Finally, in addition to the humanitarian and economic aspects of such an organization, the opportunities for research are much enhanced by the concentration of special clinical material. Thus all traumatic lesions of peripheral nerves and tendons occurring in the R.A.F. anywhere in the world rapidly find their way to one centre, giving great opportunities for the development and improvement of special surgical skills and techniques. Expensive research apparatus, such as is required for electromyography, can thus be developed most economically and efficiently. Unique clinical opportunities, not otherwise available, have enabled investigators to undertake studies of no fewer than 55 cases of osteochondritis dissecans,¹ some 1,500 athletic injuries,² the results of different forms of physical treatment in knee injuries,³ and over 1,500 menisectomies.⁴ This organization has advanced a long way from the Manchester Ship Canal fracture service of Sir Robert Jones in 1888 and the convalescent camp in Salonika formed by Sir Thomas Fairbank in 1915, and the R.A.F. is to be congratulated on continuing with such energy and skill into peacetime the rehabilitation service it founded in the second world war. The National Health Service has benefited much from it.

BRITISH SOCIETY FOR IMMUNOLOGY INAUGURAL MEETING

[FROM A SPECIAL CORRESPONDENT]

Immunologists in Britain, unlike their counterparts in America and France, have long lacked a representative body. One consequence of this shortcoming has been the unavoidable inclusion of their contributions, both verbal and written, in the *Proceedings* of other societies. While this has undoubtedly avoided some of the very real dangers of overspecialization, it has resulted in a dangerous lack of cross-fertilization between the far-spaced frontiers of a large field. Thanks to the hard work of Dr. R. R. A. Coombs, Professor J. R. Marrack, Professor G. Payling Wright, and others the British Society for Immunology came into being at precisely 10 a.m. on November 9 in the lecture theatre of the Wellcome Foundation in Euston Road. The society was particularly fortunate in having Sir HENRY DALE, O.M., F.R.S., to open its proceedings. More than 250 people attended the two-day scientific meeting, at which 22 papers were presented.

Sites of Antibody Reactions

The first session, under the chairmanship of Brigadier J. S. K. BOYD, F.R.S., was mainly devoted to studies in which Coon's fluorescent antibody technique had been applied. The method depends upon the conjugation of antibodies with fluorescein, which are then allowed to react with the antigen under appropriate circumstances—e.g., in frozen histological sections. Sites of union of the "marked" antibody with antigen are then revealed by their fluorescence under the ultra-violet microscope. The application of this method to histological sections by Drs. D. G. SCOTT and A. G. S. HILL had indicated that the basement membrane of the kidney glomerulus contains at least two antigens, one of which was apparently shared by reticular tissue throughout the body and the other shared by more restricted tissues. Dr. B. CRICKSHANK and his colleagues described their attempts to apply the method to reveal the sites of formation of pituitary hormones in man. The antibodies were prepared in rabbits against purified hormones of human origin isolated from fresh pituitaries and from urine. The use of Coon's method to study the union of antibodies with red-cell antigens was dealt with by Dr. R. ALEXANDER. All speakers were agreed that the interpretation of their results presented considerable problems, because the specificity of uptake of the conjugated or fluorescein-labelled antibodies was difficult to appraise with confidence. Dr. G. H. BEALE concluded this series of papers by describing his investigation of the use of fluorescein-labelled rabbit antibodies to study the gene-controlled ciliary antigens in *Paramecium*, which undergo transformation with environmental conditions.

Immunity to Parasitic Worms

The two final papers of the session were concerned with the immunological responses of mammals to metazoan parasites. Dr. E. J. L. SOULSBY had investigated immunity to *Ascaris lumbricoides*—a parasite of the pig—when it is introduced into guinea-pigs. A substantial immunity, which had a protective influence—as evidenced by fewer larvae, less lung damage, and degeneration of embryonated eggs—developed following the oral administration of embryonated eggs. When larvae of the organism were exposed *in vitro* to sera from immunized animals precipitates formed around them.

Studies on parasitic bronchitis in cattle, caused by nematode worms (*Dictyocaulus viviparus*) picked up from the pasture, were described by Dr. G. M. URQUHART and his associates. Animals which survived this disease acquired

a protective immunity which could be passively transferred with their serum. One of the problems to be resolved was that antibodies did not appear until after the infection had been eliminated. Some measure of protection was achieved by injection of either dried lungworms with Freund's adjuvant, or of heavily x-irradiated larvae, before challenge with living *Dictyocaulus*.

Complement, Properdin, and Immunoconglutinin

The second session was a comprehensive symposium on complement. This was ably introduced by Professor J. R. MARRACK, the chairman. Many of us have rather naively come to regard complement as being almost synonymous with freshly prepared guinea-pig serum. Certainly it was reassuring that Professor Marrack said that by definition complement is a haemolytic substance which causes lysis of red cells which have reacted with antibodies. But unfortunately the story is not simple: complement has at least four components, all of which are necessary for haemolysis. The opening speaker, Dr. R. JOHNS, stressed how little is known about the uptake of complement in the course of the formation of antigen-antibody precipitates. Active haemolytic complement could not be recovered from antigen-antibody complexes after dissociation. We really do not know, in fact, whether complement is "fixed" at all. Dr. A. C. WARDLAW dealt with the action of properdin and complement on bacteria. Properdin, a normal constituent of serum, recently discovered by Professor Pillemer, of Western Reserve University (Ohio), combines with and inactivates certain bacteria in the presence of complement and magnesium ions. Various lines of evidence suggested that properdin may act enzymatically and not be used up in killing micro-organisms. For example, a small constant amount appeared to be equally effective in inactivating small numbers or very large numbers of bacteria.

Dr. R. R. A. COOMBS and Dr. J. MARKS put forward the view that when the components of complement in man become fixed on sensitized cells *in vivo* they undergo configurative changes which make the complement auto-antigenic. A new substance, immunoconglutinin, is then formed in response to it and may be regarded as an auto-antibody. Although a high natural level of conglutinin is found regularly in ruminants, in man it appears in the serum only as a consequence of certain infections. Dr. J. V. DACIE emphasized that complement was essential for the sensitization of red cells by cold agglutinins. In the absence of complement cold agglutinins are eluted and no agglutination can then be obtained with antiglobulin sera.

In addition to the complex series of "ingredients" of complement present in blood plasma, there is also another rather complicated system of proteins which is responsible for the clotting of blood. After a comprehensive review of the present state of knowledge about these two complexes, Dr. A. SHARPE concluded that, although the matter is not completely resolved, the two systems are probably separate. The symposium was concluded by Dr. C. E. KELLETT's account of his clinical studies on the low level of complement in the blood during the course of various diseases. Recovery was generally associated with return of complement to a normal level, but there were exceptions which at present defied explanation.

Diffusion Studies of Complex Antigens

In the third session, although a wide variety of studies were presented, a common factor to all was the employment of agar diffusion techniques (variants of Ouchterlony's method). The principle of these methods is simple: antigen and antibody solutions are placed in separate wells cut in a flat agar plate. After a time lines of precipitation form where antigen and antibody make contact through diffusion. The advantage of the method is that it enables investigators to resolve complex antigens into their components.

Dr. R. R. PORTER had studied the specific reactions of "fragments" of bovine serum albumin after digestion with chymotrypsin and quite drastic purification procedures. He produced evidence that a fraction with a molecular weight about one-fifth of that of the original antigen combined with antibody. The immunological properties of fractions derived from grass pollen antigens formed the subject matter of Mrs. R. ALGUSTIN'S paper. These fractions differed in their precipitation properties *in vitro* as well as in their capacity to induce skin sensitization. During the discussion following this paper those present were pleasantly surprised to discover that among them was Dr. PRAUSNITZ-GILES, a youthful octogenarian, whose name is familiar to all from the Prausnitz-Küstner reaction.

By perfusing isolated lungs from immunized rabbits *in vitro* with ¹⁴C-labelled amino-acids Drs. J. H. HUMPHREY and B. ASKONAS had obtained evidence of continued formation of antibody and, of course, that antibody is produced in the lungs. Dr. P. G. H. GELL gave an account of elegant and highly specific agar diffusion methods for the semi-quantitative detection of certain types of serum globulins. Drs. B. CINADER and J. H. PEARCE had employed agar diffusion methods to study the antigenic composition of bovine ribonuclease. They measured the enzymatic activity of the antigen after its combination with antibodies in various concentrations.

Immunological Tolerance

Three of the four contributions at the final session dealt with immunological tolerance—a specific central *inhibition* of immunological response which follows exposure of individuals to antigens either during foetal life or soon after birth.

Dr. I. DUNSFORD described two individuals who were apparent exceptions to the rule that human beings lack iso-antibodies to antigens present in their own red cells. The first case was that of the human red-cell chimera,* Mrs. McK., who during pregnancy had developed A₁ antibodies which, however, failed to react with the A₁ cells of fraternal origin present in her own blood. The second was a woman, possibly a chimera, who was certainly not a twin at birth, but whose anomalous red-cell antigen picture might conceivably be explained in terms of an exchange of cells with a dizygous twin which had been resorbed in foetal life. Drs. R. E. BILLINGHAM and L. BRENT described a method for inducing tolerance of skin homografts in mice by intravenous inoculation of the animals at birth with spleen cells. Evidence was presented that, besides conferring tolerance, the inoculated cells might react against their hosts, inflicting damage on their lymphoid tissues. Dr. D. W. WEISS and the late Dr. A. Q. WELLS, whose untimely death was a source of sadness to all, had succeeded in making guinea-pigs partially tolerant of tuberculin by inoculation of the antigen in foetal life. This was evidenced by a reduced skin reaction in a tuberculin test. Following their prenatal injection with living B.C.G., however, evidence of sensitization at birth was obtained.

Dr. P. L. MOLLISON described the effect of the antigenic constitution of incompatible red cells on the mode and tempo of their elimination in man. Small quantities of radio-labelled red cells were injected and their fate followed in the body with a scintillation counter. His findings showed that most of the cells are removed by the spleen within a very short space of time, but a small residue of them was long-lasting in the circulation.

Throughout the meeting the standard of the papers was very high: this, combined with commendable self-discipline of the speakers in keeping to their allotted times, was amply rewarded by the excellent discussions which the society intends to foster at its future meetings.

*When tissues or cells from one individual become permanently established in the body of another, unrelated, individual the composite organism is described as a chimera.

HARVEY TERCENTENARY CONGRESS

CELEBRATIONS IN LONDON AND FOLKESTONE

June 3-8, 1957

To commemorate the tercentenary of William Harvey's death in 1657 an international congress will be held next June in London and Folkestone. The congress will comprise scientific sessions at the Royal College of Surgeons on the general theme, "A Review of the Present Knowledge of the Circulation," and a one-day conference at Folkestone, Harvey's birthplace, where the more personal and biographical aspects of Harvey's life will be reviewed. The programme of subjects and distinguished speakers is given below. The idea of the congress came from the Harveian Society of London, and the society is duly represented on the organizing committee. The president of the congress is to be Mr. A. DICKSON WRIGHT, president-elect of the Harveian Society of London. Mr. W. E. TUCKER is the honorary treasurer, and Dr. D. GERAINT JAMES honorary secretary. The congress committee reflects the wide support from other learned bodies and includes representatives of the Royal Society, the Royal College of Physicians of London, the Medical Research Council, the Cardiac Society, the Physiological Society, the Thoracic Society, and the Society of Thoracic Surgeons. Sir RUSSELL BRAIN, P.R.C.P., will deliver the concluding address of the London meeting, and Sir GEOFFREY KEYNES will be chairman of the Folkestone commemoration. The social programme includes a banquet at the Dorchester Hotel and receptions at London University and Gray's Inn.

The registration fee for both the scientific sessions and the social functions is £10; or £1 daily for attendance at the scientific sessions only. Further details and registration forms may be obtained from the congress secretary, 11, Chandos Street, Cavendish Square, London, W.1.

Scientific Programme

Monday, June 3: 9.30 a.m., Opening of the Congress. The president, Mr. A. DICKSON WRIGHT, in the chair. "Knowledge of the Circulation from the Seventeenth to Twentieth Centuries." *Contributors*: Professor K. J. FRANKLIN, F.R.S. (Medical College, St. Bartholomew's Hospital, London); Dr. F. A. WILLIUS (Mayo Clinic); Dr. J. FULTON (Yale University); Professor Sir CHARLES DODDS, F.R.S. (Middlesex Hospital, London). **2 p.m.**, Professor G. W. PICKERING (Oxford) in the chair. "The Role of the Heart in the Circulation." *Contributors*: Dr. L. KATZ (Chicago); Dr. P. WOOD (National Heart Hospital, London); Professor K. MATTHES (Heidelberg); Dr. SILVIO WEIDMANN (Berne).

Tuesday, June 4: 9.30 a.m., *Chairman*: Sir CLEMENT PRICE THOMAS (Westminster Hospital, London). "The Results of Cardiac Surgery." Sir RUSSELL BROCK (Guy's Hospital, London); Professor G. D'ALLAINES (Paris); Professor C. CRAFOORD (Stockholm); Dr. MAURICE CAMPBELL (Guy's Hospital, London). **2 p.m.**, *Chairman*: Dr. C. S. BECK (Cleveland). "The Coronary Circulation." Dr. D. E. GREGG (Washington).

Wednesday, June 5: 9.30 a.m., *Chairman*: Professor J. McMICAL (Postgraduate Medical School, London). "The Pulmonary Circulation." Dr. A. CURNAND (New York); Professor C. V. HARRISON (Postgraduate Medical School, London); Dr. S. RADNER (Lund, Sweden). **2 p.m.**, "The Foetal Circulation." Dr. G. S. DAWES (Nuffield Institute for Medical Research, Oxford).

Thursday, June 6: 9.30 a.m., *Chairman*: Dr. MACDONALD CRITCHLEY (King's College Hospital, London). "The Cerebral Circulation." Dr. S. KETY (National Institute of Health, Bethesda); Professor TH. ALAJOUANINE (Paris); Dr. E. H. BOTTERELL (Toronto). **2 p.m.**, *Chairman*: Professor Sir JAMES LEARMONTH (Edinburgh). "The Splanchnic Circulation." Dr. S. E. BRADLEY (New York); Dr. S.

DEC. 1, 1956

HARVEY TERCENTENARY CONGRESS

BRITISH
MEDICAL JOURNAL

1297

SHERLOCK (Postgraduate Medical School, London); Professor R. MILNES WALKER (Bristol).

Friday, June 7: 9.30 a.m., *Chairman*: Professor A. KEKWICK (Middlesex Hospital, London). "The Peripheral Circulation." "Circulation Through the Limbs," Professor H. BARCROFT (St. Thomas's Hospital, London); "Vascular Innervation," Professor W. D. M. PATON, F.R.S. (Royal College of Surgeons, London); "Pathology of Vessels," Professor J. H. DIBLE (Postgraduate Medical School, London); "Surgery of Occlusive Arterial Disease," Professor C. G. ROB (St. Mary's Hospital, London). **2 p.m.**, Concluding address by Sir RUSSELL BRAIN, P.R.C.P.

Folkestone Commemoration

Saturday, June 8: 10.30 a.m., Sir GEOFFREY KEYNES in the chair. "Harvey's Birthplace," Professor T. HARE (London); "Harvey at Padua," Professor A. P. CAWADIAS (London); "Harvey the Scientist," Dr. W. R. BETT; "Harvey and French Medicine," Dr. L. CHAUVOIS (Paris). **Afternoon**.—Visit to Canterbury Cathedral. **Evening**.—Civic Reception.

MEDICAL WOMEN'S INTERNATIONAL ASSOCIATION

[FROM A SPECIAL CORRESPONDENT]

The Medical Women's International Association has recently held an extraordinary general assembly at the Burgenstock, Switzerland, attended by nearly 200 delegates from 23 countries. There was also an observer from Japan, where there is a large and flourishing association of medical women. Although the meeting was short, lasting only from September 20 to 23, and called mainly for administrative purposes, one day was devoted to scientific discussions. The theme chosen was "The Problems of the Married Woman Working Outside the Home, and their Effects on the Physical and Mental Well-being of the Family Group." The assembly was presided over by its Italian president, Dr. M. YOLANDA TOSONI DALAI, of Milan, and the chairmanship of the scientific sessions was in the hands of Professor A. CHARLOTTE RUYS, of Amsterdam.

Working Wives and Their Families

Owing to the nature of the subject, one on which women doctors tend to have strong views, it was decided to employ the method of group discussion for the treatment of the theme. Four speakers had been chosen beforehand, Dr. SUZANNE SERIN, of France, a psychiatrist with a great deal of experience of work with juvenile delinquents; Dr. MARIE MEIERHOFER, of Switzerland, one of the co-founders of the Pestalozzi village; Dr. INGE JESPERSEN, a young Danish doctor who has recently undertaken specific research into the subject for a state organization in Denmark; and Dr. DORIS ODUM, president of the European League for Mental Health. After the papers, the delegates divided into a number of groups in order to discuss the subject. Each group had been left free to determine the language to be used in its discussions, and this inevitably led to a certain linguistic or regional grouping, not without advantage when so many different continents were represented. The Far Eastern group, for instance, reported that it had no real experience of such problems, but appeared to be looking forward to the day when it would have.

The views of the speakers were on the whole very similar, although the Swiss report sounded a rather negative note. The Danish paper stressed the very high degree of social legislation in the Scandinavian countries to protect the married woman at work; but, although reporting that investigations had failed to prove any unfavourable results from such work, stated that the shortage of domestic help,

the inadequate provision of crèches and nursery schools, and the discriminatory taxation of married woman had all created serious problems. The British paper dealt more with the practical aspects of the problem, and with marital and social attitudes, and stressed the fact that the emotional relationships between husband and wife, and mother and children, were the really determining factors in the case. Here again, although some increase in nervous and emotional instability was reported, the speaker could find no overall unfavourable factors to militate against work outside the home.

The Swiss report looked more on the darker side, stating that the tendency in Switzerland was to do everything to encourage the married woman to stay at home, such as by increasing the income of the husband and by various grants and tax reliefs. The view of the speaker was that the result of the married woman working outside the home was a serious strain that impaired both the well-being of the family group and of the woman herself. When this point of view was later challenged by some of the groups and even by Swiss colleagues, the speaker remarked pointedly that, although everyone was unanimous in urging practical measures to help the married woman who went out to work, such as more domestic help, more trained assistants to take charge of the children, shorter working hours, and so on, such things were difficult in practice, and married women were often doing full-time work both inside and outside the home, with an amount of overstrain which could only be injurious to their well-being.

The French report stated that, though women's employment in France had shifted considerably from agricultural to professional, clerical, and factory work, the actual proportion of women at work had remained constant for over half a century. The speaker, from her experience of the children's and adolescents' courts of the Seine department, was able definitely to refute the charge that the emotional difficulties of children and adolescents which resulted in delinquency or prostitution were more frequent in homes where the mother went out to work. The French report ended with a serious warning that women should not seek too many concessions in their work, lest they should prejudice many openings for women's employment.

Professor Ruys pointed out in her summing up that economic pressure in the Western Hemisphere was largely responsible for the increase in the employment of women in many countries. There was a tendency for women to marry earlier, owing to the increasing proportion of males in the population, and girls were staying longer at school. Thus the percentage of married women in employment was inevitably higher. The incentives, however, were not purely economic, as many women found it essential to their own development to continue with their occupations or professions after marriage. The problem was common to very many countries, and was part of an evolutionary process which, like all others, was bound to claim its victims. It was the task of medicine to try to minimize any harmful effects of such developments.

The Scientific Film Association gives details of 145 films on atomic energy and related subjects in the October issue of *Scientific Film Review*. This is said to be the first comprehensive list of such films, and the subject index covers the following categories: application and handling of radioactive isotopes in agriculture, biology, chemistry, general surveys, industry, metallurgy, and meteorology; atomic bomb and civil defence; equipment and apparatus; general surveys; moral, political, and religious problems; natural resources; nuclear reactors; occupational safety; progress reports; research centres and atomic energy plants; theoretical aspects. Single copies of this issue of the *Review* (Volume 2, No. 4, October, 1956) are available at 3s. 6d. from the association at 164, Shaftesbury Avenue, London, W.C.2.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Pharmaceutical Advertisements

SIR,—Preparations issued by certain pharmaceutical firms and the circulars advertising them have recently been the subject of animadversions in the medical press. Particular criticisms have been directed against advertisements for preparations of triiodothyronine and against the issue of capsules containing multiple anti-anaemic drugs. It is right and proper that the medical profession should take a critical interest in the suitability of pharmaceutical preparations—particularly when they contain potent remedies—and in the accuracy of the claims made for them in the circulars which reach doctors in such numbers. The splendour of the therapeutic advance in the last fifty years has been due in no small measure to the research, ingenuity, and initiative of the great pharmaceutical firms. The close co-operation of the medical profession with the pharmaceutical industry—particularly in the clinical trial of new drugs—and the confidence of the profession in the industry's integrity and altruism are of the greatest importance. Nothing is more calculated to upset that co-operation and confidence than the issue of undesirable pharmaceutical preparations and advertisements which include extravagant and unjustifiable claims.

A further attempt to popularize "blunderbuss" therapy is evidenced by the recent advertisement of a tablet for the treatment of asthma containing prednisone 1.5 mg., ephedrine hydrochloride 15 mg., theophylline 120 mg., and phenobarbitone 10 mg. Since cortisone became available for general prescription in this country it has on the whole been used with much propriety and discretion and has not been incorporated into oral polypharmaceutical preparations. This example should be followed in the administration of prednisone. Potent drugs of this nature should be prescribed alone. Any increase or decrease in their dose does not then involve an automatic—and possibly undesirable—change in the quantity of the other drugs contained in a polypharmaceutical tablet. The makers claim for this tablet that "a marked synergism exists among the constituents." The term "synergy" has a definite pharmacological connotation, and there is no scientific evidence whatever to suggest that synergism exists between the drugs included in the preparation. The makers claim further that "side-effects are negligible" and that there are "no contraindications." Doubtless in the doses recommended (up to six tablets daily—i.e., 9 mg. daily of prednisone) side-effects are unlikely to be pronounced, but there is no mention in the circular of the possible duration of treatment. It has been reported that prolonged administration of 10 mg. of prednisone daily has produced psychoses, and no one yet knows how much suppression of the patient's adrenal cortex may be produced by lengthy treatment, even if the dose employed is a small one. Further, bronchial infection, a potent factor in many cases of asthma, is likely to be exacerbated rather than relieved by such treatment, but the makers claim that the tablets are suitable for all cases of asthma "whatever the aetiology." Lastly, it is noteworthy that the price of the tablets is not mentioned in the circular.

The value of cortisone and prednisone in the treatment of certain cases of intractable status asthmaticus has been established. Their role in the long-term management of the asthmatic state is much more controversial, but at any rate they should not be incorporated in "blunderbuss" tablets for the treatment of "asthma of all aetiologies."—I am, etc.,

Edinburgh, 3.

D. M. DUNLOP.

SIR,—Dr. J. D. W. Whitney (*Journal*, November 10, p. 1116) raises a point of real importance in the business-like conduct of general practice as it is to-day. I have tried every method that I could conceive to keep a tabulated and up-to-date file of all new pharmaceutical products as their advertisements and literature reached my desk. Alas, whatever the method, I found myself in a very short space of time with an untidy and unmanageable mess of advertisements of every possible size and shape, and in desperation the whole lot were consigned to the waste-paper basket. *Faute de mieux*, I now only keep those books as issued by the larger houses, and which are kept up to date by an annual revised edition.

I feel that a loose-leaf file (as Dr. Whitney suggests) would be filled to capacity in next to no time, whatever its size. If the big pharmaceutical houses did but realize the appalling waste of printing and postages that to-day befall their efforts, surely they would get together and agree on a standard size and quality of card, and a standard size of type and layout, at least for the top line or two. It would also be necessary to start such a filing system off "on the right foot" by deciding at the outset upon the method of classification—is it to be under the manufacturers' name, or the proprietary name of the drug, or the particular condition or syndrome or symptom for which it is offered, or some other basis? But the present state of utterly wasteful advertising is long overdue for control and co-ordination by the houses from whence it emanates.—I am, etc.,

Arnold, Notts.

K. SHALLCROSS DICKINSON.

SIR,—Dr. J. D. W. Whitney's suggestion (*Journal*, November 10, p. 1116) for a card-index of pharmaceutical products would appear to be admirably met by the *Index of New Products* published by the Pharmaceutical Society of Great Britain. This index began in 1949 and costs £2 2s. per annum. Manufacturers supply the Pharmaceutical Society with the required details of their products. The Society, which is also the publisher of the *British Pharmaceutical Codex* and the *Extra Pharmacopoeia* (Martindale), edits these details and issues a new card for each new product, with revision cards from time to time. The result is an up-to-date index of scientific integrity, comprehensive in its detail and free from commercial bias.—I am, etc.,

Liverpool.

The Distillers Company (Biochemicals) Ltd.

Pitfalls in Medicine

SIR,—Many of us will have read with enjoyment and the greatest interest Dr. A. H. Douthwaite's Croonian Lectures (*Journal*, October 20 and 27, pp. 895 and 958). There is, however, one pitfall unfortunately only too common to which he does not refer but which is amply illustrated in the lecture, and that is the misinterpretation and misuse of radiological investigation. This is particularly evidenced by the suggestion that some radiologists believe it pointless to carry a barium-meal examination beyond the ileo-caecal region. I can assure Dr. Douthwaite that even in the backwoods such a view has not been held for many years (if ever), and even in the sylvan glades of the metropolis there can only be a few eccentrics who do not agree that the colon is not completely investigated unless a barium meal has been followed through to the anus.

It ought now to be generally recognized that much of the unreliability of radiological examinations stems from ignorance of the principles and methods involved, and, indeed, in the sixty years since Roentgen put this diagnostic weapon in our hands it is still seldom used efficiently. That this is so is a consequence of medical education. It is a fact that medical men, during their medical education, spend many weary hours making microscopic slides and learning about pathological changes in tissue, yet they would not make a pathological diagnosis without consulting the pathologist. Yet these same practitioners, on the strength of half a dozen sketchy lectures on radiology and fortified by the experience of wielding a box-camera in their youth, will think nothing

DEC. 1, 1956

CORRESPONDENCE

German Measles and Abortion

SIR,—In an inaugural address at King's College Hospital Medical School Lord Justice Denning is reported to have expressed the opinion that "Law and medicine went hand in hand when the Oath stipulated that the doctor should in no way misuse his art or skill. The law in regard to abortion would, his lordship was sure, permit the practice in regard to German measles. The law in England, he hoped, was in complete accord with common sense in this matter" (*Journal*, October 6, p. 821).

With reference to the position of medicine in regard to abortion and German measles, the attention of your readers is drawn to the summing-up of the medical viewpoint which appeared in a leading article in the *British Medical Journal*, September 8, 1951. In this article the following was stated, *inter alia*, "Maternal rubella in the early months of pregnancy is apparently thought by some to necessitate termination of the pregnancy . . . the medical evidence can hardly be taken to justify such a course. . . . If rubella does occur, then it is important that the anxieties, if present, of the parents should be relieved as much as possible by letting them know that they are quite likely to have a normal baby, and that, if the baby is affected, it will not necessarily be seriously."

In view of the fact that conflicting views have been expressed, it is suggested that a further leading article summarizing the present-day position would be of value in guiding medical and legal opinion.—I am, etc.,

Claremont, C.P.,
S. Africa.

R. LANCE IMPEY.

Bleeding from the Cord

SIR,—As a result of one or two personal scares caused by the occurrence of bleeding from the umbilical cords of babies delivered some hours before, I was prompted to inquire how often this happened, and to try and discover why it should be possible after seemingly adequate precautions had been taken. At the Birmingham Maternity Hospital it was the practice to divide the cord between clamps and later to tie the cord twice with tape before the proximal clamp was removed. In spite of this, investigation showed that in the course of nine months some degree of bleeding from the cord occurred in 32 babies; in eight of these the bleeding was sufficient to cause some alarm, while on one occasion transfusion was considered necessary. The bleeding nearly always occurred about two to four hours after delivery. Inquiries sent to departments in other parts of the country showed that, although the incidence elsewhere was probably less than in Birmingham, there had been occasions where the baby had actually died as a result of this haemorrhage.

How, one might ask, could such a simple procedure for controlling bleeding fail to be invariably successful? The clues to the detection of the cause were that bleeding usually occurs where there has been marked shrinkage of the cord, and when the cord is inspected the ligatures are now found to be loose and inadequate. Professor Jeffcoate kindly inquired of cases occurring in his departments, and found only very few cases of minor haemorrhage over a number of years. This he suggested might be due to the fact that the cord was not tied until the baby was bathed, usually one to two hours after it was born, so that shrinkage had largely occurred before the ligatures were applied. A little detective work in our own hospital showed that the cord was being tied soon after the baby was born. The remedy we are suggesting is as follows: (1) The cord is first divided between clamps and one ligature of tape is applied between the proximal clamp and umbilicus (tape is preferred for this ligature, as the finer ligature material may actually cut through vessels in the cord and cause bleeding). (2) When the baby is bathed about two hours later the tape is removed and a ligature of plaited thread is tied over the site occupied by the clamp. In this way there should be little doubt that there will be sufficient compression of the cord by the second ligature to prevent bleeding.

of making a firm diagnosis on an x-ray film. How often has one not observed, with rueful indulgence, medical practitioners, both general and specialist, holding x-ray films upside down, somewhere between the sink and the window, and coming to some unwarranted conclusion therefrom.

