric Motors and Controls*, *Higher Production*, *Lighting in Industry*, *Materials Handling*, and *Resistance Heating*. Price 8/6, or 9/- post free.

Issued by the
British Electrical Development Association
2 Savoy Hill, London, W.C.2

planning, thereby providing a tool with which to analyse the various media available to advertisers in this country today. The last part of the book shows how the knowledge thus gained can be incorporated into planning an advertising campaign.

The basic principles comprise four elements: the character of the individual medium, its atmosphere, its quantitative coverage, and finally its cost. By character Hobson means the broad aspects of regional coverage; class, age, and power to reach special groups; the physical characteristics of the medium; its assistance to selling; duration of interest, timing, impact or repetition; and finally its indirect effects on influential groups—for example, the retail trade.

For the most part, these are objective characteristics, measurable by research. It is, however, in discussing "atmosphere" that subjective judgment emerges as a significant factor. Here the media man is dealing with the mood of the audience and the relationship of the advertising message carried to the atmosphere of the vehicle carrying it. Nevertheless, this element is vital and must obviously take the place Mr Hobson gives it as one of the basic elements of media planning.

The other two characteristics, quantity and cost, tend to speak for themselves; they are increasingly becoming measurable, and therefore mainly objective, factors.

Perhaps the outstanding feature of the book is Mr Hobson's practical application of this analytical approach in planning a campaign. There are many things here that many people have known for a long time, but they have not before been gathered together in one place and presented as the complete logical way of handling media in an advertising campaign. Indeed, perhaps the most notable service to advertising comes in the stimulation this book affords to the growing awareness that all aspects of an advertising campaign must be completely integrated, while the old-established tendency for creation, marketing and media to play completely separate parts is fast disappearing. Mr Hobson also realises that the subject is still in its infancy, and he is constantly looking forward to new ways of gathering facts and new methods of applying those facts.

Middle Class and Bourgeoisie

STUDIES IN CLASS STRUCTURE.

By G. D. H. Cole.

Routledge and Kegan Paul. 202 pages. 21s.

THESE studies are in Mr Cole's urbane and statistical mood; they are concerned, in large part, with an attempt to measure the realities of class structure. Mr Cole is early forced to admit that as class frontiers are so ill-defined, this is a difficult task; but his analysis of the 1951 census in terms of social, and more particularly occupational, class is a useful one, especially

when compared with his own rearrangement of Baxter's figures for a century earlier. Mr Cole, perhaps naturally, distrusts the subjective criterion of class, that is, the idea that a man belongs to the class he feels he belongs to; but it is interesting to note that while in 1948 47 per cent of a British Institute of Public Opinion sample poll assigned themselves to the middle class, Mr Cole's own examination of the 1951 census returns puts between 30 and 40 per cent in the same category.

Further, he puts 60 per cent of the occupied population in the four grades of manual workers from fully skilled to unskilled; but it seems highly possible that the middle-working class frontier no longer runs along the top of the artisan stratum, but, in terms of standards of life, and attitudes towards it, some way below the top. Indeed, Mr Cole implies as much. This, however, is once again to enter the field of subjective valuations; but in so complex a class structure it is difficult to avoid this if contact is to be kept with the familiar everyday world of pubs, council housing estates and suburban streets.

Mr Cole's distinction between a middle class and a bourgeoisie is one of the best pieces of social and historical analysis in the book. He rightly compares the isolation of the urban trading and professional groups on the continent with the English middle class, which mingles inextricably with every section of the population in town and countryside, in society and in industry. He observes: "that is why 'liberalism' could never strike real roots in Europe: that is why there are no foundations today over a large part of Europe for political or economic systems which comply with the requirements of 'democracy,' as democracy is understood in Western countries that have experienced capitalist unification." Mr Cole apparently feels that democracy is somehow not quite democracy under capitalism, after showing in some statistical detail that it flourishes best where capitalism creates a broad and widening band of middle classes in the community. But he is in no doubt that the facts of middle class expansion under capitalism dispose of all Marxist pretensions to a scientific theory of economic class (he is just as firm in his rebuttal of the theory of the "managerial revolution").

It is evident that Mr Cole dislikes social class as an attribute of human existence, but his own figures show how steady has been the narrowing of economic differences between the classes, notably the differentials for skill. This he considers to be due to levelling up, hardly at all to levelling down, notwithstanding the virtual disappearance of the upper classes. But does this process end in the withering away of class distinctions and class consciousness? Has it done so in, for example, Australia, where a doctor gets perhaps 20 per cent more take-home pay than a piece-worker? Though Mr Cole does not always stick to facts and figures (his pages on the light thrown by Victorian

novels on class attitudes are highly readable) he felt unable to develop the implications of his own findings to that point.

Masters and Servants

INDUSTRIAL LAW.

By J. L. Gayler.

The English Universities Press. 388 pages. 30s.

THE author who embarks on writing a legal textbook designed for a particular class of consumers is in difficulties. He has to deal with almost all branches of the law—contract, tort, crime and property. Unless his book is to be impossibly large he must either deal with each subject superficially or else assume a large store of existing knowledge. Mr Gayler's book is written for works managers, personnel officers, trade union officials and students and within the limits set by length he is reasonably successful.

The author approaches the relations between master and servant with refreshing candour. The orthodox works on contract tend to overlook the existence of trade union agreements, whereas Mr Gayler says with truth that the vast mass of industrial workers today have very little direct say in the establishment of their rate of wages or hours of employment. Too little has been written about the effect on the individual employer or employee of agreements entered into on their behalf, or of regulations laid down for their benefit by wages councils or otherwise under the authority of statute. For this reason Mr Gayler's chapters on the legal effect of collective agreements and on the settlement of disputes are particularly helpful, though too short for many practical purposes.

The chapters on the employer's liability both at common law and under statute are sound as far as they go. In order to give a complete picture Mr Gayler has had to resort to catalogues. Running down cases and accidents at work take up the greater part of the time of the judges of the Queen's Bench Division, and the law of employers' liability is becoming complex. For this reason Mr Gayler's observations on this subject must be regarded only as an introduction.

Again, the pages at the end on social insurance are a useful summary for a newcomer, but many of the problems which arise in practice lie beyond their scope. Provided that those who use it do not place upon it a weight which the author does not intend it to carry, this book should prove useful.

Red and Other Colours

POLITICAL GEOGRAPHY AND THE WORLD MAP.

By Y. M. Goblet.

Philip. 309 pages. 30s.

IT is now a commonplace that, in an age which is supposedly emancipated from illusion, the capacity for self-deception in political matters is as great

as ever. This is especially true, as Dr Goblet points out, of discussion concerning the territory of states, their boundaries and their dependencies. Today, solemn recognition is given to states that control no territory, everybody politely forbearing to mention that, like the emperor's clothes, there is really nothing there at all. Other states are said not to exist, although they have successfully thrown all invaders from their borders. Children are being taught every day of empires long vanished, and red lines on their school maps enclose territories from which their fathers have been ruthlessly expelled. With so much confusion abroad, the value of objective studies in political geography, such as this, is clear.

Dr Goblet distinguishes between the immediate uses of political geography and what he calls its scientific aims, and this is surely useful. There can be little doubt about the desirability of an adequate geographical information service, whether for individuals or for Foreign Offices. As for the longer-term aims, it is surely legitimate to study "the part played by the territorial element in the development of states," but some will wonder how far it is possible to determine "geographical laws relating to their rise and fall."

Having made his standpoint clear, Dr Goblet devotes most of his book to the observation and classification of the facts of political geography. As a contemporary observer of the numerous frontier changes and of the rise and fall of states during the last twenty-five years, he has much of the greatest interest and importance to contribute. The systematic approach, with its emphasis on analysis, is also a most welcome contrast with the purely descriptive, regional method of some recent works in this field. The book, however, has certain idiosyncrasies. These are partly a matter of style; Dr Goblet is liable to break his admirable English with a phrase or simile which a native writer would avoid as inappropriate to the context or outworn. As regards content, although one easily forgives minor detours, such as an account of the allegedly low dietary value of modern food, it is slightly alarming to find the writer apparently retreating from his own high standards of impartiality on issues such as the Jewish-Arab conflict or the exact status of Algeria. Nevertheless, this is a stimulating contribution to a field of geography which, since the dethronement of *Geopolitik*, has been comparatively neglected.

India's Challenge to China
SPOTLIGHT ON ASIA.
By Guy Wint.
Penguin Books. 222 pages. 2s. 6d.

THE temporary "freezing" of the international situation in Europe has contributed to making the struggle for power seem more fluid in the Middle and Far East. The Asian peregrinations of Marshal Bulganin and Mr Khrushchev have certainly underlined the direction

of Soviet interests. Specialist studies of the area are not lacking, but the ordinary newspaper reader, bewildered by the complexity of a subject that recurs in the daily headlines, has a right to expect the kind of spoon-feeding Mr Wint has now given him.

To undertake to expose the basic problems of Asia, both in their local and in their international contexts without neglecting the historical background of the more important countries, presupposes a high skill in condensation. Mr Wint has that skill. He writes with disarming simplicity and clarity, and with the authority of a man who has spent many years in the two more most important countries of Asia—India and China. Inevitably, many details are blurred—as indeed they should be, if the main outline is to remain clear to his presumed readership. But this main outline is brilliantly clear; the great drama of Asia today, which is the peaceful competition between India and China in the economic field, is presented with a telling concentration on essentials. There is indeed little doubt that the degree of India's success in abolishing poverty by the methods of "controlled liberalism" will profoundly affect the resistance of other Asian nations to the lure of China's coercive path to plenty.

As the author shrewdly observes, the totalitarian victory in China was made historically probable both by the absence of western influence on its traditional administrative cadres, and by the fact that the Kuomintang, under the advice of Borodin, had organised itself on communist party lines. It should be added that the chapters devoted to the communist revolution in China constitute the best short account now available in English.

Literary Jottings

THOMAS HARDY'S NOTEBOOKS.
Edited and with Notes by Evelyn Hardy.
The Hogarth Press. 135 pages. 10s. 6d.

THE notebooks of a creative artist can be supremely fascinating. The sketch-books of Leonardo da Vinci tell us more about his genius than his finished compositions; the journals of Gerard Manley Hopkins immensely enrich our understanding of both man and poet. Some notebooks give us the privilege of entry into studio or workshop; others almost convict us of trespassing and eavesdropping, so obviously were they intended to be private.

There is nothing self-revealing in the two notebooks of Thomas Hardy now made public, and not much that illuminates his methods of work; but the fragmentary jottings have been presented with such appreciative perception by the editor that their worth has been greatly enhanced. Miss Hardy herself admits that at first glance the material is disappointing. Some five years before his death, Hardy went through his old notebooks, destroying many of them, but copying into new books certain items that he thought valuable. One of these revised note-

books, compiled probably in 1923, is presented in its entirety; it covers the years 1867-1920. The second unpublished notebook was extensively used by Hardy himself when drafting "The Later Years," and the editor has therefore only reprinted such entries as have not already been given to the public.

Miss Hardy, with her intimate knowledge of the writer's whole life and output, is able to bring out the significance of even the duller item, by identifying people and places briefly referred to and connecting paragraphs in the notebooks with passages in the novels and poems. Though a large proportion of the entries are the better for this editorial aid, many are of intrinsic interest. There are a number of careful and vivid records of rustic customs and characters, and several real or imagined episodes set down as possible material for plots. Descriptions of scenery, and particularly of the effects of the weather, are often striking. Now and again Hardy ventures an aphorism, but wit was not his strong suit; a grim humour is often betrayed in his choice of anecdotes and country sayings.

One cannot derive from these random jottings any clear impression of Hardy's personality, but they do indicate the kind of things that interested him, and to a student of his works they are genuinely valuable. So are the hitherto unpublished letters from Mrs Martin, the lady of the manor of Kingston Maurward, who taught little Thomas his alphabet and kept up an affectionate interest in his career.

Books Received

INCOME AND WEALTH: Series V.
Edited by Simon Kuznets. International Association for Research in Income and Wealth. *Bowes and Bowes*. 256 pages. 42s.

THE BRITISH SYSTEM OF TAXATION.
Her Majesty's Stationery Office. 45 pages. 2s. 6d.

This clear and comprehensive pamphlet is issued by the Central Office of Information and describes the principles underlying British taxes and the history of some of them. Direct taxation is distinguished from indirect, and for the former illustrative tables are given in an appendix. There is also a short account of local taxation.

CARLYLE: Selected Works, Reminiscences and Letters.
Edited by Julian Symons. *Hart-Davis*. 784 pages. 27s. 6d.
This is the latest in the publisher's series called the Reynard Library, in which selections from classic writers are reprinted. It has a short introduction by the editor and a chronological table of Carlyle's life and works.

RULES OF GOLF.
Once again the Royal Insurance Company have put golfers in their debt with a new edition of the rules to include the revisions that came into force on January 1st. Copies are obtainable from the company at 1 North John Street, Liverpool, 2.

SOUTH AFRICAN MINING AND ENGINEERING YEAR BOOK 1955-56.
Edited by S. R. Potter. *South African Mining Journal Syndicate*. 676 pages. 63s.

Foreign Policy and the Democratic Process

BY MAX BELOFF

"... a most illuminating little book ... Instead of the turgid Wilsonian morality that so often passes for thinking on this subject he has made a serious attempt to explore the real problems of formulating foreign policy which necessitates secrecy, speed and flexibility in a democracy which only too readily withholds funds and support from policies to which it has not been gradually and publicly brought to accept." *The Observer* (Johns Hopkins Press) 15s. net

Continuity & Change in Russian and Soviet Thought

Edited with an Introduction by
ERNEST J. SIMMONS

"Among the thirty contributors are such masters as G. Florovsky and Isaiah Berlin, several internationally known authorities, and a number of younger students who show themselves to be no mean rivals to their elders. Most of the papers are based on original research, and it is the resulting freshness that is the most welcome feature of this book." *Manchester Guardian* (Harvard University Press) 60s. net

The Economic Development of Malaya

This mission of the International Bank for Reconstruction and Development spent several months in Malaya and Singapore. Its recommendations for the Federation put emphasis on replanting the rubber areas with high-yielding varieties which can compete successfully with synthetic rubber. For Singapore the greatest part of the proposed expenditure is to go towards housing, social services and public utilities. (Johns Hopkins Press) *Illustrated* 60s. net

Washington, D.C.

WHEN President Eisenhower told the American people of his willingness to stand for re-election, he said that, as "a recovered heart patient," he would be leaving some of his important duties to his "close associates." As a result of this statement leading Democrats, such as Mr Stevenson and Mr Truman, are seriously asserting that, if Mr Eisenhower remains in the White House, the institution of the Presidency itself will be endangered. The Democrats, however, have not yet turned their attention to a closely related phenomenon of current American politics which has been given more serious implications by Mr Eisenhower's frank intention of abridging still further the active role of the President in his Administration. This phenomenon is the increasing tendency of the public to absolve the President from responsibility for the performance of his government.

This development is peculiar to the present Administration, although Mr Eisenhower has not consciously sought to bring it about. Its chief manifestation is the continued popularity of the President while resentment mounts against his subordinates and the programmes they manage. In the farming areas, serious discontent at the Administration's agricultural policy is found side by side with overwhelming approval of Mr Eisenhower. The baffling political situation this creates was exemplified in the recent primary elections in Minnesota. Many Republicans crossed over to vote in the Democratic contest as a protest against falling farm prices and lower farm incomes under the Republicans. But local analysts who are in touch with rural opinion insist that this does not forecast a protest vote against Mr Eisenhower in November. He remains a hero: farm people may blame Congress, which enacted a farm programme recommended by Mr Eisenhower, or they may blame the Republican party, which he leads, or they may blame the Secretary of Agriculture, Mr Benson, whom he appointed, but they do not blame Mr Eisenhower. In the northwest, the Secretary of the Interior, Mr McKay, is the scapegoat for Mr Eisenhower's decisions on natural resources and hydro-electricity. In foreign affairs, the arrows are aimed at Mr Dulles, the Secretary of State. The critics of military policy take as their targets the Secretary of Defence or the frugal Secretary of the Treasury, but they do not call the military professional, General Eisenhower, to account.

This tendency to regard the President as the censor of government actions, rather than as their author, is contrary to the native political tradition. It also seems incompatible with the unique American governmental process in which the structures of executive, and of political responsibility

under the party system, are tied to one man, the President. While it is easy to identify and describe the phenomenon, it is not at all easy to explain it. Some of the more thoughtful observers consider that it has at least part of its origin in the way in which mass opinion was manipulated on Mr Eisenhower's behalf from the earliest days of his candidacy by the most talented and advanced practitioners of the cynical art of publicity. To begin with, Mr Eisenhower admittedly had only a limited acquaintance with public affairs and politics, and it was necessary to build him up as a personality above and apart from them. The voters approved, perhaps because they had just gone through six uninterrupted years of a public scolding match between Mr Truman and the late Senator Taft; they may well have wanted peace and quiet more than anything else.

It is possible also that in a world where new problems of unprecedented magnitude and complexity are always appearing, voters have an inner urge to abdicate some of the political responsibility which a democratic system puts on them. Perhaps they believe that back in some forgotten good old time the Presidency was always above the daily argument, and that the Eisenhower concept re-establishes a tradition broken in the nineteen-thirties by Franklin Roosevelt and Mr Truman. The trouble with this nostalgic dream is that, where Presidents having real stature are concerned, it is necessary to go back to the sixth, John Quincy Adams, to find one who nourished the party spirit among the people as little as does Mr Eisenhower; after four years of him, the people chose Andrew Jackson in 1828 because they preferred political contention. At any rate, a conscientious voter could scarcely argue now that what was good enough for the nineteenth century and the first quarter of the twentieth fits the circumstances of today, when the government has its nose inside every economic, social, military and international tent.

The intensity of the modern challenge to the voter could, of course, explain his withdrawal, if such it be. It is much easier to take issues one at a time, identifying them with the subordinate who is immediately responsible, equating farm prices with Mr Benson, hydro-electricity with Mr McKay, the Middle East with Mr Dulles, than to draw up a complete ledger and compute the net worth of the President himself, although he is, or should be, the sum of all the issues and all the officials. The voter's obligation to do this arithmetic is, however, a distinctive characteristic of the American system.

Even if President Eisenhower has not knowingly initiated this unmistakable change in American political psychology, his conduct of the Presidency has fostered it. For what seemed to him the best of reasons, to increase efficiency and leave himself more time to think, he had already given new emphasis and scope to his version of the military staff system and to the delegation of responsibility. Now, as a result of his heart attack, his own role is evidently, from his own words, to be curtailed still further. The office of the Presidency is, indeed, to be altered. This is a new political fact. At the same time as Americans are distinguishing, to a degree never reached before, between "President" and "government," the President's actual share in the conduct of his government is becoming even harder to define, as he yields some of his duties to others.

These circumstances have a special relevance for the 1956 election campaign, for their effect is to base the presidential contest, the mainspring of the political system, on personalities rather than on questions of public policy. It follows that, as the gap between "President" and "government" widens in public thought, the ability of the voters to influence the direction of their government by their most effective instrument, their vote in presidential elections, is correspondingly impaired. The obvious corollary is that a candidate who is actually better qualified might well be denied the office solely for having a less glamorous personality, and this risk is increased now that the era of campaigning by television has arrived. When and if the historic identification of the President and the government does break down, then the polarising function of the Presidency in politics will be lost. There will then have occurred a fundamental change in the office of the Presidency and in American political tradition and custom, even though all are rooted in the Constitution.

Do-Nothing Congress?

CONGRESS'S Easter holiday was spoiled by complaints from both party organisations about the almost complete absence of constructive legislation during the present session. Republican officials want to repeat Mr Truman's 1948 strategy in reverse: he owed his unexpected victory in that year largely to his attacks on the poor record of the preceding "do-nothing" Congress, which had been in the charge of his Republican opponents. The Democratic National Committee wants the Congress which is today controlled by its own party to make a good record for Democratic candidates to run on next autumn. It is too early to judge whether or not this criticism is justified, for even without it the second half of the session would have produced a rush of legislation. During the next three months the hard work done in committee rooms is due to appear on the floors of Congress for its final tests.

Nevertheless, it is a little surprising that more has not been accomplished when the leaders of both parties are in general agreement about what needs to be done. Democrats try to put the blame on lack of guidance from the White House and delaying tactics by Republicans, but the primary responsibility lies with the party which has the majority. However, the suggestion that this is a do-nothing Congress

was spurned almost as indignantly by Republican members as by Democrats: such charges are likely to react on sitting members, whatever their party, and both parties know that, once Congress begins to do something, the bitter divisions of opinion within their ranks will become obvious. The deepest split among the Democrats is over civil rights for Negroes, and the Administration has managed to widen this by its demand for legislation on the question.

The President has also embarrassed the Democrats this week with his unusual request for an additional \$550 million in funds for defence, mainly for jet bombers; the request was sent to Congress just as an inquiry was beginning into Democratic allegations that the safety of the United States was being endangered by the Administration's parsimony. Except when it comes to foreign aid, little argument is now expected over appropriations. With a balanced Budget the case for economy has lost much of its attraction, and with contentment general there is little call for extravagant appeals to poverty-stricken areas or underprivileged groups. The farmer is, of course, the exception which proves the present prosperity. From recent elections it appears that he is in open revolt and this explains the speed with which both houses finally approved the unfortunate farm bill this week. It may be unsatisfactory to the President, but it should provide quick relief for the farmer; for this reason it is no longer as certain as it was that Mr Eisenhower will veto it.

Teamsters in Trouble

THE foul acid-throwing attack on Mr Victor Riesel, a newspaperman who has been courageously exposing the criminal connections of certain New York trade unions, has given added urgency to the current investigation of labour racketeering in that city. This for the moment is centring on local branches of the International Brotherhood of Teamsters, America's largest trade union which dominates the road transport and allied industries. The leadership of the union in the New York district is now the subject of a dispute: the recently-ousted president contends that his successor, Mr John O'Rourke, was elected by a rigged vote with the help of gangsters in the union. Mr O'Rourke, however, is backed by Mr James Hoffa, a dynamic young vice-president of the IBT. During the last few years Mr Hoffa has been extending his influence over the southern and eastern branches of the union from his original base in Detroit—not always, it is alleged, by strictly orthodox means.

Mr Hoffa's attempt to increase his power in New York City has not been confined to supporting Mr O'Rourke. He has also entered, on behalf of his union, into a working agreement with the International Longshoremen's Association, which was turned out of the American Federation of Labour some time ago on the grounds that it was corrupt and dominated by criminals. The community of interest between workers on the docks and in road transport is obvious, and the pact applies to other ports besides New York. But the heart of the agreement was a loan of \$400,000 from the teamsters to pay off the debts incurred by the longshoremen during their militant defiance of the AFL.

No margin for magic...

We do not believe in short cuts. There is no magic in our method, no mystery in our formula for progress in the air. To meet a set of known requirements we design an aircraft engine. Then, meticulously and with constant re-examination of our thinking and its results, we test it. When, and only when, its practicability is proven beyond doubt, we extend its performance and scope by continuous, painstaking development. Simple as it is, this attitude of mind has yielded such engines as the Sapphire series, now powering thirteen of the world's most formidable front-line aircraft.

Over 5,000 Sapphire engines have been made in the United States by the Curtiss-Wright Corporation. The American version is known as the Wright J.65 Sapphire.

A firm foundation for prosperity

THE NEW MARCHON SULPHURIC ACID AND CEMENT PLANT
IS BUILT ON ITS OWN RAW MATERIALS

Marchon Products Ltd. are now producing 100,000 tons of sulphuric acid a year by the anhydrite process, at a cost which compares favourably with that of any other method. This major contribution to the nation's supply of a vital industrial chemical is produced independently of imported raw materials, and the process yields a

valuable co-product in the form of one ton of Portland cement for every ton of acid.

Anhydrite is freely available in Britain. The Marchon plant at Whitehaven is literally built on an enormous deposit and the picture shows the underground handling of anhydrite in the Company's mine.

This loan, however, was too much for Mr George Meany, the head of the new national labour organisation which was formed at the beginning of this year by the amalgamation of the AFL with the Congress of Industrial Organisations. He was already incensed at the teamsters' reluctance to submit to the restrictions on union activity which made the merger possible, and he now took an unprecedentedly strong line, announcing that, if the loan to the ILA went through, the teamsters would be suspended from the national organisation. As a result, the teamsters' president, the notorious Mr Dave Beck, stepped in, perhaps welcoming a chance of checking Mr Hoffa, who is rapidly becoming a serious rival. The offer of the loan has been withdrawn, probably for ever, and Mr Beck has been given authority to clean up any branches of the union which need it. But the working agreement with the ILA remains, although the dockers may not think it worth having without the money, and it has yet to be seen what Mr Meany's attitude now is. Should he still threaten suspension, there is a strong group within the IBT, long critical of Mr Hoffa's activities, which would probably desert the teamsters' union if it insists on maintaining its alliance with the longshoremen, even at the expense of its membership in the national labour organisation.

Trade With Reservations

THE chances of Congress approving the Organisation for Trade Co-operation have brightened and, if opposition in the Senate Finance Committee can be overcome, the Administration's foreign trade programme should take an important step forward. At the same time, however, scores of business organisations are clamouring for protection against rising imports and some are trying to fight the federal government's trade policies with the aid of individual state legislatures. For while the export of American goods and services continues at an extremely high level, imports have also risen considerably. They reached a value of \$11.4 billion last year, an increase of \$1.2 billion over 1954 and of \$400 million over the previous record year, 1951. Many Americans are arguing that present tariff regulations do not suit a period in which foreign competitors—particularly in western Europe and Japan—are becoming ever stronger while the American boom may be levelling out.

At the moment the loudest clamour comes from the textile industry, in which there are numerous small manufacturers, many of them hard hit by wage increases and technological changes. The National Association of Wool Manufacturers is asking the government to increase the duty on imported fabrics from 25 to 45 per cent of their value. Imports of cotton textiles from Japan are equal to only some two per cent of total American production, but domestic manufacturers are uttering vociferous protests. Consequently, State Legislatures in South Carolina and Alabama, places which have become textile centres comparatively recently, have passed laws requiring shops which sell Japanese textiles to display signs clearly indicating this sinister fact. These laws probably violate treaty agreements between the United States and Japan and the State Department seems fairly confident that they will be ruled invalid by the courts.

Nevertheless, they display a disturbing trend and the use of a new technique by protectionist interests.

Other industries asking for added tariffs include such perennial plaintiffs as the watch makers, the manufacturers of kitchen ware and fishermen worried by imports of Canadian fish fillets and Japanese tuna. Some businesses are resorting to subtler weapons, such as suits charging that foreign producers are infringing patents or are conspiring to monopolise the American market; an example is the anti-trust suit just brought by the Park and Tilford Corporation against the British Distillers Company and several other whisky firms. But the main argument behind all this outcry—the fear of a recession—is double-edged. For as the automobile industry is continually pointing out, in the case of a slump America must sell even more abroad and there is no more efficient way of shutting off potential markets than to start a new round of tariff increases.

Two-Party Government

THE people of New York have benefited from the facts that members of the State Legislature have to face the voters in November and that Governor Harriman is an increasingly prominent contender for the Democratic presidential nomination. For the Governor and his Republican opponents, who control both houses of the Legislature, have vied with one another in putting forward constructive and popular proposals. At the end of the session, both parties congratulated themselves on their good work and each sought to persuade the voters that it had been accomplished unaided against malevolent opposition from the other party. The foremost result of the session was a reduction of some \$40 million in the state's personal income tax for 1955, allowing individual taxpayers to deduct up to \$35 from their bills. Measures to reduce taxes were put forward by both Democrats and Republicans; but, when the latter pushed their Bill through both houses, Governor Harriman threatened to veto it. He argued that it favoured higher income groups unfairly. At the last moment, however, political shrewdness overcame his equalitarian scruples and he signed the Bill, adding that a surplus of \$54 million during the fiscal year just ended justified some tax relief.

Other projects approved by the Legislature will, however, impose a severe strain on New York's finances. They include \$100 million to finance loans to private builders of houses for middle income groups and \$500 million for highway construction—both in the form of bond issues which must still be submitted to the voters. Mr Harriman disapproves of the highway issue because it does not provide for an extra tax on motor fuels to pay the interest on the bonds. Another conspicuous achievement of the state's divided government was an increase of some \$150 million, over two years, in funds for publicly-supported education. New York City's hard-pressed schools will receive about a third. Finally, after twenty years in the political mill, a measure was approved making third party insurance compulsory for anyone owning an automobile registered in the state. On the whole, the record of the 179th regular session of the State Legislature illustrates one of the paradoxes of American politics: both locally and nationally, the voter is often best served when executive and legislative powers are split between the two parties.

Battle for Power

FROM A CORRESPONDENT IN OREGON

OREGON'S primary elections on May 18th will attract wide attention. Both the strength of President Eisenhower and the rival claims of Mr Stevenson and Senator Kefauver will be tested. Originally the two Democratic contenders for the presidential nomination had both intended to keep out of Oregon, but now they are asking their supporters to write in their names on the ballot paper; the man who wins will have won sixteen votes at the Democratic national convention. In itself, this may not be a major gain, but in the present, hard-fought rivalry even a small victory can be important. On the Republican ballot, Mr Eisenhower's name will stand alone, but the President has become directly involved in the contest for the Republican nomination for the Senate.

With Mr Eisenhower's specific encouragement, and possibly at his request, Mr Douglas McKay, the Secretary of the Interior, flew to Oregon on March 9th and announced that he was giving up his post in the Cabinet in order to run for the Republican nomination for Senator from Oregon. The Administration hopes that Mr McKay will obtain this and will then defeat his Democratic opponent, Senator Wayne Morse, in the November elections. Mr McKay was Governor of Oregon when the President chose him to head the Department of the Interior which deals, among other things, with the management and conservation of the natural resources which are so important in the western United States. Mr Morse is the Oregonian who was twice elected as a Republican, but switched to the Democrats in 1954 and thus gave them a majority in the upper house.

Mr McKay's candidacy shows the gravity with which the Republicans regard the possibility of Senator Morse's re-election. Until two months ago, Republican leaders were confident that they had a strong opponent against Mr Morse in Governor Patterson, a popular and progressive Republican who had been elected to office by an overwhelming majority in spite of the Democratic trend in 1954, which was apparent even in normally Republican Oregon. But Mr Patterson died suddenly of a heart attack on the night of January 31st, only three days after he had announced his intention of standing against Mr Morse. This opened the Republican lists to a number of volunteers. They included Major General Lamar Tooze, a lawyer from Portland, and Mr Philip Hitchcock, an educator and church leader. Both had already been campaigning for the nomination for several weeks when Mr McKay literally dropped out of the sky.

They were understandably astonished. In the immediately preceding months, Mr McKay had emphatically rejected suggestions that he might be a candidate against Senator Morse, declaring that he would retire from politics when he had completed his work as Secretary of the Interior. But on March 5th he had a personal conference with President Eisenhower. Three days later he landed in Oregon, without warning, armed with a "Dear Doug" letter from the President saying: "Your decision to campaign for election to the US Senate from your beloved State of Oregon is worthy of the highest commendation."

Mr McKay arrived in Oregon obviously assuming that other Republican candidates for the Senate would bow

THE ECONOMIST, APRIL 14, 1956

out. General Tooze readily obliged. But Mr Hitchcock, after three days of deliberation, stood his ground and will oppose Mr McKay for the nomination on May 18th. Mr McKay's victory is by no means assured and, if he is defeated, President Eisenhower's prestige will have been dealt a heavy blow. Mr Hitchcock used to be a State Senator and is well known and liked throughout the 96,000 square miles of Oregon. He is a former Moderator of the Oregon Synod of the Presbyterian Church and has been active in various fraternal organisations. Furthermore, he is considered to be more "liberal" than Mr McKay and has been a prominent leader of the civil rights movement in the state.

There is not much difference, however, to be discerned in the economic philosophies of the two Republicans. It is here that the winner of the nomination will clash directly with Senator Morse, who is one of the Senate's most articulate exponents of the view that the development and management of America's natural resources should be publicly financed. Mr McKay is the very symbol of the Administration's alternative "partnership" policy under which an important share in this field would be reserved for private interests; this policy is strongly supported by the privately owned electricity companies and the great lumber concerns. The issue is especially important in Oregon which lies in the heart of the Columbia River Basin, the greatest source of hydro-electric power in the United States. Mr McKay, who has been accused of "giving away" public lands and wealth to private companies, recently stated:

The power policies are not McKay policies. They are the policies the President enunciated in the campaign in 1952. He was elected by an overwhelming majority. The people must believe in them, too.

It is true that in 1952 Oregon voters overwhelmingly endorsed Mr Eisenhower, knowing his stand on hydro-electric development. But it is also true that, in 1954, these same voters elected Senator Neuberger, a Democrat whose views on natural resources parallel those of Senator Morse, over Mr Cordon, a Republican who advocated the "partnership" policy.

Before Governor Patterson's death, Oregon Republicans felt confident that they could defeat Senator Morse and give their party one of the victories it needs so badly if it is to have a majority in the next Senate. There is no such confidence about either Mr McKay or Mr Hitchcock. All three men, however, are vigorous campaigners and Oregon can be certain of lively times both in May and in November.

New Style Credit

FROM A SPECIAL CORRESPONDENT

THE great rise in instalment buying during 1955 took place without much help from the department stores. Always anxious to maintain their traditions of being quality shopping places, these stores have been reluctant to tempt the customers with easy credit terms and advertisements of "no down payments." Consequently, an increasing share of the consumer's dollar has been captured by the more energetic sellers on credit, the automobile dealers and the

THE ECONOMIST, APRIL 14, 1956

New branch opened in Cairo

One of the newest overseas branches of the First National City Bank has recently been opened in Cairo.

Lying at the political and economic heart of the Near and Middle East, it will extend still further the world-wide service of the First National City Bank.

The organization is based on a network of 66 branches, offices and affiliates in 24 countries all over the globe. In addition, the world's markets are covered by over three thousand five hundred banking correspondents posted in every important centre of commerce.

This important service is at your disposal here in London. The staffs of the two branches, in the City and West End, are well experienced in the conduct of international business. Take your problem to them—they are anxious to help.

Simultaneously from Olympia, London and Castle Bromwich, Birmingham, comes the call of this year's great British Industries Fair. Which must you visit? Both! Both. Don't make the mistake of limiting your looking to your own particular line of business—though *that*, of course, is important. This is an exciting BIF, a science-and-technics BIF, an office-and-factory BIF, a today-and-tomorrow BIF . . . and you can't cross your heart and say you've done your duty by it if you haven't seen it all. There are no dividing lines today between one industry and another. There is no saying who may turn a new development to advantage. Let Olympia and Castle Bromwich bring you up-to-date on Britain's industrial leadership.

Come to the Fair!

APRIL 23 - MAY 4

shops which specialise in electrical appliances. Hire purchase sales of cars and appliances have been booming, while only modest gains have been shown by department store business, which is mostly for cash or on an account which in America must usually be paid at the end of the month. But now, as the solution to easy credit without uneasy dignity, more and more shops are taking up the idea of "revolving credits," which may eventually prove to be the most successful of all plans for paying over a period of time.

Under the new scheme the customer is assigned a credit limit and may be continually in debt to the shop up to this amount; interest of 1 per cent is charged on the unpaid balance. Thus, a customer with a \$400 limit may buy \$300 worth of spring finery, pay \$50 for each of the next three months, and still be able to spend another \$150 for new garden furniture this summer—all without paying more than \$50 at the end of any one month. The department stores have always made some long-term credit facilities available to their customers, for limited categories of merchandise such as furniture and substantial orders for clothing. But the staple elements in department store trade are the myriads of small items which are available under one roof. Under the new revolving credit plans, many purchases of this type can be covered by the one credit, and the temptation is to add a big purchase as well—a fur coat or refrigerator. American women shoppers have a habit of buying each item of a new wardrobe in a different place, partly because it pays to purchase small items in the cut-rate shops. The department stores hope that this habit may be overcome when the new system, with its higher credit limit, reinforces the greater convenience of shopping in one place.

Revolving credit has not yet replaced regular charge accounts at the large city shops, where many well-to-do customers prefer to continue their present arrangements, but it has been introduced at many of these shops side-by-side with the old system. About two-thirds of all American department stores now offer revolving credit; Federated Department Stores, the country's largest chain, does 60 per cent of its total business on some sort of credit, with most of the recent increase resulting from the new plan. The growth has been even more rapid among smaller shops, where the number offering revolving credit plans has more than doubled since 1952. Many of these stores are outside the large cities, since the convenience of being able to charge many items against one credit is very great for suburban and rural shoppers who cannot reach the store often. The new development has put department stores once again in the forefront of the merchandising battle.

More Trust For Brains

THE rarest form of animal life in the United States today is an unemployed scientist or engineer. Even before they graduate from colleges and universities, students in any field of technology or science are wooed with offers of large salaries, free homes and fabulous careers by private industry. Experts estimate that American industry desperately needs 40,000 fully trained new engineers each year instead of the 27,000 being graduated at present. And what is an acute handicap in the development of private

industry has become a matter of survival in terms of military research. A congressional committee recently reported that the Soviet Union, which produced 682,000 specialists and technicians in the period from 1928 to 1954 compared with 480,000 in the United States, was now training more than twice as many as America each year. Shocked by these findings, the President last week established a National Committee for the Development of Scientists and Engineers instructing it to "foster the development of more highly qualified technological manpower."

The material reasons for the present shortage are fairly obvious. Some 60 per cent of the best qualified students in secondary schools do not go on to advanced institutions; 50 per cent of those who do go on do not get a degree; and only a very small percentage obtains a doctorate. Moreover, while 12 per cent of all college students received engineering degrees in 1950, only 8.6 per cent did so last year. But the more fundamental reasons are complex and, in part, unknown. Some observers point out that many secondary schools do not have well-equipped laboratories and that there is a truly desperate shortage of good teachers of mathematics and science at the secondary level, where salaries are utterly inadequate. Others say that the reputation for extreme difficulty enjoyed by contemporary science and technology frightens away all but the most devoted students.

There may, however, be a deeper reason. During the "witch-hunting" period that followed the Korean war, many Americans came to look on scientists as either faintly comical and ineffectual egg heads addled in ivory towers or as definitely sinister personages tainted with subversion and disloyalty. At the request of the Administration, a special committee of distinguished scientists and educators has presented a report which may do much to repair the damage. It recommends above all that political loyalty should not be a primary factor in the granting of government money and support to scientists engaged on non-secret work. The committee pointed out that a cure for cancer coming from a Communist would be as valuable as if it came from anyone else. In short, more trust will attract more brains and the government now seems to realise that brains are the most strategic material of all.

CONSUMER CREDIT OUTSTANDING IN THE UNITED STATES

MILLION DOLLARS; [END OF PERIOD FIGURES]

Birth of a Salesman

FROM A SPECIAL CORRESPONDENT

IN Latin countries, or the new nations of the Far and Middle East, adolescent students can usually be found in the van of revolutionary movements; in America, things are very different. A spectacular example is a burgeoning organisation, Junior Achievement, Incorporated. The purpose of JA is simple: it gives young people, between fifteen and twenty-one, an opportunity of gaining practical knowledge of how American free enterprise works, by enabling them to set up and operate their own miniature business corporations.

Each autumn brings forth a fresh crop of these companies. Generally secondary school students provide all personnel, from executive officers to manual workers; they decide on a product to manufacture or a service to perform; they do the planning, budgeting, and book-keeping; they sell stock in their enterprise, at 50 cents a share. In the spring, before they are scattered by the long summer holiday, they liquidate their company. The winner of last year's Junior Achievement awards, the Metal Engineering Company of Houston, Texas, manufactured and sold 300 outdoor charcoal grills, which they called "Port-a-Pits," at a price of \$9.95 each; at the year's end, they paid a 20 per cent dividend and distributed almost \$600 more among themselves in bonuses. In recognition of this, the company's officers were brought to New York City by the national organisation. There they received their award from the hands of Mr Keith Funston, President of the New York Stock Exchange, heard a speech by Mr M. J. Rathbone, President of the Standard Oil Company of New Jersey, and got their pictures in the *New York Times*.

*

After a period of slow growth—the scheme began on a small scale in Massachusetts over thirty-five years ago, but has grown from 108 companies in 1942 to over 2,000 now—there are signs that JA has reached a point where it will be able to mobilise truly impressive resources in its campaign to organise young America in a Lilliput of capitalist enterprise and to convince the public that not all adolescents are halfway to delinquency. In December, it was announced that 20 major corporations had agreed to back a national publicity campaign for JA and contributions from business and industry pay the rent of local centres and salaries for full-time staff at national headquarters. There is an annual convention (NAJAC) which does everything an American convention should do, including the election of a "Miss NAJAC" to reign over the President's Ball. As incentives to all this activity there are numerous awards, badges, titles and such solid lures as scholarships to colleges and universities, applicants for which "are judged first on their excellence in JA activities. After that, scholastic rating is considered."

Each JA company is sponsored by an adult firm, which provides advisers to help with the intricacies of book-keeping, watch over the safety and practicality of production techniques, and try to fill "achievers" with enthusiasm for salesmanship. At the end of the year each geographical area holds a "Future Unlimited Banquet," at which the

"achievers" with the best records eat a sumptuous meal and are encouraged by distinguished speakers to look back with satisfaction, forward with anticipation. The spirit of JA gatherings may be inferred from a sentence concerning this year's Midwest Conference:

From the kick-off breakfast, where Bud Schwann (Executive Director of JA of the Mississippi Valley) gave the Midwest achievers the saying, "Enthusiasm! Go! Go! Go!" to the final luncheon, everybody was on the ball.

The organisation has its problems. There is always some fall in membership, as the initial "enthusiasm and go" of September fade into the routine of output, one night a week, throughout the school year. Sometimes the products are not wisely chosen, and so do not sell or cost more to make than was expected. Some members enter under the mistaken impression that JA is a lucrative part-time job; actually the emphasis is on gaining experience and acquiring the spirit of enterprise; earnings are usually modest. There is some danger, moreover, that the young boys and girls may be misled into thinking that life in the real world of business will be as pleasantly protected from risks as is life in the JA, where parents and friends can be counted on to buy the product, and where shareholders are not seriously disturbed if their 50 cents turns out to have been an unsound investment.

But there are few organisations in the United States for which it would be safer to predict future success. Junior Achievement has avoided drawing down upon it any large-scale criticism, and even trade union papers have approved it. After all, Junior Achievers are living the great American dream: each one is both a wage labourer and a director of his company. And if the atmosphere of a JA conference, or the tone of its periodicals, leave something to be desired in intellectual content or stylistic elegance, could not the same be said of the "Senior Achievement" that has given the United States a gross national product of \$400 billion annually?

SHORTER NOTES

The special Senate committee which has been investigating the offer of \$2,500 made to Senator Francis Case for his campaign fund early this year has reported that this was an improper, although not necessarily illegal, attempt to influence his vote on the natural gas Bill. The money came indirectly from the head of a big oil and natural gas company. As a result of this incident, which led the President to veto the Bill, another special Senate committee is unenthusiastically undertaking a broader investigation of lobbying activities and contributions to campaign funds.

*

This year's attempt to reform the electoral college system, under which the President and Vice President are elected indirectly, failed to obtain the necessary two-thirds majority in the Senate and is unlikely to have another chance in the present Congress. There is general agreement that the Constitution should be changed, since under it a President who had not obtained a majority of popular votes can be elected, but the Senate was unable to agree on any one of the numerous plans put before it.

The World Overseas

War Drums on the Gold Coast

FROM A CORRESPONDENT LATELY IN WEST AFRICA

THE crisis in the Gold Coast has not yet attracted the attention it deserves; but that it is a crisis nobody need doubt. Certainly the British MPs who recently visited the country were left in no doubt of it. For it is clear that if civil war in the Gold Coast were to follow the granting of independence the repercussions would be far-reaching. This is becoming a grim possibility as the breach widens between the government party (the Convention People's Party of Dr Nkrumah) and the National Liberation Movement. The NLM continues to insist on a constituent assembly and a federal form of government before independence; and—though Dr Nkrumah has repudiated it—a statement has been made by Mr Gbedemah, the able and formidable Minister of Finance, that if the British Government shows reluctance to grant self-government at the proper time, the Gold Coast government will follow the example of the Sudan and simply declare the country independent.

This statement drew the retort from the NLM that it would regard such a step as illegal and would refuse to accept the government's authority. Mr Lennox-Boyd has said that "general agreement" on the constitution was necessary before self-government could be granted. In the present turmoil of threat and counter-threat this "general agreement" is not in sight, unless Dr Nkrumah makes concessions so great that he would satisfy his opponents only at the cost of losing his supporters.

This is the situation in which Mr Lennox-Boyd and Sir Charles Arden-Clarke, the exceptionally able Governor, find themselves as the time-table, planned when Dr Nkrumah was swept to power in June, 1954, moves steadily towards independence day. The crisis, incidentally, comes just when the report of the preparatory commission on the Volta River scheme is about to be published, and plans for a vast investment of capital in the new sovereign state are being shaped. How has it come about?

The rise of the opposition which threatens to wreck everybody's plans dates from that election. There was, indeed, an opposition to the CPP in the new Legislative Assembly, but it was weak and divided, though its poll was greater than the distribution of seats suggested. But it was not in

the Assembly that a new opposition began to develop. One of the government's first acts was to "freeze" the price paid to cocoa farmers by the Marketing Board. In Ashanti two groups saw in this an opportunity for arousing opposition to Dr Nkrumah, and a curious coalition came into being; ever since it has gone from strength to strength.

Bafour Akoto, an influential courtier of the Asantehene, the Paramount of the Ashanti, and a traditionalist strongly critical of the CPP's attitude to chiefs, became titular leader of an Ashanti movement formed in September, 1954, with the support of other traditionalists to protest against

the cocoa price; but the movement's impetus seems to have come from young CPP "rebels" angry either because they had had to accept election candidates nominated by Accra or because they felt that the government's cocoa price policy had let them down. The movement took the name National Liberation Movement, and the turning point came when the Asanteman Council, the organ of the Ashanti Chiefs, gave it official support and the Asantehene himself became in fact if not in name the movement's leader. The Northern Territories Council followed, and when the Legislative Assembly met again at the end of October the centre of Gold Coast politics had shifted from Accra to Kumasi, the headquarters of the NLM.

Since then the movement has been strengthened by the defection of leading members of the Convention People's

Party and by its victory in a by-election in Ashanti. And while the cocoa price issue is almost forgotten, others far more serious have taken its place: a demand for an inquiry into the activities of the government-sponsored Cocoa Purchasing Company, which the NLM alleged had been used by the government as an instrument of bribery, nepotism and political influence; more general charges of corruption, nepotism, and dictatorship; a demand for a new, federal, constitution to allow diffusion of power, to make dictatorship more difficult, and to allow for the special circumstances of Ashanti and the Northern Territories; a demand for new recognition of the status of chiefs; and a general claim that the government elected in 1954 is totally unrepresentative—all these proved popular on NLM platforms.

In Ashanti itself there has been bloodshed, and only police vigilance and the influence of responsible men on both sides have prevented widespread disturbances.

The government was slow to recognise the strength of the movement. But to each of its complaints Dr Nkrumah has, in the end, made some kind of answer. The price of cocoa has been raised; an inquiry into the Cocoa Purchasing Company is to take place; a non-party man has replaced the CPP chairman of the Cocoa Marketing Board; the government has agreed to devolve certain powers to regional bodies; chiefs have been offered more financial security; and the government finally adopted a suggestion first made by Professor Busia of the National Liberation Movement that a constitutional adviser should be invited to the Gold Coast to report on the constitution.

But while this adviser, Sir Frederick Bourne, was at work the government caused the Assembly to pass legislation affecting the chiefs' powers which the Asanteman Council decided was directed at itself, and the National Liberation Movement declined to co-operate with Sir Frederick. He, however, completed his report, which advocates far more decentralisation than the government has yet contemplated, and makes suggestions to meet each of the NLM's grievances. A conference on the report was recently held in Accra, which the NLM declined to attend; it may also decline to attend the debate on it in the legislature.

A general election is the obvious move to avoid what might be a serious threat of civil war. But this would solve nothing if it gave Dr Nkrumah a majority in the country as a whole but the NLM an overwhelming majority in Ashanti and the Northern Territories. So far, Mr Lennox-Boyd has not intervened directly, and has been punctilious in upholding Dr Nkrumah's position. But time is running short. If the deadlock is not resolved, the Secretary of State may himself have to try to bring the parties together.

France's Eye on Inflation

FROM OUR PARIS CORRESPONDENT

THE path of a Socialist government is strewn with pitfalls. M. Moller's team is increasingly suspected by the Left of betraying its principles in Algeria and by the Right of remaining faithful to them at home. As long as the Communists lust for a Popular Front and the Right can savour the spectacle of Socialists resorting unwillingly to force in Algeria, the Assembly will probably hold its fire. But sounds can be heard of weapons being loaded as the deputies prepare to reassemble next week.

Algeria will probably not provide the first target for those who might want shooting practice. The Assembly's programme suggests that the honour will fall to M. Ramadier, the Economic Minister, when he presents his plan for financing an increase in old age pensions. Everyone agrees that the aged should have higher pensions. But the government wants to give nearly four and a half million old people thirty pounds a year more (up to £210 a year for a single person), and to meet the bill of £130 million is a delicate business. Mindful of the inflationary sins of which Socialists are ever accused, M. Ramadier reasonably intends

to raise taxes. Unfortunately, he has aroused widespread opposition as he sets about it.

He first proposed a tax on cars to milk the relatively rich. An angry howl from the car producers' and users' associations filled the press for a week. M. Ramadier changed front: he would find part of his sum by increasing income tax. This offended the trade unions, though in principle they favour direct taxation; the wage-earners who cannot, like shop-keepers, evade taxes and are not, like farmers, virtually exempt from them, would again be footing the bill.

Shaken by this opposition from his own ranks, M. Ramadier then uncovered his battery of fiscal reforms earlier than he intended. He would like to end a much evaded consumption tax which is earmarked by the government for the use of local authorities. The revenue would be recovered by extending income tax at least to the richer farmers. This may possibly placate the unions. But already it seems that the tax is a "favourite" with local authorities; and the farmers may well barricade the country roads in protest (they have done it before) when they learn that they, too, must contribute to the national finances. There is still time for M. Ramadier to take another tack, but it is hard to see what section of society is still left for him to offend. Some people are wondering how he can get the Assembly to vote his well-intentioned schemes. As so often before, it will accept the expenditure but probably refuse to pay the bill.

Cost of Living Creeps Up

This tragi-comic episode, among many such in French fiscal history, is important because it could be used to lay the blame on the government for the fears of inflation now reappearing after several years' monetary stability. Inflation has played such a diabolical part in the weakening of French social cohesion over the last forty years that here, more than elsewhere, the prospect is alarming. Last year salaries and incomes rose, chiefly in the autumn round of wage increases, by 9 or 10 per cent; production only by 6 or 7 per cent. In itself, this development was not too serious. But the prolonged winter frost will weigh, though no one knows how heavily, on food prices through the summer; there is the prospect of £150 million of extra expenditure in Algeria, with no certainty that the spending will end there; and the government has a limited but real programme of social reforms that cost money.

Slowly the cost of living index is moving up to the level where the law requires that the national basic wage be raised by 5 per cent. Because wages are already much higher than this minimum, actual wages need not follow suit. The unions do in fact heartily fear inflation. But they gained strength after their successes last autumn for the first time since 1948, and it would be hard for them to remain passive at the breaking of a price barrier which has been the *ne plus ultra* of government economists for four years. Even then, limited wage increases in the spring might not prove inflationary. But the government would feel safer if wage demands were postponed till the autumn, when the bill could be more comfortably met.

Accordingly it is doing its utmost to keep the unions out of temptation's way by holding the cost of living index below the critical level of 149.1 points (it had reached 148.1 on April 1st). With much administrative ingenuity and some success it has been weighing down on the prices of the most critically affected of the 213 items which make up the index. It hopes by fractional adjustments to keep

A towel fit for the chairman

Looks a tall order, that; yet the answer's simple—the Towelmaster. Gone are the days of unspeakable roller towels, of paper-strewn floors like Hampstead Heath. At a pull, the Towelmaster presents a length of soft, dry, laundry-fresh towel. It gives as satisfactory and as pleasant a dry as a towel in one's own house. The same pull automatically winds up a used portion into a separate compartment of the gleaming white Towelmaster cabinet.

Yet it's far from being the case that the Towelmaster is for board-room level only. It's inexpensive enough for installation everywhere. Look at the figures. A minimum of two cabinets is installed and maintained free of charge. All you pay is 5/- for each roll of towelling used. Minimum usage is one roll per cabinet per week. All else is free: fitting, maintenance, replacement... no other charges whatsoever.

Each roll gives an honest-to-goodness dry to 180 pairs of hands. If that wasn't enough for 5/-, think of the goodwill gained from staff and visitors, of the added prestige conferred by these sparkling Towelmaster cabinets. And consider, above all else, this bargain price for a clean bill of health.

We welcome your enquiries.

OUR SHOWROOMS FOR IDEAS ON BUSINESS FURNISHING

below the decimal point till late summer. The basis for this hope is the continuing boom. If industrial output merely maintains throughout the year the rates set by the January and February figures—and it seems almost certain to do so for several months—the national income should rise almost as much again in 1956 as in 1955.

Except in steel and in engineering plants making investment goods, industrial production still seems able to keep pace with demand, and for most consumer articles there is still little immediate pressure on prices. The balance of payments position is not as good as last year, but the Treasury reserves, standing at \$1,800 million, are still nearly as big as those of the sterling area for a much smaller volume of trade. Savings are high and still increasing. Optimism remains the dominant mood, though it is an increasingly wary optimism.

The question is, whose optimism? The economist's, based on statistics, is fairly well assured. But the business man's? This is where the criticisms of M. Ramadier's tax schemes, shown out at the door of logic, reappear by the window of emotion. In a country much beset by inflation business men tend to assume that taxes mean rising prices, and once people begin to speculate on rising prices, the neat sums of the economists are so much paper in the wind.

At present there is no question of a credit squeeze. The authorities do not think one is needed; they are not sure how effective it would be, and they do not want it. They do not want to backslide once more on liberalisation measures that are helping to persuade numbers of French firms to modernise. They do not want to cut down on investments. Most of the present fears of inflation boil down to a realisation that in some key industries, like steel and machine tools, reserve production capacities no longer exist, and to a suspicion that in others investment has been inadequate and that shortages may suddenly appear. The problem is less to pay for Algeria than to maintain and increase the rate of economic expansion. The French planners hope that national income will have risen by more than a quarter by 1961. France can afford little less if she is to keep pace with the world. But the situation is being carefully watched. Inflation could so undermine the country that economic aims would become almost irrelevant beside the frustrations to which Algeria is already bringing a bitter yeast.

Setting Dollar Trade Free

THERE are few surprises in the report recently published by the Organisation for European Economic Co-operation (OEEC) on the progress made in the liberalisation of trade with the United States and Canada.* But there is much to suggest that the waters of dollar competition may not be as icy as feared, and that they can be stimulating rather than paralysing to those who brave them.

The report was prepared by the joint trade and payments committee of the OEEC in accordance with a cautious recommendation of the Council, originally adopted in December, 1954, and reaffirmed last February. This urged member countries to relax quantitative restrictions on

* OEEC, *Liberalisation of Europe's Dollar Trade*, March, 1956, 135 pages, HMSO, 8s.

imports of goods (and invisible transactions) from the dollar area. No attempt has been made to work out a code of liberalisation or to agree on progressive stages of liberalisation of dollar trade, as was done in the case of intra-European trade, but the progress made by member countries is kept under review. Last September, experts from the OEEC capitals and from Washington and Ottawa met in Paris to discuss the patterns that seemed to be emerging from the liberalisation measures already undertaken and the difficulties and dangers of further liberalisation. Little was said about these discussions at the time, partly to encourage frankness and partly out of deference to those who were reluctant to be pushed into specific commitments.

PERCENTAGE OF FREED IMPORTS ON 1st JANUARY, 1956, AS COMPARED WITH PRIVATE IMPORTS FROM THE UNITED STATES AND CANADA.

On the basis of the import figures for 1953.

Countries Applying Liberalisation Lists	Cat. I Food and Feeding stuffs	Cat. II Raw Materi- als.	Cat. III Manu- factured products	Total
Germany	77	62	78	68
Austria	3	17	11	8
Benelux	88	81	89	87
Denmark	77	45	41	55
France	0	9	14	11
Greece	100	100	97	99
Ireland	7	43	2	15
Iceland	86	67	15	33
Italy	2	41	6	24
Portugal	92	21	26	53
United Kingdom	73	70	5	56
Sweden	71	61	64	64
Switzerland	94	100	99	98

As the accompanying table shows, there is wide variation among the OEEC countries in the pattern and extent of liberalisation, and average figures for the group as a whole mean little. Moreover, it should be noted that the figures for the group are strongly influenced by the record of the United Kingdom, which accounted for 42 per cent of the private imports of the OEEC member countries in the base year. As in the case of the liberalisation of intra-European trade, the percentage figures apply only to private trade—which makes the record for agricultural products, in particular, look better than it is. On the other hand, the figures do not accurately reflect the amount of relaxation which in fact exists, since they do not take into account various measures of partial liberalisation, such as increases in quotas or a liberal licensing system.

The OEEC committee is fully alive to the pitfalls in its own statistics. However, it has felt able to draw a number of tentative but illuminating conclusions. Although, since the last quarter of 1954, OEEC imports from North America have increased by 40 per cent, while imports from European sources increased by only 15 per cent, the report attributes this increase principally to the expansion in European production. Liberalisation made it easier for European industries to supplement European supplies of raw materials, and basic products required to feed the expansion, but did not result in any appreciable displacement of European supplies. And the share of their total imports which OEEC countries take from each other is today appreciably higher than it was in 1938, whereas the proportion imported from the United States and Canada is roughly the same. On the record so far, the bogey of a massive, sudden substitution of dollar goods has clearly failed to materialise.

Can you afford to use Titanium?

Titanium is an expensive metal, but . . .

I.C.I. is now making the cheapest titanium in the world, thanks to years of research and development. Ample supplies of raw titanium are available from a major new plant, which is in full production.

Titanium's properties are unique

In alloyed forms titanium can be made as strong as many high-tensile steels at half the weight. Its resistance to corrosion is phenomenal: months in boiling acids, years in sea-water, leave it hardly marked.

Titanium may be the cheapest material . . .

In aircraft, where payload and performance are worth paying for; in ships, where faster water circulation permits smaller condensers; in any plant where absence of corrosion reduces shut-downs and maintenance.

Titanium is available in many forms

I.C.I. is now supplying strip, sheet, rod, forging stock, wire and tubes in titanium and titanium alloys with a wide range of properties. Technical advice on its handling and applications is at your disposal.

Can you afford not to use titanium?

IMPERIAL CHEMICAL INDUSTRIES LIMITED, LONDON, S.W.1

As was to be expected, imports of raw materials and basic commodities have generally been treated more liberally than manufactured goods. This is strikingly true in the case of the United Kingdom, and, because of the important part Britain plays in the total, the report refrains from any general conclusions on the effects of substantial liberalisation in this category of goods. However, it points reassuringly to the experience of Switzerland and the Belgo-Luxembourg Economic Union. In these countries, which have a long record of liberalisation, the proportion of the total imports of manufactured products coming from the United States and Canada has declined over the last four years, while the share of other OEEC countries has increased.

The committee found it impossible to reach any clear verdict on the effect of the liberalisation of imports from North America on the balance of payments, both because it is difficult to disentangle the effects of liberalisation from those of the general economic upswing in Europe and because liberalisation has contradictory results. Increased imports from the dollar area are obviously a charge on the balance of payments. But, to the extent that liberalisation has enabled industry to buy raw materials and equipment not otherwise obtainable, or at lower cost, it has meant higher, and more competitive, production and exports. Again the report is cautiously reassuring. And sensibly, but unobtrusively, it points to further liberalisation of imports from the dollar area as the right road to convertibility.

Armenian Church Politics

A QUARTER of a million Gregorian Armenians living in Syria, the Lebanon and Cyprus, have had to elect a new Catholicos of the Great House of Cilicia. The mother see of this Church is at Etchmiadzin, in Soviet Armenia. The election, which took place just outside Beirut in February, had been postponed more than once since the last Catholicos died three years ago, on account of discord which has its roots in pro- and anti-Soviet thought and feeling, and which makes itself felt among Armenians throughout the world.

A majority of the Electoral Consistory was known to be anti-Soviet and the *locum tenens*, Archbishop Khat, in deference to left-wing pressure, had contrived to postpone the election arranged for last October, stating: "Our sole wish is that the election be conducted in a manner transcending factional considerations and desires, and on a high level where the sole consideration is the general welfare of our people and Church." But, by what a correspondent in Lebanon terms "a happy turn of events," the Archbishop found himself forced by public opinion to resign, and Bishop Khoren, a cleric of an independent turn of mind, took over and prepared to conduct the election. The next development was the unexpected arrival in Beirut of the Catholicos of All Armenians, direct from Soviet Armenia, to supervise the election. During his short stay, His Beatitude was unable to reconcile the conflicting groups, and on the very day of the election, he and his delegation took plane for Cairo to visit the Armenian community in Egypt. His mission had failed, and the former Archbishop of Aleppo, who is only 41, a scholar, a linguist, and a good

organiser, was elected by 32 out of fifty votes. A majority of Armenians in the Diaspora have been filled with joy by this appointment, which places the affairs of the Great House of Cilicia in the hands of a worthy servant who has its interests at heart. The new Catholicos is a liberal-minded ecclesiastic, whose known character makes it certain that he will not be subservient to Etchmiadzin.

From Cairo, the Supreme Catholicos announced the verdict of a Council of Bishops that the February election was unfair and unacceptable. The Council of Bishops added, however, that provided the newly elected Catholicos of Cilicia would recognise his subservience to the Catholicos of Etchmiadzin, it would recognise the validity of his election. The Catholicate of the Great House of Cilicia has rejected the condition. The Supreme Catholicos, Vazgen I, has since moved on to visit his flock in Britain and is staying for a few days at Lambeth.

The Soviet arm stretches southward into the Middle East in many guises. The work done by Soviet Moslems is well known. Another and a fortuitous opening has appeared in the ranks of the Orthodox church owing to a disagreement that has followed the death of the Patriarch of Jerusalem. The Jordan government, with the desires of the patriarchate's local Arab flock in mind, has asked for indefinite postponement of a new election; this is its way of championing Arab representation in the Holy Synod, hitherto a Greek preserve because of the ecumenical role of the Mother of Sees. The Russian Orthodox Church is likely to throw its weight on the side of these Christian Arabs. Probably Soviet intrusion will be more welcome to them than to the Gregorian Armenians.

Canada's Maritime Provinces

FROM OUR OTTAWA CORRESPONDENT

MR WALTER HARRIS'S second budget made so little change in the Canadian government's fiscal position that the opposition had to direct its fire, not at what was in it, but at what was not. The irrelevancies common to Canadian budget debates took on an appearance of form and system. Mr J. M. Macdonnell, the Conservative financial critic, set the pace with a complaint that nothing had been done for any of the "soft spots" in the generally booming Canadian economy; and prominent among these he put the Maritime provinces.

It was not, perhaps, entirely absent from his mind that two of the Maritime provinces—Nova Scotia and New Brunswick—are expecting provincial elections this summer; and in both cases the Conservatives' prospects are good. They won control of the provincial government of New Brunswick in October, 1952, for the first time since 1935. The provincial premier, Mr Hugh John Flemming, has proved able and popular, and he will probably have his mandate renewed. In Nova Scotia the long years of Liberal administration, which exceed even the federal government's 21 years, have not yet been broken. But Mr Angus L. Macdonald, who was the Liberals' leader, prophet and hero in Nova Scotia and had grown to be almost unbearable, died in 1954. He was succeeded, after a bitter struggle, by Mr Henry Hicks, a young and able lawyer and former Rhodes scholar. Mr Hicks need not call an election

for some years yet; but if he does decide to try to consolidate his position by going to the polls, it will be the best electoral fight Nova Scotia has had for a long time.

Control of provincial governments is beginning to seem specially important to the Conservative party because it hopes to make large inroads on the federal Liberals at the general election expected next year. One or two Liberal upsets in the provinces might have a psychological effect on the federal voting. The only two provinces where there are now strongly entrenched Liberal administrations are Newfoundland and Prince Edward Island. Manitoba keeps a Liberal government, though it is having troubles, and a vigorously led Conservative opposition appears to be making some headway there, as in Nova Scotia.

The federal Conservative party has not been at all specific about what it would do to help the Maritime provinces: it simply declares that the government is neglecting them, and that it should be the task of statesmanship to raise these least-favoured regions to the level of prosperity enjoyed in the rest of Canada. On any calculation the four Atlantic provinces—Newfoundland, Nova Scotia, New Brunswick and Prince Edward Island—have lagged behind the rest of Canada in growth. Their population increase, per capita incomes, provincial revenues and new investment have all been lower in the postwar years than in the country as a whole.

All this does not mean that the Maritime provinces have made no progress. But in general they neither possess as rich resources as does the rest of Canada nor have they made the best of those they have. The region could, for example, almost certainly supply itself with meat; but it imports a major part of its food supply from central Canada. On the whole it still sticks to a pattern of small subsistence farms which can barely support the people trying to live off them. If beef-raising is to become an economic proposition, farms must be consolidated into larger units, and organised marketing and packing arranged. It is much the same with other crops like apples and fruit. Great strides have been made in Nova Scotia in systematic apple-marketing, and in packing and selling eggs and some pig products. But these achievements have merely pointed the way; they have not solved the problem.

The inhabitants of the Maritime provinces are perhaps more conservative and individualistic than those of almost

any other part of North America. Their roots go down deeper, and they take less kindly to the slick salesmanship of the present age. Many of them doubt whether economic advancement is the supreme goal: they rather think they might prefer a staid society even if it meant being poorer. The little town of Fredericton had to decide recently what to do about a big army camp which the Canadian government wanted to build in the neighbourhood and which might have provided the sort of boost that chambers of commerce in most small towns would beg for. But Fredericton decided not to let the government build its new service housing as part of the town, where the local shopkeepers and contractors could expect to get the greatest benefit from it. The married quarters are being built as a separate community at Gagetown some miles away.

This does not mean that the rush to develop new resources has by-passed the Maritimes altogether. In New Brunswick especially, and also to some extent in Nova Scotia, new mineral finds and new wood industries have been bringing substantial investment.

New pulp mills are planned in both provinces. Nova Scotia has a big new gypsum plant, which is now supplying a good proportion of American needs. New Brunswick has large lead, zinc and copper deposits now under exploitation, and is anxious to ensure that the ores are smelted in the province rather than shipped out virtually raw to the United States.

This is one reason why so much importance is attached to the development of new power sources. None of the Maritime provinces—except for the Labrador dependency of Newfoundland—has adequate water power. They are looking to mixed systems, supplementing water power with thermal plants. They have plenty of coal, but imported residual fuel oils threaten to undercut the price at which it can be mined.

The mainland Maritime provinces have long tended to blame their economic difficulties on two of the major consequences of the Confederation of 1867 which joined the provinces into the Dominion of Canada. These are tariffs and high transportation costs. The Maritime provinces were cut off, they say, from their neighbouring markets in the United States, and were forced to try to sell their products in central Canada which could only be reached by costly rail transport. A longstanding system of subsidies is designed to offset this disadvantage; but of course there are constant complaints that it is inadequate.

A new organisation called the Atlantic Provinces Economic Council is now trying to launch a concerted drive on some of the region's problems. This attempt to spur local initiative, and to get away from the debilitating habit of asking for more and more subsidies, has been very warmly welcomed in the rest of Canada. The Council will no doubt get help from elsewhere in the Dominion, and from the federal government. But the initiative is beginning to come from the right place.

SOURCES OF POWER

Natural fuels

When first a steam engine was coupled to a dynamo, the world's natural stores of coal and oil became a treasure house. Awed, as he is apt to be, by sudden realisations of Nature's wonders, Man summoned the aid of poetry. Coal became black diamonds: oil became black gold.

Not vast exaggerations, after all; because in countries where water power was restricted these were — and still are — the only fuels available for generating electricity.

It is over three-quarters of a century since Colonel Crompton first used a steam-driven generator to produce electric light; and since that time the firm of Crompton Parkinson Ltd. has been well to the fore in the development of electrical equipment and plant. Whatever the future of electricity may hold in store, rely upon it, Crompton Parkinson — always pioneers — will be in step.

THE BUSINESS WORLD

Bigness in Britain

A LIST of the largest companies in British business, to most people, will have no more than curiosity value. But problems of size are always intriguing and there is plenty of material for a quiz about bigness in the list of public companies whose shares are quoted on the Stock Exchange with assets exceeding £2½ million that the National Institute of Economic and Social Research has produced this week.* It may even stimulate the heart-searching that is only now beginning in this country about bigness in industry. On the economic and political considerations connected with bigness this list of large companies, ranked in order of assets and of income and classified into industrial groups, has nothing to say. It merely shows how, in absolute size, the queue of giants forms on the right. The list is one of the first fruits of research by the institute into business bigness—how it becomes big and how it stays big. These are subjects that are bound to come under intense discussion in the next few years. Since 1951 the institute has been studying the sources of finance available to public companies in Britain and its assembly of facts for that purpose has thrown up a ranking of companies by size and industrial grouping; moreover, the institute has necessarily been concerned with the behaviour of the largest companies to see if they differ from other companies in the way they finance their expansion. In 1954, moreover, the institute began further research specifically into business concentration, and has been enquiring into the order of size of companies quoted on the market since 1885, and into the extent of concentration in particular industries in 1951.

The institute's new pamphlet sets out the hundred largest public companies operating primarily inside Britain which are quoted on the Stock Exchange, ranked by the size of their assets in 1953-54.

* A Classified List of Large Companies Engaged in British Industry. 39 pages. Copies obtainable from the National Institute of Economic and Social Research, price 5s.

It also shows how these would be ranked by their income in that year and by their assets and income in 1954-55. In assets they range from ICI's £360.2 million to the £14 million of Ansell's Brewery. The list cannot completely cover industry in Britain because certain large companies are not public: these include Pilkington (which in substance is the British glass industry) and the Rubery Owen group in engineering. The list then ranks, within their industrial groups, all the 512 quoted public companies with assets of more than £2½ million (an impartial but necessarily arbitrary ranking that may cause irritation here and there) and tabulates the numbers, assets and income of these large companies in different sectors of the economy.

★

It leaves open, tantalisingly, the automatic question: "What share of British industry are these companies responsible for?" The question will be examined in detail when the results of the main research into company finances begin to appear in twelve months or so. But the institute has made some rough and ready estimates, on which the chart on page 166 is based.

From the published list, it can easily be calculated that the hundred largest companies account for about 62 per cent of the assets of the full group of 512 with assets of more than £2½ million each; the hundred have £3,800 million out of £6,200 million. In fact, these 512 large companies account for about 77 per cent of the assets of all the 3,200-odd public companies that have come within the institute's purview—so that the giants can be credited with roughly half the assets of all these quoted public companies.

The next link in the chain is more tenuous. For manufacturing industry, at least, it is possible to arrive at rough estimates of the share that quoted public companies contribute to the gross output of all manu-

facturing establishments employing more than ten people each—British industry, that is, as delineated by the Census of Production. The proportion varies sharply; it is nearly 90 per cent in tobacco manufacture but less than a quarter in clothing. For manufacturing as a whole it amounts to about 56 per cent of gross output (but only 48 per cent of employment).

In the broadest sense, by linking shares of assets with shares of output, one can arrive at the estimate that the 75 manufacturing companies included in Britain's "top hundred" account for about 26 per cent of Britain's manufacturing industry (leaving out the tiniest of workshops). Among the 412 other companies with assets of more than £2½ million each there are 318 manufacturing companies; these might account for another 17 per cent of manufacturing. The

remainder of public companies (some 2,100 in manufacturing) represent 13 per cent; and small, or at least not publicly corporate, business makes up some 44 per cent. Comparisons with the Blue Book on National Income, again, suggest similar proportions for the giant companies. In 1953, they would appear to have earned about 23 per cent of all company profits (before deducting depreciation); to have paid out about 26 per cent of all dividends; to have accumulated internal savings (including depreciation) amounting to 27 per cent of those by companies as a whole; and to have accounted for well over 30 per cent of companies' gross investment in fixed assets.

The share that the large and very large companies appear to represent of British manufacturing, classified between industries, is indicated in the chart. The giants have a big share (for comparison, one may quote a recent American estimate cited by Mr J. W. Platt of Shell this week that some 135 American corporations account for 45 per cent of that country's "industrial assets"). Is it, in Britain, a growing share? Many people would guess that it is; and a paper read recently

by other members of the institute's staff* tends to support that view. Using a different measure—market valuations of companies, rather than nominal assets—this study suggests that in the sector of the economy run by public companies (which has itself grown enormously in the last half-century) the market valuation of the shares of the larger companies tended to increase, in comparison with that of the smaller companies, from 1885 to 1939, but there is a suggestion of a small decline between 1939 and 1950. Concentration in these businesses and the value put by investors on bigness appears to have increased over the years up to the war; and it is possible to argue that the apparent later decrease is a consequence of the exceptional opportunities for growth accorded to small business on the outbreak of war. Further calculations made at the institute suggest that the trend towards increasing concentration was resumed in the period 1950-55.

Big business, therefore, covers a very big slice of the British economy—perhaps as big as the share of those other giants, the nationalised industries. Its importance—to judge by its share of investment alone—may well grow further. Is that welcome, inevitable, or alarming? A long line of plausible adjectives, and arguments to support each, may also be said to form up on the right. And with the passing of the Restrictive Practices Bill now before Parliament a new sharpness will be added to the empiricism with which all British political parties declare that they approach this question. For the Monopolies Commission, which in most of its inquiries has been concerned with various cartel arrangements, in which very big firms may or may not have been concerned, will be concerned when the new bill is passed mainly with what the President of the Board of Trade calls "single-firm monopoly."

The commission's reports on bigness may in future serve to inform and develop British public opinion about this subject as they have already done about restrictive practices. Whether any distinctive British attitude towards bigness will evolve remains to be seen; the commission has already shown itself well seized of some of the latest American approaches. But one primary element in American opinion about big business is wholly lacking here. That is a vigorous small business opinion. The small businessman, as even this chart shows, is still a potent force in British industry. He is organised to defend his interests against the state and against the trade unions; sometimes, recent evidence would suggest, against the consumer; but almost never against his giant competitor. The individual free enterpriser in Britain—reason it out how one will—is hardly ever ranged against the big battalions. He is there in the rear rank, trying proudly to keep in step.

* "The Analysis of Business Concentration: A Statistical Approach." By P. E. Hart and S. J. Prais. Read before the Royal Statistical Society on February 15, 1956.

Shares Without a Say

COMPROMISES are not always decisive enough.

Some time ago the Quotations Committee of the London Stock Exchange compromised on, but did not decide, the issue of non-voting ordinary shares. It rejected a plea by the Chartered Institute of Secretaries that the designation "non-voting" (or "restricted voting" as the case may be) in the title of a stock should be a necessary condition for the granting of an official quotation. Instead, the Quotations Committee instructed the Share and Loan Department to recommend that "non-voting" be included in the title.

In turning down the suggestion, the Quotations Department felt that difficulties might arise in connection with shares with restricted rights which would make it impracticable to adopt the Institute's recommendation. Moreover, it would be impossible, short of legislation, to insist that companies must alter the title of their securities. Even the possibility of placing a note in the Official List against non-voting securities was turned down "in view of practical difficulties and the risk of further confusing the public."

There appears to be nothing that the Council of the Stock Exchange can do. It might be argued by some people that there is nothing that it needs to do—that an investor must be presumed to know what he buys, and that if he does not like non-voting shares, he need not buy them. But in practice many investors keep their eyes close to earnings and dividends and are less concerned with the distinction between voting and non-voting shares—or fail to make it until too late. There remains the practical consideration, in many cases, that a real market exists only in the non-voting stock of important companies and the investor, if he wants a financial stake in them, has to accept the non-voting shares or pay much more for the right to vote.

But there is reason for concern when, as is now happening, the non-voting ordinary share threatens to become altogether too popular. As yet, the weight of the non-voting ordinary shares in the stock exchange list is not disproportionate. A year ago the nominal value of non-voting ordinary shares in the commercial and industrial section of the list was about £60.2 million; this was associated with a voting capital of £45.2 million nominal of the same companies. The full industrial list, however, comprised £1,962 million of nominal ordinary capital. The proportions were rather different in terms of market values—the non-voting shares were worth £319.7 million, compared with £192.6 million for the voting shares, and a total market valuation of £5,698 million for all industrial equities—but the figures do not suggest a terrible storm even in this teacup. The really disturbing thing is the rate of growth in non-voting ordinary share issues. This is partly the result of free scrip issues which for many companies—Marks and Spencer for example—are a long-standing tradition. But there are plenty of

cases in which non-voting ordinary shares are designed and intended as a barrier between the "insiders" and the "outsiders." The result of this growth is shown in the last lines of the table; the nominal value of 91 issues of non-voting industrial ordinary shares had risen by the end of September to £69.7 million, with a market value of £345 million.

Such a vigorous sapling ought to be properly catalogued before it is allowed full growth. No one should shrug off the non-voting share as an inevitable product of a managerial society. In such a society shareholders have as much right to voice their views and have their interests considered as workers, consumers, the Government and the managers. Their countervailing power against arbitrary managers may not often be exercised, but it ought to be there.

Non-voting	60,197	319,670	69,663	345,023

* Refers to 91 companies in the Industrial and Commercial list which on September 30th had some non-voting ordinary capital in issue.

Yet it would be unreasonable to set up a case against non-voting shares on some supposed ground of principle. The non-voting ordinary share is sometimes used to keep the managerial control of a company in the hands of a small group, often a family or the original founders of its fortunes. Is that always a bad thing? Or it may be used to seal off the assets and goodwill of a company and to safeguard it against buccaneering raids designed merely to milk it of its earnings and assets without thought for the future. There is a strong presumption against this kind of device. But suppose that the company is still in the first stages of growth and its success is due to the efforts of a small directorial group. Is the limitation of the voting rights of outside shareholders in such a case absolutely objectionable

Where the company has grown to full stature there is indeed little to be said in favour of the disenfranchisement of the bulk of the ordinary shareholders, though it is fair to add that many industrial giants which have issued ordinary shares with restricted voting rights are not noticeably more conservative in their dividends than those whose shareholders have a bigger voice.

Non-voting shares ought always to be regarded with reserve and where they heavily outweigh the voting shares the need for circumspection is all the greater. They can put control in the hands of an irresponsible oligarchy with a minority financial stake, leaving shareholders who shoulder the major risks of the enterprise powerless to defend their interests. The danger lies in the perpetuities that non-voting shares are powerless to control. There is no guarantee in a family firm that ability will be passed on from one generation to another. If managers and directors are efficient and give active consideration to the claims of shareholders, there is little risk that the latter, if they are granted votes, will vote the board out of office and power. No directors ever suffered harm because shareholders could, if they so chose, apply the ginger of criticism by voice and vote in annual general meeting. And many companies are all the better because shareholders in recent years have found their tongues.

A balance has to be struck between the cry to abolish all non-voting shares and the plea to leave well alone.

The remedy is too extreme and the excuse is too complacent. It is too late, even if it were necessary, for London to follow the example of the New York Stock Exchange and refuse to list non-voting shares. Perhaps a solution can be sought in two directions. One course might be to discourage the voteless share and to encourage the restricted voting share which would give the shareholders a voice, even if a small one. Underwriters are already encouraging this compromise and it will do some good. Some institutional investors are taking an even stronger line; their influence was decisive in persuading the directors of Edward High Vacuum and L. Gardner to issue as free scrip ordinary shares with full voting rights, while some of them were chary of taking the ordinary shares of McKechnie Brothers into their portfolios simply because they did not carry votes. The second might be to set a specific limit to the proportion of non-voting to voting shares that a company might issue—though it is easier to say that a reasonable proportion has been exceeded already by some companies than to lay down a hard and fast line for all companies. Investors, when they buy a share, ought to be in no doubt whether it carries a vote or not and here the "recommendation" of the Stock Exchange is not sufficiently imperative. The plain truth is that in most cases votes ought to go with ordinary shares. An equity without a vote is denied its full attributes. Intelligent investment is not conducted best by mutes.

Business Notes

Exports a Record

THE Chancellor can take a modest pat on the back from the British trade returns for March. The provisional figures show that the trade deficit fell further—and for the opposite reason to that of February. In that month imports fell much more than exports; last month exports rose rather more sharply than imports and reached a new peak of £269.6 million fob. The total was £23.5 million higher than in February and nearly £2 million higher than the previous peak of October, 1955. The average monthly value of exports in the first quarter was £257.8 million, over four per cent higher than in the same quarter of last year (when shipments were inflated by the backlog from the dock strike of October, 1954) and 6½ per cent higher than the monthly average for the whole of 1955. Re-exports were fractionally smaller than in February at £13.3 million.

Imports rose by £21.2 million to £330.3 million cif, but were still well below the January total. The average

monthly value in the first quarter was £328.5 million, two per cent less than in the same period of 1955 though one per cent more than the average for that year. The result was a modest fall of £2.1 million to £47.4 million in the

1956:—				
1st quarter*...	328.5	257.8	13.7	57.0
January	346.3	257.9	14.2	74.2
February	339.1	246.1	13.5	49.5
March*	330.3	269.6	13.3	47.4

*Provisional

gross visible trade deficit for March. The average monthly deficit in the first quarter of £57 million, however, showed a big improvement: it was £20 million a month smaller than in the same period of last year and £15 million a month smaller than the average for 1955.

Exports to North America rose further, thanks to what must have been a largely seasonal increase in shipments to Canada. Shipments to Canada were nearly £2 million higher than in February, at £13.3 million, while shipments to the United States fell by £600,000 to £17 million. The monthly average for North America in the first quarter, at £28.5 million, was one-fifth higher than in the same period of last year.

Guiana Tests the Market

CITY opinion does not trust the present rally in markets far. It would at least like to see the colour of the budget before it takes a firm decision. Markets, though thin, have nevertheless been good enough to support minor refinancing operations and to enable the Iron and Steel Holding and Realisation Agency to make a minor private sale of a nationalised undertaking. By the middle of this week gilt-edged were still advancing; the *Financial Times* index of government securities stood at 86.80 compared with 86.68 a week earlier. Industrials, having advanced more vigorously, were already hesitating, though the index at 183.9 still shows a three-point advance in the week. Encouragement could certainly be drawn from the continued strength of the sterling exchange.

The two chief events in the market in a week that could not fail to be overshadowed by budget uncertainty were the British Guiana Loan and the sale by the Iron and Steel Agency of Briton Ferry Steel. British Guiana comes to the market with its first issue since 1951—£3,540,000 of 5 per cent stock 1980-85 at 96½. Since Colonial Government Funds took up the odd £540,000, in effect £3 million was offered to the public. The new stock is a full trustee security yielding £5 3s. 8d. per cent. flat at the issue price and £5 4s. 8d. per cent. to redemption at the final date. The terms were closely tailored to the market. The Rhodesia and Nyasaland 5 per cent stock which is dated 1975-80 and therefore has five years' shorter life stands at about £97. The market nevertheless made up its mind that the issue would be covered by subscriptions. The result announced after market hours on Thursday shows that that expectation was realised.

The Iron and Steel Holding and Realisation Agency has resold the Briton Ferry Steel Company at a substantial profit, the buyer being Duport, the Staffordshire engineering company formerly called Vono Industrial Products. The sale has involved a capital reorganisation, and in the course of it Briton Ferry took over the agency's investment in the small Neath Steel Sheet and Galvanising Company. The net result of the whole transaction is that the proceeds accruing to the Agency were £2,705,000 against an investment of £1,630,996. The purchaser is to retain the one million £1 ordinary shares which form the reorganised capital of Briton Ferry and to dispose of the £1 million 6 per cent debenture stock 1981-86.

The 6 per cent Line

WITH little interruption the rise in both fixed interest and industrial securities has been in progress for three weeks. It is a modest, tentative advance, but it has given just time enough to bring forward a batch of new issues. None of the offers in the past week asks for big money—the market is in no state to provide that at present—but several seem to be based on the assumption that the pension funds and other big investors have small sums that they are prepared to invest in industrial prior charges carrying a yield of around 6 per cent. In addition to the Guiana loan, which is a trustee stock and makes a different appeal, the principal prior charge issues have been:

A private placing has been made of £1 million 6 per cent debenture stock 1981-86 in Briton Ferry Steel Company. The stock has been placed without quotation by Helbert Wagg and Co. at £99. The operation proceeds from the sale of Briton Ferry Steel Company by the Iron and Steel Holding and Realisation Agency to Duport.

A further placing by Helbert Wagg and Company consists of £500,000 6 per cent debenture stock 1975-80 in United Premier Oil and Cake Company. The issue, to repay bank overdrafts, was placed at par less a commission of 1 per cent.

The £1 million guaranteed debenture stock of Whitbread Investment Company sticks to the 5½ per cent coupon. This company is taking over the Whitbread investments in other brewery companies. A massive cover is shown because the parent company, Whitbread, which holds all the share capital, guarantees the debenture stock as to principal and interest. The stock has been placed by Philip Hill Higginson and Co. at 99½.

Yet the largest issue of the week happens to be in ordinary shares. Birmid Industries is raising about £1.8 million by a one-for-three rights issue at 45s., a price sufficiently below the existing stock (67s. 6d. at the time of the announcement) to encourage the directors not to have it underwritten. In the present state of the market the equity section seems still capable of raising larger sums than can be obtained on most industrial prior charges, and the success of the Rolls-Royce offer to shareholders of 1,100,000 new ordinary shares at 77s. 6d., which attracted heavy applications for excess shares, may reinforce that view.

Credit Trend Disappoints

THE monetary trend since the increase in Bank rate makes a rather disappointing prelude to the Budget. The Chancellor is presumably looking to monetary policy to do a large part of the disinflationary work that would otherwise have to be attempted by fiscal means; yet he may feel that the contribution made by the 5½ per cent Bank rate has so far been smaller than he hoped. In the five weeks to March 21 net bank deposits declined by substantially less than in the corresponding (four-week) period last year, and bank advances rose by substantially more. Advances normally rise at this time of the year, and in addition there have been heavy new demands from the electricity and gas industries; but the month's expan-

sion of £39.5 million is much above the average for March in recent years. The principal explanation, no doubt, is that the growing stringency is causing people to borrow more closely up to their credit limits than formerly, so that, although many of these limits have been reduced, the banks' past commitments still leave scope for substantial

expansion in the credit actually extended. If an effective squeeze is to be imposed upon the economy, the pressure of official policy upon the banks themselves needs to be stronger than was formerly supposed.

The increase in Bank rate has certainly stiffened this pressure, by causing a switching of funds from bank deposits into Treasury bills; and it has been stiffened, too, by the issue last month of the 5 per cent Exchequer stock. In consequence, the banks' liquid assets declined in March by nearly £100 million, despite the fact that the Treasury was in "overall" deficit during the most nearly comparable period. But even these two stiffening processes together have not had so strong an effect as that exerted at the same time last year by the switching process alone, when the margin between deposit allowances and Treasury bill rates first became obtrusively wide. Two of the big banks have, however, felt it necessary to strengthen liquidity by selling investments; Lloyds has done so for the second successive month, and thus has contrived to keep its liquidity ratio at 32.3 per cent. The National Provincial (which also sold investments) has suffered a sharp fall in its ratio, to 31.3 per cent. The Midland shows 31.8 per cent, the Westminster 33.1 per cent, and Barclays 34.6 per cent. Individual banks may feel that they have now only a narrow margin; but for the banking system as a whole this is the seasonal nadir in the supply of liquid assets. Unless the pull of high money rates keeps up the pressure, vigorous funding tactics will be needed if undue slack is to be avoided.

Mr Watkinson Sits Firm

NOTHING the Minister of Transport said in the House of Commons on Wednesday added any merits to his argument for refusing the full increase in charges that the Transport Commission had originally asked for. His position was admittedly not made any easier by the advice

of the Transport Tribunal, even though the advice was formal and the nature of it inevitable. Mr Watkinson was obliged by the 1947 Act to "consult with and consider the advice of the Tribunal, acting as a consultative committee"; and the Tribunal, equally compelled by its duty under that Act to do nothing to prevent the Commission covering its costs taking one year with another, was almost bound to support the Commission's original suggestions, since even these would still have left a gap of nearly £25 million in a full year on rail operations and £18 million on all the Commission's activities.

Instead, by agreeing with the Minister to raise rail freight rates by only half as much as it first suggested, by adding 5 per cent to dock and canal charges in place of 7½ per cent, and by paring certain proposed increases in rail passenger fares (leaving uncut a £3 million increase in road freight and passenger charges), the Commission will be running

	British Railways	Other Activities	Total

(c) on original proposals	-24½	+ 6½	-18

an annual deficit £16 million larger on the railways and £17 million larger altogether. Since some allowance had already been made for improved efficiency the Tribunal was downright sceptical of the Minister's principal argument that signs of more efficient working justified his decision; even if further economies did materialise they could only help to reduce the original overall gap of £18 million.

How Blunt is Bank Rate?

ONE fruitful outcome of the insufficiency of monetary policy as practised last year is that it has provoked in various circles—including, one must hope, official circles—some hard thinking about the principles and mechanics of credit control under present conditions. It has also provoked a number of suggestions, apparently after less hard thinking, for the creation of a new monetary instrument, whereby the authorities would control the total volume of bank credit by prescribing—formally or informally—the minimum ratio of liquid assets to be kept by the commercial banking system and by raising or lowering the minimum as they judged fit. Two important contributions to the re-thinking upon these difficult problems have appeared in the past week or so—one in the April issue of *The Banker* and the other in *Lloyds Bank Review*. These two articles together present the first full re-appraisal of the Bank rate mechanism, and thus provide a basis for critical scrutiny of the new suggestions.

Though their conclusions differ in detail, both writers question the worth of any system of compulsory and variable

ADVERTISING AND MARKETING IN FRANCE

C.P.V. Paris was founded in 1953, when C.P.V. joined forces with an existing French advertising agency to strengthen the service on the ground in France and to bring to the French market the experience of British advertising and marketing experts. C.P.V. Paris is therefore

particularly well-equipped to handle—in addition to its many domestic accounts—advertising in France of British and American firms, and its clients are assured one of the most comprehensive advertising and marketing services available in France today.

CPV PARIS

WHAT A PRIMROSE PATH!

Dubonnet is the traditional French aperitif which the English have taken up in such a big way. Drink Dubonnet by its excellent self or mix it with gin in proportions of 4 Dubonnet to 3 gin. As a long drink with soda, a sliver of lemon and a small berg of ice, Dubonnet is quite wonderfully refreshing.

DUBONNET DOES NOT AFFECT THE LIVER

YALE TRUCKS SPEED HANDLING SAVE EFFORT AND MONEY

Yale Trucks speeds unloading of barges in Paris

No matter where Yale industrial lift trucks handle materials, they effect substantial savings in time, space and human effort—savings that actually pay back the truck investment and then improve capital position. Yale trucks will do this for your own operation, and handle bags, crates, drums, boxes or other materials with a speed and ease that allow you to systematize the flow of goods through production, storage and shipping areas. Solve your handling problems with Yale equipment—manufactured to the same high standards of quality no matter where you buy.

Profits and Investment

IN the Economic Survey the Government statisticians calculated that in 1955 gross trading profits rose by 11 per cent, by £296 million to £2,953 million. An analysis of 484 company reports published in the first quarter of this year (set down in detail on pages 187 and 188) shows that the trading profits of these companies rose by about 12½ per cent, by £45 million to £402 million. The Government's statistics reflect on the average the calendar year; the notional accounting year of the 484 companies ended in November. That is one reason for the slight variation in trends shown by the two analyses. Another is that the iron and steel companies bulk large in *The Economist's* latest quarterly survey. The trading profits of this group, at £97 million, make up nearly a quarter of the total and show an increase of 31 per cent.

Ordinary dividends have risen with profits, but not outstripped them. Net ordinary dividends rose by about £8 million to £59½ million. A part, certainly over £1 million, of that increase comes simply from the change in the standard rate of income tax. Once the dividends are grossed up and related to issued ordinary capital they show an average gross return of 18½ per cent on nominal capital—slightly lower than the gross return of 18.7 per cent shown in the previous year's accounts of the same companies. Though net ordinary dividends have gone up by about £8 million, the 484 companies have ploughed back £17 million more than they did in the year before. In depreciation allowances

and reserves of all kinds these companies have retained about £158 million.

Over the whole of industry the Government statisticians estimate that, for the first time since 1951, the amount invested in fixed assets and stocks in 1955 was larger than, undistributed profits. In the particular bunch of companies in the latest quarter's analysis it seems that more was added to fixed and working capital than was ploughed back from profits. This is a plausible result as the iron and steel companies, which were investing more heavily than most industries in fixed capital, and the electrical manufacturing companies, which were adding more to their stocks and work in progress than many, have a big weight in the latest sample.

For all 484 companies the gross book value of fixed assets rose by £138 million to £1,198½ million. Only a tiny fraction of this increase can be due to revaluations of assets; some of it relates simply to replacement; but a good part of the increase must relate to an expansion of capacity. Stocks rose by £97 million to £851 million and debtors by £64½ million to £468½ million. Part of that rise is due to price inflation but much of it must come from additions to material inventories and to work in progress. There is, perhaps, no need to underline the element of risk in carrying such heavy stocks should demand slacken. But again the sample is weighted by the producers of heavy capital goods and such industries must perforce take a long view of expansion.

Despite the increase in fixed and

working capital £2½ million more was added to net liquid assets, bringing the total up to £317½ million, though there are definite signs of a switch out of cash into securities and treasury bills. The reinforcement of liquid assets looks odd until it is remembered that a number of these companies towards the end of their financial years raised money by issues of new capital, temporarily swelling their liquid balances. About half the capital formation was financed by profit retentions; the total held in depreciation, capital reserves, revenue reserves and future tax reserves rose by £154 million. Some companies relied on the credit given to them by their suppliers, and current liabilities and creditors increased by £53 million. Many of them had to appeal for funds in the stock market. Debenture and loan capital rose by £26 million, preference capital by £5 million and ordinary capital by £62 million—not all of the latter being new money.

Reflection on these statistics can lead only to a thumping cliché—dividend policies will be cautious. With credit being squeezed companies which are just able to balance their investment in fixed assets and stocks by profit retentions will be eager to hold back earnings in the business. Where companies have invested more than they have saved out of their own resources, and where there may be new capital to service, even stronger counsels urging prudence will prevail. There is little need for the Chancellor to preach the virtues of dividend restraint; the facts themselves point to conservative dividends. And where sales are falling caution may develop into fear about the chances of maintaining existing rates.

liquidity ratios. But this attitude is not founded upon any reaffirmation of the strength of the Bank rate weapon or upon any denial of the importance of liquidity ratios. On the contrary, both articles demonstrate that it is only by influencing bank liquidity in its wider sense that the volume of credit ever can be controlled—a proposition that may startle those whose knowledge of banking mechanics rest upon the classical textbooks, and who suppose that the Bank of England can exert “quantitative” control over bank cash by open market operations. An increase in Bank rate or pressure exerted by open market sales cannot, *The Banker* shows, curtail the total volume of credit (except momentarily) unless the resultant rise in short-term rates impinges upon bank liquidity. This rise in rates can squeeze liquidity either by causing bank depositors to shift their funds into bills (or other short securities) or by causing a contraction in the total supply of bills. The big change that has occurred in the working of this classical mechanism is that now the squeeze is exerted mainly by the switching process, whereas formerly, when a large part of the banks’ liquid assets comprised commercial bills (or short loans secured by such bills), the supply of those assets was responsive to an increase in short-term rates. The Treasury bill, which has largely replaced the commercial bill, is not responsive in this way.

The Bank rate weapon, which operates upon bank liquidity indirectly, is therefore blunter than it used to be. Hence it is imperative that the authorities should also operate upon it directly. This they can do, and in some degree have been doing in recent years, by regulating the supply of Treasury bills through various devices of funding (or unfunding), such as departmental sales of stock, which have the effect of putting pressure upon the longer-term market while relieving the short-term market. Both Mr Wilfred King in *The Banker* and Mr W. Manning Dacey in *Lloyds Bank Review* regard devices of this kind as much superior to any system of compulsory liquidity ratios—which would not, indeed, be any real alternative to the funding process. And, as both writers show, if control of ratios were to be used to contract credit (as distinct from preventing expansion) it would work with extraordinary violence.

“Small” Savings Suffer

PERSONAL savings as a whole have been tentatively estimated by the official statisticians to have risen by £70 million in 1955, to £962 million. But this increase seems to have been attributable mainly or wholly to higher outlays on capital goods by unincorporated businesses. Personal monetary savings in fixed interest securities were under two disabilities—the stick of the bankers’ squeeze and the carrot of higher interest rates offered by competing investments. Broadly speaking, the savings organisations that did worst were those that made the least adjustment in their rates. The building societies suffered a heavy drain before raising their share interest rates in the summer but then enjoyed a brisk recovery.

In the national savings movement interest rates as a whole were not raised to competitive levels—with the result that in the year to end-March, new savings (excluding accrued interest) fell short of withdrawals by £35 million, whereas in 1954-55 there had been a net saving of

£60.4 million. The deterioration spread to all channels of “national savings,” but was particularly large in defence bonds and the trustee savings banks.

Holdings of defence bonds are more sensitive to competing interest rates than most forms of “small” savings, and the new issue at 4 per cent (in place of the 3½ per cent bonds) has been insufficiently attractive. The trustee savings banks, which cater for the more interest-conscious of their depositors by providing a special investment department, have lately been offering between 3 and 3½ per cent in those departments; little further adjustment has been made this year, though in recent weeks at least one large trustee bank has increased this rate to 4 per cent. On savings certificates and deposits in the post office savings bank, interest remains at the time honoured rate of 2½ per cent, tax free in the case of certificates only. The experience of the national savings movement in its latest year suggests that even the small investors for whom it caters are sensitive to interest rates in some considerable degree. The moral, surely, is to offer the public the right price for its money.

Argentina and EPU

THE operation that will disengage Argentina from the tentacles of its bilateral payments arrangements is now in full swing. At discussions now running in Paris, Argentina, represented by Dr Verrier, the Under-Secretary of Finance, faces the seven principal members of the European Payments Union. Argentine trade and payments with these countries have been conducted on strictly bilateral lines, tempered by the fact that transferable sterling and D-Marks facilities have been at Argentina’s disposal. These transfer arrangements have, however, been of little use because Argentina has run consistently adverse balances with nearly all its European trading partners. There is no opportunity for transferability or multilateral compensations when one party has only debits to offer, unless indeed one of the creditors were prepared to increase still further his claim on the universal debtor. The main problem to be solved in the Paris talks is how to clear the bilateral board of the accumulated clearing debts owing by Argentina to the countries of Western Europe. The amount involved is estimated at the equivalent of nearly £300 million and represents almost the maximum of the various credit “swings” provided under each bilateral agreement. The largest creditor is Germany, which appears to have repeated with Argentina, and under the same encouragement of Government sponsored export credit insurance, the costly excesses that took place in 1952-53 in German exports to Brazil. (It would be interesting to see some figures for the German export drive calculated after allowance for bad or frozen debts.)

If arrangements can first be made to fund the Argentine commercial, bilateral debts, the way would be open for the admission of Argentina to a fully multilateral system of payments with Western Europe. This would call for no special machinery. The suggestion that Argentina might be invited to join the EPU should be dismissed as wholly unnecessary. The required mechanism lies ready to hand in the fact that Argentina and all other countries concerned in this operation are members of the sterling transferable account system.

bumper crop of keys

Why should ignition keys remind you of bumpers, front and back, with over-riders to taste? Why should bumpers lead you irresistibly to door handles and window-regulators? Why should handles make you think of radiator grilles, three-dimensional badges and the mechanism that holds up the lid of your boot until you close it again? You pull out your golf bag and lock the boot . . . with a key . . . a Wilmot Breeden key. From bumper to boot-lock, if you drive a modern British car it's well-nigh certain that Wilmot Breeden have contributed something useful to its usefulness. And when you consider the size of the British Automobile Industry, that suggests a certain amount of activity. Next time your car key turns up in the right pocket . . . next time you see a road leading to Birmingham . . . next time your bumpers stand between you and a gatepost . . . say "Wilmot Breeden."

WILMOT BREEDEN ARE AT BIRMINGHAM: ALSO AT LONDON, MANCHESTER, GLASGOW, MELBOURNE, TORONTO

How Deliveries Lengthened

ON several occasions recently Mr Roy Harrod has persuasively argued that a sudden overload of orders for fixed capital investment, far beyond any possibility of expansion in the capital goods industries, has been the main cause of inflation in the last two years. In an analysis of "The British Boom, 1954-55" in the current *Economic Journal*, he suggests that the "time interval between order and delivery" should become "a concept of no less central significance" in general analysis of inflation and the trade cycle than the "price level" or the "level of activity." The recent boom, he feels, was characterised by "a great lengthening of delivery dates and delivery delays." His feeling is based primarily upon a calculation that between July, 1954, and June, 1955, the new orders booked for machine tools were "88 per cent above the annual rate in the preceding eighteen months, but production rose by only 5.7 per cent between these periods." This rise was paralleled by an increase of 80 per cent in the total floor area of factories upon which work was started during the period. Mr Harrod infers that orders for other industrial plant and equipment may have risen to a similar extent.

This may well be true. How far it will have lengthened delivery dates is much more doubtful. What happened to delivery dates for machine tools during this upsurge of orders can best be seen from a table:

MACHINE TOOLS: ORDERS AND DELIVERIES

	Orders in Hand End Year	New Orders Booked in Year (Net)	Average Monthly Output	Order Book, in terms of Deliveries
	£'000	£'000	£'000	Months
1951	98,887	...	4,049	24.4
1952	96,996	60,113	5,167	18.1
1953	72,251	41,435	5,515	13.1
1954	81,011	74,252	5,466	14.8
1955	100,186	94,175	6,250	16.0

The rate of ordering, certainly, rose immensely in 1954-55, after some years in which the industry had been running down its orderbook; but in terms of monthly output—the only real basis for quoting delivery dates—the length of the orderbook rose by only about three months, from thirteen months to sixteen. These are averages for a wide range of equipment, and delivery periods for certain tools in particular demand probably rose proportionately much more. But it is clear that the 88 per cent rise in the volume of ordering bears no simple relation to the rise in total orders on hand; average delivery dates for tools are not, by this count, yet as high as at the end of 1952.

Information about orders in a fair range of other capital goods industries is collected by the Government, but not published. In successive Economic Surveys, however, various hints have been let fall; this year's says of 1955: "Demand for capital goods remained high and, for the first year since 1951, new orders exceeded deliveries." This means that the total orderbook for capital equipment at the end of 1954, notwithstanding the growth of equipment orders and the increase of orders on hand for machine tools, was actually lower in value than at the end of 1953. Since

output of capital goods rose about 3 per cent in 1954, delivery periods—the orderbook in terms of months' output—must over the year have fallen rather more. In 1955, certainly, the total orderbook for capital equipment rose in value, and probably in terms of monthly output, so that delivery dates did at length begin to increase. But it seems unlikely that they will have risen for industrial equipment in general even as much as for machine tools.

Air Freight on the Atlantic

IN place of Airwork, which stopped its all-freight services across the North Atlantic just before Christmas, an American airline, Seaboard and Western, started up a similar service this week. Seaboard and Western is best known as a charter operator, tramp freighting across the North Atlantic; for a considerable time it has been attempting to get a licence to put these services on a regular, scheduled footing. The licence was granted last year, and an arrangement has been made for the British Overseas Airways Corporation to act as sales agents for Seaboard in British territories. This fills the gap left in BOAC's network by Airwork's withdrawal, since freighter aircraft can take cargo that would not fit the hold of a passenger airliner and can also carry surplus freight that BOAC might otherwise have to turn away for lack of capacity.

Why did Airwork feel obliged to close down this freight service, and, incidentally, all its freight operations in Europe, when another carrier plainly considers North Atlantic air freighting to be a promising and profitable venture? Airwork's complaint that the service failed, not from lack of traffic, but because the conditions under which it was operated had become intolerable has never been properly answered. The company maintains that its operations stood or fell on whether a liberal or a narrow interpretation was put on the terms of its freight-carrying licence. Seaboard does operate under much more favourable conditions than Airwork ever could; the backbone of its freighting to Europe is the carriage of goods to US troops; it has longer experience of freight operations on a large scale and more extensive equipment to start its scheduled services than Airwork could command. But at the back of Airwork's failure seems to lie a fundamental confusion of ideas on how potential traffic should be divided between the nationalised corporations and the independent airlines.

Ceylon and the Markets

THE first effect of the swing to the left in the Ceylon elections was a sharp fall in the prices of Ceylon tea and rubber shares. They had previously had some attractions just because bidders were about and there seemed to be chances of capital gains. The potential bidders disappeared overnight and some British holders feeling themselves under suspended sentence of nationalisation tried to sell. The market had little appetite; the volume of actual selling was not large and by the middle of the week prices had recovered about half of their losses:

Three consequences of the threat of nationalisation may affect British investors. First, since exchange control exists, despite Ceylon's membership of the sterling area, the companies are unlikely to be able to get more out of Ceylon than is required to pay a reasonable dividend. Secondly, the managements will become much more reluctant to transfer money into Ceylon; future capital

	Price April 6th	Low Point April 9th	Price April 11th
Tea:			
Nuwara Eliya	27/6	20/-	25/-
Scottish Tea & Lands	38/6	30/6	34/-
Rubber:			
Grand Central	12/6	10/-	11/-

expenditure is likely to be financed with local funds (including loans from one estate company to another). Finally, the British investor will remember that the companies are mostly British registrations. If nationalisation comes, the Ceylon government can acquire the estates in Ceylon, but it cannot take the shells of the companies in London. The amount of liquid assets held outside Ceylon is a matter to which investors will pay increasing attention.

Black February

RETAILERS will remember February, 1956, as the month when fresh hire purchase restrictions hit a trade that was already groggy and householders beat a track to the ironmonger round the corner. When many retail departments were reporting lower returns than the year before, the cold weather brought a thriving trade to the small ironmongers, whose sales rocketed 26 per cent. Other traders

reported mixed results. For the department stores, it was the poorest month for a long time, with sales 4 per cent lower than the previous February. The co-operatives did rather better, showing a 3 per cent improvement; most striking of all was the ability of the big clothing multiples to maintain their expanding turnover through good and bad trade alike. Their sales of men's and women's clothing rose 12 and 16 per cent respectively, soaring far above the limping results of their competitors.

By a kind of poetic justice, however, the fall in the furniture sales of the multiples has been steeper, sharper and apparently more prolonged than that of other furniture traders. The multiples' trade in furniture is in the doldrums, 21 per cent lower than the year before. This can hardly be due to the latest hire purchase restrictions; these increased the deposit on furniture only by 5 per cent (to 20 per cent), which is too little to have any significant effect on sales. The fate of radio sales in February is not easy to trace. They were falling before Mr Macmillan increased the deposit on radio and television sets to 50 per cent. When the restrictions were announced there was a rush that day to place orders at the old, easier rates, and the small radio shops show a 5 per cent rise in sales. But as figures are liable to include sales of all kinds of heaters and electrical goods, they are not a reliable guide.

If the February returns were all they had to go by, retailers would cheerfully write off the bad trade to the weather. But the weather has improved since then and trade has not. The buoyant spending spree of last autumn seems to have spent itself, and there are many traders who believe that only since the beginning of this year have they begun to feel the effects of the autumn budget working through. The hire purchase restrictions may be directly affecting the sales of certain types of goods, but they do not explain the prolonged slackness of sales of soft goods nor of such durable goods as furniture, for which credit is not severely restricted.

Second-Hand Car Prices

The table shows the average price that would have been obtained for a year-old car during the past two years, expressed as a percentage of its original cost, including purchase tax. The prices are those ruling at the end of each quarter, except for the last column which relates to this month.

The luck of the llama

ANCIENT PRACTICE of employing a scapegoat to carry away evil was revived by the Aymara Indians in 1857. But they didn't use a goat. To protect their homes from plague they banished a black llama to the bleak Peruvian hills—a highly imaginative though scarcely efficient safeguard. Today we require protection to be functional as well as imaginative. Look at modern packaging, in which Thames Board Mills have long been pacemakers in design and production. Every week millions of "Fiberite" cases, and cartons made from "Thames

Board" give real protection to the nation's products as they speed by land, sea and air to all corners of the earth. For in today's competitive markets the reliability of the package is a major consideration; goods must reach their destination in sound condition.

And what of the future? The virile Thames Board Mills organisation is planning for tomorrow by modernising and extending its mills and factories so that they are equipped to keep pace with the continually growing demand for "Thames Board" and "Fiberite".

Shortening the Odds on Italian Oil

THE revised petroleum Bill which has finally emerged from the industry commission of the Italian Chamber of Deputies is a decided improvement on earlier drafts. The explosive provision which would have secured for the Italian government a full 60 per cent of the oil companies' profits has gone. It has been replaced by a complicated royalty scale starting at 2.5 per cent on the first four tons a day of output from any individual well up to a maximum of 22 per cent for wells producing more than 256 tons a day. This payment would be supplemented by an income tax of 37 per cent, but the effective aggregate share of the government under the new formula could be computed only when the rate of output per well and its costs of production were both known. There will also be the usual difficulty of agreeing upon a bookkeeping price for crude oil produced in Italy.

In revising the Bill the government has removed the impression that the real intention of its petroleum legislation was to keep foreign oil companies out of Italy altogether. But what is still not clear is whether the draft Bill, even in its revised form, is favourable enough to persuade them to come in. (Gulf Oil, which has a half interest in two wells already completed, is a special case.) The horrifying prospect of a 60:40 formula in a 50:50 world has gone, but even the revised scale of royalty, together with the tax, could easily secure to the government a share greater than half of the profits on the more successful wells. In spite of the Italian Minister of Industry's claims to the contrary, the oil companies still consider the Italian Bill less favourable to them than the existing Sicilian law. And although, in the revised draft, the privileged position of ENI, the state-owned hydrocarbon concern, is somewhat weakened, the terms—apart from the royalty itself—under which private companies will be permitted to develop the oilfields they may find are far from generous.

But much as the companies may hope for further improvements—a straight declaration that the government's share will not exceed 50 per cent, for example—the key question is whether the Bill, even in its present form, can survive on the floor of the House. It is down on the agenda of the Chamber of Deputies for next week, if the government can find time for it. But left wing parties feel that the government has already gone too far in placating private enterprise, and there is no assurance that it can carry its present proposals unmodified. The tortured history of the attempt to give Italy a workable oil law makes it doubtful, indeed, whether any decision at all will be taken by the Chamber of Deputies during its present session.

and Law Life office to join the band of offices to distribute some accumulated fat. With-profits policyholders, entitled to nine-tenths of the divisible surplus, this year receive in addition to an increased normal bonus a special reversionary bonus of up to 7½ per cent of the sum assured plus existing bonuses. The dividend is also sharply increased and the uncalled capital liability is to be reduced by 2s. 6d. per £1 share to 11s. 6d. per share. Since the announcement the shares have risen from 72s. 6d. to 110s. Part of the cost of these increased distributions has been met by transferring £1 million from the published investment reserve to the life and annuity fund.

Dividends of the composite insurance companies so far make a mixed showing, not quite up to the results of 1954

when their distributions were increased across the board. Among the more disappointing results is that of North British and Mercantile, which announces no change in its 40s. compound bonus or in its 11s. dividend. So far it is only possible to guess at the 1955 underwriting results of the composite offices, but taken as a whole last year's results probably did not differ much from those of 1954, which were themselves near the average of recent years. The 1955 earnings of United States insurers suggests that the important North American business of the British companies may have turned out rather less favourably than in 1954, even though hurricane losses then bit deeply into profits. But interest earnings, out of which dividends are traditionally paid, must have surpassed the record figures of 1954.

