FOREWORD

Rarely has there been a more intense interest in any subject—or a wider range of speculation—than in Soviet developments since Stalin's death in March 1953. As the old dictator's power grew in range and intensity, he had tended more and more both to concentrate the exercise of power in his own hands and to project even minor preferences and prejudices of his own into the shaping of Soviet policy.

At first cautiously, then with greater assurance, Stalin's successors undertook to revise some of his policies and to modify some of his methods. For Moscow bureaucrats, the change of working hours must have been a portent of greater changes to come. For several decades the upper ranks of the bureaucracy had remained at their posts into the early morning hours, since Stalin worked at night and there was no knowing when he would demand their presence. By the end of 1953 normal working hours, from nine to six, were instituted.

To the Soviet population at large the new leaders' promises of more food, clothing, and housing must have had a familiar ring, but it also received some slight evidence of their partial fulfillment. The presence, after long years of exclusion, of non-Communist tourists from outside the Soviet bloc also strengthened their belief that a new war, with even greater potential for destruction, was perhaps not so imminent as they had believed.

To the world outside the Soviet bloc the new leadership, though selected and trained by Stalin for high responsibilities, began to show a somewhat different demeanor. Without relaxing its insistence on Communist purity and consistency of dogma at home, it seemed better able than at any time since the war to distinguish the real alignments of forces in the outside world. It abandoned some of the mistaken claims of Stalin's last years while stubbornly maintaining its essential "positions of strength," as in the case of Eastern Germany and the satellites.

What has been the meaning of these trends? Has the Soviet regime turned into a national state, responsive to the aspirations of its own people for a better life and for peace? Has the revolutionary belief in the world-wide triumph of the Communist system given way to a willingness to "coexist" indefinitely with other political systems? Are world politics going to move in calmer channels?

No single or simple answer to these crucial questions can be given by the conscientious student of Soviet affairs, for Soviet life and actions are themselves full of contradictions, despite the strenuous attempt to measure all life by one dogma. Careful analysts of Soviet developments are constantly examining and re-examining the available data, which are now more abundant than they were in Stalin's last years, and criticizing their own and others' estimates. Since World War II the resources of trained personnel available in the United States for the study of Soviet affairs have grown a great deal, and large bodies of specialized, even highly technical, analyses are being produced at great effort. In some respects, in this as in other fields of research, the gap between the scientific literature and the newspaper headline tends to grow wider. One of the purposes of this special issue of THE ANNALS is to enable the intelligent reader to "catch up" with a large part of the findings of the specialized research projects in this field, and to see how these findings bear on one of the most crucial questions of our time, Whither Russia?

The volume opens with an appraisal of the basic trends in Soviet society and ideology. A fresh examination of the role of the party and the state is followed by a searching analysis of the factors favoring and limiting Russia's remarkable drive toward industrial power, by a review of the problems which afflict its collectivized agriculture, and by a survey of changing Soviet economic policies in world affairs. The study of old and new trends in literature, music, and the fine arts is particularly important because of the directive role assigned to them by the party. Philosophy has, in the Soviet view, an integrative and guiding function, and this makes it essential to look closely at trends in social thought. Science occupies a central place in Soviet strength and policies; the current trends in Soviet science have been treated in an authoritative review. The final section is devoted to surveying Soviet foreign policy in the principal areas of the world. Because of limitations of space some important topics have necessarily been neglected or slurred over.

In each case, the studies presented here rest on a great body of data and on many years of experience and painstaking research. The authors have, needless to say, been entirely independent in the development of their topics and in the presentation of their conclusions. Although the volume is issued in January 1956, practically all articles composing it were, of necessity, prepared in substantially final form by mid-September 1955.

PHILIP E. MOSELY

The Outlook

By BARRINGTON MOORE, JR.*

AMONG the variety of perspectives offered by various scholars concerning possible future developments in the Soviet Union three major theses stand out. It will be our purpose in this essay to make a preliminary assessment of these views. Enough time has elapsed since the death of Stalin to make such an attempt worth while. To what extent have subsequent events shown these perspectives to be adequate or inadequate or suggested new and better ones? Though it might be wiser to have such an assessment from the pen of an author who has no intellectual investment in any of the available interpretations,[1] the facts upon which any such appraisal must be based are equally available to all independent scholars and will be discussed from differing points of view by other contributors to this volume. The reader will therefore be able to form his own judgment in answer to this query.

FUTURE DEVELOPMENTS—THREE THESES

One thesis holds that by the time of Stalin's death the Soviet regime had reached a point of equilibrium beyond which no fundamental changes were likely, short of violent destruction, presumably produced by some external agency. This view is expressed in the concluding sentences of Professor Fainsod's detailed and penetrating study: "The governing formula of Soviet totalitarianism rests on a moving equilibrium of alternating phases of repression and relaxation, but its essential contours remain unchanged. The totalitarian regime does not shed its police-state characteristics; it dies when power is wrenched from its hands."[2] Though Professor Fainsod does not say so explicitly, such an argument rests, I would suggest, on two pillars. One of these is of course the strength and effectiveness of the control system inherited by Stalin's successors. The other may be indicated in the following terms: modern totalitarianism perpetuates itself as a political system very largely through the repeated destruction of the human beings who at any one time make up the system. Thus the insecurity of both the masses and the bureaucratic instruments of the central authority constitutes not a source of weakness but one of strength to the regime.[3] The point of view set forth by Professor Fainsod may be labeled the "no change" thesis. It remains perhaps the dominant one in most American discussions of Soviet affairs.

In sharp contrast is the argument that the instability and personal character of the chief executive in a totalitarian dictatorship render the system liable to disintegration from the top downward, as contestants in the struggle for power reach back into the society for support. In this fashion the latent discontents in a totalitarian system help to break it

* I am happy to acknowledge my indebtedness to the Russian Research Center at Harvard University.

[3] See *ibid.*, Chaps. 12 and 13, especially pp. 373–76, where Professor Fainsod's position appears to me at least consistent with the above formulation.

apart instead of binding it together.[4] Let us label this thesis "potential disintegration."

The third thesis, that the Soviet Union may undergo a transformation in the direction of constitutionalism, has many varieties and requires somewhat fuller discussion. As a minor or major point it occurs in all of the discussions, including the preceding ones. Rostow anticipates it as a possible consequence of attempts by higher-level administrators to put forth their own ideas on major questions of policy and to win greater autonomy for their bureaucratic bailiwicks.[5] With considerable skepticism Fainsod outlines briefly a similar possibility.[6] As is well known, Isaac Deutscher has made the most of the constitutional point. By creating modern industry and the basis for an adequate supply of material goods, the Stalinist dictatorship, Deutscher argues, has undermined its own basis and created the necessary conditions for a free society, thus fulfilling the Marxist hope for the eventual liberation of man.[7]

Soviet Society

The preceding writers emphasize the political aspects of totalitarianism, though by no means to the exclusion of everything else. In a recent study I have tried to outline some of the ways in which the society as a whole might develop, by observing the criteria of "good" and "bad" behavior that already exist in Soviet society and drawing deductions about what would happen if the emphasis on one criterion increased at the expense of another.[8]

[4] W. W. Rostow, *The Dynamics of Soviet Society* (New York, 1952), Chap. 15, especially p. 256.

[5] *Ibid.*, pp. 191–92, 253–54.

[6] *Op. cit.* (note 2 *supra*), pp. 499–500.

[7] *Russia: What Next?* (New York, 1953), *passim*.

[8] Barrington Moore, Jr., *Terror and Progress USSR* (Cambridge, Mass., 1954), pp. 224–25.

The two major possibilities envisaged may be grouped under the constitutional rubric. One of them is technical rationalism, where the criterion is rationality in the rather narrow and technical sense that many engineers apply. If this element came to the fore, the rapid pace of economic growth would continue, but in a different direction. Though the power of the central authority would remain very great, enforced conformity to an objective code of law would replace frequent administrative shake-ups as the main device through which power and authority are exercised. By the same token the importance of organized terror would decline, though some aspects would unquestionably remain to enforce acceptance among the population of materialist and technical values held by the rulers. Some increase in the personal security of officials might be anticipated, since conformity with objective rules and the demonstration of skill and results would be the main basis for tenure in office. Social mobility would remain at a high level, as moving up or down the social scale came to depend on sheer technical abilities. The family unit would remain small in comparison with preindustrial societies. The moral code might be described as one of "No Smoking—Fire Hazard," in that rules of conduct would be based upon a judgment of results rather than upon an absolute ethical or religious standard.

The second possibility is labeled traditionalist, a term that is in some respects unfortunate, since it might apply to the stabilization of any form of society.[9] The main criterion for appraising human actions, if this element became prominent, would be the extent to which they corresponded with the way people had done things in the past. Essentially this development would mean that Soviet society had lost its dynamism and acquired a constitution in the sense of a set of rules—or, more accurately, precedents—limiting the arbitrary power of the dictator. A rule of precedent would also imply some decentralization, since the dictator would no longer be able to reach down through the bureaucracy, skipping over intervening links in the characteristic Stalinist manner, to make his power felt in farm and factory. Personal connections rather than objective capacity would become the basis of what achievement was possible in such a society—an achievement which we might anticipate would be fairly limited as the society settled into a somewhat rigid order of estates, resembling an oriental despotism rather than European feudal society.[10]

[9] In Max Weber, from whom the term is borrowed with some modification, "traditionalist" has a specific and limited meaning. See Max Weber, *The Theory of Social and Economic Organization*, translated by A. M. Henderson and Talcott Parsons (New York, 1947), pp. 341–58.

World Politics

These three theses—no change, potential disintegration, and various forms of constitutionalism—suffer from a common defect. This defect, I would suggest, is the lack of sufficient explicit attention to the international situation. International politics confronts the political leaders of a country with a world they never made and over which their control is much more limited than over domestic affairs. The choice of policy made in one sphere conditions and limits the range of meaningful choices in the other. Let us begin therefore by an examination of Soviet foreign policy and the conditions to which it is a response.

Tension between the Soviet Union and its major allies, the United States and Great Britain, was never absent during World War II. As victory approached, the disagreements became more severe and soon turned into outright hostility, which mounted steadily until some time after the entry of the Chinese into the Korean War. The sources of the hostility lay partly in the structure of international politics itself. The acrimonious breakup of a victorious coalition is no unique historical event. In the case of the allies in World War II this breakup produced a situation in which two giants glowered at each other across the globe. The hostility lay partly in a conflict between two social systems and their respective ideologies. The conflict has had the ironic effect of helping to stabilize and even to freeze both political systems and their official doctrines. For the USSR the cold war provided an obvious reason for continued industrialization under totalitarian auspices. For the United States it served, perhaps along with other factors, to create a booming economy stimulated by war industry.

The polarization of world politics and the hostility associated with it may have reached its height during the Korean conflict. Then it was possible to speak of the United Nations vis-à-vis the Soviet bloc as "a grand alliance opposing another grand alliance."[11] Since then two contrary trends have become more prominent. Germany and Japan have gained greater freedom of action. Important groups in these and other countries, notably France and India, have sought to disengage their countries from the East-West conflict. In other cases,

[10] A third possibility, the continuation and intensification of totalitarian trends, is rejected as incompatible with the continued operation of a highly industrialized society. See Moore, *op. cit.* (note 8 *supra*), p. 223 and Chap. 7.

[11] See Hans F. Morgenthau, *Politics Among Nations* (2d ed.; New York, 1954), pp. 459–65.

such as Germany and Yugoslavia, there is a visible attempt to move from the passive to the active stage—to utilize the conflict for their own national purposes. Quite possibly this aspect of the change could increase the danger of full-scale war rather than diminish it. The other change is a shift in Soviet foreign policy itself toward a reduction of its foreign commitments and a less iron grip upon its satellite allies.

SOVIET FOREIGN POLICY

The latter change is foreshadowed in Stalin's last public statement, *Economic Problems of Socialism*, where the dictator anticipated more conflict within the capitalist camp, and less between this camp and its socialist rival. Possibly the new policy was under consideration for some time before Stalin's death. Its major highlights include the liquidation of the Korean War and the war in Indochina, the signature of a peace treaty with Austria, and the rather clumsy version of the bear hug and "let bygones be bygones"—shown in Khrushchev's visit to Yugoslavia in 1955. No insignificant aspect of the change has been the willingness of top Soviet leaders to leave the Soviet capital for direct diplomatic negotiations. The visits have included not only Yugoslavia but also China, and more recently the meeting at Geneva in July 1955.

It is easy enough to dismiss the Geneva conference as one at which there was a synthetic appearance of good will without agreement on substantial issues. Nevertheless the new tone to the disagreement may conceivably turn out to be more significant than the positions and counterpositions put forth by the exalted delegates. One might interpret the conference as demonstrating that both the Western and the Eastern powers prefer the status quo to any visible alternative, and particularly to one that would allow a reunited Germany to stir up trouble between them. By the early autumn of 1955 political leaders on both sides were apparently searching for an arrangement that would simultaneously produce both a *détente* and some advantage for their own side. Since these two objectives are largely contradictory, there are grounds for skepticism about the outcome.

The change in Soviet foreign policy far exceeds the substitution of minor concessions for minor pinpricks with which the policy began. The main drift of the policy appears to be toward a reduction of international tension to free the Soviets for concentration on urgent domestic problems. It may be reversed if it does not succeed in inducing the United States to relax its pressure. For the Soviets the crucial test will be whether this policy can produce a further delay in the rearmament of Germany. If it fails in this objective, we may anticipate a reversion to some features of latter-day Stalinism both in domestic and foreign policy.

AGRICULTURE

In Soviet domestic affairs the most pressing problem is undoubtedly agriculture. On the one hand the government has embarked on a highly publicized campaign to grow more corn and to increase the total area of cultivation. On the other hand it has made some concessions to the collectivized peasantry to increase incentives. Most significant among these were the measures taken in 1953 to make work on the private plot more attractive. If the Soviets had continued to move in this direction, they could have undermined the entire system of centralized control over the production and distribution of agricultural products. By the time Malenkov had resigned the premiership, it became perfectly clear that this path would not be followed to its logical conclusion. A decree of March 9, 1955, shows that the system of assigned quotas for planting crops, and of obligatory deliveries to the government by the collective farms at harvest time, remains essentially unchanged. The decree merely gives the collective farm managers explicit authority to determine how they will meet the plan by making their own decisions as to the kinds of livestock raised and the areas sown to different crops. The party Central Committee also decided, according to *Pravda*, April 5, 1955, to strengthen the management of the farms by sending out thirty thousand "volunteer" managers, to be chosen primarily from among experienced administrative and technical officials. This mixture of the infusion of new administrative blood, partial concessions, and a campaign atmosphere is fully reminiscent of the Stalin era.

INDUSTRY

In industry a similar pattern of concessions and subsequent tightening up is apparent. Malenkov's original proposals for increasing the output of consumers' goods are well known. Less attention has been paid to some of their doctrinal justifications. These became public through D. T. Shepilov's attack on the views of otherwise little known economists in *Pravda*, January 24, 1955. No Soviet economist would be likely to submit such views for publication unless he had previously had clues that they would be acceptable to very high party officials. Thus these opinions constitute significant evidence about "advanced" thinking under Malenkov.

The essence of such views is that under socialism production should eventually serve the purpose of consumption. Both capitalism and socialism had to restrict consumption to create an adequate industrial base. This base has now been created in the USSR. While capitalism, because of the profit motive, necessarily continues to restrict consumption, socialism need do so no longer. Instead it can advance to higher levels of welfare for all.

This line of thought requires, for its execution, a marked reduction in the temperature of the cold war. It implies a policy of peaceful coexistence and the transformation of the international political contest between the two systems into an economic race. Though the supporting arguments have been officially rejected, it appears that the conclusions have been at least temporarily adopted. Thus Khrushchev was reported by the Soviet papers as early as May 19, 1955, to have said, "The fundamental principle of Soviet foreign policy is the possibility of and the necessity for the peaceful coexistence of different social systems."[12] As indicated by this statement, and by the continuity of Soviet foreign policy after Malenkov's resignation, this assessment probably remains just below the surface as an influential element in current Soviet policy. Though the full story remains unknown, this would not be the first time that a Soviet leader has emerged victorious from bureaucratic rivalries and taken over important planks from the platform of a defeated opponent.

Except for the foregoing controversy, resolved in favor of heavy industry, there is little to be gleaned from an examination of this aspect of Soviet life. The old problems of a highly centralized economy evidently remain, and are met in the same way. The drive for industrial expansion still comes from the party high command, and still encounters strong resistance from below in the form of attempts by those actively engaged in production to cling to traditional routines. A reorganization to

[12] *Current Digest of the Soviet Press*, Vol. 7, No. 20 (June 29, 1955), p. 7.

separate long-range planning from day-to-day controls appears to be the one new measure adopted so far with this problem in mind.[13] Without continued pressure from the party high command Russia's industrial expansion might slow down markedly.[14] In turn this change would have vital consequences throughout the rest of Soviet society.

INTELLECTUALS

It is to the intellectuals that we must turn to find the most definite changes in Soviet life since the death of Stalin. Shortly after this event, and presumably at the nod of high party officials, certain writers and musicians began to praise the virtues of artistic independence and to poke fun at the made-to-order optimism and cardboard heroes of "socialist realism." This brief experiment was brought to a close by the Writers' Congress toward the end of 1954. For the natural scientists the change was equally marked, though less highly publicized. Shortly before Stalin's death restrictions in science had gone so far as to place a political ban on the quantum theory. There had also been attacks on probability theory in mathematics,[15] besides the party's well-known intervention in genetics. The superiority of Soviet and even Czarist Russian science over that of the decadent bourgeois West formed a constant theme in the Soviet press.

After Stalin's death all these features suddenly disappeared. Possibly the Soviet leaders decided that they needed the best technical science they could get without worrying too much about the political implications of scientific discoveries. Perhaps they also felt that they were in a position to control these implications anyway. Still another consideration may have been that modern natural scientists are generally tame animals, raised in a bureaucratic hothouse, whose ideas no longer constitute a serious threat to the ruling powers.

FAMILY AND CLASS

The institutions of the family, formal education, and social class may be treated simultaneously as agencies through which Soviet society trains the oncoming generation and allocates its members among different occupations and social tasks. Much has been made in the past of an apparent increase in the rigidity of class barriers in the Soviet Union and of the supposed abandonment of early equalitarian ideals. But we must not forget that the socialist revolution took place in a backward agrarian country. With an extreme shortage of the necessary skills, including even literacy, the Bolsheviks had to retain and reward many members of the former ruling classes who had these skills. They also found it necessary to create their own group of administrators and technical specialists and to reward them highly. Now this situation has greatly changed as a consequence of industrialization and the spread of education. The Nineteenth Party Congress envisaged the extension of limited technical education through much of the Soviet Union in the course of the next decade. To the extent that both the structure of modern industry and the educational system make for a society of interchangeable parts, the possibility of a very great increase in equality of opportunity becomes real.

Complete equality cannot be achieved as long as the family remains the basic social cell, as it is not only in the Soviet Union but in all known human societies. The son or daughter of a successful man gains important advantages in social and cultural skills, as well as formal education, merely from being brought up in such a home. In this way advantages are transmitted from one generation to the next.[16]

JUVENILE DELINQUENCY

We do not know whether the Soviets would be disturbed by the barriers to full social equality that arise in this way. But we do know that since Stalin's death they have shown increasing concern over the opposite side of the coin—the creation of a class of juvenile delinquents from wealthy homes.[17] Some of the behavior of this group resembles that of spoiled rich children elsewhere: riding around in flashy cars, drinking heavily, night clubbing, and amusing themselves with intermittent seductions. Other aspects are more serious and include armed robbery, beatings up, and even murder.

There is no way of telling how widespread and serious juvenile delinquency is, beyond the fact that Soviet authorities now think it is bad enough to require systematic exposure in the press. It is noteworthy that the reports practically always refer to children from wealthy families. In Soviet discussions[18] one can detect an undertone of anxiety lest this behavior become a model for youth in all strata.

It is likely that the Soviets have here run up against an insoluble problem. By the mid-thirties it was clear that they definitely decided to rely primarily on the family as the agency for inculcating the moral standards needed to keep their society going, though it was to be supplemented by the school, the Pioneers, and the Komsomol. This commitment to the family has been reinforced by one to personal private property, including real estate.[19]

In the light of these commitments it is difficult to see how the Soviets can avoid the consequence of a certain proportion of spoiled children. Some parents are bound to discipline their children inadequately and spare the younger generation from facing harsh realities. Whether the attitude that work and rules of behavior are something made for the "lower orders" will gradually sap the vigor and intelligence of the ruling strata is an intriguing question to which future history may some day provide an answer. Past experience suggests that such an outcome is far from improbable.

PARTY HIGH COMMAND

Developments in the party high command and in the government have been left to the last of this discussion, since it is there that all pressures in Soviet society find their focal point. Those who have argued the instability of the executive under totalitarian dictatorship can find support for at least some of their views in the dramatic events since Stalin's death. The arrest and execu-

[13] See Bulganin's speech, which stresses these traditionalist pressures and briefly describes the planning reorganization, in the metropolitan press May 17, 1955, and *Current Digest of the Soviet Press*, Vol. 7, No. 20 (June 29, 1955), pp. 3–4, 6.

[14] For a fuller development of this argument see Moore, *op. cit.* (note 8 *supra*), Chap. 2.

[15] Moore, *op. cit.* (note 8 *supra*), pp. 139–43. See also Arnold Buchholz, *Ideologie und Forschung in der sowjetischen Naturwissenschaft* (Stuttgart, 1953), for a fuller treatment of the relationship between Marxist doctrine and Soviet science. The author's discussion, however, is limited to certain aspects of the content of scientific work and devotes almost no attention to the workings of the control system.

[19] Probably no society has been more savage in the defense of property, both private and social (*i.e.*, state property), than the Soviet dictatorship.

tion of Beria and Malenkov's unprecedented resignation from the premiership are only the highest points in a series of little known events. It would be astonishing if no further surprises were in store, possibly before this paper becomes public print. At the present writing no individual has emerged in command of the main levers of control in Soviet society: the party, the police, the military forces, and the industrial ministries. In this connection it is well to recall that these agencies do not constitute distinct interest groupings, as they still largely do in Western society. Instead the party and the police, which is now apparently clearly subordinate to the party, permeate all sections of the bureaucracy, rendering independent action very difficult if not impossible.

At the same time this permeation by the party means that its members become the channel through which the requirements of different elements in the bureaucracy find their way to the high command, the policy-making nucleus for the whole society. Party members, even high ones, often wear two hats, one as a party member and another as a key administrative official. Thus they become sensitive to the inchoate and half-formulated wishes of various sectors in the society, including even the peasantry. This is not to say that the party necessarily responds to these wishes in the way the people concerned might wish. Often the very opposite is the case. The Politburo and its successor, the party Presidium, have not been parliamentary forums where competing interest groups reach a compromise. Nothing could be further from the Bolshevik ethic of active comprehension and control of political life. Nevertheless pressures emanating from within Soviet society and the outside world form the basis for the formulation of issues by the highest party leaders.

As the discussion preceding Stalin's *Economic Problems of Socialism* and the Shepilov editorial on industrialism both demonstrate, the formulation of views that may be rejected subsequently is at times very full and explicit. Again we cannot draw the conclusion that the party leaders always sit down to discuss two or more well-argued and opposing theses before reaching a conclusion. Probably the process is more similar to what happens in our own society, where an official may sense a change in the bureaucratic atmosphere and come up with a carefully worked-out proposal. Even if the alternative is rejected and never becomes a topic of public discussion, its contents and general line of thought become known to a series of influential people.

"Consciousness" Versus "Spontaneity"

On the basis of these considerations and the very brief review of Soviet society and its relations with the rest of the world is it possible to formulate the issues now pending in Soviet society and some of the alternative courses of action that may be under consideration? I think that the attempt at least deserves to be made. Many journalistic prognoses have been cast in terms of a "soft" or a "hard" policy. More appropriate might be the terms "consciousness" versus "spontaneity," terms familiar to readers of early Russian Marxist discourse.[20] The first implies a policy of deliberate and ruthless control over the course of human events to make them yield a predetermined result. The second, closer to German revisionist Marxism, implies a policy of "letting nature take its course," since events supposedly show an inevitable trend that is in itself desirable. "Consciousness" has received the main emphasis in Soviet policy from Lenin's day onward. But we have seen that "spontaneity" lies not far beneath the surface of important contemporary thinking in the USSR and was to some extent allowed to come to the fore in policy under Malenkov. After the success of the industrialization program by the method of consciousness, which of the two will become the dominant theme in the future probably depends on developments in international politics.

[20] Cf. L. P. Haimson, *The Russian Marxists and the Origins of Bolshevism*. Cambridge, Mass., 1955.

Should the efforts to achieve a period of peaceful coexistence succeed, spontaneity might become the dominant theme. But in the light of Bolshevik tradition it is unlikely to become the sole one. More probable is a partial fusion of the two traditions along the following lines: The terror would be relaxed and kept in the background as a reserve weapon—"put in moth balls," as Alex Inkeles once expressed it. With a higher level of material goods it would be possible to manipulate the incentives and over-all situation confronting Soviet citizens so that the overwhelming majority of them would behave in the way desired by the central government. They would have the illusion of freedom without its substance. It might even be possible to permit free elections, since the citizens could be counted on to choose the "right" leaders, who would continue to manipulate the society in the "right" way. Totalitarian democracy would become a reality. Capitalism could be allowed to rot on the vine, through its alleged inherent contradictions, instead of being given a shot in the arm through a rearmament program, with its accompanying risk of mutual destruction for both social systems.

If, on the other hand, the attempts at peaceful coexistence bring forth dubious results—perhaps the more probable alternative—we may expect old-fashioned Stalinist totalitarianism to persist, with some reduction in its most arbitrary and terrorist features.

Perspectives Reviewed

We may close with a few remarks about the perspectives mentioned at the beginning of this essay. As already suggested, the major weakness in all of them comes from inadequate attention to foreign affairs. Some of the chief determinants of the future of Soviet society lie outside that society in the larger system of world politics. Among the specific interpretations the "no change" thesis appears to have the best of the argument so far, at least from a strictly factual standpoint. The Stalinist edifice in its major features still stands. But there are, I think, important changes, particularly in foreign policy and in controls over the life of professional intellectuals. The theory that stresses the instability of the chief executive has turned out to be correct in regard to this specific fact. So far, however, this instability has not had any serious consequences for the system as a whole.

As for the "constitutionalist" theories, Deutscher's optimistic hopes have not been justified by subsequent events. The USSR today appears to be just about as far from a democratic version of socialism as it ever was. Likewise the traditionalist model does not appear to be coming to the surface. Some people might be inclined to discard the traditionalist model altogether, as incompatible with the dynamic characteristics of industrial society. By the second half of the twentieth century, on the other hand, the impetus for change in industrial societies generally may no longer lie in the economy or in technology as such. Now the impetus for technical advance comes in very large measure from military requirements. Should this source of change decline in

importance, industrial societies might conceivably turn out to be rather static affairs.

TOWARD TECHNICAL RATIONALISM

To my mind the changes that have occurred since Stalin's death point in the direction of technical rationalism at the expense of old-fashioned Stalinist totalitarianism. The liquidation of the "doctors' plot," the increased incentives for agriculture, the grant of slightly greater freedom to lower officials in both industry and agriculture to make decisions on their own, the elimination of the more extreme restrictions upon scientific theorizing, the educational program, and the developments in foreign policy all can be taken as pointing toward a society that is more rational in a rather limited material and technical sense.

Further rationalization of Soviet society probably depends upon the extent to which international tensions can be reduced. Without a solution to international problems, any thoroughgoing rationalization—one that would involve a transition from destructive to creative ends for social life generally—remains impossible. But this generalization applies as much to American society as it does to the Soviet scene. Developments in the two systems cannot be understood as isolated trends independent of each other.

AMERICAN-RUSSIAN RELATIONS

Should American-Russian relations remain fundamentally unchanged over the next decade, both societies may be expected to develop increasingly similar structural characteristics despite differences in their proclaimed ideologies. These characteristics would almost certainly be much closer to those of a garrison state, though with a high standard of living and quite possibly a contented population, than to those of liberal democracy. Disagreeable though they may be, these prospects furnish no justification for an American policy of unlimited concessions to Soviet demands. Such a policy would simply lead to the same results by another route. The problem of statesmanship on both sides of the Iron Curtain, a problem far easier to formulate than to solve, is to find sufficient areas of mutually advantageous compromise to stabilize the present situation. Such stabilization might in turn permit the emergence of trends more favorable to the growth of a free society.

Governmental Developments in the USSR Since Stalin

By JOHN N. HAZARD

THE Soviet leadership's anticipation of panic in the population following Stalin's death in March 1953 seems to have passed. Measures designed, apparently, to cope with the expected danger of mass unrest have been modified. Soviet administrative and judicial policies have resumed many of the characteristics familiar to those who followed their course before Stalin died.

Two primary measures designed to save the state through political manipulation became evident immediately after Stalin's death. One step lay in the direction of reducing the circle of those with power, including those with administrative authority. The other lay in the direction of quieting the people by promising relaxation of severity in the administration of criminal law. Parallel trends within the Communist party can also be discerned, and they form the subject of a companion study in this volume. This paper has to do only with the progress of events on the governmental side of the Soviet bifurcated apparatus of power.

IMMEDIATE POST-STALIN MEASURES

Reduction in the size of the circle of those within the state apparatus holding power was achieved by combining existing ministries to establish a smaller Council of Ministers of the USSR and by creating an inner cabinet of five men. Prior to Stalin's death there had been fifty-one ministries.[1] The post-mortem decree effected a reorganization from which only twenty-five ministries emerged.[2] Prior to Stalin's death there were unofficially reported to have existed a steering committee of ten men in the Council of Ministers and an executive committee limited to four or five, above the steering committee.[3] After Stalin's death the ten-man steering committee was eliminated to leave the executive committee standing alone with five members.[4]

The promise of relaxation of severity in the administration of the criminal law took two forms: an amnesty, and an order to the Ministry of Justice to redraft the criminal code with a view to replacing prison terms by administrative penalties for the less dangerous categories of crime.[5] Under the amnesty all persons serving prison terms under court sentence up to five years in length, regardless of the offense, were to be released from prison.

Persons with terms longer than five years were also to be released under the amnesty when they were women if they

[1] This total is obtained by analyzing decrees for 1950, 1951, and 1952 as published in *Vedomosti Verkhovnogo Soveta*, No. 15 (630), July 29, 1950; *ibid.*, No. 5 (662), March 21, 1951; *ibid.*, No. 6 (713), March 16, 1952.

[2] Law of March 15, 1953; *Ved. Verkh. Sov.*, No. 3 (775), March 20, 1953.

[3] See Anatole F. Mazour, *Russia, Past and Present* (New York, 1951), chart section.

[4] Decree of March 6, 1953; *Ved. Verkh. Sov.*, No. 2 (774), March 8, 1953. Nothing was said of the inner cabinet when the Supreme Soviet adopted its law on reorganization on March 15, 1953 (*op. cit.* note 2 *supra*). It is presumed that the decision adopted immediately after Stalin's death by the Central Committee of the Communist Party, the Presidium of the Supreme Soviet, and the Council of Ministers reflected the actual state of affairs in the Council of Ministers.

[5] Decree of March 27, 1953; *Ved. Verkh. Sov.*, No. 4 (776), March 28, 1953.

were pregnant or over the age of fifty or with children up to ten years of age. Men over the age of fifty-five were to be released regardless of their offense. Persons of any age or duration of sentence were to be released if they had been convicted of crimes classified under the criminal code as "official" or "economic." Persons with terms longer than five years who did not fall within the categories of those to be released were to have their sentences reduced by one-half. The decree was silent on those serving terms in concentration camps as the result of an order of one of the "special boards" of the Ministry of Internal Affairs.

THE COUNCIL OF MINISTERS

The policy of reduction in size of the Council of Ministers underwent a change within five months after Stalin's death. When the reduction was announced in March 1953 the new chairman of the Council of Ministers, Malenkov, had declared that the reduction was not caused by Stalin's death but had been prepared long before to increase efficiency.[6] It is hard to believe this explanation in light of the reversal of policy on August 24, 1953, with the creation of a new Ministry of the Food Industry.[7] The reversal was accompanied by an explanation that the new ministry was required to increase food production and to improve its quality. The new ministry took jurisdiction over the food-processing plants, which had been transferred at the time of Stalin's death to the Ministry of Light Industry.

Other changes on the same day were to remove from the Ministry of Light Industry another of its branches to create a new Ministry of Industrial Goods in Wide Demand; to divide the Ministry of Foreign and Domestic Trade into its two components, so that commerce would again be handled as it had been prior to Stalin's death; and to separate the central administrations for state and collective farms, which had been separate before Stalin's death.[8]

In subsequent months the process of resplitting the amalgamated ministries into the same units that had constituted separate ministries prior to March 1953 gained momentum. When the Supreme Soviet met in annual session, in April 1954, it confirmed actions of its Presidium between August 24, 1953, and April 23, 1954, establishing sufficient new ministries to raise the total to forty-six. The State Bank was also removed from its position of subordination to the Ministry of Finance and restored to its seat on the Council of Ministers, from which it had been removed at the time of Stalin's death.[9] There were also added to the Council of Ministers two new "committees," one to co-ordinate construction and the other to co-ordinate internal security measures.

Although the number of ministries had reached by April 1954 almost the number existing at the time of Stalin's death, the process of fragmentation was to continue. On August 4, 1954, two new ministries were added, for the construction of means of transportation and for city and village construction. When the Supreme Soviet met at its annual session in February 1955, a new law amending the constitution to introduce new ministries brought the total to fifty-one.[10]

The process of expansion had not been completed, however, even though the total number of ministries had returned to the peak of the period prior to March 1953, for at its meeting of April 2, 1955, the Presidium of the Supreme Soviet added two more ministries, to make a total of fifty-three.[11] Within a month even the long-established State Planning Committee was split into its two parts to create one committee for long-range planning and another for current plans.[12]

Reorganization

With the increase in the number of ministries there occurred what appears to have been a return to the two-tiered inner cabinet of steering committee and executive committee which had directed the affairs of the Council of Ministers during Stalin's declining years. The metamorphosis took thirteen months. In the reorganization following Stalin's death only one Deputy Chairman (Mikoyan) had been left as a relic of the pre-Malenkov steering committee of ten. The pre-Malenkov executive committee had become the sole directing group, with five members, comprising the Chairman and four First Deputy Chairmen of the Council of Ministers (Beria, Bulganin, Kaganovich, and Molotov). On Beria's ouster on July 10, 1953, this inner cabinet was reduced to four.[13]

The return to the system of the Stalin era began when the single Deputy Chairman was joined by five new Deputy Chairmen under a decree of the Supreme Soviet enacted at its regular session on April 27, 1954.[14] There was thus restored to the administrative hierarchy a body resembling the steering committee of ten reputed to have existed during the Stalin era. The new group of Deputy Chairmen was subordinate to the inner group of First Deputy Chairmen, and the conclusion is inescapable that the inner group was an executive committee for a larger steering committee, whose members assumed responsibility for specific areas of activity within the Council of Ministers. This two-level inner cabinet has been continued to the present, although there have been changes of personalities.

Malenkov's demotion, which was announced to the Supreme Soviet on February 8, 1955,[15] was the signal for a reorganization. One of the First Deputy Chairmen, Bulganin, was promoted to fill Malenkov's place,[16] and Malenkov was dropped back to the position of a Deputy Chairman.[17] Nothing further was done at the time to rearrange the administrative hierarchy, but three weeks later three of the then Deputy Chairmen were advanced to the rank of First Deputy Chairmen (Mikoyan, Saburov, Pervukhin),[18] and their seats as Deputy Chairmen were filled by three new men (Kucherenko, Lobanov, Khrunichev).[19] On the same day a separate decree added another name (Zaveniagin) to the group of Deputy Chairmen.[20] The changes brought the number of First Deputy Chairmen to five and the number of Deputy Chairmen to eight.

DECENTRALIZATION OF MINISTRIES

The post-Stalin era has introduced a reversal of the trend toward centralization of state administration which had been a marked feature of the declining years of Stalin's power. The reversal began on April 19, 1954, with the crea-

tion of a Ministry of Coal Production in the Ukrainian Republic.[21] The previously existing All-Union Ministry of Coal Production in the federal government was transformed at the same time into a Ministry of the Union-Republic type. For those familiar with Soviet administrative terms the character of the change will be apparent immediately, for there have existed ever since the creation of the federation in December 1922 differing types of ministries. The All-Union type is highly centralized, in that the federal government's administrative apparatus has both planning and operating functions. There are no powers reserved to the republics in this type of organization. The Union-Republic type of ministry places only planning functions in the federal government and reserves operating functions to the republics. A third type of ministry, called the Republic type, places both planning and operating functions in the Union Republics.

The decree on the Ministry of Coal Production incorporated within its technical terminology a change in attitude toward the principal coal-producing republic. While the Union-Republic type of ministry had been a much-used form for the administration of the consumers' goods industries under Stalin's regime, it had not been adopted for the heavy industries, with the possible exception of the timber industry, which might be considered a heavy industry. With the post-Stalin decree on the coal industry a halfway position was taken, in that one major republic was permitted to operate its own mines subject to policy direction from the federal government. The position was only a halfway position because, unlike the pattern of the usual Union-Republic type of ministry, there was to be no scheme of ministries in all producing republics and only the one ministry was to be established in the Ukraine. The Russian Republic, with its large fields in Karaganda and its lesser fields in Eastern Siberia, was to have its coal mines operated by the ministry in the federal government.

The same halfway position was taken with the petroleum industry on May 18, 1954,[22] when a decree established a Ministry of the Petroleum Industry in the Azerbaidjan Republic, and transformed the former All-Union type of ministry in the federal government into a Union-Republic type. Again, the largest single producing republic was given operating authority, but the Russian Republic with its lesser oil fields along the middle Volga was given no corresponding ministry. These fields were to be operated, as in the past, by the federal government's ministry.

The program of decentralization was advanced considerably in the last days of 1954 with the creation of Ministries of Communications in all sixteen republics under a Union-Republic type of ministry in the federal government.[23] Previously all communications had been operated directly by Moscow through branches responsible solely to Moscow and beyond the influence of governments in the republics. On the following day the Ministry of Higher Education was reorganized to give the Ukrainian Republic a ministry in this field,[24] but all other republics were to have their higher educational institutions operated by the federal government's ministry.

Education

In the early days of the federation, education was left entirely to the republics, and no Ministry of Education was created in the federal government. By degrees the federal government assumed authority, first by adopting general schemes for the teaching program and then by creating a committee on higher education under the Council of Ministers of the USSR. This committee had been transformed into a Union-Republic type of ministry of a special character by decree of April 10, 1946,[25] in that it was authorized to operate directly a list of key institutions of higher learning and to guide the republics in operating the rest.

In the reorganization following Stalin's death the Union-Republic Ministry of Higher Education had been combined with the Committees on Art and on Radio Information, the Administration for the Publication of Political Literature, and the Ministry of Labor Reserves, in a Ministry of Culture of the Union-Republic type.[26] From this amalgamation it emerged as a new ministry of All-Union rather than Union-Republic type on March 9, 1954.[27] In this form it represented the triumph of complete centralization of operations as well as planning of the higher school system.

In light of the steady trend toward centralization of the higher school system evidenced by the decrees indicated, the new creation, in December 1954, of a Union-Republic type of Ministry of Higher Education indicated that the leaders were taking a cautious step in reversal of policy. The caution is suggested by the fact that a ministry for operating purposes was created only in the Ukrainian Republic. All other republics were to have their higher schools run by the federal government's ministry, although they maintained operating control over their elementary schools through their long existing Ministries of Education.[28]

THE SUPREME SOVIET

By the time of Stalin's death the annual session of the Supreme Soviet of the USSR for 1953 had not yet been called, and only one issue of the official gazette, in which decrees of the Presidium of the Supreme Soviet and laws of the Supreme Soviet itself are published, had appeared, in contrast to three issues in 1951 and five issues in 1952. Affairs of state seem to have been moving at a slow pace in early 1953, giving some credence to the rumors that Stalin was not available for consultation during February 1953.

Within forty-eight hours after the announced time of Stalin's death, the Central Committee of the Communist Party joined with the Presidium of the Supreme Soviet and the Council of Ministers to issue a joint decision to reorganize the government, and as a final paragraph to the decision there appeared a call to the annual meeting of the Supreme Soviet on March 14, 1953.[29] On the designated date the deputies assembled and adopted all points of the suggested reorganization in the customary unanimous fashion. Shvernik, who had gained his reputation as head of the trade unions and had been made President of the Presidium of the Supreme Soviet in 1946 on the death of the long-time President Kal-

inin, was relieved of his duties.[30] Voroshilov replaced him, perhaps to indicate that Stalin's closest friend was to remain and influence the top leaders.[31]

No discussion of the budget occurred at the meeting of the Supreme Soviet, although the budget is the usual item of principal business. The deputies went home as soon as they had taken the steps required by the constitution to form a new Council of Ministers. Presumably the new government felt it necessary to revise the plans which had probably been in preparation well before Stalin's death so as to take into account the changed circumstances.

The presumption that a new plan was being formulated in the light of the need for quieting the people was proved correct when the Supreme Soviet was called into session again on August 5, 1953.[32] This was the first time that the Supreme Soviet had met twice in one year since the schedule of a single meeting each year had been inaugurated in 1947, in violation of Article 46 of the constitution, which requires two meetings a year.

The August session of the Supreme Soviet was conducted in familiar style.[33] A budget for 1953 was adopted. Decrees of the Presidium promulgated since the previous session were approved. The constitution was amended to record the change in name of the Communist party, a change which had been adopted at the Nineteenth Party Congress, held prior to Stalin's death. A new agricultural tax was enacted, and personnel changes were made, including the appointment of a Prosecutor General of the USSR, of three new judges of the Supreme Court of the USSR, and of a few ministers. Having completed its work on August 8, 1953, in the usual brief session, the Supreme Soviet was disbanded to await elections for deputies to the next Supreme Soviet, in accordance with the constitutional requirement for holding elections once every four years.

Election of 1954

Preparations for the new elections began with the appearance in the press of the listing of new electoral districts. The decree of January 11, 1954,[34] listed 700 districts for the Soviet of the Union, indicating a population of 210 million, and 631 districts for the Soviet of Nationalities. These figures showed a growth in population since 1950, when 671 districts had been designated for the elections to the Soviet of the Union; there was no change in the number of ethnic units.

The pattern of election returns following the balloting of March 14, 1954, showed no change over the Stalin era.[35] As usual, the voting was reported as being nearly total, for 99.98 per cent of those eligible were said to have voted. One wonders whether it was a coincidence that exactly the same percentage had been reported in 1950.[36]

Expression of opposition to the regime had become nearly impossible during Stalin's tenure, even though a printed ballot had been established by the constitutional innovation of 1936 and the ballot had to be secret. Stalin had maintained the practice of placing only one candidate on the ballot. The new government made no change in procedure, for the 1954 elections likewise gave the voters no choice. What little opportunity there might have been under the Stalin regime to scratch the name of the single candidate for each post seems to have been reduced by a post-Stalin practice of encouraging citizens to fold their ballot in public without entering a booth. Under this procedure, reported by foreign correspondents, withdrawal into a booth could be interpreted as evidence of hostility to the regime, and the secrecy provided by law could mean nothing.

Official returns on votes against the single candidates showed a marked reduction over the opposition registered in 1950: 247,897 persons were reported as having voted against the candidate in their district for the Soviet of the Union, while 187,357 had voted against the candidates for the Soviet of Nationalities. In 1950 the scratches numbered 300,146 and 306,382 respectively.[37] The new government seems either to have been more popular or to have frightened more dissenters or to have wanted to appear more popular than Stalin. It is noteworthy that the usual greater number of scratches of candidates for the Soviet of Nationalities than for candidates for the Soviet of the Union was reversed in 1954.

Eight deputies to represent the Soviet armed forces abroad were added to the totals in each chamber on election day. Under a constitutional amendment of October 14, 1945,[38] there had been established representation of troops abroad at the rate of one deputy per hundred thousand troops. The 1954 returns indicated eight hundred thousand troops abroad compared with seven hundred thousand at the time of the 1950 elections.[39]

Meetings of Supreme Soviet, 1954

The usual functions were performed by the newly elected Supreme Soviet when it met on April 20, 1954, in response to a call of March 24, 1954.[40] The budget was debated and adopted. The Presidium's actions were ratified. The constitution was amended to reflect changes in the list of ministries. A Presidium and the usual committees were named. Once again the budget was introduced by the Minister of Finance, only to be changed by the budget committee of the Supreme Soviet. Once again was raised the meaning of a procedure which must be staged, since the Communist party as the director of all policy cannot have approved a draft budget only to be surprised at the Supreme Soviet by its amendment.

The second session of the Supreme Soviet elected in 1954 was held on February 3, 1955, after a call dated January 22, 1955.[41] It performed its familiar duties and then provided a surprise. Malenkov's resignation was announced. The event marked no upheaval as between Communist party and the state, for it was indicated that the resignation had been arranged at a meeting of the Central Committee of the Communist Party held a few days previously. The Supreme Soviet was not establishing within itself a procedure for effecting a change of government beyond the reach of the Communist party.

A declaration issued by the Supreme Soviet to the parliaments of the world indicated that for the Soviet leaders the

Supreme Soviet played a role which was important not only in satisfying the desires of the Soviet peoples for participation in government but also in furthering the aims of Soviet foreign policy among the peoples of the world. The declaration called upon other parliaments to adopt what amounted to a program similar to that espoused by Soviet delegates in their speeches before the agencies of the United Nations.[42]

Foreign policy

Four other important steps concerning foreign policy were taken by the Presidium of the Supreme Soviet after the deputies had returned to their homes. Two were the denunciation of the treaties of alliance with England and France, another was the approval of a treaty with Iran, and a fourth was the pardoning of Austrian prisoners of war convicted by Soviet courts of war crimes. In each instance the foreign policy matter was made the subject of a joint meeting of the foreign policy committees of the new chambers of the Supreme Soviet.[43] In the reports emanating from these joint meetings the deputies are said to have voiced their support of the government's proposal as presented to them by the Minister of Foreign Affairs, Molotov.

The Iranian treaty involved the cession of a part of the territory of two Soviet republics in rectification of the frontier and in consideration of recognition by Iran of certain territory as being indisputably a part of the USSR. The Azerbaidjan deputy reported that his republic was agreeing "in the interest of strengthening good neighborly relations between the USSR and Iran." The Turkmen deputy said the same thing.

The steps taken by the Presidium of the Supreme Soviet and its committees suggest that Soviet leadership has found it valuable in terms of its relations with the peoples of the USSR to implement foreign policy through that agency. Except to gain formal approval of the policy adopted at the meeting at the "summit" in Geneva in the summer of 1955, it has not thought it necessary, however, to call the entire Supreme Soviet into session as it did in 1939 when the alliance with Germany was made the subject of a resolution approving the government's foreign policy and western Ukraine and western Byelorussia were incorporated within the territory of the two neighboring republics of the USSR.[44]

REVISION OF THE CRIMINAL CODE

In the amnesty decree [45] issued three weeks after Stalin's death the Ministry of Justice was ordered within one month to prepare proposals for a revision of the criminal code. The policy of relaxation of severity was established by the decree, presumably to quiet the people, who had been subjected to increasingly severe criminal laws during Stalin's declining years.

A general revision of the code has not yet appeared in the public press. There have been only amendments to individual articles, and only a few of these have represented any relaxation of severity. The first change after Stalin's death increased penalties by establishing the death penalty for murder under aggravating circumstances.[46] While murder for political reasons, for example, assassination of a state official, has long been punished by death as an anti-state act, the criminal code, up to the 1954 decree, had established a maximum penalty of ten years' imprisonment for murder without political motives.

Over the years the courts have occasionally ordered the death penalty when the circumstances of a murder were particularly brutal or sadistic. This was done under the "analogy article" of the criminal code, by finding a brutal murder analogous to banditry, for which the death penalty was prescribed. The new amendment has regularized this practice and has given notice that brutal or sadistic murder will be subjected to the death penalty.

Cases reported since enactment of the amendment indicate that it is being applied as follows: murder by using an iron bar and strangling followed by disposal of the body in a ravine; murder of a war invalid on a train; stabbing of a young girl in the stomach while trying to abduct her at night from a skating rink; murder of a victim during robbery, followed by wounding of a clerk during an attempted holdup; murder of a wife with five knife wounds after protracted persecution; and another murder of a wife.[47]

UN Genocide Convention

The United Nations Genocide Convention was ratified by the USSR on March 18, 1954, subject to the reservation that the USSR would not deem the International Court of Justice to have jurisdiction over a dispute concerning interpretation of the convention unless both parties agreed to such jurisdiction.[48] No amendment of the Soviet criminal code making reference to the implementation of the convention has been adopted, perhaps because a Soviet court could apply articles of the present code, by analogy where necessary, if it desired to punish as a crime acts forbidden by the convention.

The first relaxation of severity of penalties in accordance with the mandate of the amnesty decree occurred only on August 5, 1954. The criminal penalty previously existing for women who committed abortion upon themselves was removed.[49]

Penalties for crop damage

An increase in severity followed on January 11, 1955, when a schedule of fines was established for those who allowed their cattle or birds to damage the newly sown crops of a collective farm, a state farm, or a state or public organization.[50] Higher fines applied to those who drove a wagon or tractor, truck, combine, or other machine over crops. If the offense was committed intentionally and serious damage resulted, the penalty was to range from required work under special assignment but without guard for a period of from six months to a year, with deduction from wages, to imprisonment for a period of from one to two years.

No such precise definition of the crime of crop damage had previously existed, although it had been possible to prescribe penalties ranging up to one year for those who intentionally damaged state or co-operative property.[51] In serious cases of intention to harm

the regime the courts might in the past and may still apply one of the general articles on state crimes to provide long prison terms, but such types of activity seem not to have been contemplated by the new decree. Presumably, the acts which it proposed to punish would previously have gone unpunished when committed without specific intention to cause harm.

Changes toward leniency

The first decree to reflect the attitude of the amnesty appeared only on March 11, 1955.[52] It reversed a policy established on April 9, 1941,[53] punishing unauthorized riding of freight trains. The 1955 decree abolished all criminal responsibility for the offense and created a fine up to one hundred rubles to be levied through administrative channels, presumably by the railway police. Persons serving sentences under the 1941 law were to be released.

The second decree to reflect the attitud of the amnesty appeared on May 13, 1955.[54] It eliminated the existing criminal penalties for sale by managers of state enterprises of goods found by them to be surplus. New regulations to increase authority to sell surplus goods were ordered prepared.

While very few changes toward leniency have appeared in the statutes since Stalin's death, there has been much talk of change. Suggestions for a new criminal code run generally in the direction of the amnesty, namely for a reduction in penalties for nonpolitical offenses, restoration of the suspended sentence, increase in the age of responsibility for juvenile delinquents, and abolition of the analogy article or at least its restriction to unusual circumstances.[55]

REVISION OF COURT JURISDICTION

Decentralization of the "post-audit" jurisdiction of the Supreme Court of the USSR, under which a criminal sentence or civil judgment which has already become final may be reopened for review, has also occurred since Stalin's death. Under decree of August 14, 1954,[56] there were established within the Supreme Courts of the Union and Autonomous Republics, as well as within the provincial courts (which are courts of appeal from the people's courts), new institutions called *presidia*. These new agencies are to have the right to make a "post-audit" of decisions which have become final, to determine whether a new trial should be held because of error or injury to what the court interprets to be state interests.

The new *presidia* or review benches include the president of the court, the deputy presidents, and two rank-and-file members of the court, as named by the presidium of the Supreme Soviet of the republic concerned or by the executive committee of the provincial soviet having jurisdiction over a provincial court. Cases are to be brought to the attention of the *presidia* by the Prosecutor General of the USSR or of the republic concerned or by the President of the Supreme Court of the USSR or of the Supreme Court of the republic concerned or any of their deputies. The provincial courts will be called to action by their presidents or by the provincial prosecutor.

Any decision following such a "post-audit" is subject to further review by the next higher court on protest of the next higher prosecutor or of the president of the next higher court. Rules of procedure for the newly adopted system were published on April 25, 1955.[57]

A "post-audit" procedure of this character had existed prior to the judiciary act of 1938, but at the time there was recognition of the extensive delays possible within a system in which a case might be reopened at several levels, and the "post-audit" procedure was limited to the Supreme Courts of the republics and to the Supreme Court of the USSR.[58] The provincial courts were deprived of their previously existing authority.

The 1954 change restores the pre-1938 system. In doing so it decentralizes the burden of "post-audit," but unless prosecutors and presidents of courts are willing to let the audits by the provincial courts stand, there will be added new delays to the completion of a case. An American student of the subject has already expressed his opinion that the bad results of the past will return.[59]

A second indication of decentralization was offered by a decree of April 30, 1955, placing in the administrator of the Ministry of Justice of a Union Republic attached to a provincial soviet, in those republics which are divided into provinces, the authority to appoint court marshals on the nomination of people's courts. Where there are no provincial divisions within a Union Republic, and in all Autonomous Republics, the authority to appoint rests with the Ministry of Justice of the republic concerned.

The 1938 Judiciary Act had placed the appointing authority for court marshals, even in republics divided into provinces, in the Ministry of Justice and had said nothing of the nominating procedure.[60] Since court marshals come very close to the people by virtue of their duty to enforce civil judgments, collect fines, and see to the execution of sentences, the manner of their nomination is important. The new decree may have been inspired to bring their selection a little closer to the people among whom they perform their functions.

Placing of nominating authority in the people's courts does not, however, signify that the general public has much influence, for the people's judges are still elected on a ballot bearing only one name. Elections were held in most of the republics for people's judges on December 12, 1954, and in the rest a few days later.[61] Those elected in Moscow were 54.1 per cent members or candidates for membership in the Communist party. None of the candidates proposed failed of election. The post-Stalin government seems not yet to have found the time opportune for a trial of multi-candidate elections even at this relatively nonpolitical level, if, indeed, it has ever been thought that a step in the direction of choice between candidates was desirable.

CONCLUSION

Steps taken since Stalin's death suggest that his heirs overestimated the degree of danger to the regime lurking among the rank and file when they issued their first program of reorganization. The state structure has now reverted to the pattern existing before Stalin's death. The criminal laws have been modified only slightly to reduce

severity. Even the limited modification has been offset by a few increases in severity.

The apparent desire to reduce administrative burdens on central headquarters as represented by changes in the structure of ministries has extended in limited degree to the court structure. While this measure of decentralization might suggest that the general public had acquired the opportunity to exert more direct influence on the conduct of affairs than it had enjoyed previously, the preservation of the one-candidate system of elections and of limitations on the matters subject to review permits the conclusion that there has been very little lessening of centralization in the interest of public participation in the making of decisions.

Weisberg of Cases and Readings on Soviet Law (1950), editor of a collection of translations entitled Soviet Legal Philosophy (1951), and managing editor of the American Slavic and East European Review.

The Communist Party Since Stalin

By MERLE FAINSOD

TO understand the role of the Communist party in post-Stalinist Russia it is essential to recall the transformations which it underwent during the Stalinist era. From a party with a mere 350,000 members and 122,000 candidates on January 1, 1924, just prior to Lenin's death, it expanded to more than six million members and 868,000 candidates on the eve of the Nineteenth Party Congress in October 1952. From a party which prided itself on the preference which it accorded candidates of proletarian origin and occupation, it increasingly based its recruitment policies on the assimilation of the new managerial, administrative, and technical intelligentsia into leading party posts. From a party whose Congresses still debated fundamental issues of statecraft under Lenin, it became a disciplined body of functionaries swearing unswerving allegiance to Stalin and treating his every command as Holy Writ. The apparatus dominated the party, and Stalin dominated the apparatus.

STALIN'S SYSTEM OF RULE

Under Stalin the Secretariat of the Central Committee of the party served as the primary instrument of rule. Through it Stalin controlled all important appointments in the party, the police, the armed forces, and the administration. A network of party and police controls pervaded Soviet society, but command of this interpenetrating network converged ultimately in Stalin's hands. Stalin parceled out responsibilities among his colleagues in the Politburo, but he reserved his ultimate authority by permitting no concentration of effective power short of himself. During the Stalinist era the police greatly expanded its jurisdiction and multiplied in numbers, but Stalin jealously guarded its loyalty, and it remained a creature of his will. The armed forces, too, bulked larger on the Soviet scene, but through a highly elaborate system of party and police penetration, safeguards were provided to hold Bonapartist aspirations in check. The complex task of managing a society in process of rapid industrialization enforced increased dependence on the technically trained, but at the same time Stalin also sought to ensure that the new technocracy would be suffused with a party outlook and hedged in by party controls. Behind the totalitarian façade new social forces struggled for recognition, but as long as Stalin was alive, they remained in uneasy equilibrium, held in the pattern of Stalin's system of rule.

The death of Stalin left the institutional machinery of party controls intact, but the question remained whether it could continue to function effectively in the absence of its prime mover. Would Beria and the police be content to play a subordinate role with their master gone, or would they strike out to assert supremacy over the party functionaries? Would the officer corps seek to liberate itself from party and police controls and claim a dominant position in state councils? Would the aspirations of the new managerial élite to greater autonomy and recognition contribute to a weakening of party leadership and a shift toward greater power for the bureaucracy? The issue of the succession involved more than personalities; at stake was the fate of the en-

tire structure of authority and influence which Stalin had fathered and successfully manipulated.

Even before Stalin's demise, there were some indications that he was concerned over the problem of the succession and that he was prepared to take at least a few tentative steps to strengthen the position of Malenkov and the party apparatus in the race for power. The choice of Malenkov to deliver the political report of the Central Committee at the Nineteenth Party Congress in the fall of 1952 and the relegation of Molotov and Beria to subsidiary roles in the Congress deliberations provided one index of Stalin's design. The reorganization of the party high command after the Congress also appeared to reinforce the position of Malenkov and the party officials. Of the fifteen new personalities admitted to full membership in the Presidium, successor to the Politburo, ten were party functionaries, four were state administrators, and one, S. D. Ignatiev, was a party functionary whose appointment as Minister of State Security could be interpreted as an effort to tighten party control of the political police. The weight of numbers was clearly on the side of the party apparatus. Aside from S. D. Ignatiev, there was a striking absence of top military and police officials among the newly promoted members of the Presidium. Its composition suggested that Stalin was determined to subordinate both the armed forces and the police to the top party command.

The events of the post-Congress period pointed toward a further effort to undermine the position of the political police. The announcement on January 13, 1953, of the arrest of the Kremlin doctors, who were alleged to have cut short the lives of Zhdanov and Shcherbakov and to have sought to destroy the health of leading Soviet military personnel, was accompanied by a statement that "the agencies of state security did not discover the doctors' wrecking, terrorist organization in time."[1] This rebuke was followed by a reminder that the security agencies should have been "particularly vigilant" in view of the earlier "doctors' plot" during the Great Purge, a plot in which Yagoda, the head of the NKVD (People's Commissariat for Internal Affairs), was alleged to have been involved and for which he was executed. The grim overtones of this reference seemed to augur poorly for Beria's future.

Death of Stalin and Reorganization of the Party Command

The sudden death of Stalin on March 5, 1953, precipitated a reorganization of the top structure of party and governmental authority. It would be fascinating to be able to record the maneuvers and negotiations which attended the disposition of party and governmental offices, but that knowledge is denied to us. Two facts soon became apparent: first, that no one of Stalin's colleagues was in a position to assume the position of undisputed leadership which Stalin commanded and, second, that all of them were at least temporarily agreed on the necessity of presenting a united front to the nation and to the world. Within twenty-four hours after the release of the news of Stalin's death, a whole series of arrangements and appointments was announced as a "decision" of a joint meeting of the party Central Committee, the USSR Council of Ministers, and the Presidium of the USSR Supreme Soviet. The party Presidium was reduced in size to ten members and four alternates. Malenkov became Chairman of the Council of Ministers. Beria was named Minister of Internal Affairs, Molotov, Minister of Foreign Affairs, Bulganin, Minister of Defense,

[1] *Pravda*, January 13, 1953.

and the last three, together with Kaganovich, became First Deputy Ministers of the Council of Ministers. Voroshilov was designated Chairman of the Presidium of the Supreme Soviet, while Mikoyan became Minister of Internal and External Trade as well as a Deputy Minister of the Council of Ministers. Khrushchev received no official governmental post, but retained his position as Secretary of the Central Committee while yielding his duties as head of the Moscow party organization to N. A. Mikhailov. The two remaining full members of the Presidium were successful economic administrators—M. Z. Saburov, who was designated Minister of Machine Building, and M. G. Pervukhin, who became Minister of Electric Power Stations and of the Electrical Industry. Named as alternates were N. M. Shvernik, who returned to head the Soviet trade-union apparatus which he had led from 1930 to 1946, P. K. Ponomarenko, the new Minister of Culture, L. G. Mel'nikov, the First Secretary of the Ukrainian party organization, and M. D. Bagirov, the First Secretary of the Azerbaidjan party organization.

During the first week of the new regime there were indications that Malenkov was seeking to consolidate his position as *primus inter pares*. He remained senior party Secretary as well as Chairman of the Council of Ministers. *Pravda* gave him special prominence. He was pictured addressing the Nineteenth Party Congress with Stalin looking on benevolently in the background. He was moved to the center of the stage with Stalin and Mao in a doctored photograph from which all other Presidium figures were excluded. But these none-too-subtle efforts to suggest that Malenkov was the heir apparent soon ceased, and on March 21, 1953, *Pravda* carried an announcement that a plenary session of the party Central Committee had voted on March 14 "to grant the request . . . of Malenkov to be released from the duties of Secretary of the party Central Committee."[2] Meanwhile, there was a renewed emphasis on collegial leadership in which the triumvirate of Malenkov, Beria, and Molotov were featured as the leading figures of the new regime. The maneuvers of the early days suggested a determined and successful effort to circumscribe Malenkov's powers and to prevent him from donning Stalin's mantle.

The Beria Affair

If later official pronouncements are to be taken at face value, the next stage in the struggle for the succession involved a strenuous effort by Beria to expand his authority. On April 3, 1953, Beria's MVD (Ministry of Internal Affairs) announced that the Kremlin "doctors' plot" had been a hoax, that M. D. Riumin, the former Deputy Minister of State Security in charge of the investigation, had been arrested for fabricating evidence and that S. D. Ignatiev, the former Minister of State Security, had "displayed political blindness and carelessness."[3] On April 7 *Pravda* revealed that Ignatiev had been "released" from his duties as Secretary of the party Central Committee. In mid-April came the dramatic announcement of a thoroughgoing purge of the Georgian party and governmental organization and the reinstatement of a number of Beria's henchmen who had been the victims of an earlier purge of the Georgian party. Beria's hand in the purge was frankly acknowledged in a speech to the Georgian Supreme Soviet by V. M. Bakhradze, the new Chairman of the Georgian Council of Ministers.[4] In this case, as in the Kremlin doctors' plot,

[2] March 21, 1953.
[3] *Pravda*, April 3, 1953.
[4] *Zaria Vostoka*, April 16, 1953.

the reinstated officials were declared to have been the victims of "a provocational 'case,' falsified from beginning to end, concerning a nonexistent nationalism. . . ." [5]

The evidence at hand makes it impossible to plot Beria's machinations in detail, if indeed there were such machinations. Nor do we know whether the countermeasures which his enemies were able to invoke represented a response to imminent peril or were prophylactic in character. In any case on July 10, 1953, the Soviet press announced that Beria had been removed from his governmental and party posts and expelled from the party as an enemy of the people. According to *Pravda*, "Beria's evil scheming to seize power began with trying to set the Ministry of Internal Affairs above the party and government and to employ the agencies of the MVD, both in the center and locally, against the party and its leadership, against the government of the USSR. . . ." [6] Beria was also accused of undermining the collective farms and creating "difficulties in the country's food supply," of seeking "to sow friction among the peoples of the USSR and to activize bourgeois national elements in the Union Republics," of "illegality and highhandedness," and of having long been "an agent of international imperialism" who sought to destroy the Communist party and restore capitalism.

In this curious mélange of accusations the one which carried conviction was that Beria had sought to utilize his base in the MVD to strike out for a position of leadership. The arrest of Beria was followed by a purge of his supporters in Georgia and by the removal of his old associate, M. D. Bagirov, from the posts of Chairman of the Azerbaidjan Republic Council of Ministers and party First Secretary.[7] Party organizations were instructed to tighten control over the MVD at all levels, and the elimination of Beria's entourage in the MVD extended down to the regional and district organizations.

Execution of Beria, Riumin, and Abakumov

The final chapter of the Beria story unfolded on December 24, 1953, when the Soviet press announced that Beria and six associates had been executed by a firing squad after a secret trial.[8] Two grim postscripts remained to be added. In July 1954 the news was released that Riumin, the responsible investigator in the original doctors' plot, had been shot, an action which may well have been inspired by the desire to remove an inconvenient witness who also offered an obvious scapegoat to symbolize the new regime's repudiation of past MVD brutality.[9] On December 24, 1954, came the announcement that V. S. Abakumov, former Minister of State Security, had been tried and executed for carrying out "enemy assignments for Beria against the Communist party and the Soviet government." [10] At the same time three of his associates in the ministry were shot while two others were sentenced to long terms of imprisonment in corrective labor camps. The indictment charged Abakumov and his associates with fabricating the so-called "Leningrad case," in which "many party and state officials were arrested without grounds and falsely accused of very grave state crimes." The Abakumov affair, timed exactly a year after the shooting of Beria, served as a reminder that the road to supreme power in the Soviet system lay elsewhere than through exclusive reliance on control of the police apparatus.

Malenkov's renewed prestige

The liquidation of Beria eliminated one of the chief contenders for supremacy, but it left a field of battle in which other contestants could still maneuver while proclaiming their continued loyalty to the principle of collective leadership. In the aftermath of the Beria purge Malenkov seemed to emerge with renewed prestige. The Soviet press reported that it was Malenkov who spoke for the Presidium at the plenary session of the Central Committee at which Beria was condemned.[11] It was Malenkov again who claimed the spotlight at the August 1953 session of the Supreme Soviet with a wide-ranging speech which covered the gamut of domestic and foreign affairs. But the events of the next months were to show that Malenkov's title to leadership had a fatal flaw. The fateful Central Committee decision of March 14, 1953, which had compelled him to abandon his party secretaryship, contained the seeds of his undoing. In the first struggle for the succession after Lenin's incapacitating illness, Stalin had demonstrated that control of the party apparatus was crucial to victory. It was certainly a lesson of which Malenkov was well aware. One can only surmise that he yielded the position reluctantly in the face of a superior combination of power and that he hoped perhaps to preserve his influence in the apparatus at one remove through the many patronage connections which bound its leading figures to him.

[11] *Pravda*, July 10, 1953.

RISE OF KHRUSHCHEV AND DEMOTION OF MALENKOV

The departure of Malenkov from the Secretariat left Khrushchev as the senior party Secretary. During the first six months after Stalin's death, Khrushchev remained in the shade. His activities in the Secretariat during this period are not a matter of record. Whatever they may have been, it can be surmised that they were calculated not to alarm his colleagues in the Presidium and not to lead them to fear an enlargement of his jurisdiction. Beginning in September 1953 his star began to rise publicly. On September 13 *Pravda* revealed that Khrushchev had been elected First Secretary of the party Central Committee. His September 3 report to the Central Committee on agricultural policy was widely reprinted and inaugurated a sweeping series of agricultural reform measures. Changes in the party apparatus became the order of the day. The reconstruction of the Georgian party organization and the purge of Bagirov in Azerbaidjan, which occurred in the wake of the Beria affair, were followed by the firing of G. A. Arutiunov as First Secretary of the Armenian party. On November 28, 1953, V. M. Andrianov, party chief in Leningrad, was removed at a meeting presided over by Khrushchev.[12] Mikhailov gave way to Kapitanov as First Secretary of the Moscow organization. Similar changes took place in Kazakhstan, Kirgizia, Tula, Smolensk, and many other re-

[12] *Pravda*, November 29, 1953.

gions and districts. The purge of party secretaries was open to the interpretation that Khrushchev was installing his own supporters in key positions and that a new and formidable party machine was in the making.

Signs of Khrushchev's increasing prominence mounted rapidly as the year 1954 wore on. His report of February 23, 1954, at the plenary session of the party Central Committee,[13] which unveiled a grandiose program to solve the problem of Soviet grain supply by opening up vast tracts of new land, could be construed as an implied rebuke to Malenkov, who had stated at the Nineteenth Party Congress that "the grain problem . . . has been solved, solved definitely and finally."[14] At the April session of the Supreme Soviet it was no longer Malenkov who dominated the proceedings. Both Khrushchev and Malenkov spoke on the same day, but it was Khrushchev who addressed the Council of the Union while Malenkov, the Chairman of the Council of Ministers, directed his remarks to the Council of Nationalities.[15]

By the spring of 1954 it was also clear that Khrushchev was expanding his contacts with the satellite parties. He led the Soviet delegation which attended the Second Congress of the Polish United Workers party at Warsaw in March. In June he appeared at the Tenth Congress of the Czechoslovak Communist party and delivered a fiery speech boasting of Soviet leadership in developing the hydrogen bomb.

On September 29 *Pravda* announced the departure of a Soviet delegation to participate in the celebration of the establishment of the Communist regime in China and to negotiate a new agreement with its leaders. Again it was Khrushchev who headed the delegation, and it was perhaps not without significance that Khrushchev was accompanied by Bulganin, while both Malenkov and Molotov were left at home. The return journey was replete with stops along the way and meetings with republic and regional party leaders at which, it may be presumed, fences were mended and relations cemented.

Personal leadership?

By the early winter of 1954, the publicity accorded Khrushchev in the Soviet press began to suggest an image of personal leadership, in striking contrast with the theory of collective rule which continued to be sedulously professed. The Central Committee decree of November 10, 1954, on "Errors in Conducting Scientific-Atheist Propaganda Among the Public," was signed by Khrushchev personally.[16] His September interview on agricultural policy with the British scientist Bernal was published in full in *Pravda* and *Izvestiia* on December 24, 1954. His speech to construction workers on building and agriculture received similar treatment on December 28. The complete text of his Moscow speech to the young settlers who were setting off to the new lands was reported on January 8, 1955. Perhaps not altogether coincidentally, the build-up of Khrushchev was accompanied by a resurrection of tributes to Stalin. His birthday, which was allowed to pass virtually unnoticed in 1953, became the occasion for leading articles in the press on December 21, 1954. Although the lavish adulation which had characterized Stalin worship at its height was decidedly tempered, and the restoration of Stalin to the Pantheon of top Communist heroes was accompanied by a reassertion of "the Leninist principle of collective leadership," there were many who were not apt to forget that the cult of Stalinism itself began with a glorification of Lenin and the principle of collective leadership which he theoretically espoused.

[16] *Pravda*, November 11, 1954.

Heavy industry vs. consumers' goods

While Khrushchev was increasingly articulate and vocal, Malenkov was strangely silent. Rumors of differences of view between them circulated freely, but if differences existed they were not readily documented. In the Soviet system conflicts of policy rarely rise to full visibility until the issue has been resolved, but a curious pair of editorials in *Pravda* and *Izvestiia* on December 21, 1954, suggested a difference of outlook within the leadership group on the priority to be accorded the consumers' goods campaign as against renewed emphasis on heavy industry. The differences were differences of shading, but the shading was unmistakable. *Izvestiia*, the presumed organ of the government, emphasized the increased production of consumers' goods; *Pravda*, the party organ, called "on the Soviet people to direct their main attention to fulfilling plans for the further growth of heavy industry." Khrushchev's speech to the plenary session of the Central Committee on January 25, 1955, gave even sharper expression to these differences. "In connection with the measures lately taken for increasing output of consumers' goods," said Khrushchev, "some comrades have confused the question of the pace of development of heavy and light industry in our country. . . . These pseudo theoreticians try to claim that at some stage of socialist construction the development of heavy industry ceases to be the main task and that light industry can and should overtake all other branches of industry. This is profoundly incorrect reasoning, alien to the spirit of Marxism-Leninism—nothing but slander of our party. This is a belching of the rightist deviation, a regurgitation of views hostile to Leninism, views which Rykov, Bukharin, and their ilk once preached."[17]

At no point was Malenkov publicly charged with holding these views, but at least one sentence in his letter of resignation from the chairmanship of the Council of Ministers on February 8, 1955, carried overtones of recantation. After acknowledging his administrative "inexperience" and his past "guilt and responsibility for the unsatisfactory state of affairs in agriculture," Malenkov paid tribute to the new agricultural reforms sponsored by the party, which, he declared, were "based upon the only correct foundation—the further all-round development of heavy industry—and only the realization of this program will provide the necessary conditions for a real increase in the production of all necessary consumer goods."[18] To the initiated, this devious Aesopian language suggested a capitulation which closed the debate.

Retention of Malenkov

Despite expectations abroad that Malenkov would follow Beria to the grave, the treatment of Malenkov followed a very different course from that of Beria. He was made the scapegoat for agricultural failures, but there was no suggestion of treason or espionage. Although demoted to the position of Minister of Power Stations and Deputy Chairman of the Council of Ministers, he remained a member of the party Presidium. His survival seemed to indicate that, unlike Beria, he posed no real threat to his colleagues in the Presidium. His retention, moreover, served the useful function of signifying to the outside world that the leadership, in Malenkov's words, remained "monolithic in its unity and singleness of purpose."

[17] *Pravda*, February 3, 1955.
[18] *Pravda*, February 9, 1955.

Reconstruction of top leadership

The demotion of Malenkov opened the way to a reconstruction of the top leadership. Bulganin replaced Malenkov as Chairman of the Council of Ministers and at the same time yielded his post as Minister of Defense to Marshal Zhukov.[19] Khrushchev seemed to emerge from the affair with greatly heightened prestige. He led the delegation of high governmental and party dignitaries at the session of the Supreme Soviet at which Malenkov's resignation was announced, and he moved the nomination of Bulganin as Malenkov's replacement. The ovation which he was accorded by the deputies suggested an awareness of his leading role which at least raised the question as to whether the principle of collective leadership was as "unquestionably inviolate" as Bulganin was later to affirm.[20] In their respective interviews with the American journalists W. R. Hearst, Kingsbury Smith, and F. Connif, Khrushchev spoke with a degree of freedom that was missing from Bulganin's more cautious remarks.[21] On the visit to Yugoslavia it was Khrushchev who took the lead, and on the return trip through Sofia and Bucharest it was Khrushchev again who spoke for the Soviet delegation and was invariably listed first. Whether Khrushchev was more than first among equals was still not clear. Shrewd diplomatic observers who had occasion to meet members of the Presidium and watch them in action were persuaded that junta rule continued to prevail. The powers vested in the office of First Secretary pointed toward a consolidation of Khrushchev's influence, but what forces operated below the surface only those privy to the secrets of the party Presidium could tell.

[19] *Ibid.*

[21] *Ibid.*

RECONSTRUCTION OF PRESIDIUM AND SECRETARIAT

By mid-summer of 1955 the party Presidium consisted of eleven full members. Khrushchev, as First Secretary of the Central Committee, and Bulganin, as Chairman of the Council of Ministers, occupied the most prominent posts. Another group of five, Molotov, Kaganovich, Mikoyan, Saburov, and Pervukhin, served as First Deputy Chairmen of the Council of Ministers. Voroshilov, the eldest member of the group, discharged the protocol functions of head of state. Malenkov was consigned to an inferior status as a mere Deputy Chairman, a position which put him on a par with seven other ministers outside the Presidium circle. At the July 1955 session of the Central Committee two new Presidium members were elected, A. I. Kirichenko, First Secretary of the Ukrainian party, and M. A. Suslov, one of the Central Committee Secretaries.[22]

A comparison of the present Presidium with the Stalinist Politburo provides interesting material for reflection. Of the eleven members of the Presidium in mid-1955, seven were carry-overs from the Politburo under Stalin. Within this group of veterans some marked shifts in status were evident. Khrushchev and Bulganin, who had been somewhat secondary figures in Stalin's entourage, had now clearly moved into senior positions. Malenkov had obviously suffered a serious setback. The position of the others—Molotov, Kaganovich, Mikoyan, and Voroshilov—was more enigmatic. In terms of Politburo seniority, they were the elders of the Presidium. Whether they exercised corresponding influence was less clear. Saburov and Pervukhin, the two new

[22] *Pravda,* July 13, 1955.

members admitted in the reconstruction of the Presidium after Stalin's death, represented the new generation of engineer-administrators. Their inclusion in the inner circle presumably reflected a need to broaden the knowledge and experience of the ruling group in order to cope with the burdensome administrative responsibilities which rapid industrialization imposed. The addition of Kirichenko and Suslov to the Presidium marked a reversion to a more familiar type. Both were experienced party functionaries whose career lines represented advancement on the party ladder.

The exclusions from the Presidium were perhaps even more significant than the inclusions. With the elimination of Beria, the police were deprived of direct representation in the ruling group. Kruglov, who succeeded Beria as head of the MVD, and Colonel General Serov, who was placed in charge of the newly organized Committee on State Security in the spring of 1954, were police functionaries rather than party leaders of the first rank. The new rulers appeared determined to keep the police in a subordinate position. Despite the apparent marked increase in the prestige of the armed forces and the designation of Marshal Zhukov as Minister of Defense, no new military figures were co-opted into the Presidium. Party supremacy remained the watchword, and the composition of the inner circle reflected the traditional subordination of the military professionals to the party leadership.

Central Committee Secretariat

The reconstruction of the party Presidium was also accompanied by changes in the Central Committee Secretariat. In the reshuffle of responsibilities after Stalin's death the number of party Secretaries was reduced from ten to five. Khrushchev as senior Secretary was assisted by M. A. Suslov, one-time head of the Propaganda and Agitation Department of the Central Committee and a former *Pravda* editor, P. N. Pospelov, also a former *Pravda* editor and head of the Marx-Engels-Lenin Institute, N. N. Shatalin, earlier a member of the Orgburo and a high party functionary in the Cadres Section of the Central Committee Secretariat, and S. D. Ignatiev, former Minister of State Security. Ignatiev's career as party Secretary was short-lived; on April 7, 1953, *Pravda* announced his removal for his alleged role in concocting a false case against the Kremlin doctors accused of plotting the death of Soviet leaders.[23] After the Supreme Soviet session at which Malenkov was demoted, Shatalin's name ceased to appear in the list of top party dignitaries occasionally mentioned in the Soviet press. Whether he has also been deprived of his position of party Secretary was not disclosed.

At the July 1955 session of the Central Committee, three new Secretaries were elected. They were D. T. Shepilov, editor of *Pravda,* A. B. Aristov, the party chief of Khabarovsk Province, and N. I. Beliaev, the veteran First Secretary of the Altai Province.[24] Shepilov accompanied Khrushchev on his trips to China and Yugoslavia and has been closely associated with him during the last year. The elevation of Aristov and Beliaev to Central Committee secretaryships brings to the Kremlin two men who possess an intimate knowledge of the problems of Soviet Asia, and who possibly also owe their promotion to the center to Khrushchev. The effect of the recent reconstruction of the Secretariat may well be to strengthen Khrushchev's control of this important fortress of power.

Aside from personnel shifts, there were

[23] Ignatiev subsequently reappeared as First Secretary of the Bashkir party organization; see *Pravda,* February 26, 1954.

[24] *Pravda,* July 13, 1955.

no announcements of major changes in the structure of the Central Committee Secretariat. The most important reform revealed by Khrushchev in his speech of January 25, 1955, provided for the creation in the Secretariat of a separate Section of Party Organs for the RSFSR (Russian Soviet Federal Socialist Republic) as well as an Agricultural Section.[25] The devolution of co-ordinating functions in these areas to the newly established Russian Sections pointed toward a possible congestion of decision making at the center; whether it also foreshadowed the emergence of a separate central party apparatus for the RSFSR remained to be revealed.

REORGANIZATION OF THE RURAL PARTY STRUCTURE

By far the most significant changes in party organization took place in rural areas, as an accompaniment of the ambitious series of agricultural reforms initiated in the fall of 1953. The new program involved a drastic reorganization of the district party apparatus, which was designed to bring party leadership closer to the grass roots and to make party control more effective.[26] Under Stalin the bulk of the rural party functionaries had tended to be concentrated in the *raion*, or district, centers; from these points they had supervised the collective farms, state farms, and MTS (machine-tractor stations) in their districts. Each MTS had an assistant director for political affairs, and most, but not all, collective and state farms had party organizations. Under the Khrushchev program the fulcrum of intensive control was shifted to the MTS. The post of assistant director for political affairs was abolished. Instead each *raion* was divided into zones—one for each MTS in the *raion*—and a district party secretary was assigned to each zone with headquarters at the MTS. A staff of full-time party instructors was placed at his disposal, with each instructor responsible for one or at most two collective farms.

The party apparatus at the *raion* centers was also reorganized. The Departments of Party, Trade Union, and Komsomol organs were replaced by Organization Departments which were entrusted with the tasks of regulating party membership and admissions, choosing personnel, and supervising the work of primary party organizations in the district. The post of third secretary was abolished, and the second secretary of the *raion* was made responsible for the work of the new Organization Department as well as for the Department of Propaganda and Agitation.

At the same time thousands of Communists were mobilized from the cities to strengthen the rural party apparatus. Prior to the reorganization, the agricultural sections of the district committee employed around eleven thousand full-time party workers.[27] By May 1955 more than thirty thousand party functionaries had been assigned to the instructor groups attached to the MTS.[28] This was presumably in addition to the 3,747 full-time party secretaries in the larger collective farms which had been authorized by the party Central Committee up to the fall of 1953.[29]

At the same time the party asserted a more centralized control over the selection of collective farm executive personnel. The fiction of election by the collective farmers themselves was virtually abandoned. The Central Committee decree on "Virgin and Idle Lands" of March 2, 1954, provided that collective farm chairmanships be included

"among those offices to which appointments are subject to confirmation by oblast and krai committees *and* Union Republic Party Central Committees" and that "the posts of vice-chairman, brigade leader, and livestock section manager . . . be subject to confirmation of district party committees." [30]

Collective farm leaders

This decree was followed by a decision to mobilize urban "volunteers" for work as collective farm leaders. In the words of *Pravda*, "The party Central Committee and the USSR Council of Ministers have decided to select 30,000 experienced officials of party and Soviet organizations, enterprises, research institutes, and establishments who are capable of guaranteeing the guidance of collective farms and to recommend them for the posts of chairmen of collective farms, primarily of backward farms." [31] Although *Pravda* warned party leaders that "castoffs" from enterprises would not be tolerated, by the late spring of 1955 it was evident that at least some of the "volunteers" belonged to that category.[32]

In some respects at least the recruitment of urban cadres to lead the new agricultural program was reminiscent of the mobilization of "advanced workers" which had played a prominent part in the first phase of the collectivization program, in 1929–34. The Soviet press reported that more than 120,000 agronomists and zootechnicians had been shifted from office assignments to the MTS. In the year and a half following the September 1953 agricultural decrees, some 16,000 Communists and 200,000 Komsomols were sent to work in animal husbandry.[33] In 1954 more than 100,000 young men and women were recruited to develop the virgin lands. For 1955 another 112,000 were being called upon to enlist for similar service.[34] But there were also indications that the enthusiasm of the crusade had a somewhat synthetic flavor. The Soviet press of the period contained numerous references to party members who attempted to wriggle out of rural assignments, and even Khrushchev was forced to remind an audience of Moscow "volunteers" that ". . . we are sending you off with honor, but we will take you back without pleasure. . . . Yes, and without honor!" [35]

[33] *Partiinaia Zhizn'*, No. 9 (May 1955), p. 17.

PARTY MEMBERSHIP

The dependence of the party leadership on its urban contingents reflected the relative weakness of the party in rural areas. In his speech to the February 1954 session of the Central Committee, Khrushchev disclosed that only 16,620 collective farmers had been taken into the party in 1953. Three-quarters of the primary party units on collective farms and 585 rural district committees failed to admit a single collective farmer into the party during all of 1953. His report revealed the breakdown of rural party membership given in the accompanying table: [36]

PARTY MEMBERS AND CANDIDATES IN RURAL DISTRICTS

Location	Percentage of Rural Membership	Numbers
In institutions belonging to district organizations	30.0	900,000
In industrial enterprises	20.0	600,000
In collective farms	31.0	930,000
In MTS	8.0	240,000
On state farms	4.3	129,000
Other	6.7	201,000
Total	100	3,000,000

[34] *Pravda*, February 25, 1955.
[35] *Ibid.*, January 8, 1955.
[36] *Pravda*, March 21, 1954.

Although these figures indicate a substantial increase in collective farm party membership as compared with the prewar period, they also make clear that the average collective farm in 1953 had approximately twelve party members and candidates, a total which is largely accounted for by the executive personnel of the farm. In Khrushchev's words, "Many district committees take absolutely no interest in admitting collective farmers into the party. Of course, in recent years the party has pursued a policy of restricting admissions, but this does not mean that admitting the foremost collective farmers into the party must be discontinued altogether." [37] It is also worth noting that the rural membership of the Komsomol remained low. Out of a total Komsomol membership of 18,825,327 on March 1, 1954, only two million were in collective farms, 297,000 in MTS, and 200,000 in state farms.[38]

Since the announcement at the Nineteenth Party Congress that the party on October 1, 1952, had 6,013,259 members and 868,846 candidates, no comparably precise figures have been released. From occasional general references in the Soviet press it would appear that the over-all party membership is presently stabilized around the seven-million level, but more precise breakdowns will probably not become available until the convocation of the Twentieth Congress of the party in February 1956. The emphasis of the party is still on the recruitment of "leading" personnel; as a governing party it seeks to ensure its control of all the important power positions in Soviet society. As might be expected, the armed forces remain one of the most sensitive areas and receive special attention in the party's recruitment drives. As Molotov put it in his speech to the Supreme Soviet on February 8, 1955, ". . . seventy-seven out of every hundred men in our army are Communists or members of the Young Communist League. Both Communists and members of the Young Communist League know particularly well how to defend the gains of Communism against the aggressors." [39]

[37] *Ibid.*

[38] *Komsomol'skaia Pravda*, March 20, 1954.

Party Trends Since Stalin's Death

While it is too soon to venture any definitive appraisal of party developments since the death of Stalin, some tentative observations may be hazarded. Up to this point, at least, Stalin's lieutenants have managed a remarkably smooth transition. The struggle for the succession has been contained within the inner circle; the elimination of Beria and the demotion of Malenkov have been achieved with no society-wide repercussions. Despite many visible signs of Khrushchev's rising status and the perspectives which the first secretaryship opens up to him, there is as yet no hard evidence to indicate that he has attained a position of indisputable primacy, and the reiterated references to collective leadership point toward a situation in which power continues to be shared in greater or lesser degree. In the absence of direct testimony, it is impossible to do more than speculate on the equilibrium of forces which operates within the Soviet high command; the historic experience of Stalinism does, however, suggest that control of the party apparatus is likely to play a key role in any struggle for supremacy which ensues. Although efforts to bring the armed forces or the police into action in such a struggle can never be altogether excluded, the lessons of Soviet history would also seem to indicate that such efforts are rarely made, or, if made, are unlikely to be successful. A Bonapartist coup d'état requires a degree of conspiratorial secrecy and *esprit de corps* in officer ranks which the whole pattern of party and police controls in the armed forces is calculated to discourage. As long as party discipline remains paramount, the purely military dictator is unlikely to make his appearance on the Soviet scene.

[39] *Pravda*, February 9, 1955.

The supremacy of the party continues to be the alpha and omega of Soviet rule. The reassertion of party leadership in the MVD after the arrest of Beria made this explicit. All efforts to weaken party controls in any sector of Soviet life have been sternly rebuffed. The recent rebuke administered to party officials in the Ministry of Construction who violated the party decree prohibiting the acceptance of payments or bonuses from economic organizations furnished a striking example.[40] *Pravda* seized the occasion to re-emphasize the independence of the party hierarchy and to indicate that party officials who allowed themselves to become "tools in the hands of administrative organizations" would be severely disciplined. The call for *partiinost'*, or devotion to party interests, at the Second Writers' Congress symbolized the same drive. In this respect, at least, Stalin's heirs tenants have remained true to their Stalinist origins.

Personalized leadership

In other respects their style in leadership marks a decisive break with that of their predecessor. In the period since Stalin's death the new party leaders have traveled the country, visited collective farms and factories, participated in meetings of primary party units, made numerous appearances at foreign embassies, and sought to establish a direct contact with their problems and their constituents which contrasts notably with the remoteness of Stalin. Khruschev in particular has been volubly articulate, airing difficulties with apparent frankness, putting in public appearances in every part of the Soviet Union, and conducting a tireless one-man agitational campaign on behalf of the new agricultural program without recent parallel in Soviet history. Whatever the motives which have inspired this activity, the result has been to project an image of personalized and humanized leadership which suggests a sharp change from the past.

[40] See *Partiinaia Zhizn'*, No. 3 (May 1954), pp. 47–50.

Policy

In the realm of policy the record has been more ambiguous. Such measures of the first post-Stalinist year as the amnesty decree, the price cuts, the halving of the state loan, the consumer goods campaign, the improved agricultural incentives, and the easing of restraints on intellectual creativity seemed to imply a repudiation of the Stalinist legacy. They could be explained by the desire of the new leaders to court popularity and entrench themselves in power, but at a deeper level they expressed the grievances and strains of the Stalinist epoch with which his successors had to reckon. The decision to seek a *détente* in both domestic and foreign policy was an obvious response to the problems which the new regime inherited. But the choices open to the leadership also involved risks and dangers. Any really large-scale expansion of the output of consumers' goods meant a probable cutback in military expenditures and a slowing up in the rate of growth of heavy industry. Faced with this choice, the party leaders reasserted the priority of heavy industry. But having selected the Stalinist path, they raised the specter of old dilemmas and new sacrifices; it remained to be seen whether they could transcend the difficulties which their decision imposed on them.

Each generation of leadership has its

own commitments and its own choices to make. The commitments which the new leaders inherit from the past include a vested interest in a system of party leadership which will preserve their own power, a determination to make the Soviet fortress militarily and economically impregnable, and a belief in the ultimate triumph of world communism. But the new ruling group also has its own world to build, and it must build with the material which time and history place at its disposal. It must determine whether it can stabilize its relations with the outside world and steer a course which will avoid atomic obliteration. It must decide whether it dare come to terms with the aspirations of its own people for peace, security, freedom, and a better life. What the future choices of the new rulers will be no man can know. But no one who has studied the party in which they have been schooled will lightly assume that the convictions instilled by a lifetime of conditioning are easily discarded.

Recent Trends in the Soviet Economy*

By JOSEPH A. KERSHAW

IT is now a decade since World War II came to a conclusion. That conflict inflicted great punishment on the Soviet economy. The valuable industrial and agricultural areas of the west and southwest were laid waste once by the Soviet armies retreating eastward, and again by the German armies retreating westward. This destruction, coupled with the intensive use of capital during the war and the failure to replace a good deal of it, could not help weakening the economy seriously.

It is true that by the end of the war reconstruction had already begun in a serious way. Nonetheless, the economy in 1945 was considerably smaller by almost any measure than it had been five years earlier. Casualties had been high, the people were tired, farms were depleted of their best manpower, and the nonagricultural labor force had been reduced by the operation of the draft. With the possible exception of Germany and Poland, the Soviet economy enjoyed the dubious distinction of having suffered more than any other as a result of the war.

The details of economic development following the conclusion of the war are not well known to Western scholars. The broad outlines, however, are unmistakable, and there is rather general agreement that the recovery has been little short of remarkable. The Soviet economy is now the world's second mightiest, and the scars of the war that ended just one short decade ago have all but disappeared.

The main purpose of this paper is to examine some recent trends in the Soviet economy, especially from the viewpoint of their influence on Soviet rates of growth. To do this, we shall have to look at the growth rates in effect before Stalin's death in order to evaluate the influence of the post-Stalin changes. We shall also want to speculate on future developments in the economy with particular emphasis on the probabilities that rates of growth in the future will or will not vary significantly from those that have characterized the past.

DIMENSIONS OF SOVIET GROWTH

While there is general agreement that Soviet growth since the end of the war has been rapid, there is some disagreement as to just how rapid it has been. This disagreement stems in part from the fact that there are serious conceptual difficulties in describing the growth of an economy; in the case of the Soviet Union there is the added difficulty that the Soviet authorities have restricted the amount of data made available to Western and, perhaps, Soviet scholars. The Iron Curtain has not been able to impose a blackout, since a centrally directed economy requires the existence of considerable amounts of data for the implementation of its own instructions; many of these data cannot be kept from the eyes of the West, but quantitatively and qualitatively the statistical dim-out has been impressive.

The Russians have published data on Soviet national income for some time, but those who have studied the data and the concepts and practices of Soviet na-

* This article leans heavily on research, both finished and in process, which The RAND Corporation has sponsored in the recent past. In addition several of my colleagues have commented on the article. I want to thank Abram Bergson, Oleg Hoeffding, Norman Kaplan, and Nancy Nimitz in particular.

tional income statistics find it impossible to accept the rates of increase implied by these data.[1] There has been as yet no definitive Western study indicating the rate of growth of the Soviet economy as a whole. We are not able, therefore, to describe the dimensions of Soviet growth with either exactness or confidence. But we do have estimates that are plausible.

Several years ago, at a conference of economists who are students of the USSR, Professor Gregory Grossman set forth an estimate of the growth of the Soviet economy which may be taken as of the right order of magnitude, at least pending the completion of more definitive studies. Professor Grossman found that the annual rate of growth of the Soviet economy before World War II was 6.5 to 7 per cent.[2] In the postwar period, but with the exception of the immediate postwar years when reconstruction obviously meant a rapid rate of growth, the annual rate of growth of national income seems to have been about the same. There is some discernible tendency for this rate to slacken off, but more will be said on the subject on a later page.

To some, this sort of percentage rate of increase sounds fairly modest. It is, however, large by any standards of Western experience. It may be well to keep in mind that such a rate implies a doubling in size every eleven years. Perhaps more germane is a comparison of rates of increase of the United States economy. Most American economists, when they think about the future of the United States economy, think in terms of growth rates on the order of 2.5 to 3 per cent a year. This, for example, is the range used by President Truman's Materials Policy Commission and by Gerhard Colm in a recent publication of the National Planning Association.[3] There have been occasions when the United States growth rate has been higher than 3 per cent, but there have seldom if ever been occasions when, over a prolonged period of time, the growth rate in this country has approximated that which has apparently been maintained in the Soviet Union since 1928, with the exception, of course, of the war years.[4]

But there is a real question as to whether a growth rate for the Soviet economy as a whole is the significant figure to look for. For one thing, the total economy is made up of many sectors which grow at very disparate rates. This creates serious statistical problems, and casts real doubt on the significance of a single growth rate. Moreover, when comparisons are made between two economies with rather different structures, there is a serious question as to the meaning of over-all rates of increase.

Significance of industry and agriculture in total economy

This leads to the desirability of examining separate sectors of the economy separately. Among those which might be examined, two sectors industry and agriculture—are of particular interest in themselves, because of their importance in the total economy, and because of economic relationships between them. The output of industry, or rather its relative size and rate of increase, is the magnitude of greatest interest to us when we attempt to assess the degree and rate of industrialization. Furthermore, industrial strength determines economic strength, at least in the short run when capability to make war (cold or hot) is the central issue. It is the output of the basic industries like coal, machinery, electric power, steel, and petroleum that we are really interested in when we are thinking of the comparative size of the Soviet economy and economies of the West.

On the other hand, the ability of an economy to satisfy its people becomes important in the longer run. And here, though industry too supplies consumer goods, the success of industry in this respect rests, in a virtually closed economy like the USSR, on success in agriculture. Furthermore, in a developing economy, it is agriculture which supplies an important part of the growing industrial labor force and which, to do so, requires an increasing amount of machinery.

Thus, we are led to examine the industrial and agricultural sectors of the Soviet economy. Perhaps the most important characteristic of these sectors is that they are growing at vastly different rates. To some extent this is a result of deliberate policy, but in a very important sense it is not. In any case, the difficulties of talking about growth of the total economy are perhaps best illustrated by pointing qut that the total economy is made up, among other things, of a sector (industrial output) which has grown at a very rapid rate for twenty-five years, and another sector (agriculture) which has grown at a very modest rate.

Industry

Turning first to the industrial sector, we find rates of increase that are consistently and outstandingly high. The most careful study of this sector has been that by Professor Donald Hodgman.[5] He has accumulated indices of physical output for as many industrial commodities as he could find, and has combined these indices with an approximation to value-added weights, to get an over-all index of physical production. His index is a good deal more comprehensive for the years before World War II than for the period since the end of the war. Nonetheless, it shows that industrial production (again with the exception, of course, of the war years) increased during the prewar period at a rate of approximately 15 per cent per year,[6] and for the postwar years, until the death of Stalin, at a rate of 10 per cent. As in the case of national income, these are rates of increase that are rarely if ever known in Western economies.[7]

For the postwar period the Hodgman index probably understates the annual growth rates. This is because the commodities he is able to include are mostly basic ones; very few of the more fabricated items like machinery appear, and it is these which have grown most. It is not clear, therefore, that Hodgman's

[5] Donald Hodgman, *Soviet Industrial Production 1928–51*. Cambridge, Mass.: Harvard University Press, 1954.

[6] Hodgman's index is for large-scale industry only. Since small-scale industry grew less rapidly, Hodgman's index overstates growth of total industry before the war, perhaps by two or three percentage points. Incidentally, the cited rate applies to the 1928–37 period. In the three years before the war the rate fell rapidly as the economy began to mobilize. One other study may be cited here. Professor Gerschenkron, using 1939 dollar price weights, computed an index of heavy industrial production (more specifically machinery, iron and steel, coal, petroleum products, and electric power) for the period 1928/29 to 1937. His index increases at an annual rate of 17.8 per cent. *Review of Economics and Statistics*, Vol. 37, No. 2 (May 1955), p. 126.

[7] It is possible that Japan, in the latter part of the nineteenth century, may have enjoyed comparable growth rates.

postwar 10 per cent is really lower than his prewar 15 per cent.

What *is* clear is that the rates are still high. Six years ago THE ANNALS devoted an issue to the Soviet Union. The article on the Soviet economy contained a table showing physical outputs for a selected list of commodities. When one compares these with the 1954 output, one finds that the increases imply annual growth rates of between 10 and 20 per cent in almost every case.[8] Rapid growth in industry has been and is unmistakable.

Agriculture

The situation in agriculture is quite different. Agriculture has been much in the news of late, and most of the leaders of the USSR have been clearly anxious about the general agricultural situation. In brief, the increase in output of most agricultural commodities in the last twenty-five years has scarcely kept pace with the increase in population, so that agricultural output per capita is no greater than it was before the period of the Five Year Plans began.

Two major items of agricultural output are grain and livestock. The Russians have put great emphasis on the need to increase the output of both these items, but with marked lack of success. Grain output for 1954 was less than in 1937, much less on a per capita basis;[9] and in the mid-1950's per capita grain output was below even the 1928 level. The livestock situation was no better. In no year since 1950 has the stock of cattle been as large as it was in 1928 and, while there have been some recent successes in increasing the number of hogs, it is clear that the output of meat and dairy products per capita is not as large as it was in 1928.[10] All in all, the Soviet diet has unquestionably deteriorated.[11]

The subject of agriculture and its problems is being treated in much more detail by Professor Grossman in another article in this issue of THE ANNALS. Since it is a key element in the general problem of growth, however, it deserves comment here. One should note that the lack of real progress in agriculture has come about not because the sector has been starved by the planners, for in one sense at least agriculture has been favored. There has been a consistent policy of directing appreciable proportions of total Soviet investment into agriculture. There has been a good deal of discussion about the need to mechanize, and a good deal of bragging about the extent of mechanization on the farm. Indeed, the primitive agriculture of the late 1920's has been very substantially transformed through the investment program that has been a central part of all of the Five Year Plans.

In one sense, agriculture has made a real contribution. One output of Soviet agriculture is labor. In good part, the investment in agriculture which has looked toward mechanization has had as its main purpose the release of labor from the land. We shall discuss this at a later point, but it may be noted here that the Soviet countryside constituted and perhaps still constitutes a large reservoir of labor for the rapidly expanding Soviet industry. Soviet agriculture in this regard has succeeded in supplying large quantities of labor. Most of the productivity increases have resulted in freeing labor from the land rather than in increasing output on the land. To a certain extent, this is a choice that the planners have made, although it will be pointed out later that they are faced with serious constraints in their exercise of choice.

[8] The 1948 data came from Abram Bergson, James Horton Blackman, and Alexander Erlich, "Postwar Economic Reconstruction and Development in the U.S.S.R.," THE ANNALS, Vol. 263 (May 1949), p. 56. The 1954 data were compiled by Nancy Nimitz from scattered Soviet sources.

[9] These developments have to be interpreted with care, since there is less current use of grain in feeding horses now that tractors have replaced so many horses. But even so, more grain is urgently needed, as is indicated by the 1960 planned output, which is a third larger than 1950.

[10] Two RAND "RM" studies, one published and one forthcoming, bear on these difficulties. Both are by Nancy Nimitz. "Statistics of Soviet Agriculture," RM-1250, has been published.

[11] The loss in calories has been made up to a considerable extent (perhaps completely) by the rapid growth in output of potatoes and vegetables. But the change in diet has been quite involuntary.

EXPLANATION OF HIGH RATE OF INDUSTRIAL GROWTH

The consistently high rate of industrial growth in the USSR is something which has a quite plausible explanation. Part of this lies in the distinction between the institutions of a centrally planned economy and a market economy. In a market economy such as the United States or the United Kingdom, there is a rather effective way in which the people as consumers, savers, and investors determine the overall allocation of resources. This mechanism is by no means perfect, and it is of course seriously interrupted in times of war and major depression but, by and large, the people through the marketplace determine the way in which the society allocates its resources. In their performance of this function, the people are guided by their own efforts to derive the greatest possible utility from the fruits of their own labor. In other words, the important thing is the preferences of the people themselves.

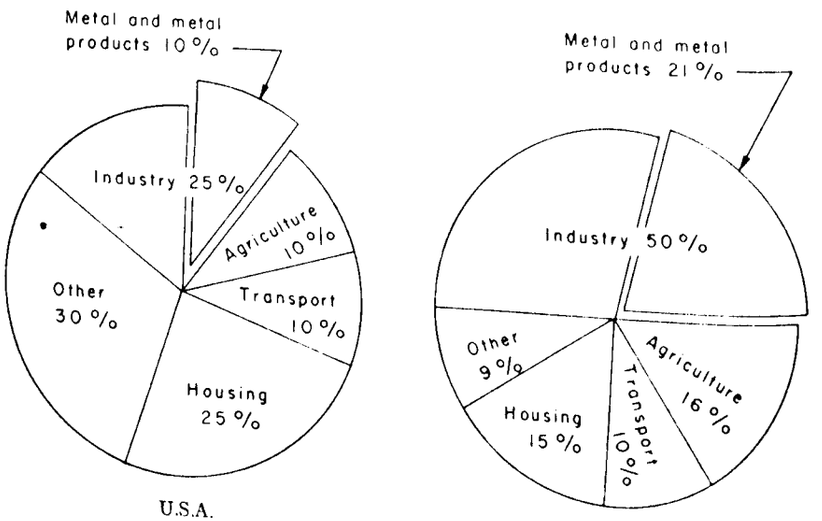
In a centrally directed economy, the situation is very different. The dictator decides how he wants the resources of the economy allocated, and then proceeds to do so by direction. In the case of the USSR, the planners decide that they are more interested in the production of heavy industrial goods than in the production of consumer goods. They are able to implement this decision by various techniques: by subsidies on industrial goods, for example, or by high taxes on consumer goods. So long as they exercise effective control over the people, they can continue to allocate the resources of the economy in a way at variance with what the people themselves would decide if they had any real choice in the matter.

It is clear from the statements of the Soviet leaders that they consciously set out in 1928, through the device of the Five Year Plans, to build up the heavy industrial sector of the economy at the expense of the consumer. A recent *Pravda* editorial puts it this way: "Heavy industry has always been and continues to be the basis of the constant development of our national economy. The Communist party has always considered rapid development of heavy industry its main task."[12] In other words, the emphasis on heavy industry has been a deliberate policy for a long period of time. The driving force has been an unswerving desire to "catch up with the West." In a perverse sort of way, the basest villain of them all, the United States, has been the ideal.

In pursuing these goals, the USSR has had a number of advantages. For one thing, he who starts late can copy. It is clear that the Russians have practiced emulation, either by importing engineering skill and exploiting it, or by the cruder technique of purchasing equipment from abroad and imitating it. Whatever form it took, emulation has made it easier to take initial strides more rapidly than the pioneer, who had to learn as he progressed.

A second important factor has been

[12] *Pravda*, March 7, p. 1. Translated by *Current Digest of the Soviet Press*, April 13, 1955, p. 19.



the vast reservoir of labor on the countryside. The process of industrial growth in any country is accomplished by a rapid shift of labor from agriculture to industry, and the Soviet Union has been no exception. The only peculiar feature of the Soviet experience is that there still exists a very large agricultural labor force in spite of the large industrial advances that have already been made. At the present time the Soviet regime still has around half of its total labor force in agriculture; the corresponding figure in the United States is about 10 per cent. Millions of people have already moved from the farm and, if solutions to the basic agricultural problems are found, the flow of labor from the farm to the city can remain high. This flow is of course in addition to the increase that results from the growth in population.

Much should also be made of the absence of the business cycle in the USSR. Prolonged periods of depression such as that in the 1930's in the United States can and do interrupt industrial progress. In the Soviet Union, the institutional arrangements are such that periods of this sort have not occurred and will not occur in the future. To be sure, Soviet society has its disadvantages, some of them coming about for the same reason that business cycles do not, but from this one difficulty, at least, it is free.

Soviet investment policy

But the most important determinant of the high rate of industrial growth is certainly to be found in Soviet investment policy. There are two things about this investment policy that are deserving of emphasis. Both are the results of conscious decisions of the economic planners.

The first is that the rate of investment (that is, the ratio of gross investment to gross national product) has been consistently high. More specifically, for the last twenty-five years, with the exception of the war years, the Soviet government has, year after year, allocated 20 per cent or more of the economy's total resources to investment. This is a percentage which the United States and other Western countries

TYPICAL POSTWAR DISTRIBUTION OF INVESTMENT BY SECTORS, U.S.A. AND USSR

equal on occasion, when economic activity is at very high levels. The difference is that in the USSR it happens every year, and no Western economy has had this experience.

The second feature regarding Soviet investment is equally important. Of the resources that are invested, a far larger proportion than is true in our case goes into heavy industry. For each unit of total investment, therefore, the payoff in terms of continued high rates of increase of industrial output is high. Whereas in the United States a good proportion of investment goes into things like luxury hotels, laundry facilities, and the like, the Russians devote every possible kopeck of their investment to electric power, steel, chemicals, and so forth. The accompanying pie chart contrasts the postwar Soviet and American practices.

The effect of these two peculiar features of Soviet investment is a continuous plowing back of resources into those areas which in turn create more resources which can be plowed back. This reflects itself in the rate of increase of industrial production, and largely accounts for its being high. It may be noted that there is no real reason why both the rate and the direction of investment should not be continued in the future as they have been in the past for an indefinite period. That is to say, there is nothing inherent in what is going on which says that there must be a change at any foreseeable date. It is possible, of course, that the policy which has dictated the nature of investment may be changed.

THE ECONOMY AT STALIN'S DEATH

It may be appropriate to summarize the situation in 1953 which had resulted from the general trends that have been thus far described. Several features stand out.

In the first place, the Russians had managed to build up a very strong industrial base. In most of the important commodities, they were second only to the United States. In spite of the terrible devastation of the war, they had managed by 1948 or so to recover their prewar position, and then had pushed ahead so that by 1953 they had passed England, France, Germany, and all others except the United States.

Secondly, and paradoxically, in spite of all this, the Soviet economy in a very real sense was still an agricultural economy. In many ways, the proportion of an economy's labor force engaged in agriculture is a measure of its stage of development, and it is noteworthy that this proportion in the USSR was still around half in 1953.

In 1953 the Soviet people were still experiencing a very low standard of living. The emphasis on heavy industry, which has been discussed, had as a natural result a standard of living which was bound to be very low. Actually, it appeared for many years as though the Five Year Plans regarded consumption as the residual claimant, while the planners determined the rate of investment that they wanted largely in terms of what they could get away with in denying consumption to the people.

In the two or three years before 1953, the standard of living had been permitted to turn rather sharply upward. It is interesting to speculate on why this should have been done, and even more interesting to wonder whether the trend will continue. To be sure, it may be that some of the increase is illusory, since about this time stories of queuing up and bare shelves began to creep into the press.

Real wage comparisons with the West are, of course, extremely difficult. Nonetheless, it may be interesting to point to some research under way at the RAND Corporation, which compares the ruble prices of a substantial number of con-

sumer goods and service items with dollar prices in the United States of the same or comparable items. When this is done, a 1950 ruble-dollar price ratio for consumer goods, including food, services, and manufactured goods, comes out to 20 to 1 when United States weights are used, and 15½ to 1 when Soviet weights are used. In 1950 the average wage in the USSR was something like 7,500 rubles, in the United States about $3,000. The Soviet worker's real wage in 1950, then, was some one-sixth to one-eighth that of the American, depending on the weighting system used.[13]

Finally, we may note that the Soviet economy at the time of Stalin's death was supporting a substantial military establishment. Some four million men were reputed to be in uniform, and the Korean experience had indicated a modern military technology to be characteristic of Soviet military equipment. The Russians had exploded their first A-bomb three and a half years previously, and were soon to begin talking about their prowess in the manufacture of H-bombs.

As nearly as we can calculate, the proportion of total resources in the USSR going into the military establishment in 1953 was around 15 per cent. It is important to understand the meaning of this, since there has apparently been a good deal of uninformed speculation about it recently. It should be clear that resources spent for the military, unlike those devoted to capital goods, are not productive. A blast furnace can be used to produce something else, a military tank cannot.[14] To this extent, therefore, the Soviet economy like any other is penalized by the resources it allocates to the military. The military is competing for resources with other sectors of the economy. It does not follow, however, that the drain is necessarily serious, so long as the total is rising and the military sector does not rise more than proportionately. Indeed there is no reason to assume that the Soviet leaders could not go on indefinitely devoting a given percentage of their total resources to the military or spending resources equal in amount to those they were spending in 1953. To repeat, what is spent on the military cannot be spent on investment or for consumers, but there is nothing to indicate that the drain represented by the military program at the stated level threatens to bring about economic collapse in any sense.

MALENKOV-KHRUSHCHEV CHANGES

The end of an era occurred in March 1953 with the death of Stalin. There followed two years during which Malenkov was at least nominally in charge. Then in February 1955 Malenkov was succeeded by Bulganin or Khrushchev or both. When Malenkov's economic program began to emerge, it appeared to constitute a real break with the immediate past. Its main outlines were as follows. There was to be a sharp shift in the distribution of investment, away from heavy and toward light industry and trade. Much more of the fruits of the economy were to be distributed to the people. In fact, promises to the consumer were lavish and, to some of us, seemed surprisingly specific. Finally, the ever-present problem of agricultural output was given even more emphasis, and price and tax policies were altered to improve the earnings of farmers and to give them incentive to produce more.

[13] For trends in real wages, see Janet Chapman, "Real Wages in the Soviet Union, 1928–1952," *Review of Economics and Statistics*, Vol. 36, No. 2 (May 1954), pp. 134–56.

[14] It does produce "national security." There is no intent to imply that military production is necessarily wasteful. The point is that military end items, unlike capital goods, do not produce additional economic goods.

It was not apparent in 1953, and still is not, how much of all this was propagandistic and how much was substantive. A great deal was made of the fact that aircraft factories had been instructed to begin turning out aluminum pots and pans. Indeed, extremely large percentage increases in things like television sets and other durables were enthusiastically reported in the press. Large percentage increases in many of these things were in fact achieved, but since the base figures from which these percentage outputs were measured were in most cases extremely small, these "triumphs" are not to be taken very seriously.

It is not easy to determine what really did happen during this period, but the data at hand point toward the tentative conclusion that changes in the structure of the economy were minor and unimportant. The revolution, if it was ever really intended, failed to come off.

If we look at the official Soviet indices of gross industrial output in the 1950's, we find that the ratio of increases in the producers' goods area to those in the consumers' goods area remained practically constant from 1951 through 1954. It is true that the latter half of 1953 indicates that the increase in consumers' goods was a bit higher than it had been earlier; but by 1954, the year in which these changes should have been reflected in the statistics, there is a decline in this rate. It is possible that the time required for true structural shifts was more than Malenkov had at his disposal. Whatever the cause, the shift did not take place, and there was, therefore, no appreciable interruption to the economic trends we have been discussing.

Although there is little evidence of such structural shifts, Malenkov was more successful in keeping his promise to improve the lot of the consumer. This appears to have been done in two ways. In the first place, there was apparently a significant drawing down of state reserves of various sorts. In the second place, there was an increase in the volume of imports that took place, beginning in the middle of 1953, and a simultaneous and substantial increase in the proportion of total imports made up of foods and consumers' goods.[15]

With the ascendancy of Bulganin and Khrushchev in 1955, Malenkov's agricultural reforms were intensified, but other parts of his program were repudiated. Bulganin reproached Malenkov specifically for what he termed errors in policy inherent in using the state reserves for current consumption.[16] The much-publicized charges of having corrupted true party ideology by asserting that the time had come to let light industry expand at a faster rate than heavy industry were explicitly directed at political unknowns, but undoubtedly were aimed at Malenkov, and whoever were his major henchmen in the intended reversal of economic policy. The announcement by Bulganin of the annual 1955 Plan targets for industry left no doubt that heavy industry was to continue to receive favored treatment, and the rate of increase for consumer goods was planned at only about half what had actually been achieved in this field in 1954. We may summarize the experience of the Malenkov interregnum by hazarding the opinion that the changes that took place were much less important, at least in areas other than agriculture, than we thought might be the case, and in fact had a minor impact on the course of economic development.

[15] Cf. the article by O. Hoeffding in this issue of THE ANNALS.

[16] *Pravda*, February 10, 1955, p. 1.

Change in economic policy?

By way of pure speculation, it may be said that a genuine change in economic policy is not completely unlikely in the future. The current soft international policy seems to have a logical counterpart in an economic policy favoring the consumer, and there are some who are expecting the change to take place if the current softness in international dealings continues. It may be interesting to consider briefly what might happen if this consumer goods reorientation should appear. A successful program would certainly have interesting propagandistic effects throughout the world. We may ask, then, what would be the result of a sincere and prolonged attempt on the part of the Soviet economic planners to move their economy away from the heavy industrial economy toward one that emphasized the output of consumer goods. It seems fairly clear that rather startling improvements in the standard of living in the near future could be achieved. Among other reasons, this could be expected because most of the small amount of consumers' goods capital in the USSR is obsolete, worn out, and inefficient. As a result, its replacement by new equipment would bring about very substantial increases in the productivity of these industries. In the economist's lingo, the marginal productivity of capital in the consumers' goods industries must be regarded as very high.

The probability is that the resulting rapid increases in the standard of living could be expected to continue for some years. Following this, however, there would be an inevitable slowdown in the rate of increase. One reason for this is that a great deal of consumer capital is very costly. All of the capital for consumer services in cities, for instance, is costly to install, and has little immediate payoff. Streets, transportation facilities, sewers, and so on are of this sort. The construction of housing in the USSR before the war did not keep pace with the growth of the urban population, and yet the improvement of housing facilities is essential to a balanced increase in the standard of living. A housing program designed to obtain accommodations merely approaching the decency level would require a tremendous investment effort in the USSR.[17]

There is another factor which would tend to bring a slowdown in due course. De-emphasis of heavy industry would mean that a larger proportion of the output of industry would be consumed. When output is consumed it cannot be used to make more output, except of course insofar as it increases the productivity of labor. The output of capital goods industries, on the other hand, is used directly to make more goods. One type of industrial output therefore produces satisfaction for consumers, whereas the other produces measurable outputs for statistical series. Paradoxically, consumers' goods production is analogous to military production. Both are consumed directly and add nothing in direct ways to the future output of the economy. Last but not least, the hypothesized policy would presuppose genuine success in expanding agricultural production, to supply more food and raw materials for consumer goods. Reliance on imports is an unlikely alternative, as we suggest below.

It is difficult, if not impossible, to quantify the course of action just described in general terms. It is also difficult to say what the propagandistic effects of a rather rapidly and continually increasing standard of living would be. It would seem, however, that they should

[17] For a summary of the housing situation, see Timothy Sosnovy, *The Housing Problem in the Soviet Union*. New York: Research Program on the U.S.S.R., 1954.

be considerable, particularly in countries like France and Italy, where the standard of living is not high and is not increasing rapidly. And they ought to be very substantial in many of the Asian countries, where freedom means a good deal less than it does in the West and where the competition of the Communistic versus the capitalistic societies is being closely watched. Indeed, it does not appear at all clear that an economic course of this sort, perhaps coupled with a substantial decline in the military claims on the economy, would be less dangerous to the West than the piling up of impressive growth rates in steel, electric power, machinery, and chemicals.

POSSIBILITIES FOR FUTURE GROWTH

We turn now to a look into the future, and an attempt to assess the probability of continued future growth. We assume, of course, that hot war does not break out. We also assume that the Soviet leaders have debated the matters referred to in the immediately preceding paragraphs and have decided to retain the present policy of building up the industrial base as rapidly as is consistent with political stability.

The first thing to say is that at some time in the future, if the time has not already arrived, a modest decline in the *rate* of industrial growth may be expected to take place. The chief reason for this expectation is that there has to be a time when the rate of release of labor from agriculture to industry must decline. This is true if only because there will always have to be some agricultural labor on the farm, and the withdrawal, therefore—and the curve indicating withdrawal—will level out in asymptotic fashion. The flow of labor from agriculture to industry can be expected to continue, therefore, but beyond some point at a diminishing rate.

Actually, the data seem to indicate that a decline in the rate of growth of nonagricultural labor has already set in. Between 1928 and 1937 the annual rate of increase of workers and employees was about 10 per cent. In the 1950's it is only about half that. Much the same changes have been taking place in the number of industrial wage earners, which means workers in manufacturing, mining, and electric power production.

Recent Soviet statements have stressed that the cities cannot in the future count on an influx of peasant labor at the rate which formerly prevailed. The decline has created a considerable campaign in recent years for a more rapid increase in labor productivity, in particular through the introduction of new techniques. The campaign has not been wholly successful; the official statistics indicate that the labor productivity goals will not be met by 1955. This has been partly compensated for by an overfulfillment of the nonagricultural labor force goal. This type of compensation cannot continue indefinitely, of course. As a consequence we can expect to see the beginnings of a reduction in the rate of increase of industrial output.

In spite of this, there is reason to believe that the rate of increase can remain above that in the West almost indefinitely. It may be noted, parenthetically, that this does not mean greater absolute increases, at least not necessarily so for some period of time. But the investment policy, in terms of both rate and direction of investment, should be sufficient to maintain rates of growth in industry which are higher than those that prevail in Western nations. And unless the Soviets run into a genuine bottleneck, this inequality can remain indefinitely.

Bottlenecks

We turn now to the bottleneck possibility. There is a good deal of loose

thinking on this matter. At various times we are told that the Soviet economy is in danger of imminent collapse because the military burden is excessive, or because the transportation situation is acutely critical, or because it lacks crude oil—and there are many other culprits. It is important to recognize that in any society which is proceeding at forced draft, there will always be one or more bottlenecks operating somewhere. It is not easy to plan the detailed growth process of a large and complex economy. The planner who seeks to maximize the rate of growth has as his ideal a situation where everything in the economy is equally critical at any given moment. If his plan results in surpluses in any parts of the economy, this is a sign to him that he is not planning well. If everything is in equally short supply, this means that he is using to the fullest everything that is being produced.

Now it is clear that no planner can be efficient enough to maintain a situation of this sort at all times. What actually happens, therefore, is that on occasion the economy seems to be held up by a shortage of freight cars or locomotives. There will be other years when rolling stock cannot move because of lack of petroleum; there will be shortages of skilled labor in certain industries where the needs have not been foreseen sufficiently far in advance; and so on. To a considerable extent, the Russians could overcome some of these difficulties, at modest cost, by maintaining fairly substantial inventories, although there is little evidence of what their practices are. But to become true bottlenecks, these difficulties would have to be more than temporary, and there seems to be almost no difficulty that, given time, cannot be alleviated by a reallocation of effort. One needs, therefore, to place in proper perspective the continual minor crises that are likely to occur and not regard them as evidences of imminent breakdown.

Agriculture a real difficulty

There is one sector which is different from others and which, because of this difference, may turn out to constitute a genuine brake on economic development. We refer to agriculture. This will be treated at greater length in Professor Grossman's article in this issue; we will confine ourselves to a few specific comments which will relate the agricultural sector to the problem of economic growth.

The great thing that sets off agriculture from other parts of the economy is its dependence upon natural factors. There is scarcely any limit to the production of most industrial commodities if the planners devote enough effort to it. There is a very real limit to the production of agricultural commodities. Man can, it is true, alter nature to some extent, but it is hard to get around the fact that the endowment by nature of agricultural resources in the USSR is very poor. The latitudinal position of the great bulk of Soviet land is such that the growing season is very much shorter than it is, for example, in United States agricultural areas. There are very few agricultural areas in the USSR where the average annual rainfall is as high as twenty inches. Also, the quality of the land itself in Soviet Russia is poor. All this means that the best agricultural lands in the USSR more nearly resemble North Dakota than Iowa.

This niggardliness of nature goes far to explain the dramatic efforts that have been made in recent years to reclaim vast quantities of land, to institute very large programs of reforestation for wind sheltering, to create the huge irrigation projects of which we have heard so much, and so on. All of these things will certainly help, but they are all expensive and the payoffs are limited. The niggardliness of nature likewise helps explain why the Russians still have half of their labor force in agriculture. One Russian farmer feeds himself and three other Russians. One American farmer feeds himself and twenty other Americans, and he embarrasses his government by insisting on producing "too much." The disposal of agricultural surpluses is a problem with which the Soviet planners would love to be faced.

To an undetermined extent, the organization of Soviet agriculture contributes to its inefficiency. The state and collective farm system is such that it is very difficult for any farmer to relate the income he receives and the effort he puts into the farm. Incentives toward hard work are so indirect as to be virtually nonoperative; the government has not helped by its practice of procuring at very low prices and under compulsion a good proportion of total output. There is no simple solution to this problem.

The population in the USSR is increasing at a rate of about 1.5 per cent per year. Soviet agricultural output, therefore, has to increase this much simply to maintain per capita consumption at its current low levels. But this is not enough. If the Soviet economy is to continue to grow, output must increase even more in order to produce surpluses. Furthermore, this must be done with less manpower than is now available, since the growth of industry requires a continuous flow of labor from the countryside. The experience of Soviet agriculture raises serious question as to whether the planners are going to be able to solve the problems that are becoming increasingly critical. If they do not solve these problems, it seems clear that the rate of growth of the economy as a whole, and of the industrial sector, must slow down. This is why we must watch with such interest the outcome of the efforts described in Professor Grossman's article.

There is, of course, one obvious method of solving agricultural problems. The British pointed the way in 1846 when it had become clear that British farmers were unable to feed the British people. In that year the Corn Laws were repealed; and the British changed their policy from one of self-sufficiency to one of ever increasing reliance on international trade. This avenue is open to the Russians. There is no reason, for example, why they should not import their cotton, and use the land in the USSR devoted to raising cotton for raising food. There is no reason why they should not go farther and import their grain or their beef in trade for manufactured goods. The probability of their doing so, of course, is very low, since it is a cardinal sin according to their ideology to make themselves dependent upon outsiders. Nevertheless, the possibility is there, and one cannot but watch with fascination for signs that international trade is increasing on a substantial scale.

Joseph A. Kershaw, Ph.D., Santa Monica, California, is an economist at The RAND Corporation in that city. He has taught economics at Hofstra College and at the University of São Paulo in Brazil, and during the war held various positions with the Office of Price Administration. At RAND, which he joined in 1948, he organized and supervised the research on the Soviet economy. He is the author of several reviews and articles on that subject.

Soviet Iron and Steel Industry: Recent Developments and Prospects

By M. Gardner Clark *

WHAT are the principal conclusions that can drawn from an analysis of material published in the USSR about recent developments in the Soviet iron and steel industry? [1] In this article we shall first call attention to some of the more important trends in the output of pig iron, ingot steel, and rolled products, as well as in the productivity of iron and steel furnaces, that have taken place since 1945. The second section will discuss current problems and future prospects based on what we know about trends in the immediate past.

Summaries are bound to underestimate many important aspects and to overlook others. Attempts to divine the future are bold indeed, particularly when we are dealing with one sector of the Soviet economy, since the development of any one sector depends as much on considerations of broad economic and political policy as on mechanics inherent in its own development. Our speculation about future prospects, therefore, will be offered merely as a basis for discussion, in the hope that we can single out possibilities deserving further consideration and attention.

Output and Productivity Since 1945

Table 1 presents the basic annual data on total production since 1940. The figures (expressed in metric tons) speak for themselves. Recovering rapidly from the destruction of World War II, output reached the prewar level by 1948, and it has continued steadily upward at the absolute rate of three or four million tons a year. The annual percentage rate of growth of all three products, as calculated from Table 1, has fallen steadily from about 25 per cent in 1948 to below 10 per cent in 1954. This decline in the percentage rate of growth can be explained as an arithmetic reflection of the steady increase in absolute production, and has not been the cause for Soviet alarm. However, the absolute growth of pig iron production has been unsatisfactory in the two years since the death of Stalin, dropping from 3.1 million tons in 1952 to 2.3 and 2.5 million tons in 1953 and 1954. Since, for lack of scrap, the production of finished steel in the USSR is tied closely to that of pig iron (see below), this drop has given the Soviet leadership cause for serious concern, and in its report on the performance of the national economy in 1954 the government singled out pig iron as the first example cited for failure to meet its annual plan. This failure, although certainly not overwhelming, was indicative of some basic problems of the Soviet iron and steel industry, about which we shall have more to say.

The first half of 1955, with its shift of emphasis from consumers' goods back again to heavy industry, has reportedly shown some improvement. Basing his forecast on the performance of the first six months, Premier Bulganin [2] forecast that over 33 million tons of pig iron and about 45 million tons of steel would be turned out in 1955. This would represent an increase over 1954 of more than three million tons of pig iron and four million tons of steel. These absolute increases would be bigger than those of 1953 and 1954, but not big enough to meet the 1955 plan goal for pig iron.

Fortunately for our purposes, the Soviet administrators utilize precise measures of productivity for the major types of iron and steel mill equipment. These measures for blast furnaces and open-hearth furnaces are presented in Table 2. From these data we can see that by 1946 the national productivity averages had recovered to almost their prewar levels. Nevertheless, the 1946 averages were well below what had been attained in the good years 1936–1937, and were low enough so that the subsequent years of the fourth Five Year Plan were bound to show substantial improvement. The Soviet planners, however, failed to anticipate how very substantially productivity was going to improve in the postwar period. In the eight years from 1946 to 1954 the national average blast furnace productivity increased 45 per cent and open-hearth productivity 61 per cent. There is nothing mysterious or even wholly new about the postwar productivity drive that gave such substantial results. It followed the familiar patterns established in the 1920's and 1930's. First the Soviet managers adopted the major technical improvements previously developed in the capitalist countries, particularly in the United States, and made a number of minor improvements of their own. Then they encouraged their widespread installation by a series of "socialist competitions" on the Stakhanov pattern. No facet was neglected, including wage incentives, publicity, technical training, heavy emphasis on interplant and intraplant team competition, and the liberal grant of fabulous Stalin Prizes for inventors, innovators, and leaders in "socialist competition." [3]

TABLE 1—Production of Pig Iron, Steel, and Rolled Products, 1940–54

(in thousands of metric tons)

Year	Pig Iron	Ingot Steel	Rolled Metal
1940	14,902	18,300	13,100
1941 Plan	18,000	22,400	15,800
1942	4,800	—[a]	—[a]
1943	5,600	8,500	5,600
1944	7,400	10,600	7,200
1945	8,900	12,300	8,400
1946	10,000	13,400	9,600
1947	11,300	14,600	11,000
1948	13,900	18,600	14,100
1949	16,500	23,300	17,900
1950	19,300	27,300	20,800
1951	22,000	31,400	23,900
1952	25,100	34,500	26,800
1953	27,400	38,000	29,500
1954	29,900	41,000	32,200
1955 Plan	34,000	44,000	34,000
1960 Plan	50,000	60,000	—[a]

* The writer is grateful to Robert Campbell for reading the manuscript and making several helpful suggestions.

[1] This article is based on my forthcoming book, *Economics of Soviet Steel*, to be published in the spring of 1956 by the Harvard University Press under the auspices of the Harvard Russian Research Center.

[2] As reported in *Pravda*, July 17, 1955.

By American standards the productivity of Soviet iron- and steelworkers is generally quite low. Soviet leadership is concerned and attempts with apparent success to raise the productivity of its labor force. The Russians, however, think first and foremost about the productivity of capital equipment, and for good reason. Compared with the United States the Soviet Union has a large supply of labor and a small supply of capital. Therefore, any attempt on their part to raise Soviet labor productivity to the level of our own would be irrational.[4]

TWO QUESTIONS

The balance of this article deals with two interrelated questions. The first concerns the latest shift in Soviet economic policy. In view of the remarkable increase in production and productivity that we have just outlined, one wonders why Khrushchev and Bulganin felt it necessary to bring the iron and steel industry back to the center of the public stage after its relegation to the wings by Malenkov. Why are they again so interested in speeding up the expansion of iron and steel? Second is our evaluation of the prospects for growth in the next ten or twenty years.

URGENT NEED OF STEEL

The answer to the first question is twofold. The Soviet Union has urgent uses for all the steel it can produce, and at the same time it faces increasing difficulties in expanding production to meet these growing demands. The principal demands for steel may be thought of as coming from five directions: heavy industry, agriculture, the needs of Soviet satellite nations, consumers' goods, and armament. Since 1928 the lion's share of Soviet steel has been fed into the maw of heavy industry. Construction of the new hydroelectric project at Kuibyshev, for example, requires about 700,000 tons of iron and steel.[5] With the demotion of Malenkov, industrial requirements such as these retain their high priority in the thoughts and plans of Soviet leaders. Until quite recently investments in the agricultural sector have been niggardly, but Khrushchev's new program of expanding agricultural production by opening up millions of hectares of virgin land suddenly imposes strenuous new demands on the steel industry. Of course nobody knows just how much steel the various facets of this program will require, but one Soviet authority claims that the working up of each hectare of land in the new farm program consumes about one ton of metal in the form of tractors and other agricultural equipment alone.[6]

The Soviet government may be primarily concerned with the needs of its own industry and agriculture, but it cannot afford to ignore the requirements of its satellite nations. The European satellites are engaged on ambitious programs of expanding their iron and steel industries. This expansion, however, is being imposed on an inadequate raw material base. The Soviet Union, therefore, has been obliged to furnish its satellites not only iron and steel mill equipment for the new plants but also iron ore to keep the plants in operation. Satellite steel production depends heavily on scrap, and there is little prospect of substantially increasing their already high levels of scrap collections. It would appear, therefore, that the Soviet Union will have to supply sharply increasing amounts of iron ore or pig iron to its European allies if the latter are to meet their ambitious goals for steel production.[7] In the last few years the USSR has assumed a measure of responsibility for the industrialization of Red China. It requires little imagination to see that China could easily become a bottomless pit for Soviet steel. At the very least, China can use whatever semifinished steel and machinery the Soviet Union feels willing and able to spare.

Further down on the priority list we find the steel requirements of Soviet consumers' goods industries. Throughout one Five Year Plan after another the Soviet consumer has found himself cut short when, as usual, it turns out that there is not enough steel to go around. Nevertheless, the mere fact that the Malenkov regime seriously attempted to meet the needs of domestic consumption indicates that the satisfaction of these needs is politically desirable.

Steel and munitions industries

Soviet leaders profess a desire to reduce their military establishment in order to meet nonmilitary demands for goods and services. Armament production has undergone sharp fluctuations in the last twenty-five years, and the Soviet government apparently wants to reduce once again its steel commitments to the military. Steel consumption by the Soviet munitions industry increased sharply during the late 1930's with the approach of World War II. Steel consumed by the munitions industry for the purpose of building munitions plants increased from 136,000 tons in 1933 to 880,000 tons in 1938.[8] This increase in defense construction came at the expense of nondefense construction, so that by 1938 the munitions industry was getting 94 per cent of steel construction material allocated to all types of machine buildings. In other words, by 1938, munitions plants were getting so much of the available steel that construction virtually ceased in all other machine-building industries, including heavy machinery, machine tools, automobiles and trucks, tractors, farm machinery, electrical machinery, railroad locomotives and equipment, and shipbuilding. At the same time, by 1938 munitions industries were getting more steel for fabrication (as distinguished from steel for construction) than all the other machinery manufacturers put together. Following the German invasion the Soviet economy was, of course, converted all out to war production. The share of rolled steel going directly into war production jumped to over two-thirds of the total in 1942.

For the postwar period we have been unable to find any figures on the consumption of steel by munitions industries, but indirect evidence indicates that the share has continued to fluctuate with changes in the international situation and in the imperative needs of the Soviet economy. The Soviet managers divide their iron and steel products into two broad categories, which they call ordinary and quality steel. The bulk of ordinary steel is consumed by heavy industry, railroads, and construction, whereas quality steel is devoted almost

[4] Soviet definitions of labor productivity in the iron and steel industry are so vague that they mean very little to foreign observers. All we can safely say is that productivity of the Soviet steelworker is much lower than that of his American counterpart, but that Soviet output per man is increasing substantially with improvements in technology and organization. See Walter Galenson, *Labor Productivity in Soviet and American Industry* (New York: Columbia University Press, 1955), pp. 108–37.

[5] L. Roitburd, "Ways of Raising Labor Productivity in the Iron and Steel Industry of the USSR," *Voprosy ekonomiki*, 1954, No. 11, p. 40.

[6] *Ibid.*

[7] See my article on iron and steel in *Industrial Russia the New Competitor*, Studies in Business Economics, Number 44 (New York: National Industrial Conference Board, 1954), pp. 34–35.

[8] For information on steel consumption for the construction of defense plants and the manufacture of munitions see Clark, *Economics of Soviet Steel* (note 1 *supra*), Chap. I and Appendixes C and D.

entirely to the manufacture of machinery and munitions. This being the case we should naturally expect that the share of quality steel in total steel production would fluctuate with the process of conversion to and reconversion from a war-oriented economy, and in fact its share rose and fell in a symmetrical curve, as Table 3 indicates:

TABLE 3—PERCENTAGES OF QUALITY STEEL AND ALLOY STEEL ROLLED IN TOTAL ROLLED PRODUCTION, 1940–43, 1945–47

YEAR	PERCENTAGE OF QUALITY ROLLED IN TOTAL ROLLED PRODUCTION	PERCENTAGE OF ALLOY ROLLED IN TOTAL ROLLED PRODUCTION
1940....	24	6
1941....	37	12
1942....	63	17
1943....	62	21
1945....	48	16
1946....	22	7
1947....	21	8

For analogous reasons the share of alloyed rolled steel fluctuated with the production of munitions during and after the war.

Unfortunately, after 1947 the Soviet government stopped publishing this data on a nationwide basis. Therefore, we have to rely on a few scattered figures to indicate the extent of Soviet conversion during the cold war. The Kuznetsk Combine in Western Siberia, representing a small cross section of the Soviet iron and steel industry, can be considered representative. Kuznetsk has boasted that during World War II it made enough shell steel for 100 million shells and enough tank steel for 50,000 heavy tanks. In 1940, 12 per cent of the plant's rolled output was quality steel. By 1944, at the height of the war, the share had risen to 73 per cent. War damage to the economy was so tremendous, however, that the rehabilitation of railroads, highways, housing, and industrial plants could have been expected to consume all the ordinary rolled steel the Soviet Union could possibly have produced in the immediate postwar period. That is why *Pravda* reported in 1945 that a large proportion of the output of the Kuznetsk Iron and Steel Combine was henceforth to consist of railroad rails and structural steel. Six years later the Kuznetsk director reported a different story. The production of quality rolled metal had increased in 1950 almost one and one-half times over 1946, and in the first half of 1951 it increased by another 35.6 per cent. Apparently, by 1950 51 Kuznetsk was again devoting its major effort to the production of quality steel, an essential factor in military output.

PROBLEMS OF EXPANDED PRODUCTION

Soviet leaders may read wistfully in the American press that Americans can enjoy the double luxury of more guns and more butter, but they do not have to read *Pravda* to learn that their own military and nonmilitary demands for steel are directly competitive. This being the case, they may welcome the opportunity to repeat the experience of 1945–47, and to reduce the share of munitions in total steel consumption. This conclusion gains further support when we consider the problems they will face in the next decade or two if they try to maintain the present rate of expansion to meet these increasing and competitive demands. To do this we shall focus our attention on three broad factors: labor supply, technical progress, and the natural resource base. Throughout we shall note that the availability of capital investment plays a key role in permitting the exploitation of labor and natural resources to produce Soviet iron and steel.

LABOR SUPPLY

The rapid growth of the industrial labor force in recent years and tentative projections of this growth by American scholars[9] indicate that the Soviet leaders can rely on a steadily increasing supply of labor. How much of the total increase finds its way into the iron and steel industry depends primarily on government policy. At the present time, for example, there may be a net shift of labor into agriculture, rather than the customary large outflow from the villages. Nevertheless, the iron and steel industry has always managed to get the unskilled labor it needs to carry out essential tasks. Soviet management has not needed to worry about total labor supplies, but it has been and still is seriously concerned about training semiskilled and skilled workers for the industry. Managerial and educational leaders cannot afford to let industrial training slide. On the other hand, they are fully aware of the problem and have now acquired a depth of experience and a well-organized and extensive system of industrial education both inside and outside the industry.[10] Furthermore, compared to the requirements of other industries, the steel industry requires a relatively small nucleus of highly skilled operators. Therefore, it is not likely that labor shortages will constitute a serious bottleneck in the future expansion of Soviet steel.

TECHNICAL PROGRESS

We have noted the remarkable and continuing improvements in the productivity of Soviet capital equipment. Much of the increase in productivity of both labor and equipment is dependent upon the development, adoption, and installation of new techniques. A few of these techniques are of enough current interest to be mentioned here.[11] The development probably most important in its total effect on productivity has been the conversion of blast and open-hearth furnaces and rolling mills to automatically controlled operation. The Soviet managers claim, for example, that automatic control of the heat of these furnaces has increased their productivity 7 to 10 per cent and has cut fuel consumption by 2 to 6 per cent.

The use of oxygen in open-hearth furnaces has developed rapidly since 1946, and the 1955 plan calls for further widespread adoption. The injection of pure oxygen cuts the total heat time as much as 40 per cent without worsening the quality of the steel. Like automatic control, the use of oxygen in open hearths has been developing apace in American practice, and Soviet engineers have been kept informed by abstracts and translations published in their own technical journals. But the Russians overcame before we did one big objection to the use of oxygen in metallurgy, namely its very high cost. On the eve of World War II their famous physicist, P. L. Kapitsa, invented a revolutionary method of producing cheap oxygen.[12] With cheap oxygen available, Soviet authorities have tried hard to use it in blast furnace operations as well as in open hearths, but so far they seem not to have overcome the damaging effects of excessively high temperatures which accompany the use of oxygen in blast furnaces.

During and after World War II, Arthur D. Little, Inc., and the Republic Steel Corporation jointly developed a startling new technique known as high top-pressure blast furnace operation.

[9] For example, Warren Eason and Frank Lorimer in Abram Bergson (Editor), *Soviet Economic Growth* (Evanston, Ill.: Row, Peterson and Company, 1953), pp. 100–125.

[10] An excellent article by Walter Galenson on industrial training in the Soviet Union will be published in a forthcoming issue of the *Industrial and Labor Relations Review*.

[11] For details, see Clark, *op. cit* (note 1 *supra*), Chap. XV.

[12] See Gerald Oster, "Scientific Research in the U.S.S.R.," THE ANNALS, Vol. 263 (May 1949), p. 138.

Opinions differ as to the economic feasibility of this process in the American milieu, but there is no doubt that it significantly increases output per furnace and cuts coke and ore consumption per ton of pig iron. As early as 1945 sharp-eyed Soviet engineers picked up references to this innovation in American journals and have avidly followed subsequent reports as they appeared. Nevertheless, Soviet adoption of it was held back a few years until the dramatic initiative of the director of Magnitogorsk cut through the inertia of central authorities.[13] The new method was first introduced successfully in Furnace No. 6 at Magnitogorsk and very quickly thereafter was widely adopted throughout Soviet blast furnace plants. Furnace No. 6 markedly improved its performance under high top-pressure operation and during the month of June 1955 reported a record productivity of 1.69 metric tons per cubic meter of capacity. This means that the Magnitogorsk furnace turned out a daily average during the month of some 2,420 short tons, which comfortably exceeds the "world's record" of 1,981 short tons reported for Bethlehem Steel Corporation Blast Furnace J for the month of May 1954.

Without going into further details, we can say that the spectacular technical progress of the Soviet iron and steel industry in recent years has been almost exclusively in the realm of adoption, modification, and improvement of inventions and innovations pioneered by the Western world, particularly the United States. However, the time lag between invention in the West and adoption in Russia has been steadily shortening, and the next twenty years might even witness some major original contributions by the Russians to the technology of iron and steel. In any case they will always be able to stand on the broad shoulders of the capitalist world. Technical progress can be counted, along with an expanding labor force, as a positive element in Soviet prospects.[14]

[13] For a description of the introduction of this and other innovations see my article, "Development of Large-Scale Organization: The Soviet Steel Industry," *Journal of Economic History*, Vol. 12, No. 4 (October 1952), pp. 396–410.

NATURAL RESOURCE BASE

Against these positive elements we have to weigh the very serious limitations of the Soviet iron and steel industry's natural resource base.[15] The most important raw materials consumed in the manufacture of iron and steel are limestone, manganese, coal, iron ore, and scrap metal. Limestone deposits are plentiful and widespread, and the USSR has three-quarters of the world's known supplies of manganese, a factor which encourages the Russians to use more of it than is normally used by Western nations in the production of iron and steel. The Soviet steel industry ordinarily consumes relatively little scrap metal. This is because, industrially speaking, the USSR is a young nation, lacking a large supply of obsolete capital equipment, which, in a country like the United States, provides about one-half of the

[14] From the Russian point of view the most attractive feature is the capital-saving nature of the increase in productivity. By means of a few calculations it can be shown that the unexpected increase in productivity—that is, the increase in excess of the planned—achieved during the fourth Five Year Plan alone (1946–50) permitted the saving of capital investment in blast furnaces equivalent to the capacity of the entire industry in 1913 or 1929. In my opinion, however, such spectacular capital savings are a thing of the past. Productivity will continue to improve, but the Russians have already pushed their existing equipment to the point where further improvements will require more substantial investments than they have heretofore.

[15] This discussion of raw materials is based on Clark, *op. cit.* (note 1 *supra*), Chaps. VII–X.

scrap consumed by our steel industry. In the Soviet Union the corresponding share is closer to one-fifth. The United States, England, and Germany have approximately four times as big a scrap fund, in relation to the demand for it, as does the USSR.

World War II, of course, provided the exception to the rule and greatly increased the role of scrap in Soviet steel production. As the supply of war scrap from World War II began to dry up in 1950, collections were given a shot in the arm by intensive scrap drives associated with the Korean War. In 1939 scrap made up only 25 to 30 per cent of the open-hearth mix, but thanks to a tremendous increase in scrap collections, by 1951 Soviet open-hearth furnaces were consuming about the same share of scrap as is customary in an industrially advanced country such as the United States. Such collections could not long continue to be scraped from the bottom of the Soviet barrel. In each of the succeeding years, 1952, 1953, and 1954, the scrap-collecting administration was taken to task for failure to fulfill its assignments, and the ratio of steel to pig iron production fell off.

Coking coal

The paucity of scrap forces the Russians to rely on pig iron for the manufacture of steel, and the basic ingredients for the smelting of pig iron are coking coal and iron ore. The economic importance of any coal basin depends not only on the quantity of its coal reserves, but also on the quality of the coke obtainable from the coal. The most important coking coal basin is the Donbass in the Ukraine. Donets coal has been for a long time the most sulphurous of any of the world's well-known metallurgical cokes. Furthermore, it contains more ash than coke from Durham, the Ruhr, Silesia, and Pennsylvania. Another big drawback of Donets coal is its unfavorable deposition, which results in a steady increase in the cost of mining. In spite of these disadvantages, the relatively favorable location of the Donets Basin has resulted in its continued expansion under the Soviet regime. Rapid exploitation has dug deeply into Donbass reserves of coking coal, which were small to begin with. The Soviet leadership was aware of the increasing shortage of the better grades of coking coal, but it was not until after World War II that the problem was really faced. There is now a difference of opinion among Soviet scientists and technicians on how to solve it. One school believes that the use of low-grade Donets coal for coking will suffice, while another sees no satisfactory solution and resigns itself to a further shifting of the center of gravity of pig iron production to the east.

The Kuznetsk Basin in Western Siberia is, next to the Appalachians in the United States, the second richest coal region in the world. Tremendous supplies are concentrated in a compact area. Coals of the Kuzbass yield good-quality, low-sulphur coke (their principal drawback is friability). Not only is the quality of Kuzbass better than Donbass coke, but also its very favorable deposition makes it much more economical to mine. The reserves of the Kuzbass at first glance appear to be practically unlimited. Not until after World War II did we learn of a real shortage of Kuznetsk coking coal. We then discovered that the good-quality coking coals make up only a very small share of total coal supplies and that the better coals had been seriously depleted during the war. The only way out of the impasse has been to resort to more low-grade Kuznetsk coals, over the objections of blast furnace operators.

The third most important coking coal basin is Karaganda in Kazakhstan, which was opened up in the 1930's as a substi-

tute for Kuzbass coal, which involved an even longer haul to Magnitogorsk. The main problems of using Karaganda coal for coking are concerned with its extremely low quality, not with any apparent lack of quantity. Although not so bad as the Donbass, Karaganda coal is very high in sulphur. But the main disadvantage of Karaganda coal is its very high ash content, which makes impossible the use of straight Karaganda coke in a blast furnace. In spite of its disadvantages and the great distance of Karanganda from the Urals, the fact that the Kuzbass is even further away has favored the steady increase in the share of Karaganda coal in the Magnitogorsk coke ovens, reaching the technical upper limit of 40 per cent.

The Kizel' coal basin lies on the western slope of the Urals. As the best coking coals of the basin average 25 per cent ash and 6.5 per cent sulphur, even the faintest possibility of using coke made from straight Kizel' coals in blast furnaces is precluded. Nevertheless, the supplying of coal from outside sources to the Urals, particularly the northern Urals, is so expensive that continual efforts are made to use Kizel' coal as one component of the mix for Urals' metallurgical coke. The results have been disheartening.

The inability to use large amounts of either Kizel' or Karaganda coal in the coke mix of the Urals' iron and steel plants has not only great economic but also strategic significance. If the Urals were to be cut off from their distant source of coking coal in the Kuznetsk basin of Western Siberia, there would be little possibility of producing the high-quality sulphur-free pig iron required in modern machinery and armaments. This consideration underlines the necessity for developing a new source of good coking coal for the Urals. The best possibility is the Pechora Basin, which lies above the Arctic Circle. The deposition of Pechora coal is more favorable than that of the Donbass. Sulphur content is high, but not prohibitive. Great difficulties, however, arise from the high content of ash and from the arctic climate, which makes reduction of the ash very difficult. Pechora is connected with the Leningrad area by railroad and has been selected as the coal base for the new Northwest Works being built at Cherepovets, near Leningrad. The potential expansion of this works, however, is quite limited. Pechora has a much greater potential as a coking coal base for use with the iron ore of the Urals. Construction of a railroad between points three hundred miles distant by air, under extremely harsh climatic and topographical conditions, appears to be the main deterrent. We are convinced, nevertheless, that any sizable expansion of the Soviet iron and steel industry clearly requires the smelting of Ural's ore with Pechora coking coal.

Total coal supplies in the outlying regions of Eastern Siberia and the Far East are tremendous, but their poor quality has defeated attempts to use them for metallurgical coke, and offers little encouragement for the future. Anything more than token development of iron smelting in either Transcaucasia or Central Asia seems to be ruled out by both the limited quantity and atrocious quality of their coking coal supplies.

As might be expected, the Soviet leaders have turned to beneficiation to alleviate their growing shortage of good coking coal. Beneficiation involves the elimination of waste and harmful impurities and makes it easier to utilize lower-grade coals for coking, a shift which is absolutely essential for the continued operation and growth of the Soviet iron and steel industry. Until the latter part of the fourth Five Year Plan the Soviet Union was rather backward in the extent of its beneficiation, compared to the Western world. Nevertheless, considerable progress has been made in recent years. The share of coal enriched jumped from 19 per cent in 1940 to about 40 per cent in 1949 and has continued to increase in recent years.

Iron ore

The influence of iron ore on industrial location and development has to be examined with an eye to both the chemical and physical characteristics of some seventy-five deposits. The importance of a handful of these deposits, however, overshadows the rest. In 1940, 63 per cent of the iron ore produced in Soviet Russia came from the mines of Krivoi Rog in the eastern Ukraine, which provide the basic ore supply for the south and supplementary supplies for the central region as well as for satellite mills in Eastern Europe. The iron content of Krivoi Rog ore is still high by European standards and reserves are very large, but the rapid expansion of production since 1928 has forced the industry to resort to steadily lower-quality ores. In fact, Krivoi Rog ores are so fine and powdery that they need to have specially high ore content to be practicable for blast furnace smelting. The progressive worsening of the quality of Krivoi Rog ore has been a compelling reason to prospect and develop new iron and steel centers outside the south. Nevertheless, Krivoi Rog remains a bulwark of the Soviet iron and steel industry. Restoration work began as soon as the German army was driven out of the basin, and by September 1952 average daily production had risen to almost 50 per cent above the prewar level.

For almost half a century another southern deposit on the Kerch peninsula of the Crimea has supplied approximately 3 per cent of the Russian iron ore output. Reserves are enormous, but their iron content is low, averaging about 31 per cent iron, and they are full of harmful impurities, particularly arsenic. In physical composition Kerch ore is practically pure powder. The disadvantages of Kerch iron ore make it cost 40 per cent more to produce pig iron than it costs using Krivoi Rog ore. The Russians continue to use Kerch ore chiefly because they are running out of high-grade iron ore.

The basic ore mass of the Urals, second in importance to Krivoi Rog among all Soviet deposits, is Magnitogorsk, which in 1937–38 produced one-quarter of the USSR total. When the giant steel works began operations in 1932, the impression was widely held that it could depend on a practically unlimited supply of some of the world's best iron ore. Our present calculations now indicate, however, that at current rates of consumption the deposit will be exhausted by about 1978. This prediction is optimistic, because it would be difficult to utilize all of the remaining ore. Recognition of this situation has resulted in attempts to develop poor and distant deposits to take the place of the Magnitogorsk's original supply.

The 1950 Plan called for 21 per cent of the nation's iron ore to be produced from Urals deposits other than Magnitogorsk. Not one of these deposits is large enough to be described in this summary. Their generally small size precludes large-scale and continued exploitation, but their large number and relatively high quality make them the best prospects in the Soviet Union for meeting the needs of an expanding pig iron production in the near future.

In recent years, local ores have been increasingly substituted for Magnitogorsk ore at the Kuznetsk works in Western Siberia. The supplies of Western Siberian ore are meager, low in iron content, and high in harmful impurities.

By Soviet admission they will last only a few more years, and the zinc content is too high for efficient operations without significant additions of Magnitogorsk ore. It appears likely that Kuznetsk will eventually turn to low-grade ores located several hundred kilometers away in the Minusinsk Basin. The only other Soviet deposits which now furnish significant supplies of ore are found near Tula and Lipetsk, south of Moscow. Their iron content averages 37–40 per cent, and they are very expensive to mine. In 1950 they were to provide less than 3 per cent of national output, mostly for smelting high-silica foundry iron. In the Leningrad region scattered low-grade deposits may not even meet the requirements of the Northwest Iron and Steel Plant, now under construction.

Other than those we have described, all of the nation's deposits taken together were scheduled to produce less than 3 per cent of Soviet requirements in 1950. For a multitude of reasons, peculiar to each deposit, none of these other deposits is likely to provide much help in meeting the growing needs for ore in the foreseeable future. The exception to this rule may prove to be the ores of the Angara River basin. In spite of their poor quality, limited quantity, and great distance from good coking coal, consumer markets, and transport facilities, the extreme shortage of preferable iron ores in the whole area from the Urals to the Pacific Ocean may force development of the Angara supplies.

Faced with the necessity of utilizing ores of lower grade, the Russians have found a partial solution to the economic and technical problems involved by preparation of the ores preliminary to charging them into blast furnaces. In 1913 practically 100 per cent of Russian ore was charged into the blast furnaces in a raw state, but by 1946 over four-fifths of the ore was treated in one way or another. Since 25 per cent of Magnitogorsk, 50 per cent of Krivoi Rog, and 100 per cent of Kerch ores consist of fines below ten millimeters in diameter, the Russians have put heavy emphasis in recent years on agglomeration. In this process, sometimes called sintering, the powdery material is baked into usable lumps.

Possible alleviations

Shortages of high-grade ore and good coking coal impose serious limitations on the expansion of the Soviet iron and steel industry, but, of course, these are not absolute limitations. They can be alleviated to some extent by massive investments in beneficiation and transportation facilities. Fortunately the United States is much better supplied than the USSR with good coking coal, and we are to a large extent meeting our shortage of good Lake Superior iron ore by importing high-grade foreign ores. But we are also attempting to utilize our low-grade domestic ores. The tremendous sums we are investing in facilities for the beneficiation of Minnesota taconite ores will give us an inkling of the much more serious task facing the Russians.

On the basis of our brief consideration of certain key economic factors we conclude that continued expansion of Soviet steel production at the current rate of three or four million tons a year is possible only at the expense of immense capital investments.[16] At the same time a cut in the consumption of steel by armaments would help the Russians avoid some of the technical and investment problems associated with further expansion. We have a strong suspicion that the leaders responsible for the expansion of the Soviet iron and steel industry would welcome such a reprieve.

[16] The Russians are well aware that the expansion of ingot steel production by the simple addition of scrap metal to the open-hearth charge requires relatively little capital investment. Unfortunately for them their lack of scrap metal forces them to invest in blast furnace plants and transportation facilities, as well as in iron and coal mines, in order to expand steel production. Furthermore, all of these investments must be greater because of the worsening quality of the coke and ore.

WHAT OF PEACEFUL COEXISTENCE?

The precise manner in which the Russians spend their precious capital and natural resources to expand steel production may give us a clue to their real long-run intentions for peaceful coexistence with their satellites and with the Western world. The Russians publicly proclaim that they want to develop the whole Communist bloc of nations into an integrated economic unit, but they contradict their professed policy by building high-cost steel plants within the USSR that can be justified only in terms of a policy of economic autarky. They admit, for example, that their long-delayed Northwest Works near Leningrad will be a high-cost operation. We wonder, therefore, why they have not diverted the machinery and building funds from the Northwest Works to further expansion of low-cost blast furnace plants in Poland, using Polish coal and either Russian or Swedish iron ore. If this were to be done, the Poles could supply pig iron to Leningrad machinery and munition plants.[17] Likewise it would be much more economical for the Russians to give up the fifteen-year attempt to smelt pig iron in the Soviet Far East from grossly inadequate local iron ores and poor coking coal, and to rely instead on their "trusted allies" to supply cheap pig iron from Manchuria and North Korea.

In the city of Zhdanov on the shores of the Sea of Azov are two Soviet blast furnace plants, one of them part of a completely new and integrated tidewater steel mill. These mills are struggling at a very high cost to utilize low-grade, high-arsenic, and powdery ores from the Crimea. The plant managers would certainly be delighted to sweeten their blast furnace mix with a share of some of the world's best-quality iron ore from Turkish mines on the other side of the Black Sea. If the Soviet leadership is looking forward to a long period of peaceful coexistence, they should be glad to rely for an essential raw material on their good neighbors, the Turks. In other words, both comparative economic advantage and professed Soviet political policy would favor integration of the Soviet iron and steel industry with the resources of Soviet satellites and the Western world. If the Russians, nevertheless, take no serious steps in the direction of industrial integration, we may conclude that they have serious political reservations about long-run prospects for peaceful coexistence.

[17] By now the construction of the Northwest Works may be so far along that it cannot be curtailed. Even if this is the case, the Russians still face a choice in deciding how to meet expanding future needs of the Northwest Region.

M. Gardner Clark, Ph.D., Ithaca, New York, is associate professor in the New York State School of Industrial and Labor Relations and the Department of Economics, Cornell University. He has taught at the University of Minnesota and Harvard University, served as a consultant on the Soviet economy, was a Fulbright research scholar, and has been a contributor to professional journals. He is the author of a forthcoming monograph on the Soviet iron and steel industry.

Soviet Agriculture Since Stalin

By Gregory Grossman *

THE collective farm system, now a quarter of a century old, has played a crucial role in Soviet industrialization by assuring a steady supply of manpower and "marketable" produce for the needs of the state. But it has failed so far to keep food production abreast of the rapidly growing population, and through its repressions has incurred the hostility of the peasantry.[1]

Any system of farming on the territory of the USSR would have to contend with the unfavorable ratio of population to resources, as the enormous area belies the country's agricultural potential. The poor correspondence between moisture, soil quality, and warmth is particularly marked. But in the short run, nature would represent a much less formidable constraint were it not for a series of interacting economic, institutional, and psychological factors. Despite great strides in mechanization, Soviet agriculture is far from amply supplied with draft power and other forms of capital,[2] nor has the capital been always wisely allocated or well employed. Shortages of shelter, fertilizer, spare parts, and various essential supplies are perennial themes of complaint.

By 1953, livestock numbers (Table 2), as well as average productivity per animal, were still at or below the precollectivization (1928) levels, owing primarily to chronic shortages of feed, poor care given by the kolkhozy to their herds, and inadequate resources of private owners.

Although centralized control affords certain advantages even in agriculture, Soviet planning has been extremely overcentralized, authoritarian, and often inept and perverse. (Recent reforms in this respect are discussed below.) Having had virtually no leeway with regard to production, and very little with regard to disposition of product, and having been in effect penalized (through higher delivery quotas) for larger output, the kolkhozy have often responded by forgoing initiative, avoiding undue effort, and practicing deceit.

Because the state takes much out of a small output and gives little in return, the "dividends" from the kolkhoz to an individual member have been low in relation to time expended, and the peasant has tended to shirk kolkhoz work in favor of his own plot. Because, under the prevailing production conditions, reward is often not commensurate with effort, the quality of kolkhoz work has been poor. Pilferage and neglect of property abound. Labor-intensive tasks (such as livestock care) and long-range improvements suffer most.

Low labor incentives, inflated clerical staffs, wasteful methods, and inadequate capital go far to explain the paradox of an apparent labor shortage in the kolkhozy when nearly one-half of the population is still on the soil. The dearth of adult males has been especially serious. War losses, migration to towns and construction sites, withdrawals to the armed forces and to penal camps, have so drained the Soviet village of adult men that the bulk of kolkhoz labor in recent years has been done by women and youngsters.

Production Record to 1953

As Table 1 shows, the gross output of agriculture per capita has not risen significantly since 1928, if at all.[3] However, nonedible crops (mainly cotton), as well as nonfood uses of edible crops, have grown in relative importance; while grain crops have barely kept up with population growth since 1928 (Table 1) —or for that matter since the 1890's. The output of edible livestock products per capita, by Jasny's estimate, was "at least 30 per cent lower in 1952 than in 1928."[4] These and other data lead to the conclusion that per capita food supply for the country as a whole was substantially lower in the early fifties than in 1928, especially in terms of nutritional value. In this regard, the urban population has fared better over time than the peasants. However, wage-price studies, and the data on "marketings" of farm produce (adduced by Khrushchev as evidence of the success of socialized agriculture),[5] indicate that even in the urban sector average food consumption in 1952–53 was at best near the 1926–28 level.

During the latter years of the Stalin era considerable improvement in urban consumption levels took place, though largely by dint of increasingly heavier pressure on the village to deliver produce out of a stable or only moderately rising total output. Major reliance for the expansion of agricultural production was placed on a series of heroic and for the most part long-term programs, such as the introduction of complex crop rotation on a vast scale, mergers of the kolkhozy to a little over one-third the former number, the shelter-belt program "to transform nature," grandiose irrigation schemes, and an ambitious (and unsuccessful) three-year plan to increase livestock numbers. Simultaneously, the ownership of productive livestock was being rapidly shifted from individual households to the kolkhozy by exerting economic and administrative pressure on the former. The fifth Five Year Plan (1951–55; announced in August 1952) called for something like a 50 per cent rise in agricultural output over the quinquennium, to be attained primarily by raising sharply yields per hectare and productivity per animal. But having rallied from the very low wartime and early postwar levels, by the early fifties total agricultural output seemingly reached its immediate limits of expansion, and even showed signs of incipient decline in some sectors.

* The author is indebted for valuable comments to his colleagues, Professors J. B. Condliffe, D. R. Hodgman, G. M. Kuznets, and J. M. Letiche. The Bureau of Business and Economic Research, University of California (Berkeley), kindly furnished general assistance, while Mr. Benjamin N. Ward aided in the research.

[1] At present, the bulk (say, four-fifths) of Soviet agricultural output is produced by the collective farms (kolkhozy) and on the tiny private plots of their members. Most of the remainder is produced by state farms (sovkhozy), employing wage labor. Uncollectivized peasant farming has by now declined to a negligible level.

The kolkhoz is nominally a co-operative, but actually functions under very close control by the authorities. (On the structure and problems of the kolkhoz see: Naum Jasny, *The Socialized Agriculture of the USSR* [Stanford, Calif.: Stanford University Press, 1949]; and Lazar Volin, *A Survey of Soviet Russian Agriculture* [Washington, D. C.: U. S. Department of Agriculture, 1951].) It averages nearly 5,000 acres of arable land and a labor force of several hundred. Nine such farms, on the average, are serviced by the equipment pool of a state-owned machine-tractor station (MTS).

[2] In part due to the large loss of horses during collectivization and again during the war, tractor and animal draft power per acre of sown area was still about one fifth less in 1952 than in 1928, when it was none too adequate. (Cf. Table 1; this estimate does not take into account the high rate of standstill of Soviet tractors.)

[3] It must be noted that the dates in Table 1 are not representative in this regard, as they straddle two deep troughs: the collectivization crisis of the early thirties and World War II.

Urban population—derived from Soviet sources and total population data. *Gross output of agriculture*—estimates by Naum Jasny at 1926–27 prices (*The Soviet Economy During the Plan Era* [Stanford, Calif., 1951], p. 17, and "A Close-up of the Soviet Fourth Five-Year Plan," *Quarterly Journal of Economics*, Vol. 66, No. 2 [May 1952], p. 165) and Soviet indices for 1950 (*Pravda*, September 15, 1953) and 1952 (*Voprosy ekonomiki*, 1953, No. 8, p. 55). Sown area, all crops—from Soviet sources (cf. Nancy Nimitz, "Statistics of Soviet Agriculture," Santa Monica, Calif.: The RAND Corporation, 1954 [duplicated]). Grains—1928 and 1938, Jasny *Socialized Agriculture* . . . (note 1 *supra*), p. 793 (1928 figures are official); 1940–1954, Sown area, Soviet sources (cf. Nimitz, *op. cit.*); Yield, computed from crop and sown area; Crop, 1940, Jasny, "Soviet Grain Crops and Their Distribution," *International Affairs*, Vol. 28, No. 4 (October 1952), p. 459; 1954, Benediktov's statement to the American farm delegation that the crop was "above 6 billion pud [pood]" (*New York Times*, August 21, 1955), which is taken to mean 6–6.3 billion pood; 1950–1953, from Soviet statements on the sizes of the grain crop in these years in relation to each other and to 1954. Cotton—1928–1950 and 1953 are official figures (cf. Jasny, *Socialized Agriculture* . . . [note 1 *supra*], p. 795, Nimitz, *op. cit.*, and United Nations Economic Commission for Europe, *Economic Survey of Europe in 1954* [Geneva, 1955], p. 79); 1952 and 1954, estimates cited in *New York Times*, August 21, 1955. Horses—official data (cf. Nimitz, *op. cit.*), except for 1952, which is the average of beginning and end of year figures raised upward by 5 per cent for seasonal adjustment. Tractor power—official data (cf. Nimitz, *op. cit.*, p. 49), except that 1952 figure has been projected back from October to January on the basis of current deliveries; 1954, *Planovoe khoziaistvo*, 1955, No. 3, p. 18.

The New Course in Agriculture

Thus, when Stalin's successors drew back the official façade of relentless progress and informed the world that all was not well with Soviet agriculture, the novelty lay less in the fact than in its frank and full admission.[6] The situation must be seen in relation to the rapid rates of growth of the total population (1.5 per cent per annum) and especially of the urban population (4.5 per cent per annum) with its higher consumption standards; the expanding claims of industry for agricultural raw materials; the difficulties experienced in other countries of the Soviet orbit with regard to agriculture; and, overhanging all these, the uncertainty implicit in the Korean crisis. Not only were higher living standards in jeopardy and military security at stake, but a Malthusian retrogression was drifting into sight. This was the problem inherited by the successor regime, a problem which the very act of succession, with its need for a gesture in the direction of the consumer's aspirations, aggravated before beginning to resolve it.

Malenkov's speech before the Supreme Soviet on August 8, 1953, formally announced the concerted drive toward a solution in agriculture, going so far as to throw out the incautious slogan of "abundance of food for the population and of raw materials for light industry in two to three years." (Shortly thereafter the phrase "a sharp rise" superseded "abundance" in the formulation.) A month later the first of Khrushchev's reports on the agricultural situation was delivered before the Central Committee of the party,[7] and the matter seems to have resided in his hands since then. Both spokesmen attempted to explain the lag of agriculture (and light industry) behind the rest of the economy by the historical necessity to develop heavy industry first, yet they have freely admitted that misplanning, improper incentives, de-emphasis of the private plots, and other functional ills have played no less a role than the lack of investment funds. Throughout the fall of 1953 a series of higher targets for consumers' goods production and sales were announced, though commodities dependent on agricultural raw materials underwent only moderate revision. The new targets hardly spelled "abundance"; but, more significantly, they did constitute a clear commitment to better the consumer's lot, largely through higher productivity in agriculture.[8]

Far from transforming the basic institutional framework of Soviet agriculture, the measures taken since 1953 clearly aim at strengthening it, largely by manipulating the established range of incentives and tightening some of the traditional controls over the peasantry. The revisions in planning are less fundamental than they might appear at first glance, since the authoritarian centralism that characterized planning in the Stalin era seems only to have changed its focus without losing much in its force.

Livestock products

It is hardly surprising in view of what has been said above that animal husbandry received major attention from

[6] However, the black picture now painted should also not be accepted uncritically. In part, malperformance may be exaggerated in the official records as a result of concealment of produce and income by the peasants; in part, the dark tones may be intentionally overpainted to spur the "campaign."

[7] Published in *Pravda* on September 15, 1953; the Central Committee resolution thereon was published on September 13.

[8] On this set of measures see Lazar Volin, "The Malenkov-Khrushchev New Economic Policy," *Journal of Political Economy*, Vol. 62, No. 3 (June 1954), pp. 187–209.

TABLE 2—PRODUCTIVE LIVESTOCK IN THE USSR
(In millions; data refer to postwar boundaries)

	January 1 Counts					October 1 Counts		
	1916	1928	1938	1941	1953	1953	1954 Plan	1954 Actual
Cattle	58.4	66.8	50.4	54.5	56.6	63	65.9	64.9
Cows	28.8	33.2	[a]	27.8	21.3	26	29.2	27.5

NOTE: October counts are normally higher than January counts. Soviet livestock data, especially after 1928, may not be very accurate.

the start. The pronouncements of September 1953 [9] called for a considerable increase in total livestock herds by October 1, 1954 (Table 2). These targets were later advanced to an unspecified extent, probably to allow for the original serious underestimate of actual hog numbers.[10] Though additional incentives were held out to promote private ownership of livestock (especially cows), emphasis was to remain on the "socialized" herds.

Productivity per animal was to rise even faster than numbers, chiefly by improving the feed situation. Thus, the average milk yield per cow in the kolkhozy, which had shown no tendency to rise for over a decade, was to increase by one-third over the next twelve months. The quest for "marketable" output was evident in these measures; thus, the high goal for state procurement of meat (a planned 37 per cent increase between 1952 and 1954) seemed to jeopardize the program of building up herds.[11]

[9] See *Pravda*, September 13, 15, and 26, 1953.

[10] *Pravda*, January 31, 1954.

The new lands

In February 1954 [12] the decision was taken to bring under the plow vast areas of "virgin and idle land" along the arid southeastern margin of cultivation, primarily for grain. In 1954, 13 million hectares (32 million acres) were to be plowed, and 2.3 million hectares were to be sown. These goals were exceeded

[11] The specific measures aimed at increasing the output and delivery of various field crops (potatoes, vegetables, cotton, flax, and hemp), published between September 1953 and May 1954, cannot be discussed here for lack of space.

[12] Published in *Pravda* on March 6 and 21, 1954.

and, by a supplementary decision, in 1956 the sown area in the new lands is to reach 28 to 30 million hectares (69 to 74 million acres).[13] Originally, an average (barn?) yield of 14 to 15 quintals per hectare was expected from the new lands, but after a year's experience Khrushchev spoke of 10 quintals per hectare "as a minimum." [14] Thus by 1956 the new lands are expected to provide a (barn?) crop of 28 to 30 million tons, or roughly 30 per cent as much as the total (favorable) 1952 grain harvest.

The action is conducted as a major campaign on the internal front, with relentless propaganda pressure and attempts to enlist widespread popular cooperation. It is notable on several other scores. It completely reverses the earlier policy, embodied in the fifth Five Year Plan, of expanding grain production by raising yields per acre rapidly and with minimal extension of sown area. It attempts to create a new granary in an area of fertile soil but very little and highly inconstant precipitation (for the most part, 10 to 16 inches per year), short growing season, and other natural handicaps. Population is sparse and the labor force must be brought in from the outside; large outlay on housing, transport facilities, and so forth, is required. On the plus side (apart from increasing the total grain crop) it brings cultivation closer to major food-deficit areas in the east and south and removes it farther from strategically vulnerable locations.[15]

[13] *Pravda*, August 17, 1954; by 1960 the scheme is to embrace even more, as some land will revert to fallow or be sown to other crops (*Pravda*, February 3, 1955).

[14] *Pravda*, December 24, 1954, and February 3, 1955. In terms of wheat, 10 q./ha. are about 15 bu./acre.

[15] For a general analysis see Lazar Volin, "The New Battle for Grain in Soviet Russia," *Foreign Agriculture*, Vol. 18, No. 11 (November 1954), pp. 194–99.

The corn-livestock program

The disappointments with the progress of the initial measures were probably the main reason for a fresh approach to the livestock problem adopted in late January 1955.[16] Its goals were set for 1960, the terminal year of the next (sixth) Five Year Plan, but only a few months later Khrushchev forecast their attainment in three to four years (that is, by the end of 1957 or 1958).[17] The central goal of the new program is a grain crop (presumably in "barn" terms) of 164 million metric tons, of which "over" 65 million tons are to be diverted for animal feed. It necessitates an increase of 60 to 70 per cent over the "barn crop" levels of 1950–54, and although the implicit "barn" yield per acre is more modest than in earlier plans, it still must rise some 20 to 40 per cent over the yields in recent years. Much stress is placed on reducing the high harvesting losses.

The fodder aspect of the scheme in large part depends on extending corn planting to "no less than" 28 million hectares (69 million acres), or eight times the 1953 area. The corn program has become the subject of a new campaign—the peg on which the main hopes for livestock products are currently hung. It is now claimed that corn can be usefully grown far outside its traditional bounds (southern European Russia), even where the ears will not ripen, because of the silage yield and because grain in the "milk stage" is of equal feed value with ripe grain.[18]

[16] Published in *Pravda*, February 2 and 3, 1955.

[17] *Pravda*, May 19, 1955.

[18] The last point is contrary to American experience, which also indicates that silage yields increase with approach to maturity (D. Gale Johnson, "Analysis of Khrushchev's Report on Livestock Produce" [March 15, 1955], unpublished).

Along with corn very large increases in the supply of other fodder (potatoes, root crops, and so forth) by 1960 are expected.

In accord with the new planning method, discussed below, no targets for livestock numbers are now indicated. Milk yield per cow in the kolkhozy is to rise to 1,700 kilograms, that is, by about one-half over the six (or 3–4?) years. Output of the main livestock products is planned to increase between 1954 and 1960 (or 1957–58?) in the following proportions: meat and fat, twofold; milk, twofold; eggs, 2.2-fold; wool (all types), 1.8-fold.[19]

What steps have been taken to bring these programs to realization?

MATERIAL RESOURCES

Draft power received early attention. From 1954 to mid-1957 the average annual rate of tractor shipments to agriculture (in terms of horsepower) is to be about one and one-half times as much as was delivered during 1953, almost the whole increase in shipments to be in row-crop tractors, of which there has been a marked shortage so far.[20] In 1954 over half the shipments of tractor power and nearly half the shipments of combines went to the new lands, very likely to the detriment of replacement and expansion in the old areas of cultivation.

Intentions to increase deliveries of other types of equipment have also been announced, with particular attention to the mechanization of hitherto largely neglected labor-intensive tasks, especially in animal husbandry and feed production. The stress on raising labor productivity in agriculture by means of expensive machinery tends to corroborate the hypothesis of labor shortage on the farms. The supply of artificial fertilizer is planned to increase nearly threefold from 1953 to 1959, and nearly fivefold by 1964, but failure to mention earlier targets strongly suggests little immediate improvement in this scarce item.