Even in these enlightened times, requests for x-ray examinations are only too frequently pushed into the department as soon as it opens, with the clinical details, if any, filled in by the ward sister and the house officer's initials (often forged) scrawled underneath—the whole accompanied by a verbal message to say please could it be done as soon as possible, so that the films are ready when Dr. Snooks does his rounds in two hours' time. Then again we have the special specialist who likes to read his own films and interpret them in the light of his own specialty and regardless of the old axiom that a patient is a person and not a case in a special clinic, and thereby missing some important evidence that lies outside his own ambit. His report is often regarded as a radiological report, and radiology falls into disrepute as a result.

No, Sir, the field of knowledge in medicine is now so extensive that no man can encompass it in its entirety, and, popular or unpopular, adequate results can only be attained by consultation and exchange of views between colleagues. Anything less than this is a disservice to medicine and an injustice to our patients, but until this liberal view is recognized and acted upon we radiologists must continue in our gloomy dens unhonoured, unvisited, and, we hope, unsued.—I am, etc.,

Newton Abbot, Devon.

A. ROBINSON THOMAS.

SIR,—Dr. A. H. Douthwaite, in the second of two excellent Croonian Lectures (*Journal*, October 27, p. 958), described a case of carcinoma of the distal colon in a man of 60. The history was suggestive; a barium meal follow-through increased the suspicion; but a barium enema showed no evidence of the neoplasm which was found at operation a month later. Dr. Douthwaite uses this case to oppose the opinion of "some radiologists" that a barium enema gives more reliable information about the colon than does a barium meal. With reference to the radiological demonstration of colonic carcinoma I would suggest that an overwhelming majority of radiologists favour the enema.

It would be unfortunate if the publicity given to this failure of a barium enema to demonstrate carcinoma should influence doctors to place more reliance on a barium meal follow-through. For Dr. Douthwaite's case was exceptional. It is an extreme rarity for a carcinoma of the distal colon to be demonstrated with certainty by a barium meal, whereas with a barium enema it is a common occurrence. The argument that an irregularity in the bowel may be completely obliterated by the hydrostatic pressure of an enema cannot apply to the post-evacuation films, which usually show good mucosal detail, especially in the distal colon.

The usual barium meal follow-through goes on for 48 and 72 hours, and often longer. It is reliable for the demonstration of diverticula, but its value in the detection of colonic carcinoma is minimal. Most radiological departments are overworked, and can ill afford the time spent on an examination which seldom reveals as much of significance in the colon as does a properly performed barium enema.—I am, etc.,

Reading.

PAUL CAVE.

Itchy Measles

SIR,—An unusual feature of a local measles epidemic is the intense irritation complained of by a large majority of the patients. Several children have said that the rash has been far more itchy than the chickenpox they had this summer. I have had several requests for calamine lotion to allay the irritation, and this is something that I have not come across in other measles epidemics. Apart from this the cases appear quite classical, and I wonder if we are seeing some modification in virus behaviour here.—I am, etc.,

Oxhey, Herts.

ERIC J. TRIMMER.

It may be that few of your readers have had any cause for alarm on this account. I feel, however, that eternal vigilance is necessary to prevent the sudden catastrophe, and occasional investigation into methods of cord ligature may be a useful prophylaxis.—I am, etc.,

Birmingham, 15.

A. L. DEACON.

Cutaneous Anthrax

SIR,—At the suggestion of my good friends, Dr. G. C. Dockeray and Dr. H. Foy, I am putting on record the fact that during the past seven years at Magadi Hospital over 500 cases of cutaneous anthrax, mainly in Masai (a nomadic cattle-rearing tribe), have been treated with penicillin under my supervision.

Year	Masai	Other Africans
1950	64	8
1951	32	7
1952	35	5
1953	43	6
1954	58	9
1955	96	7
1956 (to date)	130	2
Total	458	44

There have been three deaths only, all in small children, one of whom died within a few minutes of arrival at the hospital. The mortality rate in treated cases is therefore less than 0.5%, so that the prognosis is very good indeed.

Most of the lesions were typical "malignant pustules." A few patients who attended early had itching sores, rather like scratched insect bites. Localized "oedematous impetigo" should lead one to suspect anthrax in an area where the disease is common. Diagnoses were confirmed by laboratory examination of exudates from the lesions in all but 28 cases. The anthrax-infected "itching sore" is a pitfall for the unwary, especially in afebrile children who may be sent away with merely a local application, as happened in one instance in my series. The child was admitted the following day with typical massive oedema around the sore, convulsions, and a temperature of 104° F. (40° C.). Fits are not uncommon in children suffering from this disease, possibly because of meningo-encephalitis associated with septicaemia.

Adults respond well to intramuscular procaine penicillin in oil in doses of 300,000 units daily until 24 hours after they become afebrile (usually in three or four days). Children require heavier dosage. I have given up to 2,400,000 units of "distaquaine" initially, but such a large dose is probably unnecessary. I still give 900,000 units of distaquaine immediately to a child if the temperature on admission is 104° F. (40° C.) or over. Butobarbitone sodium controls convulsions very well. I do not give any local treatment other than calamine lotion.—I am, etc.,

Magadi, Kenya.

T. H. WHITE.

Colonic Motility

SIR,—I was interested in your annotation on colon motility and the significance of the observations of research workers in this field over the years (*Journal*, October 13, p. 870). My experience is that interpretation is very difficult, and I advise against drawing hard and fast conclusions from the work of Davidson and his colleagues at Cornell¹ on Type IV waves. To me a potentially significant point was the absence of these waves in seven children with ulcerative colitis (of more than one year's duration), not the matter of whether they had diarrhoea or not. Between 1946 and 1949 I investigated colon motility in 21 cases of ulcerative colitis, five cases of colon neurosis, and one case of duodenal ulcer, one carcinoma of stomach, one hysteria, one megacolon, and one colostomy for cancer of rectum. In the last year I have made more studies in colitis, Crohn's disease, and in one hypertensive subject, and this work is continuing. The length of each record is from two to three hours, and in some it has been repeated.

It is true that some cases of ulcerative colitis show a flat record with an inactive colon, but this is not invariable. My records tend to show that it is more common in the chronic form of the disease than in the acute severer types. This could be explained by physiological rest. After inserting the balloon through a sigmoidoscope it is usual to see a quiet period for 20 to 30 minutes which I have thought may be due to inhibition. It must not be confused with a genuinely inactive bowel. Most ulcerative colitis subjects, however inert their bowel, can produce some activity if tender emotional subjects involving their own life situation are discussed. If they still do not respond, morphine 1/12 gr. (5.4 mg.) intravenously has a remarkable effect on increasing tone and restoring motility of the normal type, if a little more excitable. Stimuli which had previously failed, such as gastrocolic reflex, increased stretch, and especially emotion, now succeed. It is possible that future investigators may find this a useful manoeuvre.

I cannot draw any definite conclusions from my work, and I think the whole matter of what happens in the colon when an ulcerative colitis patient takes umbrage is still wide open, though I am inclined to think that vascular changes, haemorrhage, and oedema in the mucosa may be the major factor, but this would not exclude muscular activity (Lium's² original work) as of contributory importance.—I am, etc.,

Ipswich.

Physiological Castration Syndrome in Breast Cancer

SIR,—The interesting paper by Professor G. J. Hadfield and Mr. J. A. G. Holt (*Journal*, October 27, p. 972), dealing with the effect of castration upon breast cancer, has prompted me to send a short note of a case of this kind that I have dealt with recently.

My patient was aged 34, with three children, and was seen 19 months ago with an enlarged, hard breast completely infiltrated with carcinoma. I removed the breast and numerous infected glands that were present along the axillary and subscapular vessels. The operation was followed by a thorough course of radiotherapy, administered at University College Hospital. The patient remained well for six months; then the skin around the mastectomy incision became uncomfortable and was found to be widely infiltrated with recurrent cancer. No further radiotherapy was possible at this time, but on the advice of Dr. Gwendoline Hilton I castrated the patient. The ovaries were enlarged to the size of big walnuts, and histological examination showed that both were extensively infiltrated with highly malignant spheroidal cancer cells. A crystal of testosterone was implanted at the same time. After the operation the condition of the skin over the chest soon improved, and it became clear that the growth was of hormone-dependent type. A further course of radiotherapy was given to the operation area just one year after the breast was removed. At present the patient appears very well. It seems that the activity of the growth is controlled and secondary deposits are in a stage of regression which has lasted over 13 months. In view of the age of the patient, the type of tumour, and the early and extensive recurrence, this seems to me most remarkable.—I am, etc.,

Chobham, Surrey.

L. G. HIGGINS.

History of Adrenal Virilism

SIR,—Professor F. T. G. Prunty (*Journal*, September 15, p. 615) mentioned Sampson (1697) as the first writer to describe the adreno-genital syndrome. According to H. Keil,¹ two cases were described more than 2,000 years earlier than this in a part of the Hippocratic writings which have never been translated into English. Keil's rendering is from the French of Littré:

"At Abdera [a married woman] had had children previously; but her husband having fled, her menses became suppressed for

a long time; afterwards pains and redness in the joints . . . the body assumed a masculine appearance, this woman became hairy all over, a beard appeared in her, the voice became rough . . . [she] died not long after." [A second patient in Thasos] "The only hope of restoring her womanly attributes lay in the return of her menses but . . . this woman soon died."

—I am, etc.,

East Melbourne, Australia.

Future of Diagnostic Procedures

SIR,—The letter from Dr. J. Shackleton Bailey (*Journal*, November 10, p. 1119) makes some interesting comments. He does not mention the possible genetic hazard in the case of his patient, but it may be as relevant as the leukaemia hazard.

Dr. Bailey does throw out the suggestion that modified echo-sounding and radar apparatus might find medical use, and this may well be so in the future. A modified mine-detector, however, is already in clinical use for the localization of metallic foreign bodies, especially during the progress of an operation for removal. So far as I know, they are only commercially available from the Berman Laboratories of New York, and Samuel Berman¹ has described the instrument and its use. I only know of four Berman locators in use in this country (in London, Newcastle, and Cardiff), but there must be already a score of surgeons who find the removal of needles, etc., greatly simplified by their use. I understand that at least one British firm is contemplating the manufacture of an instrument of this type. Should it appear on the British market, many hospitals will want to have one. This, at any rate, is one practicable step towards the reduction of radiation exposure of the population through diagnostic radiology.—I am, etc.,

S. B. OSBORN,
Principal Physicist,
University College Hospital.

London, W.C.1.

SIR,—Dr. J. Shackleton Bailey's letter (*Journal*, November 10, p. 1119) indicates the desirability for a definite pronouncement by a responsible body on the possible dangers of diagnostic radiological procedures involving doses which are very small in relation to those known to cause local damage to the skin or other tissues. Recent publications have suggested that there is a slight risk of producing leukaemia or other malignant disease from very small doses of x rays.¹⁻³ Nevertheless, we do not consider that his patient should have been refused radiography "because of the risk of producing leukaemia." We believe these risks to be quite secondary in importance to the genetic effects of radiation. We regard the risk of inducing leukaemia and malignant disease, if substantiated, as one which will presumably become apparent and calculable in the foreseeable future and will constitute a hazard which can be evaluated by clinicians.

While we await further details of the survey on which Dr. Alice Stewart is engaged, it seems likely that the risk of obstetric radiography is very small when considered in relation to the overall stillbirth and neonatal death rates. The information given by radiology is such that at the present time the risk of inducing malignant disease should certainly be ignored. It seems desirable to review radiographic procedure, partly with the object of minimizing the extent to which the gonads of patients, departmental and nursing staff, etc., who have not yet passed the reproductive period are irradiated. Many of the recommendations of the International Committee on Radiological Protection are ignored in diagnostic x-ray departments. The genetic effect of radiation is cumulative and likely to cause recessive mutations which may be serious in years to come if a sufficiently large proportion of the population has been irradiated.^{4,5} Furthermore, these effects are irreversible and will remain a permanent burden to future generations.

Radiology is an invaluable diagnostic method which carries, for the most part, probably a minute risk, and it should be used when the examination is likely to furnish information either positive or negative which is of value in the elucidation or management of the condition from which the patient is suffering or to allay anxiety. It is, however, obvious that indiscriminate and over-enthusiastic radiography of children, young adults, and pregnant women is to be deplored—largely because of the long-term genetic effects on the population.

Until more is known about the risks of diagnostic radiology it is questionable if it is justifiable to conduct radiographic surveys of normal or asymptomatic subjects under middle age for furthering academic knowledge. We believe that there is a strong case for questioning all married women of the child-bearing age referred for radiography of the lower abdomen or pelvis as to the possibility of pregnancy. Whenever possible, radiography of the abdomen should be avoided during the first three months of pregnancy and carefully controlled subsequently. It also seems desirable, in order to avoid irradiating an unsuspected pregnancy, that radiography of the pelvic region should be confined to the post-menstrual fortnight in married women.⁶

We consider that some modifications of apparatus are desirable—e.g., a shaft of light emitted by the x-ray tube to indicate the size of the primary beam falling on the patient, and a stricter discipline is required of the radiological staff to limit the extent to which the patient is irradiated when a particular part is under examination (How often is a baby's abdomen irradiated when its chest is being radiographed?).—We are, etc.,

Fetishism Treated by Aversion Therapy

SIR,—I would like to point to a rather gross error in Dr. M. J. Raymond's recent article "A Case of Fetishism Treated by Aversion Therapy" (*Journal*, October 13, p. 854).

Dr. Raymond states at the beginning of his article that he had been able to find only three apparently successful results in established cases of fetishism quoted in the literature. A purely superficial glance through the literature on this subject, however, reveals quite a number of reports of successful cures by analytical methods in cases of fetishism—and I have no doubt that a careful search would reveal many more. Abraham¹ mentions the successful analysis of a fetishist; Stekel² quotes several successful results; both Nunberg³ and Hunter⁴ report on cures; and T. Hornik's⁵ brilliant and successful analysis of a case of fetishism should be read by all people interested in this problem.

Dr. Raymond's article gives the impression that the cure of a case of fetishism is a rather haphazard procedure, depending on such factors as "co-operative wives" or "temporal lobectomy." It should be stressed, however, that the analytical approach is in no way haphazard. It has not only helped us to arrive at a comparatively profound understanding of the aetiology and symbolism of fetishism but has also evolved a technique of treatment that can usually be relied on to achieve a partial or complete "cure" (whatever this means when one is dealing with an illness that has often spread to the core of a patient's personality and character). The argument for the analytical treatment of fetishism is admittedly weakened by the fact that Dr. Raymond's case had already received a long dose of analysis.

Dr. Raymond has clearly put a lot of thought and ingenuity into his successful attempt at curing his fetishistic patient by aversion therapy. But I feel that this form of

treatment should be reserved, as it was in this case, for cases that are not amenable to analytical treatment. It would be unfortunate if aversion therapy came to be considered as a primary method of treatment for fetishism, for this would be to reject the positive contribution inherent in the analytical method, which attempts to probe to the roots of a symptom and, by understanding it, to treat it. Let aversion therapy be used as a last resort, by all means, but it should not replace an already established (and often successful) method of treatment.—I am, etc.,

London, N.W.8.

SIR,—The article by Dr. M. J. Raymond (*Journal*, October 13, p. 854) on a deconditioning process, even if only embryonic, offers solid grounds for hope that at last we may be able to deal more constructively with that obscure group of psychoneuroses known as the fetishes and perversions, and indeed many others who have been wrongly conditioned.

Doubtless the aversion technique needs improvement. Dr. Raymond tried apomorphine in his perambulator case, with the success reported, while I have on one occasion used antabuse with not so signal a success. I cannot help feeling that we need some drug—not at present discovered, so far as I am aware—which will create in the mind itself a psychological feeling of disgust and revulsion, rather than a physical action associated with nausea and vomiting. The great thing, I think, is to time the two things exactly, the disgust fantasy in the mind, and the sight, sound, or smell—i.e., the fetish or perversion sensation—and then to establish this by force of habit and repetition until cure is established.

Life as we live it in this world of flesh consists very largely, if not wholly, of images and conditioned reflexes, and if those who work in mental hospitals or with the mentally afflicted knew no other psychology but about these matters their understanding of the human mind would be facilitated. Fetishists and pervers are, of course, only a small body of a large group of people wrongly conditioned; none the less, they are an important group because of their antisocial tendencies. At the Tavistock Clinic, and elsewhere since, I have handled various fetichisms and perversions—locks of hair, high-heeled shoes, whips, leather, women's clothes, etc. (but never perambulators)—by the familiar methods of psychotherapy, suggestion, hypnosis, psycho-analysis, and re-education therapy, without, I fear, any lasting success. Recently I have had a young man with an inclination to strangle when he passed an elderly (not a young) woman on the stairs. My investigations into the psychopathology of such states almost invariably reveal a close association in childhood (and sex floods the system much earlier than we think) between two signals, the equivalent of Pavlov's signals, between a sexual sight, sound, or smell, perhaps of an unusual nature, and a tidal wave of sex in the individual himself at a time of undue sensitivity, and almost invariably in the case of the male—which is natural enough, because the male, in contrast to the woman, must, in the normal course of events, be activated by a symbol, a symbol of womanhood, so far as his normal sex life is concerned.

This faulty impression or image, so emotionally charged, becomes indelibly stamped on the psyche by force of habit or repetition, ultimately substituting for, in whole or part, the natural sex urge. And it is to this, the replacement, the patient now responds on every occasion, or whenever he is particularly sensitized through depressive factors, stress, and so forth. There can be but one hope—deconditioning—and it is indeed to Pavlov and his researches into the conditioned reflexes we have to look for the first illumination.—I am, etc.,

Exminster, Devon.

JOHN W. FISHER.

Strychnine Poisoning

SIR,—With reference to the medical memorandum by Dr. Cecily Statham on a case of strychnine poisoning (*Journal*, November 10, p. 1101), I would like to remind practitioners that mephenesin ("myanesin," "tolseram," etc.) is a powerful and specific antidote to strychnine. It may be given by intravenous injection if necessary, in doses of up to 30 mg. per kg. weight. There seems to be no reason why control of fits should not be maintained by continued slow intravenous drip of a suitably dilute solution, which would appear to offer a less hazardous and "staff-consuming" procedure than anaesthesia plus curarization plus controlled respiration for a whole day.

I would stress that I have not had the opportunity to try this technique, as the few cases of strychnine poisoning I have seen have been mild and easily controlled by intramuscular phenobarbitone sodium and mephenesin as an elixir taken orally, but it works in animals.—I am, etc.,

Cardiff.

J. D. P. GRAHAM.

Radioactive Key-light

SIR,—Recently I was sent a "luminous ignition key-light," and think that many other doctors will have received a similar article. Simple tests made locally showed the key-light to be radioactive, although it had come unscreened through the post.

Two expert opinions have been obtained upon the sample. The radioactive content, mainly derived from radium, was found to be of the order of 5.5 microcuries. This is less than the safe tolerance dose when the key-light is kept at a distance greater than 10 cm. The device might, however, do harm if kept in the pockets for a time, or handled by young children as a plaything. May I warn your readers of the probable danger were one of these articles to be accidentally swallowed by a child? If, therefore, the light is not used as instructed it is desirable to arrange for its safe disposal. I am also informed that if one is placed near a photographic film the emulsion is likely to become fogged.—I am, etc.,

Leamington Spa.

D. LIVINGSTONE.

The Motor Show

SIR,—Your correspondent (*Journal*, October 20, p. 938) has, I am sorry to see, written a rather inconsequential article on the recent Motor Show; he has mentioned hardly any of the practical points which might interest the prospective purchaser, particularly if a medical man.

The most noteworthy feature of this Motor Show was the deplorably bad design of most of the cars from the practical point of view as distinguished from pure mechanical efficiency, a fault which in some respects almost amounted to criminal negligence in design. A prospective purchaser must consider whether he wants a car for work, pleasure, travelling long distances, airing his girl friends, or merely for parking outside his front door. Half the cars at the Show were fit only for the latter purpose.

If you are a doctor, you must have a car that you can get in and out of thirty times a day without breaking either your legs or neck. Whoever you are, you must have a car that you can drive on a rainy day without facing the danger of concussion every time the car goes over a bump. If you are to drive for long periods you must have a seat that does not predispose to painful orthopaedic conditions. Now the basic fault with modern cars is that they are designed for the female driver. As a result a man can hardly get in and out of the machines. Roofs are all too low, so that in almost any car there is a danger of banging your head on the roof, while in some cases, including one semi-limousine costing over £2,000 and all the sports cars of whatever price, my head actually touched the roof when I was sitting comfortably. The only sports car that I could get into with the hood closed was the cheapest. The difficulty with the roof can be overcome by sitting well forward

in the seat with the back well rounded, but this is the very position which predisposes to prolapsed intervertebral disk and causes so much discomfort to countless motorists.

Having eventually squeezed yourself into a car, you find that the steering wheel is in the wrong place, and there is nothing that you can do about it, for the pre-war steering wheel of adjustable length and rake is a thing of the past. In some cases the pedals are so set that they cause a marked strain on the muscles of the lower leg. Finally, what amounts to the almost criminal is the crowding of the pedals. My own car is one of the cheapest models and yet one of the roomiest; its performance is indifferent, but I can sit upright in the seat without getting backache and yet have 4 in. (10 cm.) clearance between my head and the roof, but the seat, alas, lacks any pretence at design; it gives no support to the back anywhere near where it is required: yet even in this roomy car I find that the inside of my right shoe gets worn by the brake pedal while the outside of the shoe is wearing away the panelling of the bodywork. I have driven cars in which I could not use the foot-brake without also depressing with the same foot either the accelerator or clutch: could anything be more dangerous or more likely to cause accidents? I must add that I am large but no giant, being a mere 6 ft. 1½ in. (1.8 m.) and taking size 10 shoes.

If present tendencies continue, our cars will only be fit for midgets. Let us hope that next year there will be more cars for men and more consideration for some elementary points of safety and simple anatomy.—I am, etc.,

Huntingdon.

R. T. D. FITZGERALD.

Neostigmine-resistant Curarization

SIR,—The dangerous and not uncommon condition of persistent post-operative oligapnoea after the use of relaxants in patients distended by ileus has been described by Dr. A. R. Hunter (*Journal*, October 20, p. 919) and subsequent correspondents under the resounding title of "neostigmine-resistant curarization."

So far I have thought of this state all too simply as a diaphragm-resistant ileus and have tried to relieve an endiaphragm-resistant ileus by adding a slight foot-down feeble and captive diaphragm by adding a slight foot-down tilt of the bed to the routine measures of resuscitation. I see now that this humdrum mechanical concept will not do; but I shall continue to worry about how the diaphragm, and curare-synergistic bacterial toxins, can ventilate the lungs when splinted by an abdominal balloon.

Many of these patients arrive, even without the aid of relaxants, neostigmine-resistant or not, at the stage of respiratory inadequacy well described by Dr. J. F. Rickards (*Journal*, November 10, p. 1114), where one may well ask:

"Can storied Urn or animated Bust
Back to its Mansion call the fleeting Breath?"

and Dr. Rickards answers specifically: "Drugs and hyper-ventilation have no effect." I feel that we should fix the more familiar causes of apnoea well in front of our eyes before we plunge deeper into biochemical speculations.—I am, etc.,

Exeter.

W. J. WALTER.

SIR,—I have read with interest, not unmixed with horror, the recent correspondence on neostigmine-resistant curarization. Surely the solution of the problem lies in its prevention—that is, in the avoidance of the use of any relaxant drugs whatsoever in cases of intestinal obstruction. No doubt it is extremely interesting to speculate on the possible causes of death in these cases, but our work should aim at the preservation of life rather than in the production of stimulating, scientific post-mortem discussions.

As has been shown in the recent survey of anaesthetic deaths,¹ our main worry is vomiting, and the obstructed patient is very prone to vomit during induction, even where an oesophageal tube has been inserted and suction applied

to empty the stomach of its contents. To use thiopentone and relaxant drugs on such patients is asking for trouble at the start, quite apart from any question of neostigmine failing to do the trick later on. I suggest that a safer though less spectacular method is the nitrous oxide-ether sequence with intubation. This may appear to some to be old-fashioned and unprogressive, but, if it results in a diminution in the number of fatal accidents, then I think there is something to be said for it.—I am, etc.,

Glasgow.

ALBERT CHRISTIE.

Cholesterol and Vascular Disease

SIR,—In a recent letter (*Journal*, November 17, p. 1172) Sir John McNee mentions that cholesterol dissolved in sunflower oil when fed to rabbits causes atherosclerosis, whereas similar experiments in cats caused no such lesions. Recent work by Bronte-Stewart¹ and others would suggest that the use of sunflower oil as a solvent in the above experiments was unfortunate.

It has been shown that vegetable oils (especially sunflower and peanut oils), by virtue of their unsaturated fatty acid content, protect the human subject from the rise in serum cholesterol which normally accompanies a cholesterol-rich diet. For the same reason, marine oils have a similar cholesterol lowering effect; whereas all fats of animal origin (including eggs and milk products) and saturated vegetable oils (as artificially produced by hydrogenation in the manufacture of margarine and most cooking fats) cause a sharp rise in serum-cholesterol.—I am, etc.,

London, W.1.

REFERENCE

J. NICKSON.

SIR,—Sir John McNee's reminiscence (*Journal*, November 17, p. 1172) on Anitchkov's early experiments is a charming contribution to the history of experimental atherogenesis. However, his remark regarding the role of cholesterol in human vascular disease, that feeding experiments were only successful in one herbivorous animal, the rabbit, calls for some comment.

While for many years rabbits were used almost exclusively in these feeding experiments, further investigations in this line on other herbivorous animals showed surprisingly poor results. Experimental atherosclerosis could be produced only in two more herbivorous animals, in the guinea-pig and hamster,¹ and later on most of the experimental work was done on mixed-fed animals. Perhaps the most extensive studies were performed on chicks, mainly in Chicago, either by feeding large amounts of cholesterol alone² or adding stilboestrol to the cholesterol-rich diet.³ Steiner and Kendall⁴ produced typical vascular changes in carnivorous dogs by adding thiouracil to the cholesterol feeding, and after many failures atheromatous changes could be caused in "middle-aged" obese rats on diets "modelled on that of patients who developed coronary thrombosis."⁵ Incidentally, even in ducks and geese similar lesions could be effected by dietary means.⁶ Lastly, in an adult rhesus monkey extensive atherosclerosis, together with cutaneous manifestations of xanthomatosis, could be produced recently by prolonged high cholesterol feeding.⁷

Perhaps of even greater importance is the experimental production of extensive atherosclerosis by, not necessarily extensive, deficiency of different dietary factors. In rhesus monkeys widespread atheromatosis was produced by pyridoxine-deficient diet,⁸ and these findings were confirmed quite recently not only in monkeys but also in dogs.¹⁰ Furthermore, in cebus monkeys a cholesterol-supplemented diet, deficient in, but not completely devoid of, sulphur-containing protein produced extensive atherosclerotic changes.¹¹

In this short letter this vast subject cannot be discussed in detail. I only want to reiterate the statement that at the

present state of research little doubt exists about the intimate relationship of cholesterol metabolism and human atherosclerosis. It would appear that the most promising approach to this problem lies in more experimental and clinical studies on the *interrelationship* which influences the production and maintenance of high blood lipid levels in men; even more important is their permanent reduction, possibly by physiological means. Such work is in progress in several centres, and advances may be expected in the near future.—I am, etc.,

SIR.—Sir John McNee is to be thanked for referring (*Journal*, November 17, p. 1172) to his early demonstration of atheroma developing in rabbits fed with cholesterol, thus confirming the work of Anitchkov. Sir John emphasizes that this method was only successful in giving rise to atheroma in herbivores, and he states that he is unaware that atheroma has ever been produced in carnivorous or mixed-feeding animals by similar means. In this connexion it may be of interest to recall the more recent results of Steiner and Kendall.¹ These workers in fact succeeded in causing pronounced atheroma in dogs by feeding cholesterol along with thiouracil. In these experiments intense hypercholesterolaemia and also hyperlipaemia preceded the development of atheroma. Apparently, without simultaneous depression of thyroid activity, cholesterol in the diet cannot alone produce sufficient hypercholesterolaemia in dogs to cause atheroma; Steiner and Kendall used thiouracil so as to inhibit thyroid activity.

Sir John McNee suggests that the failure to produce atheroma, in any but herbivorous animals, by feeding cholesterol, diminishes the importance of the results with rabbits in their bearing on human disease. The work of Steiner and Kendall, however, indicates that excessive cholesterol in the diet, when coupled with depression of thyroid activity, may indeed be a potent factor in the generation of atheroma in omnivorous animals like man.—I am, etc.,

Degree in Nursing

SIR.—The Royal College of Nursing is convinced that nursing to-day is a truly academic discipline, and it recommends university training lasting perhaps five years. Dear, oh dear! As such graduates are intended eventually to become matrons and holders of other senior posts, does this mean that the less scholastic State-registered nurses will be bracketed with the State-enrolled assistant nurses and auxiliary helpers, and will be debarred from more responsible and lucrative posts?

Would it not help the recruitment of nurses if the syllabus of subjects for State-registration could be made less academic, and the course shortened by a year? As the evolution from student nurse to sister has repeatedly shown that in many cases "the ugliest duckling turned out to be the fairest of the swans," and vice versa, would it perhaps be a better plan to have a scheme by which each year a certain number of sisters could be sent to the universities to study politics, philosophy, and economics, if there are some posts for graduate nurses at home and abroad?—I am, etc.,

RUDOLPH PAYNE.