Dearer Tea

THE prices being paid for high-quality teas must make the common tea producer green with envy: the premium for quality is becoming larger than ever. When the London auctions were resumed this week the best grades of North Indian tea rose sharply. Best Assam broken pekoes, for example, fetched up to 6s. 10d. a lb and fannings up to 8s. a lb, roughly 1s. higher than at the previous auctions on March 26th. That rise owed much to a seasonal improvement in the quality of teas on offer, but there is

Good Insurance Bonuses

FURTHER dividend and policyholders' bonus announcements from the insurance companies are given in the accompanying table. From the life assurance offices the news is almost wholly good and bonus announcements from the life companies that have not yet announced their final dividend, and from the mutual offices, have nearly all been increased. Outstanding has been the decision of the Equity

Steel life

Leonard Sage is first hand melter in a South Wales steelworks. He has been making steel for over forty years. Skill and experience like his are vital to the industry.

Men like him keep the steel flowing. It goes out across the whole world. As cars, tractors, tinplate and household appliances.

As the world's demand grows, British steelmakers increase their efforts to turn out steel of the quality and quantity needed. Behind these increased efforts are men of the calibre of Leonard Sage.

British steel leads the world

No doubt that blenders are prepared to compete keenly for the better qualities for the good reason that the public prefers them. Prices of common tea, in contrast, were only slightly dearer than before Easter; the official quotation was 1½d. higher at 3s. 5½d. a lb, a price that is barely sufficient to cover the costs of many producers. The margin between prices of good and poor teas may well remain wide for some time. There are fairly large quantities of plain tea on the way to London from India and other countries, but the better grades are none too plentiful. So far production in Ceylon is running a little below that of last year. The shortfall may later be made good there or in India, but for the moment buyers are hardly encouraged to hold back.

Electronics Unsqueezed

THE sharp recession in the radio industry that followed the Chancellor's new hire purchase restrictions has not had as sharp an impact on the manufacturers of receiver components as might have been expected. Less than half the £60 million worth of components manufactured last year went into domestic receivers. The balance was incorporated in industrial control equipment of all kinds, in telecommunications—and for defence, which is now one of the industry's biggest customers. Components by the thousand go into aircraft and guided missiles, a thousand valves to a single Valiant bomber, and production of several big electronic computers has opened up a new market. These machines are nothing more than huge cabinets with solid trails of valves, wire and components, and they have a voracious appetite for replacements. The component manufacturers, who held their annual trade show in London this week, are much more interested in the rapidly expanding demand from industry and the services than they are in what happens to components for domestic receivers.

The output of television receivers is now generally expected to be cut back by about 40 per cent this year, which might mean a temporary reduction in the volume of component production of about 18 per cent. But production lines working exclusively on parts for domestic receivers have been hit harder by the domestic recession. Furniture factories making television cabinets have stood men off in considerable numbers; in one of the large factories, output has been halved. The production of cathode tubes has also been affected and that in its turn has led to short-time working in the glass factories making the tubes. Valve-makers are also on short-time. In some other factories the cancellation of orders from receiver manufacturers brings relief to hard-pressed plant. Some sections of the component industry had been working under great pressure; the recession has given them an opportunity to return to a more normal working week. But not all components in production for receivers can be switched without modification to other, more exacting applications (although the export market will take a fair volume), and some interruption to production is inevitable while plant is switched to other designs. There is an undercurrent of concern in the industry about what this may do to the small manufacturers. A man can start in the electronics business with the minimum of capital: many do. These are the businesses, operating almost entirely on credit, that may find the period of readjustment difficult to weather.

Freight Markets firm

THE slight weakness which appeared in the tramp shipping market in February has proved to be only temporary. Both voyage and time charter rates have been rising steadily since the middle of that month, and the unexpected entry of Soviet Russia with substantial imports of grain from Canada (from the St. Lawrence to Black Sea and Baltic ports, and from Vancouver to Vladivostok) created a new demand for tonnage. Chartering for grain from all exporting areas outside Russia has been active, probably as a result of the severe winter on the Continent.

Rates for single voyages with coal across the Atlantic have returned to peak levels, but a considerable volume of tonnage is already engaged in this trade on time or consecutive voyage charter for the whole of this year and longer. A pointer to the underlying strength of the market and the firmness of prospects is the volume of tonnage being taken up for periods of up to 18 months; even ships which are still under construction have been taken up on long-term charters extending well into the 1960s.

In recent weeks three ships have been fixed on time charter for every two returning from hire, and rates have been improving. Nevertheless, a large number of time charters are due to expire during the next three months, and these may take some time to absorb at current freight levels.

Advance in Coarse Grains

PRICES of maize and barley have risen sharply in recent weeks. Supplies in exporting countries have not changed, but the needs of consumers in Britain and Europe have. At the beginning of the year compounders and other users of coarse grains had no compelling reason to buy ahead. Supplies of American maize were larger than ever before; supplies of Canadian barley were adequate and there was plenty of Canadian feed wheat available at attractive prices. Quite suddenly the picture changed. The winter grain crops in Europe were severely damaged by the cold, and though the loss will be partly made good by spring sowings, the new crops are at present no more than seed in the ground. A hard winter and late spring increased the consumption of feeding stuffs and in Britain the remaining stock of home-grown barley appears to be smaller than was expected.

When compounders turned to the world market they found that Russia and its satellites had mopped up supplies of Canadian feed wheat; these countries were also

"Motor Business"

The March issue of this quarterly research bulletin for the motor and allied industries includes:

Stock and Sales Expectations: A New Indicator for the Domestic Market.

Return to Seasonal Trends in Production.

Crystal Gazing in the Motor Industry.

The Swedish Market for Vehicles and Tractors.

The Bulletin is fully illustrated by charts, amongst which are:

Price indexes of used cars and vans.

World exports of vehicles.

Vehicle exports by countries of origin.

Whitehall 1511. Ext. 49.

buyers of coarse grains from North America, and France had been forced to turn importer. The increased demand for feeding stuffs had to be satisfied mainly by maize and barley, and freight rates were bounding up. Since the

beginning of March Canadian 2 feed barley has risen by about £2 15s. to £27 5s. a ton c.i.f. UK and American maize has risen by over £3 to £28 10s. a ton. Plate maize has also risen sharply, and large premiums have been paid by specialised consumers in certain European countries such as Italy. The advance in maize also owes much to the strength of prices in Chicago, where the feeling is growing that the Administration will be forced to accept higher support prices for the new crop.

For the next month or two, at least, coarse grain prices may not be in much danger. Transportation difficulties are limiting sales of Canadian barley, and Argentina will hardly be a pressing seller of maize for some time. But Argentina may hold the key to prices. If the exportable supply there proves to be as large as two million tons, world maize prices could fall, and barley prices weaken too.

SHORTER NOTES

An increase of 3 per cent a year in the world demand for energy—an estimate which other authorities might consider high—was taken as the lower limit in the projections

made by Mr James W. Platt, a managing director of the Royal Dutch/Shell Group, in a paper read to the Institute of Petroleum. The lower limit for world oil production in 1975 is put at 1,600 million tons, an increase of over 130 per cent over 1955. With an instinct to "aim at a point well up the range," which one feels is an accurate reflection of today's thinking in the oil industry generally, Mr Platt puts the world production of oil in 1975 "well above" this figure. Looking further ahead, he saw nuclear power still leaving plenty of room for petroleum during the 21st century.

Diamond sales by the Central Selling Organisation amounted to £16.8 million in the first quarter of 1956, De Beers Consolidated Mines announces. This is a fall of £1.4 million compared with the last quarter of 1955, and is due wholly to the fall in sales of industrial stones to £5.1 million. Sales of gem stones were unchanged at £11.7 million. Smaller sales of industrials, it is understood, reflected not a fall in demand but in supplies.

The management committee of the London Wool Terminal Market Association has recommended that a contract for crossbred wool tops should be introduced, in addition to the existing merino contract. It is proposed that trading in crossbred futures would start on November 1st, with January, 1957, as the first delivery month.

The Bank of Canada has raised its rediscount rate from 2½ to 3 per cent. This increase is the fourth since August, 1955 (when the rate stood at 1½ per cent) and carries the rate to a new peak.

Company Notes

CUNARD STEAM-SHIP. For a few weeks last summer the "Queens" lay idle at their moorings, their traffic brought to a standstill by a strike. Despite this, the operating surplus of Cunard Steam-Ship Company in the year to December 31st rose from £6,747,584 to £7,405,872. This is the first reversal in the downward trend of profits since 1952. As Cunard does a big cargo business, the advance in profits may reflect higher freight rates and heavier traffic.

Although the operating surplus has risen, the net profit after tax has fallen from £2,157,266 to £1,827,969. The reason for this seems to lie in the increase in the taxation provision, which is up from £2,069,938 to £2,504,070; this provision is shown before taking credit for relief on investment allowances. Cunard has several new ships being built and this relief on investment allowance may be substantial.

Conservatism in dividends still rules in the Cunard boardroom. Effectively, after

allowing for the free scrip issue in 1954, the year's ordinary dividend is left unchanged at 10 per cent on a capital of £13 million. On this dividend the £1 ordinary stock units at the current price of 26s. yield 7½ per cent.

HUDSON'S BAY. "Bays" yield just over 2 per cent at the current price of 186s. 6d. Even this yield takes in the 2½ per cent tax free distribution from land sales—a source of revenue that cannot last for ever—as well as the 15 per cent dividend, less tax, from trading. The price is so high because speculators, both in Wall Street and Throgmorton Street, are attracted by the honey that may one day come from the company's investment in the developing oilfields of Canada. There is enough in the full report of The Governor and Company of Adventurers of England Trading into Hudson's Bay to whet the speculators' appetite. Income

from royalties, primarily from oil and natural gas, rose in the year to January 31st from £370,811 to £435,110. The number of the net producing wells of Hudson's Bay Oil and Gas Company (in which Hudson's Bay has a minority interest) nearly doubled to 358 wells; daily net production rose by about 122 per cent; and "substantial additions" were made to oil and natural gas reserves. All this costs money and in 1955-56 over \$27 million was spent on development, compared with about \$16,500,000 in the previous year. The bees will not taste the honey for years yet.

	Years to Jan. 31, 1955	1956
Sales and Profits:		
Retail Stores:		
Sales	35,351,000	38,618,000
Profit	2,044,000	2,179,000
Fur Trade:		
Sales	7,716,000	8,634,000
Profit	585,000	765,000
Wholesale Department:		
Sales	14,091,000	14,765,000
Profit	279,000	156,000

In the meantime the dividend is paid out of the profits earned by the company, in its extensive retail, wholesale and fur trading. Sales in all these departments rose in the latest year and profits in the

retail and fur departments went up with sales. Profits on wholesale trading were lower because of competitive price cutting. Total sales by all the departments rose from £57 million to £62 million and the gross trading profit advanced from £3,362,963 to £3,640,542.

REYROLLE and C. A. PARSONS.

The so-called nuclear power shares form an active group in the London Stock Exchange. Yields on current dividends are low. The yield on Reyrolle's £1 ordinary shares is only 3½ per cent at the current price of 100s. xd. on the dividend of 16½ per cent; that on C. A. Parsons' £1 units is even smaller—2½ per cent at 80s. on the 10 per cent dividend. The attraction is not current income but growth potentialities. The big earnings cover on the dividends is one aspect of the prospects of growth; it simply reflects the ploughing back of profits to finance present and future capital developments.

Sir Claude Gibb, who is the chairman both of Reyrolle and C. A. Parsons (in which Reyrolle has a shareholding), has already warned shareholders in C. A. Parsons that a standstill in dividend payments might be essential for a few years in order to provide the money for expansion. Hence the maintenance of the dividend at 10 per cent shattered no hopes and investors could find some encouragement in the rise in net profits from £1,484,298 to £1,962,613. Similarly, it was not the rise in Reyrolle's gross trading profits from £3,195,725 to £3,681,406 (including £232,372 arising from the revision of the basis of valuation of work in progress), nor the news of higher output and bigger orders, and not even the increase in the ordinary dividend from 15 to 16½ per cent which were of essential importance to investors in the atomic power stocks. For them the most significant pointer was Sir Claude Gibb's comments on the future. He said: "A year ago it seemed that Reyrolle would participate by supplying its standard products in the form of main and auxiliary switchgear, but its field of activities has been extended and now includes the equipment which will

be required for the control of reactors. The building of nuclear power stations has become an important feature of the generating plant programme for the United Kingdom but it may be some years before the construction of these stations is upon a scale that will enable the company to secure full benefit from current expenditure."

THOMAS TILLING.

As an investment and holding company Thomas Tilling has steadily added to its interests in a miscellaneous group of industrial and commercial companies. Last year it acquired a controlling interest in Mutual Finance, the hire purchase finance company, and in Walton Hosiery, Lime-Sand Mortar, Henry Lister and Sons and Safca Aerosol Manufacturing. Thomas Tilling's profit figures for the year to December 31st take account of these acquisitions. The inclusion of the new subsidiaries goes some way to explain why Thomas Tilling's gross profits have risen from £1,636,901 to £2,316,817 and its net profits from £738,399 to £1,086,796. Whatever their present troubles the hire purchase companies were doing well last year and among the new subsidiaries Mutual Finance probably made a useful though relatively small contribution to profits. But new subsidiaries cannot be the whole story and, perhaps, one of the most important contributions to earnings may have come from the established interest in James A. Jobling, the glass manufacturers specialising in the making of "Pyrex" glassware.

Despite the growth in profits the directors of Thomas Tilling were content to leave the ordinary dividend unchanged at 10 per cent. Their caution may have been influenced by the Chancellor's request for restraint. And there is the possibility that some of Thomas Tilling's subsidiaries may feel the squeeze this year. Thomas Tilling is nursing a number of concerns through their formative years and it is the ultimate prospect of full maturity that makes investors willing to accept a yield of 4½ per cent on the £1 stock units at the current price of 41s. 10½d.

LONDON STOCK EXCHANGE

Next Account begins: April 18th
Next Contango Day: April 18th
Next Settlement Day: April 24th

ALTHOUGH gilt-edged securities eased at the close of last week, an improvement was seen on Tuesday; by Thursday all of the lost ground had been recovered. War Loan gained ¼ to 74½ over the week and corresponding rises occurred in long-dated issues. Among the short-dated stocks, 2 per cent Exchequer showed a gain of ¼ to 90½.

Bank shares were generally higher and insurance stocks continued to strengthen. Legal and General rose another 1½ to 24, but Royal Assurance lost 2s. to 82s. 6d. on the dividend announcement. The improvement in industrial shares was halted by the disturbance in the Middle East, but although activity was curtailed by the imminence of the budget the gains made last week were generally held. Reyrolle and C. A. Parsons rose 4s. 3d. and 5s. respectively on Monday on strong buying, but eased slightly later in the week to 98s. xd and 77s. 6d., a net gain on the week of 6s. and 4s. 9d. respectively. Leading electrical stocks were also higher. Among steel shares, Stewarts and Lloyds were firm at 69s. 3d., Colvilles at 39s. and Dorman Long at 31s. 6d. gained 10½d. and 6d. respectively. Motors improved with the current increase in sales; BMC rose to 7s. 9d. and Standard to 6s. 8½d. Ford gained 4½d. to 33s. 1½d. xd. There was also an improvement in textile shares; Bradford Dyers rose to 22s. 9d. xd and Courtaulds to 39s. 3d. Horrockses Crewdson jumped 6s. to 31s. on rumours of an impending take over, but later reacted to 29s. 3d. Hudson's Bay fluctuated sharply before closing at 187s. 6d. higher on the week. Oils recovered on Thursday after receding initially on the news from the Middle East.

Kaffirs improved before the quarterly statements, but there was little response following their publication. The recovery on Wall Street led to a steadier tone in coppers, Bancroft rising to 46s. The political situation led to losses in Ceylon tea and rubber shares, but a partial recovery occurred later.

Figures cover general trade as far as possible. Area totals include estimates for countries for which data are not available. Data refer to calendar years with the following exceptions in 1938: India and Pakistan, year beginning April; Iran, year beginning June.

(¹) Excludes China (mainland), USSR, and non-reporting countries of Eastern Europe. (²) Including the trade of Newfoundland in 1938, amounting to \$36 million in exports and \$31 million in imports. (³) Excluding trade with Taiwan in 1938. (⁴) Based on two months' data. (⁵) Partly estimated.

Financial Statistics

EXCHEQUER RETURNS

For the week ended April 7th, 1956, there was an "above-line" surplus (after allowing for Sinking Funds) of £6,212,000 compared with a deficit of £21,405,000 in the previous week and a deficit of £23,983,000 in the corresponding period of last year. Net expenditure "below-line" was £3,126,000, leaving a total surplus of £3,086,000 compared with a deficit of £44,021,000 in 1955-56.

THE MONEY MARKET

LOMBARD STREET in the past week enjoyed unaccustomed relief from credit stringency. On Thursday before the weekend one or two houses were obliged to take a small amount at Bank rate, for the third day in succession; but on Friday credit was in ample supply, and it continued to be easily adequate for demands through the first three days of this week. On Tuesday, indeed, the Bank stepped in with moderate sales of bills to mop up the marked surplus of funds. Dealings in bills have been substantial; the banks have bought end-June maturities at rates down to 5 per cent, but have secured up to 5½ per cent on purchases of other June and early July bills.

At the Treasury bill tender on Friday of last week the market again bid £98 14s. 2d. per cent. Applications for the unchanged offer of £280 million dropped slightly, by just under £2 million to £408½ million, and the market's allotment rose from 54 to 58 per cent. At yesterday's tender the offer was cut by £40 million to £240 million; maturities next week are down by £20 million, exactly matching the amount of new bills, compared with an excess of £20 million of new bills this week and last.

Sterling this week has again risen strongly. On Wednesday the rate was touching \$2.81, compared with \$2.80½ on Thursday last. The price of gold in London fell in sympathy from 249s. 3½d. an ounce to 249s. 1½d.

Perhaps you
didn't know that
RAPPERSWIL

built on a small promontory jutting out into the beautiful Lake of Zurich, was once an important fortified town. In 1358 a wooden bridge, 4,672 feet long, was built across the Lake. This bridge at that time was considered to be one of the wonders of Europe.

But everybody
knows

that Rapperswil, besides being a tourist attraction, due to its historic castle, is also an important centre of industry, its main products being plastic mouldings for industrial purposes, plastic leather cloth and mechanical springs. The Rapperswil Branch of the Union Bank of Switzerland will gladly negotiate your Travellers Cheques, effect payments under your Travellers Letters of credit or advise you in other financial matters.

★ Income Tax Paid

The interest rate of 3 per cent per annum on Share Accounts, income tax paid by the Society, represents a return on every £100 invested equivalent to **£5.4.4** per cent to all investors subject to the standard rate of income tax. Ordinary Deposit Accounts earn 2½ per cent per annum, income tax paid, which is equivalent to **£4.6.11** per cent where the standard rate of income tax is paid. Amounts up to £5,000 are accepted by the Society.

★ Interest Half-Yearly

Interest, which is paid half-yearly, commences from the day after the investment is received and continues to the date of withdrawal. Sums invested may be withdrawn at convenient notice.

★ Security of Capital

Abbey National is one of the largest and oldest established building societies in the country, with £237,000,000 total assets — a token of the confidence of more than 500,000 investors.

DECENTRALISATION

Martins Bank has made a friendly personal approach a particular feature of its service to customers. The Bank's system of decentralisation of control into clearly defined districts, with local Boards of Directors and District General Managers in each District, ensures the full advantage of local knowledge and with the care and consideration of your branch manager, the "personal touch" is achieved.

THE STANDARD LIFE ASSURANCE COMPANY

BONUS ANNOUNCEMENT

The rate of bonus on full reversionary bonus policies for each year of the three year period ending 15th November 1955 is

42½%

on the sum assured and attaching bonuses

plus an additional

42½%

on bonuses attaching prior to the present declaration

Intermediate bonus at same rates

At this rate of bonus the face value of a policy would increase by more than 50% in 18 years.

MR C. BLAKER ON MORE PROSPEROUS TRADING CONDITIONS

The Ordinary Yearly General Meeting of The Hongkong and Shanghai Banking Corporation was held on March 16th at the Head Office, 1, Queen's Road, Central, Hong Kong.

Mr C. Blaker, MC, ED, the Chairman, who presided, said:

Ladies and Gentlemen,

The hour for which this Meeting was called having now passed, I will call upon the Chief Manager to read the Notice convening the Meeting. Mr Michael W. Turner having read the Notice convening the Meeting and a representative of the auditors having read their report, the Chairman continued: Ladies and Gentlemen,

As you will see from the Accounts before you, the profit for the year amounted to \$20,580,320 which is some \$1½ million higher than the corresponding figure for the previous year. In accordance with our usual practice, this profit has been arrived at after making transfers to our inner reserves out of which reserves full provision has been made for the diminution in the market value of our investments and for all known doubtful debts and contingencies.

It is proposed that this year a sum of \$4 million should be written off Bank Premises and, after allowing for this transfer and the Interim Dividend of £2 per share, the Directors recommend the payment of a Final Dividend of £3 per share, leaving a balance of just over \$10½ million to be carried forward to next year.

Although the proposed dividend for the year remains unchanged at £5 per share, it is of course payable on the Capital as increased by last year's bonus issue and is equivalent to £6 5s. per share on the old Capital.

Turning to the Balance Sheet, it will be observed that the Reserve Fund remains unchanged at \$128 million, your Directors having transferred from inner reserves an amount of \$5 million to replace the amount of the Reserve Fund which was capitalised during the year.

Hong Kong Currency Notes in Circulation remain unchanged, but Current, Deposit and Other Accounts have decreased by just over \$115 million. The trend of our ordinary deposits has in fact been upwards, but the withdrawal of certain substantial sums, which had been left with us on a short term basis, resulted in this overall reduction.

Acceptances on behalf of Customers show a decline of some \$36 million which may be attributed to an alteration in the methods of financing adopted by certain large customers during the year.

Your Directors have this year decided to state the extent of the Bank's liability in respect of Confirmed Credits, Guarantees and Endorsements by way of a note on the Balance Sheet and you will observe that this total amounts to some \$611 million. It will, of course, be understood that the Bank has recourse for a like amount on its customers.

The assets side of the Balance Sheet discloses some fairly substantial alterations as compared with last year's figures. Advances and Trade Bills have increased by \$240 million and \$66 million respectively. These increases are mainly due to the higher prices which have ruled throughout the year for certain of the primary commodities produced in the areas in which we are interested, but they also reflect the growing demand for larger advances from bankers to finance current and capital commitments arising from the growing industrial development in South East Asia.

Investments show an increase of some \$9 million being cost of additional investments acquired. Investments in and Amounts due by Subsidiary Companies are higher by \$17 million which represents our interests in The Hongkong and Shanghai Banking Corporation of California.

As a result of the increases in Advances, Trade Bills and the other items referred to above and to the net decrease in our Deposits, the total of Cash, Call Money, and Treasury Bills has fallen by some \$439 million. Although this has resulted in a drop in the ratio of the Bank's liquid assets to its total liabilities, this ratio still amounts to over 47 per cent, which your Directors consider may be regarded as a satisfactory degree of liquidity.

Shareholders will be aware that the continued expansion of world trade and the rise in the price of certain primary commodities, noticeably rubber and tin, contributed to more prosperous trading conditions generally in the territories in which we operate. On the whole, your Directors are very satisfied with the results of the year.

The printed statement which is in your hands deals with the political and economic situation in the Eastern countries where we

have offices. This follows the pattern of previous years but shareholders will notice that considerably less space has been devoted to China than has been the case in the past. This is unfortunately a reflection of the restriction of our activities in that country although I hope that circumstances will make it possible for us to continue to trade with China if no longer in China.

CONTINUED EXPANSION OF BUSINESS ACTIVITY

Hong Kong on the whole had a prosperous year as, in spite of the drop in our traditional entrepot trade with China, business activity generally continued to expand. This has been very noticeable in our office here where the number of current and Savings Bank accounts has steadily increased. We have now reached the point where these two departments have grown larger than is desirable for administrative purposes or for giving as efficient a service to the public as we should like. Your Directors therefore decided to open a new office in King's Road — the North Point Agency — which started business on Monday. This new office will, we hope, lighten the load and we are considering other means of relieving pressure.

In the printed statement details are given of the opening of our new subsidiary in San Francisco. This subsidiary will be able to give a full range of domestic and foreign banking services and will, I hope, prove popular with our many old friends and will make many new ones. It has always been disappointing to us that the services we were permitted to offer in San Francisco were so limited and I am glad that this complaint can no longer be made.

CHIEF MANAGER'S TOUR

Our Chief Manager, Mr Michael Turner, continued the tour commenced in 1954 and visited our branches at Calcutta, Bombay, Colombo and Rangoon. He also spent some time in London and was able when he was there to see our offices in Hamburg and Paris. This completed his itinerary and he has now visited all our offices. In all but a few cases he was accompanied by Mrs Turner. Shareholders will, I think, agree that the extensive tour which the speed of modern times enabled him to make — the first Chief Manager to do so — has been of considerable benefit to the Bank. This not only enabled Mr Turner

to make contact with government officials and our business friends in all these countries but to see for himself how each office was conducted and that the welfare of the staff was being looked after. Once again he was able to give a favourable report on the staff of all nationalities in the countries which he visited. I am glad to say that Mr Turner, in spite of the very busy year which he had, was able to take a short holiday in the United Kingdom.

The sudden death of Mr G. H. Stacey, who held the appointment of Deputy Chief Manager, was a severe loss to us all and the numerous letters we received from business associates of many nationalities gave evidence of the respect in which he was held.

I should like to take this opportunity of thanking all our staff, particularly the Branch Managers, for their loyalty and hard work during the year.

There were several changes in the Board of Directors during the year but as these are shown in the Report which is in your hands, I will make no further comment on them.

There were, however, various changes in London which I should like to mention. Mr S. A. Gray, who has been Senior London Manager since 1948, resigned at the end of the year and was succeeded by Mr S. W. P. Perry-Aldworth, who also took his place on the London Committee. Mr W. J. Keswick resigned from the Committee on being appointed a director of the Bank of England on which we congratulate him although we are sorry to lose the benefit of his experience. The Keswick family has had a close connection with the Bank over several generations and I hope that it will not be long before we have another Keswick on the London Committee. Sir John Nicoll, who needs no introduction to this audience, joined the Committee towards the end of the year and I am sure his experience in Colonial affairs will be of great assistance to our London Management.

Ladies and Gentlemen, The Report and Statement of Accounts having been in your hands for the required period I will now formally propose their adoption as presented.

After the proposal has been seconded I shall be pleased to answer to the best of my ability any questions which shareholders may wish to ask.

The resolution having been seconded, the report and accounts were adopted.

CHAIRMAN'S STATEMENT

The following is the Statement referred to by the Chairman:

In my statement last year I was able to record that an improvement in the cold war had been noticeable. I am now able to say that this trend continued during the summer of 1955 when the climate in international relations became distinctly milder with the meeting of the heads of governments and the feeling that a new spirit had been generated—the spirit of Geneva. Unfortunately the meeting of the Foreign Ministers in the autumn, with the deadlock over Germany, brought a lowering of the temperature which recent events in the Middle East have done nothing to improve.

Looking at the year as a whole, however, there seems to be ground for hope that the danger of war has been lessened, both as a result of the various discussions that have taken place and the growing feeling that the power of modern weapons has produced a form of stalemate. In the Far East there has been a period of quiet—as Mr Macmillan put it in a speech in Parliament in December—"A sort of *de facto* stabilisation had been secured in the Far East at the expense of

varying degrees of partition." Thus, although there remain a number of difficult international questions on which agreement has not been reached, these have not developed to such an extent as to give rise to any fresh disturbances.

Agreement was reached on the introduction of sixteen new members to the United Nations in December, thus ending a deadlock which had existed for many years. We particularly welcome the membership of Ceylon, whose influence in world affairs continued to increase, and the two new States of Cambodia and Laos. It is, however, most regrettable that Japan was not elected at the same time, and I hope that during the next session some settlement will enable this important country to be represented.

Among the many conferences that were held during the year, the one at Bandung last April of Asian and African Powers was of particular significance to this area. As has frequently been the case recently, it was not the decisions reached which gave this conference its importance but the fact that twenty-nine nations, many of whose sovereignty is of comparatively recent date and with different political forms of government, were able to discuss their common problems in a spirit of compromise. To quote from a leading British weekly periodical, "Nothing new was created; but the emancipation of the greater part of Southern Asia was solemnly placed on record, and the lines along which this vast area of the world hopes to advance were made a little clearer."

In the economic sphere considerable industrial expansion continued and in many of the more highly developed countries there were indications that the economy was becoming over-strained. A growing industrial demand for materials and labour, coupled with a high level of employment, resulted in active or threatened domestic inflation which, in some countries, was having an adverse effect on the balance of payments.

The measures taken to combat these dangers varied from country to country but the main emphasis was on monetary rather than on physical controls, on dearer money rather than on restriction of imports. This was an important development but under present conditions, with high taxation, the cost of borrowing is no longer the restraining influence it once was and the great increase in the public sector made supplementary action by governments necessary. Thus raising the bank rate was found to have only a limited effect and it may well be that the role of monetary policy in the economy of today has not yet been finally determined.

In the United Kingdom the pressure of consumer and investment demand brought a continuing rise in prices with a high level of imports which had an adverse effect on the balance of payments. The bank rate was increased to 4½ per cent in February, 1955, but this did not reduce the expansion of credit quickly enough and in July the Chancellor exhorted the banks to make "a positive and significant reduction in their advances." A supplementary budget followed in October and last month a further increase was made in the bank rate with measures to restrict capital investment and to reduce certain food subsidies. It is too early yet to gauge how effective these steps will be or whether more will be required.

A review of conditions in the United Kingdom is outside the scope of these Annual Statements, but the importance to the Bank and to the countries which it serves, of the standing of Sterling needs no elaboration and I hope therefore that the efforts being made to protect the internal value of the Pound will be successful. The high bank rate has

resulted in a considerable drop in the value of gilt-edged securities, but you will notice that we have continued as in previous years to show these in our Balance Sheet at under market value.

In the Asian countries in which most of our branches are situated progress continued to be made in the carrying out of the various development plans, but in many cases second thoughts had to be given to the targets and the speed at which they could be reached. The restricting factors here were, however, mainly lack of capital and shortage of trained technicians. These continued to limit the improvement in agriculture and industrial development which expanding populations make so necessary. Although dearer money was resorted to and had a limited effect in urban economies such as Hong Kong's, it was not in these countries the real answer to the problem. This was not to restrict demand in an over-expanded economy, but to improve the productive resources quickly enough to provide work for the growing population and at the same time to increase the supply of food and consumer goods to meet the requirements arising as a result of industrialisation.

AID FOR UNDER-DEVELOPED COUNTRIES

The Colombo Plan has been referred to from this Chair on numerous occasions and the importance of it has been stressed not only because of the continuing need for economic assistance in South East Asia, but also for the reason that this Plan has generally found favour with the countries in the area. The report by the Council for Technical Co-operation in South and South East Asia for 1954/5 shows that continued progress has been made in providing assistance in training technicians and supplying experts to aid development schemes. It was encouraging to see that while much of the assistance came from outside the area considerable progress was made in mutual aid. The report lays particular stress on the need for "a steady and ever-increasing supply of skilled administrators and technicians" who should be given "full opportunities to use their newly acquired skill at home." It recommends that "counterparts or understudies should be assigned to the expert on continuing projects so as to ensure continuity" and that new projects are "allotted the right priority." The shortage of trained personnel is probably the most serious limiting factor in the plans of these countries for greater industrialisation and the recommendations in this report deserve serious consideration. The meeting of the Consultative Committee was held in Singapore in October and made the welcome decision that the Colombo Plan would be extended from July 1957 to June 30, 1961, and that the future of the Plan would be considered in 1959. Considerable increases in aid were promised and although certain of the members felt that larger amounts of external capital were required the meeting appeared generally satisfied with the progress made. In addition to the Colombo Plan, assistance continues to be granted by the US International Co-operation Administration, various United Nations agencies and the International Bank for Reconstruction and Development. A new corporation, an affiliate of the International Bank, the "International Finance Corporation" to which I referred last year, is in process of formation. This organisation will have power to invest in productive private enterprises without the necessity of a government guarantee, which is a prerequisite of all International Bank loans. The total capital proposed is US\$100 million, but the Corporation cannot be brought into existence until at least thirty countries, with subscriptions amounting to US\$75 million,

have given their formal acceptance. Several countries have already taken this step, including the United States and the United Kingdom, and it seems likely that there will be no difficulties in the establishment of this new organisation, which should be of considerable benefit to under-developed areas.

CHINA

Shareholders of the Bank who knew China in the days prior to the establishment of the Government of the People's Republic of China must surely find it difficult to adapt their minds to the real meaning of the official Chinese policy on present day rural, industrial and sociological matters in that country. There are many pessimists just as there are many optimists in regard to the future of China but lack of information, other than official pronouncements, leaves many with a feeling of uncertainty. Even here in Hong Kong, close as we are to the Chinese scene, we find it hard to keep pace with and to evaluate the day to day economic and industrial changes and developments which are so rapidly being evolved. Nor do we know, neither can we judge, how the Chinese people as a whole—and particularly the agricultural population—are reacting to the kaleidoscopic events which have affected their lives and livelihood so closely in the last few years.

Collectivisation is certainly proceeding with ruthless vigour: at the same time almost the whole range of agricultural production is being directed and controlled from above in a way which has had no previous parallel in Asia. This line of policy is, of course, tied up with the current Five Year Plan and with industrialisation. The whole picture reveals remarkable speed of development. There is special concentration on heavy industries with extensive Russian help. Railway and road communications are being opened up at an astonishing pace, even if allowances are made for some work of a rough and temporary nature.

The key point in the economic policy of China has been summarised as follows: To build a socialist society, which cannot be raised on the foundations of a small-peasant economy; its foundations must be based on large-scale industry and large-scale collective farming.

Such being the fixed policy of the Chinese Government, if British merchants are to retain a share in the China trade and take advantage of the situation, it is important that British policy should be re-examined in collaboration with other friendly governments. No action of the kind we have in mind can however be taken until there is a considerable reduction of the items on the embargo list. The question of the embargo has raised so much controversy in recent years that it has not been easy to discuss it objectively and there are still no signs of any narrowing of the gap between the two points of view. Although we have done our best to carry out not only the letter but the spirit of this embargo we make no secret of the fact that, like almost all British merchants and bankers interested in the China trade, we will welcome the day it is abolished, but as total abolition cannot be quickly brought about, linked as it is with numerous other problems, we are contenting ourselves for the time being with advocating the reduction of the Chinese embargo list to make it similar to the Russian list. This would seem to be the logical solution as it is idle to suppose that China is not able to obtain goods shipped from the West to Russia. Instances have in fact occurred where China has exported to Hong Kong goods which are not permitted to be sent into China under the embargo. We had hoped that at the recent talks in Washington some form of agreement

of this nature would have been reached, but it appears that all that was decided was that a review of the control of trade with China would be made.

Both Hong Kong and Malaya have suffered greatly as a result of this embargo and there is the danger, particularly for Hong Kong and to a lesser degree for Malaya, that, if no substantial relaxation comes soon, the trade lost may never be regained. China is already leaning heavily on supplies from Eastern European countries and this trend is likely to increase so long as the emphasis on all arrangements for exchange of goods with China is on bilateral agreements. With the overall control of the economy which the Chinese Government now exercises, bilateral and barter agreements may be difficult to avoid but under freer conditions the advantage of dealing with Hong Kong merchants, experienced as they are in supplying the China market, would no doubt be appreciated. The Sino-British Trade Committee have recently been informed by the Chinese Government that they see no object in any further visits until there is a considerable relaxation of the embargo. This may be so as far as large parties are concerned but I am sure that a great deal of good would result if it were made easier for individual merchants to visit China to discuss their own particular business problems.

Negotiations regarding the winding up of our affairs in China have made considerable progress during the year and we have been able to reach a settlement of our local currency position but there have been no further developments in respect of our foreign currency liabilities. This settlement has not been made without cost to the Bank but under the circumstances no other course was open to us. Mr Yoxall, our Manager in Shanghai, who bore the brunt of the negotiations, finally obtained permission to leave and has now retired.

HONG KONG

Hong Kong has not featured much in world news during the last year but this lack of publicity has not meant that progress has not been made but only that it has been steady rather than spectacular. We were pleased to welcome the Secretary of State for the Colonies, Mr Lennox-Boyd, who, in his short visit, managed to see a very large part of the Colony. The squatter resettlement programme, which has been made necessary by the large influx of refugees, has always seemed to us to be one of the postwar developments of which we can be most proud and it was encouraging to find this distinguished observer describing it as "one of the most stupendous achievements I have ever seen." On the day of his departure he announced that the term of office of His Excellency The Governor, Sir Alexander Grantham, had been extended until 1957. This was extremely welcome news as Sir Alexander has a very special place in our affections and we are grateful to him for agreeing to defer his well-earned retirement.

The necessity for an improvement to the airport, to bring it up to modern international standards, has been mentioned many times from this chair and I am glad that this year I am able to report that the contract for the new runway was awarded in August and that considerable progress has already been made. Nature bestowed on Hong Kong geographical features which facilitated the construction of a harbour but she has not been as kind over the airport and this will be a costly project. Another large engineering work is nearing completion—the Tai Lam Chung water supply scheme—which will substantially increase our water storage facilities. The consumption of water, however, even under the

strict rationing to which we are subjected, continues to rise—as it must do with a growing population and increasing industrial development—and it seems obvious that some site for another reservoir will require to be found without undue delay. The recent remarks of the Governor on investigations on Lantau Island show that the Government has this matter very much in mind. I mentioned above the squatter resettlement scheme but this is only part of the immense housing problem with which Hong Kong is faced. A visitor arriving here after an absence of some years and seeing all the extensive building that has taken place might be tempted to think that the housing problem was being adequately taken care of but this is unfortunately only partly true. Many of the poorer members of the community are very badly housed and to supply them with better living accommodation at a reasonable cost is a most urgent social need. In view of the importance of this problem, the appointment last month by His Excellency The Governor, of a committee with wide terms of reference to investigate the Colony's housing problem in all its aspects was most welcome.

The development of local industries, which has been such an important feature of recent years, continued and 372 new factories were registered during the year while the production of electricity increased by 15 per cent. Energetic efforts were made to develop new markets and there are welcome signs that the importance of maintaining uniform standards of quality is being more readily understood. The formation of the Hong Kong Exporters Association, with a committee composed of many of our leading merchant houses, should greatly assist the marketing of the products of our industries. An invisible export is provided by the large numbers of tourists, both service and civilian, who visit Hong Kong each year. It has been proposed that a Hong Kong Tourist Association should be formed to develop our tourist trade and a working committee of representatives of the interests concerned was appointed in August to look into the question.

TRADE OF HONG KONG

Hong Kong's trade in 1955 increased by 7 per cent in value while volume showed a rise of 14 per cent. It is encouraging that the rise has been steady over the last few months of the year and that exports of Hong Kong products continue to increase. Exports to the United Kingdom increased by HK\$89 million. This will not cause any surprise to shareholders, who will no doubt have seen many references to this subject in the press, but imports from that country also rose by HK\$72 million which is given considerably less publicity. Even now our exports to the United Kingdom are still only 57 per cent of our imports from there. Trade with China in total was about the same as in 1954 but the drop of just over HK\$200 million in exports was offset by a rise in imports of a similar amount. This decrease in exports was caused by a considerable reduction in each of the three largest groups of commodities—namely dyestuffs, fertilizers and pharmaceuticals—which we have recently been shipping to China. Trade with other East Asian countries showed an overall increase and it was encouraging to see the steady rise in exports to Indonesia, Indo China and Thailand in the closing months of the year.

Business on the Stock Exchange continued to be very active and the volume for the first six months of the year was greater than that for the same period in 1954. In July the turnover was more than double the figure for June and there were signs that these almost boom conditions were having a disturbing effect on the economy, which if not

checked, might result in more serious developments. The rise in short term money rates in so many countries was also beginning to be felt in Hong Kong and, after consultation with the Government, we and the other note issuing banks raised our interest rates in August. This we followed in November by a reduction in the percentage of market value which we would normally advance against shares. These measures were aimed at curbing further expansion of credit for speculation and have in our opinion resulted in a healthier position in the market. The price of land continued its upward movement and some very valuable properties changed hands. There were, however, signs towards the end of the year of a slackening of demand and it may be that the peak has been reached for the time being.

FINANCES OF HONG KONG

The Financial Secretary, Mr A. G. Clarke, in his speech in the Legislative Council at the end of last month, when he presented the Budget, was able to show that the Colony's finances are in a very healthy state. A surplus of over HK\$16 million was expected for the current year which was brought about by both higher revenue and lower expenditure than was estimated. Salaries and Profits tax showed a fall but this was more than made up by rises under other headings, a large part of which was due to the active conditions in the property market and building trades. For the financial year 1956-57 a deficit of HK\$43½ million is estimated but this includes expenditure of HK\$30 million for the Tai Lam Chung scheme and HK\$32 million for the airport. Both these items are public works of a capital nature which are essential to the future of the Colony and for this reason the size of the deficit should not give cause for alarm.

At the conclusion of his address Mr Clarke took stock of the Colony's financial position ten years after the re-establishment of civil government. This showed that, in spite of the heavy programme of rehabilitation, the cost of housing the large number of refugees and general postwar development, Hong Kong has built up a reserve of a year's revenue with a public debt of less than two months' income. When it is remembered that the Colony started with no surplus funds after the war this happy state of affairs I think reflects great credit on Mr Clarke and his predecessor as well as on the industrious people of Hong Kong whose energy and adaptability have made it possible.

JAPAN

Japan's population is likely to pass the ninety million mark during 1956 and any analysis of economic and political developments in the country cannot ignore the steadily increasing pressure which a rising population makes on available resources. Economically 1955 was a good year and the visible adverse trade balance was reduced by US\$300 million while foreign exchange receipts, which include invisibles, exceeded payments by nearly US\$500 million. This improvement has been achieved in the face of a gradual but nevertheless steady decrease in the foreign currency obtained from the US Forces. The deflationary policy which we mentioned last year continued during 1955 and commercial banks' borrowings from the Bank of Japan reached the lowest level since 1946; but, helped by a lively export demand, no serious restriction in business activity was apparent although unemployment figures gave cause for concern. Good crops of rice and cereals contributed to the improved balance of payments position. The draft budget, which is at present before the Budget Committee in the Diet, shows little

change from last year and although the note issue rose by 8 per cent this is considered to be a reasonable reflection of the general expansion in production, including the bumper rice crop. The Anglo-Japanese Sterling Payments Agreement of January, 1954, was extended until September 30, 1956, with Japan agreeing to remove certain restrictions on imports from the sterling area. This agreement will be reviewed again this year. During the year Japan became a full member of GATT but her satisfaction was tempered by the fact that a number of nations invoked Article 35 against her.

Three agreements have been made with the United States Government covering the sale to Japan of agricultural produce against payment in Yen while part of the Yen proceeds is available as a long term loan for capital development. Considerable assistance is also being given by the United States Government in providing technical training and the International Bank for Reconstruction and Development has recently agreed to grant a loan of US\$8 million for the modernisation of heavy industry. All these arrangements should greatly benefit Japan's productive resources.

Unfortunately labour relations have not been too happy and there are ominous signs of further troubles on a nation-wide scale. All our Japan offices were involved in a strike which lasted seven weeks but in spite of the difficulties encountered I am glad to say that we managed for the most part to meet the requirements of our constituents.

As a result of the merger of the two wings of the Socialist party on the one hand and the Liberal and the Democrats on the other a two party system has been created. Provided each party can continue to maintain a reasonable degree of unity this development should strengthen the parliamentary system. Between the two parties themselves considerable differences exist over both foreign policy and defence. Mr Hatoyama, the Prime Minister, in December made it clear that his government—composed of the Liberal-Democratic party—intend to revise the Constitution, reform the administration and revise the system of taxation. This programme is generally regarded as designed to enable Japan to rebuild her armed forces. Mr Shigemitsu, the Foreign Minister, at the same time gave a review of foreign policy but was unable to report much progress in the Japanese-Soviet negotiations taking place in London which had foundered on the two issues of repatriation of Japanese prisoners and the settlement of territorial questions. He promised to strive for a speedy solution of the outstanding reparations agreements and to promote "a positive expansion of our trade with all countries." The Socialists on the other hand are opposed to rebuilding the armed forces and to the government's policy with regard to China.

On the whole Japan has recently made much progress but the rising population makes a continuing expansion of the export trade essential which is likely in the long run to influence political decisions.

INDONESIA

The political situation in Indonesia is extremely complex and it is often difficult for foreign merchants and bankers, occupied as they are with their day-to-day tasks, to follow the trend of events. The rivalry of political and military leaders has been a deciding factor in the composition and policies of recent governments and the elections have on that account been repeatedly postponed. It is therefore a matter of considerable importance that these elections were finally held towards the end of the year and that polling day passed off without major incident. Pro-

visional results show that no one of the four major parties obtained sufficient seats to form a government on its own and some form of coalition seems probable. The government, which has been in office since August, under the leadership of Mr Burhanuddin Harahap, appears to have tackled the many problems which faced it with vigour and, aided by the rise in the price of rubber, it has greatly improved the economic position of the country. We have more than once quoted from the Bank Indonesia Report, as this always gives an objective view of conditions in the country, and in the Report for 1954-55 published last year the Governor gave warning of the dangers of the continuing increase in the supply of money and went on to show the necessity of weakening the effect of inflation "which should primarily be brought about by reducing the cash deficit of the government." The need for such action is made apparent from a study of the current advance to the government by the Bank Indonesia. This rose from Rupiahs 1,433 million at the end of 1953 to Rupiahs 4,477 million at the end of 1954 and Rupiahs 5,959 million in June, 1955. During the second half of the year a generally tighter money policy was adopted and an overhaul of the systems of import and export control was carried out. These measures have resulted in a drop in the advance to the government to Rupiahs 4,074 million at the end of 1955. Gold and foreign exchange reserves have increased and the estimate for the 1956 budget shows a deficit of Rupiahs 1,000 million—a considerable reduction. The improvement in the free market rates for gold and foreign currencies shows that there is increased confidence in the economy.

Relations with Holland have unfortunately deteriorated in recent years and discussions over a number of outstanding matters were held recently at Geneva. Although at one time there seemed to be hope of some form of agreement being reached the conference ended in failure and Indonesia subsequently abrogated the Netherlands Indonesian Union and the financial and economic agreements entered into in 1949.

THE PHILIPPINES

Our Office in Manila was opened on November 11, 1875, and the eightieth anniversary was duly celebrated at a reception of friends of many nationalities.

During 1955 President Magsaysay considerably strengthened his position by his sweeping victories in the Senate and the local elections and he continued his drive to improve conditions for "the common man." Unfortunately, however, all has not been well on the economic front and the administrative difficulties I mentioned last year still hold up progress. Foreign currency reserves declined from a figure of US\$273 million to US\$213 million. Although the prices of copra and some other exports tended to be lower, the main cause of this drop in reserves was the increase in imports—chiefly capital goods and raw materials—which has so far only been slightly counterbalanced by restrictions on the import of less essential goods.

The revision of the Bell Trade Act was approved by both the Philippine and United States Congresses. This comprehensive treaty will materially and increasingly affect trading relations between the two countries. From the beginning of this year free trade has ended and customs duties will be applied by each country on imports from the other on a gradually increasing scale, but whereas the Philippine duty on United States goods starts at 25 per cent of the standard rate, the US duty on Philippine goods will initially be only at 5 per cent. The Philippine Government has been given power to change the value of

the Peso without reference to the United States Government, and has also undertaken to abolish the exchange tax on remittances but this tax has been replaced by a special import tax which will be gradually reduced. Alterations have been made in the rate at which import quotas will be applied by the United States, and each country is permitted reasonable quantitative import restrictions to protect domestic industries. The immediate effect on Philippine exports is likely to be small but on a long term view it will be necessary to explore ways and means of reducing production costs if the traditional markets in the United States are to be retained.

On the whole this is a favourable agreement to the Philippines as their market in the USA for their exports is still available on advantageous terms and the revenue from customs duties is likely to increase. On the other hand there is the danger that there will be a rise in the cost of living which will make a reduction in export prices more difficult. Meanwhile it is encouraging to learn that the President has instructed the Monetary Board of the Central Bank to tighten up import controls to prevent a further drop in the foreign currency reserves.

THAILAND

Reports from Bangkok indicate that there has been a considerable improvement in both the political and economic fields since my statement was issued last year. For this a great deal of the credit is due to the Prime Minister, Field Marshal Pibul Songgram who, on his return from a successful overseas tour, introduced measures aimed at stamping out corruption in the administration and permitting freedom of speech both at public meetings and in the press. It is too early to judge how permanent these reforms will be, as personalities play a large part in politics in Thailand, and already there are signs of restriction in public discussion, but the immediate outlook is encouraging. So also is the economic position, as exports were well maintained and in particular the tonnage of rice exported was greater than in 1954 although prices were lower. During the year all the regulations which necessitated surrender of part of the foreign exchange proceeds of exports at the official rate were withdrawn but rates of duty were raised to compensate. Import licence requirements were abolished in September for the majority of goods and customs duties were raised at the same time which should have a beneficial effect on the revenue.

Exchange rates during the first half of the year showed wide fluctuations, but in July a Stabilisation Fund was set up which is operated by the Bank of Thailand. This Fund seems to have been successfully managed and since its formation the market has been much more stable. Ordinary expenditure in the budget was balanced by revenue but appropriations for improving transport and irrigation resulted in an overall deficit which will be financed by loans and from Treasury balances.

The above are a few of the many developments that have taken place in Thailand in 1955, and while last year I opened this paragraph with a reference to "cautious pessimism" I think it would be reasonable to close it this year with the words "cautious optimism."

VIETNAM

The partition of Indo-China left behind many political and economic problems to be solved by the State of Vietnam. Amongst these was the settlement of the many refugees

who poured in from the north, and the challenge to the authority of the government by several warring factions, each with control over private armies. Economically there was the task of rehabilitation after the ravages of war and the building up of a viable economy—deprived as the state is of the industries and rich coal fields of the north. In these circumstances progress must inevitably be slow, but a great deal has already been achieved with the help of substantial aid from the United States of America and the government has considerably strengthened its internal position by successful military action. At a plebiscite in October Mr Ngo Dinh Diem was elected Head of State, in place of Emperor Bao Dai, and he has been recognised as such by the French and other governments. The loosening of the ties with France has resulted in a gradual switch of trade from the Franc area and the economic and financial agreement with France was allowed to lapse at the end of 1955. Elections have recently been held at a Constituent Assembly for the purpose of considering the new Constitution, but the problem of the joint elections with the north, which were part of the Geneva agreement to decide the future government of the whole country, remains.

CAMBODIA

Our Office in Phnom-penh got off to a satisfactory start and will I think prove to have been worth while. The port itself is, however, far from satisfactory due to the shallowness of the river but the scheme for the deep water port of Kompong Som is being pushed forward. Prince Sihanouk, the Prime Minister, had a sweeping success in the elections in September and the political situation appears stable.

MALAYA

Singapore is our largest office in the East after Hong Kong and in the Federation of Malaya we have a greater number of offices than in any other territory. The recent constitutional developments are therefore of great interest to the Bank and although it is always difficult to assess the importance of contemporary events, until the passing of time enables a more detached view to be taken, it appears probable that 1955 will be considered a most significant year. Elections were held in both territories and a great part of the responsibility for the day-to-day government passed to the ministers whose parties held majorities in the newly elected legislatures. As the months moved on however, it became clear that the desire for a more rapid transfer to these ministers of such powers as had been reserved was becoming more insistent and that to a considerable extent this desire would be satisfied. Shareholders have no doubt been following the course of events in these territories, as this has had a great deal of publicity in the British press, and they will therefore be aware of the way matters have developed. I sincerely hope so as it is not possible here to do more than touch on one or two of the more important items.

Arrangements were made during the summer for delegations from both territories to visit London during 1956 to discuss future political developments and the visit of Tengku Abdul Rahman and his ministers took place in January. At this meeting it was decided that every effort would be made for the Federation to have full self-government and independence within the Commonwealth by August 1957 and a Constitutional Commission would be appointed immediately to draw up a constitution. Britain would continue until that date to be responsible for foreign affairs and external defence but there would be changes in the administration of

internal defence arrangements and the Chief Minister has recently taken over the portfolio of Internal Defence and Security. Responsibility for all financial matters, at present discharged by the Financial Secretary, would be transferred at once to an elected minister and Colonel H. S. Lee has taken over this portfolio. The Federation recognised "the important part which overseas capital must continue to play in the economic and social development of Malaya" and that "membership of the Sterling Area was to the common advantage of the Federation and the other members." The talks with the Singapore Government will take place in April but Mr Marshall, the Chief Minister, with two of his colleagues, visited the United Kingdom in December when the agenda was agreed.

The discussions in London set the course for constitutional developments in these countries and I should like to wish them every success in the days that lie ahead; and to hope that their approach to the many difficult problems, both political and economic, with which they are likely to be faced will be of advantage to them both and to the Commonwealth as a whole. One of the most important of these problems will be the relationship between the two territories, as a measure of agreement on many matters of policy will be to their mutual benefit.

Economically, both have had a good year due to the rise in the prices of rubber and tin. The price of rubber was fairly steady during the first half of the year but there was a considerable rise during August and September and the average for the year increased by over 1s. per pound. Exports from Malaya were 994,000 tons compared with 915,000 tons the year before. The challenge by the synthetic industry, however, is always present and it is encouraging that a scheme to foster replanting, both for estates and small holders, was finally put into operation. This scheme has been drawn up after consideration of the recommendations of the Mudie Report and the Rubber Producers' Council and is in the nature of a compromise, aimed at assisting replanting where it is most needed.

The price of tin rose slowly during the major part of the year but there was a jump in December due to a shortage of stocks for spot delivery. Indonesia's recent decision to ratify the International Tin Agreement will enable the International Tin Council to be inaugurated but the building up of the buffer pool may take some time so long as prices remain at present levels. Tin production in Malaya was a postwar record while exports were 71,150 tons compared with 70,333 tons in 1954. Production of iron ore has been increasing in recent years and the total for 1955 was 1,466,184 tons as compared with 1,212,780 tons in 1954.

The Malayan trade figures show a favourable balance of M\$335 million with imports at M\$3,821 million and exports at M\$4,156 million.

The budgets of both territories showed few changes in taxation but this was mainly due to the fact that the Federation Government, having been in office for only a few months, decided to introduce a "standstill" budget for the time being and Singapore decided not to act on their own. From a study of the speeches, however, it would seem that some increases cannot be long delayed. Due to the rise in the price of rubber the Federation expected to turn an estimated deficit of M\$148 million into a surplus of M\$42 million. For the forthcoming year estimated expenditure shows an increase of M\$86 million, including a grant of M\$23 million to the rubber industry for replanting, leaving a deficit of M\$50 million. Singapore esti-

mated a surplus of M\$2 million for 1955 with a deficit of M\$15 million for 1956.

The report of the International Bank Mission, which visited Malaya early in 1954, was published in September, 1955, and gave a comprehensive survey of economic conditions in the Federation and Singapore and made numerous recommendations for increasing the territories' productive resources. This useful report is, I understand, being studied by the two governments and no doubt action on some of its recommendations will be taken shortly.

Although considerable successes have been achieved in the eight year old war against the terrorists, incidents continue to occur at frequent intervals and the terrorist organisation is still a very active force. In the hope of hastening the end of the fighting the Federation Government declared an amnesty in September offering freedom from prosecution to those who surrendered, but the response to this offer was disappointing. Arrangements were, however, made for a meeting between the two Chief Ministers and the Communist leader, Chin Peng, which was held at the end of December. This meeting proved a failure and the amnesty terms were withdrawn on February 8th and in broadcasts to the people of Malaya, Tengku Abdul Rahman has made it clear that action will continue against the terrorists until they surrender. Disappointing as it is that no tangible results have been achieved as a result of the amnesty, it has been clearly shown that the intention of the terrorists is to overthrow the elected government of the Federation and this has strengthened the government's hand. Tengku Abdul Rahman has been resolute in his approach to this problem and Mr Marshall showed considerable political courage in his successful effort to place certain of the emergency regulations on the statute book.

I should like to pay tribute to the Commonwealth Forces who have served in Malaya since the Emergency began. To their courage and devotion to duty the progress so far made is due. Never knowing where or when the enemy would strike their task has not been an enviable one and many have lost their lives.

In Singapore there have been considerable labour disputes and unrest resulting in a wave of strikes which has had a disturbing effect on the economy. According to statistics issued by the Labour Department, nearly 950,000 man days were lost during the year. The danger of labour disputes to a free port, dependent to such a large extent on its entrepot trade, is so evident that the finding of an early solution to this problem would appear to be one of the most urgent questions which faces the Singapore Government.

Before I leave Malaya I would like to mention the new airport at Paya Lebar in Singapore which was opened by Mr Lennox-Boyd in August. This is one of the largest in the East and will maintain Singapore's position as an important junction on the international air routes.

NORTH BORNEO

In North Borneo also the increased price for rubber resulted in a marked improvement in the trade figures and revenue. Whereas in 1954 imports and exports were almost in balance at around M\$75 million, in 1955 exports increased to M\$105 million with imports at M\$87 million. Revenue exceeded the estimate by M\$3 million. In his address in the budget debate the Governor, whom we congratulate on the well-deserved honour conferred on him at the New Year, informed the Legislative Council that he proposed to widen the composition of that body by nominating eight unofficial members from a panel recommended by certain recognised

public bodies and organisations. While this step "involves no amendment of the Constitution of the Colony," it should result in a more representative expression of opinion being heard in the Council. The labour situation, to which reference has been made on many occasions in these annual reviews, remains difficult, but I am glad to see that the Agreement with the Government of The Philippine Republic, which, I mentioned last year, was signed in August, although no immediate results can yet be reported.

The formation of the North Borneo Credit Corporation with an advance from the government of M\$1 million to provide loans for development and building should give stimulus to new projects, but the need for technicians at all levels, to which I referred above, applies with particular force in Borneo and is a long term problem with no easy solution.

The facilities at Labuan airport are proving to be inadequate by international standards and considerable work on reconstruction has been put in hand. It was subsequently found that the proposed improvements would not be sufficient to accommodate the larger types of modern aircraft and an expert from the Ministry of Transport and Civil Aviation has recently visited the airport to advise the government on what is required. The question of the restoration to Labuan of its prewar status as a free port has been in the news again and the Governor has promised to re-examine it.

Once again I have to record a most satisfactory budgetary position in Brunei State where the estimated revenue exceeds expenditure by M\$71 million.

INDIA

India has made no secret of the fact that she is moving towards "a socialistic pattern of society" and this goal has been generally accepted by the public. Until recently the movement in this direction has been gradual under the first five year plan, but the pace is likely to be increased with the introduction of the second five year plan, a much more ambitious programme. Evidence of this can already be seen in the revision of Article 31 of the Constitution, to which reference was made last year, the Companies Act 1956, with its restriction on the activities of Managing Agents, and the recent decision to nationalise life insurance. Foreign merchants are not alone in their fears of the cumulative effect on the private sector that the increasing power of the state will have.

The first five year plan with its emphasis on rural planning and communications, with the consolidation of existing rather than the construction of new industries, did not impose a great strain on the economy. Helped by three favourable monsoons agricultural production increased satisfactorily and the economy has been able to take in its stride the budgetary deficits while prices have remained stable. While final details of the second five year plan are not yet available, considerable emphasis is being laid on the expansion of heavy industry, and the total outlay in the public sector is expected to be in the nature of £3,600 million nearly double the figure for the first plan. A considerable part of the finance will be obtained again by deficit budgeting, even though a rise in taxation is expected. Whether the targets for this immense undertaking are likely to be achieved is a question on which I, from this distance, do not feel qualified to express an opinion. The President of the Associated Chambers of Commerce in India, however, in his annual address in Calcutta in December, after some very cogent remarks on the necessity of the fullest co-operation between

the public and the private sectors and the danger of unhealthy competition between the two sectors, suggested that they were attainable provided "the necessary transport—particularly the rail transport—is made available." India so far has made considerable progress—much greater than I think was expected—and at this stage we can look forward with some confidence.

The report of the States Reorganisation Commission was published in October and many of the recommendations proved generally acceptable. The proposal made regarding Bombay, however, raised considerable objections and the announcement of the decision of the government to administer Bombay from the Centre had unhappy results. Further difficulties may be encountered before a final settlement is reached.

The role of foreign capital in present-day India is difficult to forecast. A survey published recently by the Reserve Bank of India showed that nearly 83 per cent of all foreign investments in India at the end of 1953 came from the United Kingdom, and during the period 1948-53 the percentage of the United Kingdom's share of new business investments was not much less. These figures show to what extent British capital is involved. While speeches of individual ministers promise fair treatment to foreign capital they have recently made it clear that India is not likely to change her internal policies to attract foreign investment. It seems probable that in the future the role of foreign private investment in India will be smaller than in the past and that the emphasis on foreign investment as a whole is more likely to be on a government to government basis. The large sums required are probably beyond the means of all but the largest concerns but there is, I am sure, a marginal role in which private capital can play its part if given its chance.

The introduction of a decimal coinage is promised on April 1, 1957, with the rupee being divided into one hundred naya paise. This will result in the disappearance of the anna. Another break with the past was the nationalisation of the Imperial Bank of India. This bank was formed in 1921 as the result of the amalgamation of the three Presidency Banks and before the setting up of the Reserve Bank of India it acted as the government bank.

Space precludes mention of a number of other important developments in India, but I should like to touch briefly on the visit of the Russian leaders, Marshal Bulganin and Mr Khrushchev, with their attacks made, in both India and Burma, on the West and the United Kingdom in particular. There seems no doubt that this visit was a considerable personal success for the Russians but their comments on the United Kingdom must have been embarrassing to their hosts. On the economic side this visit may very likely result in increased trade between Russia and India, with greater competition for British firms, but the effect of such biased speeches on informed opinion in India should not, I think, be overrated and it may be that the Russians overplayed their hand.

BURMA

From India we now turn to Burma whose connection with her large neighbour has always been very close. Both countries have adopted a policy of neutrality and the Prime Minister, U Nu, paid a number of visits to countries on both sides of the Iron Curtain. Burma too is endeavouring to raise the standards of living of the country by means of a planned development scheme; but unfortunately the fears I expressed last year, that she might be trying to do too much too

quickly, have only been too well founded, as the difficulty experienced in disposing of her rice has resulted in a steady fall in the foreign currency reserves.

In March a severe cut was made in the import programme which had the inevitable effect of reducing customs revenue and making the balancing of the budget more difficult. As a result it was found necessary to prune rigorously the estimates for capital expenditure. A loan has been promised by India and other forms of aid are being sought. Barter deals have been arranged with several countries and while these should result in the disposal of a part of the export surplus there remains the danger, inherent in such transactions, that Burma may have difficulty in obtaining the goods she requires. Yet in view of the prevailing buyers' market for rice it is understandable that such transactions should be found attractive to Burma. Meanwhile efforts are being made to improve the quality of the paddy, and production of other agricultural commodities such as vegetable oils, cotton and jute are being increased, which it is hoped will result in a saving of foreign exchange. Fears are expressed that the increase in the number of barter deals, coupled with the Reparations Agreement between Burma and Japan, may have a serious effect on Commonwealth trade. It is, however, encouraging that a Hong Kong firm last year obtained a contract for the construction of barges against strong foreign competition.

Burma also had a visit from the Russian leaders which was followed shortly after by the visit of Sir Hubert Rance—the last Governor of Burma—accompanied by Lady Rance. The spontaneous welcome Sir Hubert and Lady Rance received during their stay was evidence that old friendships had not been forgotten.

CEYLON

The improvement in Ceylon's balance of payments, which took place in 1954, continued with increasing momentum in 1955 and resulted in a trade surplus of Rs479 million against Rs412 million for 1954.

Tea prices, which at the beginning of the year were Rs3.29 per pound, fell considerably in the early months reaching a monthly average of Rs1.34 for May, but rallied to Rs2.15 by December. The average for the year was Rs2.24 against Rs2.56 for 1954.

The increase in the price of rubber not only benefited the general balance of payments, but enabled a higher return to be obtained from June 1st for the rubber shipped to China, which was originally arranged as a barter deal against rice. Due to the drop in Ceylon's purchases of Chinese rice, China's debt to Ceylon under this arrangement is considerable and so far no decision seems to have been taken as to the method by which this will be settled.

Ceylon, like many other countries, has drawn up a new development programme for a period of six years, but this only covers government expenditure and "does not constitute an overall plan for the economy as a whole." The programme provides for an expenditure of Rs2,500 million over the period with the main emphasis on agriculture and public utilities. The targets set out are comparatively modest and it is hoped to be able to finance them out of the annual budget, but the authors of the plan appreciate that the prosperity of the country is dependent to such a large extent on the prices obtained from tea, rubber and copra that they have allowed for an adjustment in the targets if it is found that a continuing

deficit in the budget shows that they were too high.

Legislation was passed during the year for the formation of the Development Finance Corporation of Ceylon to assist private industrial and agricultural enterprises and "to encourage and promote the participation of private capital, both internal and external, in such enterprises."

Last month parliament was dissolved and elections will be held in April. The United National Party, who form the present government, wish to obtain a mandate from the people to replace English by Sinhalese as the official language of Ceylon.

SAN FRANCISCO

On August 15th a subsidiary of the Bank, The Hongkong and Shanghai Banking Corporation of California, was opened in San Francisco. The Bank, since its foundation in 1865, has had a very long connection with San Francisco as, in that year, we appointed the Bank of California as our Agent. Ten years later in November, 1875, our own office was opened. From that time this office has contributed greatly to the business of our Far Eastern offices with the West Coast of America but it has not been permitted to carry on domestic banking in the State of California. The new subsidiary, however, is able to offer a full range of domestic banking services maintaining current and savings accounts, receiving money on deposit and granting approved loans, as well as providing the facilities for financing foreign trade which has been our main function in the past. In January of this year a move was made into handsome new premises which have a modern layout and are quite up to the standard of our main offices elsewhere. I am told that they compare favourably with other banks in San Francisco and the move will give greater scope for the extension of business which we hope to see.

Once again I come to the end of our annual survey of the Eastern scene in which I have tried to give a brief review of political and economic conditions and to pick out a few of the more important events of the year. Shareholders will, I think, agree that this has been a satisfactory year: political differences have not been too acute and economic development has made progress. The countries in Asia are moving along paths of their own choosing and foreign merchants and bankers must adapt themselves to these changing conditions. This we are trying to do; as indeed we should, as indeed we must. But what of new foreign investment? That is another question altogether. Many other avenues are open and the most attractive will be chosen. Much lip service is paid by certain countries to the desire to attract foreign capital but stable conditions and prospects of an adequate reward will do much more than any number of exhortations. This is a question each country must decide for itself and the response will surely depend on the decisions made.

In conclusion I feel I cannot do better than quote an extract from a speech made at a Conference on Financing the Economic Development of Underdeveloped Countries organised by the United Nations Association in London recently. "If... the underdeveloped areas generally, are to attract private capital, they have to create conditions in which it appears to people who are trustees for other people's money that this is the best investment in the world which is open to them at the moment. This means to say that conditions have to be such that the risk of loss of income or loss of capital is at a minimum, and secondly, that the yield is likely to be sufficient to offset any such danger as remains."

THE HALIFAX BUILDING SOCIETY

ONE HUNDRED AND THIRD ANNUAL MEETING MARCH 26, 1956

SPEECH OF ALGERNON DENHAM, JP

The one hundred and third Annual Meeting of the members of the Halifax Building Society was held in Halifax on March 26, 1956, the President, Mr Algernon Denham, JP, presiding. In moving the adoption of the accounts the President said:

The figures disclosed in the Balance Sheet follow a pattern to which we have grown accustomed, the assets at £264,485,160 showing an increase of 11.23 per cent.

Perhaps one of the most welcome signs in the movement as a whole has been the evidence of greater awareness of the importance of maintaining adequate liquid funds. You are well aware of your Board's policy on liquidity, and our ratio of 15.31 per cent is reasonably adequate.

Our two major preoccupations during the year have been the changes in interest rates and the fall in the market price of Government Securities and we considered it desirable to write down the book value of our securities below market value, the result of our action being that the published reserves at £11,864,712 show a reduction of £94,461.

The interest rates paid to investors and also those charged to borrowers have moved upwards following the higher level of interest rates stemming from increases in the bank rate.

We have at all times endeavoured to operate within our resources and provide a continuity of mortgage service. 95 per cent of the advances of £48,650,298 were granted to finance home purchase.

84.42 per cent of the assets of £264,485,160 are in mortgage loans, 15.31 per cent in liquid funds and .27 per cent represents office premises. Mortgage assets have increased by £21,779,552, and our borrowers continue to meet their contractual obligations with commendable regularity. Our policy of cultivating the small investor continues unaltered, our average investment being £470 as compared with £448 last year.

One would be justified in drawing the conclusion that the figures suggest an abounding prosperity in the country's economy; that this is not so is due to the fact that we disclose our position in pounds sterling, a measure of value which has in recent years shown a persistent depreciation. Continuing inflation is a great disappointment to thrifty people, and it speaks volumes for their sacrifice and loyalty that they continue through the various savings movements to support the state almost to their own economic disadvantage.

To counteract inflation is the primary need in the state today, and requires a more resolute lead from the Government, although during the year there have been welcome signs that a realistic determination to avoid recurring crises is being taken.

May I again thank our members and depositors for their continued support. Confidence is the basic essential for the success of any financial undertaking, and the record receipts in the share and deposit departments of £63,715,648, the opening of 82,061 new accounts and the conducting for the first time in our history of over 300,000 mortgages in total are conclusive proof of the popularity and need of our services.

LEWIS'S INVESTMENT TRUST

RETENTION OF PROFITS—IMPORTANT FEATURE OF ESTABLISHED POLICY

EFFECTS OF RATING REVALUATION

MR S. H. LEAKE ON PURCHASE TAX AND RETAIL PRICES

The Twenty-seventh Annual General Meeting of Lewis's Investment Trust Limited will be held on April 18th in Liverpool.

The following are extracts from the statement of the Chairman, Mr S. H. Leake, OBE, to be delivered at the meeting and which, for the convenience of stockholders, has been circulated with the report and accounts:

I am proud to take the chair at this annual meeting in the year in which we celebrate the centenary of Lewis's Limited.

Although the profits have not increased as much as in recent years, they represent a high-water mark in the history of the business.

The revenue of the group as shown in the consolidated profit and loss account reached £5,027,926, thus exceeding the £5 million mark for the first time. After taxation, the net profit attributable to the group is £1,889,109. If the recommendations regarding dividends are accepted, the total distribution will amount to £599,471. Allowing for the reduction in the standard rate of income tax, the ordinary dividend is substantially the same as last year, but on this occasion we also propose to pay a centenary bonus of 2½ per cent, less tax. It is a source of satisfaction that it has been possible to do this out of the increased earnings of the group.

RETENTION OF PROFITS

We have retained within the group a total of £1,289,638, as compared with £1,247,355. The ratio of distribution to reserve allocations, including Lewis's Bank Limited, for the last three years, is as follows:

	Distributed	Retained
1956	39.58%	60.42%
1955	34.96%	65.04%
1954	34.42%	65.58%

Although the percentage retention has fallen, the actual amount ploughed back into the business is greater than last year. It should be noted that during the year our staff received substantial wage increases, so that once again staff, stockholders and the business itself have each shared in the increased prosperity of the group.

The retention of profits is a familiar and important feature of your company's financial policy. It is reflected in the substantial liquid resources shown in the consolidated balance sheet, where the net current assets amount to £7,692,164, including stock-in-trade of £3,551,401. These resources mainly stem from the Trust's principal subsidiaries—Lewis's and Selfridges: it is, of course, in these two groups where capital expenditure will be mainly incurred in the coming years.

CAPITAL COMMITMENTS

The capital commitments are shown at £2,240,000. The major components of this

sum are some £1,560,000 for the new Bristol store and depot and £470,000 for the completion of the rebuilding of the Liverpool store. The total, though substantial, falls into perspective when related to the liquid resources already at the disposal of the group. It confirms that there may be some merit in the old-fashioned commercial precept of accumulating your money before you spend it. Thus at a time of acute monetary stringency the group is able to face this major expansion in its activities without undue financial strain. In the last resort, however, the policy to which I have referred of retaining some £1,250,000 out of profits each year can be justified only if it is established that such substantial sums are being, or will be, profitably employed. The following table shows total earnings expressed as a percentage of the total capital employed over the last five years. These figures are the more significant as the purpose of much of this expenditure is to promote future earning capacity, probably many years ahead, and accordingly such capital cannot be expected yet to make any contribution to current earnings.

	Capital Employed	Profit as Percentage of Capital Employed
1952 ...	£22,755,347	15.28%
1953 ...	£24,531,674	16.11%
1954 ...	£25,510,214	16.36%

TRADING EXPERIENCE DURING PAST YEAR

What has been our trading experience during the past year?

On the whole it has been an unsettling year. The bewildering alternations between boom and crisis in the national fortunes make it difficult for both trader and customer to plan far ahead. Above all, it is not merely the steps which are taken to curb inflation but even the rumours of possible action that have disturbing effects on trade, not always in the direction either intended or foreseen. For example, the announcement in the Autumn Budget that purchase tax rates would be increased led to such an up-surge in public spending that turnover in October almost reached the peak levels associated with Christmas trade. As a background to these unsettling trade conditions there has been a constant rise in the costs of doing business, and of these wages account for by far the major proportion.

This raises issues of much wider significance. I have already referred to our increased wage bill during 1955 and during the current year still higher rates will operate. I cannot stress too strongly the importance of dealing decisively with the price-wage spiral of which we as distributors are so acutely conscious. On the whole the price levels of our merchandise, excluding purchase tax, have risen little, if at all, during

the past year, but in my view it is not merely a question of stabilising retail prices but of launching an aggressive attack to reduce them. People want to have access to plenty and to variety in goods. In articles which are essential to a reasonable standard of living, particularly to those starting a new home, reductions in price should be sought by a closer search for the means of reducing costs of both manufacture and distribution. The impetus to such reductions could come if the Government were to recognise that its entry into the channel of distribution through purchase tax makes them a party to some of the inflation which results in retail prices today being more than three times their prewar level. It is our experience that unless a very high rate of tax is imposed, purchase tax has not reduced spending on the goods which are taxed if people want those goods; rather it has increased the Index of Retail Prices, which is an accepted yard-stick in wage negotiations. We recognise that purchase tax is likely to remain a permanent and principal form of taxation on consumer goods. Its yield is formidable. Prior to the Autumn budget it was expected to reach £400 million: that budget was estimated to produce a further £75 million in a full year. It is, however, our experience that frequent changes in rates of tax, uncertainty as to when and what changes may be made, including a disregard of the seasonal experience of retailers, and a high rate of tax on articles in everyday use, together introduce a risk element into distribution, which is being paid for by the consumer. There is, indeed, a case for investigating afresh the ramifications and effects of purchase tax upon retail prices in the light of present-day conditions.

In our own group of department stores the yearly transactions are over 120 million. It is therefore with some knowledge of the habits and reactions of people to goods that I express a belief in the overriding importance of bringing down retail prices and of so dealing with purchase tax that an economic climate can be created in which we and other large distributors can perform our real function. That function is to increase trade, not by having to sell at ever higher prices, but by reducing them. The only real answer to wage demands is to raise the real value of money, and we look forward to the time when we as large distributors can resume the contribution to that end which we have made during a hundred years of trading.

RATING VALUATION

As no review of assessments has taken place since 1934, it was inevitable that substantial increases would occur. This proved to be the case, and the total rateable value of the properties of the group has been increased by 95 per cent. What increased charge will fall on the current year's profits under the heading of rates will, of course, depend on the rate per £, which local authorities ulti-

mately fix. On the general issue I wish to make two points. First, it is clear that under the revaluation a wholly disproportionate share of the rating burden will fall on office buildings and shops, which will increase the costs of distribution. This is a situation which should not be allowed to continue indefinitely and must be made the subject of Government action. Secondly, I strongly deprecate the tendency of some local authorities almost to exploit the higher assessments to obtain a level of revenue so much greater than what appeared adequate last year. It is a matter calling for the closest local supervision by all traders affected, in view of a danger which, if not checked, may well prove a serious handicap to the commerce of the country.

SELFRIDGES

Selfridges Limited have again had a successful year, both turnover and profit achieving new records. The trading profit before tax but after depreciation was £1,111,680, thus for the first time exceeding £1 million; while net profit, after tax, was £510,765. In view of the finance which will be required for the considerable developments which lie ahead, the dividend to Selfridge (Holdings) Limited was kept at the same level as last year, and the profits retained have raised the general reserve to £1½ million and increased the carry forward to £370,638. The consolidated balance sheet of Selfridge (Holdings) Limited now shows net current assets of £2,030,159, of which £1,551,780 is in the form of Treasury bills, tax reserve certificates and cash, as compared with £1,004,011 last year. In view of the improvement in the liquid position the dividend paid by the Holdings Company to the Trust was slightly raised to 30 per cent, and at this level the Trust now enjoys a dividend yield of about 9 per cent on the initial investment made in the Selfridge Group less than five years ago.

Major developments have also occurred in connection with the Northern Site behind the main store building. The transaction for the sale of the land fronting Wigmore Street was satisfactorily concluded on January 1, 1956, and the liquid position as shown by the consolidated balance sheet has been greatly strengthened in consequence.

We are on the threshold of developing the remainder of this exceptionally valuable site which, with one small exception, is now wholly freehold. The detailed plans now await the final approval of the London County Council. They embody an extension of the ground floor northwards, which should add a third to its effective shopping area, as well as providing for the reception, handling and despatch of all goods vehicles in the basement beneath and for the parking of 750 cars above. This development in the first instance will be spread over at least four years, and, unless anything untoward occurs, it is hoped to finance it out of the group's own resources.

In setting our hand to an extensive programme of expansion of Selfridges we have every confidence that it will increase the profit earning capacity of an already profitable investment.

BUILDING DEVELOPMENTS

The construction of our Bristol store proceeds apace and the building is now beginning to take shape. We hope to be able to adhere to our original intention of opening the store in the autumn of 1957.

In Liverpool we have had a full year's trading in the reconstructed unit consisting of two sections of the new store. The third section of the building has now been demolished, and the current year will see the new construction taking shape.

In Leicester the building extensions are practically complete, and certain of the space has already been taken over. Further selling space will be available in the course of the next few months.

In Manchester and in Leeds some progress has been made with the plans for our contemplated extensions, but constructional work has not yet commenced.

HISTORY OF LEWIS'S

As part of our centenary celebrations we hope to publish during the year a history of Lewis's. This has been written by Professor Asa Briggs, of Leeds University, and we hope it will make a contribution to the history of retailing in this country—a field which has so far been neglected by economic historians. In this work the development of Lewis's as a business with its continuing policies has been described against a background of the economic and social history of the period, with all its dramatic impact on people.

STAFF

I am happy to report that our staff relations continue to be cordial. We have been pleased to improve both pay and working conditions, and have also granted additional holidays. We attach special importance to maintaining a high standard of recruitment, and in the improvements we have made in our wage structure particular attention was paid to the level of our junior rates in order to attract the best type of applicant to our service.

THE EARL OF WOOLTON

As stated in the directors' report, your board invited the Earl of Woolton to become the first honorary president of the company upon his resignation as a Minister of the Crown, and we are gratified that he accepted this appointment.

We have thus been able to recognise the exceptional services which the Earl of Woolton rendered to the group over many years, particularly through the formation and development of the Trust.

TRADING PROSPECTS

In conclusion, you may wish me to give you some indication of trading prospects for the current year. Hire purchase and credit sales play so small a part in the activities of the group that our turnover is not likely to be much affected on that score by the present restrictions. Our strong liquid position will enable us to take full advantage of such buying opportunities as may present themselves. If these should enable us to make some impression on the level of retail prices, they will indeed be welcome. On the other hand, it would be unwise not to anticipate some repercussions on our trade from the present credit squeeze, particularly if it is maintained throughout the year; and we shall certainly have to deal with a still higher level of expenses. You may, however, be assured that we shall not lightly abandon the ground we have won in recent years, and no effort will be spared by our enterprising and virile management to overcome whatever difficulties the future may hold in store.

HADFIELDS LIMITED

RESULTS EXCEED FORECAST

REVIEW OF MAJOR DEVELOPMENTS

The sixty-eighth annual general meeting of Hadfields Limited was held on April 4th at East Hecla Works, Sheffield, Lord Dudley G. Gordon, DSO, LLD, MIMechE (the chairman), presiding.

The following is an extract from his circulated statement:

Not long after the return of Hadfields Limited to private ownership in July your Directors became aware that a bid was being made to secure control of Millspaugh Limited. It was felt that to allow this former subsidiary to pass into foreign control would be very prejudicial to all interests.

Your Directors therefore decided to make an offer to the Millspaugh Ordinary Stockholders to exchange their holding for shares in Hadfields Limited and to make use of the unissued shares for this purpose. The Board's efforts have been justified by their success and Millspaugh with its Subsidiaries is now part of the Hadfields Group of Companies.

The Consolidated Profit and Loss Account shows the profit for the year, subject to taxation, to be £826,663. This exceeds the estimate made in the "Offer for Sale" and is due in the main to the high level of sales in the last three months of the financial year. Of the profits available no less than £483,529 has had to be provided for taxation. The net available surplus for the year is £398,838. The dividend recommended is at the same rate as that forecast in the "Offer for Sale."

During the year under review the output of liquid steel exceeded that of the previous year, though it did not quite attain the record made during 1953. In spite of this the output from both the 28-inch mill and the bar mills exceeded any previously recorded figure.

The forging departments were fully occupied during the year and there was a substantial increase in output.

We have been successful in again extending sales of fully-hardened forged steelwork rolls, and our forged composite back-up rolls have continued to make headway both at home and abroad.

Other new lines being successfully developed include supplies for the paper-making industries.

The total value of commercial orders obtained from home and overseas customers was over 40 per cent higher than the previous year and export orders nearly 57 per cent higher.

The inflow of orders since the beginning of the current financial year is such that it is expected there will be no lack of work for any department.

COLLABORATION WITH WALMSLEYS

Arrangements which have been made for collaboration with Walmsleys Limited are confidently expected to result in most important developments which will enable the Hadfields Group of Companies to play an important part in providing the paper-making industry in this country and overseas with the most efficient machinery to meet the ever-growing demand for paper and board which is likely to continue for many years to come.

The report and accounts were adopted and the Ordinary dividend of 7½ per cent was approved.

THE BRITISH SOUTH AFRICA COMPANY

SUBSTANTIAL CONTRIBUTION TOWARDS RHODESIAN HYDRO-ELECTRIC SCHEME

MR C. HELY-HUTCHINSON ON VALUATION OF COPPER FOR ROYALTY

The fifty-eighth annual meeting of The British South Africa Company was held on March 22nd at The Chartered Insurance Institute, 20 Aldermanbury, London, E.C.2, Mr C. Hely-Hutchinson (the President) presiding.

The President, having paid tribute to the late Sir Dougal Malcolm, and having referred to the revival of the office of Vice-President, continued:

The Mineral Revenue for the year, as you will see in the Profit and Loss Account, amounted to £10 million after providing for the share of 20 per cent thereof which is payable to the Northern Rhodesian Government in accordance with the 1950 Agreement. 96 per cent of this was from copper, of which 340,000 tons were produced, and were valued for royalty purposes at an average of £289 per ton, which compared with 370,000 tons at an average value of £210 per ton for the previous year.

FUTURE MINERAL REVENUE

Copper is currently being produced in Northern Rhodesia at the rate of 32,000 tons a month, which is at an annual rate of 384,000 tons, subject, of course, to the effect of any strikes or coal shortages which may occur.

The value per ton for royalty purposes is, at present, over £380, though it may be unwise to base calculations too long ahead upon a continuity of that value.

In addition the Chibuluma Mine should soon be producing copper at an annual rate of 16,000 tons, and as from the beginning of 1957 Bancroft Mines should be producing copper at an annual rate of nearly 45,000 tons, which they plan to double in 1960.

Upon such figures as these may be based a variety of different calculations of future revenue—more or less rosy in proportion to the views of the calculator. The less optimistic may like to be reminded that a reliable observer has as recently as in November last year recorded that in the view of the copper industry collectively the price of Electrolytic Copper is not likely to fall much below £240 a ton in the foreseeable future. On the basis of an annual production rate of only 400,000 tons, at that price, the Company's net annual income from all sources, after tax, calculated at current rates, is not likely to be far short of £4 million.

These are comforting thoughts, but there is a matter bearing upon them of which you should be made aware.

VALUATION OF COPPER FOR ROYALTY

When last year the Rhodesian Selection Trust announced its policy of selling copper at fixed prices, we published a statement in July which recorded that: "the basis on which the Company's royalty on copper should be calculated in the future has for some time been—and still is—under discussion between The British South Africa Company and the RST Group."

Those discussions both with the Rhodesian Selection Trust and our Lawyers continued thereafter, and meanwhile the Copper Companies continued to pay royalty upon the copper produced by them on an agreed provisional valuation basis. At the end of the year, no agreement with the Rhodesian Selection Trust having by then been reached, and having in the meanwhile been finally advised by our Lawyers as to our contractual rights, we unilaterally fixed a new basis of valuation and required the Copper Companies to adjust accordingly the royalties which had already been paid on the agreed provisional valuation basis and to pay royalty in future upon the new valuation basis so fixed.

I might here explain that we had to take into account the change which the London Metal Exchange has made in the basis of its quotations for copper. Before the war the London Metal Exchange quotation was for a ton of rough copper, and that had been adopted in our contracts with the Copper Companies as the basis for valuing copper for royalty. The London Metal Exchange closed down in 1939 and temporary arrangements for valuation were made. When the London Metal Exchange resumed business in 1953, and we sought to return to the use of its quotations, we had to make provision for the fact that its quotation was then for a ton of Electrolytic Copper—a more valuable product than Rough Copper. Our contracts with the Copper Companies gave us the right in certain events to substitute similar standards of valuation to those prescribed in them, and we had to settle what, under those circumstances was a similar standard of valuation. Apart from that, the Rhodesian Selection Trust had taken the view that the London Metal Exchange quotation ought not to be the sole basis for valuing copper for royalty.

Since we thus fixed unilaterally the new basis of valuation all the Copper Companies have conformed to our requirements as to the payment of the royalties calculated in accordance therewith. The Companies under the direction of the Rhodesian Selection Trust have reserved a right to challenge the correctness of that basis, but without any consequential right to readjust retrospectively any payments which it may have made or may make in accordance therewith. The Companies under the direction of Rhodesian Anglo American have not challenged the correctness of that basis, but have reserved the right to claim the benefit of any different basis of valuation which we may hereafter apply to the Rhodesian Selection Trust Companies. This, of course, is reasonable enough.

The revenue from investments amounted to £1,800,000; three-quarters of that total derived from Rhodesian Mining Investments.

At the date of the Balance Sheet there was a net surplus of Assets of £1 million, but there were commitments of various sorts amounting in all to over £5 million. These include provision for the important commitments which, as reported to you at the last Annual Meeting, we have undertaken in

respect of the finance of Bancroft Mines.

Moreover, since the close of the financial year, we have undertaken, as was foreshadowed in principle when we last met, and as was reported in the Press a month ago, to lend to the Government of the Federation of Rhodesia and Nyasaland over the next four or five years a total of £4 million towards the moneys—now estimated at £79 million, as compared with the estimate of £54 million a year ago—required to carry out the first stage of the Hydro-Electric Installation at the Kariba Gorge. The loan is to earn interest on the same terms, whatever they may be, as may be required by the International Bank in respect of such moneys as it may find for the same purpose.

We have no doubt that this substantial contribution towards the finance of this important undertaking is fully justified, not only because, as a source of power, it will greatly benefit the Northern Rhodesian copper-producing industry, with whom our own fortunes are so closely identified, but because we have an inescapable obligation to play our part in the development of the territories from which we draw the greater part of our large revenues. That same obligation may well involve us in other similar commitments in future years.

We thus had commitments totalling some £8 million in excess of the net cash resources. Their chronological incidence is such that we have no reason to doubt, on any reasonable forecast of our future profits, that we shall be able to meet them as they mature and at the same time to maintain the dividend at the annual rate recommended to you today.

The report and accounts were unanimously adopted, and the dividend of 30 per cent for the year was approved.

SCOTTISH MUTUAL ASSURANCE SOCIETY

SATISFACTORY RESULTS OF TRIENNium

The seventy-third annual general meeting of The Scottish Mutual Assurance Society was held on March 28th in Glasgow.

Sir John Craig, CBE, DL, JP, LLD (the Chairman), in the course of his speech, said: The past year has been one of continued expansion. Again a record amount of new business was transacted, the increase over the previous year being no less than 22 per cent.

It was decided to hold investigations triennially commencing December 31st last. Throughout the triennium the mortality experienced has been more favourable to the Society than that assumed in the valuation, while the average net rate of interest has been 4 7/8 per cent, compared with 2 1/2 per cent and 3 per cent adopted in the valuation.

The result of the investigation is that in the Life Fund there is a surplus of £673,393. The Directors have declared a bonus of 44s. per cent per annum, leaving £147,125 to be carried forward. They have also decided until further notice that an intermediate bonus at the rate of 40s. per cent will be paid on claims arising by death or maturity.

Year's Accounts: The rate of interest earned on the funds has increased by 6s. per cent gross and 5s. 3d. per cent net and is now 5 1/4s. 11d. per cent gross or 4 13s. 1d. per cent net. The Society is in good heart; the funds are earning a high rate of interest, the mortality experience is good and the assets are sound. The report was adopted.

REVERTEX, LIMITED

A VERY SATISFACTORY YEAR

SALES AND PROFITS AT NEW HIGH LEVELS

MR D. H. SCOTT'S STATEMENT

The thirty-second annual general meeting of Revertex, Ltd., was held on March 15th at 31/55 Strand, London, W.C., Mr D. H. Scott, CBE, chairman and managing director, presiding.

The secretary (Mr H. K. Marsh) read the notice convening the meeting and the report of the auditors.

The following is the chairman's statement circulated with the report and accounts for the year to September 30, 1955:

I am happy to be able to report that once again our Company has had a very satisfactory year. The volume of sales and the net profit have both risen to new high levels.

rate of depreciation to this plant which will have the effect of writing it off completely in ten years instead of five. For the reasons mentioned we have continued to apply the 20 per cent rate to plant, machinery and factory buildings in Malaya.

BALANCE SHEET CHANGES

In the balance sheet you will find some material changes as compared with last year. In the first place the issued share capital is now £412,500 following the issue last year of one share, credited as fully paid, for every two held. Our stock valuation at £1,261,307 is rather more than double the figure last year. This is due partly to a physical increase in stocks and partly to a substantial rise in the price of rubber. Our policy has always been to hedge our stocks of Revertex and Revultex, in so far as they are not covered by forward sales, by selling rubber forward. This is the reason for the big increase in the item "forward sales of rubber" and the corresponding item of the same amount on the other side of the balance sheet "liability in respect of rubber sold forward." We hedge in order to reduce as far as possible the risk arising from fluctuation in the price of rubber, but in these days when there is a persistent backwardation, i.e. when the forward positions are at a discount compared with spot, this hedging can only be done at some cost.

Included in the profit on trading is the sum of £10,589 received during the year in final settlement of our claim for war damage in Malaya.

DIVIDEND AND PROSPECTS

The Directors recommend the payment of a final dividend of 15 per cent, less tax, making with the interim dividend of 10 per cent, less tax, paid last November, a total of 25 per cent, less tax, for the year. The total dividend of 25 per cent, less tax, on the increased capital will absorb the sum of £59,297 net, and after allowing for the £137,500 capitalised last year, unappropriated profits will be increased by £37,210 to £389,887. In addition, continuing the policy of bringing the issued capital gradually into line with the real capital employed in the business the Directors propose to issue to the present shareholders 165,000 new Ordinary Shares of 5s. each, credited as fully paid, in the proportion of one new share for every ten shares held. This will involve the capitalisation of £41,250 of the unappropriated profits of £389,887.

Our business continues to expand, but competition is keen and the margin of profit is less than it was last year, with the result that, for the first quarter of our current year, although our turnover has increased, the net profit is about the same as the corresponding quarter of the previous year.

TRIBUTE TO STAFF AND EMPLOYEES

In conclusion I know you would like me to express your appreciation of the good work done by all our staff and employees. It is difficult to avoid rather stereotyped phraseology each year, but I hope to make

PRODUCTION AND SALES

Sales of Emultex (polyvinyl acetate emulsion) have shown a satisfactory increase and we are steadily developing new uses for this material. Our second factory at Harlow, to which I referred in my speech last year, was completed in the spring. By a fortunate coincidence in timing, we were able to make a large part of it available for the Harlow Industrial Exhibition before we moved in ourselves. This exhibition was opened by Sir Frank Lee, of the Board of Trade, and proved a great success. Many of the visitors were surprised at the wide variety of products which are now made in Harlow and our own stand was generally admitted to be one of the best.

The development of Alcotex (polyvinyl alcohol) has proceeded steadily, and I am glad to say that this product is now making a small contribution to our trading profit. Work will shortly be started on a third factory unit at Harlow to house new plant for its manufacture, which should enable us to increase output very considerably. Sales of Revertex and Revultex were maintained in spite of the substantial increase in the price of rubber.

The area of Central Johore, in which we are mainly interested, is still unsettled. Our staff has worked extremely well under these difficult conditions and I am glad to say that the output of our plants has not been appreciably affected.

ACCOUNTS

For the year under review the profit before tax amounted to £467,007 as compared with £438,577 for the previous year and £302,493 for the year before that. The net profit, after making full provision for taxation, was £234,007 as compared with £190,077 and £101,993 for the two preceding years.

On the advice of our Auditors we have revised the rates of depreciation. Until now depreciation has been charged at the rate of 20 per cent per annum on the original cost of plant and machinery acquired since the war and in view of the disturbed conditions in Malaya the same rate has also been applied to factory buildings in that country.

It has become clear, however, that much of the plant which has been installed in our factory at Harlow will have a longer life than five years. In the accounts under review we have, therefore, applied a reduced

it clear that your thanks are none the less sincere.

The report and accounts were unanimously adopted; the proposed dividend was approved; the retiring director, Mr H. K. Marsh, was re-elected; the directors were authorised to fix the remuneration of the auditors, Messrs Deloitte, Plender, Griffiths & Company and the proposed capitalisation of reserves was approved by the shareholders subject to the consent of HM Treasury.

JOHN HOLT & COMPANY (LIVERPOOL) LIMITED

RECORD TURNOVER—REDUCED PROFIT MARGINS

The fifty-ninth Annual General Meeting of John Holt & Co. (Liverpool) Limited will be held on April 20, 1956, in Liverpool.

The following is an extract from the circulated Statement of the Chairman, Mr John A. Holt:

The year ended August 31, 1955, was disappointing. Intense competition and over-importation of consumer merchandise in most parts of West Africa resulted in our merchandise profit margins being cut to the bone, and the usual valuable contribution to our revenue from our produce activities was transposed into a substantial loss by a sharp and unforeseen fall in the market prices of cocoa and coffee.

Our total turnover in merchandise and produce amounted last year to £274m, which is another record. We do not seek an increase of turnover for its own sake, and would have been satisfied with a lower figure if we could have shown some improvement in profit margins.

The year in general has been one of falling prices for agricultural produce. We continue to buy, as agents, those types of produce whose export from Nigeria and the Gold Coast is controlled by the Marketing Boards. The sale of well over half the world's crop of cocoa is in the hands of the Boards and the Brazilian Government. My own view is that the more operators there are in the commodity market, the less violent and painful are the fluctuations in price. Within two years, the price of cocoa has fluctuated from over £500 per ton to under £200 per ton. I suggest that to have allowed the price to rise to this astronomical figure carried the seeds of its own decay by stimulating consumer resistance.

The movement towards self-government in the Regions of Nigeria and the Gold Coast continues. Many of us have had the opportunity of meeting some of the best-known West African leaders, and have been impressed by their recognition of practical difficulties and their sincerity of purpose.

Slow turn-rounds and increased volume of traffic made it necessary for The Guinea Gulf Line Ltd. to charter tonnage at high rates to meet their requirements, and this resulted in a heavy drain on The Line's earnings. However, current earnings are at a higher level and the outlook for 1956 is brighter.

In 1954, I concluded by saying: "It behoves us, therefore, to prepare for the lean years." The experiences of the last two years have shown that that warning was justified, but I feel there are grounds this year, for looking forward with cautious optimism, for the results of the current financial year so far are significantly better than they were twelve months ago.

THE BRADFORD DYERS' ASSOCIATION LIMITED

SATISFACTORY TRADING

MR JAMES EWING'S REVIEW

The fifty-eighth annual general meeting of The Bradford Dyers' Association, Limited was held on April 9th at Bradford.

Mr James Ewing (the Chairman), in the course of his speech, said:

Overseas Interests: With the exception of our Canadian subsidiary, our overseas enterprises have continued to make a satisfactory contribution to our profits. The combined trading results of these companies represent a very substantial proportion of the total profits of the Association.

UNITED KINGDOM

A year ago I referred to the successful outcome of our efforts to piece-dye cloths composed of Wool and Terylene blends, and that work has now been consolidated by experience in bulk. This does not signify the end of research into Wool/Terylene dyeing problems, but implies that bulk yardage can now be handled satisfactorily.

Several other new blends, such as Triacetate and Wool, Orlon and Wool and Acrilan and Wool, are also occupying our attention, and our constant liaison with USA developments will help us more readily to solve the piece dyeing problems which are still ahead.

We are not apprehensive that woollen and worsted fabrics are likely to be supplanted by man-made fibres, particularly for the home market; but we see increasing opportunities of extending the demand for mixture fabrics, which are as yet but a small proportion of the market for woollen and worsted cloths, and if those trends combine the old fibres and the new, then the dyer must be ready to meet this demand.

The Lancashire textile industry has been very much in the press during the past year. It is recognised in the industry that no more can be expected from the Government, whether in the home or export markets, than opportunity to trade—no more, but surely not less. We have to contend not only with competition from countries with lower living standards but with countries with harsh tariff regulations.

Despite lack of support from the Government, I believe that the industry can do much to put its own affairs in order. It is obvious that there is too much plant too lightly employed in meeting the present demands. I suggest that with the assistance of the Cotton Board a budget should be prepared for each horizontal section of the Industry, showing the plant required to produce, when fully employed on multiple shift working where practicable, the estimated volume based on realistic calculations of demands for both home and export markets.

In the Finishing Section of the Industry, the major combines have dealt with their own redundancy problem from their own resources. But more must still be done. The Industry must face, at least, double shift working in all its producing units.

Your Company has spent nearly £3 million during the past six years in maintaining the production units of the home branches in the highest possible state of efficiency. The charge, so often levelled against the textile

industry, of not keeping pace with modern needs, cannot be levelled against the leading companies in the Finishing Section.

CONTROL OF COMPETITION

Much is heard today about the abuse of monopolies. It seems to me that term has lost its significance. In private industry there are few monopolies, and having regard to the large number of producers in our own industry there is no opportunity for any one firm, even the large combines, to manipulate a market to the detriment of the consumer. This applies particularly in the export sections of the trade.

To reassure the public, the Restrictive Trade Practices Bill is timely, and the President of the Board of Trade has shown great courage in launching the Bill, which I hope in its final form will be fair to all sections of the community—the producer and the customer. The need for co-operative effort amongst producers has become more and more necessary in our complex industrial society, and it would be a calamity of the first order if the final form of the Bill put the clock back and left us in a state of chaos.

LABOUR AND PRODUCTION

In general our workpeople have been fully employed during the past year and our normal happy relations with them have continued. Changes in methods, necessitated by the development of new fibres, fabrics and machinery, have been adopted with remarkable smoothness, and the responsible attitude of the Trade Union to which we have been long accustomed is invaluable in these days when it is essential that both workpeople and management should be receptive to new ideas and new methods.

Works Councils at our Branches are democratically elected from all grades of employees, and they are of great service in joint consultation and in providing for the ventilation and consideration of many matters which, if left unheeded, might grow into causes of discord. The Branch Accident Prevention Committees also are to be congratulated in that their sustained efforts over a long period of time are achieving a continuing reduction in the number of accidents.

There is need in industry generally for the closest possible co-operation between management and workpeople, and for the settlement of disputes, particularly those affecting wage rates, without recourse either to strike action or to arbitration. Figures published in the *Ministry of Labour Gazette* show that, during 1955, 3,794,000 working days were lost in industrial disputes. The loss of production attributable to these stoppages was enormous.

Possibly the most effective single action that could be taken today to improve production in the United Kingdom would be the removal of conscription, for its adverse effect on production is immeasurable. Industry cannot afford to lose for two years young men at the highly receptive age of 18 years.

It would be rash on my part to attempt to indicate the results of our trading during the current year. All I will say is that your

company, as a result of the forward policy of the past decade, is well equipped both at home and abroad to meet competition and to give to its customers the latest and best finishes known to the industry. We can, therefore, look forward with confidence to the future, and I hope, if it is my privilege to address you next year, to place before you results no less favourable. Some progress has already been made in the employment of our substantial liquid resources by diversifying our interests in fields outside textiles, and this diversification will be extended as opportunities present themselves. Our latest interest is in the field of non-woven fabrics and a detailed announcement will be made later.

The report and accounts were adopted

THE CHARTERED BANK OF INDIA, AUSTRALIA & CHINA

THE ONE HUNDRED AND SECOND ANNUAL GENERAL MEETING

The One Hundred and Second Annual General Meeting of The Chartered Bank of India, Australia & China was held on April 4th at the Bank's Head Office, 38, Bishopsgate, London, E.C.2.

The Chairman of the Bank, Mr V. A. Grantham, presided.

Mr H. F. Morford, Chief General Manager, read the notice convening the meeting and the report of the Auditors. With the consent of the stockholders present, the Report and Accounts, which had been circulated previously, were taken as read.

The Chairman then moved that the Report and Accounts for the year 1955 be approved and that a final dividend of 7½ per cent, less Income Tax, be declared; this, together with the interim dividend of 7½ per cent already paid, made a total distribution for 1955 of 15 per cent. The resolution was seconded by Sir John Tait and carried unanimously.

Sir Kenneth Brand Harper and Sir Charles Watt Miles, OBE, were elected Directors of the Bank and the retiring Directors, Sir Paul Benthall, KBE, Sir John Tait and Sir Henry Richardson were re-elected.

Messrs Deloitte, Plender, Griffiths & Company and Messrs W. A. Browne & Co. were re-appointed Auditors and their remuneration fixed.

A vote of thanks to the Directors, General Managers, Branch Managers and the Staff at home and abroad for their successful conduct of the affairs of the Bank was proposed by Mr Joseph Nissim and seconded by Mr Arnold Jones.

EXTRAORDINARY GENERAL MEETING

Following the Annual General Meeting an Extraordinary General Meeting of the Bank was held for the purpose of seeking the approval of the Stockholders to the Court of Directors' petition for the grant of a new and consolidating Royal Charter and to the adoption of new Bye-laws and Rules.

After Mr H. F. Morford, the Chief General Manager, had read the notice convening the meeting, the Chairman proposed "That the Royal Charter in the form of the draft presented to Her Majesty in Council (a print whereof is submitted to this meeting and subscribed by the Chairman thereof for the purpose of identification) be and the same is hereby adopted as the Royal Charter of the Bank subject to such modifications and amendments as the Court of Directors may agree with Her Majesty's

Privy Council, and that such Royal Charter shall take effect as from the date when Her Majesty shall be graciously pleased to assent to the issuance of Letters Patent granting the same."

The resolution was seconded by Sir John Tait and carried unanimously.

The Chairman then moved:—

"That, pursuant to the powers conferred upon the Bank by the Royal Charter referred to in Resolution No. 1, the Regulations entitled 'Bye-laws and Rules,' in the form of the print submitted to this Meeting and subscribed by the Chairman thereof for the purpose of identification be and the same are hereby adopted concurrently with the provisions of the new Royal Charter as the Bye-laws and Rules of the Bank, in substitution for and to the entire exclusion of the provisions of the Deed of Settlement dated the 6th May, 1930, and the regulations therein contained as from time to time amended by Special Resolutions of the Bank."

The Resolution was seconded by Sir John Tait and carried unanimously.

TWINING CROSFIELD & COMPANY

EFFECTS OF PRICE FLUCTUATIONS

The thirty-ninth annual general meeting of Twining Crosfield & Company Limited was held on March 28th in London, Mr H. W. Backhouse (Chairman) presiding.

The following are extracts from his circulated statement:

On November 1, 1955, we acquired two new Subsidiaries for £187,250. The new Subsidiaries' profits for the two months to December 31, 1955, have been included in the consolidated accounts. The additional earning capacity which the new acquisitions give us will prove to be of considerable value to the group.

Tea distributors will remember 1955 as an exceptionally difficult year. Owing to the unprecedented break in the market which began at the end of January we had to face very heavy stock losses. Coffee price variations also made 1955 an uncertain period for distributors.

To a very reduced profit of £46,847 for 14 months against £95,746 for 12 months last year we have added £22,064 representing tax recoverable, stock reserve and part of our investment reserve no longer required. Since all our losses of last year have been provided for and we are now trading satisfactorily we feel justified in recommending a final dividend on the Ordinary Shares of 12 per cent less tax, making 16 per cent for the period against 18 per cent for 12 months ending October 31, 1954. After provision for taxation, the Carry Forward is £107,744 against £106,431.

The new year has started reasonably well but we can be quite sure that competition will continue to make it as difficult as is normal. Heavy advertising by our biggest competitors seems to be causing a growing proportion of the tea trade in England and Wales to drift towards advertised brands. We propose in the course of the year to start advertising our teas.

TWININGS is a name that has always been associated with "good" tea which is not quite the same as "cheap" tea. There is still a steady demand for "good" tea with flavour and character which is not surprising as the extra cost per cup is virtually negligible.

The report was adopted.

THE PATALING RUBBER ESTATES, LIMITED

SIR ERIC MILLER'S ANNUAL ADDRESS TO SHAREHOLDERS

The thirty-sixth annual general meeting of The Pataling Rubber Estates, Limited, was held on April 4th at the Registered Office of the company, 1-4 Great Tower Street, London, E.C.

Sir Eric Miller, chairman of the company, in the course of his address, said: Our crop of 9,635,200 lb was 833,900 lb higher than that for the previous year; an increase mainly attributed to cropping in post-war plantings. The average yield rose by about 70 lb per acre tapped. Including a proportion of sole crepe and lower grades the crop realised approximately 31d. per lb London landed terms—about 7½d. per lb more than that obtained for our 1953-4 harvest. On the other hand, the all-in cost of production was higher by about 3½d. per lb due to increased export duty and cess.

WORKING PROFIT

Our profit before taxation, but after charging export duty and cess, was £461,130 against £371,845 in the previous year. Export duty and cess at £218,648 took £139,730 more than in 1953-4, and the 1954-5 profit included only £32,796 in respect of replanting cess refunds, whereas in 1953-4 similar refunds amounted to £121,521. Taxation in Malaya and the United Kingdom on the year's profit absorbs £213,475 against £135,936 in the previous year when we had the benefit of a taxation refund of £40,445. We have transferred £18,780 to capital general reserve and £85,855, representing the year's expenditure on replanting, to cultivation and replacement reserve; the two interim dividends paid, together making 35 per cent for the year, absorbed £149,607, and the amount carried forward to next year will be £161,581 against £159,661 brought in.

REPLANTING

Our programme of rejuvenation was further advanced during 1955 by replanting 1,086 acres and new-planting 83 acres. Over the three years 1956-8 some 3,800 acres are scheduled for replanting or new-planting.

TIN MINING

I told you last year that we had been approached with a view to agreeing terms which might lead to part of Bikam estate being sold or sub-leased for dredging to a well-established tin company. After some delay in negotiations an agreement was reached on October 26, 1955, with Southern Tronoh Tin Dredging, Limited, giving them prospecting rights for tin mining over the estate with an option to purchase outright at an agreed figure such area as they may select for dredging. Prospecting operations started in December, but on January 25th, Mr Roderick Gordon, the tin company's prospecting engineer, was ambushed and killed by terrorists. This most regrettable outrage has made it necessary for the tin company to suspend temporarily its prospecting operations.

We are also negotiating with a Chinese miner who wishes to prospect Sultan Ydris

division of Chumor estate (comprising 300 acres) on the understanding that the whole division would be purchased by him at an equitable price if the tin content should be found to be an economic proposition.

STAFF

We are fortunate in our staff, both European and Asian. Your properties are their first care, and their keen interest and loyalty, in some cases under trying conditions, merit your best thanks.

POLITICAL DEVELOPMENTS IN MALAYA

The recent constitutional conference held in London has assured Malaya of self-government within the Commonwealth by August 31, 1957, and we must all hope that the friendly attitude adopted by both sides in these difficult negotiations will bring the lasting response which is desired by all those who have the future well-being of Malaya at heart. The agents of disruption are busy everywhere in the free world, and the best antidote to their activities is to be found where sound economic conditions prevail, affording regular work at fair wages, under a firm and just government determined to maintain law and order. We have faith in the future of Malaya and of the natural rubber industry there, and deprecate very strongly any suggestion that we should curtail our activities because of the impending political changes. On the contrary, in my considered opinion, there never was a time when people like ourselves, who know Malaya well, could play a more useful part than in helping it along the road to sound self-government.

RUBBER SITUATION

The selling price of rubber and, to a lesser degree, of tin, has a very material bearing on the financial condition of the country. A year ago the London market price of No. 1 RSS was about 25d. per lb, and during succeeding months it rose to a high point in September of nearly 44d. per lb under the influence of the hectic boom in automobile production, particularly in the USA, which far outstripped earlier expectations. The pace was too hot to last, and we are now back to 26d., which is a much healthier level for competition with the synthetic products. Violent price fluctuations are not in the best interests of the industry, but human nature being what it is, they are inescapable. The changed atmosphere will, we hope, facilitate a mutually acceptable revision of the wage scale now under negotiation.

For the current year our crop should be well ahead of last year's, for during the first four months we have harvested 3,627,300 lb against 3,102,100 lb over the same period in the last financial year. Including forward sales, we have sold to date 1,508,000 lb at an average price of approximately 30½d. per lb London landed equivalent, and we also have some sole crepe booked for forward delivery at a fair premium.

The report and accounts were unanimously adopted.

BEAUMONT PROPERTY TRUST, LIMITED

LARGER DIVIDEND

The twenty-second annual general meeting of The Beaumont Property Trust, Limited, was held on March 27th in London, Mr Cyril W. Black, JP, MP, FRICS, FAI, the chairman, presiding. The following are extracts from his circulated statement:

The property revenue of the Group for the year ended September 30th last is shown as amounting to £243,370, which is approxi-

mately similar to the corresponding figure for the previous year. The profit carried down is £177,610, which compares with a figure in the previous year of £181,270.

On the other hand, income tax and profits tax amount to £100,422, showing a reduction of over £6,000 in comparison with the corresponding figures for the previous year, and, in addition, maintenance claims to 1954/55 have enabled the company to provide for a repayment of income tax amounting to £8,217. A reduction of rather less than £4,000 in the profit before tax is therefore much more than offset by a reduction in the total income tax and profits tax of over £14,000.

RESERVES

The group capital and revenue reserves, including profit and loss balances, now amount to the very considerable total of £297,225. These reserves are equivalent to considerably more than 40 per cent of the Ordinary share capital of the company and, in addition, there is a large hidden reserve represented by the increased values of many of our properties over and above the book values.

A final dividend of 7 per cent, less income tax, is recommended and, if this recommendation is approved, it will bring up the total Ordinary dividend for the year to 10 per cent, less income tax, compared with 9 per cent, less income tax, in the preceding year.

Your Directors are proposing that the authorised Ordinary share capital of the company be increased from £718,750 to £800,000 by the creation of an additional 81,250 Ordinary shares of £1 each. It is thought that favourable opportunities may from time to time occur for the profitable employment of additional capital. Your Directors see no reason to doubt that the satisfactory position of the companies will be maintained. The report was adopted and the proposed increase of capital approved.

GENERAL INVESTORS AND TRUSTEES

INCREASE OF CAPITAL FORESHADOWED

The forty-ninth annual general meeting of General Investors and Trustees, Limited, was held on March 22nd at 52-54 Gracechurch Street, London, E.C.3, Mr R. G. Mills (the Chairman) presiding.

The following is an extract from his circulated statement:

The final dividend payment making 19 per cent for the year is appreciably better than the 15 per cent we estimated a year ago that we should be able to pay on the increased capital.