LABOR

The poverty of the village doubtless contributed to the large-scale flow of the peasant population to towns in postwar years; nine million are said to have migrated "in the last five years" (1950–54?) alone.[21] Even tractor drivers, the economic elite of the kolkhoz, left in large numbers. No wonder then that the "intelligentsia" likewise shunned the village. It was said in September 1953 that of the 350,000 trained specialists in agricultural work, only 18,500 worked in kolkhozy, and 50,000 in the MTS. The measures announced in that month called for a large redeployment of skilled and professional personnel to the village. By early 1955, about 120,000 agronomists and livestock specialists were said to be at the MTS serving the kolkhozy, and over 20,000 engineers and mechanics were added to MTS personnel. In addition, 1,250,000 tractor drivers were transferred from the kolkhozy to permanent MTS employment, with consequent increase in earnings, in order to improve their performance.

The new-lands program carried this planned reverse migration to an unprecedented extent, though one must distinguish between peasants moving from overpopulated western regions to kolkhozy in the east, and townsfolk going to staff the new sovkhozy and MTS on the virgin lands. The latter are mostly urban youths recruited through the Komsomol and places of employment. Considerable financial (and even marital) incentives are offered to the migrants; but the harsh and primitive conditions of life on this "front" are a deterrent, as the Soviet press admits. Nominally, all migrants are volunteers, though the authorities undoubtedly exert pressure. In a few months after the summons, 150,000 persons from other industries are said to have arrived in the new sovkhozy and MTS; the number of kolkhozniki who have also moved has not been revealed. Eventually the new lands will undoubtedly require millions of settlers.

[19] *Pravda*, February 2 and 3, 1955.

[20] See *Izvestiia*, May 11, 1954, for sharp criticism of past emphasis on heavy all-purpose tractors.

[21] Khrushchev in *Pravda*, February 3, 1955; it is not clear whether return flow has been deducted from this figure or not. There are no reliable data on the size of the agricultural labor force for the postwar years.

INCENTIVES

The problem of incentives has been attacked on several fronts.

1. The gross money incomes of both the kolkhozy and the individual households have been increased by the twofold device of raising the prices paid by the state for obligatory deliveries and contractual purchases and simultaneously reducing or eliminating the obligatory delivery quotas for a number of important commodities. However, it seems that the contractual purchases have been transformed into a kind of obligatory delivery at higher prices, an arrangement which tends to explain the fact that sales on the open market have hardly increased at all since the "New Course" was launched.[22] Thus, to the extent that the combined gross money receipts of households and kolkhozy have risen, they have done so almost entirely on account of the larger money payments by the state,[23] that is, by an estimated 15 per cent in 1953 and again by as much in 1954.

2. The money tax paid by the households (though not that paid by the kolkhozy) was to be reduced by "over" 60 per cent (or by about 6 billion rubles) by 1954; arrears of this tax were canceled.[24] The annual bond drive (affecting peasants as well as others) was halved in 1953 but was restored to the previous level in 1955.

3. The disincentive effects of the various progressively graduated levies and fees were recognized, and remedies were introduced. Thus, the tax on households mentioned above, which had varied with the use made of the private plot, was now to be strictly proportional to the land area of the plot, though with considerable differentiation geographically and even as between individual villages. The local officials who, in their zeal to meet their own plans, had transformed the nominally fixed obligatory delivery quotas (for kolkhozy and households) into de facto highly progressive ones were now enjoined to refrain from the practice. Lastly, the fees in kind paid by the kolkhozy to the MTS, which had been on a "sharecropping" basis to stimulate the latter to better performance (but seemingly with limited success), were now made independent of yields. These reforms appear sensible and may have a positive effect on kolkhoz production, if, of course, they are properly observed by the authorities on all levels.[25]

4. Specific incentives were also reexamined. Prices and delivery quotas

[22] Sales on kolkhoz markets in 251 cities were 3 per cent greater (presumably in value terms) in 1954 than in 1953 (*Sovetskaia torgovlia*, 1955, No. 4, p. 3); this very likely means a decline in the volume of sales because of higher market prices in 1954. It was anticipated that in 1955 sales value would remain at approximately the same level (inferred from data in *ibid.*, 1955, No. 7, p. 21).

[23] These increased by 12 billion rubles in 1953, and by another 13 billion rules in 1954 (*Pravda*, February 3, 1955).

[24] See *Pravda*, August 6 and 10, 1953.

[25] Apparently the injunction against flexible delivery quotas was not successful in ending the practice; cf. Khrushchev in *Pravda*, February 3, 1955, p. 4. Moreover, the contractual purchases may now be similarly abused.

have been readjusted to bring higher returns for commodities lagging in output, such as livestock products, potatoes, flaxseed, and so forth. Remuneration schedules for peasants and MTS workers engaged in the production of these commodities have been raised; bonus provisions have been greatly expanded. The typically Soviet system of contingent counterdeliveries of consumers' and producers' goods to the peasantry has been further elaborated. But it is difficult to appraise these measures fully because of their complexity.

5. Lastly, it should be remembered that the program of "sharply rising" consumers' goods supply, announced in the fall of 1953, not only was based on rising agricultural production but was also clearly designed to stimulate it by way of material incentives to the peasants. The return of emphasis to heavy industry in early 1955—not that it had strayed very far in the direction of light industry before—may thus be of direct import to the agricultural picture as well.

CONTROLS

Controls over the peasantry have been tightened simultaneously.

1. The labor contribution required of every kolkhoznik was raised in mid-1954.[26] Earlier, in October 1953, enforcement of the requirement by criminal proceedings was abandoned, probably because of the conspicuous failure to bring about full compliance by this method.[27] Reliance is now placed (apart from administrative measures) on a special surcharge of 50 (and in some cases 75) per cent on the household tax in the event that *any* member of the household fails to meet his or her minimum labor requirement, and obligatory deliveries of meat by kolkhoz households are also raised 50 per cent in the same event. Other measures to elicit better labor participation in the kolkhoz include new attempts to bring individual effort and reward into closer relationship, a more liberal system of advances against *trudodeи* credit before the end of the year, and—in reversal of recent policy—a shift toward the smaller work team (*zveno*), as against the larger "brigade." Presumably, the higher money earnings of the kolkhozy are in part transmitted as "dividends" to individual kolkhozniki, an arrangement which may also improve "labor discipline."

2. The position of the machine-tractor station as the regime's "stronghold" in the countryside has been considerably reinforced; it is now virtually the administrative superior of the kolkhoz. Correspondingly, its responsibility for kolkhoz performance, both in production and in deliveries, has also been enhanced. Tens of thousands of technical experts, recently removed from desk jobs, are being concentrated in the MTS. Moreover, each MTS now contains a team of party "instructors," headed by the district party chairman, who are "actively to intervene in kolkhoz life," to supervise it daily, to initiate action where necessary, but somehow "not to supplant the chairman of the kolkhoz."[28] This is one way in which the party is to penetrate deeper into the village, where it had been greatly underrepresented heretofore. It must in-

[26] The new minimum requirements, to be set by each kolkhoz, must be above the minima in effect in 1953 and are subject to confirmation by district authorities (*Kommunist*, 1954, No. 15, p. 66). It seems that approximately a doubling of the previous minima, enacted in 1942, was aimed at.

[27] Interestingly, the change has not been publicized, and is known from a passing reference in *Partiinaia Zhizn'*, 1955, No. 2, p. 15. I am indebted to Mrs. Luba Richter of Washington, D. C., and to Mr. John Grosberg of Munich for aid in locating the reference.

[28] Cf. *Partiinaia rabota v MTS* (Moscow, 1954), *passim*, especially pp. 36–37.

spire and supervise, and perform the *managerial function* as well. A case in which party vigilance saved seed potatoes from rotting is held up as an example.[29]

In April 1955 it was announced that 30,000 "experienced" functionaries, party members and others, were to take over as kolkhoz chairmen. One in every three kolkhozy was thus affected. The experience in question is probably other than farming, but this matters little—the chairman's production decisions are narrowly circumscribed—so long as the newcomers identify themselves more with the regime than with the peasants.

3. In January 1955 Khrushchev proposed that local authorities be permitted to keep 50 to 70 per cent of produce above fixed procurement quotas for local distribution, in order to stimulate their efforts to raise agricultural output and deliveries.[30] Presumably the scheme has since been put into effect. One may wonder whether, in accord with previous Soviet practice, it will not tend merely to reinforce the efforts of these authorities to secure lower procurement quotas.

PLANNING

Criticism of agricultural planning, expressed from the start of the "New Course," has been aimed largely at three related aspects: (1) Excessive detail and inflexibility in the tasks assigned to individual farms and MTS. (2) Employment of improper categories (for example, "biological" instead of "barn" crops) and wrong census dates (for example, for livestock, now moved from January 1 to October 1); and the planning of intermediate goals (for example, livestock numbers and sown areas) rather than final results, with nominal achievement of the former to the detriment of the latter. (3) Arrogant incompetence at the center in forcing the introduction of crops, rotation systems, and types of livestock where they are unsuitable.

After some minor steps,[31] a decree "On the Reform in the Practice of Agricultural Planning" was published on March 11, 1955, of which the avowed and reiterated purpose is to liberate initiative at the farm level. The planning process now is to begin with the drawing up of a detailed agricultural *procurement* plan by the government in which every kolkhoz is eventually assigned its share. On this basis the kolkhoz, in conjunction with the MTS, drafts a *production* plan, which must maximize the output of crops and animal products per unit land area. After approval by the district authorities, such plans are consolidated regionally and are submitted to the central government for confirmation. The sources do not indicate what happens if a kolkhoz and an MTS cannot agree, or if a higher level rejects a plan.

It is difficult to believe that the new planning system will release local initiative to the extent desired. The MTS and higher state organs retain their veto power over the plans of the kolkhozy, while remaining subject to overriding pressures themselves.[32] Suffice it to mention that the favored projects of the moment—corn growing, the Mal'tsev method of plowing, square-cluster planting—are being introduced with the same determination from above that marked the now condemned plans of yesteryear.

RESULTS AND PROSPECTS

Two of the "two to three years" invoked for the initial stage of the agricultural program have just elapsed as

[29] *Ibid.*, p. 61.

[30] *Pravda*, February 3, 1955, p. 4.

[31] *Planovoe khoziaistvo*, 1954, No. 5, pp. 81–83.

[32] The Soviet press has already begun complaining of indifference and pseudo compliance on the part of the peasantry, and of the persistence of authoritarian methods on the part of lower officials.

these lines are written. It would be hardly pertinent to observe that "abundance" has not yet been attained. Such gains as are discernible are modest and uncertain. Grain crops remained until 1954 substantially at the 1952 level, although the 1955 harvest seems to promise better. As regards livestock, according to the Soviet press, shortage of feed, inadequate care, and high mortality continue; the October 1954 targets were not met by substantial margins (Table 2), with the exception of hogs, for the "statistical" reason indicated.

Milk yield per cow in the kolkhozy rose during the "livestock year" ending October 1, 1954, by 7 per cent; in the sovkhozy by less than 1 per cent. Industrial output of "milk products"—an indication of procurements—increased by 23 per cent between 1952 and 1954, as against the planned 43 per cent rise in state procurements of milk. The drought which in 1954 affected the southern European area of the USSR and the western part of Kazakhstan seems to have been detrimental to dairy output.[33] However, by mid-1955 more definite improvement began to be claimed, although it is noteworthy that the situation in some of the major dairying regions (the Baltic states and certain central provinces) continues to deteriorate.

State procurements of meat (as measured by slaughterhouse output) increased 20 to 25 per cent between 1952 and 1954, as against a planned rise of 37 per cent. Although the drought may have played a positive role in this instance, procurements were still seriously lagging in the first half of 1955.[34]

[33] *Osteuropa*, Vol. 5, No. 3 (July 1955), pp. 220–21; on the extent of the drought see *ibid.*, No. 2 (April 1955), pp. 145–46.

[34] *Pravda*, June 6, 1955.

New-lands program

Substantial improvement in the supply of these and other livestock products has been pegged on the success of the two-pronged offensive on the "grain front": the new-lands program and corn growing. Large gains were claimed for the former during its first year: 17.6 million hectares (43.5 million acres) plowed and 3.6 million hectares (8.9 million acres) sown, instead of the planned 13 and 2.3 million hectares, respectively—this despite the very brief notice and the slow arrival of equipment and materials (especially housing). As with other Soviet "campaigns," quantity seems to have been achieved in part at the expense of quality.[35]

Nature was kind to the new lands in their first year of production, except in the western portion; the effects of the drought in southern European USSR on grain were thus offset. But despite very favorable precipitation as well as accumulated moisture in the soil, in 1954 the new lands as a whole hardly provided better than the 10 quintals per hectare to which Khrushchev later reduced the long-term prospect.[36] Yet even this long-run outlook for these marginal lands is questionable. It would exceed the yield (for all grains) in the country as a whole in recent years and would surpass by nearly 20 per cent the yield on state farms in the comparable Volga region during the *favorable* year 1952.[37] While some improvement in techniques of cultivation after the hectic first year may be expected, the eightfold extension of the

[35] Cf. *Planovoe khoziaistvo*, 1954, No. 12, pp. 73–74.

[36] Yield estimates for specific provinces may be found in *Osteuropa*, Vol. 5, No. 2 (pp. 147–49); see also above.

[37] *Pravda*, March 21, 1954.

harvest area of the new lands by 1956 will take them into drier zones, especially in Kazakhstan, moisture accumulation in the soil will be depleted, and, last but not least, severe droughts must be expected every few years.

Indeed, a drought struck the area in 1955, when 19.7 million hectares (48.6 million acres) of the new lands were already sown, largely ruining the grain crop and raising prospects of a huge "dust bowl," although these losses were apparently more than offset by unusually favorable conditions in the Ukraine and elsewhere in the southwest of the USSR.[38]

Corn-growing program

The first year (1955) of the corn-growing program was apparently also marked by some success. Sown area reached 16.8 million hectares (41.5 million acres—nearly five times the previous year's area and 60 per cent of the ultimate goal), and silo construction has made progress.[39] The weather has been favorable in many areas, although at this point the actual harvest is not yet known. The press has voiced complaints of resistance to the new crop; the initial achievements were doubtless largely due to strong pressure from above. This is important, as corn (especially for silage) is a highly labor- and capital-intensive crop,[40] thus involving two of the major weaknesses of the kolkhoz economy. Hence, unless incentives are greatly increased attainment and maintenance of the desired corn acreage may depend on continued pressure from above. Furthermore, judging from the instances cited by Khrushchev, the expected yield per acre (in grain and silage) may be overly optimistic.[41] Lastly, the targets for other types of fodder (root crops, potatoes, etc.) seem at least as optimistic when added to those of the grain and silage programs.[42]

Thus the outlook with regard to fodder alone places achievement of the 1960 goals for livestock products, let alone their updating to 1957–58, in serious doubt. Besides, animal husbandry under Soviet conditions is unduly labor-intensive, and any large expansion therein would tend to aggravate the labor problem of the kolkhozy. Whether mechanization can substantially alleviate this strain in the near future remains to be seen.

Possibilities of improved food supply

This is not to say that agricultural output and food production, even on a per capita basis, might not increase in the near future thanks to determined efforts in this direction. *Some* increment to gross output should be expected from the additional resources, now even including manpower, channeled into agriculture—however efficient their utilization or wise the choice. Any consequent slackening of the rate of urbanization in itself would ease the race against time. The new incentives and controls might help, though these may in part be mutually corrosive.

Deliberate restraint of the rate of population growth is still ostentatiously

[38] *New York Times*, August 16, 20, 21, and October 31, 1955.

[39] *Pravda*, June 26, 1955; D. Gale Johnson, "Corn, Commissars and Collectives, *New York Times Magazine*, September 4, 1955.

[40] Johnson, "Analysis of Khrushchev's Report" (note 18 *supra*), pp. 16–17. Professor Johnson guesses that "the corn expansion program would have labor requirements equal to from 60 to 96 million ha. of virgin land seeded to small grains *even if all the corn increase were obtained by displacing small grains* [his emphasis])." The labor requirements of the corn crop are recognized by Soviet writers; cf. V. Nemchinov in *Planovoe khoziaistvo*, 1955, No. 2, p. 26.

[41] Johnson, *op. cit.* (note 18 *supra*), pp. 7–9, 21–22.

[42] *Pravda*, February 2 and 3, 1955; *Osteuropa*, Vol. 5, No. 2 (April 1955), p. 140.

rejected; indeed the opposite is urged.[43] Substantial improvement in the food situation must therefore be sought in rapidly increasing the supply. If the present measures fail to produce it, other means (short of a radical change in institutions and incentives, a change, that is, in the nature of the regime) are still available. "Easy" solutions might be further sought in science and technology, the traditional Soviet hunting ground for panaceas. ("Easy" in this context primarily refers to bypassing the weak links of the kolkhoz system.) Another approach would be to direct considerably larger material and human resources into agriculture than is now done. A third approach would be to raise the producers' returns from farming, that is, increase the supply of manufactured and other consumers' goods for peasant consumption, in order to attain much higher levels of performance in the kolkhozy.

Political implications

The last two policies go counter to the traditional emphasis on the rapid expansion of heavy industry, maintenance of military prowess, and autarky, and the displacement of Malenkov by Khrushchev in February 1955 has reasserted the primacy of heavy industry. However, Soviet moves toward a lessening of international tension, which were launched soon thereafter, can well be interpreted, if not explained, with reference to internal economic constraints. Liberation of a large portion of the resources and manpower now committed to military end use could contribute, directly and indirectly, to a substantial advance on the agricultural front. In any event, 1953 marks a turning point in Soviet economic development: from an industrial growth largely dependent on lavish drafts of rural manpower to one of dearth of even unskilled manpower and to primary emphasis on labor-saving equipment in both industry and agriculture.

In a sense, therefore, the Soviets are right in rejecting Malthus, for their own dilemma bears less relation to his model than to the historical dynamics of Marx and Lenin. The means to provide subsistence, and even better nourishment, to the growing population are basically there. Yet if they are to be used, advance along the chosen path may have to be retarded to the point where victory in the historical race, as the Soviet leaders understand it, is placed in serious jeopardy.

He is the author of several articles on the Soviet economy.

Recent Trends in Soviet Foreign Trade

By OLEG HOEFFDING

SOVIET foreign trade moves in two different spheres. Most of it is confined to the Soviet bloc; only one-fifth crosses bloc boundaries to become East-West trade. Even before the war, Stalin had led the USSR into a condition of near-autarky. The postwar decline of East-West trade has made it a marginal matter, quantitatively at least, for the USSR, and a negligible one for the free world. The gross national product of the USSR is believed to be more than one-third that of the United States, but in 1954 the value of Soviet foreign trade with the free world was one twenty-fifth that of United States foreign trade. In the same year, trade with the USSR constituted less than 1.5 per cent of total free-world trade.

Nevertheless, the present paper focuses on the Soviet record in East-West trade since 1953, and we deal more briefly with salient developments in trade with the Soviet bloc. A detailed scrutiny of Soviet performance in trade with the free world will help to evaluate Soviet claims—insistently repeated since Geneva—that the USSR wants more trade as a natural adjunct of peaceful coexistence and relaxed tension. We address ourselves mainly to the question whether the USSR has lately shown evidence of genuinely greater trade-mindedness than it displayed under Stalin. Admittedly, the post-Stalin record is short, and the quantities of trade under observation are minute. Hence, a microscopic study of the record cannot lead to firm conclusions as to the correspondence between Soviet words and actions. Yet it seems worth undertaking, as powerful optics are needed to penetrate the myths and misunderstandings which seem to surround the subject of East-West trade.

EAST-WEST TRADE: SOVIET IMPORTS BEFORE AND AFTER STALIN

The impact of Stalin's life and death on East-West trade is depicted by the indexes of Soviet bloc imports from the free world in Table I. In the first quarter of 1953, when Stalin died, Soviet imports were at their lowest ebb in postwar history. Bloc imports as a whole had steadily declined since 1947, when they had reached an unimpressive postwar peak at about half their prewar volume. In 1952 they were nearly 30 per cent below the 1948 level. This trend seemed to promise gradual realization, at least on one point, of Stalin's weird prognosis on the trade of Soviet bloc countries with the West, written a year before his death:

> . . . it will soon come to pass that these countries will not only be in no need of imports from capitalist countries, but will themselves feel the necessity of finding an outside market for their surplus products.[1]

This forecast was strikingly out of keeping with the Soviet assurances of desire to expand two-way trade with the West made to the Moscow "International Economic Conference" two months after Stalin had written it. While Soviet diplomacy and propaganda continued to play the tune of that conference during Stalin's last year of life, the actual course of Soviet foreign trade was determined by his autarkic views. Soviet imports from the free world were re-

Sources: Calculated from United States Department of Commerce data on free-world exports to Soviet bloc at current prices in Mutual Defense Assistance Control Act of 1951, Sixth Report to Congress, Second Half of 1954, *Soviet Bloc Economic Activities in the Free World* (Washington, D. C., 1955), Tables 1, 2; unit value index of world exports in *Monthly Bulletin of Statistics* (United Nations, Statistical Office), August 1955, pp. xxiv–xxv.

duced by 40 per cent between the first quarter of 1952 and the quarter of Stalin's death.

However, with the advent of Malenkov's "new look," Soviet imports registered a striking increase. Satellite imports also expanded, as they followed the leader into a spell of eased austerity. Between July 1953 and June 1954, Soviet import volume exceeded that of the preceding twelve months by 70 per cent, and the 1948 peak was exceeded for the year as a whole. This import expansion was distinctly geared to Malenkov's attempt to raise consumption standards in the Soviet Union, in anticipation of hoped-for output increases in Soviet agriculture. His "new look" at home also imparted a new and peaceful look to the Soviet import structure: there was, literally, more butter now instead of what had been, figuratively, guns or their wherewithal. The sudden increase in Soviet imports of foodstuffs, textile fibers, and other commodities destined for consumption provided ironic refutation of Stalin's prognosis. It showed that the USSR and its satellites were far from having (as another autarky-minded ruler had put it in the eighteenth century) "no need for the produce of outer barbarians," and from exporting "in order that everyone share in our superfluous riches."[2] On the contrary, when Malenkov reached out for "abundance," an urgent demand for agricultural products had to be met by expanded imports. Soviet propaganda was quick to make a virtue of necessity, and Mikoyan asserted that, "having become wealthier," the USSR could now afford to import foodstuffs and other consumer goods.[3] The Malenkov import drive was also exploited as a demonstration of the Soviet Union's willingness to do business with capitalism, and

[2] From a letter by the Emperor of China to George III, 1783. Quoted by Robert L. Gulick, Jr., "Imports—the Gain from Trade," in *Studies in World Trade and Employment* (New York, 1947), p. 212.

[3] *Pravda*, October 25, 1953.

of the West's silliness in insisting on strategic controls of exports to the USSR, when the latter's *import demand* had turned to clearly nonstrategic goods.

Yet even while these assertions continued, the USSR had already embarked on a retreat from the import offensive. Our index shows Soviet imports in the third quarter of 1954 at little more than half their rate of the first two quarters.

The recovery of imports late in 1954 suggests that the retreat was originally intended to be temporary. But the domestic-policy background of Soviet foreign trade changed drastically in February 1955. Malenkov's policy of favoring the consumer, which had supplied the main impetus to the 1953–54 import drive, was repudiated by Khrushchev and Bulganin, and Stalinist austerity was reaffirmed.

PEACEFUL LOOK OF SOVIET TRADE

It is important to note the extent to which the moderate revival of Soviet trade since Stalin depended on what has proved an ephemeral phase of domestic economic policy. This emerges most clearly from the change in the commodity structure of Soviet imports in 1953–54. In 1951, foodstuffs and beverages had accounted for 15 per cent of total Soviet imports from the free world; in 1953 their share increased to 23 per cent. Consumer goods, and materials primarily for their manufacture, increased from 20 to 38 per cent. Conversely, the share of metals, metal products, machinery, and ships fell from 38 to 32 per cent, and that of rubber, spectacularly, from 21 to 4 per cent.[4]

This shift, apparently, was even more pronounced in 1954, when the USSR, almost overnight, became the world's third largest importer of meat and second largest buyer of butter.[5] Soviet data on imports from Western Europe supplied to the Economic Commission for Europe in October 1954 (the first detailed statistics on foreign trade released since before the war) showed an increase in the share of "peaceful" imports—foodstuffs, consumer goods and consumer raw materials—from 45 per cent in 1953 to 54 per cent in the first half of 1954.[6] In 1950—before the tightening of Western strategic controls—the same commodity groups had represented only 16 per cent of total Soviet imports from Western Europe.[7]

No full data on Soviet trade in 1955 are available at this writing. Malenkov's downfall, however, has clearly had prompt repercussions on trade policy. Large orders placed in Britain in 1954 for consumer goods and equipment for their manufacture were canceled by the Soviet government in March 1955.[8] Trade with Western Europe appears to have been maintained at roughly the late 1954 level, but Soviet purchasing overseas has reflected the switch back to emphasis on heavy industry. The spectacular meat and dairy product pur-

[4] Calculated from data on free-world exports to USSR in Mutual Defense Assistance Control Act of 1951, Sixth Report to Congress, Second Half of 1954, *Soviet Bloc Economic Activities in the Free World* (Washington, D. C., 1955), Table 10 A. (This publication cited hereafter as "Sixth Report.")

[5] Sixth Report, p. 21. A considerable portion of Soviet butter imports appears to have been re-exported to satellites in Eastern Europe.

[6] Economic Commission for Europe (UN), *Economic Survey of Europe in 1954* (Geneva, 1955), Table L. Wood and prefabricated houses (a large item in Soviet trade with Finland) are included.

[7] Calculated from *Economic Bulletin for Europe* (prepared by the Secretariat of UN Economic Commission for Europe), Second Quarter, 1952, Table B, p. 59. The 1950 data are not fully comparable with the Soviet data for 1953–54, mainly because the commodity breakdown of the latter is incomplete. Unspecified commodities account for 13 per cent of the 1953 total and 22 per cent of the first half of the 1954 total.

[8] *The Economist* (London), March 26, 1955, p. 1078.

chases of 1953–54 have not been repeated, but rubber imports, heavily throttled in 1953–54, have been stepped up.

One should not expect Soviet import demand fully to revert to the pattern of the Stalin era. Even the new leadership may continue some food imports. That it is reluctant to impose actual reductions in food supply on Soviet consumers spoiled by the Malenkov flush is suggested by the heavy 1955 purchases of sugar by the USSR, normally a sugar exporter, undertaken after a poor sugar-beet crop in 1954.[9] Foreign-policy considerations may also induce food imports, as instanced by recent large rice purchases in Burma, and a symbolic deal in United States surplus food would be a fitting commercial consummation of the Geneva honeymoon.

One may expect, however, that imports for the consumer will henceforth be undertaken only as a matter of economic or diplomatic expediency and not as a systematic major adjunct of domestic policy. Probably every effort will be made to eliminate imports of staple foodstuffs as and when successes are scored by the Khrushchev program for greater food production at home.

Retreat from the Import Drive

Another feature of post-Stalin trade policy also justifies doubts whether the USSR has become genuinely more trade-minded since the dictator's death. This is the nature of the Soviet reaction to what may be termed the Malenkov sterling gap of 1954. Major Soviet gold sales were an interesting concomitant of the import drive. Some 150 million dollars of gold were marketed between October 1953 and February 1954, mostly in London. The sales were curtailed as suddenly as they had appeared, and no unusually large new transactions have been reported, at least as of a few months ago.[10] The sales caused much speculation. Had the world's second largest gold producer at last decided to use its bullion systematically to pay for trade deficits, instead of hoarding it and balancing imports with merchandise exports? Or were the gold sales a stopgap, pending an export expansion sufficient to pay for the larger volume of imports? These were the main alternatives discussed, but actual Soviet behavior in 1954 bore out neither expectation.

The explanation of the gold sales is readily found in the movement of the Soviet trade balance with the West.[11] In 1952, following a pattern characteristic of postwar years, the USSR achieved a small export surplus in its trade with the West (exclusive of trade with Finland, where a large Soviet deficit is handled by special payments arrangements). It used the proceeds of large net exports to the United Kingdom to pay for heavy net imports from non-European overseas suppliers of primary products. Trade with continental Western Europe was broadly in balance.

[9] *New York Times*, February 19 and May 15, 1955.

[10] *Financial Times* (London), March 9, 1955.

[11] The trade-balance data which follow below are derived from "World Exports by Origin and Destination," *Monthly Bulletin of Statistics* (United Nations, Statistical Office), August 1955, pp. viii–xix, and February 1955, pp. x–xiii. They represent the difference between imports from and exports to the USSR by free-world countries, as reported in their trade statistics. The latter data have been converted into U. S. dollars, and into free-on-board values for both exports and imports, by the UN source.

It may be noted that Soviet trade does result in import or export balances, in spite of the Soviet's preference for bilaterally balanced trade. USSR trade agreements with Western countries are typically clearing and not "barter" agreements, and they allow for, or result in, net exports in one or the other direction. Much of Soviet trade, moreover, is conducted by direct purchases and sales in commodity markets, not tied to any agreement for reciprocal deliveries.

Even in 1953, despite the start of the import spree, the USSR still managed nearly to balance its trade account with the West (again, except Finland), but only by what amounted to extraordinary foreign-exchange economy measures. Drastic curtailment of imports from Britain (from 105 million dollars in 1952 to 34 million dollars in 1953) yielded an exceptionally large sterling surplus. More than 80 million dollars were saved by cutting rubber imports.[12] Finally, the exceptionally low level of Soviet imports in the first half of 1953 helped to balance trade for the year, while Soviet exports more than doubled between the first and second semesters.

In the first half of 1954, however, a continued high rate of imports and a slackening of exports caused a mounting trade deficit. Soviet net imports from nondollar areas outside Europe increased fivefold compared to January–June 1953. The sterling surplus earned in Britain, although well maintained by continued Soviet import restriction, could not offset this increase, and the USSR ended the half-year with an overall deficit of 100 million dollars, excluding the deficit with Finland. It was clearly in anticipation of this deficit that the USSR decided to bolster its sterling balances in London by selling gold.

The second half of 1954 completed the Soviet reaction to its sterling gap problem, in rather surprising fashion. Gold sales did prove a stopgap, not to be followed, however, by an expansion of exports to meet a larger import volume. Instead, the USSR proceeded with a severely restrictionist solution of its payments problem. Overseas purchases were heavily slashed, especially in the sterling area, where they dwindled from 67 million dollars in January–June to 8 million dollars in July–December. Imports from nonsterling overseas sources were better maintained, thanks largely to deliveries by Argentina (with rather little by way of Soviet counterdeliveries).[13] Even so, they were curtailed by more than one-third, and imports from continental Western Europe by one-fifth. Soviet exports increased in the second half of the year, but on balance the USSR relied heavily on import restriction to turn its deficit of early 1954 into a sizable surplus in the second half-year, which made further gold sales unnecessary. Of a total improvement of 137 million dollars in its trade balance with the West (except Finland), export expansion had accounted for 32 million dollars and import contraction for 105 million dollars.

These Soviet tactics of retreat from the Malenkov import offensive amounted to a demonstration of the kind of trade restrictionism which the free-world trading community has tried to do away with in recent years. They appear to justify doubts of the sincerity of the recently displayed Soviet interest in joining bodies dedicated mainly to the liberalization of trade, like the General Agreement on Tariffs and Trade and the new Organization for Trade Cooperation.[14]

Why Not Sell Gold?

The reaction to the 1954 trade deficit suggests that the traditional mercantilist Soviet attitude to gold has not been modified since the Stalin era. By Western standards, there was nothing unusual about the gold sales of 1953–54. It would be quite normal for a gold-producing country to use gold in pay-

[12] Sixth Report (cited note 4 *supra*), Table 10 A.

[13] Argentine exports to the USSR in January 1953–July 1954 amounted to 58.5 million dollars and its imports from the USSR to 10.3 million dollars. Sixth Report, Table 3.

[14] *The Economist* (London), July 23, 1955, p. 302. Soviet interest is reported to have extended even to the stillborn International Trade Organization.

ment for net commodity imports, and quite probably the USSR did not have to dip into its large gold reserve to cover its 1954 trade deficit.[15] However, Soviet doctrine regards gold as an export commodity of last resort only, and strongly prefers to balance, or more than balance, imports with merchandise exports. This position was reaffirmed in a recent textbook on foreign trade, which went to press in April 1954. Its authors declare that ". . . the socialist state aims at balancing imports with exports, since only such balance can, in the long run, provide a healthy basis for international trade." They stress that the USSR, surrounded by "capitalist hostility," has to maintain a favorable balance of trade, and a gold and foreign exchange reserve "against various unexpected contingencies." [16]

The same book may shed some light on the place of the import drive and gold sales in the controversy which led to Malenkov's resignation. Gold and foreign-exchange reserves, the authors observe:

> like other kinds of reserves in the socialist economy, may be used to overcome disproportions revealed in the execution of national economic plans. In the past, gold and foreign-exchange reserves have sometimes been used if the need arose for urgent imports of certain commodities, and if export commodity resources could not be mobilized fast enough to pay for such imports.[17]

[15] Reliable information on Soviet gold output and reserves is totally lacking, but the USSR is generally believed to rank second in gold production—after South Africa, which produced 463 million dollars in 1954, and before Canada, whose 1954 output was 153 million dollars (*International Financial Statistics* [International Monetary Fund], July 1955, p. 19).

[16] A. M. Smirnov and N. N. Liubimov (Editors), *Vneshniaia torgovlia SSSR* [Foreign Trade of the USSR] (Moscow, 1954), pp. 18, 99–100.

[17] *Ibid.*, p. 102.

This reference may have been to action taken in a very recent past. It will be recalled that Malenkov, when launching his "new look," had criticized lopsided emphasis on heavy industry in the Stalin era as a "disproportion" in planning. But when Stalinist orthodoxy triumphed in February 1955, it was denied that there had been one, and Bulganin castigated the "unforgivable mistake" of "solving special, current tasks at the expense of state reserves." [18] Malenkov's gold sales probably did not encroach on the gold reserve at all, but his opponents may have regarded them as a raid on the sacrosanct "state reserves."

WHAT TO SELL IF NOT GOLD?

Doctrinal inhibitions may not prevent the Soviets in the future from using gold, now and then, to settle for moderate import surpluses. They make it seem unlikely, however, that the USSR will resort to gold financing on a large and permanent scale. This raises the problem of Soviet ability to augment merchandise exports sufficiently to balance a significantly expanded import volume. The structure of Soviet exports to the West is still dominated by the same products of agriculture and forestry which were the traditional export staples of Russia long before the revolution. Agricultural products, lumber, and furs accounted for 82 per cent of 1952 exports to the free world; grain and grain products alone for 53 per cent. Minerals, or lightly processed products of mineral origin, made up most of the balance, while the share of manufactured goods was virtually negligible.

Grain exports have declined strikingly since 1952. Nearly 2.5 million tons were exported to the West from the good 1952 harvest, but in the poor crop

[18] *Pravda*, February 10, 1955.

year of 1953–54 exports shrank to less than one million tons. Recent large purchases of grain in Canada by Poland and Czechoslovakia suggest that currently the USSR is unable even to meet satellite deficits. When launching his grain program in 1954, Khrushchev cited the provision of greater surpluses for export as one of the reasons which called for more output. However, Soviet and satellite demands probably will have a prior claim on any gains in output, before East-West trade gets its share. In the meantime, the USSR will have to substitute nonagricultural export commodities for grain and other products of its ailing agriculture if it wants to maintain its imports. Its experience in 1953 illustrates the difficulty of this task: compared to 1952, the value of grain exports to the free world declined by 127 million dollars, or 52 per cent, and the increase in other exports offset only a minor portion of the impact of this decline on total exports, which fell by 89 million dollars. Since 1953, the USSR has made a determined effort to expand sales abroad of petroleum, ores, coal, and other minerals, and of metals and metal manufactures. Some gains have been made. However, to break the dependence of Soviet exports on agriculture will be an uphill struggle, especially in Western Europe, which absorbed 90 per cent of total Soviet exports to the West in 1954.

APPEAL TO UNDERDEVELOPED AREAS

This need to increase exports of manufactured goods and to find markets for them where the USSR will not have to compete with established domestic industries is one major motive of current Soviet emphasis, displayed since 1952, on fostering trade with underdeveloped countries. Moreover, the Soviet export surplus with Britain, which has paid for imports from overseas, has been predicated upon agricultural exports, and there is thus a special incentive now for the USSR to cultivate bilateral trade with non-European countries. As usual, foreign-trade tactics dictated by domestic expediency are well co-ordinated with the requirements of Soviet foreign policy. The new role of a supplier of advanced technology to backward countries not only promises gains in prestige but, where it is coupled with technical assistance by Soviet personnel or technical training in the Soviet Union, also opens new channels for political and cultural influence.

Current Soviet activity in trade negotiations, at trade fairs, and at regional economic conferences tends to obscure the fact that the effort to promote trade with underdeveloped countries was launched from an extremely slender base of actual trade and had made little real progress through 1954. Soviet exports to destinations outside Europe and North America in 1954 were less than 40 million dollars, compared to 54 million dollars in 1952 and 59 million dollars in 1948. The share of these areas in Soviet exports has steadily declined, from 14 per cent in 1950 to 6 per cent in 1954.[19]

The Malenkov import drive raised the share of Soviet imports from non-European sources from 20 per cent in 1952 to 30 per cent in 1954. However, most of the increase was due to imports for consumption, whose future is now uncertain, and most of it benefited developed economies like New Zealand and Australia. As a purchaser of primary products exported by underdeveloped countries the USSR, and even the Soviet bloc as a whole, still plays a negligible part besides the industrial economies of the West.

These facts must be borne in mind in appraising the recent Soviet agreements with Asiatic and Latin American coun-

[19] From data in *Monthly Bulletin of Statistics*, August 1955, pp. viii ff.

tries, which have been publicized as major break-throughs into markets hitherto reserved for the industrial countries of the West. Most notice was attracted by the Soviet undertaking of February 1955 to build a million-ton steel mill in India, on price and credit terms which apparently compared well to other bids received by India.[20] Soviet equipment to be supplied for the mill over four to five years is valued at some 90 million dollars, compared to total Soviet exports to India in 1954 of 1 million dollars. Soviet machinery and equipment are to pay also for the 150,000 to 200,000 tons of rice to be bought annually by the USSR under a three-year agreement concluded with Burma in July 1955.[21] It may result in Soviet-Burmese trade of some 30 to 40 million dollars each way annually, in an area where this trade previously had been nonexistent.

In other words, given the very low level of Soviet trade outside Europe now, the appearance of capital equipment among Soviet exports may help to bring large increases in trade in a short time. It is hard, however, to visualize the USSR as a major factor in extra-bloc trade in machinery and equipment. Within the bloc, it still appears to be a net importer of producers' durables, and the European satellites and China will continue to absorb the bulk of Soviet exports. It is hard to accept a recent Soviet statement that renewed emphasis on heavy industry will enable the USSR to supply capital equipment to underdeveloped areas, as well as bloc countries, as more than an effort to gather honey from the weeds of a policy change which, on balance, will probably further foster bloc autarky.[22]

[22] E. Frolov in *Kommunist*, 1955, No. 3, p. 35.

Political purposes

As of 1954, the USSR exported less machinery to the free world in a year than the United States did in a week, and its propaganda will have to go on working hard at making mountains out of what, as yet, are isolated molehills. However, it has shown skill in maximizing the political effects obtained from its slender trade with underdeveloped countries, by focusing its effort where trade lends most support to foreign policy. The USSR underbid Western competitors for the Indian steel mill when cultivation of Nehru's neutralism was a major policy objective. In Burma it stepped into a distress situation caused by the present rice glut in Southeast Asia (a glut assisted by Communist China's rice exports to Ceylon). Earlier, it had used a similar distress situation in Iran to offer large barter agreements when Iranian foreign trade was all but extinct during the oil crisis.

Soviet assertions that its exports of capital equipment can release underdeveloped countries from their alleged bondage to capitalist monopolies are matched by claims that the planned markets of the bloc provide an alluring alternative to dependence on the vagaries of unstable capitalism. This appeal was well timed in 1952–53, when primary-product exporters were hard hit by the collapse of the Korea commodity boom. It is hard, however, to detect any marked degree of stability in Soviet primary-product purchases during this period. Thus, Soviet imports of rubber, cotton, and wool (which together accounted for 26 per cent of Soviet extrabloc imports in 1951–53), measured in 1951 prices, were more than doubled in 1952 over 1951, only to be halved again in 1953.[23] There

[23] The combined value of free-world exports to the USSR of crude rubber, raw wool, and raw cotton, at 1951 prices and 1951 = 100, was 235 in 1952 and 120 in 1953. Calculated from current-price data in *Sixth Report* (cited note 4 *supra*), Table 10 A, and price data in *International Financial Statistics*, July 1955, pp. 32 ff.

was also some conflict between Soviet import policy in 1954 and the "stability" appeal addressed to primary producer countries. It was this group of countries that bore the brunt of Soviet import restrictions: comparing the second half of 1954 to the first, imports from Western Europe were cut by 24 million dollars, those from non-European sources by 80 million dollars.

FUTURE OF STRATEGIC TRADE CONTROLS

Intensive efforts have also been made by Soviet propaganda to exploit the problems raised by East-West trade elsewhere, notably in Western Europe. Since 1951 the Western system of control of strategic exports to the Soviet bloc has provided the USSR with a convenient scapegoat. It could assert, in the face of ample evidence to the contrary, that United States–instigated "discrimination" was at the root of all the troubles of East-West trade. There seems a possibility now that strategic controls, already relaxed in 1954, will melt away in the Geneva thaw. This, doubtless, would prompt the Soviets to proclaim that, at last, the West has seen reason and has mended its ways, in response to patient Soviet persuasion, just as they hailed Geneva itself as a victory for the Moscow-sponsored "peace campaign." With this possibility in mind, one may briefly examine two questions: Have trade controls been the crucial obstacle to East-West trade? Would their removal release an upsurge in East-West trade?

Undoubtedly, controls have prevented some purchases by the USSR and its satellites from the West. However, they left them also with large opportunities for using East-West trade for "strengthening and further developing the socialist economy," which is the avowed purpose of Soviet trade with capitalism.[24] During the Korean War, the USSR was able to import an annual 250 million dollars worth of machines, metals, and rubber. Conversely, controls left wide opportunities for Soviet purchases of unrestricted goods, which the USSR failed to utilize until the Malenkov shopping spree. It is a curious and little-known fact that, since imposition of controls, total exports to the USSR of the eleven European countries cooperating in controls have been increasing (except for a drop in 1953 fully attributable to Soviet restriction of permitted imports from Britain), while the exports of Sweden and Switzerland, which do not participate, have declined.[25] There is much other evidence to show that the volume of East-West trade has predominantly depended on Soviet buying decisions, and on Soviet decisions to offer Western countries the goods they wanted, at reasonable price and in acceptable quality.

A limited test of the effect of an abolition of controls was provided by their easing in July 1954. No increased purchases of decontrolled items appear to have resulted. Possibly, the USSR refrained from them for political reasons. One must bear in mind, however, that during the control period the USSR has systematically expanded, at home and in satellite countries, production of embargoed products or substitutes. The embargo may well have stimulated progress toward Soviet bloc autarky, and it seems unlikely that gains in this direction would be sacrificed after its lifting. Moreover, most of the embargoed items

[24] Academy of Sciences of the USSR, Institute of Economics, *Politicheskaia Ekonomika* [Political Economy] (Moscow, 1954), pp. 517–18.

[25] Sixth Report (cited note 4 *supra*), Tables 3, 6.

are of a kind which would not result in a large volume of unrestricted trade. All in all, it seems quite doubtful that abolition of controls would significantly stimulate trade. However, although there are weighty objections to an abolition, it would at least deprive the Soviet bloc of a convenient smoke screen and force it to show its true intentions on East-West trade.

SOVIET INTRABLOC TRADE

When Stalin discussed the "disintegration of the world economy" into the two "parallel markets" in his 1952 pamphlet, he came much nearer the truth when pointing to the rapid growth of trade in what he called the "world market of the socialist camp" than in his forecast on East-West trade, which we quoted above. The countries of the Soviet bloc, which engaged in little mutual trade before and immediately after World War II, are believed to have exported over 6 billion dollars worth of goods to each other in 1953.[26] For an area comprising one-third of the world population, this was modest compared to the 70 billion dollars worth of exports which moved in free-world trade, but it represented a fourfold expansion of bloc trade since 1948.

About four-fifths of Soviet foreign trade is now conducted within the bloc, and the USSR can now claim that its total trade volume, as officially stated in rubles and converted at the arbitrary official rate of four rubles to one dollar, makes it the sixth largest trading nation of the world. However, although intrabloc trade is much more important to the Soviet Union than its East-West trade, the USSR has remained a relatively self-contained economy even within its orbit. ECE estimates suggest that Soviet intrabloc exports and imports in 1953 amounted to some $20 per head of the population, compared to about $100 of trade per capita for Czechoslovakia and Eastern Germany.[27] Yet, the USSR is by far the leading trading unit within the bloc. It accounts for more than one-third of total intrabloc trade, and its trade volume is more than twice that of China, whose trade has grown rapidly in recent years.

Nearly two-thirds of Soviet intrabloc trade in 1953 was with the European satellites. East Germany, after a spectacular trade expansion since 1950, has displaced Czechoslovakia as the Soviet Union's biggest trade partner in the European bloc. These two countries and Poland absorb more than 70 per cent of Soviet trade with European satellites. Trade with China accounts for most of the balance of Soviet intrabloc trade.

[26] All dollar values for intrabloc trade are quoted here from Economic Commission for Europe, *op. cit.* (note 6 *supra*), pp. 109 ff. ECE cautions the reader that they should be regarded as "indicative of orders of magnitude rather than as precise statistics," and prefaces its estimates with other qualifications (p. 108). There is some doubt in this writer's mind whether ECE's cautions go far enough, and the estimates are used here as the only data available to convey some impression of the rough magnitudes involved in intrabloc trade. The ECE estimates rest, *inter alia*, on the assumption that the so-called official exchange rate of the ruble, 4 rubles to a dollar, can be used to convert ruble data on Soviet intrabloc trade into meaningful dollar values. There is no information on foreign-trade ruble prices within the bloc, and this writer knows of no reason why the official exchange rate should produce an even approximately correct dollar equivalent of trade values. One might note that even Soviet data on extrabloc trade, stated in rubles and converted at the official 4:1 rate, result in large and unexplained discrepancies with corresponding data derived from the statistics of countries trading with the USSR. Thus, the Soviet figure for extrabloc trade "turnover" (imports plus exports) in 1954 is 5.5 billion rubles (*Mezhdunarodnaia Zhizn'*, 1955, No. 7, p. 103) or 1.4 billion dollars. Preliminary data for 1954 based on Western trade statistics place turnover at 1.055 billion dollars (Sixth Report, Table I). Similar discrepancies in the same direction occur for 1952 and 1953. They appear too large to be explained by the fact that the Soviet turnover figure, presumably, is the sum of imports valued cost, insurance, and freight and exports valued free on board, while the valuation is generally reversed in the Western data.

[27] For comparison, foreign trade per capita in 1953 was about $170 for the United States, $160 for Western Germany, $180 for France.

COMMODITY STRUCTURE

Soviet accounts of the structure of its trade with the bloc tend to place prime emphasis on the role of the USSR as supplier of capital equipment for the satellite and Chinese industrialization programs. While this function is important, it is by no means a unilateral one. In fact, ECE places Soviet 1953 exports of machinery and equipment to the bloc at 550 to 600 million dollars, in what may be regarded as a generous estimate, and its imports from the bloc at about 620 to 700 million dollars.[28]

According to the same source, the Soviet Union is not only a net importer but also the largest importer of capital equipment within the bloc, and absorbs nearly half the capital equipment exported by its satellites. Soviet exports in this category, however, were exceeded in 1953 by those of Eastern Germany, and the other European satellites combined exported as much as the USSR. This role of Eastern Germany in bloc trade must significantly influence the Soviet attitude toward German unification.

Machinery and equipment do, apparently, account for about one-fifth of total Soviet exports to the bloc, but their bulk is made up of raw materials, fuels, and food. Raw materials for the heavy industries developed by the satellites play a particularly important part. Thus, Soviet iron ore meets more than half the total ore requirements of the Eastern European steel industries.[29] However, the satellite countries have increasingly turned to the USSR also for raw materials for consumers' goods industries, especially cotton. We have noted above the role played by the USSR in supplying grain to Czechoslovakia and Eastern Germany and lately to Poland, and the difficulties recently encountered in this respect.

We have seen that machinery and equipment play quite an important part in Soviet imports from the bloc. ECE places their share in 1953 at 26 to 28 per cent of the total value of these imports, and its estimates imply that they account for more than two-fifths of Soviet imports from Eastern Europe.

The composition of exports from Eastern Europe to the USSR differs greatly from country to country. Capital equipment predominates in the exports of Eastern Germany and probably Czechoslovakia, while other satellites concentrate on metals and ores, fuels, and foodstuffs. Manufactured consumers' goods, which appear to be almost absent from Soviet exports to the satellites, figure prominently in Czechoslovak and East German exports to the USSR. Agricultural products, notably oilseeds,

[28] ECE, *op. cit.* (note 6 *supra*), Table 67, as corrected in *Economic Bulletin for Europe*, Vol. 7, No. 1 (May 1955), p. 61. The history of this estimate is an interesting illustration of the difficulties involved in reconstructing intrabloc trade statistics from fragmentary official data. Originally (in *Economic Survey of Europe in 1954*, Table 67), ECE had estimated Soviet machinery and equipment exports to the bloc at a minimum of 200 million dollars, on the basis of published Soviet statements which gave 800 million rubles as the value of all or most of these exports. At the ECE meeting in April 1955, the Soviet delegate claimed that the figure of 200 million dollars was three times too small, and he is said to have "brushed aside the Secretariat's answer that their figure was contained in an official statement by Mr. Mikoian" (*The Economist*, April 2, 1955, p. 41). On the basis of this undocumented objection, the ECE Secretariat published the corrigendum cited above.

[29] ECE, *op. cit.* (note 6 *supra*), p. 119.

account for the bulk of Soviet imports from China.

MASTER PLAN AROUND THE CORNER?

Until a few years ago, in spite of Soviet and other assertions to the contrary, it was difficult to detect the existence of a central, Soviet-directed "master plan" behind the visible trends in bloc economic development and trade. Industrialization appeared to proceed in each satellite country according to relatively self-contained and similar national plans, and the Soviet Union showed little initiative in promoting division of labor and economic interdependence within the bloc, beyond what was required to support satellite industrial programs and to harness selected satellite industrial or natural resources to the Soviet plan.[30] There was little indication that the long-term trade agreements that were being arranged between the USSR and its satellites resulted from genuine co-ordination of national economic plans, and there was no sign of activity by the Council of Economic Mutual Assistance, a body supposedly created to direct economic integration within the Soviet sphere.

Since 1953 there have been signs of progress towards more bloc integration and concerted planning. The ECE Survey for 1954 has noted

> extension of industrial coordination, notably in the field of consumer goods, and the announcement of intentions to work out a more thorough-going coordination of national economies under long-term arrangements, to become effective with the start of the next Soviet Five-Year Plan at the beginning of 1956, with which the plans of the Eastern European countries are to coincide.[31]

One may speculate that several recent developments have prompted the USSR to move more energetically in this direction. Measures for co-ordination in the field of consumers' goods emerged late in 1953, as an adjunct to the "New Course" policies and may not now retain the high priority apparently accorded them at that time. Other stimuli promise to have more enduring effects. First, the ending of East German reparations, which channeled to the USSR a large supply of particularly desirable goods, should have evoked Soviet interest in perpetuating this supply through normal channels of bloc trade. Second, the relinquishing by the USSR of its shares in most of the mixed companies set up in Rumania, Hungary, Bulgaria, and China, and the return to East Germany of Soviet-owned companies, may have weakened its direct control of industrial sectors which it regarded as important to its own economy, and may again have heightened its interest in improving the trade system of the bloc. Third, the USSR has taken on a formidable commitment in support of China's industrialization plans, and greater attention to bloc-wide planning of trade would help it to devolve a portion of this commitment onto Eastern Europe. Finally, the agricultural bottleneck is a bloc-wide phenomenon and may well call for concerted countermeasures. Some effort will be made, presumably, to respond to all these stimuli in the Soviet sixth Five Year Plan and the new synchronized satellite plans.

The ECE survey also notes the appearance of "theoretical writings" in satellite sources, and a single Soviet statement by Anastas Mikoyan, which, perhaps too hopefully, it regards as evidence of "increased attention to foreign trade problems" and of "emphasis on the need for greater international specialization and for closer attention to comparative costs of production at home and abroad."[32]

[30] For an account of these trends up to 1951, see the author's "Soviet Economic Relations with the Orbit," in Abram Bergson (Editor), *Soviet Economic Growth* (Evanston, Ill., 1953), pp. 320–37.

[31] ECE, *op. cit.* (note 6 *supra*), p. 109.

MULTILATERALISM ALSO AROUND THE CORNER?

However, the Survey also finds that indications are "still slight" of progress towards removing what it rightly regards as a feature of intrabloc trade "detrimental to specialization."[33] This is the practice of conducting trade under bilaterally balanced trade agreements. In recent years, the bilateral clearing accounts associated with these agreements have been kept in rubles, and all intrabloc trade has been priced in rubles. However, there has been no provision for multilateral clearing of these ruble accounts, that is, the proceeds of net exports by, say, Poland to the USSR could not be used to pay for Polish net imports from, say, Rumania. Any temporary imbalance on the bilateral accounts had to be settled by the debtor partner through additional goods delivered to the creditor.

Until recently, the only exceptions to this rigid bilateralism were a number of triangular agreements involving Finland, the USSR, and the major European satellites, arranged in order to enable the USSR to settle its chronic heavy trade deficit with Finland by additional exports to satellite countries which were net exporters to Finland.[34] The first multilateral clearing agreement confined to the bloc appears to have been concluded in 1954 between Eastern Germany and Bulgaria. It enables the latter to use its export proceeds for buying in a "third country."[35] That an extension of this practice is in progress may be suggested by a Soviet statement which claims that it is now possible for a debtor under a bilateral agreement to clear its account by exports to "some other country" in the bloc.[36]

The interest of the Soviet government in multilateralism may well have been stimulated by difficulties met in balancing bilaterally its imports from Eastern Europe, and particularly Eastern Germany, after the end of reparations, the easing of German occupation costs, and the liquidation of mixed and Soviet-owned companies. These changes occurred at a time when the USSR had to reduce food exports to Eastern Europe, and it seems likely that the re-exports to satellites of foodstuffs imported by the USSR from the West in 1953–54, and Soviet gold credits to satellites, were an initial adjustment to this problem. It may now be seeking a more permanent solution—which would also help to preserve the near-autarky of the bloc—by fostering multilateral settlements with and among the satellites.

SUMMARY

A modest revival in Soviet trade with the West in 1953–54 resulted mainly from a short-lived change in domestic policy. There was retrenchment even before the new policy had been abandoned. Trade has remained somewhat greater than at Stalin's death, but the gain is small. There are signs that the USSR, reluctant to part with its gold,

[32] ECE, *op. cit.* (note 6 *supra*), p. 109. Cf. extensive excerpts from these writings, pp. 125–35.

[33] *Ibid.*, p. 129.

[34] As of 1954, there were five such agreements, involving Poland, Czechoslovakia, Hungary, Rumania, and Eastern Germany (*Vneshniaia torgovlia,* 1954, No. 11, p. 13). They may not have performed their declared function any too effectively, as indicated by the fact that the USSR extended gold and foreign exchange loans to Finland in 1954 and 1955, and has undertaken to pay in gold and foreign exchange for a portion of the annual trade deficits provided for by the Finno-Soviet trade agreement for 1956–60 signed in July 1955 (*Ibid.*, No. 8, pp. 2–3).

[35] ECE, *op. cit.* (note 6 *supra*), p. 129.

[36] *Vneshniaia torgovlia,* 1954, No. 11, p. 13.

finds it difficult to pay with other exports even for its small volume of free-world imports. It has to substitute nonagricultural goods for foodstuffs, the traditional mainstay of its export trade. Prospects of success in this direction appear problematic in Western Europe, but sales of Soviet capital equipment to underdeveloped countries may foreshadow expansion of trade with areas singled out for special attention by Soviet diplomacy and propaganda. However, it is doubtful that the USSR is ready to appear as large-scale exporter of capital equipment to free-world markets. Large claims on such exports are being made by China and Eastern Europe, and on balance the USSR is still an importer of equipment, even within the bloc. In its intrabloc trade, too, the end of reparations and other unrequited imports appears to confront the USSR with a problem of finding enough exports to pay for wanted imports, which it is trying to meet by improving trade planning and instituting more flexible trading arrangements.

Needless to say, the apparent difficulty of finding goods for export to the West is a political phenomenon and not an economic one. A large and diversified economy like the USSR, and one whose foreign-trade methods can divorce export prices from domestic prices, could well enjoy more of the advantages of foreign trade, if only it wanted to do so. In the early 1930's the USSR managed large grain exports in the face of famine at home, when imports deemed essential for the first Five Year Plan had to be paid for. These, however, were conceived as imports to end imports, and the USSR has made vast strides since then towards its doctrinal ideal of economic isolation from capitalism. This ideal appears to have survived Stalin, who contributed so much to its formulation and realization. What may appear as an inability to divert goods for export is actually a reluctance to let imports rise so as to require increased allocation of resources to production for export and thus to jeopardize the Stalinist heritage of Soviet autarky. As long as there is no change in this basically hostile attitude toward trade with capitalism—and we can perceive none in 1953–55—East-West trade promises to remain the trickle that it is today.

During World War II he worked in the Economic Warfare Division of the American Embassy in London. He is author of Soviet National Income and Product in 1928 (1954) and other publications on the Soviet economy.

Soviet Literature, 1950–1955

By ERNEST J. SIMMONS

A PRAVDA editorial,[1] "For High Ideological Standards and Craftsmanship," touched off a celebration of the fourth anniversary of the decree[2] of the Central Committee of the Communist Party which had prepared the way for the new postwar "line" in Soviet literature. The writer declared, among other things, that the period since 1946 had been marked "by great progress in Soviet literature owing to the guidance and daily care of the party." Whatever one may think of the veracity of this statement, the succeeding five-year period represents an astonishing rejection by many writers and critics of this claim of "great progress in Soviet literature" since 1946, and at least a covert protest against the "guidance and daily care of the party" in belles-lettres. Stalin's death in 1953 certainly intensified, if it did not exactly initiate, this widespread protest.

Though Marxian aestheticians attempt to justify the development of literature as a superstructural reflection of the socialist base in the Soviet Union, the only deterministic element in evidence is the determination of party leaders that literature shall serve the propaganda and educational purposes of the state. In fact, so importantly is literature regarded as an instrument for the presentation of an official version of Soviet life, in which the Communist party is portrayed as the main source of all character building and the inspiration of all human achievement, that very little is left to artistic chance and the vagaries of individual creative ability in an activity which in a single year (1953) resulted in the publication, in fiction alone, of 222,800,000 copies of 4,700 titles (including reprints).[3]

UNION OF SOVIET WRITERS

The production of belles-lettres is tightly organized under the direction of the Union of Soviet Writers, which has existed since 1934. As of 1954 it had 3,695 members.[4] Membership is voluntary, requiring one or more published works of artistic merit, but it would obviously be hard to enjoy a successful literary career without being a member of the union. The exact percentage of Communists in the Union is difficult to ascertain, but it must run well over fifty per cent (at the Second All-Union Congress of the Union of Soviet Writers, in December 1954, 72.5 per cent of the 738 delegates were party members).[5] A board, elected by the Congress, elects in turn a presidium and a secretariat which direct current activities, and these forty-two individuals, including the best-known names in Soviet letters, are nearly all Communists. It is they who carry out the behests of the party summit and effectively control the intricate operations of literature, manipulating the many branches of the union that exist throughout the whole of the USSR.

The leading literary publications are controlled by the union, including its official newspaper, *Literaturnaia gazeta*, which appears thrice weekly, and the

[5] *Ibid.*

important so-called "thick" monthlies *Novyi mir, Oktiabr', Zvezda, Znamia, Neva,* and *Teatr,* in which the best plays and novels initially appear. And the union also has its own book publishing firm, Sovetskii pisatel', and its own school for the training of writers, the Gor'kii Literary Institute. Any examination of the editorial boards and directors of these various publications and institutions reveals a system of "interlocking directorates." That is, they are made up largely of the leadership of the union, and in nearly every case at least two or three members of the editorial boards of each magazine sit also on the highly important presidium of the union, which, of course, appoints these editorial boards.

Union privileges

Everything possible is done by the union to achieve status and special privileges for writers and to aid them in material ways. For example, it has a literary fund with a yearly budget of 37 million rubles (1953), supported by membership dues, 6 per cent of the net returns of publishing houses and magazines, and 2.5 per cent of the gross receipts of theatrical entertainments, as well as by contributions from various establishments of the union. The fund defrays the travel and living expenses of writers who go to distant parts of the Soviet Union to collect material for their works; gives loans or outright gifts to enable hard-pressed authors to complete a work; establishes "writing centers" in quiet country surroundings where authors can work undisturbed, and in addition controls a large number of cottages in picturesque spots and sanatoriums where writers can go for vacations. The fund also provides kindergartens and summer camps for the children of union members, runs its own medical clinics, supports the sick, and secures pensions from the government for totally disabled or aged members.

Writers, in short, are a privileged caste in the Soviet Union, and it is through privilege, as well as self-interest, that the party-controlled union begins its educational work of enforcing ideological conformity. Young writers are sought out and are given scholarships to attend the union's Gor'kii Literary Institute. Special lecture courses and seminars are arranged for them to study Marxian political theory. National conferences are held for them, in which their first writing efforts receive the careful criticism of famous authors. Their early manuscripts are placed in union publications, and finally they are admitted to the union, which obliges them to subscribe to its statutes, among them the credo of "socialist realism" and the union's objective, "the production of works of high artistic excellence expressing the spirit of the heroic struggle of the international proletariat and the greatness of the victory of socialism and reflecting the far-seeing wisdom and heroism of the Communist Party." [6]

Union controls

The union, however, has it in its power to replace the silken chains of privilege with iron controls and a large element of fear. Most authors feel it necessary to abide by the customary practice of submitting their works in progress to the appropriate commission (fiction, drama, poetry, etc.) of a branch of the union. There it is subjected to a grueling criticism, largely on ideological grounds. After satisfactory revisions, the work will often require the approval of a union official to ensure its consideration by a magazine or book publisher. At this stage the work again receives a stern ideological inspection from the union-controlled editorial board. All this amounts to a form of precensorship before the work is submitted for the approval of the regular government censorship, and if published the fate of the work—and sometimes the author's future—depends upon favorable reviews in the official publications of the union. Finally, standing over all, is the Central Committee or even the Presidium of the party, which may reverse—and sometimes does—the official opinion of the union on a novel or play through the medium of a thundering editorial or article in *Pravda.* It is against this brief background sketch of the party's relation to belles-lettres and of the control and manipulation of writers and their works by the union that one must view developments in Soviet literature over the last five years.

[6] "The Union of Soviet Writers," *Soviet Literature,* 1953, No. 8, p. 142.

ZHDANOVISM

By 1950 "Zhdanovism" in Soviet literature, ushered in by the 1946 party decree of the Central Committee and interpreted in a public speech shortly thereafter by the "culture" specialist of the Politburo, the late Andrei Zhdanov, was firmly established. However, the earlier concentration on war fiction had been officially frowned upon, and by now the prevailing demand, in terms of Zhdanov's speech, was for literature that would "further the fulfillment of construction and rehabilitation plans and . . . promote the development of our country's national economy," [7] but written in accordance with the Leninist principle of *partiinost'* ("party spirit" or "conformity to party dictates").

THE NOVEL

These demands were obediently met in the wealth of fiction that appeared over the next four years. In general, the formula involved a collective farm, a factory, an industry, or some construction site after the war. The mission of the hero or heroine, who is nearly always a Communist, is to rehabilitate the farm, run down during the war, or introduce some innovation in farm, factory, industry, or construction that will result in overfulfilling norms of production. The conflict is usually between the fresh ideas and efforts of the positive hero and the backwardness or "bourgeois survivals" of a negative character or characters. In the resolution of the struggle the *deus ex machina* is often the district party secretary who in crucial situations brings the wisdom and aid of the party to the assistance of the faltering hero. Any character development that exists is ordinarily concentrated on the Communist hero. The perfect, white-marble radiance of his party virtues usually has an ideological flaw—an overweening pride, a tendency to try to do everything himself, an inability to work with the collective, or an incorrect motivation in his conception of socialist labor. Through harsh experience and the practical advice or example of the party secretary, such flaws are corrected in the course of the novel or short story. Contrary to the prevailing image of the hero type in Western fiction, who is a lonely man, alienated from society, insisting upon his individuality in opposition to the encroachments of the crowd upon his freedom, the Soviet hero fulfills his personality only by completely identifying himself with society in the joy of collective labor. In many respects, labor may be regarded as the hero of all this Soviet fiction, and a major emphasis is constantly placed upon the happiness achieved through collective striving for the sake of the socialist well-being of the country. It is largely though not entirely an idealized life that is portrayed in this fiction, for "socialist realism" justifies a presentation of life in the Soviet Union not as

[7] A. A. Zhdanov, *On Literature, Music and Philosophy* (London, 1950), pp. 38, 41.

it is but as it should be or must be—the life of the hoped-for socialist future.

Collective-farm fiction

Space permits the mention of only the most successful of the many novels from 1950 on which illustrate this predominant pattern of fiction. Galina Nikolaeva's[8] *The Harvest* (1950; Stalin Prize) is the story of how Vasilii Bortnikov, chairman of the First of May Collective Farm, transforms it from one of the worst into one of the best in the area, aided eventually by the enthusiastic support of the collective and by the district party secretary who stands as a model for Vasilii and corrects his faults. Into this framework are woven the activities of backward elements, such as the hero's father and his second wife, and also Vasilii's personal relations with his wife, Avdotia. He had returned from the war to find her married to another, as she had been led to believe him dead. After a long emotional struggle, they find their way back to each other in the common task of improving the collective farm. This particular theme is well handled and —in the given circumstances—is psychologically satisfying, perhaps because Vasilii and Avdotia live more convincingly in the emotion of love than in the heroics of collective-farm labor. (It is an interesting fact that postwar Soviet women novelists pay more attention to the theme of love in their fiction than male novelists, and, with some few exceptions, are more convincing in their treatment of it than the men.)

Another example of collective-farm fiction is Semen Babaevskii's *Light over the Land,* Part II (1950; Stalin Prize), in which the author continues the fortunes of his incredible hero, Sergei Tutarinov.[9] Sergei no longer needs the wise guidance of that helpful animal of a party secretary, Kondriat'ev, the *deus ex machina* of the preceding part of the novel. He himself has been made chairman of the executive committee of the district soviet, and, having already introduced electricity into the collective-farm villages in this region of the Kuban after the war (a surprisingly late "innovation," it would seem!), he continues his gallant efforts, despite the familiar opposition of backward elements, to build a new life, new human relations, and a new morality among the old-fashioned peasantry in the Kuban. Though the reviews in the publications of the Union of Soviet Writers acclaimed the several parts of this novel when they first appeared, the Soviet life portrayed in them, and especially the characterization of the hero, were later to come in for some harsh second thoughts on the part of the critics.

Lutonin, the hero of Aleksei Kozhevnikov's *Life-giving Water* (1950; Stalin Prize),[10] after demobilization is assigned by the party to a remote district in Khakassia. There he is given the choice of managing one of several farms. As a good Communist, he selects the worst one, a stud farm, and soon works out a striking plan for improvement which involves irrigation and afforestation. For his pains he is fired by the head of the Regional Stud Farm Trust, who represents the opponents of innovation. In desperation Lutonin goes to work as a common laborer on the farm and wins over his fellow workers and the new manager to his plan. When a crisis develops in the building of a dam for the irrigation, both the district and regional party committees rather belatedly hold a meeting, denounce the backward elements, and support Lutonin's plan. When the plan is put into operation, we are led to believe that miraculous results are achieved and Lutonin becomes famous as one of the men who acted upon the wisdom of the resolution of the Central Committee on agriculture. At best, the novel does not rise above the level of superior newspaper reporting, and its chief interest for the reader is in the unfamiliar details of native life in this remote region. In fact, the large number of novels dealing with little-known corners and peoples of the USSR has been one of the more significant trends in postwar literature.

Another Stalin Prize novel, Vitalii Zakrutkin's *The Floating Stanitsa* (1950),[11] shifts the theme from the collective-farm village to a village of collective fishermen on the Don, but the characters are poured from the same mold and the propaganda purpose is the same. The positive hero, Vasilii Zubov, an inspector of fisheries, struggles to win over the collective to scientific ideas in fish breeding. A few old-fashioned members oppose him but, largely with the help of young, forward-looking Komsomols, he wins another victory for socialism in the end.

Portrayals of industrial life

The pattern is somewhat varied in *Home* (1950; Stalin Prize), the last novel of a trilogy[12] devoted to a study of factory workers, by the older and distinguished novelist, Anna Karavaeva. In the first two novels she had told the story of an industrial plant in South Russia evacuated during the war and joined with a plant in the Urals. In *Home* she continues the history of the plant by telling of its return to the original site and the rebuilding of the destroyed factory in the war-ravaged region in 1943 against almost insuperable obstacles, which a group of devoted workers surmount in their efforts to turn out badly needed collective-farm machinery by the end of the war. The picture is varied and the details of life in the Soviet rear during the war are often interesting, but the leading characters, and especially the heroine, Sonia Chelshcheva, turn out to be the usual Soviet supermen and superwomen.

Within this period perhaps the most widely acclaimed and officially acceptable novel dealing with the working class was Vsevolod Kochetov's[13] *The Zhurbins* (1952). The obvious purpose of the novelist is to reveal the new way of life of the Soviet proletariat by concentrating on the depiction of a single family of workers—the Zhurbins—in the shipbuilding industry. Yet the everyday life of this family, its private loves and public activities, is inevitably subordinated to the prescribed formula of success in fiction. In this case the shipbuilding collective is ordered to change over from its customary task of constructing small boats to building

[8] After working as a schoolteacher in Western Siberia, Nikolaeva took to writing poetry which received some attention during the war. But her first real literary success was *The Harvest.*

[9] Babaevskii had introduced Tutarinov in his first successful novel, *Cavalier of the Gold Star* (1947; Stalin Prize), and had followed up the characterization in the sequel, *Light over the Land,* Part I (1949).

[10] Kozhevnikov began to write in 1924 and produced his first novel, *Golden Host,* in 1927. Other works followed, and in 1939 he began a series on the builders of socialist Siberia with *Brother of the Ocean. Life-giving Water* is a second volume in this series.

[11] Zakrutkin, like so many of the postwar novelists, began as a newspaper correspondent, serving in this capacity during the war. His first novel, *By the Sea of Azov,* was followed by *The Floating Stanitsa,* which won him popular acclaim.

[12] Karavaeva began writing in the 1920's. She spent seven years on her trilogy. The first novel, *Lights* (1943), was followed by *Getting Under Way* (1948).

[13] Kochetov drew upon his own experience for this novel, for he has worked in shipyards. He began writing as a journalist; published his first story, *On the Neva Plains,* in 1946; and won a wide audience in 1951 with his novel, *Under the Skies of the Motherland.*

ocean liners. The shipyard is in a turmoil; many workers will have to acquire new skills, and the oldtimers among them tend to oppose these demands. But the older members of the Zhurbin family set an example by readily going to school to learn the new techniques, and thus the crisis is overcome. The reality of this unusual family is hardly enhanced by the romantic love of its members for sheer labor.

Of the other novels concentrating on the industrial theme over these years, mention ought to be made of Boris Gorbatov's [14] *The Donets Basin* (1951) and Vera Ketlinskaia's [15] *Days of Our Life* (1952). The first deals with the introduction of new machinery and work competition in a colliery, and the second with efforts to mechanize certain operations in the manufacture of turbines in a Leningrad plant. Both novels include the familiar negative characters opposing the new, the beneficent influence of the collective on worker morale, and the glorification of labor. Like the collective-farm novels in the matter of the science of agronomy, these industrial novels unhesitatingly sacrifice human-interest elements to a staggering accumulation of boring details on work techniques and the manufacture and uses of machinery.

University and student life

Though the collective farm and industry claimed the attention of most novelists over these years, other themes were treated in fiction. But no matter what the theme, the depiction of stereotyped negative and positive characters, the struggle between the old and the new, and the pervasive emphasis upon *partiinost'* as the essential guiding influence in all life's activities and emotions persist as monotonous, wearying features. Thus the treatment of teacher and student life in higher institutions of learning, which had begun a few years before (for example, Vladimir Dobrovol'skii's *Three in Greatcoats* [1948] and Grigorii Konovalov's *The University* [1949]), was continued in the period under discussion. Yet these treatments in turn are carefully designed to illustrate the cogency of Zhdanov's remarks at a conference of philosophers, in which he fulminated against the "objectivism" of some Soviet scholars and scientists and their kowtowing to the West.[16] For example, Dobrovol'skii's novel, *Zhenia Maslova* (1950), exposes Professor Bakeev, who favors the discoveries of bourgeois scientists and "unintentionally" remains silent on the priority of Russian and Soviet scientific workers. Bakeev is reformed by the example of the collective of the students and professors. But the antisocial, negative character of Professor Yakhontov curiously remains unreconstructed in the end, and he is fired. He opposes the thesis subject of the heroine, Zhenia, because Western experiments had already revealed its futility; he insists on objectivity in the sphere of science and plainly indicates his dislike of party interference in it. "The theory of dialectical materialism," he declares, "cannot take the place of my gnosiological views." [17]

Though an antisocial professor, who has no interest in Soviet literature, is also exposed in Yurii Trifonov's widely popular first novel, *Students* (1950; Stalin Prize), the essential story is that of student life in a Moscow pedagogical institute. But interest is centered on how the good example and efforts of the hero, Vadim Belov, and of the student collective, guided by party principles and actions, finally reform the negative character, Sergei Palavin, who is antisocial, self-centered, and morally deficient. In this case, however, the "pot of message" does not swamp an otherwise fresh and interesting account of Moscow student life or prevent the creation of two or three ordinary and hence believable characters.

Historical themes

Though the official demand after 1946 had been to eschew war literature in favor of themes dealing with the reconstruction of the country, and though Zhdanov himself had declared against a "one-sided interest in historical subjects," [18] fiction in both these fields continued to appear after 1950, but with diminishing emphasis. Novels depicting the past of Russia figured prominently in the Stalin Prize awards of 1951: Stepan Zlobin's *Stepan Razin* treats the social core of the famous seventeenth-century uprising of Cossacks and peasants against the boyars; Lev Nikulin's *Russia's Loyal Sons* is a historical novel on the defeat of the French invaders in 1813–14; Nikolai Zadnovo's *Towards the Ocean* (the concluding novel of a trilogy) is concerned with Russian expansion and settlement in Siberia in the nineteenth century; and Georgii Markov's *The Strogovs* also concerns Siberia—the history of a village there, as seen through the lives of three generations of a single family. Another novel that has a "historical" aspect is Nikolai Nikitin's *Northern Aurora* (1950), one of the many contributions to the post-1946 Soviet anti-Western and anti-American literature—it is the story of the struggle of Communist-directed peasants and workers against British, French, and American interventionists in Northern Russia in 1918–20.

War novels

Of the fiction dealing with war, mention should be made of the continuation of Mikhail Bubennov's *The White Birch* (1952)—the first volume, a Stalin Prize winner, had appeared in 1947—which takes the story to the latter part of 1941, when the Soviet forces repelled the Nazis before Moscow; and of Konstantin Simonov's *Comrades in Arms* (1952) which relates the struggle of Soviet forces against the Japanese in Mongolia in the undeclared war of 1939. Il'ia Ehrenburg's *The Ninth Wave* (1952) is a sequel to his widely heralded war novel, *The Storm* (1947). Some of the leading characters of *The Storm* (Mado Lancier, Professor Dumas) reappear in the new novel, but they are now engaged in the contemporary struggle between the forces of peace and those of war, the latter symbolized by a nefarious American agent, Colonel Roberts. Vasilii Grossman's war novel, *For the Just Cause* (1952), on the siege of Stalingrad, aroused bitter critical denunciation in meetings of the Union of Soviet Writers because the author had strayed from the ideals of *partiinost'*. "He distorted life," declared Alexander Fadeev, "by making this largely philistine family (the Shaposhnikovs) the center of the novel." [19] And certain other characters were condemned because they possessed an idealist philosophy, a trait which the critics were prompt to attribute to the hapless author.

[14] Gorbatov's war novel, *The Unvanquished* (1944), brought him much fame. *The Donets Basin,* the story of which begins in the 1930's, is only the first part of a novel which Gorbatov intended to bring up to date in a second volume. He died in January 1954, leaving behind him only a section of the continuation of his novel.

[15] *Courage* (1938) and *The Siege* (1947) were two earlier novels of Vera Ketlinskaia which were favorably noticed by the critics.

Leonid Leonov

The baleful effects of the rigid postwar party control of literature began to reach their peak in 1953–54. Apparently so pronounced was the discouragement among authors that they repeatedly failed to appear at the meetings of the several commissions of the Union of Soviet Writers to discuss works in progress or published works.[20] Only about three novels in 1953 and one in 1954 won a wide reading public and both the plaudits and the brickbats of the critics. The outstanding performance certainly was Leonid Leonov's *Russian Forest* (1953), the first novel in a number of years of this outstanding Soviet writer. The plot is intricate and the time sequence complicated by flashbacks, but the central story is that of the unusual career of Professor Vikhrov, an expert on forestry, whose advanced theories of forest preservation, as well as a stubborn nature, have resulted in the estrangement of his wife and daughter and the enmity of scientific colleagues, which is furthered by a mysterious Professor Gratsianskii, a subversive figure in Vikhrov's past. The experience of the war, however, tempers and strengthens the characters of the good people, bringing Vikhrov and his wife and daughter together, and exposes the wickedness of the evil elements. There is a psychological density in the development of the main characters and a brilliance of language rarely found in Soviet novelists. But, more so than in any of his previous novels, the *Russian Forest* reveals Leonov in full sympathy with the ideological line of the party, which no doubt accounts for the unusually sympathetic reaction of the official critics.

[20] Cf. Stepan Zlobin, "O rabote tvorcheskikh sektsii," *Literaturnaia gazeta,* November 12, 1953, p. 3.

Official disapproval of Panferov and Panova

The official reception of the other three novels was negative, and in two cases rather violently so. *Mother Volga* (1953) by Fedor Panferov, author of the celebrated early collective-farm novel *Bruski,* narrates the confusing events that take place in a Volga farming district from the autumn of 1951 to the spring of 1952. It is a sprawling, inept novel with many characters and events, but the main intention seems to be one familiar in this period—to show how Communist ingenuity, fortitude, and discipline overcome the hostile forces of nature in agriculture. Unfortunately for Panferov, however, a good deal of the narrative centers in the activities of the district party committee, and as his picture of important Communists in action, especially of the hero, Akim Morev, shows them as something less than a hundred per cent perfect, the ire of official critics was aroused.

When it first appeared, Vera Panova's[21] novel *Seasons of the Year* was enthusiastically received. In picturing the life of an industrial town, the work seemed almost to be a deliberate attempt to avoid the postwar stereotypes of the "industrial novel" and to portray everyday typical family life with its joys and sorrow, its successes and failures. The story is concentrated on two families—the Kuprianovs and the Bortasheviches—which are intended by the author to illustrate a commonplace social contradiction. Although Dorofeia Kuprianova, who has come up the hard way and is a highly respected Soviet citizen, lavishes care and affection on her son, Gennadii, he turns into an evil, worthless person; on the other hand, the children of Stepan Bortashevich, a crook and an "enemy of the people," are models of socialist rectitude. On the whole, it is an interesting, well-told story, with a minimum of the embellishment of Soviet life so common in postwar fiction. After the initial and perhaps incautious favorable reception, however, the literary politicians, no doubt upon a command from above, swarmed all over the novel, roundly denouncing it as an atypical picture of Soviet life and people, lacking in the high seriousness and ideological direction of *partiinost'*. Obviously, Panova had not taken seriously enough Malenkov's assertion in his report to the Nineteenth Party Congress, in October 1952, that the typical character in literature can never be divorced from politics, that is to say, from *partiinost'*.

[21] Vera Panova's star rose in the postwar period as the author of three successive Stalin Prize novels—*Companions* (1946); *Kruzhilikha* (1947); *Bright Shore* (1949).

In Ehrenburg's short novel, *The Thaw* (1954), there can be no doubt of his deliberate intention to oppose the party formula in fiction and at the same time to criticize the controls which had obstructed the artist since the war, perhaps more than in any other period of Soviet literary development with the possible exception of the period of the first Five Year Plan (1929–32). *The Thaw* is a series of sketches of ordinary people who live in a Volga town. There is no plot in the real sense of the word, but a certain unity is achieved through the interrelations, often rather casual, of these people. Here are no positive heroes or heroines in the Soviet sense, no romantically conceived and fulfilled feats of labor, and no all-wise party secretary. In fact, the party seems to be a passive symbol rather than an active force in the lives of these people. It is perhaps indicative that the only ideal Communist is the old retired teacher, Pukhov, who, his son remarks, "grew up in another age—a revolutionary romantic."[22] The rest are not very happy, and their dissatisfaction seems somehow connected with the realities of Soviet life today. The arts and artists in the Soviet Union are harshly criticized for their conformity to stereotyped patterns of performance. The exception is the talented but starving painter Saburov, whose nonconformist and highly imaginative canvases are scorned by the critics. His model is Raphael, but the commercially successful painter Volodia Pukhov cynically declares: "Now they would not accept Raphael in the Union of Artists."[23] Most of these characters resemble, however faintly, the lonely individualists of contemporary Western fiction, that is, men and women alienated from Soviet society. And in the frustrated artist Volodia Pukhov there is much of Ehrenburg himself, perhaps nostalgically longing for those wonderful days of 1921 when, in his brilliant *Julio Jurenito,* he could have a character freely question the very possibility of art serving propaganda without murdering the creative spirit. Though the title of the novel has its point in the action of the story, it may well have been intended symbolically in 1954: the hoped-for "thaw," after Stalin's death, of the party icecap that had congealed the free spirit and imagination of the creative artist. And there seemed some point in the symbolism, for the fierce criticism of the novel, led by official denunciations in *Komsomol'skaia pravda* and *Literaturnaia gazeta,* was not unmixed with a few begrudging admissions of the reality of the Soviet life that Ehrenburg described.

[23] *Ibid.,* p. 28.

SHORT STORIES AND NOVELLE

Over this period the short story and the novella, in which Russian authors

specialize, have flourished and nearly all the novelists mentioned above, as well as many others, have contributed to these genres. In 1951, a three-volume collection of short stories appeared which contains some of the best recent examples of this form. And occasionally an author will bring out a volume of his short stories, such as *Our Contemporaries* (1952) by the well-known writer Boris Polevoi,[24] all the tales of which, in the characteristic vein of this author, are based on heroic incidents in the lives of people he met on the Volga-Don canal construction. In general, these numerous short stories and novelle do not diverge from the thematic and ideological scheme which we have observed in the novel.

Two writers, however, deserve some mention not only for their exceptional talent but also because of their relative independence in revealing the realities of one slice of Soviet life. Both Sergei Antonov and Valentin Ovechkin have concentrated on collective-farm characters and incidents. Antonov's collection *Lorries on the Road* (1950; Stalin Prize) and especially his *Poddubki Rhymer* (1951) contain stories that strike a lyrical note, almost Chekhovian in its frequent understatement. Ovechkin is an older and more practised writer than Antonov, but he did not achieve prominence until his series of stories, especially *The Daily Round*, which he wrote between 1952 and 1953, for they seemed to be a response to Khrushchev's startling revelation of the hardships, inequities, and skulduggery on the collective farms, mentioned in the report to the Central Committee in September 1953. In uncompromising language Ovechkin lifts the veil on some of these abuses, striking contrasts to the idealized pictures of collective-farm life by many of the postwar novelists. Needless to say, however, Ovechkin does not attempt to get at the root cause of the abuses he describes in his sketches and stories.

[24] Polevoi is the celebrated author of the Stalin Prize war novel, *The Story of a Real Man* (1946). Previous to this he had published the novel *Hot Shop* (1939). Another volume of short stories, *We Are the Soviet People* (1948), also won a Stalin Prize.

POETRY

With some few exceptions, the output of poetry since 1950 reveals more starkly than fictional prose the blight of the creative imagination under the severe postwar controls. Much verse has been published, both lyric and narrative, but themes and treatment are dominated by the topicality of postwar "social commands" and the directed "inspiration" of *partiinost'*. Thus Semen Kirsanov's narrative poem, *Makar Mazai* (1950; Stalin Prize), elevates labor to hero worship in telling the life story of the famed Stakhanovite steelworker Mazai, who was killed by the Nazis. Similarly, the hero of V. Zamiatin's long poem, *Green Shelter Belt* (1951; Stalin Prize), encourages the people of his community to erect shelter belts to protect the orchards and fields from the fierce wind, whereas Vera Inber dedicates her *New Poems* (1951) to the collective farmers and irrigation workers of Uzbekistan who labor to harness the waters of a river. Then there is Stepan Shchipachev's *Pavlik Morozov* (1951; Stalin Prize), the tale of a young Pioneer who perished at the hands of a kulak "bandit." More typical of many hundreds of short poems is Alexander Yashin's collection, *The Soviet Man*, in which most of the poems are concerned with the feats of workers on the construction site of the Kuibyshev hydroelectric power plant. By way of variation, scores and scores of lyrics and short poems have as their subject "peace"—the determination of the Soviet leadership to achieve it and of the "imperialistic warmongers" to destroy it. Aleksei Surkov has a whole volume on this general theme, *Peace for the World* (1950; Stalin Prize), and the fine poet Nikolai Tikhonov has also put out a cycle of poems, entitled *At the Second World Peace Congress* (1951). Perhaps superior to any of these in poetic integrity and emotional intensity is Ol'ga Berggol'ts' collection, *On Stalingrad Soil* (1952); many of these poems are filled with memories of the heroic siege. And Alexander Tvardovskii's *Space Beyond Space* (1953–54) reveals his superior poetic talents in many poems inspired by his observations of life on a journey to the Soviet east. But in one of the early poems of this cycle Tvardovskii shows his courage by making a less than veiled attack on literary regimentation.

Mention ought to be made of other well-known poets, such as Margarita Aliger, Alexander Prokof'ev, Evgenii Dolmatovskii, Mikhail Isakovskii, and Nikolai Gribachev, all of whom have published verse over this period, but the themes vary little from those mentioned above. No doubt this stifling conformity was behind a rather cautious discussion in the literary press during 1953–54 on the broad problem of the poet's right to self-expression. The position of the party critics was to dismiss the whole controversy as a terminological difficulty, but it was also made clear that the proponents of self-expression too often identified it with the philosophy of subjective idealism, and there the argument ended. Nevertheless, in a two-day meeting (January 5–6, 1954) of the presidium of the Union of Soviet Writers devoted to poetry, it was frankly asserted that the readers' interest in poetry was waning, that the poems sounded all alike, that the themes were dull and unoriginal, and that the language was depersonalized. Yet as remedies, these pundits demanded more civic poetry and complained that the theme of labor had not found its proper place in Soviet lyrics![25]

LITERARY CRITICISM

In criticism we find a public confession of the failure of postwar literature, as well as a reflection of the curious manipulations of the party and of its agent the Union of Soviet Writers in their efforts to improve literary affairs at a time of internal struggle among the leaders of the party. One of the immediate aims of Zhdanovism in literature—in which no doubt Stalin had fully concurred—was to compel artistic as well as intellectual subservience to the dictates of the party. Propaganda, controls, and fear were the instruments. The various postwar decrees of the Central Committee on the arts and on fields of learning, the anticosmopolitan campaign, and the public denunciations of artists and scholars, and even their removal from their posts, were methods used to achieve this end, perhaps justified by the party because of the postwar internal condition of the country and the dangerous international situation.

We have already observed the state into which literature quickly fell in this atmosphere of controls and fear. The party and the union tackled the problem by inspiring critical articles, especially in *Pravda* and *Literaturnaia gazeta*. The authors were blamed for sundry faults—not adhering to the truth of life, embellishing Soviet reality, relying on schematic plots, and creating wooden positive and negative stereotypes for characters. Of course the only thing that was not criticized was the real cause of the debacle—the party's postwar line in literature and the rigid controls that enforced it.

Fear at first prevented the writers

[25] Cf. *Literaturnaia gazeta*, January 12, 1954, p. 3.

from attempting any answers to these charges. Even the famous authors, whose lofty position enabled them to exhibit more courage in these matters, preferred to keep silent. After Zhdanov's death (1948), however, one observes some willingness on the part of writers to indulge in a certain degree of realistic criticism. It may be conjectured with some plausibility that they found a cautious friend in high party circles in Malenkov, who appears to have had no reason to admire the author of Zhdanovism in literature. For example, the party now urged forthright criticism. An editorial in *Literaturnaia gazeta* [26] declared: "Readers in the past found critical articles in newspapers and magazines by L. Leonov, F. Panferov, K. Fedin, and other well-known writers. Why do they not publish critical articles now?"

New critical boldness, 1950–52

Under this stimulation many highly critical articles did appear. Significantly, the main objects of attack (perhaps at a hint from party officials) were the editors of magazines and publishing firms and the equally repressive censorship tactics of the Committee on Art, which had drama under its control. (These agents, of course, were merely carrying out the orders of the party, and if they exercised their functions with excessive severity, it was through fear of committing ideological errors of their own.) Over the remainder of the summer of 1950 through the early months of 1952 many candid articles appeared, often by well-known writers and critics—especially in *Literaturnaia gazeta,* which complained of the low point reached by Soviet literature and for the most part tended to place the blame on the editorial branch of publications. Playwriting in particular was attacked, perhaps because the nearly empty theaters publicly dramatized the failure of numerous ideologically perfect plays written according to a theory of "nonconflict," which arose no doubt as much out of a sense of fear as from the conviction that a classless socialist society created no basic human conflicts. This line of criticism reached its height in an unusually bold article, "Let Us Speak Frankly," by the successful playwright Nikolai Virta, in March 1952. He excoriated the Committee on Art for compelling dramatists to rewrite their plays in order to conform to a dull, official formula which the Committee believed would escape party condemnation. Those who pass on the publication and production of plays, wrote Virta, were guided "by a wild, rabbit fear of taking any risk or responsibility for risk." Drama would get ahead, he declared, only "if the creative energies of writers are freed from the fetters forged in bureaucratic nooks and crannies by indifferent officials who preach the idea of conflictless, speak-softly, speak-gently, be-pious writing." [27]

Critical revolt after Stalin's death

After Stalin's death in March 1953 this mounting criticism was very noticeably accelerated and struck a new and significant note in demanding that literature be humanized; that love and family life and not the need of crop rotation or the technical problems of introducing the Bessemer steel process should become the themes of novels, plays, and poems; in short, that real Soviet life and real men and women, and not an imaginary society peopled with supermen, should become the concern of literary artists. In October 1953 an outstanding article by Ehrenburg considered with remarkable frankness the causes of the postwar decline of Soviet literature. After developing at

[26] August 17, 1950.

[27] Nikolai Virta, *Sovetskoe iskusstvo,* March 29, 1952.

length the obvious point that it is the business of experts in industry and agronomy to write about manufacturing and agriculture, whereas the novelist's task is to portray the living life of the people who work in factories and on collective farms, he fearlessly declares:

> The writer is not an apparatus that mechanically registers events. . . . A writer writes a book because it is necessary for him to say something of his own to people.

Then, admitting that the writer in a socialist society is sometimes called upon to fulfill a social command, he counters:

> However, the word "social" has run away with certain editors and critics; it has become a business. But the word "command" is hardly suitable in the work of a writer. In prerevolutionary times, writers did not find it easy to live, and in Chekhov's letters one may observe indications of how an editor of a newspaper ordered a short story from him. Yet even the most unthinking editor never attempted to suggest to Chekhov the theme of a story. Can one imagine commanding Tolstoy to do *Anna Karenina* or commanding Gor'kii to do *Mother?* Is it possible that there exists a writer so impersonal and so indifferent to everything that one must tell him what to write about? [28]

69627

To be sure, Ehrenburg does not challenge the ultimate authority of the party in things literary, nor did Vladimir Pomerantsev, who published another extraordinarily revealing article two months later, "On Sincerity in Literature," but both critics were by implication striking at party controls and the havoc they caused to the creative imagination of the literary artist. By insisting that the real artistic test of a work of literature was its sincerity, Pomerantsev was, in effect, questioning the prescribed tests of ideological purity and *partiinost'* and thus, by implication, condemning the whole corpus of postwar literature which had subscribed to these tests. Finally, after a lengthy exposé of the artistic insincerity that writers are forced into because they believe their creative activity to be under constant surveillance, Pomerantsev concludes by counseling the author: "Don't think about prosecution. Don't feel compelled to set down your conclusions, but don't let yourself write a single line that you do not feel. Be independent." [29]

Many similar articles, though perhaps not always so forthright, appeared over the winter of 1953 and much of 1954, including two by the famous composers, Khachaturian [30] and Shostakovich,[31] in which they forcefully asserted the artist's right to "independence, boldness, and originality," and a whole series of very critical articles in the important periodical, *Novyi mir,*[32] which condemned a number of postwar novels often for the very reasons for which they had previously been praised by the official critics. And no doubt some of the literary works deviating from the stultified postwar pattern, such as Panova's *Seasons of the Year* and Ehrenburg's *The Thaw,* reflect the new spirit of creative freedom which was espoused over this whole period after Stalin's death, for the connection between these numerous and outspoken demands for a change in literature with the so-called "soft" policy associated with Malenkov's rise to power after Stalin's death seems reasonably certain.

Reprimands and recantations

On the other hand, it is tempting to use the determination of the party to quell this promising "revolt" in literature as evidence of the dating of the beginning of a change in the power position of Malenkov. Chronological certainty is difficult to ascertain, for throughout all this "soft" period the critical views and literary works of the dissenters, and especially of Pomerantsev, continued to be attacked in *Pravda* and in the organs of the Union of Soviet Writers, an ambiguous situation that may well have reflected Malenkov's own uncertain position at the time and in turn a struggle between his adherents and opponents in the party leadership of the union.

However this may be, a meeting of the presidium of the Union of Soviet Writers on August 11, 1954, brought to an end the widespread demand in the press for sincerity and freedom in literary creation. Nearly all the authors active in the movement were reprimanded, and members of the editorial board of the offending *Novyi mir* recanted. Resolutions were passed ordering the dismissal of the distinguished poet, Tvardovskii, managing editor of *Novyi mir,* and the appointment of the prominent literary politician, Simonov, in his place, and in general the secretariat was ordered to clean house in the magazines controlled by the union.[33] If Malenkov's policy had served as a protection of the movement up to this point, which seems likely, it ceased to do so thereafter.

SECOND ALL-UNION CONGRESS OF SOVIET WRITERS

Meanwhile, the Second All-Union Congress of Soviet Writers—the first such gathering in twenty years had been announced for September 1954. Literally hundreds of articles and editorials appeared in the periodical press, often criticizing the recent dissenters, but all obviously striving to create an atmosphere of sweet reasonableness and "unanimity" of views and voting, in preparation for this important meeting. Perhaps the fact that the Congress had to be postponed several times and did not actually convene until December 15 is some indication of the difficulties encountered in whipping the dissenters back into line. Yet this effort was not entirely successful.

The formal reports (the introductory report by Surkov, Simonov on prose, Vurgun on poetry, Korneichuk on drama) at the Congress, which lasted ten days and was attended by 738 official delegates, persistently reaffirmed all the postwar party-line clichés on what Soviet literature should be. And the directives of the Central Committee of the party to the Congress, scores of speeches from the delegates, and the final statement of the Congress to the Central Committee of the party all gave little hope that the future course of Soviet literature would change radically from that which had been announced by Zhdanov in 1946.

Actually, however, the extensive protest against this course, which seemed to have been effectively silenced before the Congress, resounded again in sharp and often significant statements by some of the leading writers among the delegates. In the speeches of Ehrenburg, Sholokhov, Ovechkin, Yashin, Berggol'ts, Kaverin, and Antonov,[34] one may observe all over again the same discontent with the course of Soviet literature which had been voiced so boldly after Stalin's death. No one of these writers questioned the final authority of the party in literature. In this respect each of them would probably take his stand, with how much sincerity cannot be determined, with Sholokhov's declaration: "Evil-intentioned enemies abroad say of us Soviet authors that we write according to the dictates of the party. The matter stands somewhat differently: each of us writes according to the dictates of his heart, but our hearts belong to the party. . . ." [35] Their main criticism is directed against by-products of party controls—against the bossism, cliquishness, and literary politics of the leadership of the Union of Soviet Writers, and the vast power it has to make or break authors and to form and control literary taste. They demand that the union be democratically run by its members, that it respect the individuality of the creative artist and cease trying to foist themes upon him. "I repeat," said Ol'ga Berggol'ts at the Congress, "the time has come to have as careful an attitude as possible towards the individuality and identity of the poets, towards what the poet himself wants to say 'about the times and about himself.'" [36] Though a spirit of faithfulness to the ideology of the party breathes throughout all these statements, a kind of anguished plea is made for the right of the artist to express himself as he sees fit in these matters. Or, as Ol'ga Berggol'ts put it in her speech:

> . . . from time to time we ourselves seem to betray art, to depart from its great laws. And art ceases to be a part of life the moment it stops being art. With a kind of timidity inspired by the yelps of the critics, we still do not appraise our work and the state of literature by the criterion of artistry, yet without artistry neither ideological content nor *partiinost'* exists in art.[37]

NEW DEAL IN LITERATURE?

Available literary production and criticism in 1955 so far offers no basis for deciding definitely that this spirit of dissent continues. Two recent unconnected reports, however, may be regarded as harbingers of a change. In the past the Soviet leadership has been unrelenting in its condemnation of Dostoevsky as a writer whose views were utterly inimical to communism. Now a national celebration is being planned to mark the seventy-fifth anniversary of his death, February 9, 1957, and his collected works will be published.[38] It has also been announced that a two-volume edition, the first since 1926, of the works of Sergei Yesenin, the talented but banned "hooligan" poet of the early revolutionary years, will soon appear.[39] These items are mere straws in the wind, but they may indicate that it is blowing in the direction of a "new deal" in literature, in keeping with the momentous changes which are only beginning to make themselves apparent in post-Stalin society in the Soviet Union.

Ernest J. Simmons, Ph.D., New York City, is executive officer of the Department of Slavic Languages and professor of Russian literature at the Russian Institute, Columbia University. He formerly taught at Harvard and Cornell Universities, is the general editor of Columbia Slavic Studies, has published articles in learned and literary journals, and is the author of a number of books, the best known of which are Pushkin (1937), Dostoevski: The Making of a Novelist (1941), and Leo Tolstoy (1946).

Soviet Art and Architecture: Recent Developments

By Arthur Voyce

A STUDY of the post-Stalin aesthetic trends does not reveal any deviation from the Marxist philosophy of art. The doctrine of "socialist realism" in painting and sculpture remains valid, and any suggestion of the modern abstract tendency is still avoided. In architecture, there is evidence of a new approach to style, but "modernism"—as based on Constructivism, New Functionalism, or any other manifestation of the Western "Technocratic" movement—is still considered foreign to the Russian aesthetic ideal.

On the practical side, a survey of building activities discloses several significant facts: (1) the enormous amount of work which has been done and is being done; (2) the vast scale and boldness of the work; (3) the care being bestowed on the restoration and preservation of historical monuments; and (4) the launching of a huge program of standardization, prefabrication, and mechanization in the building industry, bringing in its wake discernible signs of a new aesthetic.

Soviet Architecture: Revolutionary and Conservative

Contemplating the recent quantitative achievements in the field of construction and reconstruction, one realizes that such a program could only have been conceived and sustained on the basis of a constantly expanding building industry, requiring vast investments in mass-producing plant and equipment. Indeed, from the facts and figures, published in the Soviet architectural press and supported by foreign eyewitnesses,[1] it is evident that in this field the Soviet Union is very far advanced.

The Western architect, schooled in the aesthetics of the modern movement, finds it difficult to understand the double image of Soviet Russia—revolutionary and conservative at once; he cannot reconcile the apparent contradictions in her architecture. On the one hand there is the ultramodern, highly mechanized building technique; on the other, the antiquated mode of expression pervading almost every type of building and evidenced in many forms, from the most imaginative reproductions of post-Palladianism to naïve, if sometimes poetic, recreations of the seventeenth-century Russian national style. He is puzzled by the seeming absence of any experimentation with advanced art forms.

However, there is plentiful evidence that the experimental approach did exist in the past, and the present indications are that there is a growing demand for a re-examination of creative attitudes. A great deal of discussion of principles and deep questioning has been going on in architectural circles. The authority of established reputations has been challenged; a number of "cliques" have had to disband, and there have been important changes in leadership.[2]

[1] The reports of British architects' delegation to Russia, *Anglo-Soviet Journal*, Winter 1953–54 and Autumn 1954; *New York Times*, April 3, 1955; reports of various recent visitors to Russia.

[2] The recent shakeup in the presidium of the Academy of Architecture and in various architectural offices was foreshadowed by a flood of critical editorials and articles in the Russian architectural periodicals. See for example, "Protiv formalizma v arkhitekturnoi praktike i nauke," *Arkhitektura SSSR* (cited hereafter as *Arkh. SSSR*), October 1954, pp. 37–40; editorial in *Arkhitektura i Stroitel'stvo Moskvy* (cited hereafter as *A. S. Moskvy*), December 1954, pp. 1–3. For the new presidium members, see notice of elections to the presidium of the Academy of Architecture, *ibid.*, June 1955, p. 30.

To appreciate the situation, and understand the Russian assessment of ideological values in architecture, it is necessary to go back a little in time and review the major aesthetic theories that have been instrumental in molding the character of recent Soviet architecture.

Search for New Architectural Ideals

The innovators of the years immediately following the Revolution were very seldom practicing architects, but rather painters, sculptors, and artists in the cinema and theater who tried to advance some particular "ism." Prominent were Malevich, the proponent of Suprematism,[3] Tatlin,[4] Lisitsky, Rodchenko, and Altman and Gabo, representatives of Constructivism.

The "left" currents in painting—Cubism, Futurism, and Expressionism—exercised a considerable influence on the architecture of the 1920's. The principles of dynamic distortion in the representation of objects, the dissociation method of composition, and other methods cultivated at that time in the various painters' and sculptors' studios were carried over into the methods of architectural composition for the purpose of enhancing the emotional force of design.

The essential characteristics of the Russian phases of Formalism, Constructivism, and Functionalism—the basic patterns of architectural thought long the subject of heated and acrimonious discussion and still branded as the fatal disease of Western *avant-garde* art to be guarded against—must be considered somewhat at length.

Formalism

Formalism as an aesthetic theory is, of course, not a product of the Bolshevist Revolution. Its influence on Russian art dates back to the pre-Revolutionary period. Essentially, the theory is based on the doctrine that the laws governing all art are "objective" and "absolute," that is, independent of social, political, and economic factors. Art, as the Formalist conceives it, is creative of "self-contained, self-sufficing, pure" abstract forms; to him it is the form (how something is expressed) and not the content (what is expressed) of a work of art that influences our reactions.

This "idealistic" interpretation of art philosophy was reinterpreted by the proponents of the movement to fit the Marxist materialistic art thesis. The fundamental mission of architecture, they asserted, is to serve the highest technical needs of man to orientate himself in space; and architecture can best fulfill that mission through the use of expressive forms. It is not enough that "form should follow function" in a merely passive way. On the contrary, form should be made to evoke aesthetic enjoyment; it should be used as a means for training the perceptive faculties of the masses, for arousing their enthusiasm, thus heightening their revolutionary fervor.

The analytical work of this school—its investigation into the study of scale and modulism, its exploration of the potentialities of various forms—intrigued many a mature professional and cast a spell upon many a beginner. But Soviet theorists claim that Formalism de-

[3] For an illustration of Suprematism in architecture, see Suprematicheskii "arkhitekton," a drawing of 1923, by K. S. Malevich, *Arkh. SSSR*, May 1936, No. 5, p. 8.

[4] Tatlin, designer of the "Monument to the Third International," used the spiral as a symbol of revolution. For illustration see Arthur Voyce, *Russian Architecture: Trends in Nationalism and Modernism* (New York, 1948), Pl. LXX.

generated into studies of psychotechnical processes, abstract spatial logic, and exercises in metaphysics. It has been bitterly attacked as "paper" architecture far removed from reality and devoid of the sociological aims of Soviet architecture.[5]

CONSTRUCTIVISM AND FUNCTIONALISM

Constructivism, on its theoretical side, was a reflex from the Cubist, Futurist, and post-Expressionist vogue in Russia, Italy, France, and Germany; practically, its emergence during the militant period of communism, as a program for an organized group, was the result of an insurrection within the ranks of Russia's archradicals in the arts—the Cubo-Futurists.

Having grown tired of experimenting with the vague revelations and the abstractions of ultramodern "bourgeois" art, the Cubo-Futurists transferred their creative efforts from the field of the studio "easel arts" and abstract aesthetics to the practical field—to the making and "constructions" of real objects and useful things.

They proceeded to throw out of art its idealism, emotionalism, and subjectivism, and to curb and harness the anarchical spirit of Cubo-Futurism. Retaining only the positive constructive values and the freer art forms developed by the movement, they built up an elaborate philosophy and terminology of their own, but at heart they professed a fairly simple creed: a belief in the functional, the utilitarian, and the comprehensible.[6]

Constructivism thus split into two factions, each championing conflicting concepts of architectural aesthetics. One faction claimed that Constructivism was essentially an aesthetic movement, that the material and utilitarian principles underlying the theory were but the physical means for a new emotional expression of a rational approach to art. The other faction, which became known as the Functionalistic Group (the SASS),[7] attempted to build up an aesthetic whose working principles were to be based on the organic and rational functions of the given structure. Architecture as a fine art did not interest them; its power of enticing the masses by forms was belittled. What did attract them was the functional and cultural organization of life in architecture. And so they replaced "content" with "function," "formalistic" methods with "mechanistic," and made fitness and utility the real foundation of design. They busied themselves with the study of European and American techniques and adopted the principles of Functionalism as taught by the West European modernists.

While much of the work in architectural design done under the influence of this school was for the sake of improving the functional organization of specific building types, the main effort was concentrated on communicating some special, if not always appreciated, "message." Architecture became self-conscious about the "functional" look, with the result that much of the construction was of the packing-box or slab variety—drab and monotonous. Moreover, the attractiveness of functional architecture depends greatly on precise details in first-class materials, which Russia of those days could not provide. As a result, after a few months' exposure to weather, the "modern" buildings began to age badly—the stucco disintegrated only too quickly, the colors faded, and the sweeping expanses of glass made the buildings too cold in the winter and too hot in the summer.

[5] For a fuller discussion of Formalism, see L. Rempel and T. Vainer, "O teoreticheskikh korniakh formalizma v arkhitekture," *Arkh. SSSR*, May 1936, pp. 8–13; L. Rudnev, "O formalizme i klassike," *ibid.*, November 1954. For an example of modified Formalism, see Central Red Army Theater by K. S. Alabyan and V. N. Simbirtsev (Voyce, *op. cit.* [note 4 *supra*], Pls. LXXXVI, XCVII–XCIX).

[6] For some interesting examples of Constructivist architectural projects showing the pictorial possibilities of the style, see the drawings of Ia. Chernikhov, *Sovetskaia Arkhitektura* (cited hereafter as *Sov. Arkh.*), 1933, No. 3, pp. 14–16.

[7] For an account of the architectural groups, see Voyce, *op. cit.* (note 4 *supra*), pp. 134–37.

REJECTION OF MODERNISM

The aesthetic uncertainty of early Soviet architecture was perhaps best reflected in the projects submitted in the international competition, and in the closed competitions[8] for the Palace of the Soviets (1931–33). Many of the projects by foreign and native architects were examples of Constructivism and Functionalism. Significantly, and prophetically, those submitted by a number of Russians contained designs in a re-created classic idiom—a synthesis of neoclassical grandeur and twentieth-century form—suggesting new potentialities for the development of Soviet architecture.

The projects were exhibited and discussed with representatives of nonprofessional groups. The popular reaction was overwhelmingly in favor of the classic designs; it became clear that ultramodern Functionalism was "strange fruit" to the people and that the dramatization of the ideals of the new life could be best expressed by an architecture based on native traditions of classical forms.

Experimentation with the modern idiom continued for some time into the 1930's, but it did not meet with any degree of success. Perhaps the chief handicap to further development of modernism was that the fashion of symbolizing the machine as dominating the forms of Soviet architecture was not received with enthusiasm by the men at the summit—those in power to shape the program. Lenin himself had no sympathy for extreme modernism.[9] He and a number of his latter-day disciples apparently sensed that Constructivist architecture caters not to the common man but rather to a coterie of like-minded Constructivists, and that modernism—as appreciated by a few snobs in the rarified atmosphere of pure aesthetics—was incomprehensible to the masses, whose tastes were conditioned by native architecture and by the examples of the Russified Baroque and Empire styles all around them.

REVIVAL OF CLASSICISM AND NATIONALISM

The spirit of classicism was invoked because it was felt to be closer to the indigenous expression of the Russian ideal in architecture and could be considered as a continuation of the national tradition for public buildings. The champions of classicism have been careful to point out that they do not want the set forms of early periods, but rather an appreciative attitude to the spirit and the methods of composition with the help of which the Russian masters of the eighteenth and nineteenth centuries were able to re-create the classic models in Russian terms.

With the growth of Russian nationalist sentiment in the late 1930's a perceptible shift toward the expression of nationalism in architecture could be noticed. The emphasis on national heritage was intensified in the early 1940's.

[8] For a fuller account of this competition, see Voyce, *op. cit.* (note 4 *supra*), pp. 145–48, 264, 265, Pls. CLXIII–CLXXVI; for the third and fourth stages of this competition, see *Sov. Arkh.*, 1933, Nos. 4, 5.

[9] See Clara Zetkin, "Lenin on Culture," *Reminiscences of Lenin* (New York, 1934), pp. 12, 13; A. V. Lunacharsky, "Lenin and Art," *International Literature*, May 1935, pp. 66–71; *idem*, "Sotsialisticheskii arkhitekturnyi monument," *Stroitel'stvo Moskvy*, May–June 1933, p. 4.

Thus in 1944, the academician A. Mordvinov wrote:

> National forms offer colorful variety. The humanism expressed in classical forms serves to unify the architecture of all the national republics, while yet allowing them to preserve traits peculiarly their own.
>
> In selecting the architectural type for public buildings we must make critical studies both of the monumental styles prevalent in our national republic and of the classical heritage. . . . However, in turning to our national heritage we must try to find and use the more progressive of its forms. . . .[10]

Somewhat later, elaborating on the same theme, one of the leading Russian architects, D. Arkin, wrote:

> The greatest traditions of the past will live on not as historical reminiscences but in an organic new creation on a national soil—national in its fullest reference to the people. . . . The creative task of the modern architect is to give architectural expression to the people's, the locality's, the city's individuality, and not hide this individuality behind a simplified screen of reinforced concrete, glass and metal.[11]

The insistence on preserving and recapturing the native idiom was instrumental in developing a diversity of architectural expression in the Soviet Union.[12] An extensive use of national forms in contemporary architecture was made at the All-Union Agricultural Exhibition in Moscow (1939–40), where the pavilions of Uzbekistan, Georgia, Armenia, and Ukraine were among the most attractive. The originality of form and richness of ornament reflected the architectural traditions as well as the folk arts of those republics. The same interest in derived forms is manifest in the current All-Union Agricultural Exhibition, where the pavilions representing every one of the republics are built in the characteristic native idiom.[13]

There are architects of many tastes and various abilities in Russia, and their work in the classic and national styles has varied accordingly - from the commonplace and pedestrian to the inspired and dynamic. In Moscow, the "classic" expression seems to lean towards orthodoxy; in Leningrad, it has assumed a freer, more modernized look, while in Kiev, Minsk, and other cities of the various republics, it is tinged with local traditions. On the whole, its qualities are those of an architecture in search of forms to express the idea of socialist realism in art—the needs and endeavors of the new society.

Design and City Planning

The enthusiasm for classicism and for national tradition was as intense as the experimentation with modernism which had preceded it. But though the classical trend has continued strong, there are signs that it is departing from the rigid orthodoxy of the late 1930's and the nostalgic romanticism of the 1940's. There has been a definite attempt on the part of the Russian architects to introduce and integrate into their designs some of the features—the neatness and efficiency, the sweep of wall surface, relation of story heights, and other architectural and decorative devices—usually associated with the modern age.

In city planning, as in building, the earlier tendencies deriving from the modern style of city layout have given way to a less rigid mode of design closer to the Russian tradition. This tradition is at its best in the art of the ensemble on a grand scale—integrating building complexes and adjoining open spaces into an architectural whole, blending silhouette and landsape and informing them with emotional appeal. The Russian pattern of city planning today is based on freely designed superblocks, with generous garden courts, lawns, and islands of trees. In great civic centers like those created in Moscow, or memorial schemes like that designed for the river front of Stalingrad, monumentality and dimensions of great magnitude often appear. Whatever one may feel about the stylistic qualities of one or another individual building, one cannot but be impressed by the technical competence and the boldness of scale and monumentality of the compositions.

Construction Activities

Leaving aside the architectural features of the great engineering works, the dams, hydroelectric stations, and canals which are "transforming nature," and confining our attention to civil architecture, we find that in the last few years many apartment houses, schools, theaters, hospitals, office buildings, and sports stadiums have been built throughout the Soviet Union.

According to the party Secretary, Nikita Khrushchev:

> During postwar years a total of more than 200,000,000 square meters of housing space[14] has been built in cities and settlements, and in rural areas about 4,500,000 dwellings.
>
> In 1954 the volume of construction work has increased to more than 2.5 times that in 1946. In 1954 alone expenditures on capital construction equal the total expenditures for this purpose during the entire second Five Year Plan. . . .
>
> In 1954 there will be built in the cities more than 30,000,000 square meters of living space, and in rural localities about 400,000 dwellings.[15]

Progress in building is not adequately described by the rise in figures of square meters or expenditure, for a steep qualitative rise has accompanied this advance, demonstrated in better construction and more conveniences and comforts for the occupants.

Reconstruction and Development in Moscow

The development of Moscow beyond its ancient rings has been spectacular. The new regional plan shows the city spreading for tens of miles. Its new districts or sectors are centering mainly about the traces of the old arterial highways that radiate from the center of the city, leaving large spaces for parks and

[11] Arkin, "Some Thoughts on Reconstruction," *Architectural Review*, May 1947, p. 178.

[12] For illustrations of a number of recent buildings in Azerbaidjan, Georgia, and Armenia, see *Arkh. SSSR*, August 1954, pp. 18–24.

[13] A good example of nationalism in art, expressed in terms of regional folk traditions, was the pavilion of the Uzbek Republic designed in the vernacular of Uzbekistan (see Voyce, *op. cit.*, Pls. CLXXVII–CLXXXIX). For a richly illustrated account of the current Agricultural Exhibition, see V. Stupin, "Ob arkhitekture vsesoiuznoi sel'skokhoziaistvennoi vystavki" *Arkh. SSSR*, September 1954, pp. 1–17; see also Iu. Iaralov, "Natsional'nye cherty v arkhitekture VSKhV," *A. S. Moskvy*, August 1954, pp. 4–11.

[14] One square meter = 10.76 square feet. In this connection it should be noted that the Soviet concept of "housing space" differs from that of "floor area" applied in American housing, as Soviet "housing space" excludes all auxiliary space, such as kitchens, bathrooms, corridors, or landings. For an extensive account of Soviet housing, see Alexander Block, "Soviet Housing," *Soviet Studies* (Oxford), January 1954, pp. 246–77. For statistics of development in housing construction, see article by B. Sokolov, *Voprosy ekonomiki*, 1954, No. 9, pp. 19–30.

[15] See Khrushchev's speech on "Building and Architecture," *Pravda*, December 28, 1954. For statistics of present and planned construction see editorial in *Izvestiia*, April 8, 1955, p. 1; report of Deputy Iasnov, chairman of the Moscow City Executive Committee, on the plan for the development of Moscow's economy for 1955, delivered at the session of the Moscow City Soviet on April 8, 1955, *Izvestiia*, April 9, 1955, p. 1; and editorial in *A. S. Moskvy*, December 1954, pp. 1–3. See also Timothy Sosnovy, *The Housing Problem in the Soviet Union*, New York, 1954.

green belts, as provided by the Moscow Planning Commission.

Blocks of new apartment houses have sprung up both in the center and in the outskirts; the city has been enriched with great squares, wide avenues, and boulevards. The Moskva River was walled in by granite blocks, and the new bridges, the subway, the Moskva-Volga canal, and the great water reservoirs have all been built under this plan.

Eight tall buildings—from twenty to thirty-two stories—were located so that their height and bulk would affect the skyline over a distance of miles.

The construction of these multistoried buildings introduced vital changes in the general contours of the city. Located as they are in different districts, nearly all confined within the Sadovoe Ring, they either form part of the older architectural ensembles or create new ones. Their distribution softens the distinction between the center of the city and its outskirts. Only one of these ensembles—the Lomonosov (Moscow) University, on the summit of the Lenin Hills—is located beyond the old limits of the central part of the city. But while the University complex is the dominating element in the southwestern district, it was conceived as an integral unit in the metropolitan system of multistoried complexes.

The main building, whose central tower reaches a height of thirty-two stories, is flanked to the right and left by two eighteen-story wings containing hostels for students and flats for professors. They form a kind of transition from the high to the low elements of the ensemble. The exterior is finished in fawn-colored ceramics. The colonnade to the main entrance is almost pure classic, while the connecting wings to the right and left of the main building have an English Renaissance flavor. The design of the entrance hall, vestibules, and staircases is reminiscent of the interiors of the imperial palaces with their classical columns, rich marbles, and mosaics, producing an impression of grandeur and opulence.[16]

The principle of tier structure, which is a prominent motif of Russian seventeenth-century architecture, is incorporated in these skyscrapers; their silhouettes grow naturally, rising as it were from among the buildings around them. Their tall needlelike spires recall some of the Kremlin "tent" towers and especially the "needles" of the Peter and Paul Fortress and the Admiralty in Leningrad.[17]

THE MOSCOW METRO

The Metro (subway)—its surface stations and underground concourses—offers perhaps the best illustration of the difference between Russia and the West in approach to the role of architecture. The spaciousness and airiness of these concourses, the costly marbles, mosaics, monumental frescoes, bas-reliefs, and sculpture in the round have caused many a gasp of wonderment and astonishment, but have also caused many an eyebrow to be raised.

The question asked by Western observers is: Why lavish so much on a subway when there is still a shortage of houses? Would it not be better to

[16] For vital statistics concerning the University's physical plant, see A. Vlasov, *Moscow's Multi-storey Buildings* (Moscow, 1954); for plans and models, see *Arkhitektura i Stroitel'stvo,* June 1954, pp. 4–6. The University was designed by L. Rudnev in collaboration with S. Chernyshev, P. Abrosimov, and A. Khriakov.

[17] For the location and an informative illustrated account of these buildings in the finished project stage, see *ibid.,* June 1949; B. Rubanenko, "Ideino-Khudozhestvennye osnovy arkhitektury vysotnykh zdanii stolitsy," *Sov. Arkh.,* 1953, No. 4. For an analysis of the principal characteristics of these ensembles relating to national traditions, see A. Opochinskaia, "Ansambl' vysotnykh zdanii Moskvy i natsional'nye traditsii russkikh zodchikh," *ibid.,* 1954, No. 5.

have a utilitarian subway and spend the money on housing? The Russian answer is that architecture, even if it is for utilitarian purposes, is a form of education—aesthetic, political, and social—and that is why the Metro, like the towers, locks, and stations of the Moskva-Volga and the Volga-Don canals, has been conceived not only as a means of transport but also as a source of inspiration, as a symbol of a finer culture and a promise of a happier and more abundant life to come.

Recent additions to the ever expanding Metro system are the stations of the Great Circle (*Bol'shoe Kol'tso*), and the Arbat Line (*Arbatskii Radius*). Each one of these stations was designed, on a competitive basis, to illustrate some definite social, political, national, or historical theme.

The stations of the Great Circle—for example, the Kursk, the Komsomol'skaia, and the Kaluga, all built after the war and using the freer classical forms—reflect the theme of victory. The Arbat station re-creates the architectural features of the Kremlin palaces (near which it is located) and develops the theme of national heritage. The Kiev and Byelorussian stations with their frescoes, decorative panels, and sculpture reflect the economy and culture of Ukraine and Byelorussia. So of the other stations, each one illustrates some past or recent achievement, some social, artistic, or cultural activity.[18]

[18] For illustrations of the Metro stations, concourses, and many details, some in color, see *Moskovskii Metropoliten* (Moscow, 1953); for an illustrated discussion of the architecture of some recent stations, see M. Tosunov, "Arkhitekturnyi obraz stantsii Moskovskogo metropolitena," *Sov. Arkh.,* 1952, No. 3, pp. 8–22, and *Arkh. SSSR,* May 1954, pp. 23–28. For names of the architects, and the participating painters, sculptors, and decorators, see above references. For the plan and illustrations of the first section stations, see Voyce, *op. cit.* (note 4 *supra*), pp. 198–201, Pls. CXI–CXXVI.

IMPACT OF MODERN TECHNIQUE

An analysis of the work projected during the life of Stalin and finished after his death shows no evidence of any significant stylistic changes. The general trend towards greater and greater monumentality and lavish decoration initiated by his regime continues unabated. But in more recent times, architecture has tended to split up into autonomous components—technology, with its functional problems of planning, organization, and construction on the one hand, and aesthetics on the other.

Designs for buildings of every type are being reviewed and revised. This redesigning campaign was initiated by the government with a view to industrializing and standardizing the building industry completely. The construction corps of the country was assigned to the task of developing assembly-line methods of building.

Building elements are manufactured to specifications of the various government departments concerned in accordance with a universal system of dimensional co-ordination, and thus can be standardized for the whole country and made interchangeable.[19] Standardization, prefabrication of both components and complete buildings, and the high degree of mechanization of site work [20] are thus transforming Soviet building technique.

The impact of a highly organized and efficient technique upon architecture as

[19] For an illustrated account of typical prefabricated building elements see F. Movchan, "Eksponaty Moskovskoi vystavki novoi stroitel'noi tekhniki," *A. S. Moskvy,* August 1954, pp. 15–22.

[20] For methods of construction on the building site, see N. Pashchenko, "O nekotorykh nasushchnykh voprosakh stroitel'stva v Moskve," *ibid.,* October 1954, pp. 5–12.

an art is creating many problems and complications. Faced with the advanced technique of the engineer and demands of the administrator and planner, the Russian architect is forced more and more into the position of a mere compiler and decorator of predetermined elements supplied by industry in prefabricated form.

ALL-UNION CONFERENCE OF BUILDERS AND ARCHITECTS

The All-Union Conference of Builders and Architects, held in December 1954, brought into sharp relief the ever latent tensions between the industry's technicians and the architects, focusing attention upon their basically different approaches to building. The deliberations and reports of its various panels are significant for the fact that they reveal the attitude of the new heads of government to a number of architectural issues which have been considered above. It will undoubtedly have important repercussions on the future of post-Stalin architectural orientation.

The most far-reaching declaration on the general attitude of the party authorities towards the Russian Academy of Architecture and the Union of Architects can be found in the speeches of Nikita Khrushchev and a number of the building-industry administrators. Especially significant was Khrushchev's attack on the architectural training system as fostered by the Academy and on the reckless disregard by Soviet architects of the factor of practical economics in building, and his caustic denunciation of their preoccupation with pseudo aesthetics, the decoration and ornamentation of their buildings with sham detail. Here are some of the highlights of his speech:

> Architects are more concerned with beautiful silhouettes than with living quarters. . . . Modern apartment houses must not be transformed into a replica of a church or museum. . . . Some leading architects refuse to adapt their work to the new materials by referring to the need of combatting constructivism. . . . Such architects should probably be called constructivists in reverse, since they themselves are lapsing into aesthetic admiration of form divorced from content.[21]

The general tenor of the criticism and self-criticism voiced by a number of the conferees was that the current architecture does not accord with the needs of the age. "A tendency has been widespread in the practice of recent years which inclines towards a florid architecture of past periods, giving little consideration to utility and technical appropriateness," said A. Mordvinov, the then president of the Academy of Architecture.[22] Architect Gradov deplored the creeping Formalism in architecture by pointing out that buildings are often designed on the basis of a one-sided aesthetic and are clothed in the archaic forms of mixed styles—huge cornices, fancy obelisks, towers and columns that are not in accord with the functions of the buildings or with modern technology.[23] In fact, it was argued, building with the new materials demands a new aesthetic, an engineer's approach to building.

[21] Speech delivered on December 7, 1954, at the All-Union Conference of Builders, Architects, and Workers in Building Materials Industry, in Construction Machinery and Road Machine Building, and in Design and Research Organizations. Translated by *Current Digest of the Soviet Press*, February 9, 1955. In this connection, it should be noted that Khrushchev is not a stranger to building. He worked on the construction of the first section of the Moscow Metro under the direction of L. Kaganovich.

[22] *Izvestiia*, December 2, 1954. Mordvinov has since been replaced as president of the Academy by A. Vlasov.

[23] G. A. Gradov, *Pravda*, December 2, 1954; for an elaboration of his theme, see his article, "Sovetskuiu arkhitekturu na uroven' novykh zadach," *Arkh. SSSR*, 1955, No. 2, pp. 4–8.

> High quality standards of architectural parts and units must be worked out, bearing in mind that standardization and mass production do not contradict but assist the creation of a majestic and gay architecture for our age.[24]

At the meetings of the architects' panel of the conference, modernistic architecture and pseudoclassical "perfumed" decoration and pretentiousness were both condemned, but no definite views were expressed at the conference on what is to replace them. Architect Borisovskii came perhaps closest to the heart of the matter when he declared that "what is needed is not a compromise between modernism and classicism in architecture but a thorough re-examination of creative attitudes."[25] It remains to be seen how this difficult reappraisal of long-esteemed values will be attempted, and what will be its results.

PAINTING AND SCULPTURE: REACTION AGAINST THE NONOBJECTIVE

The "puerilities" of the Expressionists, Cubists, and Futurists, the nonobjective painters and sculptors of the 1920's—their professed indifference to subject matter and their hostility to popular ideas—soon proved to be their undoing, thus changing the course of Soviet art. Even more important for the future of Soviet art was, as pointed out, Lenin's dislike of the involved aesthetics—"the cake and sugar"—of modernism.

> I have the courage to show myself a barbarian [he said]. I cannot value the works of expressionism, futurism, cubism and other such "isms" as the highest manifestations of artistic genius. I do not understand them. . . . Art belongs to the people. It must grow deep roots in the very midst of the broad mass of workers. It must be understood and loved by them. It must unite the feelings, thoughts, and will of the masses and inspire them.[26]

SOCIALIST REALISM

Lenin's comment became the guiding principle for Soviet art and was embodied in a program of measures aimed at democratization and humanization of art. The "left, degenerate" art groups were dissolved, and their conflicting aesthetic ideologies were replaced with the doctrine of "socialist realism." Art was to be realistic enough to be comprehensible to the people without being a mere copy of external reality—an art socially useful and educational. Consequently, socialist realism demanded of the artist active participation in the daily activities and emotions of the community; he must identify himself with the new era and draw his material and inspiration from the life of society and nature.[27]

This view of the substance of art implies thematic painting and sculpture, but also implies that art is a part of the socialist dynamic. The artist, therefore, must not dwell on the negative, static characteristics of society but must portray the positive, progressive side of socialist life by representing the inner world and deeds of its outstanding

[24] P. A. Iudin, *Stroitel'naia Gazeta*, December 3, 1954.

[25] Borisovskii, *ibid.* For excerpts from some of the main speeches, see *Pravda*, December 1, 2, 3, 4, 5, and 8, 1954.

[26] See Zetkin, *op. cit.* (note 9 *supra*). For a discussion of early developments in Soviet art, see D. D. Egbert (Editor), *Socialism and American Life* (Princeton, 1952), pp. 669–705.

[27] The historical sources and precursors of socialist realism are the writings of N. G. Chernyshevskii and N. A. Dobroliubov, and the works of nineteenth-century artists like Daumier, Courbet, or the Russian *Peredvizhniki*. The active role in the formulation of the doctrine was played by Maxim Gor'kii; it was introduced by him in a speech before the First Congress of the Union of Soviet Writers held in 1934; shortly afterwards it spread to all the other arts.

workers[28] and leaders; by "bringing into salient relief a deliberately magnified image of the 'typical,' that is, the essence of a given social-historical phenomenon,"[29] of a synthesis of human passions.

The concept of socialist realism, Soviet theorists insist, does not imply a definition of styles or forms. It permits of a variety of stylistic methods and freedom of development for creative individualities, rejecting only the kind of form that does not give an objective idea of the object portrayed.

An outstanding part in the development of Soviet art was played by Lenin's "plan for monuments," whose purpose was to honor the memory of the great revolutionists, the men of science, art, and literature, by monuments, paintings, and statues. The number of such "ideal" monuments and memorials is prodigious and has been constantly on the increase. In these paintings and sculptures, the personages appear either singly or surrounded by groups of disciples and collaborators, all represented in heroized attitudes.

Aside from portraying great leaders, the artist is urged to select his subject matter from the drama of daily life and toil of the country, stressing the theme of the "new Soviet man."[30] As a result, many canvasses and sculptures were produced depicting scientific and industrial workers and farmers, singly or in groups, at labor or at rest, in homely realism but often tinged with imagination.

A striking feature of this aesthetic trend is the scope it has given to monumental art works in which sculptors and painters collaborate with the architect. Hundreds of artists associated with different genres contributed to the decoration of the new buildings: the concourses of the Moscow Metro, the halls and auditoriums of Moscow University, the pavilions of the Agricultural Exposition, and the various memorial and public buildings throughout the country, tying in the substance of genre activities with the architecture of the structure.[31]

Many of the large buildings are adorned with sculptured figures in dramatically enthusiastic attitudes, replete with expressions of socialist endeavor. This sculpture has the qualities of exuberance and romantic heroics, relying on scale, gesture, and symbolic forms rather than texture and technique to achieve impressiveness.

It can be said that socialist realism implies a continuity of Russia's artistic heritage –a return to the more or less classic forms of the pre-Revolutionary tradition in painting and sculpture. These forms now, however, are tinged with modern experience to suggest the forward-looking spirit of the new society. Thus by means of indigenous and foreign elements Soviet Russia is seeking to achieve an art which can express a socialist content, but infused with nationalism.

[28] A classic example of socialist realism is the sculptured stainless-steel group entitled "Worker and Woman Collective Farmer," by the late Vera Mukhina, which surmounted the Russian pavilion at the World's Fair held in Paris during 1937. It was intended to reflect the new society on the move. Here an industrial worker and a kolkhoz farmerette are depicted advancing side by side, straining forward as though propelled by some powerful force symbolizing the achievements and unity of interests of industrial worker and peasant. For later examples of this genre, see the bronze statues of the "Young Transformers of Nature," in front of the Moscow University by Mukhina and collaborators, *Iskusstvo,* November–December 1953, p. 19.

Korin; the bas-reliefs of G. I. Motovilov, on the theme of glorification of labor in the concourse of the Botanical Gardens Station; and references in notes 13, 16, and 18 *supra.* For a discussion and illustrations of the University's monumental sculpture, see I. Ivanov, "Monumental'naia skul'ptura v ansamble novogo zdaniia Moskovskogo Universiteta," *Iskusstvo,* November–December 1953, pp. 15–20.

THE NEW APPROACH

Stalin's death ushered in a more liberal approach. The first signs of liberation were already discernible in 1953, when the field of the arts was slowly broadening under the impact of the new government policies. The pressure of the "tutelage system," imposed from above by a few arbiters of taste, was relaxed, and there was manifested likewise a trend toward what might be called "cultural liberalism," restoring to the artist his freedom of initiative.

An indication to this effect can be seen in Malenkov's reinterpretation of socialist realism, declaring that critical realism is a healthy and necessary ingredient of socialist art and that henceforward the theme of "conflict," which was previously frowned upon, is to be developed in the arts. He expressed the need for satire to "burn out all that is negative, decaying, and moribund," and asserted that art "must boldly portray life's contradictions and conflicts . . . employ the weapon of criticism as a means of education."[32]

Socialist realism is only now in process of evolution. Many stimulating elements and influences are taking part in its development. The evolution of the style is in the hands of relatively young men: the painters P. Gorin (monumental frescoes and mosaics), S. Grigoriev and F. Reshetnikov (children and adolescents), I. Pimenov (urban scenes), S. Chuikov and L. Zevin (portraits and landscapes), S. Gerasimov (nature scenes), G. Nisskii (industrial landscapes), and the sculptors G. Motovilov, N. Tomskii, E. Vuchetich, Iu. Neroda, and S. Lebedeva. Their work[33] reveals that art in the Soviet Union has by no means been frozen into static uniformity. There is every indication that these artists are moving along newly opened paths and are looking for new interpretations of modern experience.

Soviet Music Since the Death of Stalin

By Robert M. Slusser

CONTEMPORARY Soviet policy in music found its fullest and clearest expression in a resolution of the Central Committee of the Communist Party dated February 10, 1948, entitled "On the Opera 'The Great Friendship' by Vano Muradeli." [1] The resolution, part of Andrei Zhdanov's postwar campaign to restore ideological purity and combat Western influence in Soviet intellectual life, used a mildly modernist work by a party-member composer as the pretext for a frontal attack on such alleged Western influences on Soviet music as "formalism," atonalism, dissonance, and similar "antipopular" trends. In reality, however, the resolution was directed primarily against the Western concept of music as an art independent of politics, one of the absolute forms of expression of the human spirit—a concept which had struck deep roots in prerevolutionary Russia and which has exerted a powerful influence on several leading Soviet composers.

The resolution called on Soviet composers to write music with an explicit program or text, based on easily recognizable melody, the compositional and harmonic principles of Russian folk music, and the aesthetic tradition of the nineteenth-century Russian "classical" composers; music, in other words, which could be made to serve the political ends of the Communist party. Composers were warned to avoid such "abstract" musical forms as the programless symphony and instrumental chamber music, and to concentrate instead on the writing of operas, oratorios, and cantatas.

In the five years between 1948 and the death of Stalin the world of Soviet music underwent a profound transformation in accordance with the policy dictated by the 1948 resolution. Those composers whom the resolution attacked by name, including Sergei Prokofiev, Dmitrii Shostakovich, Aram Khachaturian, and Vano Muradeli, hastened to make their peace with the party by writing compositions conforming to the party's requirements, while a host of critics and musicologists worked out the theoretical implications of the resolution in relation to Soviet and non-Soviet music.

In enforcing the resolution, the party and its organs of control limited themselves in general to stern warnings for backsliders and rewards for those who showed signs of improvement. Acutely conscious of the prestige which accrues to Soviet art abroad from the work of such composers as Prokofiev and Shostakovich, as well as of the importance of music as an adjunct to its internal propaganda, the party relied on its well-tried combination of threats and rewards to prod Soviet musicians along the path marked out for them.[2]

While Stalin lived, however, there was

[1] "Ob opere 'Velikaia Druzhba' V. Muradeli," *Sovetskaia Muzyka* [Soviet Music], Vol. 12, No. 1 (January 1948), pp. 3–8.

[2] Thus the composer Vano Muradeli, whose opera was the immediate target of the 1948 resolution, was awarded a Stalin Prize in 1951 for a group of songs and an international peace prize in 1953 for his compositions "The Party, Our Rudder" and "Song of Youth." See "Muradeli, Vano Il'ich," in *Bol'shaia Sovetskaia Entsiklopediia* [Large Soviet Encyclopedia] (2d ed.; Moscow, 1954), Vol. 28, pp. 564–65.

no modification of the policy defined in the 1948 resolution. On the very eve of Stalin's death the appointed leaders of Soviet music reaffirmed the validity of the resolution at the Sixth Plenum of the Board of the Union of Soviet Composers. As the "first-priority task" assigned by the party to Soviet composers the Plenum named "the creation of highly artistic realistic operas on contemporary themes," while the secretariat of the union was directed to "take all necessary measures for the appearance in the immediate future of new highly artistic operatic productions." [3] Nothing was said about the need for new compositions in other forms, including the symphony.

Reorganization After Stalin's Death

In the reorganization of the Soviet government which followed Stalin's death, responsibility for music and the other arts was assigned to a new Ministry of Culture, formed from the previous Ministries of Higher Education and Cinematography and the Committees on Art (which had previously administered music), Radio Information, and Polygraphic Arts.[4] A party stalwart, Pantaleimon K. Ponomarenko, was named Minister of Culture.[5] Ponomarenko's tenure lasted only until the party needed him for a more urgent task; in February 1954 he was reassigned as First Secretary of the Communist party Central Committee of the Kazakh Soviet Socialist Republic, an area in need of a strong hand from the center.[6]

To succeed Ponomarenko the Malenkov regime in March 1954 named a man whose work had been one of the principal targets in Andrei Zhdanov's postwar ideological campaigns, Georgii F. Aleksandrov.[7] One year later Aleksandrov was dismissed in disgrace, to be succeeded by the former Soviet ambassador to Poland, N. A. Mikhailov.[8]

Organizationally, therefore, and to some extent ideologically as well, the post-Stalin development of Soviet culture, including music, falls into three phases, marked by the tenures of the successive Ministers of Culture.

First Post-Stalin Phase (March 1953 to March 1954)

The initial reaction of the world of Soviet music to Stalin's death was a prudent continuation of the fulsome praise for the dictator which had been customary during his lifetime, adroitly coupled with publicity for the ideas of the new "collective leadership," particularly Malenkov.[9] Leading Soviet composers, headed by Shostakovich, wrote panegyrics to the dead leader, praising him for his "wise and fatherly guidance" to Soviet composers.[10]

Within a few months, when the time came to commemorate the fiftieth an-

niversary of the Second Party Congress, the situation had so far changed that praise of Stalin could safely be greatly reduced or even omitted entirely.[11] The partial repudiation of the Stalinist system evident in other areas of Soviet life was gathering momentum in Soviet music as well. The official formulation of the new line, a task of considerable delicacy, since it required the ability to give the appearance of freedom from strict party controls while still implicitly recognizing their validity, was assigned to the Soviet Armenian composer Aram Khachaturian, who had assumed since Prokofiev's death a position in Soviet music second only to that of Shostakovich, and who has been used increasingly by the party as its mouthpiece in matters of music policy.

Khachaturian's contribution to the enunciation of policy took the form of an article in *Soviet Music* entitled "On Creative Boldness and Inspiration" in which he appeared to be calling for a lessening of political controls in the interest of stimulating creative originality.[12]

Outside the Soviet Union, however, the article was widely interpreted as an expression of revolt against the restrictions imposed on Soviet composers under Stalin. Khachaturian therefore wrote another article, designed particularly for readers abroad, "correcting" the unfortunate impression created by the first article.[13]

Thus far the developments in post-Stalin Soviet music presented no novelty: the party leaders had decided on a minor shift in the party line, and the "transmission belts" were passing it on to the appropriate receivers. At this point, however, an event occurred which constituted a real rarity in Soviet cultural life—the appearance of a genuine and apparently spontaneous manifestation of creative originality in music. Since this event, by a curious coincidence, took place at nearly the same time that the party, through Khachaturian, was making its carefully hedged call for increased creative originality, the leaders of Soviet cultural policy were faced with a novel situation. Instead of the token gesture they no doubt expected in answer to their new line, they were presented with a major work which they had not solicited, one moreover which violated nearly all the canons which had been established for Soviet music. Their reaction to this situation constitutes the major theme of the second post-Stalinist phase in Soviet music, under the ministry of G. F. Aleksandrov. First, however, it is necessary to consider in some detail the work itself.

SHOSTAKOVICH'S TENTH SYMPHONY: GENESIS AND CHARACTER

In the eulogy written by Shostakovich for Stalin's death there is a statement of particular interest concerning his plans for future work. Following the policy reaffirmed at the Sixth Plenum of giving first priority to the writing of operas on Soviet themes, Shostakovich wrote,

> Soviet composers are greatly in the people's debt. We have not yet responded fully to the just demands of the party and the people for the creation of Soviet operatic classics.
>
> I consider my most immediate and first-priority creative task to be work on an opera in which the great struggle of our people for the construction of communism will find reflection. I shall strive to sing worthily of the people of our heroic Stalinist epoch.[14]

Nevertheless, shortly after writing this statement Shostakovich turned to an entirely different creative task, one moreover for which there was no call from the party or the people (insofar as the latter had an independent voice in the matter): the writing of a new symphony, his first in seven years. The composer has stated,

> I worked on the *Tenth Symphony* through the summer of 1953, finishing it in the autumn. Like my other works I wrote it quickly . . . [concerning my intention in the symphony] let me say only this: In this work I tried to communicate human emotions and passions.[15]

An American correspondent who interviewed Shostakovich in Vienna in June 1953 reports that the composer told him that "like each of his other works, the *Tenth* will have a central theme, but he didn't want to discuss it until it was completed."[16] In fact, the composer has remained noncommittal on the real subject of the symphony, if any, beyond the cautious statement that in it he "tried to communicate human emotions and passions."

For an elucidation of the symphony's meaning, therefore, one is limited to the music itself and to the statements or articles written by the composer during its genesis. In character the *Tenth Symphony* is tragic, a point on which nearly all commentators, whether hostile or friendly, are agreed, a point moreover susceptible to independent verification from the score or recording available here. The tragedy expressed in the *Tenth*, however, is not of the lyric and subjective kind familiar from some of Shostakovich's earlier works, for example, the first movement of the *Sixth Symphony;* the work's tragic conflicts are imbued with an energy which suggests anger and scorn rather than personal grief. Neither is the tragic mood in any way elegiac; it has not occurred to anyone to suggest that the symphony represents a memorial either to Stalin or to Shostakovich's revered elder colleague Sergei Prokofiev, who died in the same month as Stalin.

Worst of all, from the party standpoint, the tragic conflict which dominates the *Tenth Symphony* is not resolved in the final movement in accordance with the formula officially approved for Soviet symphonies; the most the composer has offered those listeners who call for a "happy ending" is a subdued lyric passage in the final movement which can be construed as optimistic only with the greatest difficulty.[17]

To go beyond a characterization of the music in its own terms is hazardous, but the attempt is worth making, for the work speaks with an urgency which demands elucidation. It is to be noted, first of all, that the *Tenth Symphony* was written on a sudden impulse during

[17] For a critical discussion by a party musicologist of a Soviet symphony which does meet the party's requirements (the *First Symphony* of the Soviet Georgian composer O. Taktakishvili), see the article by G. Vanslov, "O nekotorykh voprosakh razvitiia sovetskogo simfonizma" [On Some Problems of the Development of Soviet Symphonism], in *Sovetskaia Muzyka: Teoreticheskie i kriticheskie stat'i* [Soviet Music: Theoretical and Critical Articles] (Moscow, 1954), pp. 573–75.

the period immediately following Stalin's death. Shostakovich has not publicly made any statement which could be directly interepreted as a criticism of Stalinism, but one feels an implied criticism in the striking discrepancy between the abject praise of Stalin in the statement he wrote on Stalin's death and the complete absence of any reference to him in the similar statement for the anniversary of the Second Party Congress.

One other curious circumstance: in the June 1953 issue of *Soviet Music* an article by Shostakovich appeared in which he discusses the work and prison songs of Negroes in the southern United States. Entitled "Songs of Anger and Struggle," the article combines a sensitive analysis of the songs with a crude propaganda attack on American "dollar democracy" for its alleged system of slave prison labor.[18] One is struck by the irrelevance of the article from the point of view of Soviet propaganda as a whole—the effort to offset criticism of the Soviet forced labor system by a counterattack on American practices was not a major propaganda campaign at that time. Could Shostakovich have been using the American subject matter to hint at a similar evil which lay closer to home? The supposition may be overly bold, but it is to be noted nevertheless that in the period immediately preceding the writing of the *Tenth Symphony* Shostakovich was studying "songs of anger and struggle" by victims of a system of forced prison labor.

Taking into account the admittedly slender evidence of an implied repudiation by Shostakovich of certain aspects of Stalinism, as provided by the two articles he contributed to *Soviet Music* for official occasions, and remembering the time and circumstances under which the symphony was written, one is tempted to frame the hypothesis that the real subject of the *Tenth Symphony* bears some relation to the human suffering inflicted on the Soviet people under Stalin.[19]

The real meaning of the *Tenth Symphony*—and it is difficult for the listener to doubt that it has one—can be elucidated only in the light of Shostakovich's work as a whole; perhaps it will never be fully defined in the absence of authentic information on the composer's real intentions. Meanwhile, however, the symphony will continue to make its enigmatic but forceful commentary on the period in which the composer lived.

CRITICAL RECEPTION OF THE TENTH SYMPHONY

The official première of the *Tenth Symphony* took place on December 17, 1953, in a performance by the Leningrad Philharmonic Orchestra under the direction of Yevgenii Mravinskii.[20] Performances in Moscow soon followed.

The controversial nature of the work was at once apparent and a heated discussion broke out, in which admirers of Shostakovich's art and proponents of greater freedom for Soviet composers were ranged against those who dislike the composer or his music and dogmatic defenders of the orthodox party line in music. The situation presented

[18] "Pesni gneva i bor'by," *Sovetskaia Muzyka*, Vol. 17, No. 6 (June 1953), pp. 33–36.

[19] Some Soviet commentators have suggested that in the *Tenth* Shostakovich is concerned with the struggle of evil against the forces of progress (that is, communism) in the non-Communist countries. The composer has not, however, lent any support to this interpretation, and it has not been accepted in the Soviet Union. At least one Soviet critic has boldly affirmed that the *Tenth* reflects Soviet realities. See M. Tarakonov, "Problema konflikta v simfonicheskoi muzyke" [The Problem of Conflict in Symphonic Music], *Sovetskaia Muzyka*, Vol. 18, No. 10 (October 1954), pp. 18–25.

[20] Malcolm Rayment, "Shostakovich," *London Musical Events*, Vol. 10, No. 4 (April 1955), p. 22.

an unexpected problem to the framers of Soviet cultural policy: were they to risk exposing the hollowness of their call for increased creative originality by damning the first major work which had appeared as if in answer to that call, or were they instead to take the risks associated with approving a work which defied the rules laid down for Soviet music?

In the face of this dilemma the first reaction of the directors of Soviet music policy was to temporize. While the controversy grew, the official journal *Soviet Music* maintained an uneasy silence; even a mention of the first performance of the *Tenth Symphony* was omitted from its chronicle section.[21]

By the time Ponomarenko had been released from his duties as Minister of Culture in February 1954, a compromise decision had been reached. Without in any way committing the party to an approval of the work, an opportunity was to be provided for a relatively open discussion of the *Tenth Symphony* in the pages of *Soviet Music*. In opening the discussion, the editors of *Soviet Music* said:

> [We] invite composers and musicologists to express themselves on the questions discussed. The development of a bold, principled criticism and self-criticism in a free discussion will assist in the successful solution of the creative problems of the development of Soviet music.[22]

ALEKSANDROV PERIOD IN SOVIET MUSIC

On March 16, 1954, the Malenkov regime announced the appointment of G. F. Aleksandrov as Minister of Culture, to fill the position left vacant by Ponomarenko's reassignment. The intention of the regime to modify the course of Soviet cultural policy could hardly have been announced more plainly than by the appointment of a man whose work had been attacked in a major ideological resolution by the party Central Committee, and who had remained in disfavor almost up to Stalin's death.[23] The new minister's policy in the field of music was soon manifested in a concrete form: a "creative discussion" of Shostakovich's *Tenth Symphony* was convened by the Union of Soviet Composers on March 29 and 30 and April 5. The discussion, as reported in *Soviet Music*, provides a revealing insight into the inner tensions and conflicts of the world of Soviet music.[24] The great admiration felt for Shostakovich and his music by most of his fellow composers was evidenced by their nearly unanimous approval of the symphony; only Shostakovich's disgruntled rival and onetime protégé, the composer Ivan Dzerzhinskii, expressed hostility.[25] The music critics were divided. Yurii Kremlev, a Leningrad musicologist, attacked

[21] *Soviet Music* did, however, note the performance of the work by the composer and a colleague in a piano transcription in a closed audition for the Union of Soviet Composers before the official première: see *Sovetskaia Muzyka*, Vol. 18, No. 1 (January 1954), p. 155.

[22] *Sovetskaia Muzyka*, Vol. 18, No. 3 (March 1954), p. 23.

[23] In 1947, the same year in which his *History of Western European Philosophy* was officially condemned for ideological errors, Aleksandrov was appointed Director of the Philosophy Institute of the Soviet Academy of Sciences. See *Entsiklopedicheskii slovar'*, Vol. I (Moscow, 1953), p. 50. His name was not included in the appropriate volume (II) of the *Bol'shaia Sovetskaia Entsiklopediia*, an indication that at that time (1950) he was still in disfavor. By October 1952, however, he had been sufficiently rehabilitated to achieve appointment as a candidate (alternate) for membership in the Central Committee of the party. See Leo Gruliow (Editor), *Current Soviet Policies* (New York: Frederick A. Praeger, 1953), p. 240.

[24] "Znachitel'noe iavlenie . . . ," *op. cit.* (note 15 *supra*). Translation of selected extracts in *Current Digest of the Soviet Press*, Vol. 6, No. 25 (August 4, 1954), pp. 8–12.

the work as "unrealistic," lacking in genuine themes, and not concerned with contemporary problems,[26] while his Moscow colleague V. Vanslov, although finding the content of the symphony to be "gloomy [and] deeply pessimistic," noted the "extreme sincerity, the high mastery, and the beauty of execution" of the work.[27]

Throughout the remainder of 1954 the debate continued in the pages of *Soviet Music*[28] and no doubt in the committee rooms and concert halls and wherever the Soviet musical public meets. No explicit final verdict in the debate was rendered, but an implicit recognition of the victory which Shostakovich and his supporters had won can be seen in the announcement, in December 1954, that the next regular plenary session of the Board of the Union of Soviet Composers would be devoted to consideration of the problem of the Soviet symphony.[29] To realize what a change in policy this announcement signified it is necessary to remember that ever since the 1948 resolution—and even earlier—the programless symphony had been almost a proscribed form in Soviet music.

EIGHTH PLENUM OF THE BOARD OF THE UNION OF SOVIET COMPOSERS

The leading article in the December 1954 issue of *Soviet Music* announcing the forthcoming plenum on the symphony marks the farthest point which the proponents of a relaxation of controls in Soviet music were able to attain. Avoiding a definite stand on Shostakovich's *Tenth Symphony*, the article characterized the debate about it as "useful for both composers and critics" and called on the secretariat of the Union of Soviet Composers to hold similar "broad creative discussions" in the future.[30]

Although it advocated renewed attention to the symphonic form, the editorial was forced to acknowledge the weakness of recent Soviet work in this field (but without reference, of course, to the obvious reason for this situation, the official disapproval of programless symphonic music).

> The lagging behind of Soviet symphonic writing [the article stated] is noticeable also in the recent period. After the *Tenth* of D. Shostakovich we have not so far heard any pure new Russian symphony. There are also very few new symphonic program compositions. No new symphonic works are forthcoming from A. Khachaturian, T. Khrennikov, V. Muradeli, G. Popov, and others.[31]

Despite its explicit announcement of a modification in the party line on music, however, the article avoided openly breaking with the earlier policy. In a spirit of caution which was typical of the half-hearted gestures towards increased liberalism made by the Malenkov regime in other fields, the article praised the 1948 decree as "historic" and stated that it had opened "the broadest perspectives for the great new upsurge of Soviet music."[32]

With such an indecisive lead, it is no wonder that the new policy made little headway. Malenkov's resignation as premier in early February 1955 was a clear signal to the wary that the era of cautious relaxation was about to end.

The Eighth Plenum was duly held as scheduled, from March 7 to 18 in Moscow, but it can scarcely be considered a success. Among the forty-odd new compositions presented, not one was found to merit general discussion. None of the more prominent Soviet composers followed Shostakovich's lead in writing a new symphony; except for the *Tenth*, the works performed at the Plenum were chiefly by young and little-known composers.

The official commentaries and speeches delivered at the Plenum treated the symphonic genre entirely in the spirit of the 1948 decree. Two major demands on the composers of Soviet symphonies were formulated: to write symphonies expressing "the heroic optimism characteristic of the epoch of the victorious building of Communist society," and to write symphonic program music, the "most democratic, clear, concretely figurative symphonic genre."[33] As a guide to what Soviet symphonic composers could choose as subjects for their works, the following list was provided:

> . . . our great deeds during the years of the Great Patriotic War [World War II], such as the victory at Stalingrad, the capture of Berlin which demonstrated to the entire world the might of our Motherland, the unforgettable Soviet patriotism of the people and their Armed Forces.[34]

FALL OF ALEKSANDROV

The decision to replace G. F. Aleksandrov as Minister of Culture was evidently taken during the period when the Eighth Plenum was meeting in Moscow. It seems likely that the failure of the Plenum contributed to his fall; the announcement that he had been dismissed in disgrace followed immediately after its close.

The new minister, N. A. Mikhailov, presented a striking contrast to Aleksandrov. Light on the policies to be expected under him is cast by his earlier career. From the post of first secretary of the Komsomol he had advanced to that of party secretary in the Moscow oblast. In March 1954 he was appointed Soviet ambassador to Poland, a post he held until his appointment as Minister of Culture.[35] Of particular interest is the fact that in December 1953 he was a member of the court which tried and condemned L. P. Beria.[36]

From such a background one would expect great organizing ability and energy, combined with uncompromising party orthodoxy. Mikhailov's first move in the field of music gave evidence of both these characteristics.

TOWARDS THE SECOND CONGRESS OF SOVIET COMPOSERS

In the same issue of *Soviet Culture* which carried the report of Mikhailov's appointment it was announced that the Eighth Plenum had resolved to call a Second All-Union Congress of Soviet

Composers, to be held in April 1956.[37] The timing of the announcement, as well as its content, made it clear that the decision to convoke the congress was the first move in the music policy of the Mikhailov ministry rather than the final one in that of Aleksandrov. No one had forgotten the First Congress of Soviet Composers; it was at that gathering that the policy formulated in the 1948 resolution on music had been laid down.

The impression of abruptness created by the manner in which the plans for the congress were announced was strengthened a short time later when a new plenum of the Board of the Union of Soviet Composers, the Ninth, was called to draw up plans for the congress.[38]

Functions

Under plans so far announced the congress is to combine two principal functions: first, to serve as an impressive demonstration of the "successes of Soviet musical culture," [39] and, second, to redefine the party's policy in music.[40] Preceding the congress, from October 1954 to March 1956, there are to be "creative plenary sessions" and congresses in all republic and provincial composers' organizations. Just before the congress, in March and April 1956, a "great festival of Soviet music" is to be held in Moscow, accompanied by similar festivals in other cities throughout the Soviet Union.[41]

The indications so far vouchsafed by party spokesmen of the policies which the congress will enunciate point strongly towards a return to those of the era 1948–53. Once again the emphasis is to be on the writing of operas on contemporary Soviet themes; the "extensive use of song forms" in opera is recommended, with the work of such dependable but uninspired party hacks as Tikhon Khrennikov and Ivan Dzerzhinskii held up as models.[42] The would-be writers of symphonies are warned that their work so far "does not give an adequate picture of the heroism of our days" and that the genre of symphonic program music is "poorly developed." [43]

Nevertheless, indications are not lacking that if there is to be a return to the policies of the 1948 resolution, it will be a skillfully masked return, in which the reimposition of stricter controls is combined with the appearance of a continuation of the more relaxed policies pursued in the first two years after Stalin's death. In terms of the dialectic, the signs point towards a policy in which the thesis represented by the 1948 resolution and its antithesis in the milder post-Stalin policy are deliberately combined into a synthesis for the greater good of the party.

One such indication is the official statement made by Khachaturian concerning the congress. Called on once again to serve as spokesman for the party to the professional world of music, Khachaturian fully justified the party's trust in him by a statement which adroitly combined acceptance of the party's "wise instructions" with a cautious appeal for a more flexible application of those "instructions." [44]

Another indication of the probable direction of policy was the startling report that Shostakovich is now engaged in reworking his opera, *Lady Macbeth of Mtsensk*.[45] When it is recalled that it was this work which provoked one of the first and most brutal attacks by the party on creative originality in Soviet music,[46] and that the work has lain under an absolute ban ever since that time, one's first reaction is to wonder whether full creative freedom has not indeed been restored to Soviet music. But sober second thoughts point in the opposite direction: if the party leaders wished to make an ostentatious demonstration, for external propaganda, of the alleged freedom of Soviet composers to write as they please, what better means could they find than the announcement that Shostakovich had resumed work on his banned opera? That he received official instructions to do so cannot be doubted by anyone who has studied the operation of the Communist system of control in the arts. The opera no longer represents in any way a living creative problem for Shostakovich; the musical phase it represents has long since been consigned to history, both by the composer and by the world of music in general. One suspects that the framers of party cultural policy, faced with the irrefutable evidence of the *Tenth Symphony* that Shostakovich will never fully submit to their controls, have resolved to use him instead as a propaganda showpiece to demonstrate the freedom under which Soviet composers work.

CONCLUSION

After a brief period of indecisive flirtation with a relaxation of party controls in music, the direction of Soviet music and cultural policy generally is now firmly in the hands of energetic and dogmatic party leaders who are skilled in the use of Soviet culture as an auxiliary weapon in the battle for control of world public opinion. The forthcoming Second Congress of Soviet Composers is likely to prove a highly potent contribution to the Communist cause in that battle.

Recent Soviet Philosophy

By George L. Kline

In philosophy, as in other areas of theoretical knowledge, the Soviet Union since Stalin would appear prima facie to have entered upon a period of relative freedom of discussion and increased latitude toward differences of opinion. Two recent editorial statements may be taken as typical:

> The solution of important scientific problems cannot be achieved by administrative action, by the harsh imposition of "authoritative" points of view upon those who think differently, by the forbidding of a free exchange of views. The path of development of scientific thought is a path of discussion and dispute, in the course of which obsolete conceptions are revised, new ideas arise, and new theories are elaborated.[1]

And, in the party theoretical organ:

> The conflict of opinions, creative disputes . . . are becoming more and more the norm of life in the scientific collectives. In institutes, departments, and scholarly councils one hears, with increasing frequency, lively discussions of manuscripts, dissertations, published books and articles, specific scientific problems.[2]

These statements are wholly consonant with Stalin's much-glossed declaration of 1950 (in *Marxism and Questions of Linguistics*) concerning the need for freedom of criticism and the clash of opinions in science. Unfortunately, however, two circumstances make it clear that, at least in the case of philosophy, the current pronouncements are quite as empty as was Stalin's. The first is the drastic restriction of such freedom by Soviet spokesmen themselves. The last-quoted editorial, for instance, contains the following stiff proviso:

> From time to time an attempt is made, under the flag of conflict of opinions, to revise root theses of Marxism-Leninism. . . . It cannot be permitted that individuals should use the freedom of conflict of opinions and criticism for the revision of fundamental principles of Marxism.[3]

In this case the example offered is from economic policy; the "revisionists" singled out for rebuke are those who ventured a theoretical defense of the "Malenkov policy" of developing consumers' goods production at the temporary expense of heavy industry.

Flatly repudiating philosopher M. T. Iovchuk's suggestion that various trends or tendencies might be admitted within the framework of a general Marxist world view, the editors of *Kommunist* exclaim: "Marxism-Leninism rests upon a single theoretical foundation—dialectical and historical materialism; hence there cannot be any question of different ideological trends within the framework of a Marxist world view."[4] This restriction is made even more explicit in another authoritative statement. After asserting that all Soviet science rests upon the "granite foundation of Marxism-Leninism," *Kommunist* goes on to stipulate that all discussion must proceed "upon a firm base of Marxism: all 'theories' which contradict Marxism must be *branded* as such, and not made subjects of discussion."[5] Many other statements might be quoted which stress, in various contexts, the "struggle for the purity and firmness of the principles of Marxist-Leninist philosophy."[6]

Any revision of Marxism-Leninism, it is clear, must come from the top. A Lenin or Stalin may with impunity discard "obsolete Marxist theses," replacing them with new ones as called for by "new historical conditions."[7] But the ordinary Soviet theorist dare not so much as scratch the monolithic surface of these unshakable blocks of granite!

The second kind of evidence of the hollowness of recent Soviet talk about freedom of discussion is provided, in superfluity, by the published writings of Soviet philosophers, which exhibit not the least tendency toward modification or creative development of Marxism-Leninism. There has been a toning down of certain Stalinist emphases, as we shall see, but this has amounted to a hardening of doctrinal positions, a kind of theoretical arteriosclerosis, following upon Stalin's deviation from orthodox Marxism-Leninism toward a more flexible common-sense view, which reached its height between 1950 and 1953. The only area in which there has been a significant broadening of permitted subject matter is the history of philosophy (see below), and even here the liberalization is thus far chiefly a matter of programmatic declaration.

Scope and Function of Philosophy

A fact which has long been evident to students of Soviet intellectual history has, in recent months, come to the murky surface of Soviet *kritika* and *samokritika*, namely, that those Soviet individuals, organizations, and activities grouped under the rubric "philosophy" are very little concerned with philosophy in the strict sense—not merely the traditional Western sense, but even the Marxist-Leninist sense. Any reader of *Voprosy filosofii* (the one official organ of Soviet "philosophic" thought), or of the various monographs, brochures, and pamphlets listed by the Soviet press as philosophical publications, will recognize that they contain a very high proportion of purely propangandistic, political, socioeconomic, topical, and even military material, which could not by any stretch of usage be termed "philosophic." For example, among Soviet *philosophy* dissertations defended in 1953–54 we find the following: D. V. Ermolenko, "Cosmopolitanism as an Ideological Weapon of American Imperialism in Its Struggle for World Domination"; A. A. Svinarenko, "Soviet Patriotism as the Source of the Might and Power of the Soviet Army"; V. A. Sergeev, "Military Questions in the Works of N. G. Chernyshevskii"! Countless philosophy dissertations, brochures and articles are devoted to the role of the Communist party in the building of socialism, "Soviet patriotism as the highest expression of proletarian internationalism," and similar topics. Perhaps the climax of philosophic irrelevance occurs in a recent *Voprosy filosofii* article:

> In his report to the February–March Plenum of the Central Committee of the

It should be noted that in the Soviet Union philosophy is classed as a "science" [*nauka*]; hence the expressions "scientific problem" and "scientific thought" apply fully to the philosophic disciplines.

[2] "O diskussiiakh v nauchnykh zhurnalakh" [On the Discussions in Scientific Journals], *Kommunist*, 1955, No. 7, pp. 117–18.

[3] *Ibid.*, p. 119.

[4] *Ibid.*, p. 123. Iovchuk's statement appears in *VF*, 1955, No. 1, p. 8.

Communist Party of the Soviet Union, N. S. Khrushchev made special mention of the indubitably great importance of *fertilizers:* "Who does not know that there is no more rapid and effective means for increasing yield than *fertilizers* . . . ?" [8]

Who indeed, unless perhaps some poor sequestered philosopher who has neglected his plowing in favor of Plato!

Admittedly, this is an extreme example. But the "substitution of questions of current politics for philosophical questions" of which a recent Soviet writer complains [9] is highly typical of Soviet practice. An authoritative critique of Soviet philosophy dissertations includes the (perfectly just) charge that many such dissertations exhibit "an extremely remote connection with philosophy." [10] The same source charges that in many cases Soviet authors construe history of philosophy so broadly that they transform it in effect into general history of ideology. Works on Marxist-Leninist philosophy, we are told, "dissolve the history of philosophy in the history of Marxism-Leninism, failing to exhibit the process of development of specifically philosophic questions." [11] The same point is made by *Kommunist:* "In works on the history of philosophy, however strange that may seem, it is precisely philosophy which sometimes gets away." [12]

The reasons for such a situation are not far to seek: it is obviously much simpler, as well as politically safer, for Soviet philosophers to discuss general ideological questions, repeating current propagandistic exhortations and denunciations, à la *Pravda,* than to enter into independent analyses of philosophic issues and distinctions which might easily lead them beyond the secure and shallow waters of received Marxist-Leninist "truths"—this from the point of view of the individual writer (who, by the way, is incessantly hounded to publish more in his field). From the point of view of editorial boards, whether of scholarly journals or of publishing houses, the quest for something to break the monotony of "philosophic" works, each as much like the last as "two drops of water" (in the Russian expression), must exert a pressure for inclusion of material that has little if any relevance to philosophy. Some such reasoning would appear to have underlain the decision of the editors of *Voprosy filosofii* to print the Oparin-Takács discussion on the physicochemical origins of life and the Fesenkov-Tikhov dispute concerning the presence of vegetation on Mars.[13] Though none of these four papers has much to do with philosophy, Marxist or otherwise, they represent relatively bright spots in an otherwise gray mediocrity. Part of the reason, beyond the intrinsic interest of the questions raised, is that all the papers are virtually free from citations of the "classics" of Marxism-Leninism.[14]

[8] G. S. Davtian, "Sovetskaia agrokhimiia i nekotorye ee zadachi" [Soviet Agrochemistry and Some of its Tasks], *VF,* 1955, No. 1, p. 85. Italics added.

[13] For the former see *VF,* 1953, No. 1, pp. 138–42 and 1955, No. 3, pp. 147–50. For the latter see *VF,* 1954, No. 3, pp. 106–24 and 1955, No. 1, pp. 92–102.

[14] It may be noted in passing that, while the number of quotations from Stalin's writings has greatly declined in philosophic works published since mid-1953, such quotations have by no means disappeared. Quotations from Lenin are more ubiquitous than ever. Marx is rarely quoted in philosophic works as a doctrinal authority, although he is occasionally cited as an example of the application of Marxist-Leninist dialectic. Engels is a close runner-up to Lenin, and Mao Tse-tung has been quoted on occasion when some other "classic" would have served doctrinal purposes equally well. It may be worth mentioning that until March 1953 *Voprosy filosofii* printed footnotes at the bottoms of pages, so that it was easy to determine the frequency of quotations from a given author. Now references are given in parentheses in the text—a change doubtless motivated both by considerations of economy and "popularity" and by the desire to render less obvious the abrupt decrease in the frequency of Stalin quotations.

In addition, the authors are not themselves philosophers, but, respectively, biochemists, an astrophysicist, and an "astrobiologist" (a Soviet specialist who studies the forms of life—if any—on other planets). Soviet *émigrés* confirm the impression which one gains from a comparison of Soviet publications in philosophy with those in the special sciences, namely, that professors of dialectical materialism (*diamatchiki,* as they are somewhat contemptuously dubbed) are among the least competent and least respected members of the Soviet scientific and academic community. There is no evidence from the postwar or post-Stalinist period to indicate any change in this situation.

Inconsistently enough, in the same breath in which they criticize philosophers for systematic irrelevancy, Soviet authorities go on to urge tasks upon them which are far from philosophical. A *Kommunist* editorial states that philosophers must be militant materialists, "assisting the party in every way to educate the workers in the spirit of communism, Communist morality, . . . tirelessly propagandizing the masses with a scientific, materialistic, atheistic world view." [15] Philosophers must make plain the decisive role of the masses in the shaping of history, and this "in indissoluble connection with the root questions of party politics, strategy, and tactics. . . ." Soviet philosophers are castigated for "failing to exhibit the scientific foundations of party policy." [16]

PHILOSOPHICAL JOURNALS—U. S. AND USSR

This unphilosophical character of much Soviet "philosophy" tends to cut the ground from beneath Soviet claims to preserve the dignity and autonomy of philosophy vis-à-vis the special sciences and politics—in alleged contrast to the subservient status of philosophy in "bourgeois" countries. The Soviet claim, in my view, is also taken too seriously by such otherwise highly perceptive critics of Soviet philosophy as Bocheński [17] and Wetter.[18] This situation also takes the edge from the Soviet assertion that the small circulation of American philosophical journals is evidence of a decline of philosophy in the United States.[19] Besides the fact that at least eight such journals are published in the United States, many American philosophers regularly follow and contribute to English, Australian, and Continental journals. The fifty thousand subscribers to *Voprosy filosofii,* the *only* Soviet philosophical journal, seem less impressive when we recall how little philosophy it contains (aside from the question of the *quality* of this strictly philosophical residuum) in comparison with American and West European journals, which are devoted almost exclusively to philosophy in the strict sense.

FORMAL LOGIC AND DIALECTIC

It is not the intent of the present paper to offer a survey or summary of the body of current Soviet philosophical doctrine.[20] Instead, certain recent developments in logic, philosophy of science, theory of knowledge, ethical and social theory, and history of philosophy will be singled out for comment.

The dramatic shift in policy toward formal logic, marked by the Central Committee decision of November 1946 to reintroduce logic courses into secondary (and higher) education—after a quarter-century of violent attacks upon formal logic as static, metaphysical, and "bourgeois"—has been widely discussed.[21] But until early 1955, when the editors of *Voprosy filosofii* printed an open letter from two Soviet logicians, it was not known in the West how hollow the apparent "triumph" of formal logic in the Soviet academic system had been. It had been known that a series of textbooks prepared after 1946 for secondary school logic courses were, one after another, condemned as unsuitable; but it had not been known that the search for a satisfactory text was effectively discontinued in 1954. Nor had it been known that logic was excluded from the list of subjects required for the "certificate of maturity"—along with singing, drawing, and physical education. Furthermore, we now learn that in secondary schools "in recent years" teachers of logic have not been permitted to assign written work—a restriction which would sharply reduce the effectiveness of their teaching. Various officials of the Ministry of Education have made it clear that logic is soon to be dropped from the secondary school curriculum. And the training of logic teachers in Soviet teachers colleges was discontinued as of 1954, despite the continuing shortage of trained personnel in this field.[22]

Presumably these measures have not, as yet, affected the teaching of logic at the university level; nevertheless, the threatened elimination of logic from the secondary school curriculum, if carried out, would constitute a sharp reversal for Soviet defenders of formal logic.

It is not difficult to agree with N. Z. Chavchavadze's characterization of the discussion on the relation of formal logic to dialectic which was carried on in the pages of *Voprosy filosofii* during 1950 and 1951. He calls it "badly handled, clarifying nothing," adding that the editorial article "summing up" the discussion "failed to resolve the controversial questions."[23] What appeared at the time as a qualified victory for the defenders of formal logic now dwindles to something much less solid. The present focus of attack is that group of Soviet logicians, headed by Bakradze and Kondakov, who defend the autonomy and importance of formal logic (in its traditional Aristotelian form) and allegedly "belittle" the role of Marxist-Leninist dialectic. Thus M. B. Mitin, long an authoritative spokesman for Soviet philosophers, currently deplores the "wide acceptance among us during recent years of incorrect, harmful views on the question of the relation between formal and dialectical-materialist logic."[24]

A long editorial statement in the latest issue of *Voprosy filosofii* to reach this country[25] attacks Soviet "vulgarizers" who want to do away with dialectical logic altogether, and who allegedly became even more impudent in their "revisionism" after the official termination of the discussion of the relation of logic to dialectic in 1951. The editors accuse G. F. Aleksandrov, who headed the Institute of Philosophy of the Soviet Academy of Sciences—the leading philosophical institution in the country—between 1947 and 1954, of supporting these erring philosophers by wholly neglecting theoretical problems of dialectical logic. After a detailed critique of the logic texts of both Bakradze (1951) and Kondakov (1954), the editors conclude:

> The rejection of dialectical logic, the replacement of dialectical logic by formal logic, leads to the crudest and most harmful vulgarization of the philosophical foundations of Marxism-Leninism and the politics of the Marxist Party.[26]

This "nihilistic" movement involves

> . . . a whole system of views in logic, views clearly deviant from Marxism. What might in the beginning have been considered—with some straining—as a conflict of opinions within the limits of Marxism has now quite openly gone beyond those limits. . . . We must put a decisive end to this erroneous tendency.[27]

Judging from the incoherent analyses and strained distinctions which characterize the latest works on the subject, the future of philosophical writing on logic in the Soviet Union is not bright.[28] The trend toward a genuine rehabilitation of formal logic, which began in 1946–47 and gained considerable momentum after Stalin's linguistics statements of 1950, would appear to have been definitely reversed.

CONTRIBUTIONS OF MATHEMATICIANS

It should be noted, however, that while Soviet *philosophers* have wholly neglected the important developments of mathematical logic during the past half century, Soviet *mathematicians,* writing in technical mathematical journals, have continued, throughout this and earlier periods, to make significant contributions to the development of this specialized field. Examples are the recent work of P. S. Novikov on logical paradoxes; B. A. Trakhtenbrot on the decision problem for finite classes; A. A. Markov on the impossibility of certain algorithms for associative systems; and A. A. Zykov on the spectrum problem in the second-order functional calculus.[29]

Soviet mathematicians have also done pioneer work in the development of probability theory, a discipline culti-

[20] The best brief accounts are those of Bocheński, *op. cit.* (note 17 *supra*). The exhaustive account is Wetter's, *op. cit.* (note 18 *supra*). An excellent critical study, thus far available only in Russian, is B. Petrov (Vysheslavtsev), *Filosofskaya nishcheta marksizma* [The Philosophic Poverty of Marxism] (Frankfurt am Main, 1952). I have discussed this work in detail in the *Review of Metaphysics,* Vol. 9 (1955), pp. 90–105.

[21] Cf. A. Philipov, *Logic and Dialectic in the Soviet Union* (New York, 1952); Wetter, *op. cit.* (note 18 *supra*), Part II, Chap. X. I have surveyed recent Soviet developments in this field in the *Journal of Symbolic Logic,* Vol. 17 (1952), pp. 124–28; Vol. 18 (1953), pp. 83–86, and Vol. 19 (1954), p. 149.

[25] "Protiv putanitsy i vulgarizatsii v voprosakh logiki" [Against Confusion and Vulgarization in Questions of Logic], *VF,* 1955, No. 3, pp. 158–71.

[26] *Ibid.,* p. 163.

[27] *Ibid.,* p. 171.

[28] After 1950 all Soviet logicians agreed that formal logic itself (though not *interpretations* of it) was above class distinctions, common to all classes, hence not a weapon of ideological warfare. But now we find logic characterized—in the aggressive tone of pre-1950 statements—as "a militant sector in the struggle against the ideology of imperialist reaction" ("Nasushchnye voprosy . . . ," *Kommunist,* 1955, No. 5, p. 17).