Irradiation-induced Malignant Hypertension

SIR.—The letter by Dr. R. W. Luxton (*Journal*, November 17, p. 1176), in which he states that we "appear to have made a somewhat limited examination of the literature" (*Journal*, October 20, p. 910), cannot go unanswered. Dean and Abels¹ did not describe a similar case, since their patient did not have malignant hypertension, nor did they claim it. Both Dr. Luxton's own patients who did have malignant hypertension died within seven weeks of the onset of symptoms, without nephrectomy.

Dr. Luxton regards as more serious that we did not mention that both kidneys may be badly damaged by radiation. It appeared so self-evident that when both kidneys have been exposed to the same dose of radiation they may suffer the same fate that it did not seem necessary to mention it, and in our particular patient the fact that there was a significant difference in the dosage sustained by the two kidneys was recorded. We believe that when, years after irradiation, one kidney is found after full investigation to be functioning normally the possibility that it has suffered serious damage can reasonably be excluded. In our case, we recorded that intravenous pyelography, chromocystoscopy, and micro-urea concentration all indicated normal function in the right kidney.

Finally, Dr. Luxton overlooks the fact that, where there has been an extensive upper abdominal deposit from a testicular growth, this is usually in close relation to one kidney and may by pressure or actual infiltration predispose to unilateral radiation damage. We did, in fact, mention this possibility in our patient. We are not quite certain as to the lesson which Dr. Luxton intends to point in his letter, unless it is that renal function tests are not to be relied upon in this condition. If, indeed, we had proceeded on that view, our patient would not have had his nephrectomy, and his life would not have been saved.—We are, etc.,

Medical Relief Appeal

SIR.—I am very distressed to find political letters, or at least letters with a strong political bias, being published in the correspondence columns of the *Journal*.—I am, etc.,

London, W.1.

LIONEL TAYLOR.

Treatment of Iron-deficiency Anaemia

SIR.—Dr. A. Piney (*Journal*, November 10, p. 1118) and Dr. M. E. Lampard (p. 1119) take me to task on the subject of iron stores. Dr. Lampard says that my "statements are hardly credible, as 50% or more of the nation would be anaemic, or on the verge of anaemia." The credibility of a statement does not turn upon the size of the problem it purports to reveal. And 50% is, of course, Dr. Lampard's own figure: I quoted none because I know of none. However, here is an extract from a recent publication,¹ chosen at random: "Due to the periodic menstrual blood loss in woman during her reproductive life, the female enters pregnancy usually in a rather precarious state of iron balance, and may spend her entire life prior to the menopause in a state of greater or lesser iron deficiency." I do not know what one of Dr. Lampard's female patients would say about "having her hide pricked," as Dr. Lampard puts it; but I think I know what alternative she would suggest if told to take one iron tablet a day for the rest of her life. I think, too, that the Chancellor of the Exchequer might be interested in any such ingestion on a wide scale.

Dr. Piney objects to my statement that "at a haemoglobin level of 100%, iron absorption from any oral preparation is very small." I mentioned two supporting papers in my original letter. I will now quote from another of the many papers² on this topic. It says: "Although the intestinal uptake in iron-deficiency anaemia may be 2-10 times that occurring in the normal individual, it has been noted that once the anaemia is corrected, uptake slows down and tissue stores are only slowly reconstituted. Has Dr. Piney some

evidence to the contrary? Or does he think that after the haemoglobin level returns to normal in a case of iron-deficiency anaemia one should continue to treat the patient with oral iron for, say, twelve months or even, as Dr. Lampard suggests, for life? Would that really be better than four or five injections given in a week?

Dr. Piney mentions the danger of siderosis resulting from parenteral iron therapy. Siderosis may be a danger, but it has an air of unreality, for to my knowledge it has never been reported. Dr. Piney also says that there is no justification "for treating every case by the parenteral route." This is tilting at a windmill, for I did not say there was any such justification; though in fact I think a quite substantial windmill could be erected. The same criticism applies to his statement that "the saturation of rather hypothetical iron-receptors in the intestinal mucosa is too facile an explanation," for I did not mention hypothetical iron-receptors, saturated or otherwise. I used the term "mucosal block" as anyone writing about this subject is bound to. I know, as I am sure Dr. Piney does, that there are many hypotheses to explain the block, some of them facile; but none of them can be laid at my door.

Dr. Piney is absolutely right in saying I made the subject simple (though not, I think, unduly simple): I did so because, as with all important matters, the essentials are simple, and because the correspondence columns of the *Journal* are not the place for the minor subtleties of the matter.—I am, etc.,

Glycyrrhetic Acid

SIR.—I have found difficulty in reconciling Dr. Brian Russell's comparative evaluation of glycyrrhetic acid (*Journal*, November 10, p. 1113) with his evaluation of hydrocortisone.¹ In the latter he could not emphasize too strongly the necessity of including a large number of patients in the trial to give conclusive results, a point with which we could all agree. In his letter Dr. Russell is ready to be dogmatic and claims to have evaluated the anti-inflammatory action of glycyrrhetic acid on the barest of evidence—namely, 7 cases of one brand and 8 cases of another.

I should like to show the fallacy of these miniature trials. Dr. Russell reports in his letter that out of 15 cases treated with hydrocortisone he obtained 13 improvements—namely, 87%; in his evaluation of hydrocortisone he obtained 87% improvements in 82 out of 132—namely, 62%. It is interesting, however, that 32 cases out of these 82 were only "slightly improved," showing that good results were only obtained in 38% cases. I am sure that this only emphasizes Dr. Russell's own warning on the dangers of small-scale trials.

Glycyrrhetic acid is a complex chemical, the value of which has yet to be fully appreciated,^{2,3} and where the vehicle can play such a great part it requires experience and selection of cases for a true appreciation of this drug. This is the key to the problem, and I find glycyrrhetic acid of great value for the subacute and chronic conditions, whereas hydrocortisone excels in the acute case, where glycyrrhetic acid is not so effective.

Dr. Russell in his evaluation of hydrocortisone reports 12 cases of infantile eczema: cleared without relapse—0; completely controlled—2; much improved—0; slightly improved—6; unchanged—4; worse or course abandoned—0. I consider these statistics a gross underestimate of the true facts, again illustrating the fallacy of figures.

I would like to compare his findings with 13 cases which I have treated with "biosone G.A.": cleared—3; much improved—8; failed—2. In addition to these cases my results with biosone G.A. in the treatment of "itchy inflammatory conditions" were: much improved—13 (48%); cleared—11 (41%); failed—3 (11%) (these results have been abstracted from a paper of mine dated July 5, awaiting publication).

I am sure that the results in selected cases prove "that glycyrrhetic acid has an anti-inflammatory action when applied to the skin." It is a question of selection of cases and the degree of response. In view of the possible lowering of costs continued investigation and trials are essential.—I am, etc.,

Location of Veins by Palpation

SIR.—Venoclysis is a very common procedure in clinical practice. Very useful accounts of the procedure are given in most textbooks dealing with the subject, but scant attention appears to be paid to the technique of location of veins by palpation. Any surgeon who uses multiple ligation of varicose veins as part of his operation for varicose veins must have resorted to finding the veins by palpation when the ink-markings have been erased during pre-operative skin preparation. The finger tip when run horizontally across the limb feels a sort of emptiness and not fullness when it passes over the vein. In normal subjects, with little practice, the same method can be used to locate veins both in upper and lower limbs with fair ease, except perhaps in infants. In cases of burns involving the proximal part of limbs with oedema in the distal part this method appears to be the only method that will help. It is also particularly useful in shocked patients when the veins are collapsed.

Repeated futile attempts are often made to enter a vein with a needle. Much valuable time, particularly when dealing with a shocked patient, can be saved by an early resort to cutting down under local analgesia. A set of instruments can be easily kept available in a small sterile drum with the necessary towels, etc. Cutting down is both quick and certain. A cannula or a polythene catheter is less likely to get blocked or be dislodged. The use of a tourniquet to distend the veins when doing a cut-down is not only unnecessary but undesirable, as it only leads to bleeding and obscuring the operative field.—I am, etc.,

Standardization of Surgical Implants

SIR.—The recent article by Mr. W. H. Cater and Mr. J. H. Hicks on corrosion in metal used for internal fixation¹ has been considered by the British Standards Institution Technical Committee on the Standardization of Surgical Implants.

While this committee is not yet in a position to give an opinion on the best material to be used for this purpose, it is considered that, where stainless steel is used, it must be of the molybdenum-bearing type corresponding to specification En58J in British Standards 970 and 1449:1956, and that the use of all other types of stainless steel, including that commonly known as "F.S.L." (which has no molybdenum) and corresponds to British Standards specification En58E, is to be avoided. En58J is identical with the British branded material "F.M.B." and to the American 18-8 SMO. As it is made by a number of manufacturers under other trade marks, it is advisable to use British Standards nomenclature to avoid confusion.—I am, etc.,

NORMAN CAPENER,

Chairman, B.S.I. Technical Committee on the
Standardization of Surgical Implants.

Christmas Gifts Fund

SIR.—I would like to remind your readers who have not yet responded to the President's appeal (*Journal*, October 6, p. 824) that it is our custom to distribute the gifts some days before Christmas.

I hope all who can will send their contributions marked "Christmas Gifts" to the Secretary, Royal Medical Benevolent Fund, 1, Balliol House, Manor Field, Putney, London, S.W.15, as soon as possible.—I am, etc.,

F. A. JULER,

Honorary Treasurer,
Royal Medical Benevolent Fund.

London, S.W.15.

Obituary

Sir LIONEL WHITBY, C.V.O., M.C., M.D., D.Sc. LL.D., F.R.C.P.

Sir Lionel Whitby, Regius Professor of Physic at Cambridge, Master of Downing College, and a former President of the B.M.A., died in the Middlesex Hospital after an operation on November 24, aged 61. When appointed to the professorship at Cambridge he was mainly known as a bacteriologist, as an international authority on haematology, and as the organizer of the Army Blood Transfusion Service in the war of 1939-45.

Always a man to inspire confidence, he cheerfully accepted positions of great responsibility, coming to the right decisions firmly and without fuss; it was this quality in particular, combined with his geniality, which made his term of office as Vice-Chancellor of the University of Cambridge from 1951-3 so successful.

Lionel Ernest Howard Whitby was a West-countryman, the son of Mr. Benjamin Whitby, of Stoke St. Gregory, Somerset. Born on May 8, 1895, he was educated at Bromsgrove School, of which he later became a governor, and Downing College, Cambridge, to which he won the senior open scholarship. Instead of going straight up to Cambridge he enlisted in the Royal Fusiliers in 1914, and in the following year was commissioned as machine-gun officer in the Royal West Kent Regiment. During the war he served in Serbia, Gallipoli, Salonika, and France, where, in 1917, he was awarded the M.C. for gallantry at Passchendaele. In 1918, when he had reached the rank of major, he was severely wounded and had to have a leg amputated. After his recovery he began to study medicine at Cambridge, going on to the Middlesex Hospital, where he was Freeman scholar and winner of the Leopold Hudson prize and Hetley clinical prize. Graduating M.B., B.Ch. in 1923, he was appointed assistant pathologist at the Middlesex Hospital shortly afterwards, and was also bacteriologist to the V.D. clinic. He took the D.P.H. in 1924, the M.R.C.P. in 1927, and proceeded to the M.D. in the same year. Even at that time his interests were in the subjects with which his name came to be associated, for he was writing on pernicious anaemia and on the organisms causing empyema not long after he had qualified. From the very first he displayed an active interest in research and a characteristic ability to teach.

Whitby's name first came before the general public in 1929, when he was one of the group of physicians

who attended King George V in his serious illness. Later in that year he was appointed C.V.O. His reputation as a brilliant clinical pathologist grew quickly, and he was elected F.R.C.P. in 1933. Besides being on the staff of the Middlesex Hospital as bacteriologist, he worked for some years as pathologist at the Hampstead Hospital for Children, and it was at this time that he wrote a number of well-known textbooks. With Sir Charles Dodds he was the author of *The Laboratory in Surgical Practice* (1931), and the first edition of *Medical Bacteriology* appeared in 1928 (sixth edition, 1956) and of *Disorders of the Blood*, which he wrote jointly with Dr. C. J. C. Britton in 1935 (seventh edition, 1953). When the sulphonamides were introduced in 1936 Whitby

eagerly turned to the study of their potentialities, and it was largely his work that led to the success of sulphapyridine (M & B 693) in the treatment of pneumococcal pneumonia. He summed up his research in this field in the Bradshaw lecture before the Royal College of Physicians in 1938. In the following year he was awarded the John Hunter triennial medal and prize by the Royal College of Surgeons for his work on sulphapyridine.

At the beginning of the second world war Whitby was a colonel in the Territorial Army and despite the disability of an artificial leg served throughout the war, attaining the rank of brigadier. As officer in charge of the Army Blood Transfusion Service he had an immense task which he per-

formed with outstanding success. Stationed for much of the time at the Army Blood Supply Depot at Southmead Hospital, Bristol, he was not only responsible for the collection of blood and its supply to armies in the field, but he established also a school for training Army officers in transfusion. He travelled constantly all over the British Isles and in the various theatres of war, and during the illness of Sir Winston Churchill in 1943 and 1944 he was called in to give advice on the chemotherapeutic control of the infection from which the Prime Minister was suffering. In Whitby's own description of the blood transfusion service of the Army he wrote: "One outstanding reason for the greatly improved results of treatment of casualties in the war of 1939-45 was the fact that the restoration of the general condition of the wounded man was made possible by the ready availability of blood (or its derivatives) which could be transferred into the circulation of the patient" (*The History of the Second World War—Surgery*, 1953).

Whitby was knighted early in 1945. The war over, he was paid the high compliment of being offered the chair of Regius Professor of Physic at Cambridge.

(J. Russell & Sons)

Apart from welcoming this great honour he moved to Cambridge with a feeling of relief that this would take him out of the approaching National Health Service. Though he recognized that the cost of medical care made some kind of national provision of medical services inevitable, he disliked the shape of things that were to come, much of which went against the grain of his sturdy individuality and his sense of professional fitness. Yet with all this he was always ready to play his part, to moderate, to persuade, and to be firm without rancour. An old Downing man and an honorary fellow of the college, he was a popular choice for the mastership, which fell vacant in 1947. Since then Whitby immersed himself enthusiastically in the affairs of his college, of the Cambridge medical school, and of the university. His term of office as Vice-Chancellor, from 1951 to 1953, was a stimulating one, for he had a practical grasp of committee business which was the envy of his colleagues, and he and Lady Whitby lent distinction and charm to official gatherings of all kinds.

Honours came to Sir Lionel Whitby from all sides. He was a Commander of the American Legion of Merit and a Chevalier of the Legion of Honour. From the Royal Society of Medicine he received the triennial gold medal for his distinguished work on wound shock and the transfusion of blood and blood derivatives. He was also a gold medallist of the Society of Apothecaries and an honorary member of the American Association of Physicians and of the New York Academy of Medicine. In 1946 he was visiting professor of medicine at Harvard, where he gave the Cutter lecture, and he was president of the International Society of Haematology in 1950 and of the Association of Clinical Pathologists in 1951. He was an honorary fellow of Lincoln College, Oxford, an honorary LL.D. of the University of Glasgow, and an honorary D.Sc. of Toronto. When visiting Australia last year as Sims Travelling Professor, he delivered the Sir Richard Stawell oration before the Victorian Branch of the B.M.A.

Whitby was an ideal president of any international gathering of doctors. His unruffled demeanour, his friendly approach to all and sundry, and his orderly mind ensured that everything would go without a hitch and harmoniously. These qualities showed themselves to perfection when he was President of the First World Conference on Medical Education in London in 1953, an office he cheerfully assumed at short notice owing to the illness of Sir Henry (now Lord) Cohen. Whitby was on this occasion what our American colleagues call a "shirt-sleeves" President. His ability to get down to the essentials of the business was highly appreciated by the colleagues with whom he worked on that occasion, and his presidential address at the opening session of the conference in London made a great impact on the 600 delegates from 63 countries there assembled. Their appreciation of his masterly conduct of the conference was shown in a moving way at the Conference banquet when all present spontaneously rose to their feet by way of salutation when he got up to speak. He continued the work begun by this committee set up to study its *Proceedings* and to make recommendations for the second conference. In 1950 he gave the Sir Charles Hastings lecture in the Great Hall of B.M.A. House on the theme, "Can Disease be Prevented?" No one will forget his great services to the Association as its President in 1948-9.

At Cambridge, where he was honorary physician to Addenbrooke's Hospital, Whitby was closely concerned with the expansion of the medical school and saw many constructional and administrative changes during his tenure of the regius professorship. For his own college, too, he worked tirelessly and saw the opening of its impressive new buildings a few years ago.

Whitby was always proud of his West-country descent, and for a good many years before and during the war he had a cottage in south-west Dorset, to which he would retire for an occasional day or two and fish on one of the small streams in the neighbourhood. After this brief relaxation he would plunge once again into the multifarious activities of his professional life. As a man, Whitby was direct, friendly, and completely free from pomposity or affectation. He disliked wasting words and thus time in committee meetings. He always tried to suffer the foolish gladly, and he dealt with them firmly and imperturbably and never with malice or in an unkindly way. His own mind was clear, and he regarded the more involved mental processes of some of his colleagues with a good-humoured tolerance. He was convinced that Britain had a great contribution to make to world medicine, and this conviction he carried with him to the great benefit of his own and other countries in his extensive travels abroad. Whitby was a great patriot, a great lover of England, and an intensely loyal son of his own university of Cambridge. He never failed to respond to any request to help forward causes which appealed to his own mind and nature, and when it was suggested after the conference on education that he might take part in the central work of the World Medical Association he agreed to join its Council. At its meetings in different European capitals, and only this autumn in Havana, he played an active part, especially on the W.M.A.'s medical education committee. He and Lady Whitby quickly endeared themselves to the doctors and wives of other countries who gathered together at the annual assembly of the World Medical Association, and no better ambassadors for Britain and British Medicine could be imagined. In his many-sided activities Whitby was immensely helped by his wife, herself a doctor. As a major in the R.A.M.C., Lady Whitby worked side by side with her husband, and to her and their sons and daughter the heartfelt sympathy of their many friends in many countries will be extended.

We are indebted to the Rt. Hon. HENRY WILLINK, Master of Magdalene College, Cambridge (Minister of Health 1943-5), for the following appreciation:

Saturday's tragic news that Lionel Whitby had died shocked and grieved the whole university beyond any words. Comparatively few had known that he was seriously ill: many had seen him but a few weeks ago and had thought him to be full of strength and vigour. All who came into any sort of contact with him felt him to be at the height of a great career with many years of distinguished work ahead of him. This is not the opportunity nor am I qualified to make an adequate assessment of his services to his university, to medicine, or to the college over which he presided with such charm and distinction. I can only write as one who served with him on the central bodies of the university, as his immediate successor in his vice-chancellorship, and as a friend. His acceptance of the Regius Chair of Physic in 1945 was a most notable event for his university. It was not only that, it was an act of both sacrifice and vision. Others will speak with more direct authority, but there is no doubt in my mind that his tenure of the chair, with its great and complex responsibilities, will be

remembered in any history of the Cambridge medical school as a period of outstandingly constructive achievement. Though by instinct strongly conservative, he seized with both hands the opportunities for progressive change presented by the National Health Service. Nor is it for me to speak of his work for Downing College. The monuments of his Mastership are for all to see: a college chapel of great beauty, a fine addition to the spacious court, the college hall restored and beautified. Cambridge will sadly miss his friendly conversation. It will long remember the courage and patience which treated the serious wound of the first world war and the consequent severe lameness as of no account. But there are many who will most cherish the memory of Lionel Whitby in his home, not alone, but with her who shared his every interest and with one or more of the children to whom he was so devoted.

We are indebted to Professor H. R. DEAN, Professor of Pathology in the University of Cambridge, for the following appreciation:

In 1945 Whitby returned to Cambridge as Regius Professor of Physic and physician to Addenbrooke's Hospital. In 1947 he became Master of Downing College and for two years, 1951 to 1953, he was Vice-Chancellor of the University of Cambridge. By these three appointments, within a term of six years, Whitby's wisdom, experience, and capacity for management were greatly and widely approved. In 1945 the university medical school and Addenbrooke's Hospital were facing many problems. The return of the Leys School to Cambridge had reduced the number of available beds from approximately 700 to 400, while there had been no corresponding fall in the number of patients expecting admission. The long-delayed liaison between the university and the hospital had raised many problems, and the Health Service was imminent. As the chairman of the honorary staff committee and later of the medical and many other committees, Whitby soon showed his ability for effective but tactful management. While his work was always scrupulously prepared, he was always able to see all aspects of a problem and often to effect a speedy and happy solution. He had a happy knack of making friends and of disarming unnecessary friction. In the successful amalgamation of the hospital laboratories with the university departments, he took an active and effective part. As chairman of the hospital medical committee, Whitby has been a moving spirit in planning improvements to Addenbrooke's Hospital and to the United Cambridge Hospitals as well as in the preparation of plans for the new hospital in the Hills Road. In medical education, both for the undergraduate and the postgraduate, he was always greatly interested and has played an effective part in the development in Cambridge of a postgraduate medical school.

Of the mastership of his college this is no place to write, but his colleagues, the undergraduates, and the buildings of Downing College bear witness to Whitby's efficiency and popularity. For the two years when he was Vice-Chancellor of Cambridge his efficiency and popularity will be remembered by many members of the university, but those who knew him best will remember Whitby as a staunch colleague and a trusted friend.

Dr. C. J. C. BRITTON writes: There will be many people in many parts of the world for whom Sir Lionel Whitby's death will be a very grievous loss. I first met him personally some twenty-six years ago when he taught me, as a young pathologist from overseas, the principles and practice of medical research, and I have been working with him in the closest friendship ever since. I had known and admired him for some years before this, for, as a lecturer in bacteriology, I had found his book *Medical Bacteriology* to be the most succinct and useful book on the application of bacteriology to clinical medicine at the time in existence.

Whitby was a great man who had not lost the common touch. His great success and honours did not spoil him. He was always ready to help his juniors and to go to great lengths in forwarding their interests. He attracted the

loyalty of his assistants and extracted from them their best in their professional life. He had no place for jealousy, and the advancement of his colleagues always pleased him. He made friends wherever he went and in whatever country. His honesty, his obvious sincerity, his humour, his common sense, and his grasp of his subject made him one of the finest lecturers I have ever met. He had the power of correlation of facts on any subject that enabled him to give a practical, realistic, and logical review of any problem that he was discussing. He did not limit himself to the current state of a problem, but in the last decades he was able frequently to predict the results and advances to be expected in the future and to find his predictions proved correct.

His contributions to medicine are many. He did much work on the treatment of pneumonia with specific pneumococcal antiserum, and his work on the discovery of the value of sulphapyridine in pneumonia was outstanding and led to world-wide recognition of his work.

From the time of Munich he organized the Army Blood Transfusion Service into the first and finest in the world—a service which became the model for all later blood transfusion services organized by the Allied Armies. During the war many hundreds of medical officers of many nations were trained by him in blood transfusion organization and methods. At the end of the war, when he was appointed Regius Professor of Physic at Cambridge and Master of Downing College, he rapidly extended his influence in the wider problems of medicine and medical education throughout a large part of the world. He made a number of visits to America, sometimes as visiting professor, and gave many lectures in many countries. He had just returned from a tour of the West Indies and North America, and as a Sims Professor in Australia and New Zealand, when he was discovered to be suffering from the condition from which he died.

Very few people in their lifetime have accomplished so much in such a quiet way. Whitby was a true and perfect example of a clinical pathologist. He believed that the pathologist should be in close touch with the patient and should apply his knowledge of the science of pathology to the art of medicine. He felt strongly that the complete separation of the pathologist from the clinical side of his work was a retrograde step, and as Regius Professor of Physic at Cambridge he ensured that contacts between bedside and laboratory should be close. All his writings were clear, concise, readable, and practical, and his three textbooks *Hygiene for Nurses*, *Medical Bacteriology*, and *Disorders of the Blood* are all "best sellers" because of these features.

Many medical men from the Commonwealth and foreign countries have worked in his departments during his lifetime; all those whom I have met have told me of the benefit and encouragement they have received from Whitby. His recent tour was a succession of reunions with those whom he had made not only his intellectual debtors but his personal friends. His innumerable friends, and I know of no enemies, will mourn his loss deeply, and none more than I, but we have known and will have memories of a man who will always be an example and inspiration for our future. Whitby has died at the height of his career and of his powers, but he has left a great legacy of work, integrity, courtesy, and humour which can never be forgotten.

Dr. MARTIN HYNES writes: Whitby's laboratory in the mid-thirties was a place to stir the mind of any young man. In the far corner at the end of one long bench sat Whitby himself, and next to him Britton. Between them lay piles of manuscripts that by long discussion, sometimes fierce argument, and always prodigious hard work became the volume that elevated haematology from a superstition to a science. Before long the laboratory was invaded by boxes of white mice, which we injected with lethal doses of cocci and then fed with new sulphanilamide derivatives brought in by Ewing. Within a few months Whitby picked out one compound for clinical trial, and M & B 693 made the long-

drawn agony of pneumococcal pneumonia a thing of the past.

During these major activities Whitby somehow found time to supervise the routine bacteriology and blood counts of the Middlesex Hospital, to give his annual course of lectures and practical classes, to run a very extensive private practice, and to prepare two editions of *Medical Bacteriology* for the press. Yet he never seemed hurried. He would cheerfully leave whatever he was doing to advise the most junior of us on any problem we brought to him, whether pathological or personal, and under his unobtrusive guidance a stream of research came out of the laboratory.

In September, 1939, Whitby moved quietly to Bristol and began to create a transfusion service for the Army. Here for the first time he showed his genius for really large-scale organization. Throughout the war the Services' rising demands for blood and plasma were met without fuss and without strain. In the Army he won the same affection and respect as in civilian life, and on demobilization was appointed its adviser in haematology. In Cambridge Whitby revealed his full stature. His unaffected modesty enhanced the true greatness of his character, and added distinction to the dignities of Regius Professor, Master, and Vice-Chancellor. His counsel was universally respected, and he came between the faculty of medicine and the rest of the university. He became a leading figure in the world of international medicine, eagerly sought as lecturer and visiting professor in the United States, Australia, and New Zealand.

One's first memory of Whitby as a man is his unvarying kindness. He suffered even fools gladly and sent them away much wiser by his advice. He loved to show friends his garden, and to experts could talk with authority of fish and postage stamps. The full quality of his mind was always hidden by his modesty, and it was only in retrospect after a conversation that one realized his breadth of knowledge and clarity of vision. His premature death has left a gap that will not easily be filled.

D. MURRAY LYON, M.D., D.Sc., F.R.C.P.Ed. D.P.H.

Professor D. Murray Lyon, professor emeritus of clinical medicine in the University of Edinburgh, died at his home in Edinburgh on November 16, aged 68.

David Murray Lyon was born on September 12, 1888, in Wooler, where his father was a veterinary surgeon. He was educated in Edinburgh at George Watson's College and at the university, where he followed a family tradition by studying medicine. Murray Lyon graduated with honours in 1910 and quickly began to establish himself as a promising young clinician with a real flair for research. However, as an officer in the Special Reserve of the R.A.M.C. he was called to the colours on the outbreak of the first world war. Before joining the British Expeditionary Force in France he married Edith Dona Lloyd, who returned to her nursing post in the military hospital established in what is now the Western General Hospital, while he was in lance, in the retreat from Mons to the Marne, and to win a mention in dispatches. Murray Lyon spent much of the later part of the war as medical specialist at Rouen, and was demobilized after the Armistice with the rank of major.

Things cannot have been easy in those early post-war years, especially for a physician whose interests lay largely in hospital work and research rather than in the development of private practice, but clinical appointments in the Royal Infirmary, together with part-time teaching posts in the university and in the school of the Royal College, gave Murray Lyon, if not affluence, at

least the opportunity of following his own bent. In 1924, when Jonathan Meakins, first holder of the Christison chair of therapeutics, returned to Montreal, Murray Lyon was an obvious choice as his successor. By this time he was a Fellow of the Royal College of Physicians of Edinburgh (1916), and his research work published in various scientific journals had gained him the degrees of M.D. in 1920 (with a gold medal) and D.Sc. in 1924. When the British Medical Association held its Annual Meeting at Edinburgh in 1927 he served as vice-president of the Section of Physiology and Biochemistry.

The professor of therapeutics at Edinburgh also has charge of wards in the Royal Infirmary. This dual post Murray Lyon held until 1936, and during those twelve

years he acted as director of the clinical laboratories. He also fostered the growth of the department of dietetics which had been started at the instance of Professor Meakins; there Murray Lyon, with Sister Pybus, did notable pioneer work, building up a teaching and practising dietetic unit of international reputation. The burden of clinical, teaching, and administrative work entailed by all

these activities had the inevitable result that Murray Lyon's personal participation in research decreased; but he continued to be a tower of strength to his associates, at whose disposal he freely placed his clear mind and great powers of constructive criticism. Nevertheless his abiding interest in the metabolic diseases, and diabetes mellitus in particular, is reflected in a number of papers published during his tenure of the Christison chair. Perhaps the most important of these were the series, dating from 1923, which dealt with the treatment of diabetes and, by combining dietetic control with the use of insulin, provided valuable immediate help and a foundation for further improvements.