The Board has now in view to recommend to you a further increase in the Ordinary capital. Subject to the contingencies mentioned below the proposals are that:

- £215,622 be capitalised to enable a bonus of £1 of New Ordinary Stock to be issued free for every £4 of Stock now held, and
- Contemporaneously a similar amount be issued in the same ratio on the existing Stock as a "rights" issue at par.

It will be necessary to obtain the permission of the Capital Issues Committee and assuming this is granted, the Board is not disposed to take the subsequent steps to implement their recommendation before they are acquainted with the provisions of the forthcoming Budget.

In conclusion, so far as we can estimate, our revenue for the current financial year should not be less than for the year just ended. Provided our estimates are not upset, we would, if the capital is increased, expect to pay a total dividend of not less than 14 per cent for the coming year, of which 5 per cent would be paid as an interim dividend on October 1st.

Addressing the meeting the Chairman said that the consent of the Capital Issues Committee had now been received in connection with the Board's capitalisation proposals.

The report was adopted.

THE MERCANTILE BANK OF INDIA, LIMITED

FURTHER GENERAL BUSINESS EXPANSION

INDIA'S YEAR OF SUSTAINED PROGRESS

SIR KENNETH W. MEALING'S REVIEW

The sixty-third annual general meeting of The Mercantile Bank of India, Limited, will be held on April 17th, in London.

The following is an extract from the statement by the chairman, Sir Kenneth W. Mealing:

The expansion recorded last year in the Bank's general business continued during 1955. The Balance Sheet total is £72,065,153, against £68,594,152 on December 31, 1954. Deposits are higher by nearly £4 million, whilst on the Assets side there are increases of over £2 million in Loans and Advances, nearly £1 million in Bills Receivable, whilst the holding of Government Securities is £4½ million higher.

There has been a considerable fall in the value of our holding of Government Securities, for which full provision has been made. Of those quoted in Great Britain, 77 per cent are due to mature within the next five years, whilst the remainder mature on fixed dates beyond that period. Similarly with securities quoted on Overseas Stock Exchanges 50 per cent mature within the next five years.

The net profit at £235,423 is higher by £41,099. The two dividends declared total 14 per cent, payable on the increased capital and cost £118,335, compared with £97,020 for 1954. From the balance the usual allocations have been made to the Officers' Pension Fund, Premises Account and Contingencies Reserve Account, leaving the balance carried forward at £219,372, against £200,284.

POLITICAL AND ECONOMIC SITUATION

The year 1955 produced high hopes of a relaxation of international tension following the "summit" talks at Geneva in the month of July. These hopes, however, were shattered at the ensuing Foreign Ministers' Conference when it became clear that the Soviet bloc had no intention of permitting free elections in East Germany as a preliminary to German re-unification, nor of paying more than lip-service to the principle of international disarmament. This reversal of the Geneva atmosphere, coupled with the provocative references made by the two Russian leaders in India and Burma to "colonialism," crystallised the opinion that there is little or no prospect of a real relaxation of tension or of ending the "Cold War" until a real disarmament agreement can be brought into effect.

In England the freedom from all economic physical controls, the very full employment and increased internal consumption reflected in a higher standard of living for the majority, set up a rising spiral of wages and costs. As a result, the country was importing and consuming more than it was exporting and this economic unbalance resulted in a weakening of sterling in the world's markets. The initial remedial steps were to raise the Bank rate to 4½ per cent and to place certain restrictions on hire-purchase terms. In October an autumn Budget increased Purchase Tax on most consumer goods, whilst further steps were taken to restrict credit. It is to be hoped that these steps and those subsequently taken, including a 5½ per cent Bank rate with further restrictions on hire purchase, together with restraint by all sections of the com-

munity, will remedy the situation without necessitating the reimposition of economic physical controls, such as limitation of imports, price fixation and rationing.

In the United States of America industrial activity continued under boom conditions.

INDIA

1955 was a year of steady and satisfactory progress for India. Agricultural and industrial output continued to rise and the standard of living of the people has also risen. The average monthly earnings of workers is calculated to have risen by nearly 50 per cent since 1947. Although the first Five Year Plan which is due to be completed by March, 1956, has not in all respects achieved its targets, it has been a success as far as the economic life of the country is concerned and it appears that deficit financing has produced a higher rate of development expenditure without causing inflation.

By Constitutional amendments, by a drastic revision of the Indian Companies Act and by the Finance Act 1955 as well as in numerous pronouncements, some of the proposed steps towards a "socialistic pattern of society" were promulgated during the year. With the third successive good monsoon there was no food problem, notwithstanding the normal increase in population: and this again resulted in a large saving in foreign exchange expenditure on imported food. During the year the Imperial Bank of India was nationalised and became the State Bank of India, thus terminating a long and honourable chapter of banking history. The State Bank has been created largely in order to extend banking facilities widely throughout rural India to an extent which it would be impossible for other than a State Bank to undertake.

The second Five Year Plan is now under consideration. It is a massive project and, bearing in mind its great objective of raising the standard of living of the people and providing for the rapidly increasing population, it must be hoped that it will meet with at least the same measure of success as the first Five Year Plan. Whether or not, however, this can best be accomplished by Government concentrating its energies on creation of the new, rather than acquisition of the old and well-tried, is a matter of opinion.

PAKISTAN

The framing of the new Constitution is making progress, but problems in regard to the allocation of powers between the centre and the provinces and on the question of joint electorates still present some difficulty.

Pakistan has decided to become a Republic and it is good to learn that it is her intention to remain in association with the Commonwealth.

The second event of major importance was the devaluation of the Pakistan rupee to its old level of 1s. 6d. One effect was to assist Pakistan's exports, but another was an immediate rise in the internal price of imported goods.

The country's shortage of foreign exchange remains a problem, although there has been some improvement during the year. As a result the control of imports has been some-

what relaxed and the internal finances of the country are considered to be reasonably sound and the budgetary position satisfactory.

CEYLON

With a record tea output for 1955 of 380 million pounds the industry generally has not done badly, but has understandably been hampered in that overseas buyers especially have been handicapped by the frequent administrative changes in the export duty.

The rubber industry has had a reasonably successful year but the generally higher external prices for the commodity have resulted in the China/Ceylon Trade Agreement not being so beneficial to Ceylon as in 1954.

Coconut oil and the copra industries have also had a reasonably successful year, whilst the cost of food imports fell substantially. It is therefore not surprising that the Ceylon Government had a net cash operating surplus of Rs.128.7 million, which compared favourably with the figure of Rs.33.7 million at the close of the previous financial year and is one of the biggest surpluses ever recorded in Ceylon.

BURMA

There has been some improvement in the internal security situation of Burma during 1955. The insurrection still continues but successful operations by the army and security forces have reduced its effectiveness to hit-and-run raids carried out by gangs of bandits supported by the Communist party. Nevertheless, the Government is optimistic of achieving internal peace before the General Elections which are due to be held in April, 1956. At these elections the Anti-Fascist People's Freedom League, the party which controls the present Government, expects to be re-elected with a large majority. Their political creed is the socialist state and the complete nationalisation of Burmese trade, and in furtherance of this policy the Civil Supplies Management Board which has hitherto imported 12½ per cent of the country's consumer requirements, will in future import 50 per cent. The department will have the sole monopoly for the import of most forms of textiles, cement and a number of other necessities. All this and much other business has to be channelled through the Government owned State Bank. Nevertheless, there is much goodwill towards the British and there may well be mutual advantage in a new growth of industrial and trading relations with Burma.

MALAYA

1955 has been an eventful year for the Federation of Malaya and for Singapore. Economically it has been a prosperous year, prices for rubber, tin and other commodities produced in these territories having maintained reasonable and, indeed, profitable prices. The export figures for 1954 (including re-exports) proved to be considerably lower than had been estimated and, in fact, only reached the figure of \$2,985 million. The export figure to the end of November, 1955, however, amounted to \$3,698 million,

so that the year 1955 should show a balance of somewhere in the neighbourhood of \$230 million in favour of Malaya compared with a deficit of \$154 million in 1954.

The main events of the year, both in Malaya and in Singapore, were the General Elections followed by the setting up of the new Governments with, in the case of Malaya, Tengku Abdul Rahman as the Chief Minister and in Singapore with Mr David Marshall as Chief Minister. In Malaya the transition to a measure of self-Government was achieved remarkably peacefully, but in Singapore there were disturbances and set-backs and a considerable amount of striking by labour.

In Malaya, although there may have been some measure of improvement in the Emergency, unfortunately there are few signs of this coming to an end.

THAILAND

Overseas trade improved considerably during the year 1955. As I told you a year ago, the rice export trade was given back to commercial enterprise and, as a result, total shipments of rice amounted to 1,223,937 metric tons compared with 993,719 in 1954. The largest individual purchaser was Japan, who took just under 350,000 tons. Singapore and Malaya between them took 400,000 tons, Hongkong 170,000 tons and the Philippines 66,000 tons. In September the Government announced that imports and exports were in balance and removed the requirement that part of the proceeds of rice, rubber and tin exports should be sold to the Bank of Thailand at the official rate. The various steps taken to free trade were bold in conception but have been proved successful. On the other hand, the teak industry of Thailand appears to be in decline and there seems little doubt that the quantity of teak available for export will decrease considerably in the next few years.

HONGKONG

Hongkong continues to make great strides in industrial expansion and the establishment of new industries; no less than \$663½ million of Hongkong made goods were exported in the first eleven months of 1955, the principal buyer being the United Kingdom, which absorbed \$125 million. This helped to replace the heavy decline in exports to Burma, Indonesia and Pakistan.

Hongkong continues to be an oasis of good Government and law and order, unencumbered with political problems and able to concentrate on industrial growth and commercial activity of high quality and resultant prosperity.

MAURITIUS

The finances of the Colony are in sound condition, and the year to the end of June, 1955, provided a surplus of some Rs.6 million of revenue over expenditure. On the revenue side 34.6 per cent is budgeted for from direct taxation with a further 24 per cent from Customs duties. The Government of Mauritius found it expedient to float a loan in October on the London market for £2,090,000 at 97 and carrying interest at 4½ per cent.

JAPAN

The anti-inflationary policy has continued and the balance of overseas trade further improved: exports rising substantially (some 24 per cent over 1954) whilst imports remained approximately unchanged, the balance is expected to yield a surplus of some 360 million US dollars.

FORD MOTOR COMPANY LTD.

SUBSTANTIAL PROGRESS DESPITE DIFFICULT TRADING CONDITIONS

LOW COSTS—KEY TO PRESENT COMPETITIVE SITUATION

The twenty-seventh annual general meeting of Ford Motor Company Limited will be held on April 20th in London.

The following is an extract from the circulated statement of the Chairman, Sir Rowland Smith, MIMechE:

Despite intensive competition abroad and increasingly difficult conditions in the home market, 1955 was a period of substantial progress, and total production of 356,000 units, reaching 1,500 vehicles per working day by the end of the year, showed an increase of 19 per cent on 1954. 168,495 units were exported and total exports realised £68,559,628. Both these figures constituted all time records, and sales of commercial vehicles overseas rose by the substantial amount of 51 per cent. The continued growth of our tractor business merits a special mention. Sales at home rose by 29 per cent and of the record production of 48,872 units no less than 67 per cent were exported.

EFFECTS OF GOVERNMENT RESTRICTIONS

Towards the end of 1955 the Government's "credit squeeze" began to have a restrictive effect on the home market and the fall in demand was accentuated by the reappearance of a seasonal pattern of fluctuation resembling that familiar before the war. In recent weeks stricter Government measures have further accentuated the falling trend in home demand. It has been officially suggested that deterrents to home sales provide a stimulus to greater export effort, but in this Company we have known only one degree of export effort—the maximum—and without it the above results could not have been achieved. This remains our policy.

The British motor industry has made greater progress in the export markets than any other major industry. Last year the value of its exports was £387 million, which was 13 per cent of total British exports, and over twenty times as great as in 1938.

Since my last report considerable progress has been made with our expansion and modernisation programme.

The year's results reflect the effect of rising costs against a background of stable prices. Although net sales rose by 19 per cent to the record total of £151 million, profit before tax declined. Taxation amounted to £8,156,000 leaving a net profit after tax of £8,551,649.

We derived a benefit in respect of investment allowances totalling £1.2 million on our considerably increased capital expenditure in 1955, but have noted with concern the recent announcement by the Chancellor of the Exchequer that these allowances are to be withdrawn in respect of future capital expenditure for which contracts had not actually been placed. Unfortunately, a large proportion of our expansion programme has not yet reached that stage of development and the adverse effect of this withdrawal upon us will be considerable.

The most significant feature of the year's operations has been the decline in profit margins.

PROBLEM OF WAGE INCREASES

I think it appropriate to say a few words about wage increases. No one would belittle

all that we owe to the many who through their loyalty and effort have co-operated in the successful expansion of production for so many years. There comes a time, however, when it is necessary to sound a note of warning. Frequent wage increases become damaging to any business and to its employees unless these are met out of increased efficiency and productivity. Only thus can we meet competition, particularly foreign competition, on equal terms. This basic economic fact must be understood by all, for if through excessive wage advances we are unable to maintain our present position in world markets, we concerned will share the responsibility and suffer the consequences.

At home, the years ahead may well present greater difficulties than have been experienced in recent years. Abroad, the main feature of the year has been the continued success of German competition in Europe, and its rapid progress in other markets. We are doing our utmost to combat this trend and will continue to do so with products of high quality and finish, and with low cost our paramount concern. Indeed, that is the key to continued production at current levels and to the maintenance of employment.

THE FUTURE

Looking further ahead, we are confident that the long-term upward trend of world demand will be resumed as living standards continue to rise, and a steadily expanding margin of income becomes available for the "non-essential" goods which, with custom and time, gradually come to be demanded as necessities. The motor car is already so regarded in North America and parts of the Commonwealth. Within a generation, given peaceful development, it may well have become a necessity not only in this country but in Western Europe and other areas with comparable living standards.

We believe that these factors assure the long-term growth of the world market for motor vehicles, and it is upon a careful appraisal of these trends that we have based our expansion programme.

DIRECTORATE

Our Executives retire at 65. I passed that milestone in 1953, but was asked to continue in the Chair for a further period. I agreed to do so to make some useful contribution towards our future plans. These are now maturing, some have already come to fruition. Consequently, I feel it now appropriate to hand over my heavy responsibilities to a younger man; my colleagues have invited me to remain on the Board. Your Directors intend to elect Sir Patrick Hennessy to succeed me in the Chair. I am sure you will agree he is an eminently suitable choice. We wish him every success.

After paying tribute to the Board of Directors, the staff, the Associated Companies overseas and the Company's suppliers and dealers for their invaluable help and support, the statement concluded: Competition in all markets is intensifying, but I am confident that the enthusiastic spirit of our organisation assures us of a great future.

ENGLISH CHINA CLAYS

ANOTHER SUCCESSFUL YEAR

DEMAND REACHES AN ALL-TIME RECORD

SIR JOHN KEAY'S STATEMENT

PRODUCTION CAPACITY TO BE EXTENDED

Despite the large capital development schemes which we have undertaken and completed in the last ten years, our production capacity is fully extended at present and we have already commenced installations of additional modern plant and equipment to deal with the processing and refining of the extra tonnage of china clay required to meet this increasing demand. Shortages of steel and labour and the late delivery of equipment have retarded the completion of a number of these capital schemes, but we believe that by late summer we shall have overtaken the present difficulties.

Meanwhile the re-equipment and modernisation of existing production capacity continues to progress with the caution required to keep abreast of scientific and engineering developments both within and without the Company itself. We are mindful of living in an age of revolutionary industrial activity based upon new scientific discoveries. The introduction of new processes and techniques in china clay consuming industries calls for a continual revision of china clay specifications. These new and highly interesting developments create problems for our production engineering and research departments, the solution of which indicates the trend of future capital expenditure.

TRAINING SCHEMES

I am sure the Shareholders will be glad to learn that the Company is shortly to extend its Apprentice and Employee Training schemes. Within the Group it is possible to give, in conjunction with the County and Local Educational Authorities, comprehensive practical and theoretical training in a very wide group of occupations from Architects to Accountants, Blacksmiths to Builders, Chemists to Carpenters, Scientists to Salesmen and Draughtsmen to Directors. We feel that ample provision should be made for the early recruitment and training of all grades of employees.

Promotion to the senior posts in the Companies should be open to Company trained personnel wherever possible, thus reducing the proportion of outside recruitment to a smaller percentage than exists at the present time. The requirement for first-class craftsmen, technologists and the professions has grown considerably in recent years following the extension of the activities of the Company and its Subsidiaries. It is hoped that this scheme will benefit all concerned, and I am sure that the Shareholders will not object to a prize, named the Shareholders' Prize, being given to the best all-round student for the year.

HOME AND EXPORT SALES

In regard to the Sales position, both our Home and Export trades reached record figures during the year. Supplies to the Home market, which represent approximately 30 per cent of our production, have been well maintained, and it is pleasing to note the spirit of first-class co-operation between the Research staffs of the Paper, Pottery and other Industries and our own

Research Department in the development of quality products.

With regard to the Export Trade the total value of foreign currency earned by the Group during this period exceeds £4 million. Whilst an improvement was made in the dollar markets, generally speaking the real expansion of the Export Trade occurred in the Continental markets.

In this connection there is one matter which I should like to mention at this stage. Of the total amount of £1,323,116 paid to shippers for the conveyance of china clay to its overseas destinations only £284,897 was paid to British shipping, the balance being carried by foreign ships. Our china clay is one hundred per cent British and its production does not depend in any major sense on imported materials. Practically the whole of its foreign currency earnings are net gain to the country's economy. In view of the National necessity to increase exports you may rest assured that we do everything possible to employ British ships, but unfortunately it is not always possible to do so.

DEMAND FOR CORNISH UNIT HOUSES

In regard to the Building side of our business, as I have already mentioned in my statement to Shareholders of ECLP, our Building Subsidiaries have again contributed substantially to the Group profits although the actual profits show a reduction due to an all-round slowing up of the Government Housing programme. Sales of Cornish Unit dwellings decreased during this period, but the reduction was mainly due to the completion of Housing contracts for special schemes not in connection with Local Authority programmes. The number of our houses erected during the period under review throughout the country for Local Authorities has been well maintained. Apart from the attractive design and appearance of the Cornish Unit house we believe that the numerous repeat orders we have received during the year were influenced by the low maintenance costs experienced on our houses erected in previous years and this has assisted us to maintain our relative position in the Local Authority Housing field.

In view of the official encouragement given to high density housing we have designed maisonette and flat accommodation to meet the new demands. We have also turned our attention to private enterprise building and have purchased land for Estate development in the Greater London area and in the South-West of England. Work on these Estates is proceeding.

TRIBUTE TO STAFF AND WORKPEOPLE

In conclusion I am sure you would wish me to acknowledge on your behalf the loyal and enthusiastic work which has been performed by the workpeople, the staff and all executives both at home and abroad. An excellent team spirit has existed throughout the year—long may it continue to do so.

The report and accounts were unanimously adopted.

At a subsequent extraordinary general meeting and class meetings the Scheme of Arrangement was approved.

IONIAN BANK

MR A. H. REID'S STATEMENT

The one hundred and seventeenth annual general meeting of the Ionian Bank Limited will be held on April 24th in London.

The following are extracts from the statement by the chairman, Mr A. H. Reid, CBE, circulated with the report and accounts for the year ended December 31, 1955:

Last year again saw an expansion of our business. Our total assets at December 31, 1955, stood at £16,695,546, compared with £15,362,374 on December 31, 1954. Advances totalled £7,260,459 at the end of 1955, as against £6,653,218 at December 31, 1954, while liabilities of customers for documentary credits, guarantees, etc., increased also from £3,787,592 at the end of 1954 to £4,242,759 at the end of last year. We have been able to maintain a high degree of liquidity and cash in hand and balances with foreign correspondents totalled £2,405,494 at December 31st last, compared with £1,869,751 at December 31, 1954. Deposits have again increased and stood at £11,217,617 at December 31st last, compared with £10,307,536 at December 31, 1954. As you will appreciate, our overhead expenses have continued to increase as the result of the constant rise in the cost of living at home and abroad. However, I am glad to say that the bank has had a good year throughout the areas in which it operates, but I am sure you will realise that the difficulties with which this country is faced in the East Mediterranean make it impossible for me in any way to forecast the trend of future results.

Greece has lost, by the death of Field Marshal Papagos in October, 1955, a leader who, in war and in peace was widely respected. The general improvement in the country's economy, to which I referred in my last report, has been well maintained. During 1955, there was a substantial increase in exports, of which as usual tobacco accounts for the larger share. The total value of imports into Greece also was higher in 1955 than in 1954, owing largely to an increase in imports of wheat. On the other hand, emigrants' remittances, shipping earnings, and the net receipts from the tourist trade in 1955 were all appreciably higher than in 1954, with the result that the position of the country's balance of payments has improved.

In Egypt, one of the Government's most important achievements was the completion in principle of the arrangements for financing the Aswan Dam scheme. Last year also saw the conclusion of arrangements for the accelerated release of Egyptian sterling balances in the United Kingdom, so that there should be wider opportunities for British trade with Egypt. The total of Egypt's cotton exports shows a notable increase mainly due to the increase of cotton sales by the Egyptian Government to other Governments, often on a barter basis.

In spite of the unhappy situation in Cyprus, last year was again one of much activity in the commercial and economic life of the island. Boom conditions once more prevailed, prices continued to rise, and there were occasionally serious difficulties in obtaining labour. The greatly increased expenditure by the British military authorities and by the Government has, in fact, led to inflationary pressures, which the Government has done its best to meet by inducing the banks to control the volume of credit. The grain harvest was adversely affected by the weather. Most of the export crops, such as carobs, were disposed of, though at rather lower prices than in 1954.

THE BIRMINGHAM & DISTRICT INVESTMENT TRUST, LIMITED

A SATISFACTORY YEAR

The seventy-second annual general meeting of this Company was held on March 22nd in London.

Mr J. S. Wills, presiding in the absence of the chairman, Mr H. C. Drayton, said in the course of his speech: There is a small drop in our investments in associated companies but our general investments have expanded by some £211,000. This is largely reflected in the reduction in our current assets of £165,000. The value of our general investments shows an appreciation over book cost of 67 per cent compared with 64 per cent for the previous year.

INCREASED REVENUE

Turning to the Revenue Account, you will see that our gross revenue has increased by some £81,000, or 13.6 per cent over that of the previous year, the bulk of this increase coming from our general investments.

Your directors are again recommending a dividend of 30 per cent on the Ordinary stock. Your Chairman last year intimated that in raising the dividend for 1954 the Board were distributing more of the available profits than they normally did, in view of the anticipated increase in revenue for the year now under review. That anticipation, as you will see, has proved to be well founded. In view, however, of the outlook, to which I shall refer later, your Board have deemed it prudent to do no more than maintain this rate.

The year 1955 proved to be satisfactory for the company and we were able to avail ourselves, as a result of the liquid resources at our disposal, of satisfactory investment opportunities as they occurred.

It is interesting to look back to 1948 when, under the new Companies Act, it became obligatory for investment companies to publish the value of their investments, and to compare the figures with those of the present day. At the end of 1948, our general investments were valued at £4½ million, but, at the end of the year under review, their value had increased to no less than £7 million, an increase of some 47 per cent, and, during that time, no new money has been introduced into your company.

INDUSTRIALISTS' PERPLEXITIES

Industrialists and businessmen alike are today faced with many perplexities and, in the field of capital investment, have many difficult decisions to make.

The steps recently taken by the Chancellor were obviously carefully thought out, were deliberate and are doubtless having the effect they were intended to have. Industries directly affected by the credit squeeze are 'cutting down production, and staff must ultimately be released for other jobs. The period of readjustment is bound to be painful. Once a movement of this sort has been started it is difficult to know where and when it is going to stop, but my own belief is that in the course of the next twelve months we shall be in a healthier economic position.

Our investments are well spread and are constantly under review. I shall be disappointed if the profits of your company are less for the current year than for the past, although there may well be less "cover" for them.

The report and accounts were adopted.

THE EASTERN BANK, LIMITED

SATISFACTORY FIGURES

The forty-sixth annual general meeting of The Eastern Bank, Limited, will be held on April 18th in London.

The following is an extract from the circulated statement by the chairman, Sir Evan M. Jenkins, GCIE, KCSI:

The Balance Sheet for 1955 shows an increase of £5,597,291 in Current, Deposit and other accounts, and of £548,316 in Bills Payable. On the assets side there is an increase of £1,482,400 in Cash on Hand, at Call and at Bankers, of £1,968,783 in Bills Receivable, and of £2,862,454 in Advances and other accounts. With these and other less important changes the Balance Sheet total stands at £43,558,711, as against £37,352,355 at the end of 1954.

These figures are satisfactory, but since the end of the year certain assets held by one of our Branches have given us concern. Provision has been made in the accounts for the diminution in the value of these assets as at December 31st last, and if necessary further provision will be made in 1956.

The further increase in our resources has been useful and profitable, but, as I said last year, it may not be permanent. Competition is increasing almost everywhere, and in the countries which enjoy a revenue from oil large fluctuations in balances are not unusual.

Bank Premises, Furniture and Equipment now stand (after the appropriation of £35,000 referred to below) at £720,953, against £538,474 at the end of 1954. Our Baghdad building is at long last nearing completion.

PROFIT AND DIVIDEND

The published profit is £132,536 against £129,011 for 1954. The appropriations from profit are £50,000 to Contingencies, £35,000 to Premises, and £28,750 to the final dividend of 5s. per share, which with the interim dividend already paid of 3s. per share, makes a total dividend of 8s. per share for the year as before. The carry forward is increased from £111,120 to £112,656.

The year has from the trading point of view been a good one. During the year we opened a Branch at Mukalla in the Hadhramaut, 280 miles east of Aden, and a Sub-Branch in Rashid Street (Southgate) at Baghdad. Arrangements were also made to open a Branch at Beirut; we entered into occupation of premises there early in the New Year, and it is expected that the new Branch will be ready for business within a few weeks.

The attention of Shareholders is invited to the Resolution concerning the number of Directors to be moved at the General Meeting. The present maximum number under Article 81 of the Bank's Articles of Association is seven (reduced from twelve during the War). Your Directors are satisfied that this maximum of seven may not in all circumstances be sufficient for the Bank's purposes, and it is proposed to increase it to nine. The two new Directorships will not be filled immediately, but will be available when required.

In November and December I visited the Bank's Branches at Aden, Mukalla, Karachi, Calcutta, Chittagong, Bahrain and Doha, and Mr Leigh-Wood is now on a tour of our Branches in Iraq and Beirut. Sir Thomas Strangman has spent some months on business in Singapore, and has been able to see something of our Singapore and Kuala Lumpur Branches.

BARRACKS FABRICS PRINTING COMPANY, LIMITED

POLICY OF CONSOLIDATION

The nineteenth annual general meeting of The Barracks Fabrics Printing Company, Limited, was held on March 21st at Macclesfield, Major K. G. Wilby (the Chairman) presiding.

The following is an extract from his circulated statement:

The profit for the year ended December 31, 1955, unfortunately shows a decline, as compared with the year ended December 31, 1954. The Net Profit is £41,597, after deducting Directors' emoluments and Depreciation. Taxation is still a very heavy charge at £23,236; more than half the profit of your Company. Your Directors recommend a final Ordinary dividend of 10 per cent, making a total of 20 per cent for the year.

It is the intention of your Board gradually to consolidate and build up not just reserves but a business founded on a still stronger financial basis. This can only be done by ploughing back a reasonable proportion of the profits, and it has therefore been deemed advisable not to utilise the Dividend Equalisation Reserve.

In the latter half of the year under review, your Company suffered from the effects of the import and credit restrictions of certain countries. For some months we were obliged drastically to curtail production with its resultant difficulties and hardships.

The cost of practically all the materials we use in our productions had increased and we therefore experienced, in addition to a reduced production, a reduced profit margin during the months of the recession.

During the last few months of the year there has been an improvement, and we have a reasonably full order book at the moment.

The report was adopted.

EASTBOURNE MUTUAL BUILDING SOCIETY

RECORD RESERVES

The seventy-ninth annual general meeting of the Eastbourne Mutual Building Society was held on March 21st at Eastbourne.

Mr Laurence A. Caffyn, chairman, in the course of his speech said:

New investments made in the Society during the year amounted to the sum of nearly £1½ million, that is a large sum of money and we are proud of the achievement. The number of investing members has increased by 300 during the year. This is very satisfactory and indicates the increasing popularity of the Society.

The money invested in the Society is, as you know, used to assist in home ownership. Here again, the Society had a busy year, and the sum of £1,093,000 was advanced to 1,050 individual borrowers for this purpose. I must state, however, that the demand for mortgages during the year was greater than this Society has ever known.

Interest rates had to be varied during the year. The increase in Share and Deposit rates to 3 and 2½ per cent was obviously due, and the influx of money which followed the adjustment proved how welcome it was. Increases took place as at August 1st. Mortgage rates also had to be increased, and the increase took place as at November 1st.

One of the difficulties during this period was the fact that for three months the Society was receiving by way of interest a lower rate of interest than it was paying, when one takes income tax into account. It is therefore very gratifying that the surplus on the year's working was practically the same as 1954, and the reserves of the Society have been increased by £20,000. The total reserves and carry forward now amount to £322,000, the largest figure ever recorded.

The report and accounts were adopted.

434,815	Investments (less Provision)	435,361	
4,356,108	Total Capital Employed	4,841,066	

EXTRACTS FROM THE CHAIRMAN'S REVIEW

The Group profit of £1,795,883, augmented by increases in Dividends, Interest and Fees Receivable, is higher than in the previous year.
The value of Orders on hand, including one for Steam Raising Plant for the High Marnham Power Station, received during the year, is considerably in excess of that at the end of the previous year. The Steam Raising Plant for High Marnham was the largest order ever received by the Organisation and also comprises the largest Steam Raising Units yet adopted in this Country or in Europe.
The output of the Derby works fell slightly due to labour turnover and steel shortages.
Valuable orders have been obtained by the Associated Companies in Africa and Australia.
It is anticipated that the working results of the Organisation for the current year should be no less favourable than those for the past year.
A new Company, International Combustion (Nuclear Applications) Ltd., has been formed to continue research work in all fields associated with Nuclear Energy Development, and expansion is also being undertaken in other fields closely allied to the main business of the Group.

JAGUAR CARS LIMITED

YEAR OF EXPANSION

SIR WILLIAM LYONS' STATEMENT

The Twenty-Second Annual General Meeting of Jaguar Cars Limited was held on March 20th at the registered office, Browns Lane, Coventry.

In his speech, which was circulated with the accounts, Sir William Lyons, the Chairman, said:

The Accounts for the year's working again show an increased profit. You will note that there is a larger allocation for depreciation, and this is required to provide a year's charge on further expenditure on plant and equipment. This increase is due to the need for additional plant required in connection with the production of the 2.4-litre model, but it must be pointed out that this plant has not been in full production during the period under review.

There is a further increase in work-in-progress and stock-in-trade which, whilst being required by the high level of production always in hand on current models and government contracts, also reflects this year the building up of materials and stocks for the production of the new model.

Taxation again takes a large proportion of the year's profits, but the charge for the year under review benefits from the reduction in the standard rate of Income Tax and the absence of Excess Profits Levy.

FACTORY EXPANSION

The year has been one in which our plans for the expansion of productive capacity, involving considerable factory reorganisation and the addition of new plant and machinery for the production of the 2.4-litre model, have largely been carried out to conform with a programme for completion before the end of 1955. Fortunately, we have been able to carry out this expansion without any interference with our current production. We have also completed extensions to our factory, which have involved new buildings, completed since the date of these accounts. I am pleased to be able to tell you that, although this expansion of capacity has incurred very substantial capital expenditure, we now have a plant which will more economically produce a much greater number of cars per annum, and will enable us to take advantage of the markets where we have developed our sales and service organisation during the last few years.

SUCCESS OF NEW MODEL

I do not think I need tell you that the new 2.4-litre car which was introduced at the Earl's Court Motor Show last October has met with world-wide acclamation and there is no doubt that we are going to find it difficult, even with greater production facilities, to meet the demand, provided that rising costs do not price us out of the world markets. With this new model we have gone even further than we have in the past to market a car of exceptional value, for we continue to believe that our customers will keep our factory working at full capacity if our cars give them everything they want at a price which offers them the best value for money.

The introduction to the Home Market of automatic transmission on the Mark VII, which has been a feature of our export models for more than two years, has enabled us to

offer the Home Market a car of quite exceptional qualities with an entirely new conception of motoring. There is no doubt that even the most enthusiastic advocate of the manual gear change must eventually be a convert to this new kind of motoring.

EXPORT INCREASE

We have again maintained a top position in our percentage of exports and, in spite of the loss of such valuable markets as Australia and Sweden due to internal legislation in those countries, our total volume of exports has been increased as a result of more intensive sales activities. For example, in America our shipments show an increase of 15 per cent over the previous year, whilst Germany and Belgium both exceeded last year's imports by 33½ per cent.

INTERNATIONAL COMPETITIONS

In the sphere of motoring events, the tragic circumstances of the accident at Le Mans resulted in a considerable curtailment of fixtures for the remainder of the season, one notable cancellation being the Rheims 12-Hours Race which has previously been won by Jaguar in the years 1952, 1953 and 1954. Nevertheless, having won the Le Mans 24-Hours Race for the third time and set up new records for lap speed, average speed and distance, Jaguar went on to create a new lap record in the Tourist Trophy Race at Dundrod. Of equal importance, particularly with regard to our dollar export drive, was the series of outstanding successes gained by Jaguar in the USA. Following the establishment of a new course record for sports cars at Daytona where a speed of 164 mph was achieved, Jaguar continued with an outright victory in the Sebring International 12-Hours Grand Prix, again setting a new record for the course. This success was followed by the winning of the Watkins Glen Grand Prix, the Seneca Cup Race and the President Eisenhower Trophy.

That Jaguar successes are not confined solely to sports car events is demonstrated by the victory achieved by Mark VII Saloons in the Silverstone Production Touring Car Race where Jaguar took first three places, set a new lap record and won the Team Prize. This year, outstanding amongst the performances put up by the Mark VII Saloon was Jaguar's outright victory in the International Monte Carlo Rally, thus adding yet another famous event to the long list of Jaguar's international successes.

RIISING COSTS

In spite of the progress we have made in considerably increasing our productive capacity and sales potential, and despite the world-wide reputation we have achieved, we view with concern the need to preserve our selling prices to meet world competition. Although we have not increased our selling prices since 1952, the continuous increase in our costs gives rise to growing anxiety. It may be that there are some industries which do not, as yet, have to face serious competition, and I have no doubt that, in some of them, rates of pay of employees may call for adjustment in the light of present-day living costs; but we in the Motor Industry not only have to be competitive but, also, are paying the highest wages in the country.

Further, we have to meet considerable capital outlay and tooling costs in order to keep abreast of modern trends. In these circumstances, it is inexplicable to me that those whom the workpeople have chosen to be responsible for guiding their welfare can be so short-sighted as to fail to see that their programme of annual wage claims must spell ultimate disaster in which nobody will escape. As I understand it, they base the reasonableness of their demand for increased pay on the alleged fact that Companies' profits justify it, and refuse to accept the necessity for conserving profits to meet the continuous need for new plant and equipment and for making available the very substantial sums which must be found for the tooling of new models—to say nothing of the need for reserves to take care of a rainy day.

You will observe from the Notice accompanying this Report that an Extraordinary General Meeting has been called for the purpose of considering an amendment to the Company's Articles of Association to permit the appointment of Executive Directors. Your Board considers that such appointments will be of considerable benefit to the organisation and the Resolution is self-explanatory.

I would like to refer to the honour of Knighthood which Her Majesty the Queen has been pleased to bestow upon me, in order that I may express the hope that this honour will be recognised as a tribute to the part played by everyone within our organisation, and our suppliers, in building up the name of Jaguar to an eminence deserving of such recognition.

The report and accounts were adopted. Mr A. Whittaker was reappointed a Director. The amendment to the Company's Articles of Association was also approved.

ARMY AND NAVY STORES

The Eighty-fourth Annual General Meeting of Army and Navy Stores Limited, will be held on May 4th, in London.

The following is an extract from the circulated statement by Commander S. C. Lyttelton, OBE, DSC, RN, Chairman and Managing Director, for the year ended January 31, 1956:

Your Company has again had a good trading year. The Group trading profit for 1955/56 is £298,959 as compared with £211,107 last year. A point of interest is an increase in the total number of transactions during the year as well as in the average value of those transactions. Taxation has increased by £38,027 leaving the Group Profit after taxation at £149,981. It is recommended that a dividend of 9d. per stock unit, less tax, be paid, the same as last year and that a distribution of 4½d. per stock unit out of capital profits should again be made.

Prospects in the immediate future are uncertain. Despite all efforts to keep them down, expenses continue to rise, and in particular of course this year we are faced with a very considerable increase in Rates. Furthermore, the general outlook for retail trade is not very encouraging. The country's financial difficulties are largely due to too much money being spent by both the Government and the people. If a favourable balance of trade and confidence in the pound sterling are to be restored and maintained, this spending must be reduced, and that is bound to have an adverse effect for a time on retail trade. With that word of warning, however, it is satisfactory to note that your Company, although not yet fully re-organised and re-developed, is in a far better position than it was a few years ago to obtain its fair share of whatever retail trade there may be.

BANK OF SCOTLAND

FURTHER EXPANSION OF BUSINESS

SIR JOHN CRAIG'S SPEECH

The Annual General Meeting of the Proprietors of the Bank of Scotland was held on April 3rd, within the Head Office, Edinburgh. Sir John Craig, CBE, DL, LLD, Governor of the Bank, presided and, in the course of his speech, said:

Proprietors will recall that it was on March 1, 1955, that the fusion of the Bank with The Union Bank of Scotland Limited took place. The year just ended, therefore, is the first year of operation of the combined Bank, and I am glad to record that in this initial year the process of welding the two undertakings together has been successfully accomplished.

There is already evidence that the fusion of the two undertakings has brought with it added strength and solidarity. The Bank, through its enlarged Branch system, seeks to provide banking facilities throughout Scotland wherever they may appear to be required.

BALANCE SHEET

The Balance Sheet of the Bank records an increase in total resources of over £4 million, and indicates a further increase in the Bank's business. Under the influence of tighter money control and the higher rates of interest which have had the effect of attracting funds in other directions, the Bank's Deposits show a reduction of approximately £5 million. Note Circulation, on the other hand, shows an increase of £1,500,000, and there has been a further

substantial increase in obligations undertaken on behalf of customers, which now amount to £20,700,000.

On the Assets side, Cash, Balances with other Banks, Documents in course of Collection, Money at Call and Bills Discounted show an increase of over £7,500,000 and, together, amount to 35 per cent of our Liabilities to the Public. The Bank's Investments have suffered a substantial depreciation in value during the year as the result of the influence of higher interest rates now current. These appear in the Balance Sheet at just under £83,500,000. This figure is less than their market value. While we are glad to have had sufficient Inner Reserves with which to provide for this depreciation, we cannot regard a continuance of this downward trend in values without some concern.

Advances to customers show little change at a total of £44,500,000, though as a result of restriction their composition is now more than ever associated with support to activities directly concerned with improvement in the country's balance of payments.

The Profit and Loss Account shows a Net Profit, after provision for all taxation and contingencies, of £643,007, compared with £630,614 last year. Adding the balance brought forward, there is available £899,061, from which there has been transferred to Reserve for Contingencies the sum of £200,000 and to Staff Pension Fund £80,000. An interim dividend at the rate of 7 per cent was paid last October, and a final dividend at the same rate is now proposed. These dividends will require £362,250, after deduction of Income Tax, and there is left a balance of £256,811 to be carried forward to next year.

Much has been said and written about the causes which have brought about the

present inflationary situation in this country. I do not propose, therefore, to deal with these in any detail. It may be sufficient to refer to what would seem to be the two predominant factors which were operating concurrently, namely, an excess of capital expenditure in the public sector of the economy over accumulating resources in the form of savings, and the increasing volume of spending power generated by rising wages from which a greater volume of savings might well have been forthcoming. In the past few weeks measures have been taken which are designed to check both these influences. A cut in Government expenditure has been imposed, and a check to the ease with which Local Authorities have been able to obtain from the Government funds for capital expenditure on development schemes has been brought about by their being directed to the Market to seek the funds they require. The cost of borrowing has been raised by the increase in the Bank Rate to 5½ per cent. At the same time further tightening in the terms of Hire Purchase credit has been introduced, and an attempt made to establish a more realistic condition of our internal economy by the reduction in the subsidies for rent, bread and milk.

Signs are not lacking that activity in certain industries is now slowing down. This as far as it goes may suggest that the Government's policy is becoming effective, and if this check to activity can be accomplished as a result of a reduction in internal demand without interfering in any way with production for export, then there may be reason to believe that the situation will have been brought under control. It is certainly vital that it should be, and the long decline in the purchasing power of the £ arrested.

The report was adopted and the final dividend of 7 per cent (actual), making 14 per cent for the year, was approved.

MIDLAND COUNTIES MOTOR FINANCE CO. LTD.

MR FRANK KENNING'S STATEMENT

The Twenty-seventh Annual General Meeting of Midland Counties Motor Finance Company Limited was held on Tuesday, March 27th, at the Royal Victoria Station Hotel, Sheffield. Mr Frank Kenning, the Chairman and Managing Director, presiding.

The Secretary, Mr R. C. Scrimshaw, read the notice convening the meeting and the report of the auditors.

The following is the statement by the Chairman which has been circulated with the report and accounts for the year ended December 31, 1955. It is with great sorrow, which I know is shared by many of you who knew him, that I have to refer to the death of my father, Sir George Kenning, our late Chairman. My father founded this Company twenty-eight years ago (together with the late Sir Ernest Shentall (its first Chairman), and Messrs Eastwood, Scorrish and Watson, all of whom he survived by many years. Under his leadership as Managing Director, the Company has grown from modest beginnings into a flourishing concern. This point will be appreciated when it is mentioned that the turnover last year was over £5 million compared with £560,000 in 1935. During the whole of this time your Company has always shown a profit and a steady expansion in profits except during the war years.

Sir George will be sadly missed and we have a very high standard to maintain.

RECORD TRADING RESULTS

The results for the year under review again reveal an expansion in business and record profits. The group profit is £322,017 compared with £293,393 last year and after taxation and all other charges and provisions, there remains £144,614 compared with last year's figure of £130,687.

Your directors recommend that a dividend of 30 per cent be paid on the Ordinary Shares, which is the same as last year. In declaring this dividend, your directors have had regard to the Chancellor's call for restraint, the increase in distributed profits tax and the necessity for financing further expansion out of profits. They also propose placing £50,000 to reserve, leaving an increase in the balances carried forward of £48,244. The balance carried forward includes the balances of

the subsidiaries, which are wholly owned.

During the year under review, Hired Balances have increased by £769,464 and this increase has been financed by the Loan Stock issue of £250,000 by loans on deposit which are up by £390,217 and by accrued profits.

The average term of hiring has lengthened so that a higher proportion of the interest chargeable is carried forward into next year than was brought in at the beginning of the year. This factor, coupled with increased costs in interest paid owing to the raising of the bank rate in February, 1955, and higher administrative costs and operating costs owing to more intense competition in rates and commissions towards the end of the period, accounts for the comparatively modest increase in profits which nevertheless can, I submit, be considered to be satisfactory. Most of the expansion in business took place in the first half of 1955, after which the restrictions placed on borrowing made it difficult to find further money for expansion. Your Company was involved only to a minor degree in the unfortunate transaction which has affected other hire purchase companies and banks and to which the Chairman of one of the leading hire purchase houses has already referred. This contingency has been fully provided for in the accounts and it is anticipated that a large proportion of our residual losses will eventually be recovered.

FUTURE DEVELOPMENTS

At the time of preparing this report, as indeed was the case last year and the year before, new and more salutary controls affecting our business have been announced. If business continues at the same level as last year, the increase in the Bank Rate will cost about £24,000 in a full year. I cannot say what the effect of the new restrictions will be. Business usually has its compensations. Nor do I propose to enter the controversial field of the morality of hire purchase or to comment on its effect on the economy of the country. Hire purchase certainly seems to have become the whipping boy of politicians and some moralists alike. What we do propose to do is to explore and exploit all possibilities of using your money as wisely and profitably as is safely possible and

permissible. With this end in mind we have, in conjunction with our friends and best customers, Messrs Kennings Limited, formed a new subsidiary called Car and Commercial Contracts Limited. This subsidiary is about to commence operations and I hope to be able to report satisfactory progress next year.

STAFF AND ADMINISTRATION

During the year we have purchased a building in Sheffield to relieve our overcrowded office space. We have also introduced a new machine accounting system. The process of moving and the introduction of new methods has meant an additional burden on the staff at a time of rapid expansion of business and I am sure you would like me to express our special thanks to them for the hard work they have put in to give effect to these improvements satisfactorily. I would particularly like to mention our General Manager, Mr C. B. Lowe, in this connection. Our thanks are also due to our Branch Managers and their staffs.

DEPOSITS

Once again I wish to draw your attention and that of your friends to the Company's scheme for the acceptance of deposits which is an important method of financing our business. This service is available to the small and large investor alike and offers an attractive and secure method of earning a realistic rate of interest (currently 6½ per cent) while still conserving capital values and availability at very short notice. Deposits can be arranged with the minimum of formality and at no cost to the investor on deposit or on withdrawal.

NEW DIRECTOR

Following the vacancy which unfortunately occurred on the Board, Mr David Kenning was elected a director. He now retires and offers himself for re-election. The Board confidently recommends him, and his legal knowledge as a Barrister at Law should be invaluable to their deliberations. The Report and Accounts were adopted, and the retiring directors, Messrs A. B. Griffiths, George Kenning and David B. Kenning were re-elected.

MITCHELL COTTS & COMPANY

GROUP'S CONTINUED PROSPERITY

The thirty-sixth ordinary general meeting of Mitchell Cotts & Company Limited will be held on April 27th in London.

The following is an extract from the circulated statement of the Chairman, Mr H. C. Drayton: The results for the year ended June 30, 1955, confirm the views I expressed in my Statement of last year regarding the continued prosperity of the Group.

The Accounts show an increase in the profit for the year of some £200,000 and I hope you will consider this figure satisfactory. After making the customary adjustments there remains a total profit for the Group of £1,510,538. Tax provisions amount to £835,000, leaving an increased consolidated profit to carry to Appropriation Account of £675,538, as compared with the 1954 figure of £612,082.

The rate of dividend on the Ordinary Shares was maintained at 25 per cent and it has been decided to make no other recommendations as to the balance of profit remaining. Accordingly, there will be carried forward £1,575,061 to next year.

There has been an increase in both current assets and current liabilities and specifically stocks and debtors have together risen by about £1,700,000. These increases may, I think, be regarded as normal and in keeping with the level of the business being done by the Parent Company and the large overseas subsidiaries. Inflationary tendencies have naturally had their effect on the increased cost of our stocks, and the necessity in several of our overseas territories to extend credit terms in order to meet the terms offered by competitors from the United Kingdom and abroad is partly responsible for the higher debtors' figure.

CAPITALISATION PROPOSALS

As a further step towards bringing our issued Share Capital more into line with the net assets which we are actually employing in the Group, it was announced last December that your Directors were prepared to use £291,600 of the Share Premium Account in paying up 1,166,400 shares and distributing to the Ordinary Shareholders in the proportion of one share for every five held. The consent of the Capital Issues Committee has been obtained. It is hoped to maintain the dividend on the increased capital.

Our Shipping Companies have shown a material improvement. Freight rates, which have become increasingly remunerative during the period, continue to be maintained at a satisfactory level.

Our Produce Division made continued progress and considerably expanded its activities, particularly in grain, pulses, oilseeds and sugar.

EXPORT TRADE

Our contribution to the export trade of this country has been well maintained. In the first six months of the current financial year our exports from the United Kingdom have increased and have exceeded the rate of £10 million per annum.

We have every reason to be satisfied with the progress reports for the first half of the current financial year. I have little doubt that you will be satisfied with our Report this time next year, which should show that your Company has continued to prosper.

BRITISH HOME STORES

RECORD TURNOVER

MR HORACE MOORE'S STATEMENT

The twenty-eighth annual general meeting of British Home Stores, Limited, was held on March 21st in London, Mr Horace Moore (the chairman) presiding.

The following is an extract from his circulated Statement for the 53 weeks to January 7, 1956:

Your Directors have pleasure in placing before you the results for last year which they consider to be satisfactory.

Profit for the period which covered 53 weeks was £1,468,223, an increase of £157,727 over last year and after Taxation £683,223, an increase of £122,727. The final dividend recommended is 3d. on the Ordinary and "A" Ordinary Units, which gives a total of 4d. per unit for the year. After providing for the net cost of the year's dividends, expenses in connection with increased capital, and allocation to General Reserve of £444,741, against £325,000, there remains to be carried forward £190,426.

Once again turnover in the year was the highest in our history, and we served many more customers than in any previous year.

We have continued our endeavours to serve to the best of our ability the members of our shopping public with constantly improving ranges of goods of sound quality and value. Our Catering and Food departments, important and expanding sections of our activities, continue to give further evidence

of the extent to which they are meeting the needs of our many customers.

DEVELOPMENT

In May 1955 we opened our new Coventry Store, followed in November by the new stores at Cardiff and Plymouth. In Coventry and Plymouth we closed the temporary stores in which we operated since the war years. We have in these cities fine modern buildings with first-class shopping and catering facilities for the public, and excellent Staff amenities. They are much larger than our older stores, giving greatly increased space for our operations. We also opened important extensions at our Henley and West Ealing stores. We are satisfied by the progress made in these additions to our business.

At Swansea it is anticipated that progress will be made in the near future. We have commenced construction on new stores at Middlesbrough, where we have not been previously represented, and at York which will replace our existing store in that city.

It is not anticipated, however, that these new projects will be completed until 1957. Also, work is proceeding on a major development in central Birmingham where we shall be represented by an important new store. Extensions of our stores at Great Yarmouth, Wakefield and Hull will be completed later in the current year. Planning work is proceeding on a number of new stores and extensions for future development.

Again it is very difficult to make a forecast of Trading in the current year. You can rest assured, however, that we shall continue to use our best endeavours to foster ever-increasing goodwill with the members of the public, and to end the year with a satisfactory result.

The report was adopted.

CROWN ZELLERBACH CORPORATION

(Incorporated in the State of Nevada, United States of America)

MANUFACTURERS OF PULP, PAPER AND ALLIED PRODUCTS, LUMBER, PLYWOOD AND OTHER FOREST PRODUCTS

CONDENSED SUMMARY OF CONSOLIDATED RESULTS FOR THE YEAR ENDED DECEMBER 31

	1955	1954
Net sales	\$414,080,000	\$383,782,000
Net income	\$44,128,000	\$36,515,000
Dividends declared	\$25,676,000	\$20,086,000
Earnings retained in the business	\$18,452,000	\$16,429,000
Shares of common stock outstanding (giving effect to stock split-up)	13,773,000	13,659,000
Per share of common stock outstanding:		
Net income	\$3.11	\$2.58
Dividends declared:		
Crown Zellerbach Corporation	\$1.65	\$1.33
Gaylord Container Corporation	\$1.80	\$1.57
Earnings retained in the business	\$1.34	\$1.20
Federal, state and other taxes (except certain social security taxes)	\$40,171,000	\$38,293,000
Additions to properties	\$39,697,000	\$34,398,000
Working capital	\$114,781,000	\$113,676,000
Ratio of current assets to current liabilities	3.6 to 1	4.4 to 1
Consolidated long term debt (excluding current portion)	\$55,777,000	\$60,184,000
Production:		
Paper and paperboard—tons	1,590,511	1,467,672
Lumber—in thousands of board feet	163,261	168,505
Plywood—in thousands of square feet	73,538	55,530

Copies of the annual report to December 31, 1955, may be obtained from the London Transfer Agents, The British Empire Trust Company, Limited, 3 Lombard Street, London, E.C.3, on application.

Residents in the British Isles, whose shares are not registered in their own names and other interested parties who wish their names placed on the mailing list for future communications, should notify the London Transfer Agents accordingly.

BRITISH INDUSTRIAL PLASTICS LIMITED

ANOTHER RECORD YEAR

The annual ordinary general meeting of British Industrial Plastics Limited was held on March 22nd in London, Mr E. R. Crammond (the Chairman) presiding.

The following is an extract from his circulated statement:

I am pleased to be able to tell you that the accounts for the year show for the Group a net profit before taxation of £669,464 compared with £571,257 for the previous year, which itself constituted a record.

Your Directors recommend a final dividend on the Ordinary shares of 12½ per cent, making with the interim dividend of 7½ per cent already paid, a total of 20 per cent for the year.

A sum of £100,000 has been transferred to Reserves, bringing the total of General Reserves up to £200,000. The increase in the balances carried forward in the Group's Profit and Loss Accounts amounts to £100,495. Thus, apart from the charge for Depreciation of £197,489, approximately £200,000 has been retained in the business. This figure may be compared with the charge for taxation of £337,524 and the cost of the proposed dividends, namely, £145,095.

For the year to September 30, 1955, the Group turnover was again a record, showing

an increase of 16 per cent over that of the previous year. Direct exports contributing £1,400,000, an increase of 25 per cent, and it may interest you to know that we are now trading with over forty countries.

PRICE STABILISATION

In considering these turnover figures it is appropriate also to consider prices. Since 1951 the price level of the products of the Group's chemical factories has been kept remarkably stable. Over these years the prices of certain basic raw materials have risen considerably and are continuing to rise, and wage rates for chemical process workers have substantially increased. It has only been possible to contain these increased costs by improved methods of manufacture made possible by modernising plant and equipment.

It is important that the cost of living should be held down and as our contribution, despite the increases referred to above in raw materials and other costs, your Directors intend to maintain as far as is practicable existing price levels for products of the chemical factories.

OPERATIONS

During the year the manufacture and sale of the products of the Group's chemical factories have been transferred to a new subsidiary company, BIP Chemicals Limited.

Thanks to the foresight of my predecessor, Mr Kenneth M. Chance, now our Life Presi-

CONSOLIDATED PROFIT AND LOSS ACCOUNT

The Group's trading profits amounted to £4,130,000, and after providing for taxation the net consolidated profits amounted to £2,019,000, an increase of approximately £640,000, compared with the previous year, which figures, however, were struck after charging £355,000 for a non-recurring insurance premium under the Group's Contributory Pension and Life Assurance Scheme. Nevertheless, it is interesting to note that apart from the exceptional results of 1950-51, which were largely inflationary, the year's trading was a record in the history of the Company.

Capital Expenditure outstanding at September 30th last amounted to approximately two million pounds, and since that date we have agreed to further expenditure which must continue if our plant is to be kept up to modern standards and maximum efficiency.

Notwithstanding these heavy capital expenditure requirements and with due regard to the request that in the national interest discretion should be exercised by Boards of Directors when considering the payment of dividends, it was considered that shareholders should participate in the improved results of the past year. Your Directors have therefore decided to recommend to you the payment of a final dividend of 6½ per cent, free of tax, on the issued Ordinary Stock, making, with the interim dividend, a total equivalent to 8 1/6 per cent, free of tax, for the year on the increased capital, being an effective increase of 1½ per cent, free of tax. We consider this is not inconsistent with the general policy of dividend restraint.

OUTLOOK

While the Group's profits were maintained at a satisfactory level for the first four months of the current financial year, they have since then been adversely affected by a labour dispute in the Printing Industry,

dent, and the Company's able experts and technicians, BIP has held a commanding position in the aminoplastics field for many years, and your Directors have every confidence that it will continue to do so. Nevertheless, it is desirable to widen the scope of our activities, and to this end we have under constant survey the many developments which are taking place in plastics. Over a period of time the adoption of new processes in this expanding industry calls for more and more specialised machinery and equipment involving considerable capital outlay, but you may rest assured that all proposals are most carefully examined and that our aim is to provide as much as possible of such expenditure out of income.

All our subsidiary companies for the period under review showed satisfactory results, including BIP Engineering Limited (Bipel), which has now passed through its development stage. As you may know, Bipel, formed six years ago, is concerned mainly with the manufacture of presses and pelletisers for the plastics industry. Great credit is due to our designers of these machines which have met an essential requirement of the moulding industry and offer considerable scope for expansion.

As to the future, whilst the prosperity of the plastics industry must necessarily be dependent on that of the major industries of the country, the year to September 30, 1956, has opened well and looks like continuing so.

The report was adopted.

which has resulted in many of our customers having to close down their establishments. In consequence, overtime working ceased at most of our Mills and short-time working is now in operation at some of them. I am happy to say that the dispute has now been settled and work has recommenced today. However, the effects of the dispute will continue to be felt for a time.

As you are probably aware, the Paper Industry is to some extent dependent on other industries, many of which are now facing a reduced demand for their products and this is bound to have repercussions on the Paper Industry as a whole.

I would here mention that our Employers' Federation has recently commenced negotiations with the Trade Unions who have asked for further increases in wage rates.

On the other hand, we should keep in mind the cumulative effect of the improvements and economies arising from the continued capital expenditure of the Group, which will have an important bearing on future results. I would again emphasise that it is only as a result of our ploughing back a substantial part of our taxed profits year after year that we have been able to finance this heavy expenditure without recourse to borrowing or raising additional share capital.

Although the liquid resources of the Group at the end of the financial year were substantial and included bank balances of over four million pounds, I can assure you these resources are not out of proportion to the Group's requirements.

As the result of the acquisition of additional undertakings in recent years and their subsequent development, the basis of the Group's activities and earning capacity have been considerably broadened, and while trading conditions may be somewhat uncertain, I am satisfied we can look forward with reasonable confidence to the future.

The Chairman concluded with a tribute to all the work people and employees.

The Report was adopted.

JAMES PASCALL, LIMITED

A SOLID ACHIEVEMENT

The fifty-ninth annual general meeting of James Pascall, Limited, was held on March 28th in London.

Mr E. Cassleton Elliott, CBE, FSAA (the Chairman), in the course of his speech, said: The trading profit for 1955 shows a reduction of £110,068 from the record level achieved for the previous year. At first sight this might be interpreted as a sign not only of increased competition within the confectionery industry, but also that the Company had lost ground relatively in meeting that competition. However, far from giving grounds for pessimism, the financial results of the trading year 1955 were a particularly solid achievement, and give every cause for optimism about the Company's continued progress.

The Chairman reminded shareholders of his warning on March 31, 1954, that there were signs that the productive potential of the industry was in excess of demand and that the necessity for expenditure on advertising and on their sales organisation, in order to meet the inevitably increasing competition,

would render it difficult to maintain the sales and profit levels of that year. In actual fact, as he told shareholders last year, the full impact of competition did not fall upon the Company in 1954; nevertheless he again repeated his warning.

In the year just completed, the national consumption of chocolate and sugar confectionery decreased, competition grew more intense, and the need for heavy expenditure on their sales organisation and on advertising materialised. Even so, he was able to report not only that their total tonnage sales and value continued to increase, but that the net profit before taxation was, in fact, greater than that for the year 1953. The actual comparison being—1955, £364,831; 1953, £343,449. In point of fact, the position was still more favourable than appeared immediately from those figures. They had had to absorb a heavy loss on cocoa and cocoa butter (£93,000) due to declining prices. But for this factor, their net profit before taxation last year would have closely approached the record year of 1954.

A GOOD AUGURY

The Chairman continued: I think one can view the future with reasonable optimism

THE ECONOMIST, APRIL 14, 1956

Our sales for the first few weeks of 1956 are running well in excess of those achieved over the same period in 1955; in an uncertain economic outlook it would be unwise to assume too much, but I think we may take this as a good augury.

Our export trade was well maintained in 1955, and I am particularly glad to report a significant increase to dollar countries, where the value of our sales rose by not less than 33 per cent. I am also glad to report a continued rise in our royalties on Pascall's products manufactured abroad.

The profit on trading was £485,964 as compared with £598,535 last year.

The surplus of current assets over current liabilities is £564,047 as compared with £635,831.

After commenting on his decision not to seek re-election to the Board, Mr Cassleton Elliott reviewed the developments and changes which had taken place since he was appointed Chairman on December 14, 1952, when they had a net loss of nearly £34,000 and were burdened by an overdraft which was immense in relation to the turnover at that time.

The report was adopted, and the Ordinary dividend of 50 per cent was approved.

ECONOMIST, APRIL 14, 1956

APPOINTMENTS

SUDAN GOVERNMENT

The Ministry of Education requires lecturers in the following departments in the Khartoum Technical Institute:

- (a) Civil Engineering.
- (b) Mechanical and Electrical Engineering.
- (c) Commerce.

A degree in Civil, Mechanical or Electrical Engineering or technical equivalent, e.g., A.M.I.E.E., A.M.I.C.E., A.R.I.B.A., etc., is essential for (a) and (b). Teaching experience in a similar appointment would be an advantage.

A degree in Economics or Commerce or equivalent qualification in Accountancy is essential for (c). Applicants must be able to read, write and speak English or Arabic up to a standard which will enable them to carry out the duties of the post. Minimum age 30 years.

Successful candidates for (a) and (b) will be required to teach their subjects up to Higher National Certificate and will also be required to supervise certain workshop and laboratory activities. Successful candidates for (c) will be required to teach their subjects, Accountancy or Economics up to professional standards.

Appointments will be on Short-Term Contract (with bonus) for a minimum period of three years. Salary scale ranges from £2,107.5 to £3,167.5 per annum. Starting pay will be determined according to age, qualifications and experience. A cost of living allowance, which is reviewed quarterly, is payable. Office allowance of £12.50 is also payable on appointment. Free passage in appointment.

Please write, preferably on a postcard, for application form and further information to: Sudan Government Mission, Sudan House, Cleveland Row, St. James's, London, S.W.1, quoting "Senior Assistants 1957" and name and address in BLOCK LETTERS.

MARKETING OFFICER required by the NIGERIA FEDERAL GOVERNMENT for Marketing and Exports Dept. for one tour of 15-24 months, in first instance, to visit the Federal States of Nigeria, with a salary scale (including inducement allowance) of £700 rising to £1,410 a year, with permanent, or £840, rising to £1,530 a year, on temporary basis, with Gratuity of £100-£150 a year. Outfit allowance, £60. Free passages for officer and wife. Assistance towards the cost of children's passages, and grant on £6-£150 annually for maintenance in U.K. Liberal leave on full salary. Candidates, preferably under 45, must have a University Degree (preferably in Commerce or Economics) and possess administrative ability. For further particulars and information about duties, write to the Director, Marketing, Federal Government, Lagos, N.W. State, and name in block letters, full qualifications and experience, and quote M/B/43051/EN.

ACTUARY

The Great Eastern Life Assurance Company Limited, Singapore, require an Assistant Actuary. Commencing salary dependent on experience and qualifications, but not less than £2,100 per annum.

The appointee will be required to contribute 10 per cent of his salary to the Staff Provident Fund and the Company will contribute a similar amount. A furnished house will be provided at a cheap rental.

The Company has for some time paid annual bonuses to its staff, the bonuses for the last three years being two, two and three months' salary respectively.

The appointee will have good prospects of promotion to the position of Actuary at an early date with an increase in salary.

Reply to: Great Eastern Life Assurance Company Limited, Box 797, Singapore.

A LARGE MANUFACTURING COMPANY, with unusually wide interests, including textiles and plastics, has a vacancy in its expanding Research Department, which could lead in a short time to a position of prime executive responsibility. Applications are invited from candidates with first-class scientific qualifications, coupled with experience in both active research and research administration, not necessarily in industry. Appointment carries first-class salary and membership of pension scheme.—Box 380.

CHARTERED ACCOUNTANT

A Chartered Accountant, under 35 years of age, wishing to widen his experience while continuing his lucrative employment, is invited to submit an application for a progressive appointment with a well-known Industrial Company. Only those who have held responsible positions in industry will be considered. Knowledge of Standard Costing, Budgetary Control and modern accountancy practice is essential. The post involves considerable responsibility, and carries a corresponding salary. Applicants are invited to send full details of qualifications and industrial experience, in confidence, to Box 391.

FLOROLOGICAL OFFICE. SCIENTIFIC OFFICERS.—The Civil Service Commissioners have applications for permanent posts. Candidates are advised to apply for posts in the study of cloud structure, synoptic and dynamical meteorology, large- and small-scale diffusion and turbulence, climatology, and development of instruments. There is a limited number of posts for forecasting work at the more important centres. Successful candidates will be given a course of meteorology before being assigned to a research or forecasting establishment. Candidates with national experience, in particular, will be given priority. Service obligations can be commuted from the R.A.F. for forecasting duties at R.A.F. stations. Meteorological Office (M.O.10), Air Ministry, Kingsway, London, W.C.2.

Candidates must be between 21 and 28 during 1956 (up to 31 for permanent members of the civil service). Other classes: (a) First- or Second-Class Honours degree, preferably in physics or mathematics. Salaries (London rates), £513-£925. Women's scales lower, but being improved under equal pay scheme. Some lower rates in provinces. Opportunities for promotion to Senior Scientific Officer (£1,070-£1,245), and higher posts.

Application forms from Civil Service Commission, Scientific Branch, Burlington Street, London, W.1, quoting No. 852/56. (Met.)

CHAIRMAN'S SPEECH

The Chairman, in proposing the adoption of the Report and Accounts for the year ended December 31, 1955, said that the Society had had a very successful year: total funds, at £10,565,183, showed an increase of £667,334, and the sum of £1,873,262 had been advanced to assist house-purchasers. Share capital had increased by £884,521 to a total of £9,246,666. A strong cash position was shown at the end of the year, the balance on hand, at £433,208, being up by over £100,000 as compared with the position at the end of 1954. Reserves totalled £230,066 the sum of £20,000 having been added General Reserve, and the carry-forward, £10,068, maintained at virtually the same figure. Concluding, the Chairman expressed the pleasure felt by his colleagues and himself that Sir John Ure Primrose, DL, JP, had found it possible to join the Board of the Society during the past year.

The Report and Accounts were adopted and the retiring Directors re-elected.

BIRMINGHAM CITIZENS PERMANENT BUILDING SOCIETY

ANOTHER RECORD YEAR

The Annual General Meeting of the Society was held at the Imperial Hotel, Birmingham, on March 7, 1956. The Chairman, Mr W. H. Madin, presided and in moving the adoption of the Report and Accounts said:

The year under review is one which again records excellent progress. The total amount invested with the Society from Members and Depositors during 1955 was £1,120,242, and after allowing for the withdrawals there is a balance of £4,670,774 due to Share Members, an increase of £449,635, and £1,126,339 due to Depositors. Interest at the rate of 3 per cent as from September 1, 1955, tax paid by the Society, has again been paid to the Shareholders, equivalent where tax is paid at the rate of 8s. 6d. in the pound, to a gross return of £5 4s. 4d. per cent.

Advances during the year amounted to a record of £1,332,060. The balance now due was £5,504,348, an increase of £478,639. Applications to finance new houses and from sitting tenants formed a substantial part of the mortgage advances. Investments in Government Securities and cash at bank amounted to £515,192, which represents 8.5 per cent of the total assets. The Profit and Loss Account shows a gross income of £267,017. After allowing Income Tax and Profits Tax £62,731, management expenses £29,344, and other outgoings, the net profit was £147,367, which together with £19,041 brought forward from the previous year has been allocated as follows:

Interest to Shareholders	£117,481
Transfer to General Reserve	20,000
Mortgage Contingency Reserve	5,000
Balance now carried forward	23,927
	£166,408

Total Reserves and carry forward are £233,928. The Assets now amount to £6,938,640, an increase of £477,325.

The Report and Accounts were adopted and the retiring Directors, Messrs H. L. Butler and J. B. Chatterley, re-elected.

ORIENT STEAM NAVIGATION COMPANY

RIISING COSTS A MAJOR PROBLEM

The fifty-sixth Annual General Meeting of Orient Steam Navigation Company, Limited, will be held on April 17th in London.

In a statement issued to shareholders with the accounts for the year ending September 30, 1955, the Chairman, Mr A. I. Anderson, said that the operating profit was £996,568 after making a transfer to Contingency Reserve and providing for depreciation. This, although an improvement on last year, was disappointing, for while the ships had in fact steamed 16 per cent more miles than in the previous year, increased costs had brought about a marked deterioration in results during the second half of the year.

Thus while at the beginning of the year the earnings/costs ratio had been on a sound economic basis by the end of the year the advantages secured by a fare increase introduced nearly two years ago had virtually gone. Any such fare increase always represented the very least necessary in the light of costs ruling at the time. To allow for any future rises in costs was to accelerate the advance of inflation, but there was therefore always a tendency for charges to lag behind costs.

Turning to the future, Mr Anderson said that the new 40,000 ton, 27 knot ship it was proposed to build was the cheapest way of providing the same annual passenger lift as that provided by the two oldest ships in the fleet. Apart from the saving in initial capital expenditure, there was also a 20 per cent reduction in the manpower required. The decision to build had been based on confidence in the future of the large passenger ship, and experience indicated that air transport was more likely to produce new passenger traffic than deplete the existing traffic.

To guard, however, against any possible slump in passenger traffic, particularly now that cargo earnings were becoming increasingly less important in faster ships, the Company had decided, as had others associated with the P & O group, to build tankers. It was intended to order one tanker of 18,000 tons deadweight and one of 36,000 tons.

DUNFERMLINE BUILDING SOCIETY

EIGHTY-SEVENTH ANNUAL GENERAL MEETING

A NEW RECORD: FUNDS EXCEED £10 MILLION

The eighty-seventh Annual General Meeting of the members of Dunfermline Building Society was held on March 20th in Dunfermline, Mr Andrew Crockett, Chairman of the Society, presiding. An apology for absence, through indisposition, was intimated on behalf of the Society's President, the Right Honourable The Earl of Elgin and Kincardine, KT, CMG. In the course of his presidential address, which was read in his absence, his Lordship dealt with the problem of interest rates and indicated that in his opinion some of the difficulties now being encountered by the movement might be overcome more easily if greater attention were given to encouraging investment by small savers. It might be argued that in recent years too much money had come into the movement from a more monied class of investor.

CHAIRMAN'S SPEECH

The Chairman, in proposing the adoption of the Report and Accounts for the year ended December 31, 1955, said that the Society had had a very successful year: total funds, at £10,565,183, showed an increase of £667,334, and the sum of £1,873,262 had been advanced to assist house-purchasers. Share capital had increased by £884,521 to a total of £9,246,666. A strong cash position was shown at the end of the year, the balance on hand, at £433,208, being up by over £100,000 as compared with the position at the end of 1954. Reserves totalled £230,066 the sum of £20,000 having been added General Reserve, and the carry-forward, £10,068, maintained at virtually the same figure. Concluding, the Chairman expressed the pleasure felt by his colleagues and himself that Sir John Ure Primrose, DL, JP, had found it possible to join the Board of the Society during the past year.

The Report and Accounts were adopted and the retiring Directors re-elected.

THE UNIVERSITY OF MANCHESTER

Applications are invited for two posts of ASSISTANT LECTURER IN ECONOMICS in the Faculty of Economic and Social Studies. Salary on a scale £550 to £650 per annum. Membership of the F.E.S.S.U. and Children's Allowance Scheme. Applications should be sent not later than April 30, 1956, to the Registrar, The University, Manchester 13, from whom further particulars and forms of application may be obtained.

THE LONDON SCHOOL OF ECONOMICS AND POLITICAL SCIENCE

(University of London)

Applications are invited for the Webb Research Fellowship for research in one of the political, economic, administrative or social fields in which the Webbs were interested. The Fellowship, tenable for one year with a possible extension to two years, will be of value not exceeding £1,000 a year, according to qualifications and experience. Men and women will be eligible without limit of age. Candidates need not be graduates of a university, but must be qualified to undertake advanced research in a selected subject.

Further particulars may be obtained from the Secretary, London School of Economics and Political Science, Houghton Street, Aldwych, W.C.2. Closing date for the receipt of applications, May 31, 1956.

CIVIL SERVICE COMMISSION

Special Departmental Classes (H.M. Inspector of Taxes; Cadet Grade, Ministry of Labour and National Service; Probationary Assistant Postal Controllers in the Post Office; Grade III Officers, Ministry of Defence). Method 1.

Statistical Class (Home Civil Service). The closing date for the receipt of completed applications for the above classes is May 31, 1956. Age: at least 20 and under 24 on August 1, 1956, with extension for Forces service and, for Statistical Class only, up to three years for approved post-graduate experience.

For particulars and application forms write (preferably by postcard) to Secretary, Civil Service Commission, 6 Burlington Gardens, London, W.1, quoting No. 17/20/56 (for Special Departmental Classes); No. 21/56 (for Statistical Class).

A WELL-ESTABLISHED Industrial Company requires a young Chartered Accountant, with Costing experience, 26 to 28 years of age. A salary up to £1,000 per annum is offered, but the successful applicant will be given every opportunity to progress to more responsible posts on merit.

The prospects are outstanding. Please send details of qualifications and experience to Box 390.

ACTUARIAL CLERK.—The General Life Assurance Company has a vacancy in its Head Office in London for a Student who has completed at least Part 2 of the Institute of Actuaries' examinations. Generous salary scale and good all-round training given. Excellent prospects in an expanding organisation for an applicant with character and initiative. Pension and Widow's Fund.

Apply in writing, giving particulars of research, to the Director of Research, General Life Assurance Company, at 99 Aldwych, London, W.C.2, marked "Confidential".

MARKET RESEARCH.—A. C. Nielsen Company Limited, Oxford, world's largest organisation in this field, has a vacancy for a Statistician for research in the home. Ideally, he or she should be between 24 and 27, be a "mathematical" Statistician, and interested in market research problems. Experience not essential. Applications, giving full details education, qualifications, experience, to Personnel Manager, 109 St. Aldate's, Oxford.

MARKET RESEARCH (Capital Goods) The export company of a large engineering group (Midlands) has two vacancies:—

ECONOMIST.—An imaginative Economist, age 25-35, is required, accustomed to following and analysing home and export market trends. A University speciality in the Theory of International Trade would be of interest. Experience of the application of Economics in industry is essential. Salary commensurate with qualifications and experience.

ECONOMICS/STATISTICS.—This post requires a male University Graduate to handle the collection, interpretation of statistics produced by subsidiary companies and a man aged 20-25, with a good degree in Economics and knowledge of Statistics, is needed, and this post also requires a talent for clear exposition in plain English. Starting salary in accordance with age and qualifications. Progress thereafter depends on performance.—Box 385.

ACTUARY

Excellent opening for young actuary of one about to qualify in consultant's office in Cape Town. Unusual prospects in developing country. Apply with full details to Box 370.

MARKET RESEARCH OFFICER, woman preferred, required at the Norwich Office of Reckitt and Colman, Ltd. Must be able to undertake control of programme of surveys, draft questionnaires and plan tabulations. Age not over 30. Apply, stating age, education, experience, qualifications and salary required, to Secretary, Carrow Works, Norwich.

INTERNATIONAL MARKETING Research Organisation has a vacancy for a trainee for future executive duties. Applicants should be between 24 and 30, with knowledge of statistics, preferably mathematical, and interested in management and marketing research problems.—Write full details age, experience, etc., to Box 377.

ASSISTANT TO PURCHASING CONTROLLER required by large Group of light engineering companies based in London area. Applications invited from economics graduates, age 24-30, with basic commercial experience, preferably in engineering. Good opportunity to promote from within wherever possible and opportunity is limited only by the ability of an individual. Please write, stating full details of previous experience, age and salary required, to Personnel Manager, Box 387.

THE ROYAL TECHNICAL COLLEGE, GLASGOW

(Affiliated to the University of Glasgow)

CHAIR

The Governors invite applications for the Chair of Industrial Administration. The salary attached to the Chair is £1,900 x £100-£2,200. Particulars of the appointment and forms of application may be obtained from the Secretary-Treasurer, George Street, Glasgow, C.1.

AN ECONOMIST with statistical experience is required to work on industrial trends and their effects in the metal and engineering industries.

A Graduate with industrial experience would find this an interesting post involving wide contacts with Economic and Statistical bodies.

Salary according to ability and experience. Apply in the first instance to the Assistant Director of Training, Tube Investments Ltd., Broadwell Road, Oldbury, Nr. Birmingham.

QUALIFIED Company Secretary/Accountant (39), at present with large shipping, export/import Company, Middle East, returning England mid-April, seeks circumstances. Fit, prime middle-age, wide experience in conduct of manufacturing businesses and well informed in modern management methods. Must locate London or Southern counties. Strict conf. asked and given.—Box 358.

RETIRED BUSINESS EXECUTIVE—Swiss—wishes to represent London Community House—selling/buying, Switzerland and Continent.—Box 376.

WELL-CONNECTED businessman, now living Germany, seeks contacts U.S. and Commonwealth.—Box 381.

MANAGING DIRECTOR, age 38, of medium-sized engineering company recently taken over by large group, desires change. Independent management of business capable of expansion preferred.—Box 375.

GENERAL MANAGER (S), B.A. (Camb.), Economics and Law, A.C.W.A., seeks new post at General Management level.

Ten years with big progressive engineering concern, mainly in administration—management accounting, budgetary control, production planning, forecasting—after 3 years, all-round graduate apprenticeship. Subsequently 10 years' varied management experience in U.K. and overseas in engineering and process industries. Last post General Manager of Lancashire company 700 employees: £21m. turnover. Remuneration £3,000 p.a. Now free. Good references.—Box 374.

SUCCESSFUL TUITION

FOR THE B.Sc.(ECON.) DEGREE

Wolsey Hall (Est. 1894) provides Postal Courses in a wide range of subjects for the two examinations for Lond. Univ. B.Sc.(Econ.) (three if Entrance is included). Students have secured this valuable degree since 1925. Prospectus from C. D. Parker, M.A., LL.D., Director of Studies, Dept. P.16, WOLSEY HALL, Springfield, Wokingham, Berks.

TAKE A BREAK in Jersey's Springtime sunshine. The floweriest restrictions and superb comfort, cuisine and cellar at Hotel L'Honore. Resident dance band. Private bathrooms and sun balconies.—Write for tariff or telephone Southern 887.

THE CHARTERED INSTITUTE OF SECRETARIES

Employers requiring the services of CHARTERED SECRETARIES to fill secretarial and similar executive posts are invited to communicate with the Secretary of the Institute (Dept. E), 14 New Bridge Street, London, E.C.4.

OWNER OF BRITISH PATENT, concerning car engines and high efficiency turbo-jet engines, with patents pending in United States, Canada, Germany and Switzerland, seeks development possibilities on royalty basis or sale of rights to interested companies, investment groups or individuals. No intermediary wanted.—Reply Box 377.

B.Sc.(ECON.) LONDON UNIVERSITY

UNIVERSITY CORRESPONDENCE COLLEGE provides postal tuition for the above Degree (obtainable without residence), which is a valuable qualification for those seeking executive appointments in commerce or industry, government or municipal service. The College est. 1887, is an Educational Trust. Highly qualified Tutors. Low fees. Prospectus of U.C.C. Courses for London Degrees and Diplomas, G.C.E. free from the Registrar, 60 Burlington House, Cambridge.

NEW ZEALAND MARKET

A well-established, keen and experienced importing firm with first-class trade credentials and offices in Auckland Wellington and Christchurch, desires to expand its activities. We seek exclusive agencies for various goods. Can we discuss the sale of your product in New Zealand? References Bank of New South Wales, London. Write direct to Mair and Co. (Importers), Ltd., P.O. Box 1471, Christchurch, N.Z.

EXPERT POSTAL TUITION

For Examinations B.Sc.(Econ.), LL.B. and other external London University Degrees: Law Society; Bar; Accountancy; Banking; Secretarial; Civil Service; Commercial General Certificate of Education, etc. Also many non-examination courses in business subjects.—Write today for free prospectus and/or advice, mentioning examination (any) or subjects in which interested, to the Secretary (E.9/2).

*"Beauty, Firmness and Convenience
are the principles"*

— Sir Christopher Wren (1632-1723)

If ARCHITECTURAL VALUES CHANGE with the centuries, architectural principles don't. Some of the basic concepts of Wren are curiously applicable to modern office blocks, factories and other large buildings constructed with Wallspan outer walls.

Employing new materials, Wallspan brings a happy atmosphere of light and air into workplaces and schools. It also gives rare beauty and colour to facades, as well as fantastic speed in their construction.

What Wallspan is. The weight of a modern building is borne entirely by the structural frame: the outer walls are simply protective and decorative. Wallspace is a grid of aluminium alloy, which is bolted to the weight-carrying frame. Into it go windows and doors.

Wallspace Beauty. The Wallspace grid is completed with any of a vast range of beautiful panellings faced in glass, stone, metal or other material—giving your architect striking opportunity for freshness and colour in design—giving you a building to be proud of.

Wallspace Firmness. Wallspace walls lose nothing in strength or durability by being light and bright. A Wallspace wall is as durable, stable and weatherproof as walls of traditional materials. It offers, in fact, more—not less—internal protection, since you can have panelling which gives up to 50 per cent. better insulation against cold—or heat—than cavity brick walls.

Wallspace Convenience. Wallspace affords altogether new standards of convenience. The grid members are so light that one man can handle them. So simple to erect that multi-story walls go up in days. So sensible that no painting or pointing-up is ever needed. Your window cleaners can keep Wallspace walls clean.

Finally, owing to its slim section, Wallspace can give you extra rentable floor space round every floor of a completed building whose human occupants enjoy a wonderful sense of airiness and freedom.

Why not have a word with your architect about the possibilities of Wallspace for any new buildings you may have in mind!

WALLSPAN

CURTAIN WALLING

WILLIAMS & WILLIAMS

RELIANCE WORKS - CHESTER

WALLSPAN IS GOING UP ALL OVER THE WORLD

All this... and many millions more!

In 1938, Richard Thomas & Baldwins Limited installed the now famous continuous strip mill, the first of its kind in Europe.

Hitherto, rolling steel sheets involved man-handling each piece; in contrast, this magnificent mill reduces the slab in successive stages, so that a strip of steel emerges at 20 miles an hour.

This steel strip is then subjected to other continuous processes until it is ready for sale as steel sheets or tinplate.

This plant was so generously planned that today it easily carries the extra load of greatly increased output, made possible by the skill of R.T.B. engineers, and is rolling all the strip for the R.T.B. production of a quarter of the nation's steel sheets and a quarter of the nation's tinplate.

Not content with that, R.T.B. have a vast new development programme for extensions at Ebbw Vale, now approaching completion.

Richard Thomas & Baldwins Ltd

PIONEERS IN MODERNIZATION

Circulation

Density

Equally important — to any national advertiser

RADIO TIMES is unique: with the largest weekly magazine circulation—8,800,715*—and the highest circulation density (174 copies per thousand population) in the world, it gives the advertiser the finest medium in existence for penetrating the mass market.

As a BBC publication, RADIO TIMES can claim a reputation of authority. It goes into at least every other household in the country—once there, it is constantly referred to throughout a minimum period of nine days. Advertisements in RADIO TIMES are seen by the greatest number of readers of any British weekly publication. So there is keen competition to use this much sought-after advertising medium—for nowhere in the world can advertising media planners find such a vast unduplicated readership at comparable cost. *Average weekly net sale (A.B.C.) FAIREY

FAIREY DELTA 2

A new world speed record of 1,132 m.p.h.* was established on 10th March, 1956, by the Fairey Delta 2. It is the first aeroplane to exceed 1,000 m.p.h. under F.A.I. conditions. (*Subject to confirmation.)

FAIREY GANNET

The Fairey Gannet has proved in service to be the world's most successful anti-submarine aircraft, combining the ability at once to search and strike decisively with newly developed weapons.

FAIREY FIREFLASH

Fairey was the first British Company to design, develop and manufacture a guided weapon which destroyed a target aircraft. This weapon—the "Fairey Fireflash"—is now in production for the Royal Air Force.

FAIREY POWER CONTROLS

Fairey Powered Flying Controls are an achievement in terms of precision. In manufacture, key components are finished to tolerances of the order of one millionth of an inch.

In operation Fairey Controls confer precise and effortless flight characteristics on aircraft as varied as supersonic fighters and large transport aircraft.

FAIREY ENVELOPE TOOLING

Rapid production, complete interchangeability and no time lag between prototype and production are the advantages of Envelope Tooling, a revolutionary method of assembly invented, designed and developed by Fairey.

Men who guide the destinies of the world wear Rolex watches

THERE IS a small group of men whose names will live on. Their faces and voices are overwhelmingly familiar. In the newspapers, on television, on the radio, the impact of their personalities is inescapable. So is the impact of their words and actions on our lives.

It would not be fitting to mention their names, for they include royalty, the heads of states, great service chiefs and statesmen. But next time you see them or their pictures, look at something you might normally overlook—the watch on their wrists. That watch will most likely have been made by Rolex of Geneva.

We are proud that Rolex watches serve so many eminent men. Accustomed though they are to the very best, they often express amazement at the accuracy and dependability of Rolex. We are pleased that they soon take it for granted.

Every Rolex Oyster Perpetual Datejust is a chronometer. This means that it has been submitted to a Swiss Government Testing Station to undergo strict accuracy tests, and has been awarded an Official Timing Certificate. And every Datejust gains the coveted distinction "Especially good results." The watch is powered by the new Rolex Perpetual "rotor" self-winding mechanism that keeps the tension on the mainspring constant, making for constant accuracy. The date is shown on the dial, changing automatically each night at midnight, and magnified by a "Cyclops" lens for easy reading. The mechanism is protected, permanently, from all harmful elements by the famous 100% waterproof Rolex Oyster case.

A ROLEX
RED SEAL
CHRONOMETER

Thirty-five years of watchmaking progress are contained in the Rolex Oyster Perpetual. In 1910, Rolex produced their first Officially Certified Chronometer. Now they have produced 250,000 chronometers—three times as many as the rest of the Swiss watch industry. The first truly waterproof case in the world, the famous Oyster, was invented by Rolex in 1926. And in 1931 Rolex invented the first "rotor" self-winding mechanism. A new refinement of this Perpetual "rotor" powers the Oyster Perpetual, silently and automatically, actuated by every slightest movement of the wrist.

1. Economy of space.
2. Stands with its own support.
3. No major scrapping of existing equipment to install.
4. Adaptable for use anywhere.
5. Ingenious classification and signalling system.
6. Better visibility.
7. Better accessibility.
8. Economy in initial cost.

The moment you hated most . . .

COMING or going, a puncture is bad enough; late at night it can take the gilt right off a pleasantly-spent evening. But not if you fit Dunlop Tubeless. Little risk then of puncture delays, or roadside wheel-changing on a cold winter's night. And further, less possibility of bursts or damage through impact or under-inflation. Except for major or freak penetrations, a nail or other sharp object can be left in the tyre, extracted when convenient to you and the hole sealed . . . without taking the tyre off! For many a good evening . . .

Fit DUNLOP TUBELESS

* Sold at the same price as the ordinary cover and tube, Dunlop Tubeless are available for wheels of 16" or less in diameter (except wire type). They are easily fitted and maintained and can be remoulded too—by Dunlop.

If you want our
reports to look as
excellent as theirs,
Mr. Taggart, we
ought to install
RONEO '750'
DUPLICATORS

Let's call in Roneo

and do the job properly!

The standards of duplicating have been rising steadily for many years. With the new Roneo '750' the quality of work, the economy of running and the simplicity are ahead of any other duplicator in the world. But do not accept our word alone — ask for a comparative demonstration.

Current Beecham Achievements

... completed to
schedule this factory.
illustrates another
successful Beecham contract,
undertaken during a period
of maximum production
and against adverse
weather conditions.

“My Board are most impressed by the way you completed the existing factory within the stated time and I would add that we are highly delighted with the finished building. It is very refreshing these days to get what you want, when you want it, without having to pay for a considerable amount of extras when you have got it. Your ability to execute this work so efficiently has helped us very considerably in meeting our own production commitments.

To meet additional requirements, I would appreciate it if you would quote me by return for extending the building by a further 20,000 sq. ft.”

*The extracts quoted are from a letter written by E. Loades, Esq., Managing Director of
The Abbey Panel & Sheet Metal Co. Ltd.,
Coventry and Bedworth.*

Concurrently Beecham Buildings have erected the largest prefabricated industrial building in this country; a 200,000 sq. ft. factory in the Midlands. Their new ways of building allow Beecham to keep the pace on all their numerous contracts. For technical efficiency and well studied economy in Industrial Building you are advised to consult Beecham Buildings Limited.

A remarkable development **'NO-CARBON'** **PAPER**

... Paper which, of itself, produces multiple “carbon copies” without the use of carbon paper, or any visible backing substance. Smears and smudges are eliminated and sharper, clearer, copies obtained. It has to be seen to be believed.

ALACRA CONTINUOUS FORMS

can now be supplied in this most up-to-date medium—thus bringing the ALACRA labour saving method of office documentation to a new peak of modernity.

This revolutionary new product is based on a chemical system developed and patented by the National Cash Register Company. This paper has been used in America for over 18 months and we are fortunate in having at our disposal the experience of one of the leading manufacturers of Continuous Stationery in that country.

Write for full details to:—

Soundings

The potentialities of a new product or process can often be forecast, and waste of effort avoided, by the effective use of project assessment. The Sondes Place Research Institute carries out project assessments which combine economic and technical investigations of some or all of these aspects:

The thermodynamics of any chemical process involved; the patent position; the existing and potential applications; the volume and value of the probable demand; the number, sources, prices and usage of competing materials; chemical engineering problems; estimated cost of production

2+2=5

When chemists, chemical engineers and mechanical engineers work together (as they will for you at Sondes Place) their combined service to industrial research and development is greater than the sum of their isolated efforts... May we send you our booklet about our services?

The Key to Greater Export Sales

The Key to increased export sales often lies in advertising . . . and in advertising three words are of great significance—who . . . where . . . how.

Consider first the word—who. As a business man, you know how much depends on *who* reads your selling message. When you advertise in **LIFE INTERNATIONAL** and **LIFE EN ESPAÑOL**, you can be certain your advertisement is being read by people who can do something about it. The readers of these international editions of **LIFE** are men of influence—leaders in business, government and the professions.

Now consider the second word—where. *Where* do you want your advertising message to go? Wherever there is an export opportunity, **LIFE INTERNATIONAL** and **LIFE EN ESPAÑOL** will be found to circulate.

The former reaches the top of the market around the world and the latter concentrates its coverage in Latin America.

How is your product presented? This is the third important point. And the *how*, of course, partly depends on you. But, the international editions of **LIFE** can certainly help you in this regard . . . giving you the opportunity to control your own advertising . . . to see that all the important selling points are properly made . . . and that your product or service is presented in a manner that does it full justice.

It is for these reasons that leading companies in Britain and on the Continent have more than doubled their investment in **LIFE**'s International Editions in the last four years.

LIFE INTERNATIONAL — rates based on net paid circulation of 250,000 copies printed in English and distributed in 120 countries outside North America.

LIFE EN ESPAÑOL — rates based on net paid circulation of 275,000 copies printed in Spanish covering all of Latin America.

These are the **INTERNATIONAL EDITIONS** of **LIFE** magazine, with a combined current circulation of over 560,000 copies every fortnight.

For further information, write or telephone The Advertisement Director, Life International Editions, Time & Life Building, New Bond Street, London W.1. Grosvenor 4080.

If you know this you know Thermotank

To the traveller by aircraft, ship or train the 'punkah louvre' symbolises comfort. It is one of the patents of Thermotank Limited, the pioneers of air conditioning whose equipment brings warmth to North Atlantic winters, cool breezes to tropical summers, protects ships' cargoes and dilutes and extracts dangerous gases in coal mines. In fact wherever control of the atmosphere is essential for physical comfort or industrial processes, Thermotank equipment will produce the required conditions. Air conditioning of ships was first carried out by Thermotank nearly fifty years ago, and marine installations are still the company's major activity. To ensure that ships' air conditioning problems are dealt with speedily, Thermotank have built up an unrivalled service organisation covering every major shipping route in the world.

SOUNDING THE CYMBALS

No clash will rend the air. The cymbals, we might say, are symbolic. Our objective is to remind you of the excellence of the things we do. These are:—

Structural Steelwork

Wire Fencing of all Types

Woodworking and Joinery

Sheet Metal Fabrication

WIRE FENCING of all types. We manufacture, supply and erect chain link and other types of wire fencing, and tubular and steel-framed gates. These are used extensively in Britain and all parts of the world. They line highways and railway tracks, enclose factories, farms and private properties, surround tennis courts and sports grounds. Their quality and workmanship remain unsurpassed.

Enquiries will be welcomed
from Architects,
Consulting Engineers,
Municipal Authorities
and the Hardware Trade

110 in the Boiler Shop

IN MATTERS OF sound measurement the word 'phon' will crop up very often, because this is the unit of measurement which acoustic engineers use to assess the loudness of sounds.

Let's look at a few examples of noises expressed in terms of phons. A pneumatic tool nearby would have a phon value of about 105, whilst a quiet street gives only 45; in an express train the reading would be about 80, compared with 20 for a rustle of leaves. In a boiler-making shop, the high rating of 110 makes the noise almost unbearable.

The human ear compares noises on a logarithmic scale so that a noise of 70 phons sounds 50% below one of 80 phons.

Those examples are perhaps sufficient to show the extent to which noise is with us most of the time. But sound, like heat, must be kept in its place, and much can be done in factories and offices to ensure that excessive and unwarranted noise is reduced to a rea-

sonable level. The best way to do this is by sound absorbing treatment of the walls and ceilings because these surfaces intensify noise by reflection. By way of example, the normal painted plaster wall to be found in many offices absorbs only 2% of the sound impinging on it.

Compare this with a modern acoustic tile which has an infinitely higher sound absorption.

Newalls (Reg'd Brand) Paxtile is such a product and has a 75% sound absorption and combines an extremely pleasing appearance with the added virtue of being incombustible and vermin-proof; it also affords effective heat insulation. Our skill and experience and our well equipped Sound Laboratory are entirely at your service to investigate any noise or acoustic problem on which you may need help. *We invite correspondence on this subject and will be pleased to submit suggestions, designs and estimates based on a careful appraisal of your particular problem.*

Petroleum Chemical Leadership...

Once again the Kellogg organisation is privileged to announce its participation in another ethylene-from-petroleum plant for Montecatini of Ferrara—the largest Chemical Manufacturing concern in Italy. In the manufacture of ethylene, process engineering by the Kellogg organisation offers many advantages over conventional systems and guarantees optimum yields and purity from economically available feedstocks. The key is the Kellogg steam-pyrolysis process. Used successfully in this country for the cracking of heavy naphtha, it permits ethane and propane pyrolysis plants to be designed for higher yields: makes possible the economic production of ethylene and other olefins from primary flash distillates, residuals, and other low-value products. The Kellogg organisation has accumulated considerable cost data on ethylene manufacture. Interested firms are invited to review these data with Kellogg International Corporation.

Missed Opportunity

MR MACMILLAN has produced a budget of safety first and very little after. The proposals are analysed in detail on page 283. It is probable that, simply by playing safe with his surplus, the Chancellor has ensured that 1956 will be a good year for Britain's balance of payments. It is possible that, if his campaign for public savings succeeds, 1956 will be a year in which there is some check to the constant rise in British wages and prices. These are the essential and courageous achievements.

The maggots in the apple are the particular reliefs, imposts and gimmicks that Mr Macmillan has chosen—and still more, the measures that he has put aside for safety's sake. It is clear what his guiding principle has been: he has decided that courage in keeping up the surplus is courage enough for the day; thereafter the measures in the budget are those that will do least harm politically rather than those that will do most good to the national economy. In this policy of non-provocation, Mr Macmillan has missed the point that if there is a check to cost inflation this year, it will be solely because employers have not got the money to accept wage demands; it will not be because trade unions have not got the gall to present them. Above all, the Chancellor has done nothing to mitigate the one disturbing feature of the price stability campaign—which is that Britain is likely to get a much smaller increase in production in 1956 than in 1954 or 1955.

The central feature of this year's disinflation, if the budget speech is to be believed, is the hope that Government expenditure will be cut by no less than £100 million in the current year. There will be no complaint about this; there will only be case-hardened suspicions about whether economies which cannot be specified will in fact be made. Perhaps this cynicism, frankly stated by detached observers, will be the best spur to action. But the Government must realise that the grounds for cynicism exist. Apart from the abolition of the bread subsidy, no major policy decisions have been taken, and there has been no hint that any are intended; the impression given is that the departments, especially the defence departments, are to search for their economies by deletions in the margin.

Mr Macmillan's other "disinflationary" measures are two small increases in taxation and a savings drive. The particular increases in taxation have apparently been chosen on the extraordinary and unexplained principle that the burden should be precisely divided between direct and indirect taxes. They look rickety as well as mysterious. It is hard to feel confident that the yield of the new tobacco duty may not have been overestimated this time; it is admitted that the increases in profits taxes will bring no yield in the current year, and certain that they will have no effect on spending in the years to come. This second Conservative increase in profits tax in six months is, in fact, merely an attempt by Mr Macmillan to steal Labour's clothes—and he has always looked slightly ridiculous in a cloth cap.

The savings drive is a very different matter; it has long been *The*

Economist's favourite child, the essential pre-requisite to salvation by high investment. But here, too, Mr Macmillan has tended to ignore an awkward fact—the salient fact that he has ignored throughout his budget. It is impossible to get an uprush of real savings without creating the right, positive conditions, and it is impossible to create those conditions (which are also the conditions of expansion, risk-taking, incentive and initiative, harder work and higher earnings) within the present tax structure, to say nothing of present tax levels. Only one feature of the savings drive recognises this, and it is therefore by far the most important measure. The Millard Tucker proposals for pensions for the self-employed may secure a genuine diversion of cash out of consumption into superannuation schemes. The other new devices will to a large extent merely divert funds from existing savings media. This is not entirely unimportant, particularly as the most unorthodox of the new channels (which is discussed in a note on page 246) may divert quite a lot. The new lures may therefore have a beneficial effect in reducing bank deposits and bank liquidity; but to forecast that private savings as a proportion of personal income will not rise significantly as a result of them seems a safer bet than any offered by Mr Macmillan's premium bonds.

When this has been said, the task of broad editorial comment is largely done. This is a budget that should not lose Britain any wickets, but also will not make it any runs. This is particularly unfortunate at this juncture. The object of the Chancellor's new policy, to repeat, is to secure greater stability of prices at the risk of some sacrifice in terms of production. Because this impulse to new production from the side of demand has rightly been moderated, it was the more important to increase the impulse from the side of incentives to work. The

budget should, while still preserving the surplus, have increased indirect taxation (including a move towards a sales tax) and reduced direct taxation (particularly in the ranges where impositions upon marginal income are high).

That opportunity has been missed. Apart from a few technical amendments, only two steps have been taken in the direction that the Royal Commission showed the Chancellor that he should go. One of these is the implementation of the Millard Tucker proposals; the other is the increase in family allowances for large families, which like the rest of the budget is politically neutral but is in this case also socially wise. All the other proposed reforms, for increasing incentives and offering equity to the middle classes, have been neglected. The only encouragement to production in this budget is that to the production of more children; the only politically possible incentives in the new Conservative philosophy, the cynic can now say, are incentives to gambling and procreation.

The most vocal criticism of this budget may be that Mr Macmillan's premium bonds will encourage people to think that they can get rich quickly; the most potent is that his whole policy may condemn the nation to get rich too slowly. When the Chancellor took office, this journal expressed the hope that he would not fall under Keynes's famous curse for the economic novice: we prayed that everything he did should be decided for its own sake, and not by reference to the effect that it might have on something else. In this first budget Mr Macmillan has fallen under the spell. As a result, the whole question of tax reform—and presumably also of rent reform—must now be postponed until nearer the next general election; and this runs the risk that some of the reforms will never be attempted at all. Shake this budget how one will, the dynamo is not there.

Five Months for Algeria

IT is tragic that the one French government that might in other days have taken action to prevent the Algerian rebellion should now be saddled with the consequences of a generation of colonial inertia—so heavily saddled that many of its own followers blame it for failure to meet its pledge to end the fighting. The Council of Ministers has been obliged to take the painful and politically risky decision to authorise the call-up of nearly 100,000 men now, and of the same number later. If the decision is carried out in full, the French forces may be brought up to a strength approaching 400,000 in Algeria and not far short of 600,000 in the whole of North Africa. The mobilisation of conscripts in France will then be more extensive than at any time since 1940. Measures of reorganisation, adapting the forces in Algeria to the guerrilla warfare there, have made them more effective for their military task. The

parties in Paris, with the exception of the Communists and of a strong socialist minority, have accepted the mobilisation as inevitable and necessary, though perhaps they have accepted it only for the moment; restiveness will spread if anything more than a short, sharp campaign has to be faced.

Weeks of heart-searching in the cabinet reflect the division of conscience in the country: the feeling that France faces her "last chance" struggles with the suspicion that this is just another colonial war in disguise. The dissenting ministers (all of whom approved the dispatch of conscripts to Algeria) have given the government a month's grace to modify its policy before they resign. This would not automatically spell the government's fall, but it might precipitate a division among the socialists and would certainly make the cabinet depend increasingly on the right wing. The

future of French, and western, relations with the whole of North Africa depends on the outcome of the developing debate.

Official policy, expressed by MM. Mollet and Lacoste, is by now well defined. The first aim is to reverse the current, up to now in the rebels' favour, and to pacify at least parts of Algeria zone by zone. Fair elections would be held in the pacified areas, beginning on a municipal basis and later proceeding to the election of Algerian deputies, probably to the French Assembly, with whom would be negotiated the statute that would "permanently" decide Algeria's future. The statute would recognise Algeria's separate "personality" but not its independence.

The two main criticisms of this policy have both come from the left. The first, formulated by the Communists, by neutralists like Claude Bourdet, the editor of *France Observateur*, who was recently arrested for a day, and by socialists like Gaston Defferre, the Minister for Overseas Territories, is that the government was elected to negotiate a peace and ought to do so. The reply is that there are no "valid spokesmen" of the Algerian people with whom to negotiate, and that the rebels are asking for independence, which "no French government could accept." The fact that the rebels administer large areas and levy taxes is not allowed to affect the argument. It is maintained that a mere 15,000 rebels are terrorising the 8 million Algerians, for whom they cannot speak; only elections can provide "valid spokesmen." These views are sincerely held. Yet they would not have prevailed by themselves; only the presence there of a million and a quarter Europeans can justify the raising of conscripts on the present scale. M. Mollet has repeatedly made the distinction between Tunisia and Morocco, the protectorates, to which the government has given independence, and Algeria, where the settlers are too numerous and too close to French hearts for their fate to be left to the Moslems. It is essentially in order to protect the settlers that the government will not negotiate with the rebels, but seeks instead to regain control of events by the massive deployment of force.

The second line of criticism is most authoritatively represented by M. Mendès-France, somewhat outstripped by the journalistic commandos of the weekly, *Express*. To this group, too, negotiation is the aim, but it holds that the government must first break the settlers' stranglehold on administration, particularly the local administration, in order to convince the Moslems that the French mean to respect their rights. M. Lacoste's reply is that elections to local councils are impossible in the present disorder; and that he himself would have to choose Moslems to head them. Would not this be the surest way to compromise the moderate men with whom France may later wish to talk? But he also says that his policy goes as far as is possible without arousing the settlers as well as the Moslems: "We cannot have both on our backs at the same time," especially, he argues, since the agrarian reforms which he

proposes will hit some settlers hard. These will include the expropriation for the benefit of landless Moslems of holdings bigger than 120 acres which are held to be capable of irrigation. The settlers are all armed, and it is certain that M. Lacoste fears civil war in Algeria. Here again the prime motive behind the pacification policy is, in practice, not to provoke the Europeans too far.

Yet pacification is a gamble. M. Lacoste himself has given his policy only five months in which to reverse the trend of events. If the Moslem holy war of liberation goes on beyond the five months in Algeria, the westward-looking regimes in Morocco and Tunisia may be disastrously undermined. In France itself it is hard to imagine public opinion being prepared to face "another Indo-China." There is the risk that the French would then be compelled once again to accord independence under duress. Five months is a very short time. Napoleon had a plan of retreat whenever he went in to the attack. This honourably civilian government has none.

★

Were the gamble lost, the best hope for the preservation of the government and the regime would be the growth in the centre parties of a willingness to grant Algeria nationhood, like Morocco. At present M. Mollet's government could find broad enough backing for such a policy only by seeking Communist support. Morocco was not so close to the hearts of the right; and last year there were non-Communists on the government's left to push for concessions. Today this is not so. The government itself is left of centre. If there is to be a change of mood, only the government can lead it. M. Lacoste is in danger both of failing to win over the Moslems, and of fencing the government within limitations which inhibit its range of action and force it into increasingly uncongenial attitudes. The most liberal of policies has an illiberal smell when it is imposed primarily by force. M. Lacoste's social reforms will take time; his administrative reforms (a Moslem has, for instance, been appointed to head the Moslem War Veterans department of the Government-General) are slight. What is visible now is the use of the army.

It is this restriction of the French government's field of vision which is alarming. It would be unrealistic to ask the government to grant Algeria independence now. Such a policy would split France down the middle and lead to the formation, possibly in blood and certainly in bad blood, of a Popular Front. In Algeria, settlers in despair would take the law into their own hands.

Yet it is now impossible to envisage a future status for Algeria other than in some form of federalism or independence. Moslem blood is up, and Moslem imagination has been captured by visions of a federated

North Africa—a proposition lately advanced both by the most powerful man in Morocco next to the Sultan, and by the extremist Algerian *Front de Libération Nationale*. If Paris is ever to catch up with the Algerian Moslems' mood, it will need to advance some proposition that will capture their imagination equally. Some kind of federal proposal that would include at the same time France, and an Africa federated all the way from Rabat to Tunis, might not be impossible. There are precedents in other federations for areas predominantly of one race having their separate powers of local government, but all uniting in a central government for certain major purposes. Even the FLN maintained, in a Tunisian paper last weekend, that there were still "some liberal Frenchmen" with whom they could talk.

No one in Paris yet sees the solution that will finally prevail, but it cannot be peacefully worked out without finding some way of marrying the Moslems' desire for independence with a "statute" safeguarding the Europeans from a tyranny by majority vote. The political obstacles are enormous, the economic ones little less great so long as it continues to be European enterprise that provides the bulk of the revenue. But some such solution must be sought if the French are not to insist on a degree of privilege for the Europeans

that would make agreement with the Moslems impossible.

One of the main stumbling-blocks in Algeria is the lack of political sense both in the rebels and in the settlers. But in France, too, latent hysterias would be reduced if real French interests were defined more coolly and certain persistent fears exorcised: the ruin of the settlers; the ruin of the French economy; more dramatic still, the ruin of France as a major power. The first problem is real; but the technical superiority of the settlers is such that their future is assured if prolonged and bitter war does not carry race hatreds beyond the point of no return. The same can be said of French commerce, since Algeria needs France as a market for her wine and oranges, and as a source of machinery, far more than France needs Algeria. France could even be strengthened by a change in relations with Algeria as long as the French can maintain their contacts and trade in North Africa—and always provided that the adverse turn of fortune does not drive the country into a hard shell of mediocrity and isolation on the model of Spain under General Franco. Algeria is France's "last chance" only if the situation worsens till there is nothing left to salvage but hatred and regret. France should have wept before for these occasions, as Britain should for Cyprus.

The Feminists Mop Up

IT is a hundred years since a group of feminists led by Barbara Leigh Smith set up a committee to collect petitions in support of a Married Women's Property Bill. The Bill failed, but the organised women's movement—as distinct from the efforts of individual women—had begun. By 1955 the last bastion of real public interest was breached, when equal pay in the public service was promised in seven annual instalments. The feminists are now engaged—very busily—in mopping-up operations.

The movement consists of a large number of women's societies, each with its own aims. Seventeen of these are represented on a body called the Status of Women Committee. This co-ordinates their common work and has a programme demanding eight legislative or public administrative changes:—

1. Equal pay for equal work in the public service. Now that the justice of equal pay is admitted, it is argued, economic expediency can be no justification for delaying it six years longer.
2. Women peers—a logical development of women's political rights.
3. The repeal of the law against solicitation, which makes it possible to convict "a common prostitute" for words or actions that would not be an offence if committed by anyone else.
4. A change in the law which aggregates a woman's earnings with her husband's for tax purposes—so that

professional women are lucky if they earn enough to pay a charwoman.

5. Equal opportunity in employment, notably by the repeal of protective legislation under the Factories and other Acts. Women's hours of work and overtime are limited, and they may not do night work or work on Saturday afternoons and Sundays, so they cannot get the enviable rates paid at such times. The feminists object to women being lumped together with young persons as being unfit to decide how much extra, heavy, and dangerous work they should do. Under the heading of equality of opportunity in employment they also ask the right to enter the Church.

6. Equality under national insurance. It is certainly a waste of public money and of womanpower that women should be retired five years earlier than men, although they live on the average five years longer. The committee also wants the same benefits for married women who insure themselves as are paid to single women.

7. Revision of the law about the married woman's domicile, which is equated for legal purposes—in nullity, divorce or separation suits—with that of her husband.

8. Equal guardianship of children. In common law the father is the guardian. A child's passport requires only his signature—which is very convenient for paternal kidnappers.

Among the proposals that the Status of Women Committee has wisely not incorporated into its programme are those about the division of family income. The Married Women's Association wants an enactment

of this kind; it thinks that provision for the home and family should be considered by the courts to be the first call on the pooled income of husband and wife, and that the surplus should be divided equally between them. A few women actually want a salary paid to the wife—though it is hard to imagine anything that would more effectively lower her status. The grievance that these proposals are meant to remedy is, admittedly, very real. As wages rise, housekeeping allowances often do not; and there is still many a wife struggling to maintain the home and family on an absurdly disproportionate pittance, completely ignorant of what her husband really earns. Some hard cases might be avoided if the signature of both husband and wife were required on income tax returns; there seems to be everything to be said for such a reform. But legislation to regulate the very personal and diverse spending arrangements of individual families is surely out of the question.

There is a much better case for another proposal of the Married Women's Association: that when a man fails to maintain his wife and family or illegitimate child, it should be possible, on a court order, to get a prescribed amount deducted by his employer from his pay. This presents some difficulties, but is not impracticable because it is done in Scotland. As a result Scottish prisons have hardly a single offender of this type, whereas in England and Wales, since the war, the number of men sent to prison for failing to comply with maintenance and affiliation orders has varied between 3,500 and 4,000 a year—a heavy burden on the state, not only in prison costs but also in national assistance to the abandoned families. This type of prisoner would presumably be more common still if the police gave deserted wives any help in tracing husbands who vanish; at the moment they resolutely refuse to do so even when they know where the husband is. In a time of full employment, of course, a man can still disappear even under the Scottish system; but Scottish experience suggests that the change in the law may be worth making, in spite of the trouble and expense that it causes to employers.

One of the difficulties in getting support for proposals such as these is the usual official reaction that marriage is a matter of love and trust, and that the law cannot intervene even where there is neither; some feminists are very angry with the Royal Commission on Marriage and Divorce for taking that line throughout much of its report. Another difficulty is that, in the main, it is only those who have personal experience of hardship and injustice who will fight for reform. Most women, who are either tolerably happily married or expecting to be ecstatically so, feel indifferent or even hostile to those who have a chip on their shoulders, and to the cranks who are found in the ranks of any reformist movement. Sensible women refuse to see everything in terms of sex war; the "average woman" tends to be put off feminism by its propagandists.

This is vexing for the feminists. More than a century after Florence Nightingale staged her passionate revolt against the trivial domestic round, here are the mass of women still preoccupied with their love-lives, clothes, children and homes—all the stuff of the women's magazines (which are utterly indifferent to the cause). The ordinary woman persists in the belief that in marriage an ounce of perfume is worth a peck of legal rights, and her dreams of power still feature the *femme fatale* rather than the administrative grade of the civil service. The working class woman, especially, is almost untouched by the women's movement. Equality has been won in a few unions—for example, musicians, cinematograph technicians and bus conductresses; and the ladies of the Amalgamated Engineering Union, with admirable self-confidence recently demanded "at least equal pay" with the men. But these are the exceptions. Although the TUC is formally committed to equal pay as one of its aims, the mass of trade union women—and of their male colleagues—refuse to get excited about it.