[29] My translation of Zykov's paper is being published in the American Mathematical Society Translations, Series 2, Vol. 3 (1956), pp. 1–14.

vated in the West by philosophers as well as mathematicians (as a part of the theory of inductive inference and scientific methodology). The major names are S. N. Bernstein, A. Ia. Khinchin, and A. N. Kolmogorov. Academician Kolmogorov has made major contributions both to the working out of a theory of probable and statistical inference on a foundation of set theory and to the special extension of this theory to what he calls "ramified contingencies." Soviet *philosophers,* in contrast, have contributed nothing to this field.

THEORY OF KNOWLEDGE; PHILOSOPHY OF SCIENCE

Theory of knowledge has long been one of the most barren "sectors" of the Soviet philosophical "front." With the single exception of M. A. Markov's interesting essay of 1947 on the role played by instruments in the cognition of microphenomena [30]—which was promptly denounced as Machian, Kantian, and a resurrection of Plekhanov's discredited theory of hieroglyphs—Soviet epistemologists have limited themselves to quoting, paraphrasing, and rhapsodizing over Engels' and Lenin's bleak and naïve "theory of reflection." In summing up a discussion on the role of practice in cognition, the editors of *Voprosy filosofii* admitted that it had not been very fruitful, since all the questions under discussion had "long since been settled by Marxist-Leninist doctrine." They added, however, that it had cleared up the "confusions" existing in the minds of some comrades on points of epistemology.[31]

In the area of philosophy of science, especially philosophy of physics, the picture is somewhat less depressing, in part at least because most of the discussion has been carried on by physicists rather than philosophers. That the gap between the two professions is sharp, if not unbridgeable, is evidenced by numerous Soviet statements. Thus, Professor B. M. Kedrov, a philosopher, urges philosophers to study the natural sciences, and scientists to study philosophy.[32] The editors of *Kommunist* complain that "discussions in the natural sciences proceed without the active participation of philosophers. . . . There has been a certain weakening of the relations between philosophers and natural scientists. . . ." At the present time, "philosophers help natural scientists very little" because they are not sufficiently familiar with contemporary scientific developments. And scientists still do not see the need for philosophy in their own work.[33]

An example of a reasonably fruitful discussion was that on relativity theory—both because of the active participation of physicists and because much of the discussion was not strictly philosophical at all (hence not Marxist-Leninist), but concerned with the broader aspects of physical theory—interpretation, terminology, and so forth. The official summing up states that the "overwhelming majority of the discussants prize relativity theory as one of the major achievements of physics." [34] A. A. Maksimov, who, while accepting the mathematical apparatus of relativity theory, rejected its physical consequences, was repudiated as a "vulgarizing" "subjectivist." [35] Several physicists felt that the *title* of Einstein's theory was inappropriate; one suggestion was that the general theory of relativity be renamed the "theory of gravitational warping of the spatiotemporal metric." [36] The proposed title is somewhat inelegant, but it does accurately convey a major emphasis of the general theory of relativity.

Of interest in this connection is Leopold Infeld's article on relativity theory (a translation from the Polish) [37] and his polemical exchange with Soviet academician V. A. Fok.[38] The dispute between G. F. Drukarev and M. E. Omelianski on Heisenberg's principle of uncertainty in quantum mechanics is carried on at a high level of technical competence.[39] (Both men are physicists.) It is worth noting that Heisenberg's *Philosophical Problems of Nuclear Science* was published in Russian translation late in 1953, presaging a new policy toward the publication of works of non-Marxist, indeed "idealist," foreign scientists. In a long introduction to the Russian edition Soviet readers are warned that while Heisenberg's theoretical contributions to quantum mechanics are sound and important, his own *interpretations* of them are idealistic, Machian, and generally anathema to good Marxist-Leninists. Omelianski re-emphasizes this point in an article published in *Voprosy filosofii.*[40] To date, however, the Heisenberg translation is a unique phenomenon. Comparable works of Schrödinger and Oppenheimer, for example, which might be of equal interest to Soviet readers, have not been translated.[41]

SOCIAL AND ETHICAL THEORY

Stalin's statements on linguistics concerning the relative autonomy of certain superstructural elements and the "creative role" of the superstructure vis-à-vis the economic base of society were widely applied between 1950 and 1953 by a large number of Soviet writers, in fields as diverse as jurisprudence, economics, linguistics, philosophy, and the natural sciences. Their chief application in philosophy (in addition to that in logic, which we have just considered) was to social theory. Countless Soviet statements of the period stressed that, in socialist society, the relations and forces of production are not uniquely independent variables (as classical Marxism held), but that ideological factors—law, the state, political institutions, as well as philosophy, science, and art—can reciprocally influence the economic base. Taking one text almost at random, we find Kareva emphasizing the "enormous creative role" of Soviet law and the Soviet state, "their great influence in transforming the economic base of society." [42]

Since 1954, however, there has been a significant retreat from this position toward a more orthodox Marxism-Leninism. Aleksandrov's book on Stalin's linguistics statements and dialectical materialism is now criticized for "slurring

over the determining role of the base and exaggerating the role of the superstructure."[43] More generally, we read, "In the recent past certain books and articles have exhibited errors of a voluntaristic character in the interpretation of economic laws and the role of the state in socialist society."[44] In other words, the unilateral causal determinism of the economic base of society is here reasserted against those authors who, in the spirit of Stalin's utterances of 1950, had questioned this determinism, putting forward an alternative "interventionist" or "voluntaristic" view of the dynamics of social change. It must be said that, if one is going to talk about social structure and historical dynamics in terms of base and superstructure, the 1950–53 position, with its admission of reciprocal influences, seems much sounder than that which is now being asserted against it. However, because of the misleading metaphorical character and dubious explanatory power of the base-superstructure image it would be better to dispense with it altogether. This drastic step, unfortunately, has not been suggested by *any* Soviet writer.

There have been no comparable doctrinal shifts in the post-Stalinist (or postwar) period with respect to ethical theory. Lenin's Machiavellian view of morality remains canonical: whatever furthers the cause of communism is "moral"; whatever obstructs or impedes that cause is "immoral." In a current Soviet formulation: "The only scientific criterion of morality is the defense of the interests of the victory of communism. . . ."[45] Another writer puts the point more bluntly: "In our time only what furthers the destruction of capitalism and the victory of communism is moral."[46] Again: "The highest criterion of Communist morality is . . . self-sacrificing struggle for communism."[47]

Current Soviet works in "ethical theory" are chiefly exhortations aimed at making the Soviet citizen meet his "moral obligations," so defined—subordinating his individual interests to collective, sociopolitical interests in all cases of conflict between the two. This general obligation entails such specific obligations as "respect for social property"; Soviet patriotism—sharply distinguished (but it seems to be a distinction without a difference) from "bourgeois chauvinism"; socialist internationalism, also sharply distinguished from "bourgeois cosmopolitanism." All of these "principles" are variations on the central theme of the individual's absolute subordination, loyalty, and devotion to the "collective." In general, Soviet writings on "ethics," besides being exhaustingly repetitious, contain vanishingly little ethical theory in the strict sense.

Of more interest is the polemic and criticism—some of it quite relevant and philosophically sophisticated—directed by Soviet writers against contemporary pragmatic, positivistic, and existentialist ethics. A good example is to be found in P. A. Shariia's *O nekotorykh voprosakh kommunisticheskoi morali* [On Certain Problems of Communist Morality],[48] a work which also contains the most literate discussion in postwar Soviet philosophy of the problem of determinism and freedom.[49] However,

[48] Moscow, 1951.

[49] *Ibid.*, pp. 42–52.

Shariia's own position—for which, with some straining of texts, he attempts to adduce Lenin's support—involving as it does a mitigation of strict determinism and an assertion of the "relative freedom of choice" between objectively existing possibilities, has received no support from other Soviet authors. And Shariia himself has published nothing since 1951.

HISTORY OF PHILOSOPHY

That there has been a certain mellowing in the Soviet attitude toward the study of the history of Western philosophy, including contemporary "bourgeois" philosophy, is indicated by three related bits of evidence. First, translations have begun to appear of certain foreign works which had not hitherto been issued under Soviet auspices, for example, Bacon's *New Atlantis* and Montaigne's *Essays* (both published in Moscow during 1954). To be sure, neither of these thinkers is of a philosophical persuasion sharply opposed to that of the Soviet authorities; but neither of them could accurately be called either atheistic or materialistic. Also, 1954 saw the publication of a Russian translation of S. Chatterjee and D. M. Datta's *Introduction to Indian Philosophy*, an event difficult to imagine in the Stalinist period.

Second, Soviet journals, especially *Voprosy filosofii* and *Kommunist*, have, since 1953, reviewed a number of Western studies in Russian philosophy and intellectual history which had previously received the "silent treatment." Zenkovskii's *History of Russian Philosophy*, first published in Paris in 1948 and 1950 (in Russian), and Losskii's *History of Russian Philosophy*, published in New York in 1951, remained unnoticed in the Soviet press until mid-1955. Then, in a single issue of *Voprosy filosofii* an editorial described this situation as "intolerable" and a long review article was devoted to the Zenkovskii and Losskii volumes. A similar review article later appeared in *Kommunist*.[50] The reviews, of course, are critical; but Zenkovskii's point of view, in the Tarakanov review, is quite fairly represented, with some recourse to direct quotation of the author. The spasmodic attacks interspersed between paragraphs of quite calm analysis have the disconnected air of editorial afterthoughts.

In the third place, a series of relatively "objective" expository and critical articles on thinkers long neglected by Soviet philosophers has recently appeared: Locke, Kant, Spinoza (the last named had been much discussed during the late 1920's and early 1930's, but not since the war); German "classical philosophy," especially Hegel; and Montesquieu, the bicentennial of whose death was widely celebrated in the Soviet Union during 1955.

At the same time, there has been a certain liberalizing of the attitude toward earlier Russian thinkers. For example, Skovoroda, long neglected or curtly dismissed with the epithet "mystic and idealist," is the subject of a recent brochure.[51] M. I. Karinskii, a Russian Orthodox priest and a highly competent and original logician of the late nineteenth century, has recently received a certain amount of favorable at-

Shchipanov, "Protiv sovremennykh burzhuaznykh fal'sifikatorov istorii russkoi filosofii" [Against Contemporary Bourgeois Falsifiers of the History of Russian Philosophy], *Kommunist*, 1955, No. 10, pp. 62–76. A very brief article is devoted to Losskii in the second edition of the *Bol'shaia Sovetskaia Entsiklopediia*, Vol. 25 (1954).

[51] T. A. Bilych, *G. S. Skovoroda—vydaiushchisia ukrainskii filosof XVIII veka* [G. S. Skovoroda—an Outstanding Eighteenth-Century Ukrainian Philosopher], Kiev, 1953.

tention; he rates an article and portrait in Volume 20 (1953) of the second edition of the *Bol'shaia Sovetskaia Entsiklopediia*. The complete works of Alexander Herzen, not published in the Soviet Union since the early 1920's (although selected works have been reprinted), are now being issued in thirty volumes, of which the first four are available. Most recently, a complete edition of Dostoevsky's novels and short stories (in ten volumes) has been announced for publication, beginning in 1956.

Recent Soviet statements insist upon the necessity of studying—and, of course, refuting—Russian *idealists*, not simply materialists, as had hitherto been the practice.[52] The importance of this shift will become evident when it is recalled that in Soviet parlance "idealist" is a blanket term applied indiscriminately to such very diverse thinkers as Bakunin, Lavrov, Mikhailovskii, Kropotkin, Leontiev, Soloviev, and Berdiaev. Among Western philosophers Soviet writers class Dewey, Santayana, Whitehead, Maritain, Jaspers, and Carnap as "idealists"!

An editorial in *Voprosy filosofii*, calling upon philosophers to "raise the theoretical and ideological level of studies in the history of philosophy,"[53] complains that "on the whole the elaboration of the history of philosophy is still in a very poor state."[54] The editorial goes on to comment that "not long ago" (namely, during the 1920's and early 1930's) Soviet historians undervalued Russian history and culture. But "most recently there has been a certain spreading of an equally erroneous, nihilistic attitude toward the achievements of foreign culture and science, and, related to this, the history of philosophic thought in the West."[55] G. F. Aleksandrov is explicitly accused of such nihilism—an opposite extreme from his earlier "error" (for which Zhdanov had chastised him) of "liberal-vegetarian praise" of Western European thinkers. The collectively written *History of Philosophy* (two volumes), of which he was in charge from 1947 until late 1953, is described as offensively nihilistic toward foreign philosophy. It is now undergoing a thorough revision.[56] The previous minimizing (in this text and others) of Western influences upon Belinskii, Chernyshevskii, Dobroliubov, and others is now repudiated as erroneous.

Elsewhere complaints are registered that too little work has been done on American social and philosophic thought;[57] that the works of Hegel, Feuerbach, and other pre-Marxist philosophers have not been republished for many years; that the printings of translations of the works of contemporary foreign scholars and scientists are much too small.[58] "The matter of publication of the works of outstanding foreign philosophers during the last few years has been neglected—which is absolutely intolerable."[59] And again: "We must get rid of the prejudice still held by certain Soviet scientists and scholars that in capitalist countries science is incapable of creating anything of value."[60]

[52] Cf. Tarakanov, *op. cit.* (note 50 *supra*), p. 83.

[53] "Povyshat' ideino-teoreticheskii uroven' issledovanii po istorii filosofii," *VF*, 1955, No. 3, pp. 3–16.

[54] *Ibid.*, p. 6.

[55] *Ibid.*, pp. 6–7.

[56] Aleksandrov's star has recently fallen very low. He was elevated by Malenkov from his position as head of the Institute of Philosophy to that of Minister of Culture of the USSR (March 16, 1954), was dismissed in disgrace a year later, and has not been heard from since. Cf. *Pravda*, March 22, 1955, p. 2.

[57] *VF*, 1955, No. 3, p. 195.

[58] "Neotlozhnye zadachi izdatel'stv" [Immediate Tasks of the Publishing Houses], *Kommunist*, 1955, No. 4, p. 48.

[59] *VF*, 1955, No. 3, p. 16.

[60] "Nasushchnye voprosy . . . ," *Kommunist*, 1955, No. 5, p. 21.

As yet, however, these are bare programmatic statements. Only time will tell whether Soviet philosophers are to be permitted to study and discuss in detail hitherto forbidden thinkers, whether Western or Russian.

Kritika AND *Samokritika* IN PHILOSOPHY

The low quality of philosophy teaching, research, dissertation writing, and general publication has recently been the object of searching criticism by official Soviet organs. Of the thousand-odd philosophy dissertations defended during the decade 1945–55 (fifty being doctoral dissertations and nine hundred and fifty "candidate's" dissertations), only about one hundred were good enough to publish. There is much duplication of subjects; many dissertations are unoriginal compilations, marred by "quotology" (*"tsitatnichestvo"*), schematism, and dogmatism.[61] As for the dissertation defense, it still is "too much like a dress parade, a jubilee celebration at which people pay each other compliments."[62] The system of guidance for graduate students in philosophy needs to be overhauled; professors should be held responsible for the quality of their students' preparation, not just for the number of hours they spend in "consultation" with them, as at present.

Of the thousand-odd graduate philosophers in the Soviet Union, only about one hundred publish regularly; the other nine hundred are "resting on their laurels." Many philosophers do not work very hard; they prefer a quiet life:

> Their philosophical swords are covered with rust . . . , bleak "quotology" has become their stock in trade. . . . They are capable of making a deal with their conscience, praising a book to the skies today and just as readily tearing it to pieces tomorrow. . . . We must put an end to such depravity.[63]

It would presumably be of no avail for ordinary Soviet philosophers to remind their critics that book-review policy is dictated from above!

As for philosophic discussion, it is said to be at a low theoretical level, often merely verbal, scholastic, incoherent, and a general waste of time. There is too much labeling of one's opponents, without grounds, as "metaphysicians," "idealists," "subjectivists," or "objectivists."[64] Published articles are found to exhibit all the defects attributed to philosophy dissertations and also to be marked by occasional outright plagiarisms from other Soviet sources.[65] *Voprosy filosofii*, in a spasm of self-criticism, deplores the low theoretical level of its articles; its secretary, M. I. Sidorov, reports, rather lamely, in partial extenuation, that a large number of even worse articles were *not* printed.[66] *Kommunist* finds that the editors of *Voprosy filosofii* fail to print articles on a number of important philosophical problems and its "summing up" articles which conclude discussions are sometimes obscure and incoherent—for example, that on philosophical problems of psychology in Number 4 of 1954.[67]

One can only say to all this—as to so much *kritika* and *samokritika*—tha[t]

[61] These charges, originally made in *Kommunist*, 1955, No. 5, p. 24, were later expanded in *VF*, 1955, No. 3, pp. 12, 193–96. We have already seen that many philosophy dissertations are written on subjects remote from philosophy.

[62] *VF*, 1955, No. 3, p. 196.

[65] *VF*, 1955, No. 3, p. 176.

[66] "K itogam . . . problemam," *VF*, 1955, No. 2, p. 233.

[67] "O diskussiiakh . . . ," *Kommunist*, 1955, No. 7, pp. 124, 127.

the Soviet critics have taken the words right out of one's mouth!

CONCLUSION

Of the three significant shifts in Soviet philosophical theory and practice since the death of Stalin, two—those concerning formal logic and the theory of superstructures—represent retreats from Stalin's "revisionist" position to a more rigidly orthodox Marxism-Leninism. The third, the only hopeful sign on the philosophical horizon, is expressed in a slightly increased hospitality toward the ideas of non-Marxist-Leninist thinkers. But this at present is little more than a program and promise for future action. There is no sign at all of any slackening of the generally authoritarian and dogmatic character of Soviet philosophy and no indication, despite misleading verbal claims to the contrary, of any genuine freedom of philosophic reflection, discussion, or criticism.

George L. Kline, Ph.D., New York City, is assistant professor of philosophy at Columbia University and has served as consultant on Soviet philosophy for the Research Program on the USSR. He is translator of V. V. Zenkovskii's History of Russian Philosophy (two vols., 1953) and author of Spinoza in Soviet Philosophy (1952), as well as numerous articles on Russian and Soviet intellectual history. He is currently completing a book on Russian Ethical Theory.

Soviet Science in the Post-Stalin Era

By JOHN TURKEVICH

IN this age when science and technology are dominant factors in the might of a nation, an assessment of Soviet science is particularly timely. Recent years have shown marked advances in many areas of Soviet science and technology and an increasing conformity with the principles of world-wide science.

Science of any nation has both international and national characteristics. In its international aspects, science moves along a broad front with scientists of many nations contributing to its progress. The atomic age was ushered into the twentieth century by Planck, Heisenberg, Hahn, and Einstein, Germans; by Bohr, a Dane; by Rutherford and Aston, Britons; by Fermi, an Italian; by Curie and Joliot from France; by Lawrence, Urey, and Rabi, Americans. Ease and freedom of communication—an assurance of cross-fertilization of ideas—has been associated with science ever since it freed itself from the mumbo jumbo of the witch doctors and the obscure jargon of the alchemical adepts. Western science of the last three centuries has been characterized by widespread and rapid exchange of information on new discoveries and advances. Exchanges of visits to laboratories have been commonplace. Formal training of advanced students is often supplemented by further study under distinguished foreign scholars. Finally, it is a principle universally recognized in the West that science brooks no interference, political or ideological, in its search for truth. It is a firm tenet in the faith of a scientist that scientific truths are based on experiments; that valid experiments can be reproduced in any country irrespective of race, nationality, or ideological outlook; and that dogmatic deductions from religious belief, neat philosophical formulations, or social-economic ideology have no place, as such, in the structure of scientific knowledge.

On the other hand science has its national characteristics. Through his knowledge and skills a scientist discharges his primary responsibility—the defense of his country. Through their inventiveness and perseverance, scientists and engineers are bolstering up the economic strength of their countries and guaranteeing an increase in the standard of living. Science and technology are part of a national life. As such, in common with other national institutions, they have a tradition, organization, capital goods, budget, training of personnel, personalities, and interaction with other groups of society. These various components have a strong national coloring differing from one country to another. They give character to the scientific activity of a given country.

The character of Soviet science is Russian. Characteristics commonly associated with Soviet politics, economics, and intellectual activity can be recognized in science. During the last few decades, crawling within the shell of its national existence, Russian science has lost considerable strength through its isolation from the co-operation and helpful criticism of world science. During the postwar period, its domination by Marxist and Stalinist ideology re-

sulted in a distortion of scientific truths, a convulsive re-examination of scientific tenets, disappearance of important branches of science, and strained relationships with the scientists of other lands. Soviet science not only lost prestige, it lost strength—it had tampered with the recognized principles of obtaining scientific truths, replacing the authority of an experimental result by the authority of an ideological principle.

The last three years have seen a change in Soviet science. The truculent attitude has disappeared; the isolation of Russian scholars is being lifted. Science is being discussed in the Soviet Union not as an expression of a Communist ideology but as a science having its own principles, traditions, and universality.

In the following pages an attempt will be made to point out the significant events that have taken place in recent years in Soviet science.

ORGANIZATIONAL CHANGES

Soviet science, like most of the other government activities in the Soviet state, is a highly organized structure. Scientific research is carried out at institutes under the auspices of the USSR Academy of Sciences, at the universities under the Ministry of Higher Education, and at plant laboratories under various specific government ministries. During the last decade there has been no change in the general pattern of the organization. The Academy still represents the "élite guard" organization; its presidium, the general staff of Soviet Science. Its president, A. N. Nesmeianov, occupies a position of prestige and power in the Soviet Union unlike that of any other scientist in any other country. The Academy has been brought to its full strength by the election on October 23, 1953, of 51 academicians and 148 corresponding members. This was the first election in seven years, and it introduced new blood into the Academy.

During the last two years the following new institutes have been established: the Institute of Biophysics, the Institute of Nuclear Problems, the Institute of Electronic and Radio Engineering, the Institute of Acoustics, the Institute of Organometallic Compounds (for substances such as tetraethyl lead, insecticides, etc.), and the Institute of Automotive Engineering. A Mathematical Computer Center has been organized. The Institute of Mathematics and that of Metallurgy have received new buildings, while the Physics Institute received an addition to its laboratory in Moscow. The Institute of Energetics and that of Plastics have been expanded.

The budget of the Academy rose from 59.2 million rubles in 1952, to 75 million rubles in 1953, and to 116.4 million rubles in 1954.

The academies of Union Republics (for example, Ukraine and Byelorussia) also carry out research associated with the scientific and technological problems of their particular region. Their work is co-ordinated with that of the USSR Academy through a co-ordinating committee and an interlocking leadership, whereby a member of the Academy of Sciences of the USSR is also the president of the academy of a Union Republic.

The presidium of the Academy—the president, the secretary-general, and the secretaries of the individual divisions—passes annually on all research proposals, authorizes funds and personnel, and evaluates the results obtained. Over and above this detailed direction, the presidium is guided by two principles. The first is the search for "key problems"—those research problems whose solution will open the maximum number of paths for future scientific development. The second is the ever insistent plea to apply scientific discoveries for the betterment of the state, for "science in the service of the people." Use of slogans as special incentives to fruitful research has been recently abandoned. Such psychological rallying points as "re-examination of science in the light of the decision of the 1948 Agricultural Congress" (the genetics controversy), "science helping to build dams and hydroelectric stations," "science as an aid to agriculture," have been replaced by a small number of more specific objectives. The tasks chosen for 1955 are high-power electronics, rapid digital calculating machines, semiconductors and their technical applications, scientific basis for catalysis, basic biological functions of proteins, material exchange of bacteria, high-temperature alloys, reliability of electronic devices, key problems in theoretical physics, automatic control of production, and the scientific basis for power exploitation in the USSR.

SCIENTIFIC ACCOMPLISHMENTS

If a well-trained science administrator examines the research scene from astronomy to zoology, he can recognize what programs are fruitful, what theoretical and experimental developments will ensure a steady expansion of scientific knowledge. For a country to be a major power it must have a full spectrum of such activity: it must have research going on in every major field. Such a program ensures the proper appreciation of new scientific discoveries for technical development of a nation even when the discovery is not made in the native country. It also maximizes the possibilities of unexpected scientific discoveries, "the breaks in the game" that give a country leadership in the race for scientific knowledge. Only a few countries—the United States, the United Kingdom, and, before World War II, Germany—could muster sufficient strength to be active at all frontiers of every science. Now, ten years after World War II, the Soviet Union has joined the ranks of the major scientific powers. As one scans the Soviet scientific scene one sees ambitious plans, tremendous organization, and an expanding plant. The Soviet government is trying hard to excel in all fields of science and to recoup the losses it suffered through the idiosyncrasies of the Stalin regime.

MATHEMATICS

Mathematics, the queen of the sciences, still dominates the scientific scene. Many branches in both pure and applied sciences are frustrated in their development because present-day mathematical thinking does not give an accurate solution to some key problems. Proper application of mathematical methods guarantees a complete formulation of a complex physical phenomenon and a consistent analysis of its implications. The general theory of relativity had to be formulated in terms of tensor analysis. Modern quantum mechanics required the solution of equations previously buried in mathematical treatises. It necessitated the widespread utilization of geometrical concepts previously considered highly sophisticated. The field of mathematics has been traditionally strong in the Soviet Union. Algebra, geometry, probability theory, have received a steady contribution from older mathematicians such as S. N. Bernstein, A. Ia. Khinchin, A. N. Kolmogorov, A. A. Markov, L. S. Potriagin, and I. M. Vinogradov. At the October 1953 session of the USSR Academy of Sciences D. S. Aleksandrov and N. N. Bogoliubov, both mathematicians of world-wide reputation, were elected to the Academy. In the field of mathematical physics the Soviet Union can boast of the achievements of L. D. Landau, V. A. Fok, D. I. Ivanenko, I. Ia. Pomeranchuk, and I. E. Tamm.

In addition to these mathematicians with world reputations, a large number of younger men are making monthly contributions to the world pool of mathematical knowledge. The following were singled out for recognition by election as corresponding members of the Academy: I. M. Gel'faud, Iu. V. Linnik, A. L. Mal'tsev, M. A. Markov, D. E. Men'shov, and S. N. Mergelian.

The middle decades of the twentieth century have seen the growing development of giant electronic computing machines for solving the complex problems of modern science and technology. Hundreds, thousands, of radio tubes, crystal amplifiers, rectifiers, resistors, condensers, electronic memory devices, are compounded into a single complex mechanism. Such machines rapidly solve problems that would otherwise require thousands of man-years for problems previously considered impossible. Their variety and complexity have created a new art, used for tracing trajectories of projectiles, the propagation of radio waves, the determination of the stability of machines, and the control of automatic factories.

Electronic calculators are essential weapons in the heavy scientific armament of any nation that considers itself a world power. The Soviet Academy has paid great attention in recent years to such calculating machines. The presidium of the Academy announced last year the operation of a giant computer and the organization of a Computer Center of the Academy for the theoretical and technical development of computing machines. This center is undertaking a systematic survey of fields of science and technology where such machines will give fruitful solutions to "key problems" and is training personnel for this new field of "applied mathematics." During the elections of October 1953 the Academy elected two specialists in this field to its rank: S. A. Lebedev as academician and P. S. Novikov as corresponding member.

ASTRONOMY

Soviet astronomy suffered a severe setback during World War II when the famous Pulkovo observatory near Leningrad and the Crimean observatory were completely destroyed. Within the last two years the reconstruction of both of these observatories has been completed and astronomical observations are actively pursued in diverse branches of the subject: on diffuse nebulae by G. A. Shain, on the polarization of stellar radiation by V. A. Dombrovskii, and on the behavior of stellar associations in an attempt to solve the problem of whether stellar creation is still taking place. A military development in England during the war led to the unexpected discovery that celestial bodies emit radiation similar to radar. Astronomers have found that a study of this phenomenon elucidates diverse astronomical processes. Soviet scientists have been active in this field, particularly in the study of the radar waves given off by the sun. President A. N. Nesmeianov, in his address before the election of new members to the Academy in October 1953, pointed out that astrophysics and astronomy give significant insight into thermonuclear processes, and this opinion was implemented by the Academy in the election of the leading astrophysicist, B. A. Ambartsumian, as academician, and of three astronomers, M. S. Zverev, E. R. Mustel', and P. P. Parengo, as corresponding members.

PHYSICS

Modern physics has three very active branches—nuclear physics, low temperature physics, and the physics of the solid state. Soviet scientists have been active in all these fields. In the summer of 1954 a five thousand kilowatt

atom power station was put into operation and in the summer of 1955 at the Geneva Conference on the Peaceful Uses of Atomic Energy the details of its construction were revealed and freely discussed. Soviet sources have also stated that many industrial atomic power stations of the same type but of greater power, fifty to one hundred megawatts, are being constructed in Russia. Early in 1955 there appeared in the *Doklady* (Reports) of the USSR Academy of Sciences the first scientific papers describing the results obtained with the 600 million volt proton synchrotron at Moscow. The largest high voltage machines of this type in the United States are of only 400 million electron volts. However, we have at the Brookhaven National Laboratory an accelerator of another type, a cosmotron of 3,600 million electron volts, and at the Radiation Laboratory in California, a bevatron of 6,000 million electron volts. The Soviet scientists are meeting this challenge, for they announced at the Geneva Atomic Energy Conference that they expect to complete a high voltage machine of 10,000 million or 10 billion electron volts. Less dramatic but very extensive and thorough work is being carried out by Soviet scientists in the many subdivisions of nuclear physics: interaction of neutrons with fissionable materials, details of the structure of radioative nuclei, and the effect of radiation of solids. At the October 1953 election the following Soviet atom scientists were elected as academicians: L. A. Artsimovich, I. E. Tamm, Iu. B. Khariton, and A. D. Sakharov.

Soviet investigation on cosmic rays, that penetration radiation of tremendous energy which bathes the earth, from unknown extraterrestrial sources, is of lower caliber than the Soviet work in other nuclear fields, no doubt as a result of the unfortunate claim made some years ago by the Soviet physicists Alikhanov and Alikhanian on the detection in the cosmic radiation of "varitrons," elementary particles of varying mass. This claim was questioned in the West and attacked by a group of Soviet physicists, with a subsequent bitter polemic in the Soviet physics journals. The controversy has never been settled officially, and Soviet cosmic ray research has suffered a lack of prestige.

Extremely low temperatures—that of liquid hydrogen and helium, hundreds of degrees below room temperature—have been of primary scientific interest to scientists of many countries, for at these temperatures many complex properties of solids become simple and susceptible to a formulation in terms of atomic structure. On the other hand, liquids such as helium show unusual and unexpected properties that baffle theoreticians. Furthermore, study of properties of matter at low temperatures leads to the development of efficient and economical methods for production of the cheap oxygen so necessary in the manufacture of gasoline from coal and natural gas and so desirable in metallurgical processes. Soviet physics has had great strength in this field, with world-famous institutes at Kharkov in the Ukraine and in Moscow. Peter L. Kapitsa, one of the leading Soviet physicists, has been prominent in this field both during his researches in England, at Cambridge University, and during his subsequent stay in Moscow. Early this year Kapitsa was named director of the Institute of Physical Problems. Soviet work in the field of low temperature has been characterized by strong theoretical insight, imagination, and experimental elegance.

Electronics is at present undergoing a revolution. Physicists and chemists have found that the fragile radio tubes, photocells, and even television tubes

can be replaced by carefully purified solids. These devices, small in size, mechanically stable, and long of life, are gradually replacing ordinary vacuum tubes. Many everyday electronic devices contain such transistors and photoelements. The solar battery has them as a component. Behind this important technological development there are decades of intensive scientific work in many countries of the world. Russian scientists have made and are still making important contributions, both theoretical and experimental, in the fields of luminescent substances, photoelectric devices, and new electric and magnetic materials. Attention is also paid to the electric and mechanical properties of plastics. Two Soviet physicists were honored by election as academicians in the general field of the solid state: A. P. Aleksandrov in plastics and I. K. Kikoin for his work on magnetic materials. At the same session of the Academy sixteen younger physicists were elected corresponding members of the Academy.

CHEMISTRY

Literally hundreds of papers are published yearly in Russian journals describing the results of chemical research in all branches of the science, inorganic, organic, physical, biochemical, analytical, and colloidal. The nature of the subject of chemistry is such that it requires detailed and painstaking work to support modern chemical industry. In general, Soviet chemistry follows the main lines of the development of the subject in other countries. One can, however, point out the following as notable points of Soviet interest: extensive use of radioactive isotopes for the study of details of chemical reactions, investigation of the chemistry of "man-made elements" such as plutonium, and the use of nuclear radiation for acceleration or activation of chemical processes. The photochemist V. A. Kondrat'ev and the geochemist A. P. Vinogradov were elected academicians in 1953, and both took part in the Geneva Conference on the Peaceful Uses of Atomic Energy. The significant achievements in the field of organic chemistry are the production of new types of plastics, a new synthetic rubber, the manufacture of chemicals and soaps from petroleum, and the synthesis of new insecticides and morphinelike drugs. The chemists who were elected to the Academy for leadership in these fields are B. A. Arbusov, I. L. Knuniants, V. A. Kargin, and I. N. Nazarov.

GEOLOGICAL SCIENCES

Geological studies in the Soviet Union cover the whole gamut of internationally recognized interests. Expeditions have been sent by the Academy to the polar section of the Urals, to Kazakhstan, and to the Altai territory. An investigation has been carried out to determine whether cotton cultivation is possible through irrigating the Tuva Autonomous Region in Middle Asia. Explorations are continually carried out for coal, petroleum, iron, and rare metals. A very extensive study of the northwestern Pacific Ocean has disclosed the existence of a suboceanic mountain range extending from the Hawaiian Islands northward to the Komandorskii Islands and dividing the northern part of the Pacific into two basins. Continued study is devoted to the Russian perennial headache—the permanently frozen lands of northern Siberia. During the October 1953 session of the Academy, ten prominent geologists, geophysicists, and geographers were elected academicians. In addition twenty-three other geologists were added to the Academy as corresponding members.

BIOLOGY

Biology, the science that suffered so deeply from the genetics controversy, has turned during the last few years to biochemistry. Radioactive tracer atoms are being used to study animals, the chemical processes of material exchange in the brain tissues, liver, and muscles (in animals and in plants) and the formation of sugars and nicotine. Photosynthesis, the process of converting abundant carbon dioxide and water into starch by means of the solar radiation, is investigated by isotopic atom methods. The solution of this "key problem" will permit the synthetic production of food. Nuclear radiation is applied to the cold sterilization of food.

Zoologists continue their publications on the fauna of the USSR, and the botanists are making similar studies of the flora. The biology section of the Academy has also dealt with practical problems. It has organized the production of the antianemia vitamin B_{12} and used radioactive phosphorus to investigate the uptake of phosphorus fertilizer from the soil by plants. The latter study permits determination of the best phosphorus compound to use as a fertilizer and the best time for phosphorus application.

The science of genetics is dead in the Soviet Union. Publications on what Western science would call genetics are nonexistent. The last few years have seen, however, the decline of the influence of Lysenko, the prophet of Soviet Marxist genetics. His voice is not heard in scientific pronouncements, though he is still active administratively in biological sections of the Academy and dominates the Soviet Agricultural Academy. The wounds of the genetics controversy have not healed. Recently there has been an attack on Lysenko's ideas by several Soviet botanists and a very polemical defense by one of his supporters. The presidium of the Academy took the biology section to task for permitting the controversy to go on.

The following biologists were elected to the Academy: A. L. Kursanov, in plant physiology, V. N. Shaposhnikov in industrial bacteriology, V. A. Engel'gardt in biochemistry, and I. V. Turin in soil science.

ENGINEERING SCIENCES

The field of engineering has shown marked activity during the last few years. Development of an atomic energy power plant, the production of a high octane gasoline, subterranean gasification of coal, study of gas dynamics, and various phases of electronics received particular attention. Soviet engineers and scientists have been particularly intrigued with the possibility of automatic control of production in factories.

At the October 1953 meeting, the following leading Soviet engineers were elected to membership in the Academy: the airplane designer A. N. Tupolev, the motor and jet engineers V. Ia. Klimov and L. I. Sedov, the famous hydroelectric power specialist S. Ia. Zhuk, the machine designer V. I. Dikushin, the marine architect Iu. A. Shimanskii, the metallurgists M. M. Karnaukov and G. V. Kurdiumov, the electronic engineers M. P. Kostenko, V. A. Kotel'nikov, A. N. Shchukin, and S. A. Vekshinskii; and the combustion engineers B. S. Stechkin and M. A. Mikheev. In addition forty-four engineers were elected as corresponding members.

INTERNATIONAL CONTACTS

A recent important aspect of Soviet science is the increase in the international contacts of Russian scientists. Before 1952 the presence of a Soviet delegation at an international scientific conference was a rare event. Since that time there has been a marked rise

in the number of delegations attending foreign scientific meetings: fourteen in 1952, thirty in 1953, and sixty-five in 1954. In August 1955 the Soviet Union sent to the Conference on Peaceful Uses of Atomic Energy at Geneva a delegation of over one hundred scientists, engineers, and technicians. The Soviet representatives were of high technical ability, presented 74 papers on various phases of atomic energy (the United States presented 166, the United Kingdom 64, and France 27 papers) and participated freely in scientific discussions. The Soviet exhibit on atomic energy, at the same time, was impressive. In the last three years the number of visits to the Soviet Union by foreign scientists has also been significant. In 1952 ten groups, in 1953 fourteen, and in 1954 eight groups were shown Soviet institutes and laboratories. In 1955 there has been a continuing stream of groups from various countries visiting the Academy institutions. Representatives of seventeen countries attended the opening of the reconstructed Pulkovo observatory. On July 1 to 5, 1955, just before the United Nations Conference in Geneva, the Soviet Academy held its own conference on the Peaceful Uses of Atomic Energy, at which twenty-one papers were presented on nuclear physics, eighteen on chemistry, twenty on biology, and twenty-one on various applications of atomic energy.

International exchanges of journals and books, curtailed three years ago by the Soviets, is again widespread, and in 1954 the USSR Academy of Sciences sent abroad 350,000 books.

SCIENTIFIC AND TECHNOLOGICAL PERSONNEL

The training of scientific personnel represents a long-time investment. In modern society equipment can be built in several weeks, laboratories in months. Training of scientists and engineers requires years. The number of such men in a given country is determined not only by the availability of schools and teachers but also by the desire of youth to enter these professions. Social mores, family background, and financial remuneration all play a role in the youth's decision. Soviet leaders have publicly recognized the importance of science for the development of the security of their country and for its military and economic potential. Russian scientists and engineers enjoy the full care of their government and the respect and admiration of the populace. They are well paid. At the same time the Soviet educational system is geared for training in science—in the primary schools, in secondary education, and particularly in universities and graduate instruction.

In the four-year primary school, normally entered at seven, the Soviet youngsters spend 30 per cent of their time on science. The secondary school system in the USSR consists of a general secondary school and vocational training schools. The general secondary school requires three or six years and the same curriculum is given to *all* students. Science teaching constitutes 46 per cent of the instruction. In 1953 there were 4,600,000 pupils in the USSR secondary schools, and 700,000 of them graduated that year. Vocational schools are either short courses for apprentices given in factories or three to four year *tekhnikum*'s which train technicians or master craftsmen. In 1953 these schools graduated 50,000 technicians. There is no analogue to the *tekhnikum* in the United States educational system. In 1953 the American secondary school system had 7,266,000 students, many of whom received a very inadequate training in science.

The Soviet higher educational system (VUZ) consists of thirty-three universities, which give general education

TABLE 1.—NUMBER OF GRADUATES FROM SOVIET INSTITUTIONS OF HIGHER EDUCATION, BY TYPE OF INSTITUTION, 1952–55

(*In thousands*)

TYPE OF INSTITUTION	1952	1953	1954	1955
Engineering	30	40	53	63
Agriculture	15	17	18	21
Health	17	16	24	25
Economics	8	9	10	11
Universities	18	18	17	18
Teacher training and art	69	65	53	47
Total	157	165	175	185

and produce most of the scientists, and some eight hundred specialized schools, for medicine (74), teacher training (320), engineering (154), agriculture (61), arts (55), economics (38), veterinary science (38), and so forth. Table 1 gives the number of graduates of each type of institution in units of a thousand.

The total number of graduates from higher educational institutions is lower in the USSR than in the United States, for in 1952 there were 333,000 new college graduates in the United States, compared to a figure of 157,000 in the USSR; in 1955 the figures are 281,000 and 185,000, respectively. However, it must be pointed out that many of the graduates of American colleges receive not professional training, but a liberal education, while all graduates from the Soviet higher educational institutions are given training in engineering, teaching, science, and so forth. A particularly important trend must be noted in the number of graduates in engineering: in the Soviet Union their number rose from 30,000 in 1952 to 63,000 in 1955, while in the United States it *decreased* from 30,000 in 1952 to 23,000 in 1955. In agriculture the number of graduates in 1952 was the same in both countries—15,000—while in 1955 the number declined in the United States to 12,000 and increased in the Soviet Union to 21,000. In the health sciences there has been a marked rise in the USSR over the four-year period, to be contrasted with the constant number of 28,000 graduates in the United States.

The importance of scientific training in higher education in the Soviet Union was underlined by the opening on September 1, 1953, of the new building of Moscow University on the outskirts of the capital. The main, thirty-two story building has a volume of 48.3 million cubic feet and contains the geology-geography departments, the science library, the mechanics department, the mathematics department, an auditorium seating 1,500 students, and the administrative and social rooms for the University. The adjoining buildings, each of a capacity of 9.4 million cubic feet, house the physics and chemistry departments. In all, the University consists of a complex of twenty-seven basic buildings and ten service buildings. These contain 1,693 laboratories, 21 auditoriums with seating capacities of 160 to 600, and 141 recitation rooms. There are 6,000 rooms available as living quarters for undergraduate and graduate students and 184 apartments for instructors and professors. The University has a library of 1,200,000 volumes. A faculty of 2,300 (of whom 30 are academicians, 59 corresponding members, 486 doctors, 846 *Kandidats*,

TABLE 2—NUMBER OF PH.D. DEGREES GRANTED IN U. S. AND KANDIDAT DEGREES IN USSR, 1952–55

(In thousands)

DEGREES	1952	1953	1954	1955
United States Ph.D.	3.8	4.0	4.2	4.4
Soviet *Kandidat*	5.9	7.3	7.8	8.4

407 professors, and 498 docents) teach 18,200 university students and 1,600 aspirants (graduate students). This impressive complex of buildings, which dominates the Moscow skyline, was built solely for the training of scientists.

GRADUATE WORK

Graduate work in the Soviet Union leads to two degrees, that of the *Kandidat* and that of Doctor of Science. The *Kandidat* degree is of a slightly lower standard than the American Ph.D. but definitely more advanced than our M.Sci. The requirements for the *Kandidat* degree are completion of a series of courses in an institution of higher education, successful solution of a research problem, and presentation and public defense of a *Kandidat* dissertation. Table 2 gives a comparison of the number of *Kandidat* degrees and Ph.D. degrees given in recent years in units of a thousand.

The doctor's degree in the Soviet Union is different from that given in Western Europe and the United States. In the Soviet Union the Doctor of Science is awarded for mature, independent research which normally requires a maximum of four years' work. It is formalized in a dissertation and is subjected to a public examination. Before this degree is awarded, the dissertation must also be reviewed by a board of experts designated by the Supreme Accrediting Committee (VKA), which finally grants the degree in the name of the government. It thus represents Soviet Union recognition of a mature scientist. About five hundred Doctor of Science degrees are granted annually.

The numbers of personnel professionally trained in science in the Soviet Union and the United States are given in Tables 3 and 4; the figures there show definitely that the pool of scientists and engineers in the Soviet Union is comparable to that in the United States. Scientists employed in research and teaching in the USSR number 165,000; in the United States, 250,000.

SCIENTIFIC PUBLICATIONS

An important feature of science is the dissemination of scientific information. It is through scientific journals that scientists keep abreast of recent developments not only in foreign countries but also in their own country. Information so obtained is used either to modify their research programs to avoid duplication or to stimulate approaches new to research. Soviet science has not neglected this feature of scientific activity. The publication program of the Academy is prodigious. Fifty journals appear weekly, monthly, or bimonthly, ranging from *Priroda* ("Nature"), a monthly popular science magazine, and the *Doklady* ("Reports") of the USSR Academy of Sciences, which give four-page communications on the latest scientific developments in the Soviet Union, to numerous journals devoted to specific sciences. In physics alone over five hundred articles are published every year.

TABLE 3—NUMBER OF UNIVERSITY GRADUATES EMPLOYED IN SCIENCE, USSR AND U. S.

	USSR	U. S.
Living university graduates, all fields	2,680,000	6,040,000
Graduates employed in science	1,140,000	1,150,000
Physical sciences and engineering	625,000	545,000
Health	310,000	445,000
Agriculture	205,000	160,000

TABLE 4—NUMBER OF INDIVIDUALS HOLDING ADVANCED DEGREES IN SCIENCE IN USSR (*Kandidat*) AND U. S. (PH.D.)

	USSR	U. S.
All scientific fields	64,000	51,000
Physical sciences	33,000	32,000
Health	19,000	8,000
Agriculture	12,000	11,000

Soviet science, isolated as it is from the Western world where most of the discoveries are made, uses three methods for following scientific developments in the West: review journals, translations of foreign treatises, and a journal of abstracts. Review journals are periodicals which give a detailed survey of subjects of current scientific interest; in the Soviet Union there are separate journals of this type for mathematics, physics, chemistry, and biology. The articles in them are well written and are ideally suited to keeping a reader informed on developments in a critical scientific field. It has also been the policy of the Academy during the last three decades to translate and publish in the Soviet Union all important English, American, French, and German scientific treatises. The Soviet Union's own books on the physical sciences are excellent—well compiled and on a par with their Western counterparts. They are published in large numbers and sell for a very low price.

The classification, systematization, and indexing of the tremendous number of scientific articles are carried out by the journals of abstracts. These periodicals, of which the most extensive is the *American Chemical Abstracts,* condense articles to short abstracts, which are then printed in sections arranged by subject matter and thoroughly indexed according to subject, formula, and author. Availability of such abstract journals is indispensable for scientific work, for they minimize the possibility of duplication and guide the research worker through the forest of scientific facts. In chemistry there are about a million compounds; by using an abstract journal and its indices a research worker can compile a bibliography on any one of them in a matter of several minutes. Publishing an abstract journal is a very expensive enterprise, carried out for chemistry and biology in the United States, and for physics in England.

Two years ago the USSR Academy of Sciences embarked on the publication of an abstract journal *Referaty,* which will cover *all* fields of science. In 1953 seven branches of science were reviewed in three thousand manuscript pages. The journals scanned for material were

both Soviet and foreign. In 1954 the number of manuscript pages rose to 18,574, containing 102,000 individual abstracts—the equivalent of thirty-five volumes of an encyclopedia. In 1955 the Academy planned to expand the abstract journal to 25,000 manuscript pages. The abstracts are of high quality and testify to the large number of people in the Soviet Union who have received an advanced education in science. A special Institute of Scientific Information has been created for the purpose of organizing the distribution of scientific knowledge in the country. The *Referaty* may be the most ambitious and comprehensive scheme in existence for extracting the essence of scientific results, sorting it according to subject, and making an index to the information so obtained.

IDEOLOGY AND SOVIET SCIENCE

Before the advent of totalitarianism there were no ideological distinctions in science. The laws of nature were invariable, unaffected by changing national scene. The methods of science were the same throughout the world, the validity of experimental fact being based on the reproducibility of experimental results by any scientist skilled in the art of experimentation. The usefulness of generalization and the fruitfulness of theories were subjected to free criticism untarnished by attacks on personalities and by appeals to authority. During the period of totalitarian regimes, and particularly after World War II, a new type of science arose—a "Marxist science." In this form of "science," conformity with the "dialectic materialism of Marxism" was established as the new and crucial criterion of truth. The struggle in the USSR between Soviet Marxist science and supporters of Western bourgeois science culminated in 1948 in the famous genetics controversy. In this heated polemic as to whether effects caused by environment can be passed on to progeny, scientific reasoning was abandoned and scientific decision was reached not by scientists but by an ex cathedra pronouncement of the Central Committee of the Communist Party. In forcing their decision on the genetics discussion the Central Committee interfered with due process for establishing scientific truths. The result was the death of genetics as a science in the Soviet Union and the disappearance from active scientific work of a number of prominent Soviet scholars. Furthermore, the decision of the Central Committee had its repercussions in other branches of Soviet science. In chemistry, a number of scientists were taken to task for espousing the "ideological resonance theory of the structure of organic molecules"; in physics the controversy centered on relativity, quantum mechanics, indeterminancy principle, definition of force; in physiology on the methods of Pavlov physiology. Many public discussions were held on these subjects; many scientists were publicly rebuked for what appeared to us in the West a trivial deviation from a weakly delineated party line.

In the last three years a calm has settled over Soviet science. No violent polemics shake its structure. Although there has been no public renunciation of the views of Lysenko's Marxist genetics, the Academy does not appeal to the principles of Marxism for the development of Russian science.

CONCLUSION

An attempt has been made in this paper to present some of the salient features of the large and complicated national activity encompassed by the phrase "Soviet science." As the world moves into the nuclear age, it should be apparent to all who consider the Soviet scene that Soviet science represents a tremendous potential for scientific and technological progress, that some of this potential has been translated into success, and that the Soviet leadership is making a conscious, well-planned attempt to assume the scientific leadership of the world.

John Turkevich, Ph.D., Princeton, New Jersey, is Eugene Higgins Professor of Chemistry, Princeton University; lecturer on government and science, Woodrow Wilson School of Public and International Affairs; and consultant, United States Atomic Energy Commission, National Science Foundation, Brookhaven National Laboratory.

Soviet Policies in Eastern Europe

By Paul E. Zinner

THE policies of the new Soviet leadership toward the countries of Eastern and Southeastern Europe—including Finland, the "People's Democracies," Yugoslavia, Greece, and Turkey—have to a large measure reflected the changing climate in East-West relations. To be sure, not all the countries have been equally affected by modifications and adjustments in Soviet policies, nor have they responded in the same way to Soviet approaches. In general, however, the Kremlin has appeared to be intent on easing tensions, international or internal as the case may be, in an area in which it has long maintained a special interest and to be seeking to further its long-range objectives through this new approach.

Wooing of Yugoslavia

Of the policies initiated by the Kremlin, the gradual but persistent rapprochement with Yugoslavia has been by all odds the most spectacular and significant.

In March 1953, when Stalin died, hostility between the Cominform bloc (including the Soviet Union and its East European minions) and Yugoslavia was at a high pitch. Frequent border skirmishes (increasing in intensity as well as in their rate of incidence throughout 1952) and vitriolic propaganda exchanges marked a relentless war of nerves on the part of the Cominform, to which Yugoslavia responded in kind.

Soviet advances

Less than two months later the Soviet Union made an opening gambit to reduce tensions. The May Day slogans of the USSR, released well in advance of the actual event itself, for the first time in five years failed to mention the "heroic struggles" of the Yugoslav people against Tito and his capitalist masters. On April 29 Molotov received the Yugoslav chargé d'affaires. At whose request the audience was granted is not known. But the subject under consideration—the re-establishment of normal diplomatic ties—suggests that it was the Russians who took the initiative. In any event, in May a new Soviet chargé was appointed to Belgrade. In July an exchange of ambassadors was agreed on and Vasilii Val'kov was immediately dispatched to Yugoslavia. The Yugoslavs, moving more circumspectly, waited until September before sending their appointee, Dobrivoje Vidić, to his post in Moscow. With this move, the first phase in the re-establishment of normal diplomatic relations was to all intents and purposes completed.

Meanwhile the situation along Yugoslavia's frontiers had shown a definite improvement. The frequency of incidents decreased and before the year was out a series of agreements designed to forestall border clashes and regulate matters of common interest had been negotiated with Bulgaria, Hungary, and Albania, setting the stage for the resumption of Belgrade's diplomatic ties with these countries. Yugoslavia could now feel reasonably secure from armed harassment on the part of the Cominform countries. It was, however, still subject to hostile propaganda and it remained economically isolated from its former trading partners of the Soviet

bloc. Additional progress toward closer and more amicable contacts was registered only in the second half of 1954.

In September 1954 the conclusion of a barter agreement with Russia marked the end of the Cominform's economic blockade. At about the same time the Soviet bloc ceased jamming Yugoslav broadcasts to Eastern Europe and halted the operations of Radio Free Yugoslavia and of other anti-Tito propaganda media.

A Russian campaign to erase the remaining traces of hostility and "normalize" relations now appeared to be in full swing. It received added and dramatic impetus in October, coincidentally with the return of Khrushchev, Bulganin, and Mikoyan from their visit to Peking, which was followed by a major reappraisal of Soviet policies.

The tenth anniversary of the liberation of Belgrade from the Germans was noted with unusual warmth in Soviet propaganda media, which, in striking contrast with past utterances, acclaimed the role played by the Yugoslavs in freeing themselves, recalled the historic friendship of the Yugoslav and Soviet peoples, and paid homage to the "best sons" of both countries, who had shed their blood jointly on Yugoslav soil. Of equal if not greater significance was the acquiescence by the USSR in the settlement of the Trieste issue on terms which the Russians had in the past consistently denounced.

On November 6, the anniversary of the Bolshevik revolution, Maxim Saburov, the official speaker for the day, went out of his way to urge "complete normalization" of relations between Moscow and Belgrade and expressed the hope that Russian efforts to renew "ancient bonds of friendship" would be duly reciprocated by Yugoslavia. He intimated that recent quarrels between the two nations had only benefited the "enemies of peace," who are ipso facto the enemies of both Russia and Yugoslavia.

Saburov's bold overture was followed up by other extraordinary approaches, many of them within the context of social occasions which began to assume importance as a vehicle of Soviet diplomacy. The Yugoslav ambassador, Vidić, found himself buttonholed by Khrushchev and Malenkov, who engaged him in lengthy and animated conversations. On November 28, at a reception given by the Yugoslav Embassy, Khrushchev, Malenkov, and Molotov toasted the health of "Comrade Tito."[1] Khrushchev was also reported to have made what seemed then an almost unbelievable statement to the effect that, since both Yugoslavia and the Soviet Union were guided by Marxist-Leninist ideology, there was no reason why differences in view between them should persist.

If this represented a complete *volte-face* in the Soviet position on the ideological aspects of the controversy with Tito, it bespoke continuing preoccupation with ideological considerations as they affected the regulation of relations with Yugoslavia and foreshadowed the tack the Russians would henceforth take on this issue.

Yugoslavian resistance

The ostentatious display of amiability by the Soviet leaders did not bear fruit immediately. While they were apparently ready to let bygones be bygones and to resume relations where they left off in 1948, the Yugoslavs showed a justifiable wariness and insisted on a clarification of the terms of rapprochement. As a result, months of hard bargaining ensued, during which the Russians found themselves cast in the role of ardent pursuers, whereas Tito ex-

[1] See G. L., "The Russo-Yugoslav Detente," *The World Today*, Vol. 11, No. 1 (January 1955), pp. 10–19.

ploited to the hilt his position as the aggrieved party. While most of the discussions were cloaked in secrecy, an occasional public statement by one side or the other afforded some insight into the issues that marred agreement.

Although the Russians showed considerable forbearance in catering to Tito's sensitivities, they could not refrain from implying (probably for domestic propaganda purposes) that a rapprochement had been made possible, at least in part, by certain changes in Yugoslavia's policies, changes which were tantamount to an admission of "past errors." Tito most emphatically rejected all such insinuations. He denied that Yugoslavia had altered its policies after Stalin's death and disclaimed the need for any change, since, in his view, no errors had been committed by his party.[2] The blame for the rift and its unpleasant consequences, he asserted, rested squarely on the shoulders of the USSR and demanded a full apology as a precondition to the re-establishing of "normal" relations. This the Russians were apparently prepared to make.

The ideological issue

A more vexing problem was raised by Moscow's obvious intention to put "normalization" on the basis of party ideology. For it, interpretations and explanations of the past were not the principal point; rather, the practical circumstances of Yugoslavia's future relations not only with the Soviet bloc but with the West were at stake.

Whatever the underlying reasons for the Soviet approach may have been, and they were admittedly not easy to fathom, Tito steadfastly refused to accept an ideological platform as a suitable basis for rapprochement. He could not disregard the probable repercussions which a reconciliation between his party and his one-time Cominform comrades within a Marxist-Leninist framework might have on his relations with the West. If his new-found Western friends abandoned him or came to distrust him intensely, he would be deprived of the backing that imparted a large measure of strength to his bargaining position with the Russians. To avoid alarming his Western friends and thus to preserve his maneuvering ability, Tito reiterated time and again that a return to the type of Soviet-Yugoslav relations that had existed prior to 1948 was unthinkable. Instead, he suggested a formula for "active coexistence" between sovereign states with different social systems, on the basis of mutual respect and noninterference in one another's internal affairs. He foresaw fruitful cultural and economic exchange with the Soviet Union, but carefully eschewed the question of party ties.

To placate Tito's fears the Russians assured him that the restoration of normal relations with the Soviet Union "in no way implies, and cannot imply, a deterioration of Yugoslavia's relations with other countries" and repeated Soviet willingness to improve relations "along the lines of state policy." But the final emphasis was on ideological matters, from which the Russians refused to depart.[3]

Belgrade meeting

Despite a standoff on the ideological issue, a sufficient area of agreement seemed to have been reached at some time during the spring of 1955 to permit arranging a meeting between the Yugoslav and Soviet leaders. A communiqué, announcing that the two governments, inspired by their common desire "for a further improvement of relations . . .

[2] See "Yugoslavia's Foreign Policy," *Review of International Affairs* (Belgrade), Vol. 5, No. 119 (March 15, 1955), p. 5.

[3] See R. L., "Yugoslavia Between Independence and Orthodoxy," *The World Today*, Vol. 11, No. 8 (August 1955), pp. 322–34.

and for the consolidation of peace" had agreed to arrange a meeting "at the highest level," was dramatically issued on May 14. On that same day the Soviet government and its satellites signed the Warsaw Pact establishing a unified military command for the Soviet bloc in Europe.

Belgrade was announced as the place of meeting—clearly a victory for Tito, for it cast the affair in the light of a pilgrimage of penance on the part of the Soviet leaders.

The meetings opened on May 27, 1955. The Soviet delegation, headed by Khrushchev, also included Bulganin, Mikoyan, Shepilov, Kumykin (a Deputy Minister of Foreign Trade), and Gromyko. Molotov, who had been directly involved in the conflict of 1948, was ostentatiously omitted. The fact that Khrushchev led the delegation and that it also included Shepilov, the editor of *Pravda*, indicated an intention to raise party issues. Indeed, Khrushchev's opening speech, delivered upon arrival at Zemun airport, left no doubt of this intent. It contained a forceful appeal for the resumption of full party relations on the basis of Marxism-Leninism.

This appeal was coupled with a most abject but ridiculous apology for the Soviet-Yugoslav rift. It laid all the blame on the machinations of "enemies of the people, Beria, Abakumov and others who have been unmasked" and pretended that, otherwise, no differences at all had existed between the two parties. Even so, it failed to get the negotiations off to a propitious beginning. Nevertheless, after six days of discussions, interrupted by sightseeing and relaxation, a document suggesting a broad identity of views on major issues of international relations was produced. The joint statement set forth the principles that were to govern the "mutual relations" of the two countries in terms eminently satisfactory to the Yugoslavs, emphasizing the "interstate" nature of these relations and putting economic and cultural co-operation ahead of other considerations. Khrushchev's bid for an exclusive party relationship was apparently unsuccessful. The joint declaration merely took note, as the last point of the agreement, that "the two Governments have agreed to assist and facilitate co-operation among the social organizations of the two countries through the establishing of contacts, the exchange of Socialist experiences and a free exchange of opinions."[4]

This did not mean that the Russians had given up pursuing party objectives. While they hailed with great satisfaction the improvement in relations between the USSR and Yugoslavia as a "new contribution to the easing of international tension and the strengthening of peace," they also continued to plump for the "re-establishment of contact and a rapprochement between the C.P.S.U. [Communist Party of the Soviet Union] and the Union of Communists of Yugoslavia on the basis of Marxist-Leninist principles,"[5] implying that along this line much was left to be done.

Economic relations

One of the results of the Belgrade meeting was a sharp increase in the number of "contacts" between Yugoslavia and the Soviet Union. These included reciprocal visits by parliamentary delegations, technical groups, teachers and journalists, a lengthy visit in Moscow of a Yugoslav economic mission and a surprising sojourn of Soviet Deputy Premier Mikoyan, a member of

[4] "Declaration of the Governments of the FPRY [Federal People's Republic of Yugoslavia] and the USSR," *Review of International Affairs* (Belgrade), Vol. 6, No. 124 (June 1, 1955), pp. 1, 2.

[5] *Pravda*, July 16, 1955; translated in *Current Digest of the Soviet Press*, Vol. 7, No. 26 (August 10, 1955), p. 3.

the original Khrushchev delegation, in Yugoslavia, ostensibly to take his annual vacation there. To date these contacts have yielded one major tangible agreement, regulating the economic relations between the two countries. An agreement signed in Moscow on September 1, 1955, calls for (1) an increase in annual trade turnover from nearly 40 million dollars to 70 million dollars in each direction over the next three years; (2) a Russian credit of 54 million dollars for the purchase of Russian raw materials, as well as additional credits for certain Yugoslav industrial projects, and (3) a Russian loan to Yugoslavia, in foreign currency or gold, of 30 million dollars, both the loan and credit to be repaid over ten years at 2 per cent interest. What is more significant, however, the Russians offered to assist the Yugoslavs in the development of nuclear energy facilities for peaceful purposes.[6] The Yugoslavs in turn, by agreeing to supply Russia with bauxite, lead, and other raw materials, have departed from their voluntary acceptance of the Western ban on the sale of strategic materials to the Soviet bloc.

The achievements of the Soviet's new line toward Yugoslavia are at this stage still difficult to assess. Rather substantial progress in restoring clogged trade channels does not necessarily represent a Soviet advance. On the contrary, it is likely to be of advantage to the Yugoslavs, who were severely pinched by the Cominform's economic blockade; they have always felt uneasy about being completely dependent on Western economic and financial assistance and find themselves currently in a tight economic situation.

A relaxation in tension, though not necessarily an unambiguous blessing, has so far benefited the Yugoslavs. It has afforded them a much needed breathing spell and has enhanced their prestige. Yet any rapprochement with the East could easily impair relations with the West, where Tito is still regarded with suspicion by many people. While no serious deterioration in these relations has taken place, dealings between Yugoslavia and the Western countries subsequent to the Belgrade meeting have been marked by a few jittery episodes. The Balkan Alliance, in turn, which promised to develop into an effective anchor of NATO's extended lines in an area of traditional military weakness, has in the meantime seriously disintegrated. The recession of an imminent threat of war has substantially cooled Tito's enthusiasm for this undertaking, which, by virtue of its close tie-in with the North Atlantic Treaty Organization, would, in fact, have been incompatible with Yugoslavia's avowed desire to eschew military blocs.

[6] See *Current Digest of the Soviet Press*, Vol. 7, No. 35 (October 12, 1955), p. 11.

Orthodoxy or independence?

Internally, Tito has stood his ground well. He has mastered what in 1954 appeared to be an incipient ground swell of sentiment in favor of a return to "orthodoxy" and has done so without undermining the solidarity of the Communist League.

Nevertheless, it would be unwise to overlook the motives underlying Soviet blandishments or to underestimate their potential effects on Yugoslavia's foreign relations and its internal political balance. The most disturbing aspect of the Kremlin's attitude has been the dogged insistence on casting the problem of rapprochement in ideological terms, despite the Yugoslavs' vigorous opposition to this. This does not mean that Soviet policy makers, given their present mood, may not be content to accept for what it is worth a *détente* or normalization of relations on an "interstate" basis, as a milestone toward real co-operation, or that they may not be prepared to show considerable patience in their dealings with Tito. What it tends to reveal is that the Kremlin's ultimate objective is not simply to normalize its relations but to reabsorb Yugoslavia in the Communist camp. To be sure, the terms on which Tito is now being lured back are those which were denied him in 1948.

This represents real progress in the Soviet position, which was not necessarily achieved without difficulty. In the meantime, however, Tito's position has also evolved. In 1948 he would have been glad to be granted autonomy within the Communist camp. He now seeks independence from it. Although he claims to be a Communist, he sees himself in a role more closely resembling Nehru than Mao. The Russians, for their part, are making it abundantly clear that they do not regard Yugoslavia—a Communist country—in the same light as, say, Finland or Austria or India, non-Communist countries with which the Soviet Union can develop a set of relations which can set a broadly applicable pattern of coexistence.

As matters now stand, the Russians face an uphill struggle in their bid for party-ideological ties. But their underlying hope may be that the liquidation of the conflict and the resumption of a variety of contacts will initiate a process inside the Yugoslav Communist League which will gradually force its leaders to return to a policy of Communist solidarity even if this is not their intention now.

The struggle between Tito and the Kremlin is far from over. It has been tamed to a tug of war, but the stakes are still very high. The supreme test determining the viability of Tito's communism still lies ahead. Until then the Yugoslav regime will walk a precarious tightrope between independence and orthodoxy, and the Russians can be relied on to try to bring it down on their side.

THE PEOPLE'S DEMOCRACIES

The changing climate of relations between the Soviet Union and Yugoslavia has given rise to speculation that the status of the satellites might also be modified. The Kremlin's attitude toward its East European minions has, in fact, undergone certain modifications. These were most clearly reflected in a *Pravda* editorial of July 1955:

> Relations between the Soviet Union and the people's democracies are built upon the granite foundation of socialist internationalism. The Communist Party has always willingly shared and still shares its wealth of experience with all fraternal parties, and at the same time Soviet Communists are called on to study assiduously and imitate all that is advanced to be found in the people's democracies in the sphere of management of the national economy, achievements of science, technology and so on.[7]

That this statement was made in conjunction with an appraisal of Soviet-Yugoslav relations hardly mattered. It implied a greater tolerance on the part of the Russians of institutional differences and of variations in the "rate of socialist transformation" and the acceptance of a degree of give-and-take between Soviet and satellite Communists. It was a far cry from the demands of strict subordination and the imposition of a rigid pattern of uniformity on the satellites, but its practical consequences remained to be tested.

This is not to say that the actual relations between the Soviet Union and the satellite countries have not undergone some evolution since Stalin's death. The lighter touch with which the new leadership in the Kremlin ruled in Russia made itself felt throughout the satellites as well. The more vulgar and of-

[7] *Loc. cit.*, note 5 *supra*.

fensive features of Stalinist rule gradually disappeared, and the new rulers showed both flexibility and adaptability in meeting local situations. Internal tensions, which were very high in all the People's Democracies, were reduced, and an impression of greater freedom was created. None of this, however, impaired the substance of Soviet control. The People's Democracies remained as dependent on Moscow as they had been under Stalin's rule.

Conditions before Stalin's death

When Stalin died in March 1953, all Communist regimes showed the strain of the pace at which they had been driven for some time: the machinery of state (and of the Communist party) was cracking, and well it might have. Their evolution since 1948—a sharp turning point in their history—had taken them far afield from what the vast majority of the people and perhaps even many Communists had expected.

Although the ruthlessness of the Communist parties, backed by Soviet power, in annihilating political opposition and capturing a monopoly of power left few illusions, the notion of "national exclusiveness," which the Communists themselves had skillfully fostered prior to 1948, had wide currency. Its implication was that each country would evolve toward "socialism" in its own particular way, suited to local conditions and requirements, and that in this manner at least some of the more brutal aspects of the history of the Soviet Russian regime would be avoided.

In the autumn of 1948, however, shortly after Tito's expulsion from the Cominform and not long after Czechoslovakia had been firmly bolted in place in the Soviet sphere, a new doctrine of "people's democracy" was announced in the Kremlin. It made short shrift of any notion that the pattern of development of the satellites could vary from that of the Soviet Union. It held that the preservation of differences would be "dangerous dogmatism . . . and criminal stupidity . . . leading to the denial and overturn of the very substance of people's democracy and restoration of capitalism." Conversely it was asserted that "ever greater utilization of Soviet experiences and thus ever closer approximation to the Soviet example . . . was . . . one of the main laws of development of the People's Democracies." [8]

The stultifying impact of this doctrine on national individuality hardly needs explaining. In practice, and it was rigidly implemented, it meant transforming the East European countries in the image of the Soviet Union, destroying their indigenous political, social, and economic institutions, replacing them with Soviet prototypes, and extirpating traditional values, substituting in their place new concepts extolling the superiority of Soviet values and of "Soviet man."

As part of the Soviet bloc, the East European countries were forced to submerge their special interests in those of the whole, as determined by the Soviet leadership. Local needs went unattended in favor of the industrial and military power requirement of the "bloc." The forced pace of industrialization, with emphasis on producer goods, in conjunction with the other burdens of "socialist transformation," imposed hardships not only on the peoples but also on the local Communist parties, whose capacities to cope with the manifold tasks for which they were responsible were heavily overloaded. For one thing, "purifying" the strain of the leadership, a cardinal principle of Communist practice, had cut deeply into the none-too-numerous leading cadres of the various parties. For another, the performance of lower echelons of the army

[8] *Rudé Právo* (Prague), January 22, 1953.

of officials, on whom the success or failure of policy ultimately hinges, left much to be desired.

Hastily recruited after World War II, the overwhelming majority of Communist functionaries had scant ideological training and no solid allegiance to the party's cause. Their motives for joining and serving were often questionable. There were some who grossly abused their positions of power and unduly alienated the people under them without commensurately advancing Communist aims. A far greater number of functionaries, whose unpleasant task it was to transmit the party's wishes to the people and to extract compliance at the grass-root level, were reluctant to expose themselves. They succumbed in varying degrees to pressures "from below," and performed inefficiently. Forging a smoothly working apparatus under these conditions was not easy.

At the turn of the year, in 1953, Czechoslovakia, the last country to come under full Communist domination and the slowest to adapt itself to the expected norm of behavior, was just emerging from the convulsions of the bloodiest Communist purge trials since the 1930's. The Slánský trial in November 1952, at which twelve of the fourteen defendants were condemned to death, marked the culmination of a year of widespread purges in the party and a simultaneous tightening of the vise around the people. If Czechoslovakia seemed in the throes of the most serious crisis, the other countries were not appreciably better off. At this point Stalin died.

Early reactions

The demise of the old despot did not result in immediate policy shifts. The leaders throughout the Soviet orbit remained attuned to the vibrations emanating from Moscow in the wake of the transfer of power. For example, an amnesty in the USSR was followed by similar measures in the satellites. Czechoslovakia, however, continued the comprehensive program of tightening which had been launched in the fall of 1951. In April 1953 it thoroughly overhauled its educational system, bringing it in line with Soviet practice, and on June 1 the government decreed a currency reform, the most severe of all such reforms which had been carried out in the Soviet sphere since 1945. At one stroke, savings were wiped out and purchasing power was sharply curtailed. The reform constituted the most drastic step yet taken by the Czech authorities to compel the workers to work harder and to remedy a chronically unhealthy balance between labor productivity and production costs. The other countries, meanwhile, seemed to be traveling more on the momentum of their previous efforts than under new steam.

The embittered reaction of the Czech workers to the currency reform sparked the first and, to date, the most serious public demonstration against any of the Communist regimes. (The East German riots are exempted from this category because of the special status of East Germany behind the Iron Curtain.) For the better part of a day, the enraged workers of the famous Škoda Works (now Lenin Works) at Plzeň held the local authorities at bay.

This unprecedented example of defiance, combined with widespread grumbling elsewhere, was optimistically interpreted in the West as evidence of the precarious hold of the Communist regimes. The modification of harsh economic and political policies throughout the Soviet sphere which followed shortly after the riots, in turn, was greeted as an unmistakable sign that the Communist rulers were acting under the necessity of making concessions to their peoples. The difficulties of the Communist regimes in implementing the new policies

in 1953 and 1954 were read as indications of growing popular initiative and of incipient trends toward greater independence from Moscow's domination.

The "New Course"

The policies identified collectively under the name of the "New Course" began to take shape in the summer of 1953.[9] Their main features were identical in all the satellite countries. To make amends for overzealous industrialization, which had resulted in lopsided economic growth, the consumers' goods and agricultural sectors of the economy were promised increased investments and greater attention. The drive for collectivization tapered off. Incentives, including forgiveness of back taxes and of arrears in compulsory deliveries which the government could never hope to collect anyhow, were held out to the peasantry as a means of raising farm productivity. Price cuts were decreed to help the consumer.

While economic measures held the limelight, a relaxation in political pressure also became discernible. Throughout 1954, the regimes were to some degree engaged in "fence mending." Elections were held, and rigged as they were with the usual return of 95 per cent plus for the regime, they were intended to serve as a means of reviving public interest in the activities of the governments. To the same end, to "activate the masses," as the Communists say, attempts were made to revive moribund National Fronts which at an earlier time had demonstrated their usefulness as instruments for manipulating non-Communist political parties and public opinion.

Despite the general uniformity of the pattern, the intensity with which past mistakes were excoriated and the scope of projected and actual changes varied from country to country. In both respects, Hungary went farthest. It alone permitted peasants to leave collective farms in large numbers and made a serious effort to refurbish the somnolescent "Independent People's Front" under a new name and with new personnel which included some prominent "Titoists" only recently released from prison. But in several countries, including Poland, Hungary, and Czechoslovakia, cautious groping for a somewhat greater freedom of expression, for a less doctrinaire adherence to rigid Stalinism, and perhaps even for the assertion of national individuality was discernible. In Poland, for example, attempts were made to rectify the distortions in the principal mission of education caused by an excessive emphasis upon party ideology. New discussions of the role of literature got under way, and the problems of creative artists in striving to adhere closely to the tenets of "socialist realism" were reviewed. Discussions of this nature were quite lively in Poland and in Hungary, and more muted in Czechoslovakia. The Czechs, ever cautious, showed little propensity for straying from a safe, established pattern. The Poles and Hungarians, traditionally more robust in giving vent to their feelings, struck out more boldly.

The very fact that the responses of individual countries to new situations could vary bespoke a welcome change in atmosphere as compared with the dreary uniformity of the Stalinist period. Hopeful expectations of real improvement, however, were quickly disappointed. Even in Hungary the implications of the "New Course" were not unequivocal. No definite pattern of softer policies crystallized. No clear-cut trends toward greater freedom from Moscow developed momentum. Local party zealots, and when necessary Moscow itself (as in the case of Polish writers), intervened to suppress and check any trend toward "liberalization" that threatened to get out of hand.

Communist parties

With the exception of Hungary, where the drama of a power struggle between contending Communist factions, divided over policy issues as well, unfolded in bolder relief—none of the satellite Communist or Worker's parties showed signicant stirrings toward greater independence from Moscow or toward self-assertion. While it would be interesting to know why the Hungarian Communists were so different in behavior, no explanation, other than a traditional propensity of the Hungarians for precisely that sort of thing, comes to mind. The parties paid homage to the principles of collective leadership then in vogue in Moscow and emulated Soviet examples with respect to structural changes in the party. One of the more important changes, the separation of powers between premier and first secretary of the Communist party, was carried out in Hungary and Czechoslovakia in 1953 and elsewhere in the spring of 1954, when party Congresses were held throughout the orbit with the single exception of Rumania. The Rumanian Congress was postponed twice. Economic problems and intraparty friction (including perhaps the unresolved question of the disposition of Ana Pauker who had been deposed in 1952 but had not been tried) were said to be responsible for the delay. A Congress is now scheduled in Rumania for the end of 1955.

Nikita Khrushchev, the First Secretary of the Soviet Communist party, attended the Polish and Czech Congresses, lending them added "glamor." The significance of his presence was not immediately apparent. For the rest, the Congresses were uninformative. They seemed to be in the nature of housekeeping meetings, to take stock of post-Stalin policies and adjust party organization and personnel to the new conditions.

Satellite leaders

The separation of functions between premier and first secretary gave no solid clues to the rising or waning star of any particular leader and except in Hungary, where Mátyás Rákosi was forced to share the limelight with Imre Nagy, it did not reveal incipient power or policy conflicts. In some countries, as in Poland and Albania, the "strong man" of the Communist regimes, Boleslaw Bierut and Enver Hoxha respectively, relinquished the premiership and took over the top party position. In Bulgaria and Rumania, on the other hand, Vulko Chervenkov and Gheorghe Gheorghiu-Dej, the leading Communists, retained the premiership while another, lesser known, figure was appointed as first secretary of the party. Gheorghiu-Dej has since been returned to a party post. Finally, in Czechoslovakia the division of functions actually dated back to March 1953 when Klement Gottwald died and power seemed to be divided among three men, Antonin Zápotocký as President of the Republic, Viliam Široký as Premier, and Antonin Novotný as the leading Secretary of the party.

The men in charge of the satellite Communist regimes had distinguished themselves by their ability to survive successive purges and navigate the haz-

[9] For more detailed information concerning developments in the satellites since Stalin's death the reader may consult the following articles: Hugh Seton-Watson, "Eastern Europe Since Stalin," *Problems of Communism,* Vol. 3, No. 2 (March–April 1954), pp. 10–17; Ivo Duchaček, "Czechoslovakia: New Course or No Course?" *ibid.,* Vol. 4, No. 1 (January–February 1955), pp. 12–19; Jean Malara, "Poland After the Death of Stalin," *ibid.,* Vol. 4, No. 2 (March–April 1955), pp. 12–19; Daniel Norman, "'New Course' in Rumanian Agriculture," *ibid.,* Vol. 4, No. 4 (July–August 1955), pp. 35–43; F. F., "The 'New Line' in Hungary," *The World Today,* Vol. 11, No. 1 (January 1955), pp. 27–40.

ardous course of the tough years of sovietization of their countries without serious mishap. Their survival could not have been due to a lack of sympathy with Stalinist policies, and there seemed to be little danger of their wanting to embark on some sort of "Titoist" venture. So long as they remained at the helm of their respective parties and governments, the People's Democracies were likely to hew close to the Soviet line.

Malenkov's downfall

The downfall of Georgii Malenkov as Soviet Premier in February 1955, and the changes it entailed in Soviet economic policies, reverberated most sharply in Hungary, whose premier, Imre Nagy, had been an ardent exponent of the "New Course." Less than a month after Malenkov's resignation, Nagy also "resigned" the premiership. Subsequently he found himself under attack for "rightist deviationist, anti-Marxist, opportunistic attitudes" and together with some of his followers (notably Mihály Farkas, the Minister of Defense) was stripped of his party functions as a member of the Politburo and Central Committee as well. Elsewhere in the satellites the repercussions of the personnel and policy shifts that had taken place in the Kremlin were not so severe. In fact, the Communist hierarchies seemed hardly at all affected. The "New Course," however, was definitely at an end.

Harsher economic policies, stressing once more the need for expanding the heavy industrial base of "socialist economies" and for collectivizing the land, were reintroduced, although neither the pace of industrial growth nor the tempo of collectivization was as rapid as in Stalin's time. If hopes for improvement in the material well-being of the people were thwarted by the abandonment of the "New Course," at least the oppressive atmosphere of intense police terror was not restored. The satellite regimes, following in the footsteps of the Soviet Union, seemed to be intent on maintaining a domestic *détente*, on creating an atmosphere of greater internal stability, and a feeling of increased security from persecution on the part of the people. This intent found expression in diverse ways such as a relatively mild policy toward the church. The church-state struggle has been at a virtual standstill for well over a year; Cardinal Mindszenty has been released from prison, though he is still confined to his living quarters, and the Poles have hinted that they might release Cardinal Wyszynski. There have been amnesties for political prisoners and more recently an intensive campaign to induce political exiles to return home—not so much, of course, to show that refugees can now return without fear of punishment as to discredit the credibility of Western propaganda beamed at the satellites and to create among the captive peoples a mood of greater receptivity to Communist propaganda and indoctrination.

Communist control unrelaxed

The conditions of the day-to-day existence of the masses behind the Iron Curtain have undoubtedly shown improvement. But although the burdens they must bear are somewhat lighter, their hopes of ridding themselves of their Communist rulers have grown considerably dimmer. For one thing, the Soviet Union has given not the slightest intimation that it would be willing to give up control over the People's Democracies. For another thing, the easing of international tensions has wiped out whatever slight hope there was of being liberated against the will of the Russians.

In diplomatic conferences the Russians have made it clear beyond a shadow of a doubt that they do not consider the satellites "expendable." They have simply refused to discuss any proposal that would tend to promote a change in the Communist-imposed regimes. In direct relations with the satellite countries the Soviet Union has also shown a continuing desire to integrate them ever more tightly into a solid Communist bloc. Even while the heavy hand of Moscow has made itself less conspicuous, though not necessarily less effective, in the internal affairs of the People's Democracies, steps have been taken to tighten the bonds that tie these countries to the USSR.

For example, "co-operation" in the realm of broadcasting was greatly expanded in 1953 through program exchanges which vastly increased the amount of Soviet material transmitted in Russian directly over the satellite networks. The volume of trade among the Communist countries has continued to mount steadily, as has their economic interdependence. Closer integration and a more "rational" allocation of economic functions among the Communist countries were foreshadowed when Hungary and Czechoslovakia deliberately postponed the beginning of their Five Year Plans so that they might coincide and be co-ordinated with the next Russian plan. The Soviet Union has not withdrawn its troops from Hungary and Rumania as it should have in accordance with the terms of the Austrian peace treaty. On the contrary it has proceeded to create a unified military command to include all the European Communist states. The command, headed by Soviet Marshal Konev, was proclaimed as an answer to NATO, to be used for bargaining purposes in pressing for the dismantling of the Western security structure. There is no doubt, however, that the Soviet Union will make good use of military unification to consolidate its hold over the satellites even more thoroughly.[10]

The easing of international tensions in turn has strengthened rather than weakened the hold of the Communist regimes. Whereas at the outset of the "New Course" expectations were high that one or another of the regimes might falter and possibly be dislodged, such expectations have been voiced much less frequently since the Geneva meeting of the four "heads of state." The Communist parties have largely overcome the difficulties with which they were beset during the earlier phases of the "New Course." These difficulties stemmed from a variety of sources, such as the lesser abilities of the parties to execute deftly the tactical twists and turns which were required of them, the propensity of a large number of local officials to succumb to pressures from below, and, finally, the nervousness and confusion engendered by the uncertainties of a transitional period in which the policies of the Kremlin had not jelled and power relations at the summit were in flux. As a result of the apparent stabilization of conditions in the Soviet Union and a relaxation in international tensions, however, the satellite Communist parties seemed to have gained new confidence. To be sure, many old problems remain to be solved. But the Communists can look back with satisfaction on the past three years, during which they survived many an uncertainty and hazard and have substantially consolidated their power.

FINLAND

Finland has enjoyed a unique status as a neighbor of the Soviet Union ever

[10] The text of the Warsaw Treaty, as the Soviet bloc military pact is called, and all the accompanying statements of the Communist officials will be found in a separate supplement to *New Times*, No. 21 (May 21, 1955).

since 1945. Not a satellite, yet far from being independent in its choice of a foreign policy, Finland has led a precariously balanced existence, in part meeting Soviet demands and in part fiercely defying Communist encroachments in its internal institutions and political life. By virtue of its special status, Finland has afforded an excellent opportunity for the new leadership in the Kremlin to demonstrate its "peaceful intentions" and its "real" desire for seeking an international *détente*.

Using trade and economic incentives as a point of departure for "improving relations," the Soviet Union offered a substantial loan ($10,000,000) to Finland in February 1954. Later that year the Soviet Union agreed to compensate Finland for a portion of its trade balance with Russia (also amounting to $10,000,000) in convertible currency. The offer was patently designed to induce the Finns to raise substantially the annual volume of trade carried on with their eastern neighbor.

The most significant and dramatic move, however, was made by the Soviet Union shortly after the Geneva meeting "at the summit" in July 1955. Quite of its own accord, without any prodding by the Finns, the Soviet Union offered to return to Finland the Porkkala naval base, a Soviet-held enclave on Finnish territory, which had been leased to Russia for fifty years under the terms of the peace treaty of 1947. The implications of the move were transparent enough. The Soviet leadership was anxious to set a precedent for "liquidating bases on foreign soil" so that it could then prod the United States to do likewise. Indeed, Soviet propaganda media did not hesitate to make this point.

Simultaneously with the return of the Porkkala base, the Soviet Union and Finland also extended their Treaty of Friendship, Co-operation, and Mutual Assistance for another twenty years, and the Russians reportedly hinted informally that they might permit the Finns to use the Saimaa Canal, a waterway which was ceded to the Russians after the war, but which at one time had been the main artery for the shipment of Finnish wood and pulp. These extraordinary blandishments tendered to the Finns were hailed by the Soviet press as a worthy example of how to regulate relations between a "Great Power and a small nation." [11]

But the Finns had good cause to wonder what price they would have to pay for the Russians' generosity. For in returning the Porkkala base or offering the use of the Saimaa Canal the Russians were giving up very little. At the same time evidence began to mount that the Soviet Union would step up its propaganda activities within Finland and, still worse, that it would probably press the Finns to abandon their strict neutrality in foreign affairs and to hew closer to the Soviet bloc.

GREECE AND TURKEY

Soviet efforts to normalize relations with Greece and Turkey met with a notable lack of success. Although some measure of relaxation in tension with these countries was achieved, both Greece and Turkey remained essentially wary of Soviet motives and cool to Soviet overtures. The Russians in turn did not seem to press matters too hard where they ran into serious obstacles.

Perhaps the most important single move made by the Russians was the abandonment of their postwar claims against Turkey. Less than four months after Stalin died, the Soviet Union renounced its claims to Turkish territory, which it had been demanding ever since 1945 as a token of "friendship." At the same time it abandoned its demands

[11] *New Times*, No. 39 (September 22, 1955), p. 3.

for joint control of sea and air bases in and around the Straits.[12] The renunciation of these claims did not necessarily improve relations between Turkey and the Soviet Union, for the Russians let it be known that they continued to be interested in arriving at some sort of agreement with the Turks on the question of the control of the Straits and kept raising this issue from time to time. Soviet activity in the Near East, especially in Afghanistan, could not but disquiet the Turks, and what had looked like an auspicious beginning for closer and friendlier contact, right after Stalin's death, failed to develop.

The situation with Greece was somewhat different, for here Greece's neighbors, the Soviet Union's satellites, carried the brunt of the burden of rapprochement. Some tangible results were actually achieved, for Bulgaria resumed normal ties with Greece after a hiatus of many years, border issues were settled, and, finally, the question of repatriation of Greeks whom the Communists had been holding in various satellite countries ever since the Civil War of 1946–49 was also resolved. But the Greek government showed little inclination to participate in the amenities which the Soviet Union has come to regard as indicative of improved relations. For example, in May 1955 it rejected a Soviet bid for an exchange of visits by parliamentary delegations on the grounds that differences in constitution and parliamentary systems between Greece and the Soviet Union would make such an exchange meaningless.

Despite Greek resistance to Soviet blandishments, the Cyprus crisis and Greece's bad economic condition might yet provide the Russians with an entering wedge in an area where their efforts to date have not yielded satisfactory results.

He served with the Office of Strategic Services in Washington (1943–45) and as an intelligence specialist with the Department of State (1945–51). He was on the staff of the Council on Foreign Relations, New York (1953–55), and is at present editor of Documents on American Foreign Relations, a volume issued annually by the Council. He is the author of articles on communism in Eastern Europe and Soviet foreign policy and has a book in preparation on the Strategy and Tactics of the Czechoslovak Communist Party.

Soviet Policy Toward Western Europe Since Stalin

By Robert F. Byrnes

STALIN'S successors inherited a policy which was global and which reflected Stalin's personal ambitions, the accumulated baggage of Russian history and of the Marxist-Leninist-Stalinist philosophy, domestic problems and pressures, and critical situations around the world, such as stalled armistice negotiations in Korea, a new administration in Washington which talked of liberation, and a divided France wrestling with the problems posed by Western German economic recovery and with plans for bringing Western Germany into the Western community. Both Stalin and his successors considered Western Europe their primary political target, but they defined Soviet policy toward this crucial area with other world problems in mind. Moreover, Stalin's successors must have been at least as impressed as some Western observers by the magnitude of the succession problem and by the growing demands of the new Soviet élite.

Stages of Soviet Policy

The history of Soviet foreign policy has been marked by extraordinary tactical switches, most notably by the sudden reversal in policy toward Nazi Germany in August 1939. This history and the great vacuum left by the charismatic Stalin have naturally increased the attentiveness with which Western observers have searched for sharp changes. Fundamentally, there has been no great change in Soviet policy toward Western Europe since Stalin's death. There has been little change in Soviet tactics, although the apparent variations have been numerous and sometimes spectacular. However, in its general emphasis, Soviet policy toward Western Europe has increasingly favored the carrot more and the stick less. In addition, the general line has been softer, subtler, and more persuasive than it was under Stalin.

During the twenty-three months in which Malenkov was Premier, there were no concessions to the West, although the tone of the Soviet Union was more mild than it had been under Stalin. The Korean armistice negotiations were finally concluded on July 27, 1953, reducing the divisive issues affecting relations between the United States and its European allies, but these conflicts were soon replaced by problems deriving from Indochina and Formosa. The Berlin and Geneva conferences early in 1954 demonstrated that Molotov still deserved his reputation and his nickname.

With the demotion of Malenkov, in February 1955, some Western observers, who had been impressed by his apparent reasonableness and occasional civilities, feared that the "final" opportunity to negotiate with the Soviet Union had been lost. However, the regime led by Khrushchev and Bulganin has maintained the principal lines of Soviet foreign policy as well as the little amenities. The most coarse anti-American propaganda has disappeared, and Soviet policy toward the West has been more flexible, moderate, and skillful. The Soviet Union in the spring of 1955 finally accepted the Austrian State Treaty, and the Soviet leaders in June

1955 made a sensational pilgrimage to a Yugoslav Canossa to admit error in past Soviet policy toward Tito. At the Geneva conference, in July 1955, they exuded friendliness and good fellowship in a meeting designed to take advantage of and to extend the new "atmosphere" so that negotiations on the basic issues might be undertaken in a friendly spirit. In September 1955, after a Soviet initiative, diplomatic relations were opened between Moscow and Bonn, which the Russians had previously denounced as a Nazi stooge of the United States.

The recent changes do emphasize the eternal problem: Is there now a genuine shift in Soviet policy toward Western Europe? Do the recent reversals on details conceal a genuine change on matters of substance or are they merely skillful tactical maneuvers? Are we at least witnessing a gradual trend which will ultimately produce a basic modification? Available evidence suggests that there has been no basic change in Soviet policy or goals, although the tactics used are now different. The Soviet rulers are simply adjusting to life without Stalin and to a new phase in post-war relations, one which assumes a temporary political and military stalemate, avoidance of war between the great powers, and continuation of the cold war by political and economic means which do not involve increasing the likelihood of general war.

Soviet Goals

The primary aim of Soviet policy, of course, is the defense of the Soviet Union and of the Soviet empire. With regard to Western Europe, the unspoken Soviet goal is Soviet control, which would swing the world balance of power clearly to the advantage of the Soviet Union. To attain this goal, the Soviet leaders seek to oust United States forces and bases and to destroy all the organizations and institutions established to promote Western unity. They seek to destroy the North Atlantic Treaty Organization, to dissolve the ties between Western Germany and its allies, and to incorporate Western Germany into a unified Germany under Soviet rule, which would enable the Soviet Union to control all of Europe. The Soviet leaders have a keen appreciation of the crucial significance of Germany and of the role of Western Germany in the Western European Union. They also have understood more clearly than most Western Europeans the political importance of the European Defense Community and of the European Political Community as means of damping and extinguishing the Franco-German conflict, directing the spiritual, economic, and military forces of Western Europe into new channels, and creating a political unity which could resist Soviet influence, pull Britain, Canada, and the United States more firmly into European affairs, and serve as a magnet to draw satellite Europe from the Soviet grip.

Bases of Soviet Policy

The principal Soviet means to attain these great goals are sometimes not noticed and usually not mentioned, because at the same time they constitute the bases of Soviet power. The basic Soviet weapon is the industrial and military power of the Soviet Union, which Stalin's successors have been just as assiduous as he to strengthen. The Soviet rulers denounce others for seeking to negotiate from a "position of force," but Soviet industrial and military power provides the base from which Soviet policy operates. The impressive growth of the Soviet economy has had a noticeable impact upon the underdeveloped countries, some of which consider the Soviet rise to power a model. However, its effect has been just as

powerful upon the governments and peoples of Western Europe, which has lost to the United States and the Soviet Union its role as world leader and which in its relative weakness and decline feels naked and defenseless before growing Soviet power and Soviet ruthlessness in the use of that power. Indeed, if the Soviet economic program is successful, within a generation or so Western Europe may be forced "irrevocably into a position of complete dependence" upon either the Soviet or the American industrial and power complex.[1]

Since the death of Stalin, several waves of Soviet speeches and decrees have signaled an apparent reversal of established policy and a heavy increase in capital investment for the production of consumers' goods. However, the industries producing capital goods and military equipment have retained their priority and still receive the lion's share of capital investment. Indeed, in the budget announced on February 3, 1955, by Minister of Finance Zverev, the funds allotted to heavy industry were more than double those assigned to agriculture and light industry combined. Expenditures for defense in 1955 were increased by almost 12 per cent over those of 1954, and the Soviet military capability continues to grow. The hearty but false emphasis on consumers' goods was designed to ease the transition from Stalin to the new regime, to placate the Soviet upper classes, and to persuade the non-Communist world, especially Western Europe, of the peaceful intentions of the Soviet rulers.

Soviet control over East-Central Europe and the gradual but inexorable reshaping of this critical area along Soviet lines constitute the second fixed base for Soviet policy toward Western Europe. The brutal division of Europe and the presence of Soviet and satellite forces at the waist of Europe have placed Western Europe in jeopardy and form the core of the threat under which it lives. Moreover, Soviet control of Eastern Germany and Soviet ability to prevent the unification of Germany block the Western program for unity and grant the Soviet Union a disruptive weapon of enormous power in Germany and in all of Western Europe.

The third established base of Soviet power is the international Communist movement, which controls hundreds of thousands of Communists and which leads millions of dupes around the world in support of Soviet policies. Every government in Western Europe, particularly the weak and unstable governments of France and Italy, is sensitive to the various forms of pressure which the Soviet government generates through its network of organizations and its vast propaganda system. These also exploit the philosophical vacuums which exist in many parts of the world by peddling the Soviet philosophy, one of the Soviet Union's most potent weapons. The Soviet rulers almost certainly believe that the road to Paris lies through Hanoi and that the channel to power in Western Europe runs through the Sea of Confusion and Despair. Consequently, the international Communist movement exerts pressures in manifold ways, from colonial revolution to incessant propaganda for "peace," and its instruments include civil war in Indochina and Malaya, the World Peace Council, Soviet Friendship Societies, the French Communist party, and the World Federation of Trade Unions.

General Relaxation of Tension

Western success in rebuilding the economic, political, and military power and unity of Western Europe and the containment of Soviet expansion in Western Europe have forced the Soviet Union to revise its tactics. Even before Stalin's death, greater emphasis was being placed upon political warfare in all its forms and upon softening resistance to expansion. The new Soviet leaders emphasize those actions in Soviet domestic policy which may help persuade the Western observer in particular that the Soviet system is thawing. At the same time, in their policies toward foreign governments and peoples, they have introduced civilities and amenities to obtain a relaxation of Western vigilance.

Domestic policy

Within the Soviet Union, these steps have been restricted to a major amnesty shortly after Stalin's death, another amnesty in September 1955, occasional emphasis upon the rights of Soviet citizens, a small, gradual increase in the production of consumers' goods, and increased access to the products of foreign culture. This approach became most marked in the summer of 1955, when tourist traffic into and out of the Soviet Union widened to a trickle. All of these steps, plus the so-called "New Course" in East-Central Europe, were designed to convince Western Europeans that the Soviet menace had evaporated and that the Western program for military strength and unity should be abandoned.

The amenities

With regard to Soviet policy toward Western Europe itself, the steps taken have generally been small. Indeed, most of them have been simple conciliatory gestures and have merely included allowing Russian wives of foreigners to leave the Soviet Union to join their husbands, allowing Swedish and Danish trawlers to fish within twelve miles of the Baltic states coast, and returning some prisoners of war. The Soviet Union "interceded" with its Far Eastern allies on behalf of civilian prisoners, and it helped to make possible the conclusion of the Korean truce. On May 30, 1953, in a note published July 19, 1953, the Soviet Union renounced its claims to Turkish territory and to special privileges in the Dardanelles. It has also resumed "normal" diplomatic relations with Greece, Israel, and Yugoslavia. The norm of Soviet practice and the eagerness with which the West hopes for change were both illustrated by the wild flurry of speculation concerning Soviet policy when Malenkov, in August 1954, picked a bouquet of flowers for a member of a visiting British Labor delegation. As someone remarked, Western observers often seem to believe that the appearance of *petits pois à la française* on a Kremlin menu marks a new policy toward France.

Current Soviet tactics are well illustrated by the action of the Supreme Soviet during the last year or so in encouraging representatives of various parliamentary bodies to exchange visits with "the Soviet parliament." In February 1955, it voted to join the Interparliamentary Union, and delegates of the Supreme Soviet attended the forty-fourth annual conference of the Union at Helsinki in August. Official delegations of the parliaments of Britain, Finland, Sweden, India, Syria, Yugoslavia, and Japan have already visited Moscow, and the parliaments of Belgium, France, Austria, Italy, and Canada have accepted invitations. While this procedure exposes some of the Soviet élite to the wholesome influence of Western parliamentary tradition, it also opens up an important new propaganda avenue for the Soviet Union. Above all, it enables the Supreme Soviet to pose as a genuine parliament, thus helping to persuade Western Europeans that the

Soviet Union is governed by law and that there is no Soviet menace.

Peace campaign

This approach is a fundamental part of the Soviet campaign for "peace" and for "peaceful coexistence." The Soviet rulers remember clearly the immense advantage Lenin obtained in 1917 by his campaign for immediate peace, and they appreciate that an opponent of this campaign is easily labeled a warmonger. Moreover, their approach to "all men of good will" for peace and "friendship among nations," their emphasis upon noble emotions and high principles, and their attacks upon Western alliances and bases and upon alleged barbarous American practices have a strong appeal in this nuclear age not only to neutralists, but even to strong anti-Communists affected by fear of nuclear war. The Soviet demands for immediate prohibition of the use and manufacture of nuclear weapons, for a reduction in conventional arms and effectives to agreed levels, and for control machinery to be created at a later date have had little effect upon *informed* opinion throughout the world but have been important propaganda weapons for weakening *popular* resistance to Soviet policy. As such, the spurious Soviet "peace" campaign constitutes a deadly threat to Western unity and vigilance.

Trade

In its efforts to convince the world that it wants peace and wishes to strengthen peaceful relationships, the Soviet Union has sought to break Western controls over the export of strategic goods, to persuade Western Europeans that the Soviet empire constitutes a vast untapped market, and to create divisions within Western Europe over trade policy. This Soviet program has been waged on several levels—the completion of short-term bilateral trade agreements, political campaigning within the United Nations Economic Commission for Europe, and general propaganda. For example, the trade agreement signed with France in July 1953 was negotiated more quickly than the one signed with Italy in November of that year, and the Soviet Union purchased some items from France rather than Italy because France and the French vote on the European Defense Community were important Soviet political targets.

The Soviet Union has been especially skillful in dangling lucrative orders before Western businessmen. For example, Kabanov, the Minister of Foreign Trade, in February 1954 told a group of British businessmen visiting Moscow that the Soviet Union was prepared to place orders in Britain for more than a billion dollars between 1955 and 1957. About half of the goods he listed were under strategic controls, but this appeal for "normalization of Anglo-Soviet trade" stimulated British industrial and commercial appetites and strengthened criticism of Western controls. Moreover, such promises created a sensation in Western Germany, where fear is strong that Britain may gain a lead in Soviet trade. Dangling the same lure before West Germans, especially after the visit of Adenauer to Moscow, will worry the British and increase competition for Soviet markets.

The Russians had shown an interest in ECE even before Stalin's death, and on January 30, 1953, the ECE announced that the Soviet Union had agreed to participate in a conference on East-West trade, although in September 1952 it had refused a similar invitation. In the various ECE conferences the Soviet representatives have given especial priority to "removal of obstacles to foreign trade" and to denunciation of the United States as the power responsible for the COCOM (Consultative Group Co-ordinating Committee) strategic controls.

This theme has been a favorite one for Soviet political warriors, and they have declared Western strategic controls responsible for the decline after 1949 in trade between Western Europe and the Soviet empire. This campaign ignores the facts of this trade, which had declined before strategic controls were established. The Soviet Union has reorganized the economic structures of the countries of East-Central Europe and has tied their trade strings to Moscow. Moreover, these states now lack supplies of grain and timber for export to the West. Indeed, on balance the Soviet Union and its satellite states even imported foodstuffs in 1954. In addition, while the COCOM states pruned the strategic list in August 1954, exports from the Soviet empire remain under complete control. Finally, Soviet abrogation of trade with Yugoslavia in 1948 and with Australia in 1954 demonstrated that Soviet trade controls are used for political reasons in a way which is not possible in the West.

Western Communist parties

Western Communist parties as instruments of the Soviet Union are used to support the impression that the Soviet Union is not a threat and that each national Communist party is just another political party. Thus, in 1953 the French party abandoned the forceful program which had led to incidents such as the Ridgeway riots in May 1952, and began to work for a "patriotic national front." Jacques Duclos on October 22, 1953, indicated that the party was prepared to join with any other Frenchmen in a national campaign to end the war in Indochina, to prevent German rearmament, and to hasten general disarmament. The Communists have co-operated closely with the Radical Socialists and the Gaullists, especially against EDC. On June 8, 1954, Thorez proclaimed that it was "orthodox Communist doctrine" to accept allies wherever they could be found, and persistent efforts have been made for a united front with the Socialists or a popular front with other political groups. The Communist effort to infiltrate political, religious, educational, and labor organizations in particular has been quite successful, especially in France, where the use of *la douce parole* works as effectively for the Communists as it did for Philip the Fair centuries ago.

International organizations

The new Soviet leaders use international organizations to carry political warfare against Western Europe. The primary forum since 1945 has been the United Nations. In addition, the Soviet Union joined the United Nations Educational, Scientific and Cultural Organization in April 1954. In July 1955 it announced it would resume active participation in the World Health Organization, from which it had withdrawn in 1949, that it would become a member of the International Bureau of Education, and that it would contribute two million rubles in kind and services to the United Nations Children's Fund. These steps, and the participation of the Soviet Union and some of its satellites in the International Labor Organization, not only provide new forums but also help convince other states and peoples that the Soviet Union is a normal state seeking to attain its goals in normal ways.

DIPLOMACY: AUSTRIA

The principal Soviet weapon against Western Europe during the past thirty months has been Soviet diplomacy, which has been generally used with great effectiveness to attain Soviet goals

or to prevent the United States and the Western European states from attaining their aims. This can be seen most clearly in the long Western struggle to obtain freedom and independence for Austria and unification for Germany. In the case of Austria, the Soviet Union in the spring of 1955 finally yielded, at a high price and in return for other advantages which it estimated then outweighed the benefits to be derived from continuing to block the treaty.

At the close of the Moscow Conference on November 1, 1943, the United States, the United Kingdom and the Soviet Union had issued a joint declaration pledging the re-establishment of "a free and independent Austria." All but five articles of the Austrian State Treaty had been agreed to by 1949. However, Austria was not freed until the spring of 1955, even though the foreign ministers dealt with the Austrian State Treaty in six conferences between 1947 and 1953 while over the same years their deputies had held more than 260 meetings. The Soviet policy was clearly based on the desire to retain troops in Austria, to prevent Austria from joining the West, to obtain economic profit from the Soviet zone, and to use Austria as a bargaining counter on the German and other issues.

The long period of Soviet recalcitrance reached its depths at the Berlin conference of the foreign ministers, in February 1954, when Molotov proposed that the Austrian treaty be linked to an agreement on German unification and that the withdrawal of foreign troops from Austria be postponed until a peace treaty with Germany had been concluded. He even refused to sign the Austrian State Treaty when the three Western powers agreed to accept the Soviet version of the five articles which had been in dispute since 1949.

The Berlin conference of 1954 was preceded and followed by minor concessions to the Austrian government, such as the note on June 30, 1953, announcing that the Soviet Union would assume all Soviet occupation costs as of September 1. However, the pressures on Austrian government and police officials remained sharp and strong, and the Soviet Union refused to discuss reducing its heavy claims upon the Austrian economy.

Signature of Austrian treaty

However, the Soviet policy toward Austria was suddenly reversed in March 1955, when Molotov announced that the Austrian treaty was not dependent upon a German treaty. He also proposed preliminary negotiations between Austria and the Soviet Union on the basis of withdrawal of all foreign troops from Austria and an Austrian undertaking not to join any military alliance or to allow military bases on Austrian territory. With this Soviet reversal, the way was opened to the signature of the Austrian treaty, on May 15, 1955. This treaty gave Austria its freedom and independence; prohibited *Anschluss* with Germany, foreign alliances, and foreign bases; provided for the withdrawal of foreign troops within ninety days of ratification; and provided for substantial payments by Austria to the Soviet Union as the price of its freedom. These payments include delivery of $150,000,000 in Austrian goods over six years, in return for handing back the ex-German assets seized by the Soviet Union; the delivery of 1,000,000 tons of crude oil a year for ten years for the oil fields and refineries of eastern Austria; and purchase of the Soviet-controlled Danube Shipping Company for $2,000,000.

Signature of the Austrian State Treaty removed the Soviet grip from Austria and marks a step backward for the Soviet forces in Central Europe. However, Western troops have also left Austria, and Austria has now been neutralized. The Soviet Union added to its laurels as a peacemaker, since the final initiative came from Molotov and the treaty was concluded after a visit of Chancellor Raab to Moscow. Moreover, Austria will remain in economic bondage to Moscow for a full decade. The Kremlin obviously hopes to draw Austria into its orbit through trade bonds and to make of Austria a kind of Central European Finland. Finally, the Soviet leaders obviously hope that this will serve as a precedent for achieving a united neutralized Germany and for forcing the withdrawal of American troops from Europe.

Diplomacy: Germany

The Soviet leaders recognize Germany as the key to Europe, and they intend in one way or another, sooner or later, to bring all of Germany under Soviet control. In this, they are simply continuing a policy which Stalin set in motion. Soviet control over Eastern Germany has given the Soviet Union the power to veto any program for the unification of Germany which it does not find acceptable. It has been clear since the end of World War II, and the Soviet leaders made it brutally plain to Adenauer and the West in Moscow in September 1955, that the Soviet Union intends to retain control over Eastern Germany and to force Western Germany and the West ultimately to sue for unification on Soviet terms. To attain this great goal, the Soviet Union has used both pressure and guile, varying its tactics and its themes as circumstances required but always keeping the main goal in view and utilizing simultaneously every type of technique.

The extraordinary reconstruction and economic recovery of Western Germany, since 1949 in particular, its rapid rise to political respectability, and the program for a European Defense Community incorporating Western Germany led the Soviet Union until September 6, 1953, to concentrate upon defeating Adenauer. After his victory in the election, the Soviet Union concentrated until late summer 1954 upon influencing the French vote on EDC. The French failure to ratify EDC was only a brief victory, because the London and Paris agreements provided a substitute which was weaker, but still too strong from the Soviet point of view, in the form of Western European Union, West German sovereignty, and West German membership in NATO. After these agreements had been ratified, the Soviet leaders again shifted gears, widened their smiles, opened diplomatic relations with the West German government, and inaugurated another period in Soviet European policy.

Eastern Germany

Eastern Germany is an important pawn in Soviet policy toward Western Europe, and the Soviet leaders like to believe that the existence of a "socialist" state in Eastern Germany exerts a magnetic influence upon Western Germany. However, Soviet control, the vast economic and political contrasts between Eastern and Western Germany, and the fraudulent elections, especially those of October 17, 1954, handicap the Soviet Union. The steady flow of refugees from Eastern Germany—over two million have "voted with their feet" by fleeing to West Berlin and Western Germany—daily indicts Soviet rule and cripples the Soviet effort to make Eastern Germany a magnet.

In the spring of 1953, following the decision of the Soviet leaders that the puppet state needed more attractive window dressing, the Pankow government announced a series of minor reform measures, such as returning confiscated waste land to farmers, increasing the production of consumers' goods, reduc-

ing labor controls, relaxing the drive for collectivization, and correcting tax collection methods. This program was upset by the June riots, which weakened the Soviet line for the September elections in Western Germany and which underlined the basic Soviet dilemma. The June riots in the East and the continued economic and political progress in Western Germany have led the Soviet leaders to increase their efforts to reward, strengthen, and dignify the German Democratic Republic. Thus, during the last few months of 1953 the Soviet Union returned about 10,000 prisoners of war to Eastern Germany. As of January 1, 1954, reparations payments to the Soviet Union ceased, firms taken over by the Soviet Union were returned to German control, and occupation costs were limited to not more than 5 per cent of the East German national income. On March 25, 1954, the Soviet government announced that it would henceforth treat Eastern Germany as a sovereign state, with "freedom to make decisions according to its own views in domestic and foreign affairs." Following the Adenauer trip to Moscow and the opening of diplomatic relations between Moscow and Bonn, the Soviet government, on September 20, 1955, granted full sovereignty to the German Democratic Republic, including control of civilian traffic between West Germany and West Berlin and the right to rearm and to play a full role in the Warsaw Pact.

As the campaign to whitewash and dignify the government of the German Democratic Republic progressed, Eastern Germany began to play a more prominent role in the Soviet plan. Its leaders frequently appealed to the French government and to groups of Frenchmen to defeat EDC and WEU. Intensive efforts were made to increase the range of contacts with West German technicians and officials on matters concerning trade, transport, sport, and cultural affairs. The program for "all Germans around one table" sought to bring workers, churchmen, athletes, newsmen, women, and above all elected representatives together for friendly discussions. Threats to force West German officials and representatives to meet with Communists were also used, most notably in the spring of 1955, when the German Democratic Republic levied enormous increases in dues on West German vehicles using Soviet-zone roads.

France

Soviet policy toward Western Germany and the Soviet design for neutralizing Western Europe are generally defined with one eye on France. Soviet policy toward France has emphasized both Soviet economic and military power and Soviet "peace" proposals. At the same time, the Soviet Union has exerted pressure on France through Indochina. It has appealed to the traditional French fear of Germany and to the old French policy of co-operating with Germany's eastern neighbors to prevent German revival and expansion.

Thus, Soviet propaganda in France through all of its outlets emphasized the dangers courted by Western policy toward Germany and the great virtues of the Franco-Soviet treaty of alliance of 1944. Great efforts were made to improve relations between France and the Communist governments of Poland and Czechoslovakia. For example, just before the final debate on EDC, Poland offered France a treaty of alliance and mutual asssitance. The legislatures of Poland, Czechoslovakia, and Eastern Germany in December 1954 appealed to the French National Assembly not to ratify the Paris agreement on West German rearmament. At the same time, the Soviet government several times warned both France and the United Kingdom that the London and Paris agreements flagrantly violated the Franco-Soviet and Anglo-Soviet treaties and that ratification would lead the Soviet Union to annul the treaties. When this threat did not succeed, the treaties were annulled by the Presidium of the Supreme Soviet on May 7, 1955. Only one month later, the carrot reappeared, when Molotov at a luncheon in Paris referred to the need to forget the past, expressed a wish for more frequent and direct contact with French leaders, and invited Pinay and Faure to Moscow.

German unification

The Western powers have sought to rebuild Western economic and political strength and to create a new unity to resist Soviet pressure and to lead toward a stable and peaceful future. General Western success and the recovery of Western Germany have thus raised to a new level questions concerning German unification and the position of a united Germany in Europe. The Western states propose free elections throughout Germany under a law drafted and promulgated by the four occupying powers and supervised by them; the convocation of a national assembly; the drafting of a constitution and the preparation of peace treaty negotiations by this assembly; the adoption of the constitution and the formation of an all-German government; and the signature and entry into force of the peace treaty. The heart of the Western position lies in free elections. As Bidault pointed out to Molotov at Berlin, "From a democratic point of view, it seems obvious that it is elections which create governments and not governments which create elections."

To counter the Western program, the Soviet Union has stood fast behind a policy which seeks controlled elections and Communist control over all of Germany. This position has been stated quite clearly a number of times, notably in a Soviet note to France, Britain, and the United States on August 16, 1953, again at the Berlin conference in January and February 1954, and during and after the Geneva conference in July 1955. Fundamentally, although this is always concealed and denied, the Soviet Union has no intention of accepting free elections. Soviet policy on German unification emphasizes the following: representatives of the governments of both Eastern and Western Germany should participate in any conference discussing German unification and a German peace treaty; an all-German provisional government, created by the parliaments of the two Germanies with the co-operation of "democratic parties and organizations," should draft an electoral law and prepare "free and secret elections" for a national assembly and should help prepare and sign a German peace treaty; all occupation forces should leave Germany after the signature of the peace treaty; German armed forces should be limited to those required for internal security and frontier patrol; and no foreign bases should be allowed. The heart of the Soviet position lies in the precedence granted to the formation of a German government over elections, which would be rigged by the government.

European "security"

The bald Soviet program for controlled elections leading to German unity under communism has been both sweetened and concealed by Soviet proposals for the withdrawal of all occupation forces and for the establishment of a European "security" system. Soviet suggestions that occupation forces be withdrawn are frequently reiterated, but this campaign for a neutralized Germany and an exposed Europe has generally had little effect.

The proposal for a European "security" system first appeared in Janu-

ary 1953, but it was presented in more elaborate form at the Berlin conference early in 1954 and has since become a standard Soviet prop. Fundamentally, this proposal is a device for removing American influence and power from Europe and for providing an ostensible substitute to NATO. In effect, it constitutes a system of "Europe for the Europeans," with the Soviet Union of course counted as a European state and with the United States belatedly recognized as one also. The pact is open to all European states "without regard to their social systems," to both German governments, and later to a reunified Germany. It specifically binds its members "not to enter any coalition or alliance." When these proposals were rejected as a plan to divide Germany for fifty years and to neutralize Western Europe, Molotov on March 31, 1954, proposed that the Soviet Union and "other European countries" join NATO to give it "a really defensive character" and to preclude Germany's being drawn into military groupings.

Soviet policy since WEU

During the past nine months or so, Soviet policy has paid particular attention to four simultaneous lines. The first of these has emphasized Soviet power and resolution and the consequences of Western refusal to abandon NATO and WEU. The Soviet Union has not threatened war—indeed, it has prated of peace—but it has reiterated that ratification of WEU would lead to the annulment of the Franco-Soviet and Anglo-Soviet treaties, to the creation of an Eastern European parallel to NATO, and to the "permanent" division of Germany. When the threats failed, the treaties were annulled. The Soviet Union and its satellites, in May 1955 at Warsaw, then "formed" a military organization under Soviet command. Finally, the opening of diplomatic relations with Western Germany and the grant of full "sovereignty" to Eastern Germany in September underlined that the West had reached a stone wall on German unification, unless it surrendered to Soviet terms.

The second emphasis has been upon the proposed Soviet European "security" system. This is offered as a substitute for NATO and WEU, as a device for bringing the two Germanies into one organization, and as a means of obtaining Western recognition of the Soviet position in East-Central Europe. It has little appeal, except to Communists, but there is some danger that it will be confused with Western plans being developed to win Soviet approval to German unity within Western union.

The third accent, and currently the most noticeable one, is upon the general relaxation of tensions. While the Soviet leaders have not concealed their goals, they have at the same time adopted a friendly, cheerful, benevolent pose to lull their opponents into carelessness and slumber. This tactic was most marked at the Geneva "summit" conference, where all of the ideas came from the West and where the Soviet leaders concentrated upon spreading an atmosphere of cordiality and friendliness.

Finally, Soviet policy stresses relations with Western Germany. The establishment of diplomatic relations between Moscow and Bonn was foreshadowed by a Moscow radio broadcast on January 15, 1955. It sent a shiver of fear through the West, which remembers August 1939, which notes with apprehension the age and importance of Adenauer, and which worries over the power of German nationalism as unification is delayed and as the two Germanies are driven into closer relationships with each other.

In other words, with regard to Germany, the Soviet leaders apparently have settled down for the long haul. While exuding good cheer and cordiality, broadcasting the virtues of peaceful coexistence, and buying apparent virtue at little price through ceding their Porkkala base to Finland, they will seek to isolate and overthrow Adenauer or to wait until his death or retirement creates a new political situation in Western Germany. In the meantime, they will strive in every way to push the two Germanies into closer contact. As these relationships improve, the structure of the East German state will probably be revised along ostensibly federal lines, and Soviet policy will concentrate upon weakening the center parties in Western Germany, strengthening the left-wing Socialists, the neo-Nazis, and the nationalists, and working for a National Front in both Germanies. In short, the Soviet leaders will probably rely upon this approach, as well as on increased trade between Western Germany and the Soviet empire under a new Rapallo, a Western economic and political crisis, the desire for "peace," and the carelessness or impatience of the West, to bring about German unification on Soviet terms.

OUTLOOK

Soviet policy toward Western Europe since the death of Stalin has been marked by the same failures which attended Stalin's efforts. The Communists have failed to prevent or even seriously to hinder the economic and political recovery of Western Europe from the depths of 1945 and 1947. NATO continues to thrive, though its foundations seem perilously military and fragile and though it is wracked by occasional conflicts between members and by growing reluctance to meet its high annual costs. The Western European Union has been established, with Western Germany a member. Above all, the United States has maintained its forces and its commitments, in Western Europe.

While the Soviet leaders have failed to attain their goals, they have achieved some successes and they have made some progress toward undermining Western unity and resolution. The Soviet Union contributed heavily to the French refusal to ratify EDC through its skillful political warfare in France and through the continuing influence of the French Communist party. While the size of the Communist parties and of Communist-controlled organizations in Western Europe has continued to decline steadily, neutralism, pacifism, and nationalism, stimulated by the Communists, have grown, undermining the foundations of Western resolution and strength. The skillful Soviet effort to persuade Western Europe that the Soviet Union is not a threat and that the high costs of defense are not necessary has softened the Western program and made the great alliance hesitate. The Geneva conference in particular has influenced popular opinion, and the smiles and bouquests of Khrushchev and Bulganin are weakening Western persistence far more than did the arrogance and ruthlessness of Stalin. In this general approach toward relaxation, the Soviet leaders have clearly inherited Stalin's great ability to create a success out of a series of failures.

Problems on both sides

Both Western Europe and the Soviet Union face serious problems. The West suffers now from its own achievements, and its prosperity and security seem so solid that vigilance slackens. Western stability and unity depend to a large degree on the solidity of economic foundations, and the economies of several of the key states and of the area in general are somewhat vulnerable. In addition, Western recovery depends to a great degree upon the survival of democracy in Western Germany, still naturally a suspect neighbor. Finally,

in its present moods, Western Europe is increasingly vulnerable to the current Soviet political warfare tune. There is some danger that the populace in one of the links which make up Western Europe will succumb to the lure of neutralism or even to a Soviet European "security" pact which would relax the vigilance of the West, lead to a serious reduction in forces, and divide the allies as they were divided during the 1930's by the Nazis. Indeed, there is some likelihood that those who stand for strength and vigilance will be hounded as was Churchill in the 1930's.

In other words, the West provides vulnerabilities and opportunities to the Soviet leaders for exploitation. However, at the same time Soviet policy must continue to operate under serious handicaps. To begin with, the Soviet record cannot be erased. In addition, while Soviet control over Eastern Europe provides a great addition to Soviet power, a strategic area of great value, and a prime source of Soviet political influence in Western Europe, at the same time it constitutes a disadvantage. This is particularly so in the case of Eastern Germany, whose true status is exposed daily by a flood of refugees and which falls ever further behind Western Germany in every index.

Moreover, while the Soviet Union can play one tune in France and another in Germany, it cannot forever be all things to all people without paying a penalty. Finally, while the current policy of smiles and co-operation helps to undermine Western vigilance, at the same time it corrodes the vitals of Communist political power. A system which is based on conflict and war requires tension and feeds on struggle. No system is more vulnerable to relaxation than a totalitarian state.

Robert F. Byrnes, Ph.D., New York City, is director of the Mid-European Studies Center of the Free Europe Committee. He served in Military Intelligence during World War II, and after the war taught French and Russian history at Swarthmore College and Rutgers University. He is the author of Antisemitism in Modern France: The Prologue to the Dreyfus Affair (1950) and of numerous shorter studies on French and Russian history.

Soviet Policy in Asia Since Stalin

By HAROLD H. FISHER

SOVIET policy in Asia has changed in the two and one-half years since Stalin's death. The aims of Soviet policy, however, remained unchanged. The Soviet Communists and all who take their orders or follow their example still hope to prevail upon the peoples of Asia to follow the Communist lead and use Communist methods to achieve peace, progress, and equality. The degree to which the Soviet Union has changed its policies to gain this end depends on the extent to which one interprets the policies of the local Asian Communist parties as actually policies ordered, suggested, or approved by the leaders of the Communist Party of the Soviet Union who direct all Soviet policy. For example, what about the decisions of the Third Congress of the Communist party of India at Madurai, December 27, 1953 to January 3, 1954? At this meeting the veteran British Communist, Harry Pollitt, attempted, in the name of Moscow and the international Communist movement, to persuade the Congress to accept an anti-American and pro-British line. Or take the purges of 1954–55 carried out by the Chinese Communists against the ex-Manchurian boss Kao Kang, the Marxist writer Hu Feng, and many others. Were these Soviet-directed policies or policies of the Communist party of China adopted in imitation of the Communist Party of the Soviet Union? Was Chou En-lai carrying out a Soviet policy in Asia when he took part in the Bandung Conference in April 1955 and announced that the Chinese People's Government wanted peace with the United States and was willing to negotiate?

The relations of Communist parties in power or seeking power to the CPSU and to each other are in many respects secret; in some respect they are open but complex. It is not easy to tell just where to draw the line between policies that have been ordered by the Kremlin and those that Asian Communists have adopted in the belief that such policies were in harmony with the international line of the CPSU. The purpose of this paper is not to explore the murky and treacherous area of Communist inter-party relations but to take note of some of the actions of Communist governments and parties in Asia that are of enough importance to justify the belief that they were approved or ordered by the Communist Party of the Soviet Union and so in some measure reflect Soviet policies.

RECENT CHANGES ENUMERATED

The changes that have been most striking in respect to Asia during the two and a half years are briefly these:

In Asia as elsewhere, the Soviet government and the Communist parties have emphasized the aim of peaceful coexistence between regimes based on different political and ideological systems, the development of trade and the export of technical assistance in international affairs instead of wars of liberation and other forms of the international class war. In domestic affairs the Communist parties have advocated "united fronts" against imperialism combined with peaceful and legal competi-

tion with the nationalist parties instead of guerrilla wars, civil wars, sabotage, and other openly illegal activities. Before Malenkov's demotion in February 1955, the Communists continued the virulence of their attacks on the United States. The "thaw" in the attitude toward the West introduced by Khrushchev and Bulganin in Europe was felt also in Asia but the temperature there did not climb as fast or as high as at the summit conference in Geneva.

In Korea, where the Communists had used the most irritating and offensive devices to stall the armistice negotiations for two years, on July 27, 1953, six months after Mao Tse-tung had said the war would be waged for years if necessary, they suddenly agreed to conditions that differed but little from what had been offered time and time again during the embittered negotiations.

At Geneva on July 21, 1954, after their sensational Vietminh victory at Dienbienphu, May 7, the Communists signed three agreements bringing to an end a war that had been waged in Indochina for seven years and seven months, a war which the Communists seemed to be winning.

In the Formosa Strait the Communists continued until the spring of 1955 to threaten to "liberate" the great and beautiful island and its offshore neighbors by force. They underscored the seriousness of these threats by intermittent bombardment of the Quemoy and Matsu islands and by troop movements and the building of air installations on the mainland opposite the strait. Tension in the Formosa Strait area was intense during the winter of 1954–55. The Tachens were evacuated by the Nationalists in February and an informal "cease-fire" status had almost been reached by the time of the Bandung Conference (April 18–24, 1955). There the Communist Premier, Chou En-lai, declared that the Chinese people did not want a war with the United States and that his government was willing to negotiate on the question of relaxing the tension in the Formosa Strait. As a sequel to these declarations and the backstage negotiations that had preceded them, a conference began in Geneva on August 1, 1955, between Ambassador U. Alexis Johnson of the United States and Ambassador Wang Ping-nan of the People's Government.

The principal Communist parties seeking power in South and Southeast Asia and Japan made significant changes in tactics. These changes did not follow the same pattern in every country, but they reflected the same general swing again from the "left," "hard" policies of civil and guerilla war, sabotage, terror, and intensified class struggle toward the "right" or "soft" policies of peaceful coexistence between classes as well as between nations. Instead of fighting the nationalist parties, which governed the newly independent states, the Communists, at different times in different places, tried to make peace with the nationalists and draw them into "people's democracy fronts" consisting of all democratic, "antifeudal," anti-imperialist forces.

The violent period had followed, in most cases, the founding of the Cominform in 1947, the development of the "Zhdanovshchina" in the USSR, and the mounting successes of the Chinese Communists spreading out from their territorial base in North China.

Indonesia and India

In Indonesia in September 1948, where the situation of the new Indonesian republic was desperate, the Communists tried to establish a territorial base by seizing the city of Madiun, the third largest in the republic. The people did not follow the Communists, and the revolt was a bloody, costly failure. In 1952 the Indonesian Communist party switched from attacking the nationalists to trying to join them in a national front. The Communist party gained sufficient strength to help bring down one ministry and to give essential aid to Dr. Ali Sastroamidjojo's nationalist ministry from 1953 to 1955. This "united front from above" tactic has increased the prestige and influence of the Communists, who made a strikingly impressive showing (about 22 per cent of the votes) in the first elections of the Republic of Indonesia in late September 1955.

The fortunes of the Communist party of India have followed a curve similar to that of their Indonesian comrades. Like the Indonesians, the Indian Communists made terror and civil war their official policy in 1948 at the Second Party Congress, which followed a Communist-inspired conference sponsored by the World Federation of Democratic Youth and the International Union of Students in Calcutta in February. Having seized the leadership of a peasant uprising in the Telengana district, the Indian Communists had, for a time, a territorial base, but they were unable to expand its area as the Chinese had done at Yenan. The Indian government forces liquidated the Telengana base, and in 1950 the Communists were told by Moscow that in trying to follow the "Chinese path" they had gone astray. They were directed to postpone armed rebellion and guerrilla war and to compete for popular support with the Indian Congress and Socialist parties by organizing legally a broad united front like the Chinese coalition of four classes. In the first Indian general election at the end of 1952, the Communists elected twenty-three deputies to the national Parliament, becoming the second largest party after the Congress party, which elected 362.

The surprising strength shown by the Communists in the general elections of 1952 did not prove that the new tactics were irresistible, for in February 1955 the Communists were decisively defeated in elections in Andhra, a new state in which the party was believed to be exceptionally strong.[1]

Soviet Communist policy in Indonesia and India and also in Burma has been to divert the local Communist parties not only away from armed revolt but also away from out-and-out attacks against the nationalist parties in power, parties that are believed to be neutralist. The chief political enemies of the Communists are the Socialist parties and those parties such as the Masjumi in Indonesia which have a religious background or are suspected of a willingness to regard the United States as a friend rather than as the leader of a new imperialism.

Philippines and Malaya

In the Philippines and Malaya the Communists had launched a guerrilla war when Moscow gave them the signal in 1948. These guerrilla wars were costly, but the Communists kept them going after they had changed their tactics elsewhere. The guerrilla wars never grew into civil wars. In May 1954, Luis Taruc, the leader of the Hukbalahaps, surrendered, and on June 23, 1955, the leaders of the Malay People's Liberation Army sued for peace. The British rejected this proposal of an armistice and offered amnesty to those Communists who gave themselves up. The Communist party of Malaya made a new peace offer on September 24, 1955, to end the eight-year war or, as it is

[1] The history of the Communist party of India has been well told by M. R. Masani, *The Communist Party of India: A Short History* (New York, 1954) and analyzed by John H. Kautsky, "Indian Communist Party Strategy Since 1947," *Pacific Affairs,* June 1955, and by Marshall Windmiller, "Indian Communism Today," *Far Eastern Survey,* April 1954.

called in Malaya, "the emergency." Tengku Abdul Rahman, the chief Minister of the Federation of Malaya, with the approval of the British High Commissioner, agreed to meet the Communist leader, Chin Peng.

Burma and Ceylon

Burma, Ceylon, and Japan have had legal Communist parties—Burma has had the dubious distinction of having two competing Communist groups and Ceylon three. In Ceylon and Burma the Communist movement has been too much divided and too badly led to be as useful an instrument of Soviet policy as in India and Indonesia. It has perhaps also been hampered by the opposition of the Buddhist faith. In Burma the orthodox Communist party followed the "Calcutta line" after 1948, engaging in guerrilla warfare and other kinds of violence while trying to follow the "Chinese path." As elsewhere, these tactics failed and as in the neighboring states, the Communist party of Burma began to change its tactics. A pro-Soviet Burma Workers' and Peasants' party was set up to carry on legal united-front political activity. This was in line with the revised Soviet policy before and after Stalin's death. As with India and Indonesia the Soviet Union prefers to cultivate the good will of the Burmese government as a member of the "peace area" rather than to encourage the local Communists to try to destroy that government.

Japanese Communist party

In Japan, Soviet Communist policy has followed a different timetable. The Communist party of Japan, organized in 1922 and suppressed in 1934, was reborn in 1945 during the American occupation, when SCAP restored "political, civic, and religious freedoms" and encouraged the revival of political parties. From the return from Yenan of the veteran leader, Sanzo Nosaka, in January 1946, to January 1950, the party followed the line of peaceful, democratic activity, trying to appear as "the lovable Communist party." In 1949 the party elected thirty-five members of the national Diet and launched a drive to "acquire a million Bolsheviks." Encouraged by Communist victories in China and by directives from Moscow, and perhaps in anticipation of the approaching crisis in Korea, the Communists in 1950 changed their tactics and launched a series of strikes and acts of violence and sabotage. Nosaka's peaceful revolution formula was denounced by the Cominform. Especially violent demonstrations took place in 1952. In the face of official retaliation and public resentment the Communists failed to elect a single deputy to the Diet in the elections of October 1952.

A year later, seven months after Stalin's death, the Japanese Communists again changed their tactics in accordance with the policies laid down by Moscow for the other Asian parties. The new program called for a united front based on the slogans "anti-America, anti-Yoshida, and antirearmament" and for repudiation of the San Francisco Peace Treaty and other agreements with the United States. The program also included opposition to foreign military bases, withdrawal of foreign troops, restoration of normal and friendly political and trade relations with the Soviet Union and Communist China, freedom of travel, speech, assembly, and association (not permitted in Communist countries), and opposition to the Pacific military alliances (such as existed or were proposed between the United States and various Pacific nations including Japan). In Japan, as in India and Indonesia, the new policy does not mean that the Communist parties have abandoned and destroyed their underground and military apparatus.[2]

Soviet-Japanese relations

Along with Communist party activities the Soviet Union has used diplomacy and propaganda to persuade the Japanese that economic survival, political independence, and national security depend on eliminating American military establishments in Japan and Okinawa, the re-establishment of normal trade and diplomatic relations with the Chinese mainland and the Soviet Union, the realization of Japanese neutrality outside the orbit of the American imperialists and alongside the "peace area" that the Peking government, with Soviet support, is working with Premier Nehru to create in Asia. The USSR has used more tangible inducements, including the possibilities of much needed raw materials, the repatriation of war prisoners, a new fishing agreement that would extend Japanese fishing grounds, the possible return of the Habomai and Shikotan Islands between Hokkaido and the Kuriles, and the possible support of Japan's admission to the United Nations. Behind these agreeable possibilities are less agreeable ones—the nearness of Russian air and naval bases, which the Japanese are never allowed to forget.

Soviet-Japanese peace treaty negotiations began in London in June 1955 and after four months were suspended. The Soviet conditions for the restoration of normal relations appear to have been little affected by the changes at the Soviet summit since 1953. They were the same as those presented at the San Francisco conference in 1951. The Soviet negotiators required Japan: (1) to recognize Soviet sovereignty over southern Sakhalin and the Kuriles; (2) to take no part in a military pact aimed at countries opposed to Japan in the Pacific war, that is, to annul the Japanese-American Security Treaty; (3) to demilitarize the straits of Tsugaru, Soya, Nemuro, and Tseushima; (4) to agree to extended cultural relations; (5) to agree not to interfere in each other's domestic affairs; and (6) to waive reparations claims.

NEW TACTICS OR NEW STRATEGY?

Does this important tactical change mean merely that the Communists have concluded that more flies can be caught with sugar than with vinegar? Or does it mean that the Communists in the last decade have worked out a new strategy? Professor John H. Kautsky makes the interesting suggestion[3] that Mao Tse-tung has combined the best features of the two traditional Communist strategies: the "left" or "hard" tactics advocating "united front from below" and the "right" or "soft" based on "united front from above." According to this formula, the Communist party is not only the party dedicated to the leadership of the toiling and exploited masses in their struggle against the bourgeoisie but also the party dedicated to the leadership of the bourgeoisie against foreign imperialists. Mr. Kautsky sums it up this way: "Indeed if the 'left' strategy was the strategy of anti-capitalism and the 'right' strategy that of anti-fascism, the new strategy is the strategy of anti-Americanism."[4]

There is no doubt that after Stalin's death and until about the time of the Bandung Conference, the Communists tried to persuade the Asians that the worst enemies of peace and progress

[4] *Ibid.*, p. 484.

were not the native middle-class nationalists but the American "colonizers" who, *Pravda* charged,[5] had promoted a terrorist organization, the name of this terrorist band being the Salvation Army! Later, particularly after Khrushchev and Bulganin became their chief Soviet spokesmen, anti-Americanism became less virulent. Peking got in step with Moscow—lagging a bit—and began to talk more about "peaceful liberation," and the virtues of trade and less about germ warfare and other atrocities.

Time will tell whether the acceleration of this tendency since Stalin's death means, as Mr. Kautsky believes, that "the class struggle has been replaced by the cold war" as the basic Communist strategy or whether, as it appears to me, this is a significant change in tactics rather than in basic strategy, a change designed to fit present conditions in, and aspirations of, underdeveloped countries. It does not appear to me to mean the abandonment of the strategy based on the Marxist theory of the class struggle, the Leninist theory of imperialism, and the Stalinist theory of the general crisis of capitalism. Under the banner of "proletarian internationalism," the encouragement of class consciousness and class struggle, the promotion of the allegedly inevitable divisions, rivalries, and conflicts between non-Communist nations, and co-ordination and mutual aid between Communist parties of all countries are still basic features of the strategy of the world Communist movement. The new tactics greatly lessen the danger of a new total war; they make possible the gradual transformation of a cold-war coexistence into a competitive coexistence. There is always the possibility that such a coexistence may continue indefinitely and that the competition of political and economic systems will lead to the modification of both rather than to their mutual destruction.

[5] September 22, 1953.

Post-Stalin Events

Stalin's death did not appear to have any important effect on Sino-Soviet relations. The Chinese Communists paid the expected tribute to the departed and accepted the principle of collective leadership for the Soviet Union and the world Communist movement without, however, adopting it for China. Mao Tse-tung became the most eminent of living Communists after Stalin's death, but China's needs and dependence on the Soviet Union were too great to allow Mao to claim the prerogatives of his pre-eminence even if he had any inclination to do so. China continued "leaning to one side," seemingly undisturbed by the fact that Beria, one of the collective leaders, was accused of treason by his comrades, condemned, and shot and that another collective leader, Malenkov, the first among the equals, confessed his inadequacy, was demoted, but was allowed to live. Behind the Chinese Communists' prompt and dutiful acceptance of these changes, the fact remained that three years after Stalin's death the prestige of the Russian leadership had fallen in Asia as that of the Chinese leaders, particularly Mao Tse-tung and Chou En-lai, had risen. It is possible that the warmth with which Khrushchev promoted peaceful coexistence may have been the result of the desire to regain for the Communist fatherland the prestige and policy initiative among the Communists that had been seriously compromised by the loss of Stalin, the Beria scandal, and Malenkov's failure to keep the power he had inherited.

Korean armistice

The Korean armistice and exchange of war prisoners showed several things of which the Kremlin was forced to take note. For one thing, neither the Communists nor the United Nations was willing to pay the cost in lives and other ways to try to unify Korea by victory on Korean soil. Neither side was ready to run the risk of a general war by spreading the fighting to the Communist "sanctuaries" in China or to the United Nations sanctuaries in Japan. The non-Korean belligerents wanted more to end the fighting than to unify Korea. The Communists must have wanted very badly to end the fighting or they would not have agreed to the voluntary repatriation of prisoners. They opposed this with all the means at their command short of continuing the war and finally agreed to the loss of face involved in the refusal of over 74 per cent of the Chinese "volunteers" to return to the fatherlands the Communists were in the process of transforming.

The Communists turned on the full force of their propaganda to obscure by extravagant claims of victory the bleak fact that they had failed in their major objective to win all of Korea by force, that they had provoked a successful application of the principle of collective action, under UN auspices, against aggression, and that they had caused the United States to speed up its rearmament and redouble its efforts to strengthen regional security and economic aid against direct and indirect aggression.

The war in Indochina

As the Korean crisis subsided into a stalemate, the war in Indochina, which had been treated as a brush fire or a fringe war for several years, suddenly seemed on the point of spreading throughout Southeast Asia. To what degree the stalemate in Korea enabled the Chinese Communists to increase their aid to Ho Chi Minh is not clear, but it is a fact that the Vietminh successes increased in range and significance after the Korean cease fire. It is also true that the regime of Bao Dai had lost prestige and the power of resistance and that both the funds and the morale of the French had been all but exhausted in a war that they could afford neither to win nor to lose. The United States seemed to be faced with the unpleasant choice of seeing all of Indochina fall into Communist hands or of intervening as in Korea, but without such a clearly drawn issue and against the prevailing opinion in Asia and in the North Atlantic Treaty Organization.[6]

Geneva Conference, 1954

At the four-power conference in Berlin in February 1954, the foreign ministers of France, the United Kingdom, the Soviet Union, and the United States agreed to meet at Geneva on April 26 to discuss Korean questions and peace in Indochina.

Representatives of nineteen countries met at the Geneva Far Eastern Conference on April 26, 1954, to discuss these matters. The Russians again tried to have the Chinese People's Government given a status of equality with the Big Four but, largely through the opposition of the United States, failed. The plan for unification of Korea on the basis of free elections made no headway in the Conference chiefly because of conditions and obstacles presented by the North Korean regime, supported by the representatives of the Soviet Union and the Chinese People's Government. The Communists, who had been declared aggressors by the UN, took the line that the UN was the aggressor and should therefore be excluded from all responsibility for the proposed elections. This

[6] The story of the war in Indochina and the cease fire has been told by Ellen J. Hammer, *The Struggle for Indochina* (Stanford, Calif., 1954) and *The Struggle for Indochina Continues* (Stanford, Calif., 1955).

line had about the same relation to reality as the myth about the Chinese "volunteers" who in complete formations and with full equipment and logistical support had joined the Korean War. If the Communists of the Soviet Union did not originate this argument, they supported it. Korea remained divided, with the elections as far off as ever. So far as Korea is concerned, Soviet policy since Stalin has been to hold to the present division, build up North Korea militarily and economically, wait confidently for the disintegration of the present regime in the Republic of Korea or its abandonment by the United States and permit North Korea to remain in the sphere of interest of China.

The Communists had much greater success in that part of the Geneva meeting that dealt with Indochina. They were in a much stronger position, because the Vietminh forces, aided by China which in turn was aided by the Soviet Union, were winning victories. Their forces captured Dienbienphu on May 8, while negotiations were going on. The French, upon whom resistance largely depended, were weary and divided. The Vietnam nationalists were at odds among themselves and with the French. The Americans, to whom both the French and the Vietnamese looked for material and moral support, were unwilling to intervene in force and so become involved in another "Korea," and they were reluctant for domestic political reasons to negotiate with the Vietminh and the Chinese Communists, with whom it was necessary for somebody to negotiate if the seven years' war in Indochina were to be ended. Neither the French nor the Americans came to Geneva with a program, much less a joint program, except the admirable but unrealistic objective of a free, united, and democratic Indochina, an objective that might have been realized only if the Vietminh had been losing instead of winning the war.

The Communists appeared to be willing to accept a stalemate of the Korean type. Since United States politics and policy prohibited Mr. Dulles from talking either peace or war with the Communists, the leadership and the laurels of the conference were taken by Sir Anthony Eden and Mr. Molotov, who served as presidents, and by Mr. Chou En-lai, who showed great skill in making the best use of the advantageous military and diplomatic position of the Communists and of the awkward predicament of their opponents, who were made to appear as opposed to peace and incapable of war.

Provisions on Indochina

On July 21, 1954, the representatives of the governments directly concerned signed agreements which included three provisions: All of north Vietnam from the Chinese border to approximately the seventeenth parallel was left under the control of the regime headed by Ho Chi Minh, now known as the Democratic Republic of Vietnam. Vietnam south of the parallel remained under the state of Vietnam, at that time headed by Bao Dai, the Emperor in absentia, who was soon succeeded by Ngo Dinh Diem, as the de facto head of the Vietnam government. The United States agreed to respect these terms but not to be responsible for their enforcement, which was left to a commission of Polish, Canadian, and Indian members under Indian chairmanship. The independence of Laos and Cambodia was recognized, and Laos was in effect divided like Vietnam when the Communist, Vietminh-led Laotian rebels, known under the ancient name of Pathet Lao, were given special status in three provinces, a status which they have since maintained with arms. The conference reaffirmed the unity of Vietnam (North and South) and agreed that its future status should be decided by a free and secret election to be held in July 1956.

COMMUNIST CHINA AFTER GENEVA

With the prestige gained by military success in Indochina and by diplomatic successes at Geneva the Communists intensified the propaganda of peaceful coexistence, and at the same time the Chinese Communists kept up the tension in the Formosa Strait by military activity and by threats to liberate the island of Formosa from alleged American occupation.

The five principles of Chou En-lai and Nehru

On June 28, 1954, Premier Chou En-lai and Pandit Nehru proclaimed their "five principles" of international conduct as a sound basis for peaceful coexistence among the nations of Asia. These principles had been the basis of the Sino-Indian agreement on Tibet of April 29, 1954. The five principles were: (1) nonaggression, (2) noninterference, (3) mutual respect, (4) equality and mutual benefit, (5) peaceful coexistence. There was, of course, nothing new about these principles. As a matter of fact, seventeen years before, on July 16, 1937, Secretary of State Cordell Hull, in different words, had covered all of these principles and in addition that of disarmament in his six "fundamental principles of international policy." They all are excellent proposals and all of them have been violated by the Communists, who committed flagrant aggression in Korea, interfered in every Asian country, and showed the utmost contempt and disrespect for the new governments set up by national and socialist parties of East and South Asian countries.

The joint promulgation of the five principles, however, had a great effect in Asia, for several reasons. They were proclaimed to be the basis of a "peace area" to which Red China and India and later Burma and Indonesia belonged. The USSR not only approved the "peace area" but, in effect, joined it by claiming that these were the very principles on which Soviet policy had been founded. The announcement was well timed, since it was issued while the Geneva talks were going on and world attention was focused on peace or war in Asia. The fact that Chou was a cosigner of the declaration seemed to suggest that the Communists might have turned over a new leaf and given up their aggressive program of liberating other Asians from their chosen leaders. The fact that Nehru was a cosigner seemed to suggest that the dangers of Red aggression and subversion could be eliminated if there were only enough confidence and good will to meet the Communists halfway.

Attitudes to U. S.

In contrast to this shining example of peaceful coexistence between "peace-loving" Communists and peace-loving non-Communists, all Communist parties and some neutralists followed the Soviet lead in representing the United States as the imperialist aggressor and "colonizer" and the chief obstacle to peaceful coexistence. They denounced the Southeast Asia Treaty Organization formed under United States leadership at Manila in September 1954 as what *Pravda* later described as "the aggressive SEATO pact" and a "military conspiracy of the colonizers in Asia."[7] Vyshinskii carried the campaign in the United Nations with a demand that something be done about American aggression against China.

[7] May 20, 1955. Translated in *Current Digest of the Soviet Press*, Vol. 7, No. 20, p. 19.

Sino-Soviet relations

During the autumn of 1954 and the winter of 1955, while there was still much talk of war in Southeast Asia, Sino-Soviet relations appeared to reach a greater degree of intimacy and mutual admiration than ever. Following in the footsteps of the Soviet elder brother, the Chinese People's Congress, on September 20, adopted the Constitution of 1954, which was based on the Common Program and the two Organic Laws adopted in 1949. But it also borrowed many of the provisions and some of the language of the Stalin Constitution of 1936. The new organic law proclaimed the successful resistance to United States aggression and "indestructible friendship with the great USSR and the People's Democracies." The Chinese Communist party followed Soviet example in another way by launching a purge as the elder brother had done so often in Stalin's time. On the fifth anniversary of the Chinese Communist assumption of state power, the Soviet Union announced that all Soviet forces would be withdrawn from the Port Arthur naval base and all installations handed over free to the People's Government. This transfer took place on May 24, 1955.

The Chinese Communists gained more prestige than the Russians from the events in Korea and Indochina, and from Chou En-lai's diplomacy at Geneva and among China's Asian neighbors. These achievements may have strengthened Peking's position in dealing with Moscow and underscored the fact that China was not a satellite but a partner of the USSR. In February 1955 Molotov paid his Chinese comrades the honor of including China with the USSR as heads of the camp of Communism. The Soviet official statement accords the Chinese the honor of being referred to as the "great" Chinese people, an honor otherwise reserved for the "great Soviet people." That China was still a junior partner of the Communist axis was clear from the fact of China's dependence on the Soviet Union for economic and technical aid in both civilian and military development programs.[8]

Three years after the Sino-Soviet Treaty of Friendship and Mutual Aid, China's trade with the Soviet bloc had grown from 26 per cent of the total to 72 per cent. In 1953 and again in 1954, when Khrushchev and Bulganin visited Peking, the Russians made economic and political agreements reflecting both China's growing prestige and her growing needs. The dissolution of the joint Sino-Soviet stock companies and the supply of more technicians were promised. But China's import needs were vastly greater than could be supplied by the USSR.[9]

It is suggested that one immediate effect of China's increase in prestige and needs is to cause the Soviet Union to retain China's warm partnership "at the expense of weaker European countries," which have been forced to help foot the bill for China's economic development.

BANDUNG CONFERENCE

The Soviet Union strongly approved of the Bandung Conference, and the Communists did their best to make the most of the occasion to convince the Asians and Africans and, in fact, the world at large, that the Soviet and Chinese parties that had previously supported and directed sabotage, guerrilla, and civil wars against the Asian governments were now wholly dedicated to the proposition that countries having different political and social systems could and should exist peacefully side by side. Large Soviet and Chinese delegations with representatives of fourteen other countries attended an unofficial coexistence conference on April 10 at New Delhi as a kind of warming up for Bandung.

President Soekarno's speech

In his speech opening the conference, President Soekarno referred to two events of the past. One was the conference in Brussels by the League Against Imperialism nearly thirty years before. He observed that many distinguished delegates who were present at Bandung had attended the Brussels meeting to discuss their fight for independence. President Soekarno did not mention the further interesting fact that the League Against Imperialism was actually a "front" organization set up under the guidance of the Comintern to establish contact with leaders of Asian nationalist movements such as Pandit Nehru and Soekarno himself. Neither the League Against Imperialism nor the Comintern exists today, but the leaders of the Communist movement have revived their policy of cultivating contact with Asian nationalist leaders.

President Soekarno also mentioned the fact that the Bandung Conference was opening on April 18, the anniversary of Paul Revere's ride on April 18, 1775, and "the opening of the American War of Independence, the first successful anticolonial war in history."

Premier Chou En-lai

Premier Chou En-lai did not salute the Americans as pioneers in the struggle against colonialism, but his references to the United States as solely responsible for the tensions in the "Taiwan area" and in connection with SEATO were made in language much more restrained than had been customary in Communist comment on American policy and national character.

In urging the Asian-African delegates to seek common ground in spite of different ideologies and different social systems, Premier Chou said that two groups of Asian and African countries had gained independence since the war. One group consists of countries led by Communists, the other group of countries like India, Burma, and Indonesia, which are led by nationalists. "Is there any reason," asked Mr. Chou En-lai, "why we cannot understand and respect each other and give support and sympathy to each other?" The Premier failed to mention one important reason why such understanding and support would be difficult, the fact that in all of the countries of the second group the Communists have tried to overthrow and destroy the independent regimes set up by the nationalists. Did he expect that Asians and Africans who had been exposed to Communist conspiracy, abuse, and violence would have forgotten so soon? In any case, other members of the conference repaired the omission and pointed out to the Chinese delegate that Africans and Asians were exposed to more than one kind of imperialism.

Premier Chou replied with courtesy and restraint. He proposed that if "peaceful coexistence" were tainted with Communism the words "Live together in peace" be substituted. He suggested that two more principles be added to the five promulgated by Premier Nehru and himself: (6) "respect for the rights of people of all countries to choose freely a way of life as well as political and economic systems"; (7) "abstention from doing damage to each other." Far more significant was a remark later in his speech. Instead of the familiar

"hate America" routine he said: "As to relations between China and the United States, the Chinese people do not want to have war with the United States. We are willing to settle international disputes by peaceful means." Chou En-lai did not, of course, admit that the problem of Formosa was an "international dispute" but he substituted "talk" for "war" as a method of dealing with differences between the United States and the People's Government.[10] This suggestion of negotiation instead of forceful liberation and the general moderation of his tone added to his prestige and contributed to the success of his diplomacy, opening the way for the talks begun in Geneva on August 1, 1955, by Ambassadors U. Alexis Johnson and Wang Ping-nan.

CHINESE-INDONESIAN TREATY

The Premier of the People's Government gave tangible evidence of Red China's good intentions toward her neighbors by announcing at Bandung his government's willingness "to solve the problem of dual nationality of overseas Chinese with governments of the countries concerned." A treaty was negotiated with Indonesia in which Peking recognized the right of the Indonesian residents of Chinese descent to choose whether to become citizens of China or of Indonesia. This treaty, intended to be the model for similar treaties with other Soviet–East Asian countries, was perhaps also intended to diminish Chinese Nationalist influence among the 12,000,000 overseas Chinese, but even so it appeared to be a step in the right direction in an old and troublesome problem.

[10] This and preceding quotations are from *Selected Documents of the Bandung Conference: Texts of Selected Speeches and Final Communiqué of the Asian-African Conference, Bandung, Indonesia, April 18–24, 1955*, distributed by the Institute of Pacific Relations.

U. S.–PEKING TALKS AT GENEVA

Soon after the summit conference, talks began at Geneva at the ambassadorial level between Messrs. Johnson and Wang. After a month of talks the Peking government agreed to release the Americans whom they had seized and condemned as spies. This bandit style of diplomacy was practiced in more primitive societies where foreigners were seized and held for ransom. In the present case, as in Soviet negotiations with the Germans and Japanese, the ransom for the prisoners was some diplomatic concession to Communist demands. Communist concessions on repatriation, however, relieved tensions on a problem that the Communists had deliberately created. Neither at Bandung nor at Geneva had the Communists changed their position on basic Asian issues.

COMMUNIST OBJECTIVES

As several observers have noted, there has been much elbow rubbing and bending and much champagne and vodka drunk in the name of peaceful coexistence, but peaceful coexistence remains in the Communist ideology not an end but a means. The new tactical objectives are these: (1) to take advantage of the Asians' desire to make technological and social progress in the shortest possible time; (2) to exploit the Asians' hope of preventing their countries from becoming the battleground of the struggle between the two great power systems; (3) to prevent the West from making use of its greater resources in technology, capital, and the creative initiatives of a free society. Soviet support of the "peace area" based on the "five principles," the offers of technical and military aid not only to the Communist bloc but to the nations of South Asia and the Middle East, and the efforts to identify Soviet policy with that of the Arab-Asian bloc and the Bandung nations generally in opposition to colonialism—these are practical applications of the new tactics.

Harold H. Fisher, L.H.D., Palo Alto, California, is professor of international relations at San Francisco State College, chairman emeritus of the Hoover Institute and Library, and professor of history emeritus at Stanford University. He served in the American Expeditionary Force in World War I, was an officer of the American Relief Administration in Eastern Europe and Russia, and has traveled widely in the Middle East, South Asia, and the Far East. He was director of the Civil Affairs Training School and the School of Naval Administration at Stanford University during World War II. Among his published works are The Communist Revolution (1955); America and Russia in the World Community (1945); The Famine in Soviet Russia (1927); and (with others) The Bolshevik Revolution (1934) and The Bolsheviks and the World War (1940).

The Soviet Union and the United States: Problems and Prospects

By Philip E. Mosely

STALIN'S successors have modulated somewhat the bad manners of Soviet policy and have refurbished its arsenal of diplomatic and psychological weapons. The new flexibility of their tactics has brought important gains and promises more for the future. Stalin's threats and bludgeonings—the pressures against Greece and Turkey, the attempt to starve West Berlin into submission, the Communist attack on South Korea—forced the threatened countries of the free world into countermeasures and new defense arrangements and made the United States, reluctantly, the chief bastion and promoter of resistance to further Soviet expansion. At first timidly, since 1954 with growing self-assurance, the new Soviet leadership has shifted and varied its tactics. Has it changed its basic strategy?

Leading from Weakness?

Since Stalin's death there have been numerous and clashing estimates of the Soviet power position. Some commentators have pictured a Soviet leadership disrupted by the danger or reality of mutual destruction. They have inflated the execution of Beria or the demotion of Malenkov into a harbinger of the imminent downfall of the Soviet system and have overlooked the basic persistence of the Stalin-erected apparatus, which rules through massive and all-embracing institutions that in turn are regulated and propelled by the Communist party. They have often confused the struggle for power within the system—a struggle which is always bitter and often fatal within a totalitarian regime—with a crisis of the system itself.

Stalin's successors have been franker than he was in admitting defects in Soviet economic plans and achievements and have taken some fairly substantial steps to raise agricultural production, improve housing, increase economic incentives, and raise somewhat the standard of living. From this fact many foreign commentators have drawn contradictory but usually comforting conclusions. The new leadership, some say, has abandoned its world-wide ambitions and is primarily interested in promoting the welfare of its own people. Or, contrariwise, the leadership is, others assert, unable to cope with its accumulated economic problems and is therefore interested in achieving a genuine basis of understanding and coexistence with the outside world, even to the point of making major political and territorial concessions.

Within the framework of the basic drive to build heavy industry and military strength, the new leaders have made substantial but still minor concessions to strengthen the lagging fields of food, housing, and living standards. But actual investments in military strength have continued to increase since March 1953, and heavy industry has maintained its remarkable rate of growth. The prospect is strong that the Soviet economy will continue the race to outstrip all other economies except

that of the United States. Ten years from now the American and Soviet economies will overshadow even more ominously those of all other countries.

The prospect is strong for a continued bipolarization of military as well as economic power. True, some analysts predict the widespread development, within a few years, of "cheap" atomic-hydrogen power and the emergence of the intercontinental guided missile as a "poor man's weapon." If these forecasts prove true, the present bipolarization of the newest forms of power may be followed by a new distribution of strength among countries, and by new dangers, too. Until these predictions have been tested, however, one basic factor of great importance is the trend toward ever more complex and costly systems of modern weapons. In this race, which is both technological and economic, only three major countries are now able to stand the pace. In both technology and resources the Soviet Union continues to demonstrate great and growing military strength.

Moscow's Political Offensive

Stalin's policies had, as he boasted, extended the Communist system to one-third of the population of the world, but they had also aroused hate and fear outside the realm of his writ. His successors turned their hands to liquidating the political liabilities which they had inherited, thereby recovering greater freedom of political action. In 1953 Moscow dropped Stalin's stubborn insistence that Turkey surrender one-fourth of its national territory. In 1955 it returned to the Finns the Porkkala enclave, a base outmoded in the age of atomic warfare. It abandoned its grip on Eastern Austria. It persuaded the Yugoslav leadership that the independence and survival of their country were no longer threatened by Soviet enmity. Except in the case of Austria, each of these "concessions" was a recognition of facts which could not be changed except at the risk of war. None of them cut into any Soviet positions of strength. However, for many people fearful of war and yearning for more hopeful omens, the new trend offered "proof" of an entirely new Soviet policy, a permanent policy of live and let live.

In Germany, which the Soviet leadership regards as the key to Europe, it has made no concessions. The two Geneva conferences of 1955 demonstrated the Kremlin's persistent belief that it can exploit the desire of the German people for reunification in order to detach it from its alliance with the West. The fear of Soviet preponderance may deter the West Germans for some years from accepting Soviet terms for reunification. Will it be effective indefinitely?

The Soviet leaders look to a new depression in America, with its repercussions throughout the free world, to force West Germany to seek markets in the Soviet bloc, to detach itself from the West, and to accept Soviet terms for national reunification. Meanwhile, it has made abundantly clear that it has no notion of sacrificing East Germany, its most valuable colony, for the sake of any paper assurances of "security."

Soviet smiles and token concessions have given new currency to Moscow's proposals for a European security pact. At the two Genevas the Kremlin proposed a series of stages by which the Western North Atlantic Pact and the Eastern Warsaw Pact would be fused into an over-all European security agreement. If achieved, this result would completely eliminate the role of the North Atlantic Treaty Organization as a framework of Western defense. On the other hand, through its control of the party, secret police, and military apparatuses in the satellite regimes, the Soviet-led groupings in Eastern Europe, now including East Germany and Al-

bania, would still remain a fully effective, ever ready instrument of Soviet purposes.

Of course, the Soviet spokesmen did not expect the NATO governments to swallow the bait, but at no cost to their own strength or programs they have promoted a greater sense of security in the West and a growing reluctance to make sacrifices for the strength of the Western bloc, and have contributed to slow down the rate of NATO's military build-up. If the NATO countries reduce their military efforts by, say, five or ten billions of dollars a year, the relative gain to the Soviet bloc, with its steady increase in military resources, will be well worth a small diplomatic effort.

SOVIET TRAVELING DIPLOMACY

As a symbol of its new flexibility of tactics, the place of the remote and cryptic Stalin has been taken by the eager and voluble travelers Bulganin and Khrushchev. While their appearance in Belgrade may have had relatively little effect upon the cautious and strong-willed Yugoslavs, with their recent memories of Russian interference and menaces, it is more difficult to appraise the impact of their visits to India and Burma. There the flattering attentions of the leaders of a great power have apparently reinforced the feeling that the Soviet Union represents a remote and presumably beneficent power. Other visits have been foreshadowed, to Britain, France, and Egypt. In each mission the Soviet spokesmen emphasize, crudely but not ineffectively, those interests and emotions which may draw other peoples to support specific Soviet policies and, above all, those prejudices and fears which may turn them against the United States.

Under Stalin, Soviet policy concentrated its pressure against its immediate neighbors along the periphery. Under his successors, Soviet policy reaches farther afield. To the Arab countries, which do not feel Soviet pressure directly, as have Turkey and Iran, it offers political support against Israel and promises of economic assistance and military supplies, to enable them to escape from one-sided dependence on the West. To India, which is more interested in its struggle with Pakistan over Kashmir than in any seemingly remote Soviet ambitions, it offers political support for the annexation of the Portuguese enclaves and remarkably favorable terms for constructing a large steel mill. To Burma, which may see the usefulness of direct Soviet interest as a potential offset to possible Chinese Communist pressure, it offers industrial equipment and technical assistance in exchange for its embarrassing rice surplus.

Within the United Nations the new Soviet diplomacy has also shown an unaccustomed sureness and flexibility. On more and more occasions it has found its positions supported not only by the Asian-African bloc but also by a substantial number of Latin American states. It can no longer complain of the "mechanical majorities" rolled up in support of United States proposals. Instead of insisting rigidly upon its one-sided proposals for disarmament, it has flexibly adopted the Western proposal for over-all numerical limitations on defense forces and has pushed hard for the acceptance of early limitations on the use of the atomic bomb, while resisting the insistence of the West on the need for establishing effective controls. Still, in many countries the Soviet tactics in the question of control of armaments have greatly lessened suspicion of Moscow's intentions.

Perhaps the Kremlin's persistent rolling of the "anticolonialist" drums has been its most effective instrument. The "West" is easily identified as the bogeyman for peoples recently emancipated from alien rule, or still seeking their emancipation, and the Soviet leaders are working hard, as they have since 1917, at attuning these deep-seated emotions to their own interests.

SOVIET EXPECTATIONS AND AIMS

While the Soviet leadership continues the strenuous pace of economic development at home and pursues the consolidation of the Soviet sphere, it looks hopefully for signs of economic decay and political disruption in the non-Soviet camp. True, the Soviet picture of American and Western economic life is no longer so grossly oversimplified as it was in Stalin's last years. Delegations of farm experts and housing administrators have admitted that there are new and valuable ideas to be gleaned from Western innovations, and *Pravda* has condemned technicians who claim that everything Soviet is best. On the other hand, Soviet periodicals are predicting an early economic depression in the American economy, which, they maintain, has been sustained only by the armaments race. They point out that the crash of 1929 came ten years after World War I, implying clearly their hope for a new depression, scheduled to begin ten years after the close of World War II.

Even without the long-awaited economic crisis, the Soviet press eagerly picks out each new evidence of "imperialist rivalries" within the non-Soviet world. As Stalin explained in his *Economic Problems of Socialism* (October 1952), these conflicts are bound to undermine any efforts to consolidate the free world and must even lead to new wars within it, wars which could only redound to the advantage of the Soviet Union. Of course, all programs of United States economic assistance, in this view, are designed only to "export unemployment," to weaken foreign competitors, and to establish "control by the dollar" over underdeveloped areas. As in Stalin's time, Soviet commentators believe that Germany and Japan are especially vulnerable to a new depression and to American competition, and therefore especially susceptible to being wooed away from the American-led bloc of "imperialists."

Without waiting for a major depression or a "general crisis of capitalism," the Soviet leadership is working hard to break up those links of solidarity which Stalin's policies did so much to forge within the non-Soviet world. Both by direct diplomatic and not-so-diplomatic appeals and by indirect appeals to pride, fear, and envy, Soviet policy and propaganda endeavor to exploit the inevitable disagreement and dissensions within the free world. Against American policies Soviet propaganda appeals in France to deep-seated fears of a rearmed Germany, in Germany to the suspicion that it is France, rather than Russia, which seeks to keep Germany divided. Soviet policy and propaganda have intensified their main effort, which aims to divide the United States from its allies, and thus to bring about the retraction of American power to North America.

The principal aim of the Soviet leaders, now as under Stalin, is to eliminate the system of bases which, in case of conflict, might support American pressure against the Soviet Union. The United States and the Soviet Union have been approaching "atomic parity," in terms of their capacity to inflict punishment on each other. Soon the principal advantage which the United States and its allies may still enjoy will be the geographical one of being able, in case of Soviet attack, to effect or threaten convergent retaliation from many directions. It would be a long time before the Soviet leadership would, under such conditions, be confident of the ability of their regime to survive, even if they suc-

ceeded in destroying the major American cities.

American and Soviet strategic power may soon enter a stage in which each can destroy the other without the use of intervening bases. However, if American policy, at that stage, discards its alliances or disregards its allies because it need no longer rely on bases outside North America, Soviet policy will be encouraged to increase its pressure on the countries lying in between. As the arm of strategic power is lengthened, the United States will need to build the community of interest within the free world not less actively but more actively than it has done so far.

SOVIET AIMS IN ASIA

Since World War II Soviet policy has failed in Europe to expand its sphere of control beyond the line of its military penetration; in fact, it failed to secure control of Austria and Finland, and in 1948 it drove Yugoslavia into a desperate assertion of its independence. As after World War I, Soviet Communism failed in Europe to win any new country by voluntary conversion to its creed.

In Asia the victory of the Chinese Communists, achieved after many years of political and military struggle, marked the beginning rather than the end of a desperate and crucial wrestling for the future of Asia. The stalemating of the Communist forces in the Korean War and the temporary pause in the military struggle for Southeast Asia offer no inherent assurance of the long-continued stabilization of contesting forces. One of the main purposes of post-Stalin Soviet policy is to prepare favorable conditions for the renewal of Communist expansion in Asia.

By cultivating a renewed sense of security and relaxation among America's Western allies, Soviet policy hopes to avoid a repetition of the dangerous experience brought on it by Stalin's Korean adventure. At the time of the Korean War many countries directly menaced by Soviet threats rallied to support American counteraction in Korea, feeling that this would in turn strengthen their own security in the future. Soviet propaganda was largely unsuccessful, outside the Soviet bloc, in picturing the Korean War as a spontaneous "civil war," in which the United States and the United Nations were gratuitously interfering. In promoting an atmosphere of relaxation, Moscow hopes now to reinsure itself and Communist China against a renewed risk of this sort. Any stepped-up demand for "elections" in Vietnam or any revival of guerrilla warfare in South Vietnam will, it hopes, be regarded generally as a purely local affair, to be settled by local forces without interference by outside powers, especially by the United States.

If the Kremlin expects a new period of tensions, risks, and opportunities for Communist expansion to unfold in Southeast Asia, it is entirely logical for it to work hard at strengthening its "peace-loving" posture elsewhere throughout the world. Thereby it can, in effect, hold the ring for the Chinese Communists and their local allies in Southeast Asia while making sure that no threat of major retaliation is directed toward the Soviet Union. If the United States and its allies should then disagree concerning the desirability or necessity of blocking further Communist expansion in Asia, the Soviet leadership might succeed in its aim of separating the United States from its allies and thus dismantling the American-led security and bases system of the free world.

THE AMERICAN POSITION

Faced by the more subtle strategy and the more flexible tactics which are being pursued by Stalin's successors, American opinion has shown a wide variety of reactions. The initial assumption that the Soviet regime was about to collapse or, alternatively, that it would now devote all its energies to the welfare of its people encouraged a natural desire to limit military expenditures and to cut down economic aid to friendly nations. At the same time, in accepting the Soviet challenge to negotiate, President Eisenhower narrowly escaped the position of being forced to "prove" America's peaceful intentions. Instead, he reaffirmed dramatically the American desire to avoid recourse to war and the American willingness to accept a drastic form of arms inspection for itself as well as for others, as a means of building confidence in the prospect of reducing the threat of war.

After the narrow limits of Soviet "concessions" had been made clear, American opinion recognized that it was the manner rather than the substance of Soviet policy which had changed. The question still remained: In the somewhat changed atmosphere, would time work for Soviet aims or for American and free-world purposes?

As many peoples and groups begin to feel less directly menaced by Soviet pressures, the task of maintaining a broad range of understanding and cooperation within the free world becomes more difficult. It will no longer be sufficient to say that the United States is willing to aid other peoples because keeping their "real estate" in friendly hands contributes to United States security. No people likes to feel that its survival or its economic development is going to depend indefinitely on the "generosity" of a more powerful state.

In the long run, interests must be mutual in order to be strong. In order to preserve and strengthen its alliances the United States must make clear the mutual interest of itself and its allies in maintaining the widest possible area of political freedom and economic opportunity within the world. The element of mutuality and joint decision making within the American-led alliance system must be strengthened constantly and systematically. Rather than allowing the United States to "go it alone," the early arrival of the stage of intercontinental combat will give a new urgency to that common interest in joint survival.

The Soviet leadership is endeavoring to deal separately with European and Asian affairs and thus to probe the weak points of American policy. It is in the American interest to combat this Soviet effort. Instead of treating the Communist-bloc demand for early elections in Vietnam as a purely localized matter, American policy would do well to link it with the free world's demand for genuinely free elections in Korea and East Germany. This would make it clear that the United States is working actively to overcome the division of all three nations. Instead of pursuing a completely separate policy with respect to the offshore islands, the United States would be well advised to draw a clear and defensible line through the Formosa Strait and to rally as wide a political support as possible for the defense of Formosa.

The industrial development of the Soviet Union is now largely self-generating, and the race in military technology is becoming closer all the time. The competition for new breakthroughs in military technology cannot be halted or slowed down. This means that the only important—if crude—instrument by which Soviet decisions can be influenced is the maintenance of a very large United States military budget.

When Soviet policy makers feel uncertain about the rate of progress in American military technology, their willingness to use their own very great power in a reckless manner may be restrained. In addition, while very large and growing, the Soviet economy is

hard pressed to meet the competing demands for improved and costly armaments, for domestic expansion of heavy industry, and for some rise in Soviet living standards, not to mention the demands of Communist China for Soviet aid to its industrialization. American policies can do little or nothing to influence Soviet decisions regarding domestic growth or aid to China, but its actions do have a direct effect on Soviet decisions in the military field. A continuing large American military budget is almost the only way of compelling the Soviet leadership to face the competing claims on its economic resources and to consider from time to time the feasibility and the desirability, from its own point of view, of taking on new risks in the pursuit of its world-wide aims.

At the same time the United States must demonstrate that free-world assistance in economic development and in political and cultural progress, offered with freedom and dignity, is both more attractive and more efficacious than the Soviet counteroffers. As far as possible, such assistance to nations eager to develop their productive resources must be offered on a continuing basis and must be co-ordinated with the development of world-wide trade opportunities rather than offered as an emergency response to Soviet blackmail or enticements. Instead of relaxing and forgetting about the needs and aspirations of underdeveloped and ambitious countries, Americans need to think now in terms of longer-range, persistent, and shared programs of economic development.

Above all, in the new phase of Soviet smiles, Americans must realize even more fully that the dangers through which we are passing are not of short-term character. No one policy, no one appropriation, no one administration, can be expected to cope with them once and for all. Whether Americans like it or not, what they do or do not do will be one of the two determining factors in shaping the world of tomorrow. If Americans are sorely tried by the too great predictability of Soviet aims and tactics, probably Kremlin analysts are constantly fuming over the unpredictability of American opinions and actions. A strong, stable, and predictable American position in world affairs is now the most important element in an increasingly unstable equation of forces.

Philip E. Mosely, Ph.D., is director of studies at the Council on Foreign Relations, Inc., and adjunct professor of international relations in the Russian Institute of Columbia University. Before World War II he taught history at Princeton, Union College, and Cornell University. During the war he served as chief of the Division of Territorial Studies in the Department of State, and attended the conferences at Moscow (1943) and Potsdam (1945). He also served as political adviser on the United States delegations to the European Advisory Commission (1944–45) and to the Council of Foreign Ministers (1945–46). He is the author of Russian Diplomacy and the Opening of the Eastern Question in 1838 and 1839 (1934) and of numerous shorter studies of Russian and Balkan history, of international problems, and of American foreign policy. He was special editor of the May 1949 volume of THE ANNALS *on The Soviet Union Since World War II.*

INTERNATIONAL RELATIONS AND WORLD GOVERNMENT

CHR. L. LANGE and AUGUST SCHOU. *Histoire de l'intèrnationalisme,* Volume II: *De la Paix de Westphalie jusqu'au Congrès de Vienne (1815).* Pp. xi, 482. Paris: Presses Universitaires de France pour l'Institut Nobel Norvégien, 1954. 3,000 *fr.*

Whoever has had, as this reviewer, the privilege of knowing Lange personally, must have been deeply impressed by the figure of this tall, Viking-like Norwegian who dedicated his whole life to the ideas of peace and international co-operation. Lange had been, first, Secretary of the Norwegian Nobel Institute and was, then for many years, Secretary General of the Inter-Parliamentary Union. In addition, he was a Norwegian delegate at the Second Hague Peace Conference of 1907 and a member of the Norwegian Delegation at the League of Nations.

He also studied the history of internationalism as a scholar. The first volume of his *History of Internationalism,* covering the time from antiquity to the Westphalian Peace, had been published in 1919. He planned a second volume (1648–1815) and a third volume, covering the period from the Congress of Vienna to the present day. But only after having resigned in 1933 as Secretary General of the Inter-Parliamentary Union, did he have the time to dedicate himself entirely to his research. While occupied with the second volume, he died in 1938. This second volume has now been published by A. Schou. It covers the period from the Westphalian Peace (1648) to the Congress of Vienna (1815). The first chapters (up to Leibniz) were fully written by Lange. For the period from Leibniz to Adam Smith he left a rather complete documentation. In any case, the account, from Leibniz on, is primarily the responsibility of Schou.

The work treats, first, the general character of the period of absolutism, which is considered as a period of international anarchy, and of the idea of an European balance of power. It examines in detail the doctrines of the international lawyers (Zouch, Rachel, Pufendorf, and the *jus naturae* school), the religious pacifism of William Penn and the Quakers, and the attitude of men of letters and philosophers, particularly of Leibniz.

In further chapters the emergence of the ideas of tolerance (Locke, Bayle, Bar-

beyrac), and of progress, as well as the projects for an eternal peace (particularly of Abbé de St. Pierre), is analyzed. It, then, describes the attitude toward internationalism, prior to the American and French Revolutions, of men of literature (for example, Defoe, Swift), politics and the science of international law (Wolff, Vattel, Martens). There follows an account of the attitude toward internationalism during the two quoted revolutions (Condorcet, Abbé Grégoire, Lessing, Wieland, Herder, Kant), during the Napoleonic era and at the Vienna Congress.

The work, to some extent, intercrosses with certain parts of the two volumes (in German) on the idea of international organization by Jacob Ter Meulen. But by its profound and original investigation not only of the ideas of world-famous men, but also of minor and anonymous writings which are, nevertheless, significant and revealing, it constitutes an important contribution to our knowledge of the history of internationalism.

JOSEF L. KUNZ
University of Toledo

HENRY L. ROBERTS, assisted by JEAN GUNTHER and JANIS A. KRESLINS. *Foreign Affairs Bibliography: A Selected and Annotated List of Books on International Relations, 1942–1952.* Pp. xxiii, 727. New York: Harper and Brothers for the Council on Foreign Relations, 1955. $10.00.

It is natural to compare this volume with its well-known predecessors, classics in the field, of which the first volume by William L. Langer and Hamilton Fish Armstrong covered 1919–32; and the second by the late Robert G. Woolbert covered 1932–42. After probing and poking this one—here and there; head, feet, and torso; front, back and middle—one must conclude that in comprehensiveness, in scholarship, and in all-round usefulness, the present volume does, indeed, stand shoulder to shoulder with its elder brothers.

Listing some 9,000 books, in more languages (thirty-four) than most users are likely to find necessary, the Roberts volume records and briefly characterizes the significant books of the decade on "general international relations" (political factors, social factors, and so forth), those on "the world since 1914" (historical accounts of the two world wars and of the aftermath of each), and those on "the world by regions" (including the Antarctic). The annotations are for the most part severely objective, and Roberts appears to be entirely open-minded on such questions as that of revisionism; but he is not afraid to say, for example, of C. C. Tansill's *Back Door to War,* that "as a history [it] suffers from the author's unbridled hostility to the Roosevelt régime."