In 1936 Murray Lyon resigned the chair of therapeutics and was translated to the more senior Moncrieff Arnott chair of clinical medicine. A short time was spent in helping the development of the teaching unit established at the Western General and other municipal hospitals, and then he returned to his "charge" at the Royal Infirmary. He found time, in 1940, to undertake the editorship of the *Edinburgh Medical Journal*, a task he continued to carry out until his retirement three years ago. The war years and those following it brought increasing routine and administrative responsibilities with calls to serve on numerous committees in Edinburgh and elsewhere—he was, for example, a member of the Spens Committee on the remuneration of consultants and specialists. But at least one of these calls was a source of great pride and pleasure to him, for he was elected President of the Royal College of Physicians of Edinburgh, and served for the two years 1945 to 1947. As a young man he had also been senior president of the Royal Medical Society. He is survived by his wife, a daughter, and two sons. All three of his children are members of the medical profession, graduates of Edinburgh University, and members of the Royal College of Physicians of Edinburgh.

Dr. C. P. STEWART, to whom we are indebted for the above account of Professor Murray Lyon's career, also writes:

The last few years of Murray Lyon's tenure of the chair of clinical medicine were clouded by failing health, and, though "the Chief" with his indomitable spirit never referred to it and would doubtless have denied it vigorously had anyone else done so, his colleagues saw with concern that his work was costing him more and more in effort.

Murray Lyon was essentially a modest, shy, and sensitive man, and his main interests outside his work—his home and family and his garden—were in keeping with these personal qualities. The more closely one was associated with him the more one appreciated his absolute honesty, his keen sense of justice, his tolerance, and his kindness. These characteristics, indeed, were reflected in his teaching (which was a pleasure as well as a duty to him) and in his approach to his patients, who were *persons* he sought to serve and to help with all the art and scientific knowledge at his command.

In the thirty years during which I worked with Murray Lyon, first as assistant and later as independent colleague, he was always approachable, and always willing, no matter at what cost to himself, to help and advise in problems whether professional or personal. Like many others, I recall with gratitude numerous acts of kindness, often so unobtrusively performed that it was only in retrospect that they were fully realized and appreciated; his shyness, which overlay a warm-hearted and lovable personality, made him try to avoid receiving thanks, though it never made him avoid the act for which he deserved thanks. Much as we, his associates, valued his friendship while we worked with him, it is probably only now that we realize fully how much he helped us and how much his friendship meant to us.

J. K. S. writes: Selected in his mid-thirties to occupy a clinical chair, a post which at that time was regarded as a prerogative of those of advanced years, Professor Lyon must surely have been accepted into the climate of senior physicians, if not with suspicion, yet with undisguised reluctance. Yet his determined purpose and outward poise were such as enabled him to overcome the embarrassments which would have swamped a lesser character. Methodical and painstaking by nature and training, loyal to the traditions of the school he respected, but none the less shy and reserved, even difficult to know intimately, he was never at his best or really happy in the chair, since, unusual in these days, the other point of view was always given full emphasis. Whatever annoyance he felt from time to time at the adverse trend of events, there was always the joyful escape to his quite splendid garden with its unique shrubs and flowers, which, with his family of three while they grew up and his devoted wife, he tended most laboriously. No more lasting tribute could be paid to a doctor, less or great, than that his children—a daughter and two sons—should all follow in his footsteps. He never betrayed the slightest pride in his own or his family's achievement, but one could sense an inward satisfaction that duty was being accomplished. The pride now rests in the happy memories of the family, with whom we join in understanding sympathy.

DENIS CARROLL, M.R.C.S., L.R.C.P.

Dr. Denis Carroll, medical director of the Portman Clinic for Delinquency and a forensic psychologist of international renown, died on November 21 after a brief illness. He was 55 years of age.

Born on May 16, 1901, the younger son of Mr. A. J. Carroll, a distinguished mining engineer, Denis Charles Carroll was educated at King's School, Chester, and at Trinity Hall, Cambridge, of which he was a mathematical scholar. He graduated with first-class honours in both parts of the Natural Sciences Tripos and was elected to the Michael Foster Studentship of Cambridge

University, carrying out physiological researches in Professor Joseph Barcroft's department. Of these, a number were subsequently published in the *Journal of Physiology* and in the *Biochemical Journal*. Turning from physiology to psychology, he studied psycho-analysis and at the same time completed his medical training at the London Hospital, qualifying M.R.C.S., L.R.C.P. in 1927. After qualifying, he pursued his psychiatric training on the staff of the Maudsley Hospital, and in due course was elected an associate, later a member, of the British Psycho-analytical Society. About 1930 he began to devote an increasing amount of attention to the psychiatric aspects of criminology, and took an active part in the development of the Institute for the Study and Treatment of Delinquency (I.S.T.D.). One of the original co-directors of its psychopathic clinic, he was at one time director of research to the institute. He was also medical consultant to the "Q" camps experiment.

Soon after the outbreak of the second world war Dr. Carroll entered the R.A.M.C. and served as a psychiatrist, first at Dumfries Military Hospital in charge of officer psychiatric casualties. Later, he was given the rank of lieutenant-colonel and made psychiatrist to the Western Command, where he was in charge of Northfield Military Hospital, a unit of 1,200 beds, the largest psychiatric centre in the Army. The administrative and clinical duties he undertook in these capacities were extremely onerous, and his work was generally recognized as of the highest order.

Returning to civilian life, he devoted the larger part of his energies to criminological work. At the time of his death he was consulting psychiatrist and medical director of the Portman Clinic for Delinquency, a member of the Home Office Advisory Training Board on Probation, of the Home Office Advisory Council for the Treatment of Offenders, of the Home Office Departmental Committee for Children and Young Persons, of the council of the Medico-Legal Society, of the joint committee of the British Medical Association and the Magistrates' Association, and of the Institute for the Scientific Treatment of Delinquency, on the Scientific Committee and Scientific Group of which he also served. He was in addition at one time chairman of the medical section of the British Psychological Society. After the war he became chairman of a committee founded to train personnel to cope with the after-effects of the war on Austrian youth. He was elected president of the International Society for Criminology in 1950, and presided, with éclat, at the International Congress of Criminology held in London in 1955. The author of a number of papers on various aspects of delinquency, he was also a successful broadcaster on the subject and in constant demand as a teacher and lecturer at criminological training courses.

Dr. EDWARD GLOVER writes: Of the many different types of personality that are caught in the meshes of the faculty of medicine, there exists a small but distinguished band of whom it can be said that they are at the same time born scientists and the salt of the medical profession. Denis Carroll was one of this distinguished fellowship. Endowed with an acute intellect, a profound scientific curiosity, and a natural turn of judgment, he submitted himself readily to the disciplines of scientific training and research. Following a brilliant scholastic and academic career, he became in turn a mathematician, a research physiologist, and, after reaching out tentatively towards what was for him in the first instance the science of psychology, he became in turn a psychoanalyst, a medical psychologist, a general psychiatrist, and finally one of the most distinguished medical criminologists

of this generation. His medical qualification, which at first was a means to the end of comprehensive training, drew out in him the humanism that is the hallmark of the born physician; hence it was not surprising that, in addition to his many preoccupations in the administrative, clinical, and teaching fields of forensic psychiatry, he conducted a heavily laden consulting and psycho-analytical practice. Dr. Carroll was never known to turn down an appeal for professional help from whatever quarter it might come, and for many years carried cheerfully a staggering load of scientific, administrative, and medico-psychological commitments, a circumstance which contributed in no small measure to his tragic death at a time when he was approaching the apogee of his professional career.

For this reason, also, he left behind him a number of clinical communications which, although of a uniformly high quality, represented merely a tithe of the contributions he could have rendered the science he made so peculiarly his own, and which indeed he did so much to set on firm scientific foundations. Another reason was readily apparent to those who knew him intimately. Denis Carroll was one of a rapidly diminishing band of practised and polished *causeurs*. Set him, in course of casual conversation, a scientific problem and his mind literally raced to meet the challenge; almost without taking breath he would embark on an orderly and consecutive survey of the issue, garnished with aphorisms that were the crystallization of ripe and deep experience. Had an amanuensis been present on these often occasions the literature of medical criminology would have been enriched by many gems of scientific improvisation.

The same qualities gave a characteristic stamp to his private relations. Quick and nimble of wit, and master of an encyclopaedic range of general information, he was of an incomparable anecdotalist and could serve up his commentaries on life with a humour that was close to drollery. Behind this social mask there could be found a shy and sensitive individual, of sweet disposition and tender heart, qualities which he poured freely into his therapeutic work and which accounted easily for the esteem and affection in which he was held by his patients and by his closer intimates. In the laudatory idiom of post-mortem panegyric it is often said of a man that his death is a grievous loss to his profession and to his friends. In the case of Denis Carroll this is no mere manner of speaking.

M. J. STEWART, C.B.E., M.D., LL.D. F.R.C.P., F.R.F.P.S.

The obituary of Professor M. J. Stewart was printed in the *Journal* of November 17 at page 1179.

Dr. R. M. HEGGIE writes: A devoted editor, a keen diarist, and a unique character has passed on. He laboured indefatigably in life. Wherever one saw M. J. S., be it in his room at the Algernon Frith Institute of Pathology, which he was instrumental in having built, in the roadway to or from the station, in the train, or in his bed during sickness, he was surrounded by manuscripts, critically correcting. Behind his penetrating expression, characterized by greying hair, bristling eyebrows, steel-rimmed glasses, and a sallow complexion, was a puckishness which was as surprising as it was a delight to the junior members of his staff. He had the best collection of "Tonics and Sedatives" from J.A.M.A. that I know. Many pathologists throughout the country as well as clinicians and countless unknown patients must be for ever grateful to M. J. S. for his "opinion" so freely and expeditiously given. When you handed him a section he would look at the cleanliness of the slide, the mounting of the coverslip, for the presence of any odd air bubble that might have eluded you, and for perfection in the section cut and stained. If it wasn't just right he told you so in no uncertain terms, even as he refused to forgive anybody who asked two people for opinions without disclosing that they had done so. As a chairman he was most tolerant, but occasionally was piqued if you took a line contrary to his, especially since he

regarded you as a friend. He would then call you a term of endearment peculiar to the Senior Service and all was well. His kindness to me as to many others was unsurpassed in his home, his club, at his various society meetings, to which I was invited, and in the medical school of which he was a worthy dean.

Dr. ELSPETH STANFORD writes: As an old student and friend of Professor Stewart's I should like to add my tribute to him as a man. Field-Marshal Smuts said, "It is a great thing to be a man, a great thing," and Matthew Stewart was just that. I remember going with some trepidation to attend my first P.M. and being completely spellbound by the dynamic little man in charge. Of course it was Matthew Stewart. He dashed in like an eager Scotch terrier, and immediately everyone was rapt attention, and soon his spotless white coat was festooned with patterns of kidney and lung where he had dried off sections to show to students. He was a born teacher, with a great sense of humour and a way of making dry bones live, so that one picked up knowledge without realizing it. Then suddenly the delightful Scottish voice would declaim Hood's "Mary's Ghost," or begin a fund of stories about old students. One of the great secrets of his success as a teacher was that he did not look on us as ignorant medical students but as potential professors, and so most of us would have followed him to the end of the earth, and none of us could do shoddy or second-rate work after watching him always give of his best. A Saturday morning with Stewart was an education in itself. Nevertheless, students who interpreted his homely manners as a warrant for experiments in familiarity sustained a shock, as he was a great disciplinarian. It was an inspiration to see him in his own delightful home, both in Leeds and at Stoke Poges, as he tackled everything with enthusiasm. To wash up with him was sheer entertainment: he had the greatest respect for bacteria, so all utensils had to be washed as rapidly as possible in scalding running water. There was nothing humdrum when "Matt" was on the warpath. I should like to take leave of this great man as I last saw him, walking jauntily along a beautiful Buckinghamshire lane, with autumn leaves falling all round him. He was clasping a little boy's hand and telling him all about trees and flowers. And as age and youth walked and talked together I suddenly saw the great keynote of Stewart's life. It was his childlike, simple faith and his great reverence for life.

Dr. S. H. R. BOTTRELL died on October 20, some two weeks before his 90th birthday. Stanley Henry Reginald Van Ryck de Groot (he changed his name to Bottrell in 1930) was born at Georgetown, British Guiana, on November 5, 1866, and studied medicine at King's College, London, qualifying L.S.A. in 1892. While at King's College Hospital he became senior dresser to Lord Lister, and the late Professor Albert Carless was one of his oldest friends. Dr. Bottrell joined the Colonial Medical Service in 1894 as assistant surgeon in the Gold Coast Colony and was stationed at Accra, where he later became health officer of the port. In 1900 he was senior medical officer in charge of a base hospital of the Ashanti Field Force, being awarded the medal and receiving a mention in dispatches. He also served in the South African War, being awarded the medal with clasps. As a captain in the Natal Medical Corps he served in the Zulu rebellion of 1906, again being awarded a medal with clasp. He took the L.R.C.S.Ed. in 1905, and settled in practice at Pietermaritzburg, Natal. Throughout the first world war he served in the R.A.M.C., and when he left the Army he was granted the rank of permanent captain. During his career he took part in five campaigns, and he was at sea with the Merchant Navy for eighteen months during the second world war. Owing to his age at that time—he was well over 70—he decided to return to practice on shore, which he did until 1950, when his health broke down. He married the widow of Dr. E. Bottrell, of Sydney, Australia, in 1930, and she survives him.

Medical Notes in Parliament

Mental Illness Research

Mr. KENNETH ROBINSON (St. Pancras, North, Lab.) asked the Minister of Health if he would specify those research projects relating to mental illness and mental deficiency which were being currently sponsored or financed by the Medical Research Council, showing the estimated annual cost of each.

Mr. R. TURTON, replying on November 23, stated that a number of research projects relating to mental illness and mental deficiency were in progress in the Medical Research Council's social psychiatry research unit. Relevant studies were also in progress in several of the Council's units whose main effort was devoted to other problems. These included: a study of the prevalence of schizophrenia in a rural and an industrial community; the relationship of various social factors to the incidence of schizophrenia and manic-depressive psychosis; a survey of the effects of the operation of prefrontal leucotomy in the treatment of mental disorders; and a study of cerebral abnormalities in epilepsy and of the effects of treatment on the disease. In addition the Council were assisting by means of grants and fellowships to individual workers.

The Council's total expenditure in the current year on projects in the fields of mental illness and mental deficiency was estimated at approximately £30,000. In addition the Council was spending approximately £110,000 on research in applied psychology and neurology.

Mr. ROBINSON asked on November 19 whether the Minister would encourage the introduction into medical hospitals of clinical research teams to take advantage of the wide clinical field for research available there. Mr. TURTON replied that, apart from the Medical Research Council, work estimated at about £70,000 a year had been carried on under the Health Service. That work would be taken over in due course by the Medical Research Council.

Voluntary Patients

Dr. DONALD JOHNSON (Carlisle, Con.) asked the Minister what record he kept of patients who entered hospital as voluntary patients and who were subsequently certified while in hospital; and what was the number of such patients during the last most convenient year. Miss PAT HORNSBY-SMITH, Parliamentary Secretary, said that records for England and Wales were kept by the Registrar-General. In 1954, the latest year for which figures are available, 576 persons who entered as voluntary patients were subsequently certified while in hospital, representing 1.12% of total voluntary admissions.

Dr. JOHNSON asked that such steps as were possible should be taken to see that this figure was reduced to an absolute minimum. Miss HORNSBY-SMITH thought that recently published figures showing that the number of voluntary patients had gone up from 45 to 75% showed very much that, so far as possible, they had voluntary rather than certified patients.

Cancer Registration in Scotland

Mr. W. HANNAN (Glasgow, Maryhill, Lab.) asked the Secretary of State for Scotland on November 20 how many hospital regions had completed their cancer registration and follow-up arrangements. Mr. NIXON BROWNE stated that it had been possible in only two of the five regions to organize a reasonably complete system of cancer registration. The difficulties elsewhere appeared to be mainly medical and statistical, and the Secretary of State had therefore asked the Cancer Committee of the Scottish Health Services Council to inquire into them and suggest ways of overcoming them.

Mr. HANNAN asked him to emphasize the urgency of this information for research purposes. Mr. A. WOODBURN (Clackmannan and East Stirling, Lab.) asked him to ensure

that medical officers who were keen to push on with this work received every co-operation from the Scottish Office. Mr. BROWNE agreed to both points.

Grants for Prescription Charges

Mr. H. MARQUAND (Middlesbrough, East, Lab.) asked the Minister of Pensions and National Insurance what additional charge he estimated would fall upon the National Assistance Board as a result of increased charges for prescriptions under the Health Service.

Miss EDITH PITT, the Parliamentary Secretary, informed him on November 22 that, on the basis of the number of refunds made last year, the additional cost of assistance grants would be about £320,000 in a full year.

Flour Controversy Revived

The flour controversy broke out again in the Commons on November 21, when Dr. BARNET STROSS (Stoke-on-Trent, Central, Lab.) sponsored a motion for the annulment of the Flour (Revocation) Order, 1956, and the Flour (Composition) Regulations, 1956. The argument was concentrated on the latter, and the attack against it was made on three grounds: (1) that in accepting the advice of the Adrian panel the Minister had gone against the advice of his own scientific and medical advisers and of the Medical Research Council; (2) that the terms of reference to the panel were so limited that it was unable to examine the issue fully; and (3) that the Minister had listened much too readily to the millers. On the second point Dr. Stross complained that the panel was told that the only matter it had to consider was the difference between flour at 80% extraction rate unfortified and flour of 70% extraction with the three token nutrients added. Against the millers he argued that their claim that the 70% extraction flour met the popular demand was not proved; and that they preferred it because the wheat offals could be sold profitably for animal feeding-stuffs, or as patent foods to prevent people getting the constipation they were likely to suffer from as a result of eating white bread.

He regarded the report of the Adrian panel as showing nervousness and hesitancy in having to disagree with the scientists at the Ministry and with the Medical Research Council.

The Medical Research Council had pointed out that in addition to the three added nutrients there were four others which were essential to health, and that the 70% extraction must lead to a reduction in some of these. Finally he quoted the leading article in the *British Medical Journal* of June 9 (p. 1347), that a tried safety measure was to be discarded for an untried substitute, adding that if as the years went by it was found that the standard of health was falling off the blame must be placed squarely where it ought to lie.

Mr. HARMAR NICHOLLS, Parliamentary Secretary to the Ministry of Agriculture, Fisheries, and Food, insisted that the panel had covered the whole area of conflict between the experts, and that there was no question of it having to make a report on only one section. The terms of reference were not criticized at the time of its appointment, so there could have been no real complaint.

Dr. STROSS referred him to a sentence in the report: "Enrichment with other essential nutrients is outside our terms of reference."

Mr. NICHOLLS maintained that the matter had been going on for years; everyone knew what was under discussion; and the whole area of conflict was submitted to the panel. The suggestion that the Ministry had ignored the evidence of their own medical advisers could not stand. There were also administrative problems. There was no effective way of checking whether bread was being made at the 80% extraction rate, and there could be therefore a doubt about the presence of the required nutrients. The panel had advised that it would be wise to adopt the positive attitude that the nutrients must be contained in the bread. Consequently, under the new regulations, the test—instead of being the 80% extraction rate—was one which could be more effectively carried out, the determination of the presence of the

DEC. 1, 1956

specific quantities of the nutrients. What was being done achieved what Dr. Stross wished more effectively than the provisions that he wished to retain.

The motion was negatived.

Medico-Legal

ACTION AGAINST ORTHOPAEDIC SURGEON DISMISSED

[FROM OUR MEDICO-LEGAL CORRESPONDENT]

On October 31 at Liverpool Assizes Mr. Justice Jones dismissed a claim for negligence brought against Mr. E. N. Wardle, consultant orthopaedic surgeon at the David Lewis Northern Hospital, and against the United Liverpool Hospital Board by Mrs. J. B. Walker. Mrs. Walker's case was that when Mr. Wardle operated on her right knee he had failed to remove the whole of her cartilage, with the result that she had suffered considerable pain, and after a second opinion she had had a further operation at Charing Cross Hospital, when what Mr. Wardle had left behind was removed. She also complained that the two surgeon registrars and the physiotherapist to whom her aftercare was entrusted, and for whom the hospital board was vicariously responsible, had not carried out their duties properly.

In May, 1952, Mrs. Walker complained of pain in her right knee, and the diagnosis was that her right external semilunar cartilage was torn. On June 20, 1952, Mr. Wardle performed a meniscectomy at the Northern Hospital. He saw her two days after the operation, but apart from that entrusted her post-operative care, in accordance with the normal practice followed at the hospital, to two surgical registrars, and physiotherapy was also given. The evidence of the surgical registrars was that after the operation all the trouble that Mrs. Walker experienced was caused by failure to co-operate in doing the exercises required to restore her muscles from post-operative wasting. Mr. Wardle was so informed. He saw her again on September 24, 1952, and then found her fit for discharge.

In May, 1953, Mrs. Walker attended Charing Cross Hospital with trouble in her knee, which the consultant orthopaedic surgeon, Mr. David Trevor, diagnosed as a tag of cartilage remaining. A further operation was therefore performed at Charing Cross by Mr. Herbert Davis, who removed a piece of tissue which he thought at the time was cartilage, and which was recorded as such in the hospital records. The specimen was not sent for histological examination until about a month later, and a report which no one understood was made on it. It was then handed over to Mrs. Walker. After the action had been started the specimen was examined by Dr. G. B. Manning, a Home Office pathologist, and the slide which had been made at Charing Cross was examined by Dr. H. A. Sissons, of the Royal National Orthopaedic Hospital. It was common ground that what was removed from Mrs. Walker's knee in the second operation was not cartilage but regenerated tissue.

In his judgment Mr. Justice Jones said that he concluded without hesitation that there was no negligence whatever on Mr. Wardle's part and that the post-operative practice followed was the same as that carried out in all the big hospitals in the country. There was nothing to suggest that the two surgeon registrars and the physiotherapist did not carry out their duties in a perfectly satisfactory manner. Much of the responsibility for the action being brought must, he said, be attributed to the entry in the Charing Cross Hospital case notes which indicated that Mr. Wardle had not removed the whole of the cartilage, and which was quite wrong because what was removed during the operation in London was regenerated tissue. Mrs. Walker's action accordingly failed.

The Medical Defence Union instructed Messrs. Hempsons, solicitors, to act for Mr. Wardle.

¹ *Liverpool Daily Post*, November 1, 1956.

INFECTIOUS DISEASES AND VITAL STATISTICS

Summary for British Isles for week ending November 10 (No. 45) and corresponding week 1955.

Figures of cases are for the countries shown and London administrative county. Figures of deaths and births are for the 160 great towns in England and Wales (London included), London administrative county, the 17 principal towns in Scotland, the 10 principal towns in Northern Ireland, and the 14 principal towns in Eire.

A blank space denotes disease not notifiable or no return available. The table is based on information supplied by the Registrars-General of England and Wales, Scotland, N. Ireland, and Eire, the Ministry of Health and Local Government of N. Ireland, and the Department of Health of Eire.

* Measles not notifiable in Scotland, whence returns are approximate.

† Includes primary and influenzal pneumonia.

§ Includes puerperal pyrexia.

Vital Statistics

Infectious Diseases

The largest fluctuations in the trends of the notifications of infectious diseases in England and Wales during the week ending November 10 were increases of 287 for whooping-cough, from 1,538 to 1,825, 69 for scarlet fever, from 574 to 643, and a decrease of 33 for dysentery, from 458 to 425.

The largest rises in the incidence of whooping-cough were 59 in Staffordshire, from 49 to 108, and 38 in Yorkshire East Riding, from 41 to 79; the largest fall was 32 in Yorkshire West Riding, from 123 to 91. The notifications of measles numbered 3,094, being 5 more than in the preceding week; the largest variations in the returns were decreases of 70 in Yorkshire North Riding, from 139 to 69, 46 in Lancashire, from 924 to 878, and an increase of 55 in Yorkshire West Riding, from 190 to 245. 11 cases of diphtheria were notified, being 7 more than in the preceding week and the largest total for 40 weeks. 7 of the cases were notified in Yorkshire West Riding, Wakefield C.B. No large fluctuations were reported in the local returns of scarlet fever. 4 of the 9 cases of paratyphoid fever were notified in Yorkshire West Riding, Shipley U.D.

121 cases of acute poliomyelitis were notified. These cases were 4 more for paralytic and 18 fewer for non-paralytic cases than in the preceding week. The largest returns were London 23 (Lewisham 6, Battersea 4, Wandsworth 4, Chelsea 3, Greenwich 2), Lancashire 17 (Liverpool C.B. 3, Manchester C.B. 3, Oldham C.B. 3, Bolton C.B. 2, Accrington M.B. 2, Eccles M.B. 2), Middlesex 12 (Ealing M.B. 5, Willesden M.B. 2), Hertfordshire 10 (Bishop's Stortford M.B. 7), Cheshire 9 (Stockport C.B. 3, Runcorn R.D. 2), Sussex 8 (Brighton C.B. 4, Portslade-by-Sea U.D. 2).

The largest centres of infection of dysentery were Yorkshire West Riding 113 (Leeds C.B. 41, Rotherham R.D. 17, Bradford C.B. 16), Lancashire 62 (Liverpool C.B. 28), London 39 (scattered through 16 boroughs), Warwickshire 30 (Coventry C.B. 18, Birmingham C.B. 9), Durham 22, Lincolnshire 19.

Graphs of Infectious Diseases

The graphs below show the uncorrected numbers of cases of certain diseases notified weekly in England and Wales. Highest and lowest figures reported in each week during the nine years 1947-55 are shown thus ----, the figures for 1956 thus —. Except for the curves showing notifications in 1956, the graphs were prepared at the Department of Medical Statistics and Epidemiology, London School of Hygiene and Tropical Medicine.

Northern Ireland in 1955

The birth rate in Northern Ireland in 1955 was 20.8 per 1,000 of the population. It has been constant in Northern Ireland during the 5 years 1951-5, and during this period has been about 5 more than the rate in England and Wales and 3 more than the rate in Scotland, but slightly below the rate in Eire. The infant mortality rate was 32 per 1,000 live births and was the lowest rate ever recorded in Northern Ireland. The rate was 7 above that of England and Wales and 2 above the rate in Scotland but 5 below that rate in Eire. The death rate was 11.1 per 1,000 of the population, an increase of 0.2 on the rate for 1954. In recent years the death rate in Northern Ireland has been below that of England and Wales, Scotland, and Eire; in 1955 it was lower by 0.6, 0.9, and 1.5 respectively.

Deaths from the principal epidemic diseases numbered 208, being 54 more than in 1954. The deaths were 129 from influenza, 48 from diarrhoea and enteritis under 2 years of age, 18 from whooping-cough, 7 from measles, 5 from dysentery, and 1 from diphtheria. A further decline was reported in the death rate from tuberculosis, and the rate, 15 per 100,000, is the lowest ever recorded; it is now only one-third of the rate in 1951 and one-tenth of the rate in

1926. The rate was the same as the rate in England and Wales and 4 below that of Scotland and 14 below the rate in Eire. During the year 536 deaths were attributed to violence, an increase of 47 compared with 1954, though the deaths due to motor vehicles, 147, were 18 fewer. The number of deaths of males from cancer increased by 21 to 1,051 and the deaths of females rose by 92 to 1,119; the death rates were 1.55 and 1.57 per 1,000 of the population respectively.

Week Ending November 17

The notifications of infectious diseases in England and Wales during the week included: scarlet fever 696, whooping-cough 2,089, diphtheria 7, measles 3,492, acute pneumonia 362, acute poliomyelitis 95, dysentery 581, paratyphoid fever 5, and typhoid fever 2.

Medical News

Olympic Silver Medal.—An Oxford medical student, Mr. D. J. N. JOHNSON, won an Olympic silver medal for Britain when he came second in the final of the 800 metres at Melbourne on Monday. He was beaten by less than 2 feet by the winner, an American, after leading in the final straight until almost the tape. The race established a new Olympic record for the distance—1 min. 47.7 sec.—in spite of the strong head wind at the finish. In the words of *The Times* Olympic Games correspondent, "Johnson ran a race of superlative judgment." This is Britain's first medal in the event since the Games at Los Angeles in 1932. Mr. Johnson is a preclinical student at Lincoln College, Oxford. We offer him our warmest congratulations.

Virus Production Laboratory.—The Medical Research Council is setting up a virus production unit at its serum laboratories at Carshalton which is expected to start operation in April. Its main function will be to produce poliomyelitis virus on a fairly large scale. It will also provide for research on virus cultivation and for the preparation of tissue cultures on a pilot plant scale. Another function will be the production, for research purposes, of different strains of virus that may find a place in future poliomyelitis vaccines. The council gratefully acknowledges a gift of £50,000 from the National Fund for Poliomyelitis Research which will pay for the capital cost of fitting out the laboratory and for its initial running expenses. The need for this new unit is explained in a Medical Research Council statement as follows:

"While there is by now a substantial amount of experience on the use of Salk-type vaccines in different countries, there is no evidence that the use of such a vaccine could entirely prevent poliomyelitis. Experience of the use of killed vaccines against other diseases would strongly suggest that their use must always be combined with other preventive measures. For the prevention of poliomyelitis, very much more knowledge is required on the way in which the virus is disseminated through the population. It is also important that methods should be developed for the early diagnosis of the disease, and such methods will acquire an even greater significance should any chemotherapeutic method of treating poliomyelitis be discovered. Promising new tests for the detection of antibody in human serum are now under investigation. These tests and also the present methods available for early diagnosis—that is, the complement fixation test and the direct isolation of virus—all need large quantities of poliomyelitis virus as well as tissue cultures. At present a great deal of time is spent in research laboratories in preparing virus and cultures before any research can be carried out."