On the contrary, trade union restrictions are an important cause of economic inequality between men and women. The Open Door Council has published a list of the trade union and statutory restrictions on women's employment, and they fill a whole pamphlet. For example, the printing industry is almost completely closed to women, although composing, as *The Economist* has good reason to know, is a job that women's deft fingers can do very well. In several other trades the unions present a closed shop to women workers, while elsewhere they bar women from certain kinds of work in the trade. It is surprising that the male trade unionists consider this to be in their interests. Given equal pay, women in equal employment might serve as a useful buffer; in a slump women, whose rate of absenteeism is usually higher than men's, would often be the first to be laid off.

*

But trade unions are not the only offenders; the traditional attitude of employers is just as big an obstacle. This is particularly true in higher posts, very few of which, as a glance down the situations vacant column of *The Times* will show, are open to women, however well qualified. To some extent this tradition is being broken down by full employment, but to some extent also it is inevitable. Few employers are willing to train women for management when they may at any time leave to get married.

Some of the economic disabilities of women are indeed inseparable from their dual potential as wives and as workers; but others are certainly unnecessary. While none of them is so grievous that it is worth being chained to the railings for, it would be a pity if for that reason—or conversely, because feminism is too much identified with extremism—interest in the movement should die altogether. A sensible and moderate programme deserves to command general support.

Stalinism in China

POLITICAL fireworks in Moscow have diverted western attention from the other major partner in the Communist alliance. Speculation has been abundant about the effects which the liquidation of Stalinism would have on the regime of the Soviet Union and its European satellites. What of its impact on Mao's China? Peking has been conspicuously quiet while the tremors from Moscow have been rippling through the eastern European capitals. Not till this month did the *Chinese People's Daily* join in the general chorus of condemnation of Stalinism, and then it did so half-heartedly, continuing to stress the dead dictator's achievements and to recommend his works, though for more critical reading. Above all, it indulged in none of the self-criticism which elsewhere in the Communist world has accompanied the revelation of the recent past. Everything is analysed with an objective detachment, as if Stalinism were a Communist disease from which China is perfectly immune.

A distaste for iconoclasm would be understandable on the part of Mao Tse-tung, since, by the new standards, the adulation with which he is still surrounded could well be branded as a cult of personality. But more is involved in this caution than a merely personal attitude. Short of a purely Manichean explanation of all Soviet calamities through the evil genius of Stalin, it is necessary to view them partly as a result of the primitive conditions in which the experiment was tried, as a price paid for the too rapid industrialisation of a backward country. In Russia the mass collectivisation of the countryside provoked the first mass application of the Stalinist scourge; in China the process has only begun. In the Soviet Union collectivisation was merely a prelude to rapid industrialisation, requiring heavy investment; this need to cut every year a big slice off a small income was not unconnected with the maintenance of a regime of concentration camps. Nobody will deny China's poverty, or the open determination of its leaders to industrialise as fast as they can. Logically, far from being immune from Stalinism, China could be expected to show the symptoms of the disease in increasing measure.

The Chinese Communists began with many things in their favour. Their austere efficiency contrasted with Kuomintang corruption; their agrarian reform, distributing land and cutting rents, gained them a measure of peasant goodwill. Though "people's courts" were set up throughout the country, the regime could still claim a degree of popular support, or at least of acquiescence, for its various "anti" campaigns. But what will happen if the peasants turn actively against the rulers they have brought to power? The mysterious "suicide" in jail of Kao Kang, the former chief planner, was the first sign that the Chinese revolution, too, can devour its children. The branding of Hu Feng as a dangerous heretic—because he claimed for the

Chinese intellectuals the limited rights that their Soviet counterparts gained after Stalin's death—showed that far from being a pioneer China was a laggard in the liberalisation movement. The real test will be faced now, when the Communist policy runs the risk of provoking an upheaval in the Chinese countryside.

Mao, who owes his success to a masterly strategy in rural areas, seemed for long aware of the threat to his regime which a turmoil among China's 500 million peasants would involve. China took a slow boat to collectivisation until lately, steering a gradual course with many ports of call. But in November Mao himself mapped out a perceptibly faster route, and even this has now been scrapped as over-cautious. Already this year the bulk of the 110 million holdings of China are to be amalgamated into looser co-operatives, in which land is still privately owned; in two years' time the countryside is to be dominated by collective farms on the Soviet model. It is doubtful whether private property can be eliminated at such a pace in the biggest peasant mass in the world without using the very methods now being solemnly renounced in Moscow.

*

With 182 million tons of grain and 1.4 million tons of cotton, China apparently gathered last year by far the biggest harvest in its history. But self-confidence is not the only reason for speeding up. Another is the conviction that unless private property is rapidly squeezed out, it will spread and swallow the rest. Parallel movements have been launched in the towns and villages. Handicrafts are to be taken over by co-operatives. The turn of private industry is brought nearer; firms are being taken under joint state control by whole trades, instead of individually. Industrialisation is the dominant motive. It has been resolved to fulfil the first five-year plan, now in its fourth year, ahead of schedule and to revise the master project which exists in the form of the second and third five-year plans. Military needs for equipment and arms will clearly play a part in the programme, both as stimulants to growth and as large claimants to the resources created. The Manchurian industrial base is to be expanded, and at the same time industry is to be spread more widely over the country. Like the Russians, the Chinese know only one method of getting rapidly the agricultural surpluses necessary for this task—to collectivise. A similar piling up of reserves for the industrial revolution has been called by a Russian economist "primitive socialist accumulation." Stalinism was its political counterpart.

China, while its task may seem the more gigantic, has the undoubted advantage over Stalinist Russia of being able to draw on the experience of the Russian ally and on the economic aid of the Soviet bloc. It is Moscow's good luck that a primitive country needs the

men qualified to do the job as much as it needs the tools. A two-way traffic of technicians—to Russia to learn, to China to teach—costs less than the supply of equipment and brings obvious political dividends.

Thus, whatever the friction between the Mecca and the Medina of Communism about the Stalinist heresy, Moscow and Peking will stand together against the "capitalist infidel." The illusion that the West can thrust a wedge between the two allies is likely to become fashionable again, but it remains an illusion. Another myth gaining currency is that China's policy will become more independent as a result of changes in Soviet methods. Such ideas may or may not have an application to Eastern Europe, but they have no relevance to Communist China, which was never anything but independent in its foreign policy. Its revolution had triumphed without the aid of Soviet bayonets; it had succeeded against Stalin's expectation and against his advice; even he never dared to treat such a mighty planet as a satellite. If anything, China was probably the more turbulent partner in the highest Communist counsels, more prone to youthful exuberance, less sensitive to atomic threats.

If there are any grounds for a cautious and qualified optimism about Chinese conduct, they spring less from the lessons of events in Moscow than from the internal development of China itself. It may be that "the high tide of socialist transformation," a term in

common use in the political language of Peking, will for a time distract Chinese attention from the troubled waters of the world outside. The gigantic task of transforming the countryside and laying industrial foundations may possibly discourage unreasonable risk-taking in Formosa, Korea, Vietnam or Malaya. Concrete achievements, by making the country more vulnerable, may make it more prudent. Western trade may exert an attraction, as a means of relieving the strain, if the grandiose plans are meant in earnest.

Radical changes in Chinese policy seem unlikely. And yet the world Communist movement cannot go through its bout of schizophrenia and remain wholly unaffected. The new winds from Russia will blow across east Asia, too. China will provide a test case: is it inevitable that the planned economic transformation of a backward country on Communist lines should lead to a tyrannical regime of the Stalinist type? The question is not academic. The new face worn in Moscow has the advantage of being more easily commended to the European taste than was the grim visage that preceded it. Asians may be less sophisticated about democratic niceties, but they will be quick to react to Mao's handling of the Chinese peasant masses. Whether or not he can find a short cut which will not be, like Stalin's, strewn with peasant corpses may thus prove a key factor in the struggle of east and west on the Asian front.

Notes of the Week

B, K, and the Middle East

THIS week's Soviet statement on the Middle East, issued on the eve of the arrival of Marshal Bulganin and Mr Khrushchev in pomp at Portsmouth, is couched in basic, as opposed to conventional, diplomatic language. What it proclaims is that responsibility for upsetting the shaky balance in Palestine lay in the first instance with the sponsors of the Baghdad Pact, and only secondarily with those of the Czech arms deal. Now that the east-west score has been evened, it continues, the Soviet Union is as ready as anyone to work through the United Nations for peace in Palestine.

Mr Bulganin and Mr Khrushchev must be given credit for proclaiming in advance the line they proposed to take in the "serious talks" in London. They could have waited till the red flag flew over Claridge's, and sprung it as a surprise; instead, they have given London and Washington time to hobnob over it. The notice was valuable,

for they have confronted western policy with a dilemma.

No doubt the straightforward course would be to challenge their *bona fides* by inviting them jointly to sponsor a United Nations arms embargo on the area. The problem for the British Government is whether it could make this move without jeopardising the stability of Iraq, where its special agreement of April, 1955, binds it to "do its best" to deliver military as well as economic aid, and where government stability hangs on getting both.

It may have been a mistake in the first place for a European power to join an Asiatic regional pact; the United States, helping from the wings, is less awkwardly placed. But, Britain once in, the perspective alters. The Baghdad Pact is working so harmoniously—all those who attend its conferences comment on the exceptional smoothness with which they run—that it has become a cornerstone of British policy. It cannot be jettisoned out of friendly feeling for two visitors who have so far only made gestures and comfortable noises about Palestine. They must be asked this week with what measures they would be ready to substantiate their peace-loving statement.

Half-Time for Mr Hammarskjöld

HALF of the month given to Mr Hammarskjöld by the Security Council is over, and its pattern so far is depressing for anyone who hoped to better the climate of eternal skirmish that exists on the Egypt-Israeli frontier. Starting work in Cairo, he won smiling compliance from Colonel Nasser in his proposals for withdrawal of troops some hundreds of yards from the truce lines, for better frontier demarcation and for more extensive supervision by United Nations observers. Going on to Israel, he was told in harder tones that Egypt's word had proved unreliable, and that assurances more substantial than those he had received would be required before Israel could make reciprocal gestures. Would he, for instance, secure its undertaking to fulfil Article 2 (ii) of the armistice agreement, which binds both parties to refrain from warlike and hostile acts? Would he, therefore, cause Egypt to cease to claim the existence of a state of war as justification for the use of the Suez Canal for purposes of blockade?

Egypt and Israel are in fact very differently placed on the armistice line. To Egypt, concessions are cheap in a desert where there are no Egyptian interests of importance. For Israel every inch matters. Close to the frontier lie settlements and towns in which Arab commandos can cause alarm and havoc. Israel can afford to concede nothing to Mr Hammarskjöld without the certainty of a practical recompense. Yet Israel needs peace far more than does Egypt, which can prosper without it. The Israelis stand, to the Egyptians, in somewhat the same relation as does Britain to Mr Bulganin and Mr Khrushchev. Britain, too, needs something more than superficial gestures before it can move.

No Red Meat

APART from his venture into national bookmaking, Mr Macmillan's Budget has made ominously little political impact. In the short run this should help him to secure a fairly smooth passage for his first Finance Bill, but on the longer view he may well find that he has missed an unrepeatable opportunity. Mr Macmillan has not angered Tory MPs—most of them feel that the immediate crisis will be weathered—but he has left them feeling rather flat, and with a sinking feeling at the prospect of meeting their constituents. One of the commonest comments is that many of the so-called "Gunboat Tories" will not now bother to turn out to vote at next month's municipal elections.

On the other side of the House, Labour's chief complaint is that it has not got very much to complain of. There is little political sustenance in a furious indignation about bread and smoke. The Nonconformist element in the party insists that it is at the lottery that Labour's all-out attack should be launched; the political strategists fear that this puritanism would lose far more votes than it would win. To cover this split, Mr Wilson pressed on Wednesday for the scheme to be taken out of the budget, put in the forthcoming betting Bill, and left to a free vote. This is quite a sensible suggestion, but Labour wavering of this sort may get the worst of all cruel political worlds. It is,

however, an apt comment on the budget that these premium bonds are the main feature of it that the politicians want to talk about.

Gambling Bonds

THERE is not much sense in arguing whether Mr Macmillan's premium bonds will be a national lottery, or half-a-lottery, or (since the investors will be gambling for the 4 per cent interest) one twenty-fifth of one per year. The point is that those who oppose gambling on moral grounds will feel that the state has entered a business of which they disapprove, and that is the only part of this sophistry that matters. It is still difficult to gauge how strong the opposition will be. The Commons vote last week on the private members'—and private enterprise—Small Lotteries Bill (discussed in a later note) may not be an altogether reliable guide, for against a national scheme bigger guns are likely to be brought to bear. With the opposition given plenty of time to mobilise before the tickets are ready, the outcry may be greater than the Government at present expects; on the other hand, if the scheme comes to fruition, the response to it may well be greater too.

The Economist's view, without any particular feeling of pleasure as the state jumps on some people's deepest susceptibilities, is that we accept the experiment. There is a lot of gambling in the country; the Government will not move against it, so it might as well profit from it. But, that decision having been taken, there is little to be said for trying to season it with hypocrisy. The proposals to keep the investor's capital intact, to sell tickets only in the expensive units of £1 each, and to put a limit upon individual holdings should be retained, for they can be justified on social and not merely sophistic grounds. But the same cannot be said of the Government's decision to accept the sales disadvantage of spreading the prize money over a lot of little disbursements, instead of adding the bait of two or three really large fortunes each year. If this hypocrisy were abandoned, the Government would not have to put into the prize pool the equivalent of the proposed very high interest rate of 4 per cent tax free. Mr Macmillan has said that even small economies are worthwhile. He might as well start here.

State of Grace

MISS KELLY was no Cinderella, though she could play opposite Prince Charming to perfection if the casting required it. The fascination exerted by her marriage on the general mind, nauseous though some of its manifestations have been, is no more than natural in a match which links the two sugar-candy worlds of Hollywood and Monte Carlo. As for the 20,000 or so residents of Monaco, they have more than mere human curiosity to justify their interest in the proceedings: for the future of the taxpayer's paradise is at stake. This is the charmed half-a-square-mile where tax collectors do not tread. But, under a treaty signed in 1918, Monaco would be incorporated into the

French Republic should the prince leave no direct heir. One can imagine the convulsion which would follow—the poujadist rising, the sad trek of men of property to colder or hotter climates.

The threat of such a calamity gave Prince Rainier a grip on his principality which his feudal Grimaldi ancestors might have envied. An illustration was provided last year, when the biggest bank in the principality—the SMBMP—went bankrupt, the shares of the radio and television company, *Images et Son*, of which it was the main shareholder, having slumped. £1,600,000 of state funds were involved; a crisis broke out and the prince was obliged to dismiss the financial secretary and a private counsellor under pressure from the elective National Council. Thereupon he took to his yacht and sulked. The two men were reinstated, the bank was taken over by a Paris syndicate, and the crisis was brought to an end. Uncharitable people claim that the hope is nourished in Monaco that the appearance of an heir, by changing the Prince's personal position as sole guarantor of tax exemption, may transform his constitutional behaviour and bring more orthodox government to Monaco. Valuable as it is, the fillip to the tourist industry and to the roulette turnover—both lately rescued from a relative decline by the action of a leading resident, Mr Onassis, in taking over the *Société des Bains de Mer*, which owns the casino and the principal hotels—may be only minor and incidental benefits of this Hollywood dynastic alliance.

Airman in Supreme Command

GENERAL GRUENTHER, when he retires from the allied supreme command in Europe, will have served three times as long as either of his predecessors, General Eisenhower and General Ridgway. It has been a long and an exacting time to have been Supreme Commander, requiring not only the energy and administrative skill of the outstanding chief of staff General Gruenther was known to be, but all the agility, diplomacy and wisdom, well leavened with humanity, that he has shown since. It has been a period when accepted working assumptions have tended to crumble and the alliance has needed flexibility as well as strength. The development of new weapons has meant radical changes in the strategy of defence and the tactics of war. Russian possession of the hydrogen bomb has turned confidence in an ultimate deterrent into recognition of a frightening stalemate. Stalinism has given way to smiles. The first German officers have been welcomed at Shape, but the twelve divisions are still a paper argument. General Gruenther will leave his successor heavy tasks as well as an admirable example.

Practically speaking, the Supreme Commander in Europe must be an American. General Norstad is also a "Nato" officer, familiar with the problems, the spirit, and the character of Shape, having been Air Deputy to General Gruenther since 1953. Still only 49, he has President Eisenhower's confidence and an enviable reputation as a brilliant officer. These may not have been the only factors governing the choice. Air defence is fundamental to Nato planning but there has so far been much less integration of air defences than of the ground and naval forces of the alliance. The deficiency was discussed by the Nato

Council in December, and a start made on a co-ordinated early warning system and the integration of continental air forces. Much remains to be done. But of all the areas of military operation, integration in the air is today the most difficult, and the most important, because it cuts closest to the bone of national survival. The revolutionary step of putting an air force general in supreme command was not taken blindly.

Tobacco and the Aged

AMINOR political row has arisen because the Chancellor has not raised the tobacco relief to old age pensioners to compensate for the increase in tobacco duty. This may be a good moment to draw attention to the embarrassing ramp which this relief scheme has become. Under it certain specified categories of pensioners—retirement pensioners and non-contributory old age pensioners—who certify that they are habitual smokers, may obtain tokens which enable

Educating the People

Three plans for ensuring the education of the people of a country are conceivable—each of them intelligible and self-consistent. The Government may, as in Prussia and other Continental States, admit the duty and assume the responsibility. It may . . . establish schools, train schoolmasters, and compel every child within certain years to undergo the training thus provided for it. Nothing can be simpler; nothing can be more complete and comprehensive; nothing, in nations already broken in to autocratic and bureaucratic despotism, can be easier. But . . . Englishmen, we all know, would not listen for one moment to such a plan: moreover, Englishmen, we nearly all of us think, ought not to listen to it. . . . Or the duty of providing of schools and schoolmasters may be imposed entirely on the local authorities, as the provision for the poor formerly was. Parishes or cities may be empowered and compelled to lay a school rate, as they now lay a poor rate—may provide for the moral as they now provide for the material destitution of their inhabitants—and administer the one as they administer the other. This plan also is clear and defensible in outline and in principle. But the instant you begin to plan details, you are met by . . . insuperable obstacles. . . . All sects agree in repudiating purely secular schools—yet all agree equally in repudiating any religious school but their own. They will have no rate levied for schools in which religion is not taught; and they will have no rate levied for schools in which religion is taught—unless it be their own creed and be conducted by their own sect. . . . The third . . . cannot be called a system of national education. It is merely a mode of letting national education alone—giving it at the same time a certain amount of irregular encouragement. It leaves the instruction of the people to the voluntary effort of individuals, aiding those efforts by moderate grants, and improving that instruction by the strict requirements on which those grants are conceded. It is not very logical; it is very unscientific; it is very hard on individuals; it is utterly inadequate. It does not nearly meet the wants of the country; but it does much incidental good.

The Economist

April 19, 1856

them to buy tobacco at a reduced price; the benefit to those who take full advantage of the scheme is 2s. 4d. a week. By now more than half of all pensioners do take full advantage of it, despite the fact that two-thirds of pensioners are elderly ladies—who formed their habits in an age when habitual smoking by women was certainly not as common as these figures imply. It is clear that those who take advantage of the relief fall into three categories: (a) some genuine habitual smokers; (b) a large number of people who quite naturally use the tokens to buy cigarettes for other members of their household; (c) a small number who work an understandable "fiddle," by buying cigarettes with their tokens and then re-selling them. The one half, or rather less, of pensioners who do not get this extra 2s. 4d. a week must include a large proportion of pensioners living on their own—and these tend, broadly speaking, to be the poorest class in the whole community.

Obviously, this state of affairs cannot be rectified by bluntly withdrawing the relief; that is shown by the row that has been stirred up merely by the Chancellor refusing to increase it. The only sensible course will eventually be to raise pensions by 2s. 4d. a week, and to discontinue the scheme then; the net cost of this to the Exchequer would be just over £10 million a year. This step could not be taken at a time when a rise in pensions was already expected; under those circumstances attention would be concentrated on the half of all pensioners who were losing the concession, and the measure would be regarded as mean. It could only be taken at a time when an increase in pensions was not expected; attention would then be concentrated on the half of all pensioners who were getting the extra 2s. 4d. a week, and the measure would be regarded as generous. The Chancellor should keep this suggestion high on the list that he must be compiling in case—just in case—there should be some grounds for increasing purchasing power later in the year. Meanwhile, stand firm.

A Bouquet for Mr Thorneycroft

IN two days of debate last week the Commons disposed of only two of the thirty-two clauses of the Restrictive Trade Practices Bill. They were, however, two days well spent, for they went some way towards providing reassuring answers to the three main questions at the outset of what

INDEX

The Index to *The Economist* is published quarterly. The subscription rate is 5/- a year; single copies are priced at 2/- each. The Index to Volume CLXXVII (October to December, 1955) is now available from:

The Publisher, 22 Ryder St., St. James's, London, S.W.1.

is likely to be the long and arduous trek of this Bill through committee. The first question concerns the Government's firmness of purpose. The answer to this must be that Mr Thorneycroft and Mr Walker-Smith, who had plainly worked overtime on their briefs, put up brilliant Parliamentary performances last week; in more than a dozen appearances at the dispatch box, they have not so far put a single word wrong. The second question was whether a group of Labour technicians would emerge with a genuine interest in helping Mr Thorneycroft to tidy and thrust through an effective measure—and thus quietly assume control of Labour's case at the committee stage from Mr Douglas Jay, who has hitherto been concerned with playing pure politics with this Bill without really understanding it. By Thursday evening it was clear that such a group had emerged; it is led by Sir Lynn Ungood-Thomas with four or five assistants, among whom Mr Roy Jenkins and Mr F. W. Mulley deserve especially honourable mention.

The third question concerned the power of the "trade association Tories," who—under the emerging leadership of the ex-Attorney General, Sir Lionel Heald—are the potential villains of this piece; they have put down a shoal of amendments, including at least a score that could destroy the whole effectiveness of the Bill. Half a dozen of their amendments, including two of the really damaging ones, came up for consideration last week; in every case Mr Thorneycroft stood firm, and the amendments concerned were withdrawn without a division.

It is essential that the Government should continue to stand firm in this way; later in the committee stage, on Clauses 22 to 25, there is an important amendment to the Bill that needs to be made—the Monopolies Commission should be kept in full being as a reserve weapon behind the new system—but there is a long defensive battle to be fought before these clauses are reached. All that can be said so far, and said very much to Mr Thorneycroft's credit, is that the opening exchanges in this defensive battle have gone the right way.

Why No Potatoes?

IN itself there is nothing particularly sinister or surprising in the exceptionally high prices (6d. a lb. and more) which old potatoes are now fetching. The decline in last year's potato acreage was a natural and appropriate response to declining consumer demand, but it happened to be accompanied by low yields both in this country and on the continent. Potato imports have been permitted since late November, but at present potatoes are almost equally scarce in many European countries; Holland has gone as far as to ban exports. Add to this the circumstances that spring greens this year are late and costly, and that the Jersey crop of new potatoes will be several weeks late, and the potato shortage is revealed as a natural minor misfortune—one that could only be worsened by clapping on price control, but which will partly right itself as consumers' resistance to paying the present high prices grows in strength.

The only point of surprise is that there exists a Potato Marketing Board, elected by producers, whose declared purposes are to achieve "orderly marketing" and to even out the flow of supplies. Last November it opposed

114 & 116 PARK STREET • LONDON • W.1
WORLD'S LARGEST PRODUCER OF AMOSITE AND "CAPE BLUE" ASBESTOS

THIS IS ONE of those legendary associations that bear no real relation to the truth. Salamanders are amphibians, the black and yellow species 'Fire Salamander' being common still throughout North Africa and Central Europe. Far indeed from being fireproof, he is found only in the dampest places.

There is nothing mythical however about the fire-resistant properties of ASBESTOLUX, one of the most up-to-date manufactured products of The Cape Asbestos Company. Non-combustible and therefore widely used in modern building practice, this asbestos insulation board is mainly composed of Amosite asbestos fibre, from the Company's own South African mines. It is this Amosite, with its high specific volume, i.e. millions of long, thin hair-like fibres per pound, that gives to ASBESTOLUX many of its outstanding qualities—high insulating efficiency, good strength/weight ratio, and extreme durability due to its indifference to temperature, moisture, chemicals, insects and fungi.

Smart and Practical

The Standard 6 cwt. Delivery Van with its well-proved 948 c.c. engine, its handsome lines and its comfortable, well-appointed 2-door cab, is the ideal vehicle for the small business where a quick, low cost delivery service is required, or as a stand-by for larger firms to carry out those light jobs at a moment's notice and when the use of a larger vehicle would prove uneconomical. The Standard 6 cwt. Delivery Van has a petrol consumption of 30/40 m.p.g. and a loading space of 88 cu. ft., including space beside the driver, thus combining the maximum capacity with outstanding economy.

(unsuccessfully) the Government decision to allow a modest amount of potato imports, on the ground that home supplies were perfectly adequate. Subsequently, it reversed a previous decision which had aimed at keeping up supplies by allowing smaller potatoes than usual to be sold for human consumption. These antics probably contributed only slightly to the present shortage, but any effect the Board has had has been precisely the reverse of its professed intentions.

How can such an egregious error be explained? A newly reconstituted Board, dealing with such a chancy crop as potatoes, can perhaps be forgiven for mistaken forecasting. Its real error lay in trying to play far too safe—safe, that is, from the viewpoint of a producers' organisation so afraid of falling prices that the greater risk of plunging the consumer into scarcity was ignored. In this case, neglect of the consumer may well rebound on the Board's own head, since the rationing-inculcated habit of eating a third more potatoes than before the war will take a severe knock from the present shortage and high prices. But the Potato Board's record in this affair shows once again the folly of the Government's readiness to entrust the marketing of food-stuffs to such biased monopoly organisations.

Danger-Time in Vietnam

IN the ballyhoo that seems inseparable from the travels of Messrs Khrushchev and Bulganin, the important Russo-British talks on Indo-China, which began in London last week, have escaped attention. Lord Reading, the Minister of State, and Mr Gromyko, the Soviet first deputy Foreign Minister, are discussing the consequences of the partial breakdown of the Geneva agreements of 1954, which ended the Indo-China war.

The two main points at issue arise, on the one hand, from the refusal of the Diem government in southern Vietnam to honour political obligations to which it has never subscribed; and, on the other hand, from the fact that the Pathet Lao—Laotian Communists, controlled by Viet Minh—refuse to surrender two provinces of Laos in accordance with the Geneva agreements.

President Diem's refusal to participate in country-wide general elections next July means that Vietnam will remain divided like Korea and Germany, unless a military attack from either side creates a new situation. The danger of

this refusal is that it constitutes a provocation to the Viet Minh to launch a war against the Nationalist south; and the danger of Communist retention of Same Neua and Phong Saly, the two Laotian provinces, is that these might be used as a springboard for an attack against southern Vietnam.

There are two subsidiary points at issue as well; these have already been aired in an exchange of Notes between Moscow and London. The Russians have accused the western powers of setting up military bases in southern Vietnam and of trying to include the south in a military bloc. The British Note, in reply, has pointed out that more than 100,000 French troops have been withdrawn from Vietnam since the armistice and that there will soon be none left, while the Vietnamese army has been reduced by 20,000 men; in contrast, the Communist regime in the north has increased the strength of its army from seven divisions to at least twenty.

The Diem government, in a statement on the forthcoming departure of the last 10,000 French troops, has promised to co-operate with the tripartite supervisory commission in Vietnam. There are no signs, however, that it is prepared to work with the Viet Minh—as the French did—in the joint sub-commission charged with patrolling the demarcation line. The danger of border incidents will therefore become very real after the French have gone. This background lends point to the argument in the British Note to Moscow that the first essential is to preserve the peace in Vietnam; a political solution can wait. Here is a challenge to Russian good will.

Trouble in Spain

THE strikes in Navarre, Guipúzcoa and Barcelona are the most dramatic, not the most important, symptoms of the malaise afflicting Spain and the regime of General Franco. Unsure of itself, the government is husbanding its strength for the home front; a clear sign has been the speedy settlement of the Spanish Moroccan question. Spain's recognition of full Moroccan sovereignty has been so swift that some of the really difficult problems—the transfer of administrative powers and the future of the Spanish towns in Morocco—have hardly been touched upon. Since early February, moreover, there has been agitation among intellectuals and in the university at Madrid for greater freedom of learning and expression. The reactions of the regime have vacillated between the traditional techniques of repression and rather ineffectual appeals and promises.

Behind the present troubles there are both economic and political factors. Despite American aid—some \$50 million in non-military funds during the current fiscal year—or perhaps stimulated by it, the cost of living has continued to rise steeply. The consequent labour troubles are discussed on page 276. Heavy frosts in February caused severe damage to citrus and olive plantations, and Spain has appealed to the United States for an additional \$200 million worth of American agricultural surpluses. The roots of the political malaise go even deeper. General Franco has deliberately sought to prepare opinion for a change of regime after he lays down his office. But the monarchic solution is increasingly unpopular with the Falange and with the general public. The death of one of the young

princes in a shooting accident at Estoril has strengthened the feeling that the royal family is not ideally suited to resume the throne. Political discussion having been allowed to begin, the regime is finding it very difficult to limit the debates to approved subjects.

On the foreign front, by contrast, Sr. Artajo, the Spanish foreign minister, has had a definite success with his visit to Washington. Every weakening in the structure of Nato brings a gain to Spain in the eyes of American strategists. Moreover, during the next six months Madrid will be host to King Feisal of Iraq, to King Ibn Saud, to Colonel Nasser, and to the President of the Lebanon. General Franco's boast that it will fall to Spain to be the link between the western powers and Islam seems to be coming true, as Mr Dulles is duly, perhaps more than duly, aware.

End of the Cominform

WHO will weep for the Cominform? It was founded in 1947 by nine European Communist parties, including those of France and Italy, "to exchange experience and when necessary to co-ordinate the activities of Communist parties." At its second meeting, in June, 1948, it brought the Tito-Stalin quarrel out into the open by declaring the expulsion of Yugoslavia. From then on it was closely associated with the Stalinist domination of eastern Europe in its worst aspect. For the West, the organisation's terms of reference made it suspect from the start; while in Communist eyes it is now discredited both by its acts and by its associations. Its dissolution deprives not Communism, but the west, of a propaganda weapon. Communism loses only a growing source of embarrassment.

Like the dissolution of the Comintern in 1943, the closing down of the Cominform is a gesture to disarm western suspicions of Soviet intentions. (It is also a particularly gay feather in Marshal Tito's cap.) The symbolic value of the gesture remains to be seen. But no one will be deceived about its practical value; *Pravda* has openly stated that the parties previously united in the Cominform will establish new ties and contacts among themselves. The Communist chain of command will remain unbroken.

The Chancellor's Competitors

LAST week MPs legalised the raffle at the church bazaar. Hardly had its opponents finished muttering that this was the thin end of the wedge than Mr Macmillan launched his national lottery. The Chancellor had no doubt been watching the debates on the Small Lotteries Bill to get some foretaste of how his scheme is likely to be received. Opposition cut across party lines, came principally from Free Churchmen, and was highly vocal, but it was not very widespread. There could, however, be a logical reason for some people who supported this Bill to oppose Mr Macmillan's scheme. It has been obvious for a long time that the most serious moral danger in private enterprise gambling is not to the gamblers but to the understaffed police left to enforce archaic and unworkable laws.

The Small Lotteries Bill got through the Commons with only two amendments of any importance: the upper limit on the value of tickets was raised from £500 to £750, and the maximum deduction for expenses was lifted from 5 to 10 per cent. Neither affected the principle of the Bill, which was to legalise, subject to fairly strict (though gradually loosening) limits, the type of small lottery which public opinion has long since come to accept. Another recent private member's Bill brought some minor improvements into the law covering football pools; if these organisations still seem singularly unanswerable to punters, they may become less smug under competitive pressure from Mr Macmillan's national lottery. But one tangle of gambling laws still waits to be unravelled: those covering off-the-course betting. The Government is now committed to bringing in a Bill to set up registered betting shops. With Mr Macmillan willing to set up as the nation's bookie, Ministers ought to feel a strengthened obligation to bring this measure forward next session. It would be quite wrong for them to draw the opposite conclusion—to say that it would be too uncomfortable to run the same pressure groups' gauntlet twice in quick succession.

White Man's Country?

THE proposals put forward by the European elected members for constitutional changes in Kenya, coupled with those for a new immigration policy tabled this week in the Legislature, have a single aim. They add up to a bid to make the colony safe for its white minority for a long period ahead; just how long, it is not easy to say. If the British Government accepted the settlers' proposals, the Legislature would be increased by fourteen new members—seven European and seven representing the other races (of whom four would be Africans). Five Europeans and five non-Europeans would be elected by regions which would overlap existing constituencies; this would necessitate all electors having two votes, though for their communal electorates the Africans have already, under the

'All one needs for growth one finds in Northern Ireland'

—says
Sir JOHN HANBURY-WILLIAMS
Chairman of Courtaulds Limited

"Before the end of the war we decided that as soon as possible, we would build a new rayon plant which would undoubtedly involve us in the expenditure of several million pounds. This decision required the careful examination of several possible sites and as a result of our investigations we decided to go to Northern Ireland. We opened in Carrickfergus, near Belfast, in 1950. Here, our 1,200 employees are turning out well over 17,000,000 lb. of rayon yarn per annum and are also making the sulphuric acid and carbon disulphide used in the process.

Our experience since 1950 has shown us that we were right in assuming that labour, both men and women, was keen and plentiful and that we would have no difficulty in maintaining a three-shift system non-stop throughout the year. Thanks to Northern Ireland's sound manufacturing tradition absenteeism and labour turnover are negligible, and we find that after training to our specialized requirements, labour is just as good as in any other of our factories in the United Kingdom. The products are very well received by the textile trade.

The Government of Northern Ireland gave us every assistance. In particular, they solved for us the formidable problem of providing many millions of gallons of water a week and disposing of the effluent, and were most helpful over questions of transport across the Irish Sea.

I believe that the advantages offered by Northern Ireland to the firm which intends to build a factory merit the closest consideration."

Over 100 firms have set up factories in Northern Ireland since the war. Here are a few of them:—

 **BRITISH THOMSON-HOUSTON CO. LTD.** **PYE LTD**
BRITISH TABULATING MACHINE CO. LTD.
LINES BROTHERS LTD **METAL BOX CO. LTD.**
HUGHES TOOL CO. LTD. (U.S.A.)

The recently-formed Northern Ireland Development Council, a Government-appointed body under the Chairmanship of Lord Chandos, has prepared a practical memorandum of the facts a business man wants to know. Ask for it in strict confidence from the Council. Read it: then if as a Managing Director you want to go further, write back to Lord Chandos and he will send his personal representative to see you. Or, if you prefer it, conduct all your correspondence with the Ministry of Commerce, Dept. E, Belfast.

Northern Ireland Development Council
13E, Lower Regent Street, London, SW1

NORTHERN IRELAND OFFERS:

- | | |
|---|---|
| 1 Plentiful labour supply. | 7 Government factories to meet your needs on rental or repayment. |
| 2 Possibility of multiple shifts. | 8 Grants for training and services. |
| 3 Little absenteeism: low labour turnover. | 9 Concession rents. |
| 4 High output per man. | 10 Coal rebate. |
| 5 25% capital grant for plant, machinery and new buildings. | 11 Housing priorities. |
| 6 Grants toward transfer of machinery to Northern Ireland. | 12 Active help by Government departments. |

We did well to choose Samson Clark . . .

For more than 25 years Samson Clark have acted for many of their most important clients. Yet, significantly, they have been appointed by several young and progressive companies. To every client they offer the experience gained during nearly 60 years as a leading London agency with the advantage of up-to-the minute ideas of a young and enthusiastic staff. Whether your advertising calls for a modest expenditure, or a national campaign embracing press, public relations, marketing and television, you can rely on the Samson Clark organisation with the utmost confidence.

modified Courtts plan, been promised three. The idea behind this move is that when a member joins the council of ministers, his constituents shall have another member in opposition to complain to. In addition, there would be two corporate members representing commerce and agriculture and elected by the organised interests and boards; to balance these, the Africans would get two more purely communal constituencies as recommended by Mr Courtts. It is hinted that the new regional members might ultimately be elected on a common roll; and the corporate members could claim to represent all races already. But the effect of the proposals taken as a whole would be to entrench European power, and perhaps to strengthen the "opposition" against the government. It is not linked to any suggestion that another African minister be appointed.

The new immigration proposals seek to replace the existing multi-racial control board by a government immigration officer responsible to the council of ministers. Their likely effect would be to restrict Asian immigration on the ground that Asians compete with Africans for jobs, while letting Europeans in on the grounds that they do not (though, Africans would add, they do compete for land). The motive force behind these proposals is the settler dream of a large settled white population, but this is hardly the way to implement it. It is very doubtful how many more large farmers are likely to bring capital into Kenya, while white smallholdings can hardly be justified as contributing to the economy, and white technicians—whose presence certainly can be justified—are, more often than white Kenyans admit, purely transient.

An Inflation of Shopkeepers?

THE National Union of Small Shopkeepers has recommended its members to raise retail prices by 5 per cent, unless the Government reviews the rating reassessment of shop premises. This recommendation is specifically said to be designed to attract the public's attention; it may therefore be useful to detail the two points that attention will be attracted to. First, the extra rate burden that shops will bear this year is not likely to exceed £15 to £20 million, which represents about one-quarter of one per cent of retail turnover; when allowance is made for the fact that rates are paid out of before-tax income, the extra burden will, indeed, probably be considerably lower. For retailers to talk of a demand for a 5 per cent increase in prices in the face of such figures, and thus to dream of an accretion of over £300 million to their own pockets, is chuckle-headed. Secondly, shopkeeping is still a sufficiently competitive trade to make such a recommendation impossible of fulfilment; if an attempt ever were made to implement even part of it, it presumably could not be done until the autumn, by which time the Restrictive Trade Practices Bill will be by the law of the land. The 11,000 small shopkeepers who are members of the National Union should ponder these points, and the likely effect upon the British public of their invitation to M. Poujade to address their annual conference next month. A majority union may gain by militancy; a minority union, with a reasonable case to argue, must lose by any public advertisement that its leaders are so exhibitionist, impractical and silly.

Gloomy Danes

THE state of Denmark is not yet fully healed. Most of the men involved in the month-old Danish strike—chiefly transport workers, builders and employees of the metal industry—went sullenly back to duty on Monday morning, after a token general strike in protest against the Folketing's decision to end the dispute by legislation. Seamen in Danish ports, however, have stayed out; some employers in other industries are finding themselves faced with "go-slow" tactics; and according to the latest news the farm workers, together with one or two other groups of men who took no part in the recent strike, are threatening to stop work themselves. The chief complaint is that the mediator's proposals, as enforced by parliament, ignore the claim for a reduction in working hours. They provide instead for a flat increase of about a penny an hour for all workers, with a little extra for the poorest, and rises in the rates of pay for overtime and for certain holidays. Since the settlement has the legal force of a normal wages agreement, it can in theory not be challenged for the next two years.

The seamen who have refused to return to work are therefore taking part in an illegal strike. But it is difficult to see what the Social Democrat government can do. The men have taken their stand, not on the main provisions of the mediator's settlement, but on a side-issue—the status of trainee officers, whom they want to be treated as ordinary members of the crew. A special committee has been appointed, and negotiations continue on the basis of new proposals. Fortunately for Denmark's foreign trade, the strike of seamen is confined to ships in Danish harbours, since those elsewhere are subject to the law of mutiny. It has thus been possible to divert ships to Hamburg, where they have picked up bacon carried over the expensive overland haul from Denmark. Britain has been getting most of its usual bacon in this way, though butter supplies have been hard hit. However, for political as well as economic reasons, Mr Hansen's government needs to end this angry dispute, which has brought with it the unexpected sight of barricades and violence in Scandinavian streets.

The Cult of Comrade Chervenkov

THE deplorable manner in which they had all been infected by the cult of personality has been denounced with apparent gusto by all the Communist leaders of eastern Europe. The Czechs have gone so far as to condemn the "aura of sacrosanctity" that surrounded their dead leader, Gottwald, "in spite of his well-known modesty." But only in Bulgaria, so far, has a living Communist leader been officially associated by name with the cult and made to suffer—albeit in a gentlemanlike way—for his failings. According to an announcement by the Bulgarian central committee, "the cult of the person of Comrade Valko Chervenkov changed to a great extent the traditional tried methods" of the party and sometimes resulted in "one-sided decisions on problems." Mr Chervenkov has now resigned from the premiership and, like Mr Malenkov

before him, stepped down to the position of a deputy premier.

Reports from Sofia indicate that self-criticism did not come easily to Bulgaria's former dictator and that by the time the rest of the central committee had persuaded him to accept his demotion they were all very tired men. Exactly in what degree his fall was caused by pressure from Moscow and in what degree by opposition within the Bulgarian party, is impossible to say. But he may have been selected by Moscow—perhaps just because he was swaying slightly on his pedestal already—as a token of sincerity and a propitiatory sacrifice to Marshal Tito. A Yugoslav parliamentary delegation happened to be in Sofia to witness the humiliation of one of Tito's bitterest opponents.

★

There is no sign that the change of prime minister means any change of policy inside Bulgaria. Chervenkov's successor, Anton Yugov, is another veteran Communist. Seven years ago, after Georgi Dimitrov, the hero of the Reichstag fire trial, had been carried off to die in a Soviet sanatorium, Yugov and Chervenkov fought hard for Dimitrov's seat as premier and party boss. The two men have been personal rivals, but as far as is known they have not (like Rakosi and Nagy in Hungary) become the protagonists of opposed policies. The most obvious lesson to be drawn from the changes in Sofia is that the man in power needs Moscow's support as much as ever. What will Moscow do if Rakosi's compulsory somersaults land him in serious trouble with his own party?

Mr Kono Goes Fishing

THE Japanese are discovering, as others who negotiate with the Russians have discovered, that all strings lead to Moscow. Mr Kono, the Japanese minister in charge of agriculture and fisheries, leaves Tokyo for Moscow this week end with a large delegation, with the task of persuading the Russians to ease the restrictions which they threaten to impose on Japanese salmon fishing in the north Pacific. But it is highly unlikely that the Moscow discussions will be confined to salmon; the Russians have bigger fish in mind. This is the latest move in the long and hard-fought negotiations for a Russo-Japanese peace treaty. The London talks, after dragging on for nine months, broke down over the return of ex-Japanese territories: Russia offered to hand back only the small Habomai and Shikotan islands just north of Hokkaido, whereas Japan asked for at least the southern Kuriles as well. The day after the talks were suspended, the Russians announced their intention to limit salmon fishing in a wide expanse of sea, stretching far beyond territorial waters, off Kamchatka.

★

Mr Kono's mission calls for much delicacy. The Japanese have drawn a subtle distinction between sending him to Moscow, which they claim does not imply diplomatic recognition of the Soviet Union, and negotiating with the unofficial Russian delegation in Tokyo, which they think

would imply it. This delegation has already hinted that the Russians are entitled to make their own rules about fisheries so long as a "technical state of war" exists between Japan and the Soviet Union. Mr Kono is likely to find that the price of freer fishing is Japan's signature to a peace treaty that ignores, or at best shelves, the Japanese claims to the southern Kuriles. Nor does he go to Moscow with his country solidly behind him. The Japanese fishing industry is carrying on with its plans to send 19 fleets to the northern Pacific, and will exert all the pressure it can to escape the crippling Soviet restrictions. The old and ailing Premier, Mr Hatoyama, who has now been elected to the presidency of the Liberal-Democratic party, clearly feels the ambition to settle affairs with Russia before ill-health forces him to retire. Mr Kono is one of his closest confidants. The Russian restrictions are due to take effect on May 15th; if he is not careful, Mr Kono will find himself casting a clout before May is out.

More Pay for Nurses

THE Government's hopes of economising in its expenditure are not going to be helped by the fact that some inevitable increases are now falling due in the pay of public employees. One of the latest announcements is that of higher salaries for nurses; it will increase hospitals' maintenance costs and means that a supplementary estimate is heralded before the new financial year is three weeks old. The estimates already presented for the hospitals allowed for an increase of £3 million in the cost of the nursing and midwifery staff in 1956-57. But the new scales for salaries and training allowances will in fact cost between £5½ million and £6 million.

THE UK TRADE GAP
£ MILLION

The old scales have been in force for only sixteen months. They were decided by an award of the industrial court in favour of the management side of the Whitley council, and the new scales go much further towards what the staff side was then claiming. They increase the training allowance of student nurses in general by £20 a year, to £260-£285, and the salaries of matrons in the largest hospitals by £95, to £1,290. The scale for ward sisters will go up from £450-£575 to £485-£615. But the biggest increase is that aimed at stemming the loss of male nurses in the mental hospitals. The training allowances for student mental nurses, who under the old scale received £45 a year more than other student nurses, are to vary with age, and those aged 21 or over will start at £390 a year. This should be a stimulus to the recruitment of men and women; but it is not nearly so certain that the increases for the trained male nurses are enough to keep them from drifting away from their jobs.

Le Temps, c'est de l'Argent

THE launching this week of the new evening paper *Le Temps de Paris* may open a circulation war in Paris. The newcomer, powerfully backed, recalls in more than name *Le Temps* of before the war. That most dignified daily of the Third Republic became in the twenties the property of the French steel federation, and in foreign policy

the mouthpiece of the Quai d'Orsay. It went on publishing for too long under the German occupation to survive the liberation, and its place as the serious paper for the middle classes fell to *Le Monde*. The heir did not take over the conformism and pliability of its predecessor, but wrote a new chapter in French journalism under the often unorthodox direction of M. Beuve-Méry, seeking no money and accepting no orders. It balances its accounts with difficulty, but by high quality of reporting and commentary it has held the respect even of those who hold some of its views to be wrong.

French industrial and financial hankering after a more adaptable journalistic tool has persisted. The incorruptible *Le Monde*, having refused to be worn down from within, is to be attacked from outside. *Le Temps de Paris* is expected to mirror conservative interests more faithfully. Some members of its editorial staff have been blamed in the past for insufficient hostility to the occupier during the war; but times have changed. The new paper will lack neither gifted journalists nor the funds requisite for success.

The scale on which it is launched is bound to set it also against another evening daily, *France-Soir*. With a circulation of more than a million this is the giant of the French newspaper world and, since it is supported by Messrs Hachette, it should be able to stand the strain and hit back. The ephemeral appearance of the mendacious *Express* as a daily provoked skirmishes among the morning papers a few months ago. The battle of the evening press is likely to last longer and prove more acute. For the good of journalism it is to be hoped that the independent *Le Monde* will survive this financial struggle.

How Blunt is Bank Rate?

SIR—With how much more mystery can British banking be surrounded? Five years ago, like Lazarus from the tomb, the "conventional" 30 per cent ratio came forth, greeted by cries of delighted recognition from the highest quarters. When some of us, looking back amongst our records, expressed doubt as to whether any recognisable ratio as such had ever existed, we were reprimanded for being mere figure-diggers. We stood duly rebuked. Imagine our confusion when in both 1952 and 1955 such credit contraction as was achieved occurred in periods when liquidity ratios were rising rapidly; very odd, we thought. Our confusion grew when we learnt from your columns (March 3, 1956) that last year "the authorities intimated that the banks ought to treat this (i.e., 30 per cent) as the normal minimum"; odder still, we thought—in what sense is this a "convention" if Big Brother has to crack his whip about it? Now our confusion is complete, since we are told, by *The Banker* no less, that it all depends on the current state of the gilt-edged market; if Consols are poorly, "liquidity may feel taut even though the ratio has risen by $\frac{1}{2}$ per cent more than seasonally."

Having emerged coughing from these dense clouds, you, Sir, smite us even more cruelly. The cash ratio was at least a ratio; we knew where we were with that. But now (April 14th) you turn to speak pityingly of those "who suppose that the Bank of England can exert 'quantitative' control over bank cash by open market operations." This belief you now report to be even more *démodé* than being polite to Stalin; credit is curtailed, we are now told, by a rise in interest rates—not, as we sillies had thought, *vice versa*. Is nothing sacred?

Yet on going into the argument it transpires that all that the New Look is saying is that if the banks lose cash they can replace it by selling bills to the lender of last resort; i.e., that the Bank cannot contract credit through the banks' cash if the banks' cash is not reduced. Put that way, the argument is not quite so atomic. And the fact remains that it is through a reduction of bank cash that the trick is worked; it is because of a loss of cash (not bills) that call money is cut down, and so on. There seems to me to be a world of difference between saying, on the one hand, that credit cannot be controlled through the cash ratio, but only through total liquid assets and, on the other, that in order to restore a threatened cash ratio the banks will take certain actions and certain consequences will follow.

Surely (I speak, as St Paul says, as one less wise) credit policy still rests utterly and unambiguously on the fixed cash ratio. This is just as well, since we have found its competitor, the liquidity ratio, a distinctly slippery customer.—Yours faithfully,
EDWARD NEVIN

Aberystwyth*

Wheat: A Permanent Solution?

SIR—I make bold to suggest that trade in wheat, both within and between countries, should be set entirely free. It would, however, be fatal to free national and international trade in wheat unconditionally, since there are in the world today enormous accumulations of redundant wheat. These unsaleable surpluses amount to some 1,800 million bushels.

If all this wheat were to be thrown on the market, the world price of wheat would at once collapse, bringing down with it the prices of all other agricultural products, and the farmers, who still constitute more than half of the population of the world, would be ruined. It follows that, if the world wheat trade is to be set free, these unsaleable surpluses must first be withdrawn from the market.

My proposal is that one-half of these surpluses should be bought up by the seven wheat exporting countries and the other half by the forty-odd wheat importing countries, in proportion to the quantities that each of these countries has exported or imported during the last six years. The quantities thus stored would be an insurance against any kind of emergency. They should not be put on sale except by a majority vote of the International Wheat Council.

Over-production of wheat in recent years has been mainly due to the policy of the wheat exporting countries, where the wheat trade has been in official hands and artificially high prices have been maintained. How can the over-production of wheat be prevented? Protection for agriculture, industry, and trade—that is, subsidies, tariffs, and combines—should be abolished by degrees. The farmer can no more than the manufacturer or trader be expected to sell in the free market and to buy in the protected market. Agricultural subsidies maintain high-cost producers in production and enable inefficient farmers to remain inefficient. Farmers deprived of subsidies should be helped with monetary grants, so administered as not to interfere with the price mechanism. Then over-production will not occur.

If economic freedom prevails and

world industrial production and employment remain at the anticipated high level, supply and demand will determine a price for wheat that will ensure to the producer not only his costs of production but also a fair profit.

The answer to the wheat problem lies in competitive trade supplemented by a futures market. The purpose of the futures market is not only to provide a means of insurance for producers, millers, exporters, and importers, but also directly to relate future supply—and hence acreage and production—to future demand. Thus, when the futures market is advancing, production is encouraged; when it is declining, it is discouraged.

The price of wheat must cease to be a political issue. Its emancipation from political influences would permanently benefit both the producer and the consumer, and would bring relief to the taxpayer.—Yours faithfully,
PAUL DE HEVESY
London

A Formosan Third Force?

SIR—I suggest that the writer on the above subject in your issue of March 17th knows little of actual conditions in Formosa. He states that "there is good reason to believe that, given a free choice, they (the people of Formosa) would opt for independence." There is not the slightest justification for such a statement. Recently I spent four months in Formosa, travelling through the island from Keelung to Kaoshiung, conversing with wharf labourers, farmers, industrial workers and ordinary people in the streets and never once did I hear any suggestion that would support this contention.

The reason is obvious. Every farmer either owns his farm or is in process of making it his own; the industrial workers have (in Asian terms) a high standard of living; and enjoy social amenities not known elsewhere in Asia. Further, the people themselves control the affairs of the island. Native-born Chinese (Formosans) are in the great majority in the Provincial Government, which administers the affairs of Formosa. In the 1954 elections for the Provincial Assembly, of the 103 candidates, the great majority of the 57 members elected by secret ballot (every person of the age of 18 enjoys the suffrage) were native-born and these included six women and three representatives of the mountain tribes (aborigines of Malayan origin). Of the 21 members of the Provincial Council, 16 are native-born. The cold fact is that the domestic affairs of Formosa are now in the hands of native-born Chinese, or Formosans.

The group in Japan mentioned by your writer comprises men whom the Japanese, before they vacated Formosa, inspired with discontent, as they did in other parts of East Asia. As I heard again and again in Formosa from native-born Formosans, they are completely discredited throughout the island.—Yours faithfully,
W. G. GODDARD

Books & Publications

Prophet from Shantytown

NAUGHT FOR YOUR COMFORT.

By Trevor Huddleston.

Collins. 256 pages. 12s. 6d.

THIS is a stern, even fierce, book—the indictment of a religious reformer who is fighting for men's souls as well as for their political rights. Father Huddleston writes as a priest and for men and women of conscience; and he bases his right to speak out on the danger that the black population of South Africa will be lost to Christianity if the policies of the Afrikaner nationalists are pressed to their announced conclusion. Persecution will, in his view, evidently destroy rather than consolidate faith in the South African context; but it would ill become anyone who is not African to make any comment on that point. Father Huddleston, as a white man speaking to other whites, is frankly casting about for means to bring pressure to bear on the Union government. He is not inclined to turn the other cheek, as his critics on occasion urged him to do "as a Christian," and as the Christian churches have done—in his view, wrongly. For he is not fighting on behalf of himself or trying to redress personal injuries; he claims the right to take up the scourge (or the sword) on behalf of the oppressed of another race. He speaks as a South African born.

Father Huddleston has not written a general exposé of the condition of black South Africans. He writes from his own experience as a pastor in Sophiatown, the African suburb of Johannesburg—he denies that it can be called a slum—in which Africans once had freehold rights now extinguished by the Union Government. He bases his arguments on issues of principle. Whether or not the new "location" is any better or healthier for the uprooted Africans, he argues that the destruction of rights is an act of sheer tyranny. He is right. It is the strength of his case that, in analysing the treatment of Africans in and outside Johannesburg from his first-hand knowledge, he sticks throughout to the restrictions placed on their liberty and the injustice of their treatment before the law and in the courts. Irrespective of their material condition in the shantytowns of the Rand, he establishes their status of helotage. It is the merit of this book that it shows what *Apartheid* means for the weaker race.

Father Huddleston makes the point that he is not negrophile in a general way. He "does not like the Africans," because nobody can like an abstraction; it is individual Africans that he likes and

loves. His case against Nationalist Native policy is that it treats the Native as an abstraction, and the result is untold suffering to real individual human beings such as he movingly, but often bitterly, describes. But he sometimes falls into the same error himself when speaking of the white South Africans, so that the Union's 2½ million whites are represented at times as an inhuman force, with a remorseless and evil core, and a penumbra of suburban indifference and hypocrisy. He will have nothing to do with the idea put about by many white South Africans that, whatever the law, they are in fact "good" to their natives, especially their servants; Father Huddleston's picture of domestic service in Johannesburg suggests that the Victorian "tweeny" was treated with deep humanity by comparison with the black houseboy or girl. But this means that one is brought up short when he produces the rare exceptions. Moreover, he fails to make his case complete when he describes, very movingly, the destruction of the mission schools under the Bantu Education Act. For he makes the assumption that the type of education purveyed to the African by the Native Affairs department will be inferior—an education to servitude; yet he does not describe it, or show how it is inferior to the education given by the mission schools.

These are weaknesses in a book otherwise so well informed and so passionately written that it will inevitably help to harden opinion in this country and America against the Union government (Father Huddleston's quarrel, however, goes beyond the government to the whole white population). Father Huddleston now despairs of the effectiveness of liberalism in the Union itself, and is clearly hoping for pressure from outside. He calls specifically for cultural sanctions; he wishes so to make the white South African stink in the nostrils of men of principle everywhere that artists and entertainers will refuse to go to the Union and international sporting associations will decline to have South African members. He suggests that the Commonwealth can hardly keep South Africa as a member. He does not, however, propose that business men should refuse to trade, or investors to invest in South Africa. But if he despairs of economic sanctions, which would at least inflict visible losses on South Africa, it is hard to see why he should assume that social ostracism would affect a people which, as he suggests himself, is every day sinking deeper into spiritual darkness and isolation. Would South

Africa mind being cut off from international rugby or cricket? Were not the Boer republics anxious to live cut off from the world in a biblical golden age of their own devising?

Like other books by South African liberals, "Naught for your Comfort" makes gloomy reading. The South African chapter in the long story of man's inhumanity to man may not be the cruellest; but it is bad enough, and there seems no early hope of its being brought to a close. It is a heavy liability to the West in the cold propaganda war. Father Huddleston himself has been withdrawn from the scene, and as their white friends are removed one by one, the Union Natives must turn more and more to devising means to organise themselves in secret and with secret leaders of their own.

Headquarters of the Revolution

THE COMMUNIST INTERNATIONAL, 1919-1943: Documents, Volume 1, 1919-1922.

Selected and edited by Jane Degras.

Issued under the auspices of the Royal Institute of International Affairs.

Oxford University Press. 479 pages. 55s.

THE Cominform has just been dissolved but the British public has no longer any excuse for ignoring the origins of its revolutionary ancestor, the Comintern. This excellent collection of documents of the Communist International comes at the right moment. The "return to Leninism" now proclaimed in Moscow is associated in certain minds with a return to Comintern traditions; some people even heard in the speeches of Mr Khrushchev and Mr Bulganin on their eastern peregrinations echoes of that earlier period. In fact, the Soviet envoys sound like pedestrian, bureaucratic reformists when compared with the stirring voice, full of revolutionary fervour, which emerges from these pages. Then the revolutionary tocsin was ringing openly its challenge to the established order for a mortal combat with no Queensberry rules:

To demand of the proletariat that like meek lambs they comply with the requirements of bourgeois democracy in the final life-and-death struggle with capitalism is like asking a man fighting for his life against cut-throats to observe the artificial and restrictive rules of French wrestling, drawn up but not observed by the enemy.

The Comintern was founded in March, 1919, when Europe was shaken to its foundations and the Communists deduced that European capitalism was tottering into its grave. Moscow was to be only a temporary headquarters of the revolution. The president of the executive committee, G. Zinoviev, allowed only weeks—months at most—for Communism to spread throughout the continent; England was given a year, the United States possibly two, and the peoples of Asia and the Arab world were already called to a "holy war against British imperialism." These illusions

were progressively dispelled by defeat in front of Warsaw and, above all, by the abortive rising in Germany in March, 1921. The retreat from war against Communism in Russia, Trotsky pointed out, coincided with the retreat of the revolutionary tide in Europe. Communists had to change their tactics from assault to siege, yet throughout this period they remained convinced that this was a temporary respite.

This belief explains both the challenging tone of the pronouncements and the methods of early organisation. Loose groupings could not be admitted because the Comintern was designed merely to assemble the disciplined vanguard of world revolution on the march. Gradually, however, contradictions appeared which were to dominate the International throughout its life. How were the interests of the Soviet state and the Communist movement to be reconciled once the world ceased to tremble on the verge of revolution? On one occasion, an Indian delegate branded the Russians as opportunists for including a non-interference clause in their trade treaty with Britain. Even Stalin, who transformed the Comintern into a tool of the Soviet state, could not entirely resolve these contradictions. But at the time when it was no such tool and when some suspicious delegates talked of shifting the centre away from Moscow, the Russian leaders could sincerely reply: we are only waiting to move it to Soviet Berlin.

In her previous work on Soviet foreign policy Mrs Degras has accustomed us to a very high standard of selection and presentation. In this new venture not only does she maintain it, but she also introduces the useful device of preceding each text by a brief introduction to place it in the general context. The book shows the gap separating the policies of the early twenties from those propounded at the latest congress, a gap created by Stalinism, by the spread of a brand of Communism to one-third of the world and by the nuclear stalemate. At the same time it shows the revolutionary heritage which, even after the dissolution of Cominform, the Communists cannot escape, however much they should try to hide in reformist clothing.

New Light on Imperfect Competition

QUALITY AND COMPETITION.

By Lawrence Abbott.
Columbia University Press. London:
Cumberlege. 238 pages. 30s.

THAT the argument of this book should appear as a startling novelty is no credit to the science of economics. Professor Abbott does not indeed claim any great originality for his basic idea, for which he finds antecedents in much modern analysis of imperfect competition. The novelty lies in his insistence that competition in "quality"—taking the word in the widest possible sense—is more central to economic progress, more all-pervasively a basic fact of

economic life, than price competition itself. His argument is based on psychological premises quite as realistic as the assumption that consumers will prefer to buy identical goods cheap rather than dear, and only very slightly more complicated.

People buy goods because they desire certain experiences—from the satisfaction of a physical appetite to a triumph over the Joneses—and believe that the goods concerned will make those experiences possible. Their basic wants (for experiences) vary with taste, temperament and age as well as with income; their derived wants (for goods) vary even more widely, since to these factors must be added imperfect knowledge. More or less intelligently and purposefully, consumers seek the products which fit their particular wants most closely; more or less intelligently and purposefully, producers modify and develop their products, or originate new ones, so as to meet the consumers' expressed or—equally important—latent desire for this closer fit. One may recognise both the motive of establishing some degree of monopoly power and the method of pseudo-differentiation by deceptive advertisements; but there is no need whatever to involve these in order to account for imperfect competition. Competition is two-dimensional—in price, and in adaptation of product to want; and it is no less real when concentrated on the dimension of quality, with stable prices, than when concentrated, as in the classical analysis, on the price of an unvarying and standardised product.

This general argument is reduced to schematic form in a succession of models no more and no less realistic than those used in the analysis of price competition, though admittedly still less capable of being compared with any real-life situation. This schematic analysis makes possible a rigorous demonstration that the generally accepted minimum-cost criterion of welfare and economic rationality would, if practically enforced, result both in a reduction of welfare and in economic stagnation. For minimum cost is only compatible with product differentiation if the consuming population—and, moreover, the consuming population situated in the same place—is large enough for each differentiated product to be produced on the optimum scale; yet product differentiation offers the only way of achieving accuracy in the filling of wants. Professor Abbott does not try to answer the inevitable question of how much sacrifice of quality (in the sense of that accurate filling of wants which depends on diversification) is worth any given gain in the realm of unit costs, or vice versa. In the siege economy, or the economy undergoing the strains of development from a primitive level, rough-and-ready satisfaction of wants at minimum cost is, on commonsense grounds, the most rational aim. But in a developed economy "diversity, variety, refinements, richness of opportunity for choice" constitute an entirely legitimate use of the margin of resources over bare subsistence.

It will be interesting to see what reception "Quality and Competition" will get from what one may call the puritan wing of the economic profession. The Puritans, it will be remembered, condemned bear-baiting not because it gave pain to the bear, but because it gave enjoyment to the spectators. One often gets the impression that in some quarters product differentiation is condemned, not because it goes beyond any rational ideal of consumers' welfare, but because it yields a profit to its originators.

Vision of Mitteleuropa

MITTELEUROPA IN GERMAN THOUGHT AND ACTION, 1815-1945.
By Henry Cord Meyer.
Martinus Nijhoff, The Hague. Distributed in the British Commonwealth by Batsford. 393 pages. 47s. 6d.

STUDENTS of European history and politics should not be put off by Professor Meyer's awkward and American style. His sentences are wildly inverted; and concepts, for example, are for ever being envisioned, for example, by the men and the governments he writes about. What is more important, his work is valuable both for its central argument and for the wealth of detail with which that argument is supported.

The central argument is that plans for the organisation of central and south-eastern Europe as a political, economic and cultural unity under German control held little interest for Reich Germans before 1915 and did not influence the policy of German Governments before the same date. When, so late in the day, the vision of *Mitteleuropa* did become popular in Germany and did occupy the attention of the German Government, the rest of the world was convinced that it had long been the object of pan-German plots, and that its achievement had been among the purposes of the German Government in beginning the war of 1914. In reality, interest in it was the product of war, and particularly of the blockade; and even in 1916 the German Government was more preoccupied with the obstacles and the opposition to *Mitteleuropa*, which were still formidable, than with its possibilities. Interest in *Mitteleuropa*, as well as being a late development, was shortlived. Before very long the German Government, under the influence of Ludendorff and of the collapse of Russia, was bent on establishing the much wider dominion of *Kontinentaleuropa*, stretching from France to Western Russia, from which *Mitteleuropa* was to be excluded. And after 1918, despite a revival of *grossdeutsch* sentiment in Germany and Austria, which aimed at the union of the two countries, and despite the use of the term *Mitteleuropa* by the Nazis, it was not *Mitteleuropa* but *Kontinentaleuropa*, based on new *gesamtdeutsch* and *grossraum* theories, which inspired German public opinion and underlay the policies of the German Government.

Professor Meyer's evidence for this thesis is much stronger in the field of public opinion than in that of Govern-

See here!... See there!...

Simultaneously from Olympia, London and Castle Bromwich, Birmingham, comes the call of this year's great British Industries Fair. Which must you visit? Both! Both. Don't make the mistake of limiting your looking to your own particular line of business—though *that*, of course, is important. This is an exciting BIF, a science-and-technics BIF, an office-and-factory BIF, a today-and-tomorrow BIF . . . and you can't cross your heart and say you've done your duty by it if you haven't seen it all. There are no dividing lines today between one industry and another. There is no saying who may turn a new development to advantage. Let Olympia and Castle Bromwich bring you up-to-date on Britain's industrial leadership.

Come to the Fair!

British Industries Fair, Birmingham Chamber of Commerce, 95 New Street, Birmingham 2.

ment policy. At some points, notably the Weimar period, what he says about German official circles is inadequately supported even if it is not necessarily wrong. His survey of the views of German publicists and journalists, on the other hand, is thorough and impressive; and there are several problems connected with official policies on which his work is stimulating. Those who are interested in wider questions than *Mitteleuropa* as such will find it valuable on Bismarck, for example, on the Baghdad Railway and on the motivation and development of *Weltpolitik* in the period between the fall of Bismarck and the outbreak of the first world war.

The PRO

THE ENGINEERING OF CONSENT.
Edited by Edward L. Bernays.
The University of Oklahoma Press:
Norman. 254 pages. \$3.75.

THE slightly sinister title of this book, with its Machiavellian implications, conceals nothing more alarming than our old friend the public relations officer at work—a team of eminent American public relations officers, indeed, headed by Mr Edward Bernays, who is described on the jacket as “the dean of public relations counsellors.” Since in America the profession of public relations is reputed to be extremely advanced and rated very highly, this pronouncement demands careful study, and, in point of fact, deserves it.

Mr Bernays and his colleagues set out to prove—and most persuasive they are—that

professionally, public relations activities are planned and executed by trained practitioners in accordance with scientific principles, based on the findings of social science. Their dispassionate approach and methods may be likened to those of the engineering professions which stem from the physical sciences.

This flattering conception has at least the virtue of raising public relations practice above the level of the publicity stunt or the press officer's routine, and for that we may well be grateful. Unfortunately, the social sciences are neither so exact nor so far advanced as Mr Bernays implies, and even this stimulating blueprint leaves us still grappling with the imponderables.

Most public relations problems, says Mr Bernays, can be handled effectively by the following sequence of actions:

1. Define your objectives.
2. Research your publics.
3. Modify your objectives to reach goals that research shows are attainable.
4. Decide your strategy.
5. Set up your themes, symbols and appeals.
6. Blueprint an effective organisation to carry on activity.
7. Chart your plan for both timing and tactics.
8. Carry out your tactics.

This is a sound enough programme, though it is consoling to discover that Mr Bernays's team, elaborating his eight basic points chapter by chapter, do not

tell us anything new. What they do, and it was worth doing, is to insist upon the need for research, planning and method, and emphasise the importance of top level consultation at the earliest formative stages of public relations policy.

There are in this country many public relations counsellors, to borrow the impressive American title, who may not find much in this book to change their thinking, but will welcome it as an authoritative exposition of the American approach. They may be as uneasy about the ethics of the entertaining chapter on strategy as the author, Nicholas Samstag, who surprisingly quotes Senator Joseph McCarthy as an example of a career of “successfully calculated risks.” They may reflect that Lord Northcliffe forty years ago anticipated the entire chapter on planning public relations in one phrase when he said, “policy is to propaganda what news is to a newspaper.”

They will agree, however, that if senior management and the upper hierarchy of Whitehall could be persuaded to consider the arguments advanced by Mr Bernays and his team, public relations might be given in this country the opportunities for service which it has earned in America.

Potpourri

PLEASURES OF THE PAST.
By Iris Brooke.
Odham's. 175 pages. 18s.

IT is difficult to stifle prejudice against a book that is admittedly made up of snippets and tit-bits of information, and one sniffs rather warily at Miss Brooke's potpourri of pleasures. It is apparent that she herself, in reading the letters and diaries of ordinary or extraordinary people, has been able to recapture the sense of happiness and excitement which animated them in the past; in the more formidable task of sharing her delight with her readers she is not always successful. Appreciation of a vanished point of view depends so much on experience and mood, and it is impossible that all of the extracts here collected should ring the same bell with everybody; furthermore, in her connecting commentary, the author sometimes uses an encyclopaedic style which is prim rather than mirthful, and one is reduced to the discomfort of a stony recipient of the joke that caused a jollier soul to scream, roar or simply die.

After this carping caveat, let it be freely admitted that the book is full of novelty, grace and charm, both in its subject-matter and illustrations. Miss Brooke's constant references to background detail in well-known and accessible paintings and prints make a valuable and delightful comment on the social habits of other generations, and underline her own expertise in the matter of costume. She stresses the ubiquity of water-sports from the fifteenth to the eighteenth century. These solved the problem of muddy and malodorous streets, menaced by cut-purses

and cut-throats, while the splendidly mounted river pageants catered to the love of lavish display which is satisfied by technicolour in less heroic times of potted amusements—and supposedly less dependable weather.

The book is certainly a dipper's paradise, and even the reluctant dipper emerges with a fresh perspective on the more colourful days when bull-baiting and cock-fighting were pursuits for the gentry, but the “bloody murdering practice” of football was only fit for soldiers and rascals in the street; when lolling at billiards was an “unhandsome offense,” and scattering tobacco ash on the cloth a “stinking indecency,” and when eggs, oranges and firework squibs took the place of paper streamers.

Shorter Notices

ARGENTINA.
By George Pendle.
Royal Institute of International Affairs.
169 pages. 12s. 6d.

Mr George Pendle is London's foremost authority on the lands around the River Plate, and he has now added to his studies of Uruguay and Paraguay an excellent volume on Argentina. It is fair to say that the present book is the best survey of Argentina's physical characteristics, history and recent political development yet offered to the general reader. To the more advanced student it will prove a handy work of reference, with an excellent bibliography.

Although Mr Pendle surveys the whole of Argentina's rather agitated history, he concentrates on the period following the revolution of September, 1930, and manages to conclude his study with the very day of General Perón's resignation a quarter of a century later. Between these dates arose the “New Argentina,” a state whose exact political future cannot, at present, be foreseen, but whose international importance it would be foolish to overlook. Argentina is a “remote colossus,” but it is a colossus nevertheless, and developments during the past few years suggest that Russia is aware of that fact even when the United Kingdom tends to forget it. Part of the trouble is that the ordinary Englishman thinks of Argentina only in relation to a shortage of beef or to loud recriminations about the Falkland Islands. Mr Pendle touches on both subjects and his discussion of rival claims in the South Atlantic is particularly illuminating, but his book shows that there are better reasons for getting interested in Argentina.

SHAPE-UP AND HIRING HALL.

By Charles P. Larrowe.
California University Press. London:
Cambridge University Press. 259 pages. 34s.

This book is a comparative study of the “shape-up” system, whereby dock labourers are employed on the New York waterfront, and the hiring halls operated by unions, employers, developed on the west coast. It is both a history of the troubled labour relations in American harbours and a fascinating analysis of the factors responsible for the crime-ridden state of New York docks as compared with the progress made in Seattle.

COUNTING THE COST

WHEN YOU CONSIDER A TENDER do you know what the job will really cost? Will the work be finished on time? How much will the delay cost your Company if your new works goes into production six months late? Will there be heavy maintenance costs and production hold ups after completion of the work? Plainly, the lowest tender is very often not the cheapest; reliability, efficiency and quality have, in the long run, a value to be taken into account.

The time to evaluate these questions is before the contract is placed. A tender's worth is not shown by price alone. What is behind it in reputation, in experience and skill, in plant capacity? Pre-planning, method study, targeting, the right use of heavy plant and small tools, all these have an important part in the scientific approach to the problem of construction.

John Laing and Son Limited are always pleased to be called in during the initial stages of design, when experience and advice can often effect the greatest saving in time and money.

In this way they can bring their full capacity to bear on a job right from the start. Behind their tender is a reputation valued far higher than the price of any contract—a reputation which the Company intends to maintain by giving complete satisfaction, not only when the contract is signed, not only on completion, but for the years to come.

President's Veto

Washington, D.C.

LAST week the Farm Bill confronted President Eisenhower with easily the most difficult domestic decision he has had to make. Possibly the bearing of declining farm incomes on election results has been over-rated: the farm population is now a lower proportion, roughly one eighth, of the total population than ever before, and by no means all farmers are affected by the price support and other actions taken in Washington. Nevertheless, there is no denying the fact that the decline in farm prices and incomes during the past four years has gone far enough to affect the chances of the Republicans seriously in a number of important states next November. Thus the President had as strong a political motive as could be imagined for signing the Bill. It would have raised rather sharply the level at which the government supports the prices of nine important crops and of dairy products; and it would have provided a tremendous increase in the sums available for taking off the market "price-depressing surpluses" of livestock, which are not subject to direct price supports.

But the Bill violated a major principle for which the President has stood resolutely and, perhaps more important from the foreign point of view, its "two-price" plans for rice and wheat contained a real threat of dumping far beyond anything done by administrative action so far. For domestic purposes, of course, the argument has been over the principle of "rigid," or fixed, price supports at 90 per cent of parity (a price designed to keep farm purchasing power at a "fair" level in relation to the past) and "flexible" support prices ranging downward from 90 per cent to 75 per cent of parity and varying with conditions of surplus or shortage. Because his Administration had made such an unequivocal stand against rigid 90 per cent supports, the President could not in good conscience sign a Bill returning to that concept, even if it was only for one year.

Increasingly, serious students of the American farm problem are becoming convinced that it is the simple existence, not the level, of price supports that produces surpluses, but this did not matter in the political context nor, probably, in the President's mind. He felt he had to veto the Bill because it returned to 90 per cent supports for five of the "basic" crops (wheat, cotton, maize, rice and peanuts), because for the first time it made supports mandatory for four other crops (oats, rye, barley and grain sorghums), because of the two two-price plans, and because of a provision which would have distorted the formula for computing parity prices.

Unfortunately, the President's veto may well have killed

all chance for a start this year on the first imaginative new approach to the farm problem in a decade. This is the "soil bank." It would cause the classical economists to turn in their graves, and it offends those who refuse to believe that true "surpluses" are possible while people anywhere are hungry, but it is at least a practical scheme for actually doing something about the surpluses. Under it the farmers would be paid to take land out of production and plant it with soil-building crops or grass or trees. Production would be reduced, the fertility of the soil would be improved, the ground would be prepared for the inevitable agricultural future of fewer crops and more livestock—all at a blow. There has been amazingly little controversy about the soil bank, except over the question of whether it should be compulsory. Yet by vetoing the Bill the President vetoed the soil bank, too.

*

The veto has an additional Alice-in-Wonderland quality about it. For the President accompanied his rejection of the Bill with an administrative action which raises support prices substantially for wheat, maize and rice; he also implied that, when support prices are announced for cotton and peanuts, they will be higher than had been indicated earlier, and he raised the support prices for dairy products. All of these new levels, ranging upward from 82 per cent of parity, are much higher than would be required by a strict, or even a reasonable, interpretation of the "flexible" support principle. All of these crops, except peanuts, are in heavy surplus, and by the "flexible" logic the level for all of them should probably drop the full way down to 75 per cent. In effect, the President has argued that high support prices produce surpluses and harm the farmers, and has then promptly raised the support prices "to improve farm income now"—which means before the election. If the President's argument were right, then he has acted in a way which will increase the very surpluses which he considers to be at the root of the farm problem.

In fact, however, his action will probably have no noticeable effect one way or the other on the surplus problem—and neither would the price-support features of the Bill which was pushed through Congress by the Democrats and which the President vetoed. The limited experience so far with the Republican principle of flexibility bears out a theoretical contention which is being made more and more frequently: lower support prices for the crops in question, at least when the floor is as high as 75 per cent of parity,

neither increase demand nor deter production. It apparently remains more profitable to produce wheat at \$1.80 a bushel—even when it used to be \$2.15—than to use the land for something else, and when it comes to a loaf of bread the difference between the two prices is less than a cent. Export demand is unaffected because even the lower levels of support remain well above world prices. Only in the case of cotton might lower prices help, and there only on the demand side by making the fibre more competitive with synthetics.

It would be impossible for the President to make the admission, but it is becoming clearer every day that lower support prices—as long as there is a relatively high floor—contribute hardly at all to the solution of the American farm problem. By the same reasoning, as long as prices are supported and production is controlled only through restrictions on the acreage that may be planted, rather than on the amount that may be grown, surpluses will develop. The history of American farm policy over two decades has shown that surpluses have always been built up, almost irrespective of the level of support prices, until a war has come along to allow the government to disgorge its hoard.

To sum up, the President has killed, fortunately, some genuinely dangerous items in a very muddled Farm Bill; he has salved his conscience and upheld a "principle" by rejecting supports at 90 per cent of parity; he has given farm income a fillip by raising support prices to nearly 90 per cent within his administrative discretion; and he has probably lost all chance of the soil bank this year. And thus the American farm headache will continue much as before. Technological improvements will keep output ahead of demand even on the reduced acreages required under the price support system; the government will continue to spend between \$2 billion and \$3 billion a year to buy up crops which can be sold later only at a loss, and usually for foreign currencies which do not help the American taxpayer; the very existence of the surpluses will continue to depress prices for the farmers, and foreign countries will continue to live in terror of American dumping.

Inflation in the Air

FRIDAY, April 13th, justified its reputation to the businessmen whose heavy demands for funds have been pushing up the figures for bank loans in a way that is not only surprising in itself but has also provided almost the only obvious statistical evidence of mounting inflationary pressure. On that day the discount rate, the interest which the Federal Reserve Banks charge on money lent to other banks, which in their turn lend it to business borrowers, went up from 2½ to 2¾ per cent at nine of the twelve Reserve Banks; at San Francisco and Minneapolis it went up to 3 per cent and Chicago was expected to increase its rate soon after. The speed and relief with which member banks took this hint and raised their charges to their own customers was final proof of how hard pressed they had been for loanable funds.

The advance in the discount rate, the first this year although the fifth in the last twelve months, was intended to check the spring boom, but certainly not to cut it off entirely. The economic indicators are about to shoot up

seasonally and there was reason to fear that the growth might be unhealthily large. For the general statistical quiescence since the beginning of the year has concealed a number of disturbing variations, notably in the price indices, where declines in farm and food prices have offset rises in the costs of industrial commodities. These rises are likely to gather strength in the next few months, mainly as a result of wage increases. It is taken for granted that the steel workers are soon to be given substantially higher

pay and that the outcome of other pending wage negotiations will be similar.

In anticipation of these increases manufacturers have been building up their stocks; this explains the extraordinarily high demand for steel at a time of slackened activity in the automobile industry. But once the expected price increases have materialised, businessmen may reduce their orders and live off their stocks for a while, thus perhaps setting off the dreaded "inventory recession." The danger of an excessive accumulation of stocks should be reduced now that it costs more to borrow money to purchase supplies in advance. Higher interest rates may also induce some businessmen to postpone buying new plant and equipment. The unexpected buoyancy of their plans for capital spending, once they knew that Mr Eisenhower was prepared to stand for the Presidency again, is another reason why inflation suddenly seems to be very much in the air.

Dilemmas for Democrats

IT has been reported that some Democrats are thinking of General Gruenther for the party's presidential nomination. If this were true, it would illustrate graphically the state of confusion in which Democratic kingmakers find themselves as they search for someone to put up against President Eisenhower in November. The latest primary elections, moreover, have increased this confusion. Stunned by his defeat in Minnesota, Mr Adlai Stevenson came back strongly in his home state, Illinois. More than 700,000 Democrats supported his bid for the presidential nomination and, although this was some 30,000 less than the

Recently a zoo in Japan decided to replenish its stock of animal wildlife. To finance the capture and shipment of animals from Thailand it was necessary to arrange an international banking loan—a transaction involving credit in Tokyo with payment upon delivery in Bangkok. Through Bank of America, the matter was speedily arranged and within a few months the shipment of animals had begun.

The point of the story is that if you have an international banking problem, no matter how unusual, Bank of America's International Department can probably help.

More motor vehicles than ever are being exported from this country and more retained at home, too. The automobile and heavy vehicle industry, which uses large quantities of alloy steels, is one of the biggest single customers of United Steel. If automotive vehicles and other products of engineering skill are taken into account, it is surprising what a high proportion of United Steel production directly and indirectly finds its way to all manner of countries overseas. This is another example of the broad-based structure of the Company's operations.

number of Republicans who voted for President Eisenhower, it represented a tremendous victory over Mr Stevenson's main rival in his own party, Senator Kefauver. The latter had not campaigned in Illinois but had expressed the hope that his supporters would inscribe his name on the ballot. Only 4 per cent of the voting Democrats heeded his appeal. In the primary in New Jersey this week the results were more difficult to interpret. In a straight "beauty contest," Senator Kefauver obtained only about 104,000 votes against well over 300,000 for Mr Eisenhower. In the more decisive contest for New Jersey's 36 votes at the Democratic National Convention there were two lists of delegates. One was committed to Senator Kefauver and the other was an "uncommitted" delegation led by Governor Meyner. Mr Kefauver's men were overwhelmingly defeated.

Until a month ago, this would have counted as a clear win for Mr Stevenson, who had long enjoyed Governor Meyner's support. But at present, the Governor and his delegation are insisting that they are going to the convention with open minds. And this seems to be the position of many Democratic leaders, including Mr Truman. The five primaries which have taken place so far have not decided the race between Mr Stevenson and Senator Kefauver. What should prove to be the decisive clashes between them are due in Florida at the end of May and in California on June 5th. If no clear-cut result emerges, the party's hunt for a third man will become more intense.

Democrats are, however, deriving comfort from the fact that in the primary elections in Illinois, Minnesota and Wisconsin their vote increased compared with 1952 while the Republican vote declined. Is this the famous revolt of the farmers on which the party is basing its hopes, or is it merely that Republicans feel that they do not have to show now that President Eisenhower will be their man in November? These, in the final analysis, are more important questions than whether the Democratic candidate will be Mr Stevenson, Senator Kefauver, Governor Harriman of New York, Senator Symington of Missouri, or one of the other dark horses now cavorting in the paddock.

Professors Talk Back

FROM A CORRESPONDENT IN ST LOUIS

AMERICAN academic freedom, which has been grimly beleaguered during the last few years, made a vigorous, if belated, counter-attack when the American Association of University Professors held its 42nd annual meeting in St Louis at the end of the first week in April. The association, whose 37,500 members comprise about one-quarter of the academic staffs of American colleges and universities, has often defended professors who find themselves in difficulties with their respective university administrations over academic rights. This time it took the offensive and voted to censure eight institutions which had violated academic freedom in various ways. The AAUP may have been prevented from acting earlier because there were so many individual cases needing its urgent attention, but meanwhile many people felt that the organisation was doing little to carry the battle to the enemy. Membership, which had more than doubled since 1945, dropped sharply

during 1955 and officials ascribed at least part of this decline to the association's failure to take a forceful public stand.

At this year's meeting, with a new general secretary in office, the AAUP made up for past deficiencies. It approved a carefully prepared statement of principles condemning the removal of a professor on the sole ground that he or she is or has been a Communist, or has invoked the Fifth Amendment—which is a witness's constitutional safeguard against self-incrimination—to avoid testifying in an official investigation. "Removal," it was stated,

can be justified only on the ground, established by evidence, of unfitness to teach because of incompetence, lack of scholarly objectivity or integrity, serious misuse of the classroom or of academic prestige, gross personal misconduct, or conscious participation in conspiracy against the government.

This forthright attack on the doctrine of automatic dismissal because of Communist affiliations or the use of the Fifth Amendment was bound to draw critical fire from outside, and even from some members of the AAUP itself to whom it seems strong medicine. At the actual convention, however, most objections came from the liberal wing. There were fears that such general phrases as "lack of objectivity or integrity" might provide enemies of academic freedom with convenient loopholes. Conservative criticism became vocal only when the convention moved on to approve concrete resolutions of censure against eight institutions—the University of California, Ohio State University, the University of Oklahoma, Temple University, Rutgers University, St Louis University, the Jefferson Medical College and North Dakota Agricultural College—for infractions of academic freedom and tenure. Six of these were cited for having dismissed professors merely for refusing to co-operate with congressional committees or for refusing to take "loyalty oaths."

Critics, including delegates from some of the censored institutions, argued that there had been insufficient investigation, because the reports on which the resolutions were based dealt only with the public records of the cases and did not include inquiries at the colleges themselves. They also complained that debate was limited, though the majority pointed out that this was essential if the two-day meeting were to conclude its business. It seems, however, that the committees of the AAUP had weighed the evidence carefully before making their recommendations; and if AAUP gains new members during the year, this will give some indication that its clear, new voice has been welcomed in the academic community.

United States?

ON April 2nd the Supreme Court decided that the State of Pennsylvania had no right to convict a local Communist leader under its anti-sedition law because Congress had made sedition "a matter of vital national concern" and had "occupied the field to the exclusion of parallel state legislation." This verdict quashed anti-Communist laws in forty-one states and Hawaii and Alaska. It also set off yet another round in the mounting battle between the federal government and the champions of the rights and sovereignty of individual states. This battle is now being waged on

many fronts: on the issue of racial segregation in publicly financed schools; over the right of the federal government to conclude treaties which may involve the concerns of individual states; on whether or not state legislatures can make laws to protect industries within their own borders against foreign imports.

To call a halt to the "dangerous disease that has threatened to destroy completely the sovereignty of the states," a group of Congressmen is sponsoring a Bill which would profoundly modify the whole structure of American government. The measure was devised some time ago by Representative Howard Smith of Virginia, who was personally outraged by the Supreme Court's decision. For in ruling state laws invalid, the Court claimed that it was interpreting the intent of the Anti-Sedition Act of 1940, which bears Mr Smith's name. Fundamentally, the new Bill would assert that no Act of Congress excludes state laws on the same subject, unless Congress specifically wishes it to, and that no law passed by Congress invalidates a state law unless there is a positive conflict between them. In effect, this Bill would be a Magna Carta for states' rights and would hamper the federal government's regulatory functions in such vital domains as public welfare, transportation, natural resources, agriculture, navigation and labour relations.

Mr Smith's Bill is being supported by a motley band ranging from southern Senators eager to preserve racial segregation to State Attorney-Generals and such private groups as the National Association of Manufacturers, which has long resented federal interference with local labour laws. It seems fantastic that such a measure could receive serious consideration a hundred years after the Civil War, but Mr Smith is a shrewd tactician and can enlist much passion on his side.

Queen Mother of the West

FROM A CORRESPONDENT IN SAN FRANCISCO

THE scum which the westward moving wave of emigration carries on its crest," wrote Lord Bryce in 1888, "is here stopped, because it can go no further. It accumulates in San Francisco. . . ." It was here that fifty years ago, on the morning of April 18, 1906, a great seam in the earth's surface settled abruptly, shaking the city and surrounding areas with a violent earthquake. Dozens of fires were fed by broken gas pipes and, because water mains had burst, the flames gutted four square miles of San Francisco's heart in the next few days.

In spite of the speed of its rehabilitation, begun "even before the ashes were cool," the lovely city of the twenty-one hills entered on a new and different phase of the history which began with the Gold Rush, some sixty years before. Not only did the wicked Barbary Coast and the Chinatown of opium dens and tong wars disappear in 1906—to be replaced by a neon-lit tourist bazaar offering Japanese goods—but the city at the Golden Gate began to lose its commercial and political pre-eminence. Yet while special local conditions, particularly geographic ones, have kept San Francisco from a full share in the spectacular twentieth-century growth of the West, the unusual character of the city has enabled it to retain its nineteenth-century leadership.

Before the disaster of 1906, San Francisco, with its 425,000 inhabitants, dwarfed all its rivals on the Pacific Coast and contained about 30 per cent of California's total population. Its magnificent harbour was the port of entry to the entire West and the gateway to the Orient; San Franciscans controlled much of the wealth and wielded most of the political power in the state. Today, although the city's population has nearly doubled, California has ten times as many inhabitants as in 1906. Almost alone among the cities in the state, San Francisco is now growing only slowly, if at all, while Los Angeles, with more than five million people, is still growing fast enough to maintain its proportion of about 40 per cent of the state's population. Both San Diego, in the far south, and Oakland, on the eastern shore of San Francisco Bay, now have approximately the same number of people as San Francisco.

The whole "San Francisco Bay Area," with its 2,500,000 inhabitants, is indeed expanding rapidly, but industry and population have grown faster in southern California where the climate is warmer, the terrain is more suitable, and trade unions are weaker than in San Francisco. Moreover, the city's cramped site—seven square miles, mostly on hills, isolated by water and steep ground—has encouraged industries to establish themselves far outside its limits. Greater population brings greater political influence: representatives of southern California and of rival cities in the northern part of the state outnumber those from San Francisco in the State Legislature and in Washington. Today's most prominent northern Californians, Senator Knowland and the Chief Justice of the United States, Mr Warren, are both from Oakland. San Francisco has no powerful leaders in either political party.

It has also lost much of its importance as a hub of transportation. All but one of the trans-continental rail routes have their northern Californian terminals in Oakland, for there is no railway bridge across the bay. Similarly, ocean cargoes are now more often handled at Oakland or the inland port of Stockton. The dwindling of intercoastal ocean traffic, the collapse of trans-Pacific passenger travel and the removal of the rich China trade of earlier decades have reduced still more the importance of San Francisco's renowned harbour. Finally, the increasingly heavy air traffic to the Orient tends to go by way of Seattle, from which the great circle route to Tokyo is 2,000 miles shorter than by way of San Francisco and Hawaii.

While other American cities are undertaking vast projects of redevelopment for areas blighted by the movement of population to the suburbs, San Francisco's urban and regional planning has been hamstrung by history and geography. The 1906 disaster, although it cleared much of the city of what would today be very old buildings, also encouraged some hasty and haphazard rebuilding. Lack of space has caused random "redevelopment" of individual sites. As a result, it is difficult to obtain agreement for re-building an entire area, particularly from those who have

Mr. H. Tipping, the Burroughs man (on the left), discusses with Mr. Ambler, Director and Secretary of Schofields, the new system, based on Burroughs equipment, that they worked on together for speeding the preparation of customers' monthly statements.

How one man solved a double problem for a famous department store

TO Schofields of Leeds, mailing monthly statements promptly to customers became a pressing problem in their constantly expanding business—moreover, filing space for sales dockets took up large areas of valuable shelving.

They called in Mr. Tipping, of Burroughs, who, with Mr. Ambler, Director and Secretary of Schofields, worked out a comprehensive plan based on Burroughs equipment, including Microfilm.

Now Schofields' statements go out proven, accurate and complete on exactly the right day throughout the month in a regular cycle.

The new statement is as modern as the equipment—instead of an abbreviated extract of debits and credits, the customer now gets the full story of each transaction, together with a summary giving all charges and credits, whilst Schofields have more accurate information on their accounting position, a considerable saving in staff and space, and the great benefit of having satisfied customers paying their accounts regularly and early with the minimum of queries.

Whatever your business, if you have an accounting problem, the Burroughs man can help you. Backed by Burroughs'

world-wide experience, he will make a full analysis and suggest the most economical, *workable* solution. If he thinks no change advisable, he will say so; if he does recommend a change, he will make a detailed plan and help you get it working smoothly. Call in the Burroughs man—you're committed to nothing. His advice is free.

Burroughs make the world's widest range of business machines. You'll find your local Burroughs office in the telephone book. Head Office: Burroughs Adding Machine Limited, Avon House, 356-366 Oxford Street, London, W.1.

FOR SPECIALIST ADVICE ON MODERN ACCOUNTING METHODS,

CALL IN THE **Burroughs** MAN

new or valuable property in an otherwise run-down quarter. The magnificent bridges which link San Francisco with its outlying areas have helped it avoid the decay resulting from the slow growth of nearby suburbs. But because of the distance and toll charges on the bridges, the suburbs have tended to become economically independent. While encouraging the city's office workers to move their homes and families and much of their shopping elsewhere, the bridges have also encouraged them to come to work in their automobiles, causing extremely serious traffic congestion inside San Francisco. The jealousy of neighbouring cities and the absence, until recently, of any regional authority to organise, plan and finance a system of public transportation have intensified this problem.

Despite its difficulties, however, San Francisco remains a very important place. As a financial centre it is second only to New York and it is still the headquarters of most of the largest corporations on the West Coast. It contains more federal officers and employees than any other city except Washington, and is the seat of several sections of the Californian state government. Moreover, it continues to attract an unusual number of professional and other people seeking a pleasant life. A recent report by researchers from Yale University, that San Francisco has the largest concentration of alcoholics of any American city, drew the explanation from a local sociologist that, as a mecca for the ambitious and creative, the city generates more than the usual number of broken dreams which need to be drowned.

San Francisco's appeal is in large measure physical. Its dramatic setting, picturesque topography and equable climate make it one of the world's most alluring cities—a fact which even Mr Molotov conceded. Its famous cable cars, restaurants, flower stalls and cosmopolitan atmosphere give it additional charm. Its residents are famous, too, for the independence of their thinking, for their aloof refusal to make concessions to popular taste, for their eccentricities and for their elegance. It is with some justice that San Franciscans, commemorating the catastrophe of fifty years ago, can still cite a further observation of Lord Bryce: "California, more than any other part of the union, is a country by itself, and San Francisco a capital."

Preparations for Statehood

FROM A CORRESPONDENT IN THE PACIFIC NORTHWEST

NEXT week the people of Alaska are expected to endorse a move which is designed to shake both the President and the Congress out of their apathy on the subject of statehood for this huge Territory which can only be reached from the continental United States by crossing some 1,500 miles of Canadian soil or Pacific water. The people of Alaska have already voted several times overwhelmingly in favour of statehood. Now they are preparing for the hoped-for honour of full membership in the Union in a more concrete way. Alaska has drafted its own State Constitution and, in addition, has made plans for the election of two Senators and one Representative, who would compose its delegation to the United States Congress when it becomes a state. These three are intended to go to Washington, D.C., to rap on the federal door until Alaska is admitted. It is a strategy that, in the past, gained

statehood for at least seven Territories, including Oregon, which at the time of its admission in 1859 was, like Alaska, separated from the main body of the United States by a vast distance. Alaskans will go to the polls on April 24th to ratify this new Constitution and to decide whether they approve of the plan for the "premature" election of a congressional delegation. If they do so decide, and public opinion appears to be in favour of both propositions, the Senators and Representative will be elected at the November general election, just as are the congressional delegations from the 48 official states.

The proposed Alaskan Constitution, drawn up by 55 elected delegates in a 75-day session that ended last February, was called "one of the finest documents of its type ever written" by a committee of political scientists who served as professional advisers to the delegates. It has several features not usually found in state constitutions. Executive power is concentrated in the office of Governor, and only one other official is to be elected, a Secretary of State, who is, in effect, a Lieutenant Governor. All other executive officers would be appointed by the Governor, some with the consent of the Legislature. The Governor would have the power to veto separate items in appropriation bills. Article I of the Constitution is a detailed "Declaration of Rights," going farther than the United States Bill of Rights. One section reads:

All political power is inherent in the people. All government originates with the people, is founded upon their will only, and is instituted solely for the good of the people as a whole.

The voting age is to be nineteen, two years below that fixed in all but one of the present 48 states; voters in Georgia have the franchise at eighteen. Judges would be appointed by a non-partisan "judicial council," but each jurist would have to stand periodically for approval or rejection at a popular election. Seats in the State Legislature (20 in the Senate, 40 in the House of Representatives) would be allocated strictly on a basis of population, and reallocated regularly as the population shifted, a provision which is lacking in many State Constitutions. But it seems doubtful whether even a constitution of this high quality, and a congressional delegation ready and waiting, will be enough to secure the speedy admission of this new state.

FOREIGN TRADE of the UNITED STATES

MILLION DOLLARS

The World Overseas

Khrushchev on the March

FROM OUR SPECIAL CORRESPONDENT LATELY IN RUSSIA

THE main economic defects of Soviet socialism have been its failure to provide the population with anywhere decent to live or anything much to eat. Whatever their pride in the regime's other achievements, Russians do not try to conceal these particular shortcomings from the visitor. They are very interested indeed in housing and food production under the sixth Five-Year Plan.

In his report to the Congress Mr Khrushchev announced that twice as many houses would be built in the next five years as during the last. This is really only a drop in the ocean. But agriculture is receiving enormous attention under the new Plan. Probably the reputation of the First Secretary, who has gone full pelt for maize and virgin lands, will stand or fall by the results. The regime is bound at long last to do something for a population which is now more dependent on bread, cabbage and potatoes than in 1913, 1928 or 1938. There has, it is true, been a considerable improvement in milk supplies during the last two years, but otherwise the national diet remains about the starchiest and least interesting in Europe.

The trouble about Communists is that they can never set economic targets without dressing them up in world-historical uniform. Thus, hard on the heels of the new investment plan for agriculture has come a decree (described on page 682 of *The Economist* of March 31st) concerning the revision of the 20-year-old statute of the collective farms. It reveals that the Presidium intends to do more than provide more food in the Soviet Union; it is also determined to press on with its ideological policy of abolishing the old country life and refashioning it in the image of the town. This may be good Marxism; but it is often a Marxism more Groucho than Karl. Your correspondent certainly expected at any

moment to see Groucho appear in person during his visit to a Ukrainian collective farm, where he saw some interesting early 19th century milking with an apparent milkmaid-cow ratio of three to one.

The financial system of the Stalinist collective farm has been very complicated and immensely corrupt. The late tyrant's agricultural policy was to extort the utmost from

the *kolkhozy* through compulsory delivery quotas, for which the state paid very low prices, selling the food to the public at a large profit which swelled the budget under the heading of turnover tax. The *kolkhozniki* themselves had two sources of income: their residual share of the farm's takings after all outgoings had been paid, and profits from the sale of the produce of their own plot on the free market. Their practice was to fake their own working-day contribution to the labour of the collective farm wherever possible and to spend the maximum time marketing their private produce. Last year this ideologically deplorable state of affairs prompted the state to sack one-third of all the chairmen of collective farms and to replace them

by "experienced cadres from the towns."

Since Stalin's death both compulsory delivery prices and over-quota prices have been drastically raised. This has increased the incentive of the collective farmers to work for the farm rather than for themselves. But further changes were necessary. Under the new decree the State Bank is to make things yet easier for the truly collective farmers by offering them substantial advances from state revenue.

The ideological aim of the new measures is to isolate the "lazy fellows" who work too much in their private gardens and not enough on the collective land, and turn

them into a rural proletariat. On the state farms (*sovkhozy*) such people cannot exist because all labourers there have the status of industrial workers, to whom state-fixed wages are paid, and who work under ordinary factory discipline. The regime would certainly like to turn *kolkhozy* into *sovkhozy*, "the highest form of Socialist property in agriculture." But there are as yet only about 5,000 state farms as against 90,000 collective ones. In this transitional period the policy of the Communist party must be to penetrate the *kolkhozy* with its own nominees. Already the agronomist of the Motor Tractor Station is an all-powerful executive and beneath him there is an élite of minor officers, farm foremen and MTS workers. The decree of March 10, 1956, is designed to increase these people's power and privileges. What resistance the semi-peasants will be able to offer if threatened with confiscation and other discipline remains to be seen.

By western standards Soviet agriculture is still primitive. It needs more tractors, much more fertiliser and above all more skill and care. According to Mr Khrushchev, mechanisation is patchy, MTS's are slovenly and cost-accountancy is in its infancy. A difficult climate, German plundering, lack of investment and the upheaval caused by Stalin were some of the reasons for failure. But in a country in which over half the population is still engaged in agriculture the results have been abysmal indeed.

Climatic Hazards

Mr Khrushchev, himself a tremendous worker and successful boss of Ukrainian postwar reconstruction, has set himself to the task with a will. Nothing could be more spectacular than his programme. It is to raise total grain production to 180 million tons (or twice the estimated barn yields of 1953) by the end of the Plan. It is to double the wheat and milk production of 1955 and more than double that of eggs and vegetables. The wool clip is to rise by 82 per cent and potatoes by 85 per cent. What are his chances?

In order to get the vast increase in fodder grain, Khrushchev is planting an incredibly ambitious area of maize. (The poetic Russian word *kookoorooza* fairly bubbles from the mouths of the propagandists and sounds particularly well in conversation in the Moscow underground.) But before he can complete this he must be assured of a huge quantity of marketable wheat from fresh sources. To this end 28 to 30 million hectares—an area equal to the arable land of Canada—of virgin or long fallow lands are being brought under cultivation in western Siberia and northern Kazakhstan. Once this is done, there can be a big expansion of the maize area in the Ukraine and the Kouban (North Caucasus).

The new lands are climatically hazardous. Rainfall is low, the growing season short and snow-cover inadequate. Komsomol volunteers are the backbone of the venture but many of the pioneers are redundant civil servants, resettled former forced labourers and miscellaneous bad hats. Free transportation and a gift of three months' pay are offered to those who stay a year. But one hears in Moscow that there are not a few dispirited returnees to European Russia.

Several factors make the new lands policy desirable in Soviet eyes. The area is insulated from the corrupting influence of urban free markets; a vast extension of the *sovkhoz* system automatically results; appeal can be made indefinitely to the zeal of unsatirical Russian youth. As

an economic venture it is very hard to consider the campaign at all because there is as yet no available method of computing its cost. In his speech Mr Khrushchev said: "Had we undertaken to develop the virgin lands in the usual way by the gradual resettlement of people in the new areas we should have required a tremendous amount of people, vast resources and much time." This implies (the logic is not quite clear) that the scheme can be done quickly and on the cheap by a few. But presumably the agricultural development of this remote area will necessitate large overheads in the future, when the settlers can no longer be housed in tents and shacks. Nor can existing communications remain adequate if huge harvests have to be transported from field to barn and barn to elevator.

Maize production has already begun on a large scale. But there are shortages of seed, of fertiliser and of silos. Further, maize needs much skilled attention. With planting on so much marginal and northern land (the area goes as far north as the latitude of Leningrad) much of it will have to be cut, if it grows at all, with the cobs unripe. Will Russian cattle thrive on this silage? The yield is likely to fall far short of the American 2.5 tons a hectare. Finally, a gain of maize is bound to mean some loss of sugar-beet.

It seems indeed that Khrushchev has gone much too far and too fast, as Stalin did several times before him. (The Soviet Union is littered with Stalin's disused irrigation follies.) Nevertheless if things do not go too badly a total grain yield of as much as 125 million tons, including maize, is possible by the end of the nineteen-fifties. This might enable an increase of 40 to 50 per cent in the Soviet Union's milk and meat. Past experience suggests that, while agricultural targets are never actually reached, some improvement usually occurs.

Many western agriculturalists believe that the new investment would have been better spent on the Ukraine and the Kouban where the land is first class, rainfall much higher and transport well organised. But the new lands campaign must surely be seen partly as a romantic venture in Soviet pioneering and partly as a feature of the general *Drang nach Osten* of a regime obsessed with military security. If totalitarians do not provide the goods, they must at least provide excitement. "Kookoorooza" and "Kazakhstan" may serve nicely as slogans for many years to come.

Blueprint for Apartheid—I

FROM OUR CORRESPONDENT IN SOUTH AFRICA

FIVE years ago the Nationalist government of South Africa appointed a commission to produce a blueprint for apartheid. Having won one election with race separation as its slogan, it felt that the time had come to prove that apartheid could be made to work—and win further elections. Roughly 13 per cent of the land surface of South Africa is reserved for the Native peoples, and is in fact today the home of 4,200,000 of them or slightly less than half the country's 8,500,000 Native people. Through European neglect and unconcern, combined with the system of land tenure and the general backwardness of their inhabitants, the Native areas, comprising about 260 separate units, are hopelessly underdeveloped. Overgrazed lands and

soil erosion, primitive methods of agriculture and a migratory labour system which deprives the areas of over 40 per cent of adult manpower each year, have between them produced a poverty-stricken population and a shrinking, purely agricultural economy which is less and less able to support its inhabitants. The average family income in 1951 was £52.55 a year, of which £29.85 came from farming and the balance from earnings outside the reserve. The Native areas have in fact become nothing more than labour reservoirs, rural slums. They had to be rehabilitated or abolished; and Nationalist theorists have always hoped that if they are built up and developed they might constitute a home for the Native people and so help to bring about total territorial separation.

Dr F. R. Tomlinson, professor of agricultural economics at Pretoria University, was therefore appointed chairman of a commission "for the socio-economic development of Bantu areas within the Union of South Africa." Although his report of more than a million words was completed in 1954, a summary of it has only now been released. It has had a curious reception. The ambitious and costly plan for developing the Native areas has been welcomed as magnificent in theory if sometimes dubious in practice. The underlying philosophy of apartheid is, of course, open to grave objection because of its obsession with race separation, and some of the reasoning in the report is based on little more than rationalisation and wishful thinking. Strangely enough, both the Nationalists and their opponents have been cautious in assessing the report's worth. While many Nationalists profess to find in it proof of the practicability of apartheid, others have obviously been embarrassed by its implications.

A Test of Sincerity

The total separationists are disappointed because their ideal seems as far off as ever. The partial separationists are uneasy because of the possible effects of large-scale development of the Native areas on the labour supply in the "White areas." A third group, which is believed to include the Minister of Native Affairs (whose lack of enthusiasm for parts of the report has long been an open secret), has been embarrassed by such recommendations as the siting of industry inside the Native areas rather than on their borders, the role of White capital and capitalists, and the tardiness with which the White areas are to be "drained" of Black families. It is expected that Dr Verwoerd will take from the report what will be politically helpful and ignore what will not be. It is generally conceded that the extent to which the Strydom government implements the development plan will be a test of its sincerity, and the choice is not going to be easy.

In the report the commissioners give their reasons for believing that the choice before South Africa "is between two ultimate poles," that of complete integration or of separate development of the two main racial groups. They do not believe that a middle way is practicable, and reject complete integration because it will lead to political control of South Africa by the Natives and also to miscegenation. They accept as "the dominant fact in the South African situation" that the Europeans will not be prepared "willingly to sacrifice their right of existence as a separate national and racial entity." Among the Natives, on the other hand, "there is a growing conviction that they are entitled to, and there is an increasing demand for, the

fruits of integration, including an ever-greater share in the control of the country." And so the commission advocates separate development in this spirit: "Either the challenge must be accepted, or the inevitable consequences of the integration of the Bantu and European population groups into a common society must be endured."

Professor Tomlinson has since explained that the commission did not ever refer to "complete separation: we talk of complete separate development." Presumably, therefore, there will always be Black workers in White areas—never pure White and pure Black areas. At the end of the century, for instance, the commission estimates that the Native population of the Union will be approximately 21 million, of whom 70 per cent will be in the Native areas—if the commission's recommendations are implemented—leaving about 7 million in the so-called White areas, or nearly twice as many as there are at the moment. The commission emphasises that if no development takes place in the Native areas, the population there at the end of the century will be about the same as it is today, that is, about 4,500,000, while that in the European areas would be about 17 million.

Apart from recommending the consolidation of the existing Native areas into seven blocks, in which Natives would some day have governmental responsibility on the lines of the present European provincial system, the commission recommends that the three High Commission territories be incorporated in the Union "as soon as possible." Only then, it says, will it be possible to implement the policy of separate development. The commissioners write:

The coming into being of seven Bantu areas, each surrounding a "heartland," will mean that the British South Africa of 1902, which covered 765,915 square miles, will be about evenly divided between Europeans and Bantu; 275,000 square miles of Bechuanaland, 6,705 square miles of Swaziland, 11,716 square miles of Basutoland, and approximately 65,000 square miles of the Union, will then be set aside for exclusive utilisation by Bantu. The total extent of the Bantu areas will then be 357,421 square miles, or approximately 47 per cent of the former British South Africa.

To administer this large area and its people will call for a drastic reorganisation and enlargement of the Department of Native Affairs. This will virtually mean the creation of a state within a state—a contingency which the commission appears to accept without concern.

(To be Concluded)

No Mandate for Merdeka

FROM OUR CORRESPONDENT IN SINGAPORE

SINGAPORE'S Chief Minister has arrived in London, supported by a motley delegation and armed with reasons why Singapore should be granted "Merdeka" or virtual independence. On a previous visit in December Mr Marshall was heard with sympathy but he has since displayed all the messianic fervour of one about to lead a forlorn hope against the colonialist barricades. Two theories have been advanced to account for this change in tone. By one account he has been warned by the Governor of the opposition he must expect. Such a warning, if

uttered, might have had the object of inducing him to form a more broadly-based coalition—which he has indeed tried and failed to do. By another account he feels impelled to create or imagine obstacles in order to claim credit for overcoming them. Neither theory may be baseless; nor is a third theory untenable—namely, that Singapore may suddenly become (like Suez) an issue for the Tory back-benchers.

What, however, does Mr Marshall seek? In a recent speech to the Singapore Legislative Assembly he was explicit enough. He demanded independence within the Commonwealth with full legislative autonomy, the removal of the official members from the Council and of the nominated members from the Assembly, and the abolition of the Governor's veto. To Britain he offered control of defence and foreign policy (but not of trade) and the use of Singapore as fortress and base. These last concessions are frankly linked with his recognition that the British armed forces employ a sixth of the local labour and spend M\$291 million each year in wages and local purchases. He also remarked (hopefully) that whereas "the British community are transients, British capital is not transient." Except for a difference with the Liberal-Socialists over the extent of British responsibility for internal security, Mr Marshall has the support of the Legislative Assembly. But Mr Lennox Boyd is being asked to give unrestrained power to a government which commands no majority on any issue other than that of independence. Mr Marshall's ministers are weak, his supporters divided, his opponents vocal and his health uncertain. To deny all he asks will be to procure his resignation. To concede all he asks will be to ensure his fall.

In considering the various issues involved a clear distinction must be drawn between the constitutional and the political. For the mere strength of Mr Marshall's case for a new constitution must weaken his case in every other respect. If the Rendel constitution is an absurdity, as it has been shown to be, what becomes of his own mandate to govern? He was elected under a constitution which includes, for example, the Governor's veto. Without such a safeguard many citizens might have voted differently. Because of that safeguard many may not have voted at all. Should it be decided to draw up a new constitution the present government should have no more than routine functions until new elections have been held.

Closed Dockyard?

The trend of the present negotiations must depend, however, to some extent, on the strategic and commercial importance of Singapore. It might well appear at the outset that Singapore has lost any value it ever had. Mr Marshall may then have to realise that "Merdeka" may mean a closed dockyard, empty barracks, grass-grown runways and silent workshops, with British capital proving perhaps more transient than he has chosen to assume. Just as "Merdeka" in the Federation means autonomy in everything but finance, so "Merdeka" in Singapore is taken to mean self-sufficiency in everything but wages.

For a man demanding so much so soon, Mr Marshall's position is weak, especially when he and his colleagues seek to decide the relationship between Singapore and Britain and between Singapore and the Federation. But neither is his record in office likely to impress either the Secretary of State or the parliamentary delegation which has been visiting the colony. His own views are enlight-

ened, as is shown, for example, by his plan for a government Department of Fine Art; but it is only in their dislike for colonialism that his followers are agreed. The result has been that he is more eloquent in demanding power than in explaining policy. He can point to little that has been planned and to practically nothing that has been achieved.

Whatever the trend of the forthcoming discussions, their ultimate result should be another general election in Singapore. When, however, the new election is held, voters must have two issues explained to them. First, "Merdeka" may mean talking themselves out of employment. They may think it worth while, but they should at least know what they are doing. Second, they must realise that their union with the Federation (if that is their aim) will be impossible unless they return a ministry in which the Federation government can have confidence. These are issues upon which the electorate has never voted; and they are the issues that matter. The prior responsibility resting upon the British is to decide who the electors are to be. Upon the local politicians, by contrast, rests the responsibility of making the issues clear. For the Secretary of State to discuss "Merdeka" with the present delegation—thirteen representatives of five different parties—may prove a major blunder. All these questions of internal security would be better deferred for later consideration by whatever government may then hold office. The best policy would be to scrap the Rendel constitution, lay down a new law of citizenship, re-define the functions of state and local government and fix the date for a new and early election.