The policy is set forth in the Foreword of excluding government publications, with few exceptions. Within that framework, the exceptions—such as the publications of the Department of State entitled *Postwar Foreign Policy Preparation* and *The Treaty of Versailles and After*—are obviously worth including. But the soundness of the policy itself is dubious. It leads, for example, to excluding not only the volumes of *Foreign Relations of the United States* and those of *Documents on British Foreign Policy,* but also those (based on captured records) of *Documents on German Foreign Policy,* as well as such nonserial volumes as *Germany, 1947–1949: The Story in Documents.* Leaving out these indispensable sources, while putting in Lippmann's little "think pieces," such as his lectures on *Isolation and Alliances* (56 pages) and his brochure on *The Cold War* (62 pages), seems anomalous, valuable though Lippmann's ideas unquestionably are.

WILLIAM GERBER
Washington, D. C.

LELAND M. GOODRICH and ANNE P. SIMONS. *The United Nations and the Maintenance of International Peace and Security.* Pp. xiii, 709. Washington, D. C.: The Brookings Institution, 1955. $6.00.

This is the first volume to appear of a series of seven comprehensive studies of the United Nations initiated by the International Studies Group of The Brookings Institution. It is certainly the most thorough and dispassionate appraisal to date of those activities of the United Nations directed towards the peaceful settlement of disputes, the regulation of armaments, and the restraint of aggression.

Professor Goodrich of Columbia University and Miss Simons, a former staff member of the United Nations Department of Security Council Affairs, have paid particular attention to the *processes* of United Nations action on the critical political and security questions which have been brought before it. The image which emerges is of a living, adaptable, essentially pragmatic association of governments, limited and at times frustrated by the crosscurrents of big-power politics, but at the end of ten years having developed a rather remarkable mastery of the art of marshaling agreement among nations to maintain peace. The authors strongly discount the organization's capacity to use coercive means to control national conduct, despite the Korean experience. And they doubt that national armaments can be regulated effectively under the United Nations until all the major powers develop greater mutual confidence in each other's intentions. In the meantime, however, contacts between the Western powers and the Soviet Union are kept alive within the organization, and it thus "provides opportunities and means by which tensions may be reduced, co-operative relations may be established, and some firmer basis for peace and security may be achieved than is provided by military alliances and armament rivalry." The study further claims, on behalf of the United Nations, a "leading and significant part in facilitating the political adjustments that have had to be made as a result of the emergence of nationalism in Asia and Africa."

Recognition of the achievement of *mutual consent* among disputing states as the key to successful United Nations peace action leads to sane conclusions about (1) the veto—actually it has *not* prevented satisfactory solutions from being found, but merely reflected basic conflicts of interest among the major powers; (2) open public discussion of controversial issues—this is not "in all cases the best way to promote the spirit of compromise and accommodation"; (3) majority decisions—resolutions adopted by the Charter specified majorities in the General Assembly and the Security Council have often had little effect because they did not have the support of states whose co-operation was necessary to their implementation; (4) giving the General Assembly authority to use collective force in cases of aggression and other breaches of peace—this might destroy its effectiveness for achieving a cessation of hostilities and a peaceful settlement.

One might hope that members of the United Nations would come to attach greater importance than does this study to the observance of legal standards and procedures in the handling of international controversies, particularly in determining the powers of the principal United Nations organs themselves. Undoubtedly, legal standards have gone by default in much of what has taken place in—as well as outside of—the United Nations. But to maintain, as do the authors, that it is "a sound position" for the Organization to rely on political rather than legal judgments in undertaking action to preserve peace is to invite even greater disregard by nations of that vital element of social restraint—the rule of law.

PHILIP E. JACOB
University of Pennsylvania

INIS L. CLAUDE, JR. *National Minorities: An International Problem.* Pp. xii, 248. Cambridge, Mass.: Harvard University Press, 1955. $4.50.

Every age has its fashions—in ideas no less than in costumes. A generation ago, after World War I, the minorities treaties were hailed as the Magna Charta of the weak and oppressed. The "new look" which emerged from World War II focused fondly upon an international bill of human rights which, it was hoped, would assure protection to all, to members of majorities as well as minorities.

The problem of *national* minorities centered in East-Central Europe, where the mixture of population precluded the establishment of "national" states on the West-

ern model. However, the disintegration of polyglot empires in 1918–19, and potent strategic considerations, as well as the principle of national self-determination, impelled the Great Powers to recognize new and enlarged national states in East-Central Europe. This posed a dilemma: millions of national minorities, in some of the states one-third to one-quarter of the total population, would be exposed to persecution or expulsion and, equally dangerous, the peace of the region would be endangered. The peacemakers of 1919 hoped to resolve the dilemma by imposing on the new and enlarged states special commitments to protect the minorities.

The Powers had concerned themselves with the problem of minorities before 1919. The novelty of the minorities treaties, and their fundamental contribution to a solution of the problem, were twofold: provision was made for *enforcement;* and the ideal was to remove the problem from the sphere of bilateral negotiation, that is, to deal with infractions on an *international* basis. Both these principles were abandoned after World War II.

During the past decade a Universal Declaration of Human Rights was adopted as a body of principles with considerable moral and hortatory influence. However, the effort to formulate legally binding covenants in human rights has come to grief. Apparently the difficulties encountered in the effort to protect some people (the exposed minorities) are not resolved by reaching for the ultimate which is the assurance of human rights to all.

With highly commendable scholarship, Dr. Claude has treated the international aspect of the problem of national minorities as revealed in the published sources. The theoretical groundwork is excellent and the writing clear and balanced. He is at his best when analyzing the published sources and achievements following World War II.

One might have hoped for a more searching account of the origins and history of the minorities treaties, for it would have clarified some of the difficulties encountered since World War II. In 1919 too, the minorities question was one of the "small matters" on the agenda of peacemaking. The Western leaders failed then as now to understand the desire or need for special rights to perpetuate ethnic differences, and the ambiguity of aim and purpose continued after 1919. A more extended treatment of that period would have revealed influences and pressures which were wanting after World War II. The value of the book would also have been enhanced by a chapter on the remaining minorities in East-Central Europe—their numbers, their distribution, their national aspirations and the like. But these strictures apart, Dr. Claude is to be congratulated on a valuable contribution to the subject.

OSCAR I. JANOWSKY
City College of New York

PHILIP C. JESSUP and others. *International Regulation of Economic and Social Questions.*

JOSEPH P. CHAMBERLAIN. *International Organization.* Pp. vi, 173. New York: Carnegie Endowment for International Peace, 1955. $1.75.

In 1942 an essay by the late Professor Joseph P. Chamberlain on "International Organization" was published in the *International Conciliation* series. In it he explained the impact of the economic social forces which we associate with the new technology upon the development of international nonpolitical organization. His generalizations on such subjects as international legislation and administration, the relation of private groups to developing organization, the nature of the international society, and the role of regional agencies were penetrating.

About one-half of this small volume, an essay by three of Professor Chamberlain's former students, brings the subject up to date; it also contains a reprinting of Professor Chamberlain's original essay. The authors give most of their attention to changes and tendencies in the international society which have lately become pronounced. They point out first the considerable area of individual action on the international level within agencies relating to human rights, trusteeship, and consultation under Article 71 of the Charter of the United Nations. A second modification of the international society which they emphasize is the diminished concern in economic and social organization for the sovereign equality of states. Third, they bring out the increasing number of public international organs with quasi-state functions that have been set up in response to a need for continuing multilateral activities. The authors conclude with a statement that "read in the light of recent developments, it is plain that subsequent events have not changed his (Professor Chamberlain's) basic conclusions."

A better exposition of the economic and social foundations of contemporary international organization than that contained in this volume cannot be found. The usefulness of the discussion is enhanced by many well-reasoned opinions of the authors on problems which they encountered along the way. For instance, they express themselves on the proper place of the regional as against the universal method of regulation. They show a relationship between the nature of a subject of international action and the question as to whether its regulation shall be assigned to a general organization like the United Nations or a specialized agency. Throughout, the authors give evidence of the scholarly maturity for which they are well known.

NORMAN L. HILL
University of Nebraska

J. F. C. FULLER. *A Military History of the Western World.* Vol. II: *From the Defeat of the Spanish Armada, 1588 to the Battle of Waterloo, 1815.* Pp. x, 561. New York: Funk and Wagnalls, 1955. $6.00.

In this second volume General Fuller continues his study of warfare in the Western world or rather the military operations of Western peoples wherever they may have attained sufficient importance. His method of treatment remains the same, namely, a series of detailed studies of decisive campaigns linked by brief historical chronicles. The latter, however, seem to be more definitely subordinated to the narratives of military operations than in the previous volume, while these have gained in tempo, in vividness, and in sureness of touch. But the author's general historical judgments expressed in the chronicles are marked by a strongly authoritarian attitude, a lack of understanding of the character of struggles for political and religious liberty, and by the acceptance of a now discredited theory regarding the connection between the Reformation and the rise of modern capitalism.

Within the limits of a short review such as this it is impossible to discuss in any detail a work which covers the military history of over two centuries. Only some general comments can be made. American readers will be pleased with the space devoted to Wolfe's operations against Quebec, as well as to the Saratoga and Yorktown campaigns. It is, however, regrettable that for the latter two episodes the writer did not have at his disposal Sir Henry Clinton's *American Rebellion* in the new edition of W. B. Willcox (1954). Many students of military history will be surprised to find no mention at all of the War of 1812, in which, even if it did end in a stalemate, Canada was saved for the British Empire, and only a very scanty reference to the Peninsular War, although it was there that Wellington attained the stature of a great commander and the British army acquired the training which made possible its success at Waterloo.

One of the outstanding merits of the work is that it drives home very forcefully two great lessons of military history. The first, which is only too readily forgotten, is that in future wars one cannot depend for victory upon the tactics and the weapons of the past. The second, that in all military operations superiority of leadership plays a decisive role, a point emphasized by excellent characterizations of outstanding military geniuses such as Gustavus Adolphus, Marlborough, Frederick the Great, Nelson, and Napoleon. Here the great problem for any government is how to recognize this quality of greatness in any of its commanders and how to develop and employ his talents to the best advantages.

University of Michigan

LIONEL KOCHAN. *Russia and the Weimar Republic.* Pp. 190. Cambridge, England: Bowes and Bowes, 1954. (Distributed by Frederick A. Praeger, New York.) $4.25.

In this excellent book, Lionel Kochan examines the rapprochement between Germany and Russia that began in the 1920's and lasted until 1934. The "Rapallo Policy" was the most important element in the foreign policy of both countries during that period. The establishment of cordial relations was based on an obvious *quid pro quo*. Russia needed German political and technical help for her internal reconstrution; even more important, Germany was regarded by Soviet spokesmen as a *point d'appui,* a foothold in the enemy's camp. Germany, on the other hand, needed Russia's help and friendship in the struggle against Versailles. The two outcasts of Europe joined forces.

In compact, objective prose the author examines the three basic elements of the relationship—diplomatic, political (that is, the connection between the Comintern and the German Communist party), and military. At first the Soviet leaders counted on an imminent revolution in Germany, which Lenin in 1918 had compared to a rotting tree. This optimistic view declined precipitously with the abortive German Revolution of November 1923, which ended the prospect of a Communist Germany. Thenceforward, relations between the two countries were relegated to the chessboard of international diplomacy. The Russo-German Treaty of Rapallo, signed early in 1922, was strengthened. The Dawes Plan of 1924 and the Locarno Pact of 1925 weakened Rapallo, but the Russo-German Treaty of Berlin of 1926 and its renewal in 1931 compensated for the temporary German defection and restored the balance. In late 1931 Rapallo gradually was overshadowed by the growth of Nazism and the emergence of a German right wing under Brüning that had no use for Russia. When in 1934 Hitler categorically rejected Russian overtures for a continuation of the old relationship, Stalin threw in his lot with the Western powers. This was the end of Rapallo, but not the end of Russia's capitalist *point d'appui,* which was revived by the Hitler-Stalin pact in 1939.

The history of this varying relationship is a story of German attempts to regain international status after a lost war. "On each occasion, Germany, after obtaining certain concessions from the West swung away from Russia and then swung back again. In 1925–26 the swing was very slight; in 1929–30 it was perceptibly greater; in 1931–39 it was plain for all to see" (p. ix). The Russian point of view was explained by Karl Radek after Locarno: "A Russia which has been weakened to the utmost by the war could neither have continued as a great power nor acquired the economic and technical means for her industrial reconstruction unless she had in the existence of Germany a counterbalance against the supermacy of the Allies" (p. 100).

This book is important for us today when once again the matter of Russo-German relations occupies the center of the diplomatic stage. Germany remains the linchpin of the whole European system. By accident of geography she has been caught between East and West, the central fact in her historical experience. After her defeat in 1918 she played East and West off against one another in a desperate attempt to avoid the consequences of Versailles. Despite the optimism of many of today's Western diplomats, there is some reason to believe that the same thing might happen again. Diplomacy does not deal with wishful thinking—only with results. George Kennan, perhaps our top expert on Russia, is reported recently to have said that the Russians are planning the "grand nightmare of Western diplomacy," a German reversal of alliances in favor of the Soviet Union. Kennan thinks the Soviets' chances for success "are not bad." Our State Department experts should read Kochan's first-rate book again, again, and again.

LOUIS L. SNYDER
City College of New York

UNITED STATES GOVERNMENT AND HISTORY

ROBERT H. JACKSON. *The Supreme Court in the American System of Government.* Pp. viii, 92. Cambridge, Mass.: Harvard University Press, 1955. $2.00.

At the time of his sudden death in October 1954, Mr. Justice Jackson was well under way with the preparation of the three Godkin lectures that he was to have delivered at Harvard University early in 1955. His manuscript-in-progress has now been published as a final statement of the Justice's views concerning the work of the Supreme Court.

This is a slender, little volume, both in size and substance, and it must regretfully be stated that it will add little to Justice Jackson's reputation. One doubts the wisdom of the decision to publish such an obviously unfinished piece of work. The incomparable literary style and the sharply etched and brilliantly argued legal views which were such characteristic qualities of Justice Jackson's Supreme Court opinions are here almost wholly lacking. To be sure, the Justice does state his views on a miscellany of legal and judicial subjects. There is an interesting suggestion that the short time available for Supreme Court conferences makes it difficult for the nine justices to reconcile their views and is thus an important factor explaining the multiple opinions of recent years. There is an exceptionally frank statement of the Court's "apparent yielding to expediency, especially during war time." And the Justice spells out his belief that Congress would do well to end federal jurisdiction based on diversity of citizenship.

Apart from such statements, this book is most remarkable for its revelation of the extreme to which Justice Jackson's growing conservatism had carried him at the time of his death. This is made particularly clear concerning the Justice's views in the area of civil liberties. He asserts that courts can do little to defend civil liberties, and he scoffs at the notion that "a 4,000 word eighteenth-century document or its nineteenth-century Amendments" have much value as a safeguard of individual freedom. The "cult" that argues to the contrary is accused of "vicious teaching." Moreover, he once more indicates his distrust of federal civil rights statutes as a basis for the positive protection of civil liberty by government and justifies the extent to which he and other members of the Supreme Court have gone in virtually interpreting existing laws out of existence, by arguing that the federal police force which is necessary for their enforcement has totalitarian potentialities.

Justice Jackson was one of the greatest figures of the Roosevelt Court and in the decade following his appointment in 1941, he made an invaluable contribution to the magnificent developments in constitutional law of that period. Moreover, his reputation is secure. As long as Supreme Court decisions are read, his opinions in such cases as *West Virginia Board of Education* v. *Barnette* and *American Communications Association* v. *Douds* will thrill and challenge men. The present work will not add to that reputation. But neither in the long run can it detract from it.

ROBERT K. CARR
Dartmouth College

RUSSEL D. NYE. *William Lloyd Garrison and the Humanitarian Reformers.* (The Library of American Biography.) Pp. vi, 215. Boston; Toronto: Little, Brown, and Company, 1955. $3.00.

This volume takes its place beside the biographies of Elihu Root, Grant, Franklin, and Morse as a worthy member of the series of biographies edited by Oscar Hamlin.

Designed obviously for the general reader, the volume is free from the usual paraphernalia of scholarship—footnotes, critical comments, and elaborate bibliography. That much research, however, lies back of the work is attested by the "Note on Sources" and allusions through the text to other reformers and to the antislavery literature of the period. It is clear that the author has relied heavily for his general chronological account of Garrison's life on the voluminous work of two of the latter's children, to which all accounts of the life of Garrison must turn.

The Epilogue, as the author terms an appendix, presents an intimate picture of the man Garrison—his appearance, his personality, his character, tastes, and foibles. Throughout the volume he is shown for what he was—the editor, crusader, "reformer incarnate," as Nye aptly characterizes him. Because the author does not hesitate to point out his failings and lack of clarity in thinking (pp. 134, 163), Garrison emerges as a living, vivid personality. A highly controversial character during his lifetime, this reviewer finds herself in agreement with the author's evaluation of Garrison's contribution. Indeed, one could scarcely differ from his conclusion that this reformer was a person of "real historical importance" in the antislavery movement, incapable of compromise or moderation. He symbolized the moral aspect of slavery (pp. 205, 206).

An effort is properly made to place Garrison in his setting and consequently the first chapter treats briefly of slavery's political involvement with the national struggle, the economic importance of cotton, and the development of proslavery philosophy and propaganda. The volume is too circumscribed in length to permit adequate analysis of all the currents which helped to produce Garrisonism. A heavier emphasis on the spiritual impact of the era might have been desirable.

The author recognizes Garrison's goal for what it was, not merely extirpation of slavery, but the redemption of the human race. This explains his scattering his energies to issues of government, disunion, even anarchy, women's rights, nonresistance, even the evils of tobacco—in a word, reform of practically every institution or tradition.

The entire content of the book is organized into seven long chapters, but the reader is aided in keeping his bearings among the many topics of each chapter by the simple device of double spacing between the topics. The style is readable, but an index of four pages seems hardly adequate.

ELLA LONN

Baltimore, Md.

REXFORD G. TUGWELL. *A Chronicle of Jeopardy, 1945–1955*. Pp. v, 489. Chicago, Ill.: University of Chicago Press, 1955. $7.50.

Mr. Tugwell has written a stimulating and provocative book. He has a fluent and indeed, at times, an eloquent pen. He writes with the deep concern of a conscientious and sensitive citizen oppressed by the magnitude of the problem unleashed upon the modern world by the advent of atomic and hydrogen energy. To Tugwell, this is man's central problem to which all else is subordinate, to which all human institutions and behavior must adapt themselves if destruction is to be escaped and a life of happiness and prosperity achieved—for the alternatives are thus being sharply and rapidly formulated. The first fifty pages or so might well have been heavily condensed or omitted, for the rest of the book states his essential thesis more convincingly and with more precision.

The *Chronicle of Jeopardy*, an analysis year by year of domestic and foreign situations since 1945, is in reality not a chronicle at all. True, the author sets forth some of the main events which take place each year, but the chronicle of events is so laden or interpenetrated with extensive interpretations—political, economic, sociological, and philosophical—as to make the contribution less a chronicle than a series of reflections upon the events of the day. Many of these reflections are, indeed, challenging, but since no precise method is given for separating the "facts" and what Mr. Tugwell calls his "opinions," the book will cause those who do not share his enthusiasm for public planning, collectivization, and accommodation with the Soviet Union to disagree most violently and, in so doing, to lose many excellent contributions which the author has to make. The nonpartisan will welcome much of the information and the stimulating judgments even though he has the methodological reservations to which I have briefly alluded. The present reviewer is inclined to think that Mr. Tugwell might better have presented a somewhat detailed chronology of events in the first part of the volume, following it with an analysis of the major topics. This would have avoided the chopping up of significant subjects on a yearly basis, which gives the impression of trying to analyze a changing scene which does not lend itself to satisfactory treatment in this manner.

All told, American Presidents, Secretaries of State, Mr. Adlai Stevenson, most of the leaders of the Western democracies, Congress, the State Department, the leaders of the armed forces, and the Communists come off pretty badly, as indeed do most people. Mr. Tugwell believes that the sheer rapidity of change with which the hydrogen bomb superseded the atomic bomb before the armed forces could adapt their methods to the new weapon, and long before nations were willing to begin to see the implications for world society, is symptomatic of the desperate challenge which mankind now faces. If some readers are inclined to disagree with Mr. Tugwell at some or even many points, they could well be recommended to share his deep concern over the new dimensional experience which confronts the human race.

LINDEN A. MANDER

University of Washington

MARTIN MERSON. *The Private Diary of a Public Servant*. Pp. x, 171. New York: The Macmillan Company, 1955. $3.00.

In the comparatively calm atmosphere of this "post-Genevan" period, this tale of subversion and disillusionment seems strangely unreal. To savor the full flavor of Martin Merson's martyrdom, one must recapture the sense of conspiracy, conflict, and panic that enveloped the American people and its government just a year and a half ago. Perhaps "martyrdom" is too strong to describe what happened to the author—a wide-eyed innocent abroad in the political jungles of Washington, D. C., in 1953.

Martin Merson, Harvard law graduate, rising young businessman, ardent supporter of General Eisenhower, found himself with his friend "Bob" Johnson, President of Temple University and Ike's first Director of the International Information Administration, at the center of a melodrama that unfortunately was not fiction but fact. The villains—Senator Joe McCarthy and his stooges: Cohn, Schine, and others—are easier to identify than the hero. In fact, I couldn't find a hero at all. Certainly there was nothing heroic in the conduct of Secretary Dulles, Assistant Secretary McCardle, Security Officer McLeod, or for that matter, Vice President Nixon or President Eisenhower. As for Johnson and Merson, one is more impressed with them as injured innocents than as heroes. They, along with a half hundred other loyal and able public servants on the staff of the International Information Administration, were victims of that mid-western Torquemada—Senator McCarthy—in his self-styled campaign against "communism in Government." In point of fact, that campaign, as we see it in operation in this book, appears to be not so much a drive on subversives in government as in itself an effort to destroy one of the Government's major agencies for combatting communism in Europe and Asia.

Had Senator McCarthy and his associates been Communist agents, they could scarcely have hoped to accomplish so much toward weakening the United States in the cold war. In a campaign filled with innuendo, slander, and downright falsehood, they came within an ace of destroying the IIA, and, in the process, bringing down upon America the ridicule and contempt of the civilized world. The antics of Cohen and Schine in their European tour of inspection might have been dismissed as low comedy were it not for the devastating consequences of their irresponsible attacks upon the personnel and policies of the IIA. Had they and their chief deliberately set out to create panic and confusion in this vital agency, to destroy its morale and undermine its influence abroad, they could not have done more toward their ends than they in fact accomplished. And Americans are still having to "explain" to Europeans that we are not a nation of book burners as a consequence of the disgraceful "purge" of books in our information libraries abroad.

Author Merson tells his story with a disarming sincerity and simplicity. In spite

of his own naiveté, he and his associates emerge— if not as heroes—at least as honest men and faithful public servants.

As for Senator McCarthy and his Janissaries, let us hope their influence is on the wane. What most troubles me in this tale is the record of inconsistency, insincerity, timidity, if not cowardice, that characterized those in high places. Neither the Secretary of State nor the President gave to Mr. Johnson the support that anyone assuming the general responsibility he was asked to assume, had every right to expect.

The Private Diary of a Public Servant is a must for anyone who would understand why morale in the public service had reached a new low in 1953 and 1954, and is also a sad commentary on the state of public morality in the United States during those trying years. As a portrait of the recent past, it is a unique and impressive document. Let us hope it is not a portent of the future.

PETER H. ODEGARD
University of California
Berkeley

FRED RODELL. *Nine Men: A Political History of the Supreme Court from 1790 to 1955.* Pp. xii, 338. New York: Random House, 1955. $5.00.

Nine Men is a political history of the United States Supreme Court from the period of the Constitutional Convention up to 1955. The author is professor of law at Yale University whose iconoclastic treatment of the Court should be familiar to readers of popular magazines and of the magazine sections of Sunday newspapers. The authors' thesis, briefly stated in his quotation from Lincoln, is that "our judges are as honest as other men and not more so. They have, with others, the same passion for party, for power, and the privilege of their corps. . . . Their power is more dangerous as they are in office for life, and not responsible, as the other functionaries are, to the elective control."

Although the Court, in passing upon a constitutional case, employs all the forms and procedures of a court of law—private litigants, learned legal briefs, decisions and opinions, majority, minority and concurring —Rodell does not consider it a court of law at all, but a political organ to the same extent as is the Congress or the President, restricted no more than they are by *stare decisis* and motivated by pretty much the same considerations. Hence, the only way to understand the Court is to study the Justices in the light of their political backgrounds and beliefs, and the only honest history of the Court is a political history.

Not only does Rodell relate the history to the Court through the political personalities of the Justice, but he deems almost every Justice to be either a hero or a villain, and he leaves the reader in no doubt as to what role he assigns to each Justice. The principal heroes are Miller, the first Harlan, Holmes, Brandeis, Stone, Black, Murphy, and Douglas; the principal villains Marshall, the Sutherlands-Van Devanter-McReynolds-Butler quarter, Jackson, Frankfurter, Vinson, Clark, and Minton.

The chief villain is Marshall (as the chief hero is Holmes) and the chief villainy is *Marbury* v. *Madison* and judicial review. According to Rodell, Marshall "by dominating the Supreme Court which dominated the judiciary which dominated the federal government which dominated the states . . . himself effectively dominated the nation for a third of a century."

Rodell has reputable authority for his evaluation of Marshall's importance in establishing judicial review and of judicial review in the American scheme of things. Nevertheless, this reviewer would venture to suggest that in both instances he has overstated the case. A reasonable argument can be made for the proposition that had there been no Marshall there still would have been a *Marbury* v. *Madison,* and had there been no Marbury the course of American history would not have been substantially different. Of the relatively few Supreme Court decisions invalidating acts of Congress, there has hardly been a single one which has not been later substantially nullified, either by amendment to the Constitution or by the action of the Court itself in overruling, distinguishing, or simply disregarding the decision. Like the House of Lords, the Supreme Court exercising judicial review can at most delay effectuation of the people's will; it can never wholly frustrate it.

This book was written neither for lawyers nor for scholars, but for the general public. A certain degree of overgeneralization, oversimplification, and overstatement is a popularizer's privilege. The trouble with this book is that Rodell comes too close to abusing the privilege.

LEO PFEFFER
American Jewish Congress

PETER M. BLAU. *The Dynamics of Bureaucracy: A Study of Interpersonal Relations in Two Government Agencies.* Pp. xi, 269. Chicago, Ill.: University of Chicago Press, 1955. $5.00.

Some widely accepted notions about bureaucratic behavior are here tested by personal observation of interaction between individuals employed in two small governmental units—one in a state employment agency and the other in a federal law enforcement agency. The author, assistant professor of sociology at the University of Chicago, responds chiefly to the studies of bureaucracy by Max Weber and the American school of sociology represented by Talcott Parsons and Robert Merton. However, the book will also interest nonsociologists, especially students of public administration, since Mr. Blau's findings provide a useful supplement and confirmation for recent trends in administrative thought and writing.

Mr. Blau thus joins forces with students of administration, who, from Mary Parker Follett a generation ago to Chester Barnard, Herbert Simon, and others, have challenged earlier characterizations of bureaucracy in terms of hierarchical authority, resistance to change, displacement of goals by ritualistic adherence to means and techniques, and formal institutional categories. One hopes that studies such as this will help to stimulate fruitful communication and interaction between sociological students of bureaucracy and writers on public administration.

The author's report draws attention to relationships among personal incentives, group behavior, and formal bureaucratic structures. For example, he found that when statistical indices were used as a basis for merit ratings, they led to competitiveness among workers in an office, but that professional standards could conduce to group solidarity despite the use of such indices; that enforcement officers found close social relations with other officers a needed source of moral support in their dealings with both supervisors and clientele; that supervisors could strengthen their hierarchical authority by showing leniency in the enforcement of some rules, thereby creating both obligations by subordinates and the opportunity to invoke sanctions if needed; that "bureaucrats" are not so much inherently opposed to change as anxious, whether by promoting or opposing change, to maximize their goal achievements.

In discussing authority and sanctions, Mr. Blau might have clarified his presentation had he made use of Simon's distinctions between different types of authority. Thus the author regards "inducements and coercion through sanctions" as forms of control different from "authority," but seems to imply on the following page (p. 173) that "bureaucratic authority" rests predominantly on the supervisor's "rating power." Yet what does rating power imply but the use of "inducements and sanctions"? Mr. Blau appears surprised to find that bureaucrats do not always resist change, although such public administration studies as the monographs of the Inter-University Case Program, widely used as teaching tools, provide ample evidence of bureaucratic innovation as well as inertia. Although *caveats* such as these will be made by readers familiar with the public administration literature, it is to be hoped that they will not prevent the book's being used as a valuable source of examples, amplification, and stimulation.

FRED W. RIGGS
Yale University

GORDON R. CLAPP. *The TVA: An Approach to the Development of a Region.* Pp. xiii, 206. Chicago, Ill.: University of Chicago Press, 1955. $3.50.

The TVA, written by the recent chairman of the Tennessee Valley Authority's

Board of Directors, was based on a group of Walgren Foundation Lectures. It is quite readable and, for pepole who are only slightly acquainted with the TVA, quite informative on the public-production side of water-basin controversies. Public *vs.* private production is the chosen setting for many of the author's questions. Description of TVA history rather than critical analysis is predominant. The author, still believing as strongly in TVA now as in the beginning, writes with enthusiasm for his subject. That is good to see in a public administrator.

This seems to be the main intention: to describe how the TVA is a distinctive creation in government and a distinctive creator in a region's economic life. The first two chapters sketch the political formation, public purposes (including new patterns of land uses), building of dams, and other significant achievements of TVA. An appendix tells about the production and use of fertilizers. The third chapter describes how the people of the valley have obtained more in employment, income, and new industries. A fourth chapter outlines the joint relations between the TVA and state (or local) governments on such matters as electric service, taxes, and reforestation. Much of this is familiar information. Some of it also gives credit too easily and completely to TVA; for example, the industrial, employment, and income changes that occurred in contexts of war, prosperity, and atomic-energy production, which were not peculiar products of TVA. Indeed, the Authority is made to appear too distinctive, too free from questions or evidence of deficiencies throughout the book.

The last two chapters deal with electricity production and pricing. A low-price policy, creating large increases in total electricity sales and per family consumption, is emphasized again. Yet when increases in output are presumed to be accompanied (continuously?) by lower unit costs ("distribute fixed charges over a larger number of kilowatt-hours"), the economic reasoning is loose and inadequate. Nothing is said about the continuation of old pricing choices, though steam plants become increasingly nowadays the sources of electricity. Nor is anything said about the new and large steam plants as significant shifts in the TVA's technical character from multi-purpose to single-purpose projects.

Like many earlier writings, this book recognizes an achievement in the "competitive spur" to neighboring private companies. "Comparison" is a better economic term here than "competition." Yet, clearly enough, the TVA prices have effects on the surrounding private-firm prices, though I do not understand the nationwide effects that are implied in the concentric-zone figure on page 122. Something else is emphasized more strongly, however, than the pricing policy: the comparisons of private and public systems in anticipating demand increases. In these comparisons the private electric firms fall behind the TVA record, reflect conservative investment choices, and are believed to be responsible for present and pending shortages of electricity.

Even if public and private systems are compared frequently in the book, we do not learn how to choose efficient limits between them. Nor is this an economic study of cost, pricing, and investment choices. Neither is it a study of how managerial decisions were made by the author and his fellow administrators. Instead, it is a guide to a man's beliefs in and hopes for an uncommon American venture in public management, the TVA.

W. DEAN BURNHAM. *Presidential Ballots 1836–1892*. Pp. xix, 956. Baltimore, Md.: Johns Hopkins Press, 1955. $10.00.

Mr. Burnham has made an unspectacular contribution to the study of American politics, but it is one which will bear fruit in the years ahead. The gathering of election data is an uninspiring task at best, but when one sets out to collect the county returns in all presidential elections from 1836 to 1892, he plans a course of disappointment, hard work, and picayunish reward. This is the only logical explanation of why these basic data have not been assembled before. It is natural, I suppose, for scholars to prefer interpretative analysis rather than mere collection of data. This has led to overanalysis of sparse data and, therefore, to a scholarship in American popular government which lacks a fundamental basis. The Washington scene has been brilliantly described and the main actors there have been psychoanalyzed with special emphasis upon their social activities, their economic interests, and their political predilections, but little has been done to explain how they happened to become members of the Washington caste.

Mr. Burnham employs a different perspective. He has gone to the country, to the sources of political power, to the homes of all those people who are merely sojourning in the nation's capital. He has opened up a whole new approach to the understanding of our politics, at least he has contributed some of the materials for that more fundamental approach. The correlation of census data with political party votes in specific counties is now possible.

I wish that Mr. Burnham had spent more time in commenting upon the county-vote data and especially in relation to their probable accuracy. Also, his method of presenting the splinter-party votes is not quite satisfactory. It is true that he gives the protest totals, but there is no designation as to the nature of the protest. How many of these were Prohibition, Socialist, or agricultural revolt votes? A study of lost causes is one of the most fruitful in American politics, for such splinter movements have had a profound influence upon the behavior of the major parties.

The author has given his own analysis of the presidential elections from 1836 to 1892. His chief contribution is that he relates the county decisions to the total victories. Using the census classification of sections, Mr. Burnham is always forced to explain that Missouri is a maverick in the West North Central or that Kentucky does not behave politically like Alabama or Mississippi. The obvious answer to his difficulty is that these states belong in a border category with West Virginia, Maryland, and Delaware.

University of Oklahoma

ECONOMICS AND INDUSTRY

GEORGE SOULE. *Time for Living*. Pp. vii, 184. New York: Viking Press, 1955. $3.00.

In this very interesting and provocative little book George Soule traces the rise in economic productivity in the United States, describes some of the most amazing machines and processes of recent years, and finds technology generally good. It has refuted Malthus's predictions and later predictions of Marx, has provided a good living for most of the people, and seems likely to continue its advance, until, some eighty years in the future, it may well provide an average family income of $25,000 a year (1953 dollars), for a far shorter working day than that of today, for technology is as much labor-saving as production-increasing. Soule sees that certain contingencies may prevent this happy economic outcome—exhaustion of resources, for instance—but he is fairly optimistic, too optimistic perhaps, about the future of resources.

Assuming a much shorter workday and much leisure time, not just for the rich, but for almost everyone, what will the people do with their leisure time? Here again Soule is judiciously optimistic. He sees people, even now, using their leisure in caring well for their families, reading (more than ever), gardening, engaging in Do-It-Yourself activities, in sports, traveling, working in voluntary organizations, playing in orchestras, amateur dramatics, and getting "what passes for education." He believes that the chances are good for a continuation and expansion of these leisure-time activities so needed in a technological civilization.

Mr. Soule sees the danger of mass promotion, aimed as it is at a low level of sophistication, sees that in an economy of mass production and mass distribution ex-

cellence has less and less chance of gaining recognition, sees that there is real danger of further regimentation of the mind, but does not stress the latter very much.

Mr. Soule's book does seem too hopeful, too optimistic, but of course time may prove it correct. At any rate, it should serve a noble purpose in pointing out what sort of life we may have if we can avoid wars and depressions, conserve our resources, reduce our birth rate, and avoid regimentation and a few other evils.

The book is well and interestingly written. It should have a wide appeal.

Goucher College

WILLIAM F. WHYTE, and others. *Money and Motivation: An Analysis of Incentives in Industry.* Pp. xii, 268. New York: Harper and Brothers, 1955. $4.00.

Money plays such a dominant role in employment that it is difficult to realize other motives may be as powerful or even more important. Many studies have shown that employees in heavy industry, retail merchandising, and white-collar workers, when asked to list in order of importance what they consider on, and what they expect from, their job, do not list wages first. Liking the job, chances for improvement, liking the people one works with are often considered more important than wages. The implication is not to be drawn that people expect to work without pay. They want other satisfactions as well.

Professor Whyte, of the New York State School of Industrial and Labor Relations, Cornell University, draws upon a series of case studies of his colleagues, and upon his own experiences, to demonstrate the complex relations between piece-rate incentives and economic production. The incentive system is not the simple matter of granting a proportionate increase in wages for every additional piece produced after the "normal" rate of production has been achieved. Production even when based upon piece-rates involves the relations of a worker to his fellow workers, to his department, other departments, to the entire plant, the company's competitors, and the union.

The workers' responses to financial incentives depend in large measure on the organizational context in which they work and upon the social system of which they are a part. Determining incentive rates is generally considered to be a technical engineering problem. This is the chief reason why incentive rates so often run into snags of restricted output, lowered morale, friction between workers and departments, and trouble between management and union. An incentive system is also a human relations problem involving the entire social setting of the industry. This, basically, lies behind the fair success of the Scanlon Plan (discussed in Chapter XIV).

Professor Whyte's thesis is not new. The theoretical framework of Part IV of the volume, A Theory of Economic Incentives and Human Relations, is familiar to every competent graduate student in sociology. (Professor Whyte is overly gracious, I think, in stating that the theoretical ideas he follows were developed by Chapple, Arensberg and elaborated by Homans. The main theoretical concepts relied upon, namely, symbols, sentiments, activities, and interactions, have been used in sociological analysis for at least the past twenty five years.)

These comments in no way are meant to detract from the excellent, pin pointed study of Professor Whyte. The thesis he demonstrates is not widely understood or accepted by managerial personnel. I recommend this study as one of the finest of its kind for any manager who has been frustrated in dealing with incentive systems. Furthermore, it is an invaluable study for anyone interested in understanding the *social* nature of industry.

NATHANIEL CANTOR

University of Buffalo

MABEL NEWCOMER. *The Big Business Executive: The Factors That Made Him, 1900–1950.* Pp. xii, 164. New York: Columbia University Press, 1955. $4.00.

Instead of being concerned with the *executive function,* this study makes inquiry into the total business experience and background of those *individuals* who

reached the top management positions in large corporations. The data presented in report form from several sources shows how individuals rose to these positions, how they were selected, and how family background and formal education influenced their lives. Three generations of executives are included in the study which covers the period from 1898 to 1953. Practically all of the chief executives in the railroad, public utility, and industrial fields are included in this period.

The research findings of the author are presented in a concise and interesting style with 62 tables of statistical data to support the text materials. Specific areas covered in the study of individual executive careers include the following: (1) social origins such as nationality, religion, and politics, (2) economic origins such as father's occupation and income, (3) education of executives, (4) early business careers, (5) service in their own organizations, (6) incentives for holding executive office, and (7) qualifications for the successful executive. Limitations of the study are given to those who may wish to interpret the data for trend purposes.

In the summary chapter entitled "The Profession of Business Administration," the author states, "the fact that professionalization of leadership is occurring is evidenced by various changes." These changes (1900 to 1950) in pointing the way to top management positions are: (1) the greater degree of education required for executives, (2) increasingly better chances for those from low-income families to reach the top, (3) the development of a code of ethics for management, (4) the long period of apprenticeship and a gradual rise to top positions, (5) a more scientific approach by executives with improved planning and research abilities, and (6) the division of power and authority among many executives in an organization instead of rule and decisions by one individual. Consideration is also given to the trend of greater separation of management from ownership. The wider diffusion of stockholdings results in fewer executives having any sizeable investment in their own firms.

This report and interpretation of the author's search into the background and careers of top management executives is one of the most interesting and significant publications on the subject since Miriam Beard's *History of the Businessman* in 1938. It is recommended for administrators and faculties of Schools of Business and Departments of Economics. Pertinent information is provided for planning purposes to guide college graduates toward positions of top executive leadership.

Indiana University

CLINTON S. GOLDEN and VIRGINIA D. PARKER. *Causes of Industrial Peace Under Collective Bargaining.* Pp. xiv, 369. New York: Harper and Brothers, 1955. $4.75.

More than fifty years ago, Nicholas Paine Gilman published a volume called *Methods of Industrial Peace.* Considering the state of the literature in the field at the time (1904), this work of over 400 pages represented no mean achievement. Gilman noted in his Preface that there was "a surprising lack of books in the English language on this vital matter," and his prescription for the attainment of this goal sounds remarkably modern. The ingredients included the full aceptance of unionism by employers, a similar acceptance of the processes of collective bargaining, the quick settlement of grievances in the shop by "conciliation committees," and the arbitration of all disputes arising out of the collective bargaining agreement. He believed that "if such committees and collective agreements were universal, strikes and lockouts would largely disappear." Gilman also warned that unless these and other parts of his prescription were accepted by the parties themselves, the state would step in with a system of compulsory arbitration.

Today there is still the comparative lack of books of which Gilman complained, the prescriptions advanced have not changed much, and the warnings continue along similar or closely related lines. Industrial peace is still not newsworthy enough for even the parties to co-operate with the late attempt of the Bureau of

Labor Statistics to put its news of peaceful negotiations and contract signings on a par with its strike statistics. All this makes the present volume doubly welcome.

To paraphrase the eminent William M. Leiserson, the performance of the marriage ceremony does not guarantee a happy married life. Similarly, he pointed out, the establishment of collective bargaining in the legal sense does not guarantee a peaceful relationship. And so here the authors go beyond the establishment of collective bargaining and report on the factors which have led to peace in this relationship. The volume has its origin in the case studies made by the National Planning Association, published *seriatim* since 1948. These case studies are summarized in the latter part of the book and constitute the bulk of the volume physically. The first part carries six essays under the collective title Fundamentals of Labor Peace, A Final Report. All of the reporters are recognized experts in the field, but since so many of us interested in this subject have read the case studies as they appeared, perhaps the most rewarding section is that by Charles A. Myers on Conclusions and Implications. For this is the real nub of the problem—to what extent are the conclusions here reached transferable to other companies with different economic, political, and social environments; to others with the same environments, but who have not found the comparative peace enjoyed by the companies studied; to what extent can the environments be changed, in the short run and in the long run, to bring about conditions more favorable to the achievement of industrial peace, and so forth. Here is food for thought. No ready or easy answers are offered. Perhaps the best partner to this excellent volume would be "matching" case studies of the failures in the quest for industrial peace. Let us hope that others take up from this fine start.

HERBERT J. LAHNE
Washington, D. C.

FONDATION NATIONALE DES SCIENCES POLITIQUES with the assistance of the INTERNATIONAL ECONOMIC ASSOCIATION and the INTERNATIONAL COMMITTEE FOR SOCIAL SCIENCE DOCUMENTATION. *International Bibliography of Economics* (*Works Published in 1952*). Vol. I. Pp. 429. Paris: UNESCO, 1955. $7.50.

This is the first volume of a world-wide bibliography of economic literature. It contains some 7,000 entries—books and periodical articles—for the year 1952. Nothing on this scale has ever been attempted in the past, and no words need to be lost to point out the potential importance of the huge enterprise.

Seven-eighths of the book is made up of the classified bibliography, which is organized under ten broad headings with very detailed subclassifications. Editorial comment is used sparsely, and is limited, in the main, to elaborations of titles that do not convey an adequate explanation of the content of an entry. Titles in foreign languages other than French are supplied in English translations. This bibliography is followed by indices of authors, subjects (six pages only), and geographical regions. A list of periodicals concludes the work.

The sponsors of the work frankly characterize it as experimental with regard to nature, content, and classification, and they invite the users' comments. The restrained use of annotations seems justified in order to prevent the volume from becoming excessively bulky. There is much to be said, however, for an expansion of the coverage. Numerous important periodicals are not included, for example, such publications of international appeal as *Metroeconomica, Economic Development and Cultural Change, Cartel,* and *International Financial Statistics.* There are references to the contents of the periodical of the American Statistical Association, but not to the periodicals of its British counterpart. The Dutch *Economist* is included but apparently not that of London. The coverage of acounting, banking, business, and legal periodicals is inadequate. As much is made of Economic Life—which serves as one of the ten broad classifications—the coverage might well be extended to articles in *Schmollers Jahrbuch, Planning, Fortune,* and the *Journal of Industrial Economics.*

With respect to the classification, it is pointed out rightly in the Preface that the scheme should not be one "to illustrate or emphasize any particular conception of economics." It seems, however, that the number of broad over-all headings—ten—is too small, whereas many of the subclassifications are unduly narrow and detailed and invite confusion in spite of frequent cross-references. The American Economic Association as well as New York University's *Economic Abstracts,* both with classifications much narrower in scope than the work under review, use seventeen over-all groupings. Economic Policy, the largest of the ten classifications, contains over 2,000 entries, that is, more than one-fourth of the total. The arrangement might be brought into better balance by bringing international economic policy into the International Relations group and by establishing a special group for Labor. Last but not least, the subject index is by far too brief and might well be expanded to a multiple of the number of pages now covered by it.

The sponsors of the volume make it plain that they have an open mind, and while, no doubt, they will be unable to satisfy all prospective users, there is good reason for the hope that future volumes will show progressive improvement. Whatever shortcomings the first volume may have, it surely is an indispensable research aid that belongs in every university library.

HENRY WILLIAM SPIEGEL
Catholic University of America

SOCIOLOGY AND EDUCATION

HERBERT H. HYMAN and others. *Interviewing in Social Research.* Pp. xvi, 415. Chicago, Ill.: University of Chicago Press, 1954. $8.00.

This book reports the results of the National Opinion Research Center's systematic studies of the sources of error in the interview. These were done under the direction of Herbert Hyman, with the collaboration of a number of members of the staff of NORC. The research was commissioned by a joint committee of the Social Science Research Council and the National Research Council and was financed by the Rockefeller Foundation.

The study began with a careful examination of the literature on interviewing and numerous consultations with experienced research workers for the purpose of collecting and constructing a number of hypotheses concerning the possible error-producing factors in the interviewing process. The hypotheses resulting from this search guided all subsequent phases of the research. They were tested by especially designed quasi-experimental projects which were done in connection with studies made for other purposes by NORC and other research agencies. These experiments deal with the following sources of effects which tend to produce error in the interview: first, with those deriving from the interviewer; second, with those deriving from the respondent's reaction to the interview situation; third, with those deriving from the relationship between interviewer and respondent under the impact of situational factors that are largely external to them both; and, fourth, with those deriving from normal operating conditions. Finally, attention is given to various ways of reducing and controlling error.

Space will not permit discussion of these quasi-experiments. However, it may be said that they were carefully and imaginatively designed and executed. The conclusions are stated in detail and properly flow from the empirical evidence. The general conclusion is that the effects of the bias introduced by the interviewer is much less than has been commonly expected. The interviewer's ideological views seem to be of negligible significance. His expectations of how the respondent should or will respond and his expectations as to the distribution of responses among respondents have some, but much less, influence than ordinarily has been supposed. The results also indicate that respondent reaction in the interview situation—particularly group membership differences between interviewer and respondent—has some influence, but not nearly as much as has been commonly thought. Finally, the error ef-

fects deriving from the relationship between interviewer and respondent, on the basis of the evidence presented, seem to have been greatly overestimated by social science research methodologists. Certainly, the results of the studies indicate that in a well-conducted research organization, where interviewers are carefully selected and trained, procedures are carefully developed, questions and questionnaires thoughtfully devised and tested, and field work adequately supervised, the interview is a reliable and valid way of eliciting data about social behavior.

Interviewing in Social Research is not designed to be a guide to interviewing. However, it can be read with profit by those who wish to improve their interviewing technique. Those who are concerned with the development of research will find it one of the best methodological studies in the social sciences to date.

WILLIAM H. SEWELL
University of Wisconsin

EVON Z. VOGT. *Modern Homesteaders: The Life of a Twentieth Century Frontier Community.* Pp. xi, 232. Cambridge, Mass.: Belknap Press of Harvard University Press, 1955. $4.25.

This is a study of a small, mainly pinto-bean farming, community in the arid plateau lands of southwest New Mexico. "Homestead," its fictitious name, was originally claimed, mostly from the public domain, in 1929–32 by eighty-one families of small southern white farmers who moved on from the Texas panhandle and Oklahoma. A total of 140 families have settled there but some became discouraged and left, so that now there are remaining about sixty-one families and 232 people. This book deals with their lives and experiences in the arid region from clearing the land, the introduction of commercial farming, droughts, frosts, wind erosion, failures, government price supports, discouragement, gradual decrease in numbers, and the final beginnings of the return to grazing and cattle ranching again upon the former cultivated soil.

The organization of work, or its scientific aim, is to show the relation of "values" to community organization, to its persistence, and to its life career. The author says that the dominant values of the people at the start were those of the mastery over nature, optimism for the future, and a system of equated working and loafing—the first during the crop season and the second in the off season. However, when the settlers came to New Mexico, they soon found themselves an isolated "anglo" community, having to live shoulder to shoulder with neighboring communities of well-to-do Pueblo Indians, poor Navahos, Catholic Spanish-Americans, and hard-working (aggregated-village) Mormons. To their original basic attitudes or values, they added a system of appraisals of themselves as an ethnic group in relation not only to the world at large, but to these other ethnic groups. Out of these appraisals considerable community antagonism arose, particularly with the Spanish-Americans.

The work is the story of these "Texicano" people in relation to the vicissitudes of nature (low and fluctuating rainfall and short and fluctuating growing season), to the other four ethnic groups mentioned, to each other, and to the ranching economy which continually sought to expand into the cultivated lands again. Its uniqueness lies in the conception of dominant values of the people as "constants" and its contention that the life history of the community, from its inception, first success, and through gradual withering away, was largely a reflection of these persistent and almost unchanging values.

The book thus introduces a new idea, or at least a new variant of one, in the field of community studies. As such it deserves wide reading and serious study. Most community studies are largely hodgepodges of mechanical descriptive details, but this one, at least, has an integrating theme. The small farmer, the marginal man in our present factory agriculture, is tending to become extinct like the American bison and the whooping crane. Most of the communities established during the thirties decade by Subsistence Homesteads, the Resettlement Administration, and other agencies or private individuals, have by now also gone the way of all flesh. Vogt's ideas must explain a class of similar phenomena before they can be accepted as valid scientific truths. Nevertheless, the author at least has ideas, and this means he should enlist a thoughtful audience.

CARLE C. ZIMMERMAN
Harvard University

JOSEPH W. EATON in collaboration with ROBERT J. WEIL. *Culture and Mental Disorders.* Pp. 254. Glencoe, Ill.: Free Press, 1955. $4.00.

Culture and Mental Disorders deals with the interactive role of social factors in mental disorders. The study was directed by a sociologist in collaboration with a psychiatrist, using a research staff from sociology, psychiatry, and psychology. Persons were studied and "good informants" were interviewed. Contacts were made with hospitals and social agencies. Data were collected from ninety-three Hutterite colonies and compared with findings in nine other studies.

This research is a shift away from the biopsychological emphasis in accordance with the realization that the explanation of mental ill-health falls between the sciences. The authors are aware that the study of mental ill-health is unfinished business with no place for a biological or sociological bias.

One wishes that the authors could restudy these colonies with the valuable information now at their disposal. They exploded the old hypothesis that few cases of mental disorders will be found in a relatively simple way of life. They have answered many questions and have raised many more. Is the Hutterite way of life simple? Strongly religious, it demands strict conformity and produces feelings of fear and guilt.

There seem to be few crisis situations in Hutterite life, but is mental ill-health produced in critical experiences or in little day-by-day experiences? Is a crisis met by the mental ill-health slowly achieved in daily living? Is a physical disturbance a causative factor or just a critical experience met with concealed mental ill-health? Is an organic malady an event? Is the behavior of a person with "infectious, traumatic, glandular, and neurological variables" entirely different from a person experiencing social variables? In this study these authors have qualified themselves to answer these and many other questions through further research.

How important is the prevailing mood in group life? There seems to be a manic depressive mood based on a sin-guilt complex in the Hutterite colonies. Are the mentally-ill the persons who have exaggerated this mood in meeting organic and cultural events? Does the mental ill-health of the patient exist also in the group of which he is an interactive part? All of his other human nature belongs as much to the group as it does to himself, how about his mental ill-health? The colony is the unit of living, is it also the unit of illness?

Genetic, organic, interpersonal, and cultural aspects of mental ill-health were considered. Research procedures are reviewed. There is a good bibliography, but no index. Anyone interested in mental ill-health will find this a valuable book, basic in many ways to any research.

L. GUY BROWN
University of Rhode Island

ALBERT K. COHEN. *Delinquent Boys: The Culture of the Gang.* Pp. 202. Glencoe, Ill.: Free Press, 1955. $3.50.

Briefly put, Cohen's major thesis in this stimulating book is that the delinquent subculture represented by the gang is a response to the status dissatisfaction of numerous working-class boys who are reacting against the middle-class value system. These middle-class norms include such values as get-ahead ambition, individual responsibility, cultivation and possession of useful skills, ability to forego immediate pleasures for future planned success, good manners and courtesy, control of physical aggression, "wholesome" recreation, a well-ordered home, and particularly possession of and respect for property.

Since working-class children are for the most part unable to attain these values, they are always conscious of a painful comparison between themselves and better-advantaged middle-class children. And they

are constantly reminded of their unpleasant bottom-of-the-heap position by their middle-class school mates and those middle-class figures represented by their teachers and the heads of community recreational agencies which are supposed to serve them.

"The crucial condition for the emergence of new cultural forms is the existence, in effective interaction with one another, of a number of actors with similar problems of adjustment." Thus, the reaction of the many working-class boys to this constantly irritating status inferiority is the development of the delinquent subculture, which confers upon them status superiority in terms of new norms peculiar to the delinquent *milieu* and diametrically opposed to middle-class social values.

Cohen describes the delinquent subculture as nonutilitarian, malicious, and negativistic. Boys in gangs steal things for which they have no use; they destroy and deface property out of pure malice; and their way of thinking is negativistic. Their explicit and complete repudiation of all middle-class standards eventuates in the active flouting of all the values of the middle-class status system.

For these boys the delinquent subculture must be a group solution, in which deviant values are given support by the general concurrence of the participants. Thus, working-class boys can achieve the status-goals denied them in the middle-class system by conforming to the norms of their peers and fellow delinquents.

In explaining middle-class boy delinquency as a masculine protest against identification with the mother, Cohen overlooks the possibility of a broader adolescent subculture affording relief to middle-class children from exacting middle-class socialization. Such a subculture is exemplified in the wild parties of high school secret societies.

This reviewer feels that Cohen's theoretical formulations would be greatly strengthened had he included case studies of typical delinquent subcultures and of the impact of these subcultures upon individual gang boys.

FREDERIC M. THRASHER

New York University

CHARLES M. HARDIN. *Freedom in Agricultural Education.* Pp. xviii, 275. Chicago, Ill.: University of Chicago Press, $4.50.

This volume constitutes a valuable contribution to the literature of academic freedom, government aid to education, and practical politics. On the basis of scholarly preparation and experience, the author was admirably equipped to undertake its preparation. For many years he has been interested in the subject of agricultural policy and the part played by political factors in its shaping.

Initially, the study, which ultimately evolved into the book here reviewed, was undertaken at the suggestion of Dr. John D. Millett, now president of Miami University, and formerly executive director of the Commission on the Financing of Higher Education. Dr. Millett and his Commission colleagues were especially anxious to ascertain to what extent, if any, the policies, programs, and personnel of our colleges of agriculture, agricultural experiment stations, and Extension services which receive financial support from the federal government are subjected to federal interference and control. The answer to this question would, they felt, throw light on the prudence and wisdom of extending federal aid to higher education generally. Professor Hardin, however, wisely believed that his research should not be confined only to this topic, but should be broadened to include the effect of political pressures from whatever source and by whatever means upon agricultural instruction and research. It followed logically that he should also study the relevant agricultural agencies as political interests and appraise their function respecting the making and administration of farm policy.

This larger task he has done in masterly fashion. Not only has he made an exhaustive examination of the printed materials, but by means of field trips and personal interviews he has amassed a wealth of contemporary material which adds richness to the quality of his findings and interpretation.

On the basis of this meticulous study, Professor Hardin finds that federal domination has failed to follow the federal dollar in the administration of federal grants to agricultural education agencies. He does find, however, some evidence of direct pressure in the domains of research and Extension. This pressure, he also finds, is much greater on the part of state and local groups than on the part of federal agencies. In recent years intrastate interest groups have been more direct and active in scrutinizing the research of the colleges of agriculture and Extension services.

Professor Hardin also finds that the colleges of agriculture are political interests, that they have their own heavy commitments and political allies among farm groups. They also contribute to the shaping of public policy by undertaking policy-oriented research and in other ways.

All those interested in academic freedom will find informative and illuminating the author's description of ways in which the instructional and research staffs have dealt with controversial issues and with those interest-pressure groups which have sought to stifle or control those whose teaching and research they opposed. Finally, the reviewer is inclined to believe that Professor Hardin is correct when he concludes that the experience of federal grants-in-aid for agricultural research and instruction suggests that federal grants could be safely and profitably expanded to aid other kinds of research and higher education without fear of federal domination.

HARRY J. CARMAN

Columbia University

VANN C. WOODWARD. *The Strange Career of Jim Crow.* Pp. xi, 155. New York: Oxford University Press, 1955. $2.50.

This little volume by a distinguished historian at Johns Hopkins University is much more important than its lack of bulk would indicate. It is an account of the development of racial segregation in the South from the time of the withdrawal of federal troops in 1877 to the present.

At a time when the Sumnerian thesis of the near immutability of the mores is coming under increasing attack from sociologists and social psychologists as the result of an accumulation of experiments and events, and when the modification of this thesis has considerable relevance for the area of race relations, Professor Woodward adds new perspective to the problem by approaching it, so to speak, from the historical rear. The period between the end of Reconstruction and, say, 1900 in Southern life has not been widely investigated by scholars, and such an area tends to become, in Woodward's felicitous phrasing, a "twilight zone that lies between living memory and written history" and thus one of the "favorite breeding places of mythology." The common belief is that Jim Crow laws and practices were imposed rather quickly by an undivided white South soon after self-rule was restored. Such a view raises the vision of an unbroken and undivided attitude towards Negroes by the whites of the South which extends indefinitely backwards into time and, by implication, forward into the future. While Professor Woodward points out that much research remains to be done before this era is completely illumined, enough is known now to explode this view once and for all.

It may come as a surprise to many to learn that Negroes voted in large numbers in the South for more than two decades after Reconstruction. Or that the great majority of the Jim Crow laws were passed *after* 1900. While Professor Woodward in no way claims that the last two decades of the nineteenth century were a golden age of race relations in the South (quite the contrary!), he does make it clear that there were varying attitudes as to the *degree* of subordination appropriate for the Negro, and the triumph of the doctrine of complete segregation and subordination came about only gradually and only after considerable controversy among the whites themselves. The various economic, political, and social forces which conspired to bring about this development are skillfully adduced.

The career of Jim Crow is brought up to date, but the more recent analysis, while well done, is familiar ground to contemporary students of race relations and will be of less interest.

PHILOSOPHY AND RELIGION

PIETER GEYL. *Debates with Historians.* The Hague, Netherlands: Martinus Nijhoff, 1955. Guilders 12.40.

This is a great, little book containing thirteen lectures on the art of writing history.

The rapier thrust of Professor Geyl's professional criticism has long been a fresh and stimulating treat to American historians. The author plays no favorites unless it be Ranke. Whether dealing with Macaulay, Carlyle, Michelet, Randall, or Toynbee his scapel cuts clean, separating truth from fiction, exposing *nonsequiturs,* ever defending vigorously objective methods which should (but never do) characterize the historian.

The most vital part of this book, and almost half the pages, relates to Geyl's private war against Arnold Toynbee. It began briskly in 1946 and has continued ever since. Geyl fights as a gentleman should, never hitting beneath the belt, without malevolent and petty criticism, but nevertheless striking heavy blows.

His major attack may be summed up under three heads: Toynbee is unscientific and unscholarly since he blueprints in detail what his conclusion is to be before commencing his research; Toynbee is so hostile to Western civilization that he distorts facts to prove his point; and Toynbee's religio-prophetic attitude of mind prevents his being a sound historian.

The first of these approaches to Toynbee has already been analyzed by this reviewer in his review of *The Pattern of the Past* (Boston, 1949), but the third, Geyl's lecture on *Toynbee, the Prophet,* is new this year (1955), and is based on Toynbee's last four volumes recently published.

These four books contain, according to Geyl, "long sustained arguments juggling with the events, the crises, the wars, revolutions, state formations and religious manifestations of all centuries and all races. . . ." They prove "absolutely nothing."

Geyl then proceeds to rake Toynbee fore and aft, accusing him of distortions, of half truths twisted out of content, concerning trade unions, the Jews, national socialism and so forth, all for the purpose of demonstrating a religious interpretation of history that defies sound scholarship and rational intelligence. "To see," writes Geyl, "a self-styled historian reducing the whole mysterious movements of history to a single motif, rejecting whole centuries as uninteresting, forcing it into the scheme of a presumptuous construction strikes me as going against all that history stands for."

Toynbee, he continues, "dwells in a world of his own imagining where the challenge of rational thinking mortals cannot reach him." Therefore Toynbee is no true historian, a point of view argued by Geyl with no little skill.

Debates with Historians will be of interest to all who wonder what history is, and how it should be written. It is heartily recommended to all young students pursuing graduate studies, and no seminar room should be without a copy.

WALTER P. HALL
Princeton University

JACQUES DELPECH. *The Oppression of Protestants in Spain.* Translated by Tom and Dolores Johnson. Pp. xii, 114. Boston, Mass.: Beacon Press, 1955. $2.00.

A very brief historical Introduction by President Mackay of Princeton Theological Seminary precedes the largely factual narrative of the author. Much of this material has long been available. Spain has always been a Roman Catholic country. American Catholic journals may interpret Spanish Protestantism as a fact, Spanish Catholicism interprets it as a threat. Spain escaped the Reformation because it already enjoyed the privileges the other countries of Europe desired.

"Every baptized person is a Catholic," in Spain in law and fact; elsewhere in theory. Such a person, even if he separates himself from the Church or is excommunicated by her, *remains subject to her.* He remains on the roll! There is no column in the American Catholic Directory for losses except by death. Nothing can relieve any baptized Roman Catholic from his obligations to the Church. Canon 87 of the *Codex Juris Canonici* settles the true interpretation of what it means to be a Roman Catholic. Protestants seem unable to understand this! (p. 35). "Spain cannot grant the same rights to Protestants as to Catholics . . ." (p. 37). Protestantism "was born in corruption and was the exclusive product to the vilest passions—sensuality, pride, and avarice" said a Spanish pamphlet (p. 39). ". . . To become a Protestant is nothing else but open apostasy against the Christian religion . . ." (p. 40).

Spanish Protestantism almost disappeared after the Spanish Civil War, but in 1945 Franco issued the *Fuero,* the fundamental law of the regime, which in Article 6 protects religious beliefs and "the private practice of worship." In 1951 the Jesuit scholar Don Luis Padrosa, director of the Loyola Institute in Barcelona, was converted to Protestantism, indicating that Protestantism was again making an impression. Mixed marriages are a problem even in Spain and burial services as well (pp. 75 ff.). Protestant army officers, nurses, teachers suffer from numerous disabilities. All hospitals are under Catholic control.

Roman Catholic journals in France, England, United States, and Denmark have protested and condemned acts of Spanish Catholics. The weekly *Commonweal* complained that "Cardinal Segura is undoubtedly moved by *a* Catholic concept of Church-State relationship. *A* Catholic concept, *not the* Catholic concept. If it were *the* Catholic concept, then Mr. Blanshard's darkest fears would be justified" (p. 100). The Jesuit weekly *America* stated: "full religious liberty should be the normal state of affairs in all advanced countries. Repressive legislation is on the primitive side" (p. 101).

In 1954 General Franco declared that separation of Church and State was inconceivable, "Will you tell me where, in a Catholic society, the temporal ends and the spiritual begins"—precisely so.

The conclusion asserts that "in spite of official declarations by Church and State, the Protestants of Spain do not enjoy the toleration that the regime promised them in 1945."

Colgate-Rochester Divinity School

WILLIAM G. MCLOUGHLIN, JR. *Billy Sunday Was His Real Name.* Pp. xxix, 325. Chicago, Ill.: University of Chicago Press, 1955. $5.50.

Had Billy Sunday not been born, Horatio Alger might have created him. He was, says Dr. McLoughlin, "a living embodiment of the mythical farm boy who went to the city and made good, an orphaned bricklayer's son who rose to fame and wealth." This volume, written by a Brown professor of American civilization and political science, meticulously traces the saga of a figure who, at the turn of this century, symbolized the frantic struggle of Protestant fundamentalism against the invasion of liberalism into the thought and mores of the nation.

The Reverend William A. Sunday was born in 1862, the son of German immigrants whose name had been Sonntag in the old country—hence, the significance of the book's curious title. From a childhood plagued with misfortune, Billy first emerged as a major league baseball player who set two records which stood for many years: he rounded the diamond in fourteen seconds and stole ninety-five bases in one season. Meanwhile, he met his future wife, "Ma" Sunday, who today continues to brandish the sword of the Lord and who contributed generously of her memories to Dr. McLoughlin's research. Largely through her influence, Billy was "saved," decided upon a religious vocation, and, by 1896, found himself treking through Iowa as a promising evangelist. By his death in 1935, Sunday personally had addressed over 100,000,000 people and had led a million penitent souls down the sawdust trail to glory.

Dr. McLoughlin's book, unlike most previous accounts of Sunday, is neither unduly sympathetic nor hostile. It attempts to recapture the evangelist's personality through graphic portrayals of his manner and vivid excerpts from his coarse

rhetoric. It also seeks to recount, in an impartial way, Sunday's revival techniques and their results, quoting judgments both of his friends and foes. The breadth and scholarship of this study testify to McLoughlin's ability and persistence. Paraded before the reader is a galaxy of facts and figures: names of Sunday's influential friends in the business and political worlds; details of the financial support of his revivals; his attitudes on political, social, and moral problems; bristling quotations demonstrating his bitterness against an assortment of enemies; and a host of other aspects of the Sunday phenomenon.

In addition to unfolding another novel chapter of American history to wider view, *Billy Sunday Was His Real Name* is of value to those who would better understand the current renaissance of revivalism in America. Dr. McLoughlin devotes considerable attention to the way in which Sunday adapted to his own day the techniques developed earlier by Charles G. Finney and Dwight L. Moody. In 1955 we are in a position to make further comparisons and contrasts between the efforts of these evangelistic patriarchs and those present-day heralds of the altar call who are preaching the same gospel to adherents of the same "old-time religion."

RALPH L. ROY
Fund for the Republic

COMMONWEALTH OF NATIONS

McKIM MARRIOTT (Ed.). *Village India: Studies in the Little Community.* Pp. xviii, 269. Chicago: University of Chicago Press, 1955. $4.50.

S. C. DUBE. *Indian Village.* Pp. xiv, 248. Ithaca, N. Y.: Cornell University Press, 1955. $3.00.

The first of these two books is one of a series of *Comparative Studies of Cultures and Civilizations,* of which the general editors are Robert Redfield and Milton Singer. They state in their Foreword that "the primary interest that brought about this volume is not the effort to understand India and her changes. It is the effort to understand how to seek understanding of any great civilization and its enormously complex changes through anthropological studies of villages. The questions asked in the seminar that gave rise to this book were questions of "method": "What forms of thought for understanding a small community are relevant when the community is an Indian village? What changes in ways to which anthropologists are accustomed when they work in isolated tribal communities are demanded when they work in a village that is part of a large society, when they study a local culture that is part and cause and product of an ancient civilization?" (Foreword, p. ix).

The contributors to this volume, Alan R. Beals, Bernard S. Cohn, E. Kathleen Gough, Oscar Lewis, David G. Mandelbaum, McKim Marriott, M. N. Srinivas, and Gitel P. Steed, whose papers deal with eight villages in different parts of India, have all to a greater or less degree presented material pertinent to a consideration of these questions. In this respect the paper of McKim Marriott, entitled "Little Communities in an Indigenous Civilization," is especially valuable. Based on field work in a north Indian village, it deals specifically with "two related questions of method: (1) can such a village be satisfactorily comprehended and conceived as a whole in itself, and (2) can understanding of one such village contribute to understanding of the greater culture and society in which the village is imbedded"? (p. 171). Few with experience in India or in other areas with a great tradition will doubt the validity of his answers. Drawing on the data of social organization and religion, Marriott concludes that the village cannot be considered as an isolate and that "a focus upon the small half-world of the village and a perspective upon the universe of Indian civilization thus remain mutually indispensable for whole understanding, whether of Hinduism or of the traditional forms of India's social structure" (p. 218). In conceptualization and in the handling of his material his work is exemplary. Mandelbaum, in a paper on "The World and the World View of the Kota," approaches these problems from another angle. From an exposition of the world view of the Kota he moves to a comparison with other villagers described in this volume and considers the possibility of determining an Indic world view. His attempt is not wholly successful, in part because, as he points out, the concept of world view needs refinement, and also because the other material does not readily lend itself to this use, but his paper is suggestive and points to possibilities for future work.

Aside from matters of methodology and theory these papers, which all reach a high standard of excellence, form a major contribution to the study of rural India, especially as regards social structure and social change. In this respect, and because the author is aware of and specifically refers to relations between Shamirpet and the world outside, Dube's book, *Indian Village,* might be considered as a companion volume. The team of investigators from Osmania University, whose work is here reported, studied a village in Hyderabad, an area on which little information has so far been available. Dube's aim as stated is deceptively simple, "to give a clear and intimate picture of some aspects of life in an Indian village" (p. 15). He has written informatively on social, economic, and ritual structure, and his book is especially noteworthy for the wealth of material on interpersonal relations.

DOROTHY M. SPENCER
University of Pennsylvania

V. H. H. GREEN. *The Later Plantagenets: A Survey of English History Between 1307 and 1485.* Pp. 438. London: Edward Arnold, 1955. (Distributed by St. Martin's Press, New York.) $4.00.

As Mr. Green points out in his Introduction he has undertaken a formidable task. Compared to the enormous amount of work which has been done on the Norman and Angevin periods, the Later Middle Ages in England has been gravely neglected. The standard surveys of the period are out of date, substantial monographs are few, and the bulk of recent research appears in articles in learned journals. Mr. Green has combed through this mass of periodical literature. The student who wants to know the most recent views of scholars on the innumerable debatable points in the history of the period will find most of them in this book. He will also find illuminating expositions of certain subjects such as the wool trade and the wars of the roses. Mr. Green has produced a guide to recent scholarly work in the period for which the historical profession should be grateful.

Unfortunately despite its virtues, Mr. Green's book is most unsatisfactory. Apparently, the author lacks the sense of continuity so important in effective historical writing. The book is a jumble of vaguely connected episodes. Vital events are left out and then referred to as if the reader knew all about them. There is no mention of the murder of John the Good, Duke of Burgundy. Hence the whole later Burgundian policy is left largely unexplained. There are several references to Henry VI's madness, but no mention of its beginning and no real discussion of its nature.

Even more serious in a scholarly historical work is Mr. Green's carelessness about accuracy in detail. The map of France at the beginning of the Hundred Years' War shows the Capetian royal domain as it existed before the reign of Philip Augustus. This is particularly inexcusable as Shepherd's *Historical Atlas* has an excellent map on this subject. On page 275 Mr. Green states that "they [the English kings] kept the appointments to the offices of seneschal, constable, and mayor of Bordeaux in their hands." Then on page 277–78 he tells how the mayor of Bordeaux was elected by a group of officials known as *jurats.* Mr. Green's failure to notice that under the Treaty of Brétigny the renunciation of the English king's claim to the French crown and the French king's surrender of his suzerainty over Gascony were to be simultaneous and never took place leads to a number of confused statements. On page 243, Henry IV is called the nephew of Richard II. On page 172, Mr. Green seems to say that the calling of the French estates general in 1343 was the first time that body had been summoned. When a reviewer notes so many obvious

errors, he is inclined to suspect the existence of others which he did not detect.

SIDNEY PAINTER
Johns Hopkins University

ASA BRIGGS. *Victorian People: A Reassessment of Persons and Themes, 1851–67*. Pp. ix, 313. Chicago, Ill.: University of Chicago Press, 1955. $5.00.

Victorian People reminds one of Lytton Strachey's *Eminent Victorians*. It is better history, yet at the same time inferior as a work of art.

It is better history because more scholarly, more objective, and much fairer in its appraisal of the importance and character of those Victorians chosen to reflect the life and spirit of the Victorian high noon. It is a failure as a work of art because one is but dimly aware of the forest because of the overemphasis on the individual trees.

Eminent Victorians is a bitterly prejudiced book, and occasionally poisonous; but one does get an over-all picture, no matter how false, of Victorian civilization. This is lacking in *Victorian People*, despite the earnest effort of the author to paint one.

Mr. Briggs has selected his *personae* with discrimination. Samuel Smiles, Trollope, Bright, Roebuck, Disraeli, and Hughes, author of *Tom Brown's Schooldays*, are all representative Victorians, and this book is replete with interesting facts concerning their lives. Possibly the trouble lies here —too many facts!

In all fairness to the author one should acknowledge, for instance, that the detailed account of Disraeli's activities at the time of the Second Reform Bill could not be improved upon, and the same holds true of Roebuck in regard to the Crimean War. But in both instances objective facts dominate the stage. There is no light, no shade, no *chiaroscuro* wherefore two striking individuals never emerge as such, both smothered in minutiae. Compare Arnold of Rugby as described by Strachey with the same man described by Mr. Briggs. Strachey's portrait is vicious, but one remembers it; Mr. Briggs' painting is blurred, since he includes too many obvious facts concerning the English public school.

Victorian People, though intended for the general public, is a professor's history. It bears all the earmarks of the profession: exhaustive scholarship, the ploughing up of new fields of research, delving into the post-Parliamentary career of Robert Lowe, tracing the late career of Hughes to a colony in Tennessee. In other words this is a very useful book for teachers of English history in search of lecture material.

To catch the color, the warmth, the meaning of the eighteen fifties and sixties is a literary problem of the first magnitude for which there are no simple answers. To this reviewer, however, it seems significant that no poet is included in the list of *Victorian People*. Poets, by definition, are excused from dealing with facts, and on that account they are frequently the best interpreters available for historic reconstruction. One wishes that either Tennyson or Browning had been included in *Victorian People*.

WALTER P. HALL
Princeton University

LEWIS NAMIER. *Personalities and Power*. Pp. vii, 157. New York: The Macmillan Company, 1955. $3.00.

Personalities and Power by a British historian contains twelve occasional papers of uneven length and uneven merit. Chapters III–V were prepared as lectures for special occasions on the party system in a constitutional monarchy, on King George III, and on the representation in Parliament. Chapter IX dealing with nineteenth-century European history was also prepared as a lecture. Six of the last seven chapters, as well as Chapter II, are reviews of important books, especially the last three dealing with the diplomacy of interwar years, Germany, and Hitler. The lectures and reviews, as well as the remaining two short chapters, were originally published in British periodicals.

The opening chapter on human nature in politics is a good beginning, but it is too brief (pp. 1–7) to be of much value except showing the author's dexterity to treat the subject from the viewpoint of a psychologist. So is Chapter II on the profession of historian. The longest chapter in the book is the Romanes Lecture for 1952 on "Monarchy and the Party System." There as well as in the next chapter (the Academy of Arts Lecture for 1953 on King George III) the author is at his best because he is perfectly at home with his subject. Unfortunately this is not the case when Sir Lewis writes on nineteenth-century European history, still less on Germany and contemporary events. Here he simply lets his emotions and feelings overshadow his judgment and learning. For instance, his statement that the Upper Silesian plebiscite of 1935 "should never have been held" (p. 116) makes little sense. There is even less sense in thinking that latent German nationalism is as dangerous to the West today as is Russian Bolshevism (p. 127). In this and in other connections Sir Lewis pursues his vendetta not only against the Nazis, dead or alive, but also against all Germans with pathological intensity. And this is regrettable, because one would have presumed that this friend of Churchill, a Fellow of the British Academy and recently knighted, could, under the mellowing weight of honors, acquire some sense of humility and learn to restrain his feelings when passing judgment on a whole nation or nations. Incidentally, the publisher's statement (on the wrapper) that the author's pieces of historical illumination "can stand comparison with the essays of Macaulay, Ranke, and Sorel" is as wide of the mark as are some of the assertions of Sir Lewis Namier.

SLAVIC COUNTRIES

JOZO TOMASEVICH. *Peasants, Politics, and Economic Change in Yugoslavia*. Pp. xii, 743. Stanford, Calif.: Stanford University Press; London: Oxford University Press, 1955. $7.50.

This is an account of the history of Croatian, Serbian, and Slovene agriculture from the Middle Ages up to 1938. The account is based mainly on secondary sources and most of these are by native South Slav writers. The author discusses first the feudal systems, then the political and economic changes connected with the downfall of feudalism in these lands. In the second part of his work the author treats the formation of pre-World War II Yugoslavia. The major part of this work is Part III in which the author gives a detailed account of the problems of agriculture in the period between the two world wars, but stops short of the important political and economic changes in 1939 when an autonomous Croatia was formed within the framework of prewar Yugoslavia. This leaves a serious gap in the study. In the period 1918–38 the author discusses peasants as a political force, resources of agriculture, and agricultural overpopulation. Then he gives an account of the agrarian reform, the structure of the farms, the state measures to safeguard the land, and the problems of output of agricultural goods. He has also chapters on agricultural credit, agricultural taxation, agricultural market, and health in rural areas.

As long as the author limits himself to economic questions of production, distribution, taxation, and market, he assembles a great amount of data from a variety of sources which are otherwise unavailable to the American reader. These data, for instance, give a rather objective picture of the agrarian problems of Yugoslavia between the two world wars. But, as soon as the author attempts to give a sociological and anthropological interpretation of peasants and their culture, he is at a loss because of his lack of training in these fields. Like a number of other South Slav writers, he has been influenced by the ideas of Slavophilism and Pan-Slavism. This has affected both the selection and the interpretation of his sources; it has, for instance, weighed in his evaluation of the effects of Turkish feudalism on the South Slavs. The author tends to ascribe some of the less attractive qualities of these people "to a general regression in the economic, social, and cultural life" caused by the Turkish rule of these lands (p. 193). Likewise, his ethnocentrism and lack of sociological and anthropological data and

concepts lead him to view all South Slavs as belonging to basically one culture (p. 248), thus disregarding autochthonous cultural differences in the family structure and interpersonal relations as well as in the community structure and community relationships. For instance, he denies the existence of basic cultural, social, and psychological differences between the migratory sheep-raisers in the Dinaric mountain range and the sedentary tillers of the soil in the Pannonian plains. Also, the author disregards the influences of religious differences between Roman Catholicism, Eastern Orthodoxy, and Islam as well as differential urban influences on these peasant peoples that have been for centuries located at a crossroad of cultures and civilizations. But when the author is free of such biases and avoids interpretation, he brings valuable data which can be used, to a certain extent, as a background for the understanding of some of the economic problems of contemporary Communist Yugoslavia. The author does not indicate how the Communist party in its underground activities took advantage of the economic difficulties of former Yugoslav regimes when planning to seize power. The documentary sources concerning these activities of the Communist party of Yugoslavia in the period between the two world wars have been available now for a number of years because they were published in the official party publications, particularly in the eight volumes of the *Istoriski Arhiv* (Belgrade, 1949–51.)

WESTERN CONTINENTAL EUROPE

CARL E. SCHORSKE. *German Social Democracy 1905–1917: The Development of the Great Schism.* Pp. xiii, 358. Cambridge, Mass.: Harvard University Press, 1955. $5.50.

The Social Democratic Party of the Federal Republic of Western Germany, forming the left wing opposition bloc in the *Bundestag,* boasts a history of greater continuity than that of any other German party. Its tradition dates back as far as to the decade preceding the foundation of the new German Reich in 1870, the time when August Bebel and Wilhelm Liebknecht had been laying the basis of a socialist labor party. However, this tradition is disrupted by a breach of fateful significance. The German Social Democrats today are stanch defenders of democratic liberties and parliamentary procedures, in their relationship to the existing state they are anything but revolutionists, and none could be more bitterly opposed to communism than they. Yet the Communist party as well as its predecessor under the Weimar Republic, the Independent Socialist party, can claim to be an offshoot of that very same tradition, split off during World War I, on the eve of Germany's defeat. The overt schism, brought about by the disintegration of German society under the threat of military disaster, made evident a cleavage as old as the German socialist movement itself, an element of growing dissent throughout its history and, in point of fact, one of the chief determining factors in its ideological and institutional development. Professor Schorske, in his competent and valuable book, relates, stage by stage, the progress and the varying manifestations of the tension which broke into open conflict in 1917. His emphasis is on the institutional and political history rather than on ideas. But also the development of doctrine is sketched in with a sure grasp of the essential. The author, laboring in a field ploughed up by numerous research workers before him, does not aim at originality, and his account, on almost every point, confirms, and at the same time refines, a familiar story. It is the story of a revolutionary party in a, by and large, progressive society. In order to survive as a party it must embrace the cause of democratic progress, thereby adapting itself to the existing society and, by the same token, jeopardizing its revolutionary pathos. Then, in order to keep alive the idea of revolution, integral part in this case of the Marxian heritage, it must renew its appeal to the restive masses by relentless hostility to the powers that be. In the long run the two requirements will prove incompatible with each other. The virtues of the reformist or revisionist wing will consist in a combination of high-minded idealism with moderation, democratic tolerance, and a willingness to take into account also those facts and developments which are at variance with the predictions of Marx, the prophet of revolution. Eduard Bernstein, the great theorist of revisionism, stands out as an exemplar of these accomplishments. Again, on the revolutionary wing, distinction is attained by that single-minded devotion to the future of mankind, even to the point of fanaticism, which gave Rosa Luxemburg her heroic stature. The author, who has no axe to grind, is able to pay an equally well-balanced tribute to both socialist prudence and socialist heroism.

HELMUT KUHN
University of Munich
Germany

HENRY C. WALLICH. *Mainsprings of the German Revival.* Pp. xi, 401. New Haven, Conn.: Yale University Press, 1955. $4.50.

In 1945 Germany was a defeated, broken country, her cities in ruins, and her people stunned and bewildered. Just a decade later the West German economy has attained a recovery almost without parallel in history. There has been a rapid expansion of production and exports since 1948. In a recent article in *The New York Times,* Melvin Lasky reports that the German *Volkswagen* is beginning to conquer the small-car market throughout the world, and that the Germans are setting up complete assembly plants for the car in several foreign countries. Unemployment has been reduced; Germany's currency reserves are almost equal to those of Great Britain; her public finances, showing surpluses despite tax reductions, are the envy of Europe.

Other observers have explained this remarkable phenomenon as mainly due to American favoritism towards Germany, which has received from the United States more than four billion dollars as a gift on the mere promise of remilitarization. In this first-rate book, Henry C. Wallich, professor of economics at Yale University, grants the importance of effective American aid and German hard work, but he points out that other countries have also worked hard and received aid with far less spectacular results. Professor Wallich believes that the recovery of West Germany is a classic case of the free-market economy operating successfully with a limited number of strategically selected controls, and greatly helped by political and economic events outside its borders. Putting it simply, Germany "has done the right things and has had the good luck to do them at the right time."

In his superbly organized book Professor Wallich turns his attention to the facts of Germany's comeback in production and income, her monetary and fiscal policies, the free market policy, investment, industrial structure, population and refugees, labor's performance, the political bases of revival, the economic consequences of the German mentality, and Allied aid and occupation.

West Germany, says the author, has been far from a laissez-faire paradise: everything has been planned and managed by the Government—and from the standpoint of the employer and capitalist. Professor Wallich is convinced that few West Germany leaders want reunification, despite their political speeches, at least not at the present time. Agricultural East Germany had to be supported before the split by high tariffs on food, thereby increasing the cost of manufacture in the West. Today the West can buy more cheaply in the world's markets. Unification at this time would bring redundant economic capacity.

In her recent bestseller, *A Train of Powder,* Rebecca West attributed the current beaver-like activity of the Germans to their desperate search to forget the past and sublimate their guilt feelings by a highly neurotic concern with work, work, and more work. Professor Wallich, too, expresses concern that since the war the Germans have paid attention to little but economic pursuits—politics and culture have received only marginal attention. He warns that for a nation of Germany's tradition this state of affairs is disquieting. "The present political and cultural vacuum in Germany compels one to speculate what

might fill it. None of the possibilities mentioned seems very likely [*resurgence of Nazism; defection from the West; a deal with Russia; a new man on horseback*]. Yet the existing condition appears unstable and in danger of being displaced by some new enthusiasm. God help Germany and the world if it is again the wrong one" (p. 21). To this shrewd observation one can only utter a fervent "Amen!"

This is a good, strong, solid book with lots of backbone, useful not only to the professional economist and historian but also to the general public. It is must reading for every American for whom this question is literally a matter of life and death: will Germany maintain a stable democracy and will she anchor herself firmly on the side of the West?

OTHER COUNTRIES

CHUNG-LI CHANG. *The Chinese Gentry: Studies on their Role in Nineteenth-Century Chinese Society.* Pp. xi, 250. Seattle: University of Washington Press, 1955. $5.75.

At last! Professor Chang has made a fine beginning by taking the subject of the Chinese gentry out of the category of "weather problems." He and his colleagues have begun to do something about it in a difficult but essential way. They have gone carefully to the voluminous Chinese texts and begun to mine them of their vast resources which have hardly been touched in terms of modern social science research. This volume represents their beginning. Professor Franz Michael in a fine introduction to the book tells us of its background and of its supplements to come. It is difficult for Western scholars who have not had to grapple with texts in Chinese, Japanese, and similar languages to appreciate the problems that they pose, but a few moments talk with scholars in these fields is enough to convince almost anyone that there exists in these texts a mass of first-rate resources on the past that can be matched in no other area of the world. One need not dwell on the fact that, although these resources have existed for centuries and the areas concerned have been of vital importance to Westerners for decades, at the very least, their use for modern purposes has only recently ceased to be both sporadic and rare.

Professor Chang has not essayed any particular analytic treatment of the rich material he has presented. He has contented himself with going to the texts and extracting as thoroughly as he could materials on the number, distribution, differentiation, and origins of the gentry during the Ch'ing Dynasty. He points out wisely that much of what these materials indicate probably holds relatively well for other periods of Chinese history, but he ties these matters down rather neatly for his chosen period at least. He presents detailed figures on most of his topics, but he makes it quite clear that he is well aware that these figures are not to be mistaken for statistics which satisfy the most rigorous demands of proper statistical procedures. He does feel that they are the best that can be done with the texts as they are, and he presents his arguments explicitly as to why he feels that the inescapable inelegance of these figures from the modern statistical point of view are not likely to threaten his uses of them very seriously. A careful considerate man could hardly be asked to do more.

Professor Chang has inaugurated a great service to those concerned with the study of Chinese society. He has also made a considerable contribution to those interested in more general problems such as those concerning elite groups, bureaucracy, and so forth. His and similar contributions will make many analytical ventures possible that might otherwise never get beyond the speculative level.

Far Eastern specialists will also bless the publishers for a bibliography and glossary that give the Chinese characters for the titles and terms used in the text. Exigencies of publishing costs have in the past forced all too much penny-wise, pound-foolish publication in these respects.

Princeton University

RICHARD L. WALKER. *China Under Communism: The First Five Years.* Pp. xv, 403. New Haven, Conn.: Yale University Press, 1955. $4.50.

Since its conquest of power, the Communist government in China has carried through a revolution that has affected every aspect of Chinese life. In his study of the first five years of Chinese communism, Richard Walker has described the measures which the Communists employed to change the whole structure of Chinese society. Walker's book reveals the whole scope of this most ruthless form of totalitarianism and is one of the best detailed studies yet made of the Chinese Communist regime. The wide use of Communist sources greatly enhances the authenticity of this book's conclusions.

Into their first five years of rule the Communists have packed a series of drives which Walker describes and analyzes. He characterizes each of the five years according to the shift in emphasis of the Communist measures: the "Flush of Victory" is followed by the "Year of Violence," the "Year of Regimentation," the "Year of Retrenchment," and the "Year of Decision." After a survey of the moves of these years, Walker discusses separately the various methods which the Communists have used and their effect on different groups in Chinese society and on the relations between China and the outside world. He describes in a carefully documented way the effects of the Communist measures of psychological control, the fearful tools of psychological mass coercion, and the establishment of a "dread prison for the mind." He discusses circumstantially the whole "dehumanization of Chinese civilization" that has been accomplished; the destruction of the privacy of home and family, the condemnation of mercy and compassion as concepts of bourgeois society, and the destruction of individual thinking. He carefully analyzes the technique of the drives or movements aimed at stirring up hatred and destroying whole social groups. He outlines the measures of economic control and the problems faced by the Communist economy to push an industrial revolution fast enough "to defeat the Malthusian counter-revolution." (Most recently Communist China has been the first Communist country that has shown an interest in the "bourgeois" ideas of birth control.)

Walker discusses the effects of these Communist measures on the peasants, the workers, and the intellectuals. He demonstrates the falseness of the Communist claims about the high incidence of landlordism in China, claims which were contradicted by the statistics of the Communist land distribution drives themselves. This legend of landlordism was the only remaining argument in the Communist fiction of "feudal China," a fiction which is necessary to maintain the applicability to Chinese conditions of the Communist doctrine of the scientific interpretation of human history. In practice, the burden of the peasants is believed to be higher today than in former years. The pressure on the workers for higher production has increased with the use of piecework pay, of "labor heroes," and labor courts. But the worst aspects of Communist policy can be found in the establishment of totalitarian orthodoxy which has forced the Chinese intellectual to an abject surrender of his freedom of thinking.

Finally, Walker analyzes the position of China within the framework of the Communist world and the bitter Communist attack against the United States. In conclusion the author gives his own views on the United States stand and stresses the importance of aiding "in creating alternatives which the people will choose instead of communism."

FRANZ MICHAEL
University of Washington

GEORGE PADMORE. *The Gold Coast Revolution: The Struggle of an African People from Slavery to Freedom.* Pp. vii, 272. London: Denis Dobson, 1953. 12*s.* 6*d.*

A West Indian whose grandfather was a slave, George Padmore has made himself an aggressive and doctrinaire protagonist of the peoples of Africa now engaged in liberating themselves from European control. To an already fairly long list of

books attacking colonialism and imperialism, he now adds this study of recent constitutional developments in the Gold Coast. Although he goes far back into a dimly known past for background, he concerns himself primarily with events in the Gold Coast since 1945.

His pleasure in telling this story is obvious, for he is an enthusiastic and uncritical admirer of Kwame Nkrumah, the African Prime Minister of the Gold Coast, and of the Convention People's Party (CPP), to which under Nkrumah's leadership should go much of the credit for the steps made toward self-government since 1945. His enthusiasm for the present government of the Gold Coast causes him to write as a warm partisan with little good to say for the political opposition to Nkrumah and the CPP. Criteria of praise and condemnation are expressed in the Marxist vocabulary. While much of his criticism of the British is shared by less passionate writers on colonialism, the latter, quite properly, give the British more credit than Padmore does for the large measure of autonomy the Gold Coast now has. Haste in the preparation of the book reveals its carelessness in several ways. The reader is given references to only about one-third of the many long quotations going into the body of the text; the page references given on page 213 are not accurate; and H. A. Wieschhoff's name is misspelled every time it is mentioned.

These shortcomings do not deprive the book of value. On the contrary, it should be read by all persons interested in finding out if Africans can govern themselves because of the revolutionary significance for all Africa of the successful outcome of this great political experiment on the Gold Coast. The book shows the formidable tasks facing the new government in every field—constitutional, economic, educational, technical, political, regional. Two chapters dealing with economic resources and industrial development suggest that economic planning and governmental controls on a large scale must take place before solid economic foundations are there to support the new state, which has hopes of becoming a dominion in the Commonwealth. One chapter is devoted to Ewe nationalism, a complex problem of many headaches for the Gold Coast, the British, the French, and the United Nations. New and serious problems have developed since Padmore finished his book in 1953—the expulsion of Communists from the CPP for their activity in labor unions, charges of corruption against Cabinet members and even against Nkrumah, intensified activities of the political opposition, and the demand for a federal form of government. For an understanding of these problems Padmore supplies essential background, if not a complete one.

HARRY R. RUDIN

Yale University

PHILIP D. CURTIN. *Two Jamaicas: The Role of Ideas in a Tropical Colony, 1830–1865.* Pp. xii, 270. Cambridge, Mass.: Harvard University Press, 1955. $4.75.

The West Indian islands, which had played a significant role in the economies and rivalries of European powers before 1800, underwent thereafter a serious decline. As a result, historians have paid scant attention to the colonies in deterioration. Curtin's scholarly study is more than a history of the doleful days of Jamaica: it is also an analysis of the interplay of ideas between England and the planters, of the entire social scene in a plantation colony, and of the crisis resulting from the emancipation of slaves.

As his subtitle indicates, Curtin is particularly interested in ideas. Although the Jamaican planters were English in culture and education, they nevertheless had the prepossessions of local tradition. Ideas could not readily be transported across the seas and applied to the colony: some were resisted, some transformed, many ignored. Humanitarianism caused a necessary readjustment of life, since it resulted in laws to be obeyed, but the idea itself took no root in Jamaica. In the whole interplay, Curtin shows the validity of the Herskovits idea of "culture focus"—that each people has a "prevailing interest" in one aspect of life. Unless the colonial power is fully aware of this focus, it cannot count upon the aceptance of its theories, its practical proposals, nor any "desirable" aspect of its culture. The unpredictability of the colonial attitude toward contemporary economic, political, moral, and religious ideas in the home country gives significance to this case-study at the present moment of colonial crisis in Africa and Asia.

At emancipation, the Jamaican planters refused to accept the ideas of the Colonial Office, and yet they could devise no workable alternative system of their own. Ex-slaves became independent settlers following their own interests, and so there were two economies and two Jamaicas. Self-government failed, and the planters relinquished complete control of the colony to London.

The first half of the book, concerned with Jamaica on the eve of the revolution caused by emancipation, is absorbingly interesting; the second half, an account of the resultant two Jamaicas, stops abruptly with the failure of self-government. The reader needs a postscript to inform him of England's attempted solution of problems that had proved too difficult for Jamaicans. The one outline map is neither detailed nor conveniently located; much useful information is hidden in notes following the text. These minor defects are insignificant, however, in a book that is not only a contribution to our knowledge of the Caribbean and of colonial life and policy, but also a relevant comment upon the effect of European ideas in the modern colonial world.

JAMES G. LEYBURN

Washington and Lee University

JOHN and MAVIS BIESANZ. *The People of Panama.* Pp. xi, 418. New York: Columbia University Press, 1955. $5.50.

From the advent of the Panama Railroad builders in 1850, through the dramatic though frustrated years of Ferdinand de Lesseps' effort to thrust a canal across the waist of the Americas, to the completion of the Panama Canal by the United States Government, a vast number of workers of many nationalities, cultures, and colors were drawn to the Isthmus at Panama. These and their numerous descendants and successors have added a blend of varied hues to the Panamanians and indigenous Indians, themselves of diverse extractions and origins. In the Canal Zone and the adjacent urban centers of Colon and Panama City are to be found an extraordinary mixture of white and dark skinned peoples: French, Spanish, Greek, Chinese, Hindu, Jamaican and Barbadoan, as well as Americans and Panamanians of many classes and stations.

Through this mixture run complex lines of class and economic privileges, some based on national affiliation, some on social caste, others on color or racial extraction, and still others upon the type and locale of employment and residence. These lines of demarcation are directly related to pay rates, housing conditions, purchase privileges, medical and educational opportunities, and general public status.

The Canal Zone and Republic of Panama as a whole comprise a sociological cosmos affording many unusual insights into social structure, human behavior, and attitude patterns. It is into this complex pattern that the Biesanzs have directed their inquiry. Their volume adds a fresh approach to the fascinating history of the Isthmian region; a new dimension to the understanding of the politics and problems of a sister Republic and our relations with it. *The Peoples of Panama* is a serious, but thoroughly readable, sociological study of the peoples who live and labor together within the Isthmus. It is primarily concerned with the life conditions, problems and attitudes of four groups: the industrious Panamanian peasants, the pleasure-loving politically acute urban Panamanians, the various groups of Americans living in and out of the Zone, and the large numbers of segregated West Indians and their descendants whose position poses serious tests for American ideals and democratic principles.

No words are minced in criticizing the effects of long-continued policies that have marked off one group from another. But taken as a whole the treatment is a constructive one recognizing the difficulties and limitations that exist and praising United States and Panamanian authorities where statesmanship and constructive effort have

been shown. The authors believe that implementation of the new treaty with Panama and the alteration in educational policy for the Zone will provide vital tests for better relations between the two Republics and for a better orientation and happier future for the colored employees of West Indian descent.

The book is the result of nine years study. During this time the senior author spent one year as United States visiting professor of sociology at the University of Panama.

Notice of

ANNUAL BUSINESS MEETING

of the members of

THE AMERICAN ACADEMY OF POLITICAL AND SOCIAL SCIENCE

In accordance with the Bylaws of the Academy, the Annual Business Meeting of the members will be held on Monday, January 23, 1956, at 2 P.M., at the offices of the Academy, 3937 Chestnut Street, Philadelphia.

The Annual Report of the Board of Directors will be presented, directors elected, and other important business transacted.

THORSTEN SELLIN
Acting President

TO PRESERVE YOUR FILE OF *ANNALS*

a specially designed *Jesse Jones* periodical file is now available. Each handsome case holds six issues of THE ANNALS and is sturdily constructed to preserve your copies dust free and readily accessible.

- bound in black-and-orange leatherette
- stamped with 16-carat gold leaf with spaces for your indexing
- sent postpaid, carefully packed (extra postage for foreign shipment)
- *satisfaction guaranteed or money refunded*
- in spite of their costly appearance, the files may be obtained for only

$2.50 each **3 for $7.00** **6 for $13.00**

Send check with order to:

THE ACADEMY **3937 Chestnut Street** **Philadelphia 4**

Kindly mention* THE ANNALS *when writing to advertisers

CHARLES J. RHOADS

1872–1956

The Academy lost one of its oldest friends by the death of Charles James Rhoads on January 2, 1956. Mr. Rhoads was elected Treasurer of our organization upon the death of Mr. Stuart Wood in 1914 and remained in that office for more than forty-one years, giving unselfishly of his time and great financial acumen to the successful management of the funds of the Academy. When he accepted the treasurership he had already had a distinguished career as an officer of the Girard Trust Company of Philadelphia and had just become the first Governor of the Federal Reserve Bank of Philadelphia, an office he held until the end of World War I, when he was elected President of the Central National Bank. In 1929, President Hoover called him to the important post of Commissioner of Indian Affairs, which he filled until 1933. His interest in philanthropy and education was shown in his work with the American Friends Service Committee during World War I, his chairmanship of the Philadelphia County Relief Board, and his work as trustee of Bryn Mawr College and of the American-Scandinavian Foundation, to mention but a few of such positions which he held either at his death or earlier.

Mr. Rhoads has left a place on the Board of Directors which he occupied with great devotion, and a keen sense of the obligation and trust which it involved.

FOREWORD

Within the last two years three momentous decisions on human rights have been handed down by the Supreme Court of the United States. On May 17, 1954, the Court declared racial segregation in the public schools of this nation to be unconstitutional. On May 31, 1955, the Court ruled that the defendants in the aforementioned case "make a prompt and reasonable start toward full compliance" with that ruling. On November 7, 1955, the Court, in effect, applied to public parks and beaches the principle enunciated in its May 17 ruling that separate educational facilities are unequal. These decisions are being interpreted as expressing a general rule under which certain racial statuses of the past are rendered null and void and new statuses are to be created. They may well be harbingers of significant changes in human relations throughout the country.

The fabric of these decisions, however—their trim yet tangled actuality—is no product of the moment but has been woven over the years. Public policy, state rights, decrees of judges, acts of legislatures, popular and unpopular opinion, have all entered into the design. And as abstractions meet concrete situations in many areas—educational, economic, political, and social—each will affect the other in the impact. For the decisions reveal a society at peace with confusion, surging toward a more democratic objective. Their ideal is social justice and their logic the logic of things that change.

But what is the meaning of these decisions for social life in the United States? What are the matters of immediate and practical concern which demand rational action and realistic planning? In general, we see two processes at work—desegregation and integration. Desegregation we regard as a neutralizing process that must occur when groups have been prevented from having equal access to the materials of a society and egalitarian relations with other groups, races, ages, religions, sexes, or classes because of edicts or customs which have limited the character and extent of their participation. The segregated society may be typified by separate schools for races and peoples, white primaries, denial of equal access to places of public accommodation, laws preventing racial intermarriage, and other procedures and rules. Desegregation is at once the removal of these barriers and the essential prerequisite to integration. It is achieved to the degree that it succeeds in modifying the social institutions, the personal behaviors, and the value systems which supported the segregated structure.

Integration, on the other hand, is the situation and the process which exists when men in society are breaking down such barriers while moving toward the full acceptance of all people without reference to their racial, religious, or ethnic differences. It is the process of achieving full equality of status and condition. The elimination of "Negro jobs" or "Mexican jobs" in employment, the establishment of "open occupancy" tenancy programs in housing, are but first steps toward integration. Ultimately, integration is an ideal condition which ceases to exist once it is achieved. In a culturally healthy community the condition may be achieved so gradually and so effectively as to attract little or no popular attention or opposition. In other situations the transition may be fraught with real or imagined dangers. Whether the transition from segregation to integration through desegregation is easy or rugged, the change always involves some social cost to the existing sys-

tem. As a consequence, the social community is called upon to determine (1) how far integration should go; (2) under what conditions it is to be achieved; and (3) within what limitations it shall occur.

This issue of THE ANNALS seeks to present significant aspects of the changes that are occurring in selected sectors of the United States community. There has been a deliberate effort to avoid retelling of the better-known examples of resistance to change as well as of successful integration. Our major concern has been to bring into central focus selected aspects of achieved and predictable change. In such a unique situation as that of desegregation this is no mean task. Our authors, however, have sought to orient their contributions around such knowledge, insights, and perspectives as will represent a contribution to the understanding of human rights and human relations within the contexts of stateways and folkways.

IRA DE A. REID

Ira De A. Reid, Ph.D., Haverford, Pennsylvania, is professor of sociology and chairman of the department at Haverford College. He has taught at Atlanta University, New York University, and the New York School of Social Work, Columbia University. He was research director of the National Urban League, consultant on minorities for the Social Security Board and the War Manpower Commission, and associate director of the Southern Regional Council. He is former editor of Phylon: Review of Race and Culture.

History of Racial Segregation in the United States

By JOHN HOPE FRANKLIN

THE enactment of state segregation statutes is a relatively recent phenomenon in the history of race relations in the United States. Of course there had been numerous segregation practices and some segregation statutes for many years, even before the nineteenth century. But it was not until the final quarter of the nineteenth century that states began to evolve a systematic program of legally separating whites and Negroes in every possible area of activity. And it was not until the twentieth century that these laws became a major apparatus for keeping the Negro "in his place." They were both comprehensive and generally acceptable, because they received their inspiration from a persistent and tenacious assumption of the innate inferiority of the Negro and because they had their roots deep in the ante-bellum period.[1]

LEGACY OF THE SLAVE REGIME

For centuries many Northerners and Southerners subscribed to the view that Negroes were of a permanently inferior type. As slavery came to be concentrated in the Southern states and as that section became conspicuous by the tenacity with which it held on to slavery, it built its defenses of the institution along lines of the inferiority of the Negro. A whole body of thought was set forth to demonstrate that "the faculties of the Negro, as compared with those of the Saxon, qualified him for a state of servitude and made him unfit for the enjoyment of freedom."[2] Slavery was, therefore, the natural lot of the Negro; and any efforts to elevate him to the status of freedom and equality were manifestly in opposition to the laws of nature and of God.

The slaveholder's task of keeping the Negro slave in his place was complicated by the presence of several hundred thousand Negroes who were not slaves, although they can hardly be described as wholly free. So that they would not constitute a threat to the slave regime, free Negroes were denied the full rights and privileges of citizens. They enjoyed no equality in the courts, their right to assemble was denied, their movements were circumscribed, and education was withheld. Their miserable plight caused them to be unfavorably compared with slaves and confirmed the views of many that Negroes could not profit by freedom. They were regarded as the "very drones and pests of society," pariahs of the land, and an incubus on the body politic.

Outside the South free Negroes fared

[1] For an illuminating discussion of the assumptions of the inferiority of the Negro see Guion Griffis Johnson, "The Ideology of White Supremacy, 1876–1910," in Fletcher M. Green (Ed.), *Essays in Southern History Presented to Joseph Grégoire de Roulhac Hamilton* (Chapel Hill: University of North Carolina Press, 1949), pp. 124–56.

[2] William S. Jenkins, *Pro-Slavery Thought in the Old South* (Chapel Hill: University of North Carolina Press, 1935), p. 243. See also Albert T. Bledsoe, "Liberty and Slavery, or Slavery in the Light of Moral and Political Philosophy," and Samuel C. Cartwright, "Slavery in the Light of Ethnology," in E. N. Elliott, *Cotton Is King, and Pro-Slavery Arguments* (Augusta, Ga.: Pritchard, Abbott and Loomis, 1860), pp. 271–458, 691–728.

only slightly better. White Christians began to segregate them in the churches in the first decade of the national period, and Negroes in Philadelphia and New York City withdrew rather than accept this humiliation. As early as 1787 a white philanthropic organization opened a separate school for Negroes in New York City. In 1820 the city of Boston established a Negro elementary school. Separate schools became the practice throughout the North. When Charles Sumner challenged the constitutionality of segregated schools in Massachusetts in 1849, his position was bitterly opposed; and it was not until 1855 that the legislature of that state abolished them. Meanwhile numerous acts of violence in urban communities underscored Northern hostility to free Negroes. Between 1830 and 1840 anti-Negro riots occurred in Utica, Palmyra, New York City, and Philadelphia.

These ante-bellum experiences with free Negroes proved invaluable in the period following the close of the Civil War. In 1865 white Southerners were not "caught short" in facing the problem of the freedmen. From their point of view the former slaves simply augmented the group of free Negroes that they already regarded as "the most ignorant . . . vicious, impoverished, and degraded population of this country." [3] Thus, the whites merely applied to the former slaves the principles and practices that had guided them in their relations with ante-bellum free Negroes. The latter had subsisted somewhere in the hazy zone between slavery and freedom. To concede the freedmen this "place" was regarded by white Southerners as generous, the Emancipation Proclamation and the Reconstruction amendments to the contrary notwithstanding.

[3] From a statement by Howell Cobb, quoted in Jenkins, *op. cit.* (note 2 *supra*), p. 246.

NEW LAWS, OLD RELATIONSHIPS

When the economic and social structure of the Old South toppled at the end of the Civil War, the ex-Confederates immediately began to erect a new structure based on the old philosophy. As a distinguished Southern writer put it not many years ago, "If the war had smashed the Southern world, it had left the Southern mind and will—the mind and will arising from, corresponding to, and requiring this world—entirely unshaken." [4] The smoke of battle had hardly cleared when the vanquished leaders, enjoying a remarkable amount of autonomy, began to fashion their new world upon the model of the old. With characteristic directness of action they went straight to the heart of their problem and worked out ways and means of holding on to the way of life that had meant so much to them.

As the ex-Confederates proceeded to restore order in their war-torn communities, they took little cognizance of the implications of the Emancipation Proclamation and the proposed Thirteenth Amendment. The major assumptions of the slave regime, the cornerstone of which was the permanent inferiority of the Negro, were still so powerful as to be controlling in most matters involving Negroes. While making some concessions, such as the competency of Negroes to testify in the courts, they nullified almost every semblance of freedom with numerous proscriptive laws. Mississippi legislators passed laws forbidding Negroes to rent or lease lands except in incorporated towns. They also enacted a law requiring every Negro, after January 1, 1866, to carry on his person written evidence that he had a home and an occupation. Louisiana forbade Negroes

[4] W. J. Cash, *The Mind of the South* (New York: Alfred A. Knopf, 1941), p. 103.

to move about in certain parishes or to be out at night without special permits. North Carolina extended to the freedmen the same privileges, burdens, and disabilities that had previously applied to free persons of color.

That the races should be kept apart, except where the whites were clearly in a superior role, was an important feature of most codes. Louisiana required that every Negro be in the regular service of some white person who was held responsible for his conduct. Mississippi forbade employees of railroads to permit Negroes to ride in first-class cars with white persons, except in the case of Negroes or mulattoes, "traveling with their mistress, in the capacity of maids." Many states provided that if Negro offenders could not pay their fines they were to be hired out to "any white person" who would pay the fines and costs and take the convicts for the shortest period of time.

Negroes were not indifferent to the process by which their former masters and their associates were nullifying the gains of the war. While they displayed no spirit of vindictiveness against those who had held them in slavery, they manifested a firm determination to secure the rights to which they, as free men, were entitled.[5] The better educated and the more articulate among them assumed the leadership in expressing apprehension regarding the developments that were pushing them back toward slavery. They were especially concerned about the numerous acts of violence perpetrated against the freedmen, the burning of their schools and churches, and the economic proscriptions to which they were subjected. In Harrisburg, Pittsburgh, Indianapolis, and Cleveland they met in conventions and solicited the support of their Northern fellows in the effort to attain first-class citizenship. In Alexandria, Norfolk, Raleigh, Charleston, and other Southern communities they met, exchanged views, and addressed appeals to Southerners, Northerners, and federal officials. These supplications fell on deaf ears in the South, but they contributed to the increasing awareness elsewhere that the victory at Appomattox was empty.

[5] On the point of the absence of vindictiveness among Negroes see Francis B. Simkins, "New Viewpoints of Southern Reconstruction," *Journal of Southern History,* Vol. 5 (February 1939), pp. 49–61.

FEDERAL INTERVENTION

The ex-Confederates looked upon the lenient Reconstruction policies of Lincoln and Johnson, which gave them virtual autonomy in every phase of life, as a normal concession to a section which was right on all the basic points in the dispute that led to the war. In the North, however, many people viewed the policy of leniency with skepticism from the outset; and congressional leaders made no secret of the fact that they regarded the resultant Presidential actions as unwise and improper, if not actually illegal. The first significant assertion of their own prerogatives was the passage of the Freedmen's Bureau Bill in March 1865, which called for an extensive program of relief and rehabilitation in the South.

The Bureau's establishment of schools for the former slaves and its attempt to protect them in their relations with white employers were especially obnoxious to the white Southerners. They were loud in their condemnation of both these features of the Bureau's program, calling them incendiary, radical, and political. They realized all too well the adverse effect that a successful prosecution of the program would have on the continued subordination of Negroes. The attempts of whites to drive out teachers of Negroes and to assert their authority over their employees were

well calculated to subvert the program of complete emancipation and to preserve the old relationships between Negroes and whites.

The findings of the Joint Committee on Reconstruction, established by Congress in 1865, convinced a majority of congressional members that federal intervention was necessary to salvage the victory over the South. The committee was of the opinion that there was in the South "no general disposition to place the colored race . . . upon terms even of civil equality" and that no semblance of order could be maintained without the interposition of federal authority.[6] In accordance with the recommendation of the Joint Committee, Congress proceeded to enact a civil rights measure, to submit the Fourteenth Amendment to the states, and to pass a series of laws placing the reconstruction of the former Confederate states under congressional control.

Civil Rights Act of 1866

The Civil Rights Act that became law on April 9, 1866, defined citizenship so as to include Negroes. Senator Lyman Trumbull of Illinois said that the purpose of the bill was to destroy the discrimination against the Negro in the laws of Southern states and to make effective the Thirteenth Amendment.[7] White Southerners were, of course, outraged that Congress should undertake to guarantee the equality of Negroes, especially since the law had been enacted in the absence of representatives from the former Confederate states. As a matter of fact, fear that at some later date a majority of Congress or a federal court would strike down the Civil Rights Act was an important motivation for writing the provisions of the act into the Fourteenth Amendment.[8]

Fourteenth Amendment

During the debates on the resolution that was to become the Fourteenth Amendment the question arose as to whether the proposed amendment protected Negroes against discrimination and segregation. There was no agreement, but proponents of the amendment were optimistic regarding its effect. In supporting the amendment, Senator Jacob M. Howard of Michigan said that the equal protection clause "abolishes all class legislation in the states and does away with the injustice of subjecting one caste of persons to a code not applicable to another." Representative John Bingham of Ohio declared that the amendment would protect "by national law the privileges and immunities of all the citizens of the Republic and the inborn rights of every person within its jurisdiction whenever the same shall be abridged or denied by the unconstitutional acts of any state"[9]

Southern resistance

Neither the Fourteenth Amendment nor the radical legislation embodied in congressional Reconstruction was sufficient to protect the Negro in his political and civil rights. Southern resistance was stiff and effective, while efforts at enforcement left much to be desired. Once they recovered from the initial staggering blow of Radical Reconstruction legislation the ex-Confederates grimly went about the task of nullifying it in every possible way. By violence, intimidation, and ingenious schemes of economic pressure, by increased participation in political affairs, they began to "redeem" their state governments. Neither the Fifteenth Amendment nor the Ku Klux Klan Acts could stem the tide. In one state after another, between 1870 and 1877, they were successful; and as they took over the Southern state governments, they began to enact laws to separate Negroes and whites.

Civil Rights Act of 1875

Congress, against the bitter opposition of the ex-Confederates who were taking over the seats the Radicals had occupied, made one final effort to prevent the destruction of the rights of Negroes. Between 1871 and 1875 it devoted much attention to various proposals for a comprehensive national civil rights bill. While the act that was passed in 1875 omitted the provision of earlier drafts requiring the admission of persons regardless of race to all public schools, it declared that all persons, regardless of race or color, should be entitled to the full and equal enjoyment of the accommodations, advantages, facilities, and privileges of inns, public conveyances, theaters, and other places of public amusement. In its scope and in its provisions for enforcement it far surpassed anything that had ever been done in the area of protecting the civil rights of Negroes.

Although the Southern whites viewed the Act of 1875 with utter contempt and violated it with impunity, they were not entirely comfortable so long as it was on the statute books. They found it impossible, therefore, to restrain their elation when the Supreme Court declared the act unconstitutional in 1883. When the decision was announced during a performance at the Atlanta Opera House, the audience broke into "such a thunder of applause . . . as was never before heard within the walls of the opera house."[10] An Arkansas newspaper expressed hearty agreement with the majority of the Court when it said, "Society is a law unto itself, which in matters social in their nature overrides the statutes. Against its decrees the written law is powerless."[11]

SEGREGATION—THE FAVORABLE CLIMATE

Before the momentous decision in the Civil Rights Cases in 1883 segregation by statutes was confined to a relatively few but highly important areas. In many states, for example, the laws against intermarriage preceded the Civil War by many years.[12] Although they were omitted from some state codes during Reconstruction, there was no wholesale repeal of them, and they remained in effect in many parts of the North as well as in the South.[13] The practice of maintaining separate schools for white and Negro children was well established in the North before the Civil War; and in the South if ex-Confederates provided schools for Negro children at all they were of course separate. Although the Radicals made some attempts to break down segregated schools during their brief period of control, they met with little success.[14] In the military services Negroes had almost always been

segregated, and the Civil War did much to strengthen the practice.

The decision in the Civil Rights Cases was an important stimulus to the enactment of segregation statutes. It gave the assurance the South wanted that the federal government would not intervene to protect the civil rights of Negroes. The decision coincided, moreover, with a series of political and intellectual developments that greatly accelerated the program of segregation. In the eighties several Southern governments were embarrassed by financial scandals, and some of them outstripped the Reconstruction governments in defalcations and pilfering.[15] Meanwhile, the agrarian unrest induced by widespread economic distress frightened the conservatives and forced them to adopt extreme measures in order to regain the leadership which in some states they had temporarily lost to white and Negro Populists. Distressed by the possibility of a strong new party composed of white and Negro farmers and workers, they dominated the Negro vote where they could and expressed grave fears of "Negro domination" where they could not. Thus, the magical formula of white supremacy, "applied without stint and without any of the old reservations of paternalism, without deference to any lingering resistance of Northern liberalism, or any fear of further check from a defunct Southern Populism," gained ascendancy in the final decade of the nineteenth century.[16]

These were the years that witnessed the effective constitutional disfranchisement of Negroes by such devices as understanding clauses, grandfather clauses, and good conduct clauses. They also saw the launching of an intensive propaganda campaign of white supremacy, negrophobia, and race chauvinism, supported by a sensational and irresponsible press that carried lurid stories of alleged Negro bestiality. New waves of violence broke out, with increased lynchings of Negroes, unspeakable atrocities against them, and race riots. Concurrently, and at a "higher level," the literary and scientific leaders of the South wrote numerous tracts and books designed to "prove" the inhumanity of the Negro.[17] In this climate segregation took a giant step toward a fully developed white supremacy apparatus.

SEGREGATION STATUTES—THE GIANT STEP

In the decade after the Civil War few laws were enacted demanding segregation. The first state segregation statutes were those of Mississippi and Florida in 1865, requiring segregation on public carriers. Texas followed in 1866, but five years later repealed the act. The Tennessee law of 1881, sometimes referred to as the first Jim Crow law, directed railroad companies to provide separate cars or portions of cars for first-class Negro passengers, instead of relegating them to second-class accommodations as had been the custom. There were only two votes against the measure in the House and one in the Senate.

In the ensuing twenty years separation of Negroes and whites on public carriers became a favorite preoccupation of Southern legislators. By 1892

[17] See the books by Thomas Dixon, notably *The Leopard's Spots: A Romance of the White Man's Burden—1865–1900* (New York: Doubleday, Page & Company, 1902); Charles Carroll, *"The Negro a Beast;" or, "In the Image of God"* . . . (St. Louis, Mo.: American Book and Bible House, 1900); and Robert W. Shufeldt, *The Negro, A Menace to American Civilization* (Boston: R. G. Badger, 1907).

six other Southern states had joined the ranks—Texas, Louisiana, Alabama, Arkansas, Georgia, and Kentucky. In some states, however, opposition had been bitter. In Louisiana, for example, a Negro representative declared that the law would humiliate Negroes and "make them appear before the world as a treacherous and a dangerous class of people."[18] In Arkansas a Negro member of the House sought to ridicule the bill's supporters by insisting that if whites did not want to associate with Negroes there should be laws to divide the streets and sidewalks so that Negroes could go on one side and white people on the other. "He would like to see an end put to all intercourse between white and colored people by day, and especially by night."[19]

With the pattern firmly established in a number of Southern states and the pressure for segregation growing, the other Southern states followed before the end of the century. South Carolina passed its law segregating Negroes and whites on railroads in 1898; North Carolina, Virginia, and Maryland soon after. When Oklahoma entered the Union in 1907 segregation had already been provided for.

By this time laws were being extended to cover all activities related to transportation. In 1888 the railroad commission of Mississippi was authorized to designate separate waiting rooms for Negroes and whites. By 1893 the railroad companies, on their own initiative, were doing the same thing in South Carolina, and in 1906 the state required separation of the races in all station restaurants and eating houses. Ultimately, legislation covered steamboats, buses, and other forms of transportation.

[19] Little Rock *Arkansas Gazette,* February 14, 1891.

Twentieth-century varieties

The first decade of the twentieth century witnessed the enactment of a wide variety of segregation statutes. Georgia had required separation of the races on streetcars as early as 1891. It was between 1901 and 1907, however, that North Carolina, Virginia, Louisiana, Arkansas, South Carolina, Tennessee, Mississippi, Maryland, Florida, and Oklahoma followed suit. Ordinances in Southern cities were even more specific than state laws. In 1906, for example, the city of Montgomery, Alabama, went so far as to insist that Negroes and whites use separate streetcars.

Wards of society—still separated

As the states assumed greater responsibility for the various wards of society they were careful to provide separate facilities for whites and Negroes. In 1875 Alabama made it unlawful for any jailer or sheriff to imprison white and Negro prisoners before conviction in the same apartments of the jail, if there were sufficient separate apartments, and ten years later prohibited the chaining of white and Negro convicts together or housing them together. In 1903 Arkansas directed that in the state penitentiary and in county jails, stockades, convict camps, and all other places where prisoners were confined, separate apartments should be provided and maintained for white and Negro prisoners. Within the next ten years most of the other Southern states had similar legislation. During the same period segregation of white and Negro insane, feeble-minded, blind and deaf, paupers, tubercular patients, and juvenile delinquents was provided for.

No detail too small

In rounding out the system of legal segregation some states provided for the separation of whites and Negroes at

work, at play, and at home. In 1915 South Carolina forbade textile factories to permit employees of different races to work together in the same room, or to use the same entrances, pay windows, exists, doorways, stairways, or windows at the same time, or the same lavatories, toilets, drinking-water buckets, pails, cups, dippers, or glasses at any time. In 1905 Georgia passed a law making illegal the use by Negroes and whites of the same park facilities; individuals were permitted to donate land for playground use only if they specified which race alone was to make use of it. Until 1940 Negroes and whites in Atlanta, Georgia, were not permitted to visit the municipal zoo at the same time. In 1929 Oklahoma authorized the Conservation Commission to segregate the races in the use of fishing, boating, and bathing facilities on lakes and streams under the supervision of the state. Arkansas enacted a law in 1935 requiring the separation of Negroes and whites at all race tracks and gaming establishments. Beginning in 1910 several cities, among them Baltimore, Atlanta, and Louisville, passed ordinances designating certain blocks, territories, and districts as Negro or white and forbidding members of one race to live in the area assigned to the other. Such zoning laws, however, were declared unconstitutional in 1917.

The supply of ideas for new ways to segregate whites and Negroes seemed inexhaustible. In 1915 Oklahoma authorized the Corporation Commission to order telephone companies to maintain separate booths for white and Negro patrons. North Carolina and Florida provided that textbooks used by the children of one race be kept separate from those used by children of the other race, despite the fact that both states have stringent rules covering fumigation of textbooks. In 1922 Mississippi forbade members of both races to ride in taxicabs at the same time unless the vehicle held more than seven passengers and was traveling from one city to another. New Orleans deemed it in the interest of the public welfare to enact an ordinance separating Negro and white prostitutes.

Two worlds—roads closed

The law had created two worlds, so separate that communication between them was almost impossible. Separation bred suspicion and hatred, fostered rumors and misunderstanding, and created conditions that made extremely difficult any steps toward its reduction. Legal segregation was so complete that a Southern white minister was moved to remark that it "made of our eating and drinking, our buying and selling, our labor and housing, our rents, our railroads, our orphanages and prisons, our recreations, our very institutions of religion, a problem of race as well as a problem of maintenance." [20]

EXTRALEGAL ASPECTS

Yet law was only one part of the mechanism keeping the races segregated. Numerous devices were employed to perpetuate segregation in housing, education, and places of public accommodation even in communities where civil rights statutes forbade such practices. Patriotic, labor, and business organizations kept alive the "Lost Cause" and all that it stood for, including the subordination of the Negro. Separate Bibles for oath taking in courts of law, separate doors for whites and Negroes, separate elevators and stairways, separate drinking fountains, and separate toilets existed even where the law did not require them. Finally, there was

[20] Edgar Gardner Murphy, *The Basis of Ascendancy* (New York: Longmans, Green & Company, 1909), p. 138.

the individual assumption of responsibility for keeping Negroes in their place, such as the white man who placed a rod across the boat to segregate his Negro fishing companion while they ate lunch, and the archivist of a Southern state who cleared a room of manuscripts, ordered a special key, and assigned an attendant to serve a visiting Negro scholar who would otherwise have had to use the regular search room, from which he was not barred by law.[21]

By the middle of the twentieth century the pattern of segregation was as irregular as it was complex. Every conceivable form of segregation had been evolved, although one would have to visit many places to observe all the variations. The wall of segregation had become so formidable, so impenetrable, apparently, that the entire weight of the American tradition of equality and all the strength of the American constitutional system had to be brought to bear in order to make even the slightest crack in it.

[21] For numerous examples of the informal but tenacious practices of segregation see Charles S. Johnson, *Patterns of Negro Segregation* (New York: Harper and Brothers, 1943).

John Hope Franklin, Ph.D., Washington, D. C. is professor of history at Howard University. He is author of From Slavery to Freedom: A History of American Negroes (1947) and other books and articles on American history. He is a member of the editorial board of the Journal of Negro History and in 1953 served as consultant to the staff of nonlegal research of the National Association for the Advancement of Colored People. In the summer of 1955 he participated in a conference of American and German historians at Brunswick, Germany, and read a paper at the Tenth International Congress of Historical Sciences in Rome.

The United States Supreme Court and the Segregation Issue

By Rayford W. Logan *

FROM the 1870's to the beginning of this century the status of the Negro in the United States steadily worsened.[1] Then ensued a decade that has been aptly termed "a low, rugged plateau," [2] during which a few Negro leaders and white supporters began to campaign militantly against what is now called second-class citizenship. World War I, the Great Depression, and the New Deal, World War II and the cold war, have greatly accelerated nationwide changes which facilitated gains for Negroes that few persons at the beginning of the century could have envisioned. These gains embraced practically every aspect of Negro life, and they have greatly altered the climate of opinion with respect to the status of the Negro in the American democracy. An increasing number of Negro leaders and their supporters, keeping pace with and sometimes moving ahead of these gains, have recently renounced the goal of equality within a segregated society and have urgently advocated desegregation and integration.

* The author gratefully acknowledges his indebtedness to Professors Charles W. Quick and Howard Jenkins, Jr., of the Howard University Law School, Mr. A. Mercer Daniel, Librarian of the Law School, and Professor Harold O. Lewis of the Department of History for aid in locating the relevant cases; to Professor Quick and Professor John Hope Franklin of the Department of History for a critical reading of the article.

[2] Henry Arthur Callis, M.D., Washington, D. C., a student at Cornell University at the time, suggested this phrase.

Era of Adverse Decisions (1873–1910)

The decisions of the Supreme Court have both reflected and helped to determine the changing status and goals. From shortly after the Civil War to the end of the first decade of this century, most decisions furthered the declining status of the Negro. The Court virtually nullified the privileges and immunities clause of the Fourteenth Amendment by declaring that it protected only rights that inhere in United States citizenship and that most rights inhere in state citizenship. It held unconstitutional most of the important provisions of the Civil Rights Act of May 31, 1870, the Ku Klux Klan Act of April 20, 1871, and the Civil Rights Act of March 1, 1875. These decisions declared that the Fourteenth Amendment was prohibitory upon states and not upon individuals and that the Fifteenth Amendment was applicable only when the denial of the right to vote was based upon race, color, or previous condition of servitude.[3]

The Court held unconstitutional a Louisiana law forbidding discrimination in interstate commerce on the ground

[3] The relevant decisions are Slaughterhouse Cases, 16 Wallace 36 (1873); United States v. Cruikshank, 92 U. S. 542 (1875); United States v. Reese, 92 U. S. 214 (1876); United States v. Harris, 106 U. S. 629 (1883); Civil Rights Cases, 109 U. S. 3 (1883). They may be conveniently consulted in Thomas I. Emerson and David Haber (Eds.), *Political and Civil Rights in the United States: A Collection of Legal and Related Materials* (Buffalo, 1952).

that it placed an undue burden on interstate commerce.[4] In *Plessy v. Ferguson* [5] the Court for the first time sanctioned a state segregation law on the ground that it was a reasonable use of the police powers of the state provided that the accommodations were "equal." The Court repeatedly declined to intervene in cases of alleged exclusion of Negroes from jury service when counsel for the plaintiffs did not show in the trial court that the exclusion was based on race or color.[6] The constitutionality of the Mississippi disfranchising amendment of 1890, which arose collaterally in a case involving exclusion of Negroes from jury service, was upheld.[7] The Court refused to take jurisdiction over the Alabama disfranchising amendment, partly because the question was a "political" one,[8] and also declined to intervene against a Kentucky statute prohibiting Berea College from continuing to admit Negro students, since the charter of the College reserved to the state the right to alter or repeal its charter.[9]

In 1910 in a case involving interstate commerce the Court held that a railway company had the right to require separate coaches for white and colored passengers, ruling that in the absence of congressional legislation the carrier could make reasonable regulations for the conduct of its business. As to what was "reasonable," it was said that this "cannot depend upon a passenger being state or interstate." [10]

[4] Hall v. De Cuir, 95 U. S. 485 (1878).

[5] 163 U. S. 537 (1896).

[6] See, for example, Charley Smith v. Mississippi, 162 U. S. 592 (1896) and Murray v. Louisiana, 163 U. S. 101 (1896).

[7] Williams v. Mississippi, 170 U. S. 213 (1898).

[8] Giles v. Harris, 189 U. S. 475 (1903); Giles v. Teasley, 193 U. S. 146 (1904).

[9] Berea College v. Kentucky, 211 U. S. 45 (1908).

[10] Chiles v. C. & O. Ry Co., 218 U. S. 71 (1910).

The only type of state action that the Court struck down was that which prevented Negroes from serving on juries on account of their race or color.[11] The Court also held that action by individuals in their capacity of state officials constituted state action under the Fourteenth Amendment.[12]

The Circuit Court of Appeals for the Fourth Circuit refused to grant relief to a plaintiff in a case involving the second section of the Fourteenth Amendment on the grounds that its enforcement was a legislative matter and that Congress had not enacted legislation to enforce it. In denying certiorari, the Supreme Court in 1946 held that the question was a "political" one.[13]

Era of Favorable Decisions (1911–55)

The reversal of the general trend of the Court's decisions after 1910 is the more noteworthy in view of the general inaction of Congress and the belated action of the executive branch with respect to civil rights. There are, however, significant exceptions to the reversal. The scope of the privileges and immunities clause is still limited to United States citizenship. The civil rights decision of 1883 is still the law of the land, and the Court in 1913 held that it applied to marine as well as to land jurisdiction.[14] As late as 1920 the Court upheld a Kentucky law requiring separate cars that involved interstate travel between Ohio and Kentucky on the ground that, since the company was chartered in Kentucky, it was subject to Kentucky

[11] The classic case is Strauder v. West Virginia, 100 U. S. 303 (1880); see also Virginia v. Rives, 100 U. S. 313 (1880).

laws.[15] Attempts to have state poll tax laws declared unconstitutional have failed.[16]

While some of the most far-reaching decisions have been handed down since the entry of the United States into World War II, a few important ones precede 1941. In fact, two—*Bailey v. Alabama* and *Guinn v. United States*—antedate the entry of the United States into World War I and one—*Buchanan v. Warley*—came shortly thereafter.

Peonage and involuntary servitude

In 1911 the Court held that peonage violated the Thirteenth Amendment,[17] and since the establishment of the Civil Rights Section of the Department of Justice in 1939 a widespread decline in peonage and involuntary servitude has occurred. In the face of new devices, the Supreme Court acted; for example, in 1944 it struck down as a violation of the Thirteenth Amendment an Alabama statute which enabled employers to force employees in debt on account of advanced wage payments to continue work for them under threat of criminal punishment.

The franchise

In 1915 in *Guinn v. United States*[18] the Court for the first time declared that the grandfather clause, one of the devices used to disfranchise Negroes, violated the Fifteenth Amendment. A new Oklahoma registration law that sought to circumvent this decision was held unconstitutional in *Lane v. Wilson*.[19] Meanwhile the Court had twice ruled that action by the state of Texas in providing for a white primary violated the Fourteenth Amendment.[20] But in *Grovey v. Townsend*,[21] the Court held that action by the Democratic state convention barring Negroes from the primary was not state action and, hence, not a violation of the Constitution. The Court, however, reversed itself in *Smith v. Allwright*, declaring that "when, as here that privilege [of membership in a party] is also the essential qualification for voting in a primary to select nominees for a general election, the State makes the action of the party the action of the State."[22]

This decision resulted, on the one hand, in a considerable increase in the number of Negro voters in southern states,[23] and on the other, in attempts by several states to circumvent it. In Alabama the Boswell amendment permitted the registration as electors of only those persons who could "understand and explain" any article of the federal Constitution. The Supreme Court affirmed the decision of a United States district court which had held that the requirement violated the Fifteenth Amendment.[24] South Carolina tried to separate completely the Democratic primary from state action by removing all mention of primaries from the state constitution and statutes. District Judge J. Waties Waring ruled that the Democratic primary remained an integral part of the state election machinery, and the Supreme Court upheld the decision by denying certiorari.[25] Georgia amended its constitution in 1945 to make eligibility for voting dependent on ability to

"correctly read in the English language any paragraph of the Constitution of the United States or of this State and correctly write the same in the English language when read to them by any one of the registrars." County registrars appointed under the Registration Act of 1949 brought suit against a county official who had refused to pay their salaries. The Supreme Court of Georgia held that the Fourteenth and Fifteenth Amendments had not been violated since the case did not involve the right to register to vote; the United States Supreme Court dismissed the appeal.[26] But the Court declared that, since for more than sixty years the county-wide Jaybird Association's candidates had invariably been nominated in the Texas Democratic primaries and elected to office, the election machinery of the Association and of the Democratic party violated the Fifteenth Amendment.[27]

The Court has also invoked Sections 241 and 242 of Title 18, United States Code (1948), to uphold indictments against election officials who had made a fraudulent count of ballots in a federal primary election and who had stuffed ballot boxes in a federal election.[28]

Housing

Shortly after the United States entered World War I the Supreme Court enunciated the basic principle which has governed subsequent decisions. In *Buchanan v. Warley*[29] a unanimous Court declared unconstitutional the provisions of a Louisville city ordinance which denied to colored persons the right to occupy houses in blocks in which the greater number of houses were occupied by white persons, and vice versa.[30]

Later, the Court was faced with the problem of restrictive covenants by which groups of individuals contracted not to dispose of their property to Negroes, Jews, Armenians, Mexicans, Indians, Orientals, Syrians, and other "undesirables." The Court held in *Corrigan v. Buckley*[31] that a restrictive agreement involving action by private individuals did not present a substantial question.[32] State court action to prevent infringement of such a restrictive covenant, however, was held to violate the equal protection of the laws guaranteed by the Fourteenth Amendment.[33] This decision, like *Smith v. Allwright*, provoked various devices to circumvent the clear mandate of the Court. For example, "gentlemen's agreements" proscribe the selling or renting to Negroes outside existing colored districts.[34]

In regard to public housing the Court followed the strict interpretation of state action. It held that the housing project of the Stuyvesant Town Corporation, built under the New York Redevelopment Companies Law, was not state action within the meaning of the Fourteenth Amendment.[35] But in 1951 the New York City Council passed an ordinance to prohibit discrimination or segregation in all private housing enjoying total or partial exemption from city

taxes or receiving direct or indirect aid from the city.[36]

Public accommodations

Morgan v. Virginia[37] concerned a Negro interstate passenger traveling on a bus from Virginia through the District of Columbia to Baltimore, Maryland, who had refused to obey the request of the driver to move to a back seat partly occupied by colored passengers in order to make room for a white passenger. She had been arrested and convicted of violating a Virginia statute which required that she sit in designated seats. The Supreme Court held that the statute was an unconstitutional burden on interstate commerce, largely because of the inconvenience caused passengers by the frequent necessity of changing seats.

To invalidate the denial to a Negro of an unoccupied Pullman seat and of an unoccupied seat in the dining car,[38] the Court invoked Section 3, paragraph 1, of the Interstate Commerce Act of 1887—the provision which makes it unlawful for a railroad in interstate commerce "to subject any particular person . . . to undue or unreasonable prejudice or disadvantage in any respect whatsoever."

Since the Civil Rights Act of 1875 and the civil rights decision did not apply to the District of Columbia, discrimination in the District of Columbia was not affected by it. Discrimination there was forbidden by measures enacted on June 20, 1872, and June 26, 1873, while the District was under a territorial form of government. The Supreme Court held that these acts, especially that of 1873, were still in effect and that consequently a "respectable well-behaved person" had to be served without regard to race, color, or previous condition of servitude by keepers of hotels and certain other public places.[39] Subsequently, not only hotels and restaurants but also theaters, which were not designated in the acts, have generally opened their doors to Negroes.

Until November 7, 1955, Supreme Court decisions with respect to public golf courses had been inconclusive.[40] On that date the Supreme Court in effect applied to public parks and beaches the principle enunciated on May 17, 1954, in the School Segregation Cases that "separate educational facilities are inherently unequal."[41] The Circuit Court of Appeals of the Fourth Circuit had held in March 1955 that segregation in two public parks in Maryland violated the principle enunciated in the public school cases and added: "It is now obvious that segregation cannot be justified as a means to preserve peace merely because the tangible facilities furnished to one race are equal to those furnished the other." The Supreme Court merely affirmed this decision. A federal district court had ordered equal facilities for Negroes on a public golf course in Atlanta, and the Circuit Court of Appeals of the Fifth Circuit had affirmed the decision. The Supreme Court on November 7, 1955, ordered these judgments vacated and the case remanded to the district court with directions to enter a decree in favor of the plaintiffs that would conform with the ruling in the two Maryland cases.[42]

Trade unions

The Court has also strengthened the rights of Negroes in trade unions. It

[41] See below.

[42] Washington *Post and Times Herald*, November 8, 1955, pp. 1, 12, news article.

has held that a state has the power under the Fourteenth Amendment to prohibit discrimination on account of race, creed, or color by any labor union with respect to membership or union services. The Court has also declared that the union as the bargaining agent of the employees selected in accordance with the National Labor Relations Act of 1935 has the duty to represent all employees without discrimination because of race or color, and that it can be compelled so to do by judicial action.[43]

Picketing

In *Hughes v. Superior Court*,[44] the Court upheld a California injunction against picketing by the Progressive Citizens of America to induce a retail chain store to institute hiring practices whereby the proportion of Negro to white employees would approximate the proportion of Negro to white customers. California did not have a fair employment practices statute, and the Court held that the state might constitutionally implement its public policy against selective hiring based on race by prohibiting picketing for such a purpose. But in *New Negro Alliance v. Sanitary Grocery Company*,[45] it ruled that picketing in that instance was a labor dispute within the meaning of the Norris–La Guardia Anti-Injunction Act of 1932.

Due process

In *Strauder v. West Virginia*,[46] the Court had held that state statutes excluding Negroes from juries violated the due process clause of the Fourteenth Amendment. As Ralph F. Bischoff has observed:

> Ever since *Patton v. Mississippi*, 331 U. S. 463 (1947) reaffirmed and lent force to the almost forgotten case of *Strauder v. West Virginia* the constitutional intent that Negroes shall not be discriminated against has been more often complied with. Where the defendant in a criminal case makes out a prima facie case of illegal exclusion, it is the state which must present detailed proof to the contrary. . . . A relatively healthy status . . . is apparent from the lack of cases on the subject in 1954.[47]

What is more important is the fact that the Court has adopted the principle that the exclusion of Negroes and other minorities is prima facie presumptive evidence of discrimination.[48]

Moreover, the due process clause of the Fifth and Fourteenth Amendments guarantees the accused a trial free from mob domination or pressure.[49] The Sixth Amendment to the United States Constitution declares that in all criminal prosecutions the accused shall enjoy the right "to have the Assistance of Counsel for his defence." In the famous Scottsboro case,[50] the Court held that "the necessity of counsel was so vital and imperative that the failure of the trial court to make an effective appointment of counsel was likewise a denial of due process within the meaning of the Fourteenth Amendment."

Education

For fifty-eight years the doctrine of "separate but equal" accommodations, sanctioned in *Plessy v. Ferguson* (1896), was the law of the land. But beginning

[43] Railway Mail Ass'n v. Corsi, 326 U. S. 88 (1945); Steele v. Louisville & Nashville R. R., 323 U. S. 192 (1944); and Tunstall v. Brotherhood of Locomotive Firemen and Enginemen, 323 U. S. 210 (1944).

[44] 339 U. S. 460 (1950).

[45] 303 U. S. 552 (1938).

[46] 100 U. S. 303 (1880).

[47] "Constitutional Law and Civil Rights," *New York University Law Review*, Vol. 30 (January 1955), p. 54.

[48] Norris v. Alabama 294 U. S. 587 (1935); Hill v. Texas, 316 U. S. 400 (1942); Avery v. Georgia, 345 U. S. 559 (1953).

[49] Moore v. Dempsey, 261 U. S. 86 (1923).

[50] Powell v. Alabama, 287 U. S. 45 (1932).

with 1938 the Court defined equality in such a way as to pave the way for the reversal in 1954 of the principle itself. In *Missouri* ex rel. *Gaines v. Canada*,[51] the Court held that if a state provided legal education within the state for white students it must provide legal education within the state for Negro students. In 1950 in *Sweatt v. Painter*,[52] the Court held that a Negro student had to be admitted to the University of Texas Law School, since the newly established law school for Negroes could not provide substantial equality in such matters as "reputation of the faculty, experience of the administration, position and influence of the alumni, standing in the community, traditions and prestige." At the same time it held[53] that a state after admitting a Negro to graduate instruction must not afford him different treatment from other students solely because of his race.

Finally, on May 17, 1954, the Court unanimously concluded that "in the field of public education the doctrine of 'separate but equal' has no place. Separate educational facilities are inherently unequal." Four cases were decided under the equal protection clause of the Fourteenth Amendment and one, arising in the District of Columbia, under the due process clause of the Fifth Amendment.[54] On May 31, 1955, the Court ruled that "the courts will require that the defendants make a prompt and reasonable start toward full compliance with our May 17, 1954, ruling." If some additional time was necessary, the burden rested upon the defendants "to establish that such time is necessary in the public interest and is consistent with good faith compliance at the earliest practicable date."[55]

CONCLUSION

The decisions in the public school cases have provoked more threats of evasion and defiance than has any decision in recent years. William Graham Sumner's dictum that "stateways cannot change folkways" is gaining new popularity. Any prediction about the extent to which these threats will be successful would be almost worthless. In the meanwhile, other decisions of the Supreme Court during the past forty-five years have greatly altered the American way of life.

Segregation in American Education: An Overview

By AMBROSE CALIVER

THE issue of segregation in American education is not new, nor is it an isolated phenomenon. Therefore in order to understand it today its historical antecedents must be studied in their broad social, economic, and cultural context. Since these are treated directly or by inference in other parts of this volume only sufficient attention will be given them here to place the subject in its proper perspective.

BACKGROUND OF SCHOOL SEGREGATION

Segregation with respect to education is perhaps the most complete and severe expression of institutionalized prejudice, and, like slavery, it existed in all the Colonies in the early days. For economic reasons and under the influence of the atmosphere following the American Revolution, slavery disappeared in the North. Abolitionist sentiment grew, and agitation against segregated schools increased. In the South, slavery and the pattern of segregation tightened their grip. Black laws were enacted making more stringent the constraints surrounding Negroes. As the "Great Debate" moved on into the Civil War the South added to the issues of slavery and state rights that of the preservation of its social structure and way of life.

During the first two years after the close of the war, the southern states generally made every effort to restore as far as possible the Negro-white relationships existent during slavery. Laws resembling the ante-bellum Black Codes were speedily enacted. Conditions became so bad that Congress took a hand, and passed the Reconstruction Act of 1867. The Reconstruction governments, which operated until the late seventies, have been the subject of much criticism, and undoubtedly there was some political chaos, extravagance, and corruption. Nevertheless, constructive benefits resulted, among them the firm establishment of a public school system and the enactment of laws providing for the education of Negroes on an equal basis with that of the whites.

Public education at that time was not popular even for the whites. It was a signal achievement, therefore, that in spite of poverty, suffering, and disorganization schools were organized. What was done came largely through the leadership of the Freedmen's Bureau, and as a result of the eagerness of Negroes to learn and the co-operation of some of the "moderate" white southerners and large plantation owners who accepted the facts of the new order. Most of the whites, of course, opposed the education of Negroes because of its political implications, their dislike of the sponsoring Bureau, their disbelief in the educability of Negroes, their fear of loss of status, the poverty of the states, and other attitudes engendered by the slave system. Hence, when the conservative poor white southerners gained control after Reconstruction, no time was lost in wiping out practically all the gains made by Negroes after the war.

By the end of Reconstruction Negroes had achieved a semblance of educational equality. There was even considerable sentiment for mixed schools, which actually existed for a short time in a few places. Already the theory of "separate

t equal" had been challenged. Litition attacking segregation and dismination started soon after the Civil ar and has continued intermittently til the present time. One writer ınd that forty-four cases reported beeen 1865 and 1935 challenged segation and twenty-eight cases were ought to remedy specific inequalities. ıtil recently, however, most of the igation, although suggesting interest eradicating segregation, has concented on the elimination of discrimina-n under the doctrine of "separate but ual."

For a short time after the overthrow Reconstruction Negroes received a atively fair share of public school nds, under the promise of southern ite politicians to distribute public ıool funds equally if Negroes discontued their advocacy of mixed schools. ch equality as was achieved, however, l not last long. Segregation in pracally every phase of life soon became mly fixed in the South by constitu-ınal provision or by statute, and dur-g the last few years of the nineteenth ntury Jim Crowism was rampant. egroes were disfranchised, discrimited against, suppressed, and lynched. ıe Civil Rights Act enacted in 1875 d omitted all reference to schools, d, probably in consequence, seventeen ıthern states and the District of Conbia enacted laws requiring separate ıools. In fact, segregation was mainned in the school systems of eight nsouthern states.

In 1896 the Supreme Court handed wn the famous *Plessy v. Ferguson* deion, which sustained a Louisiana state requiring separate railroad accomdations for Negroes and whites and support of the decision referred to e accepted practice of public school gregation. This sanction by the high Court of the previously state-sancned system of segregation was, in effect, a green light to those who had set out upon a systematic course of discrimination against Negroes. Inequalities in the allocation of public school funds now began in earnest, and in practically every item of school expense the gap between Negroes and whites grew wider year by year, in spite of the provisions in constitutions and statutes for equal opportunity for each race.

Inequalities in elementary and secondary schools

One of the clearest pictures of the developing pattern of inequality has been presented by Horace Mann Bond [1] in a list of yearly state expenditures per pupil, Negro and white, from 1871 to 1933, with ratios. In North Carolina, for example, up to 1900 differences in expenditure for the two races were very slight; in fact, in some years per capita expenditure for Negroes was slightly more than that for whites. Beginning with the school year 1900–1901, however (when $1.38 was spent for each white child to every $1.00 spent for each Negro child), the differential began to rise, in 1917–18 reaching the high point of $3.08 for whites to $1.00 for Negroes. Actual per capita expenditure for each was pitiably small—in the same year, for example, $6.53 for whites and $2.12 for Negroes. By 1932–33 the per capita expenditure for whites and Negroes had risen to $19.40 and $9.24 respectively, still more than twice as much for white as for Negro children. Beginning with the late thirties the differential decreased progressively to 1952, when North Carolina spent an average of $186.30 for each white and $149.60 for each Negro child.

Alabama presents a similar pattern, although more unfavorable. Although the differences are small up to 1891–92,

[1] *The Education of the Negro in the American Social Order* (New York: Prentice-Hall, Inc., 1934), pp. 155–56.

the fluctuation is less. At this time publication of expenditures by race was discontinued. When it was resumed in 1907–8, the per capita expenditure for whites was $5.05; for Negroes, $0.89. By 1931–32 it had risen to $17.93 and $4.43 for whites and Negroes respectively. In Alabama also the trend began to be reversed in the late thirties, and in 1952 the state was spending an average of $172.48 for each white child and $107.84 for each Negro child.

The figures do not differ greatly for other southern states: some are worse; a few are better. One of the most vicious practices of discrimination against Negroes under the "separate but equal doctrine" has resulted from the so-called state equalization allotments, made to counties or local districts as supplements to their school funds, on the basis of school population (Negro and white). In many instances, the local administrative unit not only refused to give Negroes the full amount of the state funds to which their school census entitled them, but failed to give them any of it. The funds so diverted to white schools from Negro schools amounted literally to millions of dollars a year.

Inequalities in benefits from federal funds

In practically all southern states, there have been until recently glaring inequalities in the amounts received by Negroes from most of the federal funds appropriated annually for education and research. The federal funds are distributed equitably among the states, and, in general, the state funds are also distributed equitably among the local administrative units, but discrimination has occurred in the distribution within the local administrative unit.

Funds are allotted on the basis of total population, and according to the data presented, the amount received by Negroes was over $400,000 less than their share of the allotments. In 1934–35, the amount of federal funds expended for vocational education in Negro schools per $1.00 due Negroes was only 46 cents. According to the 1947 reports received by the Office of Education from the seventeen southern states, there was only a slight increase (0.8 percentage point) in the proportion of the total federal funds allotted to Negroes.

The inequalities noted in the expenditure of funds for vocational education were also found in the expenditure of funds for agricultural extension; Negroes have failed to receive the amount corresponding to their ratio to the total population. It is generally known among persons familiar with federal appropriations for education that Negro institutions receive practically no federal funds for research and experimentation programs, nor until recently have they participated in the programs of the white institutions. Accordingly, many potential research projects relating to the special needs and interests of Negroes have been excluded from the programs of experimental stations and in addition Negroes have lacked the opportunities to develop research workers, scholars, and leaders that experimental station activities provide.

For the year ending June 30, 1947, the total funds allotted for agricultural extension work in the seventeen southern states amounted to $24,192,734.93. Of this, Negroes received $2,044,178.66, or 8.8 per cent, of the total—an increase of only 2.6 per cent over 1937—although Negroes represent nearly a fourth of the population in these states.

While no extensive study has been made of the situation in recent years, from reports and general observations it is my opinion that the situation has probably not changed very much.

One way of lessening such discrimination is to incorporate an equalization

clause in federal appropriation acts. Examples of acts containing such a clause are the so-called Second Morrill Act of 1890 and the Nelson Amendment of 1907, providing federal funds annually for certain educational programs of the land-grant colleges. Under this act the institutions for Negroes have generally received an equitable share of the federal funds that have been distributed to the states. Other examples of provisions for equitable distribution are found in some of the legislation and administrative directives concerned with Works Progress Administration, National Youth Administration, Public Works Administration, and federal housing.

Experience has shown that where such safeguards were not included in the legislation, almost invariably discrimination prevailed in the distribution of the funds on the local level, and that where such safeguards were included, they were accepted favorably by state and local administrative authorities and discrimination was reduced to a minimum.

DISCRIMINATION CHALLENGED AND THE PATTERN CHANGES

For many years the voices raised against these inequalities were few and feeble. An effort was made, however, through the publication of studies, to make the public aware of the progress and needs of Negro education. Beginning with the first report of the United States Commissioner of Education in 1870 practically every annual report has contained some reference to Negro schools. Up to 1930 there had been a total of 241 such references in the annual reports and biennial surveys, and fourteen circulars, special reports, and bulletins on the subject of Negro schools had been published.

With financial support from the Phelps-Stokes Fund, the Office of Education sponsored a comprehensive study of the education of Negroes by Thomas Jesse Jones, and published its results in a two-volume government bulletin in 1916. This report stimulated considerable discussion for several years, focusing the attention of the nation on many of the discrepancies in the education of Negroes.

There were also some early nongovernmental studies and reports on the educational situation among Negroes, the most notable of which were the Atlanta University studies of *The Negro Common School,* directed by W. E. B. Du Bois during the beginning of the century. These studies were among the first really to challenge the inequities suffered by Negroes, and undoubtedly did much to arouse the nation.

There was no definite and consistent attack on educational discriminations through publication of the facts until the early thirties, when the Office of Education established the position of Specialist in the Education of Negroes and Howard University began the publication of the *Journal of Negro Education.* It has been said by disinterested persons that the activities of these two agencies in studying and promoting the improvement of Negro education, particularly during the past twenty-five years, have made significant contributions to an understanding of the problems.

In spite of the limitations imposed on Negroes, tremendous progress has been made in their education. It must be kept in mind, however, that until only recently the progress was "absolute" rather than "relative." While Negroes advanced from year to year, the gap between Negroes and whites remained about the same, or in some instances became wider.

Closing the gap

Continued publication of the facts of discrimination under the doctrine of "separate but equal" began to advance

the education of Negroes, and here and there lessened slightly the gap between the two races. The question began to be asked, "How should progress in the education of Negroes be measured—against the Negroes themselves or against the whites?" As the answer became obvious, another question was asked, "At the rate at which the gap is closing, how long will it take Negroes to catch up, to be provided with the same educational opportunities as those of other citizens?" There were varied answers, but the consensus was that it would take *too* long. Hence it was decided to start another round of litigation, in order to eliminate discriminations and enforce equity.

As Negroes began to win these legal battles, almost immediately *real* comparative progress could be discerned in the education of Negroes. The following facts indicate what has been termed "an almost feverish activity" in Negro education during the past decade and a half.

In per cent of enrolled pupils attending schools, in average number of days attended, and in average length of school term, Negroes and whites are practically equal. In 1940, 54 per cent of the Negro elementary schools were one-teacher schools; in 1952, the percentage had dropped to 10.2. The 1940 expenditure per Negro pupil was only 43 per cent of that for the whites; in 1952 it had risen to 70 per cent. Capital outlay per Negro pupil (in eight southern states) was 23 per cent of that for the whites in 1940; in 1952, 82 per cent. The average years of college training received by Negro and white classroom teachers in 1940 were 2.7 and 3.4 respectively; in 1952, they were 3.5 and 3.8. The average salary of Negro teachers (in twelve southern states) was only 54 per cent of the average for white teachers; in 1952, it had risen to 87 per cent.

The gap between the two races not only has become less and less, but in certain instances has closed entirely. In addition many special devices were designed to assure greater equity. One of these was the provision of out-of-state scholarships for Negro students to institutions giving courses provided in the white but not in the Negro institutions of their own state. Although few persons believed this arrangement really provided parity, most of the states used it, and hundreds of Negro students thus received advanced training they might otherwise not have had.

Not all the advance noted was due to the prodding of Court decisions. But it is a well-known fact that the great spurt upward in educational provisions for Negroes did not get under way generally until the late thirties, particularly after the Gaines decision in 1938.

Presentation of facts

The manner of presentation of the facts of Negro education is an interesting study in itself. At first in many cases the facts were presented verbally in meetings, as it were sub rosa; then they began to be distributed privately among a few friends of the "cause." As they began to be more widely published, there was a hesitancy to make direct comparisons with similar facts about whites—"Comparisons are odious," and "It might do more harm than good." In time facts were published alongside similar facts for whites without interpretation—"Let the facts speak for themselves." Finally description, discussion, interpretation, conclusions, and recommendations came into the record.

Many persons believed that not only did widespread dissemination of the facts relating to the education of Negroes lay the foundation for the court cases, but also that the facts became silent and irrefutable witnesses during the litigation. Legal victories, as well

as the logic of the situation and the world scene, exposed the false basis of *Plessy v. Ferguson.* At the same time the concept of equality began to be expanded. The inevitable next step, therefore, was to attack segregation head on. Steps in this direction were taken in 1950 in the Sweatt case.

SEGREGATION CHALLENGED

In spite of the promise of equity by the politicians in the late seventies and in spite of the order of the Supreme Court in 1896, the principle of equality was not applied by the Court itself until 1935 (and then only in a limited sense), in the case of *Donald Murray v. the University of Maryland.* When the half century of discrimination suffered by Negroes is considered, the "separate but equal" dictum notwithstanding, the decision of Negroes to take their case to the courts can be understood. Equally understandable is their determination to go to the heart of the problem—segregation itself—instead of nibbling at the periphery for another half century. Their first step, then, was to attack segregation on the ground that it violates the basic civil rights of citizens.

Civil rights violated

Because of the relationship of education to all phases of life, and because of the pervasive nature of its processes, no area of life provided a better opportunity to test the principles of civil rights embodied in the Fourteenth Amendment. The way was prepared for this test when the Supreme Court began to define the personal character of the relief sought in the school cases. The Attorney General in his 1953 brief interprets the matter thus:

> The judicial inquiry . . . is not simply to determine whether there is equality as between schools: the Constitution requires that there be equality as between *persons.* The Fourteenth Amendment compels a State to grant the benefits of public education to all its people equally, without regard to differences of race or color. This has not always been as clear as it is today.

The Chief Justice touches upon the same matter when he says in the May 17, 1954, opinion:

> In approaching this problem, we cannot turn the clock back to 1868. . . , or even to 1896. . . . We must consider public education in the light of its full development and its present place in American life throughout the Nation. Only in this way can it be determined if segregation in public schools deprives these plaintiffs of the equal protection of the laws.
>
> We conclude that in the field of public education the doctrine of "separate but equal" has no place. Separate educational facilities are inherently unequal. Therefore, we hold that the plaintiffs and others similarly situated for whom the actions have been brought are, by reason of the segregation complained of, deprived of the equal protection of the laws guaranteed by the Fourteenth Amendment. This disposition makes unnecessary any discussion whether such segregation also violates the Due Process Clause of the Fourteenth Amendment.

Negroes were therefore on safe ground when they based their major argument on the Fourteenth Amendment of the Constitution, which was designed to bestow on them the benefits and obligations of *full* citizenship. Furthermore, because of the wide ramifications of education, they were wise in bringing the test in this field.

Democratic principles disregarded

Democracy as a way of life has developed gradually throughout the ages. From historical records it appears that man has endeavored to build that kind of social order which would permit the greatest realization of human aspirations, without the restrictions commonly imposed by despots, dictators, or other totalitarian governments. The Declaration of Independence, the Constitution, and particularly the Bill of Rights embody both letter and spirit of the principles of freedom, justice, and equality.

In a multiplicity of ways, segregated schools have violated these democratic principles, as well as the fundamental concept of the worth and dignity of every individual which underlies our American way of life. Real education is in essence a democratic process. It cannot operate, therefore, in an atmosphere that is restrictive, coercive, or lacking in freedom. Moreover, our leadership of the free world has been seriously hampered because of our segregated institutions. Hence, it was a service to the cause of freedom and our way of life to remove the national sanction which we have been giving to segregation.

Psychological and social hazards

Advocates of segregation have denied the validity of the arguments that segregation was inherently injurious psychologically, emotionally, and socially. However, they have done what every dictator or authoritarian ruler does when he wants to condition his people to accept his rule of force and fear, namely, taken complete control of the education of the people—children, youth, and adults. In every other area of life the pattern of segregation varied somewhat from state to state, from county to county, and sometimes from situation to situation *within a community.* But in education, segregation in the South was complete and inflexible.

The rigid adherence to the caste system of segregation gives testimony to the southern whites' belief in the "training" and "conditioning" potentialities of the sanctions imposed by segregation. They knew how such a system would affect Negroes—their goals, values, aspirations, and attitudes, as well as their knowledge, habits, and spirits. Segregated schools have prevented Negroes from achieving those major desiderata found in every normal human being—a sense of security, a sense of belonging, a desire for appreciation, and a desire *for self-expression.*

Segregation is expensive

One of the strongest arguments against a continuance of the separate but equal system, if it were really equal in physical facilities and in finance, is that it would simply cost too much. Already the southern states are putting a higher proportion of their low income into public schools than most of the other states. To attempt the herculean task of equalizing Negro and white schools would practically bring financial ruin to the South, according to the estimates of some authorities. It should be stated, however, that other authorities do not agree with this prediction.

In discussing equalization of Negro with white education within the framework of "separate but equal," it must be understood that any over-all figures on costs are merely estimates, because exact costs could only be determined by a detailed survey of many items in each school administrative district, taking into consideration a variety of factors that have special relation to the particular situation.

In eight southern states, in 1949–50, the total expenditure for Negro and white schools was $535,030,000, of which $415,902,000 was for white schools and $119,128,000 for Negro. The per pupil expenditure in average daily attendance (hereafter referred to as A.D.A.) for both Negro and white pupils was $134.83; for white, $156.66; for Negro, $91.43. Applying the extra-pupil expenditures in A.D.A. in the eight states for the respective races

the A.D.A. in the seventeen southern states and the District of Columbia gives a total estimated expenditure of $1,014,390,000 for whites and $195,571,000 for Negroes. If the per pupil expenditure for Negroes should be raised to the white level of $156.06, the estimated total expenditure for Negroes in the seventeen states and the District of Columbia would be $330,395,000. This is $134,824,000 (10.2 per cent) more than the actual estimated expenditure for 1949–50.

If the estimate is made on the basis of classroom units, an additional annual requirement of $95,216,739 is needed in order to raise the average expenditure per classroom unit for Negro pupils up to that for white pupils in the seventeen states and the District of Columbia.

The cost of school property per pupil enrolled in 1949–50 was for whites, $334.94; for Negroes, $85.08. This is a shortage for Negroes of $250 per pupil. Applying this to the total of Negro pupils enrolled in the seventeen southern states and the District of Columbia for that year, an additional estimated $600,000,000 would be needed to equalize the facilities for Negro and white pupils. This estimate is made on the basis of original costs. However, facilities cannot be provided at today's costs for $335 per white pupil. It is estimated that the cost of construction today including the land, building, equipment, and architectural and legal fees would be approximately $1,200 per pupil. It would, therefore, cost an estimated two billion dollars to provide equal physical facilities for Negroes. In order to raise the cost of transporting Negro children at the 1949–50 level to that expended for white children, it would require an additional expenditure of $55,574,582.

Such estimates indicate how expensive it would be to attempt to do, even for one year, what the *Plessy v. Ferguson* decision told us over fifty years ago we had to do.

Second Chance for American Education

The Supreme Court decision declaring segregation in education to be unconstitutional gives American education a second chance. Immediately after the close of the Civil War, and during the intervening years from that time to the present, many schools have been almost completely oblivious of their responsibility for a constructive approach to the broad issues of race relations in this country. The lack of knowledge, understanding, appreciation, and acceptance among our citizens of the fundamental principles underlying the kind of human relations required in our democracy suggests that the schools, on the whole, have failed to meet their obligations in this matter.

One reason for this lag on the part of educational institutions was the lack of scientific knowledge and techniques in the field of human relations generally and intergroup education in particular. Furthermore, school people by and large did not realize that this area of human development lent itself to educational processes. Neither of these excuses is valid now, because we have both the knowledge and the know-how of its application.

It is the considered judgment of this writer that much more could have been done by the schools, however, if we had made a serious effort to co-ordinate and apply the knowledge we had from the fields of psychology, sociology, anthropology, biology, history, and religion. If a fraction of the time that was used in devising ways and means of keeping Negroes in a subordinate status had been used in understanding them as human beings and American citizens, and in fully utilizing their resources and talents for the good of all, the South would probably not for so many years have been considered the nation's number one economic problem and our most backward area socially and culturally.

It has been said often—and truthfully—that the South is not a homogeneous entity. The variety of attitudes, temperaments, moods, and behaviors is confirmed, as was said earlier, by the variety of patterns of segregation—except, of course, in education, where segregation was complete and inflexible. Even there, however, were potentialities for change, as evidenced by the variety of reactions to the Supreme Court decision on school segregation.

The litigation on segregation during the past decade has been an educational enterprise in itself—albeit an informal one. However, if we are not to revert to a confused, discouraged, and chaotic condition similar to that immediately following the Civil War and Reconstruction, it would seem wise to inaugurate in the schools formal and purposeful educational programs designed to apply to the problems resulting from desegregation the best available information. The problems will be found not different in kind from those usually faced by school people—problems of school attendance, socioeconomic backgrounds, scholastic achievement, dropouts, and so forth. The difference in the dimensions of the problems, however, gives an added challenge to our knowledge and skills in applying the principles of good administration, guidance, and remedial teaching.

Desegration and integration have progressed in many southern as well as border states, and in elementary and secondary schools as well as in colleges and universities, without special incidents, except in a few cases inspired from the outside. This achievement is, in the main, a tribute to the good judgment and leadership of school administrators, of teachers, and particularly of students. Wherever the channels of communication among all the elements involved have been kept open and wherever the principles of sound education and good human relations have been employed with fairness and firmness, the transition, in general, has taken place effectively. This fact places a heavy responsibility on public officials who by word or deed attempt to thwart the processes of justice and the achievement of our national destiny of democracy for all.

The Supreme Court decision not only made possible the freedom of the segregated, but also released the segregationist in a variety of ways. In the long run it is to the advantage of all to implement the decision and to make the transition from segregation to integration as effectively and speedily as possible, for the freedom of none is safe so long as the freedom of one is in jeopardy.

American education, at long last, has been given in this decision a second chance to come into its birthright. It now has the opportunity not only to conserve and transmit our heritage, but also to rise to the full stature of its potentialities and to promote the best in our culture.

Ambrose Caliver, Ph.D., Washington, D. C., is assistant to the Commissioner and chief of the Adult Education Section, United States Office of Education, Department of Health, Education, and Welfare. He began his service in the Office of Education twenty-five years ago as senior specialist in the education of Negroes, following an administrative and teaching career at Fisk University.

The Search for Facts

By PHILIP H. COOMBS

A FEW weeks ago, the American correspondent of *Dagens Nyheter,* Sweden's largest newspaper, called at the office of the Fund for the Advancement of Education in New York to pick up a copy of the November issue of *Southern School News,* and took the occasion to thank the Fund for having helped to enhance his stature as a journalist. To a member of the Fund's staff who was puzzled by this expression of gratitude, the Swedish correspondent gave an unusual explanation. On May 16, 1954, he had cabled a long dispatch to his paper on the background of public school segregation in the United States, and on the following day, when the Supreme Court of the United States handed down its historic decision overturning the Plessy doctrine, his paper was in a unique position to comment intelligently on the implications of the Court's decision.

"My editor," he went on, "was impressed by the timeliness of my dispatch, and I want to thank the Fund because the dispatch was based on an advance copy of *The Negro and the Schools* which you sent me the week before." [1]

This apparent master stroke of journalistic timing was, of course, nothing but pure luck—not only for the Swedish correspondent but also for the University of North Carolina Press, which released the book the day before the Court's ruling and thereby provided a fitting climax to one of the most unusual, and in many respects most rewarding, projects supported by the Fund since its establishment by the Ford Foundation in April 1951.

The episode illustrates the keen demand for objective facts about a highly important and controversial issue of American society which the Fund's support of the "Ashmore Project" and of the Southern Education Reporting Service was intended to serve. In the Fund's view, these projects put to trial the familiar premise that if people in a democratic society are given impartial and accurate facts about a social problem or issue, their attitudes, decisions, and actions will be wiser and more effective, and the process of social adjustment made necessary by such problems will be improved.

This article attempts to tell the story behind these particular projects, in the hope of shedding additional light on some of the basic forces that are bringing rapid improvement in the status of the Negro in American society.

THE FUND AND NEGRO EDUCATION

For reasons outlined below, the activities of the Fund concerning the education of Negroes have departed considerably from the well-beaten path set by older philanthropic agencies.

In the first place, the Fund's basic mandate was to work toward the advancement of education of *all* American youth. This goal could best be pursued, its directors and officers believed, if the Fund's program were concentrated on a relatively few critical problems confronting all schools and colleges and if, with respect to these selected problems, the Fund's resources were employed largely as risk capital to support promising new ideas and experiments. This policy decision, made at the Fund's inception, ruled out the making of general support or endowment grants to institutions, and it ruled out Fund consideration of many significant problems and ideas which fell outside the selected problem areas. With the benefit of advice from many experienced persons, Fund officials selected the following major objectives for the new organization's program: (1) the improvement of teaching, (2) improvements in curriculum, (3) clarification of the functions of educational institutions, (4) equalization of educational opportunities, and (5) improvement of educational management and financing.

These considerations alone would have dissuaded Fund officials from undertaking a special program of support to Negro institutions as such, but there was a further compelling reason. The Fund had entered the philanthropic field at a time when the status and outlook for Negro education appeared to be undergoing rapid and far-reaching changes. Over a wide span of years, private funds associated with such names as Jeannes, Rosenwald, Peabody, Carnegie, and Rockefeller had been applied generously and effectively in the Southern Region, to support the advancement of education generally and more specifically to spur the construction of common schools for Negro children, to train teachers and administrators for them, and to develop higher educational institutions for Negroes. These earlier "pump-priming efforts" had achieved striking results; among other things they helped develop many of today's outstanding Negro scholars and leaders in a wide variety of fields and to produce today's much larger flow of public funds into Negro schools and colleges throughout t South. They had been carried o however, largely within the South's t ditional framework of "separate b equal," giving a greater measure of ality to the principle of "equal" but s dom challenging the practice of "se rate." On these terms northern mo had been welcomed in the South a had helped build the dual system education. Paradoxically, this syst contained the seeds of its own undo because under it, as Ashmore has served:

> . . . most Negro children received the sa *kind* of education as the whites, inferior it may have been in quantity and qual and this in itself was something of a vi tion of the spirit of the prevailing pul policy, for it was hardly logical to te the equalitarian lessons of American tory and the duties and responsibilities citizenship to a people who were presun to be permanently relegated to the lo orders.[2]

Participation on equal terms

By the time the Fund came onto scene in 1951 this whole framework "separate but equal" was being s ously challenged in the federal cou and powerful forces which had their ception in the New Deal programs the thirties and in World War II w fast eroding the whole system of se gation. Although officials of the F were thoroughly sympathetic concer the financial plight of Negro colle and disturbed by the inequalities educational opportunity that still ha capped Negro young people, they lieved, along with most Negro educa they consulted, that it would be a w and more timely policy to treat "N institutions" on a parity with all oth If institutions which until now served only Negroes were ultimatel

[1] Harry A. Ashmore, *The Negro and the Schools,* Chapel Hill: University of North Carolina Press, 1954.

[2] Ashmore, *op. cit.,* p. 19.

serve all qualified students regardless of race, then the sooner they were judged by the same standards and participated on equal terms in various programs with all other institutions, the more quickly they would be fitted for their changing functions. This was a courageous and farsighted position for Negro educational leaders to take. It was on this basis that Fisk University and Morehouse College were welcomed into the experimental Program for Early Admission to College, that Dillard University was granted support for a self-study and for a teacher training experiment in co-operation with Harvard, that Hampton University received aid to carry out a broad program of teacher improvement for the Virgin Islands, that numerous faculty members of Negro colleges, both private and public, received awards under the Faculty Fellowship Program, and that many Negro high school teachers likewise participated in the Fund's Fellowship Program.

Having set this course with respect to Negro colleges, the officers of the Fund continued their search for fruitful ways to encourage greater equality of educational opportunity, not alone for Negro youngsters but for any others who were handicapped by economic, social, or other barriers. To this end, grants were made to the University of New Mexico and to the National Negro Scholarship Fund to experiment with new ways of locating talented young people who could profit by a college education but who, because of cultural and economic handicaps, were not likely to get one unless given special encouragement. Likewise, a grant was made to the New York City Board of Education to seek out ways of overcoming the language and other cultural barriers which curtail the educational opportunities of many young Puerto Ricans.

BIRTH OF THE "ASHMORE PROJECT"

The Fund called a series of conferences early in 1953 with leading educators, Negro and white, to discuss further possible approaches to the delicate and complex problems in this area. There emerged a strong consensus that the Fund could at this point in history make an important contribution by sponsoring an objective, scholarly study of racial segregation in the public schools and of recent experiences with desegregation in certain school systems and colleges. This question had been debated long and hotly but seldom with benefit of sufficient facts which could be accepted by all concerned as authoritative. Nothing, it was suggested, could help more to lift the discussion to a calm and rational level than an abundant supply of pertinent and reliable facts. The need for such an investigation had long been recognized. Myrdal's monumental study, completed ten years before, had dealt with the question as one aspect of what he described as "the Negro problem and modern democracy," but much had happened to the status of the Negro in the intervening decade.[3] The need was now more pressing than ever in view of the five segregation cases pending before the Supreme Court. Whatever the outcome of those cases, it was felt that information regarding this whole subject would be useful to public school administrators, to school board members, to college officials, and to others carrying heavy educational responsibilities, in reaching wise decisions in an area supercharged with emotions. Primarily with the needs of these practical decision makers in view, the officers and directors of the Fund decided to support the suggested study.

It was determined at the outset that the Fund would not attempt to argue the case for or against segregation in the public schools and would avoid direct or indirect involvement in the litigation before the Court. This study, it was felt, should examine the past and present characteristics of the dual school system, the implications of the great population shifts for the schools, the legal structure undergirding the dual school system, the economic requirements for educational improvement for *all* young people in the Southern Region and the prospective economic ability of the region to meet these requirements, and the recent experiences with desegregation in certain higher educational institutions in the South and in several public school systems of border state communities. This was a tall order to be filled on a short time schedule —the month was June 1953 and the Court was expected to rule on the segregation cases sometime in the fall—and there appeared no single institution or agency equipped to handle the assignment on this basis. Thus the Fund itself, despite previous practices to the contrary, would have to assemble a temporary research staff of well-qualified people from many quarters. This would be no easy task, because the summer holiday of colleges and universities had already started. As it turned out, the proposed research task was so challenging that scarcely a single person declined the invitation, though frequently this meant substantial readjustment of personal plans and no little inconvenience.

[3] Gunnar Myrdal, *An American Dilemma*, New York: Harper & Brothers, 1944.

Director and staff

The choice of someone to direct the study was the first and most crucial problem. In this the Fund was exceedingly fortunate in securing—after a telephone chase through several states and into Canada—the services of Harry A. Ashmore, executive editor of the *Arkansas Gazette*, a widely known and respected southern editor deeply interested in and well informed about problems of both education and race relations. Not least of his assets was a rare sense of perspective and good humor, always on tap when needed. Mr. Ashmore was given complete freedom to assemble the staff, plan and carry out the research, and write the report.

When Ashmore was asked to define the responsibilities of research director to Philip Hammer of Atlanta, who stepped out of his role as executive officer of the Committee of the South to accept this post, he replied by telling the story of the man at the bar who heard two fellow tipplers debating whether man's best friend was the horse or the dog. He intervened to observe that both were wrong: "Man's best friend is the male alligator, and here's why. The female alligator each year lays more than 20,000 eggs, whereupon the male alligator proceeds to stomp on all but two or three. Were it not for the male alligator, we'd all be up to our hips in alligators." Ashmore then drew the moral for his new research director. "When all those scholars get going," he said, "they'll be grinding out facts like a female alligator lays eggs. Your job, Hammer, is to stomp on all but a few of the best. I'll take over from there."

Several months and many facts later, Ashmore emerged with a remarkable document. It was in his own words, but it reflected the competent and devoted efforts of more than forty scholars from half as many institutions, mostly southern, and from a variety of fields, including anthropology, sociology, economics, political science, education, and law. The fact that the Court deferred its decision to the spring of 1954 meant that a more extensive and thorough research effort could be made prior to publication of the Ashmore report. The whole process of developing the re-

ırch plans, getting them carried out schedule, sifting out the most signifi- ıt findings, filling in important gaps the last minute, then blending these ny parts into a coherent and read- le whole, was a fascinating experi- :e and probably sets some kind of rk in the history of American schol- hip.