Rockefeller Grants.—Among the major benefactions by the Rockefeller Foundation announced last week are three to support biochemical research in Britain. A five-year grant totalling £30,000 has been made to the Cambridge Chemical Laboratory, directed by Sir ALEXANDER TODD, F.R.S., for work on biologically important molecules; sums of £8,600 and £20,000 have been provided to support research on the biosynthesis of organic compounds and steroid chemistry

at the Dyson Perrins Laboratory, Oxford, under Professor E. R. H. JONES, F.R.S.; and £8,250 to support investigations by Professor F. L. WARREN and Dr. H. HARRIS, of the London Hospital Medical College, on the genetic aspects of biochemical abnormalities in man. Other grants to workers in Britain support virus research under Dr. M. G. P. STOKER at Cambridge (£10,000) and pharmacological research under Professor J. H. GADDUM, F.R.S., at Edinburgh (£5,000). In India a grant of \$88,200 to the Indian Council of Medical Research will be used over the next three years to expand the programme of neuropathological research at the Indian Cancer Research Centre in Bombay: lathyrism, leprosy, nutritional deficiencies, and encephalitis are cited as among the diseases prevalent in India offering opportunities for neurological investigation. A grant of \$5,500 has been made to Dr. H. G. DIXON, of the Institute of Obstetrics and Gynaecology, London, to allow him to go as a visiting lecturer to the University College of the West Indies, Jamaica. Those awarded grants for travel abroad include Dr. P. G. H. GELL (Birmingham), to visit the U.S.A.; Dr. J. A. OWEN (Edinburgh), to visit the U.S.A. and Canada; and Dr. J. S. CARMAN (Christian Medical College, Vellore), to visit the U.S.A., Canada, and Britain.

Benger Prizes.—Benger Laboratories Ltd. has announced its establishment of three prizes for original observations of value in general practice. Awards, which in the first year will be of £250, £150, and £100, will be made annually on the recommendation of the College of General Practitioners. Entry will be limited to medical practitioners actively engaged in general practice anywhere in the world. Written reports may be submitted in any form, and the sole criterion of judgment will be the worth of the observation as a contribution to the advantage of general practice. Reports may be on any diagnostic sign, any method of diagnosis, any technique employed in any professional connexion, or any method of treatment, observed or devised by a general practitioner in the course of his own work. The first award will be made in 1957, and entries must be received by July 31. Further particulars may be obtained from the College of General Practitioners, 54, Sloane Square, London, S.W.1.

Royal College of Obstetricians and Gynaecologists.—At the council meeting on November 24 a number of lecturers and scholars for 1957 were appointed. Dr. EDWARD WHITE, of Melbourne, was appointed William Meredith Fletcher Shaw memorial lecturer, and Dr. C. W. TAYLOR, director of pathology at the Birmingham and Midland Hospital for Women, William Blair-Bell memorial lecturer. Dr. J. N. HUNT and Mr. F. A. MURRAY (jointly) and Dr. N. F. MORRIS were appointed Leverhulme research scholars. Dr. D. METHUEN and Mr. G. P. CHARLEWOOD Bernhard Baron travelling scholars, and Mr. C. A. SIMMONS to the Green-Armytage short-term travelling scholarship. Dr. J. MANN, of Toronto, was awarded a prize for his essay on methods for improving the results of forceps delivery. The College has lately issued its 27th annual report, for the year 1955. The first part describes the College's activities during the year and the annual meeting held in May, 1956; the second comprises the register of fellows and members and the list of those awarded the diploma of obstetrics in 1955. The statement of accounts shows assets at the end of 1955 of £431,342 compared with £275,249 the previous year, the rise being chiefly due to the gain of £143,926 during the year in the Silver Jubilee Building Appeal Fund, to which Lord NUFFIELD gave £75,000 and the Nuffield Provincial Hospitals Trust £50,000. The College's income during 1955 was £26,708, expenditure £24,095.

London University.—After the foundation day dinner at the Senate House on November 23, QUEEN ELIZABETH THE QUEEN MOTHER, Chancellor of London University, conferred the honorary degree of Doctor of Laws on Sir HAROLD HIMSWORTH, F.R.S., Secretary of the Medical Research Council. Dr. I. M. P. DAWSON, lecturer in pathology at Leeds, has been appointed to the university readership in

pathology tenable at Westminster Medical School. Dr. Dawson is succeeding Dr. G. D. LUMB, who leaves to become professor of pathology at Tennessee University, U.S.A. The title of reader in physiology has been conferred on Dr. R. D. HARKNESS in respect of his post at University College. Dr. J. G. SCADDING, dean of the Institute of Diseases of the Chest, is to represent the University at the Fourteenth International Tuberculosis Conference in New Delhi next month.

Richard Fox Linton Memorial Prize.—The parents and brothers of the late Squadron-Leader R. A. FOX LINTON, an R.A.F. medical officer who lost his life flying, have endowed a prize fund of £1,000 in his memory. The Richard Fox Linton memorial prize will be awarded annually to the R.A.F. medical officer who, in the opinion of the Director-General of Medical Services, has performed the most outstanding work in the investigation of flying accidents and the advancement of measures for the promotion of safety in flight.

First Abraham Colles Lecture.—Professor C. A. WELLS, professor of surgery at Liverpool University, delivered the first Abraham Colles lecture of the Royal College of Surgeons in Ireland on November 19 in Dublin. He lectured on duodenal ulcer.

COMING EVENTS

Institute of Dermatology.—Semi-permanent exhibitions on "Cutaneous Tuberculosis and Sarcoidosis," December 1-24.

Moynihan Lecture.—Professor I. S. RAVDIN, of Philadelphia, chairman of board of regents, American College of Surgeons, will deliver a Moynihan lecture at the Royal College of Surgeons of England on December 12 at 2.30 p.m. His subject will be "The Complexity of Liver Disease—Surgical Steps Toward Solution."

Society of Chiropodists.—Annual dinner, April 4, 1957, at the Park Lane Hotel, Piccadilly. Details from Mr. J. R. HALL, 8, Wimpole Street, London, W.1.

SOCIETIES AND LECTURES

A fee is charged or a ticket is required for attending lectures marked ●. Application should be made first to the institution concerned.

Monday, December 3

DENTAL AND MEDICAL SOCIETY FOR THE STUDY OF HYPNOSIS.—At Medical Society of London, 8 p.m., Dr. D. E. R. Kelsey: Hypnosis in Psychiatric Practice.

INSTITUTE OF CHILD HEALTH.—At New Lecture Theatre, Hospital for Sick Children, 5 p.m., Dr. John Caffey (New York): Some X-ray and Clinical Features of Normal Infantile Hips; Their Significance in Diagnosis of Predislocation of the Hips.

MARLBOROUGH DAY HOSPITAL.—8.15 p.m., Dr. D. F. O'Neill: A Psychiatric View of Gynaecology and Obstetrics.

Tuesday, December 4

FOUNTAIN HOSPITAL, Tooting Grove, S.W.—6 p.m., subject: Emotional Disturbance and Psychosis in Mentally Subnormal Children. Speakers, Dr. Mildred Creak and Dr. Mildred Pott.

INSTITUTE OF DERMATOLOGY.—5.30 p.m., Dr. R. H. Meera: Atopy. INSTITUTE OF DISEASES OF THE CHEST.—2.30 p.m., discussion for general practitioners: Acute Respiratory Infections. Dr. N. C. Oswald: Viruses Affecting the Respiratory Tract; Dr. J. G. Scadding: Patterns of Lung Involvement; Dr. J. R. May: Use and Abuse of the Laboratory; Mr. John Fry: The Practical Problem.

●INSTITUTE OF OBSTETRICS AND GYNAECOLOGY.—12 noon, Dr. H. Bettinger (Melbourne): Hydatidiform Mole and Chorion Epithelioma. ROYAL ARMY MEDICAL COLLEGE.—5 p.m., Dr. F. E. Camps: Forensic Medicine—Routine and Research (with lantern slides).

ROYAL STATISTICAL SOCIETY.—At Keene Lecture Theatre, Westminster Medical School, 5.30 p.m., Dr. H. F. Dorn: Medical Statistics at the National Institutes of Health, U.S.A.

ST. MARY'S HOSPITAL MEDICAL SCHOOL.—At Wright-Fleming Institute Theatre, 5 p.m., Mr. D. J. MacRae: Pregnancy and Labour Complicated by Heart Disease.

WEST END HOSPITAL FOR NEUROLOGY AND NEUROSURGERY.—5.30 p.m., Mr. K. I. Nissen: Median Nerve Palsy of the Wrist.

Wednesday, December 5

INSTITUTE OF DERMATOLOGY.—5.30 p.m., Dr. C. D. Calnan: Epidermal Sensitization.

INSTITUTE OF DISEASES OF THE CHEST.—5 p.m., Dr. A. I. G. McLaughlin: Pneumoconiosis in Foundry Workers.

INSTITUTE OF UROLOGY.—4.30 for 5 p.m., Mr. C. I. Murphic: Tuberculosis of the Renal Tract.

KING'S COLLEGE HOSPITAL MEDICAL SCHOOL.—4.30 p.m., Special Lecture by Dr. H. F. Bettinger (Melbourne): Multiple Malignant Tumours in Patients Suffering from Genital Carcinoma.

MANCHESTER MEDICAL SOCIETY: SECTION OF MEDICINE.—At Large Anatomy Theatre, Medical School, Manchester University, 4.30 p.m., Mr. G. D. JACK: Dysphagia—its Aetiology and Prognosis.

MIDLAND MEDICAL SOCIETY.—At 154, Great Charles Street, Birmingham 8.15 p.m., Mr. Rodney Smith, Dr. J. J. Stevenson, and Mr. W. P. Greening: Contribution of Radiology to the Study of Function.

OXFORD UNIVERSITY.—At Radcliffe Infirmary, 5 p.m., Litchfield Lecture by Mr. T. J. Millin: Surgery of the Prostate. POSTGRADUATE MEDICAL SCHOOL OF LONDON.—2 p.m., Professor W. S. Peart: Biochemistry of Hypertension. ROYAL INSTITUTE OF PUBLIC HEALTH AND HYGIENE.—3.30 p.m., Dr. H. D. Chalke: Contribution of the Social Worker to the Community.

Thursday, December 6

CHADWICK TRUST.—At Wright-Fleming Institute, St. Mary's Hospital, 5 p.m., Malcolm Morris Memorial Lecture by Dr. J. N. Morris: Clinical and Community Medicine.

FACULTY OF HOMOEOPATHY.—5 p.m., Dr. G. R. Mitchell: Infectious Diseases and their Nosodes.

GLASGOW UNIVERSITY MEDICO-CHIRURGICAL SOCIETY.—7.30 p.m., Dr. H. R. MacLennan: Women in Medicine—Patients and Practitioners.

HONYMAN GILLESPIE LECTURE.—At University New Buildings, Teviot Place, Edinburgh, 5 p.m., Professor G. F. Marrian, F.R.S.: Recent Progress in the Biochemistry of the Oestrogenic Hormones.

●INSTITUTE OF OBSTETRICS AND GYNAECOLOGY.—4.30 p.m., Dr. H. Bettinger (Melbourne): Mesodermal Fixed Tumours of the Female Genital Organs.

LIVERPOOL MEDICAL INSTITUTION.—8 p.m., Symposium to be opened by Mr. H. Morrison Davies, Mr. J. C. Ross and Dr. J. Dobson: Recent Advances in the Treatment of Tuberculosis.

POSTGRADUATE MEDICAL SCHOOL OF LONDON.—4 p.m., Dr. J. F. Goodwin: Cyanotic Heart Disease.

ROYAL COLLEGE OF SURGEONS OF ENGLAND.—5.30 p.m., Otolaryngology Lecture by Mr. E. J. Radley Smith: Modern Application of the Physiology of the Pituitary Gland.

ROYAL SOCIETY.—4.30 p.m., Ferrier Lecture by Sir Wilfrid Le Gros Clark, F.R.S.: Inquiries into the Anatomical Basis of Olfactory Discrimination.

ST. ANDREWS UNIVERSITY.—At Physiology Department, Queen's College, Dundee, 5 p.m., Professor Ian Aird: Relationship Between the Blood Groups and Disease.

ST. GEORGE'S HOSPITAL MEDICAL SCHOOL.—5 p.m., Sir Paul Mallinson: psychiatry demonstration.

ST. JOHN'S HOSPITAL DERMATOLOGICAL SOCIETY.—4.30 p.m., demonstration and discussion of clinical cases.

UNIVERSITY COLLEGE HOSPITAL MEDICAL SCHOOL.—5 p.m., special university lecture in medicine by Dr. H. F. Bettinger (Melbourne): Genetic, Hormonal, and Practical Aspects of Intersexuality.

Friday, December 7

DUBLIN UNIVERSITY.—At Anatomy Theatre, School of Physic, Trinity College, 4.30 p.m., Frederick Price Lecture by Dr. Donald Hunter: Present Need for a Sense of Historical Perspective.

●INSTITUTE OF DERMATOLOGY.—5.30 p.m., Dr. F. R. Bettley: clinical demonstration.

INSTITUTE OF DISEASES OF THE CHEST.—5 p.m., Dr. K. F. W. Hinson and Dr. E. H. Hudson: clinico-pathological demonstration.

INSTITUTE OF LARYNGOLOGY AND OTOTOLOGY.—3.30 p.m., clinical meeting for general practitioners. Mr. C. L. Heanley: Plastic Surgery of the Nose and Face.

POSTGRADUATE MEDICAL SCHOOL OF LONDON.—10 a.m., Professor A. G. R. Lowdon: Surgery of the Spleen; 4 p.m., Mr. P. McG. Moffat, Griffiths: Sudden Death.

ROYAL MEDICO-CHIRURGICAL SOCIETY OF GLASGOW.—At Royal Faculty of Physicians and Surgeons of Glasgow, 8.30 p.m., Dr. T. F. Fox: Medicine in Soviet Russia.

SOCIETY OF MEDICAL OFFICERS OF HEALTH: WELSH BRANCH.—At 195, Newport Road, Cardiff, 6.30 p.m., Dr. A. H. Griffith: Tuberculosis Trends and Prevention; Dr. Ann Giv: Spastic Children; Dr. Lydia A. Knowson: Estimation of Intelligence in Babies.

WHIPPS CROSS HOSPITAL MEDICAL SOCIETY.—8.30 p.m., Dr. P. J. Lawther: Smor.

Saturday, December 8

●INSTITUTE OF ALMONERS.—At Conway Hall, Red Lion Square, W.C., 3 p.m., annual general meeting. Miss Helen Bate: Social Work in Medical Care; Miss Jean Snelling: Training for Medical Social Work.

INSTITUTE OF LARYNGOLOGY AND OTOTOLOGY.—11.30 a.m., Special Lecture by Dr. H. F. Schuknecht (Detroit): Surgical Management of Cancer of the Jaws.

●INSTITUTE OF OBSTETRICS AND GYNAECOLOGY.—9.45 a.m., Professor G. G. Lennon: Eclampsia; 11.15 a.m., Mr. J. A. Stallworthy: Genital Tuberculosis.

SOUTH-EAST METROPOLITAN REGIONAL TUBERCULOSIS SOCIETY.—At Middlesex Hospital W., 10.30 for 11 a.m., annual general meeting. Mr. T. Holmes Sellers: Present Position of Thoracic Surgery in the Treatment of Pulmonary Tuberculosis.

BIRTHS, MARRIAGES, AND DEATHS

BIRTHS

Adderley.—On November 21, 1956, to Jean and David Adderley, of 66, Boyne Road, Lewisham, London, S.E., a sister for Nicholas and Martin.—Ruth Margaret.

Brown.—On November 6, 1956, to Dr. Barbara Brown (formerly Jacob), wife of David Ferris Brown, of Mary's Meadow, Guildford, Surrey, a sister for Richard and Janet—Elizabeth Filmer.

Dunn.—On November 12, 1956, at Birmingham Maternity Hospital, to Sylvia Dunn, M.B., B.S., wife of Andrew Dunn, L.D.S., a second daughter—Siona Morag.

Smith.—On November 16, 1956, at B.M.H., Isertown, B.F.P.O. 34, to Dr. Dorothy Lindsay (formerly Grieve), wife of Captain Ian Inglis Smith, R.A.M.C., a son (stillborn).

Wisdom.—On November 21, 1956, to Drs. Anthony and Charlotte (formerly Hartstein) Wisdom, of 3, Woodstock Road, Strood, Kent, a daughter—Lucy Charlotte.

DEATHS

Atkinson.—On November 6, 1956, John Parkinson Atkinson, M.B.E., M.R.C.S., L.R.C.P., of "Avery," Findon, Sussex.

Campbell.—On November 8, 1956, Thomas Campbell, L.M.S.S.A., of Lytton House, Stevenage, Herts, late of Sandy, Beds, aged 77.

Freeland.—On November 4, 1956, at the London Hospital, London, E., Derek Ellis Freeland, B.M., B.Ch.

Logan.—On November 3, 1956, at Brighton, Sussex, Barbara Marshall Logan, M.B., Ch.B., D.L.O., of 232, Dyke Road, Brighton.

Sykes.—On November 1, 1956, Joseph Alfred Henry Sykes, L.M.S.S.A., of 18, St. Augustine's Avenue, Croydon, Surrey, aged 72.

Any Questions?

Ideal Weight

Q.—In treating obesity by dieting, to what level should the weight be reduced? Is there any simple way of calculating the ideal weight, or are tables available for this purpose? In what conditions is it necessary to observe caution in the rate or amount of reduction?

A.—Life insurance statisticians claim that adults of any age tend to live longer if they keep their weight close to the average weight of people of the same sex and height aged 20-25 years. Weight gain occurring after cessation of growth is due to accumulated fat, so that the proportion of fat in the body is probably optimal in the age range 20-25. "Ideal" weight cannot be calculated, but there are tables relating height and weight and sometimes age; for adults the weight given for age 20-25 should be used, regardless of the age of the patient. The thickness of a fold of skin and subcutaneous tissue on the anterior abdominal wall, taken near the midline and midway between navel and groin, is a good and simple measure of the proportion of fat in the body, and has the advantage of demonstrating to the patient how fat he is. In normal young men this fold, pinched up between finger and thumb, is no thicker than their little finger, and in young women no thicker than their thumb. The same standard applies to children over the age of 5.

There is no condition in which any degree of obesity is advisable. The rate of weight loss is determined by the calorie deficit, and, since a feasible reducing diet which provides adequate protein, vitamins, and minerals rarely contains less than 1,000 calories, the maximum rate of loss for most people is 2-3 lb. (0.9-1.36 kg.) a week after the first one or two weeks. This rate is safe, and a rate much less than this is tedious and disheartening to patient and doctor. Children, obese cirrhotics, and expectant mothers may reduce at this rate, provided their diet is adequate in proteins, vitamins, and minerals. A calorie-deficient diet may reduce milk production during lactation. Obesity resulting from overfeeding in the treatment of tuberculosis should be reduced cautiously.

Multiple Boils in Infants

Q.—How should persistent and widespread boils in infants be dealt with? The patient in question is a baby in Bombay aged 1 year, who has had boils all over the body for six months. Culture yields *Staph. aureus* sensitive to 10 units of penicillin per ml.

A.—This question involves a general medical problem and cannot be answered briefly. Here only the main points can be dealt with, and the Refresher Course article on recurrent boils should be consulted.¹

First, the diagnosis. Has the baby been on bromides? If not, a pustular bromide eruption is ruled out. Could this be cutaneous leishmaniasis? The widespread distribution makes this unlikely, though not impossible, for American troops in Iran during the second world war were seen with several hundred lesions each, resulting from sleep-seeing naked without protective nets. Cat or dog fleas may produce multiple pustules. Is the baby scratching? Has it eczema which has become secondarily infected or has it scabies? If the diagnosis of common boils is assured other questions arise. Is any relation or other person in contact with the baby suffering from boils or a purulent discharge from the nose or ears, the result of staphylococcal infection? Has the baby itself such a discharge? Is there any general condition present which might lower its resistance to infection?

Treatment depends on the answers to these questions. Local treatment should be mild and aim at reducing the population of staphylococci on the skin surface, which should be kept as healthy as possible. The baby should be

sponged twice daily with 1% cetrimide solution, its skin carefully dried, and then powdered with zinc oxide, calomel, and starch in equal quantities. Each boil, or better still the whole body, should be painted with 1% gentian violet solution or the following: Brilliant green ½%, hydrarg. perchlor. ½%, industrial spirit 99%. The boils should not be squeezed or incised, but dry gauze dressings applied and frequently changed so that the discharge of pus will not long remain in contact with the surrounding skin. Cotton clothing should be worn next to the skin, changed daily, and boiled. Moist fomentations macerate the skin and lower its resistance. If heat is required moderate exposure to sunlight or infra-red radiation is best. The antibiotics provide only temporary relief. More important is the consideration of the general resistance to infection. Diet, if not satisfactory, must be corrected. Plenty of protein and fresh fruit and vegetables and a minimum of starch are indicated. Extra vitamins may be given.

Raynaud's Disease

Q.—How should a case of Raynaud's disease be managed? The condition is very troublesome even in warm weather. Have there been any notable advances in therapy lately?

A.—The most notable advances have been in prognosis, which is worse in cases associated with scleroderma. These have characteristic appearances in the skin of the fingers and also on the face around the nose and the lips. Changes in the lower oesophagus are sometimes seen on a "barium swallow." Another group of cases which do badly are those in which secondary thrombosis has occurred in the digital arteries. Gangrene of the finger tips is frequent in these. The changes may be shown by arteriography.

There is no cure for Raynaud's disease. The most effective form of therapy is cervical sympathectomy. A pre-ganglionic operation is now done which avoids the occurrence of Horner's syndrome. Vasodilator drugs are of some help, particularly those which act directly upon the smooth muscle of the vessel walls. Tolazoline is one, and "dibenyline," a longer-acting drug, another which is of help. The action of the latter on the peripheral circulation was the subject of a recent paper in the *Journal*.¹ Several preventive measures are also of importance. The patient should wear warmer clothes than other people, and take care to protect the forearms and hands. Neglect may lead to secondary thrombosis of digital vessels and in the more severe cases to gangrene of the finger tips.

Treatment of Acne

Q.—Have there been any recent advances in the treatment of severe acne? Is carbon-dioxide snow of value? A healthy spinster of 35 has been having severe attacks for the last three years in spite of strict attention to diet. The condition began in adolescence but was mild until three years ago. Does this history suggest the need for any endocrinological assessment? Menstruation is normal.

A.—There have been no notable advances in the treatment of acne, though for acne scars the new abrasive techniques are sometimes valuable, and vitamin A by mouth has been claimed to be useful for treatment of the active lesions. The application of slush made by mixing solid carbon-dioxide and acetone is often effective for cystic acne. Although in adolescence acne may be regarded as normal—or perhaps an exaggeration of the normal—its persistence to the age of 35 suggests some constitutional cause.

Endocrine influences clearly play an important part in acne; it appears after puberty, is unknown in eunuchs, is often worse in girls before a menstrual period, and improves during pregnancy. The androgenic hormones seem to be of major importance. There is some evidence that women

with persistent acne excrete more 17-ketosteroids than normal, but the evidence is conflicting. In the patient described hormonal imbalance may be present and androgen secretion may be raised even though menstruation is normal. Estimation of the 17-ketosteroid excretion would be worth while. In any event treatment with oestrogens should be given—for example, stilboestrol, 0.5 mg., each morning—for three weeks after each menstrual period, but it should be discontinued if irregularity of menstruation results.

Persistent acne may be associated with a congenital defect of the sebaceous glands, sometimes familial, resulting in hyper-activity of the glands. Little can be done to affect this except palliative treatment, including frequent rinsing of the skin with 1% cetrimide solution to remove the sebum. There is little doubt, too, that stress affects the secretion of sebum, and some experimental evidence supports this view. Certainly students with acne often find it becomes worse before an examination. In an unmarried woman of 35 stress may play a large part and androgen secretion may well be raised. A consideration of her condition with these factors in mind might be useful.

Fibrinogen for Haemorrhage

Q.—When is fibrinogen specially indicated in the treatment of haemorrhage? Are there any contraindications to its use, and in emergency, when the cause of persistent bleeding may be unknown, is there any danger in using it empirically?

A.—Fibrinogen is specially indicated in the treatment of haemorrhage when the haemorrhage is due to or associated with fibrinogen deficiency. Fibrinogen deficiency may occur as a rare congenital defect or as a result of severe liver disease. Fibrinogen may also be reduced in the newly recognized defibrination syndrome which occurs in some obstetrical cases with antepartum haemorrhage or when a dead foetus is retained. In these latter patients the defibrination is due to removal of fibrinogen either by intravenous coagulation or by fibrinolysis. A similar state may occasionally occur in the immediate post-operative period, particularly following major thoracic surgery. The syndrome is associated with profound collapse and persistent bleeding and sometimes spontaneous bruising; it may be followed by anuria. The blood fails to clot as tested by the Lee and White method, and no clot is obtained on the addition of thrombin. The platelet count is also much reduced.

Persistent bleeding is only very rarely caused by fibrinogen deficiency. Fibrinogen should never be used for the treatment of bleeding when the cause is unknown. In these circumstances whole blood or plasma should be used. If the bleeding is due to deficiency of some blood constituent, it is more likely to be corrected by a fluid which contains all of the factors than by fibrinogen which provides only one. In addition, fibrinogen is in very short supply, and if it is used indiscriminately it will not be available for the obstetric and post-operative cases in which its use may be life-saving.

NOTES AND COMMENTS

Infirmity Mice.—Dr. W. LANE-PETTER (Laboratory Animals Bureau, London) writes: I am not altogether convinced by the explanation given for the disappearance of infirmity mice ("Any Questions?" November 17, p. 1190). Predation by cats might reduce their numbers but would be unlikely to eliminate the mice altogether. This type of predator/prey relationship does not have as a result the elimination of the prey. Other predators, such as wild rats, which are not primarily predators but competitors, can lead to complete elimination, but this is a different biological picture altogether. Control measures such as the use of rodenticides can be completely effective if properly carried out, but this cause of disappearance of mice is hardly likely to have been overlooked. Changes in the methods of handling and storing of foodstuffs, etc., might have produced an environment incompatible with the survival of the mice, but this would not

have occurred unless they had been made deliberately to this end and had been fairly radical; such changes, again, would not have been overlooked.

A more likely explanation of the disappearance of mice and a more ominous one is the appearance of a serious epizootic infection. Not all possible serious infections of mice are transmissible to man, but one of the more likely ones, mouse typhoid, is caused by a salmonella. If this is the cause of the mice disappearing, the infirmity should be on the look-out for an outbreak of food-poisoning.

Child Guidance Clinics.—Dr. P. A. TYSER (Cambridge) writes: I have no quarrel with the view expressed by a child psychiatrist and a medical officer of health ("Any Questions?" November 17, p. 1188); both have with admirable brevity dealt with a difficult question. Certain points are of such importance in my view that they require greater emphasis: (a) via the child guidance clinic much help is given to adult problems, often the child's need for referral being due to such causes; also many parents can be helped not to repeat incorrect handling with subsequent children. This constitutes an important additional curative function. (b) The child guidance clinic should not be considered as a service separate from other mental health services, both preventive and curative; it is an essential part of the whole. (c) There is much to be said for locating the clinic within the curtilage of the paediatric department of a hospital; this emphasizes to all that illness can be of both mind and body; the child does not feel it is being segregated; the parents are also made aware of the oneness of mental and physical illness. (d) Similarly, the part played by the school health services, educational psychologist service should be closely integrated with the child guidance clinic, since it will also be unearthing problems of a general mental health type as well as specific educational problems; a plea is entered here that educational psychologist services should not be made too narrow a pattern.

Alcoholic Excess and Mucous Colitis.—Dr. W. W. KAY (Epsom, Surrey) writes: In addition to the points mentioned in your reply to the question about alcoholic excess and mucous colitis ("Any Questions?" October 13, p. 893), it would be useful to consider the relationship of B-vitamin deficiency and achlorhydria to the mucous colitis. After indulgence in drinking, most alcoholics have a B-vitamin deficiency which in severe cases may manifest itself as pellagra with a superimposed thiamine deficiency. Usually this responds to treatment with full B-vitamin complex in substantial doses given parenterally at the beginning. In some cases mucous colitis is related to achlorhydria. A test-meal would decide whether there is achlorhydria in the case under consideration. If there is, then adequate doses of hydrochloric acid with meals would control the diarrhoea, whereas alkaline mixtures are likely to aggravate it.

Correction.—Mr. R. B. WELBOURN writes that, in the second paragraph of his letter on delayed emptying of gastric stump (*Journal*, November 17, p. 1172), instead of "(4) hypoproteinaemic oedema (correct fluid and electrolyte balance)," he should have written: "(4) hypoproteinaemic oedema (treat with plasma or protein hydrolysate intravenously); (5) hypokalaemia (correct fluid and electrolyte balance)."