The Spanish Strikes

FROM A CORRESPONDENT IN MADRID

IN any country where strikes are forbidden by law it is always a serious thing for a worker to down tools and join his comrades in collective dissent. He does not make the decision lightly, for if he strikes he becomes a rebel in the eyes of the State and chastisement can be severe. In Spain the striker faces formidable odds. The labour unions are no help because they are controlled by the government and by his act he has turned against them. There is no strike fund to sustain him while he is out. His pay has always been low and he probably has no savings. He risks the wrath of the State. He can be arrested; if he has "political antecedents" he will certainly be arrested and he may be held for trial. Later, when he goes back to his old job, he may find that he has forfeited his seniority rights and the benefits deriving from them, which means that he will have to resume work for less pay. Here a man must be very angry and very determined if he goes on strike. Last week some 35,000 to 40,000 Spaniards were evidently very angry and very determined. They struck.

The reasons for their walkout are predominantly economic. They want higher wages to meet the rising cost of living. On January 31st the government had announced a general wage increase of 20 per cent, to become effective on April 1st. But the increase is not as impressive as it seems at first because it applies only to the basic wage, and the basic wage in Spain generally amounts to only about half of a man's take-home pay. The rest is made up by a variety of bonuses and "family points" which are an

important and extremely complicated feature of the Spanish wage system. The strikers' complaint is that the new rise does not compensate for the increased cost of living caused by the February frosts and the consequent scarcity of some basic foodstuffs. They want to know, too, why a resolution demanding a 30 per cent wage increase passed at the Workers' Congress last July seems to have been forgotten.

The strikers showed discipline and seemed anxious to avoid incidents which could be interpreted as attempts to create disorders. They seemed intent, above all, on keeping their action strictly non-political. Yet the fact that strikes happened in spite of being illegal gives a political importance to the labour unrest. Is it a sign of the times that the movement started in Navarre? It was this conservative province that gave Franco his best shock troops in the civil war, the Requetes with the red berets. Yet it was from Pamplona that the strike contagion spread last week to the industrial centres of Guipúzcoa and beyond. The regime had been confronted by strikes before, in 1951 and 1954, but this was the first time that places as far distant as San Sebastian and Barcelona had been affected simultaneously, although news of the walkouts was kept out of the press and off the air for several days.

The end of Spanish isolation is beginning to have an effect on the working class, just as it has stimulated university students and intellectuals to impatience with the regime's restrictiveness. Particularly in the north, where the tourists come in droves, Spaniards are provoked to comparisons between themselves and the visitors from abroad; not with the American tourists who come from another world, but with the Europeans, and particularly the French, people of comparable background with themselves but conspicuously better off. Perhaps there is something of this in the angry discontent of which the strikes are an indication.

The New Alliance at Düsseldorf

FROM A CORRESPONDENT IN DUSSELDORF

AT Düsseldorf the "young men" of the Free Democrats are the most controversial group in the new coalition with the Social Democrats and the Centre Party. The morality of their overthrow of Herr Arnold by switching their support from him to the Social Democrats is still being debated. Furthermore, the Düsseldorf Free Democrats have for some time been in the habit of taking people of a dubious political past under their wing. Thus Naumann's defence counsel, Herr Achenbach, who during the German occupation served in Abetz's Embassy in Paris, is a leading member of the Free Democrat parliamentary group in the Landtag at Düsseldorf. It is important, however, to examine carefully all charges of neo-Nazism and a Nazi past, for they are still freely bandied about by all political parties. Herr Middelhaue, for instance, who resigned from the leadership of the Free Democrats in North Rhine-Westphalia after abstaining in the vote against Herr Arnold, was for many years accused of favouring neo-Nazi tendencies. Now, however, that he has sacrificed his political career to his loyalty to Herr Arnold, the verdict is different; it is admitted on all sides that with great idealism he had attempted to bring the younger generation into the political pattern of the new German state.

The two leaders of the movement for secession from Herr Arnold's government, Herr Weyer and Herr Doering,

were both members of Herr Middelhaue's circle. Herr Weyer, not quite forty, is his successor as deputy prime minister. The son of an old Democrat in Hagen on the border of the Ruhr, he became the town's deputy mayor under the Social Democrat Herr Steinhoff, who is now once more his chief. Weyer is known as a man who takes his duties very seriously. His close collaborator, Herr Doering, who is now in the middle thirties, has become the leader of the Free Democrat group in the Landtag. While still lacking the experience needed to qualify him for ministerial office, Doering—who is largely self-taught—has already acquired considerable political knowledge and skill. The two men had only a relatively slight association with National Socialism during the Hitler regime. Unlike the older Free Democrat leaders, they have few ideological ties, and it is impossible to predict with certainty the road which they will eventually follow.

Herr Steinhoff, an old Social Democrat of just under sixty, who was in a concentration camp under the Nazis, believes that the democratic views of his allies can be trusted. What he says carries conviction, for he is patently not an ambitious politician. Though a skilled tactician, he is not a great man, and great deeds cannot be expected from his government. At present its motto is moderation, born of the necessity of compromising between the Social Democrat majority and its two junior coalition partners. Comparatively few changes have so far been made among the senior civil servants. The government has promised continuity in school policy, one of the few controversial questions within the competence of the Land governments, but the churches are showing anxiety just the same.

The importance of the experiment now being carried out in Düsseldorf lies in its effect on the general political situation in the Federal Republic. The moderate Herr Arnold was punished for what are considered to be Dr Adenauer's autocratic tendencies and not for his own misdeeds. By freeing his considerable abilities, his overthrow at Düsseldorf may have unexpected and unwanted consequences; he may, for instance, become active in the trade union movement, from the Christian wing of which he came. The Federation of Trade Unions (DGB) is alive to the threat of the formation of a separate Christian trade union movement. It also has its own views of the propriety of Social-Democrat coalitions with a party like the Free Democrats.

which is closely linked with groups of industrial employers. These views the Social Democrats cannot afford to ignore. A constellation which may be tolerated in a Land government, which can decide few matters of major economic policy, would become a highly inflammable issue if repeated in Bonn. On the other hand, the Social Democrats in the Bundestag will not want to continue indefinitely eating the bitter bread of opposition, and they are likely to need allies if they want to oust the Christian Democrats from power in 1957.

Federal politics—which are not immune from changes in the international climate—have reached an almost unprecedented fluidity. Düsseldorf might represent the beginning of a new phase. The Free Democrat conference at Würzburg this weekend may throw light on the extent to which the party's heterogeneous elements outside North Rhine-Westphalia are prepared to follow the course set at Düsseldorf.

The Indian Point of View

FROM OUR CORRESPONDENT IN INDIA

FOR the first time since independence, Mr Nehru has been acting like a conventional foreign minister. He has talked in Parliament from prepared texts; he has weighed his words even on public platforms; he has taken for subject neither colonialism nor peace, but the interests of India.

His theme has been simple. Pakistan's alliances, the Baghdad Pact and Seato, encircle India; Pakistan's new American arms threaten India; Pakistan has only entered into the alliances and taken the arms from hostility to India, in order to be able to negotiate with India from strength. This makes a plebiscite in Kashmir impossible. Pakistan was always the aggressor there, so that no plebiscite was ever possible without a Pakistani troop withdrawal; but Pakistan's taking of arms, coupled with the steady squeezing out of the Hindus of East Bengal, has so changed the situation that now no plebiscite is possible at all. India and the Kashmiris cannot wait for ever for Pakistan to purge its aggression. The time has come for the Kashmiris to have some security about their future; the best answer is the one India suggested a year ago—partition on the cease-fire line.

Indians were worried about the possibility of a Pakistani coup in Kashmir when America first agreed to give military aid to Pakistan. All their conditions for a plebiscite have flowed from the determination that the modalities of any plebiscite must recognise that India is in Kashmir by right, Pakistan only by aggression. Mr Nehru is not trying to alarm or convert his people, only to clear their minds. His officials were worried about Pakistani arms before he was; the public was quite prepared to see provocation in border incidents which he dismissed as trigger-happiness.

The Indian public still does not hate the Pakistanis, but it is fed up with them. It has come to be generally assumed that no Pakistani promise can be trusted, that Pakistan will treat every concession as a sign of weakness, that Pakistan's every action is directed by hostility to India. Nobody believes that Pakistan is worried about Communism when its Prime Minister is going on a tour of China, and when

it was India's representative, Mr Khanna, and not Mr Mikoyan, whom the Karachi crowd booed on March 23rd. Above all, the suspicion that the thousands of Hindus who come every month from East Pakistan come because of deliberate Pakistani policy is hardening into a general conviction, as the refugees tell their stories of insults to women, requisitioning of houses and discrimination over jobs. So long as a quarter of a million Hindus come across the border every year, rare indeed will be the Indians who will believe in Pakistani good faith.

Mr Nehru is in fact having deliberately to hold his public back, to play the situation down and not up. He does not want to divert to arms the money he needs for the five year plan, though Delhi's staidest planners concede that defence must come first. He does not want to take cut-price Russian arms, for he feels that any country which is armed by another has mortgaged its independence. He does not want to quarrel with the West. He has been quick with praise over Malaya or Morocco, restrained about Cyprus and Algeria. He has acquitted Pakistan's western allies of any deliberate hostility to India, he has accepted Mr Dulles' reassurances as truthfully meant, he has agreed to go to Washington in July to talk to President Eisenhower.

If no more arms go to Pakistan, if the presumed danger to India recedes, there will doubtless still be much grumbling over pacts and their danger to peace; but the heat will be off, relations will be unaffected. But if Pakistan gets aircraft and tanks on a scale to tilt the balance of power against India, Mr Nehru will no longer try to hold his public back. The MP who called most loudly for Russian arms was a bitter anti-Communist.

Arguments against Pacts

The Indians are not afraid that Pakistan would beat them in a proper war, but that it might be tempted into a quick raid on Srinagar, in the hope that India would accept the *fait accompli*. After the recent western performance in the Middle East, Indians have no faith that Mr Dulles could get Pakistan out again, or indeed that he would do more than suggest a plebiscite. They never forget that a Pakistan with enough arms to stand up to the Russians would be a Pakistan stronger than they are. What makes Indians specially angry is their feeling that they are being sacrificed for no gain to the West or to freedom. They do not consider that, as against Russia and China, the Baghdad Pact and Seato add anything to the hydrogen bomb; they do consider that the two pacts have split the Middle East, made the position in Indo-China worse, and pushed Jordan, Cambodia, and now Ceylon away from the West; they contrast these failures with their own success in reducing their Communist party to the final ineffectiveness of supporting the government, and wonder what possible purpose these pacts can serve beyond providing Pakistan with allies on India's east and west.

India is waiting to see what the West will do; which in this context means America, and America alone. The crux is not the Commonwealth Prime Ministers' Conference, but Mr Nehru's meeting with President Eisenhower. Never have Indians been more agreeable than they are today to the Englishmen in their midst; but they are so agreeable partly because British policy no longer matters so much. Mr Selwyn Lloyd erased Great Britain from India's list of great powers when—as Indians see it—he responded so amiably to the whip over Kashmir.

**"You want to
cut your costs—
so do I!"**

Here is something that can save you money, and speed your production: long-run manufacturing concerns have *proved* it. It is a polystyrene plastic for mass production by injection moulding. Its name is Lustrex.

Lustrex can replace many costlier and less stable materials. But it is no mere substitute—it is a material in its own right... tough, handsome and time-saving.

In many trades Lustrex cuts out whole processes—does away with preparation of material, finishing, assembling and colouring, and quite a few storage problems, too. You can get from "raw" Lustrex to finished, marketable part or product in *one* operation.

Lustrex is versatile too. Many modern radio cabinets are attractively moulded in Lustrex—and so are toys, electrical fittings, household wares, and packages for cosmetics, toilet accessories and a thousand and one other products. In modern refrigerators, it is used to make Freezer Drawers and Doors, Drip Trays and Door Trims.

Can you afford to ignore the advantages Lustrex can bring you?

Finance for Industry and Commerce

ICFC provides finance in the form of long-term loans on fixed terms, or share capital, to industrial or commercial enterprises established in Great Britain. Amounts range normally between £5,000 and £200,000.

During the present period of credit restrictions, the Corporation will only consider applications for capital from firms concerned in work of national importance. Consideration may also be given to new ventures which are soundly conceived and adequately sponsored.

THE BUSINESS WORLD

Analysis of the Budget

MR MACMILLAN'S first Budget, apart from his stubborn (and disappointing) refusal to make a start upon much-needed—and stimulating—major reforms of the tax system, has conformed in three respects to the popular forecasts. It comprises an unusual variety of changes and new devices, yet their combined effect upon the prospective balance of revenue and expenditure, both this year and next, will be very small. Secondly, this net effect will be disinflationary: instead of dissipating his large prospective surplus, the Chancellor has slightly reinforced it—to the extent of £15 million. Thirdly, he has exercised some ingenuity in a search for new or improved media for savings and has shown a readiness to cast Exchequer bread upon the waters in the faith that it will return as swollen savings to the national economy.

This drive for savings provides the key to the structure of the Budget. The Chancellor is implementing the principle of the Millard Tucker recommendations for tax relief on premiums to provide pensions for the higher-self-employed. There are to be new and higher-yielding savings certificates and defence bonds, and by the new year these are to be flanked by a novel premium bond. Interest up to £15 on savings deposits is to be free of income tax. And the stamp duty on conveyances of houses is to be regraded and reduced. Three of the ingredients of this "savings package," as the Chancellor called it, impose a burden on the Exchequer of £20 million this year and £50-£70 million next year. The only other material concession is a proposal to extend the age limit for family allowances (for children who remain at school or are apprenticed) and to increase the allowance for third and subsequent children by 2s. a week. This will cost £5 million this year, and, apparently, £12½ million in a full year.

To finance the £25 million thus to be given away and at the same time to fortify the surplus, the remainder of the bread-subsidy is to be withdrawn as from end-September (saving £12 million this year and £23½ million next year) and the tobacco duty is to be

raised by the equivalent of 2d. on a packet of 20 cigarettes (yielding £27 million this year and £28 million next year). In addition, and apparently chiefly as a means of satisfying the Chancellor's desire to spread his tax increases evenly over direct and indirect taxation, the tax on distributed profits is to be raised by 2½ per cent—the second increase in six months—and that on undistributed profits by ½ per cent. This will provide only £750,000 this year, but £30 million in the first full year.

By these means the prospective surplus for 1956-57 will be raised by £15 million; but Mr Macmillan is evidently assuming that his policy as a whole will exert a stronger additional disinflationary force than that modest increase might imply. He is looking to the savings drive to play "a decisive part," and he also hopes that a "continuous and comprehensive" review now to be undertaken of all Government expenditure will yield savings "amounting to not less than £100 million in this current year." Nothing has been said of the means by which these economies are to be brought about; but, had it not been for the prospect of them, the Chancellor would have felt it his "duty to propose very heavy increases in taxation." Thirdly, he is counting upon a continuance of the restraints exerted by monetary policy. The only change he proposes in this sphere is an unexpected and rather startling one. In future, the nationalised industries will no longer be left to finance their capital requirements first by bank advances and then by funding issues of Government guaranteed stock; instead they will get their finance direct from the Exchequer.

The Budget Accounting

The prospective above-line surplus that confronted the Chancellor at the outset actually proved to be larger than the big surplus realised in 1955-56, thanks to a bigger allowance for the effects of past inflation upon

the yield of revenue than had been generally expected. Expenditure on Supply services, as already known, was estimated at £228 million more than was actually spent last year; after adjustment for the £35 million of savings expected from the February cuts in bread and milk subsidies and the £22 million cost of the agricultural price awards, the effective increase became £215 million. For Consolidated Fund Services, the Chancellor provided an additional £34 million, almost entirely on account of the rising cost of the national debt, so that total above-line expenditure, at £4,745 million, was estimated at £249 million more than the actual expenditure of 1955-56. Above-line revenue, however, was expected to rise by £297 million to £5,190 million. Of this increase, a net £49 million reflected the effects, in their first full year, of the tax changes made in last year's budgets. The upshot, therefore, was a prospective above-line surplus of £445 million. This is expected to be raised to £460 million by the changes noted above, compared with £397 million actually realised last year.

★

The below-line account was expected to improve even more strikingly, from an actual net deficit of £538 million to an estimated deficit of £453 million. The whole of this improvement was attributable to the

expected large reduction in borrowings of local authorities from the Public Works Loan Board; these, after allowing for repayments, are put at only £176 million in contrast with £297 million last year. A decline is also expected in advances to the Coal Board, but new expenditures will arise on account of the Potato Marketing Board and the Sugar Board, and no credit is taken for any further possible receipts from the steel realisation agency, which last year brought in £25 million. Even on this basis, it will be seen, the Exchequer account as a whole showed only a tiny prospective deficit before allowance for the changes made in the Budget. The £15 million strengthening that those changes will make in the above-line account will, however, be swallowed up by the big effect exerted below-line by the new procedure for financing the nationalised industries, for which a provision of no less than £350 million is made in the estimates. Hence the final result is a prospective "overall" deficit of £343 million, compared with a realised deficit of £141 million in 1955-56.

The Nationalised Industries

Whether the deterioration thus caused in the below-line account can be dismissed as merely technical, will depend upon the manner in which official policy in the gilt-edged market is adapted. The decision to divert the financing of the nationalised industries to the Exchequer is a heterodox move that precisely reverses the principles lately recommended by the Herbert Committee for the electricity industry and adopted in Mr Butler's policy of driving the local authorities into the capital market for finance in order to reduce the pressure upon the Exchequer for finance through the Public Works Loan Board. That policy was rightly applauded because it subjects the borrowers to the tests of the market, and because it relieves the monetary authorities of the embarrassment caused by an excessive creation of Treasury bills. The arguments that justify it might seem equally to condemn the opposite policy for the nationalised industries.

But, says the Chancellor, things are not what they seem. The eventual goal may be to enable the nationalised industries to borrow autonomously; but at present they cannot borrow without pledging the government's credit and in addition the government generally finds that it has itself to put up much of the finance whenever these bodies seek to fund their bank advances by market issues of stock. Hence the relief for the Exchequer, and the avoidance of finance by Treasury bills, is more apparent than real. It would therefore be far better, the Chancellor argues, to "face the reality," by providing Exchequer finance direct, for a period limited to two years and for total finance limited to £700 million, of which £350 million is expected to be required this year. The sum looks large by the standards of the needs of these borrowers in the past—the provision covers all the nationalised

THE ECONOMIST, APRIL 21, 1956

industries except coal, which has been thus financed throughout—but presumably that is because a substantial volume of bank advances has accumulated since the proceeds of last year's market issues were exhausted. Most of these advances will now gradually be repaid, and in future the nationalised industries will look to the banks only for their "normal requirements of short-term capital."

★

In the first instance the finance will be secured automatically by issues of Treasury bills. There is therefore the risk that, since the authorities are no longer obliged to arrange for such issues, they might look mainly to their own convenience in refinancing maturities of government stock (such as the £824 million of National War Bonds that mature next August), and might feel that they have an excuse for allowing the floating debt to rise at least to the extent of their financing of the nationalised industries. If this were so, the problem of keeping a due tautness in bank liquidity would be greatly aggravated. The Chancellor affirms, however, that the policy will not be operated in any such loose fashion. "Naturally," he says, "my purpose will be that this sum for the nationalised industries, with any other borrowing by the government, should be successfully absorbed by the public during the year." If, and so long as, gilt-edged policy is firmly and realistically directed towards that end, this new and curious expedient can have real technical advantages. These will flow from the fact that the timing of funding issues will no longer be related, as it is to some extent now, to the state of the accounts of the nationalised industries at the banks; and from the fact that the Treasury alone will decide for the character of the particular securities issued for the purpose. It remains to be seen whether practice will match the intent. It will certainly fall short of it if funding policy, conceived as a whole, is no more vigorous than in the recent past. At any rate the right resolve has been clearly stated; and one clear earnest of good intentions is to be found in the new savings securities—for sales of these will provide a funding at least as effective as any that can be done by market issues and sales by the government broker.

Boost for Small Savings

The Chancellor has produced a wide variety of new plans for saving and has not hesitated to offer attractive rates of interest. Big business will be done in the new savings certificates, the new defence bonds, the £1 premium bonds and perhaps even in building up the first £600 in the Post Office and ordinary department of the Trustee Savings Banks to earn £15 a year of tax-free interest. The attractive rates of interest now offered to the "small saver" may or may not induce new saving. They will certainly draw large sums from liquid balances and other investments. Certainly also they will attract the surtax payer within the limits of the permitted holdings.

The new savings certificate which will be on sale from August 1st and will grow from 15s. to £1 in 7 years gives a tax free yield of £4 3s. 11d. per cent compound compared with £3 os. 11d. per cent compound on the present 9th issue. There seems an advantage in switching unless the investor wants to preserve his right to buy 600 of the new units in addition to his existing holdings. No doubt for that reason the Treasury quickly followed up the Budget statement by the announcement of generous terms on which certificates of two of the older series may be continued. The new defence bonds to go on sale on May 1st bearing interest at 4½ per cent (compared with 4 per cent on the present series) and with a tax free bonus at the end of 10 years of £5 per cent (compared with the present £3 per cent) should appeal to middle-class investors. The maximum holding is £1,000 in addition to any holdings of bonds in the earlier series.

	Interest Net per cent	Gross (at 8s. 6d. tax) per cent
Savings Certs, 9th series	£ s. d. 3 0 11*	£ s. d. 5 5 11*
Savings Certs, 10th series	4 3 11*	7 5 11*
Defence Bonds (4%)	...	4 9 10
Defence Bonds (4½%)	...	5 5 0
Savings Bonds (up to £15)	2 10 0	4 6 11

* Compound interest.

No doubt is felt in the Post Office that Mr Macmillan's new introduction, the non-interest bearing premium bond, will attract big support. The issue will carry a moderately high service charge, for the 4 per cent to be used for prizes instead of as interest may be regarded as equivalent to only a little under 7 per cent gross. The Post Office will administer the issue and will keep the register and do the drawings. The operation involves the equivalent of the creation of a new department in the Post Office, which explains why the bonds cannot be put on sale at once and why they will be a registered stock and not sold across the counter.

Pensions for the Self-Employed

The Chancellor's proposals about pensions for the self-employed, controlling directors and employees not in pensionable employment represent his one big step along the road of fiscal reform. They are comprehensive, for he has ignored the limitation to the professional self-employed which the minority of the Tucker Committee sought to impose; and since they are directly geared to saving they enable the Chancellor to effect a marriage between fiscal justice and economic expediency—rare but happy bedfellows. The bare bones of the proposals so far revealed leave a great deal of flesh to be added by the Finance Bill. The premiums paid to secure retirement annuities will be relieved from income tax and surtax within the limits of £500, or

10 per cent of earned income in any one year. The investment income of life assurance companies (and, one would hope, of self-administered funds) will be exempted from tax to the extent that it relates to the provision of retirement annuities. The benefits may not include lump sums. But although Mr Macmillan spoke of giving effect to the proposals of the second Millard Tucker committee "in a simplified and modified way," the tentative cost of his proposals, £30 million to £50 million for the relief of the premiums paid, is sufficiently close to the Committee's estimates to give promise that its proposals will not be greatly whittled down.

The Tucker Committee recognised that the self-employed, lacking the discipline of an employer, would need to be restrained in the amount they could set aside. Like the Chancellor, they suggested 10 per cent of income in the straightforward case of the provision of a deferred annuity alone; and as an alternative they offered 12 per cent where there is a combination of deferred annuity with provisions for dependants and for death or incapacity before retiring age. These basic limits are not over-generous: the amounts set aside under an industrialist's top hat scheme would be far higher, while the cost of providing a civil servant's pension is about 15 per cent of his remuneration. The Tucker Committee proposed, moreover, that the allowable provision should be increased for persons who had already reached a more advanced age, up to 15 per cent in the first case of a straight annuity, and to 18 per cent in the second case covering other benefits, in order to recognise and provide for their past service. The Chancellor made no mention of this; if anything, he dashed hopes by saying in another context that the relief he proposed on purchased life annuities should be of considerable benefit to those who are too old to secure any great advantage from the deferred annuity scheme. That would be reasonable only if the individuals concerned had the opportunity of saving the purchase price.

The basic principles adopted by the Committee were that payments into a scheme should be exempted from tax and that payments therefrom should be taxable. The lump sum of up to one quarter which can be withdrawn from most existing schemes offends against the latter principle but, since it had been sanctified by custom, the Committee regretfully accepted it. In denying it to the self-employed the Chancellor is at one and the same time establishing a sound principle and maintaining a distinction of privilege between different taxpayers that cannot be justified. Here again the self-employed will not be allowed quite to keep up with the Joneses. In one other detail the Chancellor has indicated that his proposals fall short of the Committee's—the income limit of £5,000 in the place of a higher figure (with lower percentage contributions). In the majority of cases an income limit of £5,000 will be reasonable, but it may impose some hardship on those who are late starters and whose modest earnings in early years are counterbalanced by large prizes later.

The Profits Tax Mirage

Within six months two Tory Chancellors of the Exchequer have put up profits tax. If there was scepticism about the merits of Mr Butler's decision to raise the distributed profit tax, anger is justified by Mr Macmillan's proposals. At least Mr Butler left the undistributed profits tax alone. Mr Macmillan has raised it from 2½ to 3 per cent and the tax on distributed profits from 27½ to 30 per cent. The net effect of these increases will indeed be small; they bring in an additional £30 million in a full year and they will cut company earnings available for dividends only slightly. But however small, these changes make a bad two-tier tax worse—how bad was emphasised in the report of the Royal Commission on Taxation. Mr Macmillan, like his predecessor, has ignored the force of the Commission's arguments. Indeed, in a budget designed to stimulate savings, he has forced companies to dis-save. If a company decides to pay the same dividend out of the same earnings, the increase in the undistributed profits tax will automatically reduce the amount that can be ploughed back in profits.

What is the arithmetic of these changes? For each £100 of profits the following calculations on the new rates emerge:

Income Tax at 8s. 6d. in the £ takes	42.5
Undistributed profits tax at 3% takes	3.0
Leaving to be divided between the net dividend and distributed profits tax	54.5
If x is the net dividend, then at the maximum:	
$x + \left(\frac{40}{23}x + \frac{27}{100}\right) = 54.5$	
Therefore x, the full dividend payable after tax, takes	37.08
And distributed profits tax takes	17.42

On a maximum distribution of earnings these comparisons emerge:

Old Rate	Autumn Budget Rate	New Rate
Income tax at 8s. 6d. in £ ..	42.5	42.5
Undistributed profits tax at 2½% ..	2.5	3.0
Net dividend ..	40.8	37.08
Distributed profits tax at 20% of gross dividend ..	14.2	17.42
	100.00	100.00

Two facts arise from these comparisons. First, because of the increase in the undistributed profits tax the total amount available for distribution is reduced. Secondly, because of the increase in the distributed profits tax, the amount on a maximum distribution of profits that can be paid over in dividends from available earnings is reduced. On a maximum distribution, a year ago is reduced. On the Inland Revenue took 59.2 per cent of profits; on the Autumn Budget rates it would have taken 61.66 per cent; and now it will take 62.92 per cent.

The total effect of the changes in the rates is thus shown to be arithmetically small, so small that for a rough calculation of earnings—and all such calculations are necessarily rough—the investor can simply deduct one-third of the unadjusted rate of retained earnings to arrive at the true earnings rate.

Will Cigarettes Stand the 2d.?

The Chancellor appears to have no fear that his increase in the tobacco duty—amounting to twopence on 20 cigarettes and 2½d. to 3d. on an ounce of pipe tobacco—will make even a slight dent in the sales curve of smoking. The increase of 3s. a lb—to 61s. 2d. a lb on foreign tobacco, and 59s. 7½d. a lb for tobacco from the Commonwealth that obtains the preferential rate—is calculated to bring in £27 million in the current year and £28 million in a full year. The Chancellor expects, however, that total receipts from tobacco duties will rise from £668,175,000 in the current year to £707 million in 1956-57, an increase of nearly £39 million. He is counting, therefore, upon a further increase in expenditure on smoking. Spending on tobacco rose from £855 million in 1954 to £880 million last year, representing probably some 247 million lb of manufactured tobacco; the amount smoked in Britain has been rising fairly steadily since 1950-51, and the last two increases in prices—in 1951 and in November last year—came from the makers, not as a result of increases in duty. After Mr Dalton put cigarette prices up by 1s. for 20 in 1947, tobacco sales did fall significantly—consumption last year, indeed, was still some 6 per cent lower than in 1946—but that increase coincided with sharp restrictions on purchases of American leaf.

This is the only significant change in Customs and Excise duties. The Chancellor has decided to plug, or cork, one loophole in British wine duties by extending these to cover the "fortified" ciders. He is also proposing to extend purchase tax—in a way he did not disclose and which the Customs and Excise are not prepared to reveal before publication of the Finance Bill—to vehicles bought as vans, on which only a 30 per cent chassis tax is charged, and converted into estate cars. A number of the smaller "estate car" versions of popular models have pressed steel bodies identical with the same makers' smaller vans except for possessing rear side windows at the sides—which are a simple job for a resourceful buyer to put in himself. Rear side windows are, in fact, the badge of respectability that the Customs and Excise department uses to define a passenger car liable to purchase tax. The happy game of "Hunt the shooting brake" is one in which more than one Chancellor has joined since the war. Mr Macmillan, sniffing after "Do it yourself," is the first to pursue it into the back garden. The results of his zeal, on his own estimate, "are unlikely to be substantial."

Some Miscellaneous Changes

When Mr Butler withdrew the investment allowance for capital equipment in October, he exempted as particularly deserving of encouragement expenditure on equipment for scientific research and for the purchase of ships. The change will be given effect in the Finance Bill: Mr Macmillan has added to these favoured forms of investment a third—capital

Stirling Moss takes first place, in the fastest R.A.C. T.T. of all time. Fangio and von Tripps took second and third. Each drove a Mercedes 300SLR—using BP Super.

BP SETS THE PACE

THE TRACK and the test-bed are BP proving grounds. On the roads and race-tracks of Europe BP fuels and lubricants are consistently proving their worth in all types of races; in 1955 alone 12 of the world's major motor racing events were won on BP products.

At the BP Laboratories at Sunbury research

never ceases. Motor, aviation and gas turbine fuels, vaporising oils, diesel oils and lubricants—all are constantly under test, to ensure best quality.

The final gains go to millions of users all over the world. The proved performance of BP products is theirs to enjoy wherever they see the BP sign.

The BP Shield is the symbol of the world-wide organisation of

The British Petroleum Company Limited

whose products include BP Super Motor Spirit and BP Energol 'Visco-static' Motor Oil

expenditure on approved fuel-saving equipment which is installed by way of replacement or modification in existing industrial premises. This is in line with the existing Government policy of promoting the installation of more efficient fuel-burning equipment by offering industrialists loans, interest-free for the first two years, afterwards at commercial interest rates, to pay for these types of equipment. It is likely to obviate any slackening that might otherwise have occurred, for example, in industry's switch to oil fuel.

A Finance Bill which has to cover even a streamlined scheme for retirement benefits must be a lengthy document, and on that ground, if on no other, the Chancellor can be forgiven for touching only two further measures of taxation reform. By granting capital allowances for cutting and tunnelling he completes the spadework done for diggers by earlier provisions regarding mines, cemeteries and the Mersey Tunnel. His concession will be particularly valuable

to dry docks whose existing facilities are strained by the size of modern tankers. The comments about the residence rules and the basis of taxation of foreign employment suggest that the Royal Commission's recommendations will be followed: the availability of a place of abode here has been responsible for the arbitrary "one-day" rule (under which one day spent in this country by a man with a house here makes him liable to tax) and its abolition, and the replacement of the existing unwritten code by specific legislation will be welcomed. The position of foreign employment is not so clear: the Chancellor's words and the Financial Statement suggest that he will follow the Royal Commission and look to the place where the work is done, rather than to the place where the remuneration is paid. By doing so, he would upset the *Bennet v. Marshall* and *Bray v. Colenbrander* decisions; but the Budget resolutions contain no explicit reference to the point, which must await the Finance Bill.

Business Notes

Macmillan's Tonic for Markets

A BROADLY based rise in markets followed the Budget. Whether that was the right reaction to this particular Budget, and whether any budget designed for the problems of today ought to be a tonic for markets are both open to argument. The fact was that gilt-edged stocks, industrials, gold shares, and sterling all moved upwards in expanding business. On the commodity front alone there were a few signs of weakening. On Wednesday the *Financial Times* index of fixed interest securities advanced from 96.49 to 96.74; there were fairly big dealings in gilt-edged though the policy of the big investors seemed more often to be the tipped towards switches than to outright purchases. The industrial ordinary index jumped from 188.0 to 191.7. Buying expanded partly because it was the first day of a new account; the number of markings at 9,867 compare with 7,849 on the first day of the previous account but in a strong market over 11,000 bargains were marked on Thursday.

It would be false to suggest that the rise marked unqualified approval of the Budget by investors, just as false as to suggest that the Budget had been diagnosed as "inflation as before." The Budget contains features of which the investing public certainly does not approve—in particular the increased profits tax—and features that are generally approved. But much of the market's first reaction was semi-automatic. Business that had been held up just to have a look at the Budget first was released. When it was found that there were few unpleasant surprises, a fair volume of delayed investment plans were carried through. It there-

fore does not follow that the market's final verdict must inevitably endorse its first reactions. In practice the Bank of England and the Treasury have gained a little more control in the gilt-edged market through the rearrangement of the method of financing the nationalised industries. But the immediate outlook in the industrial share market seems largely unchanged.

In one direction, however, the behaviour of the market was a direct result of the Chancellor's decision. Insurance shares are normally one of the most staid sections of the

	Rise Tues. & Wed.	Price April 18	Yield
Commercial Union 5s.....	2/9	87/6	4 s. d. 3 16 2
Equity & Law Life £1 6s. pd..	1/	6 1/2	3 6 10
Legal & General £1.....	1 1/2	26	1 18 6
Pearl £1.....	1 1/2	24	4 17 10

Royal Insurance 5s.....	1/10 1/2	87/6	3 16 2

Stock Exchange. But on Wednesday jobbers there were besieged by eager brokers. The Millard Tucker provisions in the Budget brought in a mass of investors who seldom look at an insurance share and it brought in some "house speculation," too. The market that had been good for some days thanks partly to budget hopes and partly to the good results that some life offices have been showing, went roaring ahead. Buyers who know little of insurance shares bought not only life insurance, but the composite office shares in some of which the shareholders' portion comes mainly from the non-life side. Naturally, the rise soon brought in sellers

from among the more knowledgeable investors, and the house speculation dried up as brokers and jobbers realised that Millard Tucker in the Macmillan edition (with the cash option expunged) would not be quite the gift they had hoped for. On balance, however, life office shares and a few others retained a substantial rise on the day.

Bears of Sterling on the Run

STERLING has been one of the main beneficiaries of the Budget. Foreign opinion may not have been impressed by the negative character of the tax changes, but it was impressed by the size of the prospective surplus and by the promise of economies in Government expenditure (often heard but disappointed in the past but this time reinforced by a figure and a date). There was nothing in this to encourage those who were short of sterling to continue to run expensive open positions in the expectation of early disasters to sterling. So by Wednesday some of the bears of sterling were on the run. There was good commercial demand from New York and from the Continent. Moreover, it has now become evident that some of the outright forward sales of sterling recently made by foreign enterprises with subsidiaries or other insurable interests in the sterling area are not being extended as they mature. The official rate of sterling against the dollar has just risen to over \$2.81 for the first time since August, 1954. Another milestone passed this week is that the sterling price of gold has again dipped below 249s. per fine ounce. In Wednesday's active market, the Exchange Equalisation Account must have acquired appreciable amounts of dollars and other currencies.

The rate for transferable sterling has strengthened to \$2.78½. There is a persistent demand for it, but supplies are being concurrently increased as a result of arbitrage operations based on the free or convertible DM and guilder. At the prevailing level of quotations it has been cheaper to obtain sterling by selling dollars against DMs or guilders and then buying sterling with these currencies than by selling dollars direct against transferable sterling in Zurich or elsewhere. Substantial amounts of transferable sterling have thus been created. With every week that passes evidence accumulates that the various types of non-resident sterling—official, transferable and security—are becoming more nearly a single currency.

Shell of Plenty

CORNUCOPIAN is the word for the preliminary statement of the Royal Dutch/Shell group for 1955. It requires an effort of imagination to grasp the magnitude of its figures; but no effort is needed to gather the generous implications of the dividend. The ordinary dividend of Royal Dutch has been raised from 16 to 20 per cent. The tax free ordinary dividend of "Shell" Transport and Trading is 15 per cent, plus "an extra dividend" of 3½ per cent, making 18½ per cent, tax free, for the year, compared with 15 per cent, tax free, for 1954. Ordinary shareholders

in "Shell" will also receive a one for four free scrip issue of £1 ordinary shares; on the increased capital, and "subject to the conditions then ruling, it is hoped" that the tax free dividend rate of 15 per cent will be maintained. In view of the "extra dividend," it might not be too optimistic to think of 15 per cent as the minimum rate. Such optimism was certainly abroad in Throgmorton Street when the £1 stock units of "Shell" gained ¼ to 7½ and £1 100 stock units of Royal Dutch 3½ to 7½.

Behind the dividends lie most impressive trading results. In 1955 the net income after tax of the Royal Dutch/Shell group rose by 19 per cent, from £134½ million to £160 million, in line with an increase in production, refining and sales. The group's sales of oil all over the world rose by 10 per cent and the oil was sold at a higher average price. Hence for the first time in the history of Royal Dutch/Shell "sales proceeds and other income" exceeded £2,000 million, compared with £1,851 million in 1954. From the net income of £160 million dividends have been declared in the 60/40 ratio to the two parent companies, providing Royal Dutch with £33.4 million and "Shell" with £26.8 million.

SALES AND EARNINGS
(£ million)

	Sales		Net Income		Net Income/Sales	
	1954	1955	1954	1955	1954	1955
Jan.-Mar.	430	474	33.5	34.1	7.8	7.2
April-June ...	456	509	35.8	36.6	7.9	7.2
July-Sept. ...	471	557	30.1	42.7	6.4	8.0
Oct.-Dec.	494	Over 480	35.1	46.6	7.1	9.7
Total	1,851	Over 2,000	134.5	160.0	7.3	8.0

The Royal Dutch/Shell group had to pay out £444 million (£38 million more than in 1954) in sales taxes and excise duties and £116 million (£10 million more than in 1954) in income taxes. The group also spent £283 million on capital account, against £226 million in 1954, bringing the total spent over the last five years to well over £1,000 million. Nearly all these funds have come from depreciation allowances and profit retentions. It is from such expenditures that future earnings must spring for the group has outgrown the capacity of the market to feed its capital needs. A quarterly analysis of the group's sales and net income, shown in the accompanying table, reveals that profit margins were rising over the year. Thus whether a short or a long view is taken of "Shell" £1 units, the prospective yield of about 4.2 per cent, calculated on the projected dividend and free scrip issue, seems justified.

More Steel for 1956

BY raising its output to about 21,300,000 ingot tons, pegging exports and its own stocks, and importing about as much crude and semi-finished steel as it did last year, the steel industry hopes to offer consumers in Britain about 11 per cent more steel in 1956 than it did in 1955. If they want any more, they can import it themselves.

How much information can you use?

Most people, even if they are not closely connected with industry, know what a recording instrument looks like. Like a Seismograph it goes on giving a record line of information about conditions which are generally quite normal. The geologist usually only wants to record the frantic jump in this record line when an earthquake occurs; similarly the man in industry usually only wants to know when the recorded condition is abnormal. For some time Sunvic Controls Ltd. have been developing new means of monitoring this information so that it provides a more easily used record—not of the normal conditions about which nobody wants to know, but about the abnormal on which action has to be taken. One method is to record this information digitally—or in more simple terms to print it out as with a teleprinter. Alternatively the information can be placed on punch cards so that it can be analysed mechanically.

Sunvic do not pretend that they are the only people in the world thinking about this. But because of their experience in automatic controls and processes they do believe that they have more of the answers than most people. They have them because some of the best brains in industry are working on these problems. And incidentally, Sunvic are anxious to hear from younger men with scientific and technical qualifications who would like to join this Brains Trust.

Today Sunvic takes control

BRITISH OVERSEAS AIRWAYS CORPORATION IN ASSOCIATION WITH QANTAS, S.A.A. AND TEAL

That, roughly, is the prospect for steel supplies this year, as analysed by the Iron and Steel Board last week. The industry, at this rate, would be able to supply the equivalent of about 18,850,000 ingot tons of steel—which means about 13½ million tons of finished steel products. Last year, the ingot figure was about 17 million tons for home deliveries, but consumers supplemented this with imports of steel on their own account equivalent to another 1.2 million tons; total purchases of finished steel by British consumers, therefore, may have totalled a little under 13½ million tons. Nobody can guess how much the engineering industries in Britain are likely to import on their own account this year. Some of the most expensive imports, sheet and tinplate, are certainly being reduced, as a result of the cuts in output of cars and home equipment.

There ought, indeed, to be room for a substantial reduction in these expensive imports (since last year consumers who buy foreign steel have had to get it themselves at foreign prices). For their stocks, like those of the steel industry itself, were built up during last year's steel shortage, and some sections of industry ought to be able to run these down somewhat. An interesting survey published by the board shows that at the end of 1955 it was the smallest consumers of steel who had built up their stocks to the greatest degree—no doubt fearing that as the shortage became more acute they would be squeezed out of the steel producers' lists by the bigger buyers. In fact, consumers taking up to 500 tons during the half-year then held stocks ranging from 18 to 22 weeks' consumption; those taking between 500 and 1,500 tons in six months held 16 weeks' supplies; and the consumers taking more than 1,500 tons of steel in six months held only about 10-12 weeks' supplies. These larger consumers, who use about 81 per cent of the steel covered by the board's census, held only about 74 per cent of the stocks. Whether their management of stocks is likely to be more economical is a matter of opinion; but their demand is perhaps likely to react in a rather less volatile way to first the rumours and then the fact of shortage than the small buyer's.

P & O Revealed

"THE balance sheet and profit and loss account submitted with this report have been prepared without recourse to the Companies (Shipping Companies Exemption) Order, 1948." This is the most significant sentence in the full report of P & O for the year to September 30th. Hidden reserves are no longer hidden. In the old style balance sheet of September 30, 1954, the net value of ships in service or under construction was put at £96 million. In the new style balance sheet for the same date, the gross value of the fleet is put at £176 million and its net value at £117 million while payments on account of ships under construction and commitments to build new ships are shown separately. A year later the gross value of the fleet had gone up to £183½ million and its net value, based on depreciation at 5 per cent per annum, was £116 million. These are original costs. Replacement values would presumably be still higher.

Corresponding and complicated adjustments have been made to reserves. According to the old style, on September 30, 1954, capital reserves totalled £63.8 million and revenue

reserves to £22.7 million. In the new style on September 30, 1955, capital reserves came to £55 million and revenue reserves to £36.7 million. Over the year the group ploughed back from profits into reserves about £2.4 million and £13.8 million was capitalised from reserves to make the 100 per cent free issue. Reserves of about £16½ million, previously hidden, have thus been revealed.

ASSETS AND LIABILITIES (£ million)

	On Sept. 30, 1954	On Sept. 30, 1955
Fixed Assets, at cost:		
Ships	176.2	183.6
Construction payments	6.8	7.9
Other	18.8	20.0
Total	201.8	211.5
Net fixed assets	135.7	137.1
Net current assets	28.7	39.1
Quoted investments	23.3	34.8
Cash, etc.	14.2	13.8
Debtenture capital	4.2	7.9
Minority interests	20.9	21.5
Future tax reserves	21.9	24.5
Capital reserves	72.2	55.0
Revenue reserves	28.5	36.7
Deferred capital	13.8	27.6
Capital Commitments:		
Ships under construction	7.4	11.6
Ships on order	10.7	9.9

There is a tremendous weight of assets behind the P & O deferred stock, but the reckoning on earnings is less spectacular. By declaring a dividend of 8 per cent, the directors in effect maintained the payment. They can say that about one-third of net earnings is distributed and that, in view of the group's capital commitments, this is a reasonable proportion. Their critics, not yet completely silenced, reply that if the parent company's net profit of £1.9 million is related to the net book value of assets of £144 million, the return on capital employed is only about 1.3 per cent and would be even lower if replacement values were revealed. The critics will not get their way. The company will not stop trusting in shipping. If it did, it would soon be saddled with an obsolete fleet earning nothing at all. For an enterprise of the size of P & O there is no turning back.

Another point on which the critics might batten is the further reinforcement of liquid resources. This reflects in part the ploughing back of money in depreciation and in reserves, and in part the first instalment of £2.8 million from the £10 million of 5 per cent debenture stock issued, fortunately for the company, in September, before the

"Motor Business"

The March issue of this quarterly research bulletin for the motor and allied industries includes:

- Stock and Sales Expectations: A New Indicator for the Domestic Market.
 - Return to Seasonal Trends in Production.
 - Crystal Gazing in the Motor Industry.
 - The Swedish Market for Vehicles and Tractors.
- The Bulletin is fully illustrated by charts, amongst which are:
- Price indexes of used cars and vans.
 - World exports of vehicles.
 - Vehicle exports by countries of origin.

A New Measure for Hire Purchase

SUCCESSIVE Chancellors and Presidents of the Board of Trade have been applying controls to hire purchase throughout the postwar decade except for a short break late in 1954 and early in 1955. This week they learn a little of the size and shape of the growth they have been trimming. The Board of Trade has launched a group of monthly indices of the money value of hire purchase transactions starting from last October.

The Board of Trade's inquiry based on a voluntary sample (about 1,600 retailers and 262 finance houses) comprises two separate series (both with December, 1955, as 100). The retailers' index covers mainly furniture and furnishings, hardware, radio and electrical goods, but is classified by type of shop, i.e. radio, furniture, department store, gas or electricity undertaking. The other index, derived from the finance houses, covers industrial and commercial equipment, motor vehicles, as well as a few household durables. In that section are included also the manufacturers who finance the hire purchase of their own products. To minimise duplication hire purchase agreements between retailer and customer which are subsequently "block discounted" with a finance house are counted as retail.

The Board of Trade estimates that the nation's hire purchase debt at the end of last December was "in excess of £450 million"—just how much in excess it does not care to guess—but the debt to retailers was thought to have been of the order of £250 million to £300 million while the debt to the 262 finance houses taking part in the inquiry was £169 million. It is not wildly imaginative to suppose that within the wide margin of error that is inherent in all these calculations, the total outstanding

hire purchase debt was probably in the range of £450 million to £510 million at the end of 1955.

The statisticians think that in December retailers' weekly hire purchase sales were about £3 million for furniture and furnishings shops, £1½ million for hardware, radio and electrical shops, and at not quite £500,000 for the department stores—a total of £5 million a week. The 262 finance houses extended credit of £15 million in that calendar month. The statisticians wisely decline to amalgamate the two totals. The curious inquirer may guess that the volume of hire purchase selling at the end of last year may have been at the rate of at least £400 million a year net of deposit.

If indeed the average British man, woman or child was carrying a hire purchase debt of about £10 and incurring new hire purchase debt at about the same gross rate a year, that would not be wildly out of line with previous estimates. Nor is the next conclusion surprising. Hire purchase spending does not form a predominant part of consumers' total expenditure (this reached £12,700 million in 1955); but it is a dominant factor in two groups of expenditure on which it is concentrated—motors and household durable goods. The Chancellor is not wasting his time in attempting to control it. Nor will control itself solve his problems.

It is perhaps worth while to plot the British hire purchase debt per head against such figures for other countries as are readily available. The comparison cannot be treated with too much respect because of major differences in the structure of the figures.

The surprise comes in the index figures. Hire purchase through the shops and to a less extent through the finance houses (whose figures are heavily weighted by motors) was already

falling fast before the latest restrictions. came in. Between October and January the retailers' index fell 40 per cent and it fell slightly again in February. In the finance house figures there was a drop of 20 per cent between October and December followed by an approximately equal recovery in January and February. The difficulty in assessing these divergent movements is that a seasonal trend is clearly present but that its shape is not yet known. The provisional guess must be that hire purchase sales of most groups except motors were already heading downwards before the latest restrictions.

FINANCE HOUSES INDEX
Value of credit per calendar month (December 1955 = 100)

	1955			1956	
	Oct.	Nov.	Dec.	Jan.	Feb.*
<i>Hire Purchase Credit Extended</i>					
Private cars—new	111	104	100	117	...
—used	135	111	100	118	...
Commercial vehicles	127	117	100	126	...
Motor cycles, side cars, power assisted cycles	148	114	100	107	...
Caravans	160	118	100	92	...
Farm equipment and tractors	112	105	100	91	...
Industrial and building plant	121	120	100	123	...

All goods (incl. goods not shown above)	125	112	100	114	122

* Provisional.

RETAILERS HIRE PURCHASE INDEX
Weekly value of goods sold (December 1955 = 100)

The retail index is based on total selling prices including the deposit and sometimes the interest charges. It therefore differs from the finance house basis which is net of deposit but inclusive of hire purchase charges. The British figures also differ in basis substantially from most foreign sources.

By Type of Shop	1955			1956	
	Oct.	Nov.	Dec.	Jan.	Feb.
Furniture and furnishings	104	101	100	74	70
Hardware, radio & electrical	135	107	100	62	65
Of which:—					
Radio and electrical	134	105	100	62	64
Department stores	134	118	100	68	61
Total	119	105	100	71	69

Co-operative societies' figures are included only in the total for hardware, radio and electrical goods shops; the nationalised gas and electricity undertakings are included only in the total.

Avro Shackleton

Guardian of the Sea-Lanes

Anti-submarine patrols . . . maritime reconnaissance . . . convoy escort . . . these are the important roles of Coastal Command of the Royal Air Force. They are tough, arduous roles—roles that keep the sea-lanes safe for peaceful shipping: roles that call for rugged strength and high powers of endurance. And that is where the Avro Shackleton Mark 3 comes in. With its four Rolls Royce Griffon engines and its one and a half tons of sensitive search and detection apparatus, this powerful aircraft is now the backbone of Coastal Command which, during the early part of World War 2, relied on the famous Avro Anson for the protection of our sea-borne supplies. Carrying a great variety of bombs, depth charges and mines in its spacious bomb-bay, the Shackleton Mark 3 can carry out long periods of duty in climates that vary from tropical to arctic. Its large comfortable wardroom is fitted with an all-electric galley where pre-cooked meals can be prepared for its crew of ten. Should it be necessary, it can parachute a large, fully-equipped, motor driven lifeboat to the rescue of shipwrecked mariners. For these reasons, the Avro Shackleton Mark 3 is now an integral part of NATO defence plans. Its speed and precision in attack, its low altitude manoeuvrability, its great range and endurance—all these mean more effective day and night protection over vast stretches of ocean.

PULL THE TRIGGER

and shoot down accountancy problems

Manual book-keeping all but fully mechanised! This is the time-and-money-saving boon REMTIMATIC brings to all those accountancy jobs that still have to be done by hand. Only Remington Rand—with all their unmatched experience in developing mechanised accounting systems—could have produced such a revolution in the counting-house.

REMTIMATIC costs less than a typewriter. But . . . as the 'trigger' suggests, it is so simple that a clerk can learn to use it in ten minutes. It handles every kind of accounting from PAYE to cheque writing, from statistical collation to sales analysis, saving up to two-thirds of the manual labour of book-keeping. And, it proves the records. So much so, that a day-by-day check of the accuracy of his work becomes an automatic part of a Remtimatic operator's routine.

REMTIMATIC is merely one of the many modern methods devised by Remington to stream-line the day-by-day efficiency of business operations. The Man from Remington Rand will gladly call upon you to discuss their application to your own problems—without obligation.

THE ECONOMIST, APRIL 21, 1956

World-wide technical collaboration
in electrical engineering development

THE DRIVER-HARRIS ORGANISATION

Close liaison between the companies of the Driver-Harris world-wide organisation is a very real and active policy. It continues to yield an impressive dividend of technical progress.

The liaison is expressed in regular communication and exchange of visits between technologists, a pooling of knowledge on every fresh aspect of wire-drawing technique, and continuous research along parallel lines between the laboratories and manufacturing plants in the United Kingdom, United States, Eire, France, Italy, Austria and Spain.

The result of that collaboration is a succession of advances in the production of nickel-alloy resistance materials of profound importance to all development in the electrical engineering world.

BRITISH DRIVER-HARRIS CO. LTD
MANCHESTER 15

"The greatest name in
electrical resistance materials"

THE ECONOMIST, APRIL 21, 1956

capital market became really tight. These liquid assets are balanced by capital commitments, which for ships under construction or on order come to £21½ million. And these commitments exclude those relating to the tanker programme which will loom large next year and the years after.

Tax on Fortified Ciders

THE new excise duty upon the more potent makes of cider and perry comes as no surprise to the trade. "Fortified" versions of these drinks, such as "Babydam Champagne Perry" and some of the Merrydown ciders, have been selling in considerable quantities since they were first marketed on any scale three or four years ago and the traditional cider makers have not greatly appreciated this particular form of competition. Using somewhat different methods and extra materials, it has been possible to produce more sophisticated ciders and perries with an alcoholic content markedly above the normal 10°-12° proof of cider made by fermentation only, which includes farmhouse rough. These cheaper products have also recently been making some inroads upon other drink markets.

Duty of 10s. 6d. a gallon on still ciders (28s. 6d. on sparkling) will raise the shop price of a normal-sized bottle which sells at 4s. 3d. to about 6s. No doubt this will have some dampening effect upon the rate of future expansion in sales; a reasoned estimate would put present sales at between half a million gallons and three-quarters of a million gallons. This compares with a total cider and perry production of about 19-20 million gallons a year—from presses that send in returns. Ordinary cider made by simple fermentation and sold in bottles under brand names or on draught is not affected by the duty and specific provisions have been made to exclude it even if fermentation should occasionally raise its alcoholic content above the dutiable 15° proof.

Fall in Metals

THE non-ferrous metals are at last bowing to disinflation. Prices of all four on the London Metal Exchange are now at just about the lowest levels reached this year. Copper, which soared to a new peak of £437 a ton for cash early in March, has dropped by over £70 a ton, and is well below the fixed price of £385 a ton charged by the Rhodesian Selection Trust companies. In the past month tin has dropped fairly steadily by about £60 to £763 a ton for cash metal. Lead has fallen by nearly £9 a ton in the same period; the current price of £113 10s. a ton for prompt lead is so close to the American price of 16 cents a lb that a further fall in London could divert shipments to the United States and perhaps lead to a fall in the American price. Zinc, too, has dropped by over £5 since the middle of March to about £98 a ton for prompt metal. Warehouse stocks of all metals save lead have risen (though stocks of zinc are still small), and the premium for spot supplies has

297

accordingly declined. The credit squeeze here and abroad cannot take all the credit for the fall in metal prices. All four owed part of their strength not only to buoyant world consumption but to temporary shortages, or the threat of shortages, owing to strikes. Those troubles are past; con-

NON-FERROUS METALS PRICES
(£ per ton)

	Jan. 4, 1955	Jan. 2, 1956	April 3, 1956	April 19, 1956
Copper, cash.....	299	396	398	364
Tin, cash.....	693	834	785	763
Lead, prompt.....	106	121	120	113½
Zinc, prompt.....	85	102	99	98

sumers' demands have been trimmed by dearer money, and trading is temporarily slack. How many consumers dare to buy on a falling market?

Railway Investment this Year

THE report issued last week by the Transport Commission on the progress of the railway modernisation programme makes it quite clear that improvement of the freight services comes first on the Commission's present list of priorities. Dieselisation and electrification of main-line routes must first wait for the pilot batch of diesel locomotives to be tried out in normal operation and for a considerable amount of route electrification to be done. The first of these main-line diesels should be coming in next year; and some work will start this year on the electrification of certain London suburban routes, the remaining steam lines in the Southern Region, and on the Manchester-Crewe section of the London-Merseyside route. Other work to improve signalling and some passenger stations will start soon; £26 million will be spent in the next two years on new passenger coaches and another £25 million on building diesel train units and their maintenance sheds. There has been a marked improvement in traffic where these diesel trains have already been introduced on passenger services.

But well over half of the new investment—which despite the government's cuts will this year be about double the £45 million spent in 1953—has been earmarked for new freight wagons, marshalling yards, and goods depots. About 70,000 wagons are to be built in 1956. This is more than a quarter of the total for the whole fifteen years; it will mean much less work for outside contractors in a few years' time, but the Commission plainly needs the new wagons now rather than later. The latest batch of orders consists mainly of 21-ton coal hopper wagons (it also includes one 40-ton armour plate wagon). The 24½-ton coal wagon, on which the Commission intends eventually to standardise, is to await an expansion of terminal handling facilities able to take it. And now that the Commission has decided to use vacuum instead of air brakes on its rolling stock, a start will be made next year on fitting these continuous brakes to the existing stock of wagons.

De Havilland's Rising Star

THE profits of de Havilland have swung in the space of a year from a loss of £1.3 million to a surplus of £2.6 million, and after a year's lapse, the group has started paying dividends again—of 5 per cent on its ordinary shares. These buoyant results owe nothing to the Comet, but possibly a great deal to the lightening, with the help of the Ministry of Supply, of the heavy shadow that the Comet cast across the company's financial prospects. There were two sources of earnings. One is the steady bread-and-butter trade in small civil aircraft like Doves and Herons, of which 500 and 106 respectively have been sold to date or 108 now that the Queen's Flight is to add two extra Herons to its strength; and a large business in Vampire trainers, which are used by 20 air forces. Since these are fully equipped with guns and can drop bombs, small air forces buy them as a portmanteau fighter-bomber-trainer; they are, indeed, the only relatively cheap jet fighters left in production, costing less than half the price of a modern Hunter. The second source of earnings was provided by the engine and propeller companies of the group. The former is supplying engine replacements in large numbers for de Havilland fighters, and the latter builds the airscrews for many of the piston and turbo-prop engines in production in this country, including those for the Britannia. Export sales in particular earn a high rate of profit, and after payment of taxes, the group had a net surplus of £958,575 compared with a loss for the previous year of £663,415. Out of this surplus, £252,163 has been absorbed by the net dividend.

The Bill for the Comet

AT the end of September, 1954, de Havilland's stock and work in progress, after the deduction of progress payments by customers for aircraft on order (these payments included £5.3 million from BOAC) stood at nearly £24 million. Nearly £6 million of this represented Comets in various stages of completion, but in addition the company wrote off a further £4.7 million of Comets as a total loss. It was in a situation of heavy financial strain. On the last day of March, 1955, shortly after the Court of Inquiry had published its report on the Comet disasters, the Ministry of Supply gave de Havilland a cheque for £6½ million, as an advance payment towards the purchase of five Comet Is and 18 Comet IIs, some of which had been built and put into service, some of which were part finished and none of which, following the report, had any further use as civil airliners. The total bill to the Ministry is likely to be between £10 and £11 million. These aircraft have not yet been handed over, but the Ministry's £6½ million payment has gone to reduce the company's outstanding liabilities in relation to the great volume of work in hand with which it found itself at the end of the previous financial year.

The Comptroller and Auditor-General, Sir Frank Tribe, has been rather critical of these arrangements. In his recent report on the Civil Appropriations Accounts, 1954-55, he

questioned whether the Ministry should have agreed to pay as much as it did for stripped airframes and for aircraft that no longer had any market value. The Ministry told him that the Comets did have a certain value, if only as test specimens for further research. But the crux of the Ministry's case lies in the phrase that it decided against "taking advantage of the company's vulnerable position to drive the hardest possible bargains, for to have done otherwise would have been inconsistent with the purpose of these arrangements." How vulnerable the company was in March 1955, only the accountants and the Ministry will ever know. It had sunk a great deal more of its own funds in the Comet project than it will get back from the Ministry; it had to buy back from BOAC the remainder of the corporation's fleet of Comet Is at a cost of probably around £1 million; customers like Air France were demanding £2 million compensation for the grounding of Comet fleets (the airline is still waiting for its money while government negotiations drag on). The Ministry of Supply acted quickly to save the company from its worst immediate embarrassments. Who can say that the decision was wrong when other manufacturers have consumed far more public money for smaller results?

Comic Opera in HP Finance

GILBERTIAN moves, counter-moves, sallies and broadsides have characterised the attempts of the past few weeks to form a new association for hire-purchase finance companies. Elaborate rules and regulations have been drawn up for organisations without members, groups have splintered, reconciliations have taken place, all to the tune of press communiqués worthy—well, almost worthy—of a diplomatic conference.

Through the fog that these activities have succeeded in creating, the shape of events is still not clear. The attempt to form a new association was started by a number of middle-sized finance companies that are still not large enough to be accepted into the Finance Houses Association, which caters for the nationally operating institutions. Early this year, a small steering committee was set up consisting of members of Equity Credit, Campbell Discount, GNC Finance, and Belmont Finance. This committee proposed the establishment of a company entitled the Industrial Bankers Association. However, an attempt by another finance company, Gwent and West of England Enterprises, to register an association under this name had been turned down by the Board of Trade; and Gwent thenceforward changed the name of its protégé to the Association of Industrial Finance Companies, which has been duly registered as a limited company.

The London finance companies, however, were reluctant to drop the coveted word "banker" from the title of their organisation. But now they appear to have bowed to reason and agreed to come in under the registered title. That is in itself something of a euphemism, since number of the companies that are likely to join deal mainly or exclusively with the finance of consumer goods. The criterion of membership of the association is apparent that members' principal activity is hire-purchase finance. Certainly, it will be to the good if an association is estab-

MORE POWER AT LOWER COST

To add power to an existing diesel installation the simplest and most efficient way is to fit a Napier Turbo-Blower. On a 2-stroke engine power output goes up by more than 50%. A 4-stroke diesel fitted with a Turbo-Blower develops as much power as two similar, but unblown, diesels. And both power gains are made at a lower specific fuel consumption.

The Turbo-Blower is a good example of the Napier principle: more power at lower cost.

A SHIPOWNER TAKES STOCK

SIR WILLIAM C. CURRIE, G.B.E.,
Chairman of the Peninsular and Oriental Steam Navigation Company
discusses the

SHIPPING AND TRAVEL AGENT —man of many parts

Who else but your Shipping and Travel Agent can reduce for you the rival claims of a hundred different means of transport—by sea, by air, by road, by rail, to a workaday choice between suitable alternatives? Who else can give you an expert and unbiased view of what will best suit your needs? The Shipping and Travel Agent stands at the crossroads of world trade—a man of many parts. He will send your machinery to Pakistan, your sugar to Suez, your cars to Colombo, your wool to Bradford. He will send your family to the seaside, or your wife and you for a round voyage to Japan, with apparently equal ease. He is the man who "knows the ropes", saving your time, temper and trouble on every transport job.

In quite a different way Travel Agents are essential to us too. They provide us with a complete network of offices which put our services and many others before their clients. They form an essential bridge between the users, who want to buy transport, and the producers, who want to sell it. And they are well informed critics. They can tell us where we fall short. They can help us to offer you what you want. In fact, they form our unofficial "Consumers' Council", which we suspect is more effective than many.

We of the P & O Group gladly acknowledge their essential help in the considerable task of transporting millions of tons of cargo and thousands of passengers across the seas, year in, year out.

ISSUED ON BEHALF OF THE P & O GROUP
OF COMPANIES AT 122, LEADENHALL STREET,
IN THE CITY OF LONDON.

EXTRUSION

lished to lay down proper standards of conduct and liquidity for the many hundred small companies that engage in hire-purchase finance. But it is to be hoped that the organisers will henceforth show a surer touch.

Vauxhall Looks to 1958

"WHILST 1956 may in many ways be a difficult year, there is every reason to be optimistic about the long term future of the British motor industry." This sentence in full report of Vauxhall Motors for 1955 is the key to the decision to speed up the £36 million expansion programme, announced in September, 1954, and originally planned as a five years scheme. It will now be completed in 1958. The programme is well up to schedule; over £9 million was spent on fixed assets last year and contracts of £11 million for buildings and of £12 million for machinery and equipment have been placed. About half the cost of the scheme will be financed either by the private placing of loan stocks in this country or by loans from General Motors. At the end of last December Vauxhall had received about £10.8 million from these loans and at the end of March a further £5.6 million on the 5½ per cent loan stock had been received and Vauxhall had made arrangements to borrow a further \$3½ million at 5½ per cent from General Motors.

The directors of Vauxhall Motors can look back with some satisfaction at the increase in home sales from 60,182 to 66,078 vehicles and in exports from 70,769 to 76,071 vehicles last year. But, like the other motor manufacturers, they are worried by the rise in costs. The value of sales

rose by about 13 per cent, from £66½ million to £75 million, but profits before tax declined by about 13 per cent and earnings after tax by about 5 per cent, from £6,861,628 to

SALES AND PROFITS (£'000s)

	Years to December 31	
	1954	1955
Sales.....	66,631	75,113
Materials, etc.....	41,954	49,873
Wages and salaries.....	8,954	10,656
Pensions, etc.....	1,854	1,864
Depreciation.....	1,511	1,909
Taxation.....	5,571	4,282
Loan interest, etc.....	121	515
Net earnings.....	6,862	6,542

£6,542,467. The ratio of net profits to net sales fell from 10.3 to 8.7 per cent. This year may produce even more discouraging figures, but the eyes of the Vauxhall directors are on 1958 and the years after.

Speeding

40?

THE London and Home Counties Transport Committee which has seen too many of its reports quietly filed away in the Ministry of Transport treads cautiously in its latest report, on the 30 mph speed limit in built up areas. It was asked at the end of 1954 to review the inci-

New Power—but not for Cars?

A "FREE PISTON" engine, shown in the diagram in simplified form, is essentially a method of producing gas to drive a turbine. It consists of an inner cylinder containing two diesel pistons, which are driven apart by the combustion of fuel injected into the space between them. Fixed to the inner pistons are two larger compressor pistons, which work in outer cylinders the ends of which are sealed. When the inner pistons are driven apart air is compressed in the outer cylinders, forming a cushion from which the pistons rebound, compressing in turn the air in the inner cylinder ready for the next firing stroke. The exhaust from the combustion space is driven first to the gas collector and then direct to the turbine blades.

Exclusive rights, for the British Commonwealth and Egypt, to the free piston engine invented by Count Pescara were acquired by the British engineering development company, Alan Muntz & Co., Ltd.; a Swiss company and its French manufacturing associate hold the rights for the rest of the world. General Motors, which acquired over two years ago access to the work of the British and

French companies, together with prototypes of the engines they had developed, has an option to take up sub-licences to manufacture from them by next August. It has been working on a twin-cylinder model, containing two pairs of horizontally-opposed pistons, in contrast to the British and the French single cylinder engines.

In spite of General Motors' publicity and recent work by Renault on a small engine, it is still doubtful whether the free piston gas generator will ever be economic in small cars. But for heavier transport, such as lorries and earth-moving equipment, especially if a cheap fuel can be used, it may have advantages over other engines. Progress has been

Adapted from chart drawn by Associated British Engineering, Ltd.

most rapid in the fields of electrical generating and other industrial plant, ship propulsion and locomotive traction.

Xmas 6. MUSE

dence of this speed limit in London and to suggest whether different limits should be imposed on the main traffic routes in the area. On the whole it finds the present system of restriction satisfactory. It made one interim recommendation, which has since been inserted in the Road Traffic Bill, to remove a glaring anomaly in the way the restriction has been working. Since 1935 the erection of street lighting has automatically extended the speed limit, lighting being the original sole criterion for defining a built up area. This has not helped to increase the respect with which the speed limit is held so the committee suggested that trunk and classified roads should in future be excluded.

The introduction of different speed limits on major routes is a much more controversial issue and the committee has had to pick a path through the opposing arguments of the police, the Road Research Laboratory, and most local authorities who were in favour of a different and higher limit, and an unholy alliance formed by the organisations of road users who for different reasons were against any change. The committee itself split, with a minority of four arguing that the new 40 mph limit the majority recommended would probably be applied mainly to roads at present free of restriction and suggesting instead that a limit of 45 mph be first tried out as a small-scale experiment. The majority thought that the question of enforcement was the crucial factor, and were probably right to do so. Traffic flow would be improved if the new limit is properly applied and the antiquated vehicle speed limits are brought into line with present standards of bus and lorry design; and on the committee's modest list of roads at least there should be no loss in safety. As a first step the committee's proposals should be useful in making better use of parts of the present road system; some of the more attractive features of the American methods of fixing differential traffic and lane speeds can be looked at again later. But the danger of the committee's proposal lies in the obvious temptation to use different speed limits on some bad roads instead of improving them.

TV's Audience

OF all the organisations now so busily measuring the nightly size of television audiences, the BBC has the longest and the widest experience and in a paper presented on Wednesday to the Royal Statistical Society, Mr B. P. Emmet summarised the collated findings of three separate BBC investigations into the size and nature of the television audience in this country. His findings were not accepted by the audience quite without question, but they should cheer both the programme contractors of the Independent Television Authority and the hard-hit radio industry, for he traces a remarkably steady rate of growth of between 6 and 8 per cent per year in the size of television audiences in district after district where transmissions have been started. In the nine years since the service reopened in 1947, the audience has grown from 80,000 to 15 million, 40 per cent of the adult population, and from the present evidence, Mr Emmet considers it certain that by 1960, three-quarters of the adult population will have television in their homes.

The television audience gives a fairer cross-section of the population now than it did a few years ago. Families

with incomes of £10 a week and under make up a steadily rising proportion of the total audience. By the end of 1954, they accounted for 59 per cent of the adults with television while when the service started, nearly half the viewers were in families with incomes of £15 and over, the advertisers' "Class I" public. This, and the fact that it is the larger families that own sets, is of some significance to advertisers. Mr Emmet believes that, so far as employment is concerned, more than 60 per cent of the audience falls into the skilled category; the semi-skilled, the unskilled and the unclassifiable make up 31 per cent, with the professionals and executives, 8.4 per cent. The higher the level of education, the greater the sales resistance seems to be to television—or the greater the call of other expenditure.

The maximum size of the television audience seems to average about 40 per cent of the possible total in the evening, after 6 pm, and about 10 per cent during the day. During any evening, from 60 to 80 per cent of the potential audience see some programme or other, and they watch about two programmes out of every five. With 15 million potential viewers, the sheer size of the audience week in, week out, is staggering.

The coming of independent television has made little difference to this pattern; it has merely given confirmed viewers a choice of programme. Mr Emmet puts the size of the commercial audience in London at the end of 1955 at about 1.4 million, or 32 per cent of the television public in the London area, not all of whom were within range of ITA transmissions. By the end of the year, ITA seemed to have 51 per cent of actual viewers, compared with only 46 per cent when its services started in the autumn. Mr Emmet gives no views on how this trend will develop but he does suggest that the immense appetite for viewing will become satiated—a little. The longer a family has owned a set, the less its members watch. Although the television audience will grow and grow in total size, in Mr Emmet's personal opinion, the average amount of viewing that goes on may well drop from the present average of 40 per cent of the audience any evening to somewhere nearer 25 to 30 per cent.

Return of Lend-Lease Silver

THE Treasury announced last week that a start has been made on the physical return to the United States of the silver that was sent to the United Kingdom during the war under lend-lease arrangements. The total involved was 88 million ounces. Silver throughout was kept on a different footing from the other lend-lease operations; in particular, specific provision was made for the silver to be returned in kind to the United States within five years of the official termination of hostilities. For the United States this date was the signing of the peace treaty with Japan in April, 1952, so that all the lend-lease silver is due to be returned by April, 1957.

The silver received under lend-lease was used mainly for wartime industrial purposes such as the manufacture of photographic film and the wiring and soldering of special equipment. In most of these uses the silver was irretrievably lost in usage. To repay the loan in kind the British government has had to extract it from the coinage, recalling the

The case of *Odontotermes obesus* . . .

In Pakistan, groundnuts have considerable potential value as a cash crop — provided that they can be protected from the attacks of the termite *O. obesus*.

Termites are subterranean pests which normally feed on dead plant tissues but, once they have invaded cultivated ground where vegetable debris from previous crops is always plentiful, they soon augment their diet from the growing crop. Groundnuts, because the tips of the shoots enter the soil to bury the seed are particularly liable to attack.

In 1954, following the destruction of 200 acres of groundnuts on a single farm, the Shell insecticide aldrin was used for termite control. The result was a bumper

harvest with yields up ten times in the irrigated areas and up six times without irrigation. Germination was 99% throughout, against 20-30% in the untreated plot which was retained for check purposes.

Since this demonstration of its effectiveness as a soil insecticide, aldrin has come into general use and, at 1 lb. per acre, is giving complete protection from termites to Pakistan's valuable groundnut production.

Aldrin, dieldrin, endrin . . . these three advanced insecticides developed by Shell are complementary to each other. Between them they control most of the major insect pests which menace agricultural production and public health throughout the world. Have you an urgent pest problem in your area?

aldrin

aldrin, dieldrin and endrin are

insecticides for world-wide use

silver coins and replacing them by cupro-nickel. The task of melting and refining this silver coinage has presented the Mint with tremendous technical problems. Most of the coin that was called in was of post-1920 issue and consisted of 50 per cent silver. The task, however, is nearly finished and the silver has been refined into the customary thousand-ounce bars. The value of the silver being returned to the United States would at current prices be about £29 million. The United Kingdom is by no means the main silver debtor of the United States. India and Pakistan between them have to return under the same conditions about 226 million ounces of silver. This task was also the main factor in inducing both countries to recall their silver rupee coins from circulation, replacing them with almost pure nickel coinage.

Tired Pilots

A NUMBER of investigations into accidents to civil aircraft have been attributed to tiredness on the part of the pilot that blurred his judgment at a critical moment. The pilot's skill is, perhaps unfortunately, put to its most severe and exacting test right at the end of a flight, when he brings the aircraft in to land. This makes the number of hours that a pilot can be on duty, and still keep his reactions thoroughly alert and fresh, a matter of sharp concern to the airlines, the pilots and, not least, their passengers. In the United States and a number of other countries this is defined by legislation. In Britain it is not, and the Ministry of Transport has spent some time in preparing draft legislation to meet the criticisms about flying hours that have been made in the course of some accident inquiries.

Last week the British Airline Pilots' Association published in its journal criticisms of the draft that had been circulated privately by the Ministry to the parties affected by it. The limits proposed by the Ministry are wider than those in force in the United States, and provide in some cases for longer hours of duty than are worked today on certain routes. Very roughly, they would allow a pilot to fly not more than 1,000 hours a year, or 120 hours every 30 days: the maximum period allowed on duty is about 16 hours. The pilots' association would like to see much more specific regulations that would distinguish between day and night flying, between aircraft whose crew is made up of two pilots alone and those that carry also engineers, navigators and radio operators. The draft regulations for long journeys satisfy the pilots' association, but the draft shows no recognition that greater strain may be imposed on crews flying short journeys to and from Europe with frequent take-off and landing, probably during bad weather, in the same duty period that long-range crews are passing peacefully across the Atlantic with their automatic pilots. Medical evidence is not at all clear about the onset of fatigue, nor is it an easy matter for the individual himself to judge. This is not a question that should be left to arbitration like any other dispute about working conditions. Appearances suggest that the draft is now undergoing modification; the final Bill is unlikely to be tabled before the autumn.

Chilean Peso Goes Free

CHILE is the latest South American country to turn its back on multiple exchange rates bolstered by complex import licensing regulations, and to take the plunge into a multilateral system. The change is not being made to a fixed parity but rather to a free exchange system. This new system came into force last Monday, and compared with the previous official exchange rate of 110 pesos to the US dollar and the corresponding rate of 308 pesos to the £. As a result the free exchange rate has been quoted at about 500 to the dollar and 1,400 to the pound. The new arrangements have the blessing of the International Monetary Fund, in whose eyes the virtues of Chile's rejection of the former complex of multiple rates clearly outweigh the disadvantages of a fluctuating exchange rate. The approval of the IMF has been marked by granting to Chile a one-year standby credit under which Chile will have the right without further question to purchase up to the equivalent of \$35 million in currencies from the Fund. In addition the Chilean government has made arrangements for stabilisation credits of \$30 million with private banks in the United States and a further exchange agreement with the US Treasury involving total drawing facilities of \$10 million. The plunge into freedom is thus made with a fair cushion of reserves which the Central Bank of Chile can use if need be to intervene in the market and thus avoid excessive variations in the rate of exchange.

Chile's currency reform is another feather in the cap of the American firm of economic consultants—Messrs Klein and Saks—who were responsible for the Peruvian currency reform of 1949-50. Their report, on which the Chilean reform has been based, involves credit restriction stringent enough to restrain the demand for imports. It will be supplemented by severe specific restrictions, cutting imports down to a list of essential food and manufactured goods. The new rate of exchange is at the same time expected to stimulate exports. The readiness of the Chilean Government to accept the draconian programme set out for them by independent consultants reflects the serious inflation of which it has indulged and its pressing need for reserves.

Cocoa Rallies

UNTIL recently it seemed that cocoa prices could move only downwards. But a short-lived rally has occurred this month. The earlier fall in prices was accentuated by the difficulties of some French firms that had been over-trading. Dealers were affected particularly in London, and had to protect themselves by making substantial sales elsewhere. Accra cocoa dropped to 182s. 6d. a cwt. for April-June shipment, the lowest level for six years. Then some speculators in New York turned bullish, helped by unfavourable reports—later denied—of the temporary crop in Brazil. Prices rose and London dealers, who were evidently over-sold, covered their sales. That helped to push prices higher, and in just over a week cocoa rose 30s. a cwt. Now the market has weakened again, and Accra cocoa for April-June shipment is back to about 200s. a cwt. Quite large quantities have been bought this month, by manufacturers

as well as by dealers. The British West African marketing boards alone sold about 30,000 tons in the first three weeks of April; that brings their sales this season to 285,000 tons and leaves only about 50,000 tons of the current crops unsold.

Though world consumption of cocoa is responding to lower prices, the response is slower than most people had expected. Conversely, world production is higher than was expected, and well above the current rate of con-

sumption. Hence cocoa's troubles are not yet over. A reminder of what falling prices can mean to consumers as well as to producers came recently from Joseph Terry & Sons, Ltd., the chocolate manufacturers. The trading profit for 1955 fell sharply from £702,000 to £371,000 owing mainly to the writing down of stocks, and the final ordinary dividend has been cut from 15 to 10 per cent, making 15 per cent for the year.

SHORTER NOTE

The long silence of the oil companies since the Motor Accessories Manufacturers' Association was formed in January reviving the controversy about tied garages was broken last week by a policy statement from Shell-Mex and BP Ltd. Amongst other matters, the company stated that it had no intention of restricting sales of tyres, batteries, and accessories on the stations it owned or supplied.

its share of the money needed for the first two stages of development. About \$42 million will be raised by borrowing in Canada and the other \$30 million will come from subscriptions for the ordinary shares of Canadian British Aluminium by two parent companies.

British Aluminium will have to find about £7 million for the first stages of the project. It has arranged, with the consent of the Treasury, to borrow about £3 million from British banks; these loans will run for between three and five years, but within this time it is hoped to fund them, probably by issuing loan capital. The remaining £4 million will be raised by a rights issue of about 2 million ordinary shares. The details are still to come. The existing £1 stock units are quoted at 53s. 9d. to yield 4½ per cent. With more ordinary capital and either bank loans or a loan stock to service, dividends are likely to be conservative. But aluminium is a metal with a bright future.

SEARS HOLDINGS. Since his bid for the ordinary shares of J. Sears (True-form) Boot, perhaps his most famous take-over bid, Mr Charles Clore seems to have kept two objectives in mind—to extend his empire into a miscellaneous collection of enterprises and to be more generous with dividends.

For 1955 the dividend on the ordinary and "A" ordinary shares is 20 per cent, absorbing £415,000 from available earnings of £1,476,000. But that is not the end, for Sears Holdings is to make a 50 per cent free issue and the directors "hope at least to be able to maintain" the dividend of 20 per cent on the increased capital. In looking this far ahead, Mr Clore justifies the policy by saying that the directors always aim at striking a "fair balance" between dividends and profit retentions. Moreover, he points out that the cost of the additional dividend payment will be less than the £298,453 which had to be deducted from earnings in 1955 as they represented pre-acquisition profits of Bentley Engineering.

On the growth of his industrial empire,

Mr Clore can let the profit record speak for itself:

	1954	1955
Gross profits:		
Footwear group.....	996,000	1,501,000
Bentley group.....	1,734,000	1,952,000
Furness group.....	486,000	844,000
Total.....	3,216,000	4,297,000

In commenting on these figures, Mr Clore says that sales in the group's footwear shops rose by more than the national average and that the group began to receive some of the benefits from carrying "improved merchandise" and from the programme of modernising the shops. Within the Bentley group, engaged primarily in the production of hosiery knitting machines, Mr Clore hopes that the rationalisation of production will enable the group to continue to earn good profits. The Furness group, the ship-building concern, has its yards fully booked for several years ahead. Sears Holdings also acquired in 1955 the retail footwear business of Phillips Brothers Character Shoes and since the end of the financial year has acquired the share capital of Parmeko, manufacturers of transformers for the electronics and electrical industries.

WAN HUNTER AND WIGHAM RICHARDSON.

Next to the effective increase in the ordinary dividend from 12 to 14 per cent the most important change in the 1955 accounts of Swan Hunter and Wigham Richardson, the Tyneside shipbuilders, is the increase in expenditure on work in progress from £13.3 million to £17.3 million. Instalments received on account of that work also went up, from £12.2 million to £15.9 million. These figures show how fully employed Swan Hunter's shipbuilding yards were last year, even though profits remained almost unchanged at just over £3 million.

The company's yards have enough work under construction and on order to keep them fully employed for the next three years. But the chairman, Mr J. W. Elliott, is concerned about the re-emerging

shortage of steel, which may, he fears, "lead to a slowing up of the programme of new work, or at least to being unable to take full advantage of the reconstruction and re-equipment now under way designed to increase production." The reconstruction programme is making "steady progress," but at the Tyne works alone a further £3 million will have to be spent. The directors of Swan Hunter hope to be able to finance all the capital developments out of the group's own funds. At 55s. xd. the £1 ordinary stock units yield 5.2 per cent.

THOMAS TILLING. The decision of the directors of Thomas Tilling to leave the ordinary dividend at 10 per cent has already been discussed. It is still not clear from the full accounts how much of the increase in the consolidated trading surplus (from £1,357,694 to £2,179,015) is due to the bringing of earnings of recently acquired subsidiaries into account. In the parent company's balance sheet shares at cost of subsidiary companies have risen from £3,901,284 to £6,543,509. A new item appears in the consolidated balance sheet; it is £3,769,346, representing hire purchase debtors of the new subsidiary, Mutual Finance, which specialises in hire purchase finance on vehicles, plant, machinery and machine tools.

In his review Mr Lionel Fraser, the merchant banker who is chairman of this industrial and commercial holding company, deals with each of the subsidiary and associate companies. He mentions that James A. Jobling, the makers of "Pyrex" glassware, was able to secure an increase in sales and profits and that new extensions are planned. Mutual Finance, too, enjoyed a good year, but it is now under the shadow of the restrictions on hire purchase. Mr Fraser also expects "leaner years" for Cornhill Insurance. His final summing up is that "the prospects in the great majority of the companies appear distinctly encouraging, but these appearances may in the short term be upset by the battle against inflation." At 42s. 6d. xd. the £1 units yield 4.7 per cent—the yield of a growth stock.

LONDON STOCK EXCHANGE

Next Account begins: May 2nd

Next Contango Day: May 2nd

Next Settlement Day: April 24th

BOTH gilt-edged securities and industrial shares rose in anticipation of the Budget. The March trade figures assisted a steady rise towards the close of last week and in a more active market on Monday, immediately preceding the Budget, the pace of the advance increased. Further gains followed the Budget and by Wednesday's close the *Financial Times* index of ordinary shares had risen to 191.7—a gain of 7.8 over the week. Short-dated British Funds continued to lead the improvement in the gilt-edged market.

Large gains were made by insurance stocks. These rises following on the gains last week brought Pearl to 23½ while Legal and General rose to 26. Royal Exchange touched 7½ following the dividend but Guardian lost 1½ to 11½ on the announcement of the dividend. Following the Budget Associated Portland Cement gained 4s. 3d. to 108s. 6d. and London Brick 2s. 3d. to 61s. 3d. Paint manufacturers improved on Friday after the results of British Paints had been disclosed. British Paints rose 9d. over the week to 14s. 9d., Pinchin Johnson gained 2s. 6d. to 25s. and Jenson & Nicholson 1s. to 15s. 9d. Reyrolle was again prominent in a revival among electrical stocks with a rise to 106s. Stores responded to the Budget with a general improvement. GUS "A" gained 2s. 3d. on the week to 39s.; Marks & Spencer "A" reached 67s. 1½d. and Woolworth 61s. Clarke Chapman gained 5s. 6d. on Wednesday to 103s. and steel shares improved.

Oil shares were again the greatest attraction in the market. Interest was maintained through to Thursday when Shell reached 156s. 6d. xd. British Petroleum gained 12s. 6d. on the week to 126s. 10½d. and Burmah 9s. 4½d. to 81s. 3d. Kaffirs remained quiet throughout the week but some gains occurred on Wednesday; Free State Geduld improved ½ to 3½. Coppers eased on the lower price of the commodity, but Consolidated Zinc rose 1s. 3d. to 55s.

Company Notes

BRITISH INSULATED CABLES.

The increase in the ordinary dividend of British Insulated Cables from 10 to 12½ per cent was forecast when the company made a rights issue of ordinary shares in October. Hence it was not the news that this promise had been kept by the declaration of a final payment of 8½ per cent which sent the price of the £1 ordinary stock units up by 1s. 6d. to 54s. 6d. (to yield about 4.6 per cent). This increase reflected satisfaction with the profits in the preliminary statement for the year to December 31st. The group's trading profit has jumped from £7,379,205 to £11,852,852 and despite a much bigger charge for taxation (up from £2,736,162 to £4,839,058) net profits have risen from £3,206,454 to £5,128,161. The net ordinary dividend absorbs only £1,017,175 from this profit and there is thus a good margin of earnings in the leading company of an industry where profits can swing widely.

VICKERS. The bigger dividend and higher profits of Vickers sent the company's £1 ordinary stock units up by 2s. 6d. to 41s. 6d. The rise was justified. By declaring a final dividend of 7½ per cent, the directors have set the total ordinary dividend for 1955 at 10 per cent on a capital of £29,227,244. In 1954 an interim dividend of 2½ per cent on a capital of £24,630,968 was followed by a final payment of 6 per cent on a capital of £27,709,839, as increased by a rights issue. The ordinary capital was raised to its present level in 1955 by the issue of a further £1,517,405 of shares for the acquisition of more shares in Power-Samas Accounting Machines. On the new dividend the £1 units yield 4.8 per cent.

This yield looks forward. But confidence about future earnings of Vickers, from its wide field of activities in the

armament, shipbuilding, aircraft, steel and engineering industries, must have been reinforced by the good showing of profits last year. The group's net surplus after tax rose from £3,307,427 to £5,597,696 and profits before tax from £7,399,158 to £11,536,072. In 1954 the figures included the profits of English Steel for about six months and those of Oldings (Hatfield) for about nine months. Profits earned in a full year by these subsidiaries will be included in the latest results and must account for part, but only part, of the increase in earnings.

BRITISH ALUMINIUM. The interest of investors will be concentrated more on the pending rights issue of British Aluminium than on the details of its full report. But they should note that in 1955 trading profits jumped from £1,999,633 to £3,248,463 and net profits from £611,252 to £1,165,296. The value of stocks went up from £6,003,929 to £9,147,598, but the group still retained over £1,650,000 in cash. The ordinary dividend was left unchanged at 12 per cent, because perhaps of the forthcoming rights issue with its promise of more capital to service and of the costly developments that lie still further ahead.

The rights issue of ordinary shares springs from the directors' decision that British Aluminium should be assured of more of its primary metal supplies from within its own organisation. In partnership with the Quebec North Shore Paper Company, British Aluminium has incorporated a new subsidiary, Canadian British Aluminium, in Quebec. This company will build a smelter to be developed in four stages each of a capacity of 400,000 tons a year. The first two stages, costing about \$72 million, will be completed by the autumn of 1959 and the final two, costing about \$57 million, by 1965. British Aluminium's immediate concern is to raise

(¹) Relates to wholesale prices in Athens and Piraeus only for Greece. Figures for Ireland are based on January, 1952-100. (²) July-December. (³) Relates to prices in capital cities only for Austria, France, Greece and Turkey. Belgium excludes rent. Denmark includes direct taxes. Figures for Ireland are based on August, 1955-100. (⁴) Excluding rent. (⁵) Including direct taxes. (⁶) Index numbers of unit value which compare the current average value of trade with its value in 1953; they are influenced by changes in the composition of trade as well as price movements. (⁷) Deposit money and notes and coin held by business, individuals and foreigners. Except for Greece holdings of the issuing authority and other banks are excluded. (⁸) Holdings of the government and central bank at end of period; figures for Greece are gold reserves only. (⁹) Beginning May, 1954, a new drachma equal to 1,000 old drachmas introduced. (¹⁰) Including some long-term securities. (¹¹) Average for third quarter.

Financial Statistics

EXCHEQUER RETURNS

For the week ended April 14th, 1956, there was an "above-line" deficit (after allowing for Sinking Funds) of £30,379,000 compared with a surplus of £6,212,000 in the previous week and a deficit of £40,357,000 in the corresponding period of last year. Net receipts "below-line" reached £11,173,000, bringing the total cumulative deficit to £19,206,000 (£36,356,000 in 1955-56).

THE MONEY MARKET

The discount market was "in" the Bank on Thursday and Friday before the week-end, though only one or two houses were affected and the amounts involved were very small. On the first three days of this week credit conditions turned comfortable, owing partly to substantial official disbursements. On Monday funds were actually in excessive supply, and the Bank operated "in reverse" by selling bills. Even on Wednesday, the make-up day for the clearing banks, market supplies of credit were still easily adequate. Dealings in bills have been considerable; the prevailing rate has been around 5 per cent, but some May maturities have changed hands at 4½ per cent.

Despite the momentary stringency in credit supplies, and despite the increase in the re-discount rates of the Federal Reserve Banks, the discount houses raised their bid by 3d. to £98 14s. 5d. per cent at the Treasury bill tender on Friday last. This involved a reduction of approximately 3/64 per cent in their discount rate, to 5½ per cent. The action was prompted by the sharp fall in the amount of bills on offer, from £280 million to £240 million; and as total applications dropped by £27 million to £281.3 million, the market succeeded in raising its allotment from 58 to 60 per cent. At yesterday's tender the offer was cut by a further £10 million.

The Bank return shows a further post-Easter reflux of notes, of £8.0 million.

What does
THE LONDON
CORRESPONDENT
say today?

IN TO-DAY'S TRAFFIC, a step off the pavement is too often a step into hospital. That's why every walker—and aren't we all?—should carry a London Assurance Personal Accident Policy in his knapsack. He won't have to worry about loss of earnings and medical expenses—and he doesn't throw a financial spanner in the family works.

OPEN FIRE!

You never know when a red-hot coal may shoot out on to your carpet; fires have such an unhappy knack of spitting behind one's back. But with our Householders Comprehensive Policy, the accident will not burn a hole in your pocket.

LOOK FORWARD TO IT.

Old age seems a long way off—until you get there. After a lifetime's labours, it's good to

know you can start your new life on your own two feet. A regular investment in one of our Retirement Policies helps you to look forward to your retirement with equanimity and aplomb.

★ ★ ★
These are three policies from a wide selection. Should you want to know more about us, our other policies, or insurance problems generally, our address is 1, King William Street, Dept. 6, London, E.C.4.

COMPANY MEETINGS

NATIONAL PROVIDENT INSTITUTION

IMPROVED INVESTMENT YIELD

INCREASED INTERIM BONUSES

The One Hundred and Twentieth Annual Meeting of the National Provident Institution was held on April 17th at 48, Gracechurch Street, London, E.C.

The following is an extract from the address which was submitted by the chairman, Mr L. E. D. Bevan:

Before I refer to our business activities during the year I wish to comment upon the resignation from the Board of Mr Vincent Wodehouse Yorke, to which brief reference is made in the Annual Report. It is a matter of great regret to all of us, Directors and Staff alike, that he should feel it necessary, through uncertain health, to retire.

Mr Yorke came to us 50 years ago, and during this long period his services to the Institution and its policyholders have been outstanding. Some men who have succeeded to or have built up family businesses can record longer periods of service to their businesses—indeed I think that Mr Yorke himself is an example of that—but 50 years is a long time in the active and continuous directorship of any public company. His great ability and remarkable business sense have always been evident at our Board Meetings, and the staff of the Institution at Head Office and throughout the country have greatly appreciated his keen and personal interest in both their work and their welfare.

Mr Yorke was elected Chairman of the Board in 1943, and it was under his guidance during the 10 years that followed (including the immediate postwar period with its many problems) that the Institution's business experienced quite a striking development. The District Staff was increased, and new business grew steadily from £670,000 (a low wartime figure) to more than £5 million. It was also with Mr Yorke's encouragement that investment in ordinary shares, which had been quietly begun a little earlier, was recognised to be desirable and was expanded in the interests of our members. They have had the satisfaction already of seeing that policy reflected in steadily increasing rates of interest earned on their funds, and in the very attractive bonuses declared on their policies. We salute an old and valued friend whose name will be honoured by all of us for many years to come.

Mr Sylvester Gates and Sir Hugh Gurney, the retiring Directors, have I am glad to say agreed to offer themselves for re-election and proposals will be submitted to you in general meeting in the usual way.

Our new business made a big stride forward in 1954, exceeding the 1953 figure by more than 40 per cent, partly due to certain large staff pension schemes completed in 1954, so that it is not altogether surprising that the 1955 figure at £6,350,000 net should fall short of the previous year.

Those who entrust their life assurance to us have had further proof of the soundness of their choice in the excellent rates of bonus which we declared a year ago, and in the increased rates of Interim Bonus which were announced in March this year. This latter decision was taken after considering the valuation which we make each year for internal purposes, and, needless to say, was taken after satisfying ourselves on the strength of our financial position.

The undernoted rates of bonus will apply to policies maturing by death or by survival on and after March 1, 1956, until further notice, in respect of full profit premiums falling due after December 31, 1954.

Type of Policy, Full Profits	Annual Rate of Interim Bonus
Endowment Assurance maturing as at age:—	£ s. d.
50 and below.....	2 5 0
55.....	2 7 6
60.....	2 10 0
65.....	2 15 0
70 and above.....	3 0 0
Whole Life Assurance.....	3 2 6

ENDOWMENT BONUS POLICY

The outstanding rate of bonus in the case of Whole Life Assurances renders even more attractive the special form of policy which we issue as the Endowment Bonus Policy. Very briefly, this is a Whole Life Assurance with bonuses payable in cash at a chosen age—for example, at the age of intended retirement. After that age, the policy remains in force as a paid-up non-profit whole life assurance for the full sum assured, and consequently no further premiums are payable.

This is essentially a form of assurance selected by the far-sighted man who realises that however long his life may be there will remain with him a need to provide life assurance protection for his dependants. Acknowledgment of this fact is often clouded by the need to provide capital for his own later years, but with this policy he can satisfactorily meet both requirements, and the bonuses accrue at the full Whole Life Assurance rate.

The further attractions of this policy will be apparent when I tell you that for many ages and terms the bonus payment made on reaching the Endowment age may represent the major part, if not the whole, of the cost of the policy, leaving a paid-up Whole Life Assurance in force at very little, if any, net cost. This policy has proved consistently popular over the years, and I confidently bring it to the attention of those of our Members and connections who are not yet acquainted with it.

INVESTMENT OF FUNDS

The Life Assurance and Annuity Fund has grown by £2,125,876 in the course of 1955, and during the latter part of the year particularly investment yields have been improving. We have increased our holdings of mortgages quite appreciably on satisfactory terms and we have also taken the opportunity to increase our portfolio of ordinary shares. I referred at some length to our investment policy in my Address to you a year ago; the same considerations continue to apply.

In general terms the change in investment conditions during 1955 has shown itself in a fall in the market value of fixed interest securities, and in a maintenance of the index figure for ordinary shares or even an increase

in the market value of certain sections of ordinary shares in which, I am pleased to say, we have an important interest. The effect on our funds has been to cause a depreciation in the market value of some of our assets during the year, but in the aggregate the total market value at the end of 1955 was well in excess of the Balance Sheet value.

The rates of interest earned on the Funds, as shown in the Report, are £6 18s. 11d. per cent gross and £5 6s. 0d. per cent net, after deduction of Income Tax. Notwithstanding the fact that these rates are calculated on the written down value of our assets, they are outstanding—even among other Life Offices which also adopt, as we believe, a vigorous and enterprising investment policy.

CURRENT CONDITIONS

The higher interest rates now ruling are associated with the restriction on credit inspired as a matter of Government policy as a curb on inflation—a world problem of which we in Great Britain are burdened with an uncomfortably large share. Inflation and brimfull employment lead to demands for higher wages which in turn lead to higher prices for manufactured goods and services. This has an adverse effect on our exports since our prices become less competitive in foreign markets, making it more difficult to maintain our Balance of Payments position.

This Balance can no longer be supported by overseas investments readily jettisoned whilst the few were defending the many; proper reserves can only be regained by hard work, new methods and a determination to increase private savings, thus cutting down the heavy drain arising through inflated imports.

The Institution serves as one of the means by which the savings of the individual reach the stage of productive investment. Our policy of investing a substantial proportion of the policyholder's funds in ordinary shares is, we feel sure, the right one; it has certainly brought its reward by way of increased income.

Whilst any degree of inflation continues the results of a with-profit policy with the Institution should go some way, through better bonuses, to sustain the real value of the policyholder's investment.

In my statement last year I referred to the problem of death duties and expressed the hope that before long the Chancellor would introduce some convenient means whereby a prudent man could make provision for these during his lifetime by means of a series of payments. I suggested that this might be done by way of "Duty Reserve Certificates" under a system which I described as "Pay as you live," also having in mind that a special type of Life Policy in favour of the Revenue could be so drawn as to qualify for the exemption from duty that I had in mind.

It was therefore with some satisfaction that I heard that the Minister of Finance in South Africa had granted a valuable concession in the exemption from Estate Duty of sums assured and bonuses thereon up to £5,000 in any estate. This seems to be a first step in the right direction of making it

conveniently possible for a testator to defend his family and perhaps also his business and employees from the depredations of the Revenue at a moment of melancholy and bereavement.

If we could only replace the so-called Squeeze with a Savings Surge how many other problems would fall into their place! But before this can be expected on any but patriotic grounds a man must see his way clear to passing on reasonably intact the fruits of his labours to those for whom he is labouring, surely a reasonable enough ambition. In these circumstances, moreover, it would not be long before we were found to be exercising restraint in spending and thus withdrawing from competitive buying at inflationary prices. But first of all there is the paramount duty of those responsible for the expenditure of the tax-payers' money to give a positive and significant lead.

The recent announcement by the Chancellor of the Exchequer of some restriction upon capital expenditure in the fields of Government and nationalised industry is a step in the right direction, but we must hope that this lead will be followed by wise and courageous action in other directions. Failing such action it is difficult to see how

even the present standard of living can be sustained, to say nothing of the further benefits credited as being within our grasp.

PROFESSIONAL ADVISERS

I would like to take the opportunity of recording the importance we attach to the advice we receive each week from our professional advisers, Mr Alan Melville of Messrs Druces and Attlee, our Solicitor, and Dr East, our Chief Medical Officer, supported by Dr Harman and Dr Seward.

I would mention particularly the regular attendances of the doctors to guide us in our underwriting of proposals for life assurance. We have always regarded the proper selection of lives as important—and the experience and knowledge of our medical officers is most helpful to us. We are grateful also to our Surveyors, Mr Skelt and Mr Weaver, for the advice and guidance which they give in connection with our varied property problems, and to our Auditors, Mr Cash and Mr Mearns, for the work that they do on behalf of our Members.

Throughout another year of great activity our Staff have done excellent work, and it is

with much pleasure that I record the Board's thanks to them all, but particularly to the senior members who in charge of branches or of departments carry a special responsibility. I am glad to say that during the year these thanks were expressed in practical form by the consolidation into salary of certain cost of living payments, thus making them rank for pension purposes, and also by the improvement of certain benefits under the Staff Superannuation Fund. As a consequence the Directors decided to make a special payment of £50,000 into that Fund, as will be seen in the accounts, although they do not intend otherwise to change their practice of making triennial, rather than annual, payments into the Fund. I am confident that policyholders will approve of these steps taken in recognition of excellent service rendered and in an endeavour, to some extent at least, to ensure that our Staff do not fail to reach a standard of living which they have surely earned. We are most fortunate in the proprietary interest which the Staff take in the conduct of all our affairs which makes our work together an agreeable partnership in which I consider it to be a special privilege to serve.

The report and accounts were adopted.

THOMAS TILLING LIMITED

The Fifty-ninth Annual General Meeting of Thomas Tilling Limited will be held on May 14th at Crewe House, Curzon Street, London, W.1.

The following is an abridgment of the review by the Chairman, Mr W. Lionel Fraser, CMG, which has been circulated to Stockholders with the report and accounts for the year ended December 31, 1955:

The Group profit before taxation is £2,316,817 (1954, £1,636,901), and after allowing for the interests of minority shareholders, the proportion of this profit attributable to Thomas Tilling Limited is £1,520,859 (1954, £1,013,994). After allowing for taxation, the profit attributable to Thomas Tilling Limited is £712,702, which is an increase of £258,481 over 1954.

Preference Dividends of £42,562 have been paid. An Interim Dividend of 5 per cent on the Ordinary Stock was paid on November 24, 1955, and your Board recommend the payment of a Final Dividend of 10 per cent, making a total of 15 per cent for 1955 (1954, 10 per cent). It was owing to the present delicate economic situation in the country and the consequent desirability, from the national as well as our own point of view, to conserve the resources of the Group, that your Directors decided to recommend no increase in the Dividend on the Ordinary Stock.

After drawing attention to the two Companies in which a majority interest had been purchased during 1955 since the date of his last report, namely Henry Lister & Sons, Limited, 74.09 per cent (manufacturers of flannel and blazer cloths) and Safca Aerosol Manufacturing Limited, 80 per cent (fillers of pressurised packages and manufacturers of Aerosol valves), the Chairman reported on the individual Companies and other interests of the Group. (The figure shown after the name of each Company is the percentage of the equity owned by Thomas Tilling Limited):

John H. Ashton Limited, 40 per cent (mahogany and hardwood merchants); Bagshawe & Company, Limited, 56.67 per cent (manufacturers of conveyors and elevators, mechanical chains and malleable iron castings); British Steam Specialties, Limited, 33.96 per cent (manufacturers and distributors of valves, gauges, etc.); The Brush

Group Limited, 24.26 per cent (manufacturers of electrical equipment and diesel engines); Cornhill Insurance Company Limited, 52.85 per cent; Daimler Hire Limited, 100 per cent; Mark Dawson & Son, Limited, 100 per cent (worsted spinners); Heinemann Holdings Limited, 31.54 per cent (book printers and publishers); Timothy Hird & Sons, Limited, 40 per cent (worsted combers and spinners); Hobourn Aero Components, Limited, 60.185 per cent (manufacturers of light engineering components, textile machinery, electrical convection heaters); E. R. Holloway, Limited, 40 per cent (comb manufacturers, plastic goods, etc.); James A. Jobling & Company, Limited, 60 per cent (manufacturers of "Pyrex" brand glassware); Lime-Sand Mortar Limited, 80.34 per cent (ready-mixed mortar and ready-mixed concrete manufacturers, sand and gravel producers); Mutual Finance Limited, 85.05 per cent (hire purchase finance, brokerage and banking); Newey & Eyre, Limited, 70.50 per cent (industrial electrical engineering supplies); Spray & Burgess, Limited, 60 per cent (dyers and finishers); Stevensons (Dyers) Limited, 25 per cent (hosiery dyers and finishers); Stratstone Limited, 100 per cent (distributors of Daimler and Lanchester cars); F. Troy & Company, Limited, 100 per cent (building and painting contractors); Walton Hosiery Company, Limited, 66.67 per cent (manufacturers of fully fashioned nylon stockings); Western Motor Holdings Limited, 30 per cent (motor car distributors).

Having mentioned the Company's interests in Real Estate, the Chairman then continued: When, only some seven years ago, your Board had the conception of Tillings becoming an Industrial Holding Company, primary emphasis was laid on the vital importance of management of the Companies in which an interest was to be taken. We saw clearly that, if we were given the opportunity to participate in undertakings, directed by men whose thinking was lively, energetic and far-sighted, and if we could imbue them with a family atmosphere, we should be going some way towards achieving our ambition to make the new Tillings a constructive participant in industry. So far we have succeeded in our pursuits, and our Subsidiary and Associated Companies are fascinating and stimulating in their variety and wide in their scope for

growth and development. Our experience has been entirely happy, and we can say that the idea is now out of the experimental stage—it is proven.

Once again we wish to welcome new friends who have joined us since my last report and we promise them our support and encouragement. In the normal course of their expansion, some of our Companies have called upon us for financial assistance, and this has been provided, either in the form of cash advance where the need is not likely to be permanent, or by way of an increase in our participation in their share capital. This must inevitably continue. Indeed it is a measure of the progress of our underlying interests.

In May of last year 2,200,000 Thomas Tilling Limited 5½ per cent Preference Shares of £1 each were offered to Stockholders at par and your Board was gratified at the ready response at a time which was not particularly propitious. The issue was in fact an outstanding success and reflected the confidence felt in your Company's status and prospects. The proceeds of this operation provided us with sufficient funds to meet our immediate needs, but your Board remains prepared to consider the accession of suitable additional Companies to the Group.

This is the Tilling story for the year 1955. But it is the future which we have to face, and in this respect obviously I should be wrong if I did not tender a word of warning. The prospects in the great majority of our Companies appear distinctly encouraging, but these appearances may in the short term be upset by the battle against inflation, the consequences and extent of which cannot now be exactly gauged. We all know that this battle must be won if our country is to continue to prosper, and in Tillings we pledge ourselves to do all in our power to assist the victory, of which we are confident. We cannot tell who will be hit in the process, but it would be unrealistic not to anticipate some wounds. We do not foresee them in our Group, but strange and unexpected things can happen, and it is as well to be on guard.

All I would say now is that our interests are well spread, that our finances are sound, and that, above all, we have first-class men at work for us. These are the elements most needed in testing times and they afford an assurance that, come what may, the Tilling Group will continue well and truly to serve its Stockholders as well as the community.

SWAN, HUNTER, & WIGHAM RICHARDSON, LIMITED

FULL ORDER BOOK

MR J. W. ELLIOTT ON THE YEAR'S EFFICIENT OPERATIONS

The Annual General Meeting of Swan, Hunter, & Wigham Richardson, Limited, will be held on May 8th at the Royal Station Hotel, Newcastle upon Tyne.

The following are extracts from the remarks of Mr J. W. Elliott, CBE, which have been circulated with the report and accounts:

I am glad to present accounts for the year 1955 showing another year of satisfactory trading. The profit, including income from investments of £54,397, and after providing the sum of £315,434 for depreciation of fixed assets, amounts to £2,694,839, which compares with the corresponding figure of £2,725,581 for the previous year. Taxation accounts for £1,097,139 and the net profit of the group is £1,380,100. Your directors recommend that final dividends be declared of 3 per cent, less income tax, on the preference stock and of 11 per cent, less income tax, on the Ordinary stock, making a total distribution for the year of 6 per cent on the Preference stock and of 14 per cent on the Ordinary stock. In the case of the Ordinary stock this represents an increase of 2 per cent on the total distribution for 1954.

Current assets of the Group at December 31, 1955, amount to £16,305,273 and current liabilities to £5,526,034, giving a net current assets figure of £10,779,239.

INCREASED TONNAGE LAUNCHED

The aggregate tonnage of ships launched from the company's yards on Tyne and Clyde in 1955 was 124,828 tons, an increase of 33,151 tons over the output in 1954. The ships launched show the variety of work undertaken in the company's yards and include a passenger liner, *Bergensfjord*, of 17,000 gross tons, an ore carrier of 21,000 gross tons (31,000 tons dw), a troop ship of 20,800 gross tons, a refrigerated cargo ship of 11,151 gross tons, as well as oil tankers and dry cargo ships.

The company's three engine works have been employed to full capacity during the year. The total machinery output from these works was 143,500 IHP and in addition to main machinery contracts a large number of oil-burning installations have been supplied, as well as Bauer Wach low pressure turbines, sundry boilers, and Vulcan couplings.

The company's repairing departments have been fully employed during 1955: 315 ships aggregating 2,417,604 gross tons were docked and repaired, and in addition repairs were carried out afloat to 345 ships of 2,330,007 gross tons, making a total of 4,747,611 gross tons dealt with in our repairing establishments.

FULL EMPLOYMENT

At the present time the company's yards have enough work under construction and on order to provide full employment for the next three years and some of our contracts will extend to 1960. A full order book like this brings in its train difficulties, and one difficulty at the present time is again the question of steel deliveries, which we had hoped had been left behind us. Production at the moment is being hindered by lack of steel, and while the steel industry is doing all it can to help its shipbuilding customers,

there will, I am afraid, be a period when we cannot rely on getting sufficient steel to meet our additional requirements.

The long-term reconstruction and re-equipment of the company's works is making steady progress.

At Wallsend Shipyard a commencement has now been made with the large prefabrication shed I have previously referred to. This we hope will be completed in about 12 months' time. A commencement has been made with laying-out a second new berth with the necessary crane tracks and heavy cranes and this berth, we hope, will also be completed next year. Various other ancillary work is also in hand at Wallsend Shipyard, or preparations are being made to carry it out.

At the Neptune works the scheme of reorganisation referred to a year ago is now in hand. This scheme will completely remodel the Neptune Shipyard. It provides for widening an existing berth and the construction of two new berths. When completed these berths will be fitted with 10- and 40-ton cranes and will be served by new platers' sub-assembly and assembly shops capable of handling units up to 40 tons. The new deep water quay at the Neptune Works, to which I referred last year, about 1,000 ft long, and provided with travelling cranes, will be able to handle four ships at once. New blacksmiths', plumbers' and other shops will enable outfitting to go ahead with the utmost rapidity.

The new large dry dock at the Wallsend Repairing Department is proceeding satisfactorily, although, due to difficulties encountered in construction, which have now been overcome, it is now expected that the dock will not be completed until the end of this year or early 1957. This dock, which will be capable of accommodating tankers up to 45,000 tons deadweight, is now urgently needed. During the past year it was decided to proceed with the construction of a new platers' shed at the dry docks department.

I referred last year to the commencement by Barclay, Curle & Company, Limited of work on their modernisation scheme at Clydeholm Shipyard. A building 520 ft long by 63 ft wide, containing shops for blacksmiths, engineers, and electricians, pump house, workmen's canteen, lavatories, and locker room, is now approaching completion. Certain sections of this building have been in operation for some months with good results. Erection of a boilerhouse is well in hand and foundations for a new joiners' shop are largely completed. Close consideration is now being given to the next stage of the reconstruction plans dealing with prefabrication shops, berths, etc., and this work will be put in hand as soon as possible.

During the year 1955, additions to the fixed assets of the group amounted to £1,147,145.

FURTHER CAPITAL EXPENDITURE

It is estimated that the completion of the work so far authorised at our Tyne works will entail a total further expenditure of about £3 million. The present stage of reconstruction at our Wallsend Yard will be completed about 1959, after which a still further stage will be undertaken. At the Neptune Works, the complete scheme of re-

construction will be completed in about five years' time.

The financing of the various projects throughout the group will make heavy inroads into our liquid resources for some time to come, but it is expected that, so far as can be foreseen, we shall be able to meet the entire cost out of our own funds.

JAS. WILLIAMSON & SON, LIMITED

INCREASED NET PROFIT

LORD PEEL'S STATEMENT

The twenty-fifth annual general meeting of Jas. Williamson & Son, Limited, was held on April 18th at The Royal King's Arms Hotel, Lancaster, Mr F. E. Winmill presiding in the absence of the chairman abroad.