-operating school officials

Most of the facts needed could not be led from existing documents in air- ıditioned libraries, and even where ɔlished data were available, as any- : knows who has worked with educa- ıal statistics, they were often char- erized by serious inconsistencies of ınition, discontinuities, and important ɔs. Thus most of the facts had to be ; out the hard way, by field trips to ely separated communities, by long 's spent in educational offices, by ex- ded interviews, and by written re- sts. Often the people who pos- ɜed the needed facts were torn be- en a strong desire to co-operate with esearch effort whose final product y were anxious to receive and the sible embarrassment that might re- from being caught in the act of h co-operation, in view of the trou- l political climate which shrouded whole subject being studied. With- the unstinting co-operation of many :hern school officials, who were mo- ted by a strong desire to improve cation, the project could not have :eeded. There was hardly a single ance in which requested help was readily rendered.

nslating the jargon

ne especially interesting side light the problem of getting scholars ı different fields to penetrate one :her's jargon and to communicate in ɪmmon tongue. Most painful of all ır some of the scholars at least— was Ashmore's skillful effort to trans- late their professional statements into lucid prose. On one memorable occa- sion, when Ashmore was defending stub- bornly a "natural law of sociology," which he had concocted in an early draft, a sociologist on the team, in a state of utter frustration, bawled out, "But you're violating the discipline!"

Not beyond resolution by reasonable men

Ashmore violated more than one disci- pline before the presses ran but his final product was heralded as a distinct con- tribution to several of them, and he was dumfounded later by an invitation to join one of the learned societies. His introduction to *The Negro and the Schools* posed this significant challenge to his own profession of journalism and to those who sometimes doubt the power of human reason and reasonableness to solve difficult social problems:

> In many important ways this volume puts to the test one of my cherished theo- ries—that in addition to its usual functions of preparing a first draft of history, enter- taining children of all ages, and promoting the sale of certain goods and services, jour- nalism should serve as a two-way bridge between the world of ideas and the world of men. In any event my experience as a journalist in a company of scholars has strengthened my conviction that no prob- lems are beyond resolution by reasonable men—not even the thorny ones that lie in the uncertain area between the polar atti- tudes of the American white, who does not yet accept the Negro as his equal, and the American Negro, who is no longer satisfied with anything less.[4]

Further publication

Full justice could not be done in a book of such broad compass and limited length to the extensive research findings

[4] Ashmore, *op. cit.* (note 1 *supra*), p. xv.

of the Project, and so arrangements were made to make fuller use of these materials in a series of supplementary articles and books.[5] The original re- search documents have since been de- posited with the Joint University Li- brary at Nashville, Tennessee.

Factual and objective

The underlying premise of the project —that there existed a need for straight facts on this controversial subject—was amply validated by the public reception of *The Negro and the Schools*. News- papers throughout the country gave it prominent coverage, in news columns, editorials, and book reviews; it was dis- cussed extensively on radio and tele- vision; and it soon became a source book for conferences, workshops, school and college classes, local study groups, and for committees appointed by the governors to chart future public school policy. It was digested and given wide circulation in pamphlet form by the Public Affairs Committee and by the Southern Regional Council. The strenu- ous effort to make the report "factual and objective" apparently succeeded, judging at least by the almost uni- formly favorable comments by editors and action groups holding widely di- vergent views on the issue of segrega- tion.

SOUTHERN EDUCATION REPORTING SERVICE

Encouraged by this experience, the officers and directors of the Fund gave considerable thought to further steps that might appropriately be taken to assist state and local administrators in meeting the many problems raised by the Court's decision. The idea emerged that it might be useful to establish some sort of reporting service by which vari- ous communities and states could be kept accurately and fully posted on de- velopments elsewhere, as an aid to help- ing them meet their own problems calmly and wisely. The Fund subjected this idea to the critical scrutiny of sev- eral leading educators and newspaper editors in the South, purposely choos- ing editors with widely differing points of view on the subject. Their reac- tion was enthusiastically favorable, and though all were acutely aware of the explosiveness of the subject, they unani- mously agreed to constitute themselves the Board of Directors of what came to be known as the Southern Education Reporting Service, with Virginius Dab- ney as chairman and Thomas R. War- ing vice-chairman. The Fund agreed to underwrite the venture for a trial year.[6]

[6] The founding directors of the Southern Education Reporting Service included: Frank Ahlgren, Editor, Memphis (Tenn.) *Commer- cial Appeal;* Dr. Gordon Blackwell, Director, Institute for Research and Social Science, Uni- versity of North Carolina; Chancellor Harvie Branscomb, Vanderbilt University; Virginius Dabney (Chairman), Editor, Richmond (Va.) *Times-Dispatch;* Coleman Harwell, Editor, Nashville *Tennessean;* President Henry Hill, George Peabody College; President Charles S. Johnson, Fisk University; C. A. McKnight (Executive Director), Editor, Charlotte (N. C.) *News;* Charles Moss, Executive Editor, Nash- ville (Tenn.) *Banner;* T. R. Waring (Vice- Chairman), Editor, Charleston (S. C.) *News and Courier;* Dr. Henry Willett, Superintend-

It was determined at the outset that the service would be strictly factual and objective, with no editorial comment; that it would be operated by experienced newspaper personnel from the Southern Region; and that it would be distributed only on request.

The new board moved swiftly to secure the ablest director they could find and were successful in persuading the distinguished young editor of the Charlotte (North Carolina) *News,* C. A. McKnight, to accept the post on a full-time basis for one year. He in turn, with the advice of the board, other southern editors, and various commissioners of education for southern states, arranged for the part-time services of an outstanding reporter in each of the seventeen states affected by school segregation laws, as well as the District of Columbia.

Southern School News begins publication

Southern School News, thus conceived and ably staffed, got off to a fast and distinguished start, with its first monthly issue of sixteen pages, tabloid size, arriving in time for the opening of school in September 1954. This first issue demonstrated, as had been hoped, the feasibility of reporting a vital news story in depth, with objectivity and balance. Full reliance was placed on the facts alone for capturing the reader's interest, not on flashy headlines or upon the overplaying of conflict situations. An honest effort was made to report *all* the significant news in proper perspective, leaving the reader to interpret it for himself.

Regular daily newspapers throughout the country, but especially in the South, were quick to draw upon this new resource for building their own stories. Subscription requests mounted rapidly to a total of 30,000 by the end of the first year, from individual citizens, teachers, school administrators and school board members, governors and legislators, ministers and lawyers, and private organizations that ran the opinion gamut from the National Association for the Advancement of Colored People to the National Association for the Advancement of White People.

In an extensive poll of readers near the end of the first year of publication, including most southern governors and state education commissioners, more than 98 per cent expressed the view that *Southern School News* was "strictly factual and objective," and a large majority advised in favor of continuing the enterprise for at least two more years and establishing a modest subscription rate.

News and research center

In addition to publishing a monthly issue, the staff of the Southern Education Reporting Service, located in Nashville, Tennessee, soon found themselves burdened by an unexpected function, that of regional news and research center on the school segregation issue. One of Editor McKnight's first actions had been to cast out a wide dragnet for all documentary materials pertaining to the subject—news clippings from all over the region, important speeches and reports, new legislative bills, pamphlets, and the like. All of these materials, with the meaty reports from his own correspondents in the field, soon had his office bulging, and he called for technical help from the nearby Joint University Library. Meantime his office also became a way station for all sorts of fellow newsmen and magazine writers with assignments to prepare special articles on the South's number one news story. McKnight was soon obliged to equip and staff a special reference room

ent of Schools, Richmond, Va., P. B. Young, Sr., Editor, Norfolk (Va.) *Journal and Guide.* (The titles given are as of June 1954.)

to meet the needs of these reporters. In their wake, to examine the same materials, came Ph.D. candidates and other students of race and educational problems, anxious to do research. Like his fellow editor from Little Rock, McKnight soon found himself occupying the uncharted space between the world of journalism and the world of scholars.

Trial year ended

Before the trial year had ended, the directors of this unique reporting service were satisfied that the venture had more than met their expectations, and they petitioned the Fund for a further grant to sustain two more years of operation, with the provision that *Southern School News* would earn part of its costs by the institution of a modest subscription fee. The board of the Fund concurred in this evaluation and made the requested grant. With a year of distinguished service to his native South and to his profession behind him, McKnight returned to an important new editorial position in Charlotte, but only after he and his board had persuaded another able young southern editor, Don Shoemaker, to leave his position as editor of the Asheville (North Carolina) *Citizen,* to take the directorship of the Southern Education Reporting Service.

Under Shoemaker's leadership, the *Southern School News* is continuing to take on significant new dimensions as experience suggests new opportunities for reporting useful facts. The new policy of paid subscriptions, as expected, caused an initial drop in the mailing list, but in each succeeding month there has been a steady rise. A recent analysis showed an extreme variety in the types of subscribers, and in their views. Present plans call for the enterprise to continue operations until the summer of 1958, by which time, perhaps, the flow of events will have carried it to the point of diminishing returns. Only time and the reports carried in *Southern School News* will tell.[7]

THE BALTIMORE STORY

One other small but interesting project supported by the Fund arose from the temporary difficulties encountered in Baltimore soon after desegregation of the public schools was undertaken in the fall of 1954. When the difficulties subsided, several leading citizens of Baltimore became convinced that it might be useful, for Baltimore and perhaps for other communities with a tradition of racial segregation, to review carefully and objectively the factors which had affected the whole process of transition from a segregated to a nonsegregated school system in Baltimore. Such a calm examination, it was felt, might reveal useful lessons for the future. The Fund responded favorably to a joint request from the Governor's Commission on Interracial Problems and Relations and the Mayor's Commission on Human Relations for modest financial assistance to cover the research and publication expenses of such a study, to be carried out under the sponsorship of the two commissions. The final report, *Desegregation in the Baltimore City Schools,* published in July 1955, has enjoyed a wide readership and highly favorable comments in many other southern communities.[8]

ASSESSMENT

It will never be possible to evaluate the real effectiveness of the foregoing activities supported by the Fund for the Advancement of Education, but it can be said with assurance that it has

[7] Subscriptions to *Southern School News* are available at $2.00 per year from The Southern Education Reporting Service, P. O. Box 6156, Acklen Station, Nashville 5, Tennessee.

has helped to provide a truer and hence more favorable picture of the Negro's position in America—and of the progressive improvement in that position. Finally, at a time when the unique American institution of private philanthropy is under heavy attack—from one direction for being too influential and from another for being too timid—it is gratifying to examine one case where a private foundation succeeded in dealing extensively with one of the most controversial issues of the day without losing its courage or its charter.

Philip H. Coombs, Old Greenwich, Connecticut, is secretary and director of research the Fund for the Advancement of Education, established by the Ford Foundation. He a been a member of the faculties of Williams College and Amherst College, and, in s rnment service, economist in the Office of Price Administration, the Office of Strategic r ices, and the Office of Economic Stabilization, economic adviser to the United States C y Air Forces on strategic bombing, deputy director of the Veterans Emergency Hous- Program, and executive director of the President's Materials Policy Commission S ley Commission). He was also economic adviser to Governor Chester Bowles of necticut and a consultant to the Ministry of Education of the Government of India.

Legal Inventions and the Desegregation Process

By JAMES M. NABRIT, JR.

THE disintegration of the Solid South as a political, social, and economic entity is strikingly illustrated in the diversified reactions in that area to the May 17, 1954, decision of the Supreme Court of the United States declaring segregation in public school education unconstitutional. Those reactions ranged all the way from open defiance of the Court and a call for its impeachment to complete acceptance and implementation of the opinion. Proposals extended from those calling for abolition of public schools and evasive tactics on the one hand to those embracing immediate integration and progressive or gradual integration on the other, and within the entire range responsible executive and legislative leaders submitted numerous propositions. Many became a part of state constitutions by amendment; others became law by legislative enactment; others became operative through executive and administrative regulations; others passed only one branch of the legislature; others languish in committees; while still others served merely as material for political speeches. A look at these proposals may reflect to some extent the degree to which this region is no longer solid, even if it remains south.

The thrust of the Supreme Court decision primarily reached segregated public schools in Alabama, Arkansas, Delaware, the District of Columbia, Florida, Georgia, Kansas, Kentucky, Louisiana, Maryland, Mississippi, Missouri, North Carolina, Oklahoma, South Carolina, Tennessee, Texas, Virginia, and West Virginia. Except for a law suit by a citizen's group to delay integration in the District of Columbia until the Supreme Court had rendered a final judgment, no legal proposals were seriously made to circumvent the May 17 decision in the District of Columbia, Delaware, Kansas, Kentucky, Maryland, Missouri, Oklahoma, Texas, or West Virginia. In all of these areas, except Texas, integration is progressing steadily and swiftly. Some integration has taken place in Texas. Although similar delaying or circumventing proposals were made in Tennessee, Florida, Arkansas, and Virginia, they apparently have not been accorded state-wide support—yet in Virginia a suit was instituted to prevent the use of a bond issue authorized before the May 17 decision for construction of a segregated school for Negroes. Integration has begun in Arkansas. In Florida, Tennessee, and Virginia opinion has not yet crystallized, although Florida and Tennessee seem inclined toward compliance while Virginia appears leaning toward defiance. The states in which most strenuous efforts have been expended in devising legal methods of evading the May 17 decision and in which such proposals appear to have strong executive, legislative, or community support have thus far been Alabama, Georgia, Louisiana, Mississippi, North Carolina, and South Carolina. In these states, no integration at all has taken place.

The various proposals for evasion may be roughly divided into two main categories: (1) proposals designed to permit the continued operation of public schools on a segregated basis; (2)

proposals designed to abolish the public school system and to change to a system of private schools supported by the state.

PROPOSALS DESIGNED TO CONTINUE SEGREGATION

Various devices have been utilized or suggested to permit the continuance of segregated public schools.

Changing the regulations governing attendance

These proposals, which have been made in Alabama, Georgia, Florida, Louisiana, Mississippi, North Carolina, South Carolina, Tennessee, and Virginia, are designed to create administrative obstacles to legal action by proponents of integration. They are worded so as to make it difficult to separate pseudo-administrative difficulties from valid ones. One of the key measures seeks to transfer all authority over assignment and enrollment of pupils to local boards or superintendents, thus making it necessary to sue each school board or superintendent and thereby diffusing the impact of any adverse legal opinion.

A proposal in North Carolina would give county and city boards of education "full and complete authority" over assignment and enrollment, adding:

> . . . no pupil shall be enrolled in, admitted to, or entitled or permitted to attend any public school in such administrative unit other than the public school in which such children may be enrolled pursuant to the rules, regulations and decision of such board of education.
>
> In the exercise of the authority conferred by Section 1 of this Act upon the county and city boards of education, each such board shall provide for the enrollment of pupils in the respective public schools located within such county or city administrative unit so as to provide for the orderly and efficient administration of such public schools, the effective instruction of the pupils enrolled therein, and the health, safety, and general welfare of such pupils. In the exercise of such authority such board may adopt such reasonable rules and regulations as in the opinion of the board shall best accomplish such purposes.

The bills set up the machinery for appeals for the parents of children in case local boards deny admission to some children. First, an appeal may be carried to the local boards. Failing there, parents then appeal within ten days to the Superior Court in the county, where the case will be heard for the first time "before a jury in the same manner as civil actions are tried and disposed of therein." From the Superior Court, an appeal may be taken to the Supreme Court.

This proposal has three facets: (1) the wide range of administrative discretion, (2) the use of the trial by jury (usually composed of the segregating majority), and (3) appeal to the state Supreme Court, a long and expensive procedure; it seeks to require exhaustion of the appeal to the courts as a part of the administrative remedy before a litigant could even sue in the federal courts. The proposal is subject to attack principally upon its results—if all enrollments end up segregated by race the assignment is unconstitutional. It may also be attacked for combining administrative with judicial remedies, and for imposing trial by jury with its long delays, which might be considered a futile process. Nor does it contain the "plan" for ending segregation which is a basic factor in the implementation of the May 17 decision of the Supreme Court.

The Tennessee proposal seeks to enlarge the problem by "invoking the police power of the State to preserve the peace, protect the health, and morals, to improve the educational advantages and opportunities of all the pupils of all the public schools in the state and

insure the peace, health, contentment, happiness, and tranquility of all the people of the state. . . ." It attempts to place in the state statutes the very arguments rejected by the Court in the May 17 decision and it would appear to be headed for a similar fate.

Virginia would vary the formula somewhat by (1) making individual assignments of children, (2) arranging attendance through new attendance districts, and (3) allowing children within proper limitations to select their schools. "These assignments of individual students would be made on the basis of academic backgrounds; health requirements; personality, practices, needs and desires; the intensity of racial feeling in that area." This variation, however, contains the defects inherent in the North Carolina and Tennessee proposals.

Georgia goes a step further and authorizes the superintendent to consider psychological, sociological, and other scientific data. Appeals are permitted to the local board, the state superintendent, and finally to the state Board of Education. At this point it is stated, apparently in desperation: "The opinion of the state board shall be final and conclusive, and shall not be subject to review of any court or tribunal by appeal, certiorari, or in other manner."

Thus Georgia merely ignores our history, our Constitution, and our system of government. This provision would not last long in the courts. The requirements of due process are satisfied if a statute authorizing administrative determinations permits an opportunity for a fair hearing before an administrative tribunal and precludes judicial review unless this administrative remedy is exhausted.[1] But the extent to which due process requires judicial review of administrative determinations after opportunity for a fair hearing before an administrative tribunal depends on the character of the right asserted. Where a claim of constitutional right not involving personal liberty is asserted in the proceeding, due process requires an opportunity for judicial review to permit judicial determination of the issues of law, and where the claim of constitutional right involves personal liberty, opportunity must be allowed for judicial determination of the facts as well as the law.[2]

Mississippi, as might have been expected, approaches this problem in a more direct fashion. It declares the policy of the state of Mississippi to be that a free public education is a privilege and not a right, and that such privilege shall be extended only to those persons or their children who accept the same under the terms and conditions upon which it is offered. No child would be able to obtain a free public school education whose parents do not, precedent to enrollment, file with the school trustees an unconditional waiver, for themselves and their child so enrolled, of any and all rights they or their said child may have to any legal, equitable, or administrative complaint of the assignment by the board to any attendance center within the district. The assignments would be commensurate with public peace, safety, the health and morals of the people of the district, the welfare of the child being assigned, and with the available facilities. Boards would be authorized to refuse enrollment of any pupil whose parents refuse or fail to file the waiver. Thus Mississippi, for a child to be enrolled, would insist upon waiver of a constitutional right. The Supreme

[1] Lichter v. United States, 334 U. S. 742 (1948).

[2] See Mr. Justice Brandeis, concurring in St. Joseph Stock Yards Co. v. United States, 298 U. S. 38, 76 (1936).

Court has decided that such a condition attached to the exercise of a right is unconstitutional.[3]

South Carolina would remove the compulsory features of the existing attendance laws and "redesignate attendance teachers as 'visiting teachers' charged with obtaining attendance through influence and persuasion rather than through the exercise of legal authority." This proposal like all the others is merely another attempt to gloss over race as a basis for enrollment and would be similarly ineffectual. It is really another invitation for "law suits."

Alabama adds some interesting factors in its proposals. It provides for intelligence and aptitude tests but authorizes consideration of all factors involved in the pupil's adjustment to his school and surroundings, such as: distance from home to school, educational background, and home environment. It may consider whether or not the assignment would sever long-established ties of friendship and place the pupil in hostile surroundings from which his former friends and associates are completely missing; the pupil's wishes as evidenced by a written request from his parents or guardian that he be assigned to a particular school; and whether or not in the judgment of the board the assignment would cause or tend to cause a breach of the peace, riot, or affray. All appeals must be accompanied by a bond "conditioned to pay all costs of appeal."

This proposal, like the others, seeks to make appeals difficult or impossible and to subject the dissatisfied pupil to the risk of failing to exhaust administrative remedies grounded in discretion. The chief factor underlying each proposal, however, is race, and though it may take some time to secure an adjudication of the validity of each, there would seem to be no question but that all are basically unconstitutional in the light of the segregated school setting in these states.

[3] Terral v. Burke Construction Co., 257 U. S. 529 (1922).

Imposing sanctions against integration

In measures imposing sanctions against integration, Louisiana, Georgia, Mississippi, and North Carolina are proposing to act as if the May 17 decision had never been handed down. Obviously that decision voided not only all laws requiring segregation in education but also all laws which would make it a crime to abide by the decision. Measures of this nature, then, are in reality defiant gestures by a violently agitated community.

For example, Louisiana provides that the "State Board of Education shall not approve any public schools which violate the new segregation provision." She also prohibits the "granting of free school books and other supplies, or state funds for the operation of a school lunch program to any school violating the segregation provision."

Georgia makes it a "felony for any school official of the state or any municipal or county systems to spend tax money for public schools in which the races are mixed, with punishment set as two years in the penitentiary in addition to liability for the money expended," and the state Board of Education adopted a resolution to revoke "forever" the license of any teacher who "supports, encourages, condones, or agrees to teach mixed classes."

Mississippi provides for a twenty-five-member Legal Education Advisory Committee headed by the Governor, with unlimited power to conduct hearings and command appearances of witnesses to ascertain the effect of enforced public school integration on "law and order" in local communities. Subpoenas and process issued by the committee for persons, books, and records would be served by sheriffs in the eighty-two counties. Mississippi also makes it unlawful for any member of the white or Caucasian race to attend any school of high school level or below wholly or partly supported by funds of the state which is also attended by a member or members of the colored or Negro race. It provides for a fine of not less than $1.00 nor more than $25.00 and/or imprisonment in the county jail for a period not to exceed six months.

North Carolina would deny state funds to any city or county which integrated its public schools.

These four states comprise an area of unyielding resistance to the May 17 decision and their opposition will make implementation of the May 17 decision exceedingly difficult.

Changing the language of present segregation requirements

Louisiana has amended its constitution to provide that all public elementary and secondary schools be operated separately for white and Negro children and that "this provision is made in the exercise of the state police power to promote and protect health, morals, better education and the peace and good order of the state and not because of race." Mississippi has similarly amended its constitution.

In such amendments, these two states indicate their avowed purpose to continue segregation without regard to the May 17 decision, in open defiance of the highest court of the United States.

Alabama and North Carolina have not yet gone so far in their proposals to change their statutes.

Alabama would provide for individual choice of the kind of school which parents in any area may desire. If, for any reason, the system does not result in an acceptable or workable solution, then the public schools involved may discontinue operation, and the education of the pupils concerned may be aided as provided for by individual public assistance. North Carolina and Alabama both would remove the segregation provision from their state constitutions. Alabama would provide for city, county or state school authorities the right to have separate schools, where necessity exists therefor, and would compel a child to attend classes where races commingle.

Florida and Virginia have proposed voluntary or triple-choice school systems, which would also seem to be void under the May 17 decision. Nevertheless, these plans will give rise to long and expensive litigation.

Requesting congressional action

The Alabama Senate approved a resolution sharply criticizing the Supreme Court's segregation decision. As finally passed, the resolution was a watered-down version of a more vigorous one introduced by Senator Albert Davis of Pickens County (48 per cent Negro) calling for the impeachment of the high court.

Both the House and Senate in Georgia approved two resolutions which would amend the Constitution of the United States to make states solely responsible for the policies under which their schools operated. One seeks to have Congress initiate the proposed constitutional amendment; the other seeks ratification by the legislatures of at least two-thirds of the states.

In Mississippi Congress was memorialized to enact legislation limiting the appellate jurisdiction of the Court as well as of other federal courts. The resolution recited that

> . . . federal courts, and more particularly the United States Supreme Court, have through numerous opinions and decisions invaded the fields of the legislative and

ecutive branches of government, and have invaded the field of government which should be left to the control of the several states of the union.

Pointing out that the Congress is authorized under the Constitution of the United States to "control and limit the appellate jurisdiction of the United States Supreme Court and other federal courts," the resolution memorialized the Congress to

> . . . enact legislation limiting the appellate jurisdiction of the United States Supreme Court and other federal courts so that the fields of government of the executive and legislative branches and of the several states shall not be invaded but shall remain separate and distinct.

It asked Congress to call a convention for the purpose of proposing as an amendment to the Constitution of the United States an article giving the states exclusive authority to regulate, administer, and operate their respective educational systems as they deem necessary and proper and providing that "neither the Congress, the President, nor anything in this Constitution shall in anywise interfere therewith or otherwise affect same."

In South Carolina the Governor's recommendation for a similar resolution was embodied in concurrent resolutions.

Whatever differences of opinion we may have with the conclusions of these representatives in Alabama, Georgia, Mississippi, and South Carolina, we cannot object to their inalienable right to petition Congress for redress of grievances or to call for an amendment to the Constitution of the United States. The language of the resolutions, however, gives some indication of the temper of the people.

Intimidating teachers

Another key proposal in evading the May 17 decision lies in measures aimed at silencing teachers by threatening their job security. Most of these measures are constitutional, but since they place white teachers at the mercy of local boards they may not be politically acceptable to white teachers or very effective. The Alabama resolutions would in addition violate the First Amendment to the Constitution of the United States. For the Supreme Court has said: ". . . We need not pause to consider whether an abstract right to public employment exists. It is sufficient to say that constitutional protection does extend to the public servant whose exclusion pursuant to a statute is patently arbitrary or discriminatory." [4]

Alabama would allow the school board to cancel the contract of any teacher who advocates desegregation or belongs to an organization advocating it and would make officers and teachers judicial officers and immune to suit.

The Georgia state Board of Education abandoned two resolutions previously adopted which would have revoked the teaching license of any teacher who approved of or agreed to teach racially mixed classes or held membership in the National Association for the Advancement of Colored People. Instead, the board will require teachers to sign an oath to "uphold, support and defend the constitution and law" of Georgia.

In North Carolina a proposal would put teachers and principals on a one-year contract basis, in contrast to the present continuing contract (if a teacher is not notified by the end of the school year that he is not being rehired, he automatically has a contract for the next year). Another would let city and county Boards of Education establish "attendance areas" for schools without regard for school district lines. The change in teacher contracts was said to have been recommended because the Supreme Court's opinion probably made

[4] Wieman v. Updegraff, 344 U. S. 183 (1952).

separate districts for white and Negro children unconstitutional. Therefore, school redistricting will be necessary. Since school districts are employers of the teachers, who have continuing contracts, they would have a contract with old district boards after the new district boards were set up. One-year contracts would remove the possibilities of litigation and, after redistricting had taken place, the old system of continuing contracts could be restored by a subsequent General Assembly.

South Carolina would simply eliminate from the state code a section which now provides that public school teachers are considered automatically re-employed at the end of each school year unless notice to the contrary is given. Representative Charles G. Garrett of Greenville County proposes to introduce in the 1956 General Assembly a bill to forbid any state, county, or municipal employee to belong to the NAACP.

Changing the language providing for public education

An attempt to evade the May 17 decision by removing the right to an education from the state constitution and laws is an effort to retain segregation by offering public education privately. Such measures are unconstitutional, like the attempt in Texas to permit a private primary to choose public officials. Of this attempt the Supreme Court said:

> When a state structures its electoral apparatus in a form which devolves upon a political organization the uncontested choice of public officials, that organization itself, in whatever disguise, takes on those attributes of government which draw the Constitution's safeguards into play.[5]

South Carolina has amended its constitution to provide for elimination of the provision for a liberal system of free public schools.

[5] Terry v. Adams, 345 U. S. 461 (1953).

In place of public schools, an amendment recommended by the Boutwell Committee of Alabama says:

> It is the policy of the State of Alabama to foster and promote the education of its citizens in a manner and extent consistent with its available resources, and the willingness and ability of the individual students.

But, the amendment adds:

> . . . nothing in the constitution shall be construed as creating or recognizing any right to education or training at public expense, nor as limiting the authority or duty of the legislature to require or impose conditions of procedures deemed necessary to the preservation of peace and order.

PROPOSALS DESIGNED TO ABOLISH PUBLIC SCHOOLS AND INSTITUTE STATE-SUPPORTED PRIVATE SCHOOLS

Abolishing requirements for public education

Mississippi and South Carolina have amended their constitutions to provide for abolition of public schools by legislatures or counties or school districts. Georgia proposes a similar amendment. Alabama would permit the state to discontinue the public schools wherever necessary to avoid friction or disorder and to allow the state and its subdivisions to devote public money to the aid of private education when adequate public facilities are lacking or public operation involves the adoption of coercive policies.

These proposals are similar to the action taken in South Carolina to avoid the constitutional ban against the white primary and are likewise unconstitutional. Following the decision banning the white primary, South Carolina repealed all its statutes and constitutional provisions relating to primary elections. In an action brought in a federal district court to enjoin officials of the South Carolina Democratic party from refus-

ing primary ballots to Negroes, the officials contended that the party was a private organization free from all state control and therefore not subject to the prohibitions of the Constitution against state action. The District Court granted an injunction, and on appeal the Circuit Court of Appeals affirmed, holding that the party officials were subject to the limitations of the Fourteenth and Fifteenth Amendments. "Having undertaken to perform an important function relating to the exercise of sovereignty by the people, they may not violate the fundamental principles laid down by the Constitution for its exercise." [6]

In a later decision, the Supreme Court has said of education:

> Today, education is perhaps the most important function of state and local governments. Compulsory school attendance laws and the great expenditures for education both demonstrate our recognition of the importance of education to our democratic society. It is required in the performance of our most basic public responsibilities, even service in the armed forces. It is the very foundation of good citizenship. Today it is a principal instrument in awakening the child to cultural values, in preparing him for later professional training, and in helping him to adjust normally to his environment. In these days, it is doubtful that any child may reasonably be expected to succeed in life if he is denied the opportunity of an education. Such an opportunity, where the state has undertaken to provide it, is a right which must be made available to all on equal terms.[7]

Providing for grants to private individuals or schools

Georgia would make grants of state, county, or municipal funds to parents in discharge of all obligations of the state to provide education for its children. North Carolina would make tuition grants to families of school-age children to be used for tuition in private schools.

Providing for leasing, selling, or disposing of school property

Georgia would make school buildings available for educational purposes, leased to individuals under the requirement that tuition in excess of the aggregate of state and local grants not be charged, and regulated by state Boards of Education as the Public Service Commissioner regulates public utilities. Alabama and Mississippi would authorize their legislatures to dispose of school property. South Carolina would vest school trustees with the right to lease as well as to sell school property. A member of the House of Delegates in Virginia suggested leasing school buildings to private corporations. Under his plan, the private school operators would be free to admit any child they wanted to, and any child would be free to attend. The state Board of Education would retain control of educational standards.

The last two devices, grants in aid of private schools or direct grants to pupils and disposal of school property, raise serious educational questions. As a general rule, states may dispose of property and may aid private institutions as a part of their sovereign status. If the state abolishes public schools in order to evade the May 17 decision, what does it propose to substitute for (1) a system of accreditment of teachers, (2) the teacher retirement system, (3) uniformity of standards and curricula, (4) loss of federal funds, and (5) the unity of its educational policy? When factors such as these begin to affect the whites, measures of this kind may collapse. Indeed they appear to be posed as threats rather than as soundly considered educational proposals.

[6] Rice v. Elmore, 165 F.2d 387 (C. C. A. 4th 1947), *cert. denied*, 333 U. S. 875 (1948).

[7] Brown v. Board of Education of Topeka, 347 U. S. 483 (1954).

But even if they were sound educationally, they would still be fatally infected with unconstitutionality, for they would not remove the state from the field of education and would fall when tested by the May 17 decision and the primary cases. Difficult legal problems will be posed, however, in any attempts to restrict state expenditures of funds or disposal of state property.

CONCLUSION

In conclusion, it may be said that Alabama, Georgia, Louisiana, Mississippi, and South Carolina are using or contemplating use of every conceivable method of evading the May 17 decision of the Supreme Court of the United States, in open defiance of the Court.[8] This position seems to be overwhelmingly supported by the executive and legislative branches of the governments and by the majority of the people in these states, and, one might add, by the judiciary also. North Carolina and Virginia are tending in that direction. Florida is not yet clearly placed but appears to favor local option. Texas and Arkansas seem disposed to comply with the decision. Oklahoma, Kansas, Kentucky, Missouri, Maryland, Delaware, and West Virginia are integrating. The District of Columbia has integrated. The five recalcitrant states are the well-known Black Belt states, which, although some of them have large cities and are highly industrialized, have ne thrown off the political domination the farmers who have occupied t famous black strip of land. The tensity of the efforts to evade the fect of the May 17 decision seems bear in each instance a direct relati ship to the level of education and stage of industrialization. Political franchisement of the Negro is heav where the efforts to evade the deci are greatest. A Point Four progran Alabama, Georgia, Louisiana, Mis sippi, South Carolina, and perh North Carolina would seem necessar these evasive efforts are symptom Education, industrialization, polit freedom (registration and a two-p system), and mechanization of agri ture are still basic needs in this are the reaction to the Court decision i be taken at face value.

That the hard core of resistanc equal treatment of the Negro has rowed and that the South is no lo solid in its racial attitude is a hop sign, but an extended period of lit tion seems inevitable as one scans numerous and diversified proposals signed to circumvent the Supreme C decision. There is no question, howe that the end result will be the dest tion of all these proposals as unco tutional obstacles to desegregation.[9]

James M. Nabrit, Jr., J.D., LL.D., Washington, D. C., is secretary of Howard Un sity, professor of law, and director of public relations. He argued the District of Co bia School Case (Bolling v. Sharpe), the Oklahoma Registration Case (Lane v. Wil and the Jaybird Primary Case (Terry v. Adams) before the United States Sup Court, and has participated at the trial level or on the briefs in practically all civil r cases in the last fifteen years. He organized at Howard University the first cour civil rights to be taught in an American law school. He is a member of the Presid Committee on Government Contracts.

Resistance Movements and Racial Desegregation

By Harold C. Fleming

SINCE the era of Reconstruction, every period of crisis in the relations of the South and the nation has given rise to resistance movements below the Potomac. The archetypal pattern was set by the original Ku Klux Klan. Political developments around the turn of the century wove the ethos of white supremacy into the social, economic, and political fabric of southern life. During the past half century that fabric has been so stretched, patched, and retailored that in many respects it is hardly recognizable. But the tough strands of the Lost Cause have managed to hold together, providing today virtually the last reminder of a once-united white South.

Since the Supreme Court's decision of May 17, 1954, at least twenty pro-segregation groups have appeared on the southern scene.[1] Among these organizations there are wide variations in ideology and effectiveness, but they have in common the aim of mobilizing resentment against "outside interference" in the racial affairs of the region. And a substantial number of them are loosely federated under the spiritual authority of the White Citizens' Councils.

Ku Klux Klan

It is a measure of southern progress that the mummery and frontier methods of the old Ku Klux Klan are no longer respectable. There is, to be sure, a newly chartered organization which seeks to trade on the name. But it is little more than a pallid ghost of its adopted ancestor. Indeed, since the demise of the powerful Klan of the 1920's, successive incarnations have declined steadily in strength and in influence. The revival of the hooded order after World War II lasted only a few embattled years. Then it found itself denounced from the pulpit and the platform, legislated against in state capitols, and prosecuted by state and federal law enforcement agencies. Its bankruptcy was complete when it appeared on the United States Attorney General's list of subversive organizations.

The current Klan's attempts to exploit reaction to the Supreme Court's ruling have hardly been noteworthy so far. The self-styled Imperial Wizard is an Atlanta paint sprayer named E. L. Edwards. Edwards has made speeches and distributed literature in parts of Georgia, South Carolina, and Texas. Aside from these efforts to recruit dues-paying members, the Klan has shown little vitality. Ineptly led, unmasked by state laws, and inhibited by the unfriendly attentions of the Federal Bureau of Investigation, it is a "fringe" group in the full meaning of the term.

[1] U. S. Klan, Knights of the Ku Klux Klan, National Association for the Advancement of White People, Association of Citizens' Councils of Mississippi (also White Citizens' Councils of Alabama, Arkansas, South Carolina, and Texas), Constitution Party of Alabama, American States Rights Association of Birmingham, White America, Inc., of Arkansas, Christian Civic League of Georgia, States Rights Council of Georgia, Knights of the White Christians of Louisiana, Society for Preservation of State Government and Racial Integrity of Louisiana, Southern Gentlemen of Louisiana, Maryland Petition Committee, Baltimore Association for States Rights, North Carolina Patriots, South Carolina Committee of 52, States Rights League of South Carolina, Tennessee Federation for Constitutional Government, Tennessee Society for the Maintenance of Segregation, Defenders of State Sovereignty of Virginia, Virginia League. This list is based on reports in *Southern School News* and files of the Southern Regional Council.

National Association for the Advancement of White People

One of the factors contributing to the decline of the latter-day Klan has been its appeal to anti-Catholic and anti-Jewish bigotry. The South has its share of prejudice against these religious minorities, but extreme manifestations of it are generally considered disreputable. A case in point is the experience of the National Association for the Advancement of White People (NAAWP), the first and most widely publicized pro-segregation group of the present cycle.

The NAAWP—the personal creation of Bryant Bowles, a Floridian with a well-documented police record—won overnight notoriety for its role in the Milford, Delaware, controversy. At the beginning of the 1954–55 school term, the Milford Board of Education had admitted eleven Negro students to the hitherto white high school. Bowles quickly seized the opportunity to rally resentful white people of the area and to direct them in a campaign of school boycotts and demonstrations. State authorities reacted with equivocal and confused public statements, which had the practical effect of repudiating the Milford school board. In the end, segregation was restored, the school board replaced, and Bowles elevated to a position of honor in segregationalist circles.

The outcome of this local skirmish unquestionably gave encouragement and impetus to the resistance movement throughout the South. But the subsequent career of the NAAWP has been anticlimactic. Bowles's attempt to exploit antidesegregation sentiment in Baltimore was thwarted by prompt and resolute action on the part of civic groups and public officials. Unsavory details of Bowles's background came to light, and he found himself indicted on a charge of violating state school laws.

These liabilities alone might not have prevented Bowles from extending the NAAWP into the South and making of it the mass movement he had predicted it would be. It soon became apparent, however, that he was making overt and blatant use of anti-Semitism. He distributed to NAAWP supporters thousands of copies of such anti-Jewish nationalist publications as *Common Sense* and the *American Nationalist*. He also shared the platform with individuals whose anti-Semitic records were well known, and himself startled audiences with diatribes against "the Jews who are alien to the white race and most influential and instrumental in the spoiling, looting, and defilement of it. . . ."[2]

By these tactics Bowles forfeited the possibility of securing influential community backing for his organization. During the summer of 1955, a segregation-minded group in Charlotte, North Carolina, invited Bowles to address a rally, looking toward the establishment of a local chapter of the NAAWP. A public airing of Bowles's anti-Semitic activities, however, caused several of the local sponsors to withdraw and evidently destroyed any prospects of an effective organization in Charlotte. At this writing, the NAAWP appears to have little or no following outside of southern Delaware, and its long-range hopes there seem none too bright.

Significance of Extremist Groups

The contemporary Klan, the NAAWP, and other organizations of extremist temper cannot be dismissed as of no consequence. In a disturbed social

[2] Charlotte (N. C.) *News*, July 25, 1955.

ıation, fringe groups of this kind ı constitute a serious threat. Dur- quiescent periods, they maintain a ·d core of professional organizers and licated followers. When tension in ;iven area reaches a sufficiently high el, these experienced agents may ve as catalysts of violence.

While the danger of mob action should be overlooked, neither should it be ggerated. There is reason to believe t even the most vocal champions of regation among southern state offi- s would act to quell public disorders. ey are well aware that widespread or longed violence would have disas- ıs consequences for their respective es, in terms of both economic pen- es and possible federal intervention. ıs rioting and other forms of mob on, if they occur, are likely to be dized and of short duration.

THE BLACK BELT

n short, the organizations whose overt eal is to the violence-minded are not extinct, but they are becoming ob- te. The legitimate heirs of the Re- struction Klan use a subtler ap- ach. They have translated the law- elements of the resistance tradition ı more modern idiom—modern, that in terms of the plantation culture ch persists in the subregion com- ıly called the Black Belt.

'his band of agricultural counties, tching from southeast Virginia to Texas, was the heartland of the e South, just as today it is the last nghold of segregation. Both the ıomy and the social system of the :k Belt have traditionally depended the subservience of the large Negro ulation, which ranges from 40 to 80 cent of the county totals. During last century, the planter aristocracy his area imposed its will on the re- ant, and sometimes rebellious, South the highlands and the piedmont. And in the decades following the Civil War, the values of the plantation society were fixed in the states of the lower South by means of distorted legislative apportionment and similar political devices.

The agrarian Black Belt, weakened by a steady outflow of population and the ascendancy of urban industrialization, has made many concessions in the last generation. Nevertheless, in coalition with some urban business and industrial interests, it still exerts a powerful influence on the state governments of the Deep South, and it still clings fiercely to the doctrine of white supremacy. It is not surprising, then, that the most formidable of the existing prosegregation movements was born in the Mississippi Delta.

WHITE CITIZENS' COUNCILS

The first White Citizens' Council was established in Indianola, Mississippi, a few months after the Supreme Court's 1954 school decision. A state headquarters was later opened in Winona, Mississippi, the home of the executive secretary, a young planter named Robert B. Patterson. The movement was extended into surrounding counties through mimeographed mailings and semisecret meetings. By October 1954 the WCC, organized in some twenty-one counties, was strong enough to play a significant role in the passage of two state constitutional amendments—one designed to facilitate disfranchisement of Negro voters, the other aimed at circumventing the Supreme Court rulings.

Today the WCC claims more than 250 chapters in Mississippi, with a membership of 60,000. The organization has also established itself in Black Belt counties of Texas, Arkansas, Alabama, and South Carolina, as well as maintaining close ties with similar organizations elsewhere in the South. In the words of Robert B. Patterson, "In some of the states they go by different names, but we are all seeking the same goal, and that's what counts." [3]

The constituency of this loose federation was defined, at least in part, in the first issue of the WCC's official publication. An introductory editorial announced that subsequent issues would be mailed not only to WCC members in the several states, but also to members of seven other prosegregation organizations.[4]

Official pronouncements

The WCC's published statements of purpose have been couched in relatively lofty and generalized phrases. The official slogan, for example, reads: "Dedicated to the maintenance of peace, good order, and domestic tranquility in our Communities and in our State and to the preservation of our State's Rights." [5]

The main object of the WCC's official pronouncements appears to be twofold: to create an aura of respectability around the movement; and to divest the central organization of responsibility for the utterances and actions of its component groups. Toward the first end, WCC literature has stressed the claim that its leaders are drawn from the "best" people and that its program is essential to the prevention of violence. The leaflet just quoted declares:

> The highest type of leadership has been provided in each community where councils have been formed. We intend to prevent violence, friction and race hatred. We intend to carry out the peaceful relations we have had with our colored citizens. . . .

Even critics of the WCC will concede that many of the leaders of the movement have community status in terms of political influence, economic power, or both. What these critics do not concede is that status of this kind automatically confers respectability on the aims and methods of the movement. As Hodding Carter has commented:

> . . . by and large, the men who thus far have led the Councils' movement have standing in their communities. They are, primarily, men with an obsession—namely, that integration of the public schools means blood integration as well—and this obsession is shared by many who abhor the Councils. It may be remembered unhappily, that at the outset of the Klan's revival in the '20's, men also gave way to their obsessions, whether about Negro, Catholic or Jew or all three.[6]

Some uneasy recognition of this fact may underlie the WCC's insistence on decentralized responsibility. The literature of the organization asserts that local councils are independent—a point that is repeatedly emphasized by spokesmen for the parent Mississippi association. One WCC official typically disclaimed knowledge of techniques being used with the statement, "You must realize that the Citizens' Council movement is not a closely controlled movement." [7]

Economic pressure an accepted method

The advantages of such vaguely defined lines of responsibility are obvious when one turns to the question of method. Initially, the WCC made no secret of the fact that its chief weapon

[6] "A Wave of Terror Threatens the South," *Look*, March 22, 1955.

[7] Montgomery (Ala.) *Advertiser*, August 22, 1955.

would be economic pressure. One of the original leaders of the movement, former state senator Fred Jones of Inverness, Mississippi, issued a public statement in October 1954, in which he said:

> We can accomplish our purposes largely with economic pressure in dealing with members of the Negro race who are not cooperating, and with members of the white race who fail to cooperate, we can apply social and political pressure.[8]

In the context of the Black Belt, this was little more than a verbalization of the obvious. The livelihood of Negroes in this agricultural area, except for an occasional professional man, has traditionally depended on the good will of white landlords, bankers, merchants, and local officials. This economic dependence has always been a major instrument of social control. For example, it largely accounts for the fact that the counties with the densest Negro populations have few or no Negro voters.

As the WCC spread outside the Mississippi Delta, however, the principle of economic coercion drew strong criticism. At an organizing rally in Dallas County, Alabama, one speaker spelled out the principle in this bald language:

> The white population in this county controls the money, and this is an advantage that the council will use in a fight to legally maintain complete segregation of the races. We intend to make it difficult, if not impossible, for any Negro who advocates desegregation to find and hold a job, get credit or renew a mortgage.[9]

Press criticism

This widely publicized statement was roundly condemned by many newspapers, in the South as well as elsewhere. The Montgomery *Advertiser*, for example, in an editorial entitled "Economic Lynch Law," declared:

> The manicured Kluxism of these White Citizens' Councils is rash, indecent and vicious. . . . This ("economic thuggery") is rash because the Negro himself holds a powerful and growing economic power of his own. The merchants, the bankers, the grocery stores and the autodealers could find that they have grasped a two-edged sword that cuts wickedly in two directions. . . . What is proposed is indecent and vicious because we find a dominant group standing in the shadows threatening to confiscate the meat, drink, and shelter of dissenters.[10]

Organizational responsibility minimized

Since that time, leaders of the WCC have minimized or disavowed organizational responsibility for economic reprisals. Illustrative was the answer to press queries given by Alston Keith, chairman of the Dallas County WCC, after some sixteen Negro signers of an integration petition lost their jobs. Keith declared that the council would not take credit or censure for what he called a "spontaneous reaction" to the filing of the petition. But he added, "I don't believe there would have been the unity of action that there was without the educational work of the citizens. They did just what we have been advocating right alone."[11]

More circumspection is displayed by some, as witness this endorsement by South Carolina's Lieutenant-Governor Ernest F. Hollins:

> It is my belief that the Citizens' Councils, by mobilizing the best leadership at the community level, can help to restore decency in government and maintain peace and security for all people, both white and Negro. I am glad that responsible spokesmen for the movement say they do not use organized economic pressure as a weapon against anyone. . . . The organization of pressures is full of dangers.[12]

Effectiveness of economic sanctions

Whatever degree of direct responsibility may be attributed to the WCC, both economic and social pressures have been widely used against advocates of desegregation. Negro teachers have been discharged, Negro farmers have been denied credit, and Negro merchants have been boycotted by wholesale distributors. In a number of instances, signers of desegregation petitions directed to local school boards have recanted after their names and addresses were published by the newspapers. In a few cases, white persons believed to hold unorthodox racial views have been "advised" by organized groups of their neighbors to move; and a small but growing number of white ministers have lost their pulpits because of their opinions on segregation.

The relatively few publicized incidents of this kind clearly do not measure the full extent of economic and social pressure. Furthermore, "economic lynchings," like the physical lynchings of years past, are intended as object lessons; they are meant not only to penalize the individual victim but to silence and neutralize other potential dissenters. The effectiveness of this inhibiting function is a matter of speculation, but there is no doubt that a climate of fear and repression is widespread.

It should be noted, however, that the double-edged quality of economic sanctions has been felt in some communities. In Orangeburg, South Carolina, merchants and food distributors who co-operated in the WCC program found themselves boycotted by the Negro students of State College. Reports from other communities in the Black Belt indicate similar declines in Negro patronage of business establishments operated by WCC members. A countermeasure of another sort was the deposit of $250,000 in the Tri-State Bank of Memphis by the National Association for the Advancement of Colored People and other organizations to supply credit to victims of the WCC economic blacklist. The outcome of this economic tug-of-war cannot yet be foreseen, but it is apparent that Negroes will not be the only ones to suffer.

Fundamentally, the Southern resistance movement is a desperate rearguard action against the slow but inexorable advance of democratic values. The plantation culture's area of influence has shrunk steadily, until today it clearly dominates only four state governments—those of Georgia, South Carolina, Mississippi, and Louisiana—and in most of these states it is not wholly unchallenged. The resulting awareness of threat, from both within and without, has heightened the intolerance of the resistance leaders.

The propaganda of the WCC and related groups advances the segregation dogma with inquisitional fierceness. Integration, according to this orthodoxy, is an aim of the Communist conspiracy, designed to bring about "mongrelization" of the races and the consequent collapse of our society. The NAACP and other organizations with like purposes are stigmatized as agents of this vast alien plot. The Supreme Court is vilified as the "political tool" of the conspirators, while the schools and churches are represented as honeycombed by "neo-communist and neo-socialist teachers and preachers."

Political implications

Indeed, the new resistance doctrine has political implications far transcending the issue of racial segregation.

[8] Jackson (Miss.) *Clarion-Ledger*, October 24, 1954.

[9] Montgomery (Ala.) *Advertiser*, December 1, 1954.

[10] *Ibid.*

[11] Chattanooga (Tenn.) *Times*, September 8, 1955.

[12] Winston-Salem (N. C.) *Twin City Sentinel*, September 16, 1955.

Doubtless for the rank and file of adherents negrophobia is the sole motive force. But the leaders of the movement evidently view the segregation issue as a rallying point for broader purposes. W. J. Simmons, executive secretary of the Jackson, Mississippi, Council, made this revealing statement in an interview with Associated Press reporter Bem Price:

I think (the WCC) is much more than a white supremacist group and I think it is much more than a protectionist group. I think it is fundamentally the first real stirrings of a conservative revolt in this country, judging by the responses we've gotten from other states. . . . Some of the people who are attracted to this movement may not be concerned about the Negro. What would be classed as the old white supremacist movement has no place. It is too narrow.[13]

The WCC lays great stress on political participation by its members. Each local council, declares the prospectus, should have a Political and Elections Committee.

This committee studies candidates for local and state elections and presents their qualifications to the voters. It attempts to get candidates to voice their opinion on vital subjects prior to election. It can reach each voter personally to present the truth on all matters to the people.[14]

The criteria to be applied in judging candidates are not stated. But in the same leaflet appears this suggestive passage:

The idea now is seemingly to pride ourselves in the fact that everybody in the world should be made equal by law, regardless of aptitude or heritage. The "have nots" must share equally with the "have gots" in this new world order. . . .

This integration scheme ties right in with the new, one world, one creed, one race philosophy fostered by the ultra-idealists and left-wingers.[15]

The political orientation of the resistance leadership emerges even more clearly in the announcement of a new regional organization called the Federation for Constitutional Government. This superorganization lists among its officers the principals of the WCC and its affiliated groups; it also boasts the sponsorship of many of the leaders of the 1948 States' Rights, or "Dixiecrat," party, including J. Strom Thurmond and Fielding Wright, who were the presidential and vice-presidential nominees, respectively.

The preservation of segregation is, of course, one of the aims of the new federation; but this aim is overshadowed by such purposes as "resisting nomination of leftist candidates for president and vice-president and other offices" and "opposing adoption of socialistic (national party) platforms." Plainly, a new political movement is under way, its voting strength hopefully vested in the membership of the WCC and other resistance organizations.

SUMMARY AND CONCLUSION

Any assessment of the southern resistance movement at this date must be tentative. So far, attempts to implement the several desegregation rulings of the Supreme Court have not reached a decisive stage in the Deep South. Only as litigation is carried to its ultimate conclusion will the effectiveness—and the dangers—of the prosegregation groups be fully measured.

Meanwhile, it is possible to sum up the strengths and weaknesses of the resistance movement as it appears today.

[13] Montgomery (Ala.) *Advertiser*, August 22, 1955.

[14] "The Citizens' Council" (cited note 5 *supra*).

[15] *Ibid.*

Strengths

1. In areas of the South with proportionately large Negro populations, white sentiment is overwhelmingly opposed to desegregation. The very real anxieties and fears of the public offer a fertile field for racist exploitation.

2. Negroes are politically impotent and economically dependent in precisely those areas where their numbers are largest; hence, they are unable to make their full weight as a group felt in the struggle against oppressive measures.

3. Advocates of extreme prosegregation views are far more vocal than moderates or liberals; many white southerners who are opposed to the resistance groups fear the consequences of speaking out.

4. Political control of at least four southern states is in the hands of politicians who are wholly sympathetic with the aims and methods of the resistance groups; the States Rights Council of Georgia, for example, was organized by the Governor and other leading officeholders. In four additional states, the resistance groups exert strong, if not always decisive, influence on the legislatures and public officials.

Weaknesses

1. The once Solid South is solid no more. School desegregation is proceeding apace in such border states as West Virginia and Oklahoma; is under way in parts of Texas, Arkansas, and Kentucky; and appears in prospect in eastern Tennessee and western North Carolina. As the domain of segregation shrinks, the resistance groups' claims on sectional loyalty will be steadily weakened.

2. The growing Negro vote is gradually but relentlessly eroding the political base of die-hard resistance to racial change.

3. All the principal religious bodies active in the South are officially committed to the principle of desegregation. Although opposition to this principle is widespread at the congregational level, church leadership is not likely to recede from its position. As time goes on, more and more clergymen and church people may be expected to challenge segregation on moral grounds.

4. While the individual Negro in the Black Belt is relatively powerless, Negroes in the mass are capable of formidable economic retaliation. White merchants and businessmen are becoming uncomfortably aware of the potentially disastrous effects of organized boycotts by Negroes.

5. The ultraconservative political aims of the resistance leadership may ultimately alienate much of its following. Many rank-and-file members of the WCC are working people whose economic interests conflict with those of the "Dixiecrats," who are generally hostile to organized labor, progressive tax measures, and government programs benefiting low- and middle-income groups. This conflict of interests is presently obscured by racial feeling, but it is likely to be recognized in time.

6. The "respectability" of the WCC is threatened by its affinity with extreme nationalist movements elsewhere. The WCC has admitted distributing the anti-Semitic literature published by such groups, with the defense that only the anti-Negro content was considered relevant.

7. Despite loud public denials, leaders of the resistance movement realize that it can only be a delaying action. No one seriously believes that the Supreme Court's decisions will be reversed or that a handful of states can resist the national policy of desegregation indefinitely. And, although delay might be extended for a long time by determined efforts, the knowledge that de-

feat is ultimately certain should have an increasingly demoralizing effect on the movement.

In sum, the southern resistance movement is a foredoomed effort. The question is, how long can it be sustained and at what cost in human suffering and degradation?

Harold C. Fleming, Atlanta, Georgia, a native Georgian, is assistant director of the Southern Regional Council, and for eight years has directed the information and publications program of the council, an organization dedicated to the improvement of race relations in the South. He was a member of the central staff of the "Ashmore Project," the study of biracial education financed by the Fund for the Advancement of Education in 1953. He has contributed articles on southern affairs to various periodicals.

The Girard College Case: Desegregation and a Municipal Trust

By MILTON M. GORDON

WHEN Stephen Girard, French-born Philadelphia merchant and banker, died in 1831 he was one of the richest, possibly the richest, American of his time.[1] Increasingly occupied in the latter years of his life with public benefaction, Girard left the bulk of his estate in trust to the city of Philadelphia for the establishment of a "college" for the education and maintenance of "poor male white orphans."[2] The will specified elaborately the nature of the physical plant to be erected and left general instructions for the content of the curriculum. The first huge Greek-revival buildings were finally completed, and the College opened its doors in 1848 and has been in operation ever since, providing its scholars with board and room, clothing, supervision, and an elementary and secondary school education up to the maximum age of eighteen. The estate has grown in size with the passage of the years until in 1955, apart from the value of the campus property itself, it amounts to over $88,000,000, giving Girard College with its current enrollment of about 1,100 boys an endowment greater than that of any college or university in the country with the exception of Harvard, Yale, Columbia, and the University of Texas.[3]

Upon Girard's death, the city of Philadelphia created a special Board of Trustees to administer the estate; in 1869 this arrangement was superseded by a legislative act which created a Board of Directors of City Trusts and transferred to it the administration of the Girard Estate and other similar trusts. This board includes the Mayor and the President of City Council, ex officio, and twelve other citizens appointed by the Board of Judges of the Courts of Common Pleas of the County of Philadelphia.

For over a century, then, the city of Philadelphia, through its special boards, has administered a trust which is used to operate a boarding school and home for male orphans, excluding nonwhites. Against the background of changing social and cultural conceptions of race relations, the impact of the recent Supreme Court decisions against segregation in public education,[4] and the large and growing Negro population in Philadelphia (about 20 per cent of a total population of over two million[5]), a

[1] For a judicious, unbowdlerized, and essentially sympathetic account of Girard's life, see Harry Emerson Wildes, *Lonely Midas* (New York: Farrar and Rinehart, 1943). The authorized biography is John Bach McMaster, *The Life and Times of Stephen Girard*, 2 vols., Philadelphia: J. B. Lippincott Co., 1918.

[2] A nineteenth-century court decided that under the terms of the will an orphan boy was one who had lost his father. See Soohan v. City of Philadelphia, 33 Pa. 9 (1859).

[3] Girard College, however, receives no income in the form of tuition or payment for room and board. Its entire income derives from the estate.

[4] Segregation in the Pennsylvania public schools has been illegal since 1881.

[5] In the 1950 United States Census of Population, the city of Philadelphia had 2,071,605 inhabitants of which 376,041, or 18.2 per cent were Negroes. A recent estimate by the Philadelphia City Planning Commission gives the 1955 population of the city as 2,161,000, and

challenge to this policy was predictable. Furthermore, Philadelphia had been one of the first municipalities to have a Fair Employment Practices law, and its Home Rule Charter, adopted in 1951 under the stimulus of new civic enthusiasm, begins with a Preamble which declares against discrimination on account of race, religion, or national origin. The charter also set up a Commission on Human Relations, which administers the fair employment provisions and other legal ordinances in the discrimination area and has a general mandate to work for better group relations in the city. Against the background of all these factors the challenge to Girard College's racially exclusive admissions policy materialized in 1954.[6]

THE CASE

In February 1954, six poor Negro orphan boys of the required ages applied for admission to Girard College. Citing the provisions of the will, the Board of Directors of City Trusts rejected their request. In May of that year, the Council of the City of Philadelphia, the city's elective legislative body, adopted a resolution requiring the City Solicitor to petition the Orphans' Court of Philadelphia County to review the provisions of Girard's will to determine whether the College should now change its admission policy and admit Negroes. Subsequently, in September, Raymond Pace Alexander, a member of the City Council, in his capacity as a private attorney, filed in the Orphans' Court a petition on behalf of the six excluded Negro boys,[7] and on the same date the City of Philadelphia, acting through Mayor Joseph S. Clark, Jr., and the Commission on Human Relations and represented by the City Solicitor, petitioned the court for a citation upon the Board of Directors of City Trusts to "show cause" why the Negro applicants should not be admitted to Girard College.

In due course the Board of Directors of City Trusts filed a contesting answer. Thus the legal issue was joined, curiously enough, not only between a private party and an organ of the municipality but also between, on the one hand, the City of Philadelphia in the capacity of the Mayor and the Commission on Human Relations, represented by the City Solicitor, and, on the other, one of the city's agencies, the Board of Directors of City Trusts, represented by its appointed counsel.

The Orphans' Court assigned the case for hearing to Judge Robert V. Bolger, who heard oral evidence in March and April of 1955. At these hearings a number of social scientists testified for the petitioners on historical, sociological, and psychological issues related to the argument. Philadelphia newspapers gave generous coverage to these hearings, keeping the Philadelphia public informed on the issues of the case. Some time later, oral legal argument was heard by Judge Bolger and written briefs were presented by the two petitioners, by the Attorney General of the Commonwealth of Pennsylvania,[8] whose arguments supported those of the City Solicitor, and by the respondent, the Board of Directors of City Trusts. Earlier, James M. Marsh, attorney, had been appointed *amicus curiae* by the court.

On July 29, 1955, the Hearing Judge handed down a decision in favor of the Board of Directors of City Trusts, affirming its action in denying admission to the Negro applicants and dismissing the petitions. Exceptions to this decision were filed by the losing parties. These steps automatically assign the case for review by the Orphans' Court *en banc*. In view of the importance of the case, it appears likely that, whatever the decision,[9] the holding by the entire Orphans' Court will be taken to the Supreme Court of Pennsylvania and, because a constitutional issue based on the Fourteenth Amendment is involved, there is the further likelihood that the Supreme Court of the United States will ultimately be petitioned to review the record.

SIGNIFICANCE OF THE CASE

Apart from the issue of the substantive relief which is being sought for Negro boys now excluded from admission to Girard College, the case has particular significance for students of the desegregation process and social scientists generally for two reasons:

First, the final decision in the case will undoubtedly establish an important precedent for all other cases which do now or might in future revolve around the same issue: a charitable legacy, left in the public trust, with a racially discriminating provision attending its use and operation. In this respect the Girard legacy will be running true to form, for the series of legal issues which it has raised, and the court decisions over the past hundred years which have respectively settled them, have played a classic role in the development of this area of jurisprudence in the United States. Judge Bolger, in referring, in his decision, to the first great nineteenth-century case in which a number of Girard's heirs challenged the validity of the will and were soundly defeated,[10] characterized it as one which "probably established the basic principles of the law of charitable trusts in this country."[11]

Second, the presence in the case of major sociological and psychological issues and the liberal use of social scientists as expert witnesses add an important second chapter to the story of the participation of the social scientist in major litigation, the first being the School Segregation Cases recently decided by the United States Supreme Court. The role of social-science expert testimony is so recent and so unexplored that there is a great need for careful study by the social scientist himself of the opportunities, the complexities, and the pitfalls in this new and glamorous arena which summons his services.[12] One might add that such

a Chamber of Commerce study estimates the Negro population as 443,300, or 20.5 per cent of the total. See *Economic Bulletin for Chamber of Commerce News,* October 12, 1955.

[6] It is interesting to note that as far back as 1891 the City Council had passed a resolution requesting the City Solicitor to rule on whether "the City of Philadelphia can be used to execute acts that discriminate against any citizen of Philadelphia on account of color." The City Solicitor ruled that the execution of the trust was legal. See Brief in Support of Petition of William Ashe Foust and Robert Felder for Admission to Girard College (1955), pp. 21–22, Orphans' Court of Philadelphia County, No. 10, July Term, 1885.

[7] For technical reasons, all the petitions and briefs in the case were later revised to deal with only two of the Negro applicants.

[8] Girard's will provides that if the city "knowingly and wilfully [sic]" violates his provisions, the estate is to go to the Commonwealth of Pennsylvania. In the event of the Commonwealth's dereliction, the United States of America is named as the final legatee.

[9] On January 6, 1956, the Orphans' Court *en banc* unanimously sustained the Hearing Judge and dismissed the exceptions. The City Solicitor announced that he would appeal the decision.—Philadelphia *Evening Bulletin,* January 6, 1956.

[10] Vidal v. Girard's Executors, 2 How. 127 (U. S. 1844). No less a personage than Daniel Webster argued for the heirs before the Supreme Court of the United States—but to no avail.

participation also offers the social scientist the opportunity to examine and explore the degree of sophistication with which the legal profession uses and evaluates his contribution. In short, there is an interactive process between law and the social sciences beginning to take place which bears careful examination and appraisal by all the parties concerned.

Let us now examine the principal arguments of the contesting parties in the Girard litigation.

ARGUMENT OF THE CITY OF PHILADELPHIA

The argument of the city of Philadelphia, acting through the Mayor and the Commission on Human Relations,[13] is essentially five pronged.

Violation of Fourteenth Amendment

First, it claims that the administration by the Board of Directors of City Trusts of a charitable trust containing a racially restrictive clause is contrary to the Fourteenth Amendment of the federal Constitution, which forbids a state to deny to any person within its jurisdiction "the equal protection of the laws." The City of Philadelphia is a legal creation of the Commonwealth (state) of Pennsylvania and therefore any action by the municipality or any of its subdivisions constitutes state action. In the *Shelley v. Kraemer* case of 1948, the United States Supreme Court ruled that the power of government could not be used to enforce a racially restrictive housing covenant. Similarly, the Board of Directors of City Trusts, an agency of the city, cannot use its governmental powers to enforce a privately willed policy of racial exclusion, for such action would constitute state action in violation of the equal protection clause. Reference is also made to the decree of the Supreme Court in the School Segregation Cases.

Violation of public policy of city, state, and federal government

Second, the color restriction upon admission to Girard College constitutes a violation of the public policy of the city, the Commonwealth, and the federal government. The city, in 1955, operates under a Home Rule Charter whose Preamble expresses its aim of providing a government "in which all qualified citizens may participate equally without any distinction based on race, color, religion, or national origin." Moreover, the city has implemented this provision in the creation of the Commission on Human Relations with its mandate for eliminating discriminatory behavior. The Commonwealth of Pennsylvania has demonstrated its antidiscrimination policy by enacting statutes which forbid racial discrimination in many areas: public schools, public assistance, public contracts, urban redevelopment, public housing, public employment, and public accommodations. The policy of the United States against racial discrimination is revealed in civil rights legislation and in the Fourteenth Amendment cases culminating in the decision against segregation in public education.

Doctrine of cy pres

Third, the city points to the legal doctrine and precedent which permit courts of equity to modify the provisions of a will while remaining within the general framework of the donor's intent. Such action is justified when a particular provision of a charitable trust has become illegal, impracticable, or impossible, and is accomplished through the equity jurisprudence doctrine of cy pres.[14] A number of cases where such deviations have been granted by court order are cited; interestingly, two of them are in the legal history of the Girard Estate itself. The Girard will had specified that none of its real estate should be sold and that it should be leased for maximum terms of five years. In both of the cases (one in 1868, the other in 1950) the Orphans' Court had authorized a change in these administrative provisions. Therefore the court has power to authorize the deletion of the term "white" from the College's admission policy.

True intention of Girard's will

Fourth, the carrying out of the true intention of Girard's will to establish a school to endure in perpetuity requires recognition of the vast changes that have taken place since his death in the areas of human relations, education, and social science, and the removal of the color restriction because of these changes. Moreover, Girard, specifically, had shown in his will a concern for the moral quality of the instruction to be provided in his college and had instructed that the students be taught "the purest principles of morality," that they should learn to "evince benevolence towards their fellow creatures," and should develop "a pure attachment to our republican institutions, and to the sacred rights of conscience, as guaranteed by our happy constitutions."[15] At the time of his death the lowly status of the Negro, slave or free, the fact that such education as there was, whether public or private, was racially separate, the pervasiveness of notions of racial superiority and the lack of scientific knowledge about race, and the lack of public concern for equality of treatment would have made it natural for Girard to have created his college exclusively for white boys. The subsequent abolition of slavery, the adoption of the other Reconstruction amendments, the development of public concern for equality of treatment, the accumulation of scientific knowledge about race and racial equality, the desegregation of education, and the rise of modern theories of good educational practice have brought about a state of affairs which demand the abolition of the color bar in order that Girard's concern for the moral and spiritual quality of the orphans' education might be effected and the College remain abreast of the times.

Expert witnesses in social science

It was at this point that expert witnesses in the social sciences, education, and community affairs were introduced by the city. E. Sculley Bradley, Chairman of the Graduate Department of American Civilization of the University of Pennsylvania, described the culture of Girard's lifetime, concentrating on the status of the Negro and the characteristics of the educational system, and outlined the major relevant cultural changes which have taken place since Girard's death. Ira De A. Reid, Chairman of the Department of Sociology at Haverford College, discussed the developments in scientific knowledge about race which postdated Girard's lifetime and described the results of recent experimental studies, pointing to the undesirable effects of racial isolation on attitudes and behavior in intergroup relations, and the advantages to be gained by both white and

view, Vol. 30, No. 1 (January 1955), pp. 150–69; "The Lawyer's Role in Modern Society: A Round Table," *Journal of Public Law*, Vol. 4, No. 1 (Spring 1955), pp. 1–48.

[13] Represented by the City Solicitor, Abraham L. Freedman, and the Deputy to the City Solicitor, Harvey Levin.

[14] Literally, "so nearly"—in other words, the doctrine of approximation.

[15] Interestingly, Girard barred all ministers or ecclesiastics "of any sect whatsoever" from the College grounds. There is, however, no ban on the teaching of religion or religious principles, and such teaching is carried on; the newest building on the campus is a large and handsome chapel; and the boys also attend services of their choice outside the College.

Negro children in eliminating such isolation. Isidor Chein, Professor of Psychology at New York University, testified further on this latter point and affirmed the importance of group memberships and equal-status relationships in shaping attitudes and behavior in human relations. Gilbert F. White, President of Haverford College, described present-day practices and preferred policies in higher education on the segregation issue, citing resolutions by organizations of professional educators endorsing racial integration in the schools. Alice V. Keliher, Professor of Education at New York University, testified on the importance of nonsegregated education for the development of unprejudiced attitudes in children. George Schermer, Executive Director of the city's Commission on Human Relations, described the general benefits to the city of Philadelphia to be derived from eliminating the color bar at Girard College, stressing the undesirable symbolic effect on the community of the present policy. Maurice B. Fagan, Director of the Philadelphia Fellowship Commission, a private agency, also emphasized in his testimony the desirability for community morale of eliminating the color bar in an institution administered by the city.

Color restriction of secondary import

The city's fifth contention, derived from a general analysis of the provisions of the will, is that the color restriction is secondary in import to Girard's desire to have the College administered as a public rather than a private trust. The conclusion, then, derived from the application of law to the deductions from the principal claims enumerated above, is that since the two provisions (the color restriction and the public trust) cannot legally be carried out simultaneously, the dominant purpose must prevail: the city must be retained as the trustee of the College and the color bar must be removed. Thus the city's principal intent is not that the College should pass from its hands but that it should remain as a municipal trust with the color bar to admission eliminated.[16]

ARGUMENT OF THE BOARD OF DIRECTORS OF CITY TRUSTS

The argument of the rebuttal in testimony and of the Brief of the Board of Directors of City Trusts[17] may be considered directed at three areas of dispute: (1) the specific constitutional and legislative provisions and accumulated judicial decisions as they bear on the case, which we may refer to as the "legal" issues; (2) the matter of "public policy"; and (3) the social science (including educational and "community") testimony which had been presented by the petitioners.

Legal issues

The very specific, clear, and precise nature of the directions of Girard's will, including the color restriction, was asserted, and the legislation and massive judicial history which have firmly supported the validity of the trust and the city of Philadelphia's right to administer it were reviewed in detail. On the constitutional issue, two arguments were made: (1) That a charitable trust, if valid, becomes a "vested" property right which is not subject to the retroactive force of legislation passed subsequent to its effectuation. Constitutional provisions operate "prospectively" rather than "retrospectively," unless specifically worded to the contrary. The Fourteenth Amendment to the Constitution of the United States is prospective and was passed subsequent to the probation of Girard's will and is therefore not applicable to the disposition of the Girard Estate. (2) That the City of Philadelphia, a municipal corporation, acts in a triple capacity: public or governmental, when it exercises ordinary governmental functions; proprietary or municipal, as when it operates a public utility; and fiduciary, when it administers a trust. It is only when acting in the first capacity—public or governmental—that it is acting as an agent of the state and thus carrying on state action. The Philadelphia Home Rule Charter specifically exempts the Board of Directors of City Trusts from its provisions. Thus the administration of the trust is not state action and not subject to restrictions on state action.

The doctrine of cy pres is considered inapplicable to the present case because Girard's fundamental intent, as distinct from the administrative provisions he inserted to fulfill his fundamental intent, included the racial restriction and because it has not become impossible, impractical, or illegal to continue the College with the present restriction.

Public policy

Previous judicial decisions are cited to support the claim that public policy does not extend beyond specific constitutional or statutory provisions and judicial decisions which deal with the issue at hand. Thus the burden of proof is thrown upon the city to find specific provisions which forbid the administration of the trust as constituted at present, and the adducing of antidiscriminatory legislation in other areas is, by implication, deemed irrelevant.

[16] The arguments submitted in the Brief of Attorney Alexander for William Ashe Foust and Robert Felder, the two applicants for admission, and that of the Attorney General of the Commonwealth of Pennsylvania are essentially similar to those of the city. Alexander adds the considerations of tax exemption and the Charter of the United Nations.

[17] Represented by its Solicitor, Joseph P. Gaffney.

Social science testimony

The Board attempted first to have the social science testimony stricken from the record as irrelevant and immaterial. This move failing, Counsel for the Board cross-examined the expert witnesses and presented several rebuttal witnesses for testimony pertinent to the issues raised. Its chief witnesses in this area were Merle M. Odgers, former President of Girard College and President of Bucknell University, E. Newbold Cooper, then Vice-President and now President of Girard College, and John A. Diemand, a former student at the College, President of the Insurance Company of North America and President of the Board of Directors of City Trusts. The bulk of their testimony brought out that students at Girard College, though they have no Negroes as fellow pupils, meet them in athletic contests, interscholastic events, and community affairs, that Negro visitors are invited to the College to speak, that good interracial and intercultural principles are stressed in the educational curriculum and the achievements and rights of all races taught, and that Girard students go to their own family homes frequently on week ends and vacations (including the long summer recess) and have there the same opportunities as other boys for interracial contacts.

This testimony also brought out that Girard College was well regarded with reference to the quality of its graduates and had produced many outstanding members of the community. Further, it was claimed that the students and alumni of the College are no more racially prejudiced than the community at large and, if anything, are less prejudiced as a result of the quality of the education which they receive. Thus the testimony of the social-scientist witnesses is characterized as "opinion evi-

dence" which does not deal directly with the situation at Girard College and is controverted by the facts that have been presented by the school's administrators and one of its prominent graduates who has been in close touch with the school for many years.

COURT DECISION

The Hearing Judge of the Orphans' Court ruled in favor of most of the arguments presented by the Board of Directors of City Trusts. On the constitutional issue, the court supported the theory of the separation of municipal powers which declares that the city, acting in a fiduciary capacity to administer a trust, is engaging in individual rather than state action. Thus the Fourteenth Amendment is not being violated. Girard College is declared to be a private institution, and this is construed as a part of the primary intent of the donor, with the provision for munipical administration of the trust simply means to an end, namely, perpetual operation of the College. "Public policy" is interpreted in the objectively narrow manner, and since the court finds no constitutional provision, legislative act, or court decision violated by the restrictive clause, the operation of the trust is held not to offend public policy.

Changes in cultural conditions are ruled to be not sufficient by themselves to admit modification of the provisions of a will by means of the doctrine of cy pres. The necessity for such a change must have a direct relation to the testator's purpose: "Such a purpose must have failed in one way or another." [18] In this case, such failure has been alleged in the testimony that desirable educational practices which Girard intended cannot be carried out when Negroes are not admitted to the College. However, the court held that the social science evidence on this point is unconvincing, since it is "opposed by countervailing factual and credible subjective experience testimony" dealing with the "exemplary records of citizenship" [19] possessed by the graduates of the College, with the nature of the curriculum, and with the opportunities for association with Negro boys outside the classroom. Thus it is ruled that "the present policy of nonintegration is not inherently harmful to either the students at the College or to the public at large," [20] and the educational policy of the trust has not "failed."

SOCIAL SCIENCE ISSUES

An evaluation of the role and reception of social science evidence in this case must inevitably pose the question: What is the nature of the relationship of generalizations about human behavior, derived from an accumulation of experimental evidence, to specific situations which appear to fall within the area of the generalization but have not themselves been empirically examined? The generalization that the "social situation" influences behavior and attitudes, or, at a slightly lower level of generality, that a situation of racial integration, under conditions of equal-status contact, is one favorable to the development of amicable racial relationships and attitudes, now has a respectable, though by no means definitive, history of experimental verification. Is this to be dismissed as mere "opinion" and of no weight in the evaluation of an empirical situation which bears some resemblance, at least, to the conditions of the generalization? It would seem, rather, that the question becomes one of careful delineation of the variables present in the experimental situation and a careful comparison with the variables discernible in the case under review. In the Girard College example, racial isolation in the classroom and the dormitory is countered by an educational program positively oriented to intergroup relations and some contact with Negroes outside the classroom and dormitory. Is the presence of these variables sufficient to destroy the experimentally derived relationship between isolation and prejudice? Deductively, the question must be posed in this way. Inductively it can be decided only by further experimental study.

In the second place, how much scientific validity can be attributed to general reputational opinion of the quality of a body of people whose numbers run into the thousands, in the absence of a careful empirical study based on scientific principles of sampling? It is well known that negative instances are easily forgotten or frequently disappear from general public knowledge. The fact that Girard College has produced many outstanding citizens and doubtless many more of average attainment and position in the community is in no way in question. But if scientific principles of induction are to be observed, in a court of law where large issues are at stake, great care must be exercised not to overweight evidence about large numbers of people which has not been obtained by standard sampling methods.

Finally, important variables in the present case are changing with each passing day. The world into which Girard College students of a generation or more ago stepped upon graduation is a far different one from that of today, which in turn will differ from that of tomorrow. As racially segregated patterns continue to crumble and topple under the impact of changes in custom, scientific knowledge, and standards of what constitutes morally right behavior, the criteria and the conditions of successful adjustment in the community themselves undergo continual modification. Moreover, a racially segregated school situated in the heart of a northern metropolis, regardless of the excellence of its program in other respects, will itself come to be regarded with increasing curiosity and negative affect. Under these conditions, it would seem premature to conclude that the general beneficent intent of Stephen Girard can be securely attained by the retention of the racial restriction on admission to his college.

He was instructor in sociology at the University of Pennsylvania (1946–50) and assistant professor of sociology at Drew University (1950–53). His publications include numerous articles in professional journals on race relations and social stratification. He served as social science consultant to the Office of the City Solicitor, Philadelphia, in the Girard College case.

Policies and Practices of Discrimination Commissions

By Elmer A. Carter

It was in the spring of 1945, when the war to preserve democracy was drawing to a close, that the Committee on Fair Employment Practice, created by Executive Order 8802 of President Roosevelt on June 25, 1941, to end discrimination in defense industries because of race, creed, and color, received its death blow. The first significant intervention of the federal government in discrimination in employment came to an official end the following year, but actually it was destroyed by the savage eloquence of Democratic senatorial leaders on the floor of the Senate during debate on its proposed appropriation for the fiscal year 1945–46. With deliberate intent the budget of the Committee, already reeling from repeated attacks, was cut by the Congress so that only skeletal operation was possible and its final demise inevitable.

Discrimination in employment because of race, religion, and national ancestry has been experienced to some degree by segments of the American population throughout our history. The Irish Catholic was compelled to endure contemptuous treatment in his search for employment following the great Irish migrations and years afterward; the Italian, the Slav, the Pole, the Scandinavian, and the Magyar have, in their turn, had to face resistance to their efforts to gain a foothold in American commerce and industry and to acquire skills which would ensure adequate income and the opportunity of acquiring a competence. But discrimination against the Negro has dwarfed its manifestation against any other racial or national group. He is the perfect example of what has been termed dynamic causation. Caught in a vicious circle, he is at once the victim and the excuse for racial discrimination. The identity of color of the subject group with that of the dominant majority has served to ameliorate and soften and finally to overcome in large measure the handicaps and restrictions which served to deprive other groups of their share in the nation's economy. Color difference, the slave tradition, and fear of the competition of Negro workers are the principal links in the chain which has bound the Negro to the periphery of American industrial development and condemned the great majority to a standard of living measurably lower than that of most of his fellow citizens.

Mounting agitation, increasing in volume and bitterness and culminating in a threat of a march of blacks on Washington, finally wrung the executive order from the reluctant hands of the President. The entrance of the federal government as an active participant in the struggle against discrimination gave that struggle new impetus and a new dimension. By the Presidential order the struggle was lifted out of the context of social welfare and became identified with the historic struggle for civil rights.

Intimations of the increased responsibility which the national government might assume were apparent in the earlier provisions for a minimum allocation of wages to Negro workmen in contracts for building construction.[1] There can be no question that the executive order of President Roosevelt was a powerful stimulant to the Negro's loyalty during World War II. Nor can it be doubted that the work of the FEPC allayed heightening racial tensions. Its total record, judged by the conditions it faced—inadequate staff, entrenched prejudices, calculated indifference in high places—was impressive if not spectacular.[2]

[1] Robert C. Weaver, *Negro Labor—A National Problem* (New York: Harcourt Brace & Co., 1946), p. 11.

With the collapse of the FEPC, momentary despair gripped those who had hoped and fought for its retention. They could anticipate no other consequence save a reversion to the conditions which had characterized the treatment of the Negro in American industry prior to the Presidential action. They envisioned widespread disturbances and racial resentment as the nation returned to peacetime economy. These apprehensions had sound bases in history, in the events following the close of World War I when the phrase "last to be hired and first to be fired" received, with few exceptions, dramatic, nationwide, and cruel confirmation in the great industrial centers of America where Negroes, by reason of defense requirements, had gained an uncertain foothold in industry.

The brief and limited assumption by the federal government of the responsibility for dealing with racial discrimination in industry marked the beginning of the third phase of the struggle to bring the Negro within the compass of the American democracy. The first phase of this struggle was climaxed by the issuance of the Emancipation Proclamation of President Lincoln ending chattel slavery, a strategic measure dictated by the waning fortunes of the Union armies in the field. The second phase was, undoubtedly, the enactment of the Thirteenth, Fourteenth, and Fifteenth Amendments, which formally ended the system of slave labor and clothed the new freedmen with the sanctity of citizenship. The third phase, the outline of which began to emerge with President Roosevelt's executive order, seemed to be aborted when Congress refused to cast into permanent mold a government-supported agency charged with the responsibility of ending discrimination in employment and thus left the Negro still hobbled in the labor market. As victory over nazism and fascism neared, all the signs pointed to the probability that the struggle of the Negro in America to become a first-class citizen had suffered a major setback in the field of employment by congressional rejection of a permanent FEPC.

[2] Malcolm Ross, *All Manner of Men* (New York: Reynal & Hitchcock, 1948), pp. 257–60.

First State Fair Employment Practices Law

But the movement to end discrimination in employment by government action initiated by the executive order was not to be halted by the defeat of the efforts to give permanence to the FEPC. Almost unnoticed at the time in the heat of the fierce conflict raging on the floor of the House and the Senate was the shift of the terrain of the major struggle from the national congress to the state legislatures. While the FEPC was being done to death in Washington, Governor Thomas E. Dewey of New York signed the first so-called fair employment practices law ever enacted in America. This law, known as the Ives-Quinn Bill, was a bipartisan measure sponsored in the New York State Assembly by Irving M. Ives, Republican majority leader of the Assembly, and in the Senate by the late Elmer F. Quinn, Democrat, minority leader of the Senate. There was no equivocation in the language of this statute, the preamble of which declared:

> It shall be deemed an exercise of the police power of the state for the protection of

the public welfare, health and peace of the people of this state, and in fulfillment of the provisions of the constitution of this state concerning civil rights; and the legislature hereby finds and declares that practices of discrimination against any of its inhabitants because of race, creed, color or national origin are a matter of state concern, that such discrimination threatens not only the rights and proper privileges of its inhabitants but menaces the institutions and foundation of a free democratic state. A state agency is hereby created with power to eliminate and prevent discrimination in employment, in places of public accommodation, resort or amusement and in publicly-assisted housing accommodations because of race, creed, color or national origin, and to take other actions against discrimination because of race, creed, color or national origin, as herein provided; and the commission established hereunder is hereby given general jurisdiction and power for such purposes.[3]

Most of the arguments which were so fervidly advanced against the creation of a permanent FEPC during the debate in the Senate and the House of Representatives were advanced in Albany during the debates on the Ives-Quinn Bill in the New York State Legislature. Only the appeal to the deities of white supremacy was lacking. Some of these arguments may still be heard when consideration is being given to laws against discrimination in the various states, but time and experience have shorn them of any validity which they might once have possessed. One in particular dies hard, the belief that Negroes and whites cannot and will not work together without friction, despite the mass of evidence to the contrary documented before the first Fair Employment Practice laws were passed. It would be difficult to imagine more complete refutation of this presumption than is presented in hundreds of commercial and industrial plants ten years after the enactment of the laws against discrimination in public and private employment throughout the nation.

There was ample precedent for this course of action in New York State and in the other states which swiftly followed. Legislative measures directed against discrimination had been enacted in New York since 1909 and in several other states even earlier. Before Executive Order 8802 was promulgated, New York had acted against discrimination in war industries. Governor Herbert H. Lehman had appointed a committee on Discrimination in Employment within the New York Council of Defense, later changed to the New York State War Council. This committee, empowered to investigate and prevent discrimination in defense industries because of race, creed, color, or national origin, made investigations of discriminatory practices and cited cases to the Industrial Commissioner charged with the enforcement of the laws against discrimination in employment.

FEP Laws in Other States and Cities

Following the enactment of the New York law (called the Law Against Discrimination) in the spring of 1945, similar laws, patterned in part on the New York law, were enacted in New Jersey, Massachusetts, Connecticut, and Wisconsin; as this article is written laws creating agencies to eliminate discrimination in employment have been enacted in sixteen states and thirty-six cities. The form which this legislation assumed was in part, at least, shaped by the experiences and results which attended the efforts on the national level of the FEPC and on the local level of the Committee Against Discrimination in Employment of the New York Council of Defense and, in part, by the memory of the fate of the prohibition amendment. The laws in the cities and states vary in many aspects, but there is one factor common to all, namely, primary reliance on the potential of conciliation and persuasion and conference to eliminate discrimination in employment because of race, color, creed, or national origin.

When one considers the character and extent of the practice of discrimination in America, particularly racial and color discrimination, it would appear that reliance on such inconclusive procedures was an evidence of uncertainty and timidity in approaching the problem. It was pointed out by skeptics that there had been no lack of effort to end discrimination through persuasion. Private agencies had for many years exerted every method of persuasion to achieve some relaxation of discrimination against Negroes in industry. Armed only with this power, the National Urban League and its branches, with directing boards of outstanding citizens of both races, had knocked at the gates of American industry for three decades, achieving only sporadic success and this confined largely to the unskilled and semiskilled areas of employment, on isolated sectors of the industrial front. Certainly the history of the Negro in America provided justification for doubt as to the ultimate efficacy of this procedure in times of peace. For, after all, no fundamental change in the Negro's status in America has ever occurred save in the midst of war or in its wake. The threat of national disaster has levered the Negro's destiny in America. Reassuring answers to these misgivings were contained in the reports of the FEPC and the Committee Against Discrimination in Employment of the New York State War Council. But bright as was the record of their accomplishments, it was the consensus of those who had intimate knowledge of their operation that a law without sanctions or provision for plenary procedures against discrimination must be ineffectual. As a result, the first law against discrimination in employment combined in its provisions the obligation to conciliate where possible and the power to compel where conciliation failed. This provision in one form or another is contained in the laws of at least twelve of the sixteen states.

Sanctions and Compliance

Resort to sanctions in those states and cities where they may be invoked has been exceedingly rare. Agencies charged with the administration of FEP laws were at the outset hesitant to seek compliance by force. Extraordinary efforts to achieve elimination of unlawful discriminatory practices through the conciliation process have characterized the history of all FEP laws in existence. This approach has been largely responsible for the decline in active organized opposition to FEP legislation in those states which have had some experience in its administration. Enthusiastic support of this legislation, as a matter of fact, has come from individuals and organizations which once bitterly opposed the law.[4] Any other approach, emphasis on compulsion, swift citation to public hearing, would unquestionably have inspired renewed opposition and the search for vexatious legal barriers to hamper its administration.

It has long been recognized that the "preliminary attempt at understanding and conciliation" is an indispensable

[3] The law was amended in 1952 to include places of public accommodation, resort, or amusement and in 1955 to include publicly assisted housing.

[4] For example, the following: "I am one of those who was against the Anti-Discrimination Law when it was first introduced and worked hard to prevent its passage. Now after six years of operation, particularly as it is so ably enforced, I find that our fears have not been realized, but much more genuine progress has been achieved."—Statement by M. D. Griffith, Executive Vice President, New York Board of Trade, December 5, 1951.

part of the process of ending discrimination. The conclusion of the Temporary Commission Against Discrimination of New York State that "the great majority of the complaints can and will be satisfactorily settled on the threshold by conference, persuasion and conciliation . . ." has been borne out by the record of all the states which have anti-discrimination laws.

The effort to conciliate depends on a finding of probable cause to credit the allegation in a complaint charging discrimination in employment because of race, creed, color, or national origin. Discrimination now is rarely overt and seldom if ever admitted. The circumstances out of which a complaint arises are usually susceptible to more than a single interpretation. More often than not recognition of the syndrome of racial and religious prejudice, apart from the specific allegation, is necessary to reach a determination of "probable cause." The effectiveness of the conciliation procedure depends upon the discovery of the focus of infection as well as its extent. Is the source of discrimination in the attitudes of management based on apprehensions and fears of consumer resistance or employee antipathies? Does discrimination emerge as complete exclusion, limited or quota employment, or segregated employment on the basis of race or color or creed or national origin?

Discrimination is not an isolated phenomenon and it assumes many forms. The framers of the law were aware of this, and the legislative injunction to the New York commission, which is implicit in the laws of all the cities and states, is not merely to eliminate but also to prevent discrimination in employment. The preventive aspect, which after all must be the ultimate measure of success, has been and is the goal of all the agencies charged with the administration of state FEP laws. It is with this in view that the method of approach to complaints has been developed, embracing, as a rule, examination of hiring policies and employment patterns of respondents beyond the employment category specified in a complaint and including in the terms of conciliation, where probable cause is found, sweeping measures affecting the whole employment process—recruitment and the sources of recruitment, interrogations on employment application blanks (which have been subject to rulings by an administrative agency or, as in some statutes, set forth in the law [5]), and methods of evaluation for promotion or dismissal; and where membership in labor unions is in question, the history of the organization in terms of the industry and the conditions which prevail in the labor market.

INTERPRETATION OF N. Y. FEPC LAW

At the outset there were misconceptions in New York State of the provisions of the New York law and the interpretation which would govern commission action. The misconceptions were shared by those whom the law was designed to benefit, the victims of discrimination, as well as those who might be charged with discrimination. Understanding of the law by respondent and complainant is a prerequisite of successful conciliation. The conciliation agreements rest on certain fundamental assumptions:

> Quota employment, token employment, in fact any type of exclusion in any job category because of race, creed, color or national origin, as well as discrimination in terms, conditions or privileges of employment, constitutes an unlawful employment practice unless based on a bona fide occupational qualification. . . .

[5] Provisions dealing with lawful and unlawful pre-employment inquiries are included in the statutes in Massachusetts, Michigan, Minnesota, New Jersey, New Mexico, New York, Oregon, Pennsylvania, and Rhode Island.

The law, however, is not retroactive. It does not require the discharge of existing employees to provide work opportunities for minority group representatives previously rejected, nor does it require employers to create unnecessary jobs merely to afford such opportunities to minority groups. The goals of the commission are, therefore, necessarily prospective. It is not concerned with the specifications which an employer may find necessary to secure satisfactory job performance except that such specifications shall not, directly or indirectly, be discriminatory. It requires that these job specifications be applied equally to all applicants regardless of race, creed, color or national origin. Visible progress under the law is thus dependent on the rate of job turnover, new job opportunities, the availability of qualified minority group applicants, and their ability to excel in open competition on an equal basis with all other applicants.[6]

The New York commission has been forced to face an insistent challenge to these rulings on the grounds that the above interpretation will require a century, if literally applied, to bring about actual integration. It has been urged that even quota employment might provide the opening wedge. The New York commission has taken the position that quota employment is in itself the recognition and acceptance of difference, of inferior status; that the immediate gain is transitory; that the minimum invariably becomes the maximum; that it does not serve to end discriminatory practices but merely to channel them.[7]

THE CONCILIATION PROCESS

The conciliation process affords the employer respondent charged with discrimination an opportunity to bring his hiring practices and methods into compliance with the law without stigma and without shock. It provides the indifferent employer respondent, who is anxious as to the possible reactions of other employees or union members to the introduction of Negroes, with convenient insulation. He can hide behind the cryptic pronouncement, "It's the law." Another factor of vital importance in the success that has attended the attempts to eliminate discrimination through conference and conciliation has been the opportunity the conference affords to examine the rationale of discrimination and dissect the myth and the rumor. More than might be imagined, one can sense in every conference the soundness of what Gunnar Myrdal observed:

> The importance of the inculcation of the general principles of democracy in the American people which has been going on for so many generations should not be under-rated. It is true that practical and specific issues are often avoided in a rather opportunistic way, so as not to disturb the conscience of the white people. The fact that ignorance and unconcernedness are so opportune means, of course, that additional popular education along more concrete lines will meet tremendous emotional resistance. But this resistance is not insurmountable. People are also bent upon rationality. Their allegiance to the ideals of the American Creed is strong and is held consciously.[8]

Successful conciliation comprehends the elimination of the unlawful employment practice complained of and, more, that steps shall be taken to prevent its recurrence and to assure equality of opportunity on all levels of employment. In every conference of conciliation there is the appeal, subtle or otherwise, to the fundamental ideals of the American creed. The response to this appeal is

[6] Henry Spitz, "Patterns of Conciliation Under the New York State Law Against Discrimination," *New York Law Journal*, Vol. 125, No. 68 (April 9, 1951), p. 1268.

[7] Quota employment is banned by express provision in the laws of Michigan, Pennsylvania, and Rhode Island.

[8] Gunnar Myrdal, *An American Dilemma* (New York: Harper & Brothers, 1944), p. 384.

one of the bright spots in the records of this legislation.

The terms of conciliation are designed to give a respondent employer an opportunity to make the transition from a policy of discrimination in employment to that of nondiscrimination in an orderly fashion and to inaugurate this new policy in such a manner that it becomes a part of the normal employment procedure. An employer against whom a finding of probable cause has been made routinely in New York State and in all the other states is asked, within the framework of the laws, to restore the complainant's lost civil right[9] by employment immediately or on the occasion of the first vacancy, if he is found to be fitted by training and experience for the job in question, or that he be compensated for loss of earnings due to discrimination (where this is permissible) or both. As a rule the respondent, when an employer, is required to see to it (*a*) that its officers charged with the responsibility of hiring shall be advised that nondiscrimination on the basis of race, creed, color, or national origin is the policy of the respondent for every category of employment in the usual manner that directives are given to officers, with a copy to be sent to the commission; (*b*) that employment agencies or other sources of recruitment of personnel utilized by the respondent employer shall be instructed that in making referrals to the respondent no consideration shall be given to race, creed, color, or national origin. There are other terms of conciliation, depending upon the particular situation revealed by the investigation. They may comprehend distribution of commission literature to employees—pamphlets and brochures on the law—and elimination of certain questions on employment application blanks pertaining to race, creed, color, or national origin. In addition to the strict terms of conciliation involving the disposition of a verified complaint, recommendations of a preventive nature may be made, such as broadening the base of recruitment of personnel by the inclusion of non-fee-charging agencies, widening the range of high schools and colleges utilized in personnel recruitment to give heterogeneity in terms of race, creed, and color to the applicants among whom the employer will select future employees.[10]

[9] The right to work is declared to be a civil right in Kansas, Michigan, New Jersey, New Mexico, New York, Oregon Pennsylvania, Rhode Island, and Washington. In Massachusetts the right to work is "hereby declared to be a right and privilege of the inhabitants of the Commonwealth."

REVIEWS OF EMPLOYMENT PATTERNS

The commission tests and examines the effectiveness of the conciliation agreements by regular review of hiring policy and employment pattern in those establishments which have consented to carry out the terms of the agreements. Where no probable cause has been found to credit the specific allegation in a complaint alleging discrimination but where the general employment pattern or the history of employment is such as to warrant the inference of discrimination, respondents are urged to take steps to prevent discrimination. A commissioner had occasion to write an air transport company the following letter after he had dismissed a complaint charging discrimination because of creed:

> You will recall that in our conference I pointed out to you that the total absence of any Negroes from any clerical positions in this company, while not conclusive as to a discriminatory policy in itself, is so contrary to the experience of the commission where honest effort has been made of compliance with the provisions of the law as to raise serious question as to the hiring practices. This would hold equally true where there is a total absence of any young Negro women ever to be employed as stewardesses or hostesses.
>
> I wish to request that you instruct all individuals charged with any phase of the hiring process that discrimination because of race, or color, or creed, or national origin is in violation of the Law Against Discrimination of the State of New York, and, further, that it is the intention of the company to comply with the Law Against Discrimination.

[10] Such agencies might include the National Urban League, the Federation Employment Service, and high schools with a high incidence of Negro enrollment.

During a review of the case some months later, respondent's personnel director reported that a Negro girl had been hired as a reservation clerk in its Buffalo office and that she seemed happy with her position as well as popular with her fellow workers. A second review inquiry in 1954 revealed that although business was slow, two Negro girls were employed in the New York main office, one as a typist, the other as a clerk. On a third review in 1955, the respondent reported that it had taken steps to obtain applicants of minority groups; that the National Association for the Advancement of Colored People and the Urban League had been requested to refer qualified applicants and that they had been so doing. Jobs as reservation agents in the New York offices had been offered to a Negro man and a Negro girl, although only the former was able to accept.

A recent review of the pattern of employment of one of the great banking institutions, the First National City Bank of New York,[11] which prior to the law had Negroes employed in only the messenger category and there a very small number, indicates that there were approximately 171 Negroes employed in the main office and in the various branches in the following categories of employment: assistant section heads, senior clerks, junior clerks, bookkeepers, head bookkeepers, tellers, stenographers, typists, clerk-typists, adding machine operators, IBM operators, file clerks, messengers, and messenger-guards. The same pattern obtains at the Chase Manhattan Bank and many other financial institutions. A similar picture has been found on review in scores of establishments which formerly employed Negroes, if at all, in no positions above the menial or custodial level.

This in itself is not proof of complete absence of resistance to the employment of Negroes, but it cannot be dismissed as token employment even if the total number of employees is upward of ten thousand. Its significance lies in the fact that the wall which kept Negroes out has been breached and advance has been made in the removal of social and psychological barriers to promotion. The problem of promotion, of elevation to supervisory posts, must be faced once discrimination has been eliminated at the first level. The results attendant upon this step have not justified the widespread apprehension of disaffection on the part of white personnel that was anticipated by a substantial segment of management.

[11] No probable cause was found to credit the allegation in a verified complaint filed against this respondent.

INDUSTRY-WIDE CONFERENCES

The complaint procedure has its limitations. The person aggrieved by an alleged unlawful employment practice very often is reluctant to seek legal redress. Fear of reprisal, risk of being tagged a troublemaker, act as deterrents to the urge to file a verified complaint charging discrimination. The complaint technique has been buttressed by the industrial conference to which leading figures in a given industry are invited to discuss and to recommend steps for more far-reaching compliance

with the law. Results of these conferences have in some instances exceeded the expectations of the sponsoring commission. One cannot depreciate the influence which individual business leaders may exert on their associates in their own or in related fields. In Philadelphia it has been reported that this approach has achieved significant extension of employment opportunities for groups hitherto excluded from certain industrial plants. In New York the communications council, composed of the leaders in the communications industry (American Cable and Radio Corporation, New York Telephone Company, RCA Communications, Inc., and the Western Union Telegraph Company), published and distributed an attractive brochure which has unquestionably been of tremendous value in developing receptive attitudes on the part of employees and stimulating affirmative action toward compliance in other business areas.

Television

The educational possibilities of television present a continuous and sometimes a disturbing challenge. How powerful an instrument television may become in shaping attitudes and reducing racial antipathies and religious intolerance no one really knows, but few will question its potential. It is, perhaps, the most important segment of the entertainment industry. The field is one in which discrimination may be sensed but not easily proved, and in such an area the conference method provides the most effective approach. It was at the instance of the Coordinating Council for Negro Performers that the New York commission scheduled a conference of the representatives of the great advertising agencies and the television and radio networks in order to examine the conditions of employment which prevailed in the industry. For a number of years alleged discrimination against the Negro performer has been a subject which has provoked considerable comment and resentment. To cope with this situation all the great labor organizations in the entertainment industry have created permanent committees against discrimination. Until the commission-sponsored conference was held, two assumptions were more or less accepted to explain this discrimination: that there were natural limitations to the number of roles in which a Negro could be used; and that advertisers of products did not dare hazard the risk of disapproval of Southern audiences by the use of Negroes in other than traditional roles.

Spokesmen for the Negro performers charged that Negroes were systematically excluded from television programs except for so-called Negro roles which were in many instances totally unrealistic. If a person from another planet were forced to get his knowledge of the City of New York from the television screen, they maintained, he would probably conclude that the only Negroes in the metropolitan area were prize fighters or domestics. In all areas of human activity, it was pointed out by representatives of the Coordinating Council for Negro Performers, Negroes were apt to be seen: in hospitals as nurses and sometimes as physicians and surgeons, in police courts as prisoners or officers, in railroad stations and air terminals as passengers as well as porters, in subways as motormen and guards, as spectators at sports events or lining the avenue watching parades. In short, they were a part of that vast multitude known as New Yorkers. But in the projection of these areas on the television screen, Negroes were rarely seen in the ordinary familiar occupations and activities.

Representatives of both the advertising agencies and the networks conceded that without violating artistic standards it would be possible to cast Negroes in a number of parts which would not carry the connotation of Negro roles. But more revealing was the unchallenged assertion that there had been no substantial disapproval by Southern audiences or viewers of programs in which Negroes were cast in other than those roles which reflected the slave tradition. It was the consensus of opinion that the powerful pull of habit rather than deliberate intent is responsible for the failure to afford Negro performers a greater chance in television and radio. There is reason to believe that the pledges of the conference participants to remedy by affirmative action a situation which all present agreed was regrettable has been honored in a manner that deserves commendation.

The most enduring education is that which is part of the warp and woof of daily living. Acceptance of the Negro in office, in shop and factory, has been made more difficult by the fact that for the most part the Negro lives in a different world, leads an existence apart from his fellows. One of the great objectives in any educational program to end discrimination is to reduce the shock of difference by portraying the Negro as just another citizen in those activities in which his fellow citizens participate.

FEP—Factors in Success

One cannot discount certain other factors which must be considered in any appraisal of the effectiveness of the New York law or indeed of any of the laws against discrimination in employment which have been enacted in the last decade. Full employment, an expanding industrial plant, and a tight labor market have, no doubt, served to facilitate the administration of these laws. Change of employment policy is not too difficult of accomplishment in the face of pressing need for help. A low unemployment level has been a vital force in the expanding opportunities of Negroes in industry. There seems to be universal agreement that there has been a significant change in the opportunities for employment among Negroes and striking alteration in the pattern of employment in the State of New York since the effective date of the law. This is, likewise, the verdict in most of the other states and in many of the cities which have passed FEP legislation. There is a paucity of statistical data to support this opinion. But visual observation and case material in the files of the New York State commission and other agencies, private as well as public, as to the incidence of Negro employment in communications, in large and small industrial units, in the field of insurance, in banking, and in newly developed electronics—where Negroes were conspicuously absent prior to the enactment of the law—will tend to support this view. Although not so visible or apparent, there is reason to believe that resistance to the employment of adherents of the Jewish faith in certain commercial and industrial areas has, likewise, steadily declined.

Because of the success which has marked the conciliation process in meeting discrimination in employment and the results obtained through persuasion, there has been a tendency to conclude that the final elimination of discrimination can be achieved by this means alone. It has been suggested that the meager number of cases which have been noticed for hearing by the various commissions is proof of the contention that education without compulsion is sufficient in the long run to induce an orderly abandonment of discriminatory practices.[12] But the power

[12] During the period that the various state FEP laws have been in operation a total of

of compulsion is an important element in attaining compliance. The factors noted above—a tight labor market, expanding economy, the inclination under urging to reconcile individual practice with the tenets of the American creed —have contributed mightily to the readiness of those charged with discrimination to move, under the direction of the commission and similar administrative agencies, toward compliance with the provisions of the law. It would be a mistake, however, to assume that bigotry, long-held prejudices, deeply ingrained habits of thought always yield readily to mere argument, especially when concession requires embarking on a course of action which may be at variance with that hallowed by tradition and custom. The fact that the alternative to acceptance of the terms of conciliation is a hearing in which hiring policy and employment patterns, racial and religious attitudes, will be subjected to public gaze plays a significant part in stimulating compliance. And the power to invoke sanctions, to issue a cease and desist order enforceable in the courts against those who would defy the law, acts as a powerful deterrent to all save a very few. There is grave doubt whether the conciliation process would obtain comparable results in a period of rising unemployment if the administrative agency were stripped of its powers of invoking sanctions.

There are, of course, individuals who flout the law and have no intention of complying with its provisions. There are areas of employment where discrimination on the basis of race and color and sometimes religion appears to be flagrant and where compulsion seems to be the only method which can secure even a gesture toward compliance. Effective methods to bring these areas into compliance in the absence of verified complaints and in the absence of a labor market where requisite skills are available is one of the continuing problems of the commissions.

CASES INVOLVING ORGANIZED LABOR

Discrimination by segments of organized labor, particularly in those representing skilled crafts, has long been one of the recognizable phenomena of the American labor movement and, therefore, of great concern to framers of FEP legislation. Slight progress has been made in changing discriminatory employment on railways—exclusive at its worst, segregated at its best. The great railway brotherhoods have rendered perfunctory acknowledgment of the existence of the laws by making the racial clauses in their constitutions inoperative in the states with laws against discrimination in employment. Grudgingly Negroes have been admitted into chapters of the Brotherhood of Railroad Trainmen.[13] In Oregon the Industrial Commissioner, after public hearing, issued a cease and desist order against one of the lodges of the Brotherhood of Railway Carmen which had been charged with refusal to admit three Negroes to membership.

Court support in Connecticut

A case in Connecticut arose out of the attempt of two Negroes to be admitted to membership in Local 35 of the International Brotherhood of Electrical Workers, American Federation of Labor. When denied admission to the union as *apprentices*, these men filed complaints with the Connecticut Commission on Civil Rights, the body which

18 hearings has been held: 3 in Connecticut, 2 in Massachusetts, 6 in New Jersey, 4 in New York, and 1 each in New Mexico, Oregon, and Wisconsin.

[13] New York commission, after complaints filed against the J. F. McGrath Lodge of the Brotherhood of Railroad Trainmen and the Pennsylvania Railroad Company.

administers the Connecticut law against discrimination, charging that they had been refused membership in the union because of their race, in violation of the law. After investigation of the charges, the Connecticut commission found reasonable cause to credit the allegations in the complaints that the complainants were denied membership in the union because of their race and color. Following the finding of the commission, efforts to effect a conciliation were initiated but they resulted in failure.

The case was then noticed for public hearing and later, in accordance with the statute, the hearing was held before three hearing commissioners. Thirty witnesses were examined during the course of the hearing. The position of the State of Connecticut in regard to certain contentions of the respondent union is worthy of special notice. As to the union's contention that the limitation on membership to sons and relatives of present members affected Negro and white alike, the hearing commissioners declared that nonetheless this constituted "an absolute and continuing ban on Negro applicants since there was not and never had been a Negro member of the union." At the conclusion of the hearing an order was issued to the respondent union to cease and desist from excluding complainants to full membership.

The respondent union appealed the decision of the hearing tribunal to the Superior Court of Connecticut. The appeal was dismissed and the order of the hearing tribunal affirmed. In no way dismayed, the respondent union appealed from the decision of the Superior Court to the Supreme Court of Errors, the highest court in the state. In a unanimous opinion this high court held that the lower court had not erred in sustaining the hearing tribunal. Later, the court was to hold the union in contempt and to fine that organization $2,000. In its decision the Superior Court commented as follows:

> It is material to consider that the order has its source in the efforts of the people of this state through a duly constituted authority to eliminate from labor relationship the virus of race discrimination.[14]

A segregated union integrated by conciliation

Where the conciliation process failed in this case and the law and the finding of the Connecticut commission were challenged in the courts, in an important case involving another form of historic discrimination by labor organizations (the segregated union in the same craft, based on race and color) success attended the efforts of conciliation. Without going into its genesis, which can be paralleled in other phases of American life, it now is generally recognized as an unfortunate survival of the custom of racial repression of the early labor movement. It is basically a repudiation of the democratic principle; at its worst it is likewise a betrayal of the historic aims of organized labor. The New York commission was called upon to face this situation when the president and a member of the theatrical stage employees auxiliary Local No. 1-A of the International Alliance of Theatrical Stage Employees and Moving Picture Machine Operators of the United States and Canada, AFL, filed verified complaints against the president of the International Alliance of Theatrical Stage Employees and Moving Picture Machine Operators of the United States and Canada, AFL, and the president of the Theatrical Protec-

[14] International Brotherhood of Electrical Workers Local 35 v. Commission on Civil Rights of the State of Connecticut, Superior Court, Hartford County, Files No. 90351 and 90352, Memorandum of decision in action for contempt, filed March 26, 1954.

tive Union, Local No. 1 of the IATSE and MPMO of the United States and Canada, AFL, in which they charged among other things: the maintenance of Local No. 1-A as an auxiliary, segregated local; limitation of Local No. 1 to white persons only; restriction of work opportunities of Local No. 1-A to a limited number of theaters; and deprivation of collective bargaining rights of members of Local No. 1-A.

After an investigation of the complaints, the investigating commissioner made a finding of probable cause to credit the enumerated allegations in the complaints:

> Local No. 1-A is an auxiliary union which, despite the fortuitous presence of several white individuals, was expressly organized to segregate Negroes who by pressure and agitation had secured employment in those theatres located in heavily populated Negro districts. The history of its organization renders this conclusion inescapable and the limitation of its activities confirms it.

Upon the finding of probable cause there ensued the conferences of conciliation and persuasion between the investigating commissioner and the officers and executive committee members of the respondent union. The terms of conciliation were (1) that the members of Local No. 1-A should, as of April 1, 1955, be admitted to membership in Local No. 1 without discrimination in any form and with the same rights, privileges, and responsibilities then accorded members of Local No. 1; and (2) that the details of the transfer should be submitted to the Commission Against Discrimination for its approval. The respondent union, Local No. 1, accepted the terms of conciliation and "at a regular meeting of its membership the thirty members of Local No. 1-A were balloted upon for acceptance into membership in Local No. 1 and a unanimous vote cast in their favor."

PUBLIC ACCOMMODATIONS

It is the tremendous confidence in the efficacy of the conciliation process as exemplified by the progress in eliminating discrimination in employment that has led to the amendment of several FEP laws to extend their jurisdiction to cover discrimination in places of public accommodation, resort, or amusement.

Between 1949 and 1955 laws in New York, New Jersey, Connecticut, Rhode Island, and Massachusetts were amended to encompass discrimination in areas of public accommodation and in publicly assisted housing. It was held by many of those who were acquainted with social and economic conditions of racial discrimination that the conciliation procedures as developed in the field of employment might well be expected to achieve similar results in eliminating discrimination in places of public accommodation, resort, and amusement. Civil rights statutes providing civil and criminal procedures, honored more in the breach, had progressively ceased to be utilized by the victims of discrimination. The reasons are not difficult to apprehend: the burden of proof placed on the victim, the difficulty in winning civil action (particularly in small towns where the offense is not deemed too serious), the probability of lengthy litigation and the uncertainty of the result, the habitual lack of zeal of county attorneys in initiating criminal action.[15]

The procedures of administration in this area are identical with those used in cases of discrimination in the field of employment. On a finding of probable cause to credit the allegation in the complaint, the effort follows to eliminate the unlawful discrimination complained of by conference, conciliation,

[15] Morroe Berger, *Equality by Statute* (New York: Columbia University Press, 1952), p. 111.

and persuasion. The terms of conciliation here of necessity must be dominated by the preventive motif. The administrative agency created originally to end discrimination in employment is not empowered to impose fines, assess damages, inflict punishment, or in any way usurp the judicial function. Nor is this its role. What the administrative agency attempts to do is to bring about a voluntary abandonment of discriminatory practices on the part of the respondent. There have been instances where a request for refund of money legitimately expended for transportation to accommodations which were refused because of race and color of the complainants was included in the terms of conciliation, but the occasions for even this financial recompense have been rare. Where conciliation efforts fail, the complaint is noticed for public hearing and the commission is empowered to issue a cease and desist order and to require affirmative action which comprehends extension of full, equal, unsegregated accommodations, advantages, facilities, and privileges to all persons.

As might be expected, the barber shop and beauty parlor, the swimming pool, the motel, tavern, and grill, the resort hotel, have been the source of most complaints in this field. Where the club as a place of accommodation which is in its nature distinctly private ends and the place of public accommodation begins has been a question which has precipitated the most bitterly fought legal battle in the New York commission's history, with the final outcome still in doubt.[16]

Discrimination in this sphere has its base in the fear that Negro customers will drive away business rather than in actual racial or religious antipathy. There can be little question that the lifting of economic inequalities by the steady widening of employment opportunity has induced weakening of racial barriers along the whole front. Coupled with this has been the increasing importance of the Negro vote, which is the object of special solicitude on the part of political leaders sensitive to the causes of racial resentment which might be reflected at the polls and to the steadily increasing number of Negroes who occupy important and responsible positions in departments and agencies of government—city, state, and federal.

[16] The Castle Hill Beach Club was declared by the commission to be a place of public accommodation. After public hearing a cease and desist order was issued. Upon judicial review the commission was sustained in the New York State Supreme Court. The case is now before the Appellate Division.

END PRODUCT . . . INTEGRATION

Although there has been no precise measurement of the change that has taken place, that there has been considerable change in the past ten years in the attitudes and practices of hotels, restaurants, and taverns in New York and in the other states with FEP laws is the consensus of opinion among Negroes and whites in a position to know. It is common now for the Negro college fraternities and sororities and some of the professional women's clubs to hold their parties amid the magnificence and luxury of the great hotels. This change cannot be attributed wholly to the FEP laws against discrimination. Their extended jurisdiction is of recent origin, but FEP legislation has a cumulative effect on discrimination in every area.

One-third of the states in the United States now have FEP laws designed to end discrimination in employment. It would seem that the fears, the apprehensions and anxieties, always present whenever proposals for such legislation are discussed, have begun to subside. The results achieved in eliminating and preventing discrimination without industrial shock, without acceleration of ra-

cial antipathy, in those states which have enacted this legislation have, undoubtedly, contributed to the creation of a favorable public opinion without which the adoption of these laws by other states would have been infinitely retarded. In this respect it would be difficult to measure the immense influence which has been wielded by privately supported educational and civic organizations.[17] Through study and research they have been able to meet conjecture with facts and they have been able to banish the racial myths and stereotypes which sustain discrimination. They have dramatized the shameful contradiction between the ideals of democracy and its practice. They have aroused their constituencies to the evils of racial segregation and religious intolerance.

But the struggle is not over when the legislation is enacted. The most important sector in the conflict is on the job—in the shop, in the laboratory, in the factory, in the office. White workers and Negro workers will finally write the story of discrimination in employment, its swift end or a prolonged and fruitless struggle. Organized labor is playing an increasingly important role in preparing the way for integration. Antidiscrimination committees are a commonplace in scores of local labor organizations, and extensive educational programs to indoctrinate the membership in the dangers of discrimination have been sponsored and conducted by not a few labor organizations. The rationalization that discriminatory policy is based on the attitude of the workers is being riddled. The merger of the two great wings of the American labor movement has in it the possibility and opportunity, if seized now, of wiping out this encumbrance to the attainment of real democracy in America.

[17] These would include such organizations as the National Urban League, the NAACP, the Catholic Interracial Council, the American Jewish Congress, the American Jewish Committee, the Anti-Defamation League of B'nai B'rith, and the American Friends Service Committee.

FEDERAL COMMITTEES ON GOVERNMENT CONTRACTS

After the dissolution of the federal FEPC in 1946, repeated efforts to revive it were to meet with failure, but the concept of federal intervention in the problems of discrimination in employment was not abandoned. Reentry of the federal government in the struggle against discrimination came in 1951 with the creation of the Committee on Government Contract Compliance by executive order of President Truman. In every government contract there is a clause which specifically forbids discrimination because of race, creed, color, or national origin. But observance of this phase of the contract had not been subject to the same scrutiny as other phases of the contract by the contracting agency of the federal government. The Committee was created to examine and study compliance procedures with a view to strengthening them and to bringing about more widespread compliance with the terms of the contract.

In 1953 this committee was abolished by the executive order of President Eisenhower which established the new President's Committee on Government Contracts. Chairman of the Committee is the Vice-President of the United States, and the prestige of this high office graces its deliberations and directives. In the light of the fearful predictions of disaster made in the Congress whenever a bill has been introduced to create a federal agency empowered to eliminate and prevent discrimination because of race and color, it is interesting to read the press reports of the October 25, 1955, Conference on Equal Job Opportunity which

was sponsored by the President's Committee on Government Contracts. At this conference, attended by fifty-five business and industrial leaders of America whose firms employ 15 per cent of all workers and produce 15 per cent of all goods:

> . . . confidence was expressed that the elimination and prevention of discrimination in employment against Negroes, South as well as North, East, and West, was a goal within reach. Success, so it was reported, has attended efforts to integrate Negroes in a number of industries "in the Deep South."

Major business leaders reported that "the fears that many concerns had in putting non-discriminatory policies in force, particularly in the South, have proved not to be justified." "It has not been necessary in any instance up to now," Vice-President Nixon is reported to have said, "for the government to exercise its power to cancel a contract with a firm for non-compliance with the anti-discrimination clause that is in every government contract." There was this modification, "We feel that we have made substantial progress and we still have a long way to go." [18]

[18] Earl Mazo in the New York *Herald Tribune*, October 26, 1955.

LEGISLATIVE POSSIBILITIES

There is reason to believe that Illinois, Ohio, and possibly Missouri will enact FEP legislation in the not too distant future. No expectancy for similar action on the part of southern states exists anywhere. The situation in race relations in the Deep South is one of tense equilibrium. The South is in transition from a dominant agricultural economy to an industrial economy, but the change has not been completed. Integration in the market is a necessary condition before such legislation, even if enacted, can hope for success.

The contemporary experience of the states which have enacted FEP legislation, the possibilities revealed by even limited federal action, demolish all the arguments that discrimination cannot be effectively dealt with by law. The experience of great industries in the South would indicate that economic pressures sometimes can achieve the same end. But this does not obviate the need for law. For it is unthinkable that in the light of present world conditions the elimination of this wasteful and indefensible practice should be left to the onset of national crises or the vagaries of chance.

Elmer A. Carter, New York City, was appointed a member of the New York State Commission Against Discrimination in 1945 and is now serving as Commissioner of that body. In 1935 he was appointed to the Unemployment Insurance Advisory Council and in 1938 he became a member of the Board of Appeals of Unemployment Insurance. He was formerly editor of Opportunity—Journal of Negro Life.

Integration in the Armed Services

By James C. Evans and David A. Lane, Jr.

THE feature article, "The U. S. Negro, 1953: A decade of progress . . . ," in the May 11, 1953, issue of *Time* asserted, "The biggest single blow against segregation in the U. S. has been struck by the armed forces." Similarly, the *New York Times* of February 14, 1954, called the Armed Forces racial integration "one of the biggest stories of the twentieth century. *Per se* it warrants no lesser description." Elsewhere the observation has been made that one of the most significant aspects of the achievements of our forces in the Korean conflict was the validation, in the field and under fire, of the racial integration program through which co-operation and cohesion were at last substituted for conflict and confusion.

As late as 1941 a War Department spokesman, addressing Negro newspaper representatives at a conference on the problem of racial segregation, held in the Munitions Building in Washington on December 8, stated the position that had governed policy since 1914 and that was to continue at least through 1944 and probably longer:

> The Army did not create the problem. . . . Military order, fiat or dicta will not change these viewpoints [in support of racial segregation]. The Army . . . cannot be made the means of engendering conflict among the mass of the people because of a stand with respect to Negroes which is not compatible with the position attained by the Negro in civilian life. This principle must necessarily govern the Army not only with [respect to] this subject of contention but with respect to [any] other dogma, be it religious, political or economic. The Army is not a sociological laboratory; to be effective it must be organized and trained according to principles which will insure success. . . .[1]

Nevertheless, the years between 1941 and 1953 saw a change in the racial policies and practices of the armed services that was so nearly a transformation that it evoked statements of genuine surprise and sometimes enthusiasm from those concerned with advances in human relations. Increasingly, as the press carried summaries of such advances, it gave priority to the continuing success of the integration program in the Army, Navy, Air Force, and Marine Corps. One recent summary said:

> Historians agreed that the three most momentous events of the Golden Decade [1945–55] were: (1) The Supreme Court decision banning segregation in the schools; (2) the abolition of segregation in the Armed Forces; and (3) the decisions invalidating subterfuges that kept Negroes from voting in the South.[2]

Earlier a United States Senator characterized Armed Forces integration as "the first truly effective step that has been made in implementing the Emancipation Proclamation."[3]

The military establishment, in effect, executed an "about face," discarded the markers so long and supposedly so firmly established, and set out in a new direction. In so doing, with the primary objective of improving military efficiency and strengthening national defense, it took cognizance of the pressures engendered by the nation's urge toward justice and equity for all citizens in uniform, by the world-wide deployment of our forces, and by the United States position of leadership in a world in which attitudes and practices with respect to race and color were becoming more and more significant.

[3] Senator Hubert H. Humphrey, Jacket of Lee Nichols, *Breakthrough on the Color Front*, New York: Random House, 1954.

It is the purpose of this account to trace the outlines of this development, pointing out both its accomplishments and its limitations, as a basis of analysis and possibly of application.

Historical backgrounds

There is clear evidence that Negroes served widely, without being segregated, in the nation's early fighting forces. They served in the French and Indian Wars, and when Washington took "command of the Continental Army, Negroes were already in the ranks of the revolutionary militias which constituted that Army."[4] It is difficult to determine the total number of Negroes in the Revolutionary Army, for many of the state rolls carry no designation of race. They served, however, principally in the ranks, along with other patriots, and the separate Negro company did not appear until near the end of the conflict.

Moreover, "the Revolutionary Navy had a larger proportion of Negroes than the Army. . . . Negro pilots, because of their intimate knowledge of coastal waters, were in demand. . . ."[5] Another record reads:

> In 1816 I was surgeon of the *Java* under Commodore [*sic*] Perry. The white and Negro seamen messed together. About one in six or eight were Negroes. . . . There seems to have been an entire absence of prejudice against the blacks as shipmates among the crew. . . .[6]

Despite the patriotic service of Negroes in all the wars from the founding of the Republic, the separate Negro unit, with all its inherent limitations, almost always with white officers, was destined to become the established pattern for decades. Moreover, the Negro citizen had to fight to maintain his right to a place in the fighting forces. Following the Civil War, the 24th and 25th Infantry and 9th and 10th Cavalry Regiments were maintained as Regular Army units pursuant to a statute of 1866 which provided that "the enlisted men of two regiments of Infantry [and] . . . the enlisted men of two regiments of Cavalry shall be colored men." The authorization of these four units, which later achieved distinguished records, served to prevent total exclusion of Negroes from the regular forces. The record of the separate units fittingly drew to a close with the 24th Infantry Regiment achieving, at Yechon, the first decisive American victory of the Korean conflict.

At the beginning of World War II Negro officers in the Regular Army numbered three line officers and three chaplains. There were possibly five hundred Negro Reserve and National Guard officers, but few were in the grade of major or higher.

Procedures for overcoming this shortage in the face of officer requirements for the expanding forces were, to some degree, a forerunner of the program of integration that was to follow a decade later. In World War I a separate officer candidate school for Negroes had been established. In World War II, however, both white and Negro personnel, upon qualifying, were trained in

[4] Army Service Forces Manual M-5, *Leadership and the Negro Soldier* (October 1944), p. 74.

[5] *Ibid.*, p. 79.

[6] Dennis D. Nelson, *The Integration of the Negro into the U. S. Navy* (New York: Farrar, Straus, and Young, 1951), p. 4.

the same officer candidate schools. In 1942 Judge William H. Hastie, then the Civilian Aide to the Secretary of War, wrote in THE ANNALS:

> . . . Negro officer candidates are attending classes and participating in field exercises with other outstanding young Americans of every race and religion from every part of the country. These soldiers have been and are a living demonstration that ability and leadership are not racial characteristics. It is to be remembered that many of their classmates have never had an opportunity to work with or even to observe Negroes equipped by training and experience to compete with them on a basis of equality.[7]

During World War II also there were limited efforts at various times to improve the internal co-ordination of Army effort by lessening the impact upon Negro troops of regulations and practices enforcing racial segregation. Among them was the issuance by the Army, in 1944, of Army Service Forces Manual M-5, *Leadership and the Negro Soldier,* designed "to provide the main substance for a course of ten periods of instruction in schools for officers." Although not presuming to anticipate change in the established pattern of segregation, this document was in many respects a forthright statement of advanced principles that foreshadowed change.

POSTWAR PRINCIPLES AND POLICIES

Following World War II a step of great significance was taken when the Gillem Board submitted, in November 1945, the report of its study, "The Utilization of Negro Manpower in the Postwar Army." Based on experiences of the war, this report led to the announcement in 1946 of a policy which assured the Negro citizen of a continuing place in the Army; established a numerical ratio based on that in the civilian population; abolished the "all-Negro" division; authorized the grouping of Negro units and white units of smaller size into composite organizations; and for the first time took the position that, in the event of another major war, all personnel assignments should be made without regard to race. Perhaps of even greater significance, this study, in the light of the subsequent necessity for large military forces deployed world-wide, led to a revealing and a re-evaluation of all policy positions concerning the utilization of Negro manpower during both peace and war.

Subsequent attention, increasingly affirmative, led to the establishment, by Executive Order 9981, dated July 26, 1948, of the Fahy committee, which was charged with the responsibility of examining all existing Armed Forces regulations and practices, with a view of putting into effect an announced national policy of "equality of treatment and opportunity for all persons in the armed services without regard to race, color, religion or national origin."

This committee inquired into the position, long held by military planning staffs, "that (1) Negroes do not have the education and skills to perform efficiently in the more technical military occupations, and (2) Negroes must be utilized, with few exceptions, in segregated units." It "believed the assumption that equality of treatment and opportunity would impair efficiency, was of doubtful validity" and after extended study and hearings it "found, in fact, that inequality had contributed to inefficiency." The committee was "convinced that a policy of equality of treatment and opportunity . . . [would] strengthen the nation."[8]

The report of this committee, made in 1950 and entitled *Freedom to Serve,* provided the philosophy and the working basis for the program of racial integration, with no restrictions as to racial quotas, that has advanced with significant success in the Army, Navy, Air Force, and Marine Corps.

[7] Vol. 223 (September 1942), p. 59.

IMPLEMENTING POLICY

There follow now brief accounts of action taken and results effected as the services have moved to implement policy directives on racial integration.

Integrated units

As an item of general impact, June 30, 1954, was eventually agreed upon as the time limit for the dissolution of all-Negro units in the Forces. The program proceeded even ahead of schedule, so that on that date answers to the often-asked question about the number of Negro units remaining had come to be a matter of definition. There are no longer any all-Negro units in any of the services proper, though some exceptions are found in civilian components, principally a number of school and college Reserve Officers' Training Corps units. Integrated activities include organization, assignment, training, billeting, mess, supervised recreation, and all other unit operations.

Removal of racial quotas

Contrary to some predictions, removal of racial quotas and other restrictions has not resulted in any disturbing imbalance of the ratio of Negro personnel to white personnel. In a positive direction, the abolition of racial quotas for service school selection and subsequent training and assignment has more than doubled the number of Negro officers and enlisted personnel attending such schools. Significant evidence is given, moreover, by the table indicating percentages of Negro personnel in the total personnel of the various services, in 1949 and 1954. The tabulation[9] is of more than usual value because the current position in the Department of Defense toward eliminating all racial statistics will make future compilation of such comparative data practically impossible.

PERCENTAGE OF NEGROES IN THE PERSONNEL OF THE ARMED FORCES, BY SERVICES, JULY 1, 1949, AND JULY 1, 1954

	July 1, 1949	July 1, 1954
Army Officers	1.8	2.97
Army Enlisted Men ...	12.4	13.7
Navy Officers	0.0	0.1
Navy Enlisted Men ...	4.7	3.6
Air Force Officers	0.6	1.1
Air Force Enlisted Men	5.1	8.6
Marine Corps Officers ..	0.0	0.1
Marine Corps Enlisted Men	2.1	6.5

Assignment according to merit

Racial integration in the Armed Forces has given Negro personnel the opportunity to demonstrate skill and ability without limitations imposed by race. Furthermore it has released all personnel from numerous useless limitations centering around race. While the program has perhaps been under way for too short a time to bring about complete equity, Negroes are in responsible and important staff and field assignments on a fully integrated basis. Moreover, no unusual difficulties such as had been anticipated in some quarters have arisen out of the assumption of the command function by Negro officers and noncommissioned officers. In the Air Force one Negro officer is on active duty in the grade of brigadier general. In both the Army and the Air Force the promotion of more Negroes to that grade in the not-too-distant

[9] *Integration in the Armed Services: Progress Report,* prepared by the office of James C. Evans, Civilian Assistant, Office of Assistant Secretary of Defense (Washington, D. C., January 1955), p. 4.

future is indicated. Advancement of qualified Negroes throughout the hierarchy increasingly becomes routine.

Navy recruit training

In the Navy the concentration of Negro personnel in the stewards branch has been traditional. A significant step toward change was taken when the Department of the Navy announced on March 1, 1954, that separate recruitment of stewards was being abolished. The effect of this change in policy was to give all seaman recruits an equal opportunity to qualify for service in any of the Navy's specialty groups at the end of recruit training. The racial concentration in the stewards branch was not immediately dissolved under the new program, but Negro recruits are now assured of the same opportunity as that of all other recruits to seek their branch of service on the basis of recruit orientation, testing, and training.

The Marine Corps

A tradition of 167 years was broken when the United States Marine Corps accepted Negroes in 1942. The total inclusion approached twenty thousand before the end of World War II. After baptism of fire on Saipan, the Commandant of the Marine Corps announced, "The Negro Marines are no longer on trial. They are Marines, period." [10]

Service records of individuals and of units facilitated another departure from tradition in implementing the integration policy. This, when promulgated, proceeded without incident on the same timetable as the other services.

Air Force technical training

The Air Force accumulated considerable experience in integration as a result of a policy decision made in connection with Air Force training contracts with schools in states with racial segregation laws. The policy statement read:

> The Air Force will let contracts for technical training in civilian schools in accordance with the effectiveness of the service that the school can render to the Air Force. When airmen are to be sent to schools in States having statutes requiring segregation, Negro airmen will be given the option of not going if they choose. In that event, the Negro airman will be sent to a school which can accept both white and Negro airmen.

Schools for dependents

Without any formal directive, in a number of states several schools for dependents, located on government property, had been operating for some time, without incident, on a racially integrated basis. As the question of integration in public schools received widespread attention, it was determined as a matter of policy that with the beginning of the 1953 fall term all such schools operated by the military on military posts and stations would be organized and conducted on an integrated basis. This policy was carried out on schedule.

Policy concerning schools located on military installations but operated by local educational agencies was announced on January 12, 1954, when the Secretary of Defense directed "that the operation of all school facilities located on military installations shall be conducted without segregation on the basis of race or color," regardless of other considerations. He stipulated that this policy would be put into effect "as soon as practicable, and under no circumstances later than September 1, 1955." It will be noted that the United States Supreme Court decision against segregation in public schools followed four months after the announcement of the Secretary of Defense. At the present time all such schools are fully integrated, except two where negotiations are in progress centering around long-term leases still in force.

[10] Jean Byers, "A Study of the Negro in Military Service" (unpublished; 1947), p. 253.

Defense contracts

In a directive issued June 11, 1954, the Secretary of Defense provided for a program to familiarize contracting officers, contract administrators, and other personnel concerned with procurement with "the spirit, intent, and requirements of the President's policy" of nondiscrimination with respect to government contracts. In implementing this directive the Army, Navy, and Air Force conduct educational programs to impress upon contractors their responsibilities with respect to nondiscrimination in employment.

Civilian employment

It is also the established policy of the Department of Defense that its own civil-service employees shall not be discriminated against because of race, sex, color, or religion. Fair practices officers implement this policy. Nevertheless, it must be said that the utilization of individual Negro employees, especially Negro women, at maximum potential often appears as only a distant objective. Continuous evaluation of impeding factors is being made, and some progress has been noted. However, much remains to be done before complete equity is achieved in testing, selection, orientation, training, assignment, guidance, and advancement of Negro employees. The situation is neither explained nor resolved by pointing out that conditions are not measurably better elsewhere, except in the uniform of the Armed Forces. Improvements apparently depend on educational efforts and the enforcement of the fair employment practices programs of the government, the department, and the services.

Civilian employee facilities

On the other side of the picture, the Secretary of the Navy on August 20, 1953, directed the complete elimination of all barriers to the free use of previously segregated facilities for civilian employees on government-owned shore stations of the Navy. Despite evidences of objection to this modification of customs of long standing in some sections, effective negotiations and follow-up brought about full implementation of the directive. Concurrently, similar measures were taken by the Army and Air Force, with a minimum of publicity and with no untoward incidents.

The Secretary to the Cabinet, in citing examples of accomplishments in the field of civil rights in a 1955 Columbus Day address, said:

> If you have been in the Naval yards at Norfolk, Virginia, or Charleston, South Carolina, you have seen the change that came about when segregation was abolished in connection with all facilities used by civilian employees. If you have been on any military base—in the Deep South or in Greenland—you have seen Negro and white working and relaxing together. . . .

Community relations

Community mores with respect to race vary from locality to locality in the United States and in different parts of the world. It is paradoxical that the Negro citizen in uniform has frequently been made to feel more at home overseas than in his or her home town. Such matters are largely beyond the direct purview of the Department of Defense. Even so, marked progress has been made in clarifying civilian-military relationships off duty and off post, and achievements to date in replacing controversy with co-operative effort reflect credit upon the services and upon the commands immediately concerned.

When it is suggested that this clear-

cut development in the military services has significance for the social sciences, reactions vary, ranging from studied doubt of the reality of the development to denial of its applicability to the social milieu outside the military. Nevertheless, without untoward incidents of consequence, the Armed Forces, as a concomitant of efforts to improve military efficiency through the elimination of racial segregation, have developed within their own communities, both in the United States and overseas, examples of racial integration in housing, transportation, religious worship, education, recreation, and other aspects of community life for service personnel, civilian employees, and their families that are now the rule rather than the exception.

SUMMARY

The widely publicized and generally accepted thesis that the Armed Forces have in fact effected racial integration in all their activities is supported by the evidence. The documentation of this development will expand as the records increasingly become available for study.[11]

The operation was thoroughly planned in accordance with procedure for operations of such size and was carried out by personnel at all echelons under clear and unequivocal directives. There have been no untoward incidents of consequence. The fighting forces have been strengthened rather than weakened.

Combat effectiveness is increased as individual capabilities rather than racial designations determine assignments and promotions. Economies in manpower and funds are achieved by the elimination of racially duplicated facilities and operations. Above all, our national security is improved by the more effective utilization of military personnel, regardless of race.[12]

A new standard of achievement in human relations has been raised. It cannot be doubted that the results have benefited the services and the nation at home and abroad.

More remains to be done. This account has pointed out some areas of needed improvement. The rate of progress has varied from service to service and, as in all other such developments, there are and will be instances of discrimination that must be dealt with as they arise. Progress in civilian personnel employment practices lags. Some major problems in ROTC, National Guard, and other civilian component operations not controlled solely by the federal establishment will become increasingly urgent under current laws and directives for strengthening the reserve forces. Increasingly the basis of measurement and judgment will be not the distance over which the movement and other similar movements have advanced, but the distance yet to be covered in the direction of equity. The principle of integration has been established, however, and is being successfully implemented.

A clear enunciation of the position which the Armed Forces have developed under the policies now established was made in a radio broadcast on February 17, 1954, when Dr. John A. Hannah, then Assistant Secretary of Defense for Manpower and Personnel, made the following statement:

> The obligations to defend our country and our beliefs are borne equally by all of our citizens without regard to race or color or religion. . . . It should be a real gratification to all thinking Americans to know that our Armed Forces are leading the way in demonstrating both at home and abroad that America provides opportunities for all of her people. . . . In spite of all predictions to the contrary, I have yet to find a field commander in any service who has anything but commendation for complete racial integration. . . . We are demonstrating in action as well as words that we really believe in social justice, economic justice, and political justice for all people of all races and colors. . . .

[11] Examples include the unpublished official volume by Major Ulysses G. Lee, "The Employment of Negro Troops in World War II," and "Project Clear," a comprehensive research report on Army integration.

[12] Semiannual Report of the Secretary of Defense, March 31, 1955.

James C. Evans, Washington, D. C., is civilian assistant, Office of the Assistant Secretary of Defense. Since 1943 he has served in the Pentagon on policy developments concerning racial minorities. With a background in electrical engineering, he earlier served as training specialist with the War Manpower Commission, on leave from the faculty of West Virginia State College.

David A. Lane, Jr., Lieutenant Colonel, Adjutant General's Corps (Retired Reserve) is a historian at Headquarters, United States Army, Europe. His assignments during and following World War II included supervision of Troop Information and Education programs in the Pacific and the editorship of Armed Forces Talk, the Department of Defense information pamphlet for Armed Forces personnel. He was formerly dean of West Virginia State College and later of the Louisville Municipal College.

Integration in Public and Private Housing

By Robert C. Weaver

RESIDENTIAL racial patterns assume new significance in light of recent decisions of the Supreme Court banning segregation in public schools. Long before this action, concentration of nonwhites in ghettos had nullified legal prohibitions above the Mason-Dixon line on racially separate schools. After the decisions, residential segregation became a principal proposal for "getting around" the Court's decrees in the South. In all regions of the nation, restriction of colored citizens to certain areas creates de facto separate neighborhoods and public facilities—including schools—thereby delaying participation and acceptance of nonwhites in the educational, political, economic, and social aspects of American life.

Integration in housing, as in other matters, is more than proximity and spatial patterns. It involves casual associations between peoples of different races and color. It is complete when people of minority and majority groups are treated as individuals with no conscious concern for their ethnic background. Had we achieved this state, there would be no occasion for the present issue of The Annals.

Publicly Assisted, Low-Rent Housing

The federal public housing program affords the most complete quantitative data on the movement toward desegregation in housing. From the beginning of the program, there was widespread minority group participation at the same time that the issue of residential segregation was seldom raised in the South and was avoided in the North.[1] By the end of World War II, northern housing authorities had made some progress toward adoption of nonsegregation policies.[2] More recently, the trend has continued at an accelerated rate, including border cities such as Baltimore, St. Louis, Washington, and Wilmington.

Figures presented in Table 1 indicate that local authorities (or states) may adopt open-occupancy policies and still not effect compliance. Where a public housing development is located in, or contiguous to, an existing, established area of nonwhite concentration, it almost invariably becomes an all-minority group project. This is occasioned by the pressure of nonwhites to get into the unit and the disinclination of whites to enter and remain in a predominantly colored community. In practice, it is difficult to maintain a racially mixed pattern of living once the proportion of nonwhite tenants exceeds 40 to 60 per cent. Also, it is more difficult to introduce white tenants into a previously all-Negro or predominantly Negro public housing project than to bring nonwhites into a previously all-white development. Either of these changes presents more problems than establishing integrated patterns of living at the outset.

By March 1955 there were nine states with open-occupancy policies governing

[1] Robert C. Weaver, *The Negro Ghetto* (New York: Harcourt, Brace and Co., 1948), pp. 75–76. Public housing prior to World War II served to strengthen residential segregation in the North.

[2] *Ibid.*, Chap. X; Charles Abrams, *Forbidden Neighbors* (New York: Harper & Brothers, 1955), Chap. XXII.

TABLE 1—Trend Toward Desegregation and Spatial Integration in Federal Public Housing Projects, 1952–55

Year	Number of States		Number of Localities				Occupied Projects in Localities Covered

public housing. An additional eighteen states had one or more localities with a similar policy.[3] As is illustrated in Table 2, the extent of spatial integration varied among the twenty-seven states involved. Progress toward nonsegregated patterns of living reflected the extent of nonwhite concentration in urban centers, the relative size of the Negro population, the extent of local ordinances and administrative rulings, the length of time legislation had been in force, the type of law-enforcement machinery and methods in effect, and the location of sites. In at least two southern cities, spatial integration occurred in response to the play of supply and demand.[4]

In all locations, spatial integration in public housing has brought interracial contacts. The fact that this has occurred in many communities and that it often reflects conscious efforts to change from segregated to racially mixed projects illustrates the possibilities of such actions. Also, of course, tens of thousands of white and nonwhite low-income families have discovered, some for the first time, that interracial patterns of living are practical.

Spatial Integration in Connecticut and New York

Some idea of the degree of spatial integration resulting from state and local antidiscrimination and antisegregation

[3] For a detailed analysis of state and local nondiscrimination laws and ordinances governing public housing, see "Non-Discrimination Clauses in Regard to Public Housing, Private Housing and Urban Redevelopment Undertakings" (mimeographed), Washington, D. C.: Housing and Home Finance Agency, 1955.

[4] The Housing Authority of Rayne, Louisiana, operates a seventy-six-unit project. Of the tenant households, thirteen are Negroes. This situation developed because there were chronic vacancies in the project designed for Negroes at the same time that the white project had a long waiting list.—*Open Occupancy in Housing Programs of the Public Housing Administration* (Washington, D. C.: Housing and Home Finance Agency, 1955), p. 21.

The Executive Director of the Housing Authority of Crystal City, Texas, stated in a like vein, "We had not thought of this as being anything unusual. We had . . . housing units for rent . . . and there were families who needed and wanted them . . . there have been no racial problems. . . ." As of March 1955 the thirty-two-unit project in the city had four Negro tenant families.—*Ibid.*, p. 57.

laws may be obtained by probing into racial occupancy patterns in Connecticut and New York—two states for which comprehensive data are available. The statute barring discrimination or segregation in public housing in Connecticut became effective in October 1949. By 1954, 61 per cent of the low-rent projects were spatially integrated; 27 per cent were segregated by building or section; 6 per cent were all-white and 6 per cent were all-Negro. "A shift in occupancy patterns [after passage of the legislation] is particularly noticeable among the low-rent projects. Integration [in occupancy patterns] exists in only four out of every ten projects opened prior to July 1949, whereas it exists in *all* of the projects opened in the more recent period." [5]

[5] *Racial Integration in Public Housing Projects in Connecticut* (Hartford: Connecticut Commission on Civil Rights, 1955), p. 15. The figures cited above do not include Bridgeport, the third largest center of Negro population in the state.—*Ibid.*, Table 5.

These results were obtained in a state which, at the close of 1953, had approximately 9,000 low-rent public housing units and a Negro population of about 60,000. All low-rent public housing in Connecticut was financed by the federal government. In contrast, the Negro population of New York State was about 1,000,000 by 1955. In June of that year there were in the state 146 completed low-rent public housing projects, containing 94,802 dwelling units; this housing was financed by the federal government, the state, and New York City. Sixty-eight of these completed developments were in New York City and 78 were in upstate New York. One third of all dwelling units in the program of the state were occupied by Negro families and another 8 per cent by Puerto Ricans.

New York City

Although New York City (as well as most cities in the state) started its program of public housing on a segregated basis, the local authority initiated integration in the late 1930's at the behest of the United States Housing Authority. Today, there are some Negroes in each of the low-rent projects operated by the local authority. The proportion of nonwhites (Negroes and Puerto Ricans) varies from 99.8 per cent to 9.5 per cent. Negroes are most highly concentrated in projects built on sites within established nonwhite ghettos; the next highest concentration is in sites contiguous to established ghettos; the lowest concentration is in projects furthest removed from established centers of nonwhite residence. However, the program has done more than anything else to introduce colored families into new sections of all five boroughs of the city. This is, from the point of view of accelerating spatial integration in shelter, a most important contribution, since it represents establishment of new, democratic patterns of living in scores of neighborhoods where few if any nonwhites resided before the advent of public housing in New York City.

Upstate New York

The situation outside New York City is more complicated. While in 1950 Negroes constituted 9.5 per cent of the population of the metropolis they were only 2.5 per cent of the people upstate. With the exception of Lackawanna, there was no participating upstate city outside of Westchester County in which 10 per cent or more of the population were Negroes. Actually, 95 per cent of the nonwhite households in the state were concentrated in the metropolitan area and Buffalo. In eight of the forty upstate communities having low-rent public housing programs, the nonwhite population was less than .25 per cent. It was less than 2 per cent in seven additional cities.

There are fifteen projects in upstate New York with no Negro occupants; most of them are in communities with few if any colored residents. More than half the upstate projects have fewer than 10 per cent of their units occupied by Negroes, while three have all-Negro occupancy. In Schenectady, low-rent public housing projects which were opened and operated on a segregated basis have been spatially integrated in recent years; this is one of a few local programs where whites were successfully introduced into an established all-Negro project. The first public housing project in Syracuse was planned and originally operated with a Negro wing of some sixty units. Today the number of colored households in the project has more than doubled, and the 20 per cent of the tenants who are Negro live in all

parts of the project. There are, however, in some upstate cities, local programs which have only token nonwhite participation in projects removed from centers of Negro concentration, while projects in Negro areas are still inhabited predominantly by colored families.[6]

Buffalo has a varied pattern, including an all-Negro development which was designed and operated as such from the beginning of the program in the city. On the other hand, all other projects in the authority's program have some Negroes; those removed from the center of nonwhite concentration have small proportions, ranging from 2.5 to 7.1 per cent. One project, situated in the downtown area, is becoming increasingly Negro occupied, although it still has a biracial pattern. At the outset, about 15 per cent of the occupants were Negroes; today over 50 per cent of the units are tenanted by Negroes. While whites have moved out into other areas, more and more vacancies have been taken up by nonwhites, many of whom have priority because of their displacement from slum areas which are being developed for low-rent public housing. This may be offset, however, by admission of Negroes into a new project now under construction on what was a vacant site removed from the center of Negro concentration. The situation is symptomatic of a pressing problem, indicating what is so apparent in New York and other cities, that racial patterns in a community's public housing operating under an open-occupancy policy depend, in large measure, upon the location of sites and the timing of the construction of different projects; the latter, in turn, determines whether or not eligible white and nonwhite applicants have the choice of moving into one or several developments.

[6] Recent legislation in New York State, in the form of the first Metcalf-Baker Law, has placed enforcement of the state's nondiscrimination legislation for public housing in the state Commission Against Discrimination. This should accelerate integration.

URBAN REDEVELOPMENT

A second major publicly assisted housing program is authorized under redevelopment and urban-renewal legislation. In this instance, construction is usually sponsored and financed by private enterprise, often with Federal Housing Administration insured mortgages. The land, however, is acquired (through condemnation, where necessary) by a public agency and resold at a markdown to the redeveloper. Nondiscrimination legislation applies to these programs in New York State, Connecticut, Minnesota, New Jersey, Pennsylvania, and Wisconsin, as well as in Los Angeles, San Francisco, Cincinnati, and Cleveland. Since this is a relatively new program, there is not yet a body of data reflecting racial occupancy patterns. Its initiation, however, is affecting adversely the stability of interracial low-rent housing projects.

About two-thirds of those displaced by redevelopment projects are nonwhites and, as relocation families, usually have a priority on vacancies in public housing projects. Their admittance often upsets the racial balance in projects, hastening a development's becoming all or predominantly Negro. At the same time, displacement of large numbers of nonwhite families incident to slum clearance and public improvements places additional pressures on all transitional neighborhoods. The resulting immediate need for shelter on the part of a large number of colored families offers great economic incentives for doubling up and improvised conversions. Where there are not effective ordinances and occupancy standards, inundation of areas is inevitable and, in its course, racially integrated neighborhoods are threatened.

PUBLICLY ASSISTED MIDDLE-INCOME HOUSING

Some states, such as New York, Connecticut, and Pennsylvania, have relatively small programs of middle-income housing. In the North, this, too, is legally open-occupancy housing. So far, however, the degree of nonwhite participation in middle-income housing has been much less than an analysis of the relative effective demand of nonwhites for this type of shelter would suggest. The one exception is in the no-cash subsidy program of the New York City Housing Authority; here, too, however, while nonwhites are in all such projects, they are, as one would expect, concentrated in the two developments located in or adjacent to Harlem, and the number and proportion of Negroes in other projects decline generally in proportion to the project's distance from existing Negro concentrations. Only one of the privately constructed, limited-dividend projects sponsored by the New York State Division of Housing and located in the New York metropolitan area has more than twenty nonwhite families; some have none. Present administration of the Division of Housing, however, is committed to de facto open occupancy in all future middle-income projects and in existing limited-dividend developments as vacancies occur.

It appears, therefore, that in the North and to a lesser degree in border cities publicly assisted housing is currently accelerating the trend toward spatially integrated living, owing mainly to the contribution which low-rent public housing programs are belatedly making in this direction. On a national front, urban renewal has, so far, been a negative force, serving generally to endanger unsegregated patterns in public housing or initiate new patterns of residential segregation in those communities where it is not prohibited to do so by law. However, where, as in New York City, there is a combination of adequate protective legislation, effective compliance machinery, and strong community consciousness on the issue, urban renewal will ultimately serve, as low-rent public housing has served, to disperse the nonwhite population in the city. Cleveland is starting to use its redevelopment program to break up an evolving Negro ghetto by bringing some of the suburbs back into the central city. As a first step, a redevelopment project on vacant land providing 1,200 units of new housing for both low and middle-income families of all racial groups is proposed.[7] These examples indicate that the program, despite its performance to date, could become a force for integrated patterns of living above the Mason-Dixon line.

PRIVATELY FINANCED HOUSING

For some time, whites have been moving out of the central city areas into restricted lily-white suburbs; simultaneously, nonwhites have entered more housing within the borders of the central cities. In the process of this population movement, nonwhites have entered new neighborhoods.

A detailed study of Negro housing in Chicago indicated that the postwar movement in that city is largely a ghetto extension. On the other hand, analysis of block statistics of the 1950 census in Detroit and Washington, while revealing a somewhat similar over-all pattern, indicated that subsequent to repudiation of judicial enforcement of racial housing covenants Negroes with high incomes have bought expensive property in areas where, both because of the remoteness of the neighborhood from centers of colored concentration and because of high selling prices of

[7] "Cleveland: City with a Deadline," *Architectural Forum,* Vol. 103, No. 2 (August 1955), pp. 135–36.

surrounding properties, the chances of total or appreciable nonwhite inundation seems remote at the present.

In Philadelphia, too, there are desirable areas of racially mixed housing which appear to be stable. One of these is a middle-class neighborhood of some thousand homes into which Negroes have recently moved without fuss. Only 80 houses changed hands in the past year; 52 of these were sold to white buyers, 26 to Negroes, and 1 to a Chinese American.[8]

Rent control, while it often delayed the entrance of nonwhites into new areas, has also sometimes served to introduce and stabilize interracial patterns of shelter, as in the following instance.

Upper Riverside Drive in New York City lies in the path of Negro expansion. Prior to rent control, few colored families had entered the area. Rent control, however, prevented eviction of existing white tenants at the same time that it limited the degree that rents could be increased for new occupants. This meant that whites, who normally might have moved out rapidly with the advent of the first colored occupants, remained in tenancy because comparable shelter was either nonexistent or priced out of their ability to pay. The incoming nonwhite tenants could be carefully chosen, and many were able to carry rental charges without resorting to overcrowding or doubling up; owners had little incentive to encourage overoccupancy, since rents were fixed in terms of former single-family use.

Thus, in many apartment houses on the Drive white and colored families of comparable economic and social status have been living together for several years. There are indications that if rent controls continue (as they probably will in Manhattan), these buildings may remain interracial for some time. The volume of middle-income construction completed, under-way, and planned in Harlem and elsewhere in Manhattan will relieve the pressure for medium-priced housing in the Negro market, thereby somewhat limiting the extent to which rents can be raised in existing dwellings in and adjacent to the area. Almost a decade of stable interracial living in upper Riverside Drive area has conditioned both white and Negro residents to such a pattern, so that some of the housing there may continue to be interracial even after rent control has been repealed.

FHA AND VA INSURED CONSTRUCTION

A final factor in this situation is the growth of nondiscrimination legislation covering credit and Federal Housing Administration and Veterans Administration insured construction. New Jersey has amended the state banking and building and loan association laws to include phrases requiring that mortgages be made without regard to race, creed, or color of the borrower. This should accelerate the purchase of houses by nonwhites outside existing ghettos. Even more significant is passage of the second Metcalf-Baker Law in New York, extending the definition of publicly assisted housing (prohibited to discriminate by the earlier Wicks-Austin Act of 1950) to include FHA- and VA-insured construction. The Connecticut Commission on Civil Rights has recently interpreted FHA- and VA-insured construction as publicly assisted housing, subject to the state's nondiscrimination and nonsegregation statute. New Jersey, too, is considering a bill similar to New York's second Metcalf-Baker Law. This legislation has passed the state Assembly and is now before the Senate.

Those concerned with racial problems in shelter will watch developments in New York State with interest, realizing that while compliance[9] will not, in itself, solve the housing problems of nonwhites, the impact of the law can be appreciable.

[8] "Report of Church Community Council of Pelham" (mimeographed), Philadelphia, Pa., 1955.

SIGNIFICANCE OF SPATIAL INTEGRATION IN SOUTH AND NORTH

Prior to the School Segregation Cases, residential segregation was less important in the South than in the North. But when the Supreme Court declared separate public schools unconstitutional, several southern leaders minimized the impact of the decision by observing that residential segregation would soften and often remove the possibility of change. Subsequently, the then President of the National Association of Home Builders, speaking in his native Texas, observed:

> The Supreme Court ruling concerning schools, in my opinion, will have a profound effect on housing at an early date. This is the most recent of a long series of rulings which have concerned the place of the minority groups in American life.
>
> . . . . . .
>
> I have felt for some time that the home building industry must tackle this problem head on and we must plan and provide adequate and good housing for minorities of this Nation in *proper areas with proper facilities* or get ready for Congress and the Courts to seek their solution by decree and statute. . . . If we meet the issue now, plan and provide the Negro with housing on comparable Financial Terms, *but in planned communities,* society will be much better off. I know we will be happier and I sincerely believe they will be happier.[10]

In a word, there are now strong institutional forces in the South dedicated to perpetuation and extension of separate areas of living for nonwhites. This will find its most effective expression in advocacy of more all-Negro, low-rent public housing, clearance of racially mixed substandard areas and their redevelopment into segregated neighborhoods under Title I projects, and promotion of new and much more attractive Negro neighborhoods.[11]

At the same time, the constant production of new housing in suburban areas in the South and the need for buyers and renters to absorb the older units, now somewhat obsolete, render the nonwhite purchaser especially attractive to those who operate in the housing market. Thus, as residential segregation is being developed in newly constructed housing, there is a concurrent movement of nonwhites into new neighborhoods. Here, again, the basic question is the stability of interracial patterns which emerge. It is clear that social, political, and prestige pressures are being exerted upon the whites to move out; economic forces are less clear. In the first place, values in transitional areas do not necessarily fall, as was formerly expected. Then, too, the crafty

[9] Owing to legislative technicalities, the second Metcalf-Baker Law does not have specific compliance machinery. Governor Harriman, however, has appointed a Compliance Committee, which is acquainting the industry with the provisions of the law, informing them of the dimensions of the problem, and urging their co-operation; it is also seeking the support and co-operation of FHA and VA.

[10] Speech of Richard Hughes before the Texas Mortgage Bankers' Association at San Antonio, Texas, May 21, 1954. Italics mine.

[11] The most dramatic development of this type is Pontchartrain Park Homes in New Orleans. It is "the fanciest minority subdivision in New Orleans (and perhaps the whole Nation)." In kicking off the mammoth sales promotion held in an auditorium-sized exhibit and sales room on New Orleans' Main Street, Mayor Morrison asserted: "The development will be super deluxe, with features that cannot be matched in the City." The subdivision is an excellently located tract of 210 acres. It encircles a 185-acre city park including an eighteen-hole golf course, swimming pool, and playgrounds. Pontchartrain Park adjoins a famed white development of high-priced homes. It will have 1,000 homes ranging in price from $9,725 to $30,000.—"Minority Housing," *House and Home,* Vol. 7, No. 4 (April 1955), pp. 146–47.

white seller may postpone closing a deal in the belief that he can do better if he does not put his house immediately on the market. In the present situation, however, this is at best a delaying influence.

In the North, interracial public housing projects throw white and colored families of similar economic background together under conditions of equality. In a number of instances, also, higher-income Negroes are moving into medium-priced homes, where they, too, become neighbors of whites with comparable social and economic backgrounds. Although many of the pressures which discourage formation of permanent patterns of unsegregated living in the South are found in the North also, their intensity is much less. Most significant, racial mixture in schools, although far from universally approved, is not emotionally charged, and the political powers of the Negro are constantly expanding the scope and efficacy of nondiscrimination legislation in housing.

Suburban housing

The key to the situation in the North, however, probably lies in the racial composition of newly constructed suburban housing. If there are effective legislative actions and if a few of the major producers of new housing establish successful open-occupancy developments, the unsegregated patterns now emerging in the older sections of northern cities will be supported. Of course, destruction of racial ghettos will not immediately result. The majority of nonwhites will continue to live in areas of high concentration, but new patterns will emerge elsewhere, and slowly the Negro and other colored groups may begin to disperse as have other ethnic city groups.

SPATIAL INTEGRATION AND RACIAL ATTITUDES IN PUBLIC HOUSING

Intergroup contacts, per se, need not, and do not always, lead to democratic interracial understanding. Under slavery, for example, there was contact and often affection. It was a fairly stable relationship in many places, but of course there was no equality. The translation of this attitude in post-Civil-War terms was found in the position of the southern conservatives who did not feel the need for total segregation, disfranchisement, and ostracism because they could maintain their position of superiority without these devices. Many among them must have realized that their program would assure the inferior status not only of Negroes but also of poor whites.

A basic question which concerns us, therefore, is the extent to which spatial integration in shelter has facilitated mutual acceptance across the color line. Where contacts have been under conditions of equality, they may be expected to have led to such acceptance and to generation of more favorable racial attitudes, and thus to be steps toward complete integration. Complete integration is used to describe a situation in which white and nonwhite families not only live in a spatially mixed community but also accept one another, associate without self-consciousness, and do not look forward to release from each other as neighbors. Social relations need not be close—just as persons in an all-white or an all-Negro community co-operate on mutual problems without necessarily accepting all, or perhaps any, of their neighbors as social intimates. Obviously, such integration in an apartment in Manhattan would manifest itself quite differently from integration in a suburban community or in a small town in New England or the Middle West.

There are a few recent, carefully designed studies of racial attitudes in spatially integrated public housing projects. Racial attitudes in completely mixed projects are compared with those where there was partial segregation or separate projects.

A basic, and anticipated, revelation of studies of racial attitudes in spatially integrated public housing units is that opportunities and likelihood of getting to know persons of a different race are greater. This is a matter not only of proximity but also of the acceptability in integrated units of interracial contacts, for different occupancy patterns are closely correlated with differences as to how one is expected to behave. It has been observed also that the influence of living together is strong enough to reverse relationships often encountered in research studies between prejudiced attitudes and such factors as religion or political attitudes. There were, of course, more contacts, and approval of contacts, between children than between adults.

An advance toward complete integration

Spatially integrated projects represent a "real, though limited advance in the direction of integrating Negroes into the total life of the community."[12] Actually, the greatest amount of interaction between white and colored tenants took place in homes of the participants. Neighborly actions, such as helping each other in times of sickness, were most frequent; next were things like having tea and coffee together or minding one another's children. Least frequent were activities extending outside the project, such as shopping or going to the movies together.

The contrast between internal and external contacts and influences found another expression. While both white and Negro parents in public housing developments in Connecticut felt that it was desirable for children of both races to play together, whites, in general, would prefer to live in all-white projects. Although, to date, the integration achieved in some Connecticut public housing projects has been primarily of a physical nature—especially in the case of adults—the present spatial arrangements offer a basis for developing feelings of real neighborliness. Potentialities in the situation have seldom been fully realized, owing largely to a lack of management-staff orientation, failure to encourage tenant organizations, and absence of effective programs for interracial understanding. Results to date, however, suggest that spatially integrated housing may become a real factor in achieving real integration. Since the studies of attitudes now available to us indicate that fear of losing social status is a basic deterrent to such results, it is necessary to look beyond the projects into the larger society which does so much to form attitudes and direct behavior in public housing developments and elsewhere.

REACTION TO NEGRO NEIGHBORS

The classic response to Negro migration into new residential areas has been white flight. This process, so frequent in its occurrence and so dramatic in its consequences, has often blinded the public to the fact that it has never been the universal pattern. Actually, even in cities where the Negro ghetto or ghettos are rapidly expanding, there have been and are middle-income neighborhoods in which whites and nonwhites live side by side. Where the colored population is small, similar areas have maintained stability and whites have not abandoned them.

Washington, D. C., offers an example

[12] *Racial Integration in Public Housing Projects in Connecticut* (cited note 5 *supra*), p. 64.

of the former situation. Because a number of Negroes in the nation's capital have for several generations enjoyed steady incomes, they have long sought and secured attractive homes, thereby anticipating a current national trend. The entrance of colored families into Brookland, a suburb of medium-priced homes in Washington, is a case in point. In this instance, white and nonwhite families of comparable incomes have lived side by side for some sixty years. With the rapid increase in the Negro population and recent significant improvement in economic status, nonwhite demand has exerted great pressure on Brookland—the most desirable suburb occupied by nonwhites prior to 1948. Consequently there was a threat of inundation. Whites in Brookland and adjacent areas, however, resisted the idea of leaving their established homes, and repudiation of restricted housing covenants served to open other desirable neighborhoods to colored purchasers. As a result of these developments, there has been an easement of the pressure of nonwhite demand in Brookland and its environs.

In Duluth, Minnesota, where there is a small Negro population, almost all nonwhites live in neighborhoods that are predominantly white. A recent survey of the Negro population in the city reported that an overwhelming majority of the colored residents did not feel they had been victims of racial discrimination.[13] Similar patterns of dispersion exist in many smaller cities in various sections of the nation.

Acceptance of a few Negro families in an area

In the last decade a new trend is appearing. It finds expression in the entrance of a few Negroes into desirable medium-cost neighborhoods, where they purchase or build homes. Their reception has varied, but there are signs that whites are no longer generally fleeing in fear of inundation or destruction of property values. In Minneapolis, for example, it was reported that when a single Negro family moves into an otherwise white neighborhood there is a tendency to accept or accommodate to him as a neighbor. As in public housing, where whites lived close to, and had contact with, nonwhite neighbors they were more favorable to them and to interracial contacts than those who lived further away, a tendency that was more pronounced in areas where Negroes had been living for at least ten years. Thus, it appears that in northern cities where there is a scattering of Negro families living in predominantly white areas, whites are increasingly accommodating to, and accepting, them as neighbors.

Similar reactions were reported in the San Francisco area. Some 550 white residents in 35 neighborhoods containing not less than one or more than five nonwhite families were interviewed. The neighborhoods were all above the slum level. One hundred and fifty of those questioned had moved into the area after at least one nonwhite family was resident therein. Eighty per cent stated that the presence of colored neighbors made no difference to them. The majority felt that the presence of nonwhites had made no change in property values; 12.5 per cent thought that property values had declined because of the presence of nonwhites, but 19 per cent felt these same values had increased. Most had no contacts or extremely casual contacts with their Negro neighbors; however, it is difficult to determine whether this reflects racial attitudes or the pattern of social relationships in a metropolitan center.

[13] Gus Turberville, "The Negro Population in Duluth, Minnesota, 1950," *Sociology and Social Research*, Vol. 36 (March–April, 1952), pp. 231–38.

> In general [the study records], the findings . . . appear to indicate that the large majority of white residents in the 35 neighborhoods studied have witnessed the coming of non-white neighbors with equanimity. This is not to say that the white residents have looked upon this development with favor, but they have accepted it and adjusted themselves to it with little outward show of disturbance. Indeed, to the large majority of respondents, whether or not a few members of racial minority groups take up residence in their neighborhoods appears not to be a subject of particular importance.[14]

These evidences of acceptance could be expanded, suggesting what *House and Home* characterized as evidence "that some city neighborhoods—at least in the North—are ready to accept immigrant Negroes without fuss."[15] In some places, there is more than accommodation and acceptance: the beginnings of real integration are revealed. One such instance is occurring in Westchester County, where seven Negro families live in a community of forty-five homes valued from $20,000 to $45,000. The nonwhites, like their neighbors, are business and professional people. Colored residents participate rather freely in community affairs, and the current president of the civic association is a Negro doctor.

Although there is no overwhelming body of evidence indicating a break in the color bar in housing, signs of change are appearing. When viewed in the light of general trends away from segregation, it is clear that housing has lagged and is lagging in the development of interracial patterns. At the same time, it has responded to new situations occasioned by successful litigation against racial restrictive covenants, appreciable improvement in the Negro's economic status, desegregation legislation in the North, and the general weakening of the color line. These forces cannot be denied, and already we are moving toward increasing acceptance of Americans as individuals. When we do so on the neighborhood level, substance will be given to antidiscrimination and antisegregation legislation and policies in other aspects of life.

Robert C. Weaver, Ph.D., New York City, recently appointed state rent administrator, Temporary State Housing Rent Commission, State of New York, was previously the state's deputy commissioner of housing. He has served as consultant to the Housing Division of the Public Works Administration, special assistant to the Administrator of the United States Housing Authority, executive director of the Chicago Mayor's Commission on Human Relations, visiting professor at Teachers College of Columbia University, visiting professor at the School of Education of New York University and director of Opportunity Fellowships of the John Hay Whitney Foundation. He is author of Negro Labor: A National Problem (1946) and The Negro Ghetto (1948).

Eliminating Educational Segregation in the Nation's Capital—1951-1955

By Irene Osborne and Richard K. Bennett

IN September 1951 the Community Relations Program of the American Friends Service Committee began a project designed to aid in the elimination of segregation in the city of Washington. Extensive practices of racial exclusion and discrimination were especially significant and disturbing in the city which symbolizes a democratic people and expresses the nation's will to a watchful world. When we began this Quaker program we had no clear idea of how we could help. We did have a conviction that to segregate is to do harm, that people would rather do better, that the means could be found to right a great wrong. This is the story of that Quaker project.

The four-year program did its work with two staff members during the first three years, with only one for the final year. We began with a job description which read only, "See what you can do about segregation in the nation's capital." Often uncertain and sometimes afraid, we knew that we must learn and that we would need the help of other people.

The decision to concentrate on problems of segregation in the fields of education and recreation was made early. We first took a look at the city to find where progress in desegregation was taking place and where it was lacking, and to determine the resources and needs of an already established structure of citizens' organizations. When we had completed our first, intensive look, we felt that we saw the need for additional organizational effort.

Basic to all other forms of segregation was the absolutely dual school system. It kept white and Negro children apart in the years that counted most. It left no areas for joint effort of white and Negro parents or white and Negro teachers. The school structure was widely cited as the reason for a similar pattern in other institutions. Although citizens had protested and opposed school segregation for years, repeated failure and an awareness of the great difficulty of doing the job hampered effective action and resulted in apathy. School and District officials took the view that the school laws required complete segregation. Real communication was not possible while the basic issue, that of the immorality and human wastefulness of segregation, was not even accessible for discussion.

Closely allied to the school system was the public recreation system. The Recreation Board in 1949 had adopted an official policy of gradual desegregation of its playgrounds. In the first three years, under the gradual policy, only 30 out of 140 areas had been opened for interracial use. On most of the interracial playgrounds, more effective programing was still needed.

The years 1951 to 1955 proved to be dramatic for the history of the city and for the story of desegregation. In these years, the city made changes in its racial practices so rapidly as to be startling to even the most optimistic. These changes grew out of complex social, economic, and political forces world wide in scope. The city's progress reflects

untold hours of labor by its citizens. The social action movement toward desegregation has at long last begun to reach its goal. Most of its heroes are unknown and unsung.

Washington As a Community

Washington's people number more than three-quarters of a million. The metropolitan area, including suburban areas in Virginia and Maryland, has a population of well over a million.

The District of Columbia is the home of the voteless citizen. It has no local self-government, no Congressman or Senator, no voice in the selection of the President. It is governed by a Board of Commissioners appointed by the President; Congress is its legislative body; its institutions depend upon the authority of numerous federal government departments and local independent boards. Hence, the lack of clear centers of authority and responsibility makes citizen action the more difficult.

Economically, the city is unlike any other. The federal government is its principal employer. It has no productive industry and, consequently, it is lacking both in business tycoons and in labor organization. An unusual portion of its citizens are white-collar workers: professionals and technicians, idea men, executives, secretaries, clerks. Another large group is in the service occupations. The number of skilled and semiskilled laborers is proportionately lower than is normally the case in other communities.

Race relations in Washington have an importance that is widely recognized. More than a third of the population are Negroes. The Negro community is complex and highly organized. It has a well-developed aristocracy and a large middle class as well as the impoverished. At one extreme, it has technicians and professionals in government, medical specialists and lawyers, teachers and administrators. At the other extreme are those who dwell in the Washington slums: service employees, unskilled laborers, and the marginally employed. In between are an unusually large number of Negro secretaries, clerks, messengers, postmen, policemen, cab drivers.

With homes spread over most areas of the city, Washington Negroes are less "ghettoized" than in most American communities. Their numbers have increased through continuous in-migration. White families, especially those with children, have been moving to the suburbs for many years. Negro families, restricted by discrimination in housing, have remained in the District with their children.

Toward First-Class Citizenship

In 1951, when AFSC began its program, the city was rigidly segregated. With few exceptions, restaurants and theaters and hotels excluded Negroes altogether. The dual pattern obtained in schools, churches, civic organizations, and in many professional societies, character-building agencies, and clubs and associations. Discriminatory practices, often outright segregation, occurred in hospitals and medical services, welfare agencies, and the District government. Discrimination in employment presented a major problem. Traditional restrictions in housing remained, even under the pressure of the needs of an expanding Negro population.

Even so, there were areas relatively free from segregation. The public transportation system carried passengers without segregated seating. In many government offices Negro and white employees worked side by side. All government cafeterias, serving thousands daily, were open to everyone. A few churches had interracial membership. All but one of the city's universities had open admission policies. Many organizations which were opposed to segrega-

tion on principle had open membership. Negro and white children, often neighbors, played together in the yards and on the streets.

Things were changing, though the change often seemed slow. The more sophisticated "art" movie theaters began to admit patrons without discrimination. Legitimate and concert stage opened to everyone after some years of many and varied pressures. The better hotels often served banquets or conventions on an interracial basis, and a few accepted individual Negro guests. Restaurants began to change policy one by one, and the "open" list was a growing one.

A major break in the segregation pattern came with the Thompson Restaurant decision in June of 1953. The Supreme Court declared still valid an 1873 law forbidding discrimination in eating places. The decision was known and understood by everyone in the city. The Commissioners announced that they would enforce the law. The Restaurant Association advised its members to comply. Literally overnight, restaurants opened their service to everyone.

During the next year, other changes followed. All movie houses opened their doors, after agreement among the three large chains. The Commissioners announced a policy of nondiscrimination for the District government, both in employment and service. The District of Columbia Medical Association admitted some Negro members. More hotels eased their restrictions. Negroes made gains in employment, especially at the professional level.

The school decision in 1954 provided the next major change. The Board of Education moved quickly to an agreement to undertake a desegregation program. The Board of Recreation promptly removed all racial designations from its playgrounds. The work of implementation began. A number of organizations followed the lead of the public schools: settlement houses, children's organizations, parent-teacher associations, and one university, the last to drop restrictions. First steps were taken to desegregate the Fire Department, a job long delayed by false starts.

The city has taken on a new look. For the individual Negro there is freedom of movement and greater opportunity. For the Negro community, there is a lowering of barriers, the beginning of merger with the whole. For the city and the nation it symbolizes, there is greater dignity.

There are still problems. The school desegregation program is not yet complete. Hotel policy is shifting and confused. The Metropolitan Police Boys' Club, a semipublic agency, remains segregated despite extensive and continued protest from citizens' groups. Much remains undone in medical service, social work, and religious institutions. Employment and housing are still riddled with discriminatory practices.

PUBLIC SCHOOLS: FROM A DUAL SYSTEM TO AN ACTIVE PROGRAM OF DESEGREGATION

The public school system is a large and complex one, enrolling more than a hundred thousand school children. Over half of its children and teachers are Negroes. In 1951, when we began work, the dual pattern was an absolute one, separating pupils at all levels from the kindergarten through the teachers' colleges. Teachers, principles, and administrators were racially appointed and assigned with equal strictness. Division I for white children and Division II for Negro children were operated as separate and distinct units.

School problems

School officials and the community struggled with serious school problems created by rising enrollments, an old and inadequate school plant, and a stringent operating budget. The dual system accentuated these problems and produced many unnecessary ones.

Increasing enrollments in Negro schools resulted in severe overcrowding. Enrollments in white schools declined, leaving empty seats and unused facilities. The rigid color line served as an absolute barrier to matching facilities and services with need.

The problem of teacher supply and assignment was especially troublesome. There was a shortage of salaries for teachers in the Negro division, so their schools were understaffed, even though there was no shortage of available Negro teachers. White secondary schools still retained excess teachers, who could not be assigned to meet the pressing needs in the Negro high schools. The white elementary schools faced a shortage of qualified applicants and regularly employed teachers who could not qualify for certification.

The Board of Education and the Superintendent were unwilling to discuss the basic issue of segregation. Mindful of the "separate but equal" doctrine, they were reluctant to admit inequities. Year by year, they made piecemeal adjustments, always too little and too late. Teachers' salaries for Negro schools were created from savings and borrowed from white schools in a hasty scramble that recurred every fall. Negro schools converted playrooms and auditoriums into classrooms, went on double shifts, and struggled with oversized classes, often in neighborhoods where there were half-filled white schools nearby. Schools were transferred from white to Negro use, creating neighborhood tension and public strife as Negro parents proclaimed their need and white parents protested loss of schools.

The consequences for the education of children were chronic and severe. There was less for the Negro child: less for him to work with, less service to meet his need, and, as a result, less recognition of him as a person. Operation of the entire system inevitably became uneconomical, inefficient, and inflexible, with consequent loss for all children and for the community.

The public scarcely realized how closely the problems related to segregation. White citizens, even those relatively free from prejudice, had too little knowledge and too little involvement with the real problems. Negro citizens suffered both from discouragement and from growing resentment.

Stirrings in 1952

The year 1952 vibrated with major stirrings over the school issue. Controversies about school transfers were so severe that the racial implications could no longer be concealed. Citizens' groups became more active in demonstrating to the public the meaning of segregation. The Board, in some confusion, ordered a study of the savings to be expected under integration, then fearfully reversed itself and called a halt to the study. The press gave increasing space to school news. Three new Board members were appointed, more liberal than those they replaced. It began to be said, "Of course, the schools will some day be integrated." While the day still belonged to a vague future, many began to believe, hopefully or fearfully, that it would come "in our time."