Books of "Any Questions?" and Refresher Course Articles.—The following books are still available through booksellers or from the Publishing Manager, B.M.A. House. Prices include postage. *Any Questions?*, Volumes 2 and 3 (8s. each); *Refresher Course for General Practitioners*, Volume 2 (26s. 6d. inland, 26s. overseas); *Clinical Pathology in General Practice* (22s. 3d. inland, 21s. 9d. overseas).

All communications with regard to editorial business should be addressed to THE EDITOR, BRITISH MEDICAL JOURNAL, B.M.A. HOUSE, TAVISTOCK SQUARE, LONDON, W.C.1. TELEPHONE: EUSTON 4499. TELEGRAMS: *Altology, Westcent, London*. ORIGINAL ARTICLES AND LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated.

Authors desiring REPRINTS should communicate with the Publishing Manager, B.M.A. House, Tavistock Square, W.C.1, on receipt of proofs. Authors overseas should indicate on MSS. if reprints are required, as proofs are not sent abroad.

REFLECTIONS ON SOME CURRENT TRENDS IN MEDICAL EDUCATION IN AMERICA*

BY

WALTER BAUER, B.S., M.D.

Jackson Professor of Clinical Medicine, Harvard Medical School; Chief of Medical Services, Massachusetts General Hospital, Boston

The title of my discussion was carefully chosen as a restrictive one. American medical education to-day is an unusual mixture of discrete and often discordant parts—a heterogeneous collection of different schools, different techniques in teaching, and different philosophies of what the finished product of medical education should be. It would be impossible to present you with a clear distillate from this troubled brew, for the fermentation is still in progress. I shall therefore venture to examine briefly a number of seemingly unrelated topics which I believe to be of basic importance in this transitional phase of academic medicine in the United States. It is not without serious misgivings that I undertake this ambitious task, for much of what I have to say has been previously and skilfully examined here by a number of my distinguished predecessors. Their clear appraisals of our mutual problems in medical education have established a remarkable standard for this occasion.

Since the last war much thought and some experimentation have gone into many aspects of medical education in the United States. There have been a spate of conferences, a flood of articles, and a deluge of speeches concerning such topics as premedical education, the selection of students, the composition of the undergraduate curriculum, the recruitment of instructors, economic support of students and of the faculty, the pattern of postgraduate education in a profession marked by an increasing specialization, the responsibility of the medical school to medical research, the relative value of full-time versus part-time teachers, and so forth, *ad infinitum*. After attending many conferences, taking part in numerous discussions, and hearing the analyses of the few "experiments" on what ails medical education to-day, I think that some of the current confusion may be manufactured. Please do not misunderstand me; problems exist in medical education, and they need to be clearly defined and constantly met, but I am not convinced that the prognosis is so grim as to warrant radical measures at this time. One often hears such rotund phrases as "the complete physician," "the whole patient," "the fundamental or basic principles," "integrated teaching," "psychosomatic medicine," in ever-recurring themes and variations. My faith in such slogans is feeble. This is not to deny that

many of the new programmes in American medical education have a firm footing based on careful thinking of what may be accomplished by these innovations. I would only hope, however, that as we grope for "principles" in the teaching of medicine we do not ignore the words of your professor of medicine, Dr. W. M. Arnott (1955), who last year said:

"In education to-day we hear much about principles—always 'fundamental' or 'basic' principles, the teaching or inculcation of which is the proud prerogative of this school or that department. A good deal of snobbery is attached to these terms. The more basic or fundamental the principle is deemed to be, the nearer are all those concerned to some mystic state of academic grace. Much of this is little more than an example of the limitations of language. Logically it presupposes that there exists somewhere a finite body of fundamental truth. The detailed curricula of medical schools, the itemized requirements of examining bodies, even the recommendations of the General Medical Council, tend to be regarded as a supreme polypharmaceutical prescription, the accurate dispensing of which will result in the 'complete physician.'"

Some Generalizations

In the United States, as here, some would claim that there is desperate urgency to reconstruct the medical educational system. The problems we face are by no means unique to the field of medicine, and I may venture at this point to preface my scrutiny of American medical education with a few general remarks. We should realize at the onset that regardless of the educational systems we evolve, there will be a sizable proportion of medical graduates who will never be the physicians we would like them to be. This is a reality which we have to accept. One of the reasons we must accept is that all men are not born equal, although we may prefer to think they are. But whether or not they are born equal is of less importance than the basic obligation that we construct an environment permitting men to function at their maximal capacities, whatever these capacities may be. In a just world men may not be equal, but opportunity should be. This idealistic goal cannot be achieved by decree but should be constantly pursued in a democratic society. Despite how carefully they may be chosen, we know that our medical students are not of equal ability.

As candidates for our medical schools we should select young men with strong vigorous minds, stable personalities,

*Address given on October 1, 1956, at the opening of the new session in the University of Birmingham Medical School.

Opportunities for Students

May I now tell you about the experiences of medical students in a teaching hospital in the United States? One of the strongest points in the education of the student is the highly individual attention given to him in his clinical teaching. He is assigned to a ward with one or three more students, where he learns the methods available for studying and evaluating patients. Along with the resident and the intern, he is an integral part of the ward team. He has the responsibility for the complete clinical work-up of a certain number of patients. The pace is set such that emphasis is on thoroughness and quality rather than quantity. He must put his observations and evaluation into writing which forms part of the official hospital record. Each morning before the senior visiting ward physician and the rest of the ward team, he presents the history, the physical findings, the routine laboratory data, and his formulation of the case based on these facts. These findings are checked. There is a detailed discussion of the case in a spirit of free give-and-take. He is encouraged to speak his own mind freely, in agreement or disagreement, which he soon learns to do. Interpretation of clinical observations in terms of basic physiological and biochemical principles is emphasized. Stimulated by discussions of the case, the student acquires the healthy habit of reading journals to find the latest information about a disease, and this, in turn, stimulates further discussion. The visiting physician welcomes the opportunity to be drawn into a debate with the student. The atmosphere is created in which each is willing to learn from the other, without undue regard for rank on an academic scale.

Educational opportunities in a teaching hospital are unlimited, and, gratifying enough, most students take advantage of them. They spend much time in leisurely discussion regarding various medical topics with the senior ward resident and with various members of the consulting services. They attend and often participate in the weekly clinicopathological conferences, the grand rounds, and other group discussions, and are assured of a patient hearing at any of them. At the weekly ward social service rounds attended by social workers, the visiting physician, and the ward team, the student presents the social problems of his patients and learns something about rehabilitation, available social agencies, and the part they can play in alleviating the effects of illness.

The student thrives in this environment. He feels that there is no sharp distinction between students and physicians—all are students of medicine. Responsibility is given to him in so far as he demonstrates his ability to discharge it. His education is rapid, and is based on a genuine and active interest in his work.

University Teachers

Selection of academic staffs is a heavy responsibility. The faculty is composed of two types—full-time members, who receive relatively little income from private patients, and part-time staff, who can treat as many private patients as they wish, so long as private practice does not interfere with their assigned duties of instruction and, in some cases, research. The full-time members of the faculty are paid by salary and include almost all teachers in the preclinical science departments but relatively few in the clinical departments. A large proportion of clinical teaching in many medical schools, particularly those in large metropolitan centres, is carried on by part-time teachers who receive little or no salary. They are given hospital staff appointments and privileges to use the hospital facilities. The full-time teachers accept their positions because they are genuinely interested in academic medicine and are willing to serve at a financial sacrifice. Many of the part-time teachers donate their services out of the same motivation. Medical schools must find a way of raising salaries, particularly in the preclinical years, in order to attract promising medical graduates, for one of the main reasons for the dearth of physicians in the preclinical sciences is economic.

The full-time system at Harvard is rather unique in that private practice is allowed, with the proviso that income from this source is not to exceed the amount paid by salary. The system has worked well at Harvard, where the care of the patient and teaching responsibilities are shared by a large part-time clinical staff—and where, by tradition, the full-time men have voluntarily undertaken little or no private practice. A disquieting trend is the misapplication of this system in many university hospitals located in small suburban communities where little or no part-time staff is available to carry the heavy routine load. In these areas, prior to the introduction of the Harvard system, the bulk of the clinical faculty was, of necessity, so occupied with routine duties—ward rounds, out-patient clinics, and teaching activities—that there was little time for research. Now, with a full-time system that permits the clinician to earn in practice the equivalent of his university salary, the "full-time" clinician has even less time for research, reading, and furthering his own educational growth. This system is not in the best interest of academic medicine in America. This unfortunate outcome can, however, be corrected by substantial additions to the clinical faculties of the university hospitals concerned.

The full-time departmental heads at Harvard—and I suspect elsewhere—face another dilemma. Suitability for this position is determined in part by the candidate's productivity as an investigator. In his new position he finds himself saddled with too many responsibilities of an administrative nature. His research career all but comes to an end. Ruefully, Professor William B. Castle at Harvard said: "We become professors of administrative medicine."

Residency Programme, Postgraduate Training, and Specialization

Limited as our individual capacities are and vast as medical knowledge has grown to be, specialization has become a necessity. Specialization, I maintain, should begin only after three years of training in general medicine or surgery. The current practice of retiring to the sheltered confines of the left auricle or the right knee-joint after completion of one year of internship results in a specialist not properly equipped to deal with the general body of medical knowledge. Such specialists do not make effective members of a teaching hospital staff.

A training period of three years in general medicine has other things to recommend it. The limitations of human ability are such that only a few people make outstanding discoveries. The incoming interns do not realize this fact. Exposed as they are in certain university clinics to the powerful influences of their teachers, most of whom are engaged in research work, the majority of the new graduates in many large centres want to take up investigative careers. As I interview Harvard Medical School applicants each year for internship appointments at the Massachusetts General Hospital, I find that not more than one in thirty wishes to go into medical practice. Many of them are doomed to frustration; and therefore I constantly preach to these young doctors what I sincerely believe—namely, that giving good medical care is the primary duty of every physician, of every hospital, and that all research and all teaching should be subsidiary to good patient care. I say to them: "If you can do some research, God bless you; if you can do some teaching, God bless you; if you can do neither, you should be proud that you are capable of providing good medical care."

A three-year period of training in general medicine provides adequate time for the realization of one's assets and limitations as a physician. At the end of this period those who want to enter the practice of internal medicine will have had adequate training and will be ready to undertake their chosen profession as able clinicians. Others will move on for further training in their chosen fields.

A three-year postgraduate training programme has another advantage. As an intern in the first year, the young doctor learns, as he has never learnt before, how to accept responsibility,

how to evaluate emergency situations carefully and accurately, yet with some speed. His practical learning soars. He acquires competence in basic hospital procedures. As an assistant resident, he is in a position to make use of his previous experiences, to reach more mature judgments, to bring to bear on his patients' problems a fair measure of critical evaluation. As a resident, with fewer immediate ward responsibilities, he is in a position to mobilize his experience, to augment his work of the previous two years with extensive reading. His judgment bears considerable weight in the handling of difficult and equivocal patient-problems. Thus he has acquired a foundation on which to build in any direction he chooses. He is now equipped for the practice of internal medicine.

One of the most illuminating experiences this house officer has had during his three years' stay is his training in a variety of hospital settings. Does the teaching hospital which is divided into autonomous separate firms, each manned by a permanent chief and with little inter-communication, provide the same varied training experience for the house officer? There can be no doubt that he acquires coherent knowledge under this system. Is this, however, sufficient justification for its perpetuation? Does it inhibit the growth of critical knowledge, promote hero-worship, and, at times, respect for authority rather than for ideas? Will it lead to frustration when in the light of later experience these gods, not too infrequently, turn out to be "tin-gods"? Again, I can only raise these questions. I cannot answer them. Some of my British colleagues, visiting the teaching hospitals in the United States, agree with me in preferring the system in which the many wards within the service are not autonomous isolated units, but instead are supervised by carefully selected senior clinicians who are attached to the wards for periods of only two to four months each year. The house officer therefore comes in contact with many physician-teachers with differing ideas.

We face still another problem in the training required for specialty board certification. There is no doubt that for specialty boards have raised the standards of practice in America, yet they do impose severe burdens on the young doctor. In most instances board certification means prolonging his training period to four years or more. Often without such certification he cannot obtain an appointment even at the smaller non-teaching hospitals. This introduces an element of unwarranted pressure and great financial hardship on many competent young doctors who would make fine additions to hospital staffs, though not board-certified. Certainly in the academic field of medical education and research I see no need for specialty boards. It seems to me that a good medical education and three sound years of graduate training—plus a year or more in a basic medical science—equip a man for research in medicine if he has the other indispensable qualifications, which include interest, originality, and creativeness.

American Medical Association

Now, in approaching the end of my talk, I come to the difficult task of assessing the role of organized medicine in the growth of American medical education.

The American Medical Association, which regulates ethics and standards of the practice of medicine, is composed of practising physicians who, understandably, resent superimposed restrictions and impersonal remote supervision. The physician, by his nature and training, deals with people on an individualistic and personalized basis. He is in no mood to function at the command of a bureaucrat. In his mind he tends to be conservative, suspicious of encroachments by city, state, and federal agencies on his independence and freedom of action. It is not for me to decide that his attitude is good or bad, but I think we will all agree that many aspects of it are understandable.

In the United States to-day we face a real problem in the financing of our medical schools. Teachers are woefully underpaid, and schools are understaffed. Income from endowment can no longer carry the full cost. The demand

for doctors increases with the expanding population. It is in the public interest to train better doctors and more doctors, all of which is expensive. Where are the schools to get this money? Inevitably, of course, the schools are turning to the Federal Government for assistance. The American Medical Association, worried that the man who pays the piper will call the tune, has vigorously opposed efforts of the schools to achieve favourable legislation for financial assistance. The cry of socialized medicine can be heard over the battlefield, and I must confess that at times I am very confused as to what this term means. I gather that to the leaders of medical opinion in the American Medical Association, socialized medicine means the direction or undue influencing of the practice of medicine by a government body—notably a federal agency. How much of this alarm is derived from the inherent resistance of the American Medical Association to any new suggestion of change in medical practice I cannot say. As I said before, this would be understandable, but I think it is not necessarily realistic.

Proper legislation, with proper safeguards to protect the autonomy of the medical schools, could hardly be called encroachment of government influence over the domain of the private practice of medicine. Certainly federal grants for medical research have not demonstrated this predicted omnivorous tendency. In fact, they have become increasingly more liberal, often imposing fewer restrictions than many of our private granting agencies. Perhaps this is not an analogous "pilot-experiment" for federal support of medical education. The practitioner fears that if government interest extended beyond the financing of medical research the practice of medicine would be increasingly controlled and regulated by federal bureaucracy. It is my firm belief, however, that proper legislation can ensure financial support for medical schools without jeopardizing their independence of action in the teaching of students. Doctors themselves are beginning to contribute financially to the support of medical schools in larger numbers, but their contributions constitute only a trickle where a river of assistance is needed. I hope that the younger generation of doctors, working vigorously to express themselves within the American Medical Association, will ultimately help to siphon off the element of entrenched, unyielding reaction, to the extent that it exists. In this way the profession's view about the critical needs of the medical schools may be gradually broadened.

As I come to the end of my discussion, I wish to state that American medical education is basically sound. Problems are inherent in any human endeavour, yet man lives by problems. My attitude towards them is best summed up in the following quotation from Goethe: "Man is born not to solve the problems of the universe, but to find out where the problem begins, and then to restrain himself within the limits of the comprehensible."

The first four issues of the *New Scientist*, a weekly magazine for those interested in the progress of science, have now appeared. Edited by Mr. PERCY CUDLIPP, formerly editor of the *Daily Herald*, it aims to tell its readers, in clear language, about scientific discoveries and their industrial, commercial, and social implications. In appearance the *New Scientist* is a 60-68-page magazine of similar format to week-end reviews such as the *Spectator* and *Economist*. Besides expository and reviewing articles by well-known scientists and scientific journalists, the magazine also includes shorter comments, a news section, book reviews, correspondence, an American newsletter, a guide to careers in science, and a section of short annotations called "It Seems to Me." A useful feature is the potted biographies of the principal contributors. The *New Scientist* is published on Thursdays and costs 1s. an issue.

INTRA-ARTERIAL OXYGEN IN PERIPHERAL VASCULAR DISEASE

BY

R. J. MARSHALL, M.D., M.R.C.P., M.R.C.P.I.

Principal Tutor in Medicine

AND

R. F. WHELAN, M.D., Ph.D.

Lecturer in Physiology

Queen's University of Belfast

The injection of small quantities of oxygen or of various other gases into the brachial artery of the normal subject is followed by marked vasodilatation in the hand and forearm which persists for an hour or more (Duff, Greenfield, and Whelan, 1953). This observation suggested a possible application in the treatment of patients with ischaemic disorders of the limbs. Much of the disability in these patients is a direct consequence of reduced blood flow to skin and muscle, and it was felt that if vasodilatation could be obtained comparable in degree and duration to that in normal people symptomatic benefit might result. Intra-arterial oxygen has been employed as a mode of therapy in ischaemic disorders of the lower limbs by Lemaire, Loeper, and Housset (1948); they were impressed with its effect in improving symptoms. Since then several workers in Germany (Wernitz and Dörken, 1954; M. Ratschow, personal communication, 1955; Hasse, Köble, and Linker, 1955) have claimed therapeutic benefit from intra-arterial oxygen therapy.

This paper presents the results of a detailed study of circulatory changes induced by intra-arterial oxygen injections in patients with peripheral arterial disease involving upper and lower limbs. The changes are compared with those following intra-arterial injection of three potent vasodilator drugs: tolazoline ("priscol"), hydralazine ("apresoline"), and phenyl-iso-butyl-n-p-hydroxy ephedrine ("dilatal").

Methods

The investigations were carried out at a room temperature of 20-24° C. The patient rested on a couch for at least an hour before observations were made. In the case of the upper limb, injections were made into the brachial artery in the antecubital fossa; for the lower limb, they were made into the femoral artery in the groin. The limb into which the injection was made was raised slightly. A continuous infusion of 0.9% saline was maintained into the artery from a mechanically driven syringe, and the gaseous oxygen was added slowly to the stream of saline through a side-arm in the connecting tubing.

On most occasions measurements of blood flow were made by the technique of venous occlusion plethysmography (Barcroft and Edholm, 1943). The segment of limb being investigated was enclosed in a water-filled mechanically stirred plethysmograph (Greenfield, 1954), the water temperature being 31-32° C. for the hand and foot, and 34-35° C. for the forearm and calf. Normally the corresponding segment of the opposite limb was used for control observations, but on a few occasions on which it was desired to record simultaneously from the calf and the foot of the limb which received the injection no control observations were made. The venous collecting pressure was usually 50-70 mm. Hg, but at the peak of vasodilatation in the foot it was sometimes necessary to employ pressures as low as 30 mm. Hg. Cuffs at the ankle and wrist respectively were

inflated to a pressure of 200 mm. Hg for one minute before and during the recording of calf and forearm blood flows. After each injection of oxygen or of a vasodilator drug, blood flow records were taken at frequent intervals for one and a half to three hours. If at the end of this time the blood flow was still significantly raised further observations were made at intervals until it had returned to the resting level.

On some occasions changes in the skin temperature of the foot following injection were measured by a thermo-electric junction.

The dose of oxygen was 10 ml. for the upper limb and 30 ml. for the lower limb, given over a period of 10 to 15 minutes. In the case of the vasodilator drugs the quantities injected intra-arterially approached or equalled the full intravenous doses, so that a very high local concentration was attained in the limb injected. For the lower limb the quantities were: tolazoline 50 mg., hydralazine 20 mg., dilatal 10 mg.; for the forearm and hand the corresponding quantities were 25-40 mg., 10-12 mg., and 5 mg. The vasodilator drugs were administered steadily over 5 to 10 minutes.

Eighteen patients were studied, as shown in Table I:

TABLE I

Disorder	Male	Female	Total Cases	Under 50 Years	Over 50 Years
Raynaud's phenomenon	3	2	5	3	2
Intermittent claudication	8	2	10	4	6
Ischaemic necrosis of foot	2	1	3	0	3
Total	13	5	18	7	11

Appearances

Following injection of tolazoline the skin of the limb distal to the site of arterial puncture rapidly became bright red; this persisted for about an hour, then slowly faded. Colour changes subsequent to injection of hydralazine and dilatal were similar but less pronounced.

The sequence of colour changes in the upper limb (Duff *et al.*, 1953) and lower limb (Hasse *et al.*, 1955) of healthy subjects following intra-arterial injections of oxygen has already been described. Similar changes were noted in the diseased limbs of the present study. As the slow infusion of oxygen began blanching patches appeared in the skin distal to the site of injection. A crepitant sensation was imparted to the palpating finger by the passage of minute emboli through the radial and posterior tibial arteries; tinkling sounds were audible on auscultation over these vessels, and sometimes they could be heard by the naked ear up to 10 cm. distant from the vessel.

The patient was often conscious of a prickling sensation in the limb along the course of the major vessels, but real discomfort was rare. Five minutes later the limb was uniformly of a waxy white hue, the distal pulses were of poor volume, and the superficial veins were collapsed. Soon, however, the characteristic blue and then red patches appeared on the skin, spread concentrically, and coalesced to give a marbled appearance. Next the blue patches faded and the limb was uniformly erythematous. Colour changes were often noted in the ipsilateral lower abdominal wall and external genitalia owing to dispersal of gaseous emboli or vasodilator drug in the superficial hypogastric and external pudendal vessels. Localization of injected dilator drugs was sometimes seen, as evidenced by flushing confined to distinct areas, usually of the lateral or medial aspect of the thigh. Such localization was not seen after injection of oxygen, presumably because turbulence created by the fine stream of bubbles favoured more even mixing with the blood.

That the injected oxygen was distributed not only to the skin of the limb but also to the underlying muscle was demonstrated by measurement of the oxygen saturation of blood samples taken from a deep vein (draining muscle) and

a superficial vein (draining skin) before and after an injection of 5 ml. of oxygen into the brachial artery. Oxygen saturation was measured by a spectrophotometric technique (Roddie, Shepherd, and Whelan, 1956). Before the injection the oxygen saturation of the muscle blood was 55% and of the skin blood 69%. After injection the saturation of the blood from both sources rose simultaneously to attain values of 89 and 91% respectively within 25 minutes. Similar results were obtained in two other experiments, and indicate that the injection of gas into the brachial artery causes a dilatation of the vessels of both the skin and the muscle of the forearm.

Circulatory Changes in the Upper Limb

A typical series of results are shown in Fig. 1. This patient, a man of 64, suffered from severe Raynaud's phenomenon associated with arteriosclerosis; in addition he had worked with vibrating tools for a number of years.

Injection of 10 ml. of oxygen into the left brachial artery was followed by prolonged vasodilatation, the hand blood flow being still significantly increased after 48 hours. In contrast, the blood flow had returned to normal two hours after injection of tolazoline and four hours after injection of dilatal. The effect of hydralazine was intermediate, since the blood flow was still increased after five hours but had fallen to a normal level after 22 hours.

During a period of three weeks seven oxygen injections were given, the results of which are summarized in Table II. It is seen that the duration of vasodilator response is variable. After the fourth and subsequent injections the vasodilatation was no more prolonged than that obtained by tolazoline and dilatal. Similar results were obtained in the other patients with Raynaud's phenomenon.

TABLE II

No. of Injection	Hand Blood Flow (ml./100 ml./min.)			Approximate Duration of Vasodilatation (Hours)
	(i) Left Hand Before Injection	(ii) Left Hand at Peak of Vasodilatation	(iii) Right Control Hand Simultaneous with (ii)

6	6.0	15.9	6.1	24
7	5.0	11.0	5.6	2.4

Circulatory Changes in the Lower Limb

Changes in calf blood flow following intrafemoral injection of oxygen and the three vasodilator drugs are illustrated in Fig. 2. The patient, a man of 37 with Buerger's disease, had suffered for two years from severe intermittent claudication; bilateral lumbar sympathectomy had produced only transient improvement and his

exercise tolerance was limited to 50 yards. Dilatal, tolazoline, and hydralazine produced moderate increases in blood flow, with a return to the resting level in a few hours. In contrast, vasodilatation following intra-arterial oxygen persisted for over 30 hours. Before the administration of oxygen this patient could make only 30 contractions of the calf muscles at intervals of two seconds against resistance; during the subsequent vasodilatation he was able to perform 80 similar contractions before the onset of severe cramp (Fig. 3). This suggests that the ability to perform work was improved by the injections; however, too much emphasis cannot be laid on this finding, since it is difficult to assess the role of psychological factors in the performance of such tests in intermittent claudication, and a precise measurement of work capacity (Shepherd, 1950) was not made.

regarded as significant if the disease was active and required treatment. Practically all the patients were proved to be excreting the tubercle bacillus from the respiratory tract. For the purpose of the survey we excluded patients with no fixed address, such as those living in common lodging-houses or in lodgings.

While 125 is not a large number of cases, we preferred to investigate a representative sample thoroughly and personally rather than depend on a mass of statistics culled from sources of uncertain dependability and completeness. The aspects of the survey considered here are (1) incidence of cases by age groups, (2) distribution by occupation, (3) frequency of contact history, (4) overcrowding and type of house, (5) household income in relation to age groups and numbers in the household, (6) the results of radiological and tuberculin examination of the household contacts, and (7) birthplace of patients.

Incidence of Cases by Age Groups

The distribution of the cases in age groups is given in Table I. The age distribution is similar to that reported by the Scottish Health Services Council (1951), although in the present survey there is a higher proportion of new active cases in the male age group 55-64.

TABLE I.—Age Incidence

Age groups:	14-24	25-34	35-44	45-54	55-64	65-74	75+
Males	18	16	10	6	18	3	1
Females	27	14	7	2	1	1	1
Total	45	30	17	8	19	4	2

Distribution by Occupation

In the group of 125 patients, 16 were employed in preparation or distribution of foodstuffs; one patient, for example, was a baker's vanman and five were grocers' assistants. The four females shown in Table II as working with children

were a schoolteacher, a primary school dining-room attendant, a receptionist in a children's hairdressing department, and a wardmaid in a children's hospital ward; of these four, only the wardmaid had been previously radiographed. One of our patients, a woman aged 62 (suffering from active cavitation bilateral disease with strongly positive sputum), was engaged in making high-class confectionery (marzipan decoration). Of the 23 married female patients, 13 were attempting to combine the duties of housewife and wage-earner.

Frequency of Contact History

In 56 of the 72 male patients (77.7%), and in 40 of the 53 female patients (75.4%), a history of contact with a tuberculous case was definitely established after close questioning of the patient and family, thorough cross-checking of their statements, and an intensive search of the available records of previously notified cases. A positive contact history was accepted on one or more of the following grounds: (a) Present house contact with an active tuberculous case; (b) past house contact with an active tuberculous case; (c) frequent contact, past or present, with a relative suffering from active pulmonary tuberculosis but not living in the same house; (d) frequent contact with a known case of active pulmonary tuberculosis at work or socially. The figures are given in Table III.

Where a positive contact history was accepted on more than one of the above grounds, only the contact thought to be most significant is included in the four categories in Table III. The number of cases in which multiple contact was established is separately shown in the Table.

Overcrowding and Type of House

Table IV gives the number of households overcrowded, applying the standards laid down in the Housing (Scotland) Act, 1950. For the purpose of this Act a person over the age of 10 is regarded as one unit, a child aged 1 to 10 years as half a unit, and a child aged less than 1 year is disregarded.

TABLE IV.—Overcrowding and Type of House (Figures to the Left and Below the Zigzag Line Show the Number of Households Overcrowded)

No. of Units	No. of Apartments				
	1	2	3	4	5
1	2	4

3	4	15	7	4	
4	1	6	12	3	
5	1	2	12	9	1
6		2		6	
7		1	1	4	2
8			1	1	
9				2	3

Households overcrowded, 22 (17.6%).
Households not overcrowded, 103 (82.4%).

In 3 cases out of the 22 overcrowded households the overcrowding was of a voluntary nature—namely, (1) a lodger had been taken in; (2) the overcrowding operated at the week-ends, when an 18-year-old relative stayed in the house; (3) a daughter of the household who had formed a liaison with a married man brought him and their two children to stay with her parents. The overcrowding figures for the households of male patients and of female patients were substantially the same, but overcrowding was found in only 4% of the households of patients over 54 years of age, probably owing to the fact that younger members of the family had left home on marriage or had obtained employment in some other district.

As the assessment of overcrowding according to the Housing (Scotland) Act, 1950, gives no indication of the types of houses in which our patients live, we classified them in the following groups: (a) municipal, further subdivided into (1) tenement type, (2) two-in-a-block, and (3) four-in-a-block; and (b) privately owned tenements which were subdivided according to assessment, after personal inspection of the general state of repair and environmental cleanliness, into good and bad groups. The results are given in Table V, which also shows the sex distribution.

It will be seen in Table V that 52 (41.6%) of the 125 new cases were living in municipal type houses. As such houses comprise approximately 29% of the total houses in the area (personal communication, divisional sanitary inspector), it would appear that there are proportionately more new patients arising in municipal houses than in non-municipal rented houses, as other types of housing in the area are insignificant. An explanation which suggests itself is that

TABLE V.—Type of Houses

	Municipal		Privately Owned	
	Female	Male	Female	Male

TABLE VI

	Period Rehoused (Years)						Total
	1	2	3	4	5	5+	
No. of patients	5	2	6	5	4	30	52

many of the patients had been recently rehoused by the local authority, and this possibility was investigated. The results are shown in Table VI.