The secretary (Mr L. Beswick) read the notice convening the meeting and the report of the auditors was read by Mr R. W. Gorman, FCA, of Messrs Viney, Price and Goodyear.

The following is the statement by the Chairman, the Right Honourable The Earl Peel, circulated with the report and accounts.

It is with pleasure that I refer you to the Report of the Directors for the year 1955. You will see that the Net Profit before taxation amounts to £1,002,885, an increase of approximately 10 per cent over the previous year.

After providing for taxation and making what we believe to be necessary and prudent appropriations, we are able to recommend to you a final dividend of 8½ per cent. If this meets with your approval, the total distribution for the year will be 12½ per cent on the Capital as increased by the issue of £665,424 "A" Shares sanctioned at your last Meeting, and represents a small increase on the distribution of 15 per cent for 1954 on the smaller Capital.

We are by no means at the end of the heavy programme of Capital Expenditure to which I referred last year, but we believe that we are spending wisely and that we are already beginning to reap benefit from the "ploughing back" of past years. We were able to increase our Sales during 1955 both in the Home and Export Markets. This result was only accomplished by the unremitting efforts of all concerned, which I am sure you will wish me to acknowledge with gratitude.

I take this opportunity to say that I am not amongst those who think it proper to apologise for making a profit. We have an old and well-established business, sound in its foundations, suitably provided with Capital, served by experienced officials and loyal workpeople. Quite clearly such a business should earn good profits when working nearly to capacity, otherwise it could not live in times of adversity.

ACQUISITION OF LEATHER CLOTH COMPANY

During the year we acquired the whole of the capital of The Leather Cloth Company, Limited. That Company has for very many years enjoyed an excellent reputation both for the quality of its goods (which are largely complementary to our range of manufacture) and for its high standard of commercial conduct. For some time past, however, its financial resources have been insufficient for present day requirements. We believe that the joining of our forces will, in due course, make for economy and increased efficiency. The investment is in our opinion well covered by assets, but for the time being you

will understand that the item of £102,652 appearing under the heading of Capital Reserve in the Consolidated Balance Sheet is a book-keeping figure.

I am just completing an extensive tour of some of our most important overseas markets. I attach great importance to these personal contacts with our various agents and our many customers. My journey has been of absorbing interest and I trust will prove of benefit to our business.

MONOPOLIES COMMISSION'S REPORT

It will be within your knowledge that a report by the Monopolies Commission is now before the Board of Trade dealing with the Trade Practices of the Linoleum Manufacturers' Association. These practices have been patiently evolved over a period of years and are the result of life-long practical experience in this industry. Their effect is,

by competition, to impose on members the necessity of maintaining a high standard of production, quality, design and service. No attempt is made to fix prices to the public but by some measure of price stabilisation wholesalers and retailers are encouraged to carry adequate stocks and so to give a better service to the public. The interests of the Distributing Trade and of the public are vital to the continued existence of the Linoleum Industry.

A Bill to regulate procedure in relation to alleged restrictive practices has been published and will no doubt undergo much revision before it reaches the Statute Book. Quite clearly an enormous expenditure of public and private time and money is envisaged. I find, however, one grain of comfort in the fact that an attempt has at least been made to reduce terms of precision, slogans and catchwords which have all too often taken the place of clear thinking.

CLERICAL, MEDICAL AND GENERAL LIFE ASSURANCE SOCIETY

BONUS DECLARATION

CONFIDENCE IN FUTURE GROWTH AND PROSPERITY

The one hundred and thirty-second Annual General Meeting of the Clerical, Medical and General Life Assurance Society was held yesterday at the Society's chief office, 15 St. James's Square, London, S.W.1.

In moving the adoption of the report and accounts, Lieutenant Colonel Sir Francis H. Humphrys, GCMG, GCOV, KBE, CIE, the chairman of the board, said:

Before we start our business I have to refer, with the deepest regret, to the loss which the Society has suffered by the death last September of The Right Honourable Lord Courthope PQ, MC, who gave valuable service as a Director since the war and was greatly beloved by us all.

NEW BUSINESS

The net new Sums Assured under individual and Group Life Assurances reached a total of £9,820,821, an increase of 16 per cent over the 1954 figure of £8,465,933.

During 1955 we introduced our new form of Pension Contract, which was well received. The new contracts effected in 1955 are designed without any allowance for future automatic increments, to provide Deferred Annuities of about £374,000 per annum. In addition, we transacted a considerable amount of pension scheme business under the old arrangements.

For these excellent new business figures we are grateful to all our agency connections. I should like to express our thanks, in particular, for the constant help which we receive from our good friends The Employers' Liability Assurance Corporation.

CLAIMS

The claims by death, amounting to about £421,000, were particularly light, in spite of the growth in the total sums at risk, and were favourable in character. Our mortality experience, therefore, again made a satisfactory contribution to the divisible profit.

The claims by maturity, at £562,000, require no special comment.

Expenses.—Once again, the expenses of our Life business show a small reduction proportionately to the premium income.

PROGRESS OF FUNDS

The Life Assurance and Annuity Funds increased by £2,184,700 to £25,796,098. The Capital Redemption and Annuity Certain Funds decreased by £118,037 to £2,341,930.

INVESTMENTS

Our recent investment policy, which has involved considerable purchases of carefully selected equities, has produced a very satisfactory yield. The Stock Exchange securities which appear in our Balance Sheet "below middle market prices" on December 31st last are conservatively valued and a substantial margin remains as a protection against any future depreciation that may occur.

The gross yield on the Life Assurance Fund, at 55 13s. 11d. per cent is the highest in the Society's history, while the net yield has increased by 4s. 3d. per cent to 44 5s. 6d. per cent.

Before I close I must make a brief reference to the Budget proposals dealing with pension arrangements for self-employed persons and changes in the taxation of annuities. We welcome the proposals, which will go far to eliminate some anomalies which have long been apparent, and we shall not be backward in giving effect to them when the necessary legislation has been enacted.

The report and accounts were adopted.

BONUS MEETING

Presiding at the bonus meeting the chairman said:

The objects of this meeting, according to Article 74 of the Society's Laws and Regulations, are first, to declare the result of an investigation of the Society's affairs as at December 31, 1955, and secondly, to produce the accounts and calculations upon which the result is based.

We find that, after making reserves which conform to the full with the standards of

You will wish me to say something about the prospects for the year now current. This is a more than usually difficult prediction. Costs of raw materials, wages and all other expenses continue to rise alarmingly as also does Governmental expenditure and consequent taxation. It is obvious that failure to check these increases will endanger the currency and signs are beginning to appear that this inexorable law is being more widely recognised albeit grudgingly and with reluctance. In the meantime we are meeting these increasing difficulties by vigorous selling and by improving technical efficiency to the best of our ability.

The report and accounts were adopted; the proposed dividend was approved; the retiring directors, Mr G. G. Parkinson, Mr L. Beswick and Mr I. D. Taverner, were re-elected and the remuneration of the auditors, Messrs Viney, Price and Goodyear, was fixed.

stringency which are traditional in this Society, we have a surplus of £2,433,000. This is not quite the total profit of the quinquennium as £179,000 has already been paid during the last five years as intermediate bonuses to the participating Policyholders and Proprietors.

The full profit available (including £233,000 brought forward from the previous quinquennium) is, therefore, £2,612,000, which is the largest in the Society's long history. Of this sum, we propose to distribute £2,390,000 and to carry forward £222,000 into the new quinquennium.

NEW BONUS SCALES

As explained in the Report, with a very few exceptions With Profit policies effected, and policies converted to With Profits, on or after January 1, 1946, are included in what we term the "New Series." For Full Profit policies in this Series, the bonus now added, in respect of each annual premium ranking for profit in the quinquennium, is at the rate of 50s. per cent of the Sum Assured, compared with the rate of 35s. per cent declared five years ago in respect of the quinquennium 1946-50.

It is less easy to give a short description of the bonus rates for the Old Series policies. For this series, the bonus is first calculated as a cash sum dependent upon the amount of the premiums paid in the quinquennium, and also on the total period during which the policy has been upon a profit-sharing basis. This cash sum is then converted into a Reversionary Bonus by a factor which depends upon the age of the Life Assured and the class of policy.

In general, the Reversionary Bonuses for Full Profit policies in the Old Series exceed those declared in 1951 by rather more than three-sevenths, but there are a few exceptions in the case of policies of short duration. The increase for policies under the Prime Cost System is generally much greater than three-sevenths.

The only other comment which I need make on the new bonus scales is that, at least for the present, the Intermediate Bonuses payable in respect of claims in the new quinquennium will be at the same annual rates as the Reversionary Bonuses now declared. We must, however, reserve the right to vary the rates if conditions make it necessary.

ANNUITIES

In considering the values which our actuaries have placed on the liabilities, I must first refer to the Annuities. The vitality of annuitants has always been noteworthy,

and has steadily improved over a long period of years. New tables, based on recent mortality statistics for annuitants, were published a year or two ago by the Institute and the Faculty of Actuaries, and we have thought it right to adopt these new tables in our valuation. The change has increased our reserves by rather more than £200,000. For those contracts which are valued "prospectively," the rate of interest assumed has been retained at 2½ per cent.

LIFE ASSURANCES

Turning to the Life Assurances, the Society has, for over 65 years, employed the Net Premium method with interest at the rate of 2½ per cent. During much of this period, the majority of British Offices regarded the less stringent 3 per cent basis as adequate for security and bonus maintenance.

Our own valuation has been further strengthened, in recent years, by an additional reserve which, in 1951, was raised to £1 million. We have now increased this Special Reserve to £1½ million, with the result that, as in 1951, our total actuarial reserves for Life policies exceed those which would be required by a Net Premium Valuation with interest at 1½ per cent.

The Society has long been noted for the outstanding strength of its reserves and, in the combined valuations of the assets and liabilities, our tradition in this respect is being fully maintained. This fact, in itself, provides solid ground for confidence in the future profit-earning powers of the Society, resting as they do upon the continued application of those principles and methods which have served our Policy-holders well for more than 130 years.

THE STEETLEY COMPANY LIMITED

(DOLOMITE AND REFRACTORIES)

The Annual General Meeting was held in Sheffield, on 29th March, 1956.

The accounts for the years to 31st December, showed:

	1954	1955
Trading Surplus	£	£
(after depreciation, etc.)	894,062	1,187,593
Taxation	498,639	586,287
Profit	395,423	601,306
Issued Share Capital	2,239,083	3,164,874
Dividends	141,979	159,079
Undistributed Profits	253,444	442,227

The following is an extract from the statement to shareholders made by Mr N. M. Peech, Chairman:

The progress of the group was in line with recent years and the important Canadian development began to bear fruit. Projects in hand, for which finance was obtained during the year, include a major extension to the sea-water magnesite plant, a new dolomite works and new refractory brick unit. These projects which are assured of future support by customers, will not be in operation until late in 1957. Meantime current demand for the group's products remains good. Since the close of the financial year, the company has made an offer to acquire the minority interests in the common stock of Steetley of Canada Limited.

PEARL ASSURANCE COMPANY LIMITED

Chairman: G. KITCHEN, T.D., M.A.

Points from the Annual Report and Balance Sheet for the year ending 31st December, 1955

TOTAL ASSETS £230,219,398

GROSS INCOME £47,893,714

INVESTMENTS

The Assets show an increase of £10,422,662. The valuation of the investments taking Stock Exchange securities at middle market prices showed a comfortable margin compared with the values shown in the Balance Sheet after taking into account the Investments Reserve Funds.

LIFE BRANCHES

In the two Life Branches the total sums assured on new policies issued amounted to £60,141,962 compared with £52,496,202 for 1954 and the total sums assured and bonuses in force (including the Capital Redemption Fund) amounted to over £544 millions (an increase for the year of over £30 millions).

CHIEF OFFICES: HIGH HOLBORN, LONDON, W.C.1.

FIRE AND ACCIDENT

In this Branch the premium income was £7,890,784.

REVERSIONARY BONUSES

ORDINARY BRANCH—A reversionary bonus of £2 0s. 0d. per £100 sum assured on United Kingdom policies entitled to participate in full profits.

INDUSTRIAL BRANCH—A sum of £2,123,033 has been allocated to provide bonuses and other benefits to policyholders in the Industrial Branch making a total allocation up to date of £24,388,238.

LEGAL & GENERAL ASSURANCE SOCIETY LIMITED

REVIEW OF OPERATIONS FOR THE YEAR 1955

THE HONOURABLE W. B. L. BARRINGTON'S STATEMENT

The one hundred and nineteenth annual general meeting of the Legal & General Assurance Society Limited will be held on May 9th at Aldwych House, Aldwych, London, W.C.2.

The following is an extract from the statement by the Chairman, the Honourable W. B. L. Barrington, which has been circulated with the report and accounts:

LIFE ASSURANCE AND ANNUITY FUND

You will remember we had the satisfaction in the year 1954 of exceeding, for the first time in our history, the total of £100 million new sums assured. Now in 1955 we have established a further record, the new business amounting to £115,020,108 net.

I am pleased to be able to report that there has been an increase in every major section of our life business, both at home and abroad, and that our net premium income has increased from £30,597,751 to £34,764,659.

OVERSEAS BUSINESS

I am pleased to report steady progress in all spheres of our overseas activities, both for life and general business. Particularly noteworthy is the completion for the first time by our life organisation in Southern Africa of more than £20 million net new sums assured. Our arrangements to write life business in Australia have now been completed and our offices there are commencing to operate. We wish every success to the venture.

MORTALITY EXPERIENCE

The usual investigation of our mortality experience in respect of both life assurance and annuities has been made and I am once again able to report that the results of such investigation are favourable in both sections of our business.

RATE OF INTEREST

The gross rate of interest earned on the life assurance and annuity fund, excluding the amount invested in purchased reversions, was £4 16s. 4d. per cent, as compared with £4 14s. per cent in the previous year. The corresponding net rates were £4 4s. 1d. per cent and £4 1s. 4d. per cent respectively.

EXPENSES OF MANAGEMENT

The total cost of commission and expenses of management expressed as a ratio to the life premium income was 9.42 per cent, as compared with 9.34 per cent in 1954, 9.41 per cent in 1953, and 9.49 per cent in 1952. In calculating these figures we do not take into account the consideration monies received for immediate annuities which, in 1955, totalled £1,302,828, although the expense ratio does include the expenses of the annuity business.

FIRE INSURANCE ACCOUNT

The net premium income of the fire insurance account amounted to £2,194,899, which represented an increase of £83,397.

After making provision for unexpired liabilities and after transferring £25,000 to exchange reserve, the underwriting surplus for 1955, amounting to £286,171, has been transferred to profit and loss account. In addition to the normal premium reserve there has been retained in the revenue account the previous additional reserve of £465,150.

ACCIDENT INSURANCE ACCOUNT

The net premium income of the accident insurance account amounted to £1,683,384, an increase for the year of £202,308.

After providing for unexpired liabilities the underwriting surplus amounted to £92,544. As in the fire account, the whole of this amount has been transferred to the profit and loss account. In the revenue account we retain an additional reserve of £283,980 over and above the provision for unexpired risks amounting to £992,831. The latter figure corresponds to a figure of £811,559 for 1954, which was then shown separately for the item of 40 per cent of premium income and the item for risks in respect of special contracts. These have now been amalgamated.

FIRE AND ACCIDENT

The totals of our combined fire and accident accounts were therefore—premiums, £3,878,283; claims paid and outstanding £1,539,159, or 39.69 per cent of income; commission, expenses of management, and overseas taxation, £1,720,779, or 44.37 per cent. The total underwriting surplus after providing for unexpired liabilities was £378,715, or 9.77 per cent.

MARINE ACCOUNT

The fund at the end of 1955 was £912,901, as compared with £730,522 at the end of 1954. The 1953 account has been closed and the balance for that year of £44,617 has been retained in the fund. This compares with a final balance of £37,504 on the 1952 account.

PROFIT AND LOSS ACCOUNT

The balance brought forward in the profit and loss account was £1,037,704, of which £750,000 is shown as transferred to capital account to extinguish uncalled capital liability in accordance with the arrangements approved last year.

The account also includes the transfers from the fire and accident accounts to which I have already referred, and there is a balance carried forward of £238,773.

ASSETS

The total assets of the Society at December 31, 1955, amounted to £262,165,154, being an increase of £31,616,206 during the year.

In concluding, I wish to thank the management and staff once again for their splendid services in the year under review—our excellent results are in large measure due to their fine work and intense keenness.

BRITISH-AMERICAN TOBACCO

RECORD SALES

The fifty-third annual general meeting of the British-American Tobacco Company, Limited, was held on April 13th in London.

Mr D. M. Oppenheim, the Chairman, in the course of his speech, said: Whilst exports from the home factories have been maintained at a satisfactory level, the increase in the proportion of the Group net profit dealt with in the Accounts of British-American Tobacco Company Limited is primarily due to larger dividends having been received from the overseas operating subsidiaries, which is a reflection of the increased profits arising from the expanding volume of sales of the Group. As a result, the Board has been able to recommend an increased dividend for the year whilst continuing to strengthen the company's reserves and maintain a satisfactory position in regard to liquid assets.

RESEARCH AND DEVELOPMENT

Our technical and research experts have constantly under examination new and improved methods of handling leaf tobacco, modern and more fully protective forms of packaging and, of course, improved processes of manufacture of cigarettes and tobaccos. We have decided to extend scientific and technical research for the benefit of the Group and, to this end, we are now in process of constructing a new Research and Development Centre adjoining our factory in Southampton.

As was the case last year, the date of this Meeting has anticipated that of the presentation of the Budget by a few days and, therefore, in regard to what the Chancellor of the Exchequer may have in store for us all I can only express the hope that he will find it possible to give effect to some recommendations of the final Report of the Royal Commission on the Taxation of Profits and Income which was published last June.

DOUBLE TAXATION

One of the main difficulties lies in overseas income being taxed twice, both abroad and in this country. The mode of relieving this double taxation has hitherto been to grant credits against the United Kingdom taxes in respect of equivalent taxes borne overseas on the same income. Double taxation relief on these lines has been gradually extended in the form of bilateral treaties, or unilateral relief where such treaties cannot be negotiated.

Since there is a continuing tendency for overseas tax rates on companies to rise, this relief is most valuable, but it is becoming increasingly evident that the tax credit system in general is but a necessary consequence of a basically defective taxation structure.

The root cause of the trouble, as the Majority Report recognises, is the claim, which the United Kingdom has traditionally asserted, to tax a United Kingdom resident, whether company or individual, upon total income from all sources, including income arising abroad, despite the fact that the latter falls under the jurisdiction of other countries. Nowadays, these countries not only claim a prior right to assess income arising within their own countries, but are beginning to claim the sole right.

Logically, a situation in which two conflicting jurisdictions claim tax on the same fund of income can be resolved either by withdrawal of one party or by compromise;

in this case, clearly it is the United Kingdom Government which has the weaker case.

In my speech last year, I expressed the opinion that, in the year now under review, the Group would achieve a new record as far as volume of sales was concerned. This has, in fact, turned out to be the case, and for the first six months of the current financial year the volume of Group sales again shows an overall increase. Given fair trading opportunities and the absence of international upheavals, I see no reason why this satisfactory trend should not continue for the remainder of this financial year at least. Apart from the obvious satisfaction this state of affairs must give to all of us as stockholders, it is gratifying that our increasing prosperity carries with it a notable contribution to the balance of payments of this country, as well as benefiting considerably the economies of the countries in which the members of the Group operate.

The report and accounts were adopted.

BANK LEUMI LE-ISRAEL BM

STEADY PROGRESS

The fifth Annual General Meeting of the Bank Leumi le-Israel BM, the fifty-fourth of the business established in 1902, took place on March 29, 1956, at the Bank's Head Office in Tel-Aviv. Mr E. S. Hoofien was in the Chair.

In his introductory speech the Chairman was able to report steady progress: The Capital and Reserves, which had stood at IL4 million two years ago and at IL4½ million last year, now stood at IL5 million; Deposits which in the year 1954 had gone up by 34 per cent had risen by 30 per cent in the year under review. Profits had been satisfactory and the final dividend proposed would again make 12½ per cent for the full year. At the end of the year there were 61 branches; all the new branches were naturally small and the Bank generally preferred the system of a multiplicity of small offices in the country where the customer still showed so strong an inclination to look personally after his business in the bank.

BANK'S FOREMOST TASK

Referring to the general position and to the activities of the Bank of Israel, the new Central Bank which is now a little more than a year old, Mr Hoofien pointed out that the economy of a country like Israel, with its strong tendencies towards development, economic expansion and immigration, was inevitably bound to show inflationary features and that therefore it was first and foremost the task of the Central Bank to exercise the full force of its monetary power in an anti-inflationary direction. This the Bank of Israel was doing to the best of its ability. The recent discussions on the standard of wages, although little had been done yet, gave rise to the expectation that there would shortly be a sensible rise, and it remained to be seen whether the monetary means at the disposal of the Central Bank in the struggle against inflation would prove sufficient. There was every reason to give the policy of the Central Bank the strongest possible support. The Directors' Report and Accounts were unanimously approved.

The Directors retiring in rotation were re-elected, and Mr E. I. Nebenzahl, who had been co-opted to fill the vacancy caused by the death of Mr A. Hantke, was also elected to the Board.

GRESHAM LIFE ASSURANCE SOCIETY LIMITED

INCREASED BONUS TO POLICYHOLDERS

THE HONOURABLE W. B. L. BARRINGTON'S REVIEW

The One Hundred and Seventh Annual General Meeting of the Gresham Life Assurance Society Limited was held on April 12th at 188 Fleet Street, London, E.C.

The Honourable W. B. L. Barrington, the chairman, who presided, said:

INCREASE IN HOME NEW BUSINESS

I am pleased to report a further modest increase in our new business production in the United Kingdom, thus maintaining the expansion of our home business. After deducting amounts re-assured the new sums assured under life and endowment policies of all types amounted to £6,939,000 as compared with £6,835,000 in 1954.

Our overseas business, however, suffered a reduction of £614,000 to £5,053,000 in net new sums assured. Our decision to close down in Egypt accounts for part of this reduction and we must anticipate a still further reduction as a result of the loss of our Indian business.

Thus, although our total new business production decreased from £12,502,000 in 1954 to £11,992,000 in 1955 we can, I think, bearing in mind the conditions overseas, regard the year's working with satisfaction, and I should once again like to express our gratitude to our agents and friends throughout the world for all their efforts which have assisted so many persons to enjoy the benefits of life assurance.

CLAIMS AND SURRENDERS

The amount of £330,943 paid in death claims during 1955 was some £20,000 more than that in the previous year. Despite this increase, however, our mortality experience has again been very satisfactory, the claims being well within the amount expected according to the mortality tables used in the valuation.

Sums totalling £939,574 were paid in the settlement of maturing endowments and £269,764 in the payment of surrender values.

SOCIETY'S INCOME AND FUNDS

The total amount of premiums received by the Society during 1955, after deducting premiums on re-assurances, amounted to £3,808,744 and the Society's income from all sources to £4,709,551. These figures are slightly less than those for 1954, reflecting the exclusion for the first time of figures for Egypt.

The life assurance fund amounted to £22,332,848 after allowing for the transfer of the Egyptian business referred to above; the total funds of the Society being £22,626,092.

During the year a considerable fall occurred in the Stock Exchange quotations of all fixed interest securities. I am glad to record, however, that the usual valuation of the Society's assets, including its investments in house property, revealed that the book values of these investments were still within their market value at December 31, 1955.

There was a further welcome increase in the average rate of interest earned on the Society's funds. During 1955 a rate of £4 3s. per cent, after deduction of income tax, was earned as compared with £3 18s. 9d. per cent in the previous year.

QUINQUENNIAL VALUATION

As I mentioned in my speech last year, 1955 was the last year of the quinquennium and our actuaries have accordingly carried out a full investigation of the Society's financial position as at December 31, 1955.

Although the total value of the Society's assets, at December 31, 1955, was well in excess of the value placed upon them in the balance sheet, it was considered prudent, in view of the somewhat uncertain financial outlook, to transfer a substantial sum to investment reserve. The actuaries considered that, having regard to the increase in rates of interest which has taken place in recent years, a rate of interest of 2½ per cent, instead of 2½ per cent, could safely be used in the valuation of non-profit assurance business. The sum released by this change has been made up to £500,000 and transferred from the life fund to the investment reserve account.

The directors have accepted the actuaries' recommendation that, after the necessary provision for interest on the shareholders' capital, £1,525,000 of the surplus disclosed shall be declared divisible and £338,040 carried forward.

Ten per cent of the divisible surplus will be paid to the shareholders, and the remaining 90 per cent belongs to the policyholders and will enable the Society to declare reversionary bonus additions to sums assured under all with-profit policies. These bonus rates vary according to the country of the policy as well as according to the length of time during which the policy has been in force. For policies in the United Kingdom the rates of bonus, expressed as a percentage addition to the sum assured for each year of the quinquennium during which the policy is entitled to participate, vary between £1 15s. for the most recently effected policies and £4 for the oldest policies. These rates represent substantial increases on those declared five years ago.

MANAGEMENT AND STAFF

I should also like to pay a special tribute to the skill and work of our manager and secretary, Mr Chapman, and all his officials at head office who have had many problems to deal with, particularly those arising from the transfer of our Egyptian business and the nationalisation of our Indian portfolio and to our staff throughout the world who deserve the highest praise for their efforts.

The report and accounts were unanimously adopted and, the other formal business having been transacted, the proceedings terminated with a vote of thanks to the chairman.

NATION LIFE AND GENERAL ASSURANCE

POLICIES FOR ALL

The Thirty-First Annual Ordinary General Meeting of the Nation Life and General Assurance Company, Limited, was held on April 6th at Teddington, Mr H. Cox, the chairman, presiding.

The following are extracts from his circulated statement:

The company's income during 1955 was £312,756, as compared with £304,092. The premium income was £268,567, an increase of £3,980.

The new sums assured totalled £502,082 in 1955 as compared with £473,999.

The company continues to increase the amount of the sum assured per policy issued, which is above the average for industrial assurance. This increase is due to our suc-

cess in bringing the advantages of our home service to every member of the community. I can assure you that our policies appeal to all sections of the community. These policies can be for high amounts, such as are usually associated with Ordinary Life, and give our policyholders the benefit of a home service based on monthly premiums collected by our representatives.

Our prospectus is varied and we have under consideration the adoption of further types of policies on the occasion of the issue of a new prospectus, which will take place this year.

During the year we have paid to our policyholders £137,582, the total being made up of claims by death £34,803, maturity £96,540, and cash surrender £6,239. In 1954, our payments to policyholders amounted to £136,047.

We have increased our assets substantially during the year and they are now standing in our balance sheet at £1,145,530.

Your board believe that the company holds

an excellent portfolio of investments, well distributed.

Our investment income was £43,011, an increase of £4,545 as compared with 1954, and the net interest yield on the fund was £4 18s. 5d. per cent as compared with £4 12s. 7d. per cent for 1954.

You have before you a recommendation that a final dividend of 6d. per 5s. stock unit, free of tax, be paid, making a total dividend of 8d. per 5s. stock unit, free of tax, for the year ended December 31, 1955. The directors also recommend that the payment of an interim dividend of 2d. per 5s. stock unit, free of tax, be made for the year ended December 31, 1956.

The directors are pleased to be able to recommend a rate of dividend higher than that which was forecast in their report on the occasion of the application for official quotations of the company's stock. The directors are confident that this rate of dividend can be maintained.

The report was adopted.

CO-OPERATIVE INSURANCE SOCIETY LIMITED

INCREASED BONUSES FOR CIS POLICYHOLDERS

EXPENSES REDUCED

Mr S. Leonard Kassell, Chairman, at the Eighty-eighth Annual General Meeting held on April 18, 1956, said:

In submitting my report on the Eighty-eighth Statement of Accounts and Balance Sheet I realise that although technically I am reporting to the Shareholders on the stewardship of the Directors during the past year, I am in fact reporting to a much wider audience—the many millions of persons of all classes who hold policies of various types (Ordinary Life, Industrial Life, Fire, Accident and Motor) with the Society.

Very few of our policyholders will have an opportunity of studying the Society's Accounts but I hope many of them will read this Report when it is published in the Co-operative and public press.

I have previously emphasised that for all practical purposes the CIS functions solely for the benefit of its policyholders and it is in their interests that the Directors devote their time and energy to securing efficient and economical management and to investing the ever-growing funds to the best possible advantage of the policyholders and not for the furtherance of the interests of Shareholders.

During 1955 our premium income was £38,108,369, being an increase of £2,937,660 over the previous year. Our assets increased by £15,985,291 to £164,394,327. Most of the increase in Assets related to the Life Assurance funds.

The Society's House Purchase Scheme was rather more active during 1955, due very largely to the fact that many of the Building Societies were forced to restrict their lending. New advances amounted to £4,637,358 but after taking into account repayments the total amount outstanding under House Purchase mortgages increased by £2,529,541 to £28,831,029. This amount is secured on 40,678 properties and the average House Purchase mortgage outstanding was £709 compared with £666 at the end of 1954.

ADMINISTRATION

In 1955 our overall commission and expense ratio was 23.57 per cent as against 23.64 per cent in 1954. In the Industrial Section the expense ratio was 27.12 per cent as against 27.43 per cent in 1954.

The expense ratios in the Fire, Accident and Motor Departments were not materially different from those in 1954 but there was a slight increase in the Ordinary Life Section ratio from 12.78 per cent to 13.08 per cent. In view of the very substantial increase in new business with its attendant initial expenses, this was only what could be expected.

LIFE DEPARTMENT

Our total new sums assured in the Life Department last year was £77,779,523, of which £29,803,186 was in the Ordinary Life Section and £47,976,337 in the Industrial Life Section. These were record new business figures for each Section and once again the average sum assured increased, being £645 in the Ordinary Section and £60 in the Industrial Section.

The volume of business which we are able to transact in both Sections is evidence of the demand for life assurance from all classes of the community—not only from those who can pay yearly, half-yearly or quarterly, but also from those who still prefer to pay weekly or monthly. Through its full-time agency organisation the CIS is able to provide facilities for all types of individual life assurance business.

INCREASED BONUSES

I have already stressed that in the management of the Society and investment of the Funds the Directors have as their first consideration the interests of the policyholders and it is with great pleasure therefore that I am able to announce increased bonuses to our life assurance policyholders.

In the Ordinary Section the rate of bonus

MOTOR DEPARTMENT

The year 1955 saw a very large increase in the premium income, which rose by nearly £600,000 to £4,101,068, and it is pleasing to record that despite the difficulties which characterise the underwriting of this class of business a surplus of £189,897 has resulted. This figure, however, includes interest earnings, and the net underwriting surplus amounts to only 3 per cent of the premium income, which demonstrates the fine margin separating profit and loss in this field. The claims ratio, while showing a slight improvement over that of 1954, remains too high, and it is only the fact that the Society's administrative expenses are so low that has enabled us to show a profit.

FIRE DEPARTMENT

An increase of £130,514 brought the premium income in this Department up to £1,704,221, whilst a favourable experience over the year's working has resulted in a claims ratio of 43.01 per cent, which is slightly better than that of last year. After making the necessary provision for reserves a sum of £361,975 has been transferred to Profit and Loss Account.

ACCIDENT DEPARTMENT

The premium income for the Personal Accident Account was £130,335 and the trading surplus was £44,647. Of this, £37,550 has been transferred to profit and loss account, the balance being added to the reserve fund.

In the General Insurance Account the premium income at £1,599,487 was nearly £120,000 greater than that of the previous year. The surplus of £367,998 was dealt with by transfer of £310,650 to profit and loss account, the remainder being added to the reserve.

PROFIT AND LOSS ACCOUNT

The sum of £1,720,500 has been transferred to the Profit and Loss Account from

the Departmental Revenue Accounts, of which £1 million has been applied to writing down investments and £150,000 added to the General Reserve Fund.

DISTRIBUTION OF PROFITS

After making these transfers and making adequate reserves for contingencies the total amount to be distributed to policyholders in respect of our operations for the year 1955 is the record sum of £5,150,000, of which £4,725,000 is due to our Ordinary and Industrial Life policyholders. The balance of £425,000 is payable to Co-operative Societies as a dividend on the Fire and General and Collective Life premiums paid to the CIS during the year, a sum which undoubtedly emphasises the benefit to the Societies concerned of insuring with their own Insurance Society.

CONCLUSION

The Board is fully aware that the success of the Society is a result of teamwork between the Directors, the Management and the Staff and it is no mere platitude when I express to all grades of the staff the Directors' appreciation of the efforts they have made to help in the achievements which I have briefly reviewed.

It is the sincere wish of the Directors that this fruitful collaboration shall continue during 1956 and in future years.

The year 1955 was not an easy one in many respects and 1956 has not opened very auspiciously, but as the CIS is very firmly established and well organised I am certain that we shall face up to and overcome any difficulties which may arise.

The report was adopted.

NORTH BRITISH AND MERCANTILE INSURANCE

CONTINUED PROGRESS

The annual general meeting of the North British and Mercantile Insurance Company Limited will be held on May 10th in Edinburgh. The following is an extract from the circulated statement of the chairman, the Right Honourable Lord Brand, CMG, DCL.

Fire Department: In the Fire Department, which is our most important department from an income point of view, the results though much improved are still not as favourable as we should like.

Premiums at £17,426,027 show an increase of £1,024,558 over the 1954 figure of £16,401,469, whilst losses amounting to £8,560,196, 49.12 per cent of premiums, compared with the figure for the previous year of £8,670,504, 52.87 per cent.

Commission, Expenses of Management and Overseas Taxation amounted to £8,188,638, 47 per cent, as against £7,606,297, 46.37 per cent, in 1954. After allowing for the adjustment of the Provision for Unexpired Risks we are left with a profit of £491,268, 2.82 per cent, for transfer to the Profit and Loss Account, which compares with a figure of £60,047, .37 per cent, in 1954.

Casualty Department: Total premiums amounted to £7,659,948, being £2,291,701 in excess of those for 1954 of £5,368,247. The total claims incurred amounted to £4,135,629 against £2,791,596, the percentage of claims to premiums being 53.99 per cent compared with 52.00 per cent for 1954.

Commission, Expenses of Management and Overseas Taxes were £3,072,140 com-

pared with £2,093,000 for the previous year, the respective ratios to premiums being 40.10 per cent for 1955 and 38.99 per cent for 1954.

After adjusting the reserve for unexpired risks on the usual basis the underwriting profit is £237,927, 3.11 per cent of premiums, compared with £367,260, 6.84 per cent for 1954. Overall, our Casualty business at home has produced satisfactory results.

Marine Department: The Marine premium income for 1955 was £1,730,660, which compares with £1,566,197 in 1954. Claims totalled £1,122,926 against £1,024,919 in 1954, and Expenses of Management and Overseas Taxes amounted in 1955 to £272,909, the corresponding figure for 1954 being £266,038. We have transferred the sum of £331,636 from our Marine Fund to Profit and Loss Account.

RECORD NEW LIFE BUSINESS

Life Department: The year 1955 was the first year of a new quinquennium and it coincided with the completion of a record amount of new business. The total new sums assured for the year, after deducting re-assurances, amounted to £13,791,700, compared with the previous year's figure of £11,403,255. In these totals Group Life and Group Endowment Assurances together accounted for £4,804,729 and £2,817,392 respectively.

Consolidated Profit and Loss Account: Net interest on Investments amounts to £1,133,727, compared with £998,173 in the previous year. The Fire Accident and Marine Accounts contribute a total underwriting profit of £1,060,831 as against £687,378 in 1954.

The proposed dividend of 11s. per share, which is the same as last year, and the preference dividend will absorb £736,000.

ECONOMIST, APRIL 21, 1956

TAYLOR, WALKER & COMPANY

IMPROVED RESULTS DESPITE RISING COSTS

LT COL W. H. KINGSMILL ON PROPERTY IMPROVEMENTS

The forty-ninth annual general meeting of Taylor, Walker & Company Limited will be held on April 19th in London.

The following is the statement by the Chairman and Managing Director, Lieutenant Colonel W. H. Kingsmill, DSO, MC, which has been circulated with the report and accounts for the year ended December 31, 1955:

Ladies and Gentlemen,—In my last statement you will remember that I referred to the fact that we were concentrating production of beer in London at our Limehouse Brewery. This became effective last October and, judging from experience to date, would seem to be proving highly satisfactory.

The further phase of conversion of the Group's premises at the Cannon Brewery is now under way, but will take some eighteen months to complete and until this has happened the full benefit will not be apparent.

Thanks largely to the good summer last year, the continuing decline in the trade was halted and from results to date, it would seem that there is a slight trend for trade to increase. This could easily be upset should we have a bad summer.

Taxation is still one of the biggest burdens with which we are faced and it is of interest

to note that in beer duty alone the Taylor Walker Group paid direct to the revenue no less than £2,628,816 in 1955 and in addition almost twice this amount as collectors for the Inland Revenue through sales of other brewers' beers, and wines, spirits, etc.

EFFECT OF REVALUATION

There is a further and most important situation which has arisen and which will affect both the wholesale and retail side of the brewing industry. I refer to the revaluation of licensed and other premises for rating purposes. The assessment on most of our licensed premises has been raised in some cases by more than 300 per cent, and as these rates are borne by the tenant, this may affect the income which your Company receives in rents. Your Directors are fully aware of this danger and are taking all steps within their power to see that the Company's licensed premises are fairly rated in the interest of both the tenants and the shareholders. This revaluation, after all, only results in a further burden on the industry, which is already being taxed far too heavily to enable it to maintain and improve the standard of licensed premises commensurate with the standard of life enjoyed by the public in their own homes.

Your Directors are pressing ahead with alterations and improvements to licensed properties and last year spent £26,000 on new and re-opened houses and £266,000 on repairs and alterations. Three new licensed premises will be opened this year in Essex and it is planned to rebuild one or two houses which were badly damaged during the war.

The additions to the Alperton Bottling Company's premises, to which I also referred

last year, have proved a great success, but in spite of these additions your Company is still short of facilities for the ever-increasing demand for our bottled beers. It is hoped to find a suitable site for a further bottling depot, which will relieve the pressure on your Company's existing premises.

During the year under review no subsidiary failed to make a profit.

In the Export Market our sales of beer continue to expand steadily, and during the year arrangements were made for La Madriena SA of Mexico to manufacture Curtis Gin.

INCREASING SCOTTISH TRADE

In order to cope with our increasing beer trade in Scotland, we are negotiating to purchase an existing bottling factory near Glasgow, which should enable us to handle this market on a more favourable basis as well as producing a ready-made trade in other beers and soft drinks.

During the past year there have been several considerable wage awards granted, but in spite of this I am pleased to say that the consolidated accounts continue to show an increased profit, mainly due to the economies which have been effected in other directions. I am happy to say, therefore, that your Directors unanimously recommend a return to a 10 per cent dividend by the payment of a final dividend of 7 per cent less tax. Once more I would like to take this opportunity of stressing that without the loyalty and goodwill of all staff and employees these results could not have been achieved and I am glad to be able to tell you that relations between Management and all other branches have never been more cordial.

LABU CHEVIOT RUBBER

RESEARCH AND NATURAL RUBBER PRODUCTION

SIR JOHN HAY'S STATEMENT

The Third Annual General Meeting of Labu Cheviot Rubber Limited, will be held on May 9th, at 19, Fenchurch Street, London, E.C.3. The following is an extract from the circulated statement of the Chairman. After reviewing the domestic affairs of the Company Sir John Hay continued:

Our replantings are an outstanding example of the economic application of the findings of research which have enabled us to substitute for old seedling rubber planting stock which is capable of giving a yield several times greater than unselected material. It is significant that this important advance is due as much to the researches of private enterprise, working within the limitations of its own resources, as it is to the activities of research institutions supported by the collective contributions of the industry. But whilst acknowledging and welcoming the supplementary activities of independent concerns, it is to the central institutions which they support that the industry is entitled to look for scientific progress.

Nearly fifty years have passed since the rubber industry made its first essay in organised research. This was followed in 1925 by the establishment of the central Research Institute of Malaya. A great impetus was given to rubber research by a provision in the Inter-Governmental Agreement for Rubber Regulation of 1934, which committed the Governments concerned to levying and collecting a cess on rubber exports. Although this agreement was long ago terminated, the cess still operates in Malaya and in 1955 a sum of approximately £800,000 was collected.

On the basis of the acreage involved, this substantial sum represents nearly double the rate levied in this country for State expenditure on agricultural research. Other rubber producing territories within the Commonwealth make only token payments and 96 per cent of the funds available come from Malaya, although it is fair to say that Ceylon maintains within its territory its own research institute.

RADICAL CHANGE IN RUBBER SITUATION

The condition that gave rise to the 1924 agreement was an excess of supplies of natural rubber and the consequent impoverishment of producing territories. It was natural that in the circumstances then existing emphasis should be placed on forms of research directed to help "towards a natural balancing of production and consumption," and the programme was set accordingly. Since that time, however, the rubber situation has radically changed. Natural rubber is no longer in excess supply in the sense of the 1934 agreement. In quantity it falls far below the requirements of rubber manufacturers, who must perforce resort to synthetics and other substitutes with which natural rubber must now compete in price and suitability. Despite this dramatic change in the rubber outlook, research and the varied activities which are carried on under that heading have continued to follow with a misguided emphasis the 1934 pattern. Ill-advised and vain attempts have been made by lavish expenditure on propaganda to check the flow of synthetic supplies. The rubber manufacturers, by their own enterprise and expertness, have vastly increased and extended the uses of rubber products. The strong and intensive competition which is such an outstanding feature of that side of the industry is a safe guarantee that development and extension will not cease. The producing industry's less expert

excursions into this field of development, already so well served, have by contrast proved costly and barren of results. Such activities have for long involved a serious diversion of funds from what should be our primary purpose, namely the pursuance of an extensive and sustained programme of research into the production of natural rubber. Directed with energy and imagination such researches should prove an invaluable aid to our industry in its competition with synthetics.

In the course of writing this I recall a leader on the subject of research which appeared in *The Times* of August, 1954. This, of course, was not written in reference to rubber, but it seems now so apposite to our own industry that I proceed to quote:

"There has been a good deal of research into efficiency. What is now needed is a large-scale inquiry into efficiency of research. . . . The greatest gains in research can come from its scope being indefinite. At the same time for every inch won there may be acres of waste. Research can become a vested interest in itself, can be undertaken for prestige rather than for product, can be duplicated within the same industry, can be so 'pure' as to be purposeless, can give a yield hopelessly incommensurate with its effort. To say such things has been unfashionable for a long time past. It can be construed as hostility to research. It is not. It is a plea for the strengthening of research. But management must be uninhibited in clearing lumber out of the back room as out of the shop window."

An inquiry into the conduct of this industry's research is soon to take place. I hope that the inquiry will extend to the matters referred to here and that in consequence there will be a healthy clearing of lumber from the back room, and a strengthening of research.

GENERAL REFRACTORIES LIMITED

GENEFAX HOUSE, SHEFFIELD, 10

A comprehensive range of refractories serving all industries is produced by the Company and its Subsidiaries at their Works and Quarries situated in many parts of England, Scotland, Wales, and in Belgium. Research and technical field service facilities are available. The Company has offices and representatives throughout the United Kingdom and Agents in all parts of the world.

SUMMARISED CONSOLIDATED BALANCE SHEET: GENERAL REFRACTORIES LTD., & SUBSIDIARIES

Based on figures as at 31st December, 1955

Issued Capital	£1,040,000	Fixed Assets	£3,840,824
Capital Reserves	178,297	Less Accumulated Depreciation	1,944,748
Revenue Reserves and Unappropriated Profits	1,055,224		
Liabilities	1,752,327	Trade Investments, etc.	1,896,076
		Current Assets	5,092
			2,124,680
			£4,025,848

SUMMARISED APPROPRIATION ACCOUNT OF GENERAL REFRACTORIES LIMITED

Profit for year after providing for Depreciation, Taxation, etc.	£248,015
Net Distribution for year to Stockholders	104,650
Retained in the business	£143,365

EXTRACTS FROM THE CHAIRMAN'S STATEMENT

During the year our manufacturing resources were stretched to the utmost and many fresh tonnage records were established. Very satisfactory figures were recorded for the Company's sales and fresh records were established in both the Home and Export markets, the overall increase being 12.6 per cent over the previous year.

The far-reaching schemes for the expansion of the steel industry in the near future make it imperative that our production facilities should be considerably extended to cope with the substantially increased demands which will be made upon us. In the immediate future, therefore, your Directors propose to embark upon three major Capital projects.

The statement then outlined the Board's plans to expand production facilities and continued: In view of the urgency of these major schemes which are estimated to cost £500,000, your Directors have considered it desirable to invite the stockholders to subscribe additional capital. Subject to the consent of the basis of one new 10/- share for every five 10/- stock units at present held.

Your Directors feel that, provided no unforeseen contingencies arise, they will be in a position to recommend for the current year on the increased capital the same rate of dividend as for 1955.

The Group Surplus for the year after providing for Depreciation and Taxation showed an increase of £20,940 over 1954 and amounted to £267,617. Your Directors recommend the payment of a Dividend of 17½ per cent less income tax.

Copies of the Accounts and Chairman's Statement may be obtained from the Secretary, Genefax House, Sheffield, 10.

An AEI stockholder meets a new recruit into the electrical industry. Today, it often takes £5,000 or more of investment to give employment to one man.

Turbine casing for one of the six 100,000 KW generator sets being built by Metropolitan-Vickers for the Castle Donington power station.

The Foundation Stone of the new British Thomson-Houston turbine works at Larne, Northern Ireland, was laid by Viscount Brookeborough on September 29th, 1955.

We stand upon

THE THRESHOLD OF A NEW INDUSTRIAL REVOLUTION

"More than half a million pounds worth of electrical equipment for every working day of 1955."

LORD CHANDOS

Chairman of Associated Electrical Industries

AT the Annual General Meeting of Associated Electrical Industries on 4th April, Lord Chandos, the Chairman, said that the Company's achievements during 1955 had surpassed those in the record year of 1954.

During 1955 the Company shipped to its customers more than half a million pounds worth of electrical equipment for every working day. Over fourteen hundred megawatts of generating plant, equivalent to nearly two million horse power had been commissioned. Record shipments of switchgear, transformers, and cables, had been made including plant for the super-grid as well as for the whole range of electrical distribution both at home and overseas.

In the Industrial field the group had kept well to the fore, particularly in the mining, chemical, steel and paper industries and in railway traction.

Speaking of the Company's agreement with the Indian Government, the Chairman said that the building of large works to manufacture heavy equipment in India, was part of a long term programme of economic development, and that AEI had been appointed as Consultant for a basic period of 15 years. "The Indian Government," he said, "wish to have the most modern plant and layout and we shall bend every effort to meet their wishes."

Lord Chandos stated that at the close of 1955, firm orders in hand totalled £150 million. He emphasised that plans for the future involved large sums. It was becoming evident that industrial expansion must increasingly be financed from retained profits, but the stockholders' investment was not less important. Profits, therefore, must be maintained by increased turnover and greater efficiency, in order to assist in financing expansion as well as to encourage investors. For example the company proposed that dividends should be increased from 14% to 15% costing with preference dividends £2,184,000, but £8,386,000 had been retained in the business.

BRITANNIC ASSURANCE CO., LTD.

OVER £2,100,000 ALLOCATED TO POLICYHOLDERS

SECURITY FOR POLICYHOLDERS £97,500,000

At the Ninetieth Annual General Meeting, held in Birmingham on April 5th, Mr Fredk. A. Powell, FCA, Vice-Chairman, said:

It gives me pleasure to report that substantial progress was made in all branches in 1955. Our premium income in the life branches increased by over £550,000 to £12,230,000, and our total gross interest rose by £430,000 to over £44 million. Policies in force on December 31, 1955, assured with vested reversionary bonuses over £212 million. Increased surpluses have been earned, and over £2,116,000 has been allocated to policyholders. This allocation was nearly £200,000 more than last year, and has enabled us to declare increased bonuses in each of the life branches. Funds held as security for policyholders rose by £6,210,000 to a total of £97,555,000, including Investment Reserves of £7,050,000.

Ordinary Branch new business again increased in 1955, and policies were issued for net sums assured of £7,557,000 on which the annual premiums were £389,000 and the single premiums £69,000. The premium income at £4,076,000 was higher by £173,000. The improving tendency in interest earnings continued, and net interest earned at £1,206,000 showed an increase of £108,000. The net rate of interest was £3 10s. 2d. per cent against £3 8s. 3d. per cent in 1954. Expenses at 11.45 per cent were moderate and at about the same level as in 1954. Death claims at £436,000 were within the expected amount, and satisfactory mortality profits were realised. Surrenders and lapses were lower than last year, and continued the downward trend of recent years.

Claims by maturity at £1,407,000 dropped by £25,000, but during 1956 they will rise very substantially. In 1941 we commenced issuing 15-year term policies participating in profits, assuring sums in 3 per cent Savings Bonds, and during 1956 a large number will mature. The policyholders are entitled to receive a 3 per cent Savings Bond, 1955/56, for the sum stated in the policy, plus a sum in cash in respect of bonuses declared. At the time these policies were issued we did not expect that when they matured the market value of these bonds would be at a 15 per cent discount. The Directors have decided to pay in cash at 100 per cent of the nominal value of the bond, plus the bonuses declared, and our action has been greatly appreciated by policyholders.

In the Industrial Branch the premium income increased by £378,000 to £8,153,000 and the fund by £3,414,000 to £53,096,000. Death claims at £1,681,000 were up by £82,000, but payments to surviving holders of endowment assurances increased by no less than £430,000 to £2,105,000. The percentage of new endowment assurance premiums to total new premiums continues to increase, and last year it reached 91.5 per cent. Twenty years ago it was only 42 per cent, and this is a clear indication of the change in the character of Home Service Insurance. Endowment assurances are essentially savings policies and help in the battle against inflation. The thrift which is exercised through Home Service Insurance has the particular virtue of being regular and persistent because of the weekly or monthly call of the "insurance man."

Net interest earned at £2,291,000 showed an increase of £300,000, and the rate earned on the fund was £4 10s. 6d. per cent—an

increase of 6s. 6d. over the rate earned last year. The expense rate remained unchanged at 26.02 per cent.

I am pleased to be able to report a further reduction in the number and percentages of policies on which payment of premiums was discontinued during the year. This year the percentage has fallen to 2.8, and I hope that as the years go by we shall see yet further reductions. I would remind you that if policies unfortunately have to be discontinued the policyholders receive good value for the premiums already paid, by the grant of paid-up policies for an amount proportionate to the number of years' premiums paid, by the grant of a cash surrender value or by the provision of life assurance cover for periods much in excess of the actual periods of premium payments. Last year 42 per cent of the policies discontinued received proportionate paid-up policies, 32 per cent received cash surrender values, and 26 per cent received extended life assurance cover.

In the Ordinary Branch the Directors, after transferring £125,000 to Investment Reserve Fund, have allocated £936,405 to policyholders, against £857,715 a year ago, and have declared a reversionary bonus on with-profit policies in force on December 31, 1955, at the rate of 38s. per cent of the sum assured, against 34s. per cent a year ago.

In the Industrial Branch an allocation to Britannic policyholders of £1,030,000 has been made, and has enabled the Directors to improve the reversionary bonus scheme by starting with a declaration of 9 per cent of the sum assured after nine years' premiums have been paid. Total bonus additions to premium-paying policies will now range from 9 per cent after nine years to 36 per cent after 36 years.

The voluntary allocations from surplus to Britannic and British Legal Industrial Branch policyholders have now reached a total of over £11,200,000.

Our total assets are now just under £99 million, and at December 31st their value was in excess of the balance sheet figures. Nevertheless, we again increased our investment reserve funds by £475,000, bringing them up to £7,050,000, which is available against any future depreciation.

In our view the "cheap money" policy has been a contributory cause of the inflation from which we have suffered since the war and which has frustrated our achievements in the field of production. We are therefore not sorry to see a readjustment of monetary policy, but it would seem probable that interest rates on fixed interest securities must now be somewhere near high-water mark.

Of the money we had available for investment last year, £2,584,000 has been loaned on long terms to local authorities and £1,698,000 has been invested in debentures. A further £1,022,000 has been absorbed by advances to owner-occupiers of house property through our House Purchase scheme. Under the House Purchase scheme we continued to lend money at 4½ per cent until August last year. We then had to raise the rate for new borrowers to 5 per cent, and since the close of the year we have had to make a further increase to 5½ per cent. We have not, however, raised any of the rates in force on existing mortgages, and many of our borrowers still pay only 4 per cent or 4½ per cent on their mortgages. We look upon our scheme of mortgage coupled with

life assurance as a long-term contract which enables a house-owner to weigh up his commitments before he buys. We hope that we shall be able to continue this policy, which makes our scheme so attractive to a prospective house-owner.

In the Fire and Accident Branch the premium income was £745,000—an increase over the previous year of £67,000. The gross profit of £33,652, although £11,917 down, was not unsatisfactory; the reduction was accounted for by an increase in motor claims. We again thank the British General Insurance Company and their staff for their unflinching helpfulness in the management of this branch of our business.

The success of Home Service Insurance is bound up with good relations between policyholders and staff. The helpful and courteous service rendered to the public by our agents, officials and clerks at the local offices and at our Chief Office is reflected in the results we are able to report to you today. We have again transferred £220,000 to the Staff Pension Fund. Our substantial contributions to the fund are a means of expressing appreciation to our staff who by their efforts have contributed so largely to the Company's progress. I am happy to have this opportunity to express our thanks to them on your behalf.

WESLEYAN AND GENERAL ASSURANCE SOCIETY

The One hundred and fifteenth Annual General Meeting was held on April 10, 1956. Mr A. H. Sayer, MC, JP, the Society's Chairman, in moving the adoption of the Reports, said:

The Ordinary Department Fund has increased by nearly £750,000 and the Industrial Department Fund by more than £500,000. For the first time in the history of the Society new Sums Assured issued in the Ordinary Department exceeded £5 million.

The total Valuation Surplus amounts to £971,134, which includes £179,234 brought forward from 1954. The Directors have applied £310,327 for the benefit of Ordinary Department Policyholders in order to grant reversionary bonuses at the rate of £1 12s. per £100 Sum Assured, which is the same rate as last year. They have also applied £80,000 for the benefit of Industrial Department Policyholders. £300,000 has been transferred to Investments Reserve, £93,000 to the Staff Pension Fund and Staff Widows' and Orphans' Fund, £30,000 to the Outdoor Staff under the Profit Sharing Scheme and £157,807 has been carried forward to 1956.

In July, 1955, the rates of premium under all the Ordinary Department Tables were reviewed in the light of the conditions ruling at the time. It was found possible to reduce the rates quite considerably.

The Society now offers an attractive Collective Assurance Plan designed to enable employees to obtain the benefit of life assurance on most favourable terms. The employer may give financial assistance under the Plan, but this is not essential. The Plan is useful even where an existing pension scheme is in operation.

The Society's finances are sound. The Actuary has been able to report a steady improvement in financial strength every year for many years, and 1955 proved no exception. It follows, therefore, that the outlook for policyholders is bright and attractive, and that membership of this mutual office with long tradition behind it is well worth while.

The report and accounts were adopted.

TELEPHONE AND GENERAL TRUST LIMITED

OPERATING COMPANIES' CONTINUED EXPANSION

SIR ALEXANDER ROGER'S REVIEW

The thirtieth annual general meeting of the Telephone and General Trust, Limited, will be held on April 24th in London.

The following is an extract from the circulated statement of the Chairman, Sir Alexander Roger, KCIE:

Gross income rose in 1955 from £345,049 to £457,996 and after providing £166,600 for taxation, compared with £121,800 in the previous year, Net Profit at £173,900 was up by £58,706. Your Directors recommend a final dividend on the Ordinary Stock of 9 per cent, making a total of 12 per cent for the year, and a dividend of 12 per cent on the "A" Ordinary Stock. We propose transferring £25,000 to General Reserve leaving £156,909 to be carried forward on Profit and Loss Account, compared with £114,746 brought in.

The valuation of £3,491,162 for quoted investments represents an appreciation of £1,891,546 on the net book cost of £1,599,616—a substantial buffer against the fall in market prices such as we have recently experienced. Loans to and Debentures in subsidiary companies have increased by £568,057 to £1,013,927.

The Group Reserves totalling £1,460,296 show an increase of £134,364. The Net Assets of telephone operating and servicing subsidiary companies have increased by £610,886 to £4,277,941.

PORTUGAL

The Anglo-Portuguese Telephone Company has been operating the telephone service in the cities and suburbs of Lisbon and Oporto for 69 years. For the last 28 years the Trust has continued to hold a substantial investment in the APT Company and from that time onwards has been closely associated with the Company in its expansion and development plans.

In addition to day-to-day loans on a mutually satisfactory basis, the Trust and its associates are able to make available to APT the experience of personnel skilled in the telephone business, particularly finance, manufacturing, engineering and research. This association and the valuable support and service arising from it is greatly welcome by the APT Company.

The number of telephones in operation in the APT Company's areas 28 years ago was about 21,000. At December 31st last the number was over 170,000 and is a measure of the contribution made by the Trust and its associates to the activity and enterprise of the APT Company in providing the telephone public of Portugal with the best possible service.

In spite of the year-by-year increase in the number of telephones installed there is no apparent slackening in demand and further expansion of telecommunications is likely with the broadening and increasing industrial development of the country.

WEST INDIES

The telephone operating companies in which the Trust is interested in Jamaica, Trinidad and Tobago, and Barbados continued with their policy of expanding and

improving the telephone services in their respective territories. This costs a great deal of money. Your Company provides the necessary cash initially by way of temporary loans, which are repaid from time to time partly from the proceeds of local issues of capital and partly by the issue of Ordinary Shares to the Trust. During 1955 the Company advanced on temporary loan to these West Indies companies an additional £568,000 towards their capital expenditure programmes, upon which collectively they expended some £877,000 having provided the balance from their own resources.

The Jamaica Telephone Company spent some £452,400 upon gross additions to plant during 1955, and after deducting plant retired from service the Company had gross plant assets with a book value of over £2,270,000 at December 31, 1955. During the year stations in service increased by 2,842 to 22,922.

At December 31, 1955, Trinidad Consolidated Telephones Limited had 23,116 stations in service—a substantial gain of 2,143 stations. Some £342,000 was expended upon additional automatic exchange equipment and the extension of the cable net-work in various parts of the Island, and the book value of the gross plant assets of the Company amounted to over £2,450,000 at the end of the year.

The Barbados Telephone Company expended £82,700 upon plant and equipment during 1955, making total gross plant assets of some £583,000 at the end of the year. Stations in service increased by 396 to 6,275.

SAVINGS AND INVESTMENT

The annual report is published this year at a time when the country's economic position gives ground for concern.

Much that has happened to bring about our present adverse balance of payments position stems from the fact that we have sought to raise our standard of living rather too quickly. The prerequisite of increased national investment is surely increased savings and these latter have not kept pace. As a nation dependent so much upon other countries for the basic materials which are the essential ingredient of our manufacturing capacity economic unbalance is soon upon us if we increased our living standard without providing the savings to justify it.

How to increase savings is surely our main problem if we are determined to maintain our place as an industrial force in the world today.

Those in high places are examining this matter both carefully and critically. Modern lines of thought must be allowed play, for many of our old ideas on encouragement of thrift have proved of little value.

To have overinvested is a fault with much to commend it. We, at least, have striven in the right direction. There is, of course, often but a thin line between enough investment and too much. Let us hope that adequate measures be taken in the future which will enable our economy to achieve a more settled basis, and that these measures however stringent will be supported by all concerned in this country.

ALLIANCE BUILDING SOCIETY

A MOST SATISFACTORY YEAR

Presiding at the ninety-third Annual General Meeting of the Alliance Building Society held on March 28th at Brighton, Mr F. J. Wellman, JP (chairman), said:

The Society has had during 1955 a most satisfactory year of business. The total funds increased from £42,945,280 to £51,140,523, which represents a growth of over 19 per cent during the year, while the number of members and depositors now approaches 75,000.

We decided to increase the interest rate on our shares from August 1st to 3 per cent per annum clear of income tax, which is equivalent to £5 4s. 4d. per cent to investors liable to the standard rate of income tax. The effect of this change was most encouraging. The total receipts in the Share Department for 1955 were in the record sum of £14,007,388.

LIQUIDITY EXCEEDING 18.6 PER CENT

With regard to liquid funds the Alliance Building Society at December 31st last had investments and cash at Bank and in hand totalling over £9,521,000, which is equal to 18.6 per cent of the total assets.

With the wider distribution of national income and the steeply progressive taxation in this country, it is vitally important that all who are able to do so, in however small a degree, should contribute their share to the savings required by the country, and indeed, it is in their own interest to do so. May I therefore urge you with all the sincerity at my command to make the fullest use of the unrivalled facilities offered by Building Societies up and down the country for saving and investment.

Addressing the meeting, Mr Lewis C. Cohen, Deputy Chairman and Managing Director, said: It is vital that the evil of inflation which we see all around us should be controlled, and I am afraid I am one of those who doubt whether exhortations are any substitute for Government action. It is abundantly clear that far more drastic steps will have to be taken before the creeping illness which now affects our economy can be arrested.

Surely the Government must not only encourage savings and assist every section of the savings movement, but must reconsider the general attitude of taking money out of circulation which is at present too lightly spent.

I am sure that if a sense of urgency were communicated to the nation a great deal could be done in this direction.

We in this savings organisation know that we play our part gladly in assisting in some measure to channel the people's savings to a useful purpose, a purpose that can achieve nothing but good for the community. We offer safety and security to the investor in our savings organisation which is a part of the greater Building Society Movement with its assets exceeding £2,000 million, and in a voluntary capacity we help in maintaining the stability of society generally, a society which despite all past setbacks has overcome the winds of adversity which have blown so sadly and strongly against us in the last six months. We shall continue to play our part, knowing that that which we do serves our people well and is part of our national characteristic. The report was adopted.

BORAX CONSOLIDATED, LIMITED

BEST YEAR TO DATE

MR D. ABEL SMITH ON BIG NEW DEVELOPMENTS

The fifty-eighth Annual General Meeting of Borax Consolidated, Limited, was held at Borax House, London, on March 28th. The following are extracts from the circulated statement of the Chairman, Mr Desmond Abel Smith, MC.

The results of the year under review are the best in the history of the Company, having exceeded the 1951 figures which so far had stood unrivalled. This speaks very highly for our executive staff and employees as well as for our agents and representatives throughout the world, and to all of them I would express our thanks and appreciation.

Capital Expenditure of the Group during the year includes the completion of Borax House in addition to normal capital expenditures at your mines and refineries.

STUDY OF COMPANY EXPANSION

As foreshadowed in my Annual Statement last year, your Board has been actively engaged in examining the Company's corporate and financial structure in all its aspects, assisted by our Financial, Technical and Legal Advisers and Auditors.

The examination covers the whole of the field in which your Company operates and of necessity is long and complicated. It falls into three general divisions: (1) the broadening of the Company's activities; (2) the financing of the extension of our operations; and (3) possible changes in the structure of the organisation.

You are fully aware of the policy of the Board to take Stockholders into their confidence as soon as possible and this has been fully demonstrated by the letters I have sent to Stockholders during the past year. We had very much hoped to be able to complete our studies by this time so that full particulars could be given at the Annual Meeting and it is with great regret that we are unable to do so. I can assure you that as soon as ever possible full details will be circulated to you.

As you know, your Board last October authorised the start of work on the big new development in the United States which has been under study for some years and to which reference has been made on several occasions.

Although underground mining, which has been used at Boron for many years, is a very efficient operation, it will now give way to open cast (surface) mining. This new method of winning our ore is the result of various experiments carried out in recent years in order to determine how best to recover a larger percentage of the ore available in the Boron deposit.

ECONOMIES IN OPERATION

Recent developments in equipment have made open cast mining economically practicable at Boron.

As stockholders have also been advised, new concentrating and refining plants are being built at Boron, which will also lead to high production and lower costs. In the past all refining operations in the USA were carried out at our large factory at Wilmington, California, over 200 miles away by rail. Due to the long railway haul the economics of this operation have always required a high-grade feed of ore to the plant. The lower-grade ores which the open cast opera-

tion will produce made it economically necessary and desirable to avoid the railway haul from Boron to Wilmington and thus for the new refining process to be located at Boron. The savings in railway freight on the tonnage of higher-grade ore transported in the past are very appreciable. With lower-grade ore resulting from open cast mining the savings will run into very high figures. The possibility of combining the concentrating and refining operations as far as ore handling, product loading, etc., are concerned, also presents an extremely attractive picture. During recent years the development of equipment has been such that a great many advantages will be obtained by erecting a new plant with all modern devices obtainable.

It is gratifying to be able to inform you that our current year, which is now six months old, shows every prospect of being as satisfactory as the year under review. I hesitate to look far into the future but, unless there is a general recession throughout the world, your Company's business should remain satisfactory. With the expansion of world population and the improving standards of living throughout the world, the demand for our products should grow.

MANY USES OF BORON

The strength of our position lies in the fact that Boron in one form or another is used in so many different industries. Our products are sold to well over a hundred industries, of which the major users are glass, porcelain enamel, weed control, fertilisers, detergents, soaps, anti-freeze, starch and adhesives, etc. The largest single use is for glass.

We have during the past year added new products to our list and we continue our research in this country and in the USA, looking for further ones.

Another interesting new development during the last twelve months has been the production of Elemental Boron on a commercial scale and of a quality not previously produced in commercial quantities. One of its prospective uses is in atomic energy power plants as a neutron absorber for controlling the nuclear reaction and for some types of shielding materials.

US POTASH COMPANY

Our investment in the United States Potash Company continues to yield satisfactory results. The bonus dividend paid in December, 1954, and referred to in my last statement, is reflected in the increased income from our Trade Investment. You will also note that the market value of this investment was higher on September 30th last than it was a year previously. Since our accounts were prepared there has been a further increase in the market value of this holding.

Addressing the Meeting, the Chairman said: In the statement which I circulated to you I told you that studies of the plan which we have been working on had reached a critical stage. I can now amplify this. Resulting from the review we have been engaged in and the studies we have been making together with our Financial Advisers, we have agreed on a plan and the first steps in accomplishing it have already been taken.

The Report and Accounts were adopted.

UNITED SERDANG (SUMATRA) RUBBER PLANTATIONS, LIMITED

SIR ERIC MILLER'S SPEECH

The forty-eighth annual general meeting of The United Serdang (Sumatra) Rubber Plantations, Limited, was held on April 6th at 19 Fenchurch Street, London, E.C.

Sir Eric Miller (Chairman) presided and in the course of his speech said:

The local currency net profit of the group for 1954/55, at Rp10,424,033, after providing no less than Rp14,974,687 for Indonesian Company Tax and the levy on estimated remittable profits, was almost treble the corresponding figure for 1953/54. The striking increase is attributable to the relatively high average price of rubber during the period, which temporarily overshadowed a further disturbing increase in the unit cost of production.

In the space of two years, despite every prudent economy, local inflation has forced our estate cost up by the equivalent of nearly 3½d. per lb. As wage increases were only partially reflected in our 1954/55 accounts, working expenses are likely to be higher in the current year, but we are getting better crops and some alleviation will arise from lower export duties.

No authority for remittance has yet been granted in respect of our 1954/55 Indonesian currency profits, nor is it yet known when, or to what extent, this will be forthcoming.

REMITTANCES

The sterling profit and loss account shows that remittances from Indonesia during the year under review amounted to only £26,288, which was less than sufficient to cover sterling disbursements, with the result that there is a debit balance for the year of £6,396. As against this we were able to bring in credit items, as detailed, and the amount brought forward from the previous accounts, which together make the available balance £101,732.

The dividend of 6 per cent less income tax is the same as for the previous year and the amount thus distributed is £49,103, leaving a credit balance of £52,629 to be carried forward.

NEW GOVERNMENT

Since the close of our financial year the Indonesian Republic has held its first General Election, in which the Nationalist and Masjumi (Moslem) parties ran neck and neck, with the Nahdatul Ulama (another Moslem party) a good third. The formation of a coalition Government has been completed, giving proportional representation to these three and to a few of the smaller parties, but excluding the Communists.

Many speeches have been made by Mr A. L. Mathewson and myself in recent years at Plantation Company meetings setting out in the simplest possible terms the prerequisites for a restoration of confidence in the potentialities of Indonesia as a safe area for investment in rubber growing on modern lines. We are having these matters brought to the attention of those now in power, and it is to be hoped that the new Cabinet will act with all possible speed on these representations, which are applicable over a much wider field of investment in the Republic.

The report was adopted.

HARRODS LIMITED

RESULTS CONSTITUTE A RECORD

SIR RICHARD BURBIDGE ON PROBLEM OF RISING COSTS

The sixty-sixth annual general meeting of Harrods Limited will be held on April 23rd at the Company's Premises, Brompton Road, London, S.W.1.

The following is an extract from the circulated statement of the Chairman and Managing Director, Sir Richard Burbidge, Bart, CBE:

I reported last year that negotiations were proceeding for the purchase of a freehold and leasehold site in Birmingham. The negotiations with the Corporation came to a successful conclusion. To finance this development the Directors decided to issue the balance of the 677,209 Ordinary Shares of the Company. The net proceeds of the issue amounted to £1,591,677 and were sufficient to cover the £1,586,018 at which the Birmingham properties stand in our books. We have also arranged to buy the well-known drapery business of Rackhams Limited. Your Directors are confident that this project will prove a valuable extension to the Group's activities.

The accounts give a full picture of the result of the trading of your Stores for the year ended January 31, 1956, and I feel sure you will consider this result satisfactory. The amount of turnover, gross profit and net profit were all the highest in our history, but it has not been easy to obtain the increase in turnover necessary to counteract the ever-increasing expenses, and although the trade of each of the different businesses increased, this was not always sufficient to earn an increased net profit.

The total gross profit and other income of the Group was £8,263,047, an increase of £488,899, but on the other hand expenses at £6,099,651 were £322,663 more than last year, so that the profit before taxation shows an increase of £166,236 at £2,163,396. The Consolidated Net Profit is £971,939 and is £230,738 more than last year. Of this profit £191,610 or £62,662 more than last year is retained by the Subsidiary Companies as additions to their reserves, and the balance remaining to be dealt with by Harrods Limited is £780,329, an increase of £168,076.

The directors have appropriated £100,000 for Buildings Reserve, the same as last year, and £75,000 to Contingencies Reserve, and after allowing for the dividends on the Preference Stock and the interim dividends on the Ordinary Stock, recommend the payment of a final dividend of 12½ per cent on the Ordinary Stock. This final dividend will make a rate for the year of 17½ per cent on the Ordinary Stock. The balance of Profit unappropriated is £49,799 and the amount of profit carried forward £418,584.

Consolidated Balance Sheet: Total Current Assets at £10,093,696 exceed Current Liabilities (including Banking Department Balances) by £4,009,281.

HARRODS AND SUBSIDIARIES

I am pleased to say Harrods of Knightsbridge, which is responsible for more than half the turnover of the Group, had a very good year and created a record in turnover and profit. This was due, I am sure, to the ever-growing reputation and popularity of your famous store.

Kendal Milne & Company in Manchester have been affected, I think, by the recession in the textile trade, but they show a reason-

able increase in turnover. I am sure we can look forward to steady improvement here.

The sales of D. H. Evans of Oxford Street again increased but not sufficiently to counteract their increased expenses.

In Regent Street, the results of Dickins & Jones showed an increase in their turnover and a slightly larger net profit, but the rate of progress of the last year or two was not maintained. I am looking forward to better results.

The improvement at John Walsh of Sheffield continues both as regards turnover and profit, their percentage increases being one of the highest of the Group. At times they are beginning to feel the need of extra room and we shall have to consider soon the advisability of the addition of the upper floors.

Henderson's of Liverpool did not make quite as much net profit as last year, although their trade increased, but I am more than satisfied with the progress they have made in recent years. I am quite happy about the future prospects of the business.

PURCHASE TAX

The Retail Trade was very disturbed that in the Autumn Budget debates the Chancellor stated that he was making use of Purchase Tax as a flexible instrument of fiscal policy to influence the trend of consumer purchases. Our Trade Association has constantly pointed out to the Chancellor the disruption caused by mid-season tax alterations and the injustice to retailers of having to bear the burden of all losses due to such alterations. This is a thoroughly bad tax at all times, but when changes take place in the middle of the season great dislocation and confusion ensue particularly when goods have been advertised. In the case of an increase in tax we maintain the lower prices as long as possible whilst when the tax is decreased we immediately reduce prices with a consequent loss to ourselves.

If the Chancellor intends to retain this tax over the next few years it is essential that the whole structure of the tax should be critically examined so that the Retail Trade should not continue to bear the unfair burden of all the losses.

PROSPECTS

The Retail Trade generally is facing the coming year with more uncertainty than for many years past. The one certainty is that expenses are going to continue to rise and the new burden of increased rates alone, in our Group, is estimated to be over £100,000 in a full year. Added to this we now have a determined drive by the Government to restrict spending at home. Stores selling better class merchandise should feel the effects first, but in our Group we serve a wide section of the public and should benefit from the fact that with employment at a high level and the recent increases in wage rates, more money will be in circulation. We shall, however, have to fight hard to get sufficient increase in trade to take care of the rising expenses. Your management is alive to this, and while perhaps we may not be able to show you another record, I feel that we shall produce satisfactory profits this time next year.

ARISTON GOLD MINES

MAJOR GENERAL W. W. RICHARDS SPEECH

The twenty-sixth annual general meeting of this company was held on April 10th in London.

Major General W. W. Richards, CB, CBE, MC, chairman, said: Productive operations were resumed on the Mine on February 27th last. The General Manager now reports that during the month of March 31,330 tons of ore were crushed for a gold recovery of 7,747 ozs, showing an estimated revenue of £96,450 and a working profit of £8,746. We hope that the current month's production will be back to normal, as Mr R. Clelland reported that an appreciable amount of gold has been locked up in the plant by way of plant absorption, which is to be expected on resumption of operations after shut down of gold treatment plant.

Our General Manager, together with our Consulting Engineers and Industrial Consultants, West African Gold Corporation Ltd., are now actively preparing the comprehensive underground development programme to be embarked upon. The work will be started as early as practicable, after ensuring that there will be no interference with current production. The intention is to open up the lower sections of the Mine down to the 30th level.

Work has been resumed in the Gamma section of the Mine, which is between our most southerly workings and the Gold Coast Main Reef Ltd. areas. Driving North on the 3rd Level has been restarted. Reef has now been exposed on this Level showing values of 14.82 dwts over 77.8 inches, equal to 1,153 inch-dwts., for a distance of 140 feet. Driving South on the 6th Level will be resumed as soon as it has been equipped, in order to explore the area between the Gamma Shaft and the boundary. Old records indicate high values on the 2nd and 3rd Levels in this area.

Members will appreciate that the Company's cash position does not permit resumption of payment of Dividends at this time, but, as mentioned in my printed Review, this matter will be the first concern to the Board as and when the progressive results for the remaining six months of the current financial year become available.

General.—I visited the Gold Coast recently and called a conference at Takoradi of Mines Managers and Consulting Engineers, when policy was laid down, and I took the opportunity to congratulate the Staff on the excellent recovery they have made and the rapid resumption of operations.

The following is an extract from the Chairman's Review and the Report of the Directors for the year ended September 30, 1955: The activities of the Company have recently been overshadowed by the general strike of African employees in the Gold Coast gold mining industry for a 15 per cent all round increase in wages, back dated to October, 1953, which lasted for just over three months from November 20, 1955.

The profit for the year amounted to £206,274, which with the balance brought forward makes a total amount available of £284,984. The Board recommends the transfer of £130,000 to General Reserve, and the allocation of £10,000 in respect of "new additional taxation, etc." which latter is to cover the increased charge due to the provision for African Gratuities not being allowed for tax purposes. The amount to be carried forward to the current year will then be £80,297, as against £78,710 brought in. The report was adopted.

THE SCOTTISH LIFE ASSURANCE COMPANY, LIMITED

YEAR OF MANY RECORDS

Mr Charles R. Munro, CA, Chairman of the Board of Directors, presided at the annual general meeting of The Scottish Life Assurance Company, Limited, held in Edinburgh on April 4th.

In moving adoption of the report and accounts for the year ended December 31, 1955, the Chairman said:

NEW BUSINESS—SIXTH SUCCESSIVE RECORD YEAR

The net new business of 1955, after deduction of re-assurances, amounted to £8,777,278. As mentioned in the annual report, this is an increase of 28 per cent on last year, and is more than double the amount written in 1950, the closing year of the previous quinquennium. Group life assurance business included in the above total, £1,364,449, is very nearly twice the corresponding amount for 1954. There has also been a substantial increase in new deferred annuities effected in connection with pension schemes.

LIFE AND ANNUITY REVENUE ACCOUNT

The continued increases in our new business have naturally resulted in increases in premium income. A year ago I referred to a record increase of 15 per cent over 1953. In 1955 this record has been surpassed; the premium income is 22 per cent above that for 1954 and has for the first time exceeded the £2 million mark. Investment conditions during the year have been favourable and there has been a marked increase in the rate of interest earned on the Company's funds. The gross rate of £5 12s. 8d. per cent compares with £5 5s. 4d. per cent for 1954, the corresponding net rates, after deduction of income-tax, being £4 16s. 11d. per cent for 1955 and £4 9s. 3d. per cent for 1954. Claims by death at 47 per cent of the expectation are again light.

BALANCE-SHEET

During 1955 there was a marked fall in the value of Government stocks and other fixed-interest securities, but this was counterbalanced by an increase in the market prices of ordinary stocks and shares. The Company has a very substantial holding of equities in the United Kingdom and also in the United States and Canada, and at the end of the year the market value of our total assets, despite the depreciation in fixed-interest investments, was well in excess of the book value. Notwithstanding the fall in the value of all classes of investment which has since taken place, our assets are still worth considerably more than the figure at which they stand in the balance-sheet.

QUINQUENNIAL INVESTIGATION

As you will have seen from the Actuary's statement appended to the annual report, the quinquennial valuation as at December 31, 1955, has revealed a very satisfactory position indeed. As a result the Directors have declared a bonus on full-profits Policies at the rate of 48s. per cent per annum, equal to the highest rate ever declared by the Company. Interim bonus additions on full-profits Policies which become claims during the

current quinquennium will, until further notice, be at the rate of 46s. per cent.

SEVENTY-FIFTH ANNIVERSARY

Early next month the Company attains the 75th anniversary of its foundation in May, 1881, by the late Sir David Paulin. It was a bold venture at a time when there were in Scotland so many long-established and successful life assurance institutions; but Sir David's energy and enthusiasm overcame all obstacles, and from a very early stage in its career the Company became a serious competitor to its older rivals. Whether measured by new business, life funds, or premium income, the progress it has made in its first 75 years is outstanding.

THE ATTACK ON INFLATION

The fall in the value of the pound is very much in our minds in these days. One remedy for this continuous inflation is to reduce consumption and increase saving. Among the strongest influences in this direction I count the activities of the new business staffs of the Life Offices, and as our figures show, our own field staff have not been unsuccessful in diverting money from purposes less essential, or even harmful, to the national economy, into that important form of saving which is represented by life assurance premiums. There is still, however, much scope for their efforts; the average amount of life assurance per head in this country compares very unfavourably with that in the United States and Canada.

SELF-EMPLOYED PERSONS

I find that at each of the last five annual general meetings of the Company I have referred to the Millard Tucker Committee on the Taxation Treatment of Provisions for Retirement. The Committee's report was issued more than two years ago and still no steps have been taken to remedy the disadvantages to which professional men, shopkeepers, and other self-employed persons are subject as compared with employees.

There is a clear case for action by the Government to end discrimination against the self-employed person, and once again I express the earnest hope that speedy attention will now be given to this important subject.

OFFICIAL CHANGES

Mr Penn, our General Manager since 1946, who entered the Company's service in 1922, is now approaching the retirement age, and although he will not be leaving the Company's service until the autumn, it is proper that I should today take advantage of this opportunity of expressing here on behalf of the Board, shareholders and policyholders our appreciation of the efficient manner in which he has discharged his duties, first as the Company's Actuary, then as Secretary, and finally as its General Manager.

We are fortunate in having a particularly strong team of capable Officials at the head office, so that the succession creates no problem. In the meantime, the Directors have appointed Mr J. G. Wallace, MA, FFA, formerly Secretary, to be Deputy General

Manager and Mr J. M. Denholm, MA, FFA, formerly Deputy Secretary, to be Secretary. The Directors have every confidence that under these young but experienced Officials the proud record of the Company will be maintained and we hope enhanced.

DIVIDEND

The Directors recommend that the final dividend for 1955 be raised to 6s. per share, making the total for 1955 10s. per share as against 7s. 6d. for 1954. As stated in the report and accounts, they intend to declare in due course an interim dividend for 1956 at the same rate as for 1955, i.e. 4s. per share; and it is hoped to maintain the total annual dividend at 10s. per share.

The motion was duly adopted.

REFUGE ASSURANCE COMPANY, LIMITED

INCREASED REVERSIONARY BONUSES TO POLICYHOLDERS

The Chairman, in a statement submitted with the 1955 accounts, mentioned the necessity of long-term savings in the national interest, and the part that savings organisations play in accumulating small individual sums to provide the vast amounts of capital the country requires. He referred in particular to the work of the Life Assurance Companies and stressed that Life Assurance is an ideal way of helping oneself whilst playing one's part in assisting the community to combat inflation.

The combined new sums assured of £33,600,000 in the Life Branches was the greatest yet written by the Company in any year, and the sums assured and bonuses in force had increased to £345 million. The total assets of the Company were £141 million.

ALLOCATIONS TO POLICYHOLDERS

In the Ordinary Branch a surplus of over £1,500,000 was allocated to policyholders to provide a bonus on with-profit policies at the rate of £1 14s. per cent. on the sum assured in respect of each year's premium due in 1955 and paid. This rate was an increase of 2s. per cent over that of 1954.

In the Industrial Branch £1,200,000 was allocated to policyholders to provide a reversionary bonus to premium-paying policies (with certain exceptions) at the rate of £1 per cent on the sum assured for policies dated 1940 and earlier, and £3 10s. per cent for policies dated 1951, it being the first time that the latter class has participated. The conditions under which paid-up policies were granted at advanced ages had also been improved and certain other increases in benefits continued.

HOUSE PURCHASE SCHEME AND INVESTMENTS

During the year £4,900,000 was advanced on House Purchase mortgages, increasing the total advanced on mortgages and loans to £24 million. In addition, the Company has assets of £54 million invested with the British Government or Local Authorities, £37 million in Debentures and Preference Stocks and £16 million in Ordinary stocks. These investments have provided finance for many projects, national and local, and in diverse industries, to the great advantage of the community as a whole as well as of the policyholders, for the due performance of whose contracts the investments are held.

HARRODS (BUENOS AIRES), LIMITED

PRESENT AND PROSPECTIVE GENERAL SITUATION

INCREASED STERLING RESOURCES

PROBLEM OF LOCAL WORKING CAPITAL AND PROFIT REMITTANCES

The 43rd Annual General Meeting of Harrods (Buenos Aires), Limited, will be held on April 26th at Winchester House, Old Broad Street, London, E.C.2.

The following is a précis of the review by the Chairman, Mr F. A. Stacpole, which is being circulated to shareholders.

HIGHLIGHTS OF THE PRESENT POSITION

(a) At August 31, 1954, the group had sterling cash assets in London of £457,000. Now our corresponding sterling resources are about £1 million, after paying out nearly £223,000 in October last to bring the preference dividends up to date.

(b) Our peso profits in Argentina for 1954-55 at 21 million are greater by about one-third than those of 1953-54 (which in themselves showed a marked recovery after the setback of the previous year). The improvement was due to greater volume, both monetarily and in physical quantity, because in order to assist our large circle of customers we reduced our rate of gross profit. It is gratifying to see the appreciation of our efforts reflected in the figure just quoted. A satisfactory trend of trading is being maintained in the current year.

(c) These results were achieved in a period of eighteen months, marked by both political and economic upheavals in Argentina during which the capital and other cities suffered bombardment and three presidents followed one another in a matter of weeks.

(d) Let me give you a striking example of how the depreciation in the peso exchange increases the cost to us of remittances. The remittances totalling £2,200,000 which we received during the seven years to August 31, 1954, cost about 44 million pesos. Since April, 1955, we have received remittances of about £780,000 which cost us about 56 million pesos. But 56 million pesos today, were it possible to carry out such a transaction in one operation, would only produce about £470,000.

RÉSUMÉ AND CONCLUSION

This résumé also deals with some of the points which have been raised in press commentary or by shareholders.

(a) Trading profits for the first half of the current year appear likely to be better than those of last year's. It is too soon to express views about the second half-year, more especially as the Argentine authorities, not unlike their opposite numbers in Whitehall, are tending to suggest that the inevitable rises in costs can be met out of the profits of commercial and industrial enterprises, without passing them on in the form of higher prices to the consumer. As you have seen, we have already gone some way in reducing our margin of gross profit, and we cannot always rely on this being recouped by

a sufficient increase in sales or by a stabilisation of operating costs. The situation in this latter regard is made no easier by the 10 per cent increase in remuneration effective from February 1, 1956, which has just been decreed.

(b) The Board is giving serious thought to the possibilities of raising further working capital in Argentina, whether by the sale of surplus properties, by mortgages or otherwise. In the foreseeable future they do not seem likely to contribute more than a partial solution to our problem. In any case, caution should be exercised in mortgaging or selling real estate until it can be seen how the depreciation of the exchange value of the peso will be reflected in property values.

(c) Unless something on a sizeable scale can be done on the above lines, our working capital requirements in Argentina make it unlikely that we shall be able to bring back home any but the smaller part of our past unremitted profits. Indeed, we may have also to leave annually a proportion of future profits in Argentina for this purpose if price levels continue to mount.

(d) If, on the other hand, a definitely deflationary policy were made effective in Argentina, our liquid position might be temporarily eased, but we should probably have to pass through a difficult trading period during which profits might be small. The example of our 1952-53 will be fresh in the minds of many of you.

(e) There is no present indication of a buyer being interested in the undertakings of the company as a whole, if only for the reason that they are so big that their acquisition would represent a major operation.

Finally, let me leave two thoughts in your minds.

On the one hand it is our duty to be prudently cautious in the picture we present to you. In particular, you should not forget the words at the end of my last year's review—"these shares do not meet the requirements of the investor who is looking for a regular and assured source of income." This is an enterprise wholly dependent on operations in South America, an area where, as everybody knows, currency difficulties and political disturbances occur in addition to the ordinary risks of commerce.

On the other hand you should remember that you have a very large and healthy business in Argentina, and a financial situation in London which, after bringing the payment of the preference dividends right up to date, is stronger than for many years past.

This position, achieved at the end of one of the most difficult decades in modern Argentine history, gives not only the Board but also everyone in our service, grounds for confidence that the Company will be able to surmount the probably lesser difficulties of the next few years.

WESTERN SELECTION & DEVELOPMENT

MAJOR GENERAL W. W. RICHARDS' STATEMENT

The twenty-sixth annual general meeting of this company was held on April 12th in London. Major General W. W. Richards, CB, CBE, MC, Chairman, presided.

The following is an extract from his statement circulated with the report and accounts for the year ended September 30, 1955.

The strike of African mineworkers in the Gold Coast Colony which began on November 20, 1955, and ended on February 27, 1956, has seriously affected the economy of the gold mining companies in which we are largely interested.

After providing for income tax on dividends received the profit for the year amounted to £102,066. We recommend the payment of a dividend for the year of 10 per cent less tax.

The bulk of our investment holdings are in mining companies in West Africa. Our investments at September 30th last had a Market Value of £1,056,869 against a Book Value of £1,088,641. Our holdings in Companies mining for tin and columbite in Nigeria continue to yield satisfactory results.

Canada.—During the period under review a Canadian Company under the title of Anglo Barrington Mines Limited was registered in the province of Manitoba, to prospect, develop and exploit nickel, copper and uranium claims acquired in the provinces of Saskatchewan and Manitoba.

The report and accounts were adopted.

THE RIO DE JANEIRO FLOUR MILLS AND GRANARIES

The Seventieth Ordinary Annual General Meeting of The Rio de Janeiro Flour Mills & Granaries, Limited, was held on April 4th in London.

The Chairman, Mr G. McT. Sheppard, in his address referred to the fact that, although the accounts for the year ended September 30, 1955, showed an increase in the Group's Trading Profit of nearly four and a half million cruzeiros compared with the previous year, upon conversion the Group Trading profit for the year had declined from £668,444 to £642,525.

The trading of the flour mills of the Group had again been disappointing, the main contributory factors to this being the insufficient and irregular wheat supplies made available to the mills. With regard to wheat supplies for the current year, the outlook appeared to be reasonably good. The Brazilian wheat crop now being harvested showed promise both as to quality and size. The Ministry of Agriculture had raised the price of this wheat to Cr.420.00 per bag of 60 kilos placed up country—an increase of 40 per cent on last year's price!

As regards prospects in Brazil for the current year, it would seem that unless really drastic steps were taken soon to combat the problem of inflation, the outlook for 1956 would be difficult.

The report was adopted, and the final dividend of 6 per cent and bonus of 4 per cent, making 14 per cent for the year, was approved.

NATIONAL BANK OF EGYPT

FAVOURABLE ECONOMIC DEVELOPMENTS

DR AHMED ZAKI SAAD'S REVIEW

The fifty-sixth annual general meeting of the National Bank of Egypt was held in Cairo on March 28th.

Dr Ahmed Zaki Saad, Governor and President, in the course of his speech, said:

Economic developments in Egypt, during 1955, may be regarded as favourable on the whole. The monetary situation has remained stable. Commercial banks have consolidated their position and the stock market was active. The Futures market, which remained closed for about three years, was re-opened. Measures were taken to liberate the cotton market from artificial influences which vitiated the effect of the normal relationship between supply and demand. Import entitlement arrangements which led to discriminatory and multiple currency practices have been abolished. Investment activities have continued to expand, and the preliminary arrangements for constructing the High Dam are nearing completion.

Nevertheless, there has been a heavy demand throughout the year for foreign exchange, in growing volume, specially for the purposes of development. The result was an excess of external payments over receipts which is provisionally estimated at about £E35 million.

MONETARY SITUATION

The monetary situation has been characterised by stability. While the money supply has increased despite a fall in the currency circulation, prices have not risen during the year. The cost of living index has remained unchanged while the wholesale index rose by 2.6 per cent. The tendency of the banknote circulation to decrease has continued since 1952 and has resulted in a total contraction which amounted to 10 per cent up to the end of December 1955. The other component of the money supply, namely the deposits, have risen considerably, during the same period, by about 25 per cent. The total money supply rose during 1955 from £E443 million at the end of 1954 to £E458 million at the end of 1955 or by 3.4 per cent.

The increase in the money supply was due to the expansion in bank credit and the growing Government expenditure arising mainly from the execution of development projects.

COMMERCIAL BANKS

The Commercial banks have consolidated their position considerably during the year by employing the increase in current, time and savings deposits to strengthen their cash and balances with the National Bank of Egypt. Their reserve ratio rose from 17.0 per cent at the end of 1954 to 22.2 per cent at the end of December, 1955. The loans and advances granted by banks were at the end of 1955 at the same level of £E127 million as in December 1954. The notable feature of the position is an increase of bills discounted from £E17.7 million to £E20.7 million, which has had its counterpart in the volume of bills rediscounted with the Central Bank. Since the reserve position of the banks has been considerably strengthened, they may look forward with confidence to carrying out their functions of financing the economy in the current year.

As regards foreign trade in 1955, the total value of exports remained at the level of last year, i.e. about £E138 million. There was a slight reduction in the quantity of raw cotton exported, from 6.4 million to 6.2 million cantars with a fall in the value from £E113 to £E107 million, but the improvement in exports of other articles, especially of rice from 47,000 tons in 1954 to 182,000 tons in 1955, with a corresponding increase in value from £E2.6 million to £E7.3 million, bridged the gap. The increase in rice exports is due to an abnormally large crop, the reduction of the export tax and a flexible export policy. Cotton yarn maintained the same high level reached in 1954, i.e. £E4.4 million. Imports rose considerably from about £E161 million to £E183 million, and the perusal of the list of imported goods shows that the main increases took place in machinery for industry and agriculture of which the value was more than doubled, in electrical machinery and apparatus and in motor-cars and iron and steel, which shows that the main increases were for productive purposes.

An interesting feature in the development of imports is the indication of saving in foreign exchange through industrialisation: as a result of the extension of the Government Refinery at Suez the imports of petroleum products fell by £E3.7 million while the imports of Crude oil rose only by £E2.7 million. The imports of fertilisers fell from £E11.2 million to £E9.5 million, because of the increased local production. Imports of cotton piece-goods and rayon decreased for the same reason. In a number of countries expenditure by tourists represents a considerable part of the "invisible" sector of foreign exchange receipts. We feel sure that our authorities are alive to the need of fostering this source of revenue which already is yielding satisfactory results.

COTTON

A major event for Egyptian cotton is obviously the Government's decision to re-open the Alexandria Futures Market—a decision which was welcomed warmly by trading circles both here and abroad.

Given a continuation of that healthy state which our market has shown thus far ensuring the prevalence of reasonably competitive prices, it is not improbable that the present flow of exports will continue, resulting in a smaller carry-over. It is thus possible for the country to look forward to starting the coming season with a sound statistical position which will enable us to maintain our position whatever policies other producing countries may embark upon.

The Egyptian economy is now in the midst of a transition period. We are entering a time of increased investment activity which should lead ultimately to considerable increases in productivity to face an ever increasing population and to secure a higher standard of living for the people. Inevitably such investments take time to yield results.

The Profit and Loss Account shows a gross profit of £E2,675,510 as against £E2,404,298. Expenses show an increase of £E265,529. The net profit amounts to £E636,448 compared with £E630,764. This enables us to propose a dividend of 20 per cent. The report was adopted.

CALEDONIAN INSURANCE COMPANY

The 151st Annual General Meeting of the Caledonian Insurance Company will be held on May 10th in Edinburgh. The following is an extract from the circulated Statement by the Chairman, Mr W. H. Fraser, WS:

Life Department: For the third year in succession we wrote a record amount of new Life business. After deducting reassurances the new Sums Assured, including Group Life business, amounted to £3,918,585 as against £3,573,348 written in 1954. Due to an increase in our Staff Pension Schemes business, Annuity Bonds securing £327,755 per annum were issued as compared with £266,658.

The Life premium income at £1,123,801 shows an increase of £37,262 and interest income at £493,290, after deduction of tax, shows a very satisfactory increase of £69,243. The net rate of interest earned on the Life Fund was £4 per cent as compared with £3 12s. 10d. per cent a year ago. While the amount paid in respect of death claims has increased, mortality experience continues to be favourable. General expenditure has increased and our expense ratio is 16.5 per cent compared with 16.0 per cent. The Life Fund now stands at £12,993,608, showing an increase for the year of £788,044.

Fire Department: The premium income for 1955 was £3,302,250, an increase of £208,091.

We again experienced satisfactory underwriting results in the Home Department. In the Overseas field, apart from the North American Continent where our adverse experience continued, the excellent progress made in recent years was fully maintained. Due to a reduction in the reserve required for long-term business the additional provision has been reduced by £45,000 and the sum of £296,355 has been transferred to the Profit and Loss Account.

Accident Department: The premium income was £4,081,466, a record for the Company and an increase of £279,964 over 1954.

We had hoped the revised rating structures in the Motor Section in many areas would have ensured an improved world-wide experience in this section, but this year we have suffered heavy losses, with the result that while the other sections of the Department produced satisfactory profits the account as a whole shows a loss of £41,865, which sum has been transferred to the Account from the Profit and Loss Account.

Marine Department: The Fund at £933,957 represents 201 per cent of the premium income which compares with last year's percentage of 194. The sum of £70,000 has been transferred from the Account to the Profit and Loss Account. This transfer arises as a result of profitable trading in recent years, but it should be noted that we may not experience such favourable results in the immediate future years on account of the intense competition in this Department.

The total premium income for all Departments was £9,316,904, the corresponding total for 1954 having been £8,738,888.

Profit and Loss and Appropriation Accounts: The amount of interest, dividends and rents (less tax) not carried to other Accounts was £196,244.

The balance for the year transferred to the Appropriation Account was £328,603 after providing for taxation.

The Directors' recommendations for dealing with the surplus are stated in the Report, and if approved the balance carried forward is increased by £110,478 to £703,482.

or call at 30 Queen Victoria Street, London, E.C.4.

UNIVERSITY OF CAMBRIDGE

Applications are invited for three posts of Assistant Agricultural Economist to undertake research in agricultural policy, (b) agricultural production and (c) horticultural production. Qualifications should include a degree in agriculture or economics, and a knowledge of the structure with training in the economics of agriculture or horticulture. The closing date for applications is 1.11.64. Successful candidates will be given to applicants on a temporary basis. Applications should be sent to the Secretary, School of Agriculture, University of Cambridge, Cambridge.

LADING London ADVERTISING AGENCY requires PERSONNEL MANAGER. Knowledge of Advertising an advantage but not absolutely essential. Must be a person with a minimum of 10 years' experience as high-grade specialist staff of the more professional advertising agencies. The job calls for a mature judgment of men and women and the ability to assess the potential value of young people for training and promotion into jobs.

We should appreciate from applicants a detailed account of their experience and full personal particulars in the form of a letter, together with a recent photograph. "Personal" and salary requirements. Mark your envelope "PERSONNEL MANAGER" and send to:

Wood & Partners Ltd., 23, Savile Row, London, W.1.

MARKET RESEARCH—Due to expansion of its activities, the Market Research Department of a nationally known manufacturer of consumer goods has a vacancy for a Research Officer experienced in the handling of all phases of consumer surveys and in report writing. This is a senior post carrying a salary commensurate with the importance of the position. Write in first place, giving details of experience, etc. All replies will be treated in the strictest confidence, and should be addressed to Box 386.

Full particulars (including prospects of promotion) and application forms may be obtained from the Personnel Department, 6 Burlington Gardens, London, W.1, quoting number 531/567. Completed application forms to be returned by May 15.

ECONOMICS with a good University degree followed by a practical experience of market analysis or business forecasting in commercial or industrial firms are invited to apply for senior appointments with the Company. The successful candidate will have specialised knowledge which would enable them to develop new aspects of the Company's activities. Age limit 26-35. Applications (marked 'Personal') should be sent to the Personnel Department, 6 Burlington Gardens, London, W.1.

ACTUARIAL STUDENT FOR SOUTH AFRICA

Established Society conducting Life and General business in the Union and the Rhodesia is expanding and requires a young student, who has passed or about to pass Part II of the examinations, at Assistant to the Actuary. A generous commencing salary will be paid and there are excellent opportunities for promotion. All candidates to taking examinations and passage to the Union are paid by the Society. Pension scheme, medical aid scheme. Long leave granted every five years for holiday. House, London, W.C.2. —Write Box M/195.

A LEADING LONDON advertising agency requires an experienced marketing executive who will be responsible for expanding and developing its market research, marketing and merchandising activities. The content of this advertisement is known to the existing staff. Applications, which should be comprehensive, will be treated in the strictest confidence.—Please write to Managing Director, Box 371.

Imagine a farming world without oil!

As population increases, so must the food supply. Obviously. Yet, without proper implements — tractors, combines — agricultural progress as we know it could not have been achieved. For it is such equipment that permits more intensive, more productive and more profitable farming. And it is oil that runs this equipment, helps maintain and protect it. Caltex, in supplying finer fuels and lubricants to the peoples of 67 free nations, is indeed gratified to be part of this immeasurably important cycle.

INVESTING FOR THE FUTURE IN ZINC

Part of the Waelz Kiln, zinc recovery plant at Avonmouth

THE NEW WAELEZ KILN at Avonmouth is playing an increasing part in the extraction of the remaining Zinc and Lead from spent residues.

The progressive policy of the Corporation makes use of these residues from the primary smelting, in increased production of primary Zinc in the United Kingdom.

THE CONSOLIDATED ZINC CORPORATION LIMITED
57 DOVER STREET, LONDON, W.1 • 95 COLLINS STREET, MELBOURNE, C.1 • 360 ST. JAMES STREET WEST, MONTREAL

Welcome to the committee, Mr. Devoncroft . . .

WHEN Mr. Devoncroft recently accepted the vicar's invitation to be on the committee of the Church Fabric Fund, nobody was surprised. Often he is asked to serve on committees, and almost as often he consents—for, like most busy people, he can usually find time to take on yet another commitment. Mr. Devoncroft, a man in his mid-thirties, holds a senior executive position at a large engineering works in Warwickshire; and there he is respected as much for his personality as for undoubted competence at his work. At the factory or at home, he is one of those people to whom others inevitably bring their troubles, knowing that they will receive complete understanding allied with shrewd practical advice. He is on the Parish Council, adviser to the Youth Club, and prominent in local Civil Defence circles. His inventive mind appreciates useful gadgets that save time and labour but, being a skilled amateur carpenter, he has the craftsman's dislike of shoddy workmanship. Because his impact on those around him stems from happy personal relationships with people from all walks of life, his decisions

and judgments are valued, his preferences and tastes noted. He and his wife take *The Listener* because like many others, they unaccountably miss broadcast talks; previously marked as a "must" in *Radio Times*. He also turns with interest to the numerous articles in *The Listener* on social, economic and historical problems, and enjoys pitting his wits against a weekly crossword that ranges from the intriguing to the frankly diabolical. Mr. Devoncroft is only one out of thousands* who like *The Listener* because of the variety and value of its articles. *The Listener* thus enjoys considerable prestige with well-informed people who are respected—and emulated—by others. Advertisers who wish to appeal directly and economically to this discriminating and influential market will find no better medium than the advertisement pages of *The Listener*.

mind at rest

Step aboard an "Empress" liner at Liverpool and you embark on a welcome interlude of freedom from care. No pleasanter introduction to Canada, or indeed any country, than the "landscape" voyage up the St. Lawrence. No better stroke of business than to arrive refreshed.

Canadian Pacific know how to do things. Food, comfort, service—these can easily be adequate: here they are magnificent. What is more, your journey on from Quebec or Montreal is a simple matter: Canadian Pacific trains give you the freedom of Canada, and run direct, too, to many points in the United States.

Canadian Pacific

In the office
Lexikon

The office equipped with Olivetti Lexikon typewriters has many advantages. For sheer functional simplicity of design the Lexikon has been commended all over the world. In the range of its performance, in its ease of operation, and for the clarity of its work it has earned the highest praise of typists - and particularly of those who delight in being able to please the most exacting of critics.

Automatic margin stops - Key-trip device - Articulated ball-rod - Automatic tabulator - Accelerating typebar action - Carriage on ball bearings - Personal touch-tuning - British made.

and out of the office
Lettera 22

To produce a portable typewriter which, except for its size and weight, lacks none of the up-to-date features of a standard-size machine is, in itself, something of an achievement. Add to that the Olivetti flair for simplicity of design and precision of robust engineering construction and you have the Lettera 22 - the portable typewriter that is completely at home anywhere.

43 keys - Personal touch-tuning - Key-set tabulator - 4 position line spacing - Standard size ribbon - Full-length platen - 2 colour ribbon - Stencil cutting device - Weight 8lbs. 2 1/2 ozs. - British made.

ONCE YOU'VE crossed the gangplank onto the famous "United States" or her running-mate the "America" you are in America. The glamour, the luxury and the hospitality of this friendly country surround you.

And if you're a businessman, you'll find that here is the perfect atmosphere to start a successful business trip. American businessmen like to be approached, like to talk business. In these informal, friendly surroundings, you make contacts that can be of great value to you.

But there's fun aboard, too, lots of it. You'll find unexcelled food and superb wine, magnificent cinemas equipped with CinemaScope, top-grade orchestras, well-stocked libraries, every "keep-fit" facility,

and, of course, just rest and relaxation if you prefer. Yes, the few days that separate you from New York pass all too quickly.

You travel fast and in the utmost comfort when you travel by United States Lines.

* IMPORTANT!

MEMO TO BUSINESSMEN

There are great advantages to be reaped by British businessmen if they travel by United States Lines. They have time, first of all, to adjust themselves to the American atmosphere and the American tempo before they arrive in New York.

And, most important, a fresh contact is more easily made under the sociable conditions aboard ship than over an office desk; the people you meet may turn out to be more than just good friends—they may be useful friends.

IMPORTANT ANNOUNCEMENT

It is announced by

**British Titan Products Co Ltd of York and
African Explosives & Chemical Industries Ltd
of Johannesburg, South Africa**

that they are forming a new joint company in South Africa which is starting immediately with the erection at Umbogintwini on the Natal South Coast some 17 miles from Durban of a plant to manufacture **Titanium Dioxide pigments**. This plant, which is intended will reach the production stage towards the end of 1958, is designed to meet the whole of the growing demand in Southern Africa for Titanium Dioxide, a product which has hitherto been imported.

power for production. Britain's industries need more and more power—and the need is being met by new power stations. Output of current is already 76% higher than in 1943; and today's generating capacity will be nearly doubled in the next ten years. ENGLISH ELECTRIC is playing its full part in this great

development by supplying many of the turbines and generators, transformers and other electrical gear to Britain's power stations. The picture shows the winding slots being cut in the rotor of one of three 60,000-kW turbo-alternators for the Tilbury Power Station of the Central Electricity Authority.

How The English Electric Company is working for Britain at home and abroad

Britain is busy now, more prosperous than for decades past. Full employment, active industries, advances in science and technology, plenty of opportunities both for firms and for individuals... this is progress to be proud of. The challenge—the need—is to maintain it.

All depends on production—and exports.

From 1949 to 1955, our total industrial output rose by 27%, and the value of our vital exports by 58%. But still higher production, still more export activity, are needed to ensure still better living for Britain. In both these ways, ENGLISH ELECTRIC is playing its full part.

At home, this company is helping to supply the generators and other plant needed for Britain's expanding power generation programme; it also makes the electrical equipment by which our industries use this energy for production—production

not only for home demand but for developing export markets.

In addition it is itself a vigorous and successful exporter; about half the Group's business is overseas, earning foreign currency for Britain.

With the world-wide experience of its engineers and technicians, backed by great manufacturing resources and advanced research, ENGLISH ELECTRIC is hard at work, making an important twofold contribution to Britain's economic progress.

To young men and their parents. To any boy or young man considering a career in science or engineering, ENGLISH ELECTRIC offers almost unlimited opportunities—first-class training, and a choice of rewarding jobs at home or abroad. For details, please write to Mr. G. S. Bosworth, Central Personnel Department D.2.

World-wide exports. The first of twenty-three 2,000-h.p. diesel-electric locomotives built by ENGLISH ELECTRIC for Rhodesia Railways is loaded at Liverpool docks; these are the most powerful of their type ever designed for a narrow-gauge railway. Rhodesia is one of 29 countries to which ENGLISH ELECTRIC has supplied locomotives and railway equipment: a significant part of this company's overseas business.

Eight o'clock and so to bed...

Drawn by Espelid.

Not so long ago, when day was done, there was nothing to keep a wage-earner from his bed. What a variety of interests now fills the evening hours! What demand for light, heat, radio, TV, hobbies, crafts, good reading and courses of instruction! Think of the growing needs of today's wage-earners, whose standards of living have so considerably advanced in recent years. Consider especially the 6,750,000 readers of the DAILY HERALD, for they are the cream of Britain's wage-earning families, and their vast purchasing power is increased by the two or more pay packets which come into more than half of their homes each week. Shrewd and discriminating, fast becoming brand-conscious, they are a new power in the buying market, reaching out for more of the good things of life—more food, more clothes, new homes and furniture, cycles and cars, holidays and insurance. At a rough estimate these 6,750,000 will back up their wants this year with an expenditure of something like £1,000,000,000. Who will sell to them most and most often? Only those advertisers who make contact with them in their own daily paper—the DAILY HERALD. For apart from the fact that 40% of the 6,750,000 do not buy any other daily paper, the HERALD is regarded by all its readers as the representative of their interests and an intimate of the family. In fact, such is their faith and belief in it that every advertisement in the HERALD can be said to carry an advantage it gets nowhere else—that priceless and convincing aid to sales—the recommendation of a friend!

HE'S CUTTING COSTS... with *OXYGEN* piped direct to the job

The increasing use of oxygen in modern engineering makes it more than ever important to secure your own, independent supply at the most economic possible rate. The easiest and most convenient method is to install a Butterley Oxygenator. This amazingly compact and efficient plant will provide a reliable, abundant supply anywhere in your works. No more delays or bottlenecks; no awkward, costly handling problems. Your oxygen is literally on tap at any purity you need and at any desired pressure, in the exact quantity you need.

The Butterley Company hold sole rights for the manufacture of Oxygenators in the United Kingdom and British Commonwealth.

Compact, efficient, easy to maintain. Consistent purity. Constant supply and pressure.

What is the Score?

TEN days that failed to shake the world" seems a fair description of the Khrushchev-Bulganin visit to Britain. The visitors were on the wrong foot when they arrived. They had overestimated British readiness to smile politely in the face of standing affront; their public complaint about the programme which they had already agreed with their hosts had evoked a low growl even from Downing Street. Thereafter, although they came bearing gifts suited to the Englishman's love of animals, and penetrated strongholds as various as Windsor, the Mansion House and Claridge's, they made no deep penetration into their hosts' affections; and the scant indications emanating from Number Ten suggested that they were not making much positive headway in their talks with Sir Anthony Eden either. They have not, at the time of writing, left this island; the official—and agreed—conclusions of their discussions have not yet been published. But it already seems possible to draw up the balance sheet and to point to the more important lessons that can be drawn from the visit.

This Anglo-Soviet encounter has been a queer mixture of hospitality and high-level conversation; and the hospitality has taken the limelight, despite the impressively long (and refreshingly private) conversations in Downing Street. Sir Anthony Eden may have acquired some invaluable insight into Russian mental processes and into the murky gulf between Soviet promise and performance; but a probing operation of that kind is not negotiation, though it may be an eye-opening preliminary. In an age in which the free world's survival depends on its unity, there are few if any issues of importance about which Britain can or should negotiate binding agreements separately with Russia—an exception being the field of really free contact between individuals across the iron curtain. There is, one can truly say, no such definable thing as Anglo-Soviet relations.

Yet in present circumstances there would be nothing surprising about the appearance of a communiqué making the most of diaphanous generalisations rather than bluntly recording disagreement or sterility. A joint communiqué requires the approval of both parties, and it has clearly been the Soviet intention to handle the visit to Britain as closely as possible on the lines of last year's visit to India and Burma—that is, to minimise controversy, to please British opinion, to represent Britain to the world as having moved closer to the Soviet Union, and to contrive a triumphal return to Moscow with one more bond of friendship signed and sealed. And it is here that, from Mr Khrushchev's point of view, things have gone badly wrong.

The Soviet rulers apparently expected a truly popular welcome. Even when it was plain that they were not getting one, their subjects, both in Russia and in the satellite countries, were still being regaled with richly imaginative accounts of wild Cockney enthusiasm (this aspect of the visit is further discussed on page 364). And, although the Moscow press has lowered its sights already, the official Soviet verdict on the visit will in any event be that it was a success for Soviet

policy. But by all appearances the visitors themselves are far from confident that this version of events will sound convincing.

What went wrong with their well-laid plans? Nobody expected their appearance in Britain to set off an explosion of Marxist-Leninist fervour here; but curiosity alone might have drawn them crowds big enough to look well in cinema newsreels. British behaviour patterns practically guaranteed them against open hostility, and many honest folk could not have been blamed for hailing this first sight of Soviet Russia's rulers as a sure promise of peace. Stalin had been partly disowned and some of his victims rehabilitated; mischief-making in the Middle East had been apparently suspended for the time being; the Cominform had been dissolved; talk of disarmament filled the air. Waving to unresponsive onlookers, talking trade to business-men and working-class solidarity to Labour MPs, the visitors did their utmost to infect their host nation with their own initial bonhomie; and yet they failed.

Perhaps Mr Malenkov once again acted—unconsciously—as wrecker of his government's plans. He stole from his seniors the glamour of being the first exhibit from the Kremlin on show in Britain; he also had the glamour of a Soviet leader who fell but still survived. Perhaps General Serov's inopportune appearance had left a nasty taste in the public's mouth. Certainly the impressive and restrained march to the Cenotaph of the East European ex-servicemen and refugees was a disquieting reminder to the British people of the dark side of Mr Khrushchev's moon. Again, his brandishing of the Soviet hydrogen bomb and his rage at finding that democratic Socialists in Britain are not indifferent to the fate of democratic Socialists in Eastern Europe contributed to the uncomfortable climate. Whatever the aim of the visit—the declared one of fostering friendship and trust, or that of exploiting “inevitable contradictions” within and between the free nations, an aim which is also freely declared, but only to Soviet audiences—he was going about it the wrong way. The desire for peace, fervently and frequently stated, was undoubtedly genuine—and, today, realistic. But on what—or whose—terms? This is the beginning, not the end, of negotiation.