In December of 1952, the Supreme Court held its first hearing on the package of four state cases and ***Bolling v. Sharpe***, the District school case. The atmosphere in Washington changed noticeably: there was heightened public awareness and official interest on the part of the Board, which voted to seek the advice of the community on how desegregation should be best accomplished, "in the event the Court should so order."

Discussion and planning

The procedure for receiving citizens' views engaged public attention for several months. Individuals and organizations sent in writing their recommendations on how to make the transition and the "necessary educational preparation." The Superintendent reported to the Board on citizen comment. Then, the Board invited a group of leading citizens to speak to them on the subject. Those opposed to integration boycotted the entire proceeding throughout, calling it "premature." Consequently, the views that went on the record were largely those of sympathetic people who had given some thought to the subject. There was substantial agreement among those reporting that an integrated school system should be established by making pupil assignments on a geographic basis without regard to race and by providing for integration of teaching staffs.

The Board refused to engage in further public discussion of the subject, but school officers in closed meeting began giving regular attention to planning for desegregation. Public interest grew. Organizations increasingly presented meetings on desegregation and on the general theme of racial understanding. The more committed groups began studying the record of experience in desegregation in other areas of the country. Teachers and principals now believed that the day was, indeed, near; and many were considering what might be expected of them.

Naturally, there were viewers-with-alarm. It was said that white teachers would resign; that Washington teachers could not do an adequate job; that white parents would take their children out of a school; that Negroes did not want integration; that school officials would never do an honest job; that chaos would result. Still the thinking and planning went on.

In June of 1953, the Supreme Court announced its order for further argument and posed its five famous questions. The next school year, 1953–54, was a difficult one. Severe school problems continued, with the segregated solutions hopelessly inadequate. Facing an uncertain future, school people felt growing anxiety and unease. Still, much constructive interest of citizens continued. School officials proceeded with plans that remained unpublicized. An administrative and teacher committee undertook planning of intercultural education, resulting in a series of workshops in human relations for principals and administrators.

Washington declares for prompt desegregation

When the decision came on May 17, 1954, the stage was set for action. After a confused twenty-four hours, officials decided to proceed with desegregation at once. On May 25, the Board of Education adopted a forthright statement of policy, affirming its intention to operate an integrated school system on a nondiscriminatory basis. Throughout the summer, Board and community debated the plan the Superintendent announced for making the transition. The plan was criticized, altered, criticized, and altered again. A new zoning map was drawn setting boundary lines on a desegregated basis.

School opened in September 1954 with 122 schools having mixed student bodies, affecting about two-thirds of the city's school children. Thirty-eight faculties were integrated. Children had been transferred from overcrowded Negro schools into white schools. Some inconvenient school assignments had been corrected. Newly enrolling children were assigned according to the new map. Some thousands of children were granted optional transfers.

Beginning in 1955, all who wish may attend school on the basis of the desegregated boundary lines. Those first entering are required to do so. By 1960, attendance within new zones will be fully enforced for all pupils.

Opposition to desegregation was expressed in a court suit which failed, in a three-day student demonstration that remained peaceful and unsuccessful, and in considerable public talk. The community accepted the fact of desegregation, settled down to the reality, and did a creditable job of working in the new situation. Teachers did not resign, but stayed at work and did well.

There are criticisms of the plan: the option feature (allowing children to stay where enrolled until graduation) acts as a brake on the desegregation process; desegregation is largely a one-way process, with most transfers from Negro schools into white schools; little has been accomplished and little tried by way of integrating Negro schools. The first-year steps were partial, still discriminating against many and using several sets of rules as to where children should enroll. Still, much de facto integration was accomplished, demonstrating how much can be done in a short time.

On the job and learning

The first year was a year of learning. The emphasis shifted from the policy makers to the practitioner on the job. Both Negro and white teachers learned, largely by knowing each other and by overcoming their own anxieties about race. Children adjusted to changes in their school assignment and to new faces in the classroom. Parents began to work together in integrated PTA's. The administrative staff was reorganized, so that both white and Negro officers served teachers and children of both races. With the hurdle of desegregation over, the way was open for integration to begin.

AFSC PROGRAM IN OPERATION

We heard many citizens complain that school controversies were so involved they could not understand the issues. To meet this need, we published a regular newsletter on local school problems. We reported desegregation news from around the country and made regular reports on the legal status of the school cases. Later, the newsletter was most useful in reporting to the public the administrative plans for desegregating the schools, outlining the first steps taken, and following the course of the first year's desegregation program.

Assembling facts

We learned quickly that we could not talk with officials or, indeed, with the public about local problems unless we were well informed. We found that the public had a genuine hunger for further knowledge. So we undertook the job of assembling major facts about local schools and the recreation system. We spent many hours analyzing material, figuring pupil-teacher ratios, and setting up tables. We were particularly alert to the kinds of facts which demonstrated the inequality of a segregated system and the impossibility of solving problems through any means other than integration. Finding wide interest, we kept a file of current data, such as enrollments, conditions of school buildings, class sizes, and pupil-teacher ratio. Throughout the program we had many calls for such material. Some groups needed it for their own study; some as a basis for testimony in hearings on school or recreation budgets; and some for support of statements they were making to the Boards.

Requests for advice

As local interest developed, our office received an increasing number of requests for assistance to groups. Most

frequent requests were for advice on program or leads to speakers. At times organizational leaders sought guidance in difficult situations where the membership was resistant and fearful of conflict within the group. We were sometimes asked to help in starting something new. In response to such requests, staff members gave information, advised on programs, found speakers, offered counsel, and acted as trouble shooters.

Issue of teacher integration

As the school integration question developed, the issue of teachers came more and more under discussion. We felt we needed evidence on experience with teacher integration. In 1952, we wrote to the superintendents of a number of integrated school systems throughout the country. We inquired whether they had any integrated teaching staffs and, if so, how this policy worked out in practice. We were able, through this procedure, to locate fifty-five cities in which integrated teaching staffs were used. Comments made by the superintendents gave eloquent documentation of the success of teacher integration and acceptance by the public. This material was most helpful at the time Washingtonians and officials were giving serious attention to the hows of integration.

THE SEMINAR TECHNIQUE

For many years AFSC has used the seminar as a method of education. It is a method which relies on group-shared experience. It is flexible, suitable for use on any human problem. In the Washington program, we adapted it for use in helping teachers consider their role in an integrated school system.

Teachers preparing for integration

We offered the first seminar, entitled "Classroom Problems of an Integrated School System," in February of 1953. We had planned for a group of about thirty, but found that we had over a hundred applications. To meet the demand, we arranged an additional seminar in March and another in May. For the school year 1953–54, we planned four seminars in a series called "Let's Talk It Over."

Each seminar began after school on Friday and continued through dinner and the evening. The group reconvened on Saturday for an all-day session ending at teatime. The meetings were held at Davis House, an AFSC guest house. The setting was informal and friendly, allowing time for leisurely meals and impromptu conversation.

Major emphasis was placed on discussion by the total group. A permissive atmosphere encouraged teachers to speak frankly and think honestly. We chose as chairman a group leader experienced in working with teachers. Other consultants included teachers in integrated situations, those with experience with the transition process, and specialists in intergroup education and human relations. At times the group used films, role-playing, rumor clinics, small group buzz sessions, and pamphlet and display material.

Attention centered on the questions most on the minds of the participants: What are the special problems that occur when schools are changed from a segregated to an integrated basis? What are the teacher's special responsibilities in the transition period? How can we involve the community in planning and carrying out the school program? What are the insecurities that teachers feel as professional people? How can we build security in people so that they can meet changing conditions? What classroom methods can the teacher use to be of help to the children? How can we affect favorably the intergroup attitudes of children?

Seminar information was distributed to all schools with the co-operation of the school administration. Teachers attended on their own initiative. Although principals and administrators were encouraged to attend, we took care to ensure that each group contained a majority of classroom teachers. Each group was interracial.

Participants differed widely in background with respect to questions of race relations. Meeting together were crusaders in the cause of integration and the reluctant, the fearful, the antagonistic. Convinced that school integration would come, teachers were aware of the problem and a need for help. Consequently, there was no danger of simply "talking to the already convinced." Here the line between education and social action disappeared; the seminar was both. These seminars demonstrated a number of positive outcomes which can be achieved through short-term discussion.

Board members

A similar seminar was offered in March of 1954 for members of the Boards of Education and Recreation and those of private agencies serving children and young people. Agencies were aware of growing responsibility in the area of race relations. The Boards of Education and Recreation were anticipating a Supreme Court decision which would affect their operation. Most private agencies were still segregated, and their boards had begun to consider the need for a change in policy. Seminar invitations were issued to individual board members in co-operation with United Community Services. Thirty-eight persons attended, representing a variety of services. The group discussed the relation of the agency to its neighborhood and community, the role of the board in setting policy, and the needs of staff in building interracial programs.

High school leadership group

After the Supreme Court decision, a group of high school students eagerly expressed interest in finding some opportunity for white and Negro students to talk together about forthcoming integration. To meet this need, AFSC and the Anti-Defamation League worked together in offering a seminar, held in June of 1954. Students attended from high schools to be integrated in September, from other public schools throughout the city, and from some private schools. A senior from Sidwell Friends School acted as chairman. Students talked about their own attitudes and those of others. They discussed means of ensuring a place for everyone in school activities. They aired racial stereotypes and checked recurring rumors, moving toward a more realistic perspective. They expressed much idealism, much willingness to be natural themselves. They were a leadership group and shared awareness of the responsibilities of leadership.

ACHIEVING DESEGREGATION

As citizen groups undertook study of how the transition to integration can best be made, they expressed a need to learn more about experience in other parts of the country. To meet this need, AFSC staff looked into the published material about desegregation, made some visits to newly integrated schools, and talked with those who had made an intensive study. We were then able to offer some materials, suggest leads for further study, and report some conclusions based on experience. Requests for such material and advice came from Washingtonians and from people throughout the South.

When Washington citizens were writing their views to the Board of Education, we worked closely with the Joint Committee on Education in giving help.

With the Joint Committee, we prepared an outline of suggested topics and major principles to be governing in an integrated system. We gave help to many groups in writing their statements.

A pamphlet, *Working Together: Integration of Washington Schools,* was published on the eve of the Supreme Court decision in 1954. It reported the Service Committee's recommendations for integration of Washington's schools, based upon the observation and study of staff members. In public discussions of coming integration, certain questions were asked again and again. Some were expressions of stereotyped thinking. Some reflected an honest desire for information. Still others were mainly expressions of anxiety and concern about the success of an integration program. The pamphlet attempted to answer twenty-four of those questions most often asked.

We began early to talk with Board members about the most effective means of desegregation. We stressed the need for a clear statement of policy and for prompt and decisive action. We advised pupil assignment without regard to race and urged that teacher integration be undertaken along with pupil integration, following the principle of employment on merit.

When the Supreme Court made its 1954 decision, we joined with other community groups in asking for immediate adoption of a desegregation program. As plans were announced throughout the summer, we made critical appraisals, commending the Board for its prompt policy statement and stating our objection to delays and compromises in the administrative program.

Watching the Desegregation Program in Action

As Washington schools entered their first year of integration, requests came from every side for information about the school program. Citizen groups wanted to know how it was working and what the problems were. Parents wanted explanation of the plan and their children's rights under it. People in southern areas wondered what they could learn from the Washington experience. Reporters and magazine writers asked for information and leads to stories.

Keeping up with events

The staff undertook to keep up with events. We talked with teachers and principals, visited schools, studied school statistics. Finding a bewildering variety of experience in different schools, we looked for major conclusions to be distilled from the total experience.

When the student demonstration occurred in October 1954, we joined other community groups in emergency action. The groups met daily while pupils were remaining out, sent observers to the affected schools, and talked with District officials and the press about the best handling of the situation. When the demonstration ended, we commended District and school officials for holding firmly to principle and joined them in discussion of the implications of the incident. All agreed that student actions were to be taken more as adventures than as displays of hostility. Demonstrations were not major disturbances of the peace nor deterrents to the desegregation program.

Throughout the year, there was need for appraisal of new steps taken, conferences on snags, re-evaluations of policy and practice. The school administrative staff was reorganized to provide for integrated operation; there was public controversy about some of the new assignments and criticism because some steps were not completed when the year ended. PTA's and civic groups called upon AFSC for evaluative comments and public reports. There were countless rumors about school operation, rumors that needed careful checking to separate fact from fancy.

New questions

A new set of questions was being raised now when citizen groups discussed desegregation: "Is integration lowering school standards?" We found no such danger. Schools were developing improved programs to meet varied needs. "Is integration creating problems?" Integration has solved the most severe school problems: through better use of its facilities, the school system can now do a better job of meeting problems as they arise. "Are white families moving out of the District because of integration?" Movement to the suburbs has been going on for many years; this year's changes occurred in areas of the city where the white population was already rapidly decreasing and merely continued a long-time trend.

The Right of Every Child

AFSC reported on Washington school desegregation in a pamphlet, *The Right of Every Child,* published in 1955. The pamphlet described the Washington plan and the steps taken during the first year. Attention is given to the experience of children and teachers within the integrated schools. The report made a critical evaluation of the policy and its implementation.

Deaf Children

AFSC took an interest in arrangements for the education of deaf children, who are trained at District expense at the Columbia Institution for the Deaf. Prior to 1952, only white children were placed in the Columbia Institution; Negro children were sent to a segregated Maryland school and an integrated school for the blind in Pennsylvania. A United States District Court ruling of 1952 resulted in arrangements for Negro children also to attend the Columbia Institution. At first, they were in segregated classes. After the 1954 school decision, complete integration was effected, both in classes and in living quarters. We worked with several community groups, led by the American Veterans Committee, in expressing criticism of earlier discriminatory practices, conferring with officials, and visiting the school.

Teachers' College

Under segregation Wilson Teachers' College for white students and Miner Teachers' College for Negro students were operated as parts of the city school system. Many citizens favored integration of the colleges even before they were willing to support integration of all schools. In 1952, we joined with a group of twelve organizations in presenting a plan for the merger of the two institutions. In reporting to the public, we continued to note the inefficiency and educational loss involved in maintaining two colleges.

During the first year of the desegregation program, the colleges continued to operate as separate institutions, with each having a nondiscriminatory admission policy. Community groups urged that plans be made for merger. The administration announced that, for 1955–56, the colleges would function as a single institution, but would continue to use two sites. We criticized these plans, believing that integration would not be effected until the merged institution was placed in a single plant.

Information and Counsel

As national interest in the City's progress mounted, our staff several times prepared detailed reports or contributed articles on some phase of the Washington scene. Since school desegregation has become imminent in the South, AFSC has received many requests for

assistance—reports on the Washington story, counsel on the best means of desegregating, and help to citizen groups eager to make a contribution. During the last year of the program, a major portion of time was spent in answering such requests.

THE CITY HAS TAKEN OVER

When AFSC came to the end of its four years' work, it did so with the feeling that the community has now taken responsibility for the problems of segregation. We saw a city rise to a new sense of vitality, a new respect for its people, a new recognition of mutual obligation on the part of its citizens. Once those who worked for integration were few in number and, seemingly, weak in power; now the city's officials and many specialized services and efforts are devoted to the job of completing the task.

Irene Osborne, Philadelphia, Pennsylvania, consultant on school integration, American Friends Service Committee, was one of two people who supervised the Washington community relations project reported above. She has recently visited the twelve southern states under the auspices of the Southern Regional Council. Prior to her connection with AFSC she taught sociology for five years at Albany State Teachers College and other institutions.

Richard K. Bennett, Philadelphia, has been with the American Friends Service Committee since 1946, currently as secretary of the Community Relations Program and earlier as assistant secretary of Foreign Service and of the Peace Section. During World War II he was a conscientious objector, serving as a guinea pig in antimalarial experiments. In 1949 he worked for three months as a special assistant in the United Nations Department of Social Affairs, on preparation of a plan for the Office of the High Commissioner for Refugees to replace the International Refugee Organization.

Integration in Professional Education: The Story of Perkins, Southern Methodist University

By MERRIMON CUNINGGIM

IN November 1950, the Board of Trustees of Southern Methodist University took action to permit one branch of the University, Perkins School of Theology, to admit Negroes as regular students. Several features of this action were symptomatic of later developments.

The men responsible were not fuzzy idealists or emancipated sophisticates. They were, for the most part, southerners who still clung to some of their regional reflexes, but they were all churchmen, clergy and laity, who felt, in varying degrees, the judgment of the Christian ethic upon them. One influential member of the Board is reported to have said in the discussion, "I don't like this proposal. It goes against what I've always believed. But I can tell which way the wind is blowing, and I'm going to vote for it." This first step was indicative of the continuing ability of the Board to detect which way the wind was blowing before the wind had become a gale. SMU has moved steadily on: the Law School was opened to Negroes last year, and the Graduate School this year. The University has not succumbed to the temptation, sizable in its region, to hold back for the sake of short-range, though supposedly large, financial advantage over tax-supported institutions whose desegregation is now dictated by the Supreme Court decision.

The method was gradual. One school at a time was to be the formula, and the School of Theology was to be first. This may be, as southerners contend, the only method that will work, but inherent in it is the danger that progress will be slower than necessary, or even cut off altogether. As will be described below, the University did not escape this danger. Gradualism is no guarantee against die-hardism.

Finally, the Board's action was not announced. The University indulged in no public breast-beating of virtue. To this moment no general description of what happened at SMU has been made available. Though such a policy can have the mark of expediency about it, its real justification lies rather in the freedom it allows for getting ahead with the job. If the job is got ahead with, and if, as was true, no effort is made to hide or deny the developments taking place, then a policy of no publicity can give important protection to a program of desegregation in its early stages.

FIVE NEGROES ENROLLED

So the way was open. A couple of rapid admissions were made in January 1951, two local Negro ministers who wished to seize the opportunity for taking special courses. But both failed to make the grade academically. Thus no Negroes were enrolled at Perkins in the school year 1951–52, and it was clear that special effort would have to be made if fully qualified men were to be secured. Five able men were admitted in September 1952. They were from Arkansas, North Carolina, Oklahoma, Tennessee, and Texas, and represented three different denominations. Because they were the key figures in SMU's experiment, their names deserve

to be recorded: John W. Elliott, James A. Hawkins, James V. Lyles, Negail R. Riley, and Cecil Williams.

These five stayed all three years of the regular course leading to the bachelor of divinity degree. Though they had made uniformly good records in their undergraduate study, the Negro colleges from which they came were not strong enough to guarantee them safe curricular passage through their professional training. Accordingly, all five had moments of academic difficulty, though not for lack of native intelligence. But they completed their work, improving as they went along, and one of them came close to achieving honors. At commencement in the spring of 1955 they received the first degrees that SMU had ever awarded to Negroes.

But the most remarkable aspect of their career at Perkins was the contribution which their presence made to the life of the School. They were fitted to take part in the experiment by virtue of their poise, common sense, and manly sensitivity to the issues which were raised. Other Negroes have followed and will continue to follow in their steps, but it is they who deserve the credit for showing what was possible. As one of them once said, "I know how Jackie Robinson must have felt."

What did their presence mean for the School? What conclusions have been drawn by those who had firsthand contact with those five and their successors? With over three years' experience the time is now ripe for at least tentative summation. Seven items will be mentioned. Probably most of them will simply confirm what is already believed, but one or two of them may surprise northerners who do not know the South, or even southerners who think they do.

Unreadiness of Whites for Integration

The first conclusion is trite: the unreadiness of most whites for integration. But reference is made not merely to the foes of the process, for the Perkins experience showed that some who want, as well as all who oppose, desegregation may unwittingly stand in the way of integration.

For instance, there was the girl who sat at table one evening with one of the Negro students, and in a burst of enthusiasm went to her room and wrote, "Dear Mamma, The most wonderful thing happened to me tonight. . . ." But Mamma did not think it was wonderful, nor did the rest of the mammas in the southern county-seat town from which she came. That problem was successfully if painfully resolved, but all along more moments of stress have been caused by students who favored the process than by opponents; actually, there were almost none of the latter in the University student body.

The faculty, too, were not ready, however friendly. Their first tendency was to deal too generously with the Negroes, a natural response in light of the academic difficulties which the Negroes experienced. The faculty sought to overcome this beneficent discrimination, and when they did, occasionally they swung too far. One day one of the Negroes said, "Professor So-and-So is certainly taking it out on me." But when the reply came, "I'm sorry," the student responded, "No, I'm glad." It was truly a step along the way of progress. The professor was sympathetic, and the student knew it. But further steps remained to be taken, for color was still an issue. Integration means lack of color sense, and it would be foolish to pretend that even the friends of desegregation are yet ready for it.

Unreadiness of Most Negroes

The second proposition is complementary to the first: the unreadiness of most Negroes for integration. Lack of proper academic preparation for rigorous graduate study, so often noted, is only the beginning of the matter, though a necessary recognition. The feeling at Perkins was that if a conscientious search was made during 1951–52 for a capable entering group, the problem would be cared for from then on. Some members of the staff even imagined that "too many" might apply, and that a question of quota might arise. But the hope or fear, as the case happened to be, failed to materialize; and Perkins has discovered that it must make careful search every year.

But what might be called "social unreadiness" is even greater than the academic. Because of good luck in the character and behavior of the first five Negro students, the Perkins evidence for this proposition came not so much from the students themselves as, occasionally, from the Negro community of Dallas—the newspapers, the churches, the local office of the National Association for the Advancement of Colored People. No criticism is intended, for what else does one have a right to expect? As President Benjamin Mays of Morehouse College has pointed out, Negroes cannot get ready for integration in a segregated society. While desegregation proceeds, it is well to be reminded that Negroes as well as whites are often socially immature, and unprepared for the new day.

Method of Cautious Advance

Then how shall one proceed? The Perkins experience led to the conclusion that cautious advance is the only feasible method. Neither word must be emphasized at the expense of the other. Caution without advance is as bad, as disastrous, as advance without caution. The two together give promise of success.

Does such a method necessitate the sacrifice of principle? In answer, clarity as to the nature of the principle is called for. The principle is not merely legal equality, for the goal is not merely desegregation. The goal is integration, and thus the principle must be a sense of real relatedness, or to put it in religious terms, brotherliness. The method, then, must be such as to give some hope of achieving both legal equality and relatedness. Uncautious advance might achieve equality, though even that is debatable; but the way of slashing attack can never bring brotherly sentiments to pass. This is the conviction at Perkins.

The adoption of such a method means that one must play the tune by ear. What an unparalleled opportunity for rationalization! And rationalization undoubtedly was present now and again. Why were the Negro students advised not to take part in the picketing of a local movie which an NAACP official sought to persuade them to join? Because such activity might have resulted in bad publicity for the School. If this seems an instance of too much caution, some other incident could easily give just the opposite impression, to the local constituency if not to the readers of this account. But the point is not that over- and under-caution may both have been exercised at times; it is, rather, that such a method allows large opportunity for the play of extraneous considerations and for self-justification. Only a saint could practice such a method with complete success, and no saint would try it. At the least, therefore, the danger of rationalization should be recognized in the hope that recognition will reduce the danger.

The method is difficult to practice as well as dangerous to adopt. It requires minute preparation for each new activity, the ceaseless effort to think through all possible developments and repercussions. When the five students first set foot on the University campus, every step they took represented the covering of new ground.

For example, should they attend SMU's home football games, all of

which are played in the city's Cotton Bowl? The Cotton Bowl officials said that if they were asked, they could not give permission, for the Jim Crow law was still on the books. But what if they were not asked, and if the Negroes were sent to the student section as a matter of course? Oh, they wouldn't raise the issue, for they didn't want any trouble. This was as much clearance as could have been expected; and so, after a most careful briefing of those who might have contact with them, the Negro students went to the first home game of the 1952 season, and have been going ever since.

But what about their participation in, say, intramural athletics? They are regular students, aren't they? When a white student's desire to have the Negroes participate led to its discussion by the University Faculty Council, the Council tabled the question, for though none of those gentlemen had any objection, perhaps since the question had been raised the decision had better be postponed until any possible objection from others had been heard. But why make a question out of it? Why not treat it "naturally" and let them play? They played; and the question as to whether they should play is still on the table.

Maybe it was just as well that they did not play touch football that first year. No telling what will happen in body contact sports, they say. But the baseball season came along, and surely baseball is all right. But one of the Negroes wants to be a catcher; suppose he blocks the plate against some student from, say, the Law School. Oh, take the risk; you can't control everything. As a matter of fact, he was a good catcher and he did block the plate; and nothing happened, except of course a clean, honest, nonsegregated "rhubarb."

And so it went, at least for the first year. Cautious advance, the Perkins community learned, was not easy on the nerves, but it worked, as probably no other system would have done. The second time was always easier than the first. Before long most of the precedents had been set; and the five Negroes spent their careers at Perkins, studying, playing, worshiping, eating, singing, and living together with all the rest, as full members of the academic community. Interviewed at his graduation by the Dallas Negro newspaper, the *Star Post*, Cecil Williams said that the five had hoped to "be received as regular enrolled students, thereby receiving all privileges." Then the paper reported: "He further states that during his three year stay on the campus he has received all that he had dared hope for and even more." [1]

NEGRO PARTICIPATION IN DECISIONS

The heart of the method is still to be mentioned. The Perkins experiment began with the assumption that the Negroes themselves must be full partners in the making of decisions affecting their activities, and the course of the experiment has proved the soundness of that assumption. Though their life inescapably had a special quality, and called for peculiar awareness by them and by School officials, no rules were laid down that applied to them alone. When they first arrived they were assured that no arbitrary limits as to their participation in the School's affairs would be set. On the contrary they were invited to share in a discussion of problems of behavior, and to do so in anticipation rather than to wait for the problems to arise. They would be offered advice freely, but were told that they were to take what little liberty of decision such a method allowed them—for the advice of School officials would inevitably be a strong pressure upon them—in determining their own course

[1] Dallas *Star Post*, May 28, 1955.

of action. Since they half expected to be greeted by fiat and authoritative regulation, they gladly agreed to this policy; and it has been consistently followed to the present time.

Take, for example, the episode of the picket line. Though they were advised not to take part, two of them decided to do so. All of the other activities which have been referred to represented decisions in which they participated, or which they made without counsel. Many questions were hard to handle. On one or two occasions they felt distaste in the self-restricting decisions which they made. But even in moments of great trial they were loyal to the method. Referring to this experience, Negail Riley said in a personal letter, in retrospect after his graduation, that "honesty and discretion were the key" to the integrative process. Then he called to mind one of their disabling choices: "Our decision not to participate in the community swimming on Family Night came as the result of an honest and discreet appraisal of the situation. . . . The decision to swim would have been retrogressive, especially since Family Night was the program of the larger community that did not have a unanimously benignant attitude." Such responsible thinking showed itself in both affirmative and negative decisions, and the method of cautious advance worked only because the Negroes themselves participated in it fully.

THE NATURE OF THE OPPOSITION

But opposition arose, as it will sooner or later in any situation that seeks to move toward real integration. At Perkins it began to show itself in the spring of 1953, as the Negroes were completing their first year's work, and came to a climax in the late summer. It might have arisen about any number of practices or events; actually it seemed to take its cue from the fact that some of the Negroes were rooming with white students. This, strangely, had not been a matter of consultation with School officials because it had developed altogether normally. Four of the five had been assigned to the dormitory from the beginning; they had made friends with white students, who had invited them to be their roommates. But this original "charge" soon gathered a cluster of other practices about it, including, as perhaps the one most offensive, the method of giving the Negroes themselves the right of decision.

In the ebb and flow of discussion the nature of the opposition came to be clear. It was composed of men who had no firsthand contact with the Negroes, but this did not prevent their making a serious attack upon the experiment. In fact, the opposition was aimed at the most vulnerable point for any institution which, like SMU, possesses insufficient endowment and needs badly the support of its friends. The conclusions as to the character of the opposition which the Perkins experiment provoked, and which can be expected almost anywhere in the South, is that it consisted not of Ku Klux types but of community leaders who were uninformed, frightened, altogether sincere, misled by sweet assurances, angry, and yet aware of the essential weakness of their position.

They were uninformed in that their ignorance of what had taken place was greater than their knowledge; they possessed a few facts and a large body of misinformation. They were frightened because both what they did know and what they thought they knew shook the foundations of their segregated society and plunged them into a new world for which they were unprepared. They were thoroughly sincere in their opposition; they were convinced, by virtue of the beliefs which they had held so long unchallenged, that the old order was good and the new was full of peril.

They felt that they had been misled by sweet assurances that no such integration as was in progress would be attempted; some of them actually believed that when the Board took its original action, the sole intention was to let the Negroes come and sit in the back of the classrooms. As a result they were angry; for it is angry men who issue ultimatums. But though communication is difficult with uninformed, frightened, sincere, misled, angry men, enough took place to show that they were aware of the essential weakness of their position; even when aroused to attack they remembered "which way the wind was blowing."

AMELIORATIVE STUBBORNNESS

Because the experience at Perkins included the rise of opposition, it also provided an opportunity for response, and an arrival at a conclusion in respect to the nature of a successful strategy in meeting the opposition. The issue was joined behind the scenes. No public clamor was raised by either side. The outcome was altogether happy: not a single policy of the School was changed, and the program of treating the Negroes as regular students proceeded as before; moreover, the University was exceptionally fortunate in keeping the friendship of most of those who were disaffected. That this result was achieved a good six months before the Supreme Court's decision of May 17, 1954, is now a matter of pride to nearly all of the University community, including even some of those who were upset at the Perkins developments.

The conclusion to which this experience pointed is that opposition must be met by what might be called ameliorative stubbornness, which is not unlike the method of cautious advance described above. Not all amelioration, and not all stubbornness; the two must be joined together in co-operative tension. The substance of this position can best be described by five statements. First, it calls for a strenuous effort at education; the members of the opposition must have their misinformation of the local situation corrected and their horizons broadened with facts from other scenes. Second, they need comfort; because they are sincere, they must not be treated as if insincere, and because they are frightened, they must not be frightened worse. Third, education and comfort both require honesty if they are to be effective; false assurances and dissimulation have no place in solving the problems of desegregation and integration. Fourth, the opposition must be faced by the forthright expectation of victory; they voice the dying gasp of an outmoded order, and in all confidence and love they must be made to know it. Fifth, though victory is expected, it is not assured; and the proper mood is what someone has called "divine carelessness," that is, the kind of temper that can ride above the battle, and even if it is lost not be defeated. Who knows what lies ahead? But thus far these ways of meeting opposition have proved fruitful at Perkins.

INTEGRATION CAN COME

The last proposition is the most significant. In 1952 Perkins provided effective desegregation, but not integration. Yet the experience of the intervening years has led to the conviction that, though real integration can come only with time, it *can come*. No one at SMU boasts that it has yet come in all its fullness, but it is visibly on the way. If neither whites nor Negroes are ready for it, they are much readier than once they were. The method of cautious advance, that accords full partnership to the Negroes in the making of decisions, has contributed to its coming. Insights gained into the nature of the opposition and strategies employed in meeting it have brought the day of integration closer. This is the really important thing that has happened at Perkins, namely, that to a remarkable degree Negroes are now received on their merits, not as objects of pity or excessive generosity or the exercise of virtue, but as people. Perkins is not yet color blind, but many a red stop light looks green.

Evidence for such a development is always elusive, but not lacking. For example, in the winter of 1951–52, when the way was open but no Negroes were enrolled, the Perkins Student Council established a scholarship fund for Negro students as an earnest of their welcome and raised almost $1,000 for it. Only one student objected, and the grounds of his objection were just the opposite from what might have been expected. He felt that the fund was a mistake because it emphasized color, whereas the Christian witness was to forget color. He was ahead of his time, yet not very much, for the Student Council has recently decided that the need for proving welcome is now past. Next year's scholarship drive will go toward some other pioneer project, for Negroes are now at home.

Or consider the superficial matter of class elections. In the fall of 1952 one of the Negro students was nominated for a class office, and elected. In the fall of 1954, when the five had become seniors, one of them was again nominated for a class office, but defeated. For him who can read the signs of the times, and knows the comradeship in which the Negroes were held, this is progress toward integration. The white students had got beyond their first nervous cordiality, and not only discrimination but discrimination-in-reverse was passing away.

One final illustration: Perkins is proud of the degree to which integration is being achieved, but why should it be? It is an institution for the training of Christian ministers, part of a university that is nurtured by a Christian church. The Christian gospel spoke its piece on this point a long time ago, and now the American gospel has caught up with it. What cause is there for pride in a development that was long overdue? This point of view, of course, was bound to be expressed by someone in the Perkins community, some faculty member or student who was sufficiently secure in his sense of belonging to be able to say the reproachful, healing word to his fellows, and to have it listened to. But the one who said it was one of the five Negroes, during his last semester. That was one hint of their status, and another was immediately forthcoming—no one on the campus thought his speaking was strange.

Then let Negail Riley's words serve as the conclusion:

> Often there are comments heard to the effect that our presence has meant more than many sermons. This is truly a compliment, yet the gospel must be preached. . . . As we look upon brotherhood in action at Perkins, we must not become complacent, for there is much left to be desired, at SMU, in the Church, and in this country; neither must we lose sight of the far vision that is ours as witnesses of Christ.[2]

[2] Perkins *Log*, March 31, 1955.

Merrimon Cuninggim, Ph.D., Dallas, Texas, has been dean of the Perkins School of Theology, Southern Methodist University, since September 1951. Prior to that time he was director of religious activities at Duke University, and subsequently professor of religion at Emory and Henry College, Denison University, and Pomona College. He was a chaplain in the Navy during World War II. He is the author of The College Seeks Religion (1947) and Freedom's Holy Light (1955).

Desegregation, Integration, and the Negro Community

By Hylan Lewis and Mozell Hill

If one were to review the serious literature devoted to the Negro in the United States during the last twenty years, a great deal of it would be found to be dated, excessively abstract, and a poor guide to the range in types of communities in which Negroes now live. With notable exceptions, serious and scholarly accounts are just a cut above popular stereotypes and generalizations: too frequently they have become fixed in social-science and administrative exchange despite limited validity and usefulness. One of the functions of minority protest and pressure is to force an updating and correcting of scholarly conceptions as well as lay images. It is begging the factual question to say that Negro communities in the United States are specific local areas in which persons designated as Negroes live in preponderant numbers; and further that such units derive distinctive character from the fact that Negroes who live in such areas—and undoubtedly a large proportion of the Negroes who do not—tend to act toward themselves and others as if they have different life chances and participation possibilities. Such elementary conclusions should be just the starting point for any attempt to describe and analyze the manner in which Negroes and institutions in different communities respond to desegregation.

The range in types of Negro communities and neighborhoods is not significantly different from that of American communities and neighborhoods in general; they run the gamut from closed to open, small to large, cohesive to loose, and from mid-city slum to suburbia and "exurbia." In Negro communities as in communities anywhere in the United States the economy, regional cultural features, demography, and history interplay to qualify life and to condition the relationships of institutions and persons to the larger community. The precise effect of these factors taken separately or in the many possible combinations is still inadequately understood or measured. For example, the most common of these linkages—that which suggests an inverse relationship between numbers or the ratio of Negroes to whites and the quality of race relations (and by implication the possibility of integration—has too many exceptions to be reliable. The Negro-white ratio is but one of many factors whose weights vary from situation to situation as they appear in different combinations. Numbers as such are not crucial but rather the perception of numbers in so far as reactions to Negroes in any instance may be concerned; and the responses of any Negro community to desegregation are not only functions of the number of Negroes in the community but also of the quality of organization, leadership resources, heterogeneity of the population, and so forth. It is not the province of this paper to try to list the many actual and possible kinds of Negro communities and presumably by token of these the many actual and possible kinds of responses to desegregation. Our limited purposes will be to set forth propositions about the nature of Negro communities wherever found in the United States and, given these, to suggest something of the range of reactions, the logic,

the value conflicts, and the costs and rewards for different persons and groups in Negro communities.

Common Features of Negro Communities

Each Negro community represents a unique set of shared responses to selective American attitudes, customs, and institutions that keep Negroes in some degree separate and deprived. Changing "racial" institutions, in-group ways and anxieties, are those which are adaptive to special sets of American conditions which are themselves changing and characteristically operate unevenly and nonrationally. Although the details and the settings of "racial" behavior vary enormously, the following features are common to Negro communities in the United States wherever found: (1) a group of people who share and organize experiences of being treated as Negroes; (2) a capacity for elementary identification or empathy with other Negroes; and (3) circulation by all types of media of in-group symbols and myths, which are largely pragmatic variations on common American themes—success, happiness, self-fulfillment, survival, democracy, and so forth. With stress on diversity and change in Negro communities on the one hand and the ascribing of certain minimal core experiences and sensitivities on the other, our analysis of what happens, or is likely to happen, in Negro communities is based on three assumptions: (1) in every Negro community as defined there is necessarily group and personal sensitivity to the facts and prospects of desegregation and integration; (2) the responses of particular communities are functions of many inside and outside factors; and (3) the orientations and relations to power of Negro community leaders are among the most important inside factors.

Changes of the Past Decade Reflected

Even if desegregation had not come lately to be more of a formal, public, and legal process, and if the companion myth of integration had not been revitalized nearly fifty years after its strategic renunciation during the Booker T. Washington era, the changes of the past decade—the post-Myrdal years—would have necessitated a new estimate of living and expectations in Negro communities in the United States. Much of what was presumably known about Negro communities has been dated by changes in the economy; in income and occupational distribution; in the distribution of Negro and white populations between regions, within regions, and within urban centers; and in federal, state, and local sensitivity to the rights and needs of minorities. These made for extensive and basic changes in the Negro community, primarily through revising the range of participation and expectations. They set in motion a kind of "creeping desegregation"—selective and uneven, less formal, and less threatening. A significant clue to change is the fact that the most active organized and systematic current interest in the character, tastes, motivations, and expectations of the Negro is that of the market researchers. In their efforts to exploit consumer demand in the Negro community, they are actually creating a "Negro market" or reinforcing the myth. The Negro market does not represent a demand for special goods or services but rather an underrated demand for conventional and quality goods and services.

It might be noted parenthetically that increased Negro income, access to credit, capital accumulation, political strength, and the concept of the Negro market also have had the effect in many in-

stances of strengthening old racial institutions, fostering new or better quality services primarily for Negroes, and permitting integrated participation under special or limited conditions. For example, at the same time that open housing has been increasing, there has been an increase in the number of new, better-quality real estate developments exclusively or especially for Negroes—and financed by both white and Negro capital—an increase which represents expansion and increasing differentiation within the Negro community itself. New capital and new consumer demand have likewise increased the number of hotels and motels for Negroes, of local radio stations and programs geared primarily to segments of the Negro population, and of branch offices of banks and insurance companies more convenient to the Negro patron.

In some instances the fact or promise of integration has become a commodity —a way of promoting a new commercial venture such as the ill-fated Moulin Rouge Hotel in the otherwise segregated Nevada community of Las Vegas; or the integrated golf course in Charlotte, North Carolina, which returned to segregation when the number of Negroes paying to use the course did not meet expectations; or the case of the newly organized Georgia insurance company that writes to a select mailing list:

> You are invited to become a part owner in a unique new life insurance company—a company that is *making integrated stock ownership of a life insurance company a practical reality*. . . . The ———— Company is being formed to render a real and needed economic service to the Negroes of Georgia.

It is ironic, and one of the manifestations of this transition period, that when some of these enterprises fail because of risky business practices or simple miscalculations of the motivations and practices of the Negro consumer or patron they are erroneously cited as examples of the failure of Negroes to co-operate in supporting something that is beneficial for them—or worse, of indifference to integration. It is doubtful that in any Negro community just the mere fact of a competing or new institution or service being integrated will guarantee its success or significant Negro support. There are many questions: Is this real or spurious integration? Is there really effective demand for the services? Is the presumed psychic compensation of commercial, snob-appeal, or even altruistic integration sufficient to offset possible sacrifices, premium prices, and the pain of changes in habit and routine?

Factors in Community Change

As indicated earlier, the fact in many communities—and the better chance in all—that Negroes can participate increasingly in activities not based in the Negro communities, in voluntary associations not restricted to or designed primarily for Negroes, and in entirely new areas of public and private life automatically transforms Negro communities. Listed below and discussed are propositions relating to processes or circumstances primarily within the Negro community that affect the course of change.

Some Segregation Will Remain

For at least a generation, significant aspects of the total life of most Negroes in northern and western communities as well as in the South will remain segregated in fact because of involuntary and voluntary clustering.

The disproportionate clustering of Negroes within an area or areas is the tough and stubborn physical basis for Negro communities and the persistence

of some segregation. This is not likely to end soon or dramatically. In fact, formal and informal planning in many urban communities of the North and South—for example, the actual working out of urban redevelopment in many instances—has the effect of strengthening old segregated communities or of setting up new segregated housing areas. And even if discrimination were not a factor in the persistence of large Negro communities in places like Chicago, New York, Detroit, and Los Angeles, the physical, economic, and social problems of dispersing and absorbing the many new migrants who are only incidentally Negroes are stupendous.

The all-Negro communities like Mound Bayou in Mississippi and those founded in Oklahoma and other states after the failure of Reconstruction, designed to be examples of what Negroes could achieve alone and essentially withdrawn from white influence and control, established a tradition and persisted as a way of life for a relative few; and their prime significance for their own members as well as for other Negroes has been symbolic and sentimental. Race pride and sentiment will continue to play a stubborn, but, on the whole, a losing, part in the continuance of voluntary segregation, not only in such communities but also in other communities and institutions in which Negroes have a significant investment in pride, history, and tradition.

Selective and Uneven Desegregation

Where some measure of choice is involved in any Negro community the transition from segregated to nonsegregated practices will be selective, uneven, and fraught with the conflict of interests and sentiments.

Residential clustering, pride and sentiment, normal inertia, and caution and discretion in the face of opposition mean that where it is possible to exercise choice the disposition of Negroes to participate in nonsegregated activities or to desegregate Negro institutions will vary with the type of institution, with the characteristics and interests of the persons involved, and with the effectiveness of the leadership. De facto segregated and nonsegregated institutions and activities will continue together as, for example, in Washington, D. C.; however, the competition or the availability of nonsegregated activities will tend to force a modification of old-line racial institutions. There will be some conflict between the real and propagandized values of group pride in institutions on the one hand and the real and publicized virtues of unsegregated institutions on the other. At the extremes there will be those who will make sacrifices to affirm and support each while decrying the "renegade" behavior of their opposites. In the case of either type, behavior is not likely to be consistent: for certain activities or services, desegregated institutions will be preferred and patronized; for others, familiar or even new racial or community institutions will be supported out of habit or with the rationalization that this support is not compulsory. There are also the possibilities of frequent internal conflict and guilt for some who choose the easy and familiar over the newer and "right." As suggested, when personal conflict appears as to the patronage of segregated or nonsegregated activities, it is most likely to be resolved not on a basis of "right" but rather on the answer to the questions, Do I have to do it? Do I have free choice?

For Special Individuals

In its earlier stages, the approach to integration tends to be perceived or experienced in the Negro community as the rapid increase of desegregated ac-

tivities and choices largely for the emancipated, the mobile, the restless, the lucky, the talented.

The experiences of successful or active persons outside the Negro community are positive proof of what can happen and result in some collective affirmation of the social system despite the fact that these instances may not be truly indicative of the objective chances for the individual Negro's personal preferences or expectations. They serve as examples and incentives; they help to reinforce the sense of personal worth; they help to erase the stigma of inferiority and to that extent make the changing Negro community more tolerable and less a ghetto.

PERSONNEL PROBLEMS

Selective personnel demands of newly integrated institutions may cause some institutions in the Negro community to lose experienced or skilled personnel. And some old-line institutions not only find it difficult to keep or recruit key personnel but also find themselves under the simultaneous pressure to improve training programs or organizational efficiency because of new possibilities for current and future students.

There are many scattered instances of the businesss or educational institution in a Negro community which lost secretaries, bookkepers, staff persons, and technicians to integrating government, business, and educational agencies. And with expanding opportunities those institutions charged with training, particularly in the professional and technical areas, feverishly seek to improve and enlarge training and guidance. There is intense regret and embarrassment over the fact that in many instances known opportunities or demands far exceed the number now trained or qualified. It is not possible, or even desirable, for every existent Negro training institution to improve or to expand its general education and technical and professional offerings. The problem of priorities and personnel will remain acute, particularly in the early stages of desegregation; and it is complicated by group pride, sentiment, and normal self-interest within the Negro community—and by adamant positions on segregation in some states.

INSTITUTIONAL CHANGES

The institutions of Negro communities are selectively faced with changes in patronage, support, organization, and ideology.

As indicated earlier, many racial institutions will persist, although they will tend to operate in a different context and with different sensitivities. One of the simplest and earliest adjustments is to indicate symbolically or by token that they are not in public ideology and purpose exclusively for Negroes. This has happened in the case of the denomination which changed its name from Colored Methodist Episcopal to Christian Methodist Episcopal and in that of the athletic association which changed from Colored Intercollegiate Association to Central Intercollegiate Association. It is also seen in the recruitment or acceptance of white staff, students, or members, paralleling the efforts of "white" churches and educational institutions to integrate where the situation is favorable to substantial desegregation. Of the Negro institutions and professional associations subject to licensing, the publicly supported one is more likely to fold because of legislative or administrative edict and professional advantage than is the private Negro institution, voluntary association, business, or service. Private institutions are more likely to seek to adapt than to go out of business voluntarily, although they may lose some clientele or support. Where

threatened, banks, insurance companies, churches, hotels, and so forth are likely to try to compete on an open or closed basis. To some extent segregated institutions in the Negro community which are actually marginal or of low efficiency or which are conceded to be "wrong" may survive, because with a shortage of certain services there is demand for the contributions of even the least efficient or tainted. Those institutions which seek to adapt or which have no alternative but to continue may try to compete through improving services and operating efficiency or through tapping new markets and clientele within both the Negro and the white groups. Some Negro institutions will compete successfully and survive primarily because of the skillful use of in-group know-how and "race" propaganda. So long as integration remains segmental and in process, Negro institutions and organizations which serve in the breach or which exist to protest or to mobilize for more participation will have a place in the Negro community.

EXPANSION AND DIVERSIFICATION OF COMMUNITY SERVICES

The areas in which Negroes live become more diversified and complete in services and callings available to all Negroes as branches and representatives of public and private service and business institutions locate there. Desegregation in other areas stimulates this trend.

This long-time trend will continue and be speeded up by the initial examples and threats of desegregation. In many instances it will represent the belated recognition of neighborhood political power or consumer demand; in other instances the real purpose will be to delay or divert the participation of Negroes in activities outside the Negro areas. In the case of public services like firehouses, police, post offices, and libraries, such gestures or innovations will be both praised and condemned within the Negro community. They will be praised as concessions won, services gained, and sources of additional white collar and managerial jobs. They will be condemned as discriminatory, particularly when chances of promotion for personnel in the total system are limited, when the part played by Negroes in policy making is small, and when look-what-we've-done-for-you expressions come from the white community: "It's just as good as ours" or "It's better than the whites'." Within the Negro community these apparently contradictory responses which make outsiders often ask querulously, "Just what do Negroes want?" are actually complementary. Concessions wrested or granted become vantage points for seeking new goals. The "realistic compromise" and "agitation for more" reinforce and play back on each other; they are normal byproducts of "racial" experience. They are latent in every community; and the expansion and diversification of the Negro community, whether because of desegregation or the setting up of new services, tends to activate and speed up the spiral process. It is more difficult to suppress or intimidate the agitator in diversified and heterogeneous Negro communities. Until the Negro community as defined disappears there will always be something to agitate about. Continued desegregation means that agitation will be carried on, when necessary, with greater skill, resourcefulness, and confidence in the outcome.

A CHANGING SOCIETY

Desegregation means that Negro society tends to become more open; that class differentiation becomes sharper; and that new bases of distinction appear.

Participation on a basis of merit means not only that a wider range of callings is open to Negroes but also that many Negroes are upgraded to higher-skill classifications and to unique (for the Negro community) and more prestigious positions or relationships with colleagues. This new basis for ranking is reinforced by generally increased income which makes possible for new groups the indulgence of personal tastes in living arrangements and recreation on levels and—thanks in part to desegregation—in places hitherto not accessible. A premium tends to be placed on achievement and behavior that represent breaks with the offerings and norms of the meager and restricted Negro community. To the extent that this behavior is new and to the extent that significant other areas of life are still restricted or "racial," it and the *arrivistes* who practice it may have a feverish and exaggerated quality. The possibility is great of cleavage between those who are able to and choose to maximize non-Negro community activities and those who are not able to or who do not choose to broaden participation and contact. Mobility as such in this sense becomes an important criterion of social rank.

By-products of this more fluid situation are the questions with which both young and old professionals and technicians are sometimes faced: Which represents the greater "need" for my services, blazing the trail and expanding opportunities for other Negroes in an integrated setup or the continuing demands for new and more talent in the Negro community from which I have come? And which course offers greater rewards—psychological and material? Such is the nature of the changing Negro community that sound rationalizations can be found for each course, and matching instances can be cited of the choices of each. And further, the careers of many Negroes have combined the two kinds of service and satisfaction. This too is part of the logic of transition from segregated to nonsegregated communities of which the expansion of Negro communities is a necessary phase, given the current situation.

NEW TYPE OF MARGINAL PERSON

Segmental desegregation tends to produce a new type of marginal person.

This person is in some ways a counterpart of the hybrid institution mentioned earlier that operates with reference to special or limited interests in both Negro and white communities. It is increasingly common for both Negroes and whites to play many pluralistic roles inside and outside the uneven color line. As individuals move more easily from partially or almost completely segregated to less or nonsegregated orders, there need be no consistency in role or context in residential area, school, church, assembly line or store, business or profession, public office, leisure-time activities, intimate associates. It is entirely likely that for increasing numbers in our larger urban communities this marginality is—or can be—positive, yielding its own rewards and satisfactions; and that it need not be as personally tragic as the classical image of the marginal man was painted. Some persons in the new Negro community that desegregation is helping to usher in can because of enhanced mobility enjoy at least temporarily selected rewards of integrated segments as well as some of the personally preferred values of the Negro community. The fluidity or relative frequency with which individual Negroes from Negro communities may and do move in segments of the total community, which segments they are, the uneven spread of big and little patches of desegregation, will be for a considerable period better indices to the speed and success of integration than the changes that take place in the physical distribution of the Negro population. Physical distribution, however, is of course always a limiting factor and ultimately the critical index.

IN SUM

Segmental desegregation, along with other factors, is transforming the Negro communities—some very slowly and others very rapidly. At this time the most important fact about all Negro communities is that whereas they may not be disappearing as physical entities, they and their institutions are becoming inexorably less "racial" and less the major framework for the life and values of the individual Negro.

The Integration of Americans of Mexican, Puerto Rican, and Oriental Descent

By J. Milton Yinger and George E. Simpson *

CURRENT studies of desegregation are making clear the extent to which discrimination is a system of interdependent parts, each affecting and being affected by the others. Steps toward the integration of all racial groups in the schools put strain on other patterns of discrimination—in transportation, in public recreational facilities, in job training, and the like. On the other hand, failure to reduce discrimination in housing, in economic opportunities, and elsewhere strongly inhibits the achievement of integration in the schools in any but a formal sense. If residential segregation, poverty, and a class subculture that gives education a low valuation continue to affect minority groups, the achievement of legal integration in the schools loses much of its significance.

This interdependence of the various patterns of discrimination is clearly revealed in the study of the smaller minority groups in the United States as well as in the analysis of the changing status of the Negro. Most of the papers in this volume refer primarily to Negroes, the largest and probably the most disprivileged minority. Yet there are vastly important problems and lessons to be learned from the study of other groups as well.

The process of integration varies, of course, from group to group, because of differences in the degree of cultural contrast, in size and location of the group, in the length of time they have been in the United States, language factors, economic status, and other variables. The situation is quite different, for example, for a small Japanese-American group, with a relatively high proportion of urban and middle-class members, than for the much larger group of Mexican Americans, who are largely rural and lower class.

For each of the groups we shall discuss, the situation is highly dynamic. Patterns of segregation in schools, job opportunities, labor unions, housing, the armed services, transportation, recreation, churches, political groups, intermarriage laws have all, in some measure, been challenged and changed. In this brief paper, we can only suggest some of the aspects of desegregation and integration as they affect a few selected groups.

* The authors wish to thank the many persons who kindly responded to our requests for information by sending helpful letters and materials relevant to the topic. Discussion of the American Indian, which was originally projected as part of this article, will appear in a later publication.

Americans of Mexican Descent

There are about two and a half million persons of Mexican descent now residing in the United States, half of them in Texas, and most of the others in California, Arizona, New Mexico, and Colorado. In addition, there are about two hundred and fifty thousand Hispanos, descendants of Spanish colonials, who have maintained a distinctive subculture for over three thundred years. Although they face serious economic problems and some social isolation in New Mexico, where most of them live, the difficulties of the Hispanos are of a different order from those of the Mexican Americans with whom we shall be concerned.

In 1946–47, the courts ruled in the Mendez case in California that segregation of Spanish-speaking children in the schools was illegal. The ruling of Judge McCormick anticipated some of the arguments of the 1954 Supreme Court decision in its emphasis on the harm wrought by segregation, with its inevitable implication of inferiority. The Delgado case in Texas, in 1948, also established the illegality of segregation of Mexican-American children in the schools. There followed a statement of policy by the Texas State Board of Education in harmony with the court decision, and instructions were sent to the local school districts to eliminate segregation of Mexican-American children.[1] The court permitted separate classes at the first-grade level only, after scientific tests of language proficiency, for those who do not know English, whatever the national background.

Judgments differ somewhat on the degree to which these court decisions, and other influences, have brought about the desegregation of Mexican-American children in the schools of the Southwest. There is virtual unanimity on the observation that long steps in the direction of desegregation have been made. There is a growing conviction on the part of educators that the best way to teach English to a Spanish-speaking child is to place him in a class where many of his fellow pupils speak English natively.[2] This conviction has eliminated one of the rationalizations for segregation on a language basis that easily spilled over into segregation on the basis of Spanish name and nationality background. With the destruction of any legal basis for the segregation of Mexican-American children in the schools, the process of integration has been accelerated. Yet one must note the continuing presence of segregation as a result of gerrymandering and the "free choice of school" principle.[3] It is also necessary to stress the barriers to school integration imposed by the economic status of most Mexican Americans. The children of migrant workers are often not in school during the winter. With only a few months of schooling in the fall and spring, they continually fall behind their classmates and often drop out of school at an early date. Legal desegregation does not eliminate barriers to full integration that rest on economic disprivilege.

[1] See George I. Sanchez, *Concerning Segregation of Spanish-speaking Children in the Public Schools,* Austin: University of Texas, 1951.

[2] This is not inconsistent with the increasing attention to the special needs of Mexican-American children. See, for example, *Teachers' Guide to the Education of Spanish-speaking Children,* Bulletin of the California State Department of Education, October 1952, and *Teaching Children Who Move with the Crops,* published by the Fresno County Public Schools, Walter G. Martin, Superintendent, September 1955.

[3] A four-year campaign to end gerrymandering in the elementary schools of El Centro, California, was ended in December 1955, when officials of Imperial County agreed to eliminate the protested practices. A suit had been filed in the United States District Court in February 1955, and a retrial was pending when the settlement was reached. See *New York Times,* December 4, 1955, p. 64.

Temporary migrant workers

Among the migrant workers, it is the temporary residents, both the legal entry and the illegal "wetback," who are in the most difficult circumstances. Inflation in Mexico, rapid population growth, especially in border areas, and the low wages "south of the border" have sent a stream of migrants into the United States. Desire for cheap labor for the seasonal jobs involved in picking crops has been the basis of their admission. Their status has been very uncertain, however, because of conflicting interests in the United States. Present immigration procedures, operating under the McCarran-Walter Act, enhance the insecurity of the noncitizen Mexican. He is deported or allowed to stay de-

pending on a delicate balance of forces in United States politics, some of which seek to maintain a flow of cheap, tractable labor and others to deny the entrance of "undesirables" or workers who depress the wage scale. Abrams describes the problem sharply when he writes:

> Thus, in the case of the migrant Mexican, and to some extent other migrants, we have a unique kind of internal colonialism. The native laborer works hard for pitiful wages, suffers the social inferiority of a native in the eyes of his master and the community, and lives under the sub-human conditions so often characteristic of native colonial life. The difference between the traditional and the new colonialism is that our colonial natives are kept with us within distance when we want them—and then driven out of the community when no longer needed.[4]

Interacting deterrents to integration

Although Mexican Americans who are permanent residents of the United States are probably less disprivileged than the migrants, their status is also kept down by a group of interacting forces that operate as serious deterrents to full integration. Mobility, low income, poor health, lack of facility with English, and lack of persistence in school cumulatively block improvement in status. Broom and Shevky have noted a number of mutually reinforcing barriers to the integration of Mexican Americans: (1) The pattern of employment in homogeneous gangs tends to insulate many of them from contacts with non-Mexicans. (2) The status of casual laborer means instability of employment, frequent migration, and consequent institutional and residential isolation. (3) The language barrier, a symbol of group difference which would not be so important were it not for the other factors, has led to some segregation, school retardation, limited job opportunities, slower acculturation—a vicious circle. (4) The cleavage between generations has meant that Mexican youth are often left with inadequate adult models, a problem that is associated with the formation of gangs which have further blocked integration.[5]

Favoring desegregation

Our picture would be incomplete, however, were we to fail to describe some of the forces working for desegregation and integration. There has been some improvement in real wages of migrant workers since 1945. More Mexican Americans are finding industrial jobs, although primarily on the unskilled and semiskilled levels. Urbanization and job diversification have sped the process of acculturation, improved income, and brought some workers into touch with labor unions. While Mexican-American workers have not found ready acceptance in some of the unions, many, especially those in the CIO, have welcomed them. Working together on common economic problems is an important source of integration among separated groups.[6]

Although the political impotence characteristic of most depressed groups has retarded the integration of Mexican Americans, there are signs that this impotence is being reduced. The 250,000 or more who served in the Armed Forces during World War II returned to civilian life with a broader view. These, joined with the industrial workers and

[6] See William Becker, "Conflict as a Source of Solidarity: Some Notes on the California Farm Labor Scene," *Journal of Social Issues*, Vol. 9, No. 1 (1953), pp. 25–27. Broom and Shevky give strong emphasis to unions: "No other secular organization appears at this time to be so capable of affecting so decisively the pattern of Mexican isolation."—*Op. cit.* (note 5 *supra*), p. 157.

the slowly increasing middle class, have begun to overcome the inertia that blocks effective action. There are several Mexican-American city councilmen in Texas cities; Los Angeles elected one in 1949; Unity Leagues stress voter education.[7] If there is at the moment no equivalent of the National Association for the Advancement of Colored People or the Japanese American Citizens League among Mexican Americans, it can be said that they have their Booker T. Washingtons, emphasizing the importance of self-improvement, pride in their own heritage, and opposition to discrimination. With varying emphases, such organizations as the League of United Latin-American Citizens, GI Forums, the Latin-American Educational Foundation, Unity Leagues, and the Alianza Hispano-Americana are working to improve the status of Mexican Americans. In recent years there has been some shift away from the mutual aid and self-improvement approach toward a more vigorous demand for equality and the elimination of discrimination. This shift, which may have been retarded by the fact that aggressive and able Mexicans have escaped into the dominant group or allied with it more easily than have Negroes and Japanese, can be symbolized by the organization, in 1954, of a Civil Liberties Department of the Alianza Hispano-Americana, with a program dedicated to "education plus action." This may well express the activities of Mexican Americans in the next few years.

PUERTO RICAN MIGRANTS

Approximately 80 per cent of the 490,000 mainland Puerto Ricans live in New York City, but other settlements are found in Bridgeport, Newark, Passaic, Trenton, Camden, Philadelphia, Pittsburgh, Buffalo, Youngstown, Cleveland, Lorain, Gary, Chicago, Aurora, Joliet, Savannah, and Milwaukee. Puerto Ricans, most of them recent arrivals, constitute 5 per cent of New York City's population. By mainland criteria, two-thirds are colored.[8] Most of the migrants are without much skill, and three-fifths of them arrive in New York with very little facility in the English language. In many respects their experience resembles that of other immigrant groups. They are poor and uneducated and live in the least desirable sections of the city. Landlords and sharks exploit them; native Americans accuse them of "clannishness" even though the newcomers are divided by class, religion, and so forth; their crimes become "crime waves"; and they are the current scapegoat for many of the community's ills. Competition and conflict predominate in their relationships with natives, but these are giving way gradually to accommodation and assimilation.[9]

The occupational mobility of the Puerto Ricans in New York has been limited, consisting mainly, if it occurs at all, of a rise from unskilled to semiskilled jobs. Puerto Rican labor union membership is impressive, with 51 per cent of those in the labor force in 1947–48 reporting such membership.[10] However, there has been some discrimination. In one labor union, the non-Jewish members (Latin Americans, Negroes, and others) are employed largely in the less-skilled, less-well-paid crafts, owing partly to recency of entry into the trade

[7] See John H. Burma, *Spanish-speaking Groups in the United States* (Durham, N. C.: Duke University Press, 1954), pp. 105–22.

[8] It is interesting to note that the 1950 U. S. Census of Population, *Puerto Ricans in Continental United States*, Special Report P-E, No. 3D, gives as "Percentage White": Puerto Rico, 1950– 79.2; Migrants, 1950– 92.3. Cited in Migration Division, Department of Labor, Commonwealth of Puerto Rico, *A Summary in Facts and Figures, 1939–1954*.

[10] *Ibid.*, p. 110.

and partly to barriers erected by the "old-timers." [11]

In seeking to avoid the kind of crusade for "Americans" and against outsiders which other immigrant groups have faced, the Puerto Rican government has adopted a policy of caution. Farm contract labor is carefully limited and supervised, and the government acts as the principal employment agent and adviser for industrial migrants already on the mainland. One writer states that this policy has restricted the job opportunities of Puerto Ricans.[12]

Puerto Ricans in New York City schools

In 1953, Puerto Ricans comprised 8.2 per cent of the elementary pupils in the New York City public schools; 38.3 per cent of these children were "non-English-speaking." The table below shows the figures and percentages by boroughs.

	Total Pupils[a]	Total Puerto Rican	Per Cent Puerto Rican	Non-English-Speaking Puerto Rican
Manhattan	102,326	24,437	23.9	10,225
Bronx	115,871	12,226	10.5	3,921
Brooklyn	210,629	9,189	4.4	3,596
Queens	120,306	853	0.7	198
Richmond	18,930	146	0.8	14

[a] Peter Kihss, "Puerto Rican Will to Work Stressed," *New York Times*, February 25, 1953, p. 18 C.

In 1951, seventy-five schools in Manhattan had some concentration of Puerto Ricans, and these children constituted 50 or more per cent of the pupils in eight schools. They were 50 per cent of only one school among the twenty-five in the Bronx which included Puerto Ricans. In Brooklyn there were only two schools with a Puerto Rican enrollment of 50 per cent or more.[13] In one study of seven New York public schools, the percentage of pupils of Puerto Rican parentage enrolled ranged from 21 to 99 per cent.[14]

Efforts to avoid the segregation of Spanish-speaking children in New York City schools have included special "vestibule" classes under a Spanish-speaking teacher who teaches them English and some orientation to school and community life; individual help from teachers or from English-speaking students designated as "big brothers" and "big sisters"; substitute auxiliary teachers who speak Spanish and are assigned to orient Puerto Rican pupils and their families; encouraging English-speaking and Spanish-speaking children to play games together and to go on sightseeing trips together; and providing evening classes for adults (one-fifth of all persons attending elementary school evening classes for adults—or about eight thousand—are Puerto Ricans studying English).[15] According to Clarence Senior, of Puerto Rico's Department of Labor:

> . . . aside from the natural "segregation" which is involved in the migration of any working class group, we find little evidence of nonintegration of Puerto Ricans in the school systems in the continental United States.[16]

In New York City, school programs which emphasize intercultural relations have replaced the "americanization" theme of forty years ago.

Assimilation of adults

New York's Puerto Ricans are not active participants in politics. Only 10 per cent of those qualified are registered and they vote lightly.[17] One study concluded that the Puerto Rican's effective social world consists of the household, the apartment house, and the street.[18]

Puerto Rican migration has been welcomed by employers because it has provided New York City with a large source of cheap labor. The problems which have arisen have been made somewhat easier by a greater appreciation today of the nature of culture contact and conflict and by the existence of a number of organizations seeking to create better understanding in intergroup relations. Differential assimilation among the Puerto Ricans will be strongly influenced by employment, sex, education, age, and color.

[15] Peter Kihss, "Puerto Rican Will to Work Stressed," *New York Times*, February 25, 1953, p. 18 C; Welfare Council of New York City, *Puerto Ricans in New York City* (1948), pp. 41–42. In 1947, the Association of Assistant Superintendents issued a report on *A Program of Education for Puerto Ricans in New York City*. Beginning in 1949, workshops in the teaching of bilingual pupils and courses on educational programs for Puerto Rican children were introduced. In 1954, the Board of Education published a seventy-six-page booklet on *Teaching Children of Puerto Rican Background*. The Department of Education in Puerto Rico sponsors a program designed to facilitate the adjustment of Puerto Ricans who migrate to continental United States (Mariano Villaronga, "Program of Education for Puerto Rican Migrants," *Journal of Educational Sociology*, Vol. 28, No. 4 [December 1954], pp. 146–50). "The Puerto Rican Study," sponsored by the New York City Board of Education and financed by the Fund for the Advancement of Education, is a three-year study of the education and adjustment of Puerto Ricans (J. C. Morrison, *op. cit.* [note 14 *supra*], pp. 167–73). Such professional journals of New York City teachers as *Curriculum and Materials, Strengthening Democracy, The New York Supervisor,* and *High Points* have carried during the past five years numerous articles on the education of Puerto Ricans. For a good brief statement on the integration of Puerto Ricans into the life of the school and the community see Mary Finocchiaro, "Puerto Rican Newcomers in Our Schools," *Journal of Educational Sociology*, Vol. 28, No. 4 (December 1954), pp. 157–66.

AMERICANS OF ORIENTAL DESCENT

About three hundred thousand persons of Oriental descent, most of them citizens, reside in the United States. In the century or more since the first substantial number of Chinese came to this country, treatment of Orientals has ranged from intense discrimination to almost full acceptance. We shall only suggest some aspects of this range with reference to two groups of Oriental descent, the Chinese and Japanese.

Chinese

Active discrimination against the Chinese, which had been found particularly in the West, began to decline about 1900. This change was a function of their gradual acculturation, the virtual cessation of the growth of the Chinese group (there were 107,000 in 1890, 118,000 in 1950), the improvement in their economic status, and their replacement, as targets for hostility, first by Japanese and later by Mexicans and Negroes. The common effort of China and the United States in World War II gave further impetus to the process of integration—a gain that the Korean War and the current conflicts with Communist China seem not to have affected to any great extent. The McCarran-Walter Immigration and Nationality Act, 1952, granted naturalization rights to resident Oriental aliens, who formerly had been ineligible for citizenship, and brought the nations of the Far East within the quota system. The reduction in discrimination that this in-

volves must be weighed against the fact that the quota system is a device for ensuring that the major proportion of immigration from outside the Western Hemisphere shall come from Western Europe. The quotas for most of the countries of the Orient are the minimum of one hundred per year.

There is virtually no segregation of Chinese in schools or in places of public accommodation. A summary in the *New York Times,* referring to both Japanese and Chinese, holds that they "have moved into a status close to first-class citizenship."[19] One should not forget, however, the lingering patterns of discrimination. In July 1954 the National Exchange Club revoked the charters of two California chapters for refusing to ask two Chinese members to resign. Both the refusal and the revocation are significant. Housing is perhaps the most serious aspect of the remaining discrimination. As the traditional Chinatowns have lost some of their residents, "residential Chinatowns" in the suburbs have appeared, a product, in the judgment of Robert Lee, of restrictive covenants and practices, of fear of lack of welcome in other neighborhoods, and the desire to live with fellow Chinese for social and recreational reasons.[20]

This housing problem is occasionally brought to national attention by some dramatic situation. In 1952, there were vigorous protests by several white neighbors when Sing Sheng bought a home in a suburb of San Francisco. In 1955, Dr. Samuel Lee, a Major in the Army Medical Corps, Olympic diving champion, and good-will ambassador for the United States, was unable to buy a home in Garden Grove, California. He is a Korean American married to a Chinese American. In both of these cases, the news brought many offers of houses and declarations of support; but the crucial fact for less-well-known or milder persons is the quiet discrimination they face in the matter of housing.[21]

[19] *New York Times,* May 29, 1955, p. 19.
[20] Letter of August 11, 1955.

Japanese

Early in the twentieth century, the Japanese became the heirs of some of the hostility formerly directed against the Chinese. By hard work and thrift, some of them "leaning over backward" to follow middle-class values, they rapidly achieved a modest economic security. Their rapid acculturation did not protect them, however, against discrimination. If the Mexicans have been criticized for their *lack* of "American ways," the Japanese have been attacked for their *excess* of virtues—they work too hard or strive too vigorously for education.

The culmination of the discrimination against Japanese Americans is undoubtedly their "relocation" from the West Coast in 1942. This is now widely regarded as the most serious violation of the rights of citizens and of peaceful resident aliens ever actively sponsored by the federal government.[22] All Japanese Americans, about two-thirds of whom were citizens, were compelled to leave the West Coast and were held in the relocation camps. Gradually, during the next three years, some of them were permitted to leave the camps, for the purpose of entering school, of joining the Armed Forces, or of employment in other parts of the country. After the war, over half returned to the West Coast. They had suffered a loss, from the sale or deterioration of homes, farms, and businesses, variously estimated from 350 to 500 millions of dollars. Some slight violence greeted their return, but the pendulum has swung rapidly in their favor, as a result of many forces. The obvious loyalty of the great majority of Japanese Americans, the outstanding record of their men in the Armed Forces, their extensive acculturation, the activity of such groups as the Japanese American Citizens League (which has fought for restoration of losses due to the relocation and for the repeal of discriminatory legislation), the shifting of hostility toward Negroes and Mexicans, and perhaps the pressure of guilty consciences in many white Americans—these are among the factors involved. Since 1952, when resident aliens of Oriental descent became eligible for citizenship, over six thousand Japanese have been naturalized—a symbol of the extent of the integration.

[21] See Robert Lee, "The Case of Sammy Lee," *New Leader,* September 5, 1955, pp. 15–16.

[22] There is an extensive literature on the causes and consequences of relocation. See Leonard Bloom and Ruth Riemer, *Removal and Return: The Socio-Economic Effects of the War on Japanese Americans* (Berkeley: University of California Press, 1949); Morton Grodzins, *Americans Betrayed* (Chicago: University of Chicago Press, 1949); Alexander H. Leighton, *The Governing of Men* (Princeton, N. J.: Princeton University Press, 1945); Carey McWilliams, *Prejudice—Japanese-Americans: Symbol of Racial Intolerance* (Boston, Mass.: Little, Brown and Co., 1944); Jacobus ten Broek, Edward N. Barnhart, and Floyd W. Matson, *Prejudice, War and the Constitution* (Berkeley: University of California Press, 1954); Dorothy S. Thomas, *The Salvage* (Berkeley: University of California Press, 1952); and Dorothy S. Thomas and Richard S. Nishimoto, *The Spoilage* (Berkeley: University of California Press, 1946). There are some differences of interpretation among these authors concerning the balance of forces that caused the relocation order. Perhaps the most carefully reasoned statement is that of ten Broek, Barnhart, and Matson, although they may underemphasize the powerful, if indirect, influence of private groups and the climate of opinion they had helped to create.

SUMMARY

Mexican Americans have been segregated in numerous school systems of western and southwestern states, but such segregation is being contested and is decreasing. Because of residential concentration, Puerto Rican children constitute sizable proportions of several New York City elementary schools, but no school is all Puerto Rican and attempts have been made to reduce the isolation of these pupils. Chinese-American and Japanese-American school children are nowhere segregated because of race. Previous federal and state court decisions have influenced minorities other than the Negro, and the 1954 ruling may be effective in preventing the segregation of these groups in the future or in strengthening their legal position if segregation is introduced.

Integration of the minorities with which this paper has been concerned has moved more slowly on the job market and particularly in housing than it has in the schools. But the process is under way. If one may, with good evidence, remark, "How much that is discriminatory remains!" he may, in more optimistic mood, declare, "How much that was discriminatory has been improved!"

J. Milton Yinger, Ph.D., Oberlin, Ohio, is professor of sociology and anthropology at Oberlin College. He previously taught at Ohio Wesleyan University. He is author of Religion in the Struggle for Power: A Study in the Sociology of Religion (1946) and co-author, with George E. Simpson, of Racial and Cultural Minorities: An Analysis of Prejudice and Discrimination (1953).

George E. Simpson, Ph.D., Oberlin, Ohio, is professor of sociology and anthropology at Oberlin College. He has served as associate professor and professor of sociology at Pennsylvania State University and assistant professor of sociology at Temple University, and has carried out research projects on peasant life in northern Haiti and on Jamaican revivalist cults. He is the author of various papers on race relations and coauthor of Racial and Cultural Minorities, as indicated above.

Racial Policy and International Relations

By John F. Melby

THE bulk of this issue of The Annals is, I assume, addressed primarily to Americans—as it should be. But since the whole problem of desegregation and integration is part of our dirty linen which inevitably is from time to time on view for the world, I would concern myself here with what the world sees and, thus, speak not only to Americans, but also to others who are troubled about the problem. Some of the things I shall say will be rather harsh; but I trust they will need neither apology nor explanation.

By some kind of empathy the United States has come to be identified in the world mind with the equality of men, not equality as Mr. Jefferson has been misinterpreted to mean it, but equality of opportunity and of initial advantage. Part of this reputation has been deserved, but part of it is belied by the actual facts. At the outset let it be clear: the evil part of the American record on racial policies, especially in the light of our professions, is a major blot on our escutcheon, and it does positive and serious damage to the whole cause of freedom and democracy in these days in which the United States has emerged into a position of world leadership. One could even argue that the correction of racial abuses in this country is so vital and integral to the democratic cause to which the American people have dedicated themselves that there can be no quibbling over the remedy if our whole structure is not to be mortally affected. Coercion must be used should it be necessary, since the argument for gradual social change has too long and too often been abused to be any longer acceptable if we would continue to fill our role of leadership in the free world. It is an extraordinary fact that a world never noted for its racial tolerance in theory or in practice has come to look on the United States as a symbol of equality, and that the oppressed turn to America in the hope of finding understanding and an untarnished record. The burden of responsibility thus placed upon us is a heavy one.

Damage to American Prestige

It would be gratuitous to belabor unduly the point of how much damage has been done to American prestige by our enemies throughout the world by the simple device of pointing out the failures of our racial professions and the gross violations of the spirit of the Constitution. Our enemies and our friends have seldom been reluctant to bring these lapses to our attention—as indeed they should. If any reader be in doubt on the point, he need only check the percentage of Communist propaganda which concerns American racial discrimination or, in friendlier circumstances, the prominence given to racial atrocity stories in the Asian press. The observation applies with equal force to Europe, which is far less sensitive to the problem than are Asia and Africa.

Nor is there need to assume, as it might be comforting to do, that those who disseminate tales or react strongly against American discrimination necessarily do so from malice or in awareness that what they say—or say they believe—is untrue or at least not the whole truth. A special report last fall issued by the American Jewish Committee on European reaction to the Till case stated that American prestige had been "seriously damaged" and that European reaction had been "swift, violent, and universal"; nor was it limited to Communist groups, but came from liberal and conservative elements. And neither is the reaction against us confined to those groups whose somewhat limited access to information might excuse some of the distortion in their minds.

I well remember two fairly high-level Soviet officials, both concerned with Russian press and information activities, one in Moscow and the other in China, whom I came to know fairly well some years ago when I was involved in the same sort of work for the American government. Both were educated, well-read men who knew a good deal about the United States and were able to separate fact from an official line. Both were convinced almost beyond reach of argument that the fact and substance of race relations in America differed little from those of 1860, whatever the changes in outward form. Any attempted balancing of the picture on my part was discounted as being only what an American official might be expected to say. Could I produce written evidence of my statements? I could not, because the balance of the material in the American press as between advances and failures clearly seemed to substantiate their worst assumptions. Any attempt to explain this imbalance on grounds that trouble and sensation are news which people prefer to read, whereas orderly progress is not, and that a free American press for the most part prints what it thinks people will read was only an open offer for an attack on the general irresponsibility and immaturity of the American people and press.

"Freedom of the Press"

It is no answer to say that this reaction came from those who have turned out to be hostile to us, despite the fond illusions of the war years. Just as vividly can I remember comparable conversations with many Asians and Europeans whose friendship and sympathy for the United States have been demonstrated beyond question. The American kind of freedom of the press is hard enough to explain to peoples in this world who have traditions of freedom themselves; for that vast majority lacking any such tradition the task often seems hopeless. It is all very well to explain to the more sophisticated that a few American communities and their press have learned the hard lesson that exposure of racial atrocities is not necessarily the cure, that sensational headlines as likely as not can inflame passion and prejudice, and that, therefore, there are instances of responsible suppression of news. This, however, is no answer to the gnawing question about the responsibility of the press to educate and to inform fully; or if one accept the stated excuse of publishers that the public will not read the kind of news which should be published, then the even more troublesome question about the maturity of the American people who claim leadership of the free world.

The action of a Protestant congregation in Connecticut in electing a Negro as its minister without even considering his race, or the closing of a church by the Archbishop of New Orleans because of trouble over a Negro priest, which earned him the commendation of the Vatican, receive minimal coverage, where reported at all (a notable and expected exception of course being the *New York Times*). On the other hand, the Washington *Daily News* devotes a full half page to the disgraceful utterances and activities of a faculty mem-

ber of Georgetown University; whereas the disclaimer by the University that the good doctor in any sense represented the views of the University can be covered in a sentence, and is not considered worthy of a headline which would give the casual, average reader the impression that one of the great universities of America was having no truck with this kind of racial shamelessness.

Since public immaturity is hardly the whole answer in a people who have shown themselves so mature in other respects, perhaps part of the answer is that an American sense of shame and guilt that the record has not been better than it has, has led us to play down the advances and play up the failures—a kind of self-flagellation, which may be a hopeful sign for the eventual outcome. It is not in my province here to assess the meaning and implications of such a possibility in domestic American terms, but it is important to repeat again the damage it has done us abroad and the serious reservations it has created in the world mind, especially the Asian, about the validity of our professions.

A Story to Be Told

The fact is—and here I speak as much to Asians as to Americans—that there is another and exciting part of the picture of which all Americans can be proud. Despite the failures and despite the unpleasant fact that the United States was among the last of the so-called civilized countries to reject slavery as national policy, the racial advances of the United States during the past ninety years have been one of the great stories of recorded history. Without in any sense condoning what we have not done, we can and should speak with assurance of what we have done. Ninety years ago there was fought the bitterest and most devastating war in the history of the Americas—a civil war at that; a primary issue was freedom and equality for a large minority group brought here from an alien culture generations before and kept in servitude, illiterate, without economic opportunity, step by step losing its own ancestral and cultural traditions and because of its status having only the narrowest chance of creating something new, and whose psychological and social problems were complicated as offspring resulting from exercise of their property rights by white owners in periodic visits to the slave quarters were for the most part also kept in slavery. At the time this group was largely concentrated in that section of the country which for decades remained dedicated to nullifying the promises of the Emancipation and in which certain elements seemingly would still rather perish than change. The rest of the country was quickly too preoccupied with the prospects of the dazzling American expansion and development which followed the Civil War to lend much of a helping hand to a group that faced freedom with little else than an inferiority complex and its own considerable natural endowments.

The story of what has happened between then and today has many brilliant pages. It is a story which bears telling and retelling. What that story is can be found in the rest of this issue of THE ANNALS. Our government can and does tell much of it, but it can have only limited impact simply because it is government and not unnaturally suspect. The true impact can come only as we tell the story to each other day by day in true perspective and as private citizens. What free men tell each other carries a conviction nothing else can.

U. S. Position in Asia

No small part of traditional American prestige in Asia has come from our advocacy of "desegregation" for Asians.

In practical terms this began with the open-door policy and was followed by our support for Asian nationalist movements, our belief in the right of peoples to choose their own way of life, our specific compliance with promises to the Philippines, our renunciation of special privileges in China, our acceptance of Japan as a major power. If at times there were qualms about how we seemed to interpret our words at home, there seemed to be no reason for such fears abroad in so far as the immediate and burning Asian ambitions were concerned. We stood up and voted on the right side. Asia today is fully independent, with the exception of the rather special cases of Indochina and Malaya, which no one seriously doubts will in time join the ranks. But a new problem has arisen during the past decade which makes the whole situation uneasy.

Preoccupation with Communism

This problem is the overwhelming American preoccupation with communism and Communist expansion which takes precedence over all other considerations in American thinking, a preoccupation attended by a rather typically American sense of urgency and impatience. We have agreed on the nature of the danger; we believe we know what must be done about it. Anyone who does not accept the diagnosis and the remedy is at best grievously in error and must be corrected, or is potentially a menace. Unhappily, Asia does not always and necessarily agree with us or, as is more frequently the case, sees the problem and the remedy in a somewhat different light, of varying degrees of intensity.

Asian Reactions

Regardless of the nature or degree of disagreement, Asian fears and suspicions are aroused by dogmatic American insistence that the United States alone has the answers. The achievement of "desegregation" has now been followed by the demand for acceptance as equals, for "integration" in which the various Asian voices shall command the same respect as those of the erstwhile colonial powers even when they are raised in dissent or opposition. In frustration at so far having failed to receive that acceptance, Asian countries have understandably focused resentment on the major power that has taken the most rigid and clamorous position about communism in a fashion of which many Asians often disapprove.

It is hardly accident or surprising that Asians in attempting to understand our attitude should—most ably assisted by Communist propaganda—rediscover the glaring chink in our racial armor and begin to suspect that we are willing to desegregate but not to integrate. Close as they are to the achievement of their own independence, they not unnaturally feel intensely about acceptance as equals and in addition fear that American insistence on having its own way in this problem will end up as infringement on their independence. They see in our posture at least a residue of what has been described in an ugly, if graphic, phrase as a "nigger attitude." The reaction is not wholly without justification, as anyone who has observed American behavior abroad can testify. When we are concerned by foreign reactions we would do well to remember that in our position we no longer have a private life, and that what we do at home takes on an enlarged, perhaps often exaggerated, importance in the eyes of the world as evidence of what an anxious world can expect from us. Undoubtedly what Mississippi does about its school system worries New Delhi more than it does Chicago.

A final word of friendly suggestion for Asians. No problems of this magnitude are simple of solution. Certainly

no good solution is possible without mutual understanding and tolerance, nor is failure of understanding on one side really any justification for failure on the other. The Asian record on race relations is not entirely unblemished. Among many examples which could be cited one need mention only the Chinese record with minorities and the various Indian racial and social conflicts to suggest that certain weaknesses and abuses have at one time or another been indulged in by all men. Even if "under Heaven all men are brothers," the perfect brother is still a fairly rare phenomenon.

ALL HAVE SINNED . . .

In all countries, a certain contrite awareness of the mistakes of the past might well contribute to greater mutual respect and understanding, without which no flow of pious wishes or written words can be much more than an exercise in good intentions and bad style.

John F. Melby, Ph.D., Philadelphia, Pennsylvania, is executive vice-president of the National Council on Asian Affairs and lecturer on government and polices in the Far East, University of Pennsylvania. He was for sixteen years a Foreign Service officer of the United States, with service in Latin America, the Soviet Union, and during the past ten years in China and Southeast Asia. He served also as director of the United States Educational Foundation in China (Fulbright) in 1948; chairman, Joint State Defense Military Assistance Mission to Southeast Asia, 1950; acting director, Office of War Information, Moscow, 1944; and research associate in Southeast Asia Studies, Yale University, 1954–55.

Social Science and the Desegregation Process

By HERBERT BLUMER

THIS paper undertakes to analyze segregation as a social process. Subsequently, consideration is given to the problem of desegregation and to the general lines along which programs of desegregation must move. Our concern is primarily with racial desegregation.

Segregation is continuously at work in all human societies as a natural, unguided, and unwitting process. It takes the form of a diverse and chiefly undesigned operation which sets apart groups of people inside of a larger, embracing society. This setting apart may result from practices of exclusion employed by one group against others, or by voluntary withdrawal on the part of given groups, or by the operation of natural forces which place individuals in different localities or different social spheres. The result of this undesigned process is to form disparate groups. Each group is relatively homogeneous. Each constitutes the arena for the bulk of the associations and experiences of its members. Each is limited in access to the life of other groups. Each is denied, accordingly, the special privileges granted by other groups to their members. Segregation is a primary means by which a human society develops an inner organization—an allocation of diverse elements into an articulated arrangement.

NATURE OF SEGREGATION

Sociologists have been concerned with two chief manifestations of this natural process of segregation. These are (1) the formation of diversified areas of residence, chiefly in large cities, and (2) the exclusion exercised by human groups in accepting members and in granting privileges. A brief consideration of these two forms of segregation will be helpful.

Ecological studies of the residential distribution of people, particularly in large cities, show a pattern of distinguishable areas. Each area tends to be distinctive in terms of the people who inhabit it, the kind of local institutions lodged in it, and the general round of life of its people. Such areas are familiar to us in the case of "black belts," "little Italies," and other ethnic areas; they are also noted in the case of slums, workingmen areas, homeless-men areas, apartment-house areas, "gold coasts," and rooming-house areas.

The formation of such differentiated areas, while not unaffected by deliberate governmental policy, is primarily a natural and spontaneous process. They are the product roughly of three kinds of forces: (1) neutral forces, such as level of income and accessibility to places of work; (2) forces of attraction, such as wishing to live among people with whom one identifies oneself; and (3) forces of rejection, as when people are found unacceptable or unsuitable as residents in given areas. This process of ecological differentiation, operating without any over-all conscious design, promotes the formation of separate social worlds, guides and fosters separate areas of association, and restricts participation in the life of outside groups. In our modern complex world this natural process of ecological allocation has become a primary medium and cause of segregation.

The study of human group life reveals clearly another line of segregation in the form of the exclusion exercised by one group against members of other

groups. Such exclusion is indigenous in human societies. Every group having a sense of identity and some kind of purpose exercises some measure of control over membership in its body and over access to the privileges which its life affords. Whether it be a family, a social club, a clique, a group of friends, a business organization, a professional society, a labor union, a church, or a self-conscious neighborhood, the group necessarily recognizes certain criteria of membership and rejects those who are deemed not to meet such criteria. Similarly, it does not grant to outsiders the particular rights and privileges open to its membership. It is only because such group exclusion is so rarely challenged that we fail to realize how basic and extensive it is in the life of human societies. If groups could not draw lines and exercise control over accessibility to their ranks and their privileges, their existence would be intrinsically doomed and group life would be chaotic. In this legitimate sense there is in play in every human society a continuous process of preserving group domains and of excluding outsiders from ingress into such domains. Quite obviously, this process of exclusion has the effect of allocating people into separate groups, of confining them to such groups, and of establishing barriers to their free participation in each other's group life.

These few remarks call attention to the fact that a twofold process of segregation is continuously at work in modern society. This process is natural, spontaneous, and inevitable. It is essential, in the form of group exclusion, to the existence of all human societies; in the form of ecological differentiation it is essential to the existence of modern, urbanized societies. One can say, rhetorically, that the process of segregation in one or the other form is accepted, employed, and condoned by all human societies.

SEGREGATION AS A SOCIAL PROBLEM

It is evident, immediately, that when we speak of segregation as a social problem, as a condition to be prevented or overcome, we are not referring to the total process of segregation. We refer instead only to special instances which have been challenged. Such challenges arise in the form of a claim to the right of being accepted into a group or sharing the privileges which the group denies through its act of exclusion. It is evident that the claim arises and has validity only through the application of the standards of a larger inclusive group, such as an embracing political society with legal rights of citizenship or a transcending moral community with a set of ethical expectations. Given lines or instances of group exclusion become suspect only when they contravene political or moral rights. Since this constitutes the heart of the *problem* of segregation, a few further words of elaboration are in order.

Every human group may be regarded as having properly an area of private rights—chiefly in the form of deciding whom to allow to become members and to enjoy the privileges which the group life is able to provide. As suggested above, the group possession of such areas of private right is sanctioned in every society irrespective of wide differences in the nature of the rights and in the gratifications which their exercise yields. Discrimination arises when a given line of private right is defined legally or morally as a public right and the group does not accept the definition. The continuing exercise of the private right at the expense of a given group having legal or moral claims to the privileges is what constitutes segregation as a social problem. Thus segregation, as a problem, arises in the wake of the application of moral or legal definitions which stake out claims where none existed previously. Many forms of group exclusion may have a legitimate acceptance and status only to be defined later as contravening public rights. Since in our changing modern world new legal and moral definitions are readily applied to varieties of established group exclusions, we may expect new problems of segregation to arise.

In locating the problem of segregation in a clash between established group exclusion and a legal or moral claim to the privileges protected by the exclusion we can identify the lines of force affecting the outcome of the clash. On the one hand, note has to be taken of how deeply set is the practice of group exclusion and how effective is the apparatus for maintaining the practice. On the other hand, attention must be given to the authority attending the moral or legal claim and, again, to the effectiveness of the apparatus available to implement the claim. These observations set a broad framework inside of which a more detailed analysis can be undertaken.

THE SEGREGATING GROUP

To understand segregation it is necessary to see its position in the life of the segregating group. Almost always the practices of exclusion or rejection which it involves have grown up naturally in the life experiences of the group. Through these life experiences the group has come to develop a social position, a sense of identity, and a conception of itself in the light of which the practice of exclusion appears natural and proper. As a natural part of the social order the practice comes to be embedded in feelings and convictions and to be justified logically by a set of reasons whose validity is self-evident. Also, the practice is usually legitimated and bulwarked by the endorsement given by institutional authorities within the group; as the spokesmen of the group their official approval places a stamp of truth and virtue on the practice. Further, as a customary practice the exclusion feeds, so to speak, on itself; its continuous routine occurrence becomes an affirmation of its validity. As each member of the group gives expression to the practice in voice and deed; he reinforces in other members the value which all of them are disposed to attach to the practice. Sustained by these various sources of strength and sanction the established practice of group exclusion tends to be a firm part of the way of life.

This general process which imparts toughness and fixity to established practices of group exclusion is usually intensified in cases of racial segregation. The reasons for this are fairly clear. The recognition of racial or physical difference sustains and intensifies the sense of social or status difference which may have happened to develop between racial groups. The observable physical difference reinforces and rivets the feeling of the dominant racial group that the subordinate racial group is alien and not of its kind. Similarly, the feeling of superiority in the dominant group derives a greater measure of natural validity by virtue of the ability to note biological differences between the two groups. Thus, the feeling of racial difference adds tenacity to the practices of exclusion.

We need to note, also, that the range of exclusions between racial groups is likely to be extensive. They meet each other not in a restricted or specialized way, as in the case of the relation of journeymen to apprentices, but over a wide area of diverse association. Where a sense of racial difference has been fused with a sense of status difference, the inevitable tendency will be to extend the practice of exclusion along the

array of relations. Since each line of exclusion symbolizes to the dominant group its social position, all its established lines of exclusion hang together and sustain each other.

In a further continuation of our background remarks we wish to point out that patterns of racial exclusion may decline and wither away as naturally and unwittingly as they come into existence and grow. Any number of developments may interfere with the conditions and processes that cause and sustain such patterns. The social positions of the two racial groups may be shifted by changes in wealth, education, achievement, and prowess. The dominant group may change its conception of itself and of the subordinate group. Members of two racial groups may be forced through sheer expediency to associate in ways contrary to established lines of exclusion, as under varying conditions of complex industrial life. The dominant racial group may lose much of its identity through the mobility of its members and through their intermingling with other people who are not accustomed to draw the usual lines of exclusion; in this way practices of exclusion do not get the affirmation that comes otherwise from their regular and unquestioned repetition. The spokesmen and institutional leaders of the dominant group may come to appraise the established exclusions in new and different ways; to speak with a divided voice is to fragment the standing of the practices. Such occurrences as these may undermine in a natural and undesigned way established patterns of racial exclusion, without the benefit of organized efforts to eradicate them. The significance of a natural and unwitting disintegration of established patterns of racial exclusion is pronounced. It is doubtful if deliberate efforts to break down given forms of exclusion in a firmly established racial order can succeed without the operation of a prior or a concurrent process of their natural undermining.

DESEGREGATION

We can now consider the problem of desegregation. We are interested in considering the general problem of how practices of racial exclusion which are challenged as morally improper or illegal are eliminated through conscious policy and deliberate action. In other words we deal with desegregation not as a natural and unwitting process but as a directed effort to displace an established form of racial exclusion. In this latter form the problem of desegregation is thrown on a different plane. It is not a task of eliminating or reversing the process which led to segregation but rather of arresting or immobilizing its end operation.

To be sure, much—indeed most—of scholarly thought in current psychological and social science presumes that racial desegregation is to be achieved by the elimination or changing of the process which brings segregation into being. This process is usually given a four-step temporal sequence: (1) conditions which implant (2) attitudes of racial prejudice which (3) lead to racial discrimination which (4) results in a condition of segregation. It is thus reasoned that to eliminate segregation one has to eliminate discrimination; to eliminate discrimination one has to change the attitudes which bring it about; and, usually, to change the attitudes one has to correct the conditions that cause them.

Such a formulation is markedly unsuited to success in conscious efforts at racial desegregation. It implies, essentially, a destruction of a tightly interwoven and solid social structure. This can be appreciated by bearing in mind that a given form of racial exclusion is a customary adjustment which has evolved naturally out of given lines of historic experience; that it reflects the actual social positions occupied by the racial groups in their social order; that it expresses the fundamental conception which the dominant racial group has of itself and of the subordinate group; that it carries the virtue and the validity of authoritative endorsement; that it gains continuous affirmation through the daily reinforcement which members of the dominant group give to one another's feelings and convictions; and that it is an interlinked part of a system of racial exclusion. To try to eliminate the given practice of racial exclusion by altering the network of conditions which bring it about and sustain it is a task of formidable magnitude. To try to eliminate the practice by changing one phase or part of the network—as in the effort to inculcate attitudes of racial tolerance—is to ignore the complicated structure which sustains the phase or part. The attempt to achieve racial desegregation by a correction of the process which brings segregation about represents a highly unpromising line of action.

The alternative is to block the process from achieving its end result. This is done by controlling the decisions of the main functionaries who carry a given form of racial segregation into actual execution. It is important to recognize that in any given kind of racial segregation there are strategically placed individuals or small groups who set the policies and issue the orders without which the given practice of segregation could not be maintained. School boards, superintendents of education, real estate boards, realtors, hotel owners and managers, medical boards, hospital superintendents, and directors of recreational systems are a very few examples. All work through a system of subordinates who in carrying out orders and understood policies sustain in practice the given form of racial segregation. Thus, control of the decisions of the chief functionaries responsible for the actual operation of the practice of segregation offers a direct means of arresting or immobilizing that practice. To put the point in terms of a theory of social action we can say that it is not essential in efforts to change human conduct to alter, on the part of individuals, the feelings and attitudes behind that conduct, or, on the part of the group, the collective values, claims, and expectations which sustain the conduct. Feelings and attitudes, values and expectations, have *to gain expression* in conduct; the apparatus essential to such expression is, itself, vulnerable and offers pivotal points for arresting the end expression. Contemporary social and psychological science is backward in coming to see and appreciate this picture.

ROLE OF FUNCTIONARIES

To exert effective influence on the decisions of centrally placed functionaries in the operating pattern of segregation it is necessary to use the weight of transcending prestige, authority, and power. The functionaries, as members of the dominant racial group, are highly likely to share the feelings and values of that group toward the given form of exclusion, or else to respond to the expectations and pressures of that group. For them to make decisions that are opposed to the feelings and expectations of the dominant group it is necessary for them to be constrained and supported by a transcending group having prestige or power.

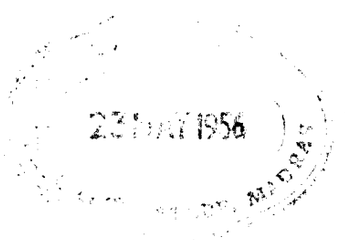
Basically, the outcome of the struggle to achieve racial desegregation through conscious effort depends on what influences the central functionaries have to take into account in making their decisions. If the conscious effort takes the

form of an educational campaign to change the views of the members of the dominant racial group or a campaign of moral exhortation to change their feelings, the functionaries are essentially well protected. They need merely, so to speak, await the outcome of such effort; they are subjected to no special pressure to change their customary lines of decision and are not forced in juxtaposition to their own group. Parenthetically, this is another reason for the relative ineffectiveness of attempts to achieve racial desegregation through general educational and moral campaigns.

A different setting is formed if the conscious efforts at desegregation are along lines which force functionaries to take cognizance of solicitations, demands, and pressures made on them to carry out a different line of decision. Such influences, if attended by any degree of weight, have the effect, psychologically, of detaching the functionaries from their group and of leading them to weigh such influences over against the views and expectations of their racial group. This is the kind of setting that is brought into being by the enactment and application of laws against segregation or by the imposition of regulations and expectations against segregation by leaders of associations and institutions in which the functionaries are in some measure incorporated. The functionaries have to take account of these demands and to form their decisions with some regard to the demands. In a genuine sense the functionary is an exposed target. This is the basic fact which structures the struggle toward deliberate racial desegregation. It also provides the opportunity for adroit advancement even where the dominant racial group is solidly opposed in feeling to a given line of desegregation.

ROLE OF ORGANIZATIONS

Recognizing the pivotal position of the decisions of functionaries, we easily see the important role of organizational pressure and support. The dominant group in a racial community, to a man, may have strong feelings of opposition to a given form of desegregation, yet be lacking in organizations to mobilize such opposition and convert it into action. Under such conditions, even though sharing the feelings of the dominant group the functionary may readily bow to the outside demands and pressures, particularly if these are backed up by weighty organizational support. Conversely, a functionary sympathetic to desegregation may be effectively deterred, not necessarily by the attitudes held by the members of the dominant racial group but by organizations among them that bespeak trouble. There is no need to spell out other possible combinations. The central point is clear. The carrying through as well as the blocking of deliberate desegregation depends on mobilizing and focusing influence and power on central functionaries. This calls, in the case of either side, for the development of organizational strength. The vehicle of procedure is strategical maneuvering, designed to marshal and utilize the potentials of power and prestige available in the given situation. Such potentials are almost certain to vary from situation to situation, thus calling for different tactical operations on local scenes.



It should be observed that in this contest, so to speak, to affect the decisions of the central functionaries, the advantage in the long run is in the hands of the side which is able to capitalize on the prestige and strength of the transcending group. Agencies seeking to achieve racial desegregation have a particularly strong strategic weapon

(it is not always seen or used) in focusing on the validity of *applying* the transcending legal or moral standard. This makes it unnecessary to challenge or impugn the feelings and attitudes of the functionary toward the subordinate racial group, or to try to change such feelings and attitudes. It makes it unnecessary, further, to argue the merits or the validity of the legal or moral standard. Instead, the approach to the functionary can appropriately be made in terms of the validity and need of *applying* the standard. This provides the opportunity of shifting the contest from a question of a struggle between the racial groups to a question of obedience to the transcending legal or moral standards. Since such standards carry implicitly the dictates of obedience, one is provided with a line along which to press the case which can largely avoid the issue of racial dispute. It may be added that this line becomes the most effective basis on which to build up organizational strength in acting toward central functionaries, for it offers opportunities of enlisting a support inside the dominant racial group that would be lost on the straight issue of racial struggle.

CONCLUSIONS

A few remarks should be made, in closing, on the relation of conscious or designed racial desegregation to natural and unwitting racial desegregation. There can be no question that the former acts back on and abets the latter. Where given programs of racial desegregation succeed, they weaken the support of other established forms of segregation. They interfere with the routine, repetitive affirmation of lines of racial exclusion. Further, in allowing the members of the racial groups to associate as equals in the new situation they lay the groundwork for acting toward one another on a human and personal basis rather than on a basis of membership in racial groups. Deliberate desegregation enters, thus, into a cyclical and reciprocal relation with natural desegregation.

Herbert Blumer, Ph.D., Berkeley, California, is chairman of the Department of Sociology and Social Institutions, University of California, Berkeley, and president of the American Sociological Society. In 1954 he was a member of the International Conference on Race Relations in Honolulu. Before going to California, he was a member of the Department of Sociology of the University of Chicago (1927–52). Past president of the Society for the Study of Social Problems and former editor of the American Journal of Sociology, he is the author of Appraisals of Social Research (1939) and other books.

Report of the Board of Directors to the Members of The American Academy of Political and Social Science for the Year 1955

THE year which has just passed has been a fruitful one for the Academy and one of more than ordinary activity.

Bylaws

At the annual meeting on January 24, 1955, you approved a revision of the Bylaws. According to Article VIII of these Bylaws, amendments may be made "by a majority vote of those present at any meeting of the members of the corporation or of the Board of Directors," and it is also provided that if the Board of Directors amend the Bylaws, the change "shall continue in effect unless and until altered at a meeting of the members of the corporation."

At the meeting of the Board of Directors immediately following the meeting of members mentioned above, the following changes in the Bylaws were made and are now submitted for your approval.

Instead of the following wording:

> There shall be at least one regular meeting of the Board of Directors in each year. The time and place of such meetings shall be determined by the Board of Directors.

Section 2 of Article V now reads:

> A meeting of the Board of Directors shall be held immediately following the annual business meeting of the members. If a quorum of directors be then present no notice of such meeting shall be necessary and at such organization meeting the Board of Directors may elect officers for the ensuing year and may also transact any other business coming before the meeting. In addition to such meeting, regular meetings of the Board of Directors shall be held on the fourth Fridays of May and October in each year at such place and hour as may be determined by the President or by a majority of the directors.

Furthermore, Section 3 of Article VI:

> The first Vice-President shall in the absence or during the disability of the President have all the powers and perform all the duties of the President.

was amended by the addition of the following words:

> . . . provided however that the Board of Directors may grant the President a leave of absence for any period and may delegate the powers and assign the duties of the President for such period or any portion thereof to some officer other than the First Vice-President, including any officer specially elected or appointed for the purpose, and may revoke such delegation of powers and assignment of duties at the pleasure of the Board.

Meetings

There were two meetings held in Philadelphia during the year. One was our regular spring convention on April 1 and 2, which for the first time in several decades dealt with an important domestic issue rather than with international relations. The general topic of the meeting was "Internal Security and Civil Rights in the United States." A distinguished array of highly competent speakers addressed the convention, and the discussion from the floor was of a uniformly high standard. Attendance at six sessions totaled 1,405, among them representatives of learned institutions and national and international organizations.[1]

On May 20 and 21, a restricted conference on "Methods of Financing Higher Education" was held, which brought together presidents, vice-presidents, and finance officials of institutions of higher learning in the eastern and central areas of the country. The conference was made possible by the generosity of members of the family of Edmund J. James, first president of the Academy, and served to commemorate the centenary of his birth.[2]

Publications

The following volumes of THE ANNALS were published during the year and distributed to all members:

January	*Ethical Standards and Professional Conduct*
March	*Contemporary Africa: Trends and Issues*
May	*Air Power and National Security*
July	*Internal Security and Civil Rights*
September	*Higher Education Under Stress*
November	*The Public School and Other Community Services*

A standard feature of THE ANNALS is the book department, which contains reviews of outstanding works in the social science fields. During 1955, no fewer than 408 reviews were published, prepared by 322 different reviewers and totaling about 308 pages.

Current and past issues of THE ANNALS are in constant demand. In 1955, total sales of individual issues amounted to $11,612, compared with $10,697 in 1954 and $11,747 in 1953.

Membership

During 1955, the Academy admitted 2,652 new members, 265 of whom were student members. There were 3,523 withdrawals and 35 members died during the year. On December 31 there were altogether 14,478 members in good standing, including 3,177 libraries in the United States. The Academy has 1,503 foreign members, including 758 libraries.

Finances

It is a pleasure to report to you that as a result of the moderate increase in membership dues in 1954 and further economies in management, we closed the year 1955 with a favorable balance of income amounting to $11,401.38, compared with a deficit of $7,173 in 1954 and even larger deficits in 1952 and 1953.

Respectfully submitted,
THE BOARD OF DIRECTORS

Thorsten Sellin, *Acting President*
C. A. Kulp, *First Vice-President*
Raymond T. Bowman, *Secretary*
Lewis M. Stevens, *Counsel*

Otto T. Mallery, M. Albert Linton, Alfred H. Williams, Stephen B. Sweeney, Jerome J. Rothschild, Norman D. Palmer, James C. Charlesworth.

January 23, 1956

[1] The addresses were published in the July issue of THE ANNALS.

[2] The proceedings were published as a section of the September issue of THE ANNALS and were also reprinted in a pamphlet which was given wide distribution.

REPORT OF AUDITORS

January 17, 1956

MR. T. WESLEY MATTHEWS, *Asst. Treasurer*
The American Academy of Political and Social Science
3937 Chestnut Street
Philadelphia 4, Pa.

DEAR SIR:

We have examined the accounts and financial records of The American Academy of Political and Social Science for the year ended December 31, 1955. Our examination was made in accordance with generally accepted auditing standard, and accordingly included such tests of the accounting records and such other auditing procedure as we considered necessary in the circumstances, except that we did not count or test the inventory of publications. We did, however, review the inventory procedure and pricing method and we believe that the inventory is stated conservatively.

In our opinion, with the exception of the inventory, the accompanying statement of financial condition and statement of income and expense present fairly the financial position of The American Academy of Political and Social Science at December 31, 1955, and the results of its operation for the year then ended, in conformity with generally accepted accounting principles applied on a basis consistent with that of the preceding year.

Your very truly,
SAMUEL R. SAPIENZA
Certified Public Accountant

INTERNATIONAL RELATIONS AND WORLD GOVERNMENT

LESTER B. PEARSON. *Democracy in World Politics.* Pp. ix, 123. Princeton, N. J.: Princeton University Press, 1955. $2.75.

It must have been a pleasure to listen to the Stafford Little Lectures for 1955 and to hear Mr. Pearson, Canadian Secretary of State for External Affairs, make an effective apologia for such respectable things as democracy, the United Nations, North Atlantic Treaty Organization, the Commonwealth, the Canadian monarchy, parliamentary government, and even diplomacy. The lectures are full of ideas expressed with clarity, directness, and vigor.

The best example of the excellence and of the limitations of the argument is the discussion of the hydrogen bomb. Massive deterrence, Mr. Pearson contends, is useful as a safeguard against the sort of war which might destroy mankind and should not be used or threatened to prevent wars with traditional weapons (including minor atomic weapons). It is justifiable to resist force by necessary violence but not by excessive violence. It follows that war aims should be moderate, and that unconditional surrender should not be sought.

Analogies from the criminal law (self-defence does not justify unnecessary violence) and the Bible (the threat of an eye for an eye is condoned, but not the threat of two eyes for one) are chosen to support this doctrine. They cannot be pressed: the law allows violence against an armed burglar, and, indeed, against a burglar who may be armed. The *talio* regulated revenge; it did not concern defence or deterrence. And unconditional surrender may be the only safe war aim for allies who distrust each other.

The practical consequences of the doctrine are important. It is a doctrine for the strong man armed and not for the weak. A country disposed to practice it must maintain costly armaments at two levels, if not at three (traditional, fission, and fusion). It is not clear what is to happen if it has overestimated its strength and faces defeat; if its allies collapse; if its people recoil from the casualties of traditional war. Must it be prepared to surrender unconditionally? Or, satisfied that it has done its best, may it resort to the hydrogen bomb? It is well to ponder these questions and to remember that our enemies, particularly if as we hope they are weaker than we are, will have them in mind. Mr. Pearson does not press them.

Hypothetical questions, the stock in trade of the academic lecturer, are distasteful to the statesman. So too, one might think, would be the penetrating observation that "the persistent flaunting (sic) of the conviction of the majority would make government impossible." Perhaps we shall never know if Mr. Pearson, who is an unusually frank statesman, permitted himself a moment of cynicism or if the printer let him down!

KENNETH INGRAM. *A History of the Cold War.* Pp. 239. New York: Philosophical Library, 1955. $5.00.

A History of the Cold War is a book by a British author who has written a dozen other volumes on political and social topics, including a recent history of World War II, *The Years of Crisis,* out of which this volume grew.

It was his study of the war which led Ingram to attack the "fundamental misconception" that the West put the past behind it when it became an ally of Russia.

This introductory denial of one of our most fixed ideas will make the book unpalatable to most Americans. An even greater shock to our cold war beliefs is to be found in the conclusions of his last chapter: (1) that the Soviet Union never at any time intended to wage a large-scale war upon the West; (2) that there is no evidence of any intent to wage attrition wars through her Satellites; (3) and that the two acts which stirred Europe so deeply, the Communist seizure of Czechoslovakia and the Berlin blockade, were defensive efforts to consolidate the postwar Soviet sphere, growing out of the earlier stages of the cold war.

He reasons that the Berlin blockade did not occur until: (a) the West was setting up a new German state, with a new capital, thereby removing the basic reason for the special status of Berlin; (b) it was evident that the West intended to rearm Germany; and (c) the West introduced a currency reform which would force a similar one upon the Soviets.

In the Korean War we suspect Soviet instigation, but he maintains that "suspicions are not proof." When, also, we abandoned the police role of the United Nations at the 38th Parallel and became cobelligerents with South Korea, we were "no longer morally entitled to indict China." Now he asks whether in China's absence from the United Nations Security Council any action taken by this body is legal?

In reaching his conclusions Ingram omits much supporting evidence. He overlooks almost entirely the tremendous importance of the Truman Doctrine in powering the cold war. Its body blow to the Big Four Conference on Germany, then sitting, is not mentioned. The great role of the atomic-arms race is not developed. The surging tides of preventive-war feeling in this country are not described. However, the author has not offered the book as a final study of the cold war. It is a first outline.

Even those who reject his belief that "toughness" was the worst possible cure for the deep-seated Soviet fear and inferiority complexes cannot afford to miss reading this book, since it forecasts the considerations they have to meet.

D. F. FLEMING
Vanderbilt University

A. H. BIRCH. *Federalism, Finance and Social Legislation in Canada, Australia, and the United States.* Pp. xiv, 314. Oxford, England: Oxford University Press, 1955. $5.60.

In Canada and Australia the central government has almost completely absorbed customs and income taxes, as well as most excises, thus depriving the local governments of revenue. Without subsidies from the central government the poorer states, especially, would suffer, and with the growth of social legislation, where equality of treatment throughout the country is desired, they would be unable to bear the burden. The Australian states derive at least 60 per cent of their income from subsidies; the Canadian provinces, except for Quebec, at least 30 per cent. The tendency since the war has been for the federal contributions to grow. In the United States the figure has risen from 12 to 20 per cent during this period.

In Canada, from the beginning, direct subsidies have been granted in return for

the surrender of customs and excises. At first granted upon a fairly equitable per capita basis, uneven growth of the provinces in population and wealth made the original plan obsolete, but failure to agree upon a general philosophy of subsidies to meet new conditions encouraged political bickering among the provinces. Indirect methods of subsidy and evasion of restrictions in the British North America Act have resulted. Recently, income, corporation, and succession taxes have been "rented" from the provinces according to a plan that gives each province a choice among several methods of compensation. Quebec has not yet come in under the plan.

In the United States, direct subsidies would contradict the theory of local autonomy, but indirect methods have not been uncommon. Grants-in-aid, when compared with the incidence of federal taxation, tend to favor the poorer states. Recently, a more direct approach to subsidies, in a relaxation of the matching principle for states of low income, has appeared in the National School Lunch Act and the Hospital Construction Act.

The book might have been more readable if the complete story for each country could have been told separately, but the presentation of a large research product in a complex subject necessarily involves difficulties in organization. There is a brief section on the newer federations particularly India, Nigeria, British Central Africa, and the proposed British West Indian federation.

W. REED WEST
George Washington University

WILLARD N. HOGAN. *International Conflict and Collective Security.* Pp. vi, 202. Lexington: University of Kentucky Press, 1955. $3.50.

This is a painstaking case study in format, technique, and scope suggestive of a doctoral dissertation, of what the author calls the "principle of concern" in international relations. War between or among any nations is regarded as affecting all, and when one attacks another it is guilty of an offense against all. The author points out that this "principle" was first incorporated into international organization in Article 11 of the League of Nations Covenant which declared war or the threat of war "a matter of concern" to all of the members of the League.

The problem of the adequate implementation of this "principle" so that aggressors may be restrained or punished, and peace preserved or restored has as yet proved insoluble in a world of sovereign states in which fear and ambition, rather than universally accepted legal principles and a fundamental political consensus, determine the conduct of these states. The presumption of political change only by peaceful means is directly expressed or inheres in the League Covenant, in the Pact of Paris, and the United Nations, as well as in other formal international undertakings; but flagrant aggression and hot and cold wars still keep the world in turmoil. Fleeting hopes for a better order of things were at one time expressed in the phrase the "spirit of Lucarno." More recently the "spirit of Geneva" is even more rapidly dissolving despite the threat of a nuclear war of annihilation.

However, the author does not permit himself to be deflected by a sense of tragedy from the prosaic, but useful task of portraying and analyzing the instruments and procedures of pacific settlement which have been devised since the First World War. Likewise he records the conflicting points of view of nations whose history, political predilections, geographic conditions, and economic circumstances present formidable obstacles to the implementation of the "principle of concern," or even to universal acceptance of its validity.

In the concluding pages the author discusses briefly the opponents of a collective security system such as that provided in the United Nations Charter. These include the isolationists and neutralists who "reject the basic validity of the principle of concern"; (p. 181) the world government advocates whose position is regarded as unrealistic since "the prerequisites and conditions for an effective world government are not presently available"; (p. 182) and the critics such as Hans Morgenthau who find the "concept of collective security . . . in principle unworkable" (p. 181). This the author denies and seeks to demonstrate the falsity of the several assumptions upon which Morgenthau relies to support his position.

FRANK M. RUSSELL
Berkeley, Calif.

UNITED STATES GOVERNMENT AND HISTORY

JOSEPH M. JONES. *The Fifteen Weeks (February 21–June 5, 1947).* Pp. viii, 296. New York: Viking Press, 1955. $3.75.

DONALD F. DRUMMOND. *The Passing of American Neutrality, 1937–1941.* Pp. vi, 409, ii. Ann Arbor: University of Michigan Press; London: Geoffrey Cumberlege, Oxford University Press, 1955. $7.50.

These two books tell a valuable story of a change in the policy of the United States which was almost revolutionary in character. On February 21, 1947, the British government let it be known to our officials in the State Department that it was impossible for that government to undertake further responsibility in the Near East and would withdraw the forces stationed in Greece. The only way to prevent Greece from falling into the hands of the Russian Communists would be for the United States to fill the breach and become an active guardian of the interests in the eastern Mediterranean. This would be a complete change of American policy since the time of George Washington. Even Monroe's enunciation of the Monroe Doctrine, in 1823, contained less danger to American interests than would this new action and its influence on American foreign policy. Nevertheless, it was a momentous action that the Truman administration thus left the policy of George Washington and started the United States in a new direction which was bound to have great significance in the history of the times. Mr. Truman appeared before a joint session of Congress on February 21 and announced his decision to undertake the consequent change to our policy.

Secretary Acheson followed this up by a speech in Cleveland, Mississippi before the Delta Council and on the following June 5, General Marshall carried further the advocacy of the new policy at Harvard University, Cambridge, Massachusetts. These three speeches with the skillful development of a favorable public opinion, were the remarkable accomplishments of the Truman administration. Mr. Jones tells the story of the fifteen weeks in which the American people and their government assumed the responsibility of world leadership.

The merits or demerits of this profound change in direction will be the subject of study by American historians for years to come. One school of thought now contends that the new developments of these fifteen weeks of change from George Washington to Harry S. Truman were from the sublime to the ridiculous. While others, such as Mr. Jones, think Truman and his advisers were showing signs of real statesmanship. It will be some time during years to come before a proper judgment of the matter can be made.

Mr. Jones was a member of the State Department and tells the story from inside knowledge of events that were rapidly changing the whole world policy of the United States. His book represents the highest type of journalistic writing. He wholeheartedly endorses the new Truman policy. There is no wild propaganda, but a setting forth of the facts of the case as he sees them and with a dramatic power of suspense that holds the attention of the reader as would a novel of our times.

Mr. Drummond gives a fine background of the events leading up to the "Fifteen Weeks." His style of writing is restrained and forthright. He gives a fine description of the passing of American neutrality during the years 1937 to 1941 which made possible the change in policy mentioned above. He, likewise, seems to endorse the strange and tortuous changes brought about by the Roosevelt administration which made possible the revolutionary events that followed. He is careful not to stress the giving of the fifty ships to Great Britain and the broad and audacious policy of "lend lease," which, under the guise of measures of peace, were a virtual declaration of war against Germany and her allies.

Like Mr. Jones, he seems to endorse the policies of Roosevelt and Truman, but in a scholarly way. This is an excellent book and worthy of careful reading by the students of today.

WILLIAM STARR MYERS
Princeton University

RICHARD HOFSTADTER. *The Age of Reform: From Bryan to F.D.R.* Pp. viii, 328. New York: Alfred A. Knopf, 1955. $4.50.

Although relatively young, Professor Hofstadter has established a reputation for himself among American scholars. *The Age of Reform* adds to his achievements as a brilliant writer. Many books have been written on the period 1890–1940, and this will not be the last, but when the final appraisal has been made many of this author's interpretations will prevail.

This book deals with three reform movements—Populism, Progressivism, and New Dealism. More than one-third of the book (130 pages) is consumed by Populism. Mr. Hofstadter is not concerned with a narrow approach to American agrarian unrest in the 1890's, but he treats the broader aspects of the movement. Populism sprang from the soft side of agrarianism. Its protests were good wholesome Americanism, but the movement spent its force on incongruous and untenable panaceas. Moreover, its efforts towards influencing economic growth were backwards.

If Populism was an outgrowth of increasing poverty among rural folk, Progressivism was a by-product of urban middle class upheaval. It was a reform movement of prosperity, not of economic want. Theodore Roosevelt and Woodrow Wilson, perhaps the two greatest proponents of Progressivism, were much in accord in their political thinking. The author contends, however, that neither of these reform presidents had much in common with Franklin Roosevelt.

To this writer, the New Deal was *new* indeed. That conclusion, along with some others, notably, that Populism was the chief source of anti-Semitism in the United States, will not be accepted unanimously by the students of the period. Obviously, there were many contrasts between New Dealism and Progressivism, and it is of these that Professor Hofstadter has written.

Here is a book that is full of new interpretations of three reform movements in an era that has been much written about. It is a reinterpretation of liberalism by a devoted liberal written in a fascinating style. This book will be avidly read by all Americans who are interested in the Age of Reform.

GEORGE C. OSBORN
University of Florida

EDWARD H. BUEHRIG. *Woodrow Wilson and the Balance of Power.* Pp. x, 325. Bloomington: Indiana University Press, 1955. $5.00.

This is a significant addition to the growing list of Wilsoniana. It is a thought-provoking book in that not all of the author's contentions will be generally accepted by students of Woodrow Wilson.

The author traces briefly the diplomatic history of the United States and England during the nineteenth century. By the close of the century, tension between England and Germany was having its effect on the delicate balance which had been reached in Anglo-American relations. If the United States and Germany evolved different attitudes towards the British control of the seas, neither doubted England's maritime supremacy.

The submarine proved the undoing of cordial relations between the United States and Germany. Not only did Germany's use of below the surface fighting ships corrupt our friendly relations with her, but this innovation of maritime warfare lessened the strain that existed on Anglo-American relations. England's effective blockade of extended sections of Europe's coastline and her policy of increasing the contraband list had placed severe strains upon our cordial relations with her.

The sinking of the *Lusitania* caused a breach in amicable relations between the United States and Germany which never healed. This catastrophe led to Bryan's resignation. Lansing, his successor, early decided that the United States must not permit a German victory even if we had to go to war to prevent it. After discussing at some length the reasons for Germany's use of the submarine and of our possible steps to prevent or curtail it, Professor Buehrig concludes that it is doubtful if submarine warfare could have been averted. Germany felt that her survival was at stake, and she used everything she possessed to prolong her national existence.

The initial identification of the league idea, declares this writer, with the United States policy was due to the diplomatic process itself. In adjusting to the sudden shift in the foundations of international politics Wilson, in May 1916, championed a league of nations. Gradually, the President and his personal advisor, Colonel House, shifted their contention from the maintenance of freedom of the seas to guarantees against aggression.

Repeatedly England's foreign minister, Grey, informed House that only by our entrance into the war could Wilson exert all possible influence on the peace. House was convinced, but Wilson had a mental reservation which, by April 1917, was erased. The conviction came not from Grey but the German use of the submarine.

Our traditional nineteenth-century policy —the Monroe Doctrine—was issued to meet a current menace. Wilson began the shift to a new twentieth-century policy of collective security which transition was completed by 1945. These developments are traced in *Woodrow Wilson and the Balance of Power.*

There are ample notes at the back of the book and the index is accurate. The treatise could have been enlivened by graphic pen portraits of some of the leaders. The book is scholarly, but is burdened with a dull style.

GEORGE C. OSBORN
University of Florida

HUDSON STRODE. *Jefferson Davis: American Patriot, 1808–1861.* Pp. xx, 460. New York: Harcourt, Brace, and Company, 1955. $6.75.

Although the author does not follow the practice, desirable in so many ways, of using page footnotes except on very controversial points, he does use considerable documentation within the narrative, and has a revealing section on Sources and Notes on Sources. He has, in fact, made use of source materials heretofore not used and has thus been able to throw new light on especially Davis' relations with his lawyer-planter brother, Joseph Davis, and on the sentimental phases of his life resulting in his two marriages.

The author's style is fascinating, and his revelation of the character and personality of his subject is superb. Davis is not the cold, austere individual so frequently portrayed by the pens of other writers. Though tragedies in his family and bodily ailments at times made him remorseful or irritable, he was usually warmhearted and intensely human. His integrity, intellectual vigor, and qualities of leadership endeared many to him and evoked admiration even on the part of his opponents.

The author is at his best in describing Davis' personal relationships, the early environmental circumstances that gave direction to his life, his training at West Point, and the period of military service that followed. The early forces that shaped his career were national in character, and in a military capacity and as Secretary of War, he performed distinguished service for the nation.

Dr. Strode presents his subject as one who had the good of the nation at heart also during the stormy years preceding war, and who sincerely felt that forces at work in the north were threatening the constitutional basis upon which the Union rested. He demonstrates, in convincing fashion, the emotional strain under which Davis labored as secession became an actuality. While the author has the happy faculty of presenting much of the history of the times without losing his biographical subject, the reviewer feels that he might have gone even more into the controversial phases of the 1850's without losing the subject. In fact, further light on the Davis-Douglas controversy, the Cuban question, and sectional differences over economic policies might have enabled the reader better to understand opposing forces, and hence to see Davis' political principles in clearer perspective.

This work is, at all odds, the most entertaining and illuminating the reviewer has read on this famous Southerner, and

those who read it, he feels, will await with interest the succeeding volume.

HENRY H. SIMMS
Ohio State University

RALPH KORNGOLD. *Thaddeus Stevens.* Pp. xiv, 460. New York: Harcourt, Brace, and Company, 1955. $6.00.

Thaddeus Stevens remains one of the most paradoxical and little appreciated figures of the Civil War period. Loving freedom as few men of his time did, he hated with equal ardor. Possessed of intellectual stature and genuine political shrewdness, occupying a dominant position in government during the early postwar years, he is remembered chiefly for his bitterness, his hatred, and his frustration. More than a decade ago Richard Current wrote an excellent biography of "Old Thad," yet many questions were unanswered, many problems unsolved. Now Ralph Korngold, author of a popular joint study of Garrison and Phillips, attempts a new appraisal of this strange man.

The author has divided his book into four parts. Law and Politics tells of the barren, unhappy Vermont childhood; the study of law; the early days in Pennsylvania; and makes up about one-fifth of the volume. Congressional Interlude is a relatively brief discussion of Stevens' early Congressional experience and the events that led to Secession. About two-thirds of the volume is devoted to the struggle of Stevens, first against Lincoln and then against Johnson.

The early years of Stevens' life are treated in conventional fashion. It is with his last decade that the author is chiefly concerned. Here the author becomes a pleader in attempting to show that Johnson was as incompetent, as unstable, and as unprincipled as he was so commonly portrayed a half-century ago and in attempting to show that Lincoln was inferior in vision, courage, and character to Stevens.

The author loves freedom and those who fought for freedom. He seems to assume that all who have fought for freedom are inherently good, competent, even superior. He attempts to increase the stature of Stevens by belittling all who opposed him. He even goes to the extreme of committing almost every sin recognized by the objective and painstaking historian. In one section of approximately thirty pages, this reviewer finds careless proofreading (p. 172), misquotes (p. 174), misinterpretations (pp. 175, 179, 194), faulty logic (pp. 184, 189), sensational and unsupported statements (p. 197), oversimplification (p. 198), and an uncritical use of sources (p. 201). The author has repeatedly gone to old, discredited, and strongly biased sources.

It is not necessary to malign Andrew Johnson, to distort and misinterpret the leadership of Lincoln, in order to admire the courage, recognize the superb political leadership, and regret the lack of appreciation commonly accorded Thaddeus Stevens. Mr. Korngold's heart is in the right place; it is unfortunate that he chose such uncritical means to arrive at such questionable conclusions.

RALPH ADAMS BROWN
State University of New York
Cortland, N. Y.

DALE O. SMITH. *U. S. Military Doctrine: A Study and Appraisal.* Pp. xiii, 256. New York: Duell, Sloan, and Pearce; Boston: Little, Brown, and Company, 1955. $3.50.

General Smith, class of 1934 West Point, flew thirty-one combat missions in World War II in command of a B-17 group. Subsequently as director of education at Air University he compiled *Air Force Leadership,* the official manual of the Air Force. His text will convince any reader that he writes with authority, sincerity, and deep conviction. Beginning with the views of Washington on our military policy, he outlines the doctrines of Clausewitz, Jomini, Dennis and Alfred Mahan, and others preparatory to relating the impact of aviation on land and sea power. In his Introduction, he reminds readers of the dangerous Anglo-American habit of denouncing war as something so unholy that it must be ignored, not studied, and he chides Americans of today who still refuse to study why wars continue to recur. The General offers his countrymen much excellent advice.

It was too much to expect an air officer who was reared in the days of Lord Trenchard, Douhet, and General Mitchell to be entirely fair to the sea and ground forces. General Smith is more than generous to the Navy of *1812,* but in quoting from a Japanese officer's statement that control of the air in the western Pacific was the cause of American victory in 1945, he leaves the impression that it was General Arnold's strategic bombers who gained that control. Actually it was Admiral Mark Mitscher's Carrier Task Forces, operating alternately under Admirals Spruance and Halsey, who broke the back of Japanese land and sea aviation. Arnold's bombers were not based near enough to reach Japan until another General Smith, U. S. Marines, captured the Mariannas; even then it was necessary for those incomparable Marines to take another island, Iwo, to provide fighter escort and emergency landing fields to reduce the unbearable losses of bombers.

It was the same in Europe. Anglo-American bombers were given all of 1943 to win the war by direct attacks on the Reich; they only reduced production by 10 per cent; the exhaustion of both bomber forces enabled the Nazis to reach another industrial peak in 1944. Air Chief Marshal Portal, commanding Eisenhower's aviation, knew that the tactical performance of German day-and-night fighters was improving steadily although training periods were reduced by shortage of fuel. So if the invasion were delayed to give the over-optimistic bombers another chance, fighters might prevent the landing entirely. In spite of this manifest failure Anglo-American bombing chiefs with the support of Winston Churchill objected to turning from attacks on Germany's industry to support the landing.

At the end of World War II the theories of air enthusiasts that bombing alone would win wars was completely discredited. This heresy was revived by the dropping of the A-bomb on Hiroshima. Because the first bomb was so heavy that only a very large bomber could deliver it to valuable targets, almost immediately scientists made smaller bombs that could be fired from land and sea artillery or delivered by carrier planes. No longer did the Air Force have a monopoly on delivering nuclear bombs, and they could be used to defend nations and fleets from nuclear attacks.

The most pressing question we face today is defense of the United States from hostile nuclear attacks. The author is apparently convinced that the Air Force can concede the Soviet Union the first blow with nuclear weapon and then retaliate instantly with deadly consequences and win the war. If our country had followed the advice of General Mitchell, we would have had no aircraft carriers or carrier pilots in World War II. If our country accepts the theory that our present Air Force after being subjected to a carefully prepared all out attack, passively awaited, can retaliate effectively, it is inviting national disaster.

ELLA CHALFANT. *A Goodly Heritage.* Pp. xiii, 239. Pittsburgh, Pa.: University of Pittsburgh Press, 1955. $3.00.

A Goodly Heritage is composed of the wills made by men and women who lived in Allegheny County, Pennsylvania, during the late eighteenth and early nineteenth centuries, when Pittsburgh was a frontier fort or a village of only a few hundred people.

"As you read their formal or their homely phrasing you are reading more than a cold legal document. You are reading their meaning of a life. . . . What matters most gets into a will—what the man truly believes, what he counts precious enough to want continued in the lives of his children or grandchildren. To bequeath pots and kettles that were hard to come by was important. A clock was a treasure; a book, above price—even for a man who could sign only 'his Mark' " (p. xi).

The first chapter of the book deals with "Allegheny County's Oldest Wills" and the first will recorded was that of John Bredy, dated April 14, 1788 and recorded March 31, 1789. The ten additional chapters have the following titles: "Four Early Intestates," "Dictated Wills," "Holograph Wills," "Slavery-Indenture-Apprenticeship," "Religion and Education," "Women in Wills," "Women's Wills," "Pittsburgh—Western

Frontier," "The Fabric of Pittsburgh." There are also a Postscript, four illustrations, a bibliography, an appendix, and an excellent index.

"Through these early wills we today can know the social background of the frontier —the dress, the business, the economic situation when whiskey was an honored medium of exchange; when soldiers' bonuses were bartered for land grants; when slaves were bought and sold and bequeathed to friends and relatives or set free to make their own new lives" (p. xi).

In the early days of western Pennsylvania, there were three kinds of labor: free labor, indentured servants, and negro slaves. However, in March 1780 an act was passed which provided for the "gradual abolition of slavery" in the state. On these pages the author makes two incorrect statements: "Up until 1820, when the Missouri Compromise made slavery illegal in Pennsylvania and in certain other states, anyone who could afford to buy slaves could own them and could dispose of them as he chose" (p. 92). On the next page the author repeats the error: "And forty years later, in 1820, the Missouri Compromise prohibited slavery entirely in Pennsylvania and other states north of 36 degrees 30 minutes north latitude" (p. 93).

The Congress of the United States could not have constitutionally abolished slavery in any of the states wherein the institution existed; therefore, after providing for the admission of Maine as a free state, the Missouri Compromise applied only to the territory within the bounds of the Louisiana purchase.

The book, however, makes an important contribution to American social and economic history.

GEORGE D. HARMON
Lehigh University

BERNARD SCHWARTZ. *American Constitutional Law.* Pp. xiv, 364. New York: Cambridge University Press, 1955. $5.00.

Case books on American constitutional law we have in abundance, a number of them accompanied by excellent notes giving the background of the particular case and the conditions under which it was decided. But treatises on constitutional law, in which the political philosophy of the law is discussed and the development of the law from case to case is analyzed and criticized, are lacking, doubtless because of the very arduous task of writing them.

It is just such a treatise that Professor Schwartz has given us, and lawyers and teachers alike will give a warm welcome to it. While not cast in the form of a textbook and not covering all of the possible topics of constitutional law, it gives us a clear picture first of the fundamental principles and organic structure of government under the Constitution and then proceeds to show the changes that have been taking place in recent years resulting from the necessity of enabling the government to meet the particular problems with which it is confronted.

The analysis of individual cases is careful and impartial, particularly so in dealing with controversial issues, such as the extension of the powers of Congress over interstate commerce, the scope of the treaty-making power, and the role of the Supreme Court in applying the amendments dealing with human rights. Two chapters concentrate upon "The Negro and the Law" and "Civil Liberties and the 'cold war'", both presenting a detached interpretation of what appears to the reviewer as the undue assumption by the Supreme Court of legislative functions.

The purpose of the volume is described as being "to present the workings of the American system of constitutional law to a British audience," suggesting that it consists of lectures delivered at the University of Cambridge by whose press it is published. The result is that there are numerous comparative references to British practice and to the decisions of British courts in cases analogous to those arising under the American Constitution—a feature which will be greatly appreciated by students of political science.

Professor Schwartz is to be congratulated on a work of scholarly research and sound critical judgment. It should prove to be admirable supplementary reading in courses on constitutional law in which case books form the primary text.

ECONOMICS AND INDUSTRY

J. FREDERIC DEWHURST, and Associates. *America's Needs and Resources: A New Survey.* Pp. xxix, 1,148. New York: Twentieth Century Fund, 1955. $10.00.

This impressive volume is a comprehensive examination of the quantitative record of the American economy. It is a revised and enlarged version of a study that originally appeared in 1947. Past and prospective growth in population, output, income, savings, investment, and consumers expenditures are studied in the aggregate and in various degrees of detail. Some figures are traced back to 1850, but the bulk of the volume is based on data accumulated since the turn of the century. In many instances the *Survey* performs a major service for lay and professional readers alike by developing consistent long-term series from diverse sets of data pertaining to different time periods. This is done, for example, for the data on consumers expenditures. Official time series on the composition of consumers expenditures are available only since 1929; the *Survey* carries the story back to 1909.

The first section of the volume is devoted to the description of basic trends and their projection to 1960. The next part is given over to a study of consumption requirements with separate chapters for food, clothing, housing, and so forth. Other major sections deal with capital requirements, government and foreign transactions, and resources and capacity. Finally, there is a summary chapter which, like most of the material in the first section, was prepared by Dr. Dewhurst. The other chapters were written by a group of twenty-five specialists, many of whom are widely recognized authorities in their fields.

The findings of the *Survey* document the remarkable growth of almost every facet of the American economy. In the century following 1850, the population as reported by the census increased by about six and one-half fold. Despite a halving of the work week, national income (in 1950 prices) was twenty-five times higher at the end than at the beginning of the 100 year period. The difference between the growth in population and in real income reflects, of course, the enormous increase in productivity. Output per manhour has increased at rates that have varied widely, but the average has been around 18 per cent per decade. Interestingly enough, the growth in productivity was greater in the second than in the first fifty years; from 1850 to 1900 output per manhour little more than doubled, while from 1900 to 1950 it nearly trebled. The major upsurge in the recent past has, of course, been associated with World War II and the years of the cold war which followed.

Indeed, almost any extrapolation of past trends into the future must be based on some decision about the relative significance of this period of war and defense-aided prosperity and the preceding period of deep depression. The *Survey,* perhaps properly, takes a moderately optimistic position on this point. Of its three projections of gross national product for 1960, each based on a different set of assumptions, the middle one indicates a 29 per cent increase. The actual increase in the first 4 years of the decade has been 17 per cent.

IRVING B. KRAVIS
University of Pennsylvania

CHARLES WOLF, JR. AND SIDNEY C. SUFRIN. *Capital Formation and Foreign Investment in Underdeveloped Areas.* Pp. viii, 134. Syracuse, N. Y.: University of Syracuse Press, 1955. $3.00.

This report growing out of a study supported by the Ford Foundation analyzes current literature and research dealing with the problem of capital formation in underdeveloped areas. It also discusses at some length future research needs and program possibilities. Special emphasis is put on the problems of South and Southeast Asia and the Near East. The short text (sixty-six pages) is concerned with three aspects of the development problem—"Entrepreneurship and the Demand for Capital,"

"Technological Alternatives and the Optimum Use of Capital," and "Foreign Investment and Capital Formation." The authors believe that foreign investment, while currently of little importance, could have some real significance in "triggering" domestic capital formation if a rather formidable array of obstacles were removed.

Ideas, theories, and tools of analysis pertinent to these topics are taken up seriatim, giving the general reader some conception of the wide range of problems relative to capital formation now engaging economists. As there is no sustained thesis throughout the book and no thoroughgoing critical evaluation of work in progress, the authors have produced what may appear to the layman to be a noncontroversial book on economic development, a highly controversial subject among economists.

The authors observe that there is a need to integrate the work of several social sciences in any serious study of the processes of economic growth; but their own work is not informed by this insight and is confined almost exclusively to an economic exposition. A vital dimension of development, namely the political one, gets short shrift. This is regrettable since it is precisely the more economically backward countries which seem to require greater State participation in accelerating the rate of total capital formation, investment allocation, and even the establishment of special industries.

Encompassing the government's role in economic decision-making is the broader question: "What is the relative strength of those forces opposing and those favoring change?" While the book mentions in summary fashion the need for social change, there is insufficient emphasis on the tremendous impetus given to economic development and capital formation by profound alterations of power relationships within a given society—whether they take the form of the overthrow of feudalism in Japan, recent Communist revolutions, or the emergence since World War II of sovereign states in the East following centuries of colonial rule. Sovereignty, while not a sufficient cause for real economic development, would certainly appear to be a necessary condition in this very context. The really hopeful aspects of South and Southeast Asia's development prospects are the new independence of the various states and the attendant decline in influence of forces identified with the old order.

Planners in new Southeast Asian states intent on rapid economic development may be disappointed by the omission from the bibliography of references describing and appraising the mechanisms for increasing and regulating capital formation in outright socialist economies. Nevertheless, the fifty-page bibliography provides a useful guide to current research by public and private agencies and to the published literature on the wide range of theory and practice of capital formation elsewhere. Coming late to the feast, the poorer nations have a world of experience on which they intend to draw.

HELEN B. LAMB
Massachusetts Institute of Technology

LAWRENCE ABBOTT. *Quality and Competition: An Essay in Economic Theory.* Pp. ix, 229. New York: Columbia University Press, 1955. $3.75.

Classical theory bequeathed to economics a theory of pure competition with complete monopoly treated as an exceptional case. The year 1933 which saw the simultaneous publication of Robinson's *Economics of Imperfect Competition* in England and Chamberlin's *The Theory of Monopolistic Competition* in this country marked a departure from this viewpoint. The result has been that pure competition and complete monopoly are no longer considered adequate models of reality. No longer treated as typical cases they are still, however, looked upon as idealizations. Now, almost a quarter of a century later, another economist announces his dissatisfaction with the picture of reality which these two recent theories have developed; nor does he accept pure price competition as an adequate idealization.

Professor Abbott has written a book in economic theory which is addressed primarily to professional economists and to graduate students. Although it abounds in references to the contributions of Robinson, Chamberlin, Triffin, Schumpeter, Reder, and others, the book may be read with profit by students of society other than economists. Except for some of the most closely reasoned chapters in the last third of the book dealing with equilibrium theory, the general thesis is set forth so clearly that the argument can be followed by those who have had a minimum of training in economic theory.

It is the author's contention that all current theories concerning competition are inadequate because they make no room for quality competition which is so prevalent a part of present market conditions. He grants that theory must take cognizance of quantitative factors, such as cost and output, but it is Abbott's thesis that qualitative factors must also be included, not as a substitute for price theory, but as an addition, in order to develop an all-inclusive analysis of a private enterprise economy. He points out that entrepreneurial activity consists not only of production methods, a grasp of cost, output, and price, but also an ability to satisfy wants of buyers, as well as an ability to change attitudes of buyers. He suggests that these latter activities lead to alterations in the qualities of products. He cites numerous illustrations to show that consumers' choices are based on quality differences and that product heterogeneity is more common than homogeneity.

The author has attempted to sketch the outlines of a more inclusive theory, running from one extreme, to wit, complete competition (price and quality) through the intermediary stages of pure price competition, pure quality competition, to the opposite extreme, namely the absence of competition. It remains to be seen whether this opening gun in a concerted attack on existing theory will prove to be as fruitful as its 1933 predecessors. In view of the trend toward quantification, this reviewer is of the opinion that many serious obstacles will have to be overcome before Abbott's position is added to the corpus of accepted economic theory.

JULES KOLODNY
New York, N. Y.

G. L. S. SHACKLE. *Uncertainty in Economics and Other Reflections.* Pp. xiv, 267. New York: Cambridge University Press, 1955. $4.75.

Professor Shackle, a British economist of originality and subtlety, has assembled here a number of essays that were published before in journals and elsewhere during the period from 1939 to 1953. Much of the content of the volume is integrated by its pervasive emphasis on that aspect of the theory of the firm which served as the central theme of Professor Shackle's earlier book, *Expectation in Economics,* first published in 1949. It was in this volume that Professor Shackle developed a new and ingenious theory of expectations, which since then has been widely discussed in the journal literature. Shackle is dissatisfied with the traditional theory of expectations, which bases the entrepreneur's decision upon a probability distribution. He visualizes the relevant decisions as unique and crucial, and therefore beyond the applicability of the probability calculus. Instead, in Shackle's model the entrepreneur concentrates his attention upon two possible outcomes of any one course of action, one favorable and the other unfavorable, and each characterized by a blending of result —prospective return, for example—and of surprise attached thereto that arrests the entrepreneur's attention more than do other such blends. With alternative courses of action treated in the same manner, an indifference map can be constructed with courses of action ranked according to their preferability.

The first and largest part of the present book contains articles restating and refining Professor Shackle's theory, and defending it against some of his critics. In connection therewith, there is developed a new theory of profits. The second and third parts of the book are made up of essays on interest rates and on investment and employment. Among the essays of the fourth part, devoted to the philosophy of economics, the reader will find Professor Shackle's inaugural address, "What Makes an Economist," a lecture replete with insight, especially about the role of mathematics in the economics curriculum.

Professor Shackle's book has an equally strong appeal to the "literary" and to the mathematical economist. Here are originality and sustained power of analysis, displayed in a prose that is cultured, lucid,

and persuasive. Few contemporary economists combine mastery of technique with attention to fundamentals in the manner characteristic of Shackle's work. As a stimulus to thought and discussion, the inaugural lecture alone is worth the price of the book, which no serious student of economics can afford not to read and ponder over.

HENRY WILLIAM SPIEGEL
Catholic University of America

LEE BENSON. *Merchants, Farmers, and Railroads: Railroad Regulation and New York Politics, 1850–1887.* Pp. x, 310. Cambridge, Mass.: Harvard University Press, 1955. $5.50.

The years which parenthesize Mr. Benson's scholarly study of railroading and politics are those between New York's Free Railroad Act and the passage of the Interstate Commerce Act. They span thirty-seven years in which the monumental growth of the great trunk lines that nourished the expanding ports of the eastern seaboard brought with it the inevitable end of the laissez faire environment which had made it possible in the first place. The buffeting of free enterprise by the increasing pressures for a regulated economy that characterized the last three decades of the nineteenth century was never more dramatically apparent than in the field of rail transportation.

Despite some rudimentary legislation, largely derived from English canal and turnpike acts, American railroads, prior to 1850, controlled their own operations without any significant public supervision or regulation. After the successful run of Peter Cooper's *Tom Thumb* in 1830, the big cities of the Atlantic Coast soon became the nerve centers of expanding rail systems that rapidly undermined the commercial value of turnpikes and canals. In this frenetic atmosphere, the infant industry's lobbyists were successful in obtaining the passage in 1850 of New York's Free Railroad Law which, in practice, freed that state's railroads from all but the slightest of public control.

The New York act—which was swiftly aped by state after state—was not, as one critic observed, a complete surrender of its right to regulate railroads. The legislature imposed some controls such as the fixing of passenger rates and the requirement of annual reports, and it recognized that the roads had a public character quite distinct from run of the mine corporations. However, all in all, these and other limitations were more theoretical than real and the act ushered in an era of unrestricted rail competition.

The bulk of Mr. Benson's book is devoted to a study of the organized reaction that arose to combat the harmful effects of the great struggles of the railway financiers that reached their peak in the 1870's. The farmer and the small shipper, in particular, began to bear the brunt of such unfair practices as the rebate and discriminatory rate structures, and the Granger Movement directed most of its protest at the railroads. It was successful in securing the passage in several midwestern states of laws establishing uniform rates and railroad commissions to supervise them. More important than this legislation, however, was the Supreme Court's determination in 1876 that such statutes were constitutional, a decision that presaged more stringent regulation.

In 1879, the New York legislature, disturbed by the growing public discontent with trunk line operation, undertook a sweeping investigation of the states. The result of its findings—the Hepburn Report—did much to bring about the passage of the Interstate Commerce Act although Mr. Benson is careful to refrain from giving it full credit, preferring to abide by the proposition that federal control was an historic inevitability as soon as steam locomotion became a fact. Be that as it may, the Committee's finding that "through the want of governmental control . . . have crept in those abuses . . . so glaring in their proportions as to savor of fiction rather than actual history" did much to accelerate congressional action barely eight years later.

The railroad revolution, unleashed by such technological advances as the mass production of steel, and fed by the desperate need of an expanding nation for quick transportation, probably justifies Mr. Benson's thesis that, sooner or later, governmental control was inescapable. More important than the Interstate Commerce Act itself, however, was the emergence of the principle that there were areas in which governmental "interference" with private industry was necessary to alter the track of what Commodore Vanderbilt liked to refer to as "natural competition." That the concept was an expanding one became obvious three years later with the passage of the Sherman Anti-Trust Act.

WILLIAM KUNSTLER
New York, N. Y.

FRED COTTRELL. *Energy and Society: The Relation Between Energy, Social Change, and Economic Development.* Pp. xix, 330. New York; Toronto; London: McGraw-Hill Book Company, 1955. $6.00.

The purpose of this book is to show the influence of the various sources of energy on social, economic, and political development. Though low-energy sources are adequately discussed, the emphasis is on the high-energy sources, such as power grids, diesel engines, automobiles, trucks, and tractors.

These complicated high-energy converters have effected, and will continue to effect, many changes in man's way of life. They require the use of large production units, whether under a capitalistic or a communistic society; a high degree of concentration of control over productive operations; widely scattered ownership of shares in the converters; a tremendous increase in the specialization of labor; an expansion of the powers of the state, and an increase in the "judicial" functions of the state to handle the growing number of conflicts that will arise because of the necessary evolution of new codes of conduct. In short, high-energy technology "requires a continuous modification of the habits, training, and occupation of enormous numbers of people."

Despite the undoubted advantages of high-energy technology in areas suited to it, no rapid expansion of industrial converters throughout the entire world is to be anticipated. If this technology is to be adopted and to survive there must be a mixture in the right proportions of energy resources, climate, population, geography, and scientific ideology; but in many areas there will be resistance of long-established customs and ideologies to the changes required by high-energy technology.

What seems probable in the short run is the emergence of three geographically well-defined systems employing high-energy technology. North America will be the base for one; England and Germany for another; and Russia for the third. Incidentally, the author makes a number of interesting comments, at scattered points throughout the book, about the Russian experiment.

What will be the course of civilization in the long run the author is unwilling to predict; there are too many variables involved. He suggests, therefore, that the chief contribution of his essay is its emphasis on the large areas of ignorance that need exploration as a preliminary to forecasting the future development of human society.

This is a thoughtful, stimulating, and important work. It constitutes a significant approach to the dynamics of social change. It should prove of interest to sociologists, anthropologists, geographers, historians, economists, political scientists, engineers, and biologists. It is, in fact, a praiseworthy illustration of "interdisciplinary orientation."

ELIOT JONES
University of Santa Clara

W. LLOYD WARNER AND JAMES C. ABEGGLEN. *Occupational Mobility in American Business and Industry, 1928–1952.* Pp. xxi, 315. Minneapolis: University of Minnesota Press, 1955. $5.50.

This book describes the methodology and findings of a study of vertical occupational mobility among some 8,300 representatives of "top management" in a variety of American business enterprises in 1952. It replicates a well-known study made by Taussig and Jocelyn in 1928 to provide comparisons of the experience of two generations of business leaders and it adds additional information. The findings are based on returns from a mail schedule sent to 17,500 persons listed in Poor's *Register of Directors and Executives.*

The most impressive finding of the study controverts the pessimistic forecast of in-

creasing occupational rigidity made by Taussig and Jocelyn and numerous others since that time. The writers find that the extent of movement to the top of the "occupational ladder" was as good or better in 1952 than it was a generation ago. Moreover, the patterns of sequence in occupational "succession" are much the same for the two periods.

What one might call direct occupational "inheritance," representing an extreme of social exclusion in American business, was most evident among leaders of brokerage and investment firms. There was more vertical mobility in other types of business and in large rather than in moderate-sized enterprises. The evidence was inconclusive with respect to the relationship of vertical mobility to the rate of expansion in the firm or industry with which the leader was connected. The writers conclude that "since 1928 there has been a strong trend away from the influence of the family and an increasing emphasis upon competitive achievement. . . . Education is now the royal road to success and to the positions of power and prestige at the higher rungs of big business."

In 1952 the average business leader was more likely to have been born in the North than in the South and to have come from a city rather than a rural area. At the time of study, he was about 54 years of age and it had taken him 21 years to reach a "top management" position. For the most part, he was a college graduate and had started his business career in a managerial or professional occupation. In two cases out of three, his father was also a business or professional man but in only half the cases had he married the daughter of a business or professional man. During the course of his business career he had typically been employed by two or more concerns and had been spatially mobile.

One could wish that more detailed records of the experience of business leaders were available so that the turning points in their career patterns could be identified and accompanying circumstances considered. Moreover, the attitudes of executives as to the factors they think contributed most to their success might be enlightening. Nevertheless, this is a carefully documented report for the student; the writers expect to interpret the significance of their findings, together with the results of some interviews, in a later publication.

GLADYS L. PALMER
University of Pennsylvania

CHARLES P. LARROWE. *Shape-Up and Hiring Hall.* Pp. ix, 250. Berkeley, Los Angeles: University of California Press, 1955. $4.50.

This is an excellent study of the longshoring industry in New York City and Seattle; two widely separated areas both in distance and in the basic principles of industrial relations. In the former, with its record throughout the years of thuggery, gangsterism, and extortion, is the shape-up and casual employment; in the latter, with twenty years of democratic union action in co-operation with the employers, is the hiring hall with regular employment and earnings, and a complete absence of gangsters and "finks". One is a system of law and order; the other of violence and turbulence. The book should be widely read and studied; the basis in satisfactory industrial relations for community welfare, industrial efficiency, and human benefits is heavily documented. Noteworthy, also, has been the consistent support of the regime of lawlessness in New York City by public authorities, federal, state and local, and at the same time, the harassment of the union on the West Coast that was attempting to bring into existence a workable system of industrial relations. Perhaps this book will help to clear the vision of those in authority.

This study is also a record of the International Longshoremen's Union in New York City and of its President Emeritus, Joseph P. Ryan, and of the International Longshoremen's and Warehousemen's Union on the West Coast and its president, Harry Bridges. But more than that, it is a detailed description of how a hiring hall can be run efficiently and in the public interest.

Seattle made the choice for the hiring hall in 1920; in that year Frank P. Foisie, then on the staff of the waterfront employers, set up the system which in its basic features continues today; that is, one central hiring hall with a group of registered men who have seniority and skill, an extra board for men who customarily work in gangs and are used for replacement, and a list of casual employees. A conscious effort was made to equalize earnings and divide work equally among the registered employees and the extra board. During the 1920's, the hiring hall was under the control of the employers; since the 1934 strike, the International Longshoremen's and Warehousemen's Union has been a full partner in its operation. The dispatchers in the hiring hall are chosen by the ILWU from its ranks. The governing body is the Joint Labor Relations Committee composed of equal numbers of union and employer representatives.

The Seattle hiring hall plan is not the perfect answer; employers would prefer a stabilized labor gang of superior men rather than a rotating system including all workers. Somewhat the same criticism has arisen in England under its dock labor scheme. Nevertheless, the results are infinitely superior for employers, workers, and the public to the product of the New York shape-up, and as it is studied and adjusted, improvements may be expected.

FREDERICK L. RYAN
San Diego State College

SOCIOLOGY AND EDUCATION

ROBERT REDFIELD. *The Little Community: Viewpoints for the Study of a Human Whole.* Pp. 182. Chicago, Ill.: University of Chicago Press, 1955. $4.00.

In every field a few men are able to present their research so that it stimulates and enriches the work of many others. In anthropology, Robert Redfield is such a man, and *The Little Community* should provoke thought, inform research, and provoke creative disagreement.

Explicitly, *The Little Community* examines the ways in which a small community may be studied as a whole. Implicitly, it is a history of one phase of a discipline and an intellectual autobiography recounted with modesty—one is tempted to say humility—by a distinguished humane scholar. From his professional beginnings as the—by modern standards—rather poorly prepared student of Tepoztlan, Redfield clearly emerges as a man always deeply concerned with the meaning of his activity, both for the world of scholarship and for the understanding of human existence.

In this book Redfield explores the various ways one may think about a small community and the consequences of each frame of reference. Following an introductory chapter, he takes up the community viewed as an ecological system, as a social structure, as a set of life patterns for its members, as the product and creator of a kind of person, as an outlook on life or system of ideas, and as a history. He also considers the problem of the community as a member of a collection of communities or as a part of a larger community and as a combination of opposite tendencies. He concludes with a discussion of the relation between the whole and its parts. Each of these ways of thinking he shows will produce a different picture of the whole. Each picture has its value as well as its deficiencies; he holds out little comfort for those who seek a single road to knowledge.

Little attention is paid to technical method but the discussion of the "inside" (native) view of a community versus the "outside" view and the development of concepts and relationships is of particular interest. He also makes clear the levels of difficulty and precision involved in different ways of studying a community.

The Little Community is a sophisticated book simply written. The intelligent layman should be able to read it with profit. The social scientist ought to read it.

RALPH L. BEALS
Center for Advanced Study in the Behavioral Sciences
Stanford, Calif.

MORRIS PLOSCOWE. *The Truth About Divorce.* Pp. 315. New York: Hawthorn Books, 1955. $4.95.

Whatever else their gifts, most lawyers are not blessed with a golden pen; indeed, one gets the impression that legal jargon is to lawyers what Latin prescriptions are to doctors: symbolic devices to befuddle the

uninitiated. Judge Ploscowe is a welcome exception in this respect, for he writes clearly and interestingly. He has given us a most excellent work on the legal aspects of divorce. Whether the reader is a lawyer, social scientist, or lay person, he will find *The Truth About Divorce* absorbing reading, and when he has finished the book he will be a wiser man. In all likelihood much of the content matter will be quoted by other writers for years to come.

Although he does not write like a lawyer, the author has organized his material and presents his case in the best legal tradition. Alternatives to divorce—annulments, criminal proceedings, separate maintenance, and judicial separations—are fully discussed, after which the technical implications of the more common grounds for divorce are analyzed. Various defenses to divorce actions, such as recrimination, condonation, and connivance, are thoroughly covered, as are the legal and judicial incongruities of migratory ("quickie") divorces. The author's legal analysis concludes with chapters on alimony and custody of children. On all of the foregoing points the author writes simply and concisely, cutting to the heart of the matter with a penetrating legal blade.

When Judge Ploscowe turns to nonlegal matters his blade loses its sharpness, and, at least on one occasion, slips. Entering the never-never land of divorce causation, he states (p. 6) that "our lax marriage laws . . . are largely responsible for the swelling ranks of divorce." This can hardly be so, since any social change (for example, an increase in the divorce rate) must be explained not by a constant (marriage laws), but by another variation.

With regard to the philosophy of divorce the author is seemingly inconsistent. He takes a grim view of the legal machinery which permits out-of-state or "quickie" divorces. He believes in the integrity of marriage, that the bonds of matrimony should not be dissolved for trivial reasons, and that the state has a vital concern with marriage; for example (p. 248), "If the judges took to heart the basic principle of law that marriage is more than a private contract and that the state has an interest in every marriage, divorce courts would be be agencies for the conservation of marriage instead of their interment." At the same time the author feels that the couple themselves ought to decide whether or not the marriage should be legally terminated! It is stated (p. 261) that a "change we should like to see adopted by our divorce law is the universal enactment of a statute which authorizes a divorce to be granted when the husband and wife have lived physically separate and apart for the period fixed by law. A statute of this character recognizes that in the last analysis a husband and a wife themselves determine whether a marriage will survive or will be permitted to die." In terms of the principle of divorce, therefore, Judge Ploscowe would merely eliminate "quickies" in favor of "slowies."

The author apparently reconciles the above-noted inconsistency by advocating "the organization in each community of a unified family court adequately equipped to deal with all problems of the family including divorce" (p. 263). Actually, the setting up of an "adequately equipped" family court would cost the taxpayers a mint, with no guarantee of results. In fact, existing family courts don't even publish figures on the effects of their so-called counseling and conciliation service.

It is unfair, however, to assess Judge Ploscowe's volume in terms of his sociological and philosophical perambulations. Basically, he has written a book about divorce law, and he has written it exceptionally well. Students of the family will wait a long time before a better one comes along. If the Judge has overreached himself on the title of the book, we forgive him.

WILLIAM M. KEPHART
University of Pennsylvania

RUTH L. MUNROE. *Schools of Psychoanalytic Thought*. Pp. xvi, 670. New York: Dryden Press, 1955. $7.50.

The impartial student of the human mind is often bewildered by the variety of theories and techniques offered by different schools of depth psychology. Most of them call themselves psychoanalytic, others do not. Their practitioners are physicians, psychologists, social workers, teachers, clergymen, and just plain people. A book which helps the inquirer to find his way about in this maze of schools and therapists is very welcome indeed.

This is exactly what this book does. Its author, a clinical psychologist, tells us that both her own and her husband's training are Freudian, yet assures us that she endeavors to be unbiased. She then proceeds to demonstrate her impartiality. She shows a remarkably full knowledge of the writings of the leaders in the more prominent schools: Sigmund Freud, Alfred Adler, Karen Horney, Erich Fromm, H. S. Sullivan, C. G. Jung, and Otto Rank. Wilhelm Reich she dismisses in a footnote. The exposition of theory and technique is clear and, considering the unavoidable condensation, very complete. In addition she gives a critique of each school, exposing both their excesses and their deficiencies. In the final chapter she attempts a theoretical integration. It is, therefore, much more than a source book or a work of reference. It should encourage, among the less doctrinaire members of all of these schools, a search for a common ground. It should lessen the trend toward isolation and cultism so evident in some more enthusiastic adherents by making each more aware of the other's findings, views, and methods. It is evidence that psychoanalysis is coming of age.

Criticisms are few. Since this reviewer is a student of Jung's analytical psychology, he paid special attention to the section devoted to this school. He is happy to report that impartiality is most evident here—even "a genuine appreciation of the clinical values of Jung's theory" because of "the almost uncanny insights they sometimes showed" (p. 567). Yet in this part there is less discussion of technique and methodology than in those on other schools. Part III, dealing with Adler, Horney, Fromm, and Sullivan, is rather chopped up, going from one to another and back again in a way that may confuse some readers. In the section on Freud, she does not mention the recent work of Thomas French of Chicago on the use of the integrating force of hope in treating psychoneurotics. He has set forth this concept in two volumes entitled *The Integration of Behavior*. This, in the opinion of the reviewer, is one of the most significant advances in psychoanalytic theory in recent years. She does frequently quote another original thinker among psychoanalists, namely, Erik H. Erikson. On the subject of marriage problems there is very little (except for a brief reference to her husband's excellent work in this field), perhaps because Freud and his followers have never had much to say about them despite their frequency and importance.

Schools of Psychoanalytic Thought is announced as one of a series of publications in interpersonal relations edited by Theodore M. Newcomb of the University of Michigan. If the others measure up to this standard, it will be a notable addition to psychological literature.

ROBERT A. CLARK, M.D.
Friends Hospital
Philadelphia, Pa.

BRUNO BETTELHEIM. *Truants from Life*. Pp. xvi, 511. Glencoe, Ill.: Free Press, 1955. $6.00.

This is the long-awaited and invaluable detailed case book describing Bruno Bettelheim's unique combination of milieu therapy with individual psychotherapy—both carried out through and by his excellent team of *counselors,* a specially educated group of personnel who are supervised by him in their joint roles as child care workers and individual psychotherapists.

The book is made up of a balanced, warm account of the background, treatment, and results with four severely disturbed children, each with a different problem, but each with a basic difficulty in knowing and accepting himself and the world of persons around him.

Paul, who suffered from "institutionitis," needed to discover or rediscover that he was a whole person and not a collection of isolated functions, each neatly cared for by a different person or department. He was "unfrozen" through an intimate and prolonged central relationship with one key adult. It took three years to help him make the transition "from Wild Critter to Great Dictator" to *real person.*

Mary, an assaultive, asocial, seductive, tantruming, schizophrenic girl, had re-

acted to her mother's pathological and prolonged grieving. Her metamorphosis from psychosis to neurosis via fantasy *autoparturition* eventually led her beyond the need for further separation from society.

John's early physical traumata and feeding difficulties gave credence to a previous opinion that he was retarded and his brain was damaged. His dim prognosis was given the lie only after years of agonizing work through phases of repulsive appearance and behavior, when finally he began to enjoy his body and accept the pleasure of being fed.

Each of the four children suffered from one form or another of intellectual backwardness or pseudo-retardation which was reversed through treatment. Actually each of the children had latent talents they were afraid or unable to manifest earlier. This came through the discovery or recovery of basic trust. As Paul put it, "Before, I thought I could only get energy and strength from food. Now I know I get energy from children, counselors, baseball, swimming, and drawing. That is, if I make a picture for somebody."

The revelation of intimate details of the curative relationship between child and counselor and of the interlarding of intellectual interpretation with "corrective emotional experiences" is the great gift of this book to all who study or care for the severely disturbed child.

EARL A. LOOMIS, JR., M.D.
University of Pittsburgh

KARL SAX. *Standing Room Only: The Challenge of Overpopulation.* Pp. 206. Boston, Mass.: Beacon Press, 1955. $3.00.

The years following World War I produced a number of works—by East, Ross, Knibbs, Sweeny—reviving the Malthusian view, but that was a gentle rain compared with the veritable flood of similar works following World War II. Professor Sax, Harvard botanist at the Bussey Institution, here gives us a semi-popular summary of present knowledge and forecasts. For its brevity it is unexpectedly comprehensive; though lacking somewhat in speculative flair, it is thoroughly scientific. Written in a clear, crisp style notable for incisive terseness and impeccable logic, it eschews imaginative flights into sociologically unrealistic proposals. It restates the facts and prospects of population growth, of present and future supplies of foods, minerals, and energy for different world regions.

The basic thesis is that, unless there is a rather speedy reduction of births, escape from mass poverty will be difficult if not impossible for two-thirds of the world's population. The treatment centers around the concept, "the demographic transition," or the replacement of high-death-rate high-birth-rate cultures by their opposites, accompanied by a change from low to high living standards. Such a transition has taken place in the West; and the author concludes that it "should be possible in Africa and South America, and it might be possible in Central America with the aid of a few scientific miracles. On the other hand, the situation in eastern and southeastern Asia appears to be hopeless" (p. 138). In later chapters social-psychological and traditional obstacles are examined, the similarity of Catholic and Communist totalitarian views noted, and various inconsistencies and futilities pointed out.

In spite of its extreme brevity, the general reader will receive an excellent orientation. One could easily give a more generous estimate of present methods and sources of food increases: one tree today can produce as many apples as grandfather's orchard and cattle can be fed from sawdust heaps. The same is true of the potentials of the new methods of deep-sea fisheries. The deserts seem likely to bloom when a cheap method of desalting sea water is developed. It is not unrealistic to suppose that vast new sources of energy will be found, and that the potentials of sun furnaces are now only glimpsed.

The emphasis on the demographic transition as the acid test is overdone. To set it up as such and then show that it can't occur is to assume that the underdeveloped areas must accomplish the impossible feat of evolving as did the West when all basic conditions are different. This is either to set up a straw man or to plunge into hopeless pessimism. Perhaps the most interesting aspect of present world development is the race between China and India toward industrialization, one by totalitarian methods, the other by humane, democratic policies. China may well win for she can sacrifice a long generation through slave labor while building her roads, dams, mills, and laboratories; her population remaining stationary or even decreasing. India must move slowly on small capital and improve her health services. She risks seeing all efforts at economic welfare swamped by a flood of new mouths to feed during the three generations her transition will take. Her situation is not, however, hopeless. Much depends on the success of the birth control movement. The motive does not need to wait for the demographic transition following an improbable industrial revolution. The reduction in fertility must come before or at least concurrently with the latter.

Smith College

FRED K. VIGMAN. *Crisis of the Cities.* Pp. viii, 155. Washington, D. C.: Public Affairs Press, 1955. $3.25.

The author of this book was for years a reporter on the *Brooklyn Eagle,* where he specialized in municipal affairs, county government, and public utilities. It was in this capacity that he watched with increased concern, indeed alarm, the efforts of county and city officials to seek solutions to the problems of their units of government. Out of this experience, and a great deal of research, the volume was written. The research dealt particularly with the historical development of American urbanism and the attempts at urban reform in individual cities, especially New York, Chicago, Boston, Pittsburgh, and Los Angeles. Much of the value of the book lies in this wealth of historical material contained in the chapters.

Crisis of the Cities is divided into two parts. Part I contains a study of three principal elements of urban decline. These are urban economic bankruptcy, civic failure, and urban exodus. Part I also contains a valuable historical discussion of city planning and the social hopes that lie in planning. Part II discusses a number of large cities in the throes of crisis and, at the end, forecasts the future of American cities.

This volume is long on problems but at spots is short on solutions. The writer has a reporter's healthy skepticism which holds that the quality of the leaders and human material in our cities will not be able to handle their financial, social, and physical problems. Regarding political leaders he says: "Noteworthy in the history of the modern American city is the consistent character of the municipal politician. Except for the temporary rise of reform mayors and reform parties, the pattern remains essentially unchanged." Apparently he would agree with Joseph F. Dinneen, who wrote the biography of Mayor James Curley of Boston, that "the average city council is made up chiefly of men whose minds cannot comprehend more than four digits and go blank beyond that."

In his final chapter on "The Future of the American City," Vigman says that the "days of reckoning" are here. Frenzied city officials seek solutions. They are handicapped by the "traditional urban classes [who] have stolen out of the corporate limits of the cities, taking with them the funds that could be taxed and the organizational abilities of the employing and white collar classes." They are often surrounded also by "constituencies who fear taxation" and by classes within the city that do not "do honor to the urban principle."

The future of the industrial city is likened to a declining New England mill town or a Pennsylvania mining town. "The city will then be a great industrial plantation where employees must perforce live and from which all other strata of the population will seek to escape."

This book is good reading and is well written. The urban tomorrows will not appear hopeful as you read it, but you will be challenged. Challenges, to move men to action, are needed in the urban future.

WILLIAM E. COLE
University of Tennessee

H. B. M. MURPHY (Ed.). *Flight and Resettlement.* Pp. 231. Paris: UNESCO, 1955, (Distributed by Columbia University Press, New York). $2.50.

There exists an abundant literature on the refugee problem of different countries, approaching it from various angles. On the other hand, general works not limited to a single country treat mainly (if not exclusively) the political, legal, demographic, and economic aspects of the problem. To supply a long-felt need, the reviewed symposium concentrated on psychological and mental health peculiarities of the refugee in various conditions and stages of his existence; it deals almost exclusively with the D. P. type of refugee who has lost his homeland, and who must seek resettlement among people of a different culture. However, there is a provocative article by Miriam L. Goertner comparing German refugees and Puerto Rican migrants in New York City.

The book opens with Dr. Murphy's introduction on "The Extent of the Problem," giving its logical delimitation, categories, and numbers of people involved in the refugee movements. There follows (as Part I) two articles on flight and its immediate aftermath. Part II, Displaced Person includes, apart from Dr. Murphy's interesting observations about the ill effects of life in *any* camp, a description of what the Allies found in Germany after her defeat. Especially gruesome is the picture of thousands of children completely on their own; children from concentration camps with numbers tattoed on their forearms; Jewish children, some of them "fortunate enough to look like Angels" who "found sanctuary in Christian homes," and others who managed to survive "living in cellars during the day and creeping out at night in search of sustenance." Part III, the most rich in material, deals with psychological and sociological aspects of resettlement and Part IV especially with refugee psychosis.

The main value of the book lies in the mass of factual data describing human beings with a tragic past and the difficulties of their adjustment to a new and strange milieu. Generalizations are sometimes less successful. Even an admirer of Freud will hardly enjoy it when Dr. Prine (a Dutch physician), in his brilliant autobiographic sketch, characterizes his and his comrades flight to England as "running away from the bad castrating father to the good Queen mother."

The Editor, Dr. Murphy, has not only contributed five articles of a total of sixteen, he also has supplied several others with introductory notes which help to preserve the unity of the book, so often lacking in symposia. The bibliography is rich and well organized. Maps and diagrams show the distribution of refugees. The text of the book is supplemented by twenty-nine skillfully made and well annotated illustrations.

Washington, D. C.

COUNCIL OF STATE GOVERNMENTS. *The States and Their Older Citizens: A Report to the Governors' Conference.* Pp. xvii, 176. Chicago, Ill.: Council of State Governments, 1955. $3.00.

Older persons are considered a problem today. They constitute a large and increasing proportion of our population. Economic and social changes that have taken place in the United States have altered the position of the aged, posing problems for state and local governments and for many private agencies.

The size of the problem of the aged is suggested by the fact that the rate of increase of older persons is twice that of the total population; the percentage of older men who have jobs is constantly decreasing; older people have sharply lower incomes than the middle-aged and for many these incomes are grossly inadequate; the cost of Old-Age and Survivors Insurance continues to increase; the aged suffer disproportionately from chronic illness and are the least insured against hospitalization costs; a tremendous rise has occurred in the number and proportion of the aged in mental hospitals; and there is a lack of specific services for older people and qualified staff to man them.

The Governors' Conference requested the Council of State Governments to "provide a basis for intelligent planning of adequate care, treatment and rehabilitation facilities to cope with the needs" of the aged. In *The States and Their Older Citizens,* the Council provided a bill of objectives for older people as well as a program for action in the field of aging.

The bill of objectives proposes equal opportunity to work, adequate minimum income, home living or homelike institutional care, physical and mental health or rehabilitation, participation in community activities, social services, and the right to free choice, self-help, and planning of their own futures.

The program for action calls for the elimination of arbitrary age limits for employment and establishment of programs of rehabilitation and vocational training for aging persons; the establishment of facilities for counseling and for early detection and follow-up of diseases; better screening of patients before admission to mental hospitals; establishment of medical home-care programs; state grants to localities for construction of medically supervised nursing homes; and establishment of community centers where aged persons may join in interesting and productive activities.

There is need of increased gerontological research and application of its results in public education and professional training.

DOROTHY C. TOMPKINS
University of California
Berkeley

WILMA DONAHUE (Ed.). *Earning Opportunities for Older Workers.* Pp. x, 277, Ann Arbor: University of Michigan Press. 1955. $4.50.

This volume is based largely on papers prepared for the University of Michigan Sixth Annual Conference on Aging. Its stated aim is to "examine the nature of the barriers to continued employment or rehiring of older persons, to seek methods by which such persons may be effectively utilized in the labor force and to outline steps by which voluntary organizations and public agencies, and older people themselves, can create new earning opportunities for older workers."

Thirty-three persons from management, unions, public service, education, and medicine contributed to the conference and to this publication. The volume opens and closes with discussions by two especially distinguished contributors. The first chapter, called "The Health and Welfare of Our Senior Citizens", is by Oveta Culp Hobby, former Secretary of the United States Department of Health, Education, and Welfare. The closing chapter, "Making a Life and Making a Living", is by the late Dr. Martin Gumpert, whose words will be greatly missed in future studies of growing old. The chapters in between move from general discussions of such problems as barriers to employment—particularly pension and insurance costs, the health and skills of older workers, and the peculiar difficulties of older women in the labor force—to programs for counseling and placement, what the Government employment security program is, and what various groups—individuals, business and industry, voluntary and community groups, and what the State can do to promote and encourage new earning opportunities. In addition to the discussions of general problems, brief descriptions of several individual projects designed specifically to employ older workers are included.

Since the conference for which the material in this volume was prepared was attended by more than 700 persons, it is not surprising that the papers are for the most part aimed at the general public rather than the student. (The fifteen-page list of references to recent writings on older workers should prove very useful to many persons interested in the field). Some of the contributions, such as the chapter on the effect of pensions and insurance costs by William H. Wandel, or that on motivation of the aging worker by Dr. Jack Weinberg, or Pearl Ravner's careful summary of the research that has been done on the psychological barriers to the employment of older women, are thoughtful and interesting. But many of the others are rather in the nature of brief comments from the conference floor—welcome to a discussion leader but not substantial enough to deserve permanent recording. To someone turning his attention for the first time to the problems of older workers in the United States, perhaps organizing a conference in his own community, this volume would introduce some of the experts and would offer a fair

cross section of the current popular thinking on various issues. For specialists, this collection of papers will serve chiefly as a roundup of familiar ideas about the aging worker.

GERTRUDE BANCROFT
U. S. Bureau of the Census

W. J. H. SPROTT. *Science and Social Action.* Pp. 164. Glencoe, Ill.: The Free Press, 1954. $3.50.

This book is the result of the Josiah Mason Memorial Lectures at Birmingham, 1953. It raises questions which are of importance to the student of social science. There are eight chapters. The first four deal respectively with the nature of social action; personality, society and culture; the scientific approach; and the small group. The last four deal with the subject of assimilation, deviants, the grand manner, and the sociology of knowledge. It is the author's contention that psychology and sociology are elaborations of ideas which inevitably arise from our everyday intercourse with people like ourselves, and that sociology and psychology unavoidably spring from social action. Social action, Sprott holds, is the basic concept in the social sciences. Four aspects of social action consist of: (1) interaction itself, (2) the social constructs within which it is performed, (3) the beliefs which it produces and which in turn guide it, and (4) the physical and demographic environment in which it takes place.

The appearance of disorder which seems to arise in a review of published books and theses are due, first to the variation in the fields of investigation; second, plausibility does not require the establishment of a theoretical framework; third, the subject matter is difficult to handle, partly because of its familiarity; fourth, the social scientist is often too closely associated with contemporary problems; and fifth, he is limited by opportunities offered him. Because of our ordinary social contacts, many of us feel competent to speak on a social concept without any investigation whatever, and as a result of our ignorance of what is actually occurring, a "considerable amount of research is pure fact-finding and nothing else."