The fact emerges that more than half of these patients had been living in satisfactory (by municipal standards) housing conditions for more than five years, but despite this had contracted tuberculosis. This group comprises a quarter of the cases in our survey, and only one of the 52 families concerned had been rehoused because of previous tuberculosis in the family. A higher proportion of female cases than male cases arose in persons living in municipal tenement houses, as opposed to the block-type of municipal house (66.6% and 42.8% respectively).

When the figures for cases arising in privately owned tenement homes are considered, we find approximately equal numbers in the good and bad types of houses (35 and 38 respectively), and of the 73 new patients living in privately owned tenements, 29 (39.7%) were females and 44 (60.3%) were males. There would thus appear to be a predominance of male cases arising in privately owned tenements.

Household Income

Accurate figures of household income are difficult to obtain because of a natural reticence on the part of the patient and sometimes a suspicion that the information divulged may be used to the patient's financial detriment—for example, in respect of national assistance or income tax. Another difficulty is that wage-earners of the household do not always disclose their true income to the others in the household, and wish to avoid the domestic unpleasantness which the truth would entail. Realizing these difficulties, we postponed close questioning until the confidence of the family had been gained and also gave assurance that any information obtained would be regarded as highly confidential. Care was taken to include in the household income figure all additional sources such as family allowances, pensions, and average overtime earnings. The results of this inquiry are given in Table VII.

This Table shows that household income varied widely from £1 12s. 6d. a week to £48 a week, but by far the greatest number were between £10 and £20. An income of £10 a week for the average household is, in our opinion, the lowest limit of income necessary to avoid undue financial strain, and our analysis shows that 70.4% of our patients were living above this level. In Table VIII we give a breakdown of the household income in relation to age group of

TABLE VII.—Weekly Household Income (All Sources) (Lowest, £1 12s. 6d.; Highest, £48)

More than £20	..	7	3	4	—	11.2%

the patients and to the average number of units in the house. A person over the age of 10 years is regarded as one unit and a person less than 10 years as a half-unit. It should be pointed out that, whereas in the housing analysis using statutory standards children under 1 year were disregarded, for the financial analysis a child under 1 year is regarded as a half-unit.

Table VIII shows the average income per household unit and also the average number of units per house according to the age groups of the patients. In the age group most

TABLE VIII.—Income Per Household Unit

	Age Group						
	14-24	25-34	35-44	45-54	55-64	65-74	75+

Average No. of units per house	4.6	3	4	3.8	3.6	2	1

prolific of new cases—namely, 14-24—the household income per unit is highest and the number of units per house is at its maximum. This group therefore has an undoubted financial advantage over all other age groups, because, apart from higher income per unit, the finding of a higher number of units per household places them in an additionally advantageous position, as more people are sharing a common roof and household expenses compared with the other age groups. In the patients of the younger age groups, therefore, poverty cannot be accepted as a significant predisposing factor. On the other hand, study of the tables will show that our patients aged 65 years and over are at a financial disadvantage when the average income per unit and the number of units are considered together. The children of these old people have usually left home and no longer contribute to a household, the basic expenses of which (rent, rates, heating, etc.) remain as high as before.

Contact Examination

We endeavoured to persuade all household contacts to submit to x-ray examination and Mantoux-testing with 1:1,000 O.T. The results are shown in Table IX. In addition, many other family and social contacts were examined, but these results are not included.

Of the 21 contacts not Mantoux-tested, seven were patients with pulmonary tuberculosis in whom testing was not considered necessary. One contact was a merchant seaman whom we managed to radiograph, but not Mantoux-test, before he rejoined his ship; 10 were out working all day and refused. Another contact, a lodger, left the household precipitately before testing could be carried out. The remaining two contacts not Mantoux-tested were an 87-year-old incontinent woman whose daughter forbade any examination,

and a 23-year-old working girl who chose to rest in bed on a Saturday morning rather than have any test carried out. These latter two were also the only household contacts not radiographed out of a total of 414. Of the group, therefore, 94.6% were Mantoux-tested and 99.5% radiographed.

As a result of the x-ray examination of these 412 household contacts 21 (5.7%) were discovered to have active pulmonary tuberculosis and a further 31 (6.8%) had tuberculous disease, probably quiescent or inactive.

As one may confidently expect that a proportion of the 31 cases classified as quiescent or inactive will break down in the future, continued observation will swell the total of active cases detected at an early stage as a result of the survey.

Racial Factors

In view of the fact that Glasgow has a large number of citizens who were born in Ireland and the Scottish Highlands, we thought it would be interesting to ascertain what proportion of the patients in our group came into this category. Only four patients (0.8%) were born in Ireland and four (0.8%) in the Scottish Highlands.

The 1951 census gives the number of persons living in Glasgow and born in Ireland as 34,475, which is approximately 3% of the city's population. The corresponding figure for persons born in the Scottish Highlands and Western Isles is 19,680, approximately 2% of the population. It would therefore appear unlikely that there is any special prevalence of tuberculosis in North Glasgow among persons of Irish or Highland birth.

Discussion and Conclusions

If the figures given above are a fair reflection of the position in the area surveyed, and if we accept Greenwood's dictum quoted in the opening paragraph, we reach some conclusions which may be at variance with generally accepted concepts of tuberculosis epidemiology. Bradbury (1933), in a frequently quoted Tyneside study, found that the triad of factors particularly associated with pulmonary tuberculosis were poverty, overcrowding, and Irish nationality, but the figures in this survey do not suggest that these factors are of appreciable importance in Glasgow. Stein (1950), in Edinburgh, also suggested a highly significant relation between tuberculosis morbidity and overcrowding, as did Macgregor (1926) in Glasgow. McKinlay (1947), however, was critical of the older views on the association between tuberculosis and housing conditions, as he could find statistically no significant correlation between tuberculosis and overcrowding in either town or rural areas. Lockhart (1949), too, in Stirling, found no greater incidence in overcrowded houses, but suggested that this may have been the result of a vigorous policy of rehousing tuberculous families.

Our figures would suggest that Lockhart's surmise is incorrect, as only one of our 52 tuberculous families in municipal houses had been rehoused because of previous infection. It would also appear that the rehousing of overcrowded families affords them no obvious protection against the development of the disease, especially when it is considered that more than half our municipally housed families had been rehoused for more than five years. Perhaps the most striking result, however, of this investigation is that we could demonstrate a definite contact history in 77.6% of the male cases and 75.4% of the female cases. This should be compared with the figure of 40% obtained by Lloyd and Macpherson (1936) in their survey of 1,000 patients aged 15-25. These authors also quoted percentages of 41 in France and 36 in Leeds. The differences between these figures and ours is even more striking when we consider the London County Council report of 1937, which emphasizes that contact history is more frequent in young adults than in patients over the age of 40 years. Semple (1955) stated that in Liverpool one in twelve of new patients gave a history of contact with a known case, and Clarke (1952) states that in perhaps two-thirds of all cases of pulmonary tuberculosis there is no family history.

If the discrepancy in these figures from different areas is not accounted for by the relative intensity of the contact investigations then it would seem that the epidemiology of the disease varies so much from area to area that case-finding schemes profitable in one part of the country may be much less so in others. We consider it noteworthy also that the contact history in our series was of a familial nature in 88.5% of cases. This very high proportion has strengthened our conviction that in the detection of new cases of tuberculosis the emphasis should continue to be laid on full and relentless investigation of all familial contacts, whether living in the household or elsewhere. In this connexion it is important to investigate all such contacts regardless of their age, as in at least two of our patients, aged 55 and 56 years, the probability of their having been infected by younger members of their families is suggested by study of serial x-ray films. This emphasis on household and familial examination is justified by the incidence of 57 per 1,000 active cases found in a total of 412 contacts examined, which may be contrasted with the usual incidence of 5 per 1,000 in mass radiography surveys in the same area (Dr. T. Miller, Director Mass Radiography, personal communication) and which underlines the dictum that the most profitable yield of previously unknown cases is obtained by examination of the familial contacts.

The results of tuberculin-testing show that between the ages of 31 and 50 years all our household contacts were Mantoux-positive. Above 50 years 11% were negative reactors. This is an interesting finding which is at present being further investigated.

An extremely disconcerting fact which emerged was that 20 out of our 125 new patients were working in food trades or with children. It is difficult to avoid the conclusion that periodical x-ray examination of such persons is highly desirable, and the fact that the employee is in one of the older age groups should not be considered an adequate excuse for failure in this respect. School authorities have already attempted with varying success to implement this policy with regard to full-time employees. We suggest that this be extended as a condition of employment of part-time workers such as our patient, who was serving meals to primary-school children.

This work has given us some general impressions which we feel may be of value to other workers in the field. For example, we find that visits by the chest physician to the homes of new patients give the health visitor a feeling of greater interest and encouragement, with the added advantage that such visits serve to reinforce, and occasionally redirect, her activities to the best advantage. We also found that home visits made in the evening were most productive in eliciting information and in establishing rapport with the members of the household. Moreover, at such times recalcitrant contacts were found to be in a more amenable state of mind and willing to discuss the reason for their reluctance to be examined. As our figures show, this reluctance could usually be overcome as a result of our methods, which, however, sometimes involved a considerable number of visits.

An easing of the situation in obtaining the co-operation of tuberculosis contacts would be achieved by facilities for having x-ray examination carried out in the evening, as it is unreasonable to expect a working man or woman to lose a half-day's wages in conforming to a recommendation which is as much in the public interest as his own. Our firm impression is that such visitation is as useful to the chest physician as to the patient, since the domestic conditions which are important in this social disease cannot be visualized accurately otherwise, and help in treatment planning and management of the patient is thereby obtained.

If there is any tendency, as is sometimes suggested, for the modern chest physician to devote his energies too much to purely clinical activities it is not in the best interests of tuberculosis control. The tuberculosis situation cannot be viewed complacently until the incidence rate for new cases, which, so far, in most urban areas has shown only a negli-

gible or moderate decline, decreases in the same marked manner as mortality. Far from the volume of work in the tuberculosis field becoming less, a marked expansion in effort is necessary, with as much emphasis placed on prevention as on treatment. Plans for the detection of tuberculosis must be based overwhelmingly on examination of the household contacts, and it must be a long-term surveillance, especially as our figures of familial contact history would appear to support the theory that inherited susceptibility to tuberculosis is a major factor in the development of disease in the adult.

Summary

The results of an intensive investigation of the sociological and epidemiological features of 125 new cases of pulmonary tuberculosis in North Glasgow are given.

Overcrowding, poverty, and Irish nationality were found not to be significant factors.

The results of x-ray examination of 412 out of 414 household contacts are given with the results of tuberculin-testing of the majority, including adults. A reason for the increased incidence of tuberculosis in older males is suggested.

Figures show that the rehousing of families confers no obvious advantage in preventing the onset of tuberculosis.

The results of contact history examination showed a possible source of infection in a very high percentage, about double those in previous surveys. The contact history was of a familial nature in nearly 90%, and a suggestion was made for the better control of the disease on this basis.

Compulsory x-ray examination of food-trade employees and persons working with children is advocated.

It is a pleasure to thank Dr. A. W. Lees, consultant chest physician, Ruchill Hospital, for his interest and advice in this work, and also our medical, nursing, and clerical colleagues in the public health department.

"In spite of the very real advances which have been made in the understanding and management of cerebral palsy during the last few years it is still unfortunately true that mitigation and alleviation of the result of the handicap are all that can be offered to-day," states the Annual Report of the British Council for the Welfare of Spastics for 1955-6. To mitigate the sufferings of 30 severely handicapped young adult spastics the Council established Ponds, a home which completed its first year in 1956. Although it would be premature to assess results there, the Warden, Dr. C. D. S. AGASSIZ, believes that practically every spastic admitted has improved socially and physically to some extent. The council regard Ponds as a long-term pioneer experiment to find out what can be achieved with spastics likely to need permanent care, and hope that it may eventually develop into a model on which local authorities may base their own schemes.

DEVELOPMENTAL SPEECH ANOMALIES IN APPARENTLY NORMAL CHILDREN

BY

C. H. M. WALKER, M.D., M.R.C.P.Ed., D.C.H.

Senior Medical Registrar

AND

P. R. LANGUTH, L.C.S.T.

Speech Therapist

From the Hospital for Sick Children, Great Ormond Street, London, W.C.1

The aetiology of speech anomalies in children is often obscure. Particularly is this so when there is no physical handicap, such as cerebral palsy, cleft-palate, or deafness, and when the mental capacity is normal. The indications for treating delayed onset of speech, arrested speech development, and subsequent dyslalia are poorly defined. In view of the scarcity of information in the literature a study of these particular aspects of the problem was planned. On completion of the study, Morley *et al.* (1955) described 72 cases, seen over a six-year period, in which similar disorders of speech were observed.

Material

The cases were selected from children who within the previous five years had attended the medical outpatient department and speech clinics of the Hospital for Sick Children, Great Ormond Street, London. At the outset, 57 children were regarded as physically normal and of average intelligence, though on re-examination doubt was cast on the intelligence in 10 cases. The intelligence quotient (I.Q.) was estimated in seven of these, and two were found to score below 80, the level accepted by MacMeeken (1942) as the lower limit of normality in a study on schoolchildren. These two and the three children whose I.Q. could not be estimated were omitted from the study. Those selected showed no evidence of deafness or neuromuscular abnormality, and it was possible to confirm this by re-examination in 43 of them. Of the children who could not attend this research clinic, further information was obtained by questionnaire in four and the original notes were adequate for some parts of the analysis in 10. In 14 cases where there was some doubt about the effects of the speech abnormality on schooling, a report was obtained from the schoolteacher. Progress reports of five children who had been referred elsewhere for treatment were received from the speech therapists of other clinics. Of the original 57 cases, then, 52 (34 males, 18 females) were included in the analysis.

Normal Speech Development

One or two special points concerning the normal development of speech are worthy of reiteration. It is now generally understood that infants first have a realization of the importance of speech at about 9 months of age (Sheridan, 1945). What is less often appreciated is that the babbling which occurs much earlier (Sheridan, 1945; Schantz-Hansen, 1952; Van Riper, 1954) is of considerable significance and plays an important part in assessing subsequent speech abnormality.

During the course of normal development the child goes through phases of "echolalia," "perseveration," "lispering," and other mild articulatory difficulties. For example, "s," "sh," "th," and "r" are among the last to be learned, along with the tricky consonant combinations such as "pl," "thr," and "sk."

Knowledge of this nature is valuable in estimating the stage at which the development of speech becomes abnormal or arrested. A careful estimation of the child's present and

past accomplishments may indicate fairly accurately the time at which the trouble began. Any unusual influence operative at or just before this time is likely to play an important part in the aetiology of the condition.

It is realized that normal children may show transient "echolalia," "perseveration," "cluttering," "stammering," "dyslalia," and many of the other features detailed below. But when these are related to delayed onset or arrest of speech, or when they persist for months or years, they become an important abnormality.

Incidence of Anomalies

The specific anomalies under review—namely, delayed onset or arrest of speech in late infancy and very early childhood—with their secondary dyslalias, constitute a small group. Unfortunately, the exact incidence is impossible to estimate. Although most practitioners will have seen and themselves advised parents concerning the management of the milder forms of these conditions, there are sufficient severe varieties to constitute 8% (52 out of 610) of all new patients attending this hospital speech clinic.

The sex incidence is approximately 2:1 in favour of the males, the overall ratio of males to females at 1 year being only 1.05:1 (Registrar-General, 1954). This male preponderance has been observed in other speech disorders of childhood, the most striking being that of 5:1 in children with "stammer" (quoted by Nelson, 1954).

Specific Speech Disorders

The first important finding is that arrested development is much commoner than delayed onset of speech. Many children who at first seemed to start sound production late were, on closer questioning, found to have "babbling" at the normal time. Table I shows the age at which "babbling" and word production started. It is unfortunate that

TABLE I.—Age at Which Babbling and Word Production Started

Age of Onset	Male	Female
Babbling		
6-12 months	20	10
Over 1 year or absent ..	4	3
Indefinite	10	5
Words		
Before 18 months	10	5
18-24 months	6	5
Over 2 years	18	8

All except 5 of the above cases had an abnormal degree of dyslalia.

an accurate report concerning babbling could not be obtained in 15 children, but even if these cases were excluded from the lower half of the table the trend is unchanged. It shows that the "late talkers" considerably outnumber the "late babblers." In fact, only 7 out of 37 (52 minus 15 doubtfuls) were late in "babbling," and only these cases can be truly called "late talkers." The remaining 30 "babbled" at a normal age, and of these half showed minimal arrest with subsequent severe dyslalia and half showed arrest for a considerable period with similar sequelae.

The total number of cases is admittedly small, and some parents found it difficult to remember accurately the information required. In spite of this, there is little doubt that in the majority of these children "babbling" occurred normally, yet the correct use of words was delayed long enough for the condition to be regarded as frankly abnormal—that is, until after the age of 2 years (Sheldon, 1955; Morley *et al.*, 1955). A search for the cause of such arrest operating at or after 1 year of age is obviously indicated.

In only five cases could it be said that the late use of words was not ultimately accompanied by some other speech defect. Only one of these five attended the research clinic, and it is likely that if the other four had been seen they too would have been found to have secondary defects. At least it can be said that it is rare for these children to talk normally when they do begin to use recognizable words. It

is therefore obviously unwise to assume, as is so often done, that spontaneous correction will occur in time. These children should be watched with a view to speech therapy when the need becomes apparent.

Multiple dyslalia was found most often, being present in 25 boys and 13 girls (approximately 73% in each sex). The 2:1 ratio of boys to girls was roughly maintained throughout the analysis, so only the totals, in numerical order, will be given. No particular defect was selective for either sex.

General difficulty in consonant formation occurred in 10 children; and specific difficulty with "s" in 11, "t" and/or "th" in nine, "k," "sh," and "r" in seven each, with all other consonants giving trouble on odd occasions. "Cluttering" occurred in five cases, "idioglossia" and "monosyllabism" in four each, "echolalia," "rhinolalia," and "sigmatism" in three each, "multiple 'd' substitution" and "rejection of speech" in two each, and "hysterical mutism" in one case. The common substitutions were as follows: "t" for "k," "d" for "g," "f" for "th," "th" for "s," "s" or "th" for "sh," and "Vw," "l," or "y" for "r."

It is obvious that these children show no fixed pattern of abnormality, though, as might be expected, the last and most difficult of the speech skills to be acquired (the "s," "sh," "th," and "r" sounds) were the most often affected.

In about 16 children the prolonged use of gesticulation was obvious to the mother, though it is difficult for the untrained observer to know what degree of gesticulation is abnormal. In these 16, however, it was obviously excessive and lasted for many months.

Effect on School Work

Of the 32 children who had reached school age and whose scholastic record was obtainable, the progress of 12 (37.5%) was considered to be impeded by the speech defect. Some of these children had received treatment before starting school and yet their dyslalia proved a handicap. This indicates just how difficult a problem it can be in some cases. This figure (37.5%) is probably a fairly true estimate of the problem, as most of the minor cases not seen in hospitals will clear spontaneously before 5 years of age. There are some, however, who are allowed to reach this age untreated, and only when schooling begins is the need for therapy realized. In this series there were several 5-year-old children and one child aged 6 referred for advice for the first time. More significant is the finding that over 40% of the children were referred after reaching the age of 4 years (Table II), thus barely giving the speech therapist

TABLE II.—Age at Which Children First Referred

	2 Years	3 Years	4 or More Years
Males	5	13	16
Females	5	7	6

time to start correcting the defects before schooling begins. The age at which the other children were first seen in hospital is shown in Table II. Although the defect is evident to parents and doctors by the age of 2-3 years, up to three more years may elapse before skilled assistance is sought. A speech therapist accustomed to children can begin treatment in these patients with normal intelligence about the age of 3 years.

Response to Treatment

The intention is not to detail the methods of treatment but rather to indicate its overall value. The results shown in Table III were obtained from this hospital and from

TABLE III.—Response to Treatment

Response	Males	Females
Very good	4	5
Good	9	4
Fair	5	3
Poor	6	1
Unknown or no treatment given	10	5

reports kindly sent from local speech clinics in the London area. It can be seen that in the 37 cases in which accurate information was available 22 (60%) had a "good" or "very good" response to treatment. Some of the remaining cases proved to be severely disturbed psychologically, and in these a combined course of treatment in the department of psychological medicine and the speech clinic is sometimes necessary. A reasonably good prognosis can be given in most cases. If treated early enough, they should be able to start school with little or no handicap, thus avoiding further psychological trauma and possibly ridicule from the other children.

Alternatively, in certain cases, nursery schooling has more to offer than speech therapy (Sheridan, 1945). When psychological factors are operative contact with other children in a new environment may have sufficient influence to obviate the need for formal speech therapy at a later date.

Specific guidance to the mother is invaluable at an early stage. Many of the common mistakes can be avoided, such as threatening, scolding, taunting, or complete neglect of the problem, and the way paved for more specific therapy later. The visits to the clinic themselves allow the child to become accustomed to the hospital surroundings and to the staff—a very necessary preliminary to successful therapy in children whose difficulty is probably psychological.

Aetiology

In the course of detailed questioning more than one possible cause of the speech defect has often been brought to light. It is quite impossible to say which influence is the most important, though it became quite obvious that (as stated by Winnicott, 1931) psychological factors played a major part, and a similar disorder was often reported in other members of the family.

In 33 children there were factors in the environment which could have been operative in causing delay or arrest in speech development. These included seven in which there was obvious mismanagement of the children at home. The family relationships were bad or the parents seemed unsuited to their task of bringing up a family. On six occasions the speech difficulty began at the time of the birth of another child. Additional trouble might have occurred in two of these children, in that they were sent away from home during their mother's confinement. In two further cases separation from home and family for other reasons seemed to be the operative factor. Lack of stimulation, having to "keep the children quiet," or over-protection could account for the trouble in four children. The exact opposite occurred in one case in which the parents pushed a child beyond his capabilities.

It is sometimes said that young children may become bilingual with relative ease. The fact that four children who had lived abroad and travelled were among the cases reviewed would suggest that this is not always so. Whether it was the insecurity of much travelling or actual confusion of language which caused the difficulty it is impossible to say, but the former is suspected.

In five cases the psychological upset was related to trauma, though in only one was there any suspicion that the trauma had caused any relevant physical abnormality.

Seven children were the youngest of large families, and it is well recognized that this may in itself tend to produce abnormalities of speech (Allen, 1950). In a few of these there were some psychological factors in addition. Among the older children there were at least nine cases of "established" nocturnal enuresis. This incidence adds to the supposition that psychological factors were operative in these children.

No cause could be discovered in two children and no cause for an obvious psychological disturbance in a further eight. A more detailed investigation of these families might be helpful.

Many children must be subjected to the above influences and yet not develop a speech defect, and it seems likely that

some other factor determines the development and site of the abnormality. There may be a genetic influence at work, because in 19 cases similar difficulties had occurred in other members of the family. Indeed, 5 out of the 10 children in whom the cause was entirely unknown were of this group. The remaining 5 are a mystery for the present.

All the children who attended the research clinic were tested for crossed laterality. In six the test results were not decisive enough for a laterality index to be made. Twenty-two children were "right laterals," one was a "left lateral," and ten (26%) were "crossed laterals." In view of the fact that in only one child could it be said that crossed laterality was the only discoverable cause for the speech defect, it is most unlikely that this factor plays an important part. Weight is added to this suggestion, by the knowledge that the incidence of crossed laterality (excluding crossing with the ear only) in an average school population was 28% (Pearce, 1953)—very similar to the incidence in this group of children (26%). Again, it has been suggested that children with complete left laterality may have some speech disturbance (Travis, 1933; McAllister, 1937; MacMeeken, 1942; Ford, 1952), but this cannot be an important factor in this group, as there was only one child with this laterality index.

Discussion

Only in recent years has the importance of speech disorders in "normal" children of pre-school age been fully appreciated. The present study indicates that about 80% of such children have arrested development (acquired aphasia) and the remainder have true delayed onset of speech (developmental aphasia or articulatory apraxia) with not infrequent subsequent dyslalia. Developmental dysarthria does not come into this group of "normal late talkers"; a suggested classification of the latter is given in Table IV.

TABLE IV.—Arrest and Delayed Onset of Speech

The psychological factors detailed above must, we feel, contribute greatly to the cause of these disorders, and others have expressed a similar belief (Winnicott, 1931; McAllister, 1937; Allen, 1950; Nelson, 1954). A family tendency to speech disorders may have some bearing on the outcome of these circumstances, which, it is realized, may have no outward manifestations in many another child. Crossed laterality, although occasionally providing some additional handicap and/or psychological disturbance, does not appear to play an important aetiological part.

Children who understand the spoken word and gesticulate in response to it probably have either "expressive aphasia" or "articulatory apraxia" (Morley *et al.*, 1954), and those who respond in the same way only to signs have "receptive aphasia." Excessive gesticulation was found in 16 children, most of whom had the "expressive" disorder. The presence of gesticulation and of babbling is helpful in assessing intelligence (Illingworth, 1955). Over-attentive siblings and parents help to perpetuate gesticulation and remove the stimulus for speech development.

Schantz-Hansen (1952) has suggested that treatment can profitably be started between 3 and 4 years of age, and we subscribe to this view. By attendance at a nursery school or speech or child guidance clinic, or by simply advising parents, 60% of these children can start school without an impediment. Still further psychological disturbance, such as described by Morley *et al.* (1950) and Ingram and Reid (1956), may thereby be avoided. Morley *et al.* (1955) suggest that the more severe and less responsive cases are due to "delayed neurological development"—a highly selective deficiency. As such cases are not always easy to recognize we believe that all these children should be given treatment in the first instance. If unresponsive, they should be watched so that therapy is given when neurological development is sufficient for benefit to be derived from it.

Conclusions and Summary

The purpose of the present study was to assess the very early development of children with so-called delayed speech and subsequent dyslalia in an attempt to discover possible causes and, in addition, to establish some indications for treatment. These children constitute about 8% of the work of the hospital speech clinic.

The larger proportion (80%) suffer, in fact, from arrested development, probably the result of non-specific psychological factors operating between the age of 1 and 2 years.

In about one-third of all the cases there is a history of other members of the family having similar speech anomalies. This, along with the unequal sex incidence, suggests that a genetically determined factor may also be operative. It may, however, be due to familial living characteristics being copied from one generation to another. Crossed laterality plays little or no part in the production of symptoms.

The specific speech anomalies have been described.

All cases should be given the benefit of a trial period of treatment. In this way many children will start school without handicap. Treatment should not be forced and should at first be on general lines. Attendance at a nursery school may be all that is required in the mild cases. A few of the severe cases, which may be due to delayed specific neurological development, may not respond. These should be reviewed regularly over the period of spontaneous speech development, and treatment for the inevitable sequelae should be given when they can derive benefit from it. Advice to parents and schoolteachers concerning their management is very important.

We wish to thank the Research Committee and the physicians and surgeons of the Hospital for Sick Children, Great Ormond Street, London, for giving their consent to this work and granting access to the case records of these children; to Professor A. A. Moncrieff for his kindly interest and advice; to the department of psychological medicine for the intelligence testing; to the Research Committee for providing funds for patients' travelling expenses, and for the secretarial work kindly performed by Miss Stringer and Miss Lépine. We also thank the schoolteachers and speech therapists who responded to our request for progress reports.

TREATMENT OF ACUTE APPENDICITIS

BY

ERIC COLDREY, M.D., F.R.C.S.

Consulting Surgeon, Rotherham Hospital

Since the days when appendicectomy became a relatively safe procedure it has been fairly generally taught that the correct treatment of all cases of appendicitis is appendicectomy, and I am told that this is still the current teaching. Nevertheless, for over fifty years surgeons from various parts of the world have written from time to time advocating conservative treatment in some of the more advanced cases.

Twenty-five years ago I began to treat cases of appendix abscess conservatively, and was surprised that most of them resolved without any operative help. Since the introduction of antibiotics I have continued this line of treatment and have usually found that it is not necessary to operate, for most cases settle down.

If with the help of antibiotics the human body could absorb an appendix abscess, I began to wonder whether it was capable of dealing with burst appendices that did not localize. Experiment soon showed that it could.

During the last four years I have asked that every case of acute appendicitis of over 24 hours' duration coming into hospital under me should be treated conservatively. During this period I have had three registrars for periods of about a year who have nobly supported me, and, although doubters at first, have become converted. But I have had, for short periods on two occasions, temporary registrars who did not always fall into line. The results of this policy are the reason for the present communication.

Extending this policy still further, I have conservatively treated a number of cases of acute appendicitis received within 24 hours, and am satisfied that the condition can be safely and certainly dealt with in this manner.

Treatment

The treatment given is rest in bed in any position the patient finds comfortable, nothing of any description by mouth except water, which is given freely, six-hourly injections of penicillin, 250,000 units, and streptomycin, 0.5 g. in severe cases, chloramphenicol, chlortetracycline, tetracycline, or sulphadimidine may be given as well. Pain is relieved by pethidine and/or morphine, but we have found

that little is needed after the first 24 hours. If vomiting is at all marked, gastric suction through a Ryle tube is instituted, an intravenous drip is set up, and total fluid intake and output are carefully balanced daily.

When the pain and sickness have subsided and the temperature and pulse have fallen, glucose, milk, and other fluids are given by mouth, and there is a gradual return to normal diet, varying in time according to the severity of the attack. No purgatives or enemas are given. Liquid paraffin, $\frac{1}{2}$ oz. (14 ml.) night and morning, is given by mouth. As the condition subsides, a glycerin suppository is used if necessary.