★

What of the British side of this visit? There can be little satisfaction in the mere thought that our Soviet guests have failed to convert us *en masse* to their totalitarian way of thinking during a stay of a few days. It is probably equally true that our free ways have made no impact—or perhaps have made a distasteful impact—on their minds. What is possible is that their experience here may have slightly weakened their dogmatic belief that free societies are houses of cards, doomed to collapse sooner or later. It may have begun to reveal to them that communism's ugly record has made even its most persuasive gestures deeply suspect in the out-

side world, and that before it can hope to win the trust of free peoples it must change not just its tune but its nature. But there is no sign as yet that it has.

There is no room for complacency about the outcome of the visit. The British are too fond of congratulating themselves on their steadiness and social unity, of claiming that while other peoples—European, Asian, or American—are volatile or gullible, wool is not easily pulled over British eyes. There is liable to be an outburst of this self-praise in weeks to come. What will be overlooked is that the invitation to the Soviet rulers was a very risky gamble, a gamble almost ludicrously characteristic of an island people. When the Government issued the invitation (and when it decided not to use Mr Khrushchev's unforgivable insults, during his tour of India and Burma, as an opportunity to withdraw it), it gave little thought to the fact that in any such encounter there is a third, invisible, but highly interested party—the rest of the free world.

★

There was never the risk of the visitors setting Britain on a neutralist or any other false path. But there was a very real risk that they would contrive to jeopardise Britain's relations with its friends—with our staunch Atlantic allies; with our less staunch, indeed wavering, allies and friends, some of whom have very naturally asked why, if Mr Khrushchev is now being welcomed at Windsor, conscription and heavy taxation are still regarded as necessary to keep this beaming, avuncular figure at arm's length; with our friends in and from Eastern Europe—the Polish airmen and soldiers who have spent a decade in exile, the Czech democrats who have been persecuted for eight years because they held to the ideals of Masaryk and Benes, and others whose lamps of hope have burned dimmer as they see their masters' masters made welcome here. The Government may, admittedly, have taken a nicely calculated risk, confident that the Russians were not clever enough to persuade the world that Britain was wobbling off its course. It seems at least equally possible that the Government simply did not know. And, in that case, we have been extremely lucky.

Is not this the most important lesson of the visit—that when any one of the non-communist nations indulges in separate and spectacular dealings with the rulers of the monolithic bloc that confronts them, it is playing the game that Moscow prefers above all others? The idea that “we can handle these fellows better than anyone else can” is shared, in varying forms, by British, American, French, German, and Asian politicians and peoples; and internal pressures, often party political ones, are apt to lead a good many politicians to try their hand at “going it alone.” By painful effort the free nations have achieved a strength and a unity that enable them to deal with the communist governments from a position of equality. That effort must not now be rendered vain because one free nation after another decides that, on grounds of national character or historical destiny, it can safely play a lone hand.

Wielding the Axe

MR MACMILLAN was engagingly frank this week in explaining how the new Government economy campaign has been conceived. He has thought of a number (£100 million of current expenditure in 1956-57) and is now going to cut it. He recognises that “savings of this magnitude may well require important changes of policy or in administration or both.” They may, indeed, and the Chancellor's hungry simplicity deserves commendation; it might even work. But there will need to be hard thinking about the particular changes in administration and policy required. This article will attempt to make a contribution to it.

The call for vast cuts in Government administrative expenditure is partly a parrot cry, especially as regards Whitehall; the cost of staffing the actual Ministries in London must be under £50 million a year, and even if 10 per cent could be saved on them (which it possibly could) the gain would be chicken feed. But, outside London, this is not a matter for parrots only. Although the ground has been harrowed in so many economy campaigns, the machinery devised for doing the harrowing is archaic. As seen from outside, the following description, and criticisms, of it emerge:

(1) *Ex ante* every item in each departmental estimate is studied by Treasury officials trained in figures rather than technical expertise; they are alert to spot if this year's estimate for any particular item is larger than last year's, but not to know whether last year's was far too high (or too low). For this they must consult experts in other departments. In the growing part of the estimates which has to do with building and maintenance costs, for example, the Treasury has presumably to consult the building trade experts at the Ministry of Works; this has not been staffed up to the grades, and with the calibre, of people that changing Government responsibility should have required.

(2) *Ex post*, there is a huge organisation for audit of accounts; every penny that is spent on every provincial public building passes through local and district audit, up to the accounting department of the appropriate Ministry, then to the Comptroller and Auditor General, and then to the Public Accounts Committee. But this organisation is largely geared to the old task of making sure that corrupt civil servants are not pinching the taxpayers' money, and to spotting any waste that has occurred through obvious mistakes. Except where the accounting departments of the individual Ministries are particularly good—and in a few cases they are—the machinery of *ex post* scrutiny does not do much more than that.

(3) Thirdly, there is what might be called the *anti-Parkinson machinery*. The staff inspection department of the Treasury busily probes each Ministry and suggests that jobs now done by an executive officer could be done more economically by a clerical officer; then the organisation and methods department of the Treasury comes along and suggests that the clerical officer could himself be replaced by an adding machine. But these and other internal investigators—who are mostly of executive,

rather than administrative, grade—are equipped only to ensure that given jobs are performed according to rule and scale. They are not equipped to ask whether particular jobs ought to be done at all.

The more closely one examines this machinery, the less satisfactory it seems. Indeed, if administrative economies are to be sought, one of the first places should be in the administration of the economy-searching and auditing departments themselves. But the big reform that is surely needed is to lay much less emphasis on ordinary accounting and much more on cost accounting—above all on principles of comparability. To be specific: the Treasury should collate more figures on comparative running costs. What, for example, was the average cost of heating per square foot last year in Government hostels, prisons, hospitals, Whitehall offices and schools? One suspects that from any such series of comparisons certain Ministries might emerge uniformly badly; under a sensible system of Treasury control, they could be told that in future their estimates would be the most heavily cut.

★

So much for changes in administration. In turning now to changes in policy, this article is going to skip swiftly over the civil departments. There are some desirable “policy economies” to be made there, especially in imposing higher charges for specific services. Dearer school meals and a boarding charge for hospital in-patients are obvious examples; it is a pity they were not imposed in February. But, apart from such scraping, the main changes in policy seem likely to affect not the butter, but the guns. It is important to feel uncomfortable about this. Only six weeks ago the defence estimates were strenuously defended as the bare minimum necessary for security. What should the right-thinking, cautious man say about the apparent intention to cut them now?

Let it be said that this is no moment on any count for lowering our guard. But let it be said also that the economics of the “long haul” in defence to which we are rightly and resolutely committed call all the time for the most careful thought to make sure that we get no less than we need for no more than we can afford.

Two realities have to be recognised. The first is that, whatever happens, and whatever government is in power, defence spending is going to be reduced. Both political parties are moving in that direction, and the question is simply whether the cut can be made now, calmly planned and without detriment to the nation's essential strength, or be improvised, hastily and perilously, later; the test is that there should be no real weakening. The second fact is that the service departments themselves admit that money is being wasted in defence. If it could be forecast exactly when the danger period is, and what weapons could be perfected

by then, many types and marks now in production would be discontinued. Such "waste" is normal—some would say inevitable—in defence planning; but it is particularly great and obtrusive now because the transition through which the technology of warfare is passing is so obviously rapid and revolutionary. The savings are there to be made: the lottery—or the task of the planners—is to pick the right ones. The outsider can best comment on the broad decisions to be made, and the dangers to be avoided, under three heads.

(1) *Research and other expenditure controlled by the Minister of Supply.* The difficulty here is that the Chancellor wants his cut made this year, not planned for next. The biggest immediate economies from the Ministry of Supply would come, not from postponing or cancelling now a marginal project in its early stages, but in stopping one that is in full career and eating money—and is thus on the verge of yielding the dividends that might justify the past investment. To cut research projects substantially by 1960—a review was promised in the defence debate—is one thing; to engineer a sharp drop in the spending rate by next July is another.

The sensible thing to say seems to be that each project should be decided solely on its merits, particularly its inter-allied merits; the temptation to continue projects for prestige reasons or to "justify past investment" should be resisted. For example, to cite a controversial issue, a strong case seems to be emerging for stopping development of British naval aircraft and equipping British aircraft carriers in future with American types.

(2) *Expenditure on the forces now in the field.* The service departments plainly expect most of the immediate economies to be concentrated on this. Fewer ships at sea, less training, reduced colonial garrisons, reduced civil defence, smaller stockpiles and stores: in short, a lot of little "agonising reappraisals" which will probably fall most heavily on the Admiralty. For this very reason there should simultaneously be, obligatorily, a much bigger and far more agonising reappraisal at the

top, in real collaboration with our allies, on the allocation of commitments as a whole. This need not necessarily mean an attempt to shift new burdens towards the United States; the older Dominions, and for that matter some of the emerging ones, could justly be asked to share certain regional obligations which are of quite as much importance to them as to us.

(3) *Finally, and most important, manpower.* The primary economic and political objective here should be to cut the training and establishment costs of conscription by recruiting enough regular soldiers, if necessary at a still higher price. But this does not mean, let Labour MPs take note, that the period of the call-up can be reduced; the two-year period must be retained in full, while reducing the intake. Indeed, there are two points that should now be forcing themselves upon the Prime Minister's attention. One is that it would probably already be militarily justifiable, and it would certainly be economically salutary, for Britain to move from a general to a selective system of call-up. The other is that some people believe that, if the call-up period of the existing draft of national servicemen were extended from two to three years, conscription for everybody else could be abolished in the very near future. A brave Government would not neglect either consideration.

It is unwise for outside commentators to be too dogmatic about changes in Government expenditure. But the broad principles enumerated in this article can be stated with some confidence. In civil expenditure the trend ought to be towards basing control on cost comparisons, instead of upon year-to-year fluctuations in estimates, and towards making specific charges for specific services. In defence (although administrative economies can be made here, too) the important points are that Britain, while still doing no less than its inescapable duty, should not waste money doing things that its allies can do better, and that efficiency rather than equality of inconvenience should be the guide for ending conscription. The Chancellor should be urged to follow these principles and to be both eager and specific with his axe.

Iraq on Show

LAST week, the Euphrates rose in sudden flood, breached its east bank just above Iraq's narrow waist, and threatened the land between the rivers with one of the spring inundations that have been its lot since Noah's day. The watchers on the bund called into action the huge new barrage at Ramadi that had been opened only ten days before. By its action, surplus water was diverted into Lake Habbaniya, the river fell and the flood, changing direction, poured back through the breach into its proper channel. The Iraq cabinet and Development Board could not have wished for a more prompt demonstration of the good use to which they are putting their country's oil revenues and the ability, arising from those revenues, to obtain machinery produced by western technical skill.

By a coincidence, the same week produced an equally satisfactory scene on the political front. The Baghdad Pact powers, meeting in Teheran, welcomed the entry of the United States into their economic committee, bringing the promise of fresh transfusions of peaceful strength. Simultaneously, the new Russian statement on the Middle East served to disillusion such Arab states as had been hoping to get the best of both worlds by flirting with the East to vex the West, and thus recalled the merits of loyal alliance. All told, the week was a good one for those Iraqis who appreciate the steadiness of their present prime minister, Nuri Pasha.

The week before had also been a good one. It was Development Week, and the authorities had staged the opening of four or five major public works, including

the Ramadi barrage, the corresponding apparatus at Samarra which will divert future Tigris floods into the Wadi Tharthar, and the opening of the road bridges at Hindiya and Kufa in the turbulent Middle Euphrates tribal area. This last scene in particular was enough to excite even the staidest foreign onlooker; tribes turned out in force, armed to the teeth but chanting and dancing, and later swept Nuri Pasha across the new bridges, impromptu, unpoliced and in a tumultuous wave. It would be well if Development Week became an annual national event, and new ventures were opened in one glorious burst each year. There could be no better way of capturing the eye and imagination of the whole of a country so long and thin that the mountainy men at one end know nothing of the marsh-dwellers at the other.

Behind the thrill of completion lie much spade-work and one specifically Iraqi quality. In contrast to the many under-developed states which pay highly for foreign advice and then pigeon-hole it because it sounds unpleasant or difficult to fulfil, the Iraqis not only seek the advice, but take it. They are less slow than most of their neighbours to grasp the importance of continuity in technical matters; they also see nothing undignified in turning to other countries for help where local talent is still in short supply. Successive governments have ignored a hostile nationalist chorus and employed foreigners as what amount to key public servants; along with some highly competent Iraqis, two foreigners—one British, one American—are permanent members of the Iraq Development Board.

Iraq would be too good to be true if it had completely escaped the adolescent craze for commissioning all too many reports on what to do next—documents now mouldering at the bottom of the drawer in nearly every Middle Eastern ministry. But again, the Iraqis are in a class apart because they have commissioned, and are using, a master document that has extracted the essence from all the rest. Lord Salter, its author, has given them a blueprint so lucid and so perceptive of the difficulties that beset not just Iraq, but the under-developed countries less blest with money and water and irrigable empty lands, that it is worth the attention of governments all over the world.* In this context, its

most important contribution to development in general is its catalogue, compressed into three pages, of the main factors that any development plan must simultaneously take into account. Later expanded, these range from advice to keep spectacular dam-building within bounds till the peasant can be taught to use the water, to outlines for the mopping-up of sudden increases of purchasing power, and warnings not to let the glamour of industries that throb, hum and clatter eclipse the claims of agriculture.

Two other points about the Salter report are of general, as opposed to technical interest. First, it is a glowing advertisement for a basic western concept: "The present study... takes the view that the nation's economy exists for man, not man for the economy." Its second noteworthy characteristic is its detachment.

Iraq began its general development planning in 1951, and inevitably the first visible results took some years to produce. The lag was worse in the south than elsewhere, because flood control was essential before major building was worth while. Looking back, other acts can be seen to have been expensive or lopsided. Lord Salter thinks that five-year plans are insufficiently flexible, and he recommends latitude for modification in the light of experience. This is the best way to shape the course of expenditure and production, for who can foretell the way in which each new opportunity will be used by the people as a whole?

Again, the first programmes were too apt to concentrate on major works necessarily slow of achievement and far removed from the sight of coffee-house critics in Baghdad. The report suggests that a new housing authority financed, though not administered, by the Development Board could quickly get spectacular results all over the country if it were to provide for all grades of house, from the cheap one that would get the slum-dweller out of his mud-and-matting hovel to the ideal home in smaller towns that would tempt doctors away from Baghdad. The latest indications are that both these criticisms have been taken to heart. The

* *The Development of Iraq: A plan of action.* By Lord Salter, assisted by S. W. Payton. Baghdad: Ministry of Development. 252 pages. Price, by registered surface mail, Iraqi dinars, 1,452 or 29s. 0½d.

Board has this year produced a set of revised forward estimates for all the items which were in the five-year plan adopted last year, plus some additional items. The biggest change is in regard to housing, for which the 1956 draft revision to ID 24 million quadruples the 1955 figure.

Other recommended changes are still under debate. Neither the Board nor the civil service is yet geared to organising expenditure of the total monies at their disposal; the Board tends to leave huge sums lying idle in current accounts or on bank deposit at low interest rates. The appointment of a special finance officer to handle this problem is suggested. Again, there is justifiable criticism of the degree to which the Development Board changes hands with the rise and fall of ministries. Originally, it had a permanent Iraqi managing director; but the familiar taste of parliaments for criticising and undermining anyone who holds a big job for too long caused a change for the worse in 1953. Today, the Board is run by a cabinet minister, beset by insecurity of tenure. How long will the Iraqi parliament go on hesitating to trust a managing director who survives the ebb and flow of cabinets?

But far the most important of the unfulfilled recommendations stems from the report's steady stream of evidence that the pace and limit of development are set not by money but by the human factor. The real crux is the lack of an efficient civil service to execute the plans. In Iraq, where most public services are nationalised, this stricture covers doctors, teachers and engineers. At present, a mere decision to move a telephone is shuffled off until it gets to the Minister. Salaries at little more than a labourer's pay bear no relation to merit or aptitude, so that most men of ability or high educational qualifications seek jobs in business or even abroad. Two bad results of the present

system are that the chances of quick action are small, and that Iraq is fast acquiring the large underprivileged middle class that is communism's breeding ground. This reform is even more urgent than the classic one of altering the system of land tenure so as to give the peasant more interest in improving the land.

Iraq is in many ways highly favoured. Its material advantages are enormous. They include money, water, living space and the modicum of competent, responsible men who have the training and acumen to hold down the twenty or thirty key jobs on which smooth development hangs. Will their fellow-countrymen leave them free to do so, and give them tools for the job in the shape of properly paid and contented subordinates?

The present government enjoys several sources of strength. It is admired in the West for the tenacity and continuity of Nuri Pasha's foreign policy, and it has gained, not lost, at home from Egyptian attacks which have been viewed as an attempt to establish a hegemony which Iraq has questioned for years. It will be helped if the Baghdad Pact gives it something to show for Nuri's policy, particularly in the realm of armaments. The first permanent television service in the Middle East, installed in Baghdad by British engineers and to be opened next Wednesday, is a spectacular dividend for it. Its chief weakness lies in the premier's relative lack of interest in domestic reforms; his main backing comes from a landed gentry that opposes them.

The race, in Iraq, is one between increasingly vocal liberal and left-wing discontent and the creation of a middle and peasant class with a vested interest in tranquillity. If economic development continues to advance as it is doing under the present minister, Dhya Jafar, and Iraqi common sense continues to prevail, the odds are on a win for the happier alternative. It must be exciting to be an Iraqi.

The Pattern of a Family Budget

BY A CORRESPONDENT

This article is written by a correspondent who, by any current British standards, is obviously a rich man. He had a disposable income of over £1,000 a year even before the war, as 200,000 Britons had; he has been lucky enough to maintain the real value of his disposable income since then, as only about 10,000 of his class seem to have done. Against this—since his three children are aged 14, 17 and 20—he is at a stage in his career when educational family expenditure is at its height. His analysis of the change in the pattern of his expenditure since before the war seems a useful individual case study in this week after Mr Macmillan's "non-middle-class" budget.

I AM in my early fifties; after the university and two years of knocking around bits of the world I settled down nearly thirty years ago to a regular pensionable job. I married in 1933 and children were born in 1936, 1939 and 1942. For many years I have kept complicated but rudimentary accounts; my wife does not understand the system, and while her cheque stubs give a clue to the larger payments, she has little record of her cash disbursements which account for one-sixth of the family outgoings. The figures that follow would not be passed by an auditor, but they are probably suffi-

ciently accurate to reflect the major changes which have taken place in a family budget over a generation. For simplicity, averages for groups of years have been taken.

Table I shows the cash at our disposal. Our joint capital at marriage was £3,500, but it was all spent within seven years. Between 1943 and 1952 we had several gifts and legacies totalling £850, which were also spent. In the last three years we have had legacies amounting to £2,000; I received £1,000 from an endowment policy; and on occasion have drawn heavily on savings. My wife has had a regular allowance from

a relation abroad; if it ceased, or became subject to UK tax, immediate retrenchment would be necessary.

TABLE I—CASH AT OUR DISPOSAL
(£: Yearly averages)

	1928/32	1933/37	1938/42	1943/47	1948/52	1953/55
Gross salary	390	713	1,114	1,571	2,901	4,000
Net salary	365	656	860	1,033	1,900	2,391
Other income (incl. family allowances since 1948)	6	85	24	10	30	133
Capital receipts	...	355	340	50	120	1,242
Wife's allowance	...	100	150	200	300	400
Total cash available	370	1,196	1,374	1,293	2,350	4,166

Table II shows how the cash was spent. There are nine points in this table that may call for comment, and I have labelled them from (a) to (i):

(a) Notwithstanding a pension I took out an endowment policy which matured at 50, and since then have maintained an equivalent premium to provide a substantial sum if I die before 60—when I hope to be free of educational responsibilities.

(b) We lived in a flat for a few months after marriage and then bought a house for £2,500, using most of our joint capital. In 1938-39 we sold it for £2,000, and built another for £3,500 by liquidating the remainder of our capital, and with a mortgage for £1,000. These transactions explained the capital receipts in Table I as well as the outgoings on house purchase in Table II for the years 1933-37 and 1938-42.

(c) "Wages" conceals the fact that from 1936-1939 our establishment consisted of two living-in staff, although my wife and I regarded ourselves as over-worked at the time. After some ups and downs early in the war we were fortunate towards the end to get some very efficient and adequate help with the children; but for the last six or seven years, partly due to the scarcity of staff and partly to the other claims on our resources, an increasing burden of cooking, cleaning and mending has been assumed by my wife, who now employs a part-time daily

TABLE II—EXPENDITURE
(£: Yearly averages)

General household (i)	100	248	380	439	743	1,456
	370	1,196	1,374	1,293	2,350	4,166

woman and endures some cheerful interference from the family.

(d) Before the war we had a new car every other year; when the basic petrol ration was abolished we gave the last away to get it out of the garage. For the next twelve years we could not afford another, but have recently used a legacy to buy one.

(e) A grandparent's generosity with a country house used to cut down the costs of holidays, but as the children have grown older we have endeavoured to give them a worth-while family holiday and an opportunity to see something of the world; since the war we have achieved the Continent (five times) and America (once).

(f) Education has risen from nil to an average of £900. One of the children went to the excellent local grammar school (no fees) and is now on a three-year course for which we pay the full expense. The other two have gone to boarding schools, but with assistance of legacies we have paid the fees for five years in advance; these capital payments have swollen the average payments in recent years, but as the fees have since increased there is a balance payable.

(g) We use the National Health Service for our doctor, but are private patients of our dentist.

(h) As we have lived on capital, we have not saved with regularity, but on occasion as we have had a surplus a part has been put aside.

(i) "General household" is a balancing item, which may cause some raised eyebrows. It doubled between 1948-52 and 1953-55, although prices generally rose by only about one quarter. The explanation is first, that we probably all lived a little more comfortably; nearly everybody is living more comfortably now than just after the war, without always realising it. But secondly, the cost of the children's maintenance (apart from purely educational expenditure) rises disproportionately as they pass through adolescence, and start acquiring a capital stock of bicycles, tennis racquets, suit cases, tools, evening clothes and other possessions for their developing interests and activities. The item mostly reflects cash disbursements and few details are kept of its build-up, but a rough analysis of its total (£1,500) for 1955 is: food and drink, including meals out for family, £400; children's clothes, equipment and allowances, £350; furniture, household and garden equipment, £165; heat, light, water and telephone, £145; family subscriptions, donations, presents, Christmas cards and other stationery, £135; cleaning and

TABLE III—PERCENTAGE OF ITEMS TO TOTAL EXPENDITURE

laundry, £100; books, papers and entertainment, £100; that leaves just over £100 of miscellaneous expenditure, including family travel other than by car or on holidays.

It has recently been suggested (*The Economist*, January 21, 1956, page 185) that when the prewar gross salary was £700-£1,000, the present gross salary should be about 3½ times as large to enable the recipient to maintain his absolute standard, and about four times as large to maintain his place in the community. If this is correct, thanks to my special additions to net income, I should be better off than before the war. Yet Table III shows how our purchasing power has been redistributed during this period of enrichment. The results are rather startling. The share of personal expenditure of my wife and myself has been halved. The heavy expenditure on the house, which in the first period absorbed a third of our income but was of a capital nature, is now below 10 per cent. Wages, which were 11 per cent, and rose to 19 per cent during the war, have fallen to 3 per cent, and reflect the pressure of family life on my wife. Education has risen from nothing until in the last eight years it has taken one-fifth. General household expenses have increased

from one-fifth to one-third, largely due to the upkeep of the children.

Since marriage, we have after spending my wife's tax free allowance lived beyond our income to the extent of £6,350, by liquidating our original capital of £3,500 and spending legacies of £2,850. In addition, we have spent my insurance of £1,000, and dipped into savings to the extent of £800. In place of these resources we now have a house (subject to mortgage of £1,000), a house full of furniture, linen, crockery and junk, a car, eighteen terms' worth of school fees paid for, about £1,000 on short call, three children and twenty-two years of married life.

Preparation of these notes has prompted the following reflections: We have enjoyed throughout a very much higher standard than the great majority of our fellow citizens, for reasons we do not attempt to justify; we have had a cushion of inherited wealth we are unlikely to pass on to our children; and our pattern of expenditure has radically changed in twenty years. Is the last due so much to the social and financial changes that have occurred round us as to our deliberate choice to indulge in family life?

Notes of the Week

Desperation in Algeria

EVENTS are moving fast on the North African side of the Mediterranean. Two leading Algerian moderates, men of education who had often helped to abate the extremists' eagerness to secure political rights through violence, have left Algiers for Cairo and there announced that they have joined the *Front de Libération Nationale*—the rebel movement. They are Ferhat Abbas, at one time a champion of assimilation with France but more lately an advocate of an Algerian republic federated to France, and a colleague with a reputation for balanced judgment, Dr Ahmed Francis. In Tunis, the Prime Minister, M. Bourguiba, has declared that though Frenchmen are friends, Algerians are brothers, and that if he is forced to choose between them, brothers come first.

For a generation, educated North Africans have been torn between the intellectual pull of France and the emotional one of race. This week two of the men for whom the double loyalty was most poignant have made a move eastwards and into Africa. A year ago, their views were remote from those of the extremists in the *Office du Maghreb* in Egypt or of the armed rebels in the Aurès. Today these unlike minds are thrown together, and the chief instrument in the process has been the behaviour of French

police and French settlers. In a current series of articles in *Le Monde* a special correspondent dispassionately describes what he has seen and heard, under the heading "Algeria Torn Asunder." He reports that even hardened veterans from Korea, "who are scarcely saints," were shocked at the inability of the Constantine authorities to prevent wholesale French police looting of a Moslem quarter from which all males had been evacuated. He describes a shooting spree by an enraged Corsican who killed or wounded eight Moslems and then escaped with police complicity.

Paris is always deploring the scarcity of "valid spokesmen" with whom it can discuss Algeria's future. Now that Ferhat Abbas and Dr Ahmed Francis have felt constrained to visit Cairo, is the exiguous number to be reduced by two?

M. Mollet's Slippery Path

FRENCH deputies have not mended their ways during the parliamentary recess. One commission of the Assembly has just approved the proposed expenditure of the old age pension fund, while another was rejecting the taxes neces-

sary to provide it with additional income. M. Mollet will thus be compelled to make it yet another question of confidence. This vote ought not to prove too dangerous, for no party is anxious to shoulder the blame for refusing relief to old people. Revenue of about £120 million is involved and this, by itself, should not be unbearable, but many critics doubt whether France can afford its social services and Algeria too. The budgeted expenditure on North Africa, at £215 million, looks more and more unrealistic as the Algerian bill piles up.

"Euratom" is another headache for the government. When M. Mollet pledged himself to get the treaty ratified before the summer, the prospects seemed bright. Now, however, the coalition which signed the death sentence of the EDC is slowly reforming its ranks. The Communists attack the plan as yet another "American tool"; nationalists are revolted by the clause which would prevent France from producing atomic weapons; all the Socialist and Radical opponents of a "Little Europe" are once again getting ready for battle. The Communist slogan "no revenge for M. Bidault" successfully evokes bitter memories of 1954 among all political groups.

All these are, however, minor troubles compared with Algeria. The dialogue between M. Lacoste, the minister resident, and M. Mendès-France, who is maintaining his demand for a more imaginative policy, continues to rock the government. Reports that diehard settlers are the real masters of the situation, that they are driving moderate Moslems into the arms of Cairo, that France is fast losing its whole position throughout North Africa, add poignancy to this debate. M. Mendès-France is in a particularly awkward situation. He has just heard a bitter attack on the government of which he is a member made by his most faithful supporters, the young Radicals. One of them, after describing the reforms as farcical, argued that the deputies of the Republican Front, who wooed the electorate a few months ago with promises of peace in Algeria, now look like "swindlers or fools." The distaste of M. Mendès-France for the traditional Radical game of criticising the government without resigning may any day outweigh his fear of being cut off from the Socialists. And if he does not upset the governmental apple cart, the Communists may. Now unusually quiet, they may well greet M. Mollet with an all-out offensive on his return from next month's visit to Moscow.

The Budget Debate

IT is a pity that brilliant debating cannot spark the engine of the economy or fill the gold reserves, for Mr Macmillan's speech at the end of the budget debate was a Parliamentary triumph; it sounded even better than it reads. But this sound should not be allowed to obscure the fact that there was very little except personal witticisms in it. Nor was there much of substance in the rest of the debate. Economically, the most interesting features were that Tory backbenchers have seized upon the case for more incentives to the £1,500-£3,000 a year family man, which means that pressure for the remaining royal commission reforms should fortunately be strong next year; and that

the Opposition has become interested in the subject of tax avoidance, which is a good thing for Oppositions to get interested in. Politically, the debate has been absurdly overshadowed by the attitudes struck about premium bonds. Labour backbenchers fear that their leaders have been misled into a too pompous morality about these, and are pressing anxiously that the party must not be left off what is likely to be a popular bandwagon. With this issue, and his own speech, to help him, Mr Macmillan has emerged from his disappointing budget with hardly a political scratch. Time will show whether Macmillan the politician has been too clever for Macmillan the Chancellor.

Mr Gaitskell and the Bear

MR GAITSKELL'S first venture into diplomatic negotiation has scarcely been a success, but in the end it may do him no harm. When he and other Labour leaders entertained Marshal Bulganin and Mr Khrushchev to dinner, he took the opportunity of pleading for Social Democrats in Communist gaols. Presumably he did not expect to be handed the keys of the Lubianka across the dinner table, but he must have hoped for a more gracious reply than Mr Khrushchev's brutal, uncompromising rejection. By all accounts, the evening had already turned sour, due to a highly provocative, though impromptu, speech from Mr Khrushchev, straight on the old Stalinist line. The reported barracking by Mr George Brown towards the end of this speech may have been unseemly in a host, but Mr Khrushchev himself does not appear to have been paying much regard to the laws of hospitality. In the end, therefore, the party, as a party, was a riot.

At first sight, the incident has delighted the Tories. Could there be a worse advertisement, they argue, for the old Labour claim that only left can speak left? But this is the last claim Mr Gaitskell would want to make just now. When the Russians arrived in Britain, they obviously had high hopes of being able to help along the new Moscow policy of "co-operation" between socialists and communists. In this they could rely on the good will not only of their convinced allies of the extreme left, but also of a far larger number of Labour people who are still reluctant to believe the worst about the country they were brought up to revere as the socialist Mecca. The fellow travellers remain Russia's allies, but many of the fence sitters seem to have been genuinely shocked by Mr Khrushchev's bitter rejection of Mr Gaitskell's pleas. No Labour man can now regard this Russian as a cuddly little bear. Not least important to Mr Gaitskell domestically, Mr Khrushchev seems to have angered no one more than Mr Bevan, who was one of those to feel the sharp side of his tongue. In the short term some Labour MPs are annoyed that the party will not now be able to make capital out of any failure of Sir Anthony Eden's "peace-making efforts," and some of those who were not there have been talking of drawing up a note of apology and "disassociation" to Mr Khrushchev. But on the long view Mr Gaitskell has performed a salutary service, both in and for his party, by reminding the country how deep is the gulf that separates socialists from communists.

Pravda Feels Let Down

THE ease with which the well-oiled machine of the Soviet and satellite press can switch from one theme to another may be very clearly seen at present. This is in effect "British month" in Moscow, and, while exhibitions of British painting and concerts of British music engage the eye and ear of the Russian public, the press has been full of sermons on Anglo-Soviet friendship and despatches from correspondents in Britain. But already the first notes are being heard of the accompaniment that will be played by press, radio, and cultural organisations during the French Prime Minister's coming visit to Moscow. (The Soviet propagandists will probably find this an easier undertaking, for they can draw on the Revolution of 1789, the Commune, and the historic alliance between France and Russia for raw material.)

Meanwhile, the symphonic variations on British themes have been interrupted by discordant sounds. Before Mr Khrushchev and Marshal Bulganin reached Portsmouth, newspaper readers in Russia had been told at great length about the "joyful preparations" that the British people were making for their visit. At the same time, "anti-imperialist" diatribes were played down, and correspondents from Moscow began to report back from these islands in quite new terms, no longer devoting their despatches solely to Britain's worst points, but presenting instead a reasonably recognisable picture. This newly uncritical approach lasted for a while even after it had become clear that the visit would not fit into the Indian pattern of tumultuous enthusiasm. The first accounts of the two leaders' reception here given to the Soviet and satellite peoples were all confetti and cheering crowds. Slowly this picture changed, but the villains of the piece were identified as "sections of the press" and "pro-fascist hooligans." The indifference of the general public in Britain was not remarked upon.

Mr Khrushchev's clash with the Labour Party leaders created a fresh problem. After the story had appeared in the London press, it was apparently decided in Moscow to take the bull by the horns. No attempt was made to play the affair down; on the contrary, the Labour leaders were bitterly criticised for spoiling the atmosphere of the

BUSINESS ABROAD

The whole world is now reported on every three months in our 54 country reviews of business conditions and prospects. This service keeps subscribers up to date on economic and business trends.

Regional subscriptions may now be taken out at considerably reduced rates for all the countries in these regions:

Middle East	North & Central America
South America	Eastern British Commonwealth
Eastern Asia	North-West Europe
Scandinavia	Southern Europe
Africa	Communist Group

visit. But up to the present there is no sign that the Moscow papers are going to tell their public just what it was that Mr Gaitskell, Mr Bevan and their colleagues were trying to get—information about the fate of imprisoned socialists in the Baltic states and Eastern Europe generally.

Body-Blow for Red Arabs

FOR the first time, so far as our knowledge goes, an Arab newspaper—*al Sham* of Damascus—has called the present Russian drive in the Middle East "imperialism." That rude word had hitherto been reserved for the West, and the reason for extending it to the eastern bloc was last week's Soviet statement on the Middle East, particularly the passage in which Russia confirmed its recognition of Israel and offered to work for peace through the United Nations. This stroke of policy, the Arabs reason, reveals a Soviet plan to curry favour with the West so as to win an assured seat in the councils of the great powers, first in regard to Palestine, and later in respect of topics such as the Suez Canal and the production of oil. "Moscow has used some of our countries to score a victory over the West," writes the Lebanese *an Nahar*, "while we, or at least some of us, thought we were using Moscow to score a victory over the West."

The qualifying phrase is important. There are plenty of sophisticated Arabs and Egyptians who never thought that the communist arms deals were transacted out of fellow-feeling for the Arab cause against Israel. But for the naïve, and particularly for those Russophiles and fellow-travellers at present prominent in Egyptian and Syrian politics, the setback has been great because the hopes were high.

Some of them were already at a loss as to what to say about Stalin. Colonel Nasser, who though anti-Communist himself has some fellow-travellers in his team, found it opportune to be able to fly to Jedda and there sign yet another military and political pact of the usual shape with Saudi Arabia and the Yemen. Militarily, the Yemen army adds nothing to the joint command already in existence between Egypt, Saudi Arabia and Syria; but, psychologically, a command stretching from the Indian ocean to the Turkish frontier gives great satisfaction and lends support to Egypt's jaunty statements that it will be unmoved no matter what the Russians and the British may do. The birth of the latest bloc will not, however, make much difference to local capacity for campaigning against British toe-holds in South-East Arabia; the individual states are exploiting this theme anyway.

No Hanging by Degrees

IT looks as if the slender abolitionist majority in the Commons is going to stand firmly by its principles. Two of the many amendments designed to retain capital punishment for the "worst murders" were rejected when Mr Silverman's Bill was considered in committee on Wednesday, each of them by twenty votes. Since several retentionist members took up a lot of time in delivering what

thought for tomorrow

Sometime in the future the results of this man's research will be applied to the solution of a production problem. The outcome may be a better quality product, or a cheaper product, or a better method of analysis or control.

You yourself may benefit from his work, for the chances are that in your industry, too, electronics has an increasingly important part to play.

Mullard scientists work hand in hand with the designers of Britain's leading electronic equipment manufacturers, and this combination helps to produce the finest equipment in the world. You can invest in it with confidence, for nowhere else will you find greater efficiency and reliability.

were really second reading speeches in this committee stage, however, the House did not reach some of the amendments on which a compromise by "moderate abolitionists" was most to be feared. It will have to consider them another day.

It is to be hoped that the majority will be uncompromising about this. They have a real chance now of winning the battle of tactics as well as that of principle. The important question may be whether, if the supporters of hanging continue to batter their heads against the abolitionists' apparent majority of twenty—in unsuccessful amendment after amendment, presumably through at least another two days of committee—the force of their attack may get spent and the public become bored; the less the public excitement about the subject, the less happy the Lords may feel about throwing any lengthily-debated decision of the Commons back at them. In view of this, one of the most interesting and heartening features of this week's debate was that the proceedings were reported on the inside, instead of on the front, pages of some of the newspapers.

Looking at Labour Practices

IT is good news that the National Joint Advisory Council is to tackle the problem of restrictive labour practices, or, as the Minister of Labour prefers to call it, the efficient use of manpower. Not that any spectacular results should be expected. The council, which represents the British Employers' Confederation, the Trades Union Congress and the nationalised industries, is sometimes spoken of as the Parliament of industry; but it can only "make recommendations"—and in the rather minimal terms necessary to reconcile the opposing interests of which it is composed. The council had no success when it tried to deal with the same problem in 1948, largely because it could not agree on what was or was not a restrictive practice.

This is likely to be the difficulty again; the trade union representatives on Wednesday primly pointed out that many so-called restrictive practices were designed for reasons of health or safety, and many were embodied in agreements to which the employers had put their names. This is perfectly true, but it is also frankly hypocritical. Some of the practices designed to protect health and safety are no longer valid because conditions of production have changed. Others have been formally included in agreements, not because there is any sense in them, but because employers were shortsighted enough to yield to union pressure. Rules governing the entry of apprentices into an industry often amount to a restrictive practice, in that they prevent expansion and unduly drive up labour costs. One-sided agreements of an informal kind should also come under scrutiny, such as ceilings set by the workers on the amount of work they shall do. It is sometimes argued that these are not restrictive because they would not in any case be reached, but they create an atmosphere of restriction, and for that reason should go.

It was agreed on Wednesday that, just as legislation would be inappropriate, there would be no value in pronouncements over the whole field of industry, and that the right approach (unlike that of 1948) is industry by industry, via the joint negotiating body for each. But, as the employers pointed out, the practices vary so much that there is almost a need for a firm-by-firm approach. Perhaps

the answer is for individual concerns to bring their particular problems before a body appointed by the joint council for each industry. If worthwhile results are to be obtained the method should be as narrow as the definition of restrictive labour practices is wide. It is important for all concerned with British industry that a success should be made of this venture.

From Gold Coast to Ghana

THE Gold Coast government's white paper on proposals for bringing about independence would be an unexceptionable document if the country were united. Perhaps significantly the white paper mentions no date by which independence could be consummated; but it will be brought before the next meeting of the Gold Coast assembly, probably in June. By then the results of the plebiscite in Togoland, to determine if Togoland wish to join the new sovereign state to be called "Ghana," will be known. The assembly, dominated—if somewhat theoretically—by Dr Nkrumah's battered People's Convention Party, will presumably approve the white paper. The British Government will then be asked to introduce an Act of Independence for the Gold Coast, and to issue an order in council removing the existing reserve powers of the Governor and arranging for Royal letters-patent to transform him into a constitutional Governor-General. The ball will thus be in Mr Lennox Boyd's court. His will be the final decision; and it is a far harder one than ever seemed likely when Dr Nkrumah swept to power in 1954.

The proposals contained in the white paper make every possible concession to the opposition, except federalism. They include Sir Frederick Bourne's recommendations for the regional devolution of powers and everything else. But the opposition has made it clear that only federalism will satisfy it. This makes Mr Lennox Boyd's position delicate. Upon independence the Ghana prime minister—whoever he was—would take over a police force which has behaved well under its British officers in a period of tension, but which is mainly composed of constables from the Northern Territories whose political representatives are the solidest part of the opposition. He would inherit an army recruited from the Northern Territories with no African officer above the rank of major. Thus he would, for the enforcement of public order, depend on the loyalty of the police and the African troops to his British police chief and Commander-in-Chief respectively. Would it hold, if the North and Ashanti tried to secede? The present smouldering revolt has gone on far longer without an explosion than most observers expected—but it will be Mr Lennox Boyd's invidious task to decide if the new sovereign state could be launched without local massacres and civil war.

Athenian Balancing Act

THE deadlock over Cyprus remains unbroken, but the future of the island continues to dominate the Athenian political scene. This week criticisms of the Foreign Minister's allegedly half-hearted handling of the

problem caused a Cabinet crisis. The campaign against Mr Theotokis, which is the work not only of the Greek opposition but also of the Cyprus Ethnarchy (which appears to have grown noticeably less restrained since the removal of Archbishop Makarios's controlling hand), finally provoked him into offering the Prime Minister his resignation. Mr Karamanlis, however, chose to stand loyally by his Foreign Minister, refused to accept his resignation and has since stoutly defended his government's policy on Cyprus in the Greek parliament. Political loyalties apart, he may well have felt that he could hardly allow an outside group, however much he might sympathise with its aims, to dictate his choice of either policies or ministers.

The whole episode reveals how slender is the tightrope on which any moderate and responsible Greek government must balance today. On the one hand it must meet the popular demand for a dynamic and forceful policy on Cyprus; and on the other, looking at Greece's wider interests, it must want to do as little further damage as possible to the Nato alliance in general and to Anglo-Greek friendship in particular. The present government's statements on Cyprus since the Anglo-Cypriot talks broke down and the Archbishop was deported have lacked neither force nor vigour. But the Foreign Minister, Mr Theotokis, has the reputation of being a mild and conciliatory man, and his critics complain that he has failed to translate brave words into bold action. The justification that he offered them in the Greek parliament this week was that the preservation of Greece's alliances with the West was the most important aspect of its foreign policy. Unfortunately this moderate approach is unlikely to satisfy either the government's critics or the many Greeks who sympathise with them. Some positive gesture by the British Government at this juncture could prove invaluable to the moderates in Greece.

No Spit for Burma

DESPITE the awful warning of what happened to Sir John Kotelawala in Ceylon, the Burmese government has been cheerfully confident that it would get a handsome majority from Friday's general elections. The ruling Anti-Fascist People's Freedom League (AFPFL) has held about four-fifths of the 250 seats in Burma's chamber of deputies since the last elections in 1952. This time no fewer than 32 of its candidates were returned unopposed, together with four members of an allied local party in the Shan states.

The opposition, apart from being split at least four ways, can find scarcely a single issue on which to make a stand against the League. All parties are agreed on the principles of a Buddhist welfare state; unfortunately for the opposition, it is the League to which the electorate is likely to give the credit both for laying its foundations and, further back, for winning independence from the British. All parties are equally willing to accept foreign aid from East or West, wherever they can get it. The election campaign has thus been confined almost entirely to personalities rather than policies. The main exception is the offer of the National United Front, the biggest opposition group, to negotiate with the still intransigent rebels whether they lay down their arms or not. But, since the opposition was not even able to draw up a combined list of candidates, tipsters

in Rangoon have been giving it only about fifty seats in the next parliament.

Some of the most interesting contests are in Arakan, on the western coast, and in the Shan states, the eastern hill region which borders on Laos and Siam. Both areas have vigorous regional parties fighting against the AFPFL or its allies, and in Arakan, which has connections with India, the local party is demanding statehood for the territory. This is a sign that U Nu and his colleagues have not yet completed the foundations of a stable and united democracy. As usual, opposition leaders have protested about the timing and organisation of the election; and U Nu has felt it necessary to call on civil servants not to interfere with the voting lest, in the robust old Burmese phrase, their country should "float in the world's spit." But the most forceful reminder of Burma's unfinished business lies in those constituencies where no election at all will be held because communists and other guerrillas are still too active.

Pressure on the AEU

THE strength of communist influence on a largely unwitting Amalgamated Engineering Union was shown at this week's annual conference of the union's national committee. In response to organised pressure for militancy the committee unanimously decided to present a "substantial" new wage claim, only seven weeks after its last claim was settled; the effect that this is likely to have on other union wage claims this summer cannot yet be gauged. But the rather special pressures now acting upon the AEU had been shown earlier in the conference, when the committee passed an aggressive resolution about automation. This was supported by communist delegates, and as one speaker on the other side pointed out, bore a remarkable resemblance to communist advice as given in a pamphlet called "Automation—friend or foe?" It demanded, reasonably enough, that automation should not be introduced without full information and consultation with union officials; but it also insisted that there should be no redundancy, and that every worker who is displaced by new machinery should be kept on full pay until other work is found for him, not merely in the same industry but actually in the same factory.

The conference, going from bad to worse, then carried an addendum to a resolution on the motor industry which congratulates shop stewards and members who actively resist redundancy and declares its support for any such resistance at the point of production.

This, as the president, Mr Robert Openshaw, pointed out, gives *carte blanche* to shop stewards to call unofficial strikes and it must weaken the power of the executive. He and his friends on the AEU executive evidently do not share the view that the way to meet technical progress is for each worker to dig a trench on the spot where he finds himself and to defend it to the uttermost. But they are finding it extraordinarily difficult to say so. In response to the general debate, Mr W. J. Carron, for the executive, merely protested mildly that not enough was yet known about automation to justify formulating a policy. His caution reflected the main present trouble about the AEU. It is a brave union leader who will suggest that his members might show restraint, and that some of them might even face a

Ten productive years in Northern Ireland

Mr. WALTER LINES, Chairman of Lines Bros. Ltd., makers of the famous Pedigree Prams and Tri-ang Toys, answers here some questions on his company's ten years of experience of manufacturing in Northern Ireland.

Why did you go to Northern Ireland?

Because in 1945 we couldn't get enough labour over here. The Northern Ireland Government offered us much practical help—a Government factory was ready, hard cash towards machinery, extra supplies of steel and other raw materials.

Did you find labour up to expectations?

Yes, we did. And our labour relations are pretty good. Now all our employees, except the Works Manager, are local people. We have found the Northern Ireland worker adaptable, very ready to learn and with good supervision he compares favourably with workers over here.

What about production problems?

None of consequence. We have been able to introduce new methods, machines and a conveyor system with the full co-operation of workers and the Unions.

Castlereagh is the only factory in the group making animals on wheels. It is a very successful line and sells well at home and throughout the world.

What about transport?

Always a problem, for prams are tricky things to pack. Castlereagh serves our markets in the North of England and Scotland, and with careful planning we keep transport costs down to an economic level.

Would you consider further expansion in Northern Ireland?

We are at present considering this matter, as we feel that our venture in Northern Ireland has been well worth while and could be developed further.

NORTHERN IRELAND OFFERS:

PLENTIFUL LABOUR

Plentiful labour supply.
Possibility of multiple shifts.
Little absenteeism: low labour turnover.
High output per man.

GOVERNMENT FACTORIES

Government factories to meet your needs on rental or repayment.

GENEROUS FINANCIAL ASSISTANCE

25% capital grant for plant, machinery and new buildings.

Grants toward transfer of machinery to Northern Ireland.

Grants for training and services.

Concession rents.

Coal rebate.

The recently formed Northern Ireland Development Council, a Government-appointed body under the Chairmanship of Lord Chandos, has prepared a practical memorandum of the facts a businessman wants to know. Ask for it in strict confidence from the Council. Read it: then if as a Managing Director you want to go further, write back to Lord Chandos and he will send his personal representative to see you. Or, if you prefer it, conduct all your correspondence with the Ministry of Commerce, Dept. E Belfast.

few days' unemployment while they change their jobs—especially if, like Mr Carron, he is standing for election to the union presidency against a communist.

Dialectic in Union Democracy

THE coming elections in the Amalgamated Engineering Union are not only a shadow over its leaders; they are the most unnerving feature of the whole trade union scene for 1956. It is generally expected that Mr Carron will defeat his communist opponent, Mr Reginald Birch, in the election for the union presidency; although Mr Birch topped the poll at the first ballot, the anti-communist vote was then split among nine candidates. With the recent death of Mr Ben Gardner, however, the general secretaryship of the AEU is also vacant, and it will be interesting to see whom the communists put up for that office. Of the possible non-communist candidates, there are two assistant general secretaries. But at least one of them, Mr C. W. Hallett, is likely to be "election tied"—in other words, his own re-election for assistant general secretary falls due at the same time, and he cannot stand for both offices. He may choose to stand only for his old job, which he knows he can get. Mr John Boyd, the Scottish member of the AEU executive, is another possibility. Those who remember his handling of the Rolls-Royce strike in Glasgow last December wonder if he would be the right general secretary for a union under communist pressure.

These are the two major elections in the AEU this year. But all officers of the union are elected—not tidily, at standard times, but three years from the time that each individual took office. This is one reason for the very low polls at AEU elections—only 9 per cent voted in the first

ballot for the presidency—and for the growth of communist influence in the union. Many rank-and-file members regard politics as quite irrelevant in these elections and vote only when there are candidates whom they happen to know; there are 100,000 AEU members overseas—mainly in Australia, South Africa and Gibraltar—who probably have little idea what is going on; and many more at home are bored stiff with perpetual union ballots. Only the communists always feel impelled to leave their television sets. Another reason for the low polls, however, is that votes can be cast only by attending branch meetings on a particular night; unions that record bigger polls take the trouble to hand out ballot papers to their members at work. If the AEU survives this year's elections as a mainly non-communist organisation—and that "if" is still quite a tremulous one—its leaders should study urgently the possibility of a reform of this kind.

Disarmament in Microcosm

THE lightning transformation of the 1948 Brussels Treaty into a seven-nation Western European Union was a brilliant diplomatic feat. But the new machinery established towards the end of 1954 has ground slowly and not too well. In part the lack of spectacular achievement has been the result of a conscious decision to merge its work, on arms standardisation, for example, with that of Nato. To the extent that this has in fact been accomplished, WEU should be applauded, rather than criticised, for voluntarily taking a back seat. But it was given two responsibilities which were peculiarly its own: the Saar, and the task of creating an agency for the control of armaments.

The Saar, by its own choice, has become once again essentially a Franco-German problem. The arms control agency exists, but that is about all. Its development has been impeded by the inconsistencies in the hastily drafted protocols that are its basic charter and, even more, by the fact that the patchwork of the Paris agreements concealed basic differences of view. Briefly, the French have always wanted an agency strong enough to control German rearmament effectively. At times, they have also wanted this European agency to be designed as the nucleus of a wider disarmament effort. The Germans have been determined that any control should be non-discriminatory and, with increasing fervour, that it should not lend itself to industrial snooping. The British have wanted a system that would not be too expensive and that would satisfy the French without annoying the Germans. The Low Countries have wanted something that would work. Out of the differences of view, ambiguities in the protocols and a year of discussion, there has emerged stalemate.

The staffing suggestions originally made by Admiral Ferreri, the director of the arms control agency, were unanimously, and rightly, thrown out by the Union's council at the end of last year on the ground that they implied functions that went far beyond the intent of the protocol. In December, the WEU ministers requested the council itself to frame general principles to guide the agency. But after four months the council has been unable to reach agreement on the central issue—that is, at what stage in the production process the agency's inspectors can make spot

WORLD'S FINEST AIRLINER IS SERVING

Great Britain

Lockheed Super Constellation

The latest in a line of great Lockheed transports, the 1049G version of the Super Constellation is serving Great Britain. Enjoy the quiet comfort and speed of the most luxurious airliner in the world. 21 great world airlines now fly Super Constellations over connecting routes which cross every ocean and span every Continent.

For your future travel enjoyment, watch for the Super Constellation 1649A with its revolutionary high-speed, long-range wing. It will go into service as a companion to the 1049G to carry further Lockheed's tradition of leadership.

Lockheed Aircraft Corporation • Burbank • California • U.S.A.

Air-India International, KLM Royal Dutch Airlines, Pakistan International, Qantas, Trans-Canada Air Lines and TWA Trans World Airlines afford Super Constellation service to 5 Continents from Great Britain.

Airlines shown: Thai Airways, AIR-INDIA, U.S. Overseas Airlines, LAI, Eastern Air Lines, PIA, Cubana, Iberia, Air France, TCA, Avianca, KLM, Flying Tiger Line, QANTAS, Deutsche Lufthansa, Varig, TAP, Northwest Orient Airlines, LAV, Seaboard & Western.

checks to ensure compliance with the proscriptions and limitations contained in the protocols. The ministers of the seven member nations, when they meet in Paris next week before the Nato meeting, will have to find a way to break the deadlock.

No control is watertight if the will to evade it is present, and it has always been evident that wholehearted German membership in, and acceptance by, the western community is what matters in the long run. What is disturbing about the present impasse is not the lack of a functioning arms control agency, but the continued disagreement among the countries which lie at the heart of the Western European community. It is not a good omen either for the success of a disarmament effort among a larger and more disparate group of countries, or for any new unity in Western Europe.

Germany's Tower of Treasure

THE British taxpayer, who has had to be content with a lottery, may be excused some feeling of envy when he reads of the various proposals for tax concessions that have been pressed in the German federal parliament. The shadow of the federal elections to be held in the summer of 1957 already looms over the *Bundestag*. The opposition parties have called for sweeping cuts in taxation simultaneously with the introduction of large-scale new social expenditure (the tax programme put forward by the Social-Democrats, which consists entirely of reductions, deserves notice as a unique phenomenon in socialist politics). The government parties, who are equally aware of the approach of the elections, have taken the same line, the scale of their demands being smaller than the opposition's but large enough to produce a head-on collision with the Minister of Finance, Herr Schäffer; the cuts proposed from the government benches would reduce yield from income tax by at least 1,500 million marks, while other proposed concessions would cost as much again. Herr Schäffer, who is particularly indignant at the way the parliamentarians have sought to cut taxation while at the same time approving the government's proposals for more costly social services, has appealed to Dr Adenauer and to the constitution and has once again threatened to resign. Although he has already agreed to certain reductions, the gap between his position and that of the deputies remains far too wide to be easily bridged.

His isolation arises not only from the deputies' distant prospect of the polling booths but also from the mesmeric attraction of the large reserves he has built up over the past few years. For three years he has considerably underestimated revenue and obtained large surpluses above his estimates, and during the last two years he has also accumulated reserves with which to pay for rearmament, a policy that has drawn fire from critics who fear inflation when this hoard is released, as well as from naturally interested taxpayers. As actual spending on rearmament has moved so slowly, Herr Schäffer had accumulated by the end of March some 3,700 million marks (about £315 million), in addition to 2,400 million put aside for support costs. In Germany his hoard is known as the *Juliusturm*, after the tower in which the old imperial treasury's war reserves used to be guarded; and the tower is now hotly besieged from all sides.

Ironically, now that all parties seem united against him, the Finance Minister's case seems a stronger one than ever. The German economy is now facing full employment, and the proposed tax reductions, which would come into force in October, would make their effect felt in terms of greater purchasing power just as rearmament was getting under way. Unfortunately Herr Schäffer has cried "wolf" so often at times when inflation was still a remote and unlikely danger that he is now getting a less fair hearing than his arguments deserve.

An American in India

IT is not only the Russians who can charm Indian audiences. Mr Walter Reuther, the second-in-command of the recently united American trade union federation, went home last week from the most successful tour a western visitor has made in India since Marshal Bulganin and Mr Khrushchev were there. He was not only a reminder to Indians that America has one of the world's most virile and successful trade union movements; he also took the opportunity to talk bluntly about the fundamentals of western policy towards Russia. Instead of being offended, most of his hearers were delighted. The *Hindustan Times*, a fairly regular critic of pronouncements by American statesmen, called his address to the Indian Council of World Affairs a "most welcome whiff of fresh air," and talked of the "immense good" that his trip could do for Indian-American relations.

Mr Reuther occasionally put his foot down where a diplomat would hesitate to tread. He roundly declared his support for India's claim to Goa and said he shared its doubts about the military side of Seato. This no doubt won him the Indians' ears; but he went on to justify Nato, and to recall that in the years when the Indians were preoccupied with their newly won independence, the Russians had forced a policy of military preparedness on the West by a whole series of attacks on the independence of other nations. He rebuked those Indians who suspect the motives behind American support for countries which, like Pakistan, have joined hands to check further Communist expansion. Future western visitors to Asia can learn a good deal from Mr Reuther's example. They must be frank enough to admit their own side's shortcomings (as he apologised for racial discrimination in America's southern states) and acknowledge that poor and backward nations are really attracted by the sight of Russia's rapid industrialisation. If they can also show that they understand Asians' special points of view in world affairs, they will carry conviction when they speak of the many things free Asia has in common with the rest of the free world.

Royal Economy

OLD feuds around the Mountbatten name being what they are, it is not altogether surprising that two sections of the popular press have recently been testing their readers' reaction by lobbying brickbats at Palace expendi-

ture; but it is surprising, and rather disturbing, that they seem to have been getting part of the reaction they wanted. Some MPs report that they are getting several letters a week about supposed "royal extravagance." It is right that royal expenditure, like all official expenditure, should be kept under close scrutiny; but the trouble about the present campaign is that it does not spring from scrutiny at all.

The "complaints" have been a strange ragbag. One item that the press has been complaining about is the royal yacht, which one source has suggested was ordered at the Duke of Edinburgh's instigation. This is nonsense. The plan for a new yacht was conceived in the reign of Edward VIII, the idea of ordering it after the war was Lord Attlee's, and the yacht itself was laid down in 1948. Rude fingers have also been pointed at the new dining car for the royal train, and extraordinary estimates of its cost have been bandied about. Once again, however, the idea did not, in fact, come from the Palace, but from British Railways. The royal train was due for a new dining car, for the old one was 57 years old. Another item, which has reached as far as a Parliamentary Question, is the Queen's Flight. It had been stated in the press that a Britannia aircraft had been ordered for the Flight, and the Duke had been criticised for his use of a Heron aircraft. Actually no Britannia has been ordered. Two ancient Vikings are to be replaced by two more Herons, as being most suitable for the short flights which form most of the royal journeys. There are also to be two helicopters instead of one, and when a long-distance aircraft is wanted one of the corporations will lend one. Long before this campaign started, it had been made known that the Queen had expressed the wish that the Flight should be re-equipped as economically as possible; it will in fact cost £300,000.

The general financial background is even more startling. The annuities payable to the Queen for the Privy Purse and for her household, known as the Civil List, were fixed at £475,000 at the beginning of the reign and have not altered. This sum includes £95,000 a year to provide a reserve margin for contingencies such as rising prices. But the revenue of the Duchy of Cornwall amounts to about £90,000 a year, and this, after providing for the young Duke (Prince Charles), is applied to reduce the cost of the Civil List to the Exchequer. The Civil List does not include annuities paid to other members of the Royal Family, the Duke of Edinburgh's being £40,000. But some idea of the real savings that have been made in royal expenditure can be gathered from the fact that King George VI's Civil List amounted to £410,000, and those of George V and Edward VII (whose pounds were worth four or five times as much as the Queen's) to £470,000. Compared with any other era modern Britain is getting the panoply, and the constitutional advantages, of royalty very much on the cheap.

Dear Money Down Under

THE erratic swings of exchange reserves and of import controls "down under" have been the bane of British exporters in the postwar period and one of the sore spots of the sterling area as a whole. But during the past two years the New Zealand government, at least, has been groping

towards new methods of disciplining its economy. Breaking with the "cheap money" tradition enthroned by its Labour predecessor, it has, like many European governments, begun to make credit restriction the main weapon of a restrictive economic policy. Bank rate, which stood at 1½ per cent in April, 1954, was raised by stages to 7 per cent where it stands today—one of the highest rates in the world; the trading banks' minimum reserve ratios have been several times increased and they have been requested to reduce their loans. This revolution in policy naturally aroused criticism, not only from the Labour party. And in the elections early last year the government was surprised by the large vote which went to the strange social credit group, which declared that the country's economic difficulties were due to a lack rather than an excess of purchasing power, and charged that high interest rates served mainly to inflate the profits of the commercial banks. Partly to put these views to the test of reasoned criticism, the government set up last April a commission which was given the task of assessing the monetary credit and banking system in New Zealand.

The commission's report, which has now been laid before the legislature, is a sweeping vindication of the government's new orthodoxy. The social credit submissions are

Russia as Adversary

Before the war Russia was regarded throughout Europe with a vague feeling of uneasy awe. Her progress had been so great, so rapid, so uninterrupted, yet for the most part so silent, that it seemed almost like the march of fate, and produced a similar impression on the beholders. She appeared so overwhelming, and believed in herself so seriously and so firmly, that other States took her at her word. She simulated omnipotence so well that we almost thought her omnipotent. The misty magnificence in which she enveloped herself aided this impression. Nothing was defined about her, but everything was vast. She was felt and heard of everywhere—in every court of Europe and in Asia—in every dispute—in every emporium. No one knew exactly what her army numbered or what was its condition, but it was supposed to be almost unlimited. She was a sort of untested, half-seen, formidable nightmare, which might not be all it seemed, but yet might be still more. She was dim, colossal, unfathomable. No one could precisely tell whether her strength was that of the giant or only of the bully; but every one was sadly disposed to fear that it would prove the former. Now, all this vague alarm is dissipated. We have tried her power, and found it formidable indeed, but not resistless. We have proved her vaunted resources, and they have turned out far scantier and more easily exhausted than our own. Nay, we have found them fail precisely where they were deemed most unlimited—viz., in men and cattle. We have tested her soldiers, and found them brave and well-disciplined unquestionably, but inferior in fighting powers to every one of her antagonists. We have had ample reason to respect the scientific and strategic skill of her generals and engineers; but even this has not enabled her to make head against her adversaries. Her soldiers have been admirably led; she has always had numbers and generally position also on her side; yet in no single battle has she been victorious. Henceforth we know her real strength: this knowledge is of itself almost worth the war, and certainly could not have been gained without it.

The Economist

April 26, 1856

demolished and its analysis of the monetary system is dismissed as "erroneous and falsely based." Policy in the last two years is criticised—not, however, because its direction is wrong, but because it has been too cautious, because the tools of credit control, like the minimum reserve ratio, have not been used with sufficient resolution, because housing has been protected from the squeeze; in short, because the new orthodox policy has not been carried out with sufficient thoroughness and gusto. And the cheap money policy of previous years gets short shrift.

A report from our Wellington correspondent on page 392 describes the reactions in New Zealand to the report. It seems clear that, despite criticisms, the report has given both moral support and detailed advice which will help the government to push ahead with its more flexible monetary policy. And on Wednesday the Minister of Finance declared that further credit restrictions would be necessary.

Squeeze Again for Swedes

BRITAIN and Sweden follow the progress of each other's struggle against inflation like two sufferers taking the cure together. The news that the Swedes have decided to tighten their credit restrictions yet another notch will be studied with interest on this side of the North Sea. The State Bank, in the peremptory manner it has adopted since Hr Asbrink took command last year, has requested the commercial banks to reduce their advances by five per cent below last July's figure. This is the third such move in a year, in addition to an increase in bank rate. Last spring the *Riksbank* told the commercial banks to cut their loans until they conformed with the statutory cash reserves requirements; and in the summer they were required to slice another portion off their total advances. The effect

of this has been to reduce considerably the amount of funds available to Swedish industrialists. However, Hr Asbrink and Hr Sträng, the Minister of Finance, have decided that it was not enough.

Their motives are fairly plain. The trade unions, which accepted a flat four per cent wage increase this spring, have already served notice that they will not feel obliged to show the same restraint next year. In any case, when rises in piece rates and the drift of workers to better paid industries are taken into account, total wages are likely to go up twice as much this year as total production. Before next spring, then, Sweden's planners have two tasks to fulfil: to discourage industry from expanding its investments still further in response to rising demand, and to create a situation in which next year's wage demands will have as little effect as possible on prices. Last year private investment rose a good deal more than the government thought it would. The theoretical balance of national resources for 1956 allows for a further rise of only two per cent—an optimistic estimate which clearly calls for fairly stringent measures if it is to be fulfilled. This particular measure has presumably been chosen because an industrial inquiry conducted last year showed that most companies had found credit restriction much more effective as a rein on investment than the higher bank rate. But Sweden's latest swing of the monetary sword, if it finds its mark, will also increase the tally of unemployed; its success as an economic measure is likely to be matched by embarrassing political consequences. The Social Democrats, the dominant governing party, are no doubt hoping that these will not become apparent until after the general election in the autumn.

Can the Worm Really Turn?

THE will o' the wisp that calls the middle classes to unite and be militant is abroad again. A "Middle-class Alliance" was formed in the House of Commons this week. This is admittedly an advance; the first middle-class union was formed, fifty years ago, in the Cannon Street Hotel. But neither it nor its successors lasted long or achieved anything tangible.

It is not crabbing the admirable aims of the new body to point out some of its difficulties. The chief of these is that, though the middle classes have innumerable and just grievances, those of no one section exactly coincide with those of any other. The salaried professional man who longs for tax rebates on his children's private school fees has slightly different priorities from the shopkeeper who is content to send his children to a state school but is furious about his new rating assessment and fearful of any tightening-up over allowable expenses for income tax. The senior executive is fearful about this too, but his principal concern is with the higher ranges of surtax. The bank clerk's main need is a union as tough as the TGWU. The self-employed, unorganised intellectual is nowhere and can combine with nobody. To find a practical programme to which all these—and other, quite as diverse—elements can subscribe on the basis of "feeling middle class," and in the hope of getting back to the golden age (circa 1880?), will be no easy piece of manifesto-making.

Letters to the Editor

Overlords and Underbodies

SIR—It may well be in the national interest that industries of outstanding importance should be subjected to periodic review, as in the case of the nationalised undertakings. It is to be hoped, however, that great care will be taken in the selection of the investigating bodies. The electricity supply industry, in which I am employed, has recently been examined by a committee—the Herbert Committee—which is so removed from the facts of life that it actually believes that potential candidates for higher management can be selected and given varied employment experience within the industry "without the knowledge of the young men concerned" and, presumably, without the knowledge of their colleagues!

Although wordy and somewhat confused, the report appears to recommend, in effect, that the present Central Electricity Authority should be split in two: that a high-powered body, a national power board, should become responsible for the Authority's functions relating to generation and main transmission; and that a second and still higher-powered body should exercise the Authority's supervisory powers over the twelve area boards (who are responsible for distribution and sales of electricity to the consumers) and also supervise the new national power board.

This body of overlords is to approve the capital and revenue budgets of the "underbodies," their stock issues, their depreciation and reserve policies, their tariffs, their general plans and so forth, and is also to prepare annual reports, financial statements and other statistics for the whole industry. It is quite clear that such powers cannot be exercised realistically and effectively without close executive control, and this indeed is indicated in the Report.

What is not clear is who is responsible for what? Who speaks for the industry? Who acts nationally for the industry vis-à-vis the Government on, say, capital investment policy or nuclear generation policy? And, particularly as the underbodies are expressly excluded from representation on the supervisory body, who runs the industry?

This is a muddle-headed proposal which offers every facility for the hamstringing of the executive branches of the industry. The present integrated organisation can provide any reasonable measure of national co-ordination which may be necessary, and the powers of co-ordination can be amended if desired. Preserve us from non-executive overlords who exercise executive control!—Yours faithfully, SIMPLUS

Middle Class?

SIR—Your issue of April 14th reviews a work by G. D. H. Cole, "Studies in Class Structure," in which Professor Cole, after examination of the 1951 Census, puts 30-40 per cent of the population in the category "middle class." The reviewer points out that this estimate agrees with that put forward in a BIPO survey when 47 per cent of people questioned claimed to be "middle class." We may therefore accept this range as one upon which there is some agreement.

It is of interest, therefore, to compare these figures with your editorial, "A Middle Class Budget." Here reforms in income tax are proposed for the income-bracket £1,000-£3,000 (before tax) and in particular for reform of super-tax affecting only incomes over £2,050. I am not concerned with the merits of these proposals, but I should like to point out that the following statistics taken from the latest National Income Accounts (1955) hardly support your argument that these income ranges represent the "Middle Class."

Range of Incomes before tax (1954) (£)	No. of Incomes*	Per cent
Under 1,000	24,880,000	95.3
1,000 - 2,000	910,000	3.5
2,000 - 3,000	161,000	.6
Over 3,000	149,000	.5
	26,100,000	100.0

* Husband and wife are reckoned as one income

If the middle class are to be assisted by the Budget, then it is clear that the Chancellor should concentrate on those receiving less than £1,000, not on those receiving more than this.—Yours faithfully, WALLIS TAYLOR
University of Exeter

Dispersing Offices

SIR—In your issue of April 14th you suggested that the plans for moving civil servants from London should be hastened and extended, while at the same time acknowledging the rapid growth of private office employment in central London. The civil servant's private life is to be disturbed so as to set an example to other employers of office workers who show no sign of being prepared to follow it. Moves involving large numbers of Government staffs have been projected for some time, causing uncertainty to the families concerned. The planning of children's education and arrangements for eventual retirement are continually upset by rumours of transfers to distant parts of the coun-

try, because in the majority of cases the staff are required to go with the work.

There is no evidence that the Government is prepared to authorise the considerable expenditure which will be necessary to provide office accommodation in dispersal centres or that houses will be available in sufficient numbers to enable families to reconcile themselves to unwanted disturbance. Unless there can be planning on a national scale which requires other employers to make a contribution, the civil servant must be forgiven if he resists being used as "a more direct example" in this way.

His attitude is understandable when office staffs of other employers are being housed in large numbers in the areas, and in some instances in the same buildings in London, as government staffs are required to vacate on transfer to a destination where office and family accommodation cannot be provided on an adequate scale.—Yours faithfully,

J. L. WILLIAMS
General Secretary

Society of Civil Servants, S.W.1

A Revalued Penny?

SIR—Now that a letter costs 2½d. in stamps and a minimum bus fare costs the same could the humble penny coin be revalued?

It would save everyone, the public, the conductors, the underground and tube ticket clerks, and maybe even the accountants so much time and fumbling for change if the penny were given boldly the value of 2½d., with the half-penny the value of a penny farthing and the old farthing the value of half as much.

The penny and ha'penny and farthing could retain their present names and aspects but we would be back to the days of penny postage and penny fares at least in name, if not in value. We could carry, and so need, fewer heavy coins and save something too on minting new ones. The old slot machines for stamps and other delicacies for the tongue could once again serve their useful purpose without conversion. Finally everyone's temper would be improved if one could tender the exact fare as we are expected to do.

Ultimately it might pave the way to a painless transition to a decimal system of coinage because the new penny (worth 2½d.) could be made to represent a tenth of a florin and ten florins go to the pound, so that £1 is. 10. could be written £1 11. And this without disturbing the value or form or name of the sixpenny bit or shilling or half-crown, which would simply take their place as convenient coins and subdivisions of the pound or of the florin like the half-dollar and quarter are of the modern descendant of the ancient thaler. If some old people were to find the transition a nuisance won't our grandchildren bless us?—Yours faithfully,

JOHN ALEXANDER-SINCLAIR
Geneva

CHANGES IN EMPLOYMENT
in GREAT BRITAIN
INCREASES OR DECREASES SINCE JUNE 1954 [THOUSANDS]

WHICH OF THESE AMERICANS IS A CUSTOMER FOR EUROPE?

A Texas cowboy, a Maine lobsterman, an Iowa farmer's wife, a Chicago corporation lawyer, a New York department store buyer. These are but a few of the incredibly varied types who are classified as Americans and comprise the American market. They differ radically from each other and other Americans in tastes, desires, needs and ways of life, and, naturally, in the kind of merchandise they buy.

Banks abroad desiring to obtain a favorable position for their customers in U. S. markets are invited to use the facilities of Manufacturers Trust Company. Through our complete branch coverage in New York City and our thousands of correspondent banks throughout the United States, we are exceptionally well equipped to obtain data on local market conditions in the United States and to handle all types of banking transactions.

American Survey

AMERICAN SURVEY is prepared partly in the United States, partly in London. Those items which are written in the United States carry an indication to that effect; all others are the work of the editorial staff in London.

Policy for the Cold War

Washington, D.C.

IF the Russian leaders seek evidence that their new tactics are confusing the west they could find it in Washington. There is much agitated discussion about foreign policy. The need to put out new ideas is asserted vehemently, but there is much modesty when it comes to suggesting any. The reigning cliché among the more extreme Republicans, almost all Democrats and the majority of newspaper editors and commentators is that America is losing the cold war. This view was recently fortified by a series of seven articles of almost unrelieved gloom by leading foreign correspondents of the *New York Times*. They documented with monotonous unanimity the distrust in which the United States is held in foreign lands and their meagre appreciation of the benefits of American aid.

Moreover, as the political campaigns get under way, foreign policy is being made so much of a partisan issue that an outsider might assume that it was a matter of genuine national controversy. This is not so. The country as a whole, as opposed to the capital, is extremely stolid about foreign affairs; to some this is a sign of maturity, to others a sign of apathy. Britain, for example, has been getting a better press than might have been expected over such delicate matters as its difficulties in Cyprus and its trade with the Communist east. Senator McClellan, Chairman of the Senate Investigating Subcommittee, is immensely indignant over British exports to Russia of items which sound like epithets for politicians, such as horizontal balancing and vertical boring machines. But his indignation has failed to spill over much more than his own committee room. Fears that Britain's entertainment of the two Russian characters in search of a stage might be misunderstood also turn out to have been unfounded.

The main reason why foreign policy seems like a political issue is that, apart from the question of farm prices, the Democrats cannot think of any other. Despite the huffing and puffing of the speech writers, there was a deep analogy in some of the remarks which President Eisenhower and Mr Adlai Stevenson delivered last week before the annual conference of newspaper editors. For in foreign policy, as in so many other fields, the Administration has been steadily occupying the ground held by the opposition. While Mr Stevenson goes on turning such old hay as Mr Dulles's reference to "unleashing" Chiang Kai-shek back in 1952, Mr Eisenhower and Mr Dulles are addressing themselves to four propositions which, while not exactly novel, are seriously intended to deck their convictions in

fresh attire. These are active sympathy for nationalist movements; ungrudging acknowledgment that neutralism has validity for young nations; a new emphasis on the non-military aspects of existing alliances such as the North Atlantic Treaty Organisation; and the granting of long-term economic aid with no military strings attached.

Thus Mr Dulles's speech on Monday was intended as a curtain-raiser for the impending Nato meeting in Paris. After turning a deaf ear for years to Canadian suggestions that Article II of the North Atlantic Alliance, which is full of social and cultural aspirations, be made into something dynamic, the Americans now plan to place it at the head of the agenda. In part, this is due to the new Russian strategy, in part to the desire of American policymakers to find a new approach to "the left" in Europe.

Apart from his persistence in listing religious piety and high regard for the personal ownership of property among the things that unite the anti-Communist world, Mr Dulles's speech was a useful review of the international situation. It suggests, at least, that the Administration is in a mood to think along constructive lines and it put in a less ambiguous light the essential point of the unfortunate appearance of the Secretary of State before the Senate Foreign Relations Committee some weeks ago. This is that, while foreign policy is in a sense more difficult to make when a common fear is not driving allies together, it is a denial of the very idea of diplomacy to refuse to take hope from Russian internal changes which may open up possibilities of freer diplomatic manoeuvre. For all the intellectual distrust which Mr Dulles has a knack for bringing upon himself, his judgment is probably closer to that of the country as a whole than the somewhat frenetic Democratic charges that the Administration talks too much, that it does not talk enough about its economic policies abroad, that it relies too heavily on its armaments and that it does not build up enough military strength.

★

But the Administration is not really clear about its new objectives. Sometimes, as in the Middle East, they conflict with one another. It is difficult to give economic support to the Baghdad Pact without appearing to favour countries that have military alliances with the west over those that do not. It is difficult to sympathise with nationalism in the Middle East without appearing to drive the British out; and the last thing American policy wants is to be confronted with the situation of 1947, when London announced

that it was leaving Greece and Turkey in Washington's lap.

Ironically enough, actual American policy is moving much closer to British policy in the Middle East just at the moment when the Americans have been reproaching the British with behaviour for which the British usually reproach them: insufficient understanding of nationalist susceptibility, too much emphasis on blunt verbal and military action and not enough political and economic tact. In fact, the State Department has, for the time being, abandoned two doctrines—that Colonel Nasser is the only man with whom it is worth negotiating a serious agreement in the Middle East and that meanwhile all issues on the rim of the Arab-Israeli dispute should be glossed over. But American strategists are still irritated by what appears to them to be a press campaign, supposed to be inspired by 10 Downing Street, to panic the United States into concrete military commitments.

In retrospect, Sir Anthony Eden's visit to Washington seems to have achieved even less than was thought at the time. There has been no perceptible sequel to the decision to review the blockade of China and no decision to put teeth into the Tripartite Declaration. The tripartite talks ran into three difficulties: the unlikelihood that Congress would contemplate war against Israel even if it was the aggressor; the unlikelihood that Russia would allow United Nations action against the Arabs; and the probability that it would not be clear who the aggressors were. For the British, action "outside" the United Nations meant action before the United Nations had a chance to meet; for the Americans, it still means action after the United Nations has failed to act—and that would probably be after the war was over. As a result of this Washington has been driven to rely on Russian co-operation in the United Nations as providing the best hope of disposing of this war crisis quickly. Until that is done, little progress can be made in developing the new American policies which responsible men in both parties now agree must be sought.

Split Over Atoms

THOSE who conceive and carry out the Administration's atomic policies may be feeling mildly schizophrenic. On the one hand, President Eisenhower has expressed deep gratification about the progress of his "atoms for peace" programme, but on the other hand his Administration is determined to go ahead with the nuclear tests scheduled to take place in May in the Marshall Islands despite mounting opposition at home and abroad.

The resistance to the further development and testing of hydrogen bombs is no longer restricted to pacifists, fellow-travellers and an isolated handful of uneasy scientists. It is now being voiced by the principal contenders for the Democratic presidential nomination, Mr Stevenson and Senator Kefauver. In a sharp attack on the Administration's foreign policy, Mr Stevenson questioned "the sense in multiplying and enlarging weapons of a destructive power already made incomprehensible." He urged the United States to give very serious thought to abandoning further nuclear tests which only served to represent it in an aggressive light. If Russia did not follow this example, tests could be resumed. This proposal appears to have

been modelled on arguments put forward earlier this month by Mr Thomas Murray, an unorthodox member of the Atomic Energy Commission. Mr Murray declared that the development of bigger hydrogen bombs had neither moral nor military justification. He said that tests should be stopped and that defence planners should concentrate on the small, tactical atomic weapons needed in "brushfire wars."

It is ironic that President Eisenhower should be represented as "sabre-rattling" with atoms. The "atoms for peace" programme, which he submitted to the United Nations in December, 1953, is an essential part of his policies. Last week this programme came nearer realisation as twelve nations, including the Soviet Union, unanimously adopted the text of a charter for an International Atomic Energy Agency. This organisation, which will be linked to the United Nations, but will not be subject to the jurisdiction of the Security Council, is intended to be a clearing house for atomic information and a bank for the deposit and loan of atomic fuels.

The relation of this idea to the military use of atomic resources is, of course, a cardinal element in the projects for disarmament which are being debated with so much deliberation in London; and Mr Stassen, on the United States' behalf, has made the relation very plain. Meanwhile, it is encouraging that the Soviet Union should have agreed to a plan which calls for considerable freedom in the exchange of technical knowledge and even for the exchange of personnel.

Party Business

BOTH parties met last week to plan the coming election campaigns; the Republican strategists were in a mood of buoyant confidence, but the Democratic organisers had a hard time concealing their gloom. Perhaps the main reason is that there are between \$4 million and \$5 million in the Republican campaign chest while the Democrats at present have less than \$100,000 in the bank. Their destitution is due to three causes: the party has only recently managed to pay off the heavy debts incurred during the presidential campaign in 1952; individual Democrats have been giving financial support to Mr Stevenson and Senator Kefauver in their bitter contests against each other, rather than to the party's national organisation; many backers who would contribute money towards a potential victory are convinced that President Eisenhower cannot be beaten and are saving their donations for a better occasion. But in American politics today, money literally does the talking: the Republicans have already booked more than \$2 million worth of radio and television time, but the Democrats were not even able to put Mr Stevenson's important foreign policy address on the air.

Their difficulties were symbolised by the dinner held in memory of Woodrow Wilson in Washington on April 21st. Instead of the 5,000 good men who have come to the aid of their party by buying tickets at \$100 a plate on previous occasions, only 2,000 showed up. There was too much competition: Miss Truman was getting married in Missouri and thus the party's star performer was away; Democrats in Minnesota were holding a "national dinner"

on the same night; Senator Kefauver was opening his campaign in Oregon; Mr Stevenson's supporters had scheduled an equally expensive dinner on behalf of their candidate for April 25th in New York and President Eisenhower was addressing the American Society of Newspaper Editors. Mr Sam Rayburn, Speaker of the House of Representatives and chairman-designate of the party's national convention in August, used the occasion to claim that because of the Administration's foreign policy "Christian civilisation stands in the greatest danger since the man stood on the sea of Galilee." Some of his listeners no doubt wondered whether "Mr Sam" was not equating "Christian civilisation" with the Democratic party.

In addition to financial worries, the Democrats are worried by signs that the Republicans are gaining in the country at large. The Gallup poll suggests that, although still the minority party, they have won some 5 million adherents during the past year and have been catching up on the Democrats among the young. So when Mr Stevenson recently remarked that President Eisenhower had left only one thing out of a speech—"He did not say he was for chicken on Sunday. I am in favour of that too"—many Americans may have applauded this sign of national unity and decided they could vote Republican with a quiet conscience.

Federal Foster Child

FROM A CORRESPONDENT IN WASHINGTON, D.C.

THE federal city is often spoken of by Congressmen, tourists and old Washingtonians in hushed and reverent tones as if it were sequestered behind pearly gates and, indeed, with the morning mists rising off the river, it frequently has the domed and pillared glow of a heavenly citadel. That Washington is also a busy metropolis of more than three-quarters of a million people comes as a shock to many, and the awed tourist, aiming his camera at the Lincoln Memorial, seldom realises that, by an anomalous twist of representative government, he has more control over the municipal machinery of the nation's capital than have the voteless inhabitants. They supply almost 90 per cent of the city's funds, yet have no representative voice in its management.

The District of Columbia is, in effect, a dual undertaking. Created in 1790 solely for the purpose of providing a seat for the federal government which would be free from interference by the states, it has also, in the course of time, become the ninth largest American city and the centre of one of the most rapidly growing metropolitan areas. It is administered as a branch of the federal government, and the United States Congress acts as city council at an annual cost of approximately 5,000 man-hours and \$2 million. With no local suffrage to provide a touchstone for legislative procedure, final responsibility for the District rests on the entire voting population of the United States, who remain happily unaware of it.

Accused of everything from colonialism to tyranny by its frustrated citizens, angered by echoes of "taxation without representation," the District government is in fact more like an erratically benevolent dictatorship of too many cooks. Administrative authority is nominally assigned to

three harassed commissioners appointed by the President, and legislative authority belongs primarily to two committees of Congress. But the commissioners' power is diluted and limited by some 75 federal and District agencies and, last year, fourteen congressional committees were involved to some degree in handling District legislation. Decisions are often the result of a tug-of-war in an atmosphere of crisis, made by Congressmen who are understandably inclined to see the politically unrewarding problems of the District through the eyes of their far-off constituents. District laws, including local ordinances, must pass through the usual 28 legislative steps of the United States Congress and be signed or vetoed by the President; in the process, a Bill changing the name of a local street may hold up a Bill on national defence.

This cumbersome and unresponsive system has been a particularly serious handicap in dealing with the city's post-war growing pains. These have also been aggravated by other factors, mostly financial. As a symbol of the nation and a model capital for the whole country, Washington must provide wide streets, imposing buildings and fitting welcomes for visiting VIPs. Yet it is denied many of the sources of revenue available to most cities and is losing some of those it has. Over 50 per cent of city property is government-owned and therefore tax free, and its largest industry, government, is untaxable and expanding; it is suffering from growing areas of blight and deteriorating public facilities; it is losing its wealthier taxpayers to the suburbs but is prohibited by law from extending its boundaries; it may not borrow by issuing bonds, and its budget is so closely balanced that any emergency must be met by a special authorisation of funds from Congress—which is quite likely not to be in session.

Congress keeps the city in a state of nerves by its capricious handling of the District's financial matters, particularly as regards the federal government's contribution to the annual budget, approximately 10 per cent of the total. Congress this year increased the federal contribution from \$20 million to \$23 million to meet the record budget of \$196 million, but at the same time local taxes were increased by \$13 million. A recent report reveals that while in six years the retail trade of the whole metropolitan area increased by 25 per cent and its population by 30 per cent, the District's share of each dropped from 75 to 60 per cent and from 61 to 47 per cent respectively. Yet District taxes for the coming year have gone up sharply compared with the surrounding area.

There are more immediate crises, however, over public transportation and education. After last summer's prolonged strike on the city's trams and buses, Congress cancelled the operating authority of the Capital Transit Company as from August 14, 1956, because of dissatisfaction with its "stockholders first" policy. No alternative management has been found.

The school crisis is the only one which has precipitated an appreciable public outcry. Already overburdened with the increased child population, the District's educational system has been further strained by the dislocation and mounting costs of integrating white and Negro schools. When the commissioners cut the Board of Education's request for 180 new teachers to 40, indignant parents took the irregular action of storming the House Appropriations sub-committee with requests for more teachers and higher taxes. The Board has now sent the sub-committee an unprecedented petition for funds to pay the required number of teachers.

One of the perennial problems before Congress is that of suffrage for the District's disenfranchised citizens. From 1802 to 1874 Washington had a locally-elected government which, having become bankrupt in an ambitious street-paving effort, "sold its birthright" for a "temporary" form of government by commissioners and a federal contribution of 50 per cent of municipal expenses, which unfortunately was really temporary. Today there is an articulate group which believes that District problems could be more effectively handled by an elected mayor and city council; this could relieve Congress of the more onerous municipal chores and incite the apathetic citizenry to civic effort. Such a system could be established by a simple Act of Congress. The opposition to this plan, which is led by a group favouring the maintenance of the present position, rallies around such phrases as "not real home rule" and "half a loaf" and urges that Washington should be represented in Congress before it has local self-government. National representation would, however, require a constitutional amendment; its chances of adoption appear dim, since Congress is loath to alter the political balance by adding members from the District. "Home rule" has the official support of both political parties and since 1947 a number of Bills have passed the Senate, but they have been buried in the House District Committee, which is dominated by Southern Congressmen fearful of how the Negroes, who make up 35 per cent of the population, would vote. However, hopes of prying the current home rule Bill out of the committee have been encouraged this week by President Eisenhower's endorsement of it, provided certain changes are made to safeguard federal interests.

Next Tuesday, however, the District of Columbia will have its first genuine election in eighty-two years when delegates to the Republican and Democratic national conventions will be chosen. Far more people have registered to vote and more excitement has been generated than anyone had predicted. This augurs well for the supporters of home rule who have been told repeatedly by Congress that Washingtonians are neither interested nor competent enough to engage in political affairs. Both Mr Stevenson and Senator Kefauver, competing for the District's six votes at the Democratic convention, have advocated home rule with enthusiasm, thus focusing attention on it as an issue. Meanwhile, Washingtonians are happily flexing their rusty political muscles and referring to civic problems as matters they could resolve if given an opportunity. Many, particularly the older people, are thrilled by the simple magic of voting: as a woman in her eighties expressed it, she hoped she would live till May 1st in order to vote at least once in her life.

Mixed Buses

IN its majestic, if sometimes rather obscure way, the Supreme Court has taken yet another great step towards ending racial segregation in the South. It refused to hear an appeal against a lower court's decision that segregation on buses operating inside South Carolina was unconstitutional because it curtailed the civil rights of Negroes. Although the Supreme Court's action may have been concerned with a point of procedure rather than of substance, most observers believe that its ruling effectively invalidates local laws maintaining segregation on buses in South Caro-

lina and twelve other states. In 1946 the Court had declared that segregation was unconstitutional on buses which cross state lines, but its new decision is more significant, for it affects the daily lives and habits of millions of southern whites and Negroes who travel to work each day.

Those bus companies which are controlled by northern interests are complying rapidly and 13 southern cities have announced that they are abandoning their previous regulations. One of the quickest acceptances of the Supreme Court's action came from the City Lines in Montgomery, Alabama. This company has been losing an estimated \$3,000 a day since last December when the Negroes began a brilliantly organised boycott to protest against the way it applied racial segregation on its vehicles, its discourteous treatment of Negro passengers and its refusal to employ Negro drivers on routes in the predominantly coloured sections of the town. But whether Montgomery's buses will be full again remains to be seen, for the Negroes are waiting until all their requests are considered and the city government and police authorities have announced they are going ahead to "enforce segregation on buses just as we have been doing." Their rather lame argument is that "this damned thing applies only to South Carolina until they tell us . . . that it applies to us." In due time, the Supreme Court will no doubt tell them that it does.

Cars in Low Gear

THE industrial production index's decline in March, the month when a seasonal upturn is expected, is being blamed on the absence of the usual spring rise in the output of durable goods. In this category the chief deficiency is obviously found in automobile production; on the other hand, the steadiness of the figure for total output, when compared with the sharp fall in the automobile index,

suggests that the motor industry may not be quite such a basic factor in manufacturing prosperity as has sometimes been thought. The theory is likely to be more thoroughly tested during the next few months. For in the early part of the year industrial activity in other fields was stimulated by the lack of demand from the automobile industry and for its products. Manufacturers of such things as railway equipment were able, for the first time for months, to obtain all the raw materials, especially steel, that they needed and so to step up their output. The consumers who were no longer buying, or paying instalments on, cars had money to spare for other purchases, particularly of household equipment and other durable goods. These compensatory demands, however, will probably be satisfied before the decline in automobile production is halted. While total output, of 1,743,430 cars, during the first quarter of the year was 18 per cent below that quarter of 1955, the drop in the second quarter is expected to be about 25 per cent. Admittedly comparisons with 1955 are

Reaching for the moon

Once it meant the impossible...today it's a progress report on scientific research

WHO DARES call anything impossible today? Not when research scientists are constantly seeking and finding new wonders to improve the way you live.

ONLY A DREAM YESTERDAY... reality today. A generation ago, Union Carbide scientists began taking oil and natural gas apart and putting the pieces together again in ways unknown to nature.

The result? A steady stream of entirely new chemicals... an average of one a month for the past 25 years. The benefits of these petroleum chemicals are everywhere—man-made textile fibers, amazing plastics, life-saving wonder drugs, enduring paints and enamels...the list is endless.

NOT ONLY CHEMISTRY has felt the touch of Union

Carbide research. Alloying metals that make possible stainless and other fine steels, oxygen from the air for medical and industrial use, a variety of carbon products—all have been developed, made better or more abundant through Union Carbide's research.

AND THE MOON? The work of Union Carbide scientists in new metals such as titanium, in rocket fuels, and in the beneficial uses of atomic energy, is helping man reach in that direction, too.

FREE: Learn more about the interesting things you use every day. Write for the illustrated booklet "Products and Processes" which tells how science and industry use the ALLOYS, CARBONS, CHEMICALS, WELDING EQUIPMENT, and PLASTICS made by Union Carbide. Ask for booklet IE-31

UNION CARBIDE INTERNATIONAL COMPANY

misleading, since that was the year in which all records were broken, and output in 1956 is still running above 1954. But it is disturbing to find short working weeks, plants closing down temporarily, and workers being laid off, at a season when the industry is usually very busy. One spokesman gave a frank reason for the present difficulties: "a shortage of customers." Recently stocks of cars in dealers' hands were at the highest level ever known, over 900,000 units, but at last they have begun to fall, as a result of the reductions in output—at a time when they usually go up in preparation for the spring demand. What happens next depends on whether this demand develops anything like its normal strength. After their excesses last year, it would not be surprising if an unusually high number of consumers decided to postpone buying another car, or replacing their present one, until the new models appear in the autumn.

Looping the Loop

FROM A CORRESPONDENT IN CHICAGO

IN order to relieve traffic congestion and revitalise its central commercial district, the famous but now decaying Loop, Chicago has launched an ambitious programme of road construction. The plans call for 55 miles of roadways to be built by 1960 at a cost of some \$443 million. By 1965, it is expected that well over two million motor cars will speed along the new routes each day, and that motorists will save \$60 million annually in time gained and in lowered operating costs and accident losses. Moreover, the centre of Chicago, that dramatic jumble of slums and skyscrapers, has been suffering heavy competition from outlying shopping and business centres. The new roads and parking facilities should reverse this trend.

The new system will include four expressways—multi-lane roads of the kind which British drivers will enjoy when the London to Birmingham "motorway" is built. These expressways will radiate from the Loop towards the west, the northwest, the south and the southwest where they will link up with projected toll roads and interstate highways. A subsidiary road, the Wacker Drive Extension, will connect the western and northwestern routes near the Loop. So far, seven of the sixteen miles of the Congress Street Expressway—which leads westward—have been completed. The whole scheme was evolved from studies of European cities made by Daniel Burnham, a Chicago architect, in the nineteen hundreds. He was impressed by London with its two axial thoroughfares, the one going from north to south and the other linking Bayswater with Whitechapel.

Even the minor portion of the work done so far indicates that there are tremendous difficulties involved and that Chicago's physical, economic and social life will all be affected by the operation. The Congress Street Expressway has eight lanes for motor cars and a railway line in the centre. In its path were some 650 business and industrial premises which had to be removed and at its eastern end the road cuts through a large post office and a railway station. In the Loop area pavements were taken over in order to gain width and this meant that new ways for pedestrians had to be created in the form of arcades passing through buildings.

At first, it was thought that the demolition of factories would cause considerable economic hardship, but this proved untrue. The buildings that were levelled were

mostly obsolescent and the purchase money paid to the owners for their old properties gave them the means to construct new and more efficient plants in suburban districts. And where buildings have not been razed—in Wacker Drive, for example—the new expressway has encouraged owners to improve their properties, to add new fronts and so on, and this has meant higher property values. At the city limits—formerly an undesirable position because of inadequate transport facilities—the proposals for new roads have brought with them many prosperous families anxious to live in a semi-rural setting.

A much more serious problem was to remove and re-house some 14,000 "displaced persons." To begin with there was a housing shortage and the first three miles of the Congress Street route led through a slum-ridden area thickly populated by racial minorities of Mexican, Italian and Puerto Rican background. Out of psychological and social self-protection, these groups tend to stick closely together and their way of life is intimately tied up with their homes and neighbourhoods. So when the Department of Superhighways began clearing the right of way in 1947, it called on the assistance of the Housing and Development Co-ordinator. His staff soon realised what a complex job it had taken up. Occupants of condemned properties were notified and interviewed, and everything possible was done to find new homes for them. At first, the tenants protested, held mass meetings and tried to exercise pressure on the city government. But when they realised that eviction could not be avoided the search for new homes became frantic.

Naturally enough, elderly people were most reluctant to move. Some refused to budge until moving vans were obtained for them and one family insisted on taking along its large menagerie. A van had to be backed up against the doomed house and into this ark advanced some twenty-five pets—dogs, cats, pigeons and a parrot. But as the demolition extended beyond this inner belt of slums and into a more prosperous area, the attitudes of residents changed. Middle-class families were more prepared to leave their homes and search for new and better ones in the suburbs where, unlike the racial minorities, they found a ready welcome. In 1950, nearly twenty per cent of the "displaced persons" had to be relocated in public housing projects; by 1954, this figure had shrunk to two per cent. On the whole, the clearance proceeded calmly and only three tenants finally had to be evicted. The experience gained during the process will serve Chicago well since some 40,000 more people will have to be moved.

The World Overseas

Retreat from Stalinism in Poland

ECHOES of the Moscow congress sound louder in Poland than anywhere else in Eastern Europe. The break with the Stalinist past seems to be more radical, the recantation more sincere. A wide amnesty has just been proclaimed. A purge is still going on among judicial and police organs held responsible for abuses. Emigrés are being called back with promises that the slate will be wiped clean. Even the *Sejm*, the Polish parliament, is being encouraged to show some critical spirit in its dealings with the government. All these are external signs of a tide sweeping through the country with unprecedented force; its cleansing or disruptive power has still to be measured.

It is no accident that Polish communists are in the forefront of the anti-Stalinist campaign. Their grudge is long standing. After the war they had to parade under an assumed name, because their ancestor, the Polish Communist party, had been disbanded by the Comintern in 1938 and its leadership wiped out during Stalin's purges. Thus Poland's postwar rulers wore the shoes of Stalin's victims and found themselves in the curious position of both blessing and cursing the hand of Moscow which had brought them to power. From the very first they had to fight on two fronts: the struggle against a predominantly hostile population had to be combined with passive resistance to Russia's excessive demands. During the purge of suspected Titoists the Polish leaders protected Wladyslaw Gomulka because they were sufficiently aware of their own isolation at home and the difficulty of arresting the inexorable mechanism of the guillotine once it had started. They also knew that the antics imposed on them by Stalin were weakening their already precarious position inside the country. Yet the régime was too dependent on Moscow to protest, let alone to put up demands. It was not until Stalin was dead that the Polish Communist party could be rehabilitated and after the Soviet party congress the movement of protest gathered strength. How strong were the pent-up emotions of resentment can be judged from the violence of the present catharsis.

The whole press is full of anguished confessions. In this gigantic revaluation many party writers ask why for so long they had to subordinate their own conscience to a false collective one and cover known falsehoods and injustices under the hypocritical cloak of orthodoxy. The condemnation of the recent past is far from half-hearted. A poet describes this period as one when:

Men on crutches taught us walking
Blind men were carrying torches
Deaf men examined consciences on the market-place
And ascetic men indulged in crimes.

This is not the voice of the opponents of the régime. A great cry for inner party democracy is coming up from the Communist ranks themselves. Only open decisions openly arrived at, it is argued, can preserve the party from a repetition of the Stalinist nightmare. An end must be put to the double life, to the Jekyll and Hyde existence of the party. The campaign is not discouraged by the leaders. On the contrary, in official speeches or editorials one can hear the same criticisms of Stalin, the same repentant admissions about the past. It is proclaimed that this spring cleaning of Stalinist shibboleths will have to go much further before the party can regain its health.

The Polish retreat from Stalinism is much faster than the Russian; though it probably cannot be as orderly. The opposition is stronger, the ground more slippery and the situation could easily get out of control. A decade has not been long enough for the régime to strike very strong roots. It has to face a Catholic Church still commanding the support of millions. It also has to cope with its discontented peasants. Despite industrialisation, half the population is still employed in agriculture and only one-fifth of the land is in State or collective hands. The remaining mass of small-holders must have grave suspicions about a régime committed to the elimination of private property. In the towns, too, the leaders must reckon with hostility, and not only among those hankering after prewar days. The industrial revolution has been carried out largely at the cost of the living standards of the masses; it has also brought in its train a formidable and ever-present housing problem. Even those who turn a deaf ear to slogans coming from abroad have many reasons for discontent.

In such a hostile environment it is not easy to speak openly inside the small party circle without provoking dangerous echoes. It is one thing to give more scope to a puppet Diet, quite another—using Byron's words—"to tell pugnacious Poland to keep quiet." In the case of Poland the Russian dilemma of reconciling inner-party democracy with outside dictatorship is magnified. It is difficult to confine the expressions of discontent to those who carry a party card. Even the funeral of Boleslaw Bierut, the party secretary who died in Moscow after the Soviet congress, was apparently used by some people in Warsaw as an opportunity for an anti-Soviet demonstration.

The new official line will no doubt please the Poles. Measures, such as the amnesty, should also prove popular. Appetite, however, grows with eating, and if police pressure is weakened, some substitute for it must be found. The government has no intention of relinquishing its power, or of abandoning its conquests or objectives. In the transitional

period it must, therefore, try to buy public acquiescence at a high economic price. Hitherto, Poland has industrialised at breakneck speed regardless of human cost. Mr Ochab, the successor of Mr Bierut, has now admitted that the standard of life is lagging far behind industrial development. He has promised some immediate improvement for those workers and small officials who are in the worst plight. But how much is the government willing to sacrifice its objectives in order to achieve a rapid improvement in the well-being of the masses?

The heated discussions on this subject are responsible for the failure so far to publish the new Five-Year Plan (1956-1960). The plans of all the East European countries are now being co-ordinated and dovetailed with the Russian one. It would be a real sign of relative independence if Poland, which up to now has copied the Soviet model even down to the virgin lands and maize campaigns, were to emphasise the rights of the consumer at a time when this is a heresy in a Russia concentrating on heavy industry. Short of such a striking departure the Polish retreat from Stalinism runs the risk of ending in a panicky rout.

Danish Socialists in Trouble

FROM OUR SCANDINAVIAN CORRESPONDENT

THE unseasonable snow which fell in parts of Denmark last week did little to cool the passions aroused among the normally good-humoured Danes by industrial unrest. The series of strikes, which for four weeks threatened to paralyse the country's economy, were only checked when the *Folketing*, after a stormy all-night session, passed an Act giving the official mediator's proposals the force of law. These proposals, which satisfied only a small part of the workers' original demands, had been accepted by 74 per cent of the Employers' Federation but rejected, albeit by a narrow majority, by the Federation of Trade Unions.

Had these positions been reversed the Social Democrat government would have felt itself on firmer ground. Its reluctant intervention was greeted by a 24-hour general strike and a countrywide wave of protest demonstrations. In Copenhagen, a crowd over 100,000 strong demonstrated before the Parliament, brought traffic to a standstill, and called for the Prime Minister's resignation. Demonstrators in Odense stopped buses and overturned cars. At Aalborg, a policeman died after being struck by a missile. Rioting dockers in Esbjerg attempted to throw the cargo of a British merchant ship into the harbour. In the larger centres throughout Denmark the police made numerous arrests.

The Danish industrial conflict became critical in March when deadlock was reached in the biennial wage negotiations. The workers, who were clearly overcalling their hand, demanded increases of 20 per cent, which would have cost the country £30 million annually at a time when competition in export markets is increasing. A strike of petrol-tanker drivers, which stopped the distribution of liquid fuel, lamed internal communications, left schools and hospitals unheated, and forced tractors to stand idle. Several hundred Easter holidaymakers were marooned on Bornholm. Meanwhile the metal workers' strike brought shipbuilding work to a halt, and lost the country valuable export orders. Strikes of dockers and seamen prevented the turn-round of

ships and exports piled up. Confusion was worse confounded by the typographers' strike; only the former resistance organ, *Information*, and the Communist and Social Democrat newspapers continued publication.

The enforced arbitration agreement, which broke the back of the strikes, provides for wage increases of approximately 3 per cent, which will cost the country about £8 million per year; but it did not meet the strikers' demand for a 44-hour week. (The mediation agreement for agricultural workers, providing for more pay and shorter hours, will, if implemented, cost Denmark a further £3 million a year.) Most workers have now followed the advice of the union leadership and returned to work. Only the Seamen's Union, in which Communist influence is strong, and some bakers remain in revolt.

Although conditions are apparently returning to normal, there is a deep malaise beneath the surface which may well lead to fresh outbreaks or to falls in productivity which the country can ill afford. The strikes revealed that the Communists wielded an influence out of all proportion to their numbers; for a time the so-called "general staff" of shop stewards in Copenhagen wrested the initiative from the responsible trade union leaders. Since the disorders, the Communists have increased their hold on the important Metalworkers' Union. With some pardonable exaggeration, *Information* has written of "Czechoslovak conditions" and stated that a "puff of wind from outside would have blown the cardhouse over." It was fear of the Communists which caused the unions to overcall their hand at the outset.

Nigger in the Woodpile

Among the workers there is a widespread feeling that the Social Democrat government has betrayed its own supporters. It can certainly be argued that, if events had been allowed to run their course, substantially the same result might have been achieved without precipitating the unfortunate division between the political and trade union wings of the Social Democrat party. Hire-purchase commitments were already straining the strikers' budgets. The uneasy personal relationship between the Prime Minister, Hr H. C. Hansen, and the trade union chairman, Hr Eiler Jensen, perhaps helped to cause the division. But the real nigger in the woodpile was—as nearly always in Danish politics—the small Radical party, which threatened to gang up with the Conservative and Liberal opposition, and thus forced the government's hand. Even some of the employers question the wisdom and propriety of the government's action in riding rough-shod over the trade union vote, and in the *Folketing* several Social Democrats abstained from voting on the law to end the strikes. The government's prestige, which was at its zenith on Hr Hansen's triumphant return from Moscow a few weeks ago, has suffered a severe reverse.

While the immediate political consequences of the strike are clear, the economic consequences remain cloudy. In a desperate attempt to forestall a new inflation, the government has tabled proposals to check prices and profits, and to increase taxes on dividends. These stand little chance of obtaining even qualified support from the Radicals, except at the expense of further defence cuts. During the first half of April the foreign currency deficit with the National Bank rose by £3 million; this shows that Denmark's balance of payments position, which has steadily improved since last July, is once again endangered.

The Ghost of Tukhachevsky

BY A CORRESPONDENT

IN the revision of history now taking place in Russia the army is getting its proper share of the limelight. The blame for early defeats during the last war is now being shifted from the shoulders of the generals to those of Stalin, who refused to heed warnings from abroad and failed to listen to the professional advice of his generals. In a secret session of the Soviet party congress Mr Khrushchev apparently went even further and accused Stalin of sapping the strength of the army on the eve of the war by the massacre of some 5,000 generals and officers. Among the persons who are now rehabilitated in the pages of *Voprosy Istorii* are to be found the names of Marshals Gamarnik (who committed suicide) and Yegorov, two victims of that bloody purge. The turn of Marshal Tukhachevsky, the most distinguished of all these victims, can hardly be long delayed.

If Trotsky was the original creator of the Red Army as an instrument of civil war, it was Marshal Tukhachevsky who refashioned it as a force capable of taking the field in full-scale war against a great power. Although nominally subordinate to Stalin's henchman Voroshilov, Tukhachevsky as Vice-Commissar for War in 1936 was the real head of the armed forces and enjoyed an immense prestige and influence. On May 11, 1937, however, he was demoted to a minor provincial command, and on June 12th the Soviet government announced his execution, together with that of seven other generals, after an alleged trial *in camera* by court-martial. This was the beginning of a purge that began among the top-ranking officers and extended downwards right through the officer corps.

The official report at the time on the secret trial of Tukhachevsky and his associates stated that

These eight spies regularly supplied confidential information to the military circles of a foreign state; they committed criminal acts in order to undermine the strength of the Workers' and Peasants' Red Army; they worked to prepare the defeat of the Red Army in case of aggression against the USSR. They aimed at promoting the dismemberment of the USSR and the restoration of the power of landowners and capitalists.

What is most remarkable in the historical record is that a number of the highest-ranking officers of the army should have been willing, even under the severest intimidation, to endorse such charges against their colleagues. There are grounds for believing, however, that evidence of a sort was presented to them to persuade them that the accused generals were in German pay. Important testimony to this effect comes from the former German intelligence agent, Wilhelm Hoettl, who in his book "The Secret Front" relates a story told him by SS General Behrens who was executed as a war criminal in Yugoslavia in 1946. According to this account, Heydrich, having received information of disaffection against Stalin in the Red Army, decided, after consultation with Hitler, to strike a blow at Russian military strength by supplying Stalin with forged documents for use against Tukhachevsky. The task of preparing the material was entrusted to Behrens, who carried it out with the aid of expert forgers. The dossier was ready by the beginning of May, and Heydrich first tried to play it

THE ECONOMIST, APRIL 28, 1956

into Stalin's hands through the Czech General Staff. When this plan did not work out to his satisfaction, Heydrich offered them directly to an official of the Soviet Embassy in Berlin who was known to be a representative of the NKVD. In response to this approach a special messenger was sent from Moscow who bought the papers for three million roubles.

Partial confirmation of this account is provided by a story told by President Benes to Sir Winston Churchill and recorded by the latter in his war memoirs. Benes affirmed that the Czech authorities had learnt of communications passing between Germany and high personages in Russia and that he had passed on the information to Stalin. The attempt to transmit the forged documents to Moscow through Czech channels, as related by Hoettl, would explain the belief of Benes both that the Tukhachevsky group were working for Germany and that he, Benes, had rendered Stalin a great service by revealing the conspiracy.

If such documents were indeed used, it is probable that they would have convinced honest serving soldiers in Russia of the guilt of Tukhachevsky and thus enabled Stalin to divide the army which otherwise might have risen against him on the arrest of its leaders. It is unlikely that Stalin himself would have believed in the authenticity of the letters. He was undoubtedly aware, however, of the disaffection in the Red Army, and the documents would have provided the means of discrediting a dangerous military faction. According to Erich Wollenberg, who served for several years in the Red Army and was an admirer of Tukhachevsky, there was in fact a plan for a *coup d'état* against Stalin to be carried out by Red Army troops. If this is true, Stalin had cause for taking action against Tukhachevsky.

But there is, of course, a world of difference morally and politically between a purely internal revolt against a dictator and an agreement to betray the vital interests and integrity of one's country to aggressive foreign powers. In Wollenberg's version the aims of the Tukhachevsky group were the opposite of those attributed to them by Stalin's propaganda; they blamed Stalin for having weakened Russia by his policy of forced collectivisation and they charged him with failing to counter the menacing moves of German and Japanese expansion. They demanded a relaxation in internal policy, with concessions to the peasants, and a stronger external policy for the security of the Soviet Union. Now that the history of the Stalin era is being revised, we may hope soon to hear more about a movement the nature and purposes of which have hitherto been successfully concealed from the outside world.

Cocoa Feels the Pinch

FOR the first time in their nine years' life the Cocoa Marketing Boards of the Gold Coast and Nigeria are facing a substantial loss. The scarcity of cocoa began to ease nearly two years ago, after the market price had soared to a peak of £560 a ton. As supplies steadily became more plentiful, the price as steadily fell, until it recently dropped below £200 a ton, the lowest point for six years. In the

Fractional Horsepower MOTORS

BTH fractional horsepower motors are second to none in quality and proved performance. All types are available in sizes to meet every domestic, commercial, and industrial need. Precision-built of highest grade components, and fully tested, they will give long and trouble-free service. No manufacturer can offer a wider choice in fractional horsepower motors. Whatever the conditions of service or type of drive, there is a BTH motor well suited to the job.

For the B.E.A. project at Shoreham, Sussex, the Contractors, Peter Lind & Co. used modern oil-flooded rotary compressors of the latest type.

Because they virtually cut out maintenance...

these new Power Vane rotary compressors are the most important advance in design since portable air compressors came into general use. All the parts which are commonly subject to trouble in

any compressor of conventional design—clutch, crankshaft, valves, pistons—are replaced by a simple two-stage vane type rotary compressor. The entire unit runs in oil and is oil-cooled.

And fully automatic safety devices prevent damage in the event of mishap or negligence. These revolutionary features mean infinitely lower maintenance costs, longer life, greater convenience all round. Certainly it is something your Plant Engineer should know about...

ROTARY COMPRESSORS

in capacities of 120, 175, 210, 365 and 600 cu. ft.

MANUFACTURED BY CONSOLIDATED PNEUMATIC TOOL COMPANY LTD. 232 DAWES ROAD, LONDON, S.W.6.

CPS

1953-54 season, the last for which the accounts of the two boards have been published, the average price realised by both was £360 a ton fob. In that season the fixed price paid to the cocoa farmer in the Gold Coast—the world's largest producer—was £134 a ton and in Nigeria £170 a ton. After all expenses had been met, including the payment of huge sums in export duty, the Gold Coast board was left with a net surplus of £11.1 million, and the Nigerian board with a surplus of £6.2 million. Last season the average price realised for Gold Coast cocoa was probably in the region of £350 a ton, and the quantity was substantially the same as in 1953-54. Since the producers' price remained unchanged, and marketing expenses could hardly change much, the board's net surplus for 1954-55 must have been similar to that of the previous season. In Nigeria, however, the board's trading margin must have dropped by about 40 per cent, because the producers' price was raised by £30 to £200 a ton; the net surplus probably dropped in proportion.

Cocoa farmers in the Gold Coast are being paid nearly £150 a ton this season, an increase of £15, while the market price has fallen sharply. The average price of the 190,000 tons sold so far is unlikely to be more than £235 a ton. After paying export duty of about £67 a ton and marketing expenses of about £20 a ton, the board would be left with just under £150 a ton. Up to the present, then, the board has at best broken even. But the price of Gold Coast cocoa has now come down to £200 a ton and the board still has about 35,000 tons unsold. If all that cocoa had to be sold at present prices, the board would incur a loss of about £20 a ton, or £700,000.