Since a social system is a dynamic process, it is only here and there that the dominant features of beliefs and values remain constant over a considerable period. To obtain absolute validity there must be universal agreement since only in terms of agreement and disagreement between persons is there any sense in the notion of "validity".

This book by Sprott shows an exceptional understanding of the relation of scientific inquiry to the field of social action. It provides the entering wedge to an area which in much of our contemporary sociological writing and research has been somewhat obscured.

M. C. ELMER
University of Pittsburgh

HENRY GRAYSON. *The Crisis of the Middle Class.* Pp. xv, 172. New York: Rinehart and Company, 1955. $2.75.

The middle class, Grayson believes, is beset by a crisis that threatens its very existence. Its predicament, which stems most directly from the increasing circumscription of its historic innovative role, is aggravated by the growing acuteness of the more fundamental cultural disequilibrium of Western society. Two cultural lags, involving the disparity between the rate at which social problems are created by the advance of the natural sciences and solved by the social sciences and the incongruity between the knowledge of the intellectuals and the popular beliefs of the masses, only add to the gravity of its plight. Consequently, the author's probe of the crisis of the middle class is conducted within what is essentially an analysis of the crisis of the Western world. His investigation departs from a theory of the structure and dynamics of civilization, inquires into the economic aspects of the major cultural epochs of Occidental civilization, examines the dimensions of the modern business cycle, and outlines the alternatives open to America for solving the problem of cultural lags.

Nevertheless, the author is primarily concerned with the nature of the middle class, its origins, vicissitudes, and prospects. Its emergence appears to require the ruler-slave stratification of a conquest state and the development of portable and negotiable wealth. Ancient Egypt and Mesopotamia illustrate incipient stages, while only ancient Greece, which achieved the first industrial revolution, had all of the required circumstances for full maturity of the middle class (pp. 41–44). Still, the Hellenic middle class followed its predecessors into decline. Not until the end of the European Dark Ages did the next major spiral of economic advance begin. Modern England and, more recently, the United States have carried this most recent middle class efflorescence of the second industrial revolution to its apogee. But once more the threat of stagnation and decline impends. Here, as in England, "the middle class individualist is suffering from increasing restrictions and narrowing opportunities brought about by the monopoly-minded upper and lower classes" (pp. 86–87).

Of the author's entire analysis, nothing appears so striking, so unconventional, and so controversial as his definition of the middle class, which is implied in the sentence just quoted and explicitly elaborated elsewhere (pp. xi–xii, 28–29). Membership in the middle class is characterized *not* by rank in the social hierarchy but by an individualistic proclivity to innovate. The excessive brevity of Grayson's historical study is likely to raise the disquieting possibility that the author has simply illustrated, rather than critically tested, his de-stratified notion of the middle class and his Paretian-mechanistic theory of social dynamics which, by deriving change from individualism, logically implies his concept of the middle class.

ROSCOE C. HINKLE, JR.
Ohio State University

LYMAN BRYSON and others (Eds.). *Symbols and Society.* Pp. xi, 611. New York: Conference on Science, Philosophy, and Religion in Their Relation to the Democratic Way of Life, 1955. (Distributed by Harper and Brothers.) $6.00.

This is the second of a two-volume study of the part played by symbols in the life of mankind. The articles included were prepared for the Fourteenth Conference on Science, Philosophy, and Religion in Their Relation to the Democratic Way of Life. The sixteen papers and the comments on them by other participants thus represent the collaboration of some forty scholars who met at Harvard University in the fall of 1954 to explore the ways in which symbols influence social thought and action.

This volume surveys the role of symbolism in establishing relationships between individuals, groups, and nations. The studies range from the physical sciences (Philipp G. Frank), politics (T. R. Adam and Karl W. Deutsch), law (F. S. C. Northrop), prestige (Lyman Bryson), education (Robert Ulich), and the Old Testament (Louis Finkelstein) to cultural values and the arts (by various writers). The conclusions which emerge from these diverse and sumptuous offerings illustrate the manifold uses and abuses of the symbolic expressions of human purposes.

The work is described as "the first comprehensive study of its kind." Yet one comes away from it with the impression that the group was not entirely representative of all approaches. For example, there is no treatment of the semantics movement, whether in the form of general semantics (Korzybski, Lee, Hayakawa, Stuart Chase, *et al.*) or the more restricted logistic approaches of Bertrand Russell and Rudolf Carnap. Nor does the work of Bliss's semantography, the fundamental research of Carl Jung on archetypal imagery, or the contributions of Oriental philosophies and religions find adequate recognition. The international symbolism movements—for example, Leibniz's *characteristica universalis, Esperanto, Interlingua,* and others—find no place in these discussions. On the other hand, Harlow Shapley's article on "Galaxies and their Human Worth," included in an Appendix, is a masterly summary, but seems rather irrelevant in this volume. Hudson Hoagland's valuable paper, "Some Considerations of Symbolization and Nervous Action," is quite relevant; but in that event one can only regret that Ralph Gerard's article along similar lines was not also included. But criticism aside, this book and its companion volume, *Symbols and Values,* provide extremely useful source materials

and documentation for all serious students of these important topics.

OLIVER L. REISER
University of Pittsburgh

RICHARD HOFSTADTER and WALTER P. METZGER. *The Development of Academic Freedom in the United States.* Pp. xvi, 527. $5.50.

ROBERT M. MACIVER. *Academic Freedom in Our Time.* Pp. vii, 329. New York: Columbia University Press, 1955. $4.00.

The attacks on colleges and universities, and on professors singly and collectively, have produced their own antidote: an awakened watchfulness on the part of the victims and a determination to meet the attacks with courage, intelligence, and dignity. A significant aspect of the counter-attack was the establishment of the American Academic Freedom Project at Columbia University by the Louis M. Rabinowitz Foundation, with Dean Louis M. Hacker as executive secretary and professor Robert M. MacIver as director. The two volumes under review are the fruit of this project. McCarthyism was an evil, and there is no compulsion to strain to detect some elements of good in it. "My dear sir," said Samuel Johnson, "never accustom yourself to mingle virtue and vice. The woman's a whore, and there's an end on't." Yet one cannot help thinking that it took a mountain of evil to produce the first major study of academic freedom in the United States.

The volume by Professors Richard Hofstadter and Walter P. Metzger is a solid scholarly achievement and ought to be considered a strong contender for the Pulitzer Prize in history. It is based on careful scholarship, it is written in a literary style that has distinction, it is comprehensive and yet well-balanced in its parts and emphasis. The first part, which deals with the European background, the early days of Harvard, the colonial colleges generally, and developments through the Civil War, was written by Hofstadter; and the second part, which brings the study through the founding of the American Association of University Professors in 1915 and the events of World War I, was written by Professor Metzger; but the Preface makes it clear that the book has been "in every sense a collaborative enterprise."

The book by Professor MacIver is concerned with academic freedom "in our time". It does not create the impression of historical writing; unlike the volume by Hofstadter and Metzger, this book is written in a strident key, as a tract for the times. This is understandable, for Mac Iver is concerned with current events about which we have read on the front pages of our newspapers and with issues that have divided citizens into different camps. It creates the impression that the author is concerned almost exclusively with the attacks on and the defeats of academic freedom—although he himself warns against the danger of forgetting that this is a big country, with many hundreds of colleges and universities, and that in hundreds of these institutions no threats to basic liberties have been experienced; that in nearly all the greater institutions attacks on their integrity have been successfully rebuffed. Nothwithstanding this caveat, the reader cannot, I think, but carry away the predominant impression that freedom on the American campus has in recent years been the exception rather than the rule. This is because, I suspect, often the author uses language that has too great a sweep—for example, "The evidence of the magnitude of the wave [of intolerance] comes from many sides. There has been a vast increase of suppressive controls, unofficial and official, over books, public addresses, and generally over all forms of the expression of opinion"; he speaks of "the proliferating censorship of books," and that "it is the libraries of schools and colleges that are subjected to the strongest onslaught"; he says that "the number of organizations carrying forward the crusade of intolerance is very large and has a formidable impact," and that "the spirit of apprehension and the sense of intimidation" have, "according to a considerable amount of testimony," "invaded the halls of learning."

But, as I have said, this failing of the book is understandable, and perhaps is largely insurmountable when one writes of events and issues from which one cannot disconnect himself. On the whole, we should be grateful to Professor MacIver for the book he has written, which has in it much valuable information and which forthrightly advances the debate on behalf of a maximization of intellectual freedom.

MILTON R. KONVITZ
Ithaca, New York

THOMAS EVANS COULTON. *A City College in Action.* Pp. xix, 233. New York: Harper and Brothers, 1955. $3.50.

GAIL KENNEDY (Ed.). *Education at Amherst.* Pp. xi, 330. New York: Harper and Brothers, 1955. $4.00.

These intimate studies of two very different types of institutions of higher education bring into sharp relief both their differences and their common goals. The subtitle and the content of each reflects the differences. The former, *Struggle and Achievement at Brooklyn College, 1930–1955* is a description of the interrelationship of a municipal institution and the community it serves and a candid analysis of several basic and highly explosive issues; the development and expulsion of Communist influences in the college, the impact of World War II, "Basketball and the Smart Money," and the influence of pressure groups. Under the chapter title, "Everybody's Business," the author describes the activities of the American Civil Liberties Union and its Academic Freedom Committee, the Americans for Democratic Action and Students for Democratic Action, and the Joint Committee Against Communism.

The latter, *The New Program* is a description of the recommendations of Amherst's Faculty Committee on Long Range Policy and their implementation over approximately the same period of time. There were issues also at Amherst, but with one exception they were internal issues growing out of departmental interests and differences in educational philosophy. The exception was the Committee's recommendation that national fraternities be abolished because they were "anti-democratic" and "anti-intellectual." When a poll of the alumni showed overwhelming opposition to their abolition, they were permitted to continue but under greater control by the College. Two fraternities withdrew from their national organizations and became local in order to eliminate the racial discrimination policy of the national organization.

The account of Brooklyn College is primarily one of the institutions response to external forces; the Amherst report is primarily one of internal development. The two are complimentary to each other.

There is, however, much basic similarity in these two interesting accounts of developments in higher education since 1935. Both reflect the leadership of able presidents, their support of faculty policies, and their concern for the total welfare of the students. Issues in both institutions were resolved by frank discussion and democratic procedure. Both portray the earnest efforts of conscientious faculties to seek ways to retain the basic values of a liberal education in the face of internal and external pressures. Both volumes emphasize the need for closer co-ordination of the curriculum and student activities and that student responsibility must go hand in hand with student rights. Perhaps most important is the common faith of the faculties of these institutions that higher education has a grave responsibility not only to each individual student but to the nation and the world.

Those who now seek to point up the preferential values of public or of private higher education will do well to read these two interesting volumes—Amherst established in 1821 by the Congregational Church and Brooklyn College created by the New York State Education Law in 1930. In a study of the fifty leading sources of American scholars, Brooklyn College was listed immediately following Amherst.

FRANCIS J. BROWN
American Council on Education

GEORGE D. SPINDLER (Ed.). *Education and Anthropology.* Pp. xxviii, 302. Stanford, Calif.: Stanford University Press, 1955. $5.50.

Both educators and anthropologists have a twofold common core of interest: the role of the individual as a member of a social group and the influence of group behaviors, norms, and values on the indi-

vidual. *Education and Anthropology* represents an attempt to examine the above areas of common concern as well as such related topics as models for the analysis of the educative process, the school in the context of the community, conflicts between cultural ideals and educational action, problems relating to intercultural understanding, contrasts between prepubertal and postpubertal education, communication theory in learning situations, and the relationships between anthropological and educational theory.

This book is the report of papers and discussions occasioned by a conference held at Stanford, California under the joint auspices of the School of Education and the Department of Sociology and Anthropology, Stanford University, and the American Anthropological Association. In this conference twenty-two recognized educators and anthropologists met for six days to exchange ideas and opinions for the mutual benefit of the two fields.

An especially heartening feature of this book is the realistic approach evidenced by the various conference participants on the contributions each discipline could make to the other. The anthropologists in particular were quick to point out that their major contribution to education is not the supplying of direct answers to specific questions, but rather enabling educators to obtain newer insights through the use of methodological tools for the study and analysis of educational and cultural processes. Both educators and anthropologists, while recognizing the need for more anthropological knowledge in the study of the educational process, agreed that it would be "dreadfully dangerous" to argue: "there was a psychological phase of education; now there should be the anthropological" (p. 277).

Dr. Spindler has not only done an admirable job in so editing the book as to retain the informal "flavor" of the conference, but has contributed a most valuable overview which summarizes the major written works that deal with the relationships between anthropology and education. The book concludes with a paper by Solon T. Kimball on the Supreme Court desegregation decision and a discussion of its educational consequences. Authors of other papers presented at the conference are I. James Quillen, Bernard J. Siegal, John Gillin, Cora Du Bois, C. W. M. Hart, Dorothy Lee, Jules Henry, and Theodore Brameld.

A minor criticism that the reviewer has of this otherwise excellent compilation is the apparent reluctance of the conference participants to give further attention to the relationships between education and that part of the field of sociology that is closely allied to social and cultural anthropology. Znaniecki, for example, in his discussion of the scientific function of the sociology of education deals with a remarkably large number of relationships similar to those found in this book.

STANLEY P. WRONSKI
Boston University

COMMONWEALTH OF NATIONS

LEWIS BROAD. *Anthony Eden: The Chronicle of a Career.* Pp. 280. New York: Thomas Y. Crowell Company, 1955. $5.00.

The dust cover blurb states that although for twenty-five years Sir Anthony Eden has loomed large in foreign affairs, little is known of the man behind the elegantly dressed public figure. It may be true, but this book makes no great progress toward revealing him. It is a readable sketch based upon slight research; the bibliography consists of a few biographies, personal accounts, and Eden's own published speeches. The result in many chapters is a sketchy narrative in which Eden appears occasionally by name and in a few quotations. Nowhere are there signs of thorough study to satisfy the serious reader, though outlines are traced for a popular audience who likes easy sentences and short paragraphs.

The point of view is that of an admirer of the Conservative party and of the Prime Minister. The author likes Eden the man, the idealist who supported the League of Nations, the skilled diplomatist, and the social Conservative whose slogan is "a property owning democracy." He is likewise an enthusiast for Stanley Baldwin as "the greatest peacetime Prime Minister since Walpole" (p. 91), although his bibliography does not include the biography by G. M. Young which would question this evaluation. The prewar "appeasers," however, do not come off well, and he questions the honesty of Chamberlain's motives and statements. The Opposition is ridiculed and treated with some partisan inaccuracy. It is not true to say that: "the idealists of the left would have been satisfied with nothing short of a punitive war against Italy" (p. 52). His version of Labour's armaments policy is likewise incorrect. Labour did not object to the use of force by the League under certain circumstances and, as many official statements and the Peace Ballot of 1935 showed, would provide it, but for a time it was unwilling to put it entirely at the disposal of a distrusted Conservative government. In retrospect that distinction may seem to have been too fine, but it seemed intelligible to those who remembered the moves of 1919–20 to aid the Poles which might have involved Britain in a war against revolutionary Russia. The interpretation of the election of 1945 and its aftermath is questionable, too; the voters were not looking backward and repudiating Churchill because of Chamberlain's mistakes, but were concerned with the future and thought Labour the better party to implement the Welfare State to which in greater or less degree all parties were committed.

CARL F. BRAND
Stanford University

SHEILA FERGUSON and HILDE FITZGERALD. *Studies in the Social Services.* Pp. ix, 367. London: Her Majesty's Stationery Office and Longmans, Green, and Company, 1954. (Distributed by British Information Services, New York.) $5.25.

As the Preface says, *Studies in the Social Services* by S. M. Ferguson and H. Fitzgerald is a successor to *Problems of Social Policy* by Professor R. M. Titmuss. It examines the effect of war upon families and shows the efforts made by public policy to improvise social services that would take the place of the help normally available within the family in peacetime.

Before the war started it seemed reasonable to anticipate a reduction of the social services for civilians; in fact, this book reaffirms the statement made by Professor Titmuss in the earlier book that far from reducing the social services, the war years and their aftermath brought new and improved services in order to keep up the national morale and the efficiency of industry.

For instance, the mobilization of man and woman power was so complete that the only people left unoccupied were the very young, the very old, and the incapacitated. The dispersal of families and neighborhoods due to the mobilization of munition workers and evacuation schemes removed many possible sources of self-help among families and friends, and to quote, "what distinguishes British experience and what is of great importance to the theme of this book is the unparallelled mobilization of women and in particular of married women." The State, therefore, had to take a hand in looking after the families of servicemen when they were in trouble, and, because of old prejudices against the existing system of public assistance, had to build services on a new foundation.

One notable exception was, however, the Assistance Board, which in 1940 took over the administration of the new Supplementary Pensions for old-age pensionees. From the start, the Assistance Board conducted its administration in such a way that they provided a national scheme of welfare for old people who needed financial assistance and followed the now familiar British pattern of using voluntary organizations and local authority services alike to help their pensionees.

The authors, however, emphasize that it would be a mistake to deny altruism to the nation's social progress in the war years, and it should be a source of national pride that a lively public interest in two of the most helpless classes in the community—the aged and the deprived children began during the war. The government moved thousands of mothers from cities into the country, and therefore had to provide an Emergency Maternity Service, which in spite of its shortcomings proved to be one of the government's most suc-

cessful social ventures. Special interest lies in the section devoted to the social problem of illegitimacy dealt with here with unusual directness. The Government had to accept rseponsibility for the welfare of the unmarried mothers and their babies and to continue to do so after the end of the war.

To make sure that the health of babies and children did not suffer from food shortages, services far in advance of those previously available were gradually built up with the result that many young children were better nourished than before the war.

Day nurseries were established both to relieve householders in reception areas and also, more especially, to allow more women to work in factories. The nursery was a contribution toward the feeling of mutual responsibility between government and the family.

Residential nurseries had to be established for the child who needed full-time care. At the end of the war most of the children went home, but some of the local authorities were prepared to continue some of the nurseries. An interesting section deals with tuberculosis—a family problem and emphasises the economic strain thrown upon the family if the breadwinner has to undergo long treatment. In anticipation of many air-raid casualties, some sanatoriums discharged patients back to their homes when they were in an infectious condition; this was rectified, but the danger of pollution presently became apparent in public air-raid shelters. The scheme of tuberculosis allowances is explained in detail with its shortcomings. With the assessment, "it is not surprising that the tuberculosis allowances scheme, built as it was on a principle of discrimination, should be among the less successful aspects of war-time social policy."

The final chapters deal with the nursing services, the difficulties of extending these services when there was a shortage of nurses before the war, which became even more acute in the war years. This book is a most valuable record supported with appendices of statistics and carefully documented information. It also makes fascinating and easy reading both for a British public who lived through the years described and also for the American readers who have not experienced it.

The language of the authors is so free from "jargon" that it is with something of a shock that one reads in the description of the Home Help Service that the Ministry of Health should encourage immobile women over 40 to take it up. Such are the pitfalls of ministerial terminology.

DOROTHEA RAMSEY
Keswick, Cumberland
England

J. W. GOUGH. *Fundamental Law in English Constitutional History.* Pp. x, 229. Oxford, England: Clarendon Press, 1955. 25*s*.

This is an important work which no political scientist can afford to neglect not so much because of many new contributions made to the subject, but because of its penetrating analysis of the relevant literature and its illuminating criticism of modern studies in this field. The book apparently sprang chiefly from Mr. Gough's conviction that American writers, notably Professor C. H. McIlwain, had overemphasized the role of concepts of "fundamental law" as limiting the competence of parliament in the later Middle Ages and early modern times. Students of this subject were thus led, Mr. Gough feels, to read back into the English constitutional history of that era a well-defined doctrine of "judicial review" of legislation. Mr. Gough is therefore most anxious to avoid attributing to the period before 1641 either the later British doctrine of parliamentary sovereignty or the later American practise of judicial review. In tracing the role of ideas of fundamental law in English constitutional history, he seems to have three aims in view: first, to marshal the evidence for the omnicompetence of parliament; second, to show that the struggle which culminated in the English Civil War was not essentially a contest for sovereignty but for the preservation of the previously "balanced constitution, in which the law held the royal prerogatives poised against the rights of the subject" (p. 56); and third, to show that the influence of the older ideas of fundamental law persisted for some time after the triumph of parliamentary sovereignty at the close of the seventeenth century.

With respect to the omnicompetence of parliament in the later Middle Ages, Mr. Gough amplifies the evidence brought forward in such works as those of W. S. Holdsworth, T. F. T. Plucknett, S. B. Chrimes, and Miss Faith Thompson to show that there was a great deal of conscious law *making* by medieval parliaments and that even the Magna Charta was not sacrosanct. On the other hand, he marshals ample evidence proving that "sovereignty" in the Austinian sense was an idea alien to medieval thought and that there were concepts of "fundamental law" or "laws" by which the actions of kings, courts, and parliaments were presumed to be bound; even though there was no clear cut and precise method of binding them thereto. It is in this connection that Mr. Gough seems to have overstated his case.

This reviewer is not conscious of having been taught by Professor McIlwain that judicial review found a place in the early English constitution. He was, however, taught that to the extent that this problem of binding parliament (whether as a court or a legislature) was grappled with at all it was grappled with by the judges. It was they who in effect sometimes voided statutes, at least in part, by failing to interpret them strictly. It was they who ignored the commands of parliament on those rare occasions when parliament seemed to force an individual (or a corporation) to be a judge in his own cause or to do something manifestly absurd.

Mr. Gough and Mr. McIlwain are not so far apart either in the Middle Ages or the seventeenth century. On the later period, Mr. Gough should be read as a corrective to the sharp antithesis of royal versus parliamentary sovereignty presented by the classic Whig historians and by S. R. Gardiner. This short study presents one of the best and clearest accounts available of the development of the doctrine of parliamentary sovereignty. In doing so, it reminds us of a truth we are now too often inclined to forget, namely that it is not constitutions or "fundamental laws" *per se*, whether written or unwritten which count. It is the will to abide by them and the clear understanding of their historic traditions which is the guarantee against tyranny. Mr. Gough's work should make a significant contribution to that understanding on both sides of the Atlantic.

HOLDEN FURBER
University of Pennsylvania

R. K. WEBB. *The British Working Class Reader 1790–1848: Literacy and Social Tension.* Pp. ix, 192. London: George Allen and Unwin, 1955. (Distributed by Columbia University Press.) $3.00.

The title of this book, as Mr. Webb explains in his Foreword, pertains to the first chapter which deals with the working class reading public. After struggling with sparse statistics on education, the author estimates that three-fourths of the working people were literate by the middle of the nineteenth century. The rest of the book concerns "the challenge which the literate working class presents to its betters" and is more adequately described by its subtitle, *Literacy and Social Tension.*

Mr. Webb has studied primarily the social tensions of the 1830's, the agricultural disturbances, the breaking of machinery, the agitation against the New Poor Law, and the rise of the trade unions. Relying mainly upon the papers of Francis Place and the materials of the Society for the Diffusion of Useful Knowledge, he has carefully studied the middle class efforts to educate and reform the working classes. He concludes, however, that these attempts failed because the ruling classes did not understand the masses (p. 161).

Social history in the Marxian vein of class warfare imposes a severe methodology, more severe than Mr. Webb has employed. It requires, in this instance a systematic treatment of the statistics of education. It requires also a careful definition of social groups. When speaking of the working class, he is not always clear whether he means urban or rural labor, the artisan or factory worker. Occasionally he lapses from the theme of class warfare to show a coincidence between the artisans and the lower middle classes. If he had studied Chartism and the factory movement, he might have found a greater coincidence of these classes as well as sev-

eral earnest attempts to mitigate social animosities. Moreover, the author's failure to define "radical" leaves the reader in doubt as to whether he means working class agitators or the followers of Jeremy Bentham.

Notwithstanding these defects of methodology, Mr. Webb has compiled a useful catalogue of the literature designed to educate and uplift the working people. Since he is unable to engender sympathy for the middle classes, Mr. Webb would do well to turn his attention to the study of literature of the working classes and present a catalogue of the materials which, in his judgment, lifted the working classes to literacy.

Lehigh University

A. L. ROWSE. *The Expansion of Elizabethan England.* Pp. xiii, 450. New York: St. Martin's Press, 1955. $5.75.

To Dr. Rowse, Elizabethan expansion begins at home—English law and order, English language and custom are introduced, by force when necessary, into the Celtic lands of the Scottish border, Wales, and Cornwall. Ireland is another story, for here bloody conquest was necessary to subdue the country. Even while these tasks were being accomplished, Englishmen penetrated to the distant East and Muscovy, and finally made their first attempts to settle in the New World. In a great burst of energy, the island people caught up to and prepared to surpass the mighty Spanish bid for empire.

The author tells the story with gusto and unabashed partisanship. There are heroes and villains, wise men and fools. The great English soldiers and sailors flash brilliantly. Of the foreigners, William the Silent, "one of the truly great men of history," and Parma, although an enemy, receive the accolade. Essex is the lightweight dilettante, and Philip of Spain is the bigot, sometimes the fool. Above them all is Queen Elizabeth—guiding, goading, scolding, praising, with an uncanny knowledge of all that goes on; but being a woman she hates war! Yet the queen is vigorously defended against the detractors who accuse her of criminal parsimony in the payment and care of her valiant troops. In truth, she could do little to prevent the rampant corruption of captains and civilian purveyors. Corruption, disease, and inefficiency made for the miseries of the armed forces. Despite these difficulties, such great advances were made in ship designing and in military organization, training and equipment, that Elizabethan England emerged as a first-class power. In fact, in the author's opinion, Elizabeth made only two major mistakes: she failed to supply sufficient funds for the conquest of Ireland earlier in the reign, and secondly she intervened in the French civil wars.

To this reader at least, there is hardly a dull moment in Dr. Rowse's book, even though the expert may not find much that is new or different from previous accounts. Attention is held by the careful blending of contemporary sources and modern authorities, and by the verve of the writing, particularly in describing the exploits of the sailor-heroes, the defeat of the Armada, intervention in the Netherlands, and the Irish troubles. May the reviewer nevertheless express a few disagreements? The learned author seems to fall into a curious Celtic racism: Celts are withdrawn, sensual, and bad cooks! Dr. Rowse hates the fanatic, Puritan or Catholic; but is not this hatred carried too far, apropos Motley: "Puritans have seldom much minded about truth in what they say of others"? Or in the dictum that "the odious, the superfluous Civil War in England" destroyed the possibility of integrating England and Ireland?

But then, perhaps these crochets add spice to an admirable book, and in any case do little harm. We look forward to the final volume of Dr. Rowse's Elizabethan trilogy.

E. A. BELLER

Princeton University

WILLIAM HALLER. *Liberty and Reformation in the Puritan Revolution.* Pp. xv, 410. New York: Columbia University Press, 1955. $6.00.

Professor Haller in this latest work continues his earlier study, *The Rise of Puritanism* and brings it down to 1649. Utilizing printed tracts, sermons, and other literature to the fullest, the author depicts the struggles of a "Godly preaching ministry" and its "gathered" flocks as they strove to win religious liberty from Charles I and to prevent their newfound freedom from degenerating into chaos. In these pages, replete with quotations and paraphrases of hundreds of sermons, the reader follows the battles of the Saints first against Laud and episcopacy, then against parliament and presbytery and finally against Levellers and sectaries. At last Cromwell, Ireton, and the army intervened to provide the compromise of Independency, which charged individuals, magistrates, and churches alike to maintain truth and oppose heresy, "but nothing, certainly not the prison or the halter, can really serve to that end but 'Gospel conviction'" (p. 339). Throughout the protean conflict the close correlation between religious and political liberty is lucidly illustrated.

There are many heroes in the struggle for liberty and reformation as depicted by Profesor Haller, but John Milton stands forth above them all. Although no Carlyle, Professor Haller has perhaps ascribed too much importance to his hero. While admitting that Milton's tracts had little effect until 1649, the author holds to the opinion that Milton's "participation in the argument for liberty and reformation was a fact of extraordinary significance" in the history of Puritanism for his writings carried "the enduring ideas of Puritanism to later generations" (p. xv). Be that as it may, Professor Haller's admiration for Milton the literary figure caused him to elevate the poet to a loftier stature than he deserved during the period 1642–49.

All but the expert will find some sections of the book rough sledding. On the other hand, some portions are delightful. In spite of its unevenness *Liberty and Reformation in the Puritan Revolution* is a fascinating study based upon sound scholarship. Long awaited it should be well received by students of literature, history, and political science, as well as by those interested in man's struggle for freedom as it unfolded during the Puritan revolution.

JOHN J. MURRAY

Coe College

THOMAS L. COONAN. *The Irish Catholic Confederacy and the Puritan Revolution.* Pp. xii, 402. Dublin: Clonmore and Reynolds; New York: Columbia University Press, 1954. $6.00.

Dr. Coonan maintains that the Irish rebellion of 1641 and the ensuing Catholic Confederacy were the outcome of the agitation of the Catholic Irish for an independent Irish parliament under the crown analogous to the English parliament. This agitation paralleled that of the English parliament against Charles I. It foreshadowed the coming struggle of the American colonies for representative government under the crown, independent of the Westminster parliament, and thus anticipated the future constitutional development of the British Commonwealth. The Irish Catholic Confederacy was made possible by the collapse of royal power before the attack of a strongly Protestant parliament, and if things had turned out differently might have made possible the early establishment of a Dominion of Ireland with its own parliamentary government. But the outcome of civil war in England left the Irish with the English parliament and the Puritan army to contend with, and nothing to depend upon besides its own resources but the word and the authority of a defeated king who had previously inflicted Strafford upon his Irish subjects. The revolutionary regime in England had no intention to relinquish any aspect of the sovereignty in England or Ireland of which it had now taken possession. Cromwell came to Ireland and put an end to Irish Catholic hopes. But the reason for Cromwell's success in this was not really or not only the evil embodied in him and his cause, but also the weakness of the Irish Confederacy itself, which began disintegrating from within almost from the moment of its inception. The roots of this weakness reached far back into Irish history. The difficulty was that, although there was among the Irish a deep, even fierce, sense of being Irish and Catholic, Irish nationalism had been able to develop no cohesion, no unity, and no sense of what effective action in the cause of national unity required. There was conflict of in-

terest going back to Norman times between the Anglo-Irish feudal landlords and the Old Irish with their own customary social organization. There was the conflict between the Old Irish and the Anglo-Irish on the one hand and on the other the swarms of English and Scottish intruders who came in under the Tudors and Stuarts, and this conflict was complicated by religious differences. Religion on both sides went hand in hand with inflamed nationalism. There were, not least important, the unending jealousies and rivalries among the Irish themselves. There was the clergy on both sides to keep the fires of conflict well stoked. Consequently the history of the Catholic Confederacy, as this writer presents it, is a story of vain appeasements, fruitless compromises, betrayals compounded, disintegration and defeat from which the Irish spirit has not yet recovered. The story has been told often enough from the English Protestant point of view. It is good to have it also told as Father Coonan tells it in such well-documented detail from an Irish Catholic point of view.

WILLIAM HALLER
Folger Shakespeare Library

JOSEPH FRANK. *The Levellers*. Pp. viii, 345. Cambridge, Mass.: Harvard University Press, 1955. $5.00.

Basing his story primarily upon the pamphlets and tracts of John Lilburne, Richard Overton, and William Walwyn, Professor Frank has written an artistic and informative book on the rise and fall of the Leveller party. Supplementing the writings of his three social democrats with the works of their friends and enemies, Professor Frank traces the growth of the Levellers step by step until the individual efforts of Lilburne, Overton, and Walwyn merge with those of John Wildman to bring forth the various agreements of the people. Lilburne's propensity for martyrdom, Walwyn's philosophical radicalism, and Overton's sardonic skill are evaluated as are the roles they played in hammering out the postulates of the Leveller party.

By appealing to history, God, reason, and nature, the Levellers brought forth a political philosophy which had to wait two hundred years before it found acceptance. This ideology, rejected by the factions of the time, consisted of four overlapping elements: optimism, secularism, rationalism, and pragmatism. Professor Frank weighs carefully the Leveller contribution to modern society and convincingly shows that the Levellers were the progenitors of constitutional democratic government rather than harbingers of communism. Their leveling was mainly in the political sphere and not in the economic as their many enemies charged.

Professor Frank's work is of intrinsic value for the student of seventeenth-century political thought and party warfare, and stylistically is an improvement over some of its predecessors in the field. At times, however, he allows his enthusiasm to carry him out on an historical ebb tide. His using Lilburne's tracts to substantiate Lilburne's successes is not always conclusive evidence. Presentism also occasionally raises its insidious head. These later remarks are personal observations and are in no way intended to detract from a thorough, well-written treatment of the writings of three seventeenth-century social democrats.

JOHN J. MURRAY
Coe College

SLAVIC COUNTRIES

ITHIEL DE SOLA POOL and others. *Satellite Generals*. Pp. vi, 165. Stanford, Calif.: Stanford University Press, 1955. $1.75.

The Hoover Institute and Library of War, Revolution, and Peace, under the able guidance of its chairman, Harold H. Fisher, and its director, C. Easton Rothwell, and with the aid of the Carnegie Corporation, is currently engaged in the preparation of studies designed "to describe the world revolution of our time and its consequences for world politics and national policy." The monographs in print to date are grouped under five headings: General, Elites, Symbols, Communities, and Institutions. Since the "world revolution" embraces a series of racial, colonial, nationalistic, scientific, and technological changes on a global scale, all prospectively of decisive significance for the fortunes of mankind, it is to be hoped that these studies will not continue to be limited, as is thus far the case, to the institutional differences and ideological rivalries among democracy, fascism, and communism.

Within these limits the present survey, subtitled *A Study of Military Elites in the Soviet Sphere,* is among the more valuable of the series. Its purpose is to illumine the dilemma of Communist power-holders who require, simultaneously, professional skill and unquestioning loyalty from military commanders. Its method is to survey the careers of representative generals in the armies of Czechoslovakia, Poland, Rumania, Hungary, and China. The research staff comprises, in addition to Ithiel de Sola Pool as editor, George K. Schueller, Robert H. Billigmeier, Cary Fisher, Paul Katona, Cheng Yuan, Janusz K. Zawodny. All have toiled valiantly among obscure sources. Their findings, as here published are admittedly out of date in some details, but are more complete than could reasonably be expected. Numerous new insights into Communist military theory, practice, and organization are afforded, for which all scholars and policy-makers should be grateful.

Carping criticism of so difficult an enterprise, here executed so remarkably well, would be strictly out of order. It may nevertheless be noted that China is in no meaningful sense a "satellite." Some would still question the factual accuracy of the statement (p. 57) that 4,300 Polish officers were "murdered by the Russians at Katyn." And it may be doubted whether wishful thinking of the usual cold war variety, postulating alternately that the Communist systems are menacing monsters of invincible might and malice or are on the verge of internal breakdown because of insoluble paradoxes, represents the most useful orientation of scholarship aimed at description, analysis, understanding, and prediction.

FREDERICK L. SCHUMAN
Williams College

Justice Enslaved: A Collection of Documents on the Abuse of Justice for Political Ends. Pp. 535. The Hague, Netherlands: International Commission of Jurists, 1955. No price.

This compendium of materials was originally prepared for the use of the lawyer-delegates from forty-eight countries outside the Iron Curtain who met in Athens in June 1955 for the International Congress of Jurists. It is now being distributed in English, French, and German versions by the International Commission of Jurists.

The collection contains 591 "documents" arranged under four main heads: Public Law, Criminal Law, Civil and Economic Law, and Labor Law. In each instance the editors have used appropriate articles from the United Nations Declaration of Human Right to keynote (by contrast) the subgroups of evidentiary materials. The case to be made is unfortunately no longer news: it is that the Soviet nations regard and utilize the legal system as a handmaiden of political control and that justice there is "enslaved". One rather imagines that the German title might have used the word *Justiz,* with its connotation of law administration—for this is the subject of the volume.

The materials to be found here range from such readily accessible items as sections of the Soviet constitution to depositions from Iron Curtain refugees and extracts from speeches of Satellite law officials such as East Germany's notorious Frau Benjamin and Bulgaria's Nikola Takov. The array is wide, massive—and soberly depressing. To anyone trained in, or even only accustomed to, the legal traditions of the West, whether common law or civil law, the partisan polemics of the judges of the people's democracies can only appear as sordid travesties of anything resembling a legal system. The International Commission of Jurists indicts the practices portrayed in these pages as flagrant betrayals of the rule of law and pleads with lawyers throughout the free world to strengthen faith in the rule of law as the principal foundation stone of free government.

As a legal brief, marshalling evidence to substantiate its charges, this is an impressive effort. As a source for students of judicial administration, it offers documen-

tation that is, if not novel, then certainly scarce: decrees and decisions of Satellite courts, memoranda of the East German secret police on such sensitive matters as the procurement of informers, and numerous refugee statements.

For the researcher, the value of some of the most shocking documentary materials is limited by the, presumably necessary, anonymity of the sources. Throughout, the editorial work leaves something to be desired. Apparently the German version was the original and the English edition is a translation prepared by German hands, or at least not by anyone for whom English is the primary language. Sentence structure and word choice combine to give the text an aura of heaviness and abstruseness. Proofreading failed to prevent such obvious slips as omissions of closing parentheses or the use of a person's given name in a document that otherwise takes pains to conceal his identity.

These mechanical defects may deter readers. Students of Soviet law will prefer to draw on such writers as Harard and Berman. But as an indictment of the lawlessness of Communist law this volume is tellingly effective.

FRANCIS H. HELLER
University of Kansas

HANS KELSEN. *The Communist Theory of Law.* Pp. viii, 203. New York: Frederick A. Praeger, 1955. $5.00.

I am tempted to say that the subject of this book is not worthy of the writer, for Communist theories of law are too crude, too confused, too contradictory to give much scope to the critical powers of a man like Professor Kelsen. He possesses all the qualities that the legal theorists (if I may so call them) criticized by him conspicuously lack: he is scrupulous, acute, dispassionate, and relevant. He cares deeply for what matters least to them, which is the study of law for its own sake. More even than most "bourgeois" writers on law, he lives in quite another world from theirs. Whatever else may be said about him, no one will pretend that his kind of jurisprudence has a political or social bias or is intended to serve a practical end.

Soviet theories of law are, in this book, revealed in all their blatant poverty—carefully, patiently, lucidly, without malice and without irony. It is an operation done by an expert, who uses his sharp instruments, not to wound, but to dissect. There is, indeed, about the book, a certain hospital atmosphere, bare and antiseptic, except that the author no more seeks to cure than to kill. For he knows that the theories he pulls apart so deftly are also, in a sense, out of his reach, being products of policy and of faith, ideology and not science.

The best chapter is perhaps the first. It would be difficult to explain more succinctly and clearly the confusions that make up the notion of "ideology" as we find it in the writings of Marx and Engels. Marx at least, if not Engels, was much less simple-minded than most of his Russian disciples, and the criticism of his ideas and arguments, though more difficult, is also more rewarding. But I am inclined to believe that Professor Kelsen oversimplifies the Marxian doctrine by assuming that Marx, when he treats law as part of the "superstructure," nearly always treats it as if it were ideological in a sense in which it clearly cannot be, as if it were a way of looking at social reality which distorts its true nature. But Marx, though he sometimes speaks as if everything belonging to the "superstructure" were ideological in this sense, much more often implies the contrary; much more often speaks as if the "superstructure," though determined by the "substructure," were only in part ideological. It does not therefore follow that Marx, whenever he (as he often does) clearly implies that law is not ideological, is referring it to the "substructure."

Unavoidably, the later chapters are somewhat repetitious, for the stock of ideas of Soviet jurists is not great, and they are seldom original even in their mistakes and absurdities. Time and again, Professor Kelsen has to make the same points against them. It may be, however, that he insists, if not too much, then sometimes in a way apt to mislead, on the need to distinguish sharply between legal norms and social relations. No doubt, they are not the same and ought not to be confused, but the connection between them, even in thought, is closer than Professor Kelsen appears on occasion to think. Social relations are not even intelligible apart from the normative order, for they always involve rights and obligations. It is surely one of the many faults of the Marxists, as social theorists, that they do not admit this, but treat social relations as somehow quite separate from morals and from law. I hope that Professor Kelsen does not agree with them.

LEOPOLD H. HAIMSON. *The Russian Marxists and the Origins of Bolshevism.* Pp. viii, 246. Cambridge, Mass.: Harvard University Press, 1955. $5.50.

This volume, which is conceived by Dr. Haimson as the first of a series on the development of Bolshevism in Russia, attempts to accomplish several tasks in hardly more than two hundred pages of text. It is an essay on the evolution of the Russian intelligentsia, a study of the reception given Marxism in Russia and of the transformation of Marxism there, an analysis of the emergence of Bolshevism and of Menshevism, and an analysis of the early development of Plekhanov, Axelrod, Lenin, and Martov. It has quite a good bibliography, and it has been carefully edited and printed.

On the whole, Dr. Haimson reviews in some detail what has become for most scholars a fairly familiar story because the spread and transformation of Marxism in Russia has been a subject of careful study both in the Soviet Union and in the West for some time. He does add materials with regard to Axelrod and Martov which were not generally known, but this benefit is diminished to some degree by his failure to be even more full on these men, who have not received the attention from scholars which Plekhanov and, above all, Lenin have received.

Dr. Haimson chose to analyze the origins of Bolshevism in Russia in a chronological fashion, with some modifications. This procedure does assist in describing to the reader the painful and confused swirl of discussion over plans and programs, but at the same time it causes some confusion. Thus, it is difficult to follow the strands of thought of the four principal individuals when they are tangled and meshed again in almost every chapter. Dr. Haimson's style, which is somewhat affected by sociological jargon, is to some degree responsible for this confusion.

In the conclusion, which is quite excellent, he pulls together his ideas on "consciousness" and "spontaneity" as two established conflicting categories. This is a stimulating and perceptive chapter, but one is struck by the lack of connection between it and the body of the volume.

ROBERT F. BYRNES
Mid-European Studies Center
New York, N. Y.

HARRY HODGKINSON. *The Language of Communism.* Pp. xiii, 149. New York: Pitman Publishing Corporation, n. d. $3.75.

To students of foreign affairs, Soviet Russian is a growing headache against which little remedy is offered in our classrooms and special literature. The theory prevails that Russian is the language of Pushkin and Tolstoy, and no manuals of modern Soviet usage exist. Some novelties, for example, "soviet," "bolshevik," "cominform," "agrogorod," become our loan words before Russian-English dictionaries give them entries. Others can be looked up in Ushakov's *Russian Standard Dictionary,* the last volume of which is dated in 1940. Except for some work in technical fields, there have been no attempts to fill the gap.

More important than lexical are semantic and stylistic changes. Agreements appear to have been reached when the two parties mean quite different things by the words they use. Each continues to act in terms of his own understanding of them, and there follow inevitable accusations of betrayal from either side. Complaints are loud and frequent. Would not many disillusions have been avoided had we been wise enough to find out, before making agreements with the Communists, what such words as "freedom," "democracy," "peace," and "coexistence" mean to them? We have no guide, besides conjectures and

impressions. The problem involves the general question of relationship between language and culture.

While scholars ponder, the problem is attacked by Harry Hodgkinson, sometime intelligence officer in the British Royal Navy. He wrote a book in the classical fashion published as *Doubletalk* in Great Britain, and *Language of Communism* in the United States. The text is preceded by the statement that "the meaning of a Communist word is not what you think it says, but what effect it is intended to produce." The book is inspired by practical consideration and represents a glossary of terms which, in Communist usage, are not only means of communication but "weapons" and "instruments of struggle."

The book lives up to its promise but in parts. Two-thirds of the 164 entries are "information, please" type summaries of the Communist theories of genetics and of astronomy, of "family," "art," "astrobotany," "sports," of "current Soviet military thinking" (pp. 79, 138–43) and "foreign policy" (pp. 50–51); of the party attitude toward "alcoholism," "religion," "America," even "Nobel Prize" and "Shakespeare." The reader is given a list of fifty-four famous "inventions" on which the Communists claim Russian priority (pp. 61–66); he is told that "women" are exploited in the USSR and in the satellites (pp. 143–45), and that the Soviet "plumbing" is bad (pp. 99–100). The author's comments contain little that is new but are readable and witty.

Only fifty odd entries deal with language in the proper sense. Some definitions are pertinent and useful, for example, of "aggression," "agitator," "collectivity," "espionage," "culture," "genial," "warmonger." A number of others are debatable or incomplete, and a few are rather inaccurate. Important words such as "elections," "compromise," "*partiinost*," "agreement" are lacking. Instead, we find "lysenkoism" (pp. 72–75), "yezhovschina" (p. 117), and "zhdanovschina" (pp. 148–49), which, coined in Soviet Russia as they may have been, belong to the language of *anti*-communism. It is a good bet that they are never used in the Communist press!

The author's comments are supported with quotations from many sources. The degree of authority of the sources is not evaluated, and some selections make the reader wonder. Transcription of Slavic words is inconsistent and careless.

With all its limitations, Mr. Hodgkinson's book is not without value. It touches upon one of the most urgent problems of foreign relations and of scholarship. Contributing little itself to a solution, it has the daring and the merits of a pioneering work.

NICHOLAS P. VAKAR
Wheaton College

CONSTANTIN DE GRUNWALD. *Tsar Nicholas I*. Translated by Brigit Patmore. Pp. ix, 294. New York: The Macmillan Company, 1955. $4.50.

Constantin de Grunwald began his study of the life of Tsar Nicholas I with many advantages: knowledge of the sources, access to important archival material in Vienna, experience in the writing of biography (Metternich, Baron de Stein, and Bismarck), and that fundamental requisite for good biography, sympathy for his subject. He has used these advantages skillfully to write a highly satisfactory life of the Russian ruler.

The author faced no serious competition in this particular field; few had previously undertaken a study of Nicholas I, and none had succeeded in completing an adequate one. That fact is not surprising in view of the broad and intricate nature of such a study. Nicholas ruled during one of the most critical periods in Russian history, one that included the Decembrist Revolt, the Polish Revolt of 1830, intervention in the Hungarian Revolution of 1848, the Crimean War, the crisis of serfdom, the beginnings of Russian greatness in fiction and music, the growth of the intelligentsia, and the development of a Russian police state.

As Grunwald indicates, Nicholas was an ordinary man with extraordinary power living in an extraordinary time, a man who achieved fame and notoriety as a result of the circumstances under which he was born and the age in which he lived rather than as a consequence of his contributions as a ruler. Though it must have been difficult to keep a biography of this man from being resolved into a history of his times, Grunwald has managed to keep the spotlight on Nicholas rather than on the state and to depict events as they affected him or were affected by him. The result is a nicely balanced picture of Nicholas as a person and as a ruler.

Tsar Nicholas I is a modest book: it is short, and it gives no hint that the author is seeking the accolade of "definitive" for his work. It is written smoothly and interestingly. Some may wonder why the French translation of Russian titles is retained in the footnotes (the work was published in French in 1946); and some may disapprove of the degree to which the author's sympathy for his subject leads him to accept the tsar's views of reality, particularly with respect to the Polish and Jewish problems and the police state. But any reader will find the book a useful introduction to an important and much neglected subject.

SIDNEY HARCAVE
State University of New York

THAD PAUL ALTON. *Polish Postwar Economy*. Pp. x, 330. New York: Columbia University Press, 1955. $5.75.

The analysis of the economy of a country is not an easy assignment in itself. But it becomes highly complicated with a country which has the bad habit of publishing only fragmentary statistics of its economy. This is the case of postwar Poland. Furthermore, in the so-called peoples' democracies there is a peculiar discordance between the word of the law and the manner of its application. Judging from the texts of the laws and regulations issued by the Communist regimes in the peoples' democracies, their present system of government is almost ideal. However, in examining the application and execution of these laws and regulations one sees the ideal vanish.

Mr. Alton made extensive and effective use of Polish and other sources used for his analysis. He discusses the political framework in which postwar Polish economy developed; he analyzes planning in agriculture, industry, and finance. Much space is given to a detailed description of the intricate mechanics of state control and administration of Poland's economy. By relying on official publications, however (others do not exist in present-day Poland), this description suffers from one-sidedness: in effect, it summarizes what Polish Communist officials want to see in and what they write about this administration. So, for instance, Mr. Alton writes that "the newly created enterprises operated on commercial principles on the basis of financial and economic plans approved by higher levels of the economic administration" (p. 91). This sounds very businesslike and promising. But how does it work in practice? True, Mr. Alton mentions that in 1953 "the administrative and control machinery still failed to come up to the desires of the planners" (p. 103), but the reader obtains no glimpse into these failures and is unable to evaluate their importance.

One merit of Mr. Alton's approach is just his use of sources originating in the country whose economy he is analyzing. Information obtained from these sources build the backbone of his book. However, he could have obtained more of these sources. His list of almost one hundred "Works in Polish" that he used includes only three books; the remainder are articles in a few periodicals from Poland, periodicals which are mentioned separately in the bibliography. A few additional books are mentioned as "Public Documents." There are at least a dozen other books on the subject available in libraries in this country. Finally, not a single item published by the Polish emigration since 1945 was consulted or mentioned.

These shortcomings do not, however, prevent the evaluation of Mr. Alton's book as a remarkable contribution to a better understanding of the intricate problems of Poland's postwar economy. To the scholar and specialist, it will give an intelligently prepared digest of Polish laws, regulations, and planning procedures. Considering that the source material is contained in publications in the Polish language, the book will be a welcome tool to those who do not know this language.

Stanford University

WESTERN CONTINENTAL EUROPE

EWAN BUTLER. *City Divided: Berlin 1955.* Pp. 187. New York: Frederick A. Praeger, 1955. $3.95.

Since World War II, and more particularly since the split of Germany, Berlin has become a focal point in world history. The Berlin blockade and airlift, the Juné Revolts, and the Berlin Four-Power Conference in 1954 have repeatedly thrust Berlin to the forefront of the cold war and have made it a barometer for measuring the tension between East and West. And even when the city is not rocked by some dramatic crisis it continues to command the attention and concern of the Western powers because of its prime importance as bulwark of the free world and as a window through the Iron Curtain. It is indeed this latter function, made possible by the four-power status of the city, situated 100 miles inside Communist East Germany, that gives Berlin its continuous significance. It is not surprising, therefore, that a number of books have already been written about postwar Berlin, both by former American officials like Brigadier General Frank Howley or Lowell Bennett, and by journalists like Curt Riess. The present work is also by a journalist, a competent British observer, who attempts to read the life-pulse of this anomalous metropolis. In some eighteen brief, breezy chapters the author sketches the historical background, the life and activities of the burghers, and some of the unique features and institutions of this besieged fortress. He obviously knows the city well, has explored some of the main thoroughfares, theaters, and stores, hotels, cafes, and night clubs, both in East and West Berlin. He is successful in conveying the atmosphere of the city, the scene of relentless and militant political, economic, and cultural warfare between two worlds. It is also, as he points out, the scene of spies, smugglers, and kidnapers. But Berlin is much more than all this. It is essentially the mental and political health of the Berliners, quite in contrast to the more complacent and conservative West Germans, that give this city its unique and admirable quality. Berlin is, as it were, the gadfly of the German body politic. It is a pity that one misses in this book certain characteristic features that make Berlin what it is. There is lacking, for example, a sufficient emphasis of the refugee problem which at certain times threatened to turn the whole city into one vast refugee camp. A description of the city's refugee processing center and one of its many camps would have been a rewarding contribution. One misses any discussion of such typical anti-Communist organizations as the Free Jurists, the Fighting League against Inhumanity, and similar groups. One would like to see a discussion of the functions and activities of the Allied occupation agencies which play a very considerable role in a city that is technically still occupied territory. And although the book's title is *Berlin 1955*, the historical discussion would have justified, nay, required a portrayal of the leader who more than any other man embodied the spirit of postwar Berlin: the late Ernst Reuter. Unfortunately the account is marred by a few factual errors and mistakes in spelling. On the whole, one is thankful that a keen observer and a warm friend of Berlin has told again the story of this fighting outpost, but one wishes at the same time that before long a historian will produce a serious, balanced, and reliable work on this important subject.

CARL G. ANTHON
American University of Beirut

RUDOLF COPER. *Failure of a Revolution: Germany in 1918–1919.* Pp. xi, 294. Cambridge, England: Cambridge University Press, 1955. $5.00.

The author, a journalist and a native of Germany, retells the often-told story of the revolution which followed Germany's military collapse in 1918. He terms the revolution a failure because, in his opinion, it set up a democracy with no "democratic social and economic substance to support it"—a rather sweeping indictment of the Weimar Republic. In view of this diagnosis the writer understandably deplores the failure. But does he realize that the only conceivable success of the revolution of 1918, and certainly the one anticipated by its leaders, Rosa Luxemburg and Karl Liebknecht, would have been the victory of communism in Germany? There is in these pages, apart from their ideological bias, nothing that could be called new or instructive—they rather illustrate the saying: "Books generate books." The writer, it is true, claims first-hand knowledge: "I saw and heard in action most of the men and women who speak from these pages and of whom these pages speak. I knew many of them. I am not an actor in this book, though you might have found me in many of the crowds I describe" (p. xi). But since the author, at the time of the revolution, was a lad of just 14 (according to the biographical information on the flap of the jacket he was born in 1904), we will be permitted to maintain, with due allowance for prodigious precocity, a degree of scepticism in regard to his authenticity as an eyewitness.

Germany

KARL GRUBER. *Between Liberation and Liberty: Austria in the Post-War World.* Translated by Lionel Kochan. Pp. 240. New York: Frederick A. Praeger, 1955. $4.50.

Mr. Gruber was head of the resistance movement in Tyrol which took over the province a few days before American troops entered on May 3, 1945. For a brief period he acted as Governor of that province under both American and French occupation forces, and he makes some interesting contrasts between the two. On September 25, 1945, he resigned this post and took over the direction of Austrian foreign policy in the central government headed by Karl Renner. To speak of an Austrian foreign office or a foreign service at this time would be a misnomer, but there were many problems to be dealt with and under Gruber's direction Austria progressively won back her position in international affairs. In 1953, while still in office, Gruber published the German edition of this volume, and excerpts were printed in the Vienna press. This led to heated controversy, particularly in regard to some of his observations on internal politics, and the question was raised whether a foreign minister should publish his views in book form while still in office. In a Foreword to the second edition Gruber defended his right to do so, but nevertheless the episode led to his resignation and subsequent appointment as Ambassador to the United States.

The book is written discreetly as one might expect, and there are no startling revelations. On the other hand it is informative in a broad sense. There is a good chapter on the question of South Tyrol, but much more needs to be said to clarify the position taken by the powers. There were plenty of American officials who knew about the historical aspects of this issue than Gruber seems to think. If the powers fell back on the boundaries of 1938 in this case, they also did so in the case of the boundary difficulties with Yugoslavia. Gruber attributes much of the Austrian success in the latter dispute to his adamant stand that Austria would never agree to a diminution of her frontiers. Much is also said about the negotiations for a state treaty, but again the account is general and details must be sought elsewhere. In this matter the description of the Moscow Conference in 1947 and Austria's appeal to the United Nations in 1952 is most informative. Although there can be no question as to Gruber's Western orientation, he has no bitter diatribes against the Russians. They are hard bargainers, schooled in the ways of the market places of the East, but they can be dealt with if one's patience holds out.

The book is interlarded with humor and acute observations on personalities and politics. Characterized more by English than American idiom, the translation seems excellently done, and the book reads smoothly and easily.

E. C. HELMREICH
Bowdoin College

CHARLES W. HALLBERG. *Franz Joseph and Napoleon III, 1852–1864.* Pp. 448. New York: Bookman Associates, 1955. $5.00.

This book by the author of *The Suez Canal: Its History and Diplomatic Importance* is typical of the better diplomatic studies—detailed, archival, narrow

in space-time dimensions, competent. The subtitle, *A Study of Austro-French Relations* is more descriptive than the main title, but unfortunately, it is poorer copy. Although we hear about Franz Joseph from time to time, especially in the conclusion, we meet and know rather his chief ministers, Schwarzenberg, Buol, and Rechberg; this is also true of Napoleon III and his numerous advisors.

Here is no Napoleon le Petit, no Caeserean Democrat, but Napoleon III, Revisionist; he is a capable, enigmatic man committed to overthrowing the Congress of Vienna settlements to make way for the *Idées Napoléonienne* of nationalism and the predominance of France. The whole development is colored by Hallberg's adoption of the standard view of the Congress of Vienna as anti-French, antiliberal, antinational. Napoleon III saw it that way also. To examine Hallberg's exposition of the bases of Austro-French antagonism is to realize that we have no corner on ideological diplomacy. Napoleon III is fighting the good fight against dynasty, oppression, and reaction in behalf of nationalism and the preponderance of France. Austrian actions rested on an opposing policy of dynasty and conservatism. All this is evident in the contretemps over recognizing Louis Napoleon as Napoleon III, in his Italian, Rumanian, and Polish ventures, and in his expansive plans for a general reorganization of all Europe which would at once emulate and repudiate the reorganizations of 1815.

Hallberg builds securely on archival materials, especially from the Haus- Hof, und Staatsarchiv. His documentation produces the security of detail. More specifically it shows up the myths of an Anglo-French ultimatum forcing Austria into a triple alliance against Russia, of Franz Joseph as a mere tool of Buol, and of Drouyn de Lhuys being jockied out of office in 1853 by Lord Cowley. Buol, Hallberg rehabilitates in a limited and gentle manner. Regrettably, there is nothing conclusive about the reasons for Napoleon's early withdrawal from the Italian war.

Clear in style, this book lacks vivaciousness; this is not to suggest dullness, for the book is not dull. Skillfully employed quotations add salt to a meaty dish. The riches in the footnotes are disgustingly hidden between the conclusion and the extensive bibliography. The index is full and usable. In fine, here is a book which is important for serious students of the mid-nineteenth century.

GARLAND DOWNUM
Arizona State College
Flagstaff

MARIO EINAUDI, MAURICE BYE, and ERNESTO ROSSI. *Nationalization in France and Italy.* Pp. x, 260. Ithaca, N. Y.: Cornell University Press, 1955. $3.50.

The fourth "of a series devoted to the political, economic, and constitutional problems of post war France and Italy," this volume presents a brief for comprehensive organization of most of the nationalized sectors of these two national economies. All three authors assume that nationalization in both countries is here to stay—perhaps to be further expanded in some directions. But while notable improvements have been made in many instances, yet management is frequently subject to harassing political interference, efficiency is sometimes low, responsibility is difficult to fix, and the need for technical organization and planning is generally evident. In both countries part of this confusion is a heritage of the past circumstances under which nationalization took place: "In Italy, amid the secrecy imposed by the fascist dictatorship trying to avoid public scandal; in France, in the rush of the glittering hopes created by victory and liberation." Part of it is due also to the impact of conflicting interests and policies of employers, trade unions, established governmental civil service bureaucracies, but above all to the rapidly changing power structures of the political parties to the center and left.

Several lines of therapy are suggested. Especially favored are (1) the autonomous public corporation of the type developed in labor-dominated postwar Britain where government has taken over most of the economic activity as in "natural monopolies" public utilities; (2) where nationalization has stopped short of complete government ownership, the reorientation of public corporations in order to make effective use of the yardstick principle as in the Tennessee Valley Authority; (3) where international interdependencies and the need for the development of large free-market areas are especially striking the subjection of national corporations to super-national authorities as in the case of the European Coal and Steel Community; and (4) the giving up, or "privatizing," of a wide variety of relatively small, scattered industries and businesses from whose operation by government, even to the most ardent socializers, little of public advantage can be expected.

There are a few flaws in these otherwise admirable short studies. Closer familiarity with the British nationalized industries would have disclosed that they are by no means the models of efficiency these authors imply. Nor will it do to assume that the nonnationalized industries in that country are left untouched because they are not in need of reorganization. The chaos of the British textile industry is a particularly striking case in point. Again, TVA was only in part advocated because of its yardstick function. Far more important were the problems of multiple purpose development. The need for technical rationalization of both French and Italian industries, heavy and light alike, is greater than these writers suppose.

Nevertheless, this volume is a remarkably compact, objective, and well-reasoned presentation of one of the most significant problems of contemporary times.

ROBERT A. BRADY
University of California
Berkeley

ELIO CARANTI. *Sociologia e statistica delle elezioni italiane nel dopoguerra.* Pp. 176. Rome: Editrice Studium, n. d. L. 200.

While statistics in Italy has a long and brilliant history, electoral statistics and its scientific elaboration had to wait for the fall of the Fascist regime. Therefore Elio Caranti's little book, in spite of a certain lack of depth and of methodological shortcomings, must be welcomed as a pioneer work which will render good services to an expert reader and will provide the unexperienced one with a well rounded, if not wholly unbiased, political orientation.

Though Signor Caranti occasionally quotes American works, his methods are chiefly those of the French school of *géographie électorale* founded by André Siegfried. This is quite understandable since France and Italy have much in common, including a multiparty system. Siegfried, however, singled out two opposite tendencies—conservatism and progressiveness—as the basic ingredients which, more or less watered down or intermingled, form the foundation of the checkered and changing political spectrum of France. Perhaps because he does not like to call his own party "conservative," Signor Caranti, obviously a Demochristian of the left wing, introduces a few more "cardinal points," extremism (represented by Communists and Fascists) and moderation (represented by Demochristians and Republicans). Certainly this distinction has tremendous practical importance and may often lead both extremes to gang up against a coalized mean; but does it really represent another Cartesian co-ordinate rather than a difference in intensity along the same line? Moderate though they are, the policies of the Demochristians are definitely conservative. In words if not in deeds, the Communist platform is extreme but progressive. If Siegfried's graded scale needs another co-ordinate, this ought rather to be the opposition between lay and religious tendencies, which is independent of conservatism and progressiveness and may be observed at all ranges of the graded scale.

One does not have to agree with Signor Caranti to appreciate the wealth of statistical data often divided by regions, provinces, age groups, and sexes which he offers on every Italian vote since 1946 and on a good deal of relevant economic, cultural, and social problems. The latter will prove most instructive for the average American reader who can easily find in his newspaper a competent analysis of the Italian vote and its changes from one election to another, but not a reminder of such underlying factors as the following: in Upper Italy only 0.3 per cent of brides in 1951 were unable to sign their wedding certificate, whereas in Southern Italy the

illiterate brides were 12.2 per cent; there are 45.5 radio sets for every 100 northern Italian families, but only 21.4 for every 100 families in Sicily and Sardinia. Caranti's data come mostly from the official figures of the Istituto Centrale di Statistica and from the polls of the Istituto Doxa, an Italian equivalent of Gallup. The following sample will point out the interest of these polls: only two thirds of those who were asked whether communism was incompatible with Catholicism gave an affirmative answer.

At the bargain price of roughly thirty cents, the book is a mine of information, and it should be on the desk of every student of Italian politics.

ROBERT SABATINO LOPEZ
Yale University

MARSHALL W. BALDWIN (Ed.). *A History of the Crusades.* Vol. I: *The First Hundred Years.* Pp. xxvi, 694. Philadelphia: University of Pennsylvania Press, 1955. $12.00.

While the episodes of the Crusades will probably never be excelled for story-book thrills from real history, there is today unquestionably a greater appeal to the student of social history in the recollection of this medieval epic. Conscious of the threatening alliance of Eurasians under a political ideology alien to the Western world, the American reader will quicken to the more recently established fact that the Crusades were not essentially the romantic episodes of knights errant, but rather the key to a clash of two civilizations over four centuries upon a frontier ranging from Portugal to the Euphrates, and from Cairo to the Baltic Sea. A generation of patient research into Arabian and Byzantine, as well as more traditional Western sources, has now uncovered the pattern of ebb and flow throughout this vast theatre of operations.

This is a splendid volume, enlisting as it does all the equipment of modern scholarship to put this new history at our disposal. Fourteen maps conveniently located throughout the text, and the normalization of spelling from one-half dozen languages, more than compensate for the increased cost. The projected five volumes are all to be constructed, like the familiar Cambridge histories, from the contribution of various chapters by specialists. Of the fifteen contributors to this first volume, almost one-half are from abroad, including such names as the famous Byzantine scholar, Steven Runciman of London, England. Despite the co-operative structure, the single theme has given remarkable unity and continuity to an immense coverage of detail and incident. This is largely due to the clarity with which the stage is set for the Crusades in the first one-half dozen chapters of this volume. The pattern of success or failure is already seen in the cycles of religious fanaticism, military oligarchy, and stagnation among the Mohammedans; in the clash of feudal ambitions in the Western ranks; in the desire of Eastern Christians to maintain their ancient traditions and liberties before the Christian foreigner as well as the old Moslem neighbor. And yet for this reader the most fascinating quality of the volume is the manner in which individuals and personalities break through the familiar patterns at every stage; it is still the stirring story of those least subtle of men, the religious enthusiast and the professional warrior, while the length of the volume makes it possible to bring out the full color of the times, as with the Assassin sect or the People's Crusade. Professor Baldwin and his associates are to be congratulated for a work that will undoubtedly become a classic in its field.

J. A. RAFTIS
Pontifical Institute of Mediaeval Studies
Toronto, Canada

NAPHTALI LEWIS and MEYER REINHOLD (Eds.). *Roman Civilization.* Vol. I: *The Republic;* Vol. II: *The Empire.* Pp. ix, 544; viii, 652. New York: Columbia University Press, 1951, 1955. $12.00.

This useful addition to a notable series of source translations is well organized and carefully thought out. The excerpts are arranged under topics, some 373 altogether, numbered consecutively for each volume. These topics may be broad—for example, No. 66 in Vol. II, "Freedmen"—or specialized—for example, the last topic in Vol. I, "The Julian Calendar." Where needed the editors have supplied separate introductory statements about the passages and references to modern literature or, in the case of archaeological finds, added information on their discovery and preservation. The seventeen chapters are skillfully designed to maintain a chronological frame of reference without undue fragmentation of the subject matter. The bulk of the first volume concerns the period between 264 and 27 B.C., though the earlier Republic and the Monarchy are not neglected. In Volume II there are three main periods: The Augustan Age; The Roman Peace (A.D. 14–192); and the later Empire (A.D. 193–337). The last three chapters include excerpts on law, the army, and religion, for the empire considered as a whole. Frequent cross references prevent this grouping from becoming a strait jacket. The emphasis in both volumes is social, economic, and institutional rather than political or aesthetic, since the editors assume the reader will be familiar with "the main lines of Roman history and literature . . ." (I, vii). This policy enables them to include generous selections from the documents, and much of this material has not been available to the English reader (see I, 41; II, vii).

No one can hope to win universal agreement as to what such a book ought to contain. The *Res Gestae* appears in full (though this has long been available in English), and there are abundant selections from Roman laws and other official documents, from the Laws of the Twelve Tables all the way down to the Edict of Milan. Less solid but more moving are the funerary inscriptions, election advertisements, and extracts from private correspondence—especially letters from humble individuals not striving for authorship—which bring us very close to the every-day life of ordinary people. But occasionally the editors forget their role of referee and take sides in the struggle. There is unmistakable prejudice in singling out Cicero for his 'unscrupulous demagogy" in attacking the Rullan bill (I, 274), and in raking him over the coals once more for his compromise of principle while governing Cilicia (I, 366). The copious selections from Cicero given here fail to do justice to his personal charm and his wit. But we are not spared the revolting details of his assassination (I, 303). Seneca, also, is exposed in a footnote for failing to live up to his Stoic principles in real life (II, 255), but nothing is said about the philosophic calm with which he met his death.

The book includes substantial bibliographies, both general bibliographies for each volume and separate ones for the individual chapters. The editors have avoided citing books in foreign languages because: "The realities of the American educational scene . . . are that only a most exiguous number of our students have any acquaintance with either Latin or Greek, and very few possess facility in the use of any foreign language" (II, viii). This statement, if correct, is surely an indictment. What have our foreign language departments been doing? But even if it is correct, to give up the struggle for literacy is to make a more than Ciceronian compromise of principle. Surely a few titles of particularly readable books in French, German and Italian ought to be included, if only as a reward to the handful of students who can read them, and as an incentive to those who cannot. Otherwise there are bound to be absurdities. For example, Carcopino's mediocre work on Cicero appears because it has been translated, while a really important work like his *Autour des Gracques* does not. Mommsen is represented only by his *Provinces* (the *History of Rome,* though available in English is left out), while his monumental *Römisches Staatsrecht* is not mentioned.

In closing it should be added that each volume is provided with indices, both general and source indices, and that Volume I also contains a convenient series of thumbnail biographies of classical writers on Roman history. There are surprisingly few typographical errors.

TRUESDELL S. BROWN
University of California
Los Angeles

R. E. SMITH. *The Failure of the Roman Republic.* Pp. viii, 202. New York: Cambridge University Press, 1955. $4.75.

Historical autopsies upon the Roman Republic are perennial, yielding in interest

only to explanations of the "fall" of the Empire.

Professor Smith maintains that in the period after the Second Punic War, the Senate governed by virtue of demonstrated capacity to govern. Roman society was aristocratic, but integrated, with tradition the chief cohesive force as exemplified in the epics of Naevius and Ennius which interpreted Rome's history as the unfolding of destiny foreordained by the gods.

After the Hannibalic War Rome's attitude continued to be that of a city state, preoccupied with concern for self preservation. The provinces, acquired primarily to keep them out of the hands of potential enemies, were Rome's extension of herself. The great problem of the Republic was to emerge from the mentality and organization of a city state to rule an empire, with acceptance of responsibility for the provinces and for the world.

The destruction of Corinth and Carthage in 146 B.C. was a great turning point. No longer need resurgence of Carthaginian power be feared, nor could Greece again be a base for threats such as had been posed by Philip V and Antiochus III. Self preservation ceased to be a paramount consideration of policy; gone was the earlier sense of urgency that had made possible complete acquiescence in senatorial rule.

Problems of transition to world rule might have been solved, but the Gracchi, "by the means they adopted in pursuit of their ends precipitated a spiritual crisis in Rome which was the first cause of all that followed" (p. 5). With the upheavals of the Gracchan period the social and political harmony of an earlier era was shattered. The rise of the *equites* constituted a powerful divisive force, and the proletariat were a ready instrument of violence and revolution.

The volume presents no new factual material, and the interpretation is novel only in the degree to which the Gracchan responsibility for the Republican debacle is emphasized. Cause and effect become somewhat confused; spiritual decay is presented as a basic cause of political breakdown, but it is also a consequence of this breakdown. Some readers will be dissatisfied with Professor Smith's comparative neglect of economic factors on the ground that, since the Romans did not understand economic forces, they ignored them in political action. The space devoted to literature may be considered excessive in an over-all interpretation of the failure of the Republic.

CHARLES EDWARD SMITH
Louisiana State University

JOYCELYNE GLEDHILL DICKINSON. *The Congress of Arras, 1435.* Pp. xxii, 266. Oxford, England: Clarendon Press, 1955. (Distributed by Oxford University Press, New York.) $6.75.

In reading a volume on the Congress of Arras which is subtitled a study in medieval diplomacy, the question arises as to whether or not the diplomacy of the fifteenth century can be characterized as truly medieval. Is it not rather transitional to the diplomacy of the early nationalism of the sixteenth and seventeenth centuries? In this study, however, the author is careful to distinguish the congress as an example of later medieval international diplomacy and, as such, it is to be considered.

It often happens that set forms of diplomatic usage and behavior are often achieved and enforced at the end of an era when the spirit of diplomatic negotiations has already radically changed or is in the process of change. Such was the case at Arras. It provides an excellent source for the study of later medieval formalities and is, indeed, a comprehensive view of the types of personages involved in medieval diplomacy, the methods of negotiation, and the customary procedure and ritual attendant upon such meetings of great civil and clerical powers. At the same time, one senses a pervading nationalism at Arras which was too strong to be truly medieval.

The present study is above all concerned with the technicalities of medieval formal diplomacy as exemplified at Arras. The author has carefully analyzed and painstakingly arranged all the minutiae of detail available—and the sources for this particular congress are quite voluminous. A large part of the book evaluates the various embassies attending, their instructions, and duties. This section is especially interesting for its detail on the papal mediators and conciliar representatives. Of greatest value to the student of diplomacy, however, are the chapters on the setting and procedure of the congress and the procedure of the Franco-Burgundian treaty.

One could wish that the historical significance of Arras were not so obscured by detail in this study. Events leading up to the treaty have been largely glossed over, and economic considerations ignored completely. These lacks are relatively unimportant, though, when the author has so admirably treated the procedural details regulating international diplomatic customs of the fifteenth century.

The appendices include sixteen previously unpublished sources dealing with invitations and replies to the congress, instructions and powers of the delegates and mediators, and the consequences of the congress. These are admirably chosen to illustrate pertinent points of diplomatic procedure. Other appendices include an annotated source list, a list of the Duke of Burgundy's gifts to those attending the congress, and a note on the Burgundian memoranda concerning peace with France. The author has also provided an excellent bibliography and an index.

M. NICKERSON HARDWICKE
Downey, Calif.

JOHN H. MUNDY, RICHARD W. EMERY, and BENJAMIN N. NELSON (Eds.). *Essays in Medieval Life and Thought.* Pp. xviii, 258. New York: Columbia University Press, 1955. $4.00.

This is a collection of fourteen essays published in honor of Austin Patterson Evans of Columbia University by students trained in his graduate courses. In an introductory essay there is a sensitive appreciation of him by Henry H. Wiggins of the Columbia University Press, with whom Evans has had long and close association. A book of this sort must be judged for what it claims to be: a sincere tribute of young scholars to the learning, integrity, and kindness of an exacting master, ever-helpful guide, and prized friend. The essays are arranged in three groups: Religion and Heresy, Science and Thought, Institutional and Local History, and, as would be assumed, in most cases reflect interests that have long held Professor Evans' attention. Some are the result of investigations he urged to be made by careful, often arduous and difficult examination of printed and manuscript sources. Many of the authors present their findings in tentative fashion and all are duly modest, possibly too modest in evaluating their offerings. There is respect for what others have done and full understanding of what yet needs to be accomplished in the many areas of scholarship represented.

William May's "The Confession of Prous Boneta, Heretic and Heresiarch," a posthumous publication; Francis Benjamin's "The *De Quantitatibus Stellarum* of Thebit Ben Kourrah," Marshall Clagett's "The *Quadratura per Lunulas.* A Thirteenth-Century Fragment of Simplicius' Commentary on the *Physics* of Aristotle," George Fowler's "Engelbert of Admont's *Tractatus De Officiis et Abusionibus eorum,*" and Sister Mary Ambrose's "Statutes on Clothmaking: Toulouse 1227," are all welcome scholarly contributions of distinction. They are all, however, primarily works for specialists among medievalists and meaningful only for readers with a knowledge of Latin. Problems of our own day give heightened interest to Albert Shannon's "The Secrecy of Witnesses in Inquisitorial Tribunals and in Contemporary [thirteenth and fourteenth centuries] Secular Criminal Trials," which explains conditions prevailing when a court of exception considered it necessary to withdraw "certain refinements of the ordinary judicial processes." Pearl Kibre's fine "Academic Oaths at the University of Paris in the Middle Ages" will be read with profit and understanding by modern professors. "An early and important step on the road we are still travelling" is analyzed in Merriam Sherwood's "Pierre Dubois on the Arbitration of International Disputes." For the more philosophically minded there is Dayton Phillip's "The Way to Religious Perfection according to St. Bonaventure's *De Triplici Via*" and Charles Trinkaus's "The Religious Foundations of Luther's Social Views." Richard Emery contributes an especially interesting study on "Flemish Cloth and Flemish Merchants in Perpignan in the Thirteenth Century" and Peter Riesenberg deals systematically with the importance of "Roman Law, Renunciations, and Business in the Twelfth and Thirteenth

Centuries." John Mundy supplements earlier studies of Toulouse in his "Hospitals and Leprosaries in Twelfth- and Early Thirteenth-Century Toulouse," and Kenneth Setton in his "The Archaeology of Medieval Athens" by wit and learning gives life and meaning to material from excavators' notebooks.

GRAY C. BOYCE
Northwestern University

DAVID RODNICK. *The Norwegians: A Study in National Culture.* Pp. vi, 165. Washington, D. C.: Public Affairs Press, 1955. $3.25.

The Norwegians is a report of a study based on field work carried out during Dr. Rodnick's one-year visit to Norway in 1950 as a Fulbright research grantee. The publisher has attempted to make up for the author's failure to clearly express the purposes of the study. The blurb on the paper cover points out that Dr. Rodnick seeks to find out what Norwegians are like, how they get along together, and why they behave as they do.

The book will inevitably be met with suspicion by many because the author also has neglected to describe clearly the sample and the procedures followed in collecting the data.

The findings and interpretations are presented in eleven chapters dealing with personal and cultural characteristics of Norwegians: family relations, descriptions of various occupational and socioeconomic groups, religious patterns, and political trends. Chapter II deals with Norwegian people's attitudes toward other nationalities. In reading this chapter one should keep in mind that Scandinavian people's appraisal of each other is characterized by subtle banter and raillery, the true meaning of which is not easily detected by a visitor. Those sections of the book are best where the author has been able to supplement the interview material with information from other sources. The topic of religion has received undue emphasis at the expense of such important variables in Norwegian culture as education and recreation. Problems of translating Norwegian ideas into American English are apparent. The word "clever" is put to strange uses. The reader will be aided in his understanding of many quotations if he substitutes the word "able."

Another weakness of this study is its failure to organize observations around relevant themes. However, in view of the limitations of the data, an attempt in this direction might have done more harm than good. As it stands, the book is of little scientific value and at best it is a readable account of some features of Norwegian life. Above all, it furnishes proof of the author's statement that "it is not possible for a visitor to understand through one year of field work the complexities of three and a quarter million people and to be able to conclude that his description is exactly what they are like."

University of Wisconsin

OTHER COUNTRIES

STANLEY R. ROSS. *Francisco I. Madero: Apostle of Mexican Democracy.* Pp. ix, 378. New York: Columbia University Press, 1955. $5.50.

Francisco I. Madero was an unlikely revolutionary. Born of a marital union representing two of the greatest landowning families in northern Mexico, it was strange that he should have launched an attack on the very system—"the Diaz peace"—of which he was a beneficiary. But stranger still was the fact that "the Apostle of the Mexican Revolution" had no intention of being a revolutionary. The man who opened the floodgates to socio-economic revolution steadfastly refused to recognize the urgency of meeting the demands for reform, but was preoccupied in giving to the people of Mexico democratic conditions under which they, through their representatives, could devise the needed laws, all in good time.

Madero's failure to understand the significance and strength of the forces he had unleashed proved to be his undoing. Blindly confident that faithful adherence to democratic processes, conciliation, and co-operation would consolidate the nation, he gravely miscalculated the depth of the cleavage that separated the old and the new orders in Mexico. It was a situation not congenial to democracy, and it was the tragedy of Madero that he chose to stand or fall in support of an impossible ideal.

Francisco Madero has had his adulators and his detractors. His character and his role in the Mexican Revolution has intrigued numerous writers. From the more objective studies has emerged a generally accepted representation of the man. The writer of the present biography adds a bit of colorful detail to the portrait, but it remains substantially the same. This is not a "new" Madero. On the contrary it is simply a touching-up of the kind of Madero we have believed he was: "a sincere, well-intentioned idealist" whose "conduct was influenced by a generous, emotional, and overly optimistic, overly enthusiastic nature." Often confused and vacillating, he proved to be inadequate presiding over a nation in chaos. Indeed, who could be adequate?

The reviewer noted with surprise that this book contains no mention of Charles C. Cumberland's *Mexican Revolution: Genesis Under Madero,* published in 1952. Could Dr. Ross have been unaware of the existence of this volume? If not, why isn't it mentioned? Certainly not because he regarded it as valueless, for in fact both writers use substantially the same source materials and arrive at remarkably similar conclusions. In fact Cumberland's final chapter "An Evaluation," could serve equally well as a final chapter of the Ross study. A minor difference is that Dr. Ross is a more interesting and facile writer. His Madero is a more vivid personality.

J. LLOYD MECHAM
University of Texas

ALVIN H. SCAFF. *The Philippine Answer to Communism.* Pp. viii, 165. Stanford, Calif.: Stanford University Press, 1955. $4.00.

The Republic of the Philippines, "showcase of democracy" for the Far East, has to display a practical product. Moreover, as the only predominantly Christian country in Asia, it is the proving ground of Western religious ideals in the contest against an ideology which would nullify God and enthrone the state. *The Philippine Answer to Communism,* written by an expert in Philippine affairs, now on the faculty of Pomona College, is the result of a Fulbright Grant study of the successful fight in the Philippines to overcome a threat of communism comparable in seriousness with that in China, Korea, Malaya, and Indochina.

Many early observers, including this reviewer, believed that the Huks, abbreviation of Hukbalahap meaning in dialect, People's Army Against the Japanese, were a loosely organized group of dissidents reluctant to lay down their arms at the end of the War and rather enjoying a life of violence and plunder. There is an inertia in the lawlessness of warfare which could account for the Huks without borrowing trouble from the worldwide menace of communism. Dr. Scaff points out, as we have learned through harsh experience, that the Huk revolt was, in fact, a carefully conceived Communist thrust.

The hard core of the organization derived from many uprisings in the course of Philippine history and militant movements by Socialists and Communists dating back to the '20's. Fattening on agrarian unrest it was ready in 1946 to take over what had been an effective guerrilla unit on the Island of Luzon as a readymade medium for direct revolutionary activity. For most of a decade following Philippine Independence, greed, political corruption, and ineffective military controls, added strength to the rebellion and almost cost the Philippines their democratic government. A man of the people, Ramon Magsaysay, first as Secretary of National Defense and then as President is given much of the credit for stemming the tide of revolution and breaking up the Communist-Huk organization as an effective threat.

A specific device employed by the Philippine Army through an agency labelled Edcor (for Economic Development Corps) is a farm-settlement program for defecting or captured Huks. The author dwells upon this recent development and presents many case histories based upon interviews and illustrated by photographs, throwing light on the motivation of the malcontents and the essential elements of their rehabilitation.

It would be an unwise oversimplification

of the problems of the new Philippine Republic to ascribe the recent anti-Communist victory to a resettlement plan which in two small frontier areas in Mindanao might account for a few hundred reformed Huks out of a force which was once estimated at a hundred thousand. The conclusion which the reader must reach is that in a country of democratic traditions the threat of communism may be met successfully, as it appears to have been in the Philippines, only by first creating a political, economic, and social atmosphere favorable to the people from whom the government stems.

In a book on the same subject, *Crusade in Asia* (1955), compiled from a rich treasure of personal reminiscences, General Carlos Romulo sounds the real keynote of the valiant campaign waged by his countrymen in answer to the threat and the promise of communism: "When a government is clean, competent, honorable, and representative of the wishes and needs of the people, when it is the people, Communism doesn't have the ghost of a chance."

ERNEST SCHEIN

Washington, D. C.

J. GARNER ANTHONY. *Hawaii Under Army Rule*. Pp. x, 203. Stanford, Calif.: Stanford University Press, 1955. $5.00.

This small volume tells some of the story of a shameful episode in recent American history. In the fall of 1941, the Hawaii Legislature enacted a sweeping Defense Act, at the request of the Commanding General and vested in the civil governor powers over the inhabitants of Hawaii and their property "adequate to meet any emergency limited only by minimum safeguards for the rights of the individual." But, within hours after the bombs fell on Pearl Harbor, this Act was bypassed, the privilege of the writ of habeas corpus was suspended, martial law was proclaimed, and the Commanding General became military governor of the Territory and proceeded "to exercise increasing stringent controls over the civil population . . . regardless of whether or not they [had] any basis in military necessity. These controls [were] exercised in the form of general order [which] proceeded upon the theory that the Constitution itself and all federal and territorial laws may be freely ignored or suspended at the will of the commanding general." General orders regulated food, prices, liquor distribution; froze labor in civilian occupations; substituted provost courts disgracefully administered for the civil courts.

Garner Anthony, who protested this conduct both as private citizen and, later, as Attorney General of Hawaii, writes with vigor and with bitterness. He tells the story as seen by a lawyer reared in the traditions of American constitutionalism and respect for human rights. It is written in anger, with an eloquence that should arouse equal anger in the reader—and his book should be read by everyone concerned with the preservation of America from authoritarian assaults, whether from without or from within. One of the most saddening components of the disturbing complex is the reported complaisance of the citizenry; yes, the positive endorsement of the usurpation by eminent and influential elements of the population. As late as December 27, 1942, the Honolulu Chamber of Commerce declared that the "military governor has been eminently fair and considerate of our civil rights," while about the same time one of the two large local newspapers declared that "Hawaii has been a test tube and a guinea pig for what might happen on the mainland. It does not mind this role. It is proud that it has had the opportunity to serve in this humble way. . . . The public has accepted military rule. . . . It does not ask its abolition or that Washington turn over all of the duties of the military in government to civilian authority."

The author indicates that other elements of the population disagreed. But it is a weakness of the book that we receive no rounded portrayal of "Hawaii under army rule." Mr. Anthony approaches the topic as a lawyer, and largely limits himself to formal legal and governmental aspects of the situation described. The reader would welcome application to the subject of the techniques of the sociologist, political scientist, psychologist to the end that he be given the full story of American citizens under military government. That story remains to be written.

Five appendices carry the proclamations relating to martial law, the general orders of the military governor and Attorney General Anthony's devastatingly critical report to Governor Stainback. Unfortunately, most of these essential documents are printed in very small type and from unclear type.

ALLAN F. SAUNDERS

University of Hawaii

CHESTER C. TAN. *The Boxer Catastrophe*. Pp. ix, 276. New York: Columbia University Press, 1955. $4.50.

Although a number of Western books have been written on the subject, there is more than justification for the appearance of the volume under review. The author has made the best use of both Western and Chinese source materials.

The introductory chapter treats the unhappy relationship between China and the West, the inevitable conflicts and the failure of the Hundred Days reform movement. It goes on to examine the genesis and the development of the Boxer movement and how the movement was being harnessed by the reactionary forces rallying around the Empress Dowager. But a greater part of the empire, under the leadership of several able governors, refrained from plunging into the catastrophe and this resulted in the maintenance of peace in the southeast. After the fall of Peking, the court took flight and there was no hope for the reactionary group. Li Hung-chang carried the heavy burden of negotiating a peace under the most disadvantageous circumstances. Imperial Russia pressed hard to get concessions in Manchuria as embodied in the Tseng-Alexeieff agreement, which, however, the Chinese court braced itself not to sign. The story ends with the international settlement and the return of the court to Peking.

The author has labored through the Chinese materials to bring out a number of valuable revisions. Mr. Tan refutes the theory of origins of the Boxers proposed by George Nye Steiger in his *China and the Occident*. Steiger asserted that the Boxers were volunteer militia, recruited in response to the express commands of the throne. But according to Mr. Tan, "the Boxers were officially reported to have appeared in Shantung as early as May 1898 while the first decree ordering the organization of the militia was not issued until November of that year," and that the Boxers began as a volunteer association under the influence of the heretical sects with the declared aim of fighting the native Christians. Mr. Tan also reexamined the parts played by the leading statesmen of the time such as Li Hung-chang, Jung Lu, Liu Kun-i and Chang Chih-tung. He gives special credit to Sheng Hsuan-huai, the Director of Railways and Telegraphs and of the China Merchants Steam Navigation Company, who had contributed a great deal in influencing the measures taken by southern viceroys to maintain peace in the southeast. Another interesting point he makes is that the Tseng-Alexeieff agreement was signed without the Imperial Court's knowledge and that the text of the agreement printed in several outstanding document works is incorrect.

The introductory chapter does not match the quality of the following chapters because the author ventures with somewhat untenable generalizations. He seems to make light of the anti-foreign feelings of the common people as reflected in religious persecutions and the Boxer movement. He also fails to enlighten the reader as to the policy of foreign trade, if any, of the Ming government. The 1529 memorial of the Viceroy of Kwangtung and Kwangsi (p. 5) deals with the ban on trade which resulted from the unhappy episode of the Folang-chi (Portuguese) mission. But the context conveys the idea that the ban tried to remedy the situation caused by Japanese piracy. As to the central subject itself, it may be more desirable to elaborate the thinking of the conservatives at court and the actual practices and ideologies of the Boxers themselves. All these, however, are minor limitations and do not affect the value of the book.

Claflin College

RALPH L. POWELL. *The Rise of Chinese Military Power, 1895–1912*. Pp. x, 383. Princeton, N. J.: Princeton University Press, 1955. $6.00.

I like to approach a book review with a dual perspective, on the one hand asking

myself "what is good about this book," and then asking "what are its shortcomings?" Applying this test to Mr. Powell's volume, I shall say immediately that most of my opinions about it are favorable, and I welcome it as a worthy and scholarly addition to our growing literature on modern China. This is not to say that Mr. Powell has exhausted the subject or produced a definitive volume, but he has opened up a new approach to modern Chinese history, given us some interesting new angles on such events as the 100 Days Reform, the Boxer Movement, the revolution of 1911 and the compromise aftermath, and on the career of Yuan Shih-k'ai.

He has used mainly Western sources, many of them obscure and rich, but he has also made use of the *Veritable Records* of the Ch'ing dynasty, certain collections of memorials, and a number of secondary books and articles by Chinese authors which prevent his assuming a purely Western point of view. He has not, as far as I can tell, gone into Chinese provincial gazeteers and other grass roots materials which must be explored before telling the full story, but one man cannot do everything on any subject

I do have one criticism, one which I think should be taken into consideration by any historian who ventures into the field of military history. There is an easy ensnarement, by which the writer on military history can come to regard "progress" and "success" in the development of an improved military establishment in a country as true progress and success. In a very limited sense, of course, it is "success" to make troops well trained, well groomed, "an efficient fighting machine." But from the long view of history it is clear that such "success" is merely expediency, necessary perhaps to meet a "clear and present danger" (and certainly the Chinese of the 1895–1912 decade were facing that), but not a goal worthy of the definition of "progress."

At various points in his book Mr. Powell seems to be cheering on more efficient military organization and tactics as the end all of the problems for China. For example, he seems to regard it as a sign of improvement when (pp. 196–97) the breakdown of civilian control of the Board of War made it possible to have "more competent military administrators"; and he indicates it as a mark of progress that the "people were finally being shown that the military profession could be respectable" (p. 208). This seems to me true only within a military-power politics frame of reference. The Confucianist instinct against militarism is truer for purposes of progress.

However, in his conclusion Mr. Powell tones down this implication when he says, "Military developments in China during the last half century of the monarchy have had a marked and detrimental effect on more recent Chinese history" (p. 338). With an emphasis on this correction of the tendency I have noted above, I would unreservedly recommend the book to scholars in the Far Eastern studies field.

HILARY CONROY
University of Pennsylvania

ROBERT S. SCHWANTES. *Japanese and Americans, A Century of Cultural Relations.* Pp. x, 380. New York: Harper and Brothers for the Council on Foreign Relations, 1955. $4.00.

Japan has been adjusting to Western modernism while the United States has been a leader and part of that dynamic civilization. Americans have only begun to gain noticeably in the desire and ability to understand Japanese culture. Americans have been keen to impress Japanese with the fact that they are creatively interested in cultural as well as in technical and organizational matters.

Extensive research has resulted in a volume which will be useful for a variety of people active in inter-cultural relations. The treatment has been enhanced by the author's knowledge of Japanese language and his genuine appreciation of many facets of Japanese culture.

If one should try to read this book with the detachment of, say, a European or Near Eastern social scientist, however, a number of points should be mentioned by a reviewer. Implicit in many passages is the point of view of an American nationalist, to be sure interested in cultural relations for their own sake and for the mutual understanding of many individuals, but also impelled by the urgencies of combating communism into an acceptance of public relations with political objectives. See on page 253 the statements: "Botanical exploration and borrowing goes on all the time, of course, without creating any special feeling of indebtedness. For a cultural effect there must be flowers plus publicity."

In the Introduction and at two or three places in the main study there are allusions to the thorny problem of possible conflicts of national interests capable of overriding cultural appreciations. One looks in vain for an appraisal of how Japanese and American interests have developed since 1945 in this connection. And there is not much analysis of important sectors of Japanese society which react rather differently to American policies as well as to cultural ideas and products. Since the Japanese, too, know that "actions speak louder than words", what have been the effects of American policies on Japanese receptivity to democratic ideas and practices, for example? There is not a single mention of McCarthyism in this volume, though the reviewer seldom spent an evening among Japanese intellectuals during 1953–54 when that did not become a topic of conversation. Americans do well to admit that democracy is an ideal toward which we strive and are joined by the Japanese. Yet, if our policies encourage the "reverse course"—away from democratization—and at home tolerate serious erosion of democracy in the process of opposing communism, the best of information programs cannot hope to exert as much influence on the Japanese in a democratic direction. Or to say this positively, our information programs are more effective when our performance squares with declared values.

On pages 32–33, the author realistically points out that whereas more adequate communications can increase mutual sympathy and understanding, close contact on a broader scale (as in the case of *issei* and *nisei* in Pacific Coastal states and numerous Americans in occupied Japan) can lead to more friction. The paradox (as hinted on p. 254) that better acquaintance by peoples of different cultures clarifies not only what they share but how they differ, could have been further developed. Professionals in the fields of public and cultural relations tend to stress commonality, while social and cultural anthropologists tend to emphasize divergence. As an historian the author tries to strike a balance.

ALLAN B. COLE
Fletcher School of Law and Diplomacy

TIBOR MENDE. *South-East Asia Between Two Worlds.* Pp. viii, 337. New York: Library Publishers, 1955. $3.95.

Dr. Tibor Mende, a native Hungarian and former economic editor of the European edition of the New York *Herald Tribune,* tells us how the people of Indonesia, Burma, and Pakistan live; what their problems are; and how they attempt to solve them. He believes that these countries provide the answers to the problems of Southeast Asia, which term he stretches unconventionally to include the vast territory from the Khyber Pass to Indonesia, including India, Pakistan, Ceylon, Burma, Thailand, Malaya, and the former French Indochina. This strategic area includes 600 million people, or one-fourth of mankind and contains important raw materials which Soviet Russia and Red China lack. The author's views are based on his observations in these countries, most recently in 1952–53, and on a limited amount of research. Unfortunately, he touches on too many problems to cover any one of them thoroughly.

The author concludes that the choice of southeast Asia (in his wider sense of the term) lies between India's socialistic "planning by persuasion" and Red China's "planning by force" (p. 318). To "graft Western institutions and technology, or the Western economic system, on the South East Asian societies is a utopian enterprise" (p. 281). In the absence of an entrepreneurial class, capital accumulated from domestic savings, and labor imbued with the acquisitive spirit of the Western workers, Southeast Asia's development "can take place *only through direction from above* [italics by the author]: by government initiative and state management. Unpalatable as the words may sound, this means state planning" (p. 288).

The important contribution of this book is that it poses as a challenge the vital ques-

tion of how we can best help the Asian nations to meet their needs and achieve their aspirations, although it does not succeed in answering it. Much more research and a more balanced use of statistics are needed to provide a convincing answer. For instance, it constitutes an assertion, rather than sound analysis, to say: ". . . if nothing unforeseen intervenes, the standard of living of the people of the Soviet Union—or their consumption of goods per head—will probably surpass that of most of Western European countries before 1960 and will reach Great Britain's in about ten years" (p. 328).

The author is correct in stating that Asians "are not flattered by references to their countries as 'underdeveloped'" (p. 273, n. 1). He should mention this fact to his publisher, who claims on the blurb that Dr. Mende "has written six books on the world's under-developed areas."

SOCIOLOGY: *An Analysis of Life in Modern Society*

By ARNOLD W. GREEN, Pennsylvania State University. New Second Edition. Ready in May.

A sound, provocative introduction to the field of sociology. Descriptive in approach, it constitutes a complete analysis of modern American society. It permits the student to see himself and his social world in an accurate and interesting manner, capitalizing on the student's interest in his own past, present, and probable future experiences. New materials include a chapter on Recreation in America—the significance of mass entertainment.

COMPARATIVE ECONOMIC DEVELOPMENT

By RALPH H. BLODGETT, University of Florida, and DONALD L. KEMMERER, University of Illinois. Ready in May.

Written at an elementary level, this unusual book describes and compares the economies of the U. S., Great Britain, Russia, and Germany. More factual and historical than it is analytical, the book shows how the geography, resources, history, and economic problems of each of the four nations determined to some degree the type of economy that it eventually developed.

SOCIAL SECURITY AND PUBLIC POLICY

By EVELINE M. BURNS, Columbia University. 300 pages, $5.50

Provides an analysis of the factors influencing policy decisions in the field of social security. While drawing illustrative material primarily from the American Social Security System, it introduces a great deal of comparative material, in order to show how other countries and systems have solved specific problems, or failed to solve them.

THE ECONOMICS OF CONSUMPTION: Economics of Decision-Making in the Household

By WILLARD W. COCHRANE, University of Minnesota, and CAROLYN S. BELL, Wellesley College. 486 pages, $6.50

A description and analysis of the decision-making of households within the frame of reference provided by modern economics. The decision-making and behavior of individuals and groups involved in consumption activities are described. New material and new thinking are included on this group decision-making in consumption and on minimum standards consumption.

THE AMERICAN SYSTEM OF GOVERNMENT—*Fourth Edition*—Ready in March

THE AMERICAN FEDERAL GOVERNMENT—*Fourth Edition*—Ready in March

By JOHN H. FERGUSON, The Pennsylvania State University, and DEAN E. MCHENRY, University of California, Los Angeles. *McGraw-Hill Series in Political Science.*

Both texts open with historical materials essential for the understanding of the roots of American government and a discussion of the fundamental principles of the American constitutional system. A detailed examination of national institutions and the national powers and functions follows. Here THE AMERICAN SYSTEM OF GOVERNMENT continues with additional chapters on constitutions and charters, legislative bodies, executives, and selected functions and problems of state and local government. Both books have been brought up to date, with many chapters rewritten and improved.

FOREWORD

At the present juncture in international affairs the problems raised by the economic advancement of the so-called underdeveloped countries have assumed exceptional importance. In the last ten years these problems have been made the subject of a multitude of inquiries and studies, but in most instances the pressing immediate needs of populations whose livelihood had been impaired by war or some other catastrophe, or the longer-run perspectives of narrow economic planning, have been the chief concern of these studies. As a result relatively little knowledge has been gathered about the noneconomic aspects of technical change, and the scientific study of cultural and social conditions in underdeveloped countries has also remained behind the concern with practical matters. Moreover, to the extent to which knowledge of the social implications of technical change has become available, it was gathered to a large extent from historical and sociological studies of more highly developed countries with Western culture and institutions. Yet in view of the different cultures and over-all social conditions in underdeveloped countries, studies of social and political movements and adjustments of social relations to the new forms of economic activity are likely to lead to different results if the peculiarities of these countries are taken into account.

Two examples of how profound these differences may be must suffice. Whereas all Western countries, at the beginning of their process of industrialization, showed moderate population densities and were thus able to absorb rapidly growing populations without great dislocations, population densities in countries such as India, Eastern Pakistan, Java, and Egypt are among the highest in the world, and it is difficult to see how very much larger populations can be absorbed in these countries without serious and far-reaching social and economic disorganization. In the second place, the economic growth of some Western countries, among them the United States, was inaugurated under the general value system derived from Puritan and Presbyterian religious doctrines; the values of Asian peoples are derived from Islam or Buddhism, religions whose view of salvation and the good life differ profoundly from those of Calvinism.

The subsequent articles are designed to present some rather general and some more specific conclusions derived from a study of social conditions and consequences of technological modernization in underdeveloped countries. The contents are divided in two main portions. The first nine essays are concerned with some of the general social consequences and conditions of economic advancement in underdeveloped countries. They center on problems of population growth and urbanization, political movements and administrative institutions, entrepreneurship, labor conditions and standards of consumption, and on the general changes in value structures in society. To the extent to which they describe situations in certain countries, these descriptions serve primarily as examples of the more general propositions developed by the authors of these papers.

The last six articles in this work apply the general principles and the general knowledge of social consequences of technical change to a series of particular countries. These countries were chosen so as to have a representative sample from each major region of the underdeveloped world. Japan; West Africa; Jamaica, a Caribbean island; Egypt, a Middle Eastern Moslem country; Ceylon, a South Asian

heavily populated country; and Israel, a nation in which a dominant Western-educated elite is confronted with a population that grew up largely under conditions of economic backwardness—there seem to be characteristic examples of the conditions of economic development found in the various parts of the world. This list is rounded out by the examples contained in some of the earlier papers. Dr. Nash writes about a typical Hispano-American country in Central America with a large indigenous Indian population, Professor Singer writes about India, and Dr. Comhaire primarily about Africa south of the Sahara.

Thus a good many countries of Asia, Africa, and Latin America are considered in one way or another. But the six studies designed to elucidate patterns of social change accompanying economic and technical change in particular countries also stress some aspects of social relations which are not treated at all, or only marginally, in the "topical" essays. Professor Bennett and Mr. McKnight investigate the role of a social elite, Professor Harbison and Mr. Ibrahim are concerned with labor-management relations, Professor Morgan with the problems of an agrarian society, and Professor Eisenstadt with the adjustment of immigrants.

Taken together, the essays presented here offer, therefore, a fairly complete discussion of the various problems that arise in the social, political, and cultural life of peoples undergoing rapid economic change. At the same time they exhibit the variations in these changes in diverse countries with differing cultures and civilizations. They display, I believe, the multitude of problems confronted by these countries, and some possible approaches to their solution.

BERT F. HOSELITZ

Nationalism, Economic Development, and Democracy

By BERT F. HOSELITZ

AN often observed characteristic of the newly emerging societies in Asia, Africa, and other parts of the economically less advanced portions of the world is the sharp and undisguised nationalism prevailing in these countries. Sentiments of nationalism are loudly proclaimed in countries which have recently gained independence as well as in those which are still under some form of foreign colonial domination. They are present also in countries which have gained independence some time ago, such as the republics of Latin America, and in those in which foreign domination has never succeeded in establishing itself. Even the form of government of a country, its membership in the Communist bloc or among the free nations of the world, does not seem to make any difference: Chinese nationalism is as strong and as dynamic in its aspirations as Indian or Indonesian nationalism.

To be sure, the actual forms which nationalist movements take are dependent upon the narrower political conditions under which these movements exist. In some countries the attainment of independence is the immediate goal; in others it is the full integration and consolidation of a country's territory; in still others, an expansionist, aggressive type of nationalism is discernible; and in some countries national sentiment is directed primarily towards cultural integration rather than political ends.

Since apart from political or cultural objectives all these countries also have the economic objective of increasing the level of living of the members of the society, the question may be asked what relationships exist between the processes leading to higher welfare aspirations on the part of the people and the nationalist sentiment prevailing among them. Moreover, both the implementation of a planned program of economic advancement and the spreading of an ideology of nationalism require agencies which often overlap and supplement one another. The men and agencies that advocate most vociferously the need for economic advancement also stress the common national objectives of their societies; indeed the ideology of nationalism seems to be one of the requirements for the achievement of developmental goals in societies on a relatively low level of economic advancement.

LIVING STANDARDS AND NATIONALISM

This paper is devoted to an examination of the relationships between aspirations for higher levels of welfare and nationalist movements and trends. First, I shall describe the negative and the positive aspects of nationalism in underdeveloped countries. The former defines the separateness and exclusiveness of a group; it often stresses its antagonism to others, especially those who are, or are felt to be, opponents of indigenous national aspirations. The second attempts to give meaning to the communality of interests of a given group and to define the rights of membership in the group of all those who are said to belong to it. It tends to break down loyalties to particularistic subgroups, such as clans, tribes, or specific ethnic or linguistic groups in a country, and to replace them by loyalty to the nation as a whole. Next, I shall attempt to relate the positive aspects of in-

digenous nationalism to forms of economic development and trace the interrelations between them. Finally, I shall try to relate the social processes involved in economic development and the growth of a common national consciousness in an underdeveloped country to its sociopolitical structure. In this way I hope to clarify the interaction between exigencies of maintaining social privileges arising out of a stratified society and democratic implications associated with the improvement of mass living standards supported by a common nationalist ideology. If the problem is posed in this fashion it may be possible to discover what are the chances of democratic developments in these countries, as against the likelihood of some form of authoritarian government.

COMMON CHARACTERISTICS

A nationalist ideology and a welfare-oriented program of economic development have as common characteristics, on the one hand, the aim of affecting the life of all members of a given society and, on the other, stress on the interrelation between the welfare and security of each member of the society and the welfare and security of the society as a whole. Let us analyze these two features somewhat more in detail.

Programs of economic development may have various more or less immediate objectives, but one common goal of most of them is a general rise in mass levels of living. In some countries this objective is stressed much more strongly than any other, but even in those countries in which more emphasis is placed upon the building up of capital equipment or a military machine, some stress is laid on the ultimate benefits which economic development programs will have on the general level of economic welfare of the masses. Economic development is thus commonly declared to be an essentially democratic process. Its benefits are expected to accrue to all members of the society, and even where collective aims are given preference, the impact upon the private personal welfare of the members of society is stressed as a concomitant development.

Just as programs of economic development are represented to be matters of concern for all members of a society, so the equal partnership of all members of that society is "legitimized" by increased emphasis on their common nationality. A nationalist ideology normally presents a Janus-faced appearance. On the one hand it delineates a series of features which are common to all members of a given nationality, which tie them together, and which establish a special kind of solidarity between them. On the other hand it lists a series of factors which divide this nationality from others, which indicate its separateness, its exclusiveness, and often its alleged superiority over others.

NEGATIVE ASPECTS OF NATIONALISM

In countries which still lack independence the foreigner is easily discerned. The dominant metropolitan power is the representative of all that is foreign to the subject nation; the common positive tie is the struggle to emancipate all members of the indigenous population from the foreign yoke. Once independence has been achieved, the image of the foreign dominating power disappears from the immediate scene, and with it a convenient scapegoat on whom could be placed all the ills from which the indigenous society suffered.

But the image of the domineering foreigner is too good a symbol in nationalist propaganda to be let go altogether. Thus we observe a not infrequent technique employed by Communist parties, especially in former colonial countries, of discovering at various times the workings of alleged oppressors in their midst. The fact that even today in Russia and China the actual presence of "imperialist warmongers and their native stool pigeons" is every now and then discovered is eloquent testimony to the powerful role which the foreign dominating power plays in the process of building a nationalist ideology in these countries. Similarly, though admittedly in less crude fashion, the sins of imperialism are still today appealed to in many countries of Asia and even Latin America, even though the former imperialists have lost control and, in many cases, have completely withdrawn from these countries.

The loss of significance of these negative aspects of nationalism and the dilemma created for native leaders by the weakening and gradual withdrawal of the dominant foreign power can be well seen in West Africa. Technically the British territories of that part of the world are still in a colonial status. But in Nigeria and, above all, the Gold Coast, a rather high degree of self-government has been attained. The purely political nationalist objectives have been won to a large extent, and although these countries have not yet attained *de jure* independence, many powers, especially in the economic field, are exercised now by natives rather than Europeans. This has weakened the negative appeal of nationalism and has introduced a number of difficulties for the more doctrinaire and above all the irresponsibly inclined nationalists. Just as in the fully independent countries it is becoming more difficult to place economic failures at the doorstep of the former dominant power, so in these semi-independent countries nationalist leaders have been forced more and more to stress the positive aspects of nationalism rather than its defensive features, its opposition against the foreign oppressor.

POSITIVE ELEMENTS

Through the attainment of full independence or a larger or smaller measure of local autonomy, the main aspects of nationalist ideology shifted. Its features as a movement of opposition and defiance were weakened, and its positive elements became more and more important. The main positive element of nationalism is the proposition that all members of a given country belong to one and the same in-group, which is distinct from the various out-groups surrounding it. This aspect of nationalism is of considerable importance also as a factor of economic development. Since among the goals of economic development programs the attainment of higher levels of mass welfare is stressed, membership in a national group assures participation in this improvement of private economic conditions. Moreover, it also enhances the second aspect of nationalist ideology in stressing the interdependence of the economic and political goals of all members of the in-group and in supporting the proposition that what benefits the community also benefits each individual member of it.

This positive aspect of nationalism in many underdeveloped countries seems to be an indispensable aspect of the actual achievement of higher levels of living. It must not be forgotten that many of these countries exhibited until recently a high degree of heterogeneity in social structure and institutions. Some writers in discussing the social arrangements of these countries have spoken of dual or of plural societies. But even if we disregard these abstractions as too general, when we look at underdeveloped countries more closely we find that almost all of them comprise several ethnic or linguistic communities and that, apart from such divisive elements as castes and deep class lines, there are sharp differences between city and country,

between occupational groups, and between persons belonging to certain clans, fraternities, or other groups and those outside such groups.

DIVISIVE FORCES IN NATIONALISM

In fact, the rise of nationalist sentiment in underdeveloped countries has strengthened some of these divisive tendencies. In India, for example, the attempt to make Hindi the common national language has met with increased opposition from other language groups and, in fact, the language question has brought to the fore a kind of local "nationalism" which seeks to go beyond the dispute over a national language and to establish additional political goals, notably a higher degree of local autonomy. In other words, the linguistic controversy, which could be regarded as a symptom of cultural nationalism, becomes tinged with political aims that tend to strengthen the divisive internal forces. A similar development is discernible in Nigeria, where the political leaders of the three major ethnic groups, the Ibo, the Yoruba, and the Hausa, waver between supporting an all-Nigerian nationalism and a tribal nationalism.

Effect on economic development

Such divisive forces in nationalist movements have unfavorable consequences for economic development. In Nigeria the primary problem before the native leaders is the issue of full independence. Though Nigeria is, in a sense, an artificial state, with boundaries which do not correspond to any ethnic or natural lines of division, the most successful policy in attaining the goal of independence is the fostering of a common Nigerian nationalist ideology rather than an ethnically divided one. Yet the existence of separatist nationalist movements shows that common Nigerian national sentiment is relatively weak, and there is a definite likelihood that the three peoples may form separate states once the goal of independence is reached. Separation was also one of the results of the attainment of political independence of British India, although the divisive force there was religion rather than linguistic or ethnic differences. In Burma division has only been avoided after a long and destructive civil war, which delayed economic development greatly, and the granting of far-reaching powers of local autonomy to some ethnic groups within the Union of Burma. This process of "balkanization," even where it does not lead to internal struggles, has doubtless an unfavorable impact upon economic development. Not only does it impede the optimum harnessing of all human and nonhuman resources of a given region, and thus interfere with their optimum allocation, but also it tends to maintain particularistic relations in many fields of social action and slows up in this manner the development of fully rational, efficient forms of political and economic administration.

TRANSFER OF LOYALTY TO THE LARGER GROUP

Thus the penetration of attachments and loyalties to particularistic entities and their replacement by loyalty to the whole nation is the most important positive effect of nationalist ideologies in underdeveloped countries. If we consider that in most of these countries the great majority of the people are still engaged in subsistence agriculture and therefore living in villages to a large degree economically self-contained, the paucity of interaction between them becomes plain. Their limited economic horizon affects their world view and their political awareness. Anthropological studies in many parts of the world have shown that the common understanding of the villagers of their place in the world usually does not reach far beyond the limits of their village. They maintain relations with persons living in the surrounding region and occasionally may go to a nearby town, but their loyalty is to their own home community, and people in other parts of their country are regarded by them as strangers. The function of nationalism in such a society is the transference of loyalty from the narrow village or kinship group to the larger national group.

To be sure, in many underdeveloped countries a number of factors which facilitate this process have been operating, some for a long time and others more recently. The establishment of Western enterprises in parts of underdeveloped countries has tended to break down the isolation of the villages. They have attracted workers from the villages and have brought them in contact with persons from other villages, towns, and often also other parts of the country. The growth of urban centers has had a similar effect. Villagers have migrated to the cities and settled there, permanently or temporarily. There they have been thrown with persons from other parts of the country, have worked and often lived with them, and have attained membership in clubs, trade unions, or other voluntary organizations composed of many people with whom they had no previous tie, kinship or regional. A similar melting-pot effect was exercised by service in the army or sometimes in work gangs, and the effects of warfare which forced many people to flee their homes and settle among strangers also brought about the establishment of new contacts and the general enlargement of the horizon of simple people, whose previous world was confined to the boundaries of their village or district.

All these processes which tended to make people more mobile geographically and to enhance the number and frequency of contacts between them led to an increased awareness that beyond those persons with whom one customarily maintained face-to-face relations were others who had some things in common with the members of the in-group, and yet were strangers. It was this faintly felt tie that received its most powerful support from nationalist ideology. Nationalist symbols provided a meaning and an interpretation for the very imprecise and blurred sentiments of community of interest and destiny which people in many underdeveloped countries began to experience. They drew a firmer boundary around the new in-group and defined in more expressive forms the differences between that in-group and the various out-groups. And they showed how the activities of each member of the in-group interrelate with, and are dependent upon, what others of the same in-group are doing, even though the various actors may not know each other personally. In the course of this process the main goal of nationalism tended to be achieved, namely, the gradual transference of primary loyalties from the village or kinship group to the larger society.

Difference from earlier large states

In this, the modern sentiment of nationalism differs from analogous ideologies held in the earlier large societies in underdeveloped countries. The establishment of large states in the territories of many underdeveloped countries is nothing new. The Mogul Empire in India, the empire of Majapahit in Java, even the kingdom of Dahomey in West Africa, were large states covering the major part of present nations or peoples aspiring to independent nationhood. Like the monarchies of early mediaeval Europe, however, they were not built upon nationality as a common bond but rather upon submission to a common

ruler and assignment of places in a sociopolitical hierarchy with this ruler at the apex. In this sense the upsurge of a nationalist ideology in Asia and Africa is an outgrowth of the contact of these peoples with Europe and the West. Nationalism provides a means by which strong common ties can be established without hierarchical subordination and with maintenance of the principle of equality as a significant political value. This is the reason why programs of improvement of mass welfare, buttressed by a nationalist ideology, have, in principle, an egalitarian, democratic hue, and this is the chief feature by which modern nation-states in underdeveloped countries are distinguished from their monarchical predecessors.

LEADERSHIP

But although this phase of nationalism combined with aspirations to higher levels of welfare on a mass basis appears to offer a fertile soil for democratic political institutions, the very need for the institutionalization of these processes requires strong centralized leadership, which in turn makes possible the development of autocratic and, in extreme cases, even totalitarian government.

Requirements of national propaganda

Although nationalism attains and preserves a momentum of its own in the societies of the West, the very newness of nationalist ideology in many underdeveloped countries requires that it be attended to and supported constantly. In spite of the persistence of processes of social and economic change which tend to break down the isolation of the villages, and in spite of the buttressing of these processes by an officially promulgated nationalist ideology, the attachments of the kinship group or the local community in many underdeveloped countries are strong enough to make necessary the constant maintenance of nationalist propaganda and agitation. This requires a staff of skilled and devoted persons who become the chief manipulators of nationalist symbols and the elite personnel in the promulgation and diffusion of these symbols.

The logical group to undertake this task in an underdeveloped country is the leadership of political parties both in and out of government office. In fact, the manipulation of nationalist symbols might be regarded as one of the two or three most significant and appropriate functions of political party leadership in underdeveloped countries. This statement applies to all parties which wish to maintain and enlarge their influence and extends from the parties on the radical right to those on the radical left, that is, the Communists. The association in underdeveloped countries between nationalism and Communist ideology has often been observed, in spite of the pretensions of Communists to an ideology of internationalism. Resentment against those alleged to have kept large colonial populations in a state of poverty and hence to have "exploited" them and resentment against the foreign powers which until recently have supplied the political machinery maintaining this condition of exploitation have combined to offer these Communist parties a fruitful soil for action and propaganda. It should be noted that the Communist appeal depends upon this two-pronged resentment: on the one hand against the "exploiters" and on the other against the foreigners who are either identified with the exploiters or presented as supporting them.

But the Communist leaders are not the only ones who use nationalism as a plank in their party propaganda. In fact, the ability of a party to manipulate the nationalist symbols and appear in the eyes of the masses as the true representative of nationalist aspirations seems to be an important factor of its success. For example, the relatively poor showing of the Socialists in the Indonesian elections of 1955 must be attributed in large part to inability to make optimum use of nationalist propaganda.

If the proposition is granted that nationalist propaganda requires ceaseless activity because of the still somewhat ambivalent loyalties of many simple people in underdeveloped countries, and if it is granted that the persons in positions of political leadership in the government and political parties are the primary carriers of this nationalist propaganda, the ultimate political effect of nationalist trends and their association with economic development programs will depend upon the aims and objectives of the leaders. For this reason it is important to ask not only what these aims are but also what the social composition of the new political leadership in underdeveloped countries is and what the relation of the leaders to the mass of peoples over whom they exercise power.

Gap between the elite and the masses

One of the outstanding characteristics of the political elite in underdeveloped countries is the wide cultural and educational distance which separates them from the masses of the people. The exigencies of government, administration of economic and political bureaucracies, and control of media of mass communication require a degree of technical and organizational skill which could only be acquired in the West or in Western dominated institutions. Thus in those countries in which independence has been attained the political elite are to a considerable degree Western educated and have adopted not only Western forms of behavior but in many instances also Western values. Even in countries which are still lacking full independence, as, for example, Nigeria and the Gold Coast, many members of the native political elite conform to this pattern. The social distance between these persons and the mass of their followers is often greater than that between them and the Western foreigners designated by nationalist propagandists as the main representatives of the inimical out-group.

The result of this situation is, first, a sharp class division between the common people on the one hand and members of the government and leading political figures on the other. Another result of the conflicting cultural orientations of the elite and the masses is the monopolization of many functions of leadership by the members of the elite. Modern administration, in the political as well as the economic field, requires rationalized, impersonal bureaucracies. Their optimum performance depends upon the assignment of roles on a universalistic, achievement-oriented basis. But in view of the fact that traditionalist, often strongly particularistic, norms are widely observed among the popular masses, the political and to some minor extent the economic elite occupy a favored position with respect to leadership. Although widespread extension of education would gradually make it possible for increasing numbers to compete for leadership roles, most underdeveloped countries lack the necessary educational facilities and hence are deficient in suitably trained technical personnel with qualifications necessary for the fulfillment of administrative tasks on the higher or even medium levels.

The social characteristics of the political leadership group therefore tend to place it in a position somewhat apart from and on top of the mass of the people, and the often observed absence of

a middle class in underdeveloped countries is perhaps not so much a true description of actual facts as a reflection of the social distance between those who are leaders in some political or economic area and those who are not. Since it takes a long time to develop adequate educational institutions, the members of the present elite are able to maintain the social differentiation which endows them with positions of leadership. Correspondingly, we can understand why in most underdeveloped countries education is so highly prized. It is perhaps the most important, though not the only, means of social advancement.

Aids to social advance

Besides education, there exist several other avenues of social ascent. One of them, as in Western countries, is the acquisition of wealth, and another the attainment of positions in the bureaucracies of religious and voluntary organizations. The former usually requires educational attainments of a high order. The latter, among which positions in trade unions and some semipolitical bureaucracies are the most important, has on the whole greater significance in underdeveloped countries than in the West, since there the ties between trade unionism and political partisanship are stronger and more obvious.

An aid to rising in the social scale is the fact that the economic expansion of the countries, even if gradual and halting, and the increase in political and administrative tasks require the gradual enlargement of the social elite. In countries where pressures to move upwards are strong, because there is a relatively greater abundance of trained personnel or because economic development is slow and stagnant, the supply of "intellectuals," especially intellectuals of certain kinds—for example, lawyers—may exceed the demand for them and force them into accepting leadership in political counterelites, such as radical political parties or popular movements with real or alleged charismatic objectives. This development has, for example, occurred in India and is one of the reasons for the violent political radicalism of many Indian intellectuals.

Economic Development and Social Structure

The general picture presented by the social structure in underdeveloped countries thus is one in which there exists a wide gap between the upper and the lower classes. The upper classes have adopted many Western values and forms of behavior; they are familiar with the operations of a money economy; and many things bought from the West become status symbols. The lower classes frequently follow traditional indigenous values, often have little skill in monetary transactions, and live to a considerable extent still in an economy in which the village or a more or less clearly defined local region is largely self-sufficient. As a consequence of this dichotomy in values and behavioral norms, the upper classes enjoy an almost exclusive monopoly of access to those "goods" in society which are most highly prized: political power, education, and wealth.

Centralized planning

The power of this group is enhanced by the fact that economic development in almost all underdeveloped countries is fostered to a large extent by the central government. This is not the place to discuss whether centralization of developmental planning is a matter of choice or necessity for these countries. In view of the fact that they still lack most of the capital equipment which is usually referred to as "social overhead"—transport and communications networks, power stations, educational and health facilities, and the like—and in view of the further fact that these installations are of primary importance for economic development, a high degree of centralized developmental planning may be unavoidable. At any rate the prevailing inclination of governments to undertake the function of programing economic development can easily be understood. But the result of this centralization of developmental planning is the enhancement of the power of the sociopolitical elite and the increased dependence of the large mass of the people upon decisions made by this relatively small section of the population.

Conflicting forces

The main dilemma of political, and with it economic, development in underdeveloped countries results from this divergence between, on the one hand, the actual structure of social relations, which is rigorously hierarchical and associated with deep social cleavages, and, on the other, the collectivity-oriented values expressed by nationalism in its positive aspects and the ideology of elevation of mass living standards. The pressure of these ideologies tends to push in the direction of greater democracy and mass participation in political and economic processes. The interests inculcated in the members of the political elite and buttressed by the inequalities in the social structure tend to push in the direction of authoritarianism and a high degree of centralization of governmental powers.

It is difficult to predict the outcome of these conflicting forces. In different countries different results may ensue. For example, some observers who have noted the pressures discussed in this essay in the emerging societies of Africa have expressed the fear that the attainment of independence may there be associated with the coming to power of a highly authoritarian black elite rather than with a democratization of political and social relations. Such an outcome seems not improbable since, as may be seen in Central and Eastern Europe, a nationalist ideology can be diverted to the support of totalitarian or quasi-totalitarian governments as well as democratic ones.

As against this alternative must be held the potentialities for greater equality and freedom which stem from the struggle for political independence. Although the internal class relations in the societies of underdeveloped countries provide a fruitful soil for authoritarian political developments, the forces unleashed by the struggle for independence may lead in the opposite direction. The actual course of political developments in these countries appears to me to depend upon two factors, which are operative with varying force in different underdeveloped countries. One is the rapidity of economic development, and the other is the success of transforming the many particularistic hierarchical relations now existing on the social and political levels into a system in which the different interest groups become coordinated, with power distributed among them, rather than subordinated within one hierarchy.

Rapidity of economic development

The impact of rapid economic development upon the potentialities of democratic political institutions is not very difficult to see. If the economy, especially in its consumption goods sector, grows rapidly, the goal of improved mass living standards can be implemented more fully. Although economic growth, and especially industrialization and urbanization, remain associated with recurring episodes of social disorganization, the visible increase in consumption standards compensates for this to some extent, and the implementation of developmental programs can count upon

a greater degree of consensus. The government needs to use fewer constraints, and there tends to develop less conflict between the leaders and the mass. Moreover, a rapidly growing economy has a greater and more insistent demand for skilled personnel, and the rising members of the lower social strata are less frequently frustrated in their desire for social and economic advancement.

Remolding the social structure

But economic development alone, even if it stresses and actually succeeds in bringing about an elevation of consumption standards, does not guarantee the evolution of democratic political forms unless the sociopolitical structure is remolded at the same time. It has been argued that a nationalist ideology tends to break down particularistic loyalties and interests. But if its over-all effect is to bring the various groups, once they are robbed of their traditionalist values, into a rigorous hierarchy with a small group of nationalistic, sometimes charismatic, leaders at the top, democratic political forms will have a negligible chance of evolving. The main problem before these societies is not merely the abolition of particularist elements in their sociopolitical structure, but the replacement of these elements by groupings which, though universalistically oriented in their over-all values, nevertheless maintain independence of action and the power to represent the interests of functionally diverse social elements on an approximately equal level.

Two possibilities

In more concrete terms, this can be expressed by saying that there are two possible ways of eliminating the existing particularistic structures in underdeveloped countries.

1. They may become rigorously subordinated to a central hierarchy. The leaders of the various village and regional communities, even of ethnic and linguistic groups, are assigned positions on various lower levels of this hierarchy and exercise their power roles through it. The society returns to the type prevailing in earlier monarchical periods, only with the difference that modern methods of communication and the addition of a nationalist ideology provide this structure with increased strength and resilience as compared with its monarchical forebears. The similarities to these earlier structures are even enhanced if, and to the extent to which, the leadership in the new hierarchy is endowed with charismatic qualities.

2. Democratic development, on the contrary, is aided if the dissolution of particularistic groups leads to their replacement by functionally specialized groupings among which power is distributed in a more or less co-ordinate fashion. Or, more concretely: If the present petty elite in the village, the region, the ethnic or linguistic group, are robbed of their positions of leadership in these particularist groupings and new groups are formed along political party lines, occupational interests, or social class lines, leadership in these new groups depends not upon undifferentiated localized control and power but upon adequate representation of the interests of the members of the new group.

It does not matter greatly whether the leaders in these new groups are identical with those in the old ones or not. In general, the universalistic values which are forced, as it were, upon the leaders of the new interest groups, will tend to bring about a gradual replacement of the old elite by new leaders, and thus will tend to encourage a circulation of the elite. New leaders will attain positions in the functionally differentiated groups not because of the position of their family or the accidents

surrounding their birth (in other words, not because of genealogical or magical qualities), but rather because of achievement in representing the group interest. This, in turn, will contribute to the greater degree of circulation of the elite and also to the distribution of power among the various interest groups, since each of them, provided it maintains its independence of action, will find a place in the total social structure in accordance with the success with which it can uphold the special interests of its members as against the claims of other competing interest groups.

Given an essentially universalist orientation of the members of these groups, the competition for influence and power need not lead to a rupture of society but will rather eventuate in an over-all rough balance of the power positions of these groups. In the most commonsense terms, one might say that if and to the extent to which tribal chiefs and village heads can be transformed into or replaced by secretaries of competing political parties or trade unions, officers of independent chambers of agriculture, industry, or labor, or chairmen of regional welfare or health committees, the over-all chances of democratic development in underdeveloped countries will be much enhanced. It goes without saying that this development will take place only if this change is one in substance rather than one in name.

THE DEMOCRATIC ALTERNATIVE

In general, economic development sets a framework in which these sociopolitical changes may take place. It affords opportunities for the evolution of less tradition-oriented and more rationalized social and economic action. But whether these opportunities will be grasped and implemented so as to lead to democratic political institutions will also depend upon whether the nationalist symbols are used to enthrone a centralized bureaucratic authoritarian leadership or to provide new avenues for political expression of diverse functionally oriented interest groups in a sociopolitical framework in which power is not centralized but widely distributed.

Bert F. Hoselitz, Dr. Jur., Chicago, Illinois, is professor of the social sciences, University of Chicago, editor of the quarterly Economic Development and Cultural Change, and executive secretary of the Norman Wait Harris Foundation in International Relations. In 1952 he served as industrial economist on a United Nations Technical Assistance Mission to El Salvador. He is adviser on economic subjects to Encyclopaedia Britannica, author of articles in learned journals, and coauthor of The Economics of Military Occupation (1942) and of The Progress of Underdeveloped Areas (1952).

The Impact of a Money Economy on Consumption Patterns

By Elizabeth E. Hoyt

In this paper I am interpreting my subject as the effect on consumption patterns of situations in which new money income results from new opportunities to make or earn money under conditions of technological change. It is implied in my subject that new opportunities for choice are offered. The most important source of these would ordinarily be the market. There is, however, another source, namely, goods and especially services which may be offered free or at low cost by government, religious, or social agencies; these may directly affect consumption choices and indirectly influence market choices as well.

No situation of economic change in underdeveloped societies is a simple one, and many noneconomic as well as economic influences affect the spending and use of income. These influences vary greatly from time to time and from place to place. Further, we have no complete picture of the impact of economic change on consumption patterns in even one underdeveloped society. Economic change has been studied much more frequently from an interest in production or an interest in distribution than from an interest in consumption. For consumption we have some studies of family expenditures, usually made with primary concern for whether or not people have enough (in no case known to the writer do we have studies relating to the same people at different periods made with the same classifications and interpretations of spending); evidence of change from the production and sale of new goods and services in the economy; some studies relating to particular areas of consumer expenditure, as food and housing; and a variety of more or less organized observations of change, some of them made by careful observers. It would be premature, in fact, to look for accurate measurement in a field in which basic theory needs development and for which we first need to agree on what it is most important to measure.

The subject of consumption change under impact of a money economy might be approached from the point of view of effects of buying on production, effects on trade, effects on stability, and of several other interests to which the actions of consumers contribute. The point of view of this paper is that of consumers as such, their attitudes and behavior and their welfare in so far as the latter is a matter of objective proof or objective agreement.

Resistance to a New Money Economy

It is safe to say that among underdeveloped peoples there is likely to be some resistance to a new money economy. The attractions of new goods and services do not completely outweigh the objections to regimented production, loss of leisure, closer contact with outsiders as officials or taskmasters. Even freedom from want itself unless the want is dire may at first seem less attractive than freedom to carry on in the old way.

The easiest transitions to a new money economy occur when change is slow and people are able to set their own pace.[1]

[1] Actually the test of successful change is equilibrium among the changes, which is most likely to be achieved when change is slow and the people affected have an opportunity to make their own selections and adjustments. An outside group, say an employer or a colonial government, introducing change is almost certain to interpret success in terms of its own cultural values. When a day of reckoning and confusion comes, the outside group is likely to ascribe the confusion to agitators, failing to recognize that they themselves did not understand the cultural situation with which they were interfering. The people affected need to have adequate opportunity to select among new alternatives which conform to their own sense of equilibrium; this requires not only a variety of alternatives but time to become acquainted with their significance.

Such an opportunity is found in the agricultural production of peasant proprietors, who can adjust their work and income as their wants expand. In some parts of Africa it is customary for the owners or administrators of large plantations to offer their workers the opportunity of doing only half-time work for wages, since they find the people more willing to be employed if they can have less money and more leisure, or more time to provide their own food. A similar desire to work shorter hours and provide their own food, or part of it, is found among the Indian employees of the plantations of Guatemala, and employers furnish their workers with milpas, small plots of ground for agricultural production. Thus the problem of transition to a money economy is simpler in rural regions than it is in cities, where employees have no opportunity to produce their own food and the employer or some other agency must furnish housing for each employee in a crowded area. In South Africa, East Africa, and Central America, the regions with which I am best acquainted, full-time wage earners in cities or mines very often keep their wives and children in the country; they themselves can escape there when some particular object of spending is obtained or when the pressures of full-time employment become too great. One result of this kind of employment, of course, is that wages tend to be set at the cost of sustenance for a single man, rather than at a family level; and a major problem of support arises for such wage earners as to bring their families to cities.

Another and curious example of compromise transition is found in the Gezira in the Sudan, where a large-scale social and economic planning project has set up hundreds of peasant proprietors who are under a certain mild compulsion to produce cotton and other economic crops. By means of this, peasant incomes have greatly increased. Many of these "peasants," who have no particular use for all the new consumers' goods such incomes could bring, now employ others to do a part of their work for them, while they themselves spend a good portion of their prosperity in leisure or in supervising the work of their employees.

Where people are plunged all at once into a situation away from home in which they have no choice but full-time earning for money, they have lost their familiar anchorages and are without experience to guide them in the new set of conditions and the new opportunities for spending which the money economy brings. Such situations do not automatically take care of themselves. The use of money and opportunity has to be learned, and the price can be a high one.[2]

[2] The Belgian Congo is frequently mentioned as a place where major economic change has been favorable to native people, but as yet this remains to be demonstrated so far as effects on consumption patterns are concerned. In 1952–53 the International African Institute set up and UNESCO financed a study to be called "Social Implications of Technological Change and Urbanization in Africa South of the Sahara." The field work was carried on in Stanleyville, Belgian Congo. Unfortunately the findings of the study have not yet been published and could not be made available for the purposes of this paper.

FIRST NEW CHOICES

The first uses of new income are likely to be for more of what has customarily been enjoyed or for new choices which do not much disturb old consumption patterns. They tend to be either easily incorporated additions (like a taste for new sweets within the food pattern) or something which can function outside the existing pattern without much immediate effect upon it (like a bus trip).

The first new choices in general fall into four categories, of which the fourth to some extent crosscuts the other three. The first of these categories is goods making an immediate appeal to sensory tastes which are universal or nearly universal among all peoples, such as sweets of all kinds, including cakes and sweet drinks, tobacco and drugs which give temporary emotional satisfaction, and intoxicants. Most of these have the advantage of being relatively cheap, and traders can readily put them on the market. The introduction of new spirituous liquors to American Indians and of great supplies of opium in Asia are well known examples. Almost everywhere the per capita consumption of sugar notably increases as a new money economy comes in.

The second category, in some cases related to the first, is proprietary medicines and devices to which magical or semimagical qualities are attributed. The category is smaller than the others but it may be the most harmful in its effects. It was noted that after various proprietary medicines, or claims for them, were made illegal under the United States Pure Food and Drug Act of 1906, a great increase in their sale took place in Central and South America. A considerable part of the advertising in vernacular papers published among underdeveloped peoples is of proprietary drugs and devices, and even where people cannot read they can be attracted by colored posters, as one I saw in an isolated region of Honduras —Christ holding out to a sufferer a familiar box of pills.

Prestige and emulation

The third category is of goods and services associated with prestige, either something already in use and approved among the native people (as metal ornaments) or something approved by outsiders whom the native people desire to emulate. Among foods, white flour and white-flour products generally have more prestige than the old familiar staples. Very often the most prestige-carrying goods are something to wear, both because what is worn is conspicuous and because such goods, though not necessarily inexpensive, are relatively so compared with housing, house equipment, and vehicles. That beads, metal decorations, and bright cloth should be a part of the equipment of traders going to far-flung tropical shores is taken for granted. At the present time, parts of tropical Africa offer an immense market for the second-hand clothing of Europe. Recently there has been a great run in British East Africa for dark spectacles, so much so that an African character wearing dark spectacles is used to typify a vain simpleton, the reason being that dark spectacles are desired for dress wear at social events after the sun has set.

A great deal could be written about the social conditions which most favor emphasis on conspicuous and emulative consumption, and how they favor it. Where caste is rigid or differences between native people and the outsiders introducing change are felt to be very great, emulation favors more expensive or fashionable forms of what is already in the caste or native culture. Where there are social classes but mobility among them is readily possible, people naturally tend to copy the class above, and if the outsiders are admired the highest native class copies outsiders. A good example is found among the Baganda of Uganda, a stratified but not rigidly stratified society, where each stratum copies the one above and the top group, represented by the king and his associates, copies the conspicuous culture of British royalty and aristocracy, so far as this culture is known in Uganda. Not only British dress but the elaborate complex of fashionable social events is taken over by this group. On the other hand, in two more democratic tribal societies with which I am somewhat familiar, that of the Kikuyu in Kenya and the Chagga in Tanganyika, emulative consumption tends to take over some conspicuous traits believed to belong to a world society and the customs of the British aristocracy as such have no particular appeal.

Targets

The fourth category, to some extent crosscutting the first three, has been described as "targets," a target purchase usually being something relatively important or substantial which stands by itself and is not necessarily bound in with other culture changes. When a person has once hit his target he can sit back and rest for a while—perhaps for the remainder of his life. Regular food and drink would hardly be included in this category, but the giving of a feast might be a target. More expensive clothing purchases are very often targets—shoes, for instance. A target may be almost anything which commends itself to people because of its obvious usefulness or its associations with prestige, but the choice of particular targets depends in part on aggressive salesmanship. The wide introduction of the sewing machine is a case in point. An intelligent African I knew had worked several years to save enough money for a bicycle (a target desired for both its usefulness and its prestige), and the bicycle had become the limit of his horizon; he could not conceive of anything that cost more than a bicycle, even the coronation.

It is true that most target goods serve some "useful" purpose, but it is not true that ability to serve a utilitarian purpose is necessary for their introduction. Immediate sensory and emulative appeal is likely to bring them in; but once introduced they may remain and more of them be desired because their utilitarian superiorities have become obvious. In respect to targets, Major Orde-Browne says:

> . . . astonishing differences will be found to exist between tribes. Cooking-pots, hurricane lamps, shoes, unbrellas, hoes, and numerous other items will each be found to be the particular favourite of a certain community. . . .
>
> The primitive tribe will as a rule be attracted at first by trifles of little value; a knife, axe, or other useful article may be purchased, but it is often accompanied by a number of quite unnecessary adjuncts, such as shoddy but showy clothing, brightly coloured hats, or toys such as mirrors and mouth-organs. Later, the first novelty of the contents of the store will have worn off, and more sensible things will be favoured; metal cooking-pots have been found superior to easily fractured earthenware, blankets are appreciated, or the attractions of lamps may be discovered.[3]

A special case of target—which also, of course, may bring about a major modification of culture pattern—is the

Bernot, "Markets in the Chittagong Hill Tracts" (Eastern Pakistan), *Information* (Paris: International Social Science Council, International Research Office on Social Implications of Technological Change), Vol. 2 (October 1954), pp. 1–6; Cyril S. Belshaw, *In Search of Wealth* . . . (Southeastern Papua), American Anthropological Association, Memoir No. 80 (*American Anthropologist*, Vol. 57, No. 1, Part 2 [February 1955]).

desire for education, most commonly the education of children, though adult education as a target is not absent. In British East Africa education is not free, and again and again I was told there that the reason a father or brother had left home to earn was so that the children, or the younger ones, could be educated. In one place, the Kikuyu region of Kenya, where not enough schools were available even if people could pay to go, the building of schools had become a target; and the people were erecting them on every hilltop, contributing their labor. It was said that some families gave to such a target as much as half their money income.

MAJOR MODIFICATIONS OF CONSUMPTION PATTERNS

"Modification of consumption patterns" may apply to the separate patterns of family expenditures—food, housing, clothing, and so on—and it may apply to consumers' use of resources as a whole.

Food

To begin with the separate patterns, and with food, the weight of evidence indicates that in areas that have come under the influence of a modern money economy diets are poorer than they are in more primitive areas.

In general, the effect of a cash crop or wage economy on nutrition has been one of lowering the level by disturbing the balance achieved under subsistence economy, introducing processed foods as prestige foods, limiting the amount and quality of subsistence crops in favor of cash crops, or the amount of time spent in preparation and preservation of food for home consumption.[4]

A study of the American Geographical Society supported by the United States Office of Naval Research concluded, on the basis of incomplete evidence it is true, that of 209 tribes selected as "primitive," only 12 had diets defective in both energy and protective foods, 7 had diets defective in energy only, and the remaining 190 had diets that were adequate, at any rate for the life the people were leading. On the other hand, most of Asia, about half of Africa, and about half of South America, areas which had come to a greater extent under the impact of a money economy, had diets defective both in energy and in protective foods. The best nourished areas of the world were, in general, those that we regard as the most civilized and those that we regard as the least civilized.[5]

Some deterioration of diets would, on a priori grounds, be expected. The quick expansion of tastes for sweets, mentioned in the preceding section, almost always means less rather than more protective elements in the diet. White sugar contains no protective elements, and a considerable increase in the consumption of sweets usually means a smaller consumption of foods containing vitamins and minerals. Desire for prestige foods strengthens the demand for sweets and may lead also to increased consumption of white flour and polished rice. As people give up their old subsistence agriculture and buy their food in markets, white flour and polished rice, which are more easily preserved than whole-grain flour and rice

See also *ibid.*, pp. 211–20. The book is published also by Mentor Books, New York, 1955.

[5] "Study in Human Starvation," Sheet 2: "Diets and Deficiency Diseases," *Atlas of Diseases*, Pl. 9 (New York: American Geographical Society, 1953). An extensive bibliography is given. (The *Atlas of Diseases* is published and distributed plate by plate.)

rich in vitamins and minerals, tend to take the place of the more nutritious cereals, and to some extent also of vegetables and plantains, which contain elements essential for balanced consumption. Prestige value attaches itself not only to white-flour products but also to food in packages and cans, which increases the cost of the diet without necessarily improving it.[6]

Where workers employed away from home eat in large numbers in commissaries run by employers, considerable attention has been paid to giving them food that will increase their productivity. A diet worked out in detail to every calorie and every established protective element is fed to workers in the copper mines of the Rhodesias and the gold mines of the Witwatersrand, and whether they like it or not they have no choice but to take it. I know of no evidence, however, indicating that such diets influence food consumption in the homes of the workers when they return to them; on the contrary there is evidence to show that, since the women of the family are those who prepare the food, changes in the diets of men in mining and industrial establishments have little effect on family nutrition.

The first impact of a money economy is typically accompanied by the introduction of new diseases, but in many cases there is a good record of improvement later, when doctors, nurses, and hospitals for native people are introduced. Satisfactory figures on change, however, are lacking.

[6] Considerable research has gone into the preservation of whole cereals and to the restoration of vitamins and minerals to commercially prepared foods. This can be done, and sometimes quite inexpensively. The problem now is chiefly to ensure that the more nutritious products are on the market and are the ones actually used by the people. Such groups as the United Nations Food and Agriculture Organization are trying to bring this about.

Housing

In the area of housing the weight of evidence is not so strongly on one side as it is in the case of food. According to circumstances, both improvement and deterioration take place. So long as people can live in their own native habitat, changes tend to be for larger space, better construction, and more amenities; but these changes come slowly. On the other hand deterioration comes rapidly when workers move themselves, and especially their families, to centers of industry. There is no worse housing in the world than in the slums of many Asian and African cities. Flimsy construction, as of cardboard and tin, terrific crowding, the absence of elementary sanitation, and the presence of insects and rodents—all these distinguish the kind of houses in which many workers have to live when industry expands. A great deal has been written on experiments in good housing for underdeveloped peoples as they come to new centers of labor, and there are many such experiments under municipalities and employers, but compared to the need for them they are numerically unimportant. What is also little recognized is the fact that employers of labor in providing "good" housing often pay little attention to what workers want; for example, they substitute identical rows of rooms for separate huts, thus depriving families both of privacy and of the opportunity to have in their homes a little variety and expression of personal taste. So the values gained by better construction and equipment, when these are given, may be more than offset by the fact that the new houses do not accord with the families' living habits and interest in their home.

Clothing

So far as clothing is concerned, when a money economy is initiated direct ef-

fects on welfare are generally not very important, though the introduction of new kinds of clothing needs to be accompanied (as it sometimes is not) by understanding of ways to use it hygienically and keep it clean. The indirect effects may be considerable, however, because clothing makes one of the earliest appeals to consumers' interest, and after absolute necessities are met it attracts expenditures more rapidly than objectives which, like housing, require more experience and education. It is of interest that in underdeveloped societies in general men change their styles of clothing before women change theirs, that for both sexes the ages where change comes first are from twelve to twenty, and that for both sexes the forms of outer wear are generally changed before underwear. This is in accordance with what we should expect from the facts that women are held to be culturally the more conservative sex, that disposition to change in general is more marked at adolescence than at other periods of life, and that outer wear, being more visible than underwear, is more subject to the influence of emulation.

Recreation

It is difficult to generalize on the effects of a money economy on recreation, since influences which may be much more important than those of money economy enter into the picture. Recreation, moreover, is closely related to adjustment in the pattern of consumption as a whole. Motion pictures of certain types (in my experience the most popular types are animated cartoons and Wild Wests) are greatly desired and extend the horizon in various ways. But much of the change in the recreation area is due not so much to the availability of new commercial forms of entertainment as to the lapse of old forms of tribal recreation, sometimes related to tribal religion, and to their suppression or discouragement by the authorities, and in some cases, to the provision by those authorities of new forms of recreation free or at low cost. In British East Africa, for example, the government has encouraged the institution of social halls where beer or tea can be obtained, and in some cases the beer hall plays a major part in the recreation of the community.

Social participation

Social participation, which is a part of the pattern of consumption, is related in some way to all the categories of consumption, particularly to recreation and to contributions to religion, organizations and movements, and gifts to other people. Most people in economically underdeveloped societies have more of a large-family system than we, and under the impact of a money economy this tends to break up. But the need of social participation, the willingness and desire to contribute to others, remains, and seeks other outlets. I know of no study which deals with the nature and amount of contributions among underdeveloped peoples under the impact of change, but I know that sometimes the amount, in proportion to income, is very great. I have spoken of the large contributions to schools made by the Kikuyu. Contributions to organizations are likely to be especially great if the people see a means to bolster their morale through a religious, educational, or political organization of their own. The rapid growth of what to our eyes are peculiar religious movements among underdeveloped peoples is a good example of this. Some of these movements or churches operating as Christian introduce old magic under new guises, represent Christ as an Indian or a Negro, and make a great economic show which serves to compensate the members for the sense of personal inferiority they may have received from the outsiders who are the agents of economic change. Members live vicariously in the splendors of this organization.[7]

The total pattern

This latter part of our discussion has indicated that what may happen to the pattern as a whole is much more important than what happens in any single category of consumption. We need a word on the nature of total patterns,[8] which are made up of parts interrelated and to a considerable degree interdependent. Any influence which disturbs any part greatly is likely to react on the rest; and the whole may be disturbed also by any over-all conditions which increase or decrease available resources in any major way, or which (particularly in the case of standards of living) introduce new concepts of the values of life.[9]

As has been said, if change comes slowly to underdeveloped peoples and they can set their own pace, no very serious problems may arise. But people who find themselves precipitated into a new situation of greatly increased purchasing power may go berserk with it. They may not know what to do with the new money, and the transitory delights of sensory and emulative spending may take it all before a wider range of alternatives comes into the picture. Not only may the people throw away their money for almost any new object, but unaccustomed spending of a sensory and emulative nature may lead to decay of morale and permanent loss. The willingness to follow any leader who promises prestige and security and the increase of crime found in societies in process of very rapid change are symptoms of this.[10]

Obviously more than consumption patterns are involved in the tensions and attitudes towards life which arise under the impact of a money economy. The problems call for understanding from many disciplines besides econom-

[7] See B. G. M. Sundkler, *Bantu Prophets in South Africa,* London, 1948.

[8] Our subject might include discussion of changes in proportions given to different categories of expenditure as a money economy comes in. For example, a money economy tends to increase real income, and it is as true as it ever was that as incomes increase a smaller proportion of income is usually spent for food (Engel's law); indeed, this should be obvious. Also, as income increases it is likely that for a considerable time a larger proportion goes for durable goods. (Cf., for United States, "Income Sensitivity of Consumption Expenditures," *Survey of Current Business,* Vol. 30, No. 1 [January 1950], pp. 17–20. As far as I know, however, no statistical data on proportions for expenditure for durable goods in a group of underdeveloped countries have ever been compiled.) In services, too, proportionate expenditures of underdeveloped peoples tend to increase with income, though this does not mean that such proportions increase indefinitely. For example, people in underdeveloped societies who are very poor by our standards may employ a servant as their means increase; but as they step out of the category of "underdeveloped," expenditures for servants may decline and greater proportionate expenditures for household equipment be made. A considerable body of data on family expenditures has been collected among various underdeveloped peoples, and it might seem at first that we could compare proportions of expenditure made by less-developed groups with those made by the more developed. But since the background conditions of the different societies are very different, and since the studies vary greatly in selection of families and in classification and interpretation of data, as well as in accuracy, it would be dangerous to use them for this purpose.

[9] The *locus classicus* for discussion of standard of consumption and standard of living is Joseph S. Davis, "Standards and Content of Living," *American Economic Review,* Vol. 35, No. 1 (March 1945), pp. 1–15. Among other things, this stresses the importance of balance in the whole.

[10] See Margaret Mead (Ed.), *op. cit* (note 4 *supra*). Cf. E. E. Hoyt, "Tiquisate, A Call for a Science of Human Affairs," *Scientific Monthly,* Vol. 72, No. 2 (February 1951), pp. 114–19.

ics, and a whole complex of related values must be understood. Consumption patterns are the most tangible part of this complex.

THE MARKET AND OTHER MEANS OF CONSTRUCTIVE CHANGE

Little thought has been given to the nature and organization of markets in underdeveloped societies as an appeal to new purchasing power and as an encouragement to increase this power. In the earliest stages of development of money economies among underdeveloped peoples in modern times a good deal of emphasis was placed on compelling the people to work by force or by laws requiring every man to give evidence that he had been employed so many days out of the year or by taxes that could not be met except by new forms of labor. At a later or higher stage attention was paid to trying to make the conditions of employment pleasant, as by giving prizes for regular work. Very little attention indeed has been or is being given to motivating the people by giving them a new and greater choice of goods. The value of the spread of wants to stimulate economic development has been for the most part unperceived.[11] One can look through whole shelves of books on the economics of underdeveloped areas without finding reference to the importance of incentive through development of wants or the importance of markets as a means by which this incentive can be given. This silence contrasts oddly with the emphasis on aggressive salesmanship and advertising in our own economy. It might be assumed that we need to have our imaginations stimulated, but that underdeveloped peoples have imagination enough already.

[11] Cf. I. C. Greaves, *Modern Production Among Backward Peoples* (London, 1935), Chap. V ("Monetary Incentives and the Standard of Living").

The general assumption has been that if the profit motive of traders is given relatively free play the problems of supplying new goods and services through markets will be taken care of by itself. In my experiences in Central America and British East Africa, the markets show cultural lag. Indeed the traders themselves are in general unfamiliar with the wide range of inexpensive goods which we in the United States take for granted, as a result of the competition of five-and-ten-cent stores, mail-order houses, and other merchandising agencies which offer mass-produced goods at low prices. Also, particularly in Central America, tariffs interfere with imports for popular consumption, and in both Central America and East Africa there is little manufacture of such goods within the countries themselves.[12] On the other hand, in these countries or areas there appears to have been no lack of effort to supply the people with goods and services of an elementary sensory nature such as I spoke of earlier —sweets, proprietary medicines, tobacco, soft and hard drinks—and prostitutes and temporary wives are readily available for wage earners away from home and for some who have their families with them. Governments fight such sensory amenities in some cases, but

[12] That offerings of inexpensive consumers' goods are neglected in underdeveloped countries which have been under the impact of a money economy for some time is suggested by W. H. Nicholls in "Domestic Trade in an Underdeveloped Country—Turkey," *Journal of Political Economy*, Vol. 59, No. 6 (December 1951), pp. 463–80. Not only was there inadequate attention to consumers' wants or needs in Turkey, but "in so far as . . . the consumer-goods industries have . . . been developed, the government has frequently followed a high-price policy to produce the profits necessary to offset losses" incurred elsewhere (p. 465). The author of the article believes that his conclusions are "probably applicable to other countries in approximately the same stage of economic development as Turkey" (p. 478).

are less active in providing a range of alternatives which might take their place.

Two examples of market development

In contrast to this negligence or lethargy, I should like to mention two approaches to the development of markets, one by a colonial and the other by an independent government. The first is in Danish Greenland, where the colonial government has for many years put emphasis on the development of the trading post as an agency for bringing modern civilization to Eskimos. In the second case, at the request of the government of India Professor Lincoln Clark of New York University conducted in the summer of 1955 a marketing experiment to see what consumer response would be to a variety of inexpensive goods sold through mobile stores in different types of regions. To finance this the Indian government set up the National Small Industries Corporation. It is significant that private capital was unwilling to take the risk. The government hopes, however, that after it has demonstrated that selling a variety of inexpensive goods is good business, private investors will buy stock in the corporation.

Our assumption that private capital will take the risks involved in such new undertakings arose at a time of great economic expansion, during and following the commercial and industrial revolutions in Western Europe and the United States, when large risks were taken by men inoculated with the spirit of enterprise and selling primarily to their own people. Very different conditions are involved in the development of new consumers' markets among underdeveloped peoples, either by members of those societies or by businessmen from without. For our businessmen to see opportunities of profit in our own society by selling to our own people calls for less imagination than to see such prospects far afield, especially as the opportunities at home are now very great.

Other contributions to integrated consumption

It is obvious, of course, that a wide range of goods offered through markets, important as it is, is not by itself enough to take care of the development of incentive in an intelligent way. Consumers would still need protection from harmful or deleterious products, and although the offering of a wide range of alternatives is far better than the offering of a narrow range, there could still be disorganization in consumption patterns. The subject is too large to be treated here with any completeness, and I shall not discuss education, which in its broad sense is the foundation of constructive and integrated consumption. I should, however, like to mention two efforts made by native people themselves to deal with the problems involved in incorporating new goods and services into their consumption patterns.

The first example is Japanese. At least as early as the Meiji period, the rulers of Japan began to send some of their own people abroad to examine and bring back elements of foreign culture which appeared to them desirable. These elements were then further examined in Japan and if they passed the test were modified as necessary and introduced into the home culture under the aegis of the emperor, who was also the cultural high priest.

The second example is from modern Kenya. I have mentioned earlier the passion for school building which I saw in the Kikuyu territories in 1950–51. Some of these schools were "independent" schools and had as one of their objects to bridge the gap between the old cultures and the new as a money economy came in. Important elements

both of the curriculum and of extra-curricular activities were the peoples' own efforts toward easing the cultural transition. But when Mau Mau troubles broke out in 1952, these schools were closed on the grounds that they were contributing to Mau Mau; they were not permitted to reopen under their former direction; and their constructive and positive contributions to consumption adjustment were not examined. In this case the money necessary for such a study was offered to the British Colonial Office, the Colonial Office itself to appoint the personnel for the study. It was said that tensions were too great to make study possible, and the offer was declined.

TOO LITTLE EXPLORED

In relation to their great importance, consumption patterns and adjustment within them have received little attention, and little research has dealt with them directly. Consumption problems in general have been less studied than those of other main areas in economics, partly because the consumer's interest is everybody's interest, not that of a special group. In addition, consumption requires a considerable appreciation and some knowledge of social sciences other than economics; in fact, it is the economic example par excellence of need for collaboration among the social sciences. And the problems of consumption, difficult enough at home, become even more difficult when our concern is with the consumption patterns of underdeveloped peoples. We need to acquire a new set of facts and we need to enter into the minds of others, understanding why a condition of wants or lack of wants which seems to us completely unreasonable may not be unreasonable in view of the background against which the condition occurs. Only with such understanding can we see the most intelligent ways by which we can help in providing adequate substitutes for what is passing and in enlarging the range of alternatives for choice. Only with such understanding can we help the people to see their own situation in relation to others, so that they themselves can lay the foundations for their own balanced development.

Elizabeth E. Hoyt, Ph.D., Ames, Iowa, is professor of economics at Iowa State College and the author of a number of books dealing with consumption. She is joint author of American Income and Its Use (1954). She has engaged in research on technological changes affecting consumption in Guatemala and British East Africa and has published articles dealing with various aspects of this change.

The Recruitment of Wage Labor and Development of New Skills

BY MANNING NASH

IN the vanguard of theoretical and practical problems of economic development are the formation and training of a labor force. Attempts to raise the productive capacities and levels of living in regions called "underdeveloped" depend in large measure on the successful and orderly transfer of workers from agricultural and traditional pursuits to occupations connected with the highly rationalized enterprises of modern production.

The change in the disposition of the working population is not only a quantitative redistribution but a qualitative one. A labor force amenable to, and useful in, the process of economic development must at least develop the characteristics of regularity and continuity, technical proficiency, and relatively high productivity. In the context of economic development the emergence of a labor force is not the mere grafting on of manual skills nor the sheer mobilization of numbers of hands. It is a deep-going social process which penetrates the psychology of the worker and reorders his cultural norms and social relations.[1]

Modern inquiry into the process of the transformation of peasants and primitives into members of an industrial labor force is concerned with three analytically distinct aspects of the single social process. (1) What are the circumstances, incentives, and motivations which will induce workers to leave traditional modes of production and enter modern economic activity?[2] (2) What are the processes and mechanisms whereby the personality of the worker, his social relations and cultural norms, become modified so that commitment is made to the industrial way of life? (3) What is the range of social structure, cultural pattern, and personality type which may carry on industrial production?

These large areas of investigation must be resolved by studying a series of variables or factors which in their interconnections will show why peasants and primitives work, how a productive labor force is developed, and what are the limits of the institutional structure of such a labor force. Satisfactory answers to the questions raised are contingent upon a series of empirical instances in a framework of controlled comparisons between the cases. Such an empirical basis hardly exists. The literature on the evolution of a wage labor force is not directly concerned with the problem as such. Most inferences are by-products of studies oriented to other ends.[3]

[1] M. J. Herskovits, "Motivation and Culture Pattern in Technological Change," *International Social Science Bulletin,* Vol. 6 (1954), pp. 388–400; R. Firth, "Money, Work, and Social Change in Indo-Pacific Economic Systems," *ibid.,* pp. 400–410.

[2] This question takes its form from the work of Wilbert E. Moore, *Industrialization and Labor,* Ithaca, N. Y., 1951. In asking it I am concerned with the voluntaristic offering of persons for wage work. Direct and indirect coercion, from slavery to the head tax or vagrancy laws and debt peonage, has sufficed in the past to recruit wage labor. Such labor forces do not offer promising material for economic development, and such methods of recruiting are here considered self-defeating for the end in view.

[3] Wilbert E. Moore, *op. cit.,* makes this evaluation of the literature. His work (*In-*

I shall orient my discussion around the case history of the successful adaptation of a peasant society to industrial work. In the course of this exposition I shall block out those social and cultural factors which appear crucial in the process of labor recruitment and commitment. Such generalizations as I shall arrive at will be "diagnostic." That is, they will point to what, in any primitive or peasant society undergoing economic transformation, seem to be the areas of social life most intimately and immediately involved with, and strategic for, the emergence of a labor force. I need hardly enter the caveat that the range of diversity in peasant and primitive societies precludes the automatic application of principles, or that it is the daily, small-scale actions and decisions which are most likely to determine success or failure, rather than the mere possession of general knowledge.

CANTEL, GUATEMALA

I choose to write about Cantel, an Indian community in the Western Highlands of Guatemala, first because I have intimate, firsthand knowledge of this community, and second because the social and natural situation of the community permits a large degree of control over inference. Cantel is an agrarian community of peasant Indians about six miles from Quezaltenango. Like its neighbors it is a self-conscious local society. Its people have an ethnic identity, a set of shared and particular cultural features, a dialect, and costume which serve to distinguish the local society from other Indian societies and from the larger national society and culture of Guatemala.[4] Cantel's radical difference from the Indian communities around it consists in the fact that Central America's largest textile mill operates within its boundaries, drawing on the local Indian population for its labor force.[5] This circumstance permits the controlled comparison of Cantel's institutional structure with that of neighboring *municipios*, socially and historically similar but for the presence of the factory.[6] Internally, Cantel offers the opportunity to contrast a farming population with a factory population whose cultural norms and economic activities were identical prior to the coming of the factory. Such a social and natural situation permits the description and analysis of the process of labor recruitment and commitment with some confidence as to the correct selection and weighting of variables.

dustrialization and Labor [Ithaca, 1951]; "Primitives and Peasants in Industry," *Social Research*, Vol. 15 [1948], pp. 41–81; "Theoretical Aspects of Industrialization," *ibid.*, pp. 277–303; *Economy and Society* [Garden City, N. Y.: Doubleday & Company, 1955]) is both an excellent summary and a skillful interpretation of the literature.

[4] The cultural features of Indian communities like Cantel are briefly summarized in R. Redfield and S. Tax, "General Characteristics of Present-Day Mesoamerican Indian Society," in Sol Tax (Ed.), *Heritage of Conquest* (Glencoe, Ill., 1952), pp. 31–39. The relations of one Indian community to others are described by Sol Tax, "The Municipios of the Midwestern Highlands of Guatemala," *American Anthropologist*, Vol. 39 (1937), pp. 423–44. These communities closely approximate the "corporate" type described by Eric R. Wolf, "Types of Latin American Peasantry: A Preliminary Discussion," *American Anthropologist*, Vol. 57, No. 3, Part 1 (June 1955), pp. 452–71.

[5] A fuller description of Cantel can be found in Manning Nash, "Cantel: The Industrialization of a Guatemalan Indian Community," unpublished Ph.D. dissertation, University of Chicago, 1955.

[6] The methodological rationale of the comparative method in modern anthropology is expounded by Fred Eggan, "Social Anthropology and the Method of Controlled Comparison," *American Anthropologist*, Vol. 56, No. 5, Part 1 (1954), pp. 743–63. See also O. Lewis, "Comparisons in Anthropology," *Yearbook of Anthropology—1955* (New York, 1955), pp. 259–92.

THE FACTORY

The factory came to Cantel some sixty-five years ago, not because of special labor advantage but rather because the river dropped near Cantel and thus could supply the water power necessary to the factory. The Indians of Cantel, who now form the work force of the factory, were not the first recruits to wage labor. The first workers came from the surrounding villages in the valley of Quezaltenango. These workers were, on the whole, poor propertyless Ladinos (as the carriers of the national brand of Hispano-American culture are called). Along with these Ladinos came some "ladinoized" Indians, persons, for one reason or another, detached from their local Indian communities. Still later some Canteleños, marginal in terms of participation in community affairs, accepted factory work. This labor force was characterized by chronic absenteeism, high turnover of personnel, and the continual loss of skilled hands to Guatemala City. Management met these problems by a combination of coercion and paternalism. Local police were used to round up late and absent employees. Troops of the national government were on hand to quell labor disturbances and curb the villagers' antipathy to the factory. The firm offered inducements of land and housing and tried to settle the minutest disputes by direct intervention of top managers. But until the third decade of the twentieth century, high turnover, absenteeism, and low productivity persisted.

Today (as of 1954, and prior to the dissolution of the local union in that year) the factory of Cantel employs about nine hundred Canteleños, one-fourth of the community's working population. The work force is regular in reporting, skilled in technical operations, not marked by high turnover, and of reasonable productivity. Between the founding of the factory and its current operation, therefore, there has taken place a process of commitment of workers, so that a labor force with characteristics suitable to further economic development has emerged. How did such a working population become attracted to factory work, and how did those who came to the factory become sufficiently involved in it to stay and learn new manual skills together with the discipline and routine of centralized machine production?

ATTRACTIONS OF FACTORY WORK

When it is asked why the first Canteleños accepted factory work, the answer is poverty. Cantel is essentially an agrarian community where most people's living depends upon ownership of or access to tillable land. To meet Cantel's modest definition of a standard of living, twenty *cuerdas* (a *cuerda* is a land measure equaling 0.108 acre, so that twenty *cuerdas* equal 2.16 acres) of good land are needed. The average land holding appears to lie between eight and nine *cuerdas* per family. And from the sample made of those who are factory wage workers, only two persons with more than ten *cuerdas* were so employed. In its early days, the factory paid a wage equivalent to the going rate for field hands, but since the enactment of a minimum wage law factory work pays more than double the field wage. Poverty is the first propellent to factory work, and a significant economic differential return for labor is the second.

Money is a familiar thing in Indian Guatemala, a part of daily experience and necessary for the purchase of many of the essentials of life and for participation in the ritual aspects of community membership. As such, the economic differential of the rewards of factory work is translatable into the goods

of traditional life. A wage from the factory has certain other characteristics which make it appealing when contrasted with farming income. It has regularity, week after week, and continuity, year after year. Agricultural returns, both for hired help and proprietors, have peaks and troughs corresponding to the harvesting, planting, and marketing cycle. And since farming in Cantel is but little removed in technology from pre-Columbian methods, there are in addition lean and fat years. Factory wages—since the factory has worked without major stoppage except for a brief period in the depression—are more nearly matched to the constant need for money. The factory employee recognizes in expressions like *el centavo mas seguro* ("the sure and continual penny") this advantage which is the economic attraction of the factory.

Beside wages, factory employment offers social services. Housing is provided in 125 separate, rent-free houses. The houses are not large, nor do they have patios as do all other houses in Cantel, however poor, but some are equipped with electricity, elsewhere available only in a few houses in the town center. The social importance of having a house, of being head of a household, cannot be overestimated in Cantel, so that this practice enables many to set up an independent household. In addition to housing, the factory operates a school for employees' children. The school has a six-hour day in contrast to the four-hour day of the national schools. This longer day is considered advantageous for the absorption of knowledge. By parents who have decided that something of the national language, Spanish (usually a second language and learned in the school; Quiché is the language of the home), is useful for their children, the supposed virtue of the longer day is recognized.

Some minor social services are available only to factory hands. Medical facilities consisting of the services of a doctor who makes daily afternoon visits, a nurse always on hand, and a clinic dispensing simple palliatives along with medical advice are paid for by the mill. The clinic and the doctor's services are not highly valued by the factory worker, since the examination is superficial and the Indian knows he would get a better treatment were he pay for it. But the prenatal care given to factory women or wives is more valued. Being a factory worker entitles one to participate in the Guatemalan system of social security, which is an accident and ambulance service rather than an old-age retirement plan. This medical care is a distinct good, although only utilized in crises or accidents.

These factors, taken together, are the economic dimensions of the factory's attractiveness: a clear and significant income differential, social and medical services, and the possibility of a house or land use lent by the factory. They have their pull in a context of rural poverty and inadequate land resources.

ADJUSTMENT TO OCCUPATIONAL ROLE

Between recruitment, which is accomplished by the economic and social service factors enumerated, and commitment, which is the personal involvement in and attachment to the industrial work cycle, lies adjustment or adaptation to a new occupational role. The Canteleño in the factory finds himself working under conditions for which there are no analogues in his society or life experience. He or she comes to the factory usually illiterate,[7] without previous experience with machinery of any kind; neither the gadgets of the housewife nor the motors and tools of Western men. The incoming worker is used to small

[7] For the past four or five years only "literates" have been hired.

work groups where work is carried out by men repeating the same kind of task rather than a true division of labor requiring co-ordination and teamwork. The worker is used to setting his own rhythm of physical output, not adjusting to a machine tempo. He is accustomed to work without direction or supervision. He works with relatives or acquaintances, not strangers, choosing with whom he shall share effort. If tired or ill he need not go to his field, whereas the factory has a fixed hour of reporting and a set number of hours of continual effort. In agricultural work, standards of performance are judged by himself against a physical harvest; in the factory, output is measured by impersonal standards of numbers of inches of cloth, and there is no product which is the worker's own.

Training techniques

This discontinuity between the occupational role of farmer and factory worker sets the problem of accommodation of the individual to factory work. Induction into the factory routine and the pattern of authority in work relations facilitate personal adjustment. New workers in the factory are trained by other Canteleños, in a manner similar to the learning situations in the home and throughout childhood. Essentially the new skills connected with factory work are learned through observation of the already skilled operator by the recruit. Not much verbal instruction is given, not many questions are asked, and no display of superiority or overt use of authority is made. The novice begins work when he feels he is able to perform, not after a fixed training period. Such a pattern of training duplicates the older-younger sibling learning in a Cantel home and avoids the public shame of bad performance or too rapid demands on the novice. For skills of greater technical proficiency than running a weaving or cotton spinning machine, training lies in the hands of the technical staff. The technical staff consists of a British engineer in charge of weaving, another Britisher in charge of spinning, and a German dye master. These foreign engineers have both Indian and Ladino assistants who work in machine maintenance, electrical shops, and a carpentry workshop. Here training is carried out differently. If the training situation for the mill hand is analogous to the home, the highly skilled training is similar to the school. Performance is more difficult to secure, and the engineers complain that costly mistakes are often made. Raw recruits to factory work do not get selected for this work, and skilled trainees are taken from the mill hands who have already shown an involvement with factory work.

An acceptable schedule

The time and tempo patterns of factory work are not large problems in adjustment. The peasant Indian is a regular and hard worker, so that getting to work daily fits his value system and his past work experience. Reporting at a fixed hour was once a problem, but sanctions of wage loss cured this. Factory work does not, furthermore, require a different diurnal or annual cycle from agricultural work. The three-meals-a-day custom can easily be carried on by the factory worker, as well as the customary leisure time. The factory closes during communal festivals, and workers are given time off to participate in social and religious communal duties.[8] The work year of the factory is neces-

[8] The adjustment of the factory and community is described in Manning Nash, "The Reaction of a Civil-Religious Hierarchy to a Factory in Guatemala," *Human Organization*, Vol. 13 (1955), pp. 26–28.

sarily in accord with the workers' demands, rather than an ideal one from the point of view of most efficient production. Several attempts by the managers to alter the work pattern have come to nil. The factory comes back to a schedule acceptable to the Canteleño.

In comparison to the physical demands of agriculture, factory work is, in many senses, less demanding and less fatiguing. Even housework in Cantel is a physically trying task when compared to factory work. There is some need for adjustment to the strange tempo of machine rhythm, but this is not difficult. Questioning about difficulties in getting used to physical strain and tempo in the factory elicits blank stares or long pauses while memory is ransacked. For peasants who value industriousness and are accustomed to few physical comforts and a life of toil, the shift in work pattern when entering the factory is at most only a ripple and not a jolt. Some selection, of course, takes place in terms of the routine of work and effort. Those who leave on this count leave early, and they are those whose work habits are not regular even in traditional occupations—chiefly the young loafer, the habitual drinker, and the housewife seeking escape.

The Canteleño foreman

The co-ordinated work of a machine line is under a foreman who, like his workers, is a Canteleño. In the exercise of his role, he takes into account the cultural notions of the legitimate exercise of authority; there is little overt display of power or direct giving of orders. Co-ordination on the machine line becomes not greatly different from a work party at harvest time. The identication of foreman and worker insulates the management from the informal norms which on the one hand govern productive output and on the other assist the worker to integrate himself into a group work situation.

NEW SOCIAL RELATIONS

Commitment to factory work is only partly explained by adjustment to the occupational role. Around that role have grown up sets of social relations and cultural norms which help to tie the worker to his job and to make the job itself more desirable.

The labor union

The *sindicato,* or labor union, of Cantel was the chief agent through which new social relations evolved in conjunction with wage work in the factory. As a direct economic consequence of unionization, wages were raised, a mechanism for direct and swift airing of grievances was instituted, some control over the job and conditions of work were gained. But in addition to these gains, the fact of unionization and participation in a voluntary organization in itself made for greater involvement with factory work. Workers, by attending the frequent union meetings, developed friendships among themselves on the basis of personal choice and came to have a sense of distinctness as a pressure group and a power group. Since personal friendships of any deep and intimate nature are lacking in traditional interpersonal relations, the growth of personal ties in a job-union context gave those who developed them additional reasons for staying at the factory.

The power and pressure aspects of the union's political activity gave factory workers a sense of communal importance and individual worth. The union acted often in the name of the factory workers as a group in the community. It worked jointly with the community to get a school of the modern type built in Cantel; it helped pay

for a bridge across the river which divides the town settlement from the factory, and together with the community paid for the making of a public bathing place. Union membership, which just before the revolution of Castillo Armas was nearly coterminous with factory employment, made individuals feel both socially more useful and politically more powerful. The union played the role of welding the worker to his job, as well as increasing his control over it and return from it. In the week after the revolution which brought the union to an end, thirty-two workers, mainly those who had been politically active and those who feared a wage cut without the presence of the union, voluntarily left their jobs, the largest single week of turnover in more than three decades.

Leisure-time activities

Other voluntary associations playing in lesser degree the role of the union have grown up around factory work. A bicycle club, a basketball team and a soccer team, and a religious society dedicated to a patron saint of the factory settlement are the associations based on leisure-time activity in which membership or participation is contingent upon factory employment.

Background continuity

This attachment to and involvement in factory wage work takes place against a background of social and cultural continuity. The factory worker, when compared to the nonfactory worker, is not, beyond the bounds of the factory walls, visibly socially differentiated or culturally distinct. The factory worker's values, world view, familial relations, religious notions, social obligations, nearly match those of his agricultural counterpart. Such small social and cultural differences as have obtained between factory and nonfactory worker tend to be additive, rather than opposed to traditional norms and usages. In short, the factory worker continues in those relations and with those cultural norms which in the past have given the context of meaning for occupational effort.

Some new items of consumption are restricted in use only to factory workers, and some items of consumption are used most frequently by factory workers. The bicycle, wrist watch, correspondence course, and motorcycle are owned only by factory workers. Radios, shoes, sewing machines, canned foods, felt hats, and fully cut men's jackets with shirts and ties are more used by factory wage workers than the rest of the Cantel population. On the whole, it appears that new income is used to implement old cultural needs and wants. Factory workers use more of, and different proportions of, the same things that nonfactory workers use. Women's dress illustrates this. The Indian costume of the factory girl is, in content and style, exactly like the agricultural housewife's—except that it tends to be of better material, have more embroidery, be newer, and to be one of a wardrobe.

INTERACTING FACTORS IN LABOR RECRUITMENT AND COMMITMENT

The recruitment and commitment of the labor force of Cantel, in summary, appears to be a product of the interaction of several factors. In isolating these factors which seem to underlie the successful emergence of a wage labor force, I am at the same time offering a theory of wage-labor recruitment in peasant societies. Stated rather abstractly, and with some attempt at rigor, it may be said:

A wage labor force which is regular, efficient, and willing to learn new skills

will be recruited from peasant societies and maintained at wage work if: (1) the economic returns of wage labor are significantly greater than alternative opportunity in an impoverished rural area; (2) the income is translatable into customary channels of expenditure; (3) the training for wage work, the exercise of authority on the job, and the standards of output allow the recruit to adjust occupationally at his own pace; (4) new relations emerge in the context of wage work, and if these new social relations involve personal bonds; (5) a workers' organization evolves which gives wage workers some command over the job and conditions of work; (6) the institutional structure beyond the wage work situation is relatively intact so that a set of cultural norms and social relations continue to give content and meaning to work effort and coherence to personality; (7) the wage worker is not significantly differentiated socially or isolated culturally from those with whom he has the greatest frequency and depth of social interaction; (8) there are new wants tied to money wages and some social and medical services contingent to staying at wage work.

These eight variables apparently are logically adequate to describe the successful adaptation to wage work in Cantel. Several large areas of doubt, however, remain, even if the posited factors are accepted. First, the question of the weighting or ranking of the variables is left unresolved, although the order in which they appear testifies to my conviction as to their relative importance. Second, such a process as took place in Cantel is only one of a number of possibilities. And finally, the question of the role of cultural variability is not directly faced. We are left unsure, then, as to the relative importance of the variables, the delimitation of other processes of development, and the meaning of different cultural heritages in the recruitment and commitment of a wage labor force.

Comparative evidence, controlling some of the variables, is needed to assess the general adequacy of such a series of propositions as are offered here. By crude inspection, cases in which unsuccessful labor recruitment and commitment processes were undergone appear to lack one or another of the eight factors enumerated. Thus in much of Africa unions are not permitted, traditional social relations are subverted, and satisfying new ones are not permitted to emerge, while the rate of pay is often only nominal.[9] In South and East Asia, money returns are low, living conditions associated with wage work are poor, and much of the social and cultural life of the wage worker is disorganized.[10] In China the conditions of factory work and especially the pattern of the plant authority make for disgruntled workers.[11] In Latin America the work force in many countries leaves regular employment at the first opportunity. This catalogue does not advance our theoretical understanding, although it gives a certain aura of plausibility to the theory here developed. Only further field work can solve the problems.

INDUSTRY WITHOUT DESTRUCTION

The emergence of the Cantel wage labor force and the relatively smooth adjustment of the factory and community to each other are historical products, evolved over time without plan or blueprint. If the community had been studied in the early 1920's, the results here described could not have been forecast, for then a reasonable observer would have had strong doubts about the stabilization of a labor force and would, in justice, have singled out social and cultural features which would impede or prevent the operation of a factory using Cantel Indian labor. Yet it is this same institutional structure, with but slight modifications, and the same factory, again with minor changes, which live in peaceful coexistence.

Theoretically, such an admission implies that the range of social structures and conventional understandings in which modern industry may operate is not yet charted. Procedurally and practically the consequences are significant: administrators, planners, technical assistance experts, and social scientists cannot specify with confidence what degree and kind of change will be necessary in a peasant society if it is to have a wage labor force, though they may be able to say what is necessary to get a process of economic development started. If this is indeed the case, then the course of wisdom appears to be that of allowing the peasant to choose between as many alternatives as the ingenuity of the administrator and the peasant can devise.[12] The process of economic betterment of the peasant and primitive depends upon their personal commitment. It is only prudent to proceed along those paths which the people of underdeveloped countries wish to tread.

Perhaps Humboldt's observations on the drive for progress of the last century are even more applicable today than when made:

> We hear it frequently repeated in the Spanish colonies, that the inhabitants of the warm regions (tierra caliente) will never awake from the state of apathy in which for centuries they have been plunged, till a royal *cedula* shall order the destruction of the banana plantations (*platanaris*). The remedy is violent, and those who propose it with so much warmth do not in general display more activity than the lower people, whom they would force to work by augmenting the number of their wants. It is to be hoped that industry will make progress among the Mexicans without recurring to means of destruction.[13]

For our times we cannot afford the luxury of calling our needs other people's imperatives; we must primarily take into account the aspirations and values of those from whom we seek to lift the stigma of poverty.

[12] The theoretical and anthropological canons underlying such a course are presented in Sol Tax, "Selective Culture Change," *American Economic Review*, Vol. 41, No. 2 (1951), pp. 315–20.

Manning Nash, Ph.D., Los Angeles, is an instructor in anthropology in the Department of Anthropology and Sociology of the University of California. He has been a research associate at the Research Center in Economic Development and Cultural Change, University of Chicago, and a lecturer in anthropology at University College, University of Chicago. He held a Social Science Research Council fellowship, under which he did field work in Guatemala.

The Evolution of Entrepreneurship in the Process of Economic Development

By Leo Silberman

THE underdeveloped countries share with the so-called developed countries a common preoccupation. However at variance their general problems, they must both maintain a high degree of enterprise if their economies wish to take advantage of current opportunities —indeed if they want to keep going at all. Under the prevailing political, demographic, and technological pressures discussion must sooner or later center on the demiurge of economic change, the enterprising individual. Real, full-blooded persons whose genesis, role, and training can be studied therefore engage the attention of the theorists, bringing economics and historical scholarship into a closer, fruitful relationship. The new interest has a wide scope. The entrepreneur may be a private individual, the head of a cooperative society, or member of the board of a nationalized industry. In any guise the manner in which he makes his economic decisions and adapts them to new areas—many of them stagnant, economically uncreative—will unlock new, rich, factual material of the utmost importance to economic theory. The purpose of this paper is to examine (1) the reasons why despite a hopeful beginning in the eighteenth century this discussion is still a relative novelty; (2) the particular political and conceptual labors which in the underdeveloped territories are giving birth to entrepreneurship; and (3) the likelihood that amid these difficulties new aspects of economic entrepreneurship will be discovered.

What gives the new focus a special point of interest is its relevance to teaching. American universities, of course, can look back upon forty years of industrial economics and administrative engineering. Until the postwar days, however, schools of business did not attract the right kind of students. As surveys in *Fortune* (among others) show, the average IQ is below those of other university departments and senior executives have not usually been trained in them. In Europe, and still more in the underdeveloped countries, academics have been largely indifferent to the professional training of the businessman. Aided at last by American foundations, by the United Nations or their agencies, or by their governments, the underdeveloped countries are just establishing institutes of management, schools of business administration, or special "administrative staff colleges." The International Labor Organization has started a department directed towards the improvement of management and its morale, a move which would have surprised the founders of the Organization.

As a theoretical movement, the inquiry into the "entrepreneurial elites" goes back some ten years.

One can trace it to its origin, recalling a small, and at the time seemingly unimportant, controversy in 1946–47. Professor Frederic Benham's *National Income of Jamaica* was taken to task in a long review by Arthur Lewis, a West Indian by birth, who since has advised a number of governments concerned with promoting economic growth. Prior to the war, Colin Clark's work and plea for a trend-minded, statistically informed economic analysis, and the subsequent difficulties of governments with production and wartime taxation, gave occasion for a number of national income inquiries. The West Indies, which had languished ever since the Great Depression, were an obvious area of study. Benham showed painstakingly the contributions made by the different sectors of the economy to the national income, but, on the constructive side, concentrated on agriculture and a demand for higher labor productivity, tempered by an undisguised pessimism that in hot climates little could be expected; the small local market gave faint hope for industrial developments. Lewis challenged all this. He criticized the neglect of the sociological and educational problems of entrepreneurship. To him Benham reflected the "laisser faire philosophy of the British West Indian governments, which was "the principal obstacle to the industrialization of the islands."

> Successful industrialization demands self-confidence, drive, initiative and soundly conceived policies, and it is precisely these that are most obviously lacking in those who have the formal responsibility for the development of manufacturing in the island. . . . Oxford has no particular geographical advantages for motor car manufacture; it just happened that Lord Nuffield's father had a bicycle shop there.[1]

On Forgetting a Concept

At first sight it must seem odd that these phrases and emphases came as something new. *How was it that economists could have taken entrepreneurship for granted?* The earliest economists were aware of the problem. Colbert complained that "French businessmen have no initiative; they won't touch anything that is novel." [2] Colbert's official life was spent in the search for means of stimulating French entrepreneurship. In *Le Parfait Négociant* (1736), dedicated to him, Jacques Savary hoped to counteract "the disdain of our youth for industry and commercial careers." A generation later, the "father of political theory," Cantillon, quite in the modern manner, told us "how villages may be settled; how market towns may be established; how capital cities may be established"; and in Chapter 13 of the *Essai sur la nature du commerce en général* showed why the number of risk bearers must be small and entrepreneurship a scarce resource:

> Entrepreneurs can never know the volume of consumption in their town, nor how much their customers will buy of them. This causes so much uncertainty among these entrepreneurs that there are almost daily bankruptcies among them.

Cantillon introduced the term *entrepreneur,* for which no happy English word was found. The article on commerce in the *Encyclopédie* gave practical hints on enterprise. Adam Smith referred to Cantillon. But already Adam Smith had little doubt that if the market presented opportunities there would always be men who would turn them to good account. Enterprise was an economic not a human problem. More and more discussion revolved around the just reward which enterprising individuals could expect, less and less on the generation of managerial ability and risk taking. Entrepreneurial talent was a mystery. Alfred Marshall wrote of "the supreme economizing force of a great constructive genius working at a

[2] Quoted by Paul Kaeppelin, *Les Origines de l'Inde française. La Compagnie des Indes orientales et François Martin* (Paris, 1908), p. 273.

new and large problem with a free hand," and thought that "Mr. Vanderbilt probably saved to the people of the United States more than he accumulated himself." [3] It was idle to plumb the depths of entrepreneurial genius. Anyway, at home and overseas, the intelligent nineteenth-century observer found no want of enterprise. It was not like Mr. Vanderbilt's but there was no occasion to worry oneself on this score:

> Broking and discounting and forestalling and retailing were going briskly along either bank of the Ganges while Gurney and Overend were squabbling over the skin of a badger; while Fortnum and Mason were driving a bouncing trade in acorns; while Rothschild was compounding his last grinder with some fierce chieftain in Franconia.[4]

One will look in vain for any mercantilist anxiety over entrepreneurship in the volumes of Cromer on Egypt. The British agent and consul general, scion of the Baring banking family with a background in Jamaica, the Ionian Islands, and India, dealt with a dozen developmental problems; was concerned with standards of honesty and competency in the overseas administrations, the building of ports, the Suez Canal, the repayment of loans and khedival extravagances; but nothing was mentioned about the dearth of enterprise among the ordinary Egyptian countrymen. Today Egyptian nationalists are supremely concerned with the "egyptianization" of trade and have a whole corpus of legislation to promote it; they deem the stimulation of enterprise (by fair means and other) one of their prime duties; indeed Egypt has, as the wits might say, been "Baring too much." However, this is a recent, postwar dissatisfaction. Egyptian nationalism in Cromer's day and into the interwar years was silent about entrepreneurial matters, for it, like the rest of the world, put the accent on other considerations, which still form the grand antithesis to what must appear to many of the older generation as a strange evolution, "promoting the promoters."

[3] *Principles of Economics,* Book VI, Chap. XII, § 11.

[4] G. O. Trevelyan, *The Competition Wallah* (Cambridge, Eng., 1864), pp. 254–55.

Specter of Overenterprise

British and Arab nationalists agreed in the interwar years that entrepreneurial problems should take second place, that they ranked in importance far behind strategic and administrative developments and welfare. "I'm damned if I let any Whiskeyfied Scot engineer into the Sudan," wrote Sir Douglas Newbold to a friend.[5] The Chief Secretary pointed with pride to the government-run railways, the government hotels and Nile ships, the sugar monopoly, and to the nationalization of gum products and of the Gezira Cotton Scheme—in fact, of everything of any real interest in the Sudan. The Sudan needed no more enterprise.

Schooled in the fight against the slave traders, in the protection of indentured labor (long before in Europe factory inspectors had become effective instruments), in the prohibition of further land alienation and the redemption of debts foolishly incurred by ignorant, wasteful chiefs and sultans, the British, French, and Belgian Colonial Services saw themselves as a counterweight to large-scale enterprise. Social reformers made the most of the exploitative aspects of enterprise. "The soap boilers of the world" (as Milner called them) might argue that Nigeria needed new incentives, but the Nigerian government refused them concessions. They pleaded

[5] K. D. D. Henderson, *The Making of the Modern Sudan: The Life and Letters of Sir Douglas Newbold* (London, 1953), p. 100.

that to achieve progress, Nigeria had to export; progress would give hope; hope would unleash the productive faculties of the Africans; a busy society would attract further capital and secure higher standards of living. Left to himself the African with his "magical techniques" would continue to collect wild oil-palm fruits instead of cultivating them: he would lose time climbing trees deep in the indigenous forests, stack the fruit in heaps where it would ferment, and so deliver oil of low quality. The government was deaf to these representations. Its business was to make haste slowly; its real "dual mandate" was to protect indigenous society from the ravages of detribalization and achieve probity in the civil service. This if anything was the meaning of the League of Nations Mandate system, the conventions of the ILO, the policy of indirect rule with its respect for native custom and native law. More and more overseas governments had become conscious of the drain which foreign enterprise constituted in the remittances of dividends, savings, and pensions spent in the European countries.

Those engaging in retail trade—the Lebanese, the Greeks, the Indians, the Chinese with their long string of middlemen—seemed a great annoyance, raising the cost of consumption goods and thus reducing the real income of the natives. Their books were kept in strange languages or not at all, and they paid little in income tax. In times of stress their propensity for gun running, diamond smuggling, drug peddling, black marketeering, exposed their natural inclinations. They entered into rings which kept the natives out, and they tried to corrupt the civil service. The stereotype became so fixed that the Martindale Commission wrongfully charged the Supplies and Customs Departments of the Gold Coast with corruption by a "group of importers, none of whom notably was of other race than Greek or Asiatic." [6]

Fear of a proletarianization of the tribal peoples was now uppermost in the minds of the welfare-conscious governments, thoroughly scared by the depression of the prices of tropical products on the world market. The interwar period was fertile above all in restrictive practices. International cartels for the control of metals, nitrate, sulphur, quinine; the Stevenson Plan for the limitation of rubber production and the Chadbourne Plan for wheat; sugar quotas and the burning of coffee; were much publicized. In a pacifist age the uneasy feeling that enterprise was at the bottom of the "imperialist rivalries" and war recalled the old remark by Goethe: "War, trade, and piracy, an inseparable trinity." This was not the atmosphere in which entrepreneurship could be fostered or become a plank of overseas development as it has today. And yet the recent debate has not come completely as a surprise.

Meaning of "Entrepreneurial Elite" Discussions

We were being prepared for it before World War I. Werner Sombart's *Der Bourgeois,* a *Geistesgeschichte* of capitalist man, still conceived him as a rugged individualist, a piratical, condottieri type, but Sombart foreshadows the day when bourgeois will have to be made not restrained. "In the first stages of capitalism entrepreneurs seek a system, in the mature stages the system seeks entrepreneurs." He ends his book with the question:

> And what will happen when the time of senescence comes? It is not our business to inquire into the period when the capitalist spirit will have exhausted its vitality.

[6] Quoted by P. T. Bauer, *West African Trade* (Cambridge, Eng., 1954), p. 86.

The giant gone blind may perhaps be harnessed to the cart of democratic culture-mongering. Or perhaps the time of the *Götterdämmerung* will have struck and the gold will be returned to the Rhine stream. Who can tell? [7]

Contemporary policies intend to harness the entreprenurial drives to national policies designed to speed the process of economic growth; they are often suggested by "planners" with little personal sympathy for the world of the "bourgeois" and the moneybag. One has the suspicion that the entrepreneurs are to be the cart horse of "democratic culturemongering," a kind of Lucifer who unwittingly promotes a divine plan.

Inevitably one thinks of Schumpeter in this context. Schumpeter was a man of very different stamp from Sombart, but in his *Capitalism, Socialism, and Democracy* (1942) he echoed some of Sombart's impressions of a capitalistic *Götterdämmerung*. He spoke of the "obsolescence of the entrepreneurial function," a consequence of technical and statistical progress; what amounts to a time and motion study of every phase of industrial activity will shortly replace the old flair and the capitalist intuition. "The more we progress in our control over nature and the more the domain of rationalization and calculation is extended, the more will the importance of the entrepreneur decline, as the importance of the general has already declined." [8] Schumpeter saw youth turning its back on money-making; high taxation abolished the leisure classes; an opprobrium had fallen upon the rich men that survived. However, curiously enough, Schumpeter is nowadays more often quoted for his contrary views, for his earlier glorification of the leadership function of the entrepreneur class endowed with "excess energy," prepared to do "more and more things differently." "The entrepreneur is nothing but leadership expressed in the economic field." [9]

Looking over the history of economic theory since the days of Cantillon, we can see a gradual sharpening of concepts: there is the classical undifferentiated notion which combined in one person—the man of property—the functions of financing, managing, and selling; the nineteenth century separated the capitalist from the production manager; Pareto, taking exception especially to Marx's analysis, sharply contrasted the psychology of the entrepreneur and the rentier; finally we reach Schumpeter's Promethean definition of the innovating entrepreneur as one who breaks out of the traditional culture flow, one who rebuilds the economy, and redirects human interactions towards new forms of living. Thus investment becomes the economic equivalent of personal "commitment": a nation which hoards its strength forsakes its obligations; it abandons its frontiers. National income now becomes a function of employment, employment of investment, investment a strategic defense—of progress, of the security of the currency, and of political security. When in 1940 the German armies overran France, the lack of overseas enterprise in the French Empire made the arguments for a humiliating surrender in Paris most plausible.

Postwar world

In the postwar world the voice of world opinion has been added: our social conscience is demanding the raising of overseas living standards. An increase in world prices and in the output of the raw materials exported by backward areas gives a note of realism to these demands. Purse strings have been loosened; economies are healthier. In 1938, the Gold Coast earned 4.5 million pounds from its cocoa exports; in 1952 these had risen to 52.5 million. Prior to the war, Nigerian exports were less than 10 million pounds; in 1951 they totaled 116 million. Southern Rhodesian exports increased from 1.6 to 28 million pounds. In South America and Asia similar progress has been achieved. Copra from the Polynesian islands sold at £5 per ton before the war; now it fetches £60. Travelers to the smallest islands report the spread of mosquito nets and electric flashlights in the forests. Surfaced roads, more children wearing shoes, street lighting, the replacement of thatched roofs by permanent materials, herald the coming of new days. Technical and agricultural discoveries, medical progress, cheaper transport, better international communications, migration and exchange schemes, more education (the enrollment at the University College of the Gold Coast in Achimota rose in six years from 90 to 480 students)—the territories have at last a chance of deploying their entrepreneurial capabilities. Meanwhile in the hands of Keynes economics made sense of dynamic analysis.

NATIONALISM THE SECOND LANGUAGE OF ENTREPRENEURSHIP

Keynesian economics was directed primarily against the rentier mentality. People could call themselves businessmen and yet refuse to invest; playing safe they could invest in consols rather than in industrials and generally show pusillanimity in their economic conduct. There was in the developed countries a dangerous propensity to hoard and by the use of a dear money policy to exploit many imperial monopolies. They were defiantly resting on the oars of previous venturers who had rowed themselves up the Nile or the Ganges. Recalling the spurned wisdom of mercantilists (Josiah Child had misgivings about emigration, for it constituted to the motherland a loss of social intelligence and of manpower), Keynes as early as 1924 attacked the Colonial Stocks Acts which had caused "large sums to flow abroad without there having been a vestige of deliberate calculation on the part of anybody that this is the best way of employing resources in the national interest."

> . . . the nineteenth century . . . came to look on an arrangement as normal which was really most abnormal. To lend vast sums abroad for long periods of time without any possibility of legal redress, if things go wrong, is a crazy construction; especially in return for a trifling extra interest. . . . If a loan to improve a South American capital is repudiated we have nothing. If a Poplar housing loan is repudiated, we, as a nation, still have the houses. If the Grand Trunk Railway of Canada fails its shareholders by reason of legal restriction of the rates chargeable or for any other cause, we have nothing. If the Underground System of London fails its shareholders, Londoners still have their Underground System.[10]

Keynes reintroduced and gradually familiarized us with the national, or rather the nationalist, interest. The nineteenth-century belief in a world economy of interlocking continents, the peripheral nations in continuous and growing commercial dependence to the Western manufacturing nations, had been dissipated in World War I. Another world war, and the "dependent"

[10] Quoted by S. Herbert Frankel, *Some Conceptual Aspects of International Economic Development of Underdeveloped Territories* (Essays on International Finance, No. 14 [Princeton, N. J.: Princeton University, Department of Economics and Social Institutions, International Finance Section, May 1952]), p. 11.

developed their own fierce nationalism. Hence at a moment when entrepreneurship is once again acclaimed and international investment is considered important for international survival, nationalism (in both the old and new countries) runs a turbulent crosscurrent. We find Mr. Richard Wright advising Mr. Nkrumah, the Prime Minister of the Gold Coast:

> Beware of a Volta Project built by foreign money. Build your own Volta, and build it out of the sheer lives and bodies of your people! . . . Africa needs this hardness, *but only from Africans.*
>
> . . . Be on top of theory; don't let theory be on top of you.
>
> . . . I am an American and my country too was once a colony of England.[11]

Lever Brothers and Shell and the other large foreign companies which operate in the United States cause no adverse criticism among patriotic American citizens, but the same firms or their local subsidiaries are the subject of controversy and sometimes of revolutions in the countries which simultaneously complain of being underdeveloped and in need of foreign technical aid. The United States plentifully provided with entrepreneurial talent and know-how will absorb without fuss foreign enterprise. Whereas the countries starved of capital and commercial skills of a high order make countless difficulties. Moreover, the present buoyant developments in the "developed" countries give an opportunity for profitable investment at home. Contrary to the assumption by Hobson and Lenin at the beginning of the twentieth century, there is little money pressing for export in overseas investment, less in the more mature stages of capitalist development than in its early phases. Mr. Benjamin Higgins calculates that if the United States were to invest the same proportional amount of her national income as that invested by British capitalists of the nineteenth century abroad, her lending abroad would have to be increased tenfold, to an annual amount of 600 billion dollars. Where, as in the oil industry, foreign capital is invested in a massive way the very size and monopolistic character of the undertakings give rise to misgivings in the weak overseas countries.

[11] *Black Power* (New York, 1954), pp. 349–51.

The foreign flag follows foreign trade

Nationalism is of course right to remember that the foreign flag frequently followed foreign trade. In the process the term "native" acquired a belittling connotation. From small coastal stations and trading concessions the East India Company made the whole subcontinent a British dominion. The Baghdad Railway was the football of imperial rivalries. Kruger at Pretoria appreciated the threat which the *uitlanders* at Johannesburg constituted to his archaic Boer Republic. The long war which ensued was not completed with the Treaty of Vereeniging; it goes on to this day. The Boer Chamber of Commerce last year called with defensive fervor upon all the *volk* to "buy Boer" and build firms free of British participation. The same policies have begun to animate in turn South Africa's non-European sections. Even the Cape Colored, people of slave and mixed descent, traditionally artisans, servants, and workers in the vineyards, feel:

> . . . it is time that the Coloured people show a little enterprise themselves. Apart from a fairly large number of Indian shops and very few isolated business concerns (usually one-man shows) the commercial enterprise of the Coloured man is a blank. Something can be done if only the people have guts and ambition. It is time that we made our own openings for our youth.[12]

Sectional nationalism

Sectional nationalism is invoked to assist the concentration of capital, to ensure a market for the enterprise belonging to one's own ethnic group, to use a local rather than a foreign bank, to rig licenses, and on occasion to expel the foreigner.

> In Kumasi in the Gold Coast there is opposition from Ashanti traders to the Goa migrants, and farther South by the Fanti to the Kwahu, as well as to the Yoruba from Nigeria. Somewhat similar tendencies can be seen in Sierra Leone where in the Protectorate area there is now a noticeable hostility to the Creoles from Freetown and the Colony. In Nigeria, almost every prominent Yoruba chief has trading interest and so have many Hausa emirs. In many instances the official attitude has failed to check and has at times encouraged the restrictive aims of sectional interests, possibly for reasons of administrative convenience and because of fear of political unsettlement.[13]

Statesmanship is engaged in an uphill fight to keep federal bodies together. In Nigeria, in the West Indies, in Malaya, plural societies show centrifugal tendencies. Partition schemes and immigration restrictions are multiplying. British Honduras in need of manpower is opposed to Jamaicans, linguistically and racially kinsmen, for fear of the greater vitality *and entrepreneurship* of the people from the neighboring island.

Values of nationalism

Nonetheless, it must be admitted that nationalism breaks down the belief that some products and techniques belong to the foreigner; [14] that trades are fixed, the specialism of certain races; the manipulative element which accompanies political resurgences has reduced (or at least shifted) the magical beliefs. It is no more believed that a certain sail or craft must for all time be Moslem, another technique or instrument Hindu. Myrdal and Nurkse have stressed the positive features of nationalist policies: the transcendence of parochial boundaries, the activization of large numbers, dynamic commercial policies, and a civic pride in physical reconstruction. "Nkrumah's Special Talcum Powder" bearing the nationalist colors may cause a smile in Europe but the nationalists and the Gold Coast may have the last laugh.

In East Africa, the African has traditionally been the hewer of wood and the carrier of water; the Sikh and Moslem Indians were the craftsmen; the Hindu the retailer; the European the wholesaler; Arabs found a place in government and the police force of the Coast; Goans were the clerks and men of trust; Somalis the cattle dealers. *The Report of the Royal Commission on East Africa* (1955) has pointed out that progressive policies lie with the fostering of diversification. The viewpoint of this report, which constitutes an authoritative statement of sound contemporary opinion, is well summarized in the following sentences:

> By the present policy of exclusive tribal reservations and under the various obligations by treaty, agreement and formal declaration of which we are instructed to take account in our deliberations, Kenya

[12] *The Sun* (Cape Town), September 9, 1955.

[13] Bauer, *op. cit.* (note 6 *supra*), pp. 40–41.

[14] "When European powers came with better ships the Moghul Emperors never tried to improve their own ship building. They took superiority for granted. For more than a hundred years before the battle of Plassey the patrolling of the waters of the Bay of Bengal by the ships of the East India Company and other European powers made no impression on the rulers and people of Bengal."—S. Bhattacharya, *The East India Company and the Economy of Bengal from 1704–1740* (London, 1954), p. 224.

in particular has been divided up into a number of water-tight compartments, none of which is or can be made economically self sufficient, and the frustrations of the last 20 years have been largely due to the failure to recognize the fact. Therefore we think it necessary to break down tribal and racial boundaries and to replace them by confirming individual titles of land, where they exist, and to encourage their acquisition where they do not.[15]

A recent supplementary study made in Uganda of how to help Africans in trade and industry places squarely in front of overseas governments the problem of finding new outlets for entrepreneurship, using the national self-consciousness before it has gone sour to promote the sponsorship of viable enterprises. There is a note of urgency in all this. The rapid increase in population was not foreseen by the policy makers of the past; the growth of educated commoners and the soldiers returning from overseas wars make the authority of the chiefs look outdated; the transfer of ideas in a world of radio and films has its "demonstration effects." In search of a concrete expression of enterprise the new countries look to industrialization. Arthur Lewis seemed once an extremist, but the Steel Report on *Industrial Development in the Caribbean* (1950) made for the Caribbean Commission and the study made by a team of British industrialists on the *Industrial Development in the British West Indies* have brought his remarks into the fold of economic orthodoxy. And there is the example of some progressive governments, such as Puerto Rico.

INDUSTRIALIZATION THE PRINCIPAL CONTENT OF ENTREPRENEURSHIP?

The Puerto Rican entrepreneurial welfare state is frequently cited, more especially in the Caribbean. The annual increase of its national income by 3 per cent is a remarkable achievement. Explaining it, the former Governor of Puerto Rico has underlined the novelty of the Puerto Rican approach:

> The British [West Indies] have had a development program since before the war. It resulted from the recommendations of the Moyne Commission of 1938. From the first, however, it concentrated on welfare rather than productive development. The result was a series of fine educational, health and allied institutions beyond the means of the local governments to support, although the policy was not to outrun local resources. In Puerto Rico a sharply contrasting concentration on productive facilities has set in motion an upward spiral so decisive that the island has become a kind of pilot plant for induced economic development among all underdeveloped peoples.[16]

Puerto Rico is a significant example of an intelligent government promoting capitalist enterprise without having recourse to extensive state subsidies, tariffs, devaluation, and state-run industries; as part of the United States, the island is precluded from embarking on these devices. Instead, an imaginative effort is made by the Puerto Rican government to attract American entrepreneurs by means of tax holidays; freight rebates; government-built factories and government-trained labor; plentiful cheap labor; free market research and engineering advice. The "feudal cast," the exclusive dependency on sugar, the slothfulness of colonial days, have given way to a remarkably dynamic and vigorous social and entrepreneurial experiment.

But Puerto Rico can also be quoted by the skeptic. It has not solved the island's basic economic problem—growing unemployment. Only 302 factories have been opened up, employing no more than 28,000 workers. The multiplier effect of new investment is small. The required government expenditure in planning the new investment and advertising for more of it is very large and would be beyond the capacities of most underdeveloped countries. Much of the trained labor migrates to the continent, where wage rates are better. Some of the capitalists that have been attracted may leave the island again when the minimum wages creep up or the tax subsidies end.

To the skeptic the case for promoting industrial entrepreneurship seems psychological rather than economic. Factories are monuments of progress. They convey a new ethos and testify to the application of science and production planning. In the tropics they are as much an expression of the twentieth century as the harbor constructions, the ocean liners, and all-purpose merchant houses symbolized to the nineteenth century the emergence of world trade. They are a negation of the agricultural and pastoral past, when surpluses were immediately consumed or invested in the land or in luxury items. However, the enthusiasts-for-industry need perspective. They must not overlook the patient work of peasants in ditching, fencing, clearing, maintaining, and tilling their fields, capital with the promise of increasing returns as management and knowledge slowly improve. The World Bank's *Report on Nigeria* lauds the achievements of the postwar years and omits the work of the periods that have gone before, which, less spectacular, may be for that reason better understood by the people themselves. It is the managerial elites and the United Nations School, as one may call it, who believe in industrialization. They favor the policies which change the ratios of rural population to urban population, and they increase, by deliberate action, the inroads to be made by the money economy. They concentrate attention on large-scale investments and measurable indexes of progress. Their theoretical bias has been fashioned by the so-called New Welfare Economics and its econometric study of risk, indebted to probability and games theory. Fundamentally, UN economists are interested in the evolution of scientific businessmen, a species of "stochastic entrepreneurship."

New Laisser Faire School

Opposed to them are all those who remain unimpressed by what still appear to be artificial models with assumptions of constant technological ratios and linear relationships and doubtful methods of aggregation in only apparently sophisticated input-output matrices. S. H. Frankel, P. T. Bauer, and others of the New Laisser Faire School stress (with support from some anthropologists) the small-scale efforts of the ordinary man. Accepting a bad world as probably the best of all possible worlds, with everything in it as a necessary evil—the multiplicity of middlemen, underemployed resources, ramifying family commitments—they deny that there are really unproductive employments; nor are they convinced that induced mechanization is the answer for countries which have an abundance of labor. Unexpectedly in agreement with the mercantilists, they feel with Colbert that machines in the tropics can be the "enemies of labor," and with Postlethwayt they recommend prudence lest by the employment of machines "we lose in strength what we gain in expedition." [17]

[15] P. 56.

[17] *The Universal Dictionary of Trade and Commerce, Translated from the French of Monsieur Savary . . . with large Additions and Improvements . . . by Malachy Postlethwayt* (2nd ed.; London, 1757), Vol. II, p. 121, under "Machine."

The members of the New Laisser Faire School recognize in the mechanistic formulas the arid minds of international and national bureaucracies with their known proclivities for forms and things done by rote. They are conscious that enterprise is a matter of ingenuity and shrewdness, judgment and "heterodoxy." They rejoice in the close connection of entrepreneurial psychologies with gambling:

> With uncertainty absent, man's energies are devoted altogether to doing things automatically; . . . with uncertainty present, doing things, the actual execution of activity becomes in a real sense a secondary part of life. The primary problem is deciding what to do and how to do it.[18]

One recalls that official spokesmen and moralists have never taken kindly to the entrepreneur: that St. Augustine, St. Thomas Aquinas, Luther, Scottish divines, and many after them have spoken of "the too great fondness for trade"; that the guild of "projectors," *donneurs d'avis, brasseurs d'affaires,* who surrounded any gullible king or emperor in Christendom disgusted all the pedestrian regular servants. The future happened to be with the demimonde of enterprise. Without that "Commercial Revolution" no Industrial Revolution! The New Laisser Faire School goodnaturedly accepts the inevitable accompaniment of economic progress, the humus of enterprise, the slum streets of entrepreneurship, which sharpen the wits of everyone, not least the consumers who are duped.

Background realities

Alberti, writing in the fifteenth century, knew of only six major means of acquiring wealth: "(1) treasure hunting; (2) legacy hunting; (3) being a 'client' of patrons; (4) usury; (5) tiring out beasts of burden; and (6) merchandising."[19] Throughout history there has been a tussle between those who make their way by honest but unimaginative toil and the gamblers, pirates, hucksters of patent medicines and the exploitative mediums of newfangled religions. The latter are to be found in every overseas harbor town; but the port town is the gateway of trade. In them the African, the Indian, and the Middle Eastern beggars, battering on the innocents' pity in the best tradition of *The Beggar's Opera,* teach a surer sense of realities than the idealistic planners. Their presence eloquently verifies the sparsity of national wealth.

> The total currency in circulation in Nigeria in 1951 was £40,000,000 and this included money held for business transactions and for current expenditure on consumption as well as for savings accumulated over a period. The total volume of bank deposits outstanding was about £18,000,000 and these were largely business and government deposits.[20]

On such a fragile basis, industrialization is a more than usually hazardous business, particularly in view of the known low marginal efficiency of capital, the higher profits demanded, the longer waiting period, the social overheads. The failure of mechanized agriculture in the case of the costly East African Groundnut Scheme, which tried to cultivate five million acres and after spending £52 million now operates an experimental station of 60,000 acres, should be a lasting warning. While industrialization remains the ideal of those with an "architectonic" approach to development, its pace forced by governmental timetables and targets, the perspicacious "developer" will never forget

the absorptive capacity of the economy in question. His is an ecological and historical approach, giving the recognition to small-scale enterprise.

THE SMALL MAN'S ENTERPRISE

An early report from a colonial governor instanced an interesting form of the small man's "developmental" entrepreneurship:

> There is a class of people here called "entrepreneurs," generally men without capital or ostensible means, or settled occupations, whose leisure and habits give them great facilities in treating with the disengaged and unsettled Indians, of which they avail for the purpose of collecting together bands of 20 to 100 men whom they attach by furnishing them means of indulgence in advance against their future earnings and whom they succeed in engaging by the promise of indulgences and wages greater than a prudent planter can offer.[21]

These labor contractors are one of many. In developing economies small shops, Christmas clubs, funeral clubs, secondhand clothing, entertainment, food and drink, give occasion for entrepreneurship in all but the least advanced tropical countries. On a higher plane we find ice making; beermaking; processing of insecticides and other local products, including building stone and cement; shoemaking and tailoring; repair and maintenance shops. There is the ubiquitous taxi driver. Newspapers and movie houses provide lucrative openings for those who know how to cater to a public.

Small enterprise is at its best in exploiting some traditional culture trait, perhaps for the production of curios or souvenirs. Performers like fire walkers or drummers, the dragoman guiding tourists through Cairo, deep sea divers, and the dancers of Bali—their organization and exploitation rapidly fuse with the larger tourist industry. In Jamaica tourism is the third industry of the country and the second largest dollar earner. "Whoever you are, wherever you are, tourism matters to you" is a slogan recently launched by the Jamaican government. Converting swords into plowshares is less frequent than the conversion of soldiers into hotel keepers, following the famous example of the Swiss. The buccaneers of Jamaica, the terror of the Spanish Main, make a dramatic backdrop to tourism, and in 1947 Jamaica registered 55,000 tourists who spent 5.5 million dollars; by 1953 their number had grown to 120,000 spending 14 million dollars. For every person directly employed in the tourist industry four other persons find a livelihood outside the industry. Since the tourist industry flourishes on ideas, a high standard of service, adaptability, and discretion, it is the seedbed of many forms of enterprise. Its weakness is its vulnerability to the trade cycle and, less calculable but nevertheless real, the spread of a certain venality in the population. Treasured rituals are surreptitiously transformed into curiosities, and beauty spots are commercialized. In a more subtle way than the old-time colonials, the holidaymakers take over the country and cheapen it.

Every progressive step is achieved at the expense of some loss, and if we stress this obvious observation it is only —as the fate of the notion of entrepreneurship and its long neglect by economics revealed—that the obvious is often overlooked. A survey of the historical process of modern societies, helped and hindered as it has been by policy measures, education, and theoretical analysis which have given the dynamic elements of an economy careful attention, then leaves us with a sense of the complexity, difficulty, am-

[21] Colonial Office Papers: *Labour (Colonies). West Indies and Mauritius.* Governor of Mauritius Report (London, 1847), p. 325.

bivalence, and with the immense creative opportunities open to entrepreneurial action.

The welfare preoccupations of the interwar years fall into place as a kind of hinterland of modern policy operations with a quartermaster's functions behind the front line of entrepreneurs. Political parties may constructively advance judgment where and how the balance between the different forms of entrepreneurship is to be struck. In any case, research will seek to remove the irritant of ideology from the discussion. The *forms* of entrepreneurship will have to be of a much less uniform kind in the future. Western-type capitalism will be one subculture in the entrepreneurial world. Itself a mixture of new and ancient elements, of co-operatives and public boards, entrepreneurial civil services and sedate bank-clerkish private industry, it cannot object to further experimentation.

Leo Silberman, Chicago, Illinois, is visiting professorial lecturer at the University of Chicago. A South African by birth, he has taught successively at the Universities of the Witwatersrand (Johannesburg), Liverpool, and Oxford. His particular concern is with colonial studies and the process of "decolonization." He has sat on a number of commissions studying matters of social policy in British colonial territories. At present, he is working on population policies in the overpopulated countries. His publications are on aspects of town planning in Africa, social surveying, population studies, and historical writings. Recent books are Analysis of Society (1951) and as coauthor Approaches to Community Development (1953) and The Study of Population (1954).

Economic Change and the Extended Family

By JEAN L. COMHAIRE

ECONOMIC change as it operates today in underdeveloped countries involves a conflict between two or more different cultures which was absent in the Western world at the time of its own industrial revolution. One of the consequences expected from the introduction of a money economy and from urbanization is the dissolution of the joint family, a universal institution, more universal indeed than the nuclear family of contemporary Western society. Factors of such change, whose destructive effects are generally recognized, include the dispersal of kin, contacts with strangers, and prevalence of market values.[1] Disturbing reports on family disorganization reach us from all parts of the world recently affected by economic change. Even comparatively advanced countries, such as the West Indies and West Africa, are conspicuous for a high percentage of marital unions which, under the existing laws of European origin, are declared irregular.

But if the threat to the extended family—or even to any form of family—looks obvious, the degree to which other institutions, and more particularly the small patrocentric family of the Western type, are going to replace the old-style family offers ground for considerable doubt. In the Western world, everything combined to bring about the triumph of the nuclear family. Institutions inconsistent with the needs of an industrial society were slowly undermined, and the extended family broke up the more easily that Indo-European societies had a millenary tradition of simple kinship structures.[2] Today, underdeveloped countries are all on a sudden provided with modern plants of the largest possible scale, with comparatively little need for individual skills (an important factor in the growth of an individualistic middle class), so that a repetition of the Western process should by no means be expected.[3]

In the appraisal of the situation, the danger of ethnocentrism and also of economic determinism should be constantly kept in mind. Human societies have many ways of meeting identical challenges, and even if it could be proven that industry everywhere calls for the recognition of achievements rather than of family status, it should nevertheless be remembered that heredity never is more than the basis for what ultimately constitutes a social rather than a biological concept.[4] Will anyone claim that Western business never discriminates on other grounds than individual abilities, rather than on the basis of racial and family heredity held to be sufficient evidence in the matter of these abilities?[5] The same applies to Western bureaucracy, whose problem of selection, in underdeveloped countries, is made more difficult by the

prevalence of family and other personal relations.[6]

On the other hand, before trying to visualize where the native family is headed, we must be careful to take stock of everything in its original situation. In tribal society, groupings of kin are not usually clearly divided into two or three definite categories, such as immediate family, lineage, and clan, whose break up would mean the end of everything. There may be any number of recognized groupings, including any number of generations.[7] An African village also is no preserve of one or more of these groupings; it is a community of strangers and slaves living together with members of the land-owning kin group.[8] Recent research, moreover, has demonstrated that although an extended family, in order to be manageable, must be limited to relatives according to one single line of descent, either patrilineal or matrilineal, many African societies nevertheless grant some degree of recognition to both lines.[9] Those tribal communities, far from being stagnant, were living organisms long before the advent of Europeans. Adventurous young men all the time kept leaving their villages, to start a new life in some other community where they of necessity became the founders of nuclear families which at the next generation became extended ones. It is important to keep such a situation well in mind, because institutions already tested that way should not be expected to give way without a fight under the pressure of Western-inspired change.

BELGIAN CONGO FAMILY TRENDS

The Belgian Congo stands as an excellent case in point. Nowhere do the native institutions look more primitive and so less able to adjust themselves to the needs of a Westernized world. Nowhere are they subject to a better integrated assault from state, church, and business, all committed to the triumph of the nuclear family. As a Belgian administrator, now in the copper mining business, once put it, "Such promotion of the Western family constitutes the most significant process now on its way in the [Elisabethville] center." [10] However, the same author agrees that tribal, clan, and kinship ties remain an important factor in urban life, and also that the policy of his government makes the maintenance of parasitism founded on extended family ties inevitable. Another observer of the Belgian Congo industrial setup states that clan ties enable the workers to display "a casual attitude towards their employment" by always giving them a place where they may go for help.[11] In a field where religious bias easily creeps in, it is interesting to note that a strong plea on behalf of the extended family was lodged by a Belgian Catholic author, who claimed that the Congolese clan had substituted new functions for those lost through economic change and who refused to deplore such amazing vitality. In his view the growth of a father-centered Christian family depended on monogamy rather than on the abolition of extended family ties, and the Catholic faith should not be unable to assimilate any residue of ancestor worship that might otherwise be inherent in such relationships.[12]

In Léopoldville, the capital of the Belgian Congo, the growth of the nuclear family and of a native middle class is impeded by low wages as well as by the absence of private property for African residents.[13] The extended family thus remains a necessary institution, for security and for educational and religious purposes. The newcomer in town and the unemployed both expect from their cousins some help, which they will be prepared to return when fortune changes. Children born in town are often sent to relatives in the rural home who can more easily take care of them and who educate them in customs which include the recognition of kinship ties up to the level of ancestor worship. On the other hand, prosperous native farmers send their children to Léopoldville, where they receive school education while staying with relatives. Urban social life centers around *matanga,* week-long funeral proceedings which include both rites and entertainment, and to whose considerable cost distant relatives must contribute. The absence of middle-class consciousness is reflected in the very small number of intertribal marriages, in spite of the growth of intertribal customs.

GROWTH OF INTERTRIBAL CUSTOMS

An unexpected effect of the introduction of money in all African towns was to give unprecedented strength to the institution of the dowry, or bride wealth paid by the man to his wife's family. The dowry in traditional African society, though very widespread, was important mostly in patrilineal tribes, where the wife's family suffered the loss of all her descendants. In the new towns, the dowry today constitutes a major social problem, even in Léopoldville, where more than two-thirds of the inhabitants are matrilineal in their original tribal law. This no doubt is due to the greediness of parents anxious to make money out of their family position, but it inevitably gives a new meaning to extended family relationships. Relatives sometimes help the young man in collecting the bride wealth, and the depositor, whoever he may be, automatically acquires a measure of control over husband-and-wife relationships.

Developments connected with the bride wealth are only one aspect of the growth of intertribal customs, an important consequence of urbanization. In the tribal villages of southern Africa, matrilineal customs prevail north of the Zambezi River and patrilineal south of it, but intertribal systems are in the making in all urban areas and they everywhere display a matrilineal tinge. At Broken Hill, Northern Rhodesia, the persistence of extended-family consciousness is reflected in such habits as joint cooking and joint eating, in addition to hospitality and lavish gifts to distant relatives.[14] In patrilineal South Africa, the dispersal of kin is said to affect relationships with relatively near cousins, but wider clan ties are actually strengthened by the fact that they are more likely to have representation in

town.[15] Children often are sent to the country, usually to their mother's village, though this is a traditionally patrilineal country. A major problem of South African urban life is that the bride wealth must include *lobola,* that is some cattle which must of necessity be kept by relatives staying on rural family land. Even the professional class insists on *lobola,* which in all urban inquiries was found paid by anything between two-thirds and three-fourths of the families.[16]

It should also be noted that modern means of communication help to keep together kinsmen whose dispersal under past circumstances would have meant the end of all relationships. A significant function of the joint family today is that of facilitating travel. Colonial bureaucracies maintain their staff scattered all over territories of enormous size, and many Africans take advantage of this situation to travel at a pace that baffles their European employers. They know how relatives everywhere are ready to supply them with board and lodgings and, when not traveling, they make extensive use of mail, telegraph, and telephone services which help them to keep in touch with each other.[17]

FAMILY ORGANIZATION IN WEST AFRICA

The Yoruba of Nigeria, long before colonial times, had gathered together in towns of up to 100,000 inhabitants, where they maintained their traditional family pattern in an urban setup, including some ties of maternal affiliation, which have in recent times been reinforced, although the whole system is patrilineal.[18] The case of Lagos, the capital of the country, deserves special mention, as a striking example of maintenance of extended family ties in a town teeming with political and business activities of the most modern kind.

The people of Lagos, in spite of their extensive associations with the Western world, remain deeply attached to their old family system. To give a recent instance, when a tangle occurred in February 1955 on the matter of who was the rightful head of the Onisemo family, the *oba* (native king) of Lagos appointed a six-man commission to determine the headship. The commission's decision was rejected by the section of the family already in possession of the *iga,* the family headquarters. Tension grew to the point that on August 8 a party of forty persons besieged the place, vainly trying to expel the occupants. The next day the latter ceremoniously proclaimed their candidate head of the family, with the concurrence of Prince Oyekan, a pretendant to the *oba's* crown, who came to dance with the merrymakers.[19]

An important aspect of Yoruba family life is that native political titles often go with the position of head of the extended family. In 1931, the Privy Council in London ruled that the Governor had no right to depose the *oba* for improper conduct, because his title was a monopoly of the Docemo, or Ado family; an official commission then found that the matter of heading certain families was no private business. Their heads are elected by committees of other family heads, styled "kingmakers" in

the case of the royal dynasty.[20] All families anyway hold monthly meetings, attended not only by their members but also by their ex-slaves and by members of associate (which in practice means non-land-owning) families. Political as well as other subjects are freely discussed on such occasions.

Religion is another important function of the extended family. Ancestor worship answers deep emotional needs of mankind not easily disposed of. Funeral rites among the Yoruba are elaborate affairs, conducted at regular intervals, for an indefinite length of time. In 1955, the Animashawun family held a three-day celebration in Lagos, to commemorate the sixtieth anniversary of the death of Sunmonu Animashawun, the founder of the local branch of the family.[21] Greater tolerance in this matter than Christian missionaries customarily show explains in part the popularity of Islam in Africa, and it should come as no surprise that the Moslem majority in the Assembly of Northern Nigeria recently rejected a bill because it failed to mention brothers and sisters as members of the "immediate family." [22]

Similar situations prevail all over West and West Central Africa. French authors as a rule insist on family parasitism but the Dakar society has been described as resting mainly on parental relationships, with self-employment, as in the case of traders, gardeners, and fishermen, permitting the retention of an almost unaltered tribal family setup.[23] At Cotonou, tribal chiefs are important only to those town residents whose birthplace is too far distant for the maintenance of extended family relationships.[24] At Douala, Europeans and Africans alike complain of the exorbitant rents collected by the clan owner of all the land downtown.[25] At Brazzaville, jobs are as much as possible given by native middlemen to kin rather than on merit.[26] In all cases, family parasitism largely destroys the individual character of the salary paid by European employers and the possibility of a middle class growing out of salaried employment.

FAMILY AND LAND TENURE IN LAGOS

The strongest pillar of extended family relationships in Africa probably is native land tenure, and the case of Lagos is of exceptional importance in this respect. The British government there, far from denying the local inhabitants the right of private property, actually made a determined effort to popularize English laws of property, with the help of detribalized immigrants from Sierra Leone and Brazil, whose attachment to European Christian culture had resulted from exceptional circumstances. Lagos became a colony in 1861, and up to four thousand Crown grants were soon issued on local land. As early as 1862, Chief Oshodi Tappa, who headed a group of refugees from the Nupe, or Tappa, tribe, was given the suburban district of Epetedo for himself and for his wards. He divided the land into twenty-one plots, and an individual Crown grant was issued on each one of these subdivisions.

Today however, the Oshodi family still claims the property of all Epetedo,

in spite of an ordinance of 1947 recognizing the rights of occupiers of plots, or "courts." At the same time, it should be noted that there is no question of subdividing the original plots, which now are family property. Chief Oshodi II in 1918 succeeded in expelling from Epetedo an ex-slave, or *arota,* who wanted to sell a court granted his father by the first chief. The recognized situation is that in the case of *arotas* the occupants only hold their land subject to reversionary rights to the Oshodi family.[27]

On another occasion, the Supreme Court of Nigeria ruled in favor of a man who had refused to sell a family house.

> Now [said the Court], with all due respect to the opinion expressed by Speed, Acting Chief Justice, in the case of Lewis v. Bankole (1883) to the effect that family ownership is a dying institution, I am bound to place on record my view that notwithstanding the lapse of nearly a generation since that judgment was delivered the institution of family ownership is still a very live force in native tenure in Lagos. The purpose of the institution is, as its name implies, to provide a place where members of the family can reside if they so desire and, so long as that purpose is still capable of achievement, I conceive that it would be wrong for the Court to order the sale of property subject to this form of tenure. . . .[28]

The main changes observed in Lagos are that the use of European money enabled the occupants to mortgage their land, though such a right never existed in native law, and that the introduction of English law permitted the seizure of land in execution of judgments against individuals. The results after about a century of operation are appalling. An English expert writes:

> There is plenty of evidence that even in the progressive Colony of Lagos family ownership continues to be an integral feature of the social life and that any sweeping change in the system of land tenure would cause widespread disturbance. So long as the social system of Africans continues to differ from that of Europeans, the African system of landholding cannot be assimilated to that contemplated by English law.[29]

The Lagos families today seem to constitute corporations, run by heads of considerable economic acumen. In several instances, the collective strength so mustered proved effective in securing huge compensations from the colonial government. The Oluwa family, owner of the land on which the Apapa wharf was built, thus obtained compensation to the amount of £22,000, as against an original offer for £500, and the Onikoyi family £32,000 instead of £8,000, for the ground of the former white location of Lagos.[30]

EXTENDED FAMILY IN THE PACIFIC AREA

As the applicability of African experiences to other areas of the world might be doubted, a few other cases reported by competent observers are mentioned here.

All over the Malay-Polynesian area, membership in some kind of kin group has always been associated with individual land rights, so that European property laws by themselves brought no fundamental change in the existing situation.[31] In Malaya in particular, both family and individual customary rights are maintained together in the new rubber economy.[32] In the Philippines, wealth has brought to some tribes both class and kin pride simultaneously.[33] In Samoa, usehold rights are eliminating formerly distinct ownership rights, but there is no formal individualization of property. The household remains the unit and when an individual branches out, group property is restored with the next generation.[34]

SUBSTITUTES FOR THE EXTENDED FAMILY

The most conspicuous example so far of a complete breakup of a strong family system is that of Africans brought as slaves to the American continent. Many authors have taken it for granted, to the point of denying the possibility of any significant survival of African culture in Afro-American families. The high rate of illegitimacy in particular is mentioned as undiluted disorganization, the possibility of a conflict between Western and African family patterns being ruled out. As a matter of fact, complete family disorganization as anything but a strictly temporary situation may well be the product of imagination rather than of observation.

In the case of the Haitian family, close observation shows that there is in it more organization than is often said to exist, though not necessarily in the sense of the Western Christian father-centered family. *Plaçages,* or unions left unrecognized by church and state, usually are stable marital situations,[35] largely connected with a justifiable reluctance to accept French laws of land tenure and succession.[36] Even in towns, Haitian families are wary of dividing land property, a process which would affect the social and economic power of all their members. Family ties everywhere are kept strong through such devices as attendance at *veillées,* or funeral rites.

A possible substitute to natural family relationships is pseudo kinship, or ritual kinship, but it usually grows strong only in situations affecting even nuclear family relationships, such as that of predominantly male communities of traders and workers in foreign lands. Pseudo kinship then works as a way of maintaining a family atmosphere under circumstances looked at as undesirable and temporary. The most conspicuous example is provided by the organizations of Chinese overseas, which are adaptations of their traditional kinship groups.[37] They are not unknown in Africa, where the term "tribal, or family, union" may be independent of any actual kin relationship.[38] True and permanent substitutes for the extended family exist in Latin America, where

the Catholic Church seems to have eradicated unilateral kin groups by way of relationships centered around godparents,[39] but this case brings us back to what was said at the beginning of this study, on how simple kinship structures are characteristic of Indo-European societies, or of societies of predominantly Indo-European descent.

Before concluding, let us mention that the celebrated institution popularly known as "blood brothers" seems to perform different functions and so be unrelated to our subject.[40]

CONCLUSIONS

Any conclusions on our subject must of necessity remain tentative. One point only is clear: family institutions everywhere are subject to the pressure of disruptive forces, but extended family relationships in many countries have displayed much more vitality than in majority groups of Western societies. Inconsistent as they are held to be with the needs of an economic pattern founded on achievements and mobility, we cannot write them off in the immediate future. Maybe we should also remember that nineteenth-century observers of the Industrial Revolution erroneously expected the downfall without further delay of institutions still much alive today, such as religion and racial discrimination. Human beings being what they are, and not always anxious to be consistent with themselves, many of them seem to be able and willing to delay for any length of time the breakup of the extended family. Colonial policy at the same time does not everywhere foster the progress of the nuclear family as unreservedly or as effectively as it might appear to observers at a distance.

The Unpredicted Pattern of Population Change

By KINGSLEY DAVIS

OF all the problems affecting mankind today, one of the gravest and most paradoxical is the close association between population growth and widespread poverty. In the past the world has seen plenty of poverty, but it was not associated regionally with rapid population growth. Instead, such increase as did occur tended to take place among the economically developing peoples—the Neolithic agriculturalists as against the hunters, the industrial West Europeans as against the agrarian Asians and Africans, the colonists as against the aborigines. Now, however, it is primarily the underdeveloped parts of the earth, the parts where additional population is least needed, that are contributing most to the phenomenal inflation of world population. Although relatively new, this development is now so familiar to us that we see nothing strange in it. Yet it is a grotesque and tragic evidence of human self-frustration and an insistent omen of potential danger.

What is hardly realized as yet, and what was certainly not predicted, is the amazing acceleration of the rate at which populations in impoverished regions are growing. At the same time that the industrial nations have been recently exhibiting an unexpected spurt of growth, the underdeveloped areas have been manifesting an equally unpredicted speed-up of their already fast rate of human multiplication. The pace of their increase is faster than any ever known in the Old World industrial countries. It behooves us to take a close look at these new developments.

STARTLING GROWTH IN NUMBERS

No one can deny that population growth in the past was one of the clearest and most demonstrable consequences of economic development. From 1650 to 1930 the commercially and industrially active peoples of European culture multiplied themselves sevenfold and doubled their proportion of the world's population. The Japanese, whose numbers had been more or less static during the long Tokugawa regime, more than doubled their number during the industrial period between 1870 and 1940. Everyone knows in a general way the mechanisms that were involved. Economic improvement brought down the death rate while the birth rate remained high.

It might seem that what is happening now in underdeveloped areas is simply a repetition of what happened earlier in the now industrialized nations. But this is not true. The excess of births over deaths in today's backward regions is far greater than it ever was in the history of the advanced nations. This excess is occurring in regions which, for the most part, already have heavier population densities than the peoples of Europe, North America, and Australasia had in the eighteenth and nineteenth centuries, and they have far fewer resources in relation to human numbers. Their dazzling population increase is occurring in a world with few open spaces and with few outlets for migration. The situation is therefore fundamentally different from what it was. Above all, the rapid population growth is not arising

from the same causes that operated earlier in the now advanced nations. It is not arising from economic development but primarily from other factors that are new today.

To see the unusual character of what is happening, one can look at the growth trends summarized in Table 1. The figures indicate that thirty-eight underdeveloped countries showed an average gain of better than 51 per cent in population during the twenty years from 1935 to 1955. This is the average increase when the countries are taken as equal units. When they are weighted by their populations, the average gain drops to 37 per cent, because the population of India (382 million in 1955) looms so large in the total for the thirty-eight countries (711 million in 1955) and yet has a slow growth for a present-day underdeveloped area. Whichever figure is taken, however, the fact stands out that the growth during the last two decades has been extremely rapid. It exceeds substantially the growth in industrial areas, whether in the Old or the New World. Since the thirty-eight underdeveloped countries were chosen not because of their fast rate of growth but because of the at least approximate accuracy of their population figures for the two dates, their striking numerical increase should be roughly representative of that of underdeveloped areas in general. If the rates of growth are continued, well over half of the thirty-eight countries will double their populations in less than forty years, and the combined population of all of them in less than fifty years.

The full significance of the rapid increase in the population of underdeveloped areas during the last two decades cannot be grasped by comparing them with the industrial countries during the same period. The latter, from 1935 to 1955, had a faster growth in numbers than anybody predicted and thus contributed a good share to the world's population growth. But they were not at this time in an early stage of economic development. A better way is to compare the recent growth in the underdeveloped areas with that which occurred in the earlier history of the industrial nations. Table 2 shows that the countries of northwestern Europe grew during previous periods at a rate less than half that shown recently by our underdeveloped countries. The only countries which ever exceeded the latter rate were the New World nations which started out with almost no people and rapidly gained by both natural increase and immigration. Between 1840 and 1860, for instance, Australia's white population increased by 429 per cent, but the country had had only half a million white inhabitants in 1840 to begin with. For the most part the underdeveloped countries on our list of thirty-eight had little immigration from 1935 to 1955. More of them lost by migration than gained by it. Their growth should therefore be compared to that of the European industrial countries. When this is done, as just noted, the evidence is that genuine industrialization did not create half as much population increase as our backward areas are now experiencing.

WHY THE RAPID GROWTH?

If the current demographic upsurge in nonindustrial regions is due to economic development, we find the evidence difficult to locate. Since the upsurge is twice what it was in northwest Europe during the period of industrialization there, we should expect to find twice as much economic progress being made now in underdeveloped areas. Actually, however, there seems to be less of such progress in countries like Ceylon, Egypt, Fiji, Jamaica, and Thailand than there was in nineteenth-century Sweden, England, and Switzerland. In fact, most of the backward areas show only enough economic expansion to keep up with the population growth, with little left over for real development.

More conclusive evidence on the question is found by examining the demographic components of the population increase. When this is done it becomes clear that the increase has come from an unprecedented and unforeseen decline of mortality in the underdeveloped areas—a decline much sharper than any ever experienced in the history of the presently industrial nations.[1] Analyzing the data for fifteen underdeveloped countries, we find that the crude death rate dropped by 53 per cent during the thirty years from 1920–24 to 1950–54. The diminution has been accelerating, as Table 3 shows. Over a five-year period (from the average for 1945–49 to the average for 1950–54), the death rate in eighteen underdeveloped countries declined by 20 per cent. The history of the northwest European coun-

[1] For a fuller account of mortality trends, see George J. Stolnitz, "A Century of International Mortality Trends: I," *Population Studies*, Vol. 9 (July 1955), pp. 24–55; and Kingsley Davis, "The Amazing Decline of Mortality in Underdeveloped Areas," *Proceedings of the 1955 Annual Meeting of the American Economic Association*, in press.

30-Year Change		
1920–24	—	—
1950–54	15	53.1

[a] Computed from crude death rates as reported in the United Nations *Demographic Yearbook* for 1953 and 1954 and *Population and Vital Statistics Reports*, October 1955.

[b] Eighteen countries were used, but in some cases data were missing for one or both periods compared. The countries used were: Barbados, Costa Rica, Ceylon, Cyprus, Egypt, El Salvador, Fiji, Formosa, Jamaica, Malaya, Mauritius, Mexico, Panama, Philippines, Puerto Rico, Surinam, Thailand, and Trinidad and Tobago.

tries back to the eighteenth century shows no thirty-year period in which a consistent decline occurred between half-decade averages, or in which the total thirty-year change was anywhere near the 53 per cent record of our backward areas. Similar findings emerge when life-table values are used instead of crude death rates to measure mortality trends.[2]

The drop in the death rate has not been equally sharp in all underdeveloped areas. It has been greater in countries with room to expand (like Ceylon and Mexico) than in those with little room for massive and dense populations (like Egypt and India). But speedy declines have occurred nearly everywhere in nonindustrial areas, whatever their condition. Interestingly enough, no one predicted such startling changes in the death rates. As a consequence nearly all past estimates of future population growth in such areas were too low.

In the past the decline of mortality was attributed basically to economic development.[3] This view, essentially correct when applied to the Western industrial peoples, does not fit the contemporary underdeveloped areas. The elimination of high death rates, wherever it has occurred, has been due mainly to success against infectious diseases. In Western history this success came gradually as a result of improved diets, housing, sanitation, and medical discoveries. The downward slope of mortality was gradual because time was needed to invent and apply the technology of death control. Now that the discoveries have been made, and are continuing to be made, in the industrial nations, they can be immediately applied in the nonindustrial areas. Infectious diseases are being conquered in backward regions not through slow economic development within those regions but through the transfer of scientific knowledge and personnel and financial aid from the industrial nations to these regions, often under the auspices of international agencies such as the World Health Organization, the United Nations Educational, Scientific and Cultural Organization, the United Nations and the United Nations Children's Fund. It is being demonstrated in country after country that widespread diseases such as malaria, yaws, syphilis, trachoma, cholera, plague, and typhoid can be controlled on a mass basis at low cost. Most of the discoveries that make these accomplishments possible

[3] *E.g.*, Warren S. Thompson, *Population Problems* (4th ed.; New York: McGraw-Hill Book Company, 1953), pp. 77–82.

are recent: insecticides like DDT (dichlorodiphenyltrichloroethane), antibiotics like penicillin, vaccines like BCG (bacillus Calmette-Guérin), drugs like sulfanilamide, better instruments like portable X-ray machines, and rationalized public health campaigns and statistical reporting. It is confidently expected, for example, that the cost of curing yaws in mass campaigns can be reduced from about $3.30 per head to $1.00.[4]

The amazingly accelerated reduction of mortality in underdeveloped areas in recent years has thus been accomplished by international disease control, not by economic development in these areas themselves. It required no essential change in the customs and institutions of the people, no advance in general education, no growth in per capita income. The same sort of improvement in health and mortality can be achieved with respect to domesticated animals.

In commending the antituberculosis campaign in Jamaica, C. M. Wilson illustrates the situation:

> It is a noteworthy fact that the general economy of the island has worsened during the seven years just past. Nevertheless, competent public health work, featuring first-hand diagnosis and active treatment of the disease, has proved effective without the much needed upbuilding of Jamaican living standards.[5]

BIRTH RATES AND NATURAL INCREASE

Since disease control has not involved basic changes in social institutions, education, and real income, fertility has remained high in nonindustrial regions. It was higher to begin with in most of these regions than it ever was in northwestern Europe, and it has in most cases declined little or not at all. The industrial countries began lowering their birth rates *before* their sharpest declines in mortality, but the backward areas will do so long *after* their mortality has reached a low modern level. As a result the densely settled and impoverished countries of the world are experiencing an unprecedented population growth which does not reflect economic development but in fact creates strong impediments to it.

Let us look at the figures on natural increase—the difference between birth and death rates. For seventeen underdeveloped areas having remotely adequate vital statistics, the average natural increase during the 1940–49 decade was 21.3 per thousand population per year. This was high enough, but such is the speed of change in this sphere that in 1950–54 the figure was 27.5. Such rates of multiplication did not occur in the history of the now industrial nations. In five northwest European countries,[6] for example, the average natural increase was as follows:

	AVERAGE ANNUAL RATE PER THOUSAND
1735–1799	5.0
1800–1849	9.0
1850–1899	11.7
1900–1949	8.2

Even the New World industrial countries have shown no rate of human multiplication equal to that now found in nonadvanced areas.

Although the United States lacks adequate information on births and deaths back to 1800, we do know that during the period of this country's most rapid demographic expansion, from 1790 to 1860, the average rate of *population growth* was only 30 per thousand per year, and a part of this was contributed by immigration rather than by natural

[4] *Chronicle of World Health Organization*, Vol. 8 (February–March 1954), special issue on *Treponematoses: A World Problem*, p. 63.

[5] *One Half the People* (New York: William Sloane Associates, 1949), p. 195.

[6] England and Wales, Denmark, Norway, Sweden, Switzerland.

increase. Today the underdeveloped areas are tending to match this increase by the sheer excess of births over deaths, as the following examples show:

	AVERAGE NATURAL INCREASE, 1950-54
Ceylon	27.8
Costa Rica	37.3
El Salvador	33.2
Fiji	29.6
Formosa	35.0
Malaya	29.6
Mauritius	33.0
Mexico	28.7
Panama	26.2
Puerto Rico	27.6
Surinam	27.0
Trinidad and Tobago	26.6

A margin of error is undoubtedly present in most of these figures, but since there is no reason to think that births on the whole are better registered than deaths, the errors may lead to understatements of natural increase as readily as to overstatements. Such fast multiplication would not seem strange if the underdeveloped areas were still sparsely populated and had rich resources and expanding frontiers—as did the New World countries in the nineteenth century. This situation clearly does not exist in most of the backward regions. It does exist in parts of South America and Central Africa, but even there the accelerated natural increase is not mainly a response to economic opportunity but an anomalous by-product of imported death control.

In the immediate future the rate of natural increase in underdeveloped areas may rise still higher. Much reduction in mortality is still possible, and no evidence exists that birth rates will soon drop sharply. If peace and stability should somehow prevail during the next twenty-five years (an unlikely prospect), the inhabitants of the world's underdeveloped regions could easily double within that time. Since these areas currently contain nearly two billion people (roughly three-fourths of the global population of 2.64 billion), such a prospect is disquieting unless we reject it as improbable.

It is not the underdeveloped areas alone which are growing in population. That such growth is found virtually everywhere, as Table 1 suggests, is one reason why international migration, often suggested by those seeking an easy escape from hard facts, is no solution. A real solution can come only from an ultimate reduction to zero of population growth itself.

SOME IMPLICATIONS

Too much of the theorizing about population and economic development is phrased in terms of mere survival. The problem is assumed to be that of securing enough food to feed the world's people, especially in retarded areas. To do this, economic expansion is certainly required. There is every evidence that such expansion is taking place; indeed, without it the massive population increase we have documented could not have occurred. But the point is that this is not economic *development*. The latter occurs only when the average real income, and hence the average product per man, is rising. Sheer economic expansion in the sense of increased national income to support ever more people at a near-subsistence level offers no solution for the problem of poverty. It is instead an enlargement of that problem.

One can in fact maintain that poverty is more prevalent today than it was a century ago. At that time the earth had about 1.2 billion people; now it has 2.6 billion. If everybody had been poor in 1856 and one billion were not poor now (both untrue statements), the world would still have gained nearly half a billion poor people. The philosophy of public health is that of keeping people alive. The philosophy of economic development is that of improving their level of living. A strange imbalance in most of the world in recent times is that the gains in the one sphere have not been matched by gains in the other.

Our thesis is not that future economic development is rendered impossible by a continued population climb, but that it is rendered improbable. Technological and economic gains *may* eclipse a rapid natural increase, in which case the birth rate would eventually respond to social modernization and thus finally stop the disfunctional human multiplication. But it appears more likely that economic expansion will barely be able to match the 3 per cent population growth per year, much less exceed it.

To see what is likely to happen, we have to look candidly at the political situation which the combination of rapid population growth and widespread poverty provokes in the underdeveloped countries. The leaders of such countries as India, Egypt, China, Pakistan, Indonesia, Greece, and Nigeria, where densely settled and poverty-stricken agrarian citizens are increasing at phenomenal rates, are faced with almost insuperable domestic problems. The one thing these countries have in superabundance is manpower. The one safe issue is nationalism. The leaders, whatever their personal desires, are forced by circumstances to focus on international problems and to see in the risk of war a lesser hazard than the risks of peace. If they lack weapons, this is a lack that can be overcome, because the industrial nations, divided among themselves, stand ready to arm their potential allies.

The situation around the entire rim of Asia, in North and West Africa, and eventually in the Caribbean and Central America, is one of unrest. It is an unrest that comes not from poverty alone but from the vision of better things—a vision that contrasts painfully with the unremitting reality. As long as the industrial powers see fit to demand peace, the conflicts may be confined to small areas and short periods; but there is always the chance that a regional fire will become a global conflagration much more deadly than any in the past. Thus the twentieth century may be brought unwillingly to a painful solution of the problem to which its rational control of death and its irrational attitude toward reproduction have in large part contributed.

Kingsley Davis, Ph.D., Berkeley, California, is professor of sociology and social institutions at the University of California. He was formerly at Columbia University and at Princeton, has long worked on international population problems, and is currently the United States representative on the United Nations Population Commission. A frequent contributor to journals and symposia, he was special editor of Volume 237 (January 1945) of THE ANNALS, *on World Population in Transition, and is the author of Human Society (1949) and The Population of India and Pakistan (1951).*

The Pattern of Urban and Economic Development: Social Implications

By Catherine Bauer

In the potential progress of underdeveloped countries, the city plays a dynamic multiple role. Urbanization is a key factor in the race between increased productivity and population growth, because it creates the milieu for modern industry on the one hand and apparently tends to reduce the birth rate on the other. Also, most of the political and economic leadership for national development is likely to come from the urban centers. And finally, cities are where the basic social transformation must usually begin. New values and motivations take hold here, gradually spreading outward into the more conservative hinterland.

In most developing countries, a period of very rapid urban growth is imminent, with the present trend toward heavy concentration in ever larger metropolitan communities. But it is by no means certain that these expanding great cities are capable of fulfilling their important role effectively. Rising congestion and chaotic disorganization seem to create serious obstacles for both economic and social progress. Productive enterprise is hampered by low labor efficiency and inadequate services, even when capital and entrepreneurial initiative are available. And extremely bad living conditions may have a harmful effect not only on welfare and working efficiency per se but also in the failure to provide adequate incentives for constructive social adaptation, or satisfactory new values to replace traditional goals.

Substantial efforts are being made to improve housing and urban services in some of the major cities, but the problems multiply much faster than the resources available to remedy them. Assuming the continuance of present trends, the urban environment in general seems doomed to get worse before it can begin to get better.

There are also efforts to promote various forms of decentralization: village industry, satellite communities, company towns, new towns related to resource development schemes. But these experiments have not always proved successful, and in any case have diverted very little urban and industrial development from the burgeoning metropolitan centers.

Certain questions therefore arise. Are these unsatisfactory urban conditions inevitable in the early stages of the industrial revolution, because of inherent economic limitations? Or could conditions be improved with a less concentrated pattern of urbanization and economic activity? Is the present pattern conditioned by economic requirements and the primary need for increased productivity? Or could certain industries and services function quite as well, or better, on a more decentralized basis? And finally, if a greater degree of decentralization is desirable, what form should it take? How can it be effectuated at a scale large enough to reverse present trends?

Rapid Urbanization: the Challenge

The world's population may rise from two and a half to four billions in the next thirty years, according to the United Nations demographers, with most of this increase occurring on the now underdeveloped continents. In countries where medical science is rapidly reducing the death rate while fertility remains high, the population is likely to double.

Moreover, the rate of urbanization will usually be much higher than the over-all rate of population increase. Not only is a far greater proportion of industrial and service employment required to achieve better living levels, but also many people will be forced out of agriculture because of overcrowding on the land. In some countries practically *all* the additional population must find nonfarm support of some kind if they are to survive at all, particularly with the escape valve of mass emigration no longer available.

All in all, the rate of urbanization is likely to be faster in developing countries today than it was in Europe or North America in the nineteenth century, despite (or because of) their economic limitations and regardless of whether or not the resulting problems can be satisfactorily solved.[1]

With perhaps a billion people to be added to the world's nonfarm population in the next thirty to fifty years, for the most part in presently underdeveloped areas, what kind of community are the new urbanites in these countries likely to find themselves living in?

If present trends are projected, the majority may well be residing in vast metropolitan centers, some of them reaching a size entirely unprecedented. The present major cities in Asia and Latin America already tend to be very large by comparison with those in Europe and the United States at a similar stage in population growth and industrialization. And in recent decades, the biggest cities have been growing far more rapidly than the smaller communities. In the underdeveloped countries, there are almost twice as many people in cities of over 100,000 as there are in communities of 20,000 to 100,000.[2]

Of the twenty-five largest cities in the world, according to the latest figures available in 1950, twelve were in Japan, China, India, Africa, and Latin America.[3] And at least eight additional cities in India and Southeast Asia are rapidly pushing into this category; several of them in fact have probably reached there by now.[4] In 1951, India had ten million people in five metropolitan areas, which had increased by 68 per cent since 1941. And the wave of urbanization is just beginning. In 1850, at a roughly comparable stage in the development cycle, the largest city in the United States was New York with only about half a million.

The population of Latin America is expected to double or more in the next thirty years.[5] And if the proportionate increase in cities of over 100,000 continues as at present, their population will be almost quadrupled in the same period, with a still higher rate for the biggest metropolitan centers.[6]

Clearly, present trends suggest the possibility, at least, of mammoth agglomerations, numbered in the tens of millions.

The urban environment: an insoluble problem?

These growing cities are the focal points for change and progress in their countries. New employment opportunities with higher wages tend to develop here; rising social standards and political demands emanate from them; and it is here that most of the housing construction, improvement efforts, and major expenditures for public works are centered.

Yet living conditions for the majority of the population tend to be very bad, often worse than in the villages because of acute overcrowding, both on the land and inside the dwellings. Densities are frequently fantastic, and one or more families per room is likely to be the general rule for all but the well to do. In some cities, thousands of people are entirely homeless. The most elementary sanitary services are often missing, whether in congested central districts or outlying shack towns. Transportation is inadequate. And local government is weak, lacking essential personnel, power, and financial resources except as intermittently provided by the national or provincial government.

In most cities, real improvements can be found here and there. But by and large they do not keep up with the influx, and over-all conditions are probably getting worse in many respects rather than better, particularly in the largest centers.

This picture is overgeneralized, of course, and exceptions could certainly be found. But it represents a fair summary of the large and growing stack of surveys, reports, and increasingly urgent recommendations issued by public agencies and qualified individuals.[7]

The United Nations, in the words of a resolution by the General Assembly, recognizes "that lack of adequate housing constitutes one of the most serious deficiencies in the standard of living of large sections of the population of the world" and has been increasingly concerned with the problem. Numerous housing and related improvement measures have been inaugurated, with or without international assistance, with tangible results.

What these studies and experiments are mainly demonstrating, however, is the difficulty of achieving any general solution in the growing, congested cities. With a backward building industry, low purchasing power, and limited public funds, even the most rudimentary standards for metropolitan homes and services would require a tremendous slice of the national budget. But poor countries with rising population pressures have a desperate need to increase productivity as quickly as possible. And the economic development experts tend to discourage ambitious schemes for large-scale housing or long-term civic improvements in favor of investments likely to bring more immediate and tangible economic returns.[8]

Meanwhile, with the threat of still worse conditions to come, the pressure for effective action in the congested metropolitan areas is mounting. And at the same time there is a growing demand, primarily from city planning and housing experts, for some form of urban and industrial decentralization.

[7] For example, see United Nations, *Preliminary Report on the World Social Situation* (1952), *Low Cost Housing in South and South-East Asia* (1951); Pan American Union, *Problems of Housing of Social Interest* (1953); Government of India, *Report of the Environmental Hygiene Committee* (1949); and an excellent summary of the local government situation by Joseph Froomkin, "Fiscal Management of Municipalities and Economic Development," *Economic Development and Cultural Change*, Vol. 3, No. 4 (July 1955), pp. 309–20.

[8] This is less true than it was a few years ago, but the rising concern with housing and civic needs of the International Bank and other organizations only underscores the importance of finding appropriate and practicable solutions.

CONCENTRATION VERSUS DISPERSAL

Many economists tend to assume that the cost of urban improvement is more or less uniform in any given country at a particular stage of development, irrespective of locational factors.[9] Viewing the expensive metropolitan experiments in the light of obvious national limitations, therefore, they see little hope for any general betterment within the foreseeable future. Moreover, this dismal outlook is fortified by history, since similarly bad conditions prevailed in many Western cities a century ago and have not been wholly remedied even to this day. On the other hand those who promote dispersal and smaller communities are apparently convinced that city size is itself a significant factor in the cost of a decent urban environment, particularly in the less advanced countries.[10] But there has been little systematic analysis to prove or disprove either of these conflicting assumptions, and none under a given set of specific local conditions.

The important distinction between "level of living" and "consumption level"[11] is not always heeded in development economics, however, nor the advice of an eminent consumer economist who offered "a valuable hint toward the technique of improving the living planes of depressed groups of peoples whose productive or earning power is low. A well-balanced simple plane of living may be definitely superior to an ill-balanced elaborate plane. . . . "[12] And in these terms, there is a mass of evidence which strongly suggests a very direct relationship between improvement costs and type of community.

Price of progress in great cities

A big metropolitan community is inherently a very complex mechanism. As long as misery and inefficiency are taken for granted, it can of course get along with very rudimentary services. But as soon as it begins to recognize the need for anything resembling "minimum standards" in the modern sense, whether in the interests of social welfare or productive efficiency, it must have a vast network of utilities and services requiring tremendous capital outlays and highly organized governmental machinery.

And size *is* a factor, as American and European studies demonstrate.[13] But although it costs much more to achieve a given level of living or standard of civic efficiency in a large metropolitan center than it does in a smaller city, this may not be a vital issue per se in a country or city which can afford this investment. For a poor country, however, the cost differential is likely to have serious implications. Moreover,

[9] See Leo Grebler, Possibilities of International Financing of Housing in Underdeveloped Countries (draft, United Nations, Housing and Town and Country Planning Section, 1953); and Max F. Millikan, as well as various other economists, in "Housing and Economic Development" (mimeographed; Massachusetts Institute of Technology, City and Regional Planning Department, 1954).

[10] See *Low Cost Housing in South and South-East Asia*, Report of Mission of Experts (United Nations, Department of Social Affairs, 1951) and Catherine Bauer, in "Housing and Economic Development" (cited note 9 *supra*).

[11] See *Definition and Measurement of Standards of Living*, Chicago: Public Administration Clearing House, 1953.

[12] Joseph S. Davis, "Standards and Content of Living," Presidential Address, *American Economic Review*, Vol. 35, No. 1 (March 1945), p. 9.

[13] See W. H. Ludlow, "Urban Densities and Their Costs," in Coleman Woodbury (Ed.), *Urban Redevelopment: Problems and Practices* (Chicago, 1953), p. 152.

the differential is likely to be far greater in regions with backward technology and limited resources. Here a modern transportation and utility system, absolutely essential in a large city for any semblance of decency and convenience, will cost relatively more. A smaller community, if properly laid out, can get along with a much simpler standard of services and still maintain a level of living and productivity which would represent genuine progress in most underdeveloped countries.

Housing density is perhaps the key factor. Densities are always likely to increase with city size, and this is almost inevitable where inadequate services limit the supply of usable sites, and where land speculation is rampant. Land prices are disproportionately high in most of the burgeoning metropolitan centers, even in semisocialist countries. And exorbitant land prices (assuming the absence of confiscatory powers or subsidies) mean large crowded insanitary shacks or multifamily structures. But the latter, even at one family per room with shared sanitary facilities, are relatively expensive in underdeveloped countries because building technology is backward. Low densities, on the other hand, make possible an entirely different approach: cheap local materials, simple building methods, minimum utilities, unskilled labor, often on a "self-help" basis, and outdoor space which (particularly in mild or tropical climates) can make up for some of the other limitations. But even if low-density housing were possible on the metropolitan fringe, the problem of extending minimum services over a much wider area would probably prohibit any general solution by this means.

A single illustration must suffice. The price of a tenement dwelling in Bombay (including land) is likely to be three times as much as for equal or better accommodation in an outlying house, and the cash cost of the latter could probably be halved if the owner contributed labor. But the high cost of adequate transportation precludes much suburban development for ordinary workers as long as most of their jobs are in central districts.[14]

It is therefore no accident that the most promising housing and community betterment schemes are not found in the big cities, as a rule, but in rural villages where "aided self-help" and "community development" programs have taken hold. Here real though modest physical improvements can apparently be made, with minimum cash expenditures and without complex administrative or service machinery.

Are there compensating advantages?

Whatever the cost differential, continued metropolitan concentration has a unique advantage over wider urban dispersal in the fact that it is apparently a "natural" or at least spontaneous trend under the conditions prevailing in most developing countries today. People flock on their own initiative to the place where they seem most likely to achieve some kind of subsistence, however minimal. Then the vast underemployed labor supply leads to the concentration of new economic activities in the same place, and the cycle continues on another round. Considerable time may pass before governments are forced to do something about such resulting problems as housing, sanitation, and communications, and then the measures taken are likely to be sporadic *ad hoc* remedies, however costly, to meet particularly pressing emergencies.

On the other hand it takes effective planning and highly co-ordinated action to establish a successful new town or even to divert population and economic enterprise to some existing smaller community. And this is a real problem, even though the capital cost would probably be demonstrably lower than the expenditures required, sooner or later, if the same population and industry were to establish themselves in congested metropolitan centers.

Moreover, the functional role and magnetic power of the great city must not be underestimated, particularly in countries where it is the focal point for rising nationalist pride and the well-nigh exclusive source of political, economic, and cultural leadership. In the early development of Western countries, the metropolis rarely played such a dominant part. Also, it can be claimed that material values assume much less importance in the culture systems of most developing countries today than they have in Europe and North America. Perhaps the emotional attractions and psychological influences of the great city outweigh its physical disabilities.

Unfortunately, with all the voluminous recent research on cultural adaptation and the social dynamics of economic development, very little attention has been given to the urban physical environment and its role in welfare, attitudes, and social change.[15] In general, however, social scientists are now disinclined to see the current development process as primarily a recapitulation of the nineteenth-century Western experience. The difference in conditions and motivations is emphasized, as well as the critical time factors today. The fact that people are driven into cities by rural population pressures, as a general rule, rather than by personal choice or any positive attraction, is frequently stressed, along with the problem of apathy and lack of "drive." Viewpoints and judgments vary greatly, but the relative lack of emphasis on urban environment per se as a significant influence may itself represent a judgment. Nevertheless, two theories have been taking shape which reflect somewhat divergent views on the role of great cities and the issue of concentration versus decentralization.

Community structure and social progress: two views

No one claims that conditions in the big cities are either good or getting better, by any standards or value system. But one group seems to suggest that the extreme social disruption experienced by peasant in-migrants may be not only inevitable but also necessary for the drastic transformation required. The "cataclysmic" break with traditional habits, values, and ties might clear the way for rapid social reorientation, perforce if not by choice, perhaps first taking hold in the factory rather than in the family.[16]

[14] See: *Low Cost Housing in South and South-East Asia* (cited note 10 *supra*), p. 25; Albert Mayer, *Self-Help Housing and Construction: Some Experiences in India* (draft, United Nations, Housing and Town and Country Planning Section, 1952); N. V. Modak and Albert Mayer, *Greater Bombay: The Master Plan in Outline* (Bombay, 1948), p. 30.

[15] Anthropologists tend to neglect the city entirely, *e.g.*, in *Cultural Patterns and Technical Change* (UNESCO, 1953). Demographers, sociologists, and economists are increasingly interested in urbanization as a vital part of the development process. See *World Urbanism*, special number of the *American Journal of Sociology*, Vol. 60, No. 5 (March 1955); and *Economic Development and Cultural Change*, especially Vol. 3, No. 1 (October 1954) and No. 2 (January 1955). But with a few scattered exceptions, there has been little academic concern, in any systematic sense, with the regional pattern of urbanization, resulting community structure, or physical living conditions.

[16] See Kingsley Davis, "Population and the Further Spread of Industrial Society," *Proceedings of the American Philosophical Society*, Vol. 95, No. 1 (1951), pp. 8–19, and (with Hilda Hertz Golden), "Urbanization and the Development of Pre-Industrial Areas,"

This theory would seem to accept if not embrace the great city, with or without any feasible improvements. And although fertility is admittedly little understood, the shock treatment theory may be supported by the belief that city size and resulting social disruption might be more significant factors in reducing the birth rate quickly than education, higher wages, or better living standards, all of which are likely to come very slowly.

It would be unfair to suggest that this somewhat neo-Malthusian view is presented as a positive planning philosophy, however. Rather it is an objective interpretation of current trends which assumes their inevitable projection into the future and therefore seeks a rationale for accepting a long period of social disorganization.

But a great deal of current evidence suggests that disorganization may be an unreliable tool wherewith to stimulate constructive social change. Broken or rootless families, mass insecurity, and hopeless overcrowding can produce demoralization, unrest, and perhaps a lowered birth rate. But they provide no incentives for positive social adaptation, and they tend to keep workers inefficient and productivity low.[17]

More action-oriented, the other group would mainly argue that there ought to be a pleasanter, safer, and surer way to achieve the necessary social transformation in the present state of our knowledge. By this group it is assumed that current trends and conditions may be consciously modified and new motivations nurtured. Tangible incentives and "new patterns of expectations" with some degree of cultural continuity are held to be the primary need, rather than maximum social disruption, in order to overcome the apathy so prevalent in many poor countries.[18]

The essential problem from this point of view is how to translate limited economic gains into recognized social benefits, however modest, as quickly and cheaply as possible, while at the same time fostering a greater sense of responsible popular participation in the development and improvement process. This approach leads to intensive work on the specific needs and possibilities within a given area and is largely responsible for the current programs of self-help village improvement.[19]

Basic to the problem is also the question of how to temper the "social costs" involved in transforming an ancient static society into a modern industrial democracy, including the heavy sacrifices usually incurred in rapid urbanization. For this purpose the great city has many inherent disadvantages, not only in terms of bad living conditions and high improvement costs but also in its disintegrating social effects and the frustration of individual and group initiative.

Obviously, such a diagnosis supports the desire for a greater degree of urban and industrial decentralization in one form or another.[20] But thus far the recommendations and experiments in this field have had little effect on over-all development patterns. And whether or not a determined national policy could accomplish such decentralization is still an open question.

Economic Development and Cultural Change, Vol. 3, No. 1 (October 1954), pp. 6–24; also Bert F. Hoselitz, "The City, the Factory, and Economic Growth," *American Economic Review*, Vol. 45, No. 2 (May 1955), pp. 183, 184.

[17] See Robert I. Crane, "Urbanism in India," *American Journal of Sociology*, Vol. 60, No. 5 (March 1955), p. 467.

[18] See, for instance, George A. Theodorson, "Acceptance of Industrialization and Its Attendant Consequences for the Social Patterns of Non-Western Societies," *American Sociological Review*, Vol. 18, No. 5 (October 1953), especially pp. 480 and 483.

[19] The literature in this field is increasingly voluminous, but the general principles are emphasized in *Programme of Concerted Practical Action in the Social Field of the United Nations and Specialized Agencies* (United Nations, 1953), pp. 165–66 and *passim*.

[20] An interesting analysis of the economic and social factors in development in relation to the pattern of industrialization and urbanization has been made by Wilbert E. Moore, "Problems of Timing, Balance and Priorities in Development Measures," *Economic Development and Cultural Change*, Vol. 2, No. 4 (January 1954), pp. 239–48.

IS DECENTRALIZATION FEASIBLE?

In the first place, great cities are necessary and desirable, and no one seriously proposes to break up the existing centers. Moreover, with their current momentum they will undoubtedly continue to grow no matter what measures of control or diversion are undertaken. The only issue is the *scale* of their future expansion. Must they absorb most of the tremendous horde of additional urbanites due in the next few decades, thus swelling their size to fantastic proportions? And if a more balanced pattern of urbanization is preferable, in economic as well as social terms, how can present trends be effectively redirected?

Also, it is important to note that decentralization can take many different forms depending on local conditions: not only full-blown "new towns" created as entirely independent units but also village industry, groups of industries to serve several villages, expansion of existing smaller cities, and development of satellite communities in the metropolitan hinterland.

Location of employment

In the long run it is the pattern of economic development which determines the size and distribution of urban communities. Even where the people tend to come first, as in many metropolitan centers today, most of them would move again if better economic opportunities became available elsewhere.

The locational requirements of needed industry and business are therefore a key factor in the decentralization question. On this score there seems to be no obstacle at all, at least according to the economic theorists. Obviously, certain types of economic enterprise demand metropolitan locations or depend on linkages or services that only a very large city could provide. But in general, the development experts seem to be arguing for more emphasis on various kinds of enterprise which could be carried on quite as well outside metropolitan areas, and in some cases better.

The arguments for cottage industry, agricultural processing, and simple plants for light manufacture are remarkably similar to those that support low-density housing and smaller communities per se. The scarcity of capital favors small local industries, it is claimed, because they require less overhead and fewer costly urban services, tend to be labor intensive rather than capital intensive, may call forth local savings not otherwise available, and reduce the "social costs" of urbanization.[21] A strong case is also made for industrial dispersal in order to utilize underemployed agricultural labor and benefit rural areas in general.[22]

On the other hand there is rising concern for the unbalanced character of national development which derives from the concentration of investment and economic activity in a few congested cen-

[21] For a detailed analysis, see Henry G. Aubrey, "Small Industry in Economic Development," *Social Research*, Vol. 18, No. 3 (September 1951), pp. 269–312.

[22] *Land Reform: Defects in Agrarian Structure as Obstacles to Economic Development* (United Nations, 1951), pp. 85–86.

ters at the expense of the rest of the country.[23] The size of these swelling metropolitan agglomerations, it is more and more frequently suggested, is in no sense a mark of national progress, but rather a direct reflection of the economic weakness and lack of opportunity elsewhere.

But why, then, is there so little sign of any real shift toward a wider distribution of industrial and urban development?

One answer is that it is difficult or impossible to persuade the people with entrepreneurial skill and capital to leave the big cities, in part for economic reasons (the lack of essential services elsewhere, such as water, power, roads, railroads) and in part for personal or cultural reasons (the lack of adequate schools, health facilities, housing, and so forth).

Yet all these services are today largely in the realm of public responsibility. And in most developing countries governments are even more directly involved in the location of industrial enterprise, through subsidies, licensing controls, and often public construction and operation of plants.

Here, then, is the crux of the problem, which should not be impossible of solution. The pattern of economic development and urbanization is already largely shaped by public decisions. As long as practically all the public services, community facilities, and government-aided industry go into the existing metropolitan centers, they will continue to expand at a tremendous rate, with relatively little urban development elsewhere. If the pattern is to be modified, a number of varied public decisions and investments (which have to be made anyway, in one location or another) must be co-ordinated to the end of diverting industry and urban development to other areas. Within the present framework of planning and administration, however, this is easier said than done.

Need for a regional focus in planning and research

One difficulty is the gulf between "economic planning," carried on mainly at the national level in terms of quantitative analysis and specialized policies, and "city planning," which tries to cope with community problems *after* the basic development trends and decisions have established the pattern. ("Social planning," incidentally, often means national subsidies to help communities remedy these problems.) In this no man's land, some form of area-wide programing of urban and industrial growth seems to be needed. Regional planning is probably the best term for it, although the efforts in this field (including the Tennessee Valley Authority) have rarely been much concerned with urban distribution.[24]

The frequent failure to view development as essentially a continuous process, from the cradle in economic and resource policy to the grave in urban slums, is of course a by-product of overspecialization. But there is now a serious effort, however painful, to achieve better integration between economic and social measures.[25] And the new emphasis on comprehensive community-development programs in rural areas is a significant step toward the type of area planning needed at the regional level.

Systematic research is also required on numerous aspects of the development pattern. Most of the propositions and

[23] *Measures for the Economic Development of Under-developed Countries* (United Nations, 1951), p. 26.

[24] The need for regional planning in the sense used here is emphasized in *Low Cost Housing in South and South-East Asia* (cited note 10 *supra*), pp. 21–23.

[25] This is the basic theme and purpose, for instance, of the *Programme of Concerted Practical Action* (cited note 19 *supra*).

arguments put forward in this article are necessarily based on highly tentative evidence, from random sources. With more substantial knowledge, quite different conclusions might result. On most of the issues, however, there is a limit to the possibility of reaching more refined judgments as long as the problems are viewed in generalized terms. All the underlying conditions vary tremendously from one area to another, and universal truths are few. General theory is needed, including theory on regional planning. But for research that can be applied to practical policy in this field, intensive interdisciplinary analysis of problems and possibilities in a given area, directly related to potential decisions, is probably the only effective answer.

Catherine Bauer, Berkeley, California, lecturer in City and Regional Planning at the University of California and former lecturer in Regional Planning at Harvard University, has long been associated with housing and redevelopment policy in the United States in various roles, and a student of housing abroad. *The article is based on a study of urbanization and living conditions in underdeveloped areas now in preparation by Miss Bauer for the United Nations.*

Public Administration: A Neglected Factor in Economic Development

By Frederick W. Riggs

THE stability of the Manchu Dynasty, China's last, depended upon its ability to bring annually three to four million piculs [1] of rice by barge through the Grand Canal to Peking. In its early years, the Manchu regime carried out gigantic and successful projects to dredge and build dikes on the Yellow River and to improve the Canal. Gradually, a huge establishment employing, by the mid-eighteenth century, some four hundred civilian officials, twenty thousand military men, and an equal number of laborers, was built up to maintain the Yellow River system.

During the early construction period, annual outlay for the river work cost about three million taels.[2] By the nineteenth century, two hundred years later, regular appropriations for work on the river amounted to four and one-half million taels. But maintenance had deteriorated, and appropriations for emergency repair projects were much higher. An imperial edict of 1811 stated:

> The southern part of the Yellow River in recent years has had floods every year, and so far more than 30 million taels have been spent without achieving any tangible results. At the present time, extensive works are undertaken one after another, costing nearly ten million taels.[3]

Since national revenue was little more than 40 million taels at that time, this was a major drain on the imperial budget.

[1] 1 picul equals about 133 to 140 pounds.

[2] 1 tael equals 1⅓ ounces of silver.

[3] Quoted by Ch'ang-tu Hu in "The Yellow River Administration in the Ch'ing Dynasty," *Far Eastern Quarterly*, Vol. 14, No. 4 (August 1955), p. 511.

The reason for this phenomenal cost is to be found in administrative decline. Less than one-tenth of the money spent appears to have actually been used for water conservancy. A contemporary noted that the dikes were deliberately neglected so that they would "rot faster, decay faster, and be carried away faster, thereby justifying the request for more appropriations." [4] The self-interest of bureaucrats had become incompatible with the accomplishment of the objectives they were employed to achieve. In 1855 the Yellow River broke loose, cut through the Grand Canal, brought an end to the Yellow River Administration, and disrupted the revenues of the imperial government, hastening its ultimate collapse.

The administrative troubles of Manchu China were not unique. In many countries today, defective public administration hampers and even prevents the attainment of economic development goals. Evidence may be found in the reports by missions of the International Bank for Reconstruction and Development. Most of these reports, after surveying a country's resources and economic prospects, point out administrative obstacles to further progress. The report on Cuba, for example, notes that "economic advance is not at present restricted by lack of available resources," and the country "has great opportunities for economic development." The report continues, "It is chiefly deficiencies in the 'organizing factors' which limit Cuba's prospects today." Improvements in this field "can have the greatest effect on Cuba's economic progress." [5]

[4] *Ibid.*, p. 512.

In the following analysis we will look at some of the administrative obstacles which hamper economic development abroad. Lest misunderstandings arise, observe that examples of every kind of administrative weakness noted in foreign countries may also be found in the United States. The chief difference is, perhaps, that they cannot afford administrative waste as well as we can.

Governmental Provision of Services

Many of the requisites for economic development—a communications and transport net, educational facilities, public health services—are often provided by government. Waste in the provision of these services, often reported by the International Bank, can stunt the growth of industry and agriculture. In Cuba, for example, the mission found an extensive network of highways deteriorating rapidly for lack of adequate maintenance. Frequently a highway was started and then abandoned. One stretch was graded but never paved. "Successive rains have so thoroughly ruined the raised central graded section that traffic now habitually travels by preference in the ditches on either side." Thus the ultimate cost of paving is estimated at twice what it would have cost to complete the road originally.[6]

[5] International Bank, *Report on Cuba* (Washington, D. C.: International Bank, 1951), p. 67. More than twenty years ago the noted British authority R. H. Tawney, in his report on Chinese developmental problems, wrote that, in its practical work, the "gravest weakness" of the Chinese system of government "is the absence of efficient administration, and, indeed, apart from exceptional individuals, of any adequate idea of what administration means."—*Land and Labour in China* (New York: Harcourt, Brace and Company, 1932), p. 173.

[6] *Ibid.*, p. 266.

In Mexico the Bank reported new railways under construction although those completed in recent years had fallen into decay because of poor maintenance.[7] In Colombia lack of integration of publicly owned lines adds to the cost of transport. The practice of paying train crews for time regardless of mileage, with extra rates for overtime after 10:00 P.M., "apparently led to deliberate delays by the train crews in order to earn overtime." Unreliability of schedules and delays in service made it "almost impossible for shippers to count on definite dates for rail delivery." [8]

In the communications field, Iraq suffers from poor co-ordination. Telephone equipment ordered abroad often arrives before buildings are ready to receive it. "Equipment is stored and maintained, in some cases for more than a year, waiting for the building to be completed, and even, on occasion, to be started." [9] The mission to Guatemala reported, of that country's telecommunications network, "Were it not for the condition of the government-owned services, coverage of the Republic could be considered fairly good. As it is, however, internal service is low and unsatisfactory." [10]

In education, the school system of Iraq is reportedly "too highly centralized," resulting in stereotyping of instruction and methods, while "the Ministry at Baghdad is so burdened with administrative detail that it cannot give adequate attention to policy and planning." [11] Much of the educational in-

[11] *Iraq* (cited note 9 *supra*), p. 70.

vestment made by the Cuban people, according to the Bank's report, was wasted because of "unstable administration, poor planning, political patronage and maladministration of funds." "Administrative faults" are considered the "most important cause of Cuba's educational deficiencies." [12]

In public health, the mission to Turkey complains that the government:

> lacks the organization necessary to plan and carry out the broad program we suggest. The Ministry of Health is complex and overcentralized. Provincial Directors of Health are caught between bureaucratic restraints imposed by the Ministry and the political and administrative control of the provincial governors to whom they are subservient.[13]

Health services in Colombia are impaired by "(1) a low salary scale for public employees, and (2) very poor personnel practices and policies. These conditions are not peculiar to the public health agencies but are characteristic of the entire structure of government." [14]

Agricultural services in Iraq are limited by the fact that the "Department of Agriculture has less than 25 qualified agriculturists capable of research and educational work, and much of their attention is devoted to administrative and regulatory tasks." "They lack the time, the transport facilities, and, often, the ability to counsel farmers on methods of improving their output." Financial stringency has led government farms to turn to commercial production instead of serving as experimental and demonstration stations.[15] The Bell mission to the Philippines, while deploring the small appropriations for agricultural research, added, "The lack of an efficient agricultural extension service is even more lamentable for there is much useful information already available which could be put into practice." Even the few existing services are so divided into separate specialized organizations that they cannot co-ordinate their work effectively. The Bell mission considered the integration of extension activities in a division free of regulatory duties "the basic need of Philippine agriculture." [16]

The International Bank, in almost every report, notes the inadequacy of statistical reports for planning and developmental purposes. In Iraq, for example, the annual Statistical Abstract "omits useful information which could be collected without too much difficulty; it includes much unnecessary detail and some statistics of highly dubious value; and the same mistakes have tended to be perpetuated year after year." [17] The mission to Cuba found statistics on unemployment, wage levels, cost of living, and prices (except for a few commodities) unavailable, thus hampering planning for employment. "In some cases," the mission reported, "there is no information at all and in almost every case important details are not available." [18]

REGULATION BY GOVERNMENT

As critical for economic growth as the services provided by government are the regulatory and political policies which affect the social climate of development. Much attention has been devoted to the impact of specific policies on economic growth. Even favorable policies, however, may fail of their objectives if they are not well carried out. Unfortunately, administrative regulation becomes more crucial and also more difficult to enforce the more development takes place.

An example is labor-management regulation which arises concurrently with industrialization. Typical of the difficulties encountered in this sphere is the situation in Iraq where the Labor Department is reportedly understaffed and ineffective. "In 1949/50, of 1,228 enterprises inspected, only 136 were found to comply with the law. Of the remainder, 974 were simply warned and 118 cases were referred to courts." The Bank's report adds that it would be desirable "to enforce existing legislation before enacting other labor laws." [19] Sometimes labor laws are interpreted so one-sidedly as to hamper industrial development. For example, employers complained to the Bank's mission to Guatemala not so much about the Labor Code as about the "manner in which it has been interpreted and implemented by the Labor Courts and Labor Inspectors." These interpretations have made it extremely difficult to dismiss an employee without severance pay, which is retroactive, without limitation, at the rate of one month's pay for every year of employment.[20]

The standardization and enforcement of weights and measures is essential for the efficient conduct of commerce and industry, yet many governments have been unable to enforce this elementary step. The mission to Cuba, for example, declared emphatically:

> A vigorously active Bureau of Weights and Measures, backed by laws providing stiff penalties for short weight and misrepresentation in commercial practice, would do more to give the customer his money's worth than a great deal of unrealistic price control.[21]

Adulteration and lack of product standardization has cost many countries dearly on the world market. The Indian Planning Commission laments that "for want of proper grading, agricultural products, such as cashew-nuts, black pepper, turmeric and wool, fetch low prices in foreign markets." It recommends government-enforced grading not only for export but also in the interest of national health.[22] The Chinese Nationalist government on Formosa is initiating controls to ensure that foreign purchasers will receive standardized products, a field in which Chinese efforts have hitherto proved damagingly defective.[23]

Currency and exchange controls have become essential in countries faced with foreign exchange shortages. In the Philippines the need for import controls is accepted by most of the business community, but complaints arise from "the lack of clarity in policy and in the interpretation of the law. The administration is needlessly complex, costly and dilatory." When charges of favoritism and corruption are added, dissatisfaction with the system becomes acute.[24]

Enforcement programs involving the grant of licenses open the door to many administrative abuses. The Indian Planning Commission observes:

> In recent years, the most conspicuous fields of corruption have perhaps been those in which businessmen had to apply for permits and licenses. Supervision and vigilance within the administration were inade-

quate and illegitimate gains were undoubtedly made.[25]

Government planning for land use, resources conservation, community development, and so forth is frequently criticized, not only for its absence, but also for lax or ruthless enforcement. Thus the International Bank found in Iraq that

> surveys, plans and partial plans have generally been hastily drawn and with little regard for the actual conditions prevailing in the community. In any event, municipalities have for the most part continued to develop without reference to any plan. In many towns new streets have been arbitrarily cut through residential and commercial districts with little concern for real needs or for the people affected. The various ministries concerned with the erection of schools, hospitals, public buildings and bridges generally locate their projects without reference to an overall plan and without consultation with each other.[26]

A fundamental manifestation of governmental failure to establish a favorable climate for development is evidence of insecurity, fear, and lack of confidence in the future. The Bank's mission was told by "informed Cubans, in every walk of life," that "one of Cuba's weaknesses is a prevailing lack of integrity in public administration and personal conduct." Many Cubans told the mission that "for many years the misuse of public funds has been extensive and that public administration still leaves much to be desired." "Lack of confidence in the predictability and impartial protection of the law deters Cuban and foreign investment." Evidences abound of lack of continuity and consistency in government policy such as unfinished and abandoned projects, roads, and public buildings.[27]

[27] *Cuba* (cited note 5 *supra*), pp. 9–12.

STATE AS ENTREPRENEUR

Increasingly, governments of the "underdeveloped" countries are producing and distributing goods. It needs little argument to show that the success of these public undertakings depends on the effectiveness and efficiency of their administration and management, and greatly affects the pace of development in private sectors of the economy. Yet the reports of the Bank's missions contain many instances of faulty management of public enterprises.

Backstopping its role as producer and distributor, and a critical factor in the over-all development of a country's economy, may be the planning activities of government. In Cuba, typically, a cabinet level National Economic Council, supported by a Technical Commission staffed by high civil servants, is supposed to plan developmental goals, help co-ordinate the work of different government ministries and agencies, provide information and studies for the President, and so forth. Yet the International Bank found that "even if the *Junta* has made a number of constructive suggestions, relatively few results can be noticed in the actual policies of the government." [28] Similar criticisms of the ineffectiveness of central planning machinery may be found in many other reports of the International Bank.

ADMINISTRATIVE DIFFICULTIES

What are the reasons for the administrative weaknesses which, as we have seen, so frequently hamper economic development? A universal complaint runs as follows: too many persons are employed, their services are not fully utilized, and they are frequently not qualified by training or experience to do the work that needs to be done. The report on Cuba, for example, notes that,

[28] *Ibid.*, p. 499.

next to the sugar industry, the government is the largest employer of labor. While admitting that many public servants work "with a real sense of responsibility and devotion to duty," many others:

> regard government jobs as sinecures. Apparently in many ministries a number of the employees never appear at all except to draw their pay-checks. Of those who do attend regularly, a significant proportion turn out very little work, either from incompetence, or inertia, or from lack of proper supervision and organization.[29]

The mission to Iraq found public servants inefficient and lacking in morale. It attributed this to the "low level of government salaries and the lack of any sense of real participation in constructive work." Low salaries reportedly put the "probity" of civil servants to a "severe test" and compel many officials to take outside employment.[30] In Turkey the Bank found that:

> recruitment often has no relation to need, with the result that many government offices are overstaffed. Duties are poorly defined and insufficiently coordinated. Advancement depends primarily on seniority rather than demonstrated merit. The inefficient are protected by rigid personnel laws and regulations designed to protect the civil servant rather than to promote efficient administration.[31]

In some countries, especially in Asia where recent colonial administration has left a strong imprint, closed career systems of personnel administration prevail. Elsewhere, especially in Latin America, rapid turnover and patronage appear more prevalent. In both situations, however, the same kinds of complaint are voiced. It would appear that in each instance the personal incentives of public employees are not strongly identified with the organizational or governmental goals they are nominally of working for. Whether because of low salaries, lack of opportunity to take part in program planning and decision making, or little reward for achievement as against mere timeserving, the general pressure of society, the prodding of individual organizations and pressure groups, are not mobilized so as to drive the individual to exert himself to accomplish specific production goals. For many employees, holding the job appears to be an end in itself—the status it confers is more important than the financial reward. Governments are pressed to maximize appointments on the public payroll, without much regard for the ratio between cost and the value of work output. Perhaps all too frequently, as in the case of the Chinese Yellow River Administration, the self-interests of employees become institutionalized in such a way as to defeat the organizational objectives for which they were supposedly employed.

[29] *Ibid.*, p. 453.
[30] *Iraq* (cited note 9 *supra*), p. 78.
[31] *Turkey* (cited note 13 *supra*), pp. 58–59.

CONSEQUENCES FOR PERFORMANCE

What does this mean for administration? If you cannot count on the loyalty and competence of civil servants, you must try to check their performance at every turn, audit every detail of expenditure, collect only taxes that are most easily supervised. The prevalence of inequitable and regressive tax policies has been widely noted and correlated with the power of privilege and the consequences for development. Less attention has been paid to the relation between tax administration and these policies. Yet governments lacking reliable machinery understandably collect mainly the taxes that are easiest to collect, generally preferring indirect, turnover taxes to direct levies on income.

In Iraq, typically, during the period 1948–49 to 1950–51, only 18 per cent of tax revenues came from land, prop-

erty, and income taxes as compared with 82 per cent from indirect sources, especially customs duties and excises.[32] Preoccupation with finding any source of tax revenue which *can* be collected naturally restricts the ability of governments to use fiscal policy as a means of regulation and to stimulate economic development.

Understandably, also, the taxes that are imposed are not fully collected. It is reported, for instance, that with better administration and enforcement, Colombia might raise its total tax yield by one-third or more. The reason for poor enforcement given by the Bank mission is "lack of adequate staff and trained personnel."[33] The Bell mission attributed mounting deficits in the Philippines to a "failure on the part of the Government to recognize its responsibility to levy taxes and to provide an administrative enforcement staff that can collect taxes."[34] In tax administration there is a point beyond which, for any tax, marginal revenue falls below marginal cost of collection —a law of diminishing returns. In underdeveloped countries this point is often reached very early. The consequence: proliferation of new taxes and surtaxes, and inequitable enforcement.

Inability to rely on staff to carry out policy has many other consequences. Legislatures try elaborately to restrict the way in which public funds are spent. They impose rigid and often ineffective accounting and auditing controls—frequently vested in the same agency—to prevent misuse of funds, thereby throttling imaginative and effective program administration. Cuban expenditure controls illustrate both rigidity and laxity. Pension benefits had to be reduced and delayed because the government had "borrowed" pension funds. "The greatest part of the reserve funds of at least eleven non-government pension and retirement funds were used to cover government deficits." On the other hand, inspectors in the agricultural services often cannot obtain travel and expense funds, so that farmers must call on the inspector in the nearest town. The law setting up a National Transportation Commission established a fixed annual budget of $120,000 and set the salaries of commissioners and senior staff at amounts totaling half the budget. As a result the Commission was able to employ only five inspectors for the whole country.[35]

Overcentralization and Poor Co-ordination

Obstacles to identification of personal with program goals are especially conspicuous in the way the work load and responsibilities of different officials are allocated, that is, in "organization and management." These often make it impossible for anyone to carry out a constructive project without waiting for the concurrence of many others, whereby many people have the power to block action. One result is often to elevate the level of settlement of even minor disputes to ministerial, cabinet, and chief executive levels. Top administrators become embroiled in continual interagency conflicts while subordinates piddle away their energies waiting for requisite approvals. Moreover, because many persons far from the scene of action become involved in decision making, questions are often referred to persons with only remote interest in them, it becomes difficult to assign responsibility for action, and final decisions hinge on the outcome of power struggles among individuals only indirectly concerned.

In Iraq, the Bank's mission reported that "excessive centralization causes ministers and high officials to be overburdened with detail to the neglect of policy formulation and planning. Inadequate use is made of such talent and knowledge as is available elsewhere in the government, including the local administration." In the Department of Agriculture the mission found that "excessive centralization leaves little room for initiative. Even the taking of a field trip requires the consent of the central office." The Ministry of Social Affairs was found to be "too rigid throughout, without sufficient delegation of responsibility and without enough consultation among departments of the Ministry."[36]

In some countries elaborate ministerial secretariats, staffed by generalists who rotate frequently between headquarters and district assignments, have been placed in the line of communication and command between ministers and executive or administrative departments and divisions. Universally this causes great delay while secretariat officials review more and more of the work nominally assigned to and originating in the departments. As a result, in the words of a distinguished former Indian civil servant:

> The head of the department is deprived of all initiative and instead of being allowed to attend to and make progress with his own work, has to spend a great deal of time submitting unnecessary reports, explaining the position in individual matters to the Ministry and getting its orders on points which lie well within his own sphere of authority.[37]

A former British adviser in the Siamese government notes, similarly:

> The ministries get bogged down with masses of papers on more or less unimportant issues, nearly all of which have to pass through the bottleneck of an overworked Permanent Under-Secretary's office.[38]

Tasks often undertaken in America by local governmental authorities and municipalities are frequently taken over by central government. The Bank's mission noted an "extreme centralization of municipal public works" in Cuba: "local initiative is given little chance, and the public is accustomed to expect the central government to do everything."[39] In Turkey:

> Top officials are subjected to an undue pressure of work and the higher levels of the Government have become increasingly clogged with masses of minor problems. Even Ministers feel they must consult the Council of Ministers on operational as well as policy matters.[40]

Because of overcentralization and lack of delegation, those close to the goals of action cannot easily co-operate with their colleagues in other agencies whose work directly affects the success of their own efforts. Characteristically, we find lack of co-ordination and co-operation. Moreover, to overcome this stagnation, new agencies are often set up in the hope that, outside the bog of established structures, action may be possible. But the new agencies simply add to the intrabureaucratic conflict and competition, increasing the burden on the top of the hierarchy to impose co-ordination.

The Bank noted in Colombia, for example:

> Numerous agencies are involved in almost every field of activity, often with little co-

ordination. In the field of agriculture alone, there are twenty or more agencies, corporations or boards, in addition to the Ministry, whose activities affect agriculture in one way or another. . . . The same is true in lesser degree in the fields of health, public utilities and transport.[41]

In Mexico the International Bank mission found an urgent need for co-ordination of government transportation agencies "if serious waste of resources is to be avoided in the further development of transportation facilities and if the railroads are to cease to be a major impediment to economic growth." [42] In Ceylon the mission complained that un-co-ordinated requests for foreign technical assistance had

resulted in duplication and overlapping, waste or poor use of specialists once obtained, sometimes procurement of the wrong type of specialist or even, occasionally, of an incompetent or completely unnecessary one. We are convinced that there is great need for coordination here.[43]

UNDERLYING FACTORS

Are these administrative difficulties prime causes in themselves, or are they symptoms of more basic conditions? It is well to remind ourselves here of the statement made above, that examples of the administrative difficulties found in underdeveloped countries could also be found in industrialized countries. What we seek, therefore, is not so much unique factors as the reasons why these problems appear to be more crippling abroad than in the United States in their impact on development.

The fact that effective administration is no monopoly of the West is demonstrated in William W. Lockwood's comprehensive analysis of the economic development of Japan. He shows in detail how the government acted effectively, in the early years of industrialization, to:

stimulate new investment and technological change, and to guide economic development in accordance with national interests. . . . A rapid succession of measures established a milieu of law and administration and finance within which the gestation of capitalism took place. Beyond this the government itself ordinarily shared the initiative in building systems of transport and communications, establishing credit institutions and even launching new factory enterprise.[44]

In comparing the work of the average administrator in underdeveloped countries with his counterpart in Japan or in the industrialized West, a sharp contrast may be noted between the terrific pressures on the latter to show results compared with the relative weakness of the incentives offered the former. In Japan these pressures took the form of a vast devotion to the goals of national survival and strength. In private industry, the market may furnish a whip in the form of bankruptcy for the nonproductive. In American government the legislatures, the party battle for votes, the pressures of organized clientele groups and professional societies, combine to prod the public administrator to produce results if he would keep his post and win promotions.

In contrast, in many countries bureaucracy seems to lay down its own terms for survival. Seniority, patronage, strict tenure rules, part-time employment, corruption—these are signs that the dominant pressures on administrators are not directed toward production. They suggest rather the importance of connections with influential families and cliques, of timeserving, of catering to those with standing and money, and so forth. Alternatively these signs may be taken as indications of political weaknesses in government, as evidence that the bureaucracy has become a politically dominant rather than a subordinate organ of government, that administrators deal with their clientele as "officials" imposing orders from above rather than as "public servants" responsive to articulate needs.

The International Bank mission attributed economic stagnation in Cuba, in part, to a "tendency to freeze or rigidify economic relationships." [45] This tendency is linked with the view that total economic resources are constant. Each competitor strives to maximize and protect his share of this unchanging pie. The idea that the pie might be enlarged and that efforts to increase the total would add to the share of each individual is uncommon. In administration this view is reflected in the quest for jobs, security, and tenure as ends in themselves. Administration seems more concerned to protect and freeze status, relationships, and privileges than to achieve organizational output goals.

A frequent corollary of the static view of production is preoccupation with social status, measured not in terms of productivity but by the nature of the activity, mental or manual, in which one engages. The American assumption that status should be measured by production, as indicated by salary, rests, in turn, on the assumptions of the "neutrality of means" and the possibility that compensation can vary directly with output—hence the stress in our administrative lore on job classification and the slogan: "equal pay for equal work." The reduction of human values to the "cash nexus" is a feature of our cultural system that repels people of older cultures, but it appears to have a positive relation to our high level of economic productivity.

The International Bank noted in Iraq that, although the number of students in technical schools appeared inadequate for the needs of the country, even the available graduates were not employed. "They show a distaste for manual work." The mission urged vocational schools to place "emphasis upon the dignity and value of manual labor." [46] A study of senior secondary students in Ceylon showed that more than half aspired to "service occupations," largely government employment, although only 15 per cent of the population can hope to obtain this kind of work. The survey findings reflect "a strong desire for the security and status of government employment . . . a dislike of work involving direct contact with the soil or the exercise of manual skills." [47] Clearly the more public employees limit the ways in which they will permit themselves to be used for organizational purposes, and the more they are able to lay down their own terms of employment, the more difficult it will be to increase their organizational work output.

Space forbids the exploration of other cultural values and social and political factors that affect administrative performance, such as differences in interpretations of the role of law and the hierarchical relationships of individuals, the structure of the family and child-rearing practices, the individual's conception of the self and the roles that he will play, the flexibility and viability of contracts, voluntaristic versus deterministic views of life, sense of time and predictability of future events, diffuseness versus specificness of expectations arising in institutionalized relationships.[48]

CONCLUSION

Attempts to assist and advise persons in non-Western cultures, whether in the fields of public administration or in the substantive fields of economic development, will undoubtedly be more fruitful the more participants become aware of the complex interrelationships between cultural values and administrative and economic problems. No single factor may properly be considered a basic "cause" of these problems. Rather, all factors are interdependently related to each other. Cultures manifest a totality of interactions.

Many of the factors in these totalities, however, can vary independently. In response to such variations, one may expect repercussions and reactions in other variables. Thus decisions about the approach to change in cross-cultural situations depend on strategic calculations concerning which changes are most desired, and most likely to elicit the kinds of reactions that are desired, by participants. Such calculations are made daily by practical administrators and by practitioners of technical assistance. Our hope is that these decisions can become more sophisticated, based on more accurate predictions. Clearly public administration and economic change have this kind of interdependent relationship with each other and with the total cultural setting in which they take place. As such they should be increasingly studied as interacting variables, rather than abstractly as independent phenomena.

in China, where "the object of the official charged with administrative duties is less to impose the law on recalcitrant wills than so to comport himself that a direct collision of wills may be avoided, even if the law suffers in the process."—*Op. cit.* (note 5 *supra*), p. 175. The obstacles the Chinese approach presents to the making and enforcement of contracts, so necessary to the Western economic system, are analyzed in Edith E. Ware, *Business and Politics in the Far East* (New Haven, Conn.: Yale University Press, 1932), especially Chaps. II and III. On the other hand, the weakness of pressures for performance in many underdeveloped countries often cause administrators to become preoccupied with procedural and legalistic ritualism at the expense of goal-oriented behavior. For a comprehensive discussion of the relation between cultural values and productive activity, see Margaret Mead (Ed.), *Cultural Patterns and Technical Change,* Paris: UNESCO, 1953. Cultural Values in India's Economic Development

By MILTON SINGER

WRITING of her impressions of India in 1953, Eleanor Roosevelt incisively states a widespread view of the strategic role of cultural values for India's economic development:

> . . . Prime Minister Nehru is trying to develop a democracy that, though perhaps not exactly like ours, will ensure all the people personal freedom. But if an accompanying material prosperity is also to be achieved—and the government will not be successful unless it can demonstrate certain progress on the material side—considerable education and re-education of the people will be necessary. For a belief in the virtue of renunciation is not an incentive to hard work for material gain; but only hard work by all the people is going to bring any real betterment of their living conditions. Somehow a spiritual incentive, a substitute for renunciation, will have to be found. Somehow they must be made to realize the living and exciting possibilities of the freedom and democracy their new government offers them.
>
> Our material wealth has come to us almost as a by-product of our effort to fulfill our spiritual and democratic ideals and as a result of our philosophy of work. But our ideals are peculiar to our culture; they satisfy us, but they would not necessarily satisfy the Indian people. . . . My own feeling is that with their religious and cultural background something different will be required to spark in them the conviction that the modern struggle of a highly technologically developed state is worth while.[1]

There are many Indians and non-Indians who would agree with Mrs. Roosevelt's diagnosis, although they might not agree on the particular set of ideals required to spark in the Indian people "the conviction that the modern struggle of a highly technologically developed state is worth while." Agreement is much easier to find on the negative thesis that India's traditional ideals and values—asceticism, fatalism, the cyclical view of time, the low value put on manual labor, the village-centered caste society, etc.—are major obstacles to economic development, than on the positive cultural conditions for such development.

Observations made during a recent visit to India have raised serious doubts in my own mind whether the traditional cultural values are as great an obstacle to economic development as has been thought, and whether a substitute for renunciation is needed to provide a spiritual incentive in the Indian people for the acceptance of the new program the government offers them. There are many indications to the contrary—that popular expectations are now running so far ahead of what the government can deliver that more rather than less "renunciation" is needed if wholesale disillusionment with the government is not to set in.

I do not question Mrs. Roosevelt's emphasis on the "philosophy of renunciation" as the prevalent expression of Indian spirituality. For despite the insistent refrain of so many Indians that they are "spiritualistic" whereas Westerners are "materialistic," one does come away from India feeling that there is something to this contrast, and that there is a greater "starving of the senses" in the service of self-realization than one meets with in Europe or the United States. But the contrast mis-

[1] Eleanor Roosevelt, *India and the Awakening East* (New York: Harper & Brothers, 1953), pp. 196–202.

leads in its implication that "materialism" has no positive value in India or that "spiritualism" precludes the coexistence of "materialism." These implications are perhaps more commonly drawn by Westerners than by Indians; at any rate they underlie the strong sense of paradox which Americans in India feel when they hear pandits sing Vedic chants over a public address system in a temple yard or meet a Western-educated lawyer at an orthodox wedding ceremony with his Western clothes replaced by a simple dhoti.

INDIAN "MATERIALISM"

In the traditional Indian pantheon material wealth and power have an important place. Lakshmi, goddess of wealth, is worshiped at least once a week and is the patron deity of the merchant caste, known by different names—*vaisyas, banias, chettiars*—in different parts of India. *Artha,* wealth and power, represents one of the four major ends of life, and there is a science of it in *arthasastra.* In the classic work of that name, wealth and power are indeed considered as essential in the scheme of things as are the other three basic values—*dharma* (duty), *mokhsa* (liberation), and *kama* (pleasure). And this judgment is supported by the stories of the epics in which wealth and power, usually the reward of virtue, are ever present.

In their everyday behavior, too, Indians do not show less of that propensity to trade, barter, and exchange than Adam Smith found in the mainsprings of the wealth of nations. Every village has its shopkeeper and every town its bazaar. The mutual exchange of services among cultivators and artisans in village and town has over the centuries been developed to so regular and precise a level that Western students like the Wisers have found in it a special system of economic exchange which they call the *jajmani system.*[2] To Indians it appears odd that this should be singled out as a special system; they take it for granted as part of the social landscape, of the texture of their daily relations with others. The occasions for trade even in the villages are numerous and periodic—weekly fairs and markets, religious festivals where the merchants in the temple streets are a regular feature of the festival.

Specialized skill is highly regarded and expected from the artisan, who by virtue of his hereditary training usually has it, although the artisan crafts are now in decline. Nor is innovation absent from this traditional system. A sacred image maker proudly described to me how by using a finer grain clay from a river bed he was able to develop casting material completely unknown to his father and other image makers.

Behind the mud walls of an Indian village one will not find as much conspicuous consumption as in the towns and cities, but even in the humble village one finds love for fine cloth, bangles, and precious gems. And what is perhaps more important, the desire for land and cattle and oxcarts, a good match and education for his children, a job for a relative, are for the villager real desires and express in these local terms his ambition to improve his position. Some of the things he wants may not be for himself alone or even for his family and caste—a new school, a road, better drinking facilities, these are for all the village.

I have perhaps said enough to indicate that those values and motivations usually associated with the "materialism" of the West are also commonplaces in India. And it is not, therefore, their absence which is the source of that economic "underdevelopment" to which

[2] W. H. Wiser, *The Hindu Jajmani System,* Lucknow, U. P.: Lucknow Publishing House, 1936.

the Nehru government is now addressing itself. But this is only one half of the picture. There is also to be considered that philosophy of renunciation to which Mrs. Roosevelt has called our attention. It is a real and living force today and is frequently invoked by Indians to curb their more "materialistic" desires.

PHILOSOPHY OF RENUNCIATION

The theme of the king or rich man who gives up everything for the sake of a spiritual principle is very common in Indian literature. The dramatization of this theme in the stories of Rama, the Pandavas, Harischandra, are almost universally known and beloved by Indians everywhere. And it is not only the mighty and rich who are expected to renounce, for in the traditional Indian theory of the stages of life, the householder who has discharged his responsibilities to his family should renounce his possessions and eventually all familial ties to become a Sannyasi or holy man who lives on alms. Not all householders live up to this theory, but one does meet engineers, lawyers, doctors who phrase their retirement in these terms, and younger men who walk out of their jobs in order to engage in more "spiritual" preoccupations. The holy man who is poor is respected and his advice and blessing sought after. To the rich man, the appeal that he renounce his wealth and become like a holy man has a compulsion which, when combined with other types of appeal as in Vinoba Bhave's movement, may result in one of the most spectacular voluntary redistributions of land in history.

The Indian world view encompasses both material and spiritual values, and these can be found in the behavior of the ordinary Indian existing side by side and in functional interdependence. Indian thought, too, particularly the work of Tagore, Aurobindo, Radhakrishnan, Raghavan, shows a balance and complexity in these respects which is far from that overspecialization on the spiritual, the sacred, and the life-denying to be found in the interpretations of some Western scholars.[3]

INDIAN ASCETICISM AND THE RISE OF SOCIALISM

The philosophy of renunciation smooths the transfer of holdings from generation to generation within the family, and it may also be used to lever a redistribution of property. In neither of these functions does renunciation constitute an obstacle to economic development. In fact I should go farther and say that in performing these functions it furnishes an incentive for hard work on the part of the younger generation which is going to inherit the property renounced by the elder generation and holds out to the poor and landless a prospect of redistribution in their favor. But in furnishing a "rhetoric of motives" for working hard and for keeping the traditional economy going, the philosophy of renunciation functions negatively in relation to the accumulation of wealth. In this function it serves to redistribute wealth but not necessarily to increase the total national income. There is another and more positive relationship in which renunciation may serve as a direct motive for the increase of wealth, personal and national.

In the *Ramayana,* Ravanna's great wealth and power in Lanka is traced to the fact that he had practiced so many austerities that the gods were compelled to give him what he wanted. The ascetic who gains his boons in this manner is again a very common theme in Indian literature and folklore. And it is

[3] R. Tagore, *The Religion of Man* (London: Allen & Unwin, 1931); S. Radhakrishnan, *The Hindu View of Life* (London: Allen & Unwin, 1927); V. Raghavan, "Some Leading Ideas of Hindu Thought," *The Vedanta Kesari* (Madras), February 1955.

not only the gods but other men who find his spiritual powers irresistible. Asceticism takes on a social and practical significance.

I did not myself meet anyone in India who claimed to have acquired his wealth from the practice of ascetic austerities. Most professional holy men—the sadhus—are quite poor, and the sincere among them prefer to remain that way.[4] So perhaps it is only in the stories that asceticism is a technique for becoming rich. Yet the connection between asceticism and economic activity does not appear a farfetched one, particularly to anyone who has read Max Weber's *The Protestant Ethic and the Spirit of Capitalism*. According to Weber, the Calvinistic emphasis on self-denying activity in a "calling" as the path to salvation was easily converted into a "this-worldly asceticism" that provided both the discipline and spiritual sanctions for the economic activities of the early industrial capitalists. The doctrine of "election" lent specious plausibility to the feelings of the prosperous that they were also a spiritual success and of the poor that they were spiritual failures.

Indian asceticism has traditionally been otherworldly. Even in those cases where it is used as a means to acquire worldly goods, the techniques involve a withdrawal from the world, from family and everyday occupation. And so long as it remains otherworldly it is difficult to see how it may provide those incentives for industrial development which Weber found in Calvinism. But asceticism in India has not remained altogether "otherworldly." In recent years it has been undergoing a process of interpretation which brings it quite close to the type of "this-worldly asceticism" which Weber described in Europe and the United States. A leading influence in this reinterpretation has been the views and example of Mahatma Gandhi, who crystallizes a vigorous and continuing effort to bring the religious force of Hinduism into the service of modern social reform.

Gandhi's asceticism

Gandhi's personal asceticism is well known from his autobiographical writings. It is not, however, his vegetarianism and teetotalism, his continence and stand against artificial birth control, that are significantly new. These are the norms of right conduct for all the "twice-born" castes, and many instances are known where a lower caste will give up beef and alcohol in an effort to raise its status.[5] The novel element in Gandhi's asceticism is to be found in his philosophy and program of social reform. His philosophy of nonviolence (*ahimsa*), of the simple life in self-sufficient villages, of the necessity of work and the dignity of manual labor, of service to neighbors, of social justice in the distribution of power and wealth, has breathed a vitality into traditional Indian asceticism which animated India's successful struggle for independence and which shapes much of the present government's domestic program.

Interpretation of the Bhagavad-Gita

Gandhi himself found the source of this social philosophy in Hindu religious traditions and particularly in the message of that "spiritual reference book," the *Bhagavad-Gita*, whose meaning he sought to enforce in his own conduct for an unbroken period of forty years.[6] Challenged by some of his coworkers to deduce the doctrine of nonviolence from

[4] G. S. Ghurye, *Indian Sadhus*, Bombay: Popular Book Depot, 1953.

[6] Mahadev Desai (Ed.), *The Gospel of Selfless Action or the Gita According to Gandhi* (Ahmadabad, 1946), p. 123.

the *Gita*, he translated the work in 1929 into Gujerati, his mother tongue, and published it in the columns of *Young India* together with a commentary. This translation he said he designed "for women, the commercial class, the so-called Sudras and the like, who have little or no literary equipment, who have neither the time nor the desire to read the *Gita* in the original, and yet stand in need of its support."[7]

The apparent justification for warfare in the *Gita* Gandhi dismisses by arguing that physical warfare is "brought in merely to make the internal duel [in the hearts of men] more alluring."[8] He does not read the *Mahabharata* and its crown, the *Gita*, as a historical work; its author uses historical persons "to drive home a religious theme."[9] The theme of the *Gita*—and of all scriptures—is self-realization, "the ambition to become like God." The *Gita* tells how a perfectly realized man is to be known through the example of Krishna, who is "perfection and right knowledge personified." Although all embodied life is an incarnation of God in Hinduism, "it is not usual to consider every living being an incarnation. Future generations pay this homage to one who in his own generation has been extraordinarily religious in his conduct . . . to one who has performed some extraordinary service to mankind."[10]

The *Gita* shows, according to Gandhi's reading, that the best way to reach self-realization and the perfect peace of salvation is through the renunciation of the fruits of action. Renunciation means "desireless action" and requires right knowledge and a devotion which does not consist in blind faith and observances.[11] Action "includes all activity, whether mental or physical." "The *Gita* says do your allotted work but renounce its fruit, be detached and work, have no desire for reward and work."[12]

Renunciation of the fruit does not mean indifference to the result of action. "He who renounces reaps a thousandfold." "In regard to every action one must know the result that is expected to follow, the means thereto, and the capacity for it. He who being thus equipped, is without desire for the result, and is yet wholly engrossed in the due fulfilment of the task before him, is said to have renounced the fruits of his action."[13]

Application to economic life

This doctrine applies to economic life, for the author of the *Gita*

> . . . has drawn no line of demarcation between salvation and worldly pursuits. On the contrary he has shown that religion must rule even our worldly pursuits. . . . The *Gita* teaches that what cannot be followed out in day-to-day practice cannot be called religion. Thus according to the *Gita*, all acts that are incapable of being performed without attachment are taboo. This golden rule saves mankind from many a pitfall. . . . Murder, lying, dissoluteness and the like must be regarded as sinful and therefore taboo. Man's life thus becomes simple and from that simpleness springs peace.[14]

"In trying to enforce in one's own life the central teaching of the *Gita* one is bound to follow Truth and *ahimsa*."[15]

Gandhi is aware that this interpretation of the *Gita's* message rests on the distinctive meaning he gives to the Hindu notion of "yajna" or sacrifice.

[7] *Ibid.*, p. 122.
[8] *Ibid.*, p. 123.
[9] *Loc. cit.*
[10] Desai (Ed.), *op. cit.* (note 6 *supra*), p. 124.
[11] *Ibid.*, p. 126.
[12] *Ibid.*, pp. 127–28.
[13] *Ibid.*, p. 128.
[14] *Ibid.*, pp. 128–29.
[15] *Ibid.*, p. 129.

" 'Yajna' literally means worship; hence sacrifice; hence any sacrificial act or any act of service. And in this sense every age may and should have its own particular sacrifice (*yajna*). For mankind lives by *yajna,* sacrifice." [16] The sacrifice called for in this age is "body-labor" in the service of others (*Gita* III), and it is for this reason that self-realization cannot be attained without action which renounces its fruits.

How this path of desireless action may lead to that mechanically disciplined behavior which Max Weber believed necessary for industrial life is suggested by the editor, Mahadev Desai, of *The Gita According to Gandhi:*

> Man must reduce his daily conduct to mechanical regularity and precision, but he must do so intelligently. . . . One has but to withdraw the self, withdraw attachment to fruit from all action, and then not only mechanical precision but security from all wear and tear will be ensured.[17]

I have not sought to suggest that Gandhi's reinterpretation of India's otherworldly asceticism will produce in India "a protestant ethic" and "a spirit of capitalism" which will stimulate a development of industrialism similar to the European counterpart analyzed by Weber. A book on the Indian case would more accurately be titled "The Hindu Ethic and the Spirit of Socialism." I have merely wanted to show that the traditional Indian philosophy of renunciation is not a major obstacle to economic development, that it has in fact been all along functionally linked to the material side of Indian life, and that as interpreted by the religious social reformers of the last hundred years, especially by Gandhi, it is perfectly capable of providing the spiritual incentives and disciplines of a modern industrial society.

[16] *Ibid.,* p. 174.
[17] Pp. 179, 180.

CULTURAL VALUES OF THE SECOND FIVE YEAR PLAN

Gandhi, it is true, was not in favor of industrialism; his opposition extended to the socialistic as well as to the capitalistic varieties.

> Pandit Nehru wants industrialization because he thinks that, if it is socialized, it would be free from the evils of capitalism. My own view is that the evils are inherent in industrialism and no amount of socialization can eradicate them.[18]

Yet as Nehru leads India into a program of industrialization one finds Gandhi's spirit very much in evidence, especially his beliefs that economic reform should be brought about by non-violent means, that "work is worship," that an agrarian simplicity of life is to be preferred to "the mad desire to destroy distance and time, to increase animal appetites and go to the ends of the earth in search of their satisfaction."

Industrialization and the welfare state

On the surface the second Five Year Plan, which is to be launched in the spring of 1956, does not appear to be very Gandhian or agrarian.[19] Its emphasis is on rapid industrialization: the national income is to be increased by 25 per cent in five years—through investment in heavy industry, transport, power, and communications—"in order to endow the economy with the capacity for self-propelling and accelerated growth." Nine to ten million new jobs are to be created for the new labor force, and the production of consumption goods is to be increased so that there will be incentive and enthusiasm for popular effort. Housing, schools, health facilities, and other social services are to be extended. If there are cultural values in this emphasis they are the values of the modern industrial state—economic power and independence, mass production and mass consumption, planned development, social welfare. These values are new to India, for although it is possible to find some historical precedents for some of them, the idea of a planned welfare state is, as Professors Altekar and Karve have shown,[20] a relatively recent one in India, as it is in most other countries of the world.

[18] Quoted from *Harijan* for September 29, 1940, by S. N. Agarwal, *The Gandhian Plan of Economic Development,* Foreword by Mahatma Gandhi, Bombay: Padma Publications, 1944.

[19] I have used the following three statements as my chief sources on the second Five Year Plan: P. C. Mahalanobis, "Draft Recommendations for the Formulation of the Second Five Year Plan, 1956–1961, March 17, 1955; "The Second Five Year Plan, a Tentative Framework," March 21, 1955; "The Second Five Year Plan, Basic Considerations Relating to the Plan Frame; A Memorandum Prepared by the Panel of Economists, Planning Commission," April 10, 1955.

Cottage and small-scale industries

A more Gandhian note is struck in the feature of the second plan which provides for the development and protection of cottage and small-scale industries. The reason given for this feature is that it will release scarce capital resources for heavy industry, and provide jobs and consumption goods, since the "capital intensive" producers' goods industries will not be able to provide much of either. Ostensibly this is a short-run, ingenious device for cushioning the human costs of heavy industrialization. It should disappear when capital becomes available for investment in consumption goods factories and when unemployment is liquidated. But that it is more than this is evident from the inclusion of other Gandhian planks in the plan frame: the extended arguments to demonstrate that "the very development of agriculture beyond a certain stage requires the development of non-agricultural activities, specially of Industry" to provide markets for agricultural produce, to supply industrial consumer goods, and to provide equipment and products needed by the expansion of agriculture; provisions for land reform, state-supported agricultural co-operatives, and industrial townships to reverse the migration of people and industry to the big cities; the extension of community development and extension service to all villages; the insistence on reducing economic and social inequalities to accord with social justice. Taken together with the provision for the development of cottage and small-scale industries, this adds up to a substantial agrarian program which seeks to carry the Gandhian ideals into action.

[20] Seminar on Interdisciplinary Indian Studies, Deccan College, Poona, 1955, Summary Report, pp. 21–25. I shall be glad to make copies of this report available on request.

Compromises

I have heard some observers in India say that not all members of the planning commission or of Nehru's cabinet sincerely believe in the economic wisdom of the agrarian part of the plan, but have gone along with it out of deference to the popularity of Gandhian "sentiments" or as a practical compromise with the Gandhians in the Congress party. That may or may not be the case, but even if this is true, it testifies to the strength and influence of Gandhian "sentiments" within the country and among some of the leading people in government. To call the second Five Year Plan a compromise between industrialism and agrarianism does not appear to me to condemn it. One might speak of it equally well as expressing the compromise which the Gandhians have made with the industrializers. In fact one can find in S. N. Agarwal's *The Gandhian Plan of Economic Development for India,* published in 1944 with an endorsement from

Gandhi,[21] the outline of a national economic plan essentially quite similar to the second Five Year Plan. Although this leading Gandhian bases his plan on the Gandhian ideals of decentralized, small, and self-sufficient village communities, he does not hesitate to include the following "basic industries" in his plan: defense industries; power—hydro and thermal electricity; mining, metallurgy, and forestry; machinery and machine tools; heavy engineering—ships, locomotives, automobiles, and aircraft; chemicals—heavy chemicals, fertilizers, pharmaceuticals. About the defense industries the author adds a footnote: "Although Gandhiji is an uncompromising pacifist and a staunch believer in nonviolence, he is practical enough to concede that a free India may require an armed defence."

It will not be the role of these basic industries in this plan to supply consumption goods, "which will mainly be supplied by cottage industries," but they will "help the growth and evolution of cottage factories."

Nehru, although far "softer" in his attitude towards industrialization and mechanization than Gandhi, saw good economic reasons for the development of cottage industries:

> India, like China, has enormous manpower, vast unemployment and under-employment. It is no good comparing with the tight little countries of Europe which gradually became industrialised with small and growing populations. Any scheme which involves the wastage of our labour power or which throws people out of employment is bad. From the purely economic point of view, even apart from the human aspect, it may be more profitable to use more labour power and less specialized machinery. It is better to find employment for a large number of people at a low income level than to keep most of them unemployed. It is possible also that the total wealth produced by a large number of cottage industries might be greater than that of some other factories producing the same kind of goods.[22]

The cultural values of the second Five Year Plan represent three different layers of culture—agrarian, industrial, and welfare. The conflicts among these three layers have, in rather characteristic Indian fashion, been reconciled and accommodated to coexist within a single plan and program of action. The ideals of Gandhian agrarianism have been, for the time being, joined to those of the industrial and welfare state for the immediate objective of creating "a socialistic pattern of society."

THE CHANGING VILLAGE

Between the thinking and targets of the second Five Year Plan and the realities of Indian life there exists an enormous gap. I do not mean to question whether cottage industries can supply the jobs and consumption goods on the scale planned for, whether they can be successfully protected from the competition of factory goods, and whether sufficient capital can be found for the expansion of heavy industry, although these matters are problematic and are being much discussed.[23] I have in mind rather the changing nature of the Indian village—within which over 75 per cent of the population is still to be found—and the mental outlook of the villager. Within the last hundred to two hundred years many things have happened to undermine the foundations of the self-sufficient, self-governing village communities described by Sir Henry Maine and projected as the ideal of the Gandhian movement. Individualized land tenure; the expansion of a money economy; the search for better jobs, loans, movies, medicine, and education in the cities; the coming of the suffrage and the political party—all these things have brought the Indian village and villager into a wider and more complex modern world from which disengagement will not be very easy.[24] Nor do the plans and planners that seek to bring to the villager some of the benefits and technology that would improve his lot under these new conditions always meet with a favorable reception. To those who do not understand the experience and mind of the villager, these resistances appear to stem from an unintelligent and stubborn traditionalism. To those who have a deeper knowledge they spring from reasons the planners have not thought of.[25]

Despite these resistances and the ignorant mistakes of well-intentioned reformers, one comes away convinced that the Indian government's tremendous effort at economic reform is taking hold at the village level. It may be that the achievements of the first plan's targets—particularly in food grains—should be attributed to the providence of three good monsoons (at least 40 per cent of it, according to the estimates of one Indian writer). But what impressed me personally from observations of some South Indian villages is that New Delhi has succeeded in establishing communication at the village level and that villagers are co-operating in the community development and extension service programs.

Chain of disciples

The language through which the communication occurs is not that of modern economics used by the planners. In one project village I visited, I asked the head of the village development committee after he proudly explained how they had fulfilled almost all of their targets—in the use of the Japanese method of rice planting, digging of compost pits, planting of trees, construction of latrines, culverts, roads, wells, and so forth—what would happen when the block development officers withdrew their help. He replied confidently that he and the villagers would continue to improve the village themselves. I pressed him to explain why. "Because," he said meditatively, "Gandhiji said the village should be improved, and Gandhiji had a disciple, Nehru, who made a five-year plan for the villages, and we who are Nehru's disciples will

[21] Cited note 18 *supra*. N. K. Bose, *Studies in Gandhism* (2nd ed.; Calcutta, 1947) gives additional direct evidence of Gandhi's qualified acceptance of industrialism and technological invention: "I do visualize electricity, shipbuilding, ironworks, machine-making and the like existing side by side with village handicrafts. But the order of dependence will be reversed" (p. 89). "I would prize every invention of science made for the benefit of all. There is a difference between invention and invention" (p. 48). I am indebted to Robert Redfield for calling my attention to Professor Bose's valuable collection of Gandhi's writings and interviews.

S. Rao, "The Second Five Year Plan—Some Methodological Considerations," *The Economic Weekly*, Vol. 7, No. 46 (November 12, 1955); "Planning in India," *The Economic Weekly*, Vol. 7, No. 47 (November 19, 1955). I owe these references to Professor David G. Mandelbaum of the University of California.

[24] McKim Marriott (Ed.), *Village India; Studies in the Little Community*, Chicago: University of Chicago Press, 1955. Gandhi did not envisage *complete* independence for the village but saw it as "a complete republic, independent of its neighbors for its vital wants, and yet interdependent for many things in which dependence is a necessity."—Bose, *op. cit.* (note 21 *supra*), pp. 57–58.

[25] David G. Mandelbaum, "Planning and Social Change in India," *Human Organization*, Vol. 12, No. 3 (1953), pp. 4–12.

help him carry out the plan in our village."

This man was a Brahmin and a landlord but he was obviously proud to be taking an active lead in bringing "modern reforms" to the village. His phrasing of the village's relation to the government in terms of the relation of a chain of disciples to their guru, or religious teacher, is most interesting and significant. For this language suggests that it may not be fear of a coercive authority or the expectation of increased "consumption goods" that primarily motivates the people's co-operation but rather their respect for Gandhi and Nehru as "religious" men who show the path to spiritual salvation.

Nehru has frequently disclaimed being religious in any orthodox sense; but as one who has made great sacrifices in the service of others he is worshiped by his countryman and believed to have "a spark of the divine" in him. During last year's meeting of the Congress party at Avadi near Madras, one woman suddenly came forward from the crowd to crown Nehru because she believed him to be an incarnation of Vishnu. Nehru demurred, although he finally interceded for her with the police, remarking that, after all, women have kind hearts. The incident does not mean, as some Americans have interpreted it, that Indians are lusting after royalty. It is rather a dramatic and symbolic expression of the message of the *Gita* according to Gandhi—of the search for self-realization and "the ambition to become like God." "Future generations pay this homage to one who in his own generation has been extraordinarily religious in his conduct . . . to one who has performed some extraordinary service to mankind." Because Indian villagers believe that Gandhi and Nehru have performed such services they worship them and stand ready to undertake public-spirited sacrifices themselves for the sake of approximating the self-realization to which their gurus have attained.[26]

Most villages are not yet within the community-development program, and not all those that are have a record of achievement as impressive as that of the model village from which the exemplary Brahmin leader comes. Only a few miles from this village I visited a colony of *harijans*—Gandhi's name for the untouchables is used all over India—who had hardly heard of Nehru or the Five Year Plans. They said they needed more common land on which to move their congested huts, a connecting path to the main road so they would not always have to wade through the paddy fields, a better drinking well, and free lunches for their children in their mission school. When I asked whether they also wanted easier access to the temple of the adjoining village from whose streets they were excluded, one of them replied, "Why should we want that; God is everywhere." The culture of these *harijans*, except for a school-teacher, a dramatics teacher, and one man who worked in the police force of a neighboring town, is very impoverished. Their horizons did not seem to extend beyond the ambition to acquire a fraction of an acre of land and the articulate group demands formulated by one of their spokesmen. Yet nearly all male members of the colony had heard of Gandhi, referred to him reverentially as "Gandhiji," and knew that land reform legislation was pending which was designed to improve their condition.

[26] When the socialist leader Jai Prakash Narain joined Vinoba Bhave's *Bhoodan yagna* movement, Bhave's secretary said: "In the beginning of this century, India witnessed Ram Krishna Paramahansa as the great Guru and Swami Vivekananda as his great disciple. India of today has in Acharya Vinoba Bhave a great Guru and Mr. Jai Prakash Narain as his great disciple." Quoted in the *Indian Press Digest*, Vol. 4 (Berkeley, University of California), p. 110.

MOTIVE FORCES FOR ECONOMIC DEVELOPMENT

Is it necessary to seek new spiritual incentives to make the Indian people work hard and bear the austerities added by their struggle to modernize their economy? In their indigenous "materialism," as well as in their philosophy of renunciation, interpreted by Gandhi as a discipline of action in the service of others, and in their quest for spiritual salvation under the guidance of gurus who have already achieved self-realization, may reside the psychological and moral motive forces needed for a democratic and nonviolent industrial development of India.

Milton Singer, Ph.D., Chicago, Illinois, is Paul Klapper Professor of the Social Sciences in the Department of Anthropology and in the College, University of Chicago. For the early part of 1956 he had a special research assignment as research anthropologist in the Institute of East Asiatic Studies at the University of California, Berkeley. He visited India for six months in 1954–55 under a project directed by Robert Redfield at the University of Chicago. He is coauthor with Gerhart Piers of Shame and Guilt: A Psychoanalytical and Cultural Study (1953) and, with Professor Redfield, is coeditor of the series "Comparative Studies of Cultures and Civilizations" being issued by the University of Chicago Press.

The Economic Development of Ceylon

By Theodore Morgan

THE Island of Ceylon is the pearl at the tip of India, barely north of the equator, with a population in mid-1956 of 8.8 million, and a land area half that of Wisconsin. It is an eight year-old independent member of the British Commonwealth, with little or no hostility and some real attachment to Westminster and the English. "Ceylon is the best job the British have done," once said Sir Oliver Goonetilleke, the present Governor General.

About seven-tenths of the people are Sinhalese, descended from ancient invaders out of North India—the Sinhalese view Ceylon as their own country. Slightly under one-quarter are Tamils from South India, of whom half have been in Ceylon for many generations, the other half having migrated during the past century or so. About 7 per cent are of other races.

The temperature hardly changes the year round. Near Colombo, in the southwest, where there is the most rainfall and the population is most dense, the monthly average temperature varies only between 79° and 82°. As one travels up into the hill country of the central south, the climate becomes semi-tropical and temperate. At Nuwara Eliya, 6,200 feet up, the monthly average temperature hovers close to 60°.

Agricultural Economy

Ceylon is an agricultural country. About 72 per cent of the population live in rural areas, producing some tea, rubber, and coconuts, but more characteristically growing rice and minor crops on minute land units. The median peasant rice paddy is under one-half acre. Some 10 per cent more of the population live on large-scale estates, many of them owned and operated by Europeans, and producing most of the export crops —tea, rubber, and coconuts. The remaining 18 per cent live in towns.

Reliance on agricultural exports means variable incomes. Between 1951 and 1952 the buying power abroad of Ceylon's exports dropped nearly a third; and between 1952 and 1955 rose by about four-fifths. This variability is an especial worry for a country that must import about half of its main food, rice. Average monthly incomes for individual income receivers were in 1953 Rs 107 ($22.50); and median income was Rs 66 ($13.90).[1] Income was distributed considerably more unequally than in the United States or England.

Consumption

Has average consumption been rising in recent years? The evidence is mixed. My own conclusion is that per capita consumption has probably risen by 10 to 25 per cent since the late 1930's, after being depressed during World War II. Domestic food production per capita seems to have remained about constant.[2]

[1] The study from which these figures are taken—Central Bank of Ceylon, *Survey of Ceylon's Consumer Finances* (Colombo, 1954)—included the value of income in kind as well as of money income.

[2] Per capita consumer imports averaged for 1951–54 16 per cent above 1938 levels, and these imports have been running at about 40 per cent of consumer spending.—Ministry of Finance, *Economic and Social Development of Ceylon, 1926–1954* (Colombo, 1955), pp. 36–37; W. Rasaputram, in the Central Bank of Ceylon *Bulletin*, December 1955, "Gross National Product of Ceylon at Constant Prices." Per capita national income in real terms has risen appreciably, though, I think, less than the figures of the Planning Secretariat show, owing to their failure to adjust for a change in the method of calculating national income between 1950 and 1951—*Six-Year Programme of Investment, 1954–55 to 1959–60* (Colombo: Ceylon Government Press, 1955), p. 4.

[3] Of course, a boom in the prices of Ceylon's exports *due to* war—like the Korean War boom in rubber prices—at the same time that imports remain available at less variable prices, will help out Ceylon's economy so long as it lasts.

Two Crucial Conditions

By "economic progress," I mean below simply rising average real income, that is, a rising quantity of goods and services produced per person. We can take it for granted that Ceylon will gradually import and adapt to its own uses foreign techniques, capital equipment, and varieties of plants and of animals.

Adequate world and domestic order

Such ingredients of progress will inevitably raise *total* real income unless there is overwhelming disruption from war outside or in Ceylon. Peaceful conditions abroad mean continued markets[3] for Ceylon's export crops and continued supplies of half of its food and nearly all its amenities. Peaceful conditions at home mean more investment in the long-run future of the Ceylon economy, and avoidance of the destruction and dislocations that can make progress impossible.

I leave to the reader's judgment the chances of adequate world peace. What are the chances of adequate order within Ceylon? In its favor are isolation by water from other countries, the example of Gandhian nonviolence north in India, the local Buddhist teachings of nonviolence, a working democratic system on the British model, and considerable respect for law and order. And yet, consider other indications. The murder rate in Ceylon is one of the highest in the world—nearly half again as high as in the United States. India, whose culture is much like Ceylon's, fell into savage violence during partition. Ceylon has a Communist movement sufficiently confident to have staged a trial insurrection in 1953, in protest against reduction of the rice subsidy.

On balance, the prospect for Ceylon's continued domestic order seems to me good. I assume in the rest of this paper that a government machine something like the present one continues.

But if, some time in the next generation, a Communist regime should seize and hold power, the social problems of economic progress considered below would still exist to plague the new bureaucrats. A Communist regime devoted in fact as well as in form to raising consumption would face greater obstacles than a democracy because part of the population would be hostile and would act only by compulsion. On the other hand, such a regime would be willing to tolerate greater human suffering —"You must break eggs to make an omelette," said the late Joseph Stalin—and it would be willing to use force.

Checking the population rise

In 1870, Ceylon's population was 2.5 million. Today it is 8.8 million, and is rising 2.6 per cent a year—one of the highest rates in the world. Ten years from now, current growth rates will build up to nearly 12 million people.

One of the great medical achievements of our times is the victory of DDT over malaria. In 1946 the Ceylon death rate was 20.2 per thousand; in 1947, 14.3. Continued medical and sanitary work had reduced the rate by 1954 to 10.4—lower than the death rates of Belgium and France!

But the birth rate remains nearly as high as ever—in recent years between 36 and 41 per thousand per year. Ceylon faces the hard fact that, in view of

the cultural and physical obstacles, modern science can much more easily cut the death rate than lower the birth rate or raise the food supply.

The issue is plain: Any check to population growth will make economic progress more likely or speed it up. Continued or accelerated population growth will make progress slow down or stop. In one meeting of government officials I attended, the problem of development was put as that of keeping the standard of living from falling—not of raising it.

Possibilities of increased production

What are the ways of meeting the needs of growing numbers of people? First, production from existing acreage can be raised. But such advance will take place slowly. A peasantry is by nature conservative: farmers cannot afford to lay a heavy bet on the advice of outside experts who will not themselves starve if their advice is wrong. Two-thirds of the agricultural workers of rural Ceylon are hired laborers or tenants; many of these people have little conscious interest in higher agricultural production. The rise of population already has forced fragmentation of cultivated land into postage-stamp plots for which improved methods are often not practicable.[4]

Second, more land can be cultivated —perhaps half as much again. But the land now left to jungle is not of first quality, and heavy investment is needed to clear, irrigate, and fertilize the marginal lands that are brought into cultivation. Recent land reclamation has cost the state up to $210 an acre.

Be as optimistic as you will about the possibilities of land improvement. As farmers gradually improve their methods and as they and the state develop new lands, the population will still keep on rising—and it is a gamble whether *average* output will rise.

Other solutions to population pressure

Emigration is no way out, since migration has been planned to a near standstill in our present world. Absorption of the growing numbers of the work force into industry is no adequate solution to population pressure either, in a country that is, by present knowledge, not endowed with minerals and fuels for industry. Nor can Ceylon afford to wait and hope that a rising standard of living and broadening education will eventually lead to a falling birth rate. Europe's example suggests that the population would triple or quadruple while, and if, this adjustment was being made.

The remaining possibility is a crucial watershed for Ceylon's future. Can the government plump for family planning, and dispense information and facilities for contraception at hospitals, dispensaries, and maternity homes? Bold action is needed, and considerable expenditure, if the birth rate of 36.2 per thousand is to be brought down within earshot of the death rate of 10.4.[5]

Official opinion leans this way and that. The first prime minister after independence, D. S. Senanayake, felt that Ceylon's population was no issue. His son, the second prime minister, felt it was.

India, to the north, gives example of government-sponsored family-planning clinics. The International Bank mission urged such a policy for Ceylon. In the country as a whole, there is little religious opposition: Buddhist and Hindu opinion seems neutral; Catholic opinion is opposed, but Catholics are a small minority. The growth of social welfare measures of the state means that children are less needed as social security for the parents. On the other hand, if Ceylon remains mostly agricultural, as is highly probable, the spread of social attitudes favoring the small family will be slower than it has been in urban societies.

The handicap of swiftly increasing numbers is so obvious, that, I think, a considerable effort toward family planning will probably be undertaken by the government during the next ten years.

So much for the crucial conditions of economic progress: *enough* peace and order and *not too fast* a rate of population growth. Given these, a rising standard of living is inevitable.

OTHER FACTORS

I come now to the social implications of other influences on Ceylon's economic development. They seem to me to be less crucial than the first two. Yet they are correlated with what happens to public order and to population, and in a situation otherwise nearly neutral can sway the balance toward growth or decline of average incomes.

Nutrition and health

Hungry and sick people cannot do much work. Sick people still need to eat. Improvement in diet and in health are part of the foundation for economic advance.

Nutrition is a problem both of production and of social attitudes and habits. Ceylon's diet is much above Indian standards. Nevertheless, a quarter or more of hospitalized illness is attributed at least partly to malnutrition. Rice is the staple food. The typical diet appears deficient in calcium, iron, phosphorus, certain vitamins, and available proteins. Foods that could supply the gaps—such as milk, cheese, eggs, fruits, and vegetables—enter the main meal of most people only as delicacies, much as candy does in an American diet.[6] The almost universal hookworm infection diminishes available nutrition.

Death-dealing diseases are steadily being conquered in Ceylon. Infant mortality is half what it was ten years ago, and maternal mortality nearly one-quarter; malaria is under control, tuberculosis deaths are falling rapidly, and so on.[7] But there is still much to do. Parasitic diseases continue to sap vitality. Hospitals are overcrowded; doctors and nurses are too few. Ayurvedic (folk) and ceremonial medicine continue to be popular.

Better food and better health are a cause of increased production, for a great deal of continuing improvement is possible just through making people aware of what foods they need and of the ways in which disease is spread. More money to spend is by no means necessary; the aim is rather to have people choose to work and live somewhat differently.

Here are two examples:

1. Rice is the respectable staple food, which you eat unless you are desperately poor. But the same food values can be got cheaper in *kurakkan* (a cereal), and far cheaper in cassava. The cost of calories in the form of cassava is a sixth to an eighth of their cost in the form of rice. The right variety of cassava must be used, and it

[4] Ceylon also suffers from difficulties over land titles. Boundaries are often uncertain, and three sets of land laws—Sinhalese, Dutch, and English—survive side by side. One piece of land, and one coconut tree, sometimes has a swarm of claimants who become still more numerous and their rights more complex with each generation. How seriously should one take a claim of one-fifth of a sixteenth share?

[5] 1954 provisional figures.

[6] International Bank for Reconstruction and Development, *The Economic Development of Ceylon* (Baltimore, Md.: Johns Hopkins Press, 1953), p. 735.

[7] *Six-Year Programme of Investment* (cited note 2 *supra*), pp. 380–83.

must be prepared properly to avoid the formation of a poisonous compound in its starch. We can easily show people how to grow and prepare safe cassava. The real difficulty is to convince them that eating cassava can be safe, and that it is respectable. The savings from these cheaper calories could be put into more protective foods. What protective foods? People need to be made aware of what their bodies need, and of the particular food values of the fruits and vegetables they often can easily grow.

2. Among the parasitic infections are hookworm, afflicting about nine in ten of the population, and roundworms, a chief cause of death to children in their early years. Filariasis is not uncommon; diarrheas and dysenteries are both acute and chronic. If there were enough sanitary latrines and better personal hygiene these infections would be wiped out. Less than one house in three has any sort of latrine; many of the latrines in houses, schools, and other public places are in bad order. Among towns and cities only Colombo has an effective sewage system, and even in Colombo only one house in three is connected to the sewer.[8] Few families boil their drinking water. All of them ought to. Nearly all people eat with their fingers. Their fingers are not always clean.

There is no point to the government's latrine building program if latrines are not kept in good order and are not used. Nor would the government need to build them at all if individual families were aware of their importance and put some of their free time into building and maintaining them.

In these matters of diet and hygiene a good deal is gradually being done, and much more could be done to secure the needed change in attitudes. The newspapers; the radio; government billboard advertising and pamphlets; meetings and conversation between the staffs of the hospitals, dispensaries, and maternity homes and the natural leaders of the people, especially village headmen; and, above all, a very serious effort in the schools to inculcate basic knowledge of nutrition and hygiene—these can in time do wonders for the health and vitality of the Ceylonese. "It's just not done" needs to become the automatic reaction to poor practices.

Prestige, income, and training

In Ceylon, as in other countries of the East, class divisions cut deeper than they do in the West. All aspects of status—income, prestige, occupation, caste—are closely correlated with each other. And the range between high and low is far wider than in the West: "Civil servants," says Professor T. L. Greene of the University of Ceylon, "walk with the gods—but the sweepers are less than the dust." We have accordingly a powerful social engine that can either channel peoples' energies into work that will advance economic progress or handicap progress. In fact, it does the latter.

The ambitious young man in Ceylon wants to be a civil servant—from 75 to 99 per cent of secondary school boys recently gave this as their first choice, and 63 per cent of university freshmen.[9] Among the reasons for this choice are the prestige of posts once filled by the British, "economic security," and the large dowries that a civil servant can command. Runner-up occupations are medicine, the law, and perhaps politics.

[8] International Bank, *op. cit.* (note 6 *supra*), pp. 750–53; *Survey of Ceylon's Consumer Finances* (cited note 1 *supra*), p. 34, Table 39.

[9] Professor T. L. Greene, of the University of Ceylon, unpublished study of 1,365 secondary school students in 1950. Murray A. Straus, "Family Characteristics and Occupational Choices of University Entrants As Clues to the Social Structure of Ceylon," *University of Ceylon Review*, April 1951, p. 9.

Not a single university entrant in the Straus study just cited wanted to be a planter, although tea, rubber, and coconuts are the major export industries of Ceylon.

In sum, the preferred occupations are bookish occupations. Prestige and a sense of personal success go to the person who is skilled in words. The upper social and income groups are disdainful of practical and mechanical work in which you get your hands dirty. The English tradition of university work as a training ground mainly in literary subjects for an elite group has been a reinforcement to these local attitudes.[10]

The result is that, although training in practical fields is available, almost no students choose it voluntarily. The students who choose it are those who are compelled to, because they have failed to pass the examination [11] that would qualify them for further academic work. Their failure means they are the least competent of the candidates, at least in the ways the test measures. It also means they are discouraged. It is from their ranks that the middle range of technicians will mainly be drawn—the foremen and shop managers—on whom Ceylon depends vitally for the prompt and imaginative adaptation of modern technology to local needs.[12]

[10] The University of Ceylon was recently moved from the capital city of Colombo, where many of its students could live at home and attend at low social cost, and placed in beautiful but expensive new buildings, sixty miles inland in the country. The move symbolizes the university as an institution removed from and contemplative of the world, not a part of the world and its problems.

[11] The Standard VIII Selective Test.

[12] It is not surprising, in view of the cultural pressure, that even the successful examinees who go on to the university show up poorly in tests involving physical and mechanical relationships. In a test of 1,950 university male freshmen the median score was one-fourth the American score on the same test.—Murray A. Straus, "Mental Ability and Cultural Needs: A Psychological Interpretation of the Intelligence Test Performance of Ceylon University Entrants," *American Sociological Review*, Vol. 16, No. 3 (June 1951), pp. 371–75.

Swabasha

The new independence of Ceylon has encouraged a *Swabasha* program: school students are to be instructed in Sinhalese or Tamil, depending on what is spoken in their homes. English is to become a secondary language, whereas in the past it has been the primary language of instruction in the upper grades and the university.

The psychology of wanting to have education in one's native tongue is understandable, but the policy will tend toward intellectual starvation. For knowledge of English will wither, and there will be few original writings of quality, and few and often late and imperfect translations into the local languages. The populations that use those languages are relatively small and will not be able to provide financial support for much of a publishing industry. Ceylon will be more isolated culturally and scientifically than it would have been had English been retained as the language of higher instruction.

Obedience and docility

Ceylon's culture teaches obedience and passivity. Schools emphasize learning by memorization, and students often recite in unison. Teachers indoctrinate; they do not encourage their students to experiment and question. Desire is thought the root of evil; asceticism and austerity are revered. In the Hindu and Buddhist views, obedience and resignation are primary ideals of life and will improve one's fortune in this life and in reincarnation.

A Westerner in Ceylon is struck by some degree of pessimism and cynicism about Ceylon's future. Ceylonese peo-

ple hardly believe that the long stagnation of the past is going to change in ways that they want.

CHANGING ATTITUDES AND VALUES

What I have put down on these matters of education and culture indicates a society that values security more than progress. And yet the Ceylonese do want economic progress. I once sampled for two weeks the front page items in the two leading English language papers of Colombo, the *Times* and the *Daily News*. Two-thirds of the items had some connection with economic development.

Development is going on, and as it proceeds, these social attitudes will gradually change in the direction of more practical-mindedness; more mobility, geographically, socially, and economically; the attachment of more prestige to getting ahead financially and greater focus of ambition on financial success; a frame of mind more inquiring, skeptical, and experimental; less attachment to family and to family occupations; more of the unsettling notion that *les grandpères ont toujours tort*. These changes—many of them unpleasant to the Ceylonese—will be concomitants and results of development. But they are also causes of economic progress.

GOVERNMENT POLICY

Several policies that can be emphasized by government would be helpful to progress, and probably also socially acceptable.

Vocational counseling

Effective vocational counseling is needed to steer young people away from vain ambitions for the civil service and into occupations which have more openings and which will further progress—such fields as bacteriology, genetics, agronomy, soil chemistry, engineering in general, agricultural extension, nursing, public health and preventive medicine, and practical teaching.

The disjointedness of training and needs is underscored by the 1950 survey of Professor Greene.[13] Over half of secondary school students wanted to go into professional and public service work, but only one in six could expect to find a job there. Only one-fourth wanted to go into "production" occupations, but almost two-thirds of the opportunities were there.

One result of wrongly directed training is that unemployment and underemployment appear to be equally heavy whether people have had no schooling, primary schooling only, or secondary schooling. According to a 1953 survey, unemployment was about 17 per cent of the work force for all three groups, and underemployment (defined as working less than twenty hours a week) ranged from 10 to 14 per cent.[14]

Relative pay rates

The government could boost the prestige and the attractiveness of practical work by setting its own pay scale higher for such types of work. Maintenance grants for secondary school and university students who are specializing in practical fields could be relatively large. The civil service examinations should be revised so that they give a great deal of emphasis to problem-solving ability in agriculture, biology, and mechanics.

Rote versus educational adventure

The Ministry of Education should do all it can, year after year, to shift educational practice away from the old memorization—reciting in unison and blackboard and book work in which facts are indoctrinated by authoritarian teachers—to training that is an adventure of discovery shared by teacher

[13] *Op. cit.* (note 9 *supra*).

[14] *Survey of Ceylon's Consumer Finances* (cited note 1 *supra*), pp. 12, 13.

and students, oriented in large part toward local problems of production, diet, and hygiene. The problem-and-experiment approach can be used on many an issue of seed types, animal breeds, fertilization and irrigation practice, bacteriology, chemistry, and physics.[15]

CAPITAL FORMATION

I have so far said nothing about a matter that in many a treatise swallows up everything else—the volume of capital formation. I have subordinated this matter by postponing it—partly because this article was designed to be mainly on the social implications of economic development; partly because *government* investment is covered so fully in the Planning Secretariat's *Six-Year Programme of Investment;* and partly because I think emphasis on government investment is often exaggerated as compared with the less controllable private investment, and the volume of total investment as compared to the less tangible social influences that determine the productivity of investment.

Of course power, tools, and structure are aids to labor. But investment can have accounted for only a small part of the economic advance of developed countries.[16] In this article I have been implying that matters of culture, diet, and health deserve primary emphasis in Ceylon, as being the prospective causes of increasing returns to present and future capital investment.

OTHER CULTURAL HINDRANCES

A Westerner in Ceylon is conscious of other social attitudes than those I have listed that are hindrances to economic advance. Caste still counts in Ceylon [17] and bars the choice of the best man or woman for a given task. But caste distinctions are weakening and will continue to weaken as development proceeds.

As in any rural and isolated environment—for example, Tom Sawyer's in Missouri—ghosts, spirits, and gods of various descriptions are numerous in Ceylon. Even men who have taken their degrees at Cambridge and London, and the highest ranking graduates of the University of Ceylon, are acutely aware of the spirit world around them. Astrology is more firmly established even than in Hollywood: officials and businessmen often take astrological advice before making important decisions. I can only think that such an attitude is a distraction from the prompt and efficient solution of practical problems. The attitude will wane as economic advance continues, since that advance means more of a materialistic approach toward concrete problems.

The culture of Ceylon encourages women to be especially submissive and docile, and so their contribution to production is lessened. Their movement into industry no doubt will increase as economic progress continues.

As in many another traditional community, close family ties are a hindrance to any individual's getting ahead, and hence to his trying to get ahead. If the

[15] There are today some hopeful trends toward more formal technical training; see *Six-Year Programme of Investment* (cited note 2 *supra*), pp. 351–58.

[16] Gross investment (including depreciation) in developing countries does not usually run above some 10 to 16 per cent of income. Subtract half of this as a rough allowance for depreciation, and net capital formation comes to 5 to 8 per cent per year. Assume that the productivity of capital is from 6 to 10 per cent. Then 0.3 to 0.8 per cent per year of growth in total production is explained by capital formation. But developing countries often raise production by 2 to 5 per cent or more a year. Conclusion: other more important influences than capital formation must be at work. Cf. Leon H. Dupriez (Ed.), *Economic Progress* (Louvain, 1955), the estimates of A. K. Cairncross, p. 235.

[17] Cf. Bryce Ryan, *Caste in Modern Ceylon,* New Brunswick, N. J.: Rutgers Press, 1953.

culture compels him to share his gains with many a less fortunate relative, his taking risks and struggling for financial success are discouraged. These family ties should slowly soften with increased mobility and the growth of a commercial point of view.

At the government project in irrigation, electric power, and resettlement at Gal Oya, a settler proudly showed visitors his sacks of harvested rice. But the sentiment nearest his heart was the inefficiency of his government, which obstinately refused to repair the roof of his grain room, with the result that his harvest was rotting. The settler's attitude is an extreme case of a common malady. The psychology of looking to government for action and care of everything is deeply imbedded in Ceylon's ancient culture; it has been reinforced by the authority of the Portuguese, Dutch, and British regimes, and reinforced again by the obvious need, in these days, for a great deal of government action to further development. The present Six Year Development Program is a program for investment *by the government.*

The psychology of dependence on Colombo, and the related unique prestige and self-conscious authority of the civil servants, are sharp handicaps to Ceylon's progress. These handicaps, too, should diminish as development proceeds, as more and more people achieve the self-respect and independence that economic progress implies, and as the school system, one hopes, inculcates more of self-reliant, practical-minded attitudes.

CONCLUSION

A final summary view on Ceylon must be optimistic. Ceylon is in a favorable geographical location for stimulus from outside, much as England and Japan are and were. She is removed from probable storm centers and hence may hope for a peaceful future. Certainly techniques will keep on improving. Mistakes will be made by government and by private entrepreneurs, but they will be corrected, or put up with. If the country stays peaceful, production will rise. Production will rise faster if and as attitudes and values change so that they favor economic advance, and if and as real investment speeds up. If the population increase is checked *enough,* the standard of living will rise.

Theodore Morgan, Ph.D., Madison, Wisconsin, is professor of economics at the University of Wisconsin. He was earlier instructor at the University of Hawaii (1936–38), tutor and fellow at Harvard University (1940–41), assistant professor at Randolph-Macon Woman's College (1941–42), and instructor at Harvard (1942–47). In 1942 he also served as associate economist in the Department of State. He has been at Wisconsin since 1947, save for a leave in 1951–53 to be economic adviser to the Central Bank of Ceylon and in 1952–53 its Deputy Governor. He is the author of Hawaii, A Century of Economic Change (1948), Income and Employment (1949, 1952), and Introduction to Economics (1950, 1956), and coauthor of The Challenge of Our Times (1954).

Approaches of the Japanese Innovator to Cultural and Technical Change*

By JOHN W. BENNETT and ROBERT K. MCKNIGHT

EUROPEAN nations experienced modernization as part of a gradual historical development from feudal society through nationhood and the industrial revolution. Nonliterate tribal societies have undergone related changes as a consequence of colonialization and economic exploitation by the West. In most cases change in these societies has taken the form of a haphazard transition, with accompanying disharmonies in rate and scale as measured by the classic European evolution. Non-Western civilized societies, like Japan, commenced their transformation to modern industrial nationhood from stages of relative political and economic complexity, and with varying degrees and kinds of prior association with Western nations.

In the Asian countries the transition from a traditional social order to a modern framework of institutions has tended to engage the interests and emotions of a majority of the intelligentsia: there have been—and this is true of Japan—few "free-floating intellectuals."[1] The educated person, as an academic or professional specialist, has occupied a vital role: he has been called upon to serve his country and its goals (or to attempt to reformulate them), and he has viewed the world through special lenses colored by the needs and problems of the national experience with modernization. Cultural and technical change in these countries has not been simply a practical problem of instituting educational facilities, constructing factories, and organizing bureaucracies. It has involved the intellectual question of how people are to orient their images of themselves in the changing scene, and how the society is to orient itself to the world as a whole.

In other words, many aspects of modernization in those societies that are "catching up" or have "caught up" with Western developments may be treated as ideological problems of individual and social perspective. In this paper we shall be concerned with the innovator and ideologist in one of these societies, Japan, and will consider the position of highly educated Japanese persons in cultural and technical change with respect to their attitudes, values, and social roles.

MODERNIZATION AMONG THE LATECOMERS

An important difference in the historical process of the modernization of Europe and of a country like Japan lies in the fact that in the latter the changes

* This paper is based upon data acquired in a two-year study of Japanese educated in America, sponsored by the Social Science Research Council. The study included research on Japanese in residence at American educational institutions and on others in Japan who had previously studied here. Considerable documentary study of the Japanese intelligentsia and Japan's modernization provided a necessary foundation for the empirical research. The study of Japanese in the United States was directed by John W. Bennett; the study of "returnees" by Herbert Passin (see Herbert Passin and John W. Bennett, "The America-educated Japanese," Parts I and II, THE ANNALS, Vol. 295 [September 1954], pp. 83–107). A book on the entire study is under preparation at the Ohio State University.

[1] See Karl Mannheim, *Ideology and Utopia,* translated by L. Wirth and E. Shils (New York: Harcourt, Brace and Co., 1936), pp. 157–60.

were not so much a matter of social evolution as the products of continuous planning taking place within a few generations. The rapid and *planned* character of modernization in Japan, as in many non-Western civilized nations, has been given an urgent accent by international developments. In Japan the desire to escape colonial or imperial domination—as witness the fate of China—lay behind much of the energy and singleness of purpose which characterized her transformation. In India today, the need to attain modern nationhood as a device to escape economic and military encirclement is equally potent as a stimulus to rapid, efficiently planned transformation. Latin American countries have presented similar profiles. This is not to imply that planning did not accompany some phases of the European transformation, but only that Japanese leaders attempted to exercise strong and continuous rational control over the nation's institutions and their alterations. Modernization thus came to be seen by many Japanese as the result of consciously formulated ends and means and not as a gradual and inevitable evolutionary process.[2]

In view of these differences in the social process of change, it is useful to consider certain broad aspects of the history of modernization as a background for our analysis of basic ideologies. In the case of Western nations, contemporary analyses seem to agree on a definition of three major developmental stages: [3] the first consists of feudal society, with its traditional culture, fixed contractual relationships between classes, and static economy; the second is the stage of dynamic politico-economic expansion, with ideological controversy and great individual mobility; the third is the period of consolidation, with an emphasis upon consumption, greater predictability in career development, and pressures toward conformity (though science may continue its creation of new horizons, and political dynamism, at least between nations, persists).

The directed role of the educated in modernization

These three stages, superficially at least, may be evident in Japan's historical development from Tokugawa feudalism to the contemporary period. However, the *differences* in Japan's changes when compared with those of Western nations are more important for our present discussion. First, as we have noted, the process in Japan was more rapid and under much greater conscious control. Unrestricted individual achievement was less evident, and mobility was generally directed by national purposes or took place within traditional forms of interpersonal relations. The European second, or transitional, stage was exceedingly attenuated. In Japan the balance of political power was retained by the elite aristocracy, and the social forces that might have instituted social-relational forms and philosophy along European lines experienced frequent frustration by a national loyalist mass movement efficiently activated via educational and communication facilities