Must Prices be Reduced?

Nigeria must have incurred a substantial loss already. The average price realised for the 95,000 tons sold so far can hardly be more than £225 a ton, for Nigerian cocoa normally fetches about £10 a ton less than that of the Gold Coast. After paying export duty (about £45 a ton) and marketing expenses (about £20) the board would be left with £160 a ton. Yet it pays the producer £200 a ton. Hence on its sales to date the board has probably lost about £40 a ton, or nearly £4 million. If the remaining 15,000 tons of the crop have to be sold at about £190 a ton the board's total deficit this season would be nearly £5 million.

A loss in one season is of no great moment to the boards' finances, for their reserves are large. Their accounts for 1953-54 showed that the Gold Coast board had a general reserve of £6.5 million, and its stabilisation reserve, which was set up to shelter the producer in times of low prices, stood then at £51 million. The general reserve of the Nigerian board, before it was distributed among the regional marketing boards that have assumed the central board's main functions, stood at £29 million; no specific allocation was made to a stabilisation reserve.

The political implications of a loss, however, could be troublesome. The government of the western region of Nigeria, which produces the bulk of the crop, is now responsible for fixing the price guaranteed to the farmer. Can it avoid reducing the price for the coming crop? The farmers no doubt will argue that the government should instead exact less in export duty, and let any remaining loss fall on the board's reserves. In the Gold Coast, where the fixed price is £50 lower at £150 a ton, the need for

a reduction is less urgent, and the government could be forgiven for wanting to maintain the price at least for another season. In both countries the reserves could well be drawn upon to cushion the full impact on the farmers of the fall in the market price. Though the cocoa boom is past the outlook is not altogether gloomy. World consumption is responding to lower prices, and will in time catch up with—if it does not surpass—world production. Any recovery in the price, however, will be moderated by the heavy stocks in consumers' hands.

Blueprint for Apartheid—II

FROM OUR CORRESPONDENT IN SOUTH AFRICA

THE Tomlinson commission devoted a great deal of attention and attached much importance to what is called "ecclesiastical development." The greatest and most difficult problem confronting it "was the fact that it appeared as if all efforts in connection with the development of the Bantu areas were arrested by the unwillingness of the Bantu." It came to the conclusion that the Christian religion and education would help "to convert this reluctance into spontaneous and purposeful action," because

the Christian religion is indeed a miraculous power which has radically affected the lives of the Bantu in such a way that no natural scientific explanation can be found for the transformation which has taken place in their lives. It is a supernatural power which has asserted itself in their lives and in every aspect of them.

The commission therefore believes that the churches should be deliberately associated with the entire development programme. It recommends the establishment of a special Church and Mission Affairs section in the Department of Native Affairs; the large-scale training of missionaries and Native spiritual workers; registration *de novo* of all churches and missionary societies; the issue of permits to all missionary workers among the Natives in order to prevent witch-doctors, communists, agitators and exploiters from carrying on their undesirable and politically dangerous practices under the cloak of Christianity. The commission also considers it necessary that in future a much larger percentage of missionary workers should have a South African background and training. It wants the Natives eventually to develop "a Bantu civilisation with its own Christian way of life."

The commission suggests a ten-year development plan under which £104 million would be spent on building up the agricultural, industrial, mining and commercial resources of the areas, and on providing health, welfare, educational and other services. Of this amount, £33 million would be spent on agriculture; £30 million on industry, commerce, financial institutions and so on; £13 million on basic facilities; and £12 million on urban development. More than a hundred towns must be established on an economic basis to house and support the 64 per cent of the population who would not be able to gain a living from agriculture. Investigation has shown that it should be feasible to establish and develop an iron and steel industry and quite a wide variety of secondary industries ranging from cotton textile and woollen industries to light metal factories and sugar

Fly to New York and across the USA WITH TWA's NEW SUPER-G CONSTELLATIONS

Quietest, most luxurious
long-range airliners
in the world

THERE'S ROOM
to relax and much to admire
aboard the new Super-G.
You'll meet interesting people
in the beautifully spacious
First Class lounge. And in
America, you link with TWA's
services to 63 major U.S. cities.

TIME FOR FOOD
and it's a Super-G spread.
Delicious food superbly served—
here's a banquet on top of the
world. TWA is famous for its
service, and Super-G hospitality
is in tradition.

SNUGGLE DEEP
in the bliss of your full-length
berth, or thrifty Sky Tourist
stretch-out reclining seat.
Whichever you prefer, you
can now enjoy your trip
on the new Super-G.

AS YOU FLY
steadily on, radar in the nose
plots the smoothest weather
a hundred miles ahead.
Wing-tip tanks mean greater
range—less travel time.
For all the speed and
comfort, too, fly Super-G.

Make your next flight by TWA Super-G, for your journey
is quicker, your comfort unequalled in these magnifi-
cent new airliners. Ask about TWA's Time Pay Plan
(you fly now, pay later) from your travel agent or call

Simon resources and experience are brought
to bear on many industrial developments of
national and international importance.

SULPHURIC ACID

Many Simon-Carves sulphuric acid plants are used in oil
production at great overseas refineries. Others in Britain and
abroad help to increase world harvests by supplying acid
for fertiliser manufacture: among these are two important
new plants in Australia. Also in Australia are plants
operating in the vital field of uranium production. At
home the output of acid is significantly increased—and
payments for imported materials reduced—by two great
plants at Billingham and Widnes which make sulphuric
acid and cement clinker from British anhydrite.

refineries. Native banks, building societies and insurance
companies would also have to be established.

In order to promote industrialisation in the Native areas
"the aim should be not to force industrialists to move into
the reserves, but to attract them there voluntarily by pro-
viding facilities such as transport, power, water and urban
development." The commission envisages that the "Native
sector" should have at its disposal the entire economic and
administrative machinery of the "European sector," and it
adds:

It is essential that the economic unity of the country and
the free participation of the Bantu areas in the total
economic activity of the Union should be preserved; more-
over, economic barriers or divergent directions of develop-
ment would not promote development, while different price
structures or a division of the national market area by
customs barriers, would be unthinkable. All establishment
of industries will, therefore, in the long run have to take
place on an economic basis, and there will have to be co-
ordination with the directions of development, economic
institutions and financial resources of the Union.

To begin with, Europeans would have to act as entre-
preneurs, but ultimately the Natives would have to take
over entirely, and they would from the outset be given pro-
prietary rights in both rural and urban areas. Paradoxically,
however, the commission does not recommend giving the
Native workers in the reserves the right to form trade
unions—they are not, it says, ripe for this. Although the
Natives "will tend to move in the direction of the industrial
civilisation of the European," they will not be westernised.

Footing the Bill

The money for all this gigantic development will have to
come from government as well as from private sources. The
commission suggests that the International Bank for Recon-
struction and Development and the American Point Four
programme might be possible new foreign sources of sup-
port. A Development Corporation for the Native Areas
would derive capital from the Nature Trust, and would also
be empowered to issue redeemable shares. After the first
ten years the Bantu areas themselves should be able to
provide substantial amounts for their further development.
But, as the commission rightly points out, a vitally important
question is "whether Bantu and European enterprise will
be attracted to the Bantu areas in sufficient measure to
utilise to the fullest extent the capital which will be
invested" there.

This is but one of many questions which the commission
leaves unanswered. The overriding issue, of course, is the
practicability of the segregation formula. One member of
the commission, Professor Bischoff, fears that it will prove
to be impracticable, and says, in a dissenting passage, that
"progressive integration, with its economic and political
consequences, will then have to be accepted." His views
are widely shared in other quarters. There is also the
question of the degree to which the Native people will co-
operate in a scheme designed by white men primarily to
safeguard their political domination. And the commission
does not touch on the vital issue of the political representa-
tion in the central government of the 16 million people who,
it hopes, will be living in the Native areas by the end of
the century. It was not asked to consider the problem of
political rights for the Natives outside the Native areas, but
it makes it clear that such people will not be entitled to any
rights because they are "visitors" to the white areas.

The fact that most of the "visitors" will never have lived
anywhere else and will be fourth or fifth generation dwellers
in the white areas is conveniently glossed over.

Moreover, will white capital, white entrepreneurs, white
technicians and supervisors be attracted to the Native areas
if they know they are to be there on sufferance and only as
long as they can be used and are needed? And what will
white industrialists and farmers say if black men start
moving to the Native areas in large numbers? Fifty per
cent of the workers in South African industry are Natives.
There are today 21,000 Native tractor drivers in the smallest
province, the Free State; the agricultural industry in this
area will collapse if these men decide to go and drive tractors
in the Native areas.

As a regional plan to develop an underdeveloped area, the
Tomlinson report has much to commend it. But it fails
completely to provide a satisfactory formula either for total
territorial separation or for co-existence in a multi-racial
society. This crucial problem remains as urgent as ever.

(Concluded)

German Free Democrats at Würzburg

FROM A CORRESPONDENT

THE conference of the German Free Democrats at
Würzburg last weekend was a landmark in the party's
history. It endorsed the breach with Dr Adenauer's coal-
ition and put the seal on the secession of the sixteen dissident
Bundestag deputies, including four Federal ministers. At
the same time, it provided some clues about the alignment
of forces for next year's Bundestag election.

The conference showed that for the present the remain-
ing Free Democrats manage to combine a certain amount
of unity with the greatest possible differences in background,
approach and temperament, ranging from the strong
personal quarrels within the leadership of the party's *Land*
organisations to the bizarre mosaic of varied opinions
without any common roots. Even the split with the dissi-
dent wing of the Federal Vice-Chancellor, Herr Blücher,
did not substantially reduce the number of different group-
ings, since it cut across them. The dissidents who have just
formed a new Free People's Party range from the "Euro-
pean" Herr Blücher to the rather nationalistic and right-
wing Herr Euler, the former chairman of the Free Demo-
crats in Hesse. The split was not primarily over ideological
differences, but over the question of whether the party was
with Dr Adenauer or against him.

It is therefore not surprising that opposition to Dr
Adenauer was the central theme at Würzburg. It dominated
the main speech of the party's chairman, Dr Dehler, who
was re-elected by a considerable majority, though largely
for lack of a genuine alternative. With his usual rhetorical
skill, Dr Dehler produced a brilliant criticism of what he
called the Chancellor's autocratic methods. Though he
vastly overplayed his theme, he did touch on feelings which
cut across party divisions. But there was little attempt by
any speaker to go beyond the general criticism that the
Chancellor did not pay enough attention to German
reunification and that he had neglected German interests

in the Saar. It was claimed that the Free Democrats had, above all others, won back the Saar for the Fatherland. The prominence given to the Saar question, which is almost the only one over which the Free Democrats can claim a success, is understandable. But it is full of risks, since it plays into the hands of the man who is now possibly the most dangerous active German politician on this side of the Iron Curtain—Herr Heinrich Schneider, the leader of the Democratic party in the Saar (DPS).

Herr Schneider sounded the shrill clarion call of extreme German nationalism. He compared the treatment of the Saar by the French in the postwar years with that of the Soviet Zone by the Communists and proclaimed the liberation of the Saar as the pattern for German reunification. He insisted that German reunification had to precede the establishment of European co-operation and demanded, in due course, direct negotiations with the Soviet Union on German reunification. No one except the chairman of the Berlin Free Democrats, Herr Schwennicke, contradicted Herr Schneider, who, in fact, received considerable applause. But when questioned at a press conference Dr Dehler said that Herr Schneider had merely put forward his own opinions and that these had not been agreed with him. While he to some extent dissociated himself from these opinions, one could sense his reluctance to engage in controversy with a man with a considerable following. The influential North Rhine-Westphalia group seems at one time to have toyed with the idea of Herr Schneider as a possible successor to Dr Dehler, and he certainly remains in the running.

The party endorsed the Düsseldorf switch to a coalition with the Social Democrats and at present favours this constellation for Bonn in 1957. But at the same time even Dr Dehler was careful not to rule out other possibilities; he confined his personal attacks to Dr Adenauer and was complimentary to the Federal Foreign Minister, Herr von Brentano, and the Federal Minister for Home Affairs, Herr Schroeder. The Free Democrats hope to remain the third strongest party in the Bundestag in 1957 and to be able to tip the scales. But it remains to be seen to what extent the new Free People's party will be able to draw away support from them. To maintain their strength, the Free Democrats will have to make up their minds on a positive programme acceptable to their various groups.

Orthodox Finance for New Zealand

FROM OUR WELLINGTON CORRESPONDENT

THE report of New Zealand's Royal Commission on monetary, banking and credit systems has been welcomed by the government, which admittedly has political cause to be grateful for it. It has also been welcomed on the whole by the press, banks, commercial interests and, as far as one can judge, by that considerable section of the public which still has misgivings about financial nostrums prescribed by unregistered and untried practitioners.

Inevitably its orthodoxy has been the chief criticism levelled against the report by those who want a change, and the most vocal of these critics are the social creditors.

The commission spent a good deal of time listening to their evidence and theories. Its report said in effect that it could not understand some of their evidence, but what it could understand convinced it that social credit is no remedy for anything, but simply a short cut towards inflation and economic confusion. Naturally the Social Credit League does not like this and is saying so. The unexpected size of the social credit vote at the last election startled the government, and it obviously hoped that an objective examination of these troublesome theorists would provide an authoritative funeral oration on them. These hopes were fulfilled by the report, but it is extremely doubtful whether the corpse will lie down. Social creditors are now saying that they never expected anything else from the commission but a whitewashing of the present monetary system; they are certain to make this contention their chief argument at the next election and to obtain a good deal of support for it.

Criticism from the Left

Apart from the social creditors, the chief criticism of the report comes from the Labour Party, which holds that anything wrong with the financial system is *ipso facto* the fault of the government and that any report which in general sustains the government is a poor one. In particular, it dislikes reports of criticism of the cheap money policy which the present government inherited from its Labour predecessor and which it has maintained largely because it lacked the courage to abandon it. Labour also does not agree with the commission's view that New Zealand's present housing policy is a contributory cause of inflation. The New Zealand Master Builders' Federation does not like this either and has already asked rather plaintively why building should be the only industry singled out in the report for critical attention.

The commission's recommendation that New Zealand should join the World Bank and the International Monetary Fund also creates political problems for the government. Some New Zealand opinion is strongly opposed to joining the World Bank. Labour habitually represents both the World Bank and the International Monetary Fund as covers for American dollar diplomacy and the social creditors say that overseas borrowing would not be necessary if their theories were adopted. The reserve bank has several times recommended that New Zealand should join the World Bank but the government has so far fought shy of the uproar which it fears this step would create. It may be helped to make up its mind by the report's recommendation, but, as the commission has pointed out, political considerations tend to weigh heavily in deciding New Zealand's financial policy.

Most of the rest of the commission's recommendations do not present the government with any serious problems. It stopped short of an unqualified recommendation in favour of PAYE, and its criticism of the cheap money policy which the government is now in the process of abandoning will strengthen the latter's hand if it wants to expedite the process. The commission said some necessary and useful things about the need for strengthening New Zealand's overseas reserves and encouraging thrift and savings. Its report also has the virtue of being a lucidly written, plainly expressed document which provides an authoritative outline of New Zealand's existing financial and credit system and makes a number of practical, if orthodox, suggestions for its improvement.

every day

every way

10th April. The Clean Air Bill was considered at the Report stage in Parliament today. A major factor in the prevention of atmospheric pollution is the increasing use of electricity. Ever since 1900 it is broadly true to say that the use of electrical energy has doubled every ten years. AEI is the largest group of electrical manufacturers in this country with companies building equipment for the complete range of generation, distribution and use of electricity.

11th April. At Cranwell yesterday a senior R.A.F. officer emphasised the desire of the Service to modernise itself and substitute new 'push button' weapons for aircraft as soon as possible. B.T.H. built equipment for our Battle of Britain aircraft and today the AEI contribution to defence includes guided missiles, radar, gas turbines for the Royal Navy and even miniature cookers for tank crews.

12th April. The Minister of Education opened the Conference of the National Association of Mental Health at Harrogate today. Hospitals all over the world use Newton Victor X-ray and Ediswan shock therapy equipment for the diagnosis and treatment of mental disorders.

CHINCHONA

The Chinchona is an evergreen tree which is native to the well-watered eastern slopes of the Andes near the equator. Although it has been successfully grown in other parts of the world, it is still exported from Peru and neighbouring Republics.

In almost all the important commercial centres of these countries and throughout South and Central America, branches of the Bank of London and South America serve the needs of traders. Reports on local produce markets, trading conditions, exchange regulations and economic affairs in general are sent by the branches to the Bank's Head Office; the contents of these reports are published in our Fortnightly Review, which is distributed to our customers and correspondents.

The Countess of Chinchón, wife of the Viceroy of Peru, was cured of a fever in 1639 by taking a potion prepared from the bark of a tree which, a century later, was named Chinchona by the botanist Linnaeus. The indigenous name of the bark in Peru is quina-quina; it has saved countless lives for it is the natural source of quinine, once man's only weapon against malaria.

THE BUSINESS WORLD

Cold Water on Coal

MOST people who have considered the future of Britain's fuel supplies at all recently have thought it advisable to hedge the bet made by the National Coal Board in 1950 that it would be able to mine 240 million tons of coal a year by 1965. The board, however, remained outwardly sanguine, making reassuring noises about "revising the long-term plan"; as recently as June last year, in its last annual report, it was even talking of "production of the order of 250 million tons a year" as "the most it could expect to be available by about 1965," though admittedly it did not quite say that this would all be available from the mines alone. But last autumn it did at length carry out a full revision of its long-term mining plan, asking every pit management in the country what it now, after six years' investment under the "Plan for Coal," really hoped to produce by 1965-1970.

The upshot may be, as the board says, realistic: it is also pretty dismal. The board no longer hopes to be able to produce 240 million tons a year from the mines by 1965; it has put this target back to 1970. It still intends to supply 240 million tons of coal in 1965; but it can only hope to do so by continuing to claw 10 million tons of opencast coal a year from the surface. It has already invested about £348 million in "collieries and associated activities" since nationalisation (including between 1950 and 1955, in real terms, nearly as much as it intended under the long-term plan). By 1960

it intends to spend another £500 million on this colliery investment, and between 1960 and 1965 a further £360 million; between 1965 and 1970, the board guesses, colliery investment may have to continue at about the same level. But output from the Coal Board's mines, into which these vast sums are being sunk, is not expected to exceed 216 million tons in 1960 (it was 208 million tons last year, but 214 million tons in 1953 and again in 1954); it is expected to reach only 228 million tons by 1965; and only 238 million tons by 1970. The board's original planned investment (over and above the compensation paid for nationalisation) in collieries, plus its mixed bag of ancillary assets, was to have cost some £635 million, reckoned at mid-1949 prices; the £353 million that has actually been spent since it began has, owing to continuous inflation, accounted for only some £268 million of that original total. The remainder, at today's prices, might amount to about £565 million. The board's revision of its plans, allowing for more major projects and for the fact that they turn out to be longer and costlier to complete, now raises expenditure between 1955 and 1965 to a suspiciously neat £1,000 million.

Why have the output targets been revised downwards, and the capital costs—inflation apart—revised so far upwards? This is a question to which the board's progress report "Investing in Coal" gives only rather oblique answers; those given this week by Mr James Bow-

man, the board's new chairman, were more resounding, but not much more detailed. The board did not make the most of its own real explanation, which is depressing but—at least in terms of physical output—fairly convincing. This is, in short, that in 1949 its planners did not properly comprehend the "factors of decline" that beset an extractive industry of the maturity—or senescence?—of British coal.

A mine is an underground factory with moving walls, and it works by consuming its own capacity for future production. With a long life already behind it, and after about 30 years of insufficient investment to maintain its capacity in being, Britain's coalmining industry contains 200 or more mines, with a present output of some 30 million tons a year, that are due to go out of production in the next 15 years. That is a steady, visible, reduction of capacity by about 2 million tons a year during the period of the Coal Board's plan. But the same process of working out productive capacity is continuously going on in many mines with a longer productive life before them: whole districts, seams, and coalfaces are being steadily used up, and the normal "development work" of opening up new coal workings to support production cannot keep pace with this loss of capacity. In such mines, merely to maintain mining capacity in being can require heavy investment.

One group of mines in Britain, again responsible at present for about 30 million tons, is having about £130 million spent upon major reconstruction schemes in it merely to hold output at a level that will, at the end of the effort, be about 300,000 tons a year less; put into new mine sinkings, that £130 million might yield 13 million tons a year of extra output. Investment, on this analysis, cannot simply be measured against the net increase in output that is finally achieved right across the industry; it has to wipe out a considerable "below the line" loss of capacity before the iceberg breaks surface in visibly increased production.

Since 1950, the board asserts, the yearly loss of capacity from mines that are dying and in others that have some time before they lie down may have totalled about 4 million to 5 million tons a year. At present, it says, about 4 million tons a year of capacity are being lost and have to be replaced by new capacity elsewhere; over the period of the plan, as more and more of the dying mines go out, this yearly wastage of capacity may be somewhat reduced. But new capacity has to be opened up to offset yet another loss of saleable tonnage—"loss of vend." As machine-mining sends up worse coal and more washeries are installed to clean it, the amount of dirt extracted from the tonnage raised

before it can be sold is rising steadily—at present by about a million tons a year. These are the major "factors of decline" with which the board has become uncomfortably familiar in recent years.

The board has not published a clear assessment of these investment needs in terms of tonnage "above and below the line." The accompanying table indicates the rough order of magnitude of these tonnages, so far as may be guessed from what figures the board has disclosed. In order to achieve a net increase in deep-mined output of 14-20 million tons a year by 1965 (taking present capacity as something between the 1954 output of 214 million tons and the 1955 output of 208 million tons), such an analysis suggests that the industry will have to create more than 60 million tons of additional annual capacity. So far, about £117 million has been spent on major schemes still to be completed, an expenditure that might be closer to £200 million if

ORDER OF INCREASE IN COAL-MINING CAPACITY, 1956-70			
	1960	1965	1970
Net increase planned in deep-mined output by:.....	4-10	14-20	24-30
"Below the Line":—

increase of some 21 million tons a year in deep-mined output between 1947 and 1955 (more precisely the rise of 27 million tons a year between 1947 and 1952, and the stagnation and decline in output since), represented a growth of capacity covering both this net increase and the perhaps 25 million tons or so by which (on the board's figures) capacity might have declined. Quite obviously no such amount of extra capacity was created in the industry. The board generally holds that only expenditure on "major schemes and reconstructions" can be said to open new capacity; and only 20 such projects, costing in all about £11½ million, have been completed—creating perhaps a million tons of extra capacity.

That postwar increase of output, the board thinks, did not come from extra capacity; it came from using existing capacity more efficiently. Increased mechanisation and "general improvements" throughout the industry raised output by 12½ per cent during the period in spite of the tendency for capacity to diminish. But

For the future the replacement of this lost capacity and most of the positive gains in output and efficiency must come from the major schemes.

grossed up to 1955 prices; between now and the end of 1965 some £430 million is expected to be spent on further schemes to be completed in the period. The "marginal investment" per annual ton of output, therefore—if such a term can be used here—looks to be of the order of £10 a ton.

This table covers the period from 1956 to 1970, not the first six years of the plan. The board is a little coy about arguing that the

It should perhaps be added that making the capacity available will not ensure that the output is achieved: that depends also on manpower and productivity. The original "Plan for Coal" has often been criticised for its assumption—repeated in this week's revision—that manpower would be available in the numbers and at the places required; it also assumed, as the new plan does not, that a 2½ per cent improvement in attendance could be assumed, and has, therefore, decided that by the mid-sixties it will need nearly as many miners as it has now. The new plan's assumptions are in other senses even more hazardous. It is assumed that working time, as determined by the length of the shift, Saturday working, holidays, attendance, and effective working time at the face, will remain more or less as at present, "the outcome of any change being such as not, on balance, to affect output." These assumptions are clearly addressed to the National Union of Mineworkers.

The figures that the board has produced to show what this plan will cost will not bear an any more calculating scrutiny. In spite of the face-saving proviso that the country needs all the coal that can be produced "within reasonable economic limits," it is clear that wherever increased production has appeared practicable the board has not worried much about the cost of the coal. If the country hopes to achieve the economic expansion upon which forward estimates of mounting fuel demand are based, it is hardly in a position to argue. Between now and 1970, fairly certainly, there is no other primary fuel likely to be available in quantities that would enable Britain to do with much less coal than this. This is not a matter of the relative investment required—by which criterion coal might not be all that much cheaper. But anyone tempted to suggest this investment should be put into other fuels must be prepared to find the equivalent of about 60-70 million tons of coal a year for the money, not merely about 20 million tons a year

more. It may cost £10-11 of investment to produce one ton of coal a year in about eight to ten years' time; a ton of oil products, worth two of coal, can be found, drilled, delivered, and refined, probably quicker, for an investment of about £40 a ton/year; conceivably even nuclear electricity, back to uranium, may not require investment of a wholly different order from thermal electricity, counted all the way back to coal. But during the next fifteen years all that Britain can possibly hope to get of both these extra primary fuels will be required as well as coal—if the economy is to achieve its desired expansion. If it does not, the whole fuel problem shrinks; so does Britain's place in the world.

Of the £640 million that it expects to spend—assuming stable money—by 1960, the Coal Board hopes to provide about £300 million from depreciation allowances: it will need to borrow up to £350 million during the five years, and this week a Coal Industry Bill was presented by the Minister of Fuel and Power to raise the board's borrowing powers from £300 million, now largely exhausted, to £650 million. After 1960 the board expects to need to borrow little more: depreciation allowances on its greatly increased capital will cover its continuing investment. Capital charges, incidentally, are expected, again rather neatly, to swallow up any reductions in cost that might follow from this prodigious investment: Britain can count itself lucky if it gets the coal. All the financial implications of this plan are balanced upon such an airy structure of assumptions that it is difficult to know where any conscientious guardian of the public purse could begin to apply an effective scrutiny. The Chancellor of the Exchequer last week, in bringing the other nationalised industries under the Treasury for capital advances, as coal is already, felt that by "actually pressing the money into the piper's hand, you have a better chance of influencing the tune." What tune does one call for a thousand million pounds, return undefined?

Disinflation by Funding

NOW that Britain's effort to stop inflation is so largely entrusted to monetary policy, any sign of improvement in monetary technique and of sureness in applying it deserves a warm welcome. The launching this week of a new Treasury stock issue is such a sign. It is one of special importance, because it goes some way towards allaying doubts about the future of monetary policy that had been aroused by one aspect of the Budget.

These doubts sprang from the decision to discontinue, for two years, the financing of the nationalised industries by bank advances and by issues of their own Treasury-guaranteed stocks, and to finance them instead by direct lendings from the Exchequer. The budget speech made it reasonably clear that the purpose of the change was to make monetary policy more

effective. But the change could have precisely the opposite effect. Whether it will stiffen or weaken the monetary effort at disinflation will depend entirely upon the degree of realism and courage that the authorities show in regulating the Treasury's floating debt. The appearance of a new issue so soon after the Budget—it was announced last Friday week, and the lists opened and closed on Wednesday—was evidently intended to confirm the authorities' full awareness of the dangers. It was a sign that the grip upon the money supply should be tighter under the new procedure than it might have been under the old.

The authorities' control over the volume of money is exerted primarily through their influence upon bank liquidity. If the commercial banks find that a larger proportion of customers' deposits is repre-

sented by liquid assets than they currently think necessary, they will tend to expand credit—by buying investments or by lending more freely, thereby increasing the deposits until the liquidity ratio is reduced to its equilibrium level. Conversely, if that ratio looks too low, they will contract credit by selling investments or by tightening up on new lendings. And since the bulk of their liquid assets, apart from till money or cash at the Bank of England, consists of Treasury bills or short loans secured upon them, the volume of deposits tends to fluctuate with the supply of Treasury bills. If the Treasury is increasing its borrowings on such bills through the tenders, bank deposits will tend to expand—unless other influences, such as a rise in interest rates, either cause the banks to desire greater liquidity or attract other lenders to withdraw deposits from the banks in order to take up most of the additional bills themselves.

The strength of a disinflationary monetary policy therefore depends very largely upon the ability of the authorities to achieve a due contraction, or avoid an undue expansion, of the supply of Treasury bills. The doubt about the new plan for the nationalised industries arose from the fear that it might cause such an expansion. The Treasury must always finance by Treasury bills whatever portion of its cash requirements is not financed by other methods of borrowing—such as net sales of tax certificates, “small” savings, and sales of marketable stocks (whether by formal issues or by offerings by the Government broker). Now the Treasury has formally added to these cash requirements the £350 million that it expects to provide this year for the nationalised industries. Its “overall” deficit is increased correspondingly. To some people this seemed to threaten a large increase in borrowings on bills.

What has happened, in fact, is that the Chancellor has brought into the open, and into his budget accounts, a burden that he was carrying already. In the recent past, the issues of Treasury-guaranteed stock by the nationalised industries have evoked only a small response from investors. As a result they have had to be largely subscribed or carried by governmental agencies (such as the “Issue” department of the Bank of England). The money for these subscriptions, used by the nationalised industries to repay borrowings from the banks, has had to be found by the Treasury by additional issues of tender Treasury bills, but the subscriptions themselves have not had to be accounted in the Exchequer return.

The fact that there is no real addition to the Treasury's burden is not, however, any guarantee in itself that the volume of Treasury bills will not become excessive; and this year the risk of expansion is much increased by the big bond maturity, the £824 million of National War Bonds, that has to be faced next August. Moreover, it will be still further increased if, as must be hoped, Britain continues to gain gold, since the Treasury must provide sterling to pay for it. On

the other side of the account there is the hope that the new inducements to “small” savers will substantially increase the flow of cash through the National Savings movement, reducing correspondingly the need for bill finance.

It can hardly be expected, however, that sales of these and other non-marketable securities will provide more than a modest part of the Treasury's total requirements. The only means, therefore, of keeping a taut monetary control will be by a vigorous policy of selling marketable securities in order to avoid undue recourse to Treasury bills. The authorities believe that their chances of successfully pursuing this course will be much improved by the new arrangement. The argument is that it will be easier to sell direct Treasury obligations designed for the immediate purpose in view than it would have been to sell nationalisation stocks, the issues of which have in the past been timed largely by reference to the scale of the nationalised industries' borrowings at the banks. The prompt launching of the new loan is evidently intended to indicate that the process of disinflation by funding—which is the key necessity—will be steadily pressed forward. Sir Edward Boyle has put this point explicitly: the “various forms of funding and reducing the credit base,” he said at the end of the Budget debate, “will be used steadily all the time”—and he then cited the new loan as “the latest instance of this policy.”

It needs to be emphasised, however, that while this operation gives welcome confirmation of good intentions, it does not of itself demonstrate that the authorities' market tactics will be as forthright as may be needed. The issue took the form of a further £250 million tranche of the existing 3½ per cent Treasury Stock 1979/81, but the offering price of £81 was almost precisely equivalent to the market price of the existing stock. This suggests that the authorities are not yet prepared to accept the view that their fundings will be more effective if they offer clear inducements. In this instance, it can probably be argued that the issue is more attractive than at first appears, since the prospect of an inflow of insurance funds to the market, in anticipation of additional insurance business from the self-employed, might otherwise have been expected to raise gilt-edged prices. Thus far, the “departments” have had to take up the bulk of the issue, so that no funding has yet been achieved. But, as and when these hoped-for insurance monies flow to the market, there should be a corresponding outflow of stocks from the governmental holdings. A policy of merely waiting for demand to develop seems unlikely, however, to prove firm enough. If the August maturity is to be financed without a net addition to the floating debt—again, the key requirement—another formal issue may well be needed within the next three months; and it will be necessary to press stock more forthrightly upon the market.

ICI's Titanium Venture—I

Cheaper Titanium

IT was early in 1951 that Imperial Chemical Industries began to study one of the textbook methods of producing titanium metal that nobody else believed could be used outside the laboratory. In January this year, about six months after bringing a full-scale plant using this method into successful production at its Wilton works, ICI began to offer crude “granulated” titanium at 21s. (\$2.95) a lb, roughly 15 per cent cheaper than the current “world price” which American producers were quoting.

To reduce titanium from its tetrachloride with sodium metal is not a new reaction. It was indeed the method used by Hunter in 1910 to produce some of the first reasonable laboratory samples of this metal—which has been known since 1780, and is indeed one of the commonest occurring in nature, but which until 1938 had been one of the least useful metals to man. In developing the commercial process most commonly used today, Dr William Kroll of Luxemburg rejected the sodium reaction because of fears that the great heat involved in the reaction might not be sufficiently controllable, and because he expected difficulties in separating titanium from the reaction product. The successful process that he patented in Germany in 1938 and in the United States in 1940 involved the chlorination of titanium ore and the reaction of the tetrachloride thus produced with magnesium metal to give titanium metal plus magnesium chloride. Titanium occurs in nature as a dioxide in two ores, rutile and ilmenite. This dioxide is one of the whitest pigments known, and was in substantial production long before the metal was ever commercially produced; but there is no economic way of getting the metal directly from the oxide.

When ICI began research on titanium in 1949 it started with the Kroll process. It built a small Kroll plant in 1951 and later one that would produce 100 tons of titanium a year. By this time the Government, which wanted the titanium for military aircraft, was anxious to get to full-scale production: ICI indeed felt itself under some pressure to “freeze out” on the proved and until then universally used magnesium process. Meanwhile, however, the company had become interested in the sodium process. This, if practicable, had clear cost advantages; and with its unrivalled experience in the production and handling of sodium metal, ICI had a strong feeling that the sodium process must be able to be made practicable. The impasse was solved by something of a research breakthrough: ICI's General Chemicals Division became sure that they had a practicable technique and began to build a pilot plant capable of making 50 tons a year by the sodium route. Even before that was complete, the company was confident enough to decide on a full-scale plant at Wilton with a rated output of 1,500 tons of titanium a year. It ventured on this

costly capital investment on the basis of a government undertaking to purchase up to 75 per cent of its crude titanium production for four years. The contract, signed on August 6, 1953, called for ICI's full-scale plant to be operating within two years. It was.

Development of the sodium process from a laboratory reaction to a full-scale industrial process capable of producing titanium of high and consistent quality has been much quicker than the perfecting of the Kroll process. The American companies that used the Kroll process have now ironed out the quality troubles that used to beset them; but it took some years. The first trouble with titanium quality is to get it soft enough: the average hardness of all the metal so far made on ICI's Wilton plant has been similar to the average of full-scale American output.

The titanium plant at Wilton gets its sodium from electrolytic plants operated by the General Chemicals Division and buys its titanium tetrachloride from Titanium Intermediates Ltd. Both this tetrachloride, produced by the chlorination of a mixture of coke and rutile ore, and the sodium require additional purification before they are put into the titanium reactor. The main reaction consists of the addition of titanium tetrachloride to molten sodium under an inert gas “blanket” in an oil-fired furnace. At the end the titanium is left as a spongy mass embedded in solidified salt. Getting this out of the reactor requires much less work than the same job in the Kroll process.

The main cost advantages of the sodium process, indeed, come in separating the titanium from the salt. The mixed reaction product, ground down to a manageable size, is fed into leaching tanks, where the salt is simply dissolved and washed away, leaving the titanium for drying and packing as a granulated powder. In the Kroll process part of the magnesium chloride is usually recovered by “trapping” it in molten form, which gives a credit in the economy of the process; but the remainder is generally removed by an expensive high vacuum process. A leaching process can be used, but then recovery involves expensive purification procedures not required by the sodium process; even if recovery is not attempted, disposal of the magnesium chloride in solution might cause effluent difficulties. A sodium process sited on top of natural salt deposits, as Wilton is, does not require to recover sodium chloride; nor does the disposal of a salt solution offer any effluent problem.

Granular titanium, packed in drums, goes to ICI's main metals plant at Witton, Birmingham, to be made into wrought and semi-fabricated metal for sale. The melting of raw titanium to the primary ingot is itself a vexatious business, owing to the extraordinary facility with which titanium takes up oxygen, hydrogen,

nitrogen and carbon when hot. In its specially built plant at Witton, ICI at present uses a batch of water-cooled copper crucibles in which the titanium, pressed into small pellets, is melted in graphite arc furnaces under an inert gas atmosphere. It adopted this method, which it does not consider ideal, in order to get the plant up and working in time: so far the quality of the ingots produced for the commercially pure metal has been much better than ICI expected. But it is now putting in furnaces for melting titanium under vacuum by the "consumable electrode" method many American producers use, which should give higher quality, particularly for titanium alloys.

The ingots produced—cylinders about 12 inches in diameter and about two feet long, with a nominal weight of 400 lbs—require the rough skin to be machined away. So do the slabs, bars and billets that are forged under a two-ton hammer and a 1,500-ton forging press in the Witton titanium shop for conversion into wrought products—plate, sheet, strip, rod, wire and tube—on the normal non-ferrous rolling mills of the main plant. Yield is an important factor in these semi-fabrication processes. From the crude granules to the primary forging the loss is 20 per cent, to the bar 35 per cent; the average yield on the finished titanium products that ICI sells—for further working by its customers—is somewhat less than 50 per cent. Scrap recycling poses a series of very difficult problems. The segregation and sampling of scrap and the melting of this together with fresh raw titanium is by no means easy, while scrap badly contaminated with oxygen is irrecoverable. ICI is continuing to devote a considerable research effort to this problem and is already recycling scrap on a very limited scale.

Although yield is clearly a primary element in the cost of fabricating titanium, the capital cost of processing equipment also bulks large in the price of mill pro-

ducts. In terms of passes on a four-high mill, titanium and its alloys may tie up the mill for 10-20 times as long as say copper or brass. In terms of its pre-emption of key portions of a whole rolling plant and ancillaries—generally required for metals sold on a competitive market where ICI could easily lose business—titanium may tie up 100-200 times the capital that ordinary non-ferrous metals do. The Metals Division of ICI soon decided that the whole job must inevitably go to an all-titanium mill: ICI may be the first producer in the world to do this, at the new plant the company is putting down at Waunarlwydd in South Wales.

This may be the cheapest raw titanium in the world; it has cost a lot. In plant and working capital, ICI will have invested about £9 million by the time the new Welsh rolling mill is completed. Its research and development expenditure—and the proportion of ICI research effort that titanium has required during the last few years—raise this investment much further. In no ordinary sense can this be called a cheap metal.

What does the customer—at present, mainly but not wholly, the taxpayer—get for the price? What return will ICI get from its titanium venture? The nation gets a light, strong, and corrosion-resistant metal, 60 per cent heavier than aluminium but only 56 per cent as heavy as alloy steel, with a strength-weight ratio better than either—a metal without which, in some experts' opinion, military aircraft may not long be able to compete. That has made titanium production, despite the cost, essential to a nation striving to stay in the first division of defence. The return ICI will get—which it confidently hopes may go far beyond anything that the Government can guarantee—will depend upon the widening possibilities of titanium outside the military field. Those possibilities—and the chances of cheaper titanium to make them real—will be examined in a second article.

Business Notes

Reaction in the Market

IN the industrial share market prices continued to bound forward until Monday of this week. The *Financial Times* index had by then reached 195.3, a rise of 7.3 since the Budget. At that point the market boiled over; the volume of business shrank and in the next two days the index dropped a total of 3.6 points. It seemed that the first rush of delayed investment had been put through and the first feeling of relief that the Budget had contained no worse

barbs had worn off. In the gilt-edged market the check to the post Budget rise came sooner because it was deliberately applied. The announcement of the issue of £250 million 3½ per cent Treasury stock 1979/81 on Friday provided an efficient check. The Government Securities index had by then reached 87.54, an advance of 0.32 since the Budget. It dropped 0.40 in the first half of this week, so that though there was a rally on Thursday it had lost a little more than the whole of its post-Budget rise.

It is arguable that that suits the Bank of England and the Government broker fairly well and that what they need now is not a gilt-edged market that forges on to higher levels

but one which can absorb a rising volume of stock at steady prices. The conventional form of words used to describe the result of this week's government issue: "applications for up to and including £1 million have been allotted in full. For larger amounts the allotment is about 88 per cent of applications" emphasises the fact that the departments have subscribed and that Treasury 3½ per cent stock will obviously be added to the shortening list of stocks that the Government broker still has to offer to the market. Spreading of sales over a period are the inevitable sequel when as much as £250 million is required from investors. What the market must now take into account is that the stream is likely to be continuous, that the credit squeeze will be maintained, and that the market will be used as an instrument—as efficient as may be for raising finance. Another substantial Government loan must be expected before, and perhaps well before, the National War Bonds 1954/56 mature in August. The multiplicity of small loans will continue. The Ayr County loan of £2½ million five per cent stock 1968/71 offered at par with rights of conversion to the holders of the maturing three per cent stock which was opened this week, and the £2 million of Sydney County stock 1965/66 at 98 offered in conversion of the maturing £2 million of Sydney 4 per cent stock are examples.

BOAC and Mr Watkinson

THE top management of the British Overseas Airways Corporation temporarily disintegrated this week under the impact of a series of resignations and dismissals that can hardly be paralleled in the stormiest days of the corporation's history. Trouble in this case came out of a clear blue sky. The corporation had made a good recovery from that period in 1954 when its fortunes were at a low ebb, with the fleet of new Comets grounded, and the delivery of Britannias subjected to apparently interminable delays and postponements. The financial year 1955-56 had ended with a small surplus in hand, the first Britannias had been delivered and were being made ready for service, and the corporation was expecting its first deliveries in the autumn of the long-range Douglas Seven Seas for non-stop North Atlantic schedules. These aircraft would provide BOAC with the nucleus of a fleet more modern than those of the majority of its competitors. It was in these circumstances that Sir Miles Thomas, who has been with BOAC since 1948, and had been both its chairman and its chief executive since 1949, decided to resign and take up the post of chairman of Monsanto Chemicals.

The Minister of Transport, Mr Harold Watkinson, appointed Mr G. D'Erlanger to be the corporation's new chairman, on an unpaid and nominally part-time basis, but with expenses amounting to £2,000 a year—which, to a super-tax payer, are not insignificant. For one short period, Mr D'Erlanger was the chairman of British European Airways, but after a sharp disagreement on policy with the then Minister of Civil Aviation, Lord Pakenham, which was mainly concerned with the introduction of economies, Mr D'Erlanger's appointment was not renewed. It is therefore not surprising that in accepting for the second time the post of chairman of a nationalised airline, he has not

wanted to cut himself entirely adrift from his other interests and hence accepted the post on a part-time basis. The form of remuneration that Mr Watkinson has chosen is likely to be sharply questioned. But he is nevertheless fortunate to have found a new chairman who combines considerable airline experience with a business background, and this particular appointment is likely to be popular inside BOAC.

The New Appointments

IT is not Mr D'Erlanger's appointment that has brought BOAC to the verge of crisis, but the less explicit decision of the Minister to appoint Sir George Cribb, a distinguished civil servant from his Ministry, to the post of full-time deputy chairman. Mr Watkinson had decided, very sensibly, that with Sir Miles Thomas's resignation, the post of chairman and of chief executive of the corporation should no longer be held by the same man. He went on to rule that if the corporation was to have a part-time chairman, it should have a full-time deputy chairman to be answerable to the Minister whenever his chief was not available. The Air Corporation Act of 1949 allows for two deputy chairmen: BOAC already had one part-time deputy in Lord Rennell of Rodd. Sir George was appointed as the second. The chief executive, who was and is widely expected to be Mr Basil Smallpiece, the present deputy chief executive, who has had much to do with putting the corporation's finances on a sound footing, will be appointed by the new chairman when he meets his board for the first time early next week.

BOAC's truncated board is openly resentful of the new arrangement. The functions of the new full-time deputy chairman are obscure: there is a fear that he will come between the chairman and the chief executive, so weakening the status and authority of the post of managing director to something approaching assistant manager, which would be a quite unacceptable solution. Although Sir George had decided to leave the Ministry before he was offered the post of deputy-chairman, the feeling is strong in all ranks of the corporation that he has been appointed as the Minister's watchdog to bring the corporation more directly under the control of Berkeley Square. This may not be Mr Watkinson's intention, but he will find the belief difficult to dispel, especially since his comments during the week-end on the necessity for BOAC to buy and fly British aircraft have irrevocably linked the new board appointments in the minds of the corporation staff with Ministerial interference in the purchasing policy that sanctioned the order of the Douglas Seven Seas even though Mr Watkinson appeared partially to withdraw these later in the week. Lord Rennell has already resigned in protest; no one would be surprised if other members of the Board followed his example. Meanwhile, the Minister has chosen this time of general upheaval to tell Lord Burghley, a part-time board member of long standing, that his appointment will not be renewed.

Mr Watkinson's course is plain. He should refrain from any more statements about the future policy of BOAC, which are deeply resented in a corporation jealous of its

autonomy, and see that the new board has a breathing space, free from major decisions, in which to settle down. This week-end, BOAC is for all practical purposes without any effective management, and it will be no easy task to get it back into the smooth running order essential for an airline of this size and status. But the initiative no longer lies with Mr Watkinson. He will have to answer some difficult questions from the rump of the old Board about Sir George Cribbitt's precise functions and authority before it is even clear how many of its members will be prepared to co-operate.

ICI Pays the Same

IMPERIAL CHEMICAL INDUSTRIES is beginning to reap the benefits from its recent capital investments but its stockholders will not taste the fruit this year. The ordinary dividend has been held at 10 per cent. To some investors this decision will be as surprising as it is disappointing. As they notice the fall in the price of their units from 48s. 6d. to 46s. 9d. they will ask why the dividend has not been raised in a year in which the value of turnover has gone up by about 16½ per cent and the gross income by about 12 per cent. In reply, the directors can say that, while both the volume and value of sales have climbed to new record

THE ECONOMIST, APRIL 28, 1955

levels, the £411 million of sales, compared with £354 million, includes £43 million in respect of the company's Canadian subsidiaries for which only six months' sales were included in the 1954 figures. But this does not alter the fact that the gross income has risen from £47,684,602 to £53,579,085 and that this income is struck after charging more for depreciation (£20,379,824, compared with £16,617,557) and more for the employees' profit sharing bonus (up from £2,652,857 to £2,833,467).

It is true that comparing the full calendar year, 1955, with 1954 the ratio of gross profits to sales has fallen slightly. But it is also true that while sales in the second half of last year were almost exactly equal to sales in the first six months of the year, profit margins seem to have been higher—in contrast to the experience of some other chemical companies. In the first six months of 1955 the group earned an estimated gross income of £20,855,000 from a turnover of £206 million and in the last half of the year a gross income of £32,724,000 from a turnover of £205 million. Part, but only part, of the apparent increase in the six monthly income figures may be due to the late declaration of dividends by associate companies. Taxes on these profits were higher, at £23,900,433 compared with £21,226,230 in 1954, but the group's net income rose from £21,741,904 to £23,977,733 from which the net ordinary dividend absorbs £8,167,631. The dividend looks conservative. Is this because ICI still has heavy capital expenditures facing it or is it simply because the directors have taken heed of the Government's exhortations for dividend restraint?

How Big are the Reserves?

THE figures of the central pool of gold and dollars published monthly by the Treasury cover only that part of the sterling area's gold and dollar holdings which is under the control of the Exchange Equalisation Account. The figures represent the measure of the backing available to the managers of the sterling exchange; but the total reserves and working balances are swollen by the separate gold and dollar holdings of overseas sterling countries, and by the dollar balances of private firms and individuals in Britain. Figures of these balances are not issued by the Treasury;

but detailed estimates are published by the US Federal Reserve Board. It will be seen from the table that, at the end of 1955, the total gold and dollar holdings of the sterling area thus computed reached all but \$4,000 million—nearly double the published central reserve, though about \$266 million of the total was attributable to South Africa, which takes no part in the sterling area's gold and dollar pool.

STERLING AREA HOLDINGS
(\$ million)

	Gold reserves	Short-term dollars	US Govt. bonds and bills
UK	2,050*	543	282
Colonies	...	88	12
India	247	73	1
South Africa	212	53	1
Others	254	179	4
Total sterling area ..	2,763	936	300

* Estimated holding of Exchange Equalisation Account; published holding of gold and dollars together was \$2,120 million.

The Federal Reserve states that in 1955 there was an increase in private dollar holdings of the United Kingdom—so that its total gold and dollar reserve fell by only \$530 million, compared with the fall in the British Treasury's figure

of \$642 million. But, as the chart on the right shows, the trend in the sterling reserves presents a sorry contrast with the remarkably persistent climb in the reserves of the continental countries. In 1955 nearly the whole of the increase in reserves of countries other than the United States was in dollar holdings, as opposed to gold. A large proportion of that increase was in private holdings. In Britain these holdings comprise mainly the working balances of corporations trading in the United States. Most continental countries in contrast have recently permitted their foreign exchange banks and private traders to maintain their own dollar holdings.

Car Exports Slump

UP to the end of March British car exports were 23 per cent down on last year, and March was only fractionally the best month of the three. The detailed record shows just how disappointing these recent sales have been, though some allowance must be made for the effect of the November 1954 dock strike on last year's figures. Shipments to Australia were down by 10,830 or by more than a third during the quarter; this was perhaps to be expected following that country's attempts to cut imports, and it accounted for nearly the whole of the net decline in sales to Commonwealth and Eire markets, though heavy falls in sales to New Zealand (where imports have also been pruned) and Eire were offset by gains in South Africa and in Canada. But sales to the United States fell by a seventh, and the drop in the European market was as big, in numbers, as the decline in sterling markets. Proportionately it was more since sales there fell by a half. Exports to the four Scandinavian markets plummeted to a third of last year's level, and

CAR OUTPUT AND EXPORTS
(January and February)

	Output		Exports	
	1956	1955	1956	1955
Britain	140,252	140,828	52,736	70,314
Germany	139,310	101,162	60,552	51,162
France	110,347	85,277	20,606	18,551

sales in Germany and the low countries were 2,054, or 27 per cent, fewer. This is where West German competition is fiercest and most successful; but it is being met not only in Europe, and the 11 per cent increase chalked up in French car exports in the first two months (American and Italian figures are not yet available) suggests that suc-

Now in the bookshops:

THE BUSINESSMAN'S GUIDE TO BRITAIN IN 1956

cessful competition may not be confined only to the Germans.

Thus overseas markets have not been giving manufacturers here the relief they would certainly have been glad of to weather the seasonal cut in home sales. New car registrations stopped rising last November, and in January they were practically the same as last year. The figures for February, when they appear, will probably show a fall. Production was, nevertheless, down by only 8 per cent for the three months. This would include a sizeable number of cars that went into stock, and output during March was in fact 19 per cent lower. There are signs, however, that the industry's markets may have done their worst. Stocks have been falling and home sales appear to have been picking up seasonally, there are reports of an improvement in some export orders, and the amount of short time working in the industry is gradually being reduced. But more swallows than this are necessary before anyone will readily predict a fine summer for the industry.

The Budget Under Fire

IN the debates on the Budget that have been running through much of the past week three declarations of principle, vague perhaps, and two points of fact have emerged. The points of fact worth putting on record both came from the Financial Secretary to the Treasury who explained last week why an increase in Schedule "A" income tax in line with the new rating valuations is for the present a non-starter. Valuations do not yet exist for property in Scotland or for farm land in England and Wales; revaluation in Northern Ireland is still in progress. Therefore to change the basis of Schedule A immediately is in his view a sheer impossibility. If the Government stood on fairly firm ground there, it gave itself a mean look when Mr Brooke showed the breakdown of the yield from the profits tax increase. The £30 million that the extra 2½ per cent on distributed profits and ½ per cent on undistributed profits is to bring in in a full year is divided in the proportion £20 million from distributed and £10 million from undistributed. A mere £10 million on undistributed profits therefore is the unworthy incentive to dis-saving by companies that the Chancellor has imposed for the doctrinaire purpose of making exactly the same additions to direct as to indirect taxation.

Those who are looking for an indication of future policy may find modest consolation in two negative declarations of policy. The Chancellor has not rejected the recommendation of the Royal Commission on Taxation that the tax on company profits should be at a single undifferentiated rate. He has not, the Financial Secretary explained, reached a decision on it. The Labour party meanwhile does not, Mr. Harold Wilson declared, oppose Millard Tucker type pensions for the self employed, though he would have liked to damp down on the generosity of some of the "top hat" schemes to employed people in the higher income groups. On one point Mr Wilson made a declaration of Labour's intentions that seems to disclose his future strategy. "What we have in fact," he said, "is a high superstructure of taxation on too narrow a tax basis."

Trade Winds in March

THE detailed returns of British overseas trade in March reveal that the further improvement in the balance of trade last month was partly fortuitous. Imports from Australia and Finland were held back by strikes, and the earlier delay in shipments from Baltic countries was not made good. Total imports came to £330.2 million c.i.f., bringing the monthly average in the first quarter to £328.5 million; this was two per cent less than the average of the first and fourth quarters of last year. With a rise in import prices of one point to 106 (1954=100) in March (which moved the terms of trade adversely by one point to 101) import prices in the first quarter were a little higher than a year ago. Hence the volume was between 1 and 2 per cent lower than in the first quarter of last year. After trying to allow for fortuitous influences, the Board of Trade thinks that imports have probably levelled off at the rate of about £335 million a month reached in the first and fourth quarters of last year. But a levelling off is not enough; a reduction is urgently needed.

Exports in March were even higher than the provisional total; they amounted to £271.3 million f.o.b., bringing the average monthly value in the first quarter to £258.4 million, 4½ per cent higher than in the same quarter of last year. As export prices have risen by 5 per cent the volume changed little. Once more, however, comparison must take account of a still earlier outbreak of strikes. The volume of shipments in the first quarter of 1955 was swollen by the over-spill from the 1954 dock strike in Britain, so the real increase in volume in the first quarter of this year was probably about 5 per cent. This suggests that the real increase of about 5 per cent in the volume of British exports during the last two years has continued in 1956. With re-exports at £13.3 million in March, the gross visible trade deficit fell by £4 million to £45.5 million.

The rise in British exports is not enough, judged not only by Britain's needs but by what Britain's competitors are doing. Preliminary figures suggest that world exports of manufactures in the last quarter of 1955 were 16 per cent higher in value than in the same quarter of 1954; for the whole year world exports were about 13 per cent higher than in 1954. British exports of manufactures rose by 10 per cent in 1955, and the British share of the world total fell again from 20½ per cent in 1954 to less than 20 per cent in 1955; Britain's prewar share was 22½ per cent. The share of the United States has also fallen since 1951, though it is still much higher than before the war. Germany and Japan have substantially increased their shares in recent years and so, to a small extent, have Belgium, France and Holland.

New Look in Trade Fairs

THE British Industries Fair, bravely singing its swan song at Olympia this week, has secured a good turn out from the chemical industry, and attracted an effective display of electrical equipment down from Birmingham. But the rest of last year's absentees—notably the textile

THE ECONOMIST, APRIL 28, 1956

industry—are still conspicuously absent from the half-filled halls. The directors of BIF Ltd., the company set up by the Government in 1954 to run the fair, still argue that, given government support, many more exhibitors could be persuaded to return next year, and even that the fair could be self-supporting by the end of 1957. But the initial Treasury guarantee of £100,000, which was intended for a five-year period, has already been overspent, and the Government has decided that public funds could be put to better use in assisting British firms to display their goods more effectively in overseas fairs. The engineering section of the BIF, run on a self-supporting basis by the Birmingham Chamber of Commerce, will be continued.

There is a natural reluctance to admit that Britain—unlike the Italians or the French or the Germans—cannot make a success of a national fair—or of an international fair, which has not been tried here. But the decision to spend most of the £100,000 a year formerly spent on publicity for the BIF on assisting British firms to participate in overseas fairs (in addition to the £60,000 now so spent) is probably the right one. The responsibility for British participation in overseas fairs has been left in the past almost entirely to private enterprise, on the grounds that only in that way can the commercial advantages of trade fairs, as opposed to other methods of export promotion, be accurately assessed. In the more advanced industrial countries, where trade fairs are usually organised on a basis of trade sections, private firms can bear the cost of participating. But in underdeveloped countries fairs are usually organised—often to give scope for their own national pride of achievement—on the basis of national pavilions. Costs are very high, and private enterprise cannot be expected to shoulder the entire financial burden of putting up an effective British performance. The appalling British display at Karachi and Addis Ababa and the ineffectual exhibits at New Delhi and other important overseas fairs last year are sufficient evidence that this policy has failed.

This the Government has now realised. But how should the money now available be spent? The Government could follow the Communist—and American—models and undertake the entire task of constructing national pavilions itself. But the Belgian and German methods, which involve a joint government and industry approach, through a guiding committee supported by government funds, appear more attractive. Since the Government would provide the money, it should have the final say on policy. Even this augmented government expenditure is small. The German government spends over twice as much, and the American government is spending 2½ million dollars a year on participating in overseas fairs. The results so far, in the view of both governments and industrialists in these countries, fully justify even greater expenditures—as do the national fairs which they also manage to run successfully.

Daily Mirror Takes to ITV

IN its time the *Daily Mirror* has both supported and attacked commercial television in this country. Bitterest criticisms were made over the period when the Independent Television Authority was deciding whether

The New Wheat Agreement

AFTER protracted discussions in Geneva and London a new International Wheat Agreement was drawn up this week. It is of the same type as the one that expires next July. The objectives are to assure wheat supplies to importing countries and markets for exporting countries at equitable and stable prices. To this end the exporting countries undertake to sell an agreed quantity of wheat at a maximum price, and the importing countries to buy the same quantity at a minimum price, if called upon to do so. Though the objectives and form of the scheme have not changed since 1949 its significance in the world wheat trade has. The first agreement worked according to the book. In those years demand exceeded supply; the IWA price went to the maximum and the "free" price far above it; and importers obtained their guaranteed quantities at the maximum.

In the second agreement the emphasis was reversed. Supply exceeded demand; the "free" price fell below the maximum, and took the IWA price down with it. The guaranteed quantities by then covered less than half the world trade because Britain, the largest importer, refused to accept a maximum of 205 cents a bushel and did not join. As more than half the world's exports could in theory move at less than the IWA minimum it was feared that the scheme might not be able to prevent a collapse in prices. That fear proved groundless. The state marketing systems of the United States and Canada, where the bulk of the surplus was held, proved equal to the strain. No. 1 Northern Manitoba wheat did not fall to the mini-

mum, as in strict logic it should, but certain grades of American wheat and Australian wheat fell to their minima and—save in isolated cases—no further.

It became clear that the policy of the exporting governments rather than the agreement was the real bulwark against a collapse in wheat. But the IWA minimum served a purpose in setting a recognised floor to prices. It also became clear that the scheme fell far short of what was required of any international attempt to promote stability. Too many exporting and importing members followed domestic policies that encouraged high-cost production and aggravated the surplus of wheat. Could a new agreement be drawn up that would deal with the problem of instability and surplus at the source?

That hope was dashed last October, when the conference called to discuss a new agreement decided that only the existing type was acceptable. At the succeeding conference Britain announced that it would not take part, partly because it did not consider that the agreement made a positive contribution to the problems of over-production and the disposal of surpluses. But it hoped that when the negotiations were over the conference would agree to amend the constitution of the Wheat Council so that it could examine domestic production policies and means of regulating the disposal of surpluses. In such discussions Britain would play a full part. In the event, the other countries have a new wheat agreement, and Britain has seen its suggestions adopted.

Apart from this amendment of the constitution there are three main differences between the new agreement and the old. It is expected that the membership will include Argentina, the major exporter hitherto outside the agreement. The guaranteed quantities are reduced by 2½ to 8.2 million metric tons, and the price range is reduced by 5 cents a bushel. The drop in the guaranteed quantities to a figure equal to roughly one-third of world trade is by now of minor significance.

Now that Argentina is moving towards multilateralism it is hoped that its bilateral trade pacts, covering 2 million tons of wheat, will gradually be ended and that wheat put under the agreement. But while Argentina is moving away from bilateralism the United States is moving towards it, through its special sales of wheat under PL 480. The United States hopes next season to sell 2½ to 3 million tons of wheat in this way, and since it regards these sales as abnormal marketings they cannot be registered under the wheat agreement. But these sales are becoming more "normal" every day and they make nonsense of the wheat agreement.

How much progress will be made on the British proposals is anyone's guess. The next step is for the Wheat Council to appoint a study group on which Britain would certainly be represented. The council may collaborate in these discussions with other United Nations organisations and with non-member countries. Most countries recognise that an effort must be made to rationalise wheat production, but it will not be easy to persuade them to put principle into practice. It seems unlikely that supplies might be so reduced over the next three years that a bad harvest could lead to shortage. If that did happen, Britain might be faced with the unpalatable choice of having to pay more than the maximum for its wheat or of seeking to join the wheat agreement.

(Continued from Page 406)

applicants should receive licences to act as programme contractors on its various stations. It has never been clear whether the *Daily Mirror*, previously known as a supporter of commercial television, omitted to put its name forward deliberately or through an oversight, but the wheel has now come round and a "substantial" part of the new money that Associated Television is seeking to finance its London and Birmingham programmes will be contributed by the *Daily Mirror*.

The nominal capital of Associated Television is £1 million, and the permission of the Capital Issues Committee has been asked to double it. Of the new money, £750,000 will be new capital (largely from the *Daily Mirror*) and the existing loan stockholders are being given an option to convert one-third of their loans into the balance. The only shares with voting rights at present are 75,000 £1 ordinary, the great majority being non-voting ordinaries, and a recent examination of the records showed that a third are held by the Incorporated Television Programme Company, which was set up by Mr Littler and Mr Parnell and which once applied unsuccessfully, for a programme contractors' licence. Most of the other voting shares are held in varying amounts by a number of nominees, but the *Birmingham Gazette* holds 10,000; the *Birmingham Post*, 5,000; and Associated Electrical Industries, another 5,000. The *Daily Mirror* does not appear to be receiving any voting shares, as none of the new capital carries voting rights, but it does get two nominees to the board of the company.

This is generally regarded as a shrewd investment by the *Daily Mirror*. Associated Television needs better studio facilities than it now possesses and is not finding it easy to induce advertisers to buy time on its Birmingham week-day programmes, but this does not alter the general conviction that commercial television is both growing and consolidating. Had the *Daily Mirror* put off a decision much longer, it might have had to pay a far higher price for participation; to come in earlier would have meant sharing the risks and losses of the opening months. The fox has reached the grapes.

Mr Kurchatov at Harwell

THE Russian scientist, Mr Kurchatov, a member of the Praesidium who is in this country with the Soviet mission, gave a lecture on Wednesday to scientists of the Atomic Energy Authority that was remarkable both for its frankness and spontaneity and its considerable scientific quality. He talked about two subjects, the Russian atomic power programme, and the spectacular progress made, mainly under his direction, in developing a method of controlling thermo-nuclear reactions. This is the first step towards using the force released by a hydrogen bomb as the basis for power production. It involves reaching temperatures equivalent to those in the sun before the fusion reaction can be triggered off. In a bomb, these temperatures are obtained by putting a small atom bomb in the core. The Russians have come very close to achieving them in controlled laboratory conditions by bombarding heavy hydrogen with an electric current. In the short period before the container disintegrated under the effects

of heat, they managed to work up to temperatures of 1 million degrees Centigrade, which is at the threshold of those needed to bring about fusion in the hydrogen atoms. This is an immense technical achievement, and Mr Kurchatov's lecture was so carefully documented and illustrated as to leave little doubt about the accuracy of the claims. At the same time, it is easy to exaggerate the results of the experiments and to assume for them a degree of success that the Russians themselves have not claimed. This is not controlled hydrogen fusion, but an experiment that goes a long way on the road towards it.

The lecture was of a much higher scientific standard than those delivered by Russian scientists during the atomic energy conference at Geneva last summer, which were impressive chiefly because they demonstrated the close parallel between the degree of success achieved in Russia, shut off from any but illicit contact with scientists in the West, and Britain and the United States. In describing the Russian atomic power programme, Mr Kurchatov was on ground that he knew less well. He said that during 1956-60, Russia intended to build five experimental power stations of various types, two giving 70,000 kW of electricity each, and the others, 200,000 kW. Four smaller pilot plants will also be built to test more elaborate designs and these will provide data for developments in the decade starting in 1960. It will be interesting to see if this lecture, and the free and spontaneous answers that Mr Kurchatov gave to questioners, goads either British or American scientists into revealing how far they themselves have progressed in the control of the fusion reaction. Some intensive work is being done both here and in America, but no general survey of British—or for that matter American—work has yet been released.

A New Thames Tunnel

THE idea of a tunnel under the Thames east of London to provide a direct link between Kent and Essex was first seriously suggested over 150 years ago; the plans were abandoned after one bore hole had used up all the capital. There was another try before the last war, on a new site between Dartford and Purfleet some five miles west of the previous Gravesend-Tilbury line; this attempt was postponed, first by the financial crisis in 1931, and then by the war after a pilot tunnel had been successfully completed. But last year the project was revived with renewed official blessing from the Ministry of Transport, as part of its expanded road programme and the main contract was awarded last week. When the tunnel is finished in about five years time—provided progress is not again delayed—it will be the third such tunnel to have been built in Britain this century and the first since the Mersey tunnel was opened in 1934.

It will cost altogether about £10½ million; the Ministry of Transport and the Essex and Kent county councils are contributing just over £3 million between them, and the remaining £7½ million will come from the Ministry's road construction funds—to be recouped from tolls paid by the two million vehicles that are expected to use it each year. When finished, the tunnel—which will be almost a mile long—and its approach roads will form a new four-mile direct link between the main A.2 and A.13 trunk roads;

A 'Terylene' rope after hauling Thames barges for 137 days

an ordinary rope after hauling
the same barges for only 6 days

(Result of trial conducted by William Cory & Sons Ltd.)

Why has this 'Terylene' rope withstood 23 times the wear—and more? The answer is that 'Terylene' has a combination of properties found in no other fibre. In a rope these properties produce resistance to stretch, suppleness after continuous contact with salt water, low moisture absorption, and great strength even when wet.

Can 'Terylene' save money in your business?

These exceptional properties of 'Terylene' are already being applied successfully and economically in many industries, in many parts of the world.* Perhaps they can save money for you too. Have you a need for a textile fibre that is strong wet or dry, has low stretch, resists corrosion by acid, resists heat, does not rot,

has low moisture absorption, has high abrasion resistance, withstands weather and is ideal for electrical insulation purposes? Then find out more about 'Terylene' fibre for industry by writing to: Imperial Chemical Industries Limited, Hookstone Road, Harrogate, Yorks. Telephone: Harrogate 68021

*Some of the many uses to which 'Terylene' is being put are: electrical insulation fabrics; lifeboat covers; deck awnings; fire hoses; ropes; paper machine felts; filtration cloths; sewing threads; fishing nets; laundry machine clothing; dye bags; conveyor belts; industrial clothing.

it will also be the first completed section of the north and south orbital roads that are "planned" to circle 15 miles outside central London. Parliamentary sanction has yet to be sought for the last half-mile north of the river, which involves carrying the approach road on a viaduct over A.126.

To excavate the tunnel, which will be following the line of the pilot tunnel built in 1938, the contractors will use

massive shield excavators, each weighing nearly 300 tons, similar to those used to build London's underground railways. The outer edge of the cylinder-shaped shield cuts, and the whole contraption is moved forward bodily by powerful hydraulic rams when the next stint of tunnel face has been dug out to the required depth. The shield gives protection for the erection of the tunnel's cast iron lining and for the injection of liquid cement under pressure to grout this lining to the surrounding earth. Since this surrounding material is alluvial or water-bearing chalk, all cutting and lining operations will be done in compressed air.

rates 70 per cent or more above level at the beginning of the month and a good deal of business is being done.

The exact cause of this formidable and unusual increase is not easy to pin down. Certainly more oil has been imported so far this year than twelve months ago. There has also lately been a trough in the pace of new tanker deliveries—but no more than was expected. But the high rates currently being paid for grain shipments have been attracting a significant number of tankers for use, after cleaning, in that trade; and the conversion of older tankers into bulk carriers of ore and coal has also continued. A combination of these factors would result in a tighter supply of tankers for the work available and suggests, moreover, that tanker freight rates should remain for some time to come rather higher than last year—when they were again somewhat above 1954 rates.

A growing number of tankers have been fixed on period charters—mainly for several voyages in succession but some for longer fixed periods—at rates not markedly below the current spot market level. The oil shippers, most of whom are in the market, are holding out for rates between Scale rate plus 30 per cent as a minimum and Scale plus 100 per cent as the maximum for periods of up to 12 months (Scale rate is equivalent to 32s. 6d. a ton from Curaçao to London) whereas owners are asking for rates between Scale plus 40/50 per cent and Scale plus 150 per cent. Tanker owners are pointing out that this minimum rate is roughly equivalent to the return they can now get, after cleaning costs, for similar contracts in the grain trade.

The Rise in Stocks

Full Employment for Tankers

THE tanker freight market has produced a number of minor surprises lately: the latest and by far the biggest is the most unseasonal rise in freights that began about two months ago and as yet shows little sign of stopping. Normally the rates at which tankers are chartered start to fall from about the end of February, in company with the

seasonal decline in oil movements to Europe and North America. But this year tanker freights have been moving in the opposite direction; they have climbed upwards by more than a quarter since the middle of February. Although little business has been completed this week on the London market as

owners are holding off for even higher prices and charterers are waiting in the hope that the end of the month may bring a fall, the American coastwise market has been very busy with spot

IN the last quarter of 1955 the value of stocks and work in progress held by manufacturing companies reporting to the Board of Trade rose by two per cent. That was the smallest quarterly increase of the year, and it brought the total increase in 1955 to 13 per cent, stocks being valued at the lower of cost or market value. A large part of the increase occurred among companies in the metal manufacturing and metal using trades, where production rose most sharply last year. The value of stocks of materials and fuel, work in progress, and finished goods all rose in about the same proportion in 1955. The companies account for about one-third of the total value of stocks and work in progress in manufacturing. As they are all large firms the results are not necessarily representative of manufacturing as a whole, still less so of the whole economy, where the value of stocks is roughly twice as high as in manufacturing.

But as far as they go the figures support the Economic Survey's view that manufacturing claimed the largest share of the increase in stocks and work in progress in the whole economy last year. The Survey estimated that total stocks in the economy went up in value by £600 million last year: the value of the physical increase in stocks, however, contributed only £350 million of this. At the end of 1954 stocks in manufacturing amounted to about £3,600 million. If indeed the increase was 13 per cent last year that would imply a rise of £470 million—nearly five-sixths of the increase in the whole economy. Against that 13 per cent increase in manufacturing stocks must be set the rise of

6 per cent in prices of basic materials and of 5 per cent in manufactured products last year; and output in manufacturing rose by 4½ per cent. This confirms earlier indica-

tions that stocks rose proportionately more than the rise in production. Whether or not the rise in stocks was excessive in relation to the needs of production, it was certainly excessive in relation to what Britain could afford.

The Pru' and the Pearl

LIKE other life insurance companies the two giants, the Prudential and the Pearl produced excellent results for 1955. Shareholders and policyholders have already learned something to their advantage. The ordinary investor will study the accounts of the monster investors with another interest. What is their investment policy? The attitude of the Prudential with its total assets of £817.4 million, and of the Pearl with £235.2 million, must have a bearing on the future of markets. The table of portfolio distributions suggests that when the "bull" market turned into a "bear"

market last year the giants did indeed carry out a change in policy, though it may have been a change that waited only

for the opportunity. They both moved in the same direction and the switching that they did out of gilt-edged into debenture stocks and ordinary shares would have produced a marked effect on prices if they had not used one of the occasions when sellers dominated the market.

Each company has substantially reduced its gilt-edged holdings. The Prudential shows a reduction of £18.1 million, the Pearl of only £400,000, but that company also reduced its holdings of municipal and foreign government securities while the Prudential slightly increased its investment in that category. Not all the reduction in gilt-edged holdings represents sales; perhaps it is a fair guess that about half the Prudential's £18.1 million reduction represents writing down. Nevertheless all the new money—£45.9 million increase in total assets in the Prudential and £10.5 million in the Pearl—went into investments other than gilt-edged. Each company increased substantially its holding of ordinary shares and each increased its holding of debenture stocks. It must have been helped by the fact that there were substantial issues of ordinary shares and debenture stocks in the autumn when credit was scarce and when issuing houses were delighted to be able to get underwriting done. For investors of the size of the Prudential it is only possible to obtain industrial debentures in quantity as an underwriter or as an original applicant. The Prudential (but not the Pearl) has also put a substantial sum into mortgages and loans on the public rates; evidently it has played a part in the recent and more arduous financing problem of the local authorities. Both companies have put money—the Prudential £6.7 million, and the Pearl £1.1 million, into real property. Insurance companies invest in property with great discretion, but to some extent it must have been possible for the owners of businesses to raise finance by selling freeholds when other sources of finance were difficult. Despite the investment switching programme both companies have kept rather more than usual of their powder dry. Liquid assets are up in both companies.

Bigger Profits from Gallaher

GALLAHER, the most successful of the smaller tobacco manufacturers, will pay a final dividend of 20 per cent for 1955, as was promised by the directors two months ago when the rights issue of ordinary shares and the Loan stock issue were announced. Together with the interim dividend this makes the year's dividend 25 per cent, compared with 22½ per cent for 1954. At the time of the rights issue the directors estimated gross profits in 1955 at not less than £3,850,000. This is an under-estimate. In fact, gross profits came to £4,033,217, compared with £2,510,841 in 1954. The tax provision was much higher, rising from £1,408,209 to £2,085,196, but the group's net profit jumped from £1,102,632 to £1,948,021, from which the net ordinary dividends absorb £767,266. The rights issue was made before the increase in the duty on tobacco and at that time the directors were so confident of future expansion that they were willing to predict that the dividend on the ordinary capital, as doubled by the rights issue, would be 17½ per cent for 1956.

ADVERTISING AND MARKETING IN BELGIUM

CPV-Bart, of Brussels, is the newest member of the CPV World Organisation. It was formed early this year, as a logical extension of the service that CPV offers its clients in markets overseas, and is backed by all the international resources of CPV. CPV-Bart

embraces the territories of Belgium, Luxemburg and the Belgian Congo; and now offers British and American exporters a specialized service which applies proved advertising and selling methods to these highly individual markets.

CPV-Bart, 192 rue Royale, Brussels

Edible Oils Dearer

THE late winter frosts in the Italian olive groves have affected more fortunes than those of the unlucky farmers. A substantial proportion of the young trees in Italy and southern France are thought to have suffered, and because olive oil output last year was low there are no carry-over stocks to help these countries through the coming season. Unless reports of damage are much exaggerated, the Mediterranean countries will have to import up to half a million tons of edible oils to make good their losses. That is why prices of all liquid edible oils have risen sharply, particularly cotton oil and groundnut oil. In the space of three months these two oils have risen by over 30 per cent to about £150 a ton cif Continent. The Indian government, anxious to keep down domestic prices, made matters worse by banning exports of groundnut oil. In contrast to previous years, American sales of surplus oils have in no way depressed the market; large quantities have been sold to Italy, Spain and South America under Public Law 480, which authorises sales of surplus farm products for local currencies.

Oils from the coconut and palm have only recently shared in the prosperity of liquid oils. The "hard" oils group cannot be substituted for all the uses of soft oils and were therefore less directly affected by the shortage of olive and groundnut oil. But in the middle of this month prices suddenly started rising in sympathy, with Ceylon coconut oil rising by about 10 per cent to a little over £100 a ton. The margin between the two groups is still considerable, however.

Building Society Growth

THE building societies showed a substantial growth in their total assets and in the new funds lent on mortgage last year notwithstanding the credit squeeze which led to some withdrawals by investors in the summer months of last year and which have slowed down mortgage lending ever since then. The Chief Registrar of Friendly Societies reports* total assets of £2,064 million, an increase of £196 million, so that the growth of assets in 1955 was 10.5 per cent compared with 14 per cent in 1954, and that notwithstanding that withdrawals of capital by investors at £285 million were the highest ever experienced by the building societies. New advances on mortgage were £393 million—also a record compared with £373 million in 1954. For the first time for many years the number of building societies on the Register shows an increase. It was 783 at the end of last year compared with 777 at the end of 1954. The Registrar naturally does not give the number of members of the Building Societies Association which is, however, understood to be around 360 and declining slightly owing to the strict enforcement of the 7½ per cent liquidity rule by that body.

* Report of the Chief Registrar, Friendly Societies for the year 1955. HM Stationery Office, 2s. 6d.

Colonial Development Progress

A NEW broom usually sweeps clean, when it is a ruthless broom and when it is given time. Lord Reith succeeded Lord Trefgarne as chairman of the Colonial Development Corporation in 1950 and Mr H. N. Hume (chairman of a London issuing house) took over from Mr Robin Brooke as deputy in 1953. For the year ended 1955 the Colonial Development Corporation shows its first profit—£409,000, compared with a loss of £511,000. The 1955 figure is struck after providing for all outgoings, including £307,000 on interest payable to the Colonial Office on short, medium, and long term loans. The Colonial Development Corporation, which should never be confused with the Colonial Finance and Development Corporation (financed by private enterprise) is a Government controlled body that fosters colonial development projects with Colonial Office money in co-operation, when occasion offers, with private industry.

But the new broom has more sweeping still to do. The report for the year to December 31st makes it clear that costly investigations which do not show reasonable expectation of return will not be possible. The Corporation has struggled out of the red, but must go on raising its net revenue each year to stay there. One of the problems arises from the fact that long term borrowings from the Colonial Office have been subject to an initial seven-year interest moratorium. From now on the service of existing borrowings from the Colonial Office will build up steeply to over £1 million in 1960 and nearly £2 million in 1964. So higher earnings will be needed to cover them.

SHORTER NOTES

Competition in the bakery trade is likely to become still keener when the subsidy on "national" flour is withdrawn. Price control will go too. National-type bread, which now accounts for about 90 per cent of all sales, will then probably cost about 10d. for a 1½ lb loaf compared with about 1s. for other kinds. But prices might draw still closer together as bakers attempt to win custom for their individual types. A larger variety of products may lessen the competitive advantages of the big multiple bakers, and the small "craft" bakers have claimed that they will gain by being able to serve local tastes.

In *The Economist's* Budget analysis last week the withdrawal of the investment allowance was attributed to Mr Butler. It was however done by Mr Macmillan in February of this year. The formula for calculating profits tax on a full distribution was also printed incorrectly. It should have been, where x is the net dividend, as follows:—

$$x + \left(\frac{40}{23}x \times \frac{27}{100} \right) = 54.5$$

And hence $x = 37.08$ of every 100 of gross profits.

The International Sugar Council's estimate of the requirements of the free market in 1956 has been raised by 250,000 to 4,770,000 metric tons. The council may meet in New York during or after the International Sugar Conference that opens there on May 21st.

Company Notes

CUNARD STEAM-SHIP.

"By the Companies (Shipping Companies Exemption) Order, 1948, the company is exempt from disclosing certain information relating to reserves and provisions and changes therein and certain details of fixed assets and the depreciation thereof, and these accounts have been prepared accordingly." This note to the full accounts of Cunard for the year to December 31st explains why less can be learned from the balance sheet than can, say, from the balance sheet of P & O in its new form, though there is no evidence that Cunard created any new inner reserves in 1955. The "operating surplus" rose from £6,747,584 to £7,405,872. "Cargo freight services in the Atlantic, Australian, New Zealand and Eastern trades together with the cruise earnings

£1 ordinary stock at 25s. 6d. yields 7 1/2 per cent.

have in the main provided this increase." Higher freight rates in the latter months of the year played their part, and while Cunard lost passengers during the strikes on the Queens the total volume of Atlantic traffic was larger and by the end of the year Cunard had carried "virtually its normal annual number of passengers."

But both depreciation and taxation were higher and the net surplus fell from £2,157,266 to £1,827,969. The ordinary dividend was left unchanged at 10 per cent. One reason for this decision is perhaps revealed in Mr D. H. Bates's comment that "the costs of running and working ships are still rising and such essential items as fuel and diesel oil, for instance, show considerable advances, and it will be very difficult to increase revenue to cover the additional expenditure."

Another reason for conservative dividends is the directors' perpetual concern with the replacement of the fleet of ships. In a note to the consolidated balance sheet outstanding liabilities for new ships are estimated at £14,450,000. "That is a formidable programme," says Mr D. H. Bates, "but it will only carry us to, say, 1958." Investment allowances on new ships help the shipping companies but, Mr Bates points out, that if Cunard were registered under a "flag of advantage" instead of under the Red Ensign its profits over the six years 1949-54 would have been increased by about £14 million by savings in taxation. Companies registered

under such flags thus possess a competitive advantage.

Like P & O, Cunard is strong in liquid resources, but, again like P & O, these assets have to be balanced against replacement commitments. In the Cunard balance sheet the book value of quoted investments is over £18½ million. This is above their market value, "but being all in dated Government securities with the redemption dates spread to suit the company's likely requirements it is not anticipated they will have to be realised before the date of redemption and no allowance has therefore been made for the depreciation in current market value."

UNITED MOLASSES. The directors of United Molasses are not repeating the tax-free cash distribution of 4 per cent from capital reserves made in the 1954 accounts. But they have recommended an increase in the ordinary dividend. It has been put up from 12½ per cent, tax free, to 16½ per cent, tax free; this is equivalent to an increase from 22.1 to 28.99 per cent gross. On this dividend the 10s. stock yields 6½ per cent at 41s. 10½d. The only unsatisfactory aspect of the preliminary statement is that £763,798 has been provided from reserves against the fall in the market value of British Government securities.

	Years to Dec. 31, 1954	1955
Consolidated earnings:—		
Gross profit.....	4,322,696	5,170,654
Depreciation.....	1,084,828	1,179,088
Taxation.....	1,914,522	2,096,211
Net profit.....	1,319,427	1,891,728
Ordinary dividends..	732,938	977,250

The group's trading profit has risen from £4,322,696 to £5,170,654, thus recovering part of the sharp fall suffered in 1954 because of lower freight rates. Happily the forecast of a further fall in 1955, which the chairman, Mr G. W. Scott, made a year ago has proved over-pessimistic. The rise in freight rates last year doubtless helped—even though much of United Molasses's fleet works on time charter. And the demand for molasses has been high.

BOWATER PAPER. Growth stock is a hackneyed phrase, but to no stock has it been applied with greater exactness in recent years than to the £1 units of the Bowater Paper Corporation. Outward signs of the company's standing include the interest taken by American investors in the stock and the low yield it offers. Currently the yield at a price of 58s. 9d. is only 3.8 per cent. The reason for the favour accorded to the stock is not mainly the company's profit record, nor in its progressive dividend record, nor even its massive and growing interests in newsprint and other types of paper in this

country. The reason lies mainly in the group's large and growing investment in the North American newsprint industry. And here it is not the established mills in Newfoundland, but the recently opened mills in Tennessee that provide the lure.

By far the greater part of the Corporation's earnings are derived from its interests overseas. And the fact that the gross profit of £13,209,637 earned in 1955 was actually more than the £13,095,463 earned in the previous fifteen months was due in particular to the first full year's operation of the mills of Bowaters Southern Paper Corporation in Tennessee. It was for this reason, too, that the 1955 profits of the Bowater Corporation of America, at \$22,579,253, were so much higher than the figure of \$17,043,035 earned in the previous fifteen months. There should be bigger profits still to come out of the Tennessee mills. Bowaters Southern is producing at an annual rate of about 200,000 tons of newsprint and 75,000 tons of pulp and capacity is to be raised to about 300,000 tons of newsprint and 45,000 tons of pulp a year. This newsprint has already been sold forward under long-term contracts extending to the end of 1968. Presumably it is the expansion of these mills which will absorb most of the \$17½ million—about £6½ million—to be raised by a public issue in Canada of 350,000 5 per cent \$50 preferred shares at par of the Bowater Corporation of North America. The yearly capacity of the Cornerbrook mills, in Newfoundland, is also to be raised, from about 310,000 tons to 340,000 tons of newsprint.

On the present capital of £19,200,000 the 1955 dividends are equivalent to 11½ per cent and compare with an equivalent annual rate of 9 per cent paid in the preceding accounting period. The directors of Bowater Paper have always cultivated good relationships with stockholders and there is no better way than through dividend payments.

SPILLERS. For the fourth successive year the directors of Spillers, the millers and manufacturers of animal foods, have raised the ordinary dividend. That is in keeping with the steady advance in profits from one record level to another. In the year to January 31st, the trading profits of the group rose from £4,414,532 to £4,977,000, and despite bigger charges for depreciation and replacement (up from £1,025,000 to £1,230,000) and taxation (up from £1,926,000 to £2,143,000) the net surplus rose from £1,488,898 to £1,616,000. Terminal payments from the Ministry of Food upon the cessation of control, which after tax amount to £418,000, are not included in these profit figures and have been separately credited to reserves. The ordinary dividend has been raised from 11 to 12 per cent; this was followed by a rise in the price of the £1 stock units from 41s. 6d. to 43s. 6d., to set the yield of 5½ per cent.

The latest trading year of Spillers was completely free from the Government's control and this may have resulted, as it did with Ranks, in a rise in stocks. Like

Ranks, also, Spillers in protection of its markets extended its interests in bakeries last year; this must have cost money and the full benefits from these acquisitions may still lie in the future.

CAMMELL LAIRD AND HARLAND AND WOLFF.

Shipbuilding profits move erratically from one year to another because of the uneven incidence of contract completions. Costs are now rising and no firm conclusions about the future can be drawn from the preliminary reports of Cammell Laird and Harland and Wolff for the year to December 31st. The gross profits of Cammell Laird have risen only slightly, from £1,017,386 to £1,097,006, while the gross profits of Harland and Wolff have fallen from £2,157,652 to £1,799,627. Cammell Laird's net profits have gone up from £654,716 to £724,403. But Harland and Wolff's net earnings have fallen from £1,104,762 to £910,859, and this figure includes £200,581 (against £33,536) of profits arising from the settlements of contracts completed in earlier years.

Both companies have been content to leave their ordinary dividends unchanged. Cammell Laird's total dividend is again 14 per cent and Harland and Wolff's is again 10 per cent, though the directors have consolidated the special bonus of 3 per cent paid in 1953 and 1954 into the ordinary dividend. At the current price of 26s. 6d. Harland and Wolff's £1 stock units yield 7½ per cent and at a price of 10s. 9d. the 5s. stock units of Cammell Laird yield 6½ per cent.

PRESSED STEEL. The bulk of Pressed Steel's output goes to the motor vehicle manufacturers, many of which draw up their accounts at the end of July and August. Pressed Steel's accounting year ends on December 31st. It was in the last few months of 1955 that profit margins in the motor industry were narrowing, partly as a result of the expensive imports of sheet steel from abroad. This is perhaps reason enough to account for the contrast between the increases in

profits shown in the latest accounts of the motor companies and the decline in Pressed Steel's profit before tax from £3,115,485 to £2,582,064. Pressed Steel also makes refrigerators, and this side of the business came, no doubt, under the shadow of the credit squeeze and the hire purchase restrictions. One part of the business which may have come out of the year unscathed is the manufacture of rolling stock for railways.

The portents look ominous enough from a reading of the 1955 figures. But they are made even blacker by the directors' additional comment that "profits for the three months of the current year are lower than those for the corresponding period of 1955." As promised at the time of the rights issue, the final dividend is 15 per cent, making 22½ per cent for the year, but investors are entitled to feel cautious until they see the effect of the credit squeeze on the motor industry. The ordinary dividend is covered about two and a half times by earnings and at the current price of 15s. 6d. the 5s. stock units yield 7½ per cent.

BRITISH ROPES. Since 1952 the consolidated trading surplus of British Ropes has been rising steadily. In 1955 it advanced from £1,904,693 to £2,321,146, not far short of the record profit achieved in 1951. Making all types of steel and fibre ropes, the company serves almost every industry, and though, like most other engineering concerns, it must be feeling the pressure of rising costs, it can hardly fail to do well when its customers are fully employed and investing more heavily in capital equipment.

Last year's trading results, culminating in an increase in net profits from £767,295 to £942,456, are one reason for sober confidence. And the directors cannot be unduly pessimistic about the future, for they have more than carried out their promise of December, when a one for ten rights issue was made, that the final dividend would not be "less than 11 per cent." On the increased capital they have, in fact, recommended a final dividend of 12 per cent, making 16 per cent in all.

LONDON STOCK EXCHANGE

Next Account begins: May 2nd

Next Contango Day: May 2nd

Next Settlement Day: May 8th

Gilt-edged securities continued to improve until the announcement of the new issue of 3½ per cent Treasury Stock 1979/81 on Friday. Prices fell until after the closing of the lists on Wednesday when small gains were made, the existing 3½ per cent Treasury Stock 1979/81 rising ¼ to 81½, compared with the issue price of 80 for the new. Industrial stocks improved until settlement day on Tuesday, but then weakened. The *Financial Times* index of industrial shares declined from 195.3 on Monday to 191.7 on Wednesday.

Bank shares show small advances on the week; Lloyds "A" rose 1s. to 55s. 6d. and Westminster "B" 6d. to 73s. Insurance stocks lost some of their recent gains; Legal and General fell ½ to 25½, while Pearl fell 1½ to 22½. Brewery shares were much firmer, Whitbread "A" rising 3s. 9d. to 75s. and Guinness 9d. to 41s. 9d. Distillers gained 7½d. to 24s. Steel and engineering stocks declined after rising steadily until Monday. Dorman Long weakened to 33s. 3d. after touching 34s. 3d. Swan Hunter fell back to 56s. 6d. and Vickers were unchanged over the week at 42s. 6d. Motors were further depressed by the fall in output and exports last month. Ford fell 10½d. to 34s. 7½d. on Wednesday and Rootes 3d. to 5s. 6d. The drop in profits of the *Daily Mirror* group caused a fall in the "A" ordinary to 16s. 6d. 6d.

Oils continued to advance strongly on Monday; British Petroleum rose to 140s. 6d. and Burmah to 87s. 9d. They bounded back, however, on Tuesday and Wednesday to 131s. 6d. and 81s. 6d. respectively. Shell Transport were firm on Wednesday at 7½d. 10d., but Royal Dutch lost 1 to 7½d. Kaffirs were much improved at the close of last week, and considerable gains were made on Monday, Free State Geduld rising ½ to 4½ and Western Holdings ½ to 2½. These rises were not maintained, and by Wednesday they had receded to 4½ and 3½ respectively. Teas and rubbers remained quiet throughout the week.

Financial Statistics

EXCHEQUER RETURNS

For the week ended April 21st, 1956, there was an "above-line" deficit (after allowing for Sinking Funds) of £29,270,000 compared with a deficit of £30,379,000 in the previous week and a surplus of £5,485,000 in the corresponding period of last year. Net expenditure "below-line" last week reached £4,423,000, bringing the total cumulative deficit to £49,813,000 (£79,619,000 in 1955-56).

THE MONEY MARKET

The discount market made no change in its bid at the Treasury bill tender on Friday last, offering £98 14s. 5d. per cent. The amount on offer was down by £10 million, to £230 million, and as total applications rose by just over £1 million, to £382.4 million, the market's allotment fell sharply, from 60 to 43 per cent. The average rate of discount on all bills fell at the same time by nearly 1½d. to £5 2s. 4½d. per cent. At yesterday's tender, the offer was restored to £240 million; matching maturities next week will exceed new bills by £10 million, as this week.

Credit supplies were exceptionally plentiful in the middle of the week; on Wednesday a surplus of funds remained even after the Bank had made considerable reverse sales of bills, both direct to the market and to the banks. Rates for overnight money from non-clearing banks were down to 3 per cent. On Monday, however, the Bank made a fair amount of special purchases to mitigate stringency, whilst on Thursday of last week one or two houses were forced to take loans at Bank rate, though for a very small amount.

Sterling has slipped slightly from the peak reached on the aftermath of the Budget. The spot rate on New York weakened from \$2.81½ on Thursday of last week to \$2.80½ at Wednesday's close. The London gold price has risen in sympathy, from 248s. 11½d. a fine ounce to 249s. 0½d.

COMPANY MEETINGS

THE CUNARD STEAM-SHIP COMPANY LIMITED

1955 FIGURES BETTER THAN EXPECTED

Colonel Denis H. Bates, Chairman of the Company, in a statement to stockholders for submission at the seventy-ninth Annual Meeting to be held on May 16th says:

Her Royal Highness Princess Margaret conferred a signal honour on the Company by naming and launching in December our new *Carinthia* at Clydebank, and we are deeply proud of the continued and gracious interest of the Royal family in our endeavours.

Mr R. Crail retired from the Board in December after 56 years devoted service to the Company. Mr J. C. Taylor was appointed a Director in September.

In 1955 we were bedevilled with many difficulties: first we felt severely the aftermath of the dislocation to our services caused by the United Kingdom dock strike of the autumn of 1954. There followed in quick succession another unofficial strike of dock labour, railway strikes in the United Kingdom and France, and the unofficial ships' crews strike in the summer. Abroad there was a long "go slow" movement in the Calcutta docks and difficulties and delays on the waterfronts of Australia and New York.

The year taxed the ingenuity and resource of shipowning management to the utmost in the endeavour to mitigate the sad effects caused by these problems. The 1955 figures have in fact turned out a great deal better than might have been anticipated and we are greatly indebted to the skill of management and to the hard work of Cunard, Port and Brocklebank staffs and to our many agents.

The unofficial strike of ships' crews was a particularly unhappy experience and I would like to make it clear that the loyal members of the seagoing staff greatly outnumbered those who were dissident or who had been led astray by extremist elements but the necessary reorganisation and regrouping of full crew complements of loyal members inevitably takes time to carry out before sailings can be resumed.

Though the trouble originated from dissension within the Union, complaints subsequently were made about accommodation and conditions in some of our older ships. The financial problem of tonnage replacement has undoubtedly caused us to run several passenger and cargo ships beyond our normal retiring age and, of course, such vessels suffer by comparison with our newer ships in their design and standard of crew accommodation and though every effort is made to rejuvenate such accommodation to modern standards there are practical limitations.

Whilst I can appreciate the urge behind official strikes and am aware of the serious thought generally given before they are launched, the "wild cat" or unofficial strike such as this crews' strike seems a double edged weapon forged without much thought. Our passenger ships are dependent on the goodwill of our passengers, to whom the strikes were clearly timed to cause the greatest possible embarrassment—the very people on whom the crews as well as the Company depend for their livelihood. The Management naturally did their utmost to lighten the ill effects and hardships: as many alternative berths as possible were found for the stranded passengers in foreign flag ships and

in the air lines. But the question remains—how many passengers upset by the crews' strike learned to travel in future by means other than Cunard?

INCREASE IN OPERATING SURPLUS

In the Consolidated accounts, despite the year's adverse incidents, operating surplus at £7,405,872 shows a welcome improvement of £658,288 on 1954. Freight services in the Atlantic, Australian, New Zealand and Eastern trades, together with the cruise earnings have in the main provided this increase, but whilst we lost passengers at the height of the season through having to blank some sailings during the crews' strike the total volume of Atlantic traffic was larger and at the end of the year Cunard carried virtually its normal annual number of passengers.

With new tonnage coming into commission, annual depreciation of £3,446,293 shows an increase of £554,292. United Kingdom taxation at £2,504,070 is calculated in the normal way and includes the investment allowance for the Group of £746,148 which is transferred direct to reserve for ship replacement. Despite the increase in operating surplus the balance surplus at £1,827,969 is £329,297 less than the previous year mainly on account of the rise in annual depreciation and income tax.

Amounts retained by subsidiary companies and transferred to Cunard reserves are both considerably reduced compared with previous years; these annual allocations, together with annual depreciation, form the backbone for replacement of the fleets and the position is being watched closely.

As to the ordinary dividend, I would again remind you of your Board's endeavour to "steer a steady course." The net amount of the interim dividend declared last October was the nearest figure without going into decimal points to the same net amount paid out in the two interim dividends for 1954, which were calculated on different totals of capital and at different rates of tax. Now recommended is a final dividend of 7½ per cent, making the total payment less tax the same as for 1954. Carry forward at £1,321,154 is increased by £85,231.

In the consolidated balance sheet, reserves are increased by £1,622,012 and show the impact of the investment allowance. Creditors and debtors at £28,227,946 and £5,175,060 respectively both show increases from normal fluctuations of trade. The enlargement over last year is mainly due to open running voyages at the end of the year and to prepaid passage monies. Before the close of 1954, £5 million of invested funds were realised on the market to provide the near requirements of our building programmes. The market value of to-day's investments is below the value in the books but being all in dated Government securities with the redemption dates spread to suit the Company's likely requirements, it is not anticipated they will have to be realised before the date of redemption and no allowance has therefore been made for the depreciation in current market value.

FORMIDABLE BUILDING PROGRAMME

Total gross tonnage under construction is 96,300 and outstanding liabilities for new

ships are approximately £14,450,000. That is a formidable programme but it will only carry us to, say, 1958 and as I pointed out at great length last year the problem of full replacement is a very difficult one which has been made no easier over the past year on account of a further increase in shipbuilding costs.

The retention of the investment allowance for the shipping industry by the Chancellor of the Exchequer is a valuable and much appreciated aid in this direction. But Companies with their ships registered under flags of "Advantage" or "Convenience" continue to thrive in happy and almost total avoidance of taxation in a perfectly legal manner and to make the position clear to stockholders, if the Cunard had been able to work under a Company registered under a flag of "Advantage" instead of in Britain under the Red Ensign, our profits over the six years 1949/54 would be increased by over £14 million (saved in taxation). This additional finance would, of course, have solved our difficulty in providing the extra cost of building to replace fully the ships as they age and it is well to remember that those foreign shipping concerns who can and do adopt this method of advantageous registration will be in a very strong competitive position in the future.

Will, in fact, Britain's future and eventual participation in world shipping be forced to the level of the following notice which I recently saw in the press? "The Greek owned, Liberian registered, Japanese built, British chartered and British skippered 14,000 tons steamer S.S. sailed or what?"

As to prospects for 1956, with the economic situation in the United Kingdom somewhat uncertain in regard to the volume of exports and imports it is difficult to form a worth while forecast for the next twelve months, nor can industrial peace be relied on.

The costs of running and working ships are still rising and such essential items as fuel and diesel oil for instance show considerable advances and it will be very difficult to increase revenue to cover the additional expenditure.

NEED FOR SPEEDIER "TURN-ROUND"

From the angle of cargo ships the saving which would give the best result would be the speed up of the turn-round of the ships in port. Port authorities everywhere are well seized with this important point and are making every effort to improve the position. For instance, the port commissioners of Colombo harbour with much foresight have embarked on a large scheme for the reorganisation of the port's quays and wharves which is partly in operation and is already giving quicker ship despatch.

However that may be, the first essential for 1956 is industrial peace and if this could be attained and the ships could be allowed to run their schedules and services regularly the year's results of the three main operating Companies of our Group would be reasonably good because the teams and organisations generally of the Cunard, Port and Brocklebank Lines, together with their offices and agents overseas, are all well set and poised to take advantage of the opportunity if only it is granted to them.

F. PERKINS LIMITED

(Manufacturers of High Quality Diesel Engines)

TURNOVER FIGURES ACHIEVE FURTHER RECORDS

POLICY OF GREATER EXPORTS

MR F. A. PERKINS ON INCREASE IN DIESEL MARKETS AND APPLICATIONS

The twenty-fourth annual general meeting of F. Perkins Limited will be held on May 14th at the May Fair Hotel, London, W.1.

The following is the statement by the Chairman, Mr F. A. Perkins, which has been circulated with the report and accounts for the year ended December 31, 1955:

The Report and accompanying Accounts are the Twenty-Fourth in the history of the Company.

The turnover of the Company has continued to increase and at nearly £20 million shows an increase of 18 per cent over 1954. The whole of this increase is attributable to an expansion of the business as the prices of the Company's products have not been increased.

The net profit for the year after charging all working expenses and depreciation was £828,759 as compared with £1,169,340 in the previous year.

Your Directors recommend a Dividend of 10 per cent for the year. This is equivalent to the rate paid last year after taking into account the Bonus Share issue.

The Accounts and the Directors' Report show the appropriations of the profits which are recommended by the Directors.

CAPITAL COMMITMENTS

During the year the Company spent £666,708 on Fixed Assets and with further calls on the cash resources to finance an increase in stocks and trade debtors our cash on hand at the end of the year was £574,103 less than a year ago. It is clear that with Capital Commitments of £729,000 it will be necessary to raise additional finance in the near future, and your Board is giving considerable thought to this problem. It is worthy of note that no new capital has been raised since 1951 and that in the meantime the turnover has been doubled.

Due to shortages of constructional steel and the lack of availability of building labour the progress of the factory extension has been slow, but this is now nearing completion and some part of the machine tools are installed and are in operation. Other machine tools and equipment are due for delivery during the current year and it is not anticipated that the full benefit of this expenditure will be apparent until 1957.

Last year I said that we would, without doubt, find it necessary to hold larger stocks, and they have in fact increased by £802,731 during the year. With an ever-increasing range of engines and the need to give prompt delivery it has been found necessary to hold these increased stocks; continuous attention is, however, being given to this very important matter.

Trade Debtors show an increase over last year and this trend has been due very largely to the fact that our direct exports overseas have increased. Suitable terms of payment are still an important factor in securing this type of business. In the home market there are definite signs of a deterioration in payment of accounts.

The reduction in profit over last year is

in great part due to heavy expenses incurred in developing the R6 engine. This was produced to meet the demands of overseas users for a diesel engine which would maintain a high road speed. In some respects we were pioneers in this direction, and in spite of extensive road tests, difficulties were shown up under operating conditions.

Your Board's policy has been to ensure that as little inconvenience as possible should be caused to operators of R6 powered vehicles. We have spent a considerable sum in carrying out modifications to the engine and we feel that in doing this we have retained the goodwill of our customers by demonstrating to them that we stand behind our product.

When the modifications are complete, we are confident that the engine will be fully up to the standard of reliability of our other products.

There has been a further increase in costs of material, labour and transport during the year, but we did not increase our prices; in fact, we have not increased our engine prices since February, 1952.

Suitable sources of supply of our more specialised components show only a very slow improvement, and from time to time it has become increasingly difficult to meet our customers' demands. I made reference to this last year, and in spite of our forward planning and our close relationship with our suppliers, these difficulties persist right up to the present day.

Last year I referred to the shortage of steel and of grey iron castings, and since then conditions have not improved. We had to make purchases on the Continent and are continuing to do so in order to meet our customers' growing demands.

POPULARITY OF DIESEL ENGINES

With the increased popularity of the diesel engine for commercial vehicles and tractors there has been an increased demand for components suitable for those engines and the basic industries have not, as yet, increased their supplies to satisfy the demand, in particular in the matter of alloy steel. For example, a diesel engine crankshaft is approximately twice the weight of a petrol engine crankshaft and of much higher quality steel.

I am able to report that our Order Book continues to increase in line with our increased turnover, and that there has been again a spreading of both customers and applications.

Until recent years, municipal engineers had not been satisfied that the diesel engine was necessarily an economical proposition for powering their specialised vehicles, but I am able to say that there is now no doubt about the economy of diesel engines in this field, and the number of makers of these types of vehicles fitting our engines has increased.

Our Subsidiary Companies in Australia, Canada and South Africa have continued to look after our interests in those areas and

each one of them shows an increase in business during the year.

In Canada, after some years of preparation, we have now started to get some worth-while business, and one Agricultural Equipment Company has standardised on our L4 engine for their tractors. The first order has been completed and the second is now in our hands. Our Canadian Company has moved to new premises where they are able to carry out Engineering Development work to suit North American customers' requirements. This Development work will also benefit the Group's products as a whole.

In Australia the Company is now operating its engine reconditioning plant, and this business should increase from year to year. A tractor manufacturer in Western Australia has standardised on the L4 engine. Industrial Development in Australia is proceeding rapidly and as our engines are well known there, we can expect to reap some advantage in the future.

The South African Company has continued to trade satisfactorily. Alterations in distribution methods have resulted in increased sales.

Last year I referred to the reorganisation of the French Company, and I am happy to report that during 1955 a large number of engines have been assembled and partially manufactured by our sub-contractors. It is anticipated that local manufacture will develop more rapidly during the next twelve months, and although this will result in a reduction of shipments from Peterborough, your Company as a whole will continue to benefit from this business.

During the year new dollar markets have been developed in both the Philippines and Mexico, while established markets such as Germany, India and the Middle East have taken increased numbers of engines.

The percentage of our turnover applicable to exports is approximately 70 per cent and in this respect I am able to report that this year the proportion of these exports which have been direct from Peterborough have increased. A great part of this increase is due to the importance we place on endeavouring to do business in every part of the world where the demand exists and the local regulations do not make business impossible.

Our confidence in the future of the diesel engine remains as firm as ever. The Company's Design and Research Departments are working on new engine designs, and at the same time studying other new forms of power which may have an application in the very long-term future.

For some years now it has been our aim to introduce a Works' Retirement Benefit Scheme, and I am happy to be able to report that this was successfully launched in the middle of the year. It was very well received by all concerned.

The continued success of the Company is due in great part to the efforts of all ranks of employees. Without the full co-operation and joint understanding which exists, it would not be possible to continue to prosper.

THE ROYAL LONDON MUTUAL INSURANCE SOCIETY LIMITED

TOTAL ASSETS EXCEED £124 MILLION

BONUSES TO LIFE POLICY
HOLDERS

MR E. H. HAYNES'S SURVEY

The ninety-fifth annual general meeting of The Royal London Mutual Insurance Society Limited was held on April 24th at the Chartered Insurance Institute, 20 Aldermanbury, London, E.C.

Mr E. H. Haynes, FIA, chairman and Joint Managing Director, who presided, said: It cannot be denied that substantial investment is essential if this country is to hold its place in world trade, and the long-term remedy must be to keep consumer demand within the limits imposed by productive capacity and the needs of capital investment.

To my mind the most important factor, which can help to keep demand within bounds is habitual saving on a substantial scale by a wide sector of the population. In

fostering the habit of saving, the Home Service Insurance Offices, such as ourselves, have a most important part to play.

Royal London endowment assurance policies provide an ideal method of easy saving and at the same time cover the policyholder's dependants against the mischance of his early death.

December 31, 1955, marked the end of another quinquennium in the Society's history and was the occasion of an actuarial valuation of each of the Funds.

ORDINARY BRANCH

The premium income in the Ordinary Branch (including consideration for annuities granted) amounted to £3,962,000, an increase of £88,000 over the previous year. The Fund at the end of the year amounted to £34,797,000, an increase of £1,635,000.

A simple Reversionary Bonus at the rate of £1 10s. per cent per annum in respect of the years 1951-53 and £1 14s. per cent in respect of each of the years 1954 and 1955 is allotted to fully participating with-profit policies.

The Directors have pleasure in announcing that Interim Bonus will be payable during the ensuing year at the increased rate of £1 18s. per cent per annum, subject to with-

drawal or modification by the Directors at any time without notice.

INDUSTRIAL BRANCH

In the Industrial Branch the premium income for the year amounted to £9,593,000, an increase of £315,000 over the previous year.

It gives me great pleasure to announce that a Reversionary Bonus has been allotted on policies issued in the years 1946-1950 at the rate of £1 3s. per cent per annum in respect of the years 1951-1955 and at the rate of £1 per cent per annum for calendar years completed during the period January 1, 1946, to December 31, 1950. Policies issued on or before December 31, 1945, receive a new bonus at the rate of £1 3s. per cent per annum for five years.

GENERAL BRANCH

The premium income in this Branch for 1955 was £730,000, an increase of £72,000.

The total income of the Society during the year was £19,221,000, while benefits paid to policyholders amounted to £7,693,000. The total payments to policyholders since the inception of the Society amounted to more than £140 million.

The report and accounts were unanimously adopted.

BRITISH OXYGEN COMPANY

MODERATE INCREASE IN PROFITS

EXPENDITURE TO MEET GROWING DEMAND

MR J. S. HUTCHISON'S SPEECH

The seventieth annual general meeting of The British Oxygen Company, Limited, was held on April 25th in London.

Mr J. S. Hutchison, chairman of the company, in the course of his speech, said: The Consolidated Profit at £4,277,152 after charging Depreciation of £2,015,484 includes the profit of the Subsidiary Companies for twelve months and the profit of the Parent Company Industrial Medical and Chemicals activities in the United Kingdom for nine months, to September 30, 1955. Profits in 1954, adjusted to corresponding periods would have been £4,168,369. Accordingly there has been a moderate increase in the profit earned in the period of these Accounts.

In accordance with the indication given last year the Ordinary Dividend payment has been maintained at the full rate of 15 per cent without adjustment for the shorter period of operation to September 30, 1955. The special basis applied in these particular circumstances does not carry any implication as to future dividend rates.

CAPITAL REQUIREMENTS

We have experienced over a period of years a steady growth in demand for our products for general industrial purposes. Bigger outputs of steel have led to bigger demands for industrial gases and particularly for oxygen. In the next few months, to meet this, we shall complete the installation of a series of 50-ton per day liquid oxygen plants as standard production units and the capital cost already incurred and to be incurred to bring this significant additional capacity into use with buildings, services, vehicles, and associated equipment will lie in the neighbourhood of £3 million.

New and greatly increased targets were recently announced for United Kingdom steel production up to 1962 and we must look to the production capacity we shall have to create over that period to meet the resultant call on us for supplies of oxygen and other gases. The extension we shall require to make in the period may be considerable.

There has been a rapid advance, too, in which we have played a prominent part, in the use of oxygen in steelmaking for pre-treatment, for assisted melting, for assisted refining in open hearth practice and for blast enrichment in the Bessemer process. Sales for such purposes which were 274 million cubic feet in 1954 are now at a rate of 700 million cubic feet per annum. Our technical contribution in this development is a full one and the prospect is that today's figures will quickly be dwarfed by the scale on which the steel industry now intends to apply these processes.

The stage has been reached, as many will be aware, of our installation of specially sited "tonnage" oxygen producing plants to provide the very large continuous supplies required by the steelworks for process use and we announced recently initial projects for the development of two new works at a cost of £1 million with 200-ton per day oxygen plants at Scunthorpe and Middlesbrough to serve in the most economic way important users in these areas.

These capital expenditures are considerable and although our Ordinary Share Issue of last year furnished an addition to our resources of £4 million after repayment of our former £4 million loan, we must look to the fact that we have further very necessary expenditure to meet. Towards this our total depreciation provisions and profit retentions amounting to some £3 million per annum make a substantial contribution. The programme ahead, however, to meet the requirements I have indicated and for other tonnage oxygen supplies, will go beyond these resources and it will be appreciated that the conjunction of the three factors of firm general growth in use of industrial gases, the greatly increased steel programme, and the new steelworks' demand for process use, will focus for us considerable expenditure into the next two or three years.

The requirement by the Chancellor of the Exchequer, on the other hand, is for the deferment of capital expenditure which does not have the element of urgency in relation to current needs. It means the postponement of many items which are desirable in our general facilities which do not meet this stipulation and a strict control of the development projects that do. The situation cannot be precisely defined at this stage and the Directors accordingly have the subject of Capital Expenditure programmes and Capital resources under very close review.

GAS DIVISION—INDUSTRIAL AND MEDICAL

Earnings from our business in the United Kingdom were adversely affected in the period by heavy cost increases in three main directions—electricity, wages and salaries. Electricity forms a very large part of our oxygen production cost, and wages and salaries have heavy effect in every branch of handling, distributing and general organisation. The sharp increases we had to face in the period in these basic items had an impact on margins quite beyond any benefit experienced from greater scale of operation or improvement of plant and methods and we have had no option but to increase selling prices. We continue to make every endeavour to keep a tight rein on costs and to hold selling prices, but there are limits to what we can do in face of these recurrent increases which are part and parcel of the inflationary situation.

OVERSEAS INTERESTS

Experience overseas in 1955 was favourable throughout, with continuing increase in demand for our products and improvement in earnings from a steady expansion of sales.

PROSPECTS

British Oxygen Gases Limited, which now operates the industrial and medical gas business and handles the sale of gas equipment in the United Kingdom, is experiencing a favourable progression of sales with, I am glad to say, no perceptible effect from the present lessened activity in certain sections of industry. The home business has in recent years, and particularly in the last nine months, been very much subject to the effect of cost increases. Provided we can avoid further inflationary cost increases, I am confi-

dent that British Oxygen Gases Limited should at least hold its own and gain some additional reward for the appreciable increase in business expected to be transacted.