In cases of appendix abscess the same treatment is given and usually resolution occurs. If this does not happen, a waiting policy should be adopted until the abscess either comes up to the abdominal wall or can be felt as a bulge in the pelvis. In the former case, when the percussion note is dull, under general anaesthesia a wide-bore needle is passed through the abdominal wall until pus can be aspirated. A stab incision is made with scalpel along the needle, a large artery forceps is used to enlarge the stab, the pus is evacuated, and a small drainage tube inserted. I think it is a mistake to do a formal gridiron operation and open up the muscle and fascial planes. In the latter cases, under general anaesthesia, the patient is placed in a lithotomy position, the sphincter ani is dilated, and the abscess is opened with sharp-pointed sinus forceps at the point of fluctuation. No drainage is necessary. Cases of burst appendices with localized, spreading, or general peritonitis, even with distended abdomens and paralytic ileus, were treated conservatively and settled down.

During the course of treatment of advanced appendicitis by conservative means it is not unusual to find distension of the abdomen with dilated loops of small intestine on a straight x-ray film. It is nearly always of a paralytic nature and settles with treatment. But it is important to realize that mechanical obstruction with colicky pains and peristaltic waves can develop during an attack of acute appendicitis, and that this necessitates operation. We had one such case under our observation—that of a woman who had late appendicitis which was treated conservatively, and who developed mechanical obstruction. At operation, a loop of ileum was found hitched on to an acutely inflamed appendix, causing kinking and obstruction. The adhesions were separated, the appendix was removed, and all went well.

Case 1

A mongol idiot aged 7, of poor physique and low mentality, was admitted to hospital with acute appendicitis and peritonitis. There was a history of abdominal pain and vomiting for three days. On admission he was gravely ill and slightly cyanotic; temperature 102° F. (38.9° C.), pulse rate 150 and almost impalpable. The abdomen was distended, generally rigid, and tender, especially in the right lower quadrant. Straight x-ray films of the abdomen and chest were normal. The white blood cells numbered 22,000.

Continuous gastric suction was instituted, water only was given by mouth, and a continuous intravenous drip was set up with "polythene" tubing. Continuous individual nursing was necessary to stop him pulling the tubes out. His fluid balance was kept right by a carefully maintained intake and output chart.

During the first week he was treated with penicillin, streptomycin, and tetracycline, and during the second week with penicillin and sulphadimidine. For four days he was gravely ill, and it was the general opinion that his chances of survival were not good. But after this he made an astonishingly rapid recovery and was discharged from hospital 17 days after admission, free from all abnormal signs and symptoms.

Comment.—I have chosen this case to disprove the theory that the peritoneum in children cannot stand up to infection as well as in adults, which I do not believe, and to demonstrate the efficiency of treatment in an extremely severe case under the most difficult circumstances.

Case 2

A girl aged 15 was admitted to hospital with acute appendicitis and pelvic peritonitis. There was a history of five days' abdominal pain and vomiting. On admission the temperature was 102° F. (38.9° C.) and the pulse rate 140. The lower abdomen was tender and rigid, particularly in the right iliac fossa, where a diffuse hard swelling could be felt. The pelvic peritoneum was very tender on rectal examination, straight x-ray films of the chest and abdomen showed nothing abnormal, the W.B.C. was 12,000, and the urine was normal.

Conservative treatment was instituted, and for 14 days antibiotics were administered. Her temperature fluctuated during this time between 103° F. (39.4° C.) and normal, and her pulse rate between 140 and 100. After the first three days she had little pain and no vomiting, and she said she felt reasonably comfortable.

At the end of 14 days a fluctuating swelling could be felt in the anterior rectal wall. This was opened under general anaesthesia without any difficulty, and rather more than half a pint (280 ml.) of offensive pus evacuated. No drainage tube was inserted. Her temperature and pulse rate soon fell to normal and all abnormal physical signs gradually disappeared.

She was discharged from hospital 16 days after the operation free from all abnormal signs and symptoms.

Comment.—This case shows how a severe appendix abscess which does not resolve with conservative treatment can be brought to a successful termination by simple means, without removing the appendix during the acute stage.

Case 3

A boy aged 9 (the son of an experienced nurse) was admitted to hospital with acute appendicitis. There was a history of abdominal pain and vomiting for four days. On admission his temperature was 101.5° F. (38.6° C.) and his pulse rate 120. The abdomen was rigid and tender in the right iliac fossa.

Conservative treatment was adopted and nothing was given by mouth except water. Injections of penicillin and streptomycin were given six-hourly for seven days. In 24 hours his pain and vomiting had gone. In three days his temperature and pulse rate fell to normal and stayed there. In 12 days he was sent home free from all abnormal signs and symptoms.

Four months later he was readmitted to hospital for an interval appendicectomy. The operation was easy; there were no adhesions to the abdominal wall, but some adhesions between the caecum, ileum, and appendix were present. He made an uninterrupted recovery, his temperature and pulse rate remaining normal throughout.

Comment.—This is a typical case of acute appendicitis, received late, treated conservatively, and brought to a successful conclusion by an interval appendicectomy.

Results

In the years 1953, 1954, and 1955, in my general surgical clinic at the Rotherham Hospital, 609 appendicectomies were performed by myself or, in my absence, by my deputy, my registrar, or my house surgeon. Of these, 395 were cases of acute appendicitis; 100 were cases of chronic recurrent appendicitis or were interval appendicectomies; 23 were cases in which no pathological lesion was found; and 91 were done *en passant* in cases of gall-stones, duodenal ulcer, ovarian cyst, carcinoma of the colon, etc. Five cases of appendix abscess were drained, and 137 cases of acute appendicitis of more than 24 hours' duration were treated conservatively.

During these three years we have had two deaths from appendicitis.

The first was that of a man aged 78 who was admitted with advanced appendicitis and peritonitis, which settled down with conservative treatment. His temperature and

pulse rate became normal, his pain and vomiting stopped, and his tenderness, rigidity, and distension went. On the 17th day, however, he began to get "chesty" and rapidly deteriorated, and on the 19th day he died from bronchopneumonia. He was a frail, feeble old man, and I very much doubt whether his chances of survival would have been greater if we had operated on him on admission.

The second fatal case was that of a man aged 58, who was operated on eight weeks previously in another hospital for gangrenous appendicitis, followed by a second operation for a pelvic abscess. He became depressed and, very foolishly, went home against medical advice. He deteriorated at home, with diarrhoea, malaise, sweating, abdominal pain, etc., and when I saw him he was gravely ill. He refused to go back to the hospital where his appendix had been removed, and only under great pressure did he agree to come into the Rotherham Hospital. In spite of treatment he died a few days later. It is an interesting speculation whether he might have survived if he had been treated conservatively from the start.

Among the 609 appendicectomies performed, 395 were for early acute appendicitis with no deaths; and 137 cases of late appendicitis were treated conservatively with one death. One patient died whose appendix had been removed elsewhere in the late stage.

Points for Consideration

The treatment of late acute appendicitis by conservative measures is, in our experience, a sound procedure and is justified by the results. But there are also other matters that must be considered.

When cases of severe appendicitis are operated on in the acute stage, suppuration in the abdominal wall may complicate matters. This may settle down and healing take place, but a weak spot may well be left. This may cause slight inconvenience at the time, but as the patient ages and the muscles weaken, and particularly if large deposits of fat appear in the abdomen and abdominal wall, ventral hernias may develop later. During the three years under review six cases of ventral hernia following appendicectomy were treated by operation. One of these was irreducible; one was obstructed; one was done more than 40 years after the appendicectomy; and one was performed through a gridiron incision. Adhesions, too, may form between the omentum and the small bowel and the abdominal wall. These usually cause little trouble, but they can jeopardize the patient's life even many years later. During the three years we have had three cases of acute intestinal obstruction, requiring operation, caused by such adhesions.

Adhesions may also form between loops of bowel and cause trouble. During this year we lost a youth who had had an appendicectomy in 1944, done at a late stage, complicated by suppuration in the abdominal wall, and followed by a weak scar. He had a massive volvulus involving the greater part of the small intestine. It is possible that the story might have been different if he had been treated conservatively in 1944.

It is, of course, correct to argue that adhesions may follow conservative treatment, and may cause trouble subsequently. We have had many opportunities of testing this matter when doing interval appendicectomies. No doubt some adhesions are found, but we have usually been surprised to see how beautifully nature has cleared things up, and how few are the adhesions present. Often after a really severe appendicitis, or after quite a large appendix abscess, all that is found is a wizened appendix.

We have usually found these interval appendicectomies easy operations, and often there are no adhesions to the abdominal wall. The secret is to wait for at least three months before doing the interval operation.

The argument is sometimes put forward that conservative treatment of severe appendicitis in the female may lead to sterility. It is true that sterility may follow pelvic suppuration, but it is my belief that fewer adhesions form after

conservative treatment than after operative treatment, particularly if a drainage tube is inserted. One of my cases of pelvic abscess due to appendicitis, treated conservatively in the early stage, then by rectal incision followed by interval appendicectomy, later had a successful pregnancy.

Appendix abscesses should not be drained during the early acute stage. The case of appendicitis that gave us most trouble during the three years was such a case. A young man with an appendix abscess was operated on through the peritoneal cavity, and drained, by one of my temporary registrars. He developed a faecal fistula that later became a discharging sinus, which had to be excised. We had trouble with this patient for many months.

From time to time circumstances arise that make an operation for acute appendicitis undesirable. Medical examples that we had were appendicitis with measles, appendicitis in pregnancy, appendicitis in an old man with severe bronchitis, appendicitis in a woman with auricular fibrillation and heart failure, and appendicitis with influenza. Another example is that of a case on board ship at sea. I recently removed a wizened appendix from a ship's engineer who had had acute appendicitis in mid-ocean and who was fortunate enough to have a ship's surgeon who treated him conservatively.

One cannot help feeling that all cases of acute appendicitis occurring away from skilled surgery and adequate surgical surroundings are best treated conservatively. The unskilled surgeon will be saved a lot of anxiety and the patient have a better chance of survival.

Confidence in the excellence of conservative treatment permits the more frequent use of that most valuable process, observation. Observation prevents many errors in diagnosis and unnecessary operations. We have had two cases sent in as appendicitis that after two or three days' observation turned out to be infective hepatitis. At a meeting of a local medical society some years ago, during a discussion on influenza, a well-known surgeon said he had just removed a normal appendix from a case of influenza. Observation would have saved a lot of trouble. Two years ago I removed a stone from the right ureter of a young man who had had his appendix removed elsewhere a month previously. All doctors and surgeons could quote similar examples.

The point I wish to make is that if there is any possible doubt of the diagnosis it is safer and wiser to observe and treat conservatively, and allow time for investigation. A year ago a young girl was admitted to hospital as a case of appendicitis, and presented some of the symptoms and signs, but operation was postponed. After observation for a period, she was found at operation to have regional ileitis, and an enterectomy was performed. We all felt afterwards that it was wiser and safer that the operation was done "on a list" rather than as an emergency at night.

Emergency operations, done under difficulties, perhaps in the middle of the night, perhaps by relatively inexperienced surgeons, with inadequate assistance, without a consultant anaesthetist, with a scratch theatre staff, and perhaps during a period of overwork and fatigue, may lead to errors that observation and conservative treatment would prevent.

Comments

All cases of acute appendicitis, or of doubtful acute appendicitis, should be admitted to a hospital or nursing home at once, if possible, in order that they may have constant skilled surgical and nursing attention.

In cases of doubt it is not wise to observe the case in a private house, and in cases where a firm diagnosis has been made it is not safe to adopt conservative treatment at home. Nobody can say at the beginning of an attack how severe it is going to be, and the treatment of an advanced case may require calm courage and firm nerves in addition to skilled surgical and nursing technique.

We are still getting many cases of acute appendicitis too late. During my three years, 395 cases of acute appendicitis were under 24 hours old when admitted, but 137 cases were more than 24 hours old when admitted.

A great deal of trouble and anxiety, not only to the patient, relatives, and doctor, but also the hospital staff, could be saved if we can get a higher proportion earlier.

Summary and Conclusions

An account is given of a series of cases of acute appendicitis treated conservatively with some illustrative cases.

During the course of over 30 years of surgery, a good deal of which has been emergency surgery, I have gradually been tending more and more to conservative treatment in cases of advanced appendicitis.

For many years I have believed it best to treat appendix abscesses conservatively. For more than four years I have believed it best to treat all cases of acute appendicitis over 24 hours old conservatively.

It is probably wise to treat all cases of acute appendicitis under 24 hours old by an emergency appendicectomy, and this is our usual custom.

One sometimes wonders whether it would not be a sound procedure to treat all cases of acute appendicitis conservatively. They seem to settle down quite nicely, and some never seem to have any further trouble: the appendix has wizened.

We should then be left with appendicectomy for recurrent acute appendicitis, and for chronic appendicitis—the "grumblers" with faecaliths in the appendix, with kinks, and with adhesions.

Looking into the future, one cannot help feeling that our successors will be more conservative in their outlook in this matter, and may look back on us as having been too "appendicectomy-minded."

I acknowledge the assistance of my three registrars, Mr. K. Drummond, Mr. R. Kotariya, and Mr. R. Mansharamani, without whose help, skill, and co-operation this work would not have been possible.

EXFOLIATIVE CYTOLOGY IN THE DIAGNOSIS OF LUNG CANCER EXAMINATION OF ONE LABORATORY'S RESULTS

BY

F. HAMPSON, D.M.

From the Department of Pathology, Grimsby General Hospital

Although much of the early work on the recognition of cells exfoliated from tumours was done in this country, little use is made here to-day of the techniques of exfoliative cytology in the diagnosis of cancer, though there have been signs recently of a renewed interest in the subject (Osborn, 1953; Philips, 1954).

After I had spent several months in Dr. Papanicolaou's department a service in cytology was offered in this laboratory for some four and a half years. The majority of requests have been for the examination of sputum. A review of the results obtained might be of some value in assessing whether exfoliative cytology has any contribution to make towards the diagnosis of lung cancer.

Material and Method

Specimens of sputum have been sent to the laboratory from a wide area, most of them coming from chest clinics and chest hospitals. In 1955, for example, 567 specimens out of a total of 855 arrived from such

sources. The remainder were from general hospitals and general practitioners.

All specimens, whether sent to the laboratory by post or not, had been collected by getting the patient to cough directly into a jar containing 70% alcohol. This routine, which is necessary only for specimens that cannot be examined at once, has proved very satisfactory in practice. Any possible slight loss in quality has been preferred to the risk of specimens being spoilt altogether by delay in sending or examining material not so treated.

It is not intended to describe the laboratory procedures that have been followed. No new methods have been developed, and the techniques and the reporting of results have followed closely those described by Papanicolaou (1954). Specimens have been placed into one of five classes: (1) absence of atypical or abnormal cells; (2) atypical cytology but no evidence of malignancy; (3) cytology suggestive of, but not conclusive for, malignancy; (4) cytology strongly suggestive of malignancy; and (5) cytology conclusive for malignancy. For the purpose of this report, specimens which had been reported originally as class 3 have been called "suspicious" and those which had been placed in class 4 or 5 have been called "positive."

Results

Table I shows the outline of the results obtained for the years 1952-5. For the years 1952, 1953, and 1954 the number of specimens examined, the number of patients from whom they came, and the number and percentage of patients diagnosed cytologically as suspicious and positive are given.

TABLE I

Year	Total Specimens	Total Patients	Suspicious or Positive	
			No.	%
1952	200	107	10	9.4
1953	444	232	27	11.6
1954	743	329	44	13.4
1955	855	351	42	11.9

For the year 1955 a more detailed analysis is possible. A request for information was sent to the doctors concerned in respect of the 42 patients diagnosed as suspicious or positive and full information was obtained about 40 of them. The smears from 23 of these 40 patients were reported as positive and from 17 as suspicious (Table II).

TABLE II

	Final Diagnosis of Cancer	Final Diagnosis Not Cancer	Histological Evidence of Cancer	Cancer Cases with Positive Smears and Negative Biopsies
Positive group (23 cases)	23	0	11	2
Suspicious group (17 cases)	12	4 and ?1	5	2

During 1955 all cases from which positive smears were obtained were finally diagnosed as cancer. Histological confirmation in all cases was not available. Several patients were too ill for further investigations and bronchoscopy was refused in one case. The final diagnosis of cancer was taken from the opinion expressed by the doctor concerned in his answers to the questionnaire. In some cases, therefore, the final diagnosis of cancer rests on clinical findings, plus radiology, smears, and histology; in others, one or more of these pieces of evidence will be lacking, but in no case was the doctor in any doubt about the diagnosis. In the suspicious group it is seen that four

cases for certain and a possible fifth turned out to be non-malignant, whilst 12 were confirmed as malignant either by histology or on clinical grounds, or both. In 10 of these 40 cases the doctor concerned said that the smear result had been the first objective evidence of malignancy. The series includes two cases reported as positive where a biopsy was negative; two cases reported as suspicious also had negative biopsies. In one of these four cases operation showed an epidermoid carcinoma. In all the others the diagnosis was of inoperable carcinoma, and two patients have died whilst one was alive six months after diagnosis was made.

Discussion

The results obtained over the past few years have shown that exfoliative cytology is of real value in the diagnosis of lung cancer. It is not suggested that it should replace any of the existing diagnostic methods but that it is a most useful additional aid. In the first place, the method is simple and practicable for patient and clinician. No preparation of the patient is necessary, he does not have to attend hospital, and additional specimens can be readily obtained. For the laboratory the method has the advantage that no elaborate equipment is required, although it is certainly true that experience is needed before confident results can be given.

It has been found that reliance can be placed on positive results. In 1955 all of 23 cases reported positive were finally diagnosed as malignant, and in no case was any doubt expressed on this point by the clinician concerned. In four of the 17 suspicious cases the clinician was satisfied that the diagnosis was non-malignant, and in a fifth case the patient died before a firm diagnosis was made.

It is clear, therefore, that if a confident diagnosis of malignancy is made on cytological grounds there is a very high probability of proving malignancy, and that most of the cases regarded as suspicious will also prove to be malignant. Further experience will probably reduce the number of specimens placed in this category. Negative results are of less significance. It has not been possible to ascertain the number of malignant cases on which negative results were returned, but there were undoubtedly instances of this. Apart from inadequate examination or inaccurate appraisal of cells seen, negative smears may be found in cancer cases for several reasons: it may be that no tumour cells were being exfoliated at the time of the examination; the tumour may not communicate with a bronchus, or, even if it does, the bronchus itself may have become obstructed by pressure so that no escape of cells can take place (Osborn, 1953).

The results presented and the answers to the questions asked of the clinicians show that the method is of value in the early diagnosis of cancer, and this is of especial importance in this disease. In 1955, 40 cases were regarded as positive or suspicious, and in 10 of these the clinician stated that the positive report issued after cytological examination constituted the first objective evidence of malignancy. It is here that the extreme simplicity of the method—from the patients' point of view—is so important. It is a simpler matter to arrange for cytological examinations of sputum than to arrange for other special examinations to be performed, and it seems reasonable that earlier recourse should be had to cytological methods for that reason. It is undoubtedly true that small early tumours produce recognizable exfoliated cells, and "carcinoma *in situ*" of the bronchus has been diagnosed by cytological methods (Papanicolaou and Koprowska, 1951). In the case described by these authors it is stressed that positive cytological findings were repeatedly obtained in spite of negative biopsies, and the diagnosis of carcinoma *in situ* was finally established at the post-mortem examination following death from pneumonia.

It is difficult in such a small series to attempt to compare the value of cytological diagnosis with that of other special methods of examination. However, even among these few cases two reported as positive and two as suspicious were

negative according to the biopsies. These four cases were subsequently regarded as undoubtedly malignant. In one case the diagnosis was proved at operation; the other three cases were found to be inoperable. Herbut (1951) referred to 500 cases of lung cancer in which cytological methods gave positive results in 88% and bronchoscopic examination a positive result in only 31%; in 29% of the proved cases cytology gave positive results and bronchoscopy was negative. Again, Benioff (1951), referring to 162 proved cases that came to operation, showed that in 24% of these cytology provided the only pre-operative evidence of malignancy. The conclusion seems justified that cytological methods will disclose more positive cases than will bronchoscopy.

The objection is sometimes raised that it is a time-consuming method of investigation. This is true, but it is also true of many other laboratory procedures which, nevertheless, are in common use. Over a four-year period more than 10% of patients from whom specimens have been sent to this laboratory have been regarded as showing definite evidence of malignancy or as affording strong grounds for suspicion. This compares well with the percentage of positive material obtained in many other laboratory investigations. The actual examination of the slides takes somewhat longer to perform than does an examination for tubercle bacilli; and here, where the preliminary screening is done by an experienced technician, some seven to eight minutes is spent in examining a negative smear.

Summary

The incidence of "positive" and "suspicious" smears from sputum suspected of containing malignant cells is surveyed for the years 1952-5.

For the year 1955 the results are followed in greater detail and the accuracy of the cytological diagnoses is assessed.

It is concluded that the method is of great value in the diagnosis of lung cancer, and especially in early cases; that the positive results are reliable; and that in accuracy it compares favourably with bronchoscopic examination.

The method is extremely convenient for the patient and clinician, and demands no elaborate laboratory equipment.

My thanks are due to Mr. E. C. Darnell for expert technical assistance and to all those clinicians who provided information about their cases.

A medical manuscript written very legibly in Anglo-Saxon before the Norman Conquest was bought for £550 at Sotheby's on December 11 by the Wellcome Trust. Although the text covers only one side of a single leaf, there was brisk bidding from both English and American buyers. The manuscript contains recipes for making medicines and salves for "heartache," disease of the lungs and the liver, and for tumours. It was incorporated in the binding of a book printed in Antwerp in 1558 which later came into the library of Lord Robartes. This fragment must have belonged to the vast quantity of mediaeval manuscripts which were thrown out of the monasteries at the time of the Dissolution and used for all kinds of menial purposes. As Bishop Bale wrote in 1549, "Some they sold to the grossers and sopesellers, and some over see to the bokebynders, not in small nombre, but at tymes whole shyppes fulle, to the wonderynge of the foren nacyons."

RECOVERY FROM PERITONITIS FOUR YEARS AFTER BILATERAL TRANSPLANTATION OF URETERS

BY

W. MILO KEYNES, M.D., F.R.C.S.

Surgical Registrar, Addenbrooke's Hospital, Cambridge

AND

J. N. HARCOURT-WEBSTER, M.B., B.Chir.

House-surgeon, Addenbrooke's Hospital, Cambridge

Not until the past five years have the biochemical abnormalities that follow uretero-colic anastomosis been extensively studied. Ferris and Odel (1950) found that of 141 patients who had undergone bilateral uretero-sigmoidostomy, 80% showed a reduced alkali reserve and 79% a hyperchloraemia. The condition of hyperchloraemic acidosis was usually associated with a high blood urea. These findings were confirmed in the series of 201 cases collected by the British Association of Urological Surgeons (Jacobs and Stirling, 1952), in which 78% had a lowered alkali reserve, and 31% the full syndrome of hyperchloraemic acidosis with raised blood urea. In only 6% were the levels of the blood urea, chloride, and alkali reserve all normal. Hypokalaemia was present in about a third of the patients.

Symptoms attributable to electrolyte disturbances in patients with bilateral transplantation of the ureters include general weakness and fatigue, thirst, nausea, vomiting, anorexia, a salty taste in the mouth, hyperventilation, and loss of weight. There may be rectal urgency, and polyuria with diarrhoea. Osteomalacia due to chronic acidemia with consequent renal loss of calcium may occur with bone pains and multiple fractures (Pines and Mudge, 1951; Badenoch, 1952; Moore, 1952).

Excessive reabsorption of chloride and urea from the colon forms the basis of the electrolyte disturbance, but it is now considered that an impaired renal function is necessary for hyperchloraemic acidosis to develop (Lapides, 1951; Parsons *et al.*, 1952; Pyrah, 1954). Such an impairment results from an ascending infection from the colon, or back-pressure effects, leading to a diminished capacity of the distal tubules to acidify the urine. Hypokalaemia is probably mainly due to loss of

base in patients with polyuria and diarrhoea, and is therefore a secondary manifestation (Jacobs and Stirling, 1952).

Any intercurrent illness associated with diarrhoea or vomiting, but especially an attack of acute pyelonephritis, may precipitate acute symptoms in patients with bilateral transplantation of the ureters. The electrolyte balance of these patients can be more easily upset than in the normal. Westlake (1954) has described the recovery of a man in acidemic coma with hypokalaemia, precipitated by acute pyelonephritis, four years after operation. In this paper the recovery is reported of a man with transplanted ureters who had intestinal obstruction and peritonitis due to a band four years after total cystectomy for carcinoma. The post-operative care was undoubtedly complicated by the transplantation. As patients with bilateral ureteric transplants into the colon become more numerous such problems will be seen more often in non-urological surgical units, as in the present case.

Case Report

In 1945 the patient, aged 55, underwent a partial cystectomy for papillary transitional-cell carcinoma. He remained well until November, 1950, when he again developed haematuria. In December, 1950, Mr. V. C. Pennell performed a total cystectomy with transplantation of the ureters into the sigmoid colon, by Coffey's method, in two stages. This was complicated by the development of a faecal fistula between the rectum and the anterior abdominal wall which was excised in March, 1952. After this third operation he remained well except for loss of appetite and a slight loss of weight. An x-ray film of the dorso-lumbar spine in November, 1952, showed moderate osteoporosis, and another in May, 1954, following a slight fall from a ladder, a fracture of the lower end of the right ulna with extreme osteoporosis. In January, 1955, his blood urea was 78 mg./100 ml.

On March 24 he was readmitted to Addenbrooke's Hospital with a history of six days' upper abdominal colic and vomiting which over the last 24 hours had become faeculent. When examined he was an ill, dehydrated, but fully conscious man with no clinical evidence of acidosis or uraemia. His abdomen was resonant but greatly distended, with tenderness in the upper half and a generalized positive release sign; a few bowel sounds were present. A straight x-ray film of the abdomen showed distended loops of the jejunum and proximal ileum, with fluid levels.

Laparotomy revealed peritonitis with a fibrous band between the lower ileum and the anterior abdominal wall.

Blood Electrolyte State and Fluid Balance During Post-operative Period

Post-operative Day:	0	1	2	3	4	5	6	7	8	9	10	11	12	13	14	27

* To convert pints and fluid ounces to millilitres, multiply by 568 and 28 respectively.

by 10 p.m., and on noisier nights several were still awake at 10.30 p.m.

It has been said that each tablet was not given an equal number of times on the four nights. Accordingly separate figures are given for each tablet on each night. Without any formal tests of significance it can be seen that this fact has not materially affected the results. For instance, the figures for the control are the lowest on three of the four nights.

TABLE I.—Objective Assessment by Night Nurses*

Tablets	Nights. Hours of Sleep and Mean Scores				Hours of Sleep and Mean Scores for Tablets	Standard Error of Mean Scores for Tablets
	1st	2nd	3rd	4th		
Amylobarbitone sodium	6½ 27.2	6½ 26.7	7 29.4	6½ 28.2	6½ 27.9	0.40
Butobarbitone	6½ 27.8	6½ 28.1	6½ 27.3	7 28.7	6½ 28.0	0.38
Methypyrilone	6½ 27.2	6½ 27.8	6½ 28.2	6½ 27.7	6½ 27.7	0.37
Control	6½ 26.4	5½ 24.0	6½ 26.9	6½ 28.4	6½ 26.3	0.43
Hours of sleep and mean scores for nights	6½ 27.1	6½ 26.6	6½ 28.0	6½ 28.2		

*Calculation of Approximate Duration of Sleep from Mean Score.—On the basis that the night nurse gave a patient 2 marks each half-hour he was asleep (see text), duration of sleep may be estimated in hours by dividing the night's score by 4. This, however, implies that the patient has been asleep for half an hour when the first 2 marks are given. If an average time of a quarter of an hour is allowed for him to get to sleep after the tablet or the last half-hourly observation, then 1 mark, representing nearly a quarter of an hour's sleep, is subtracted from the score before dividing by 4. The formula Hours of sleep = $\frac{(\text{score}-1)}{4}$ probably gives too generous an estimate, as it does not allow for waking between observations, but the mean scores would be open to the same objection if taken as absolute values. Their translation into hours of sleep is given for the sake of convenience. (Maximum possible score: 34 marks, representing 8½ hours' sleep.)

TABLE II.—Onset of Sleep

Tablets	Did You Get to Sleep		Total	Mean Scores of 1 and 0
	Quickly? (1)	Slowly? (0)		
Amylobarbitone sodium	64	36	100	0.64
Butobarbitone	79	21	100	0.79
Methypyrilone	74	26	100	0.74
Control	56	44	100	0.56

$\chi^2=15.73$. D.F.=3. $P<0.01$.

TABLE III.—Quality of Sleep

Tablets	Was Your Night's Sleep				Total	Mean Scores of 3, 2, 1 and 0
	Sound? (3)	Fair? (2)	Poor? (1)	Bad? (0)		
Amylobarbitone sodium	41	40	18	1	100	2.2
Butobarbitone	46	42	11	1	100	2.3
Methypyrilone	48	43	7	2	100	2.4
Control	26	47	24	3	100	2.0

$\chi^2=13.90$. D.F.=6 (third and fourth columns taken together). $P<0.05$.

TABLE IV.—After-effects

Tablets	Did You Wake				Total	Mean Scores of 3, 2, 1, and 0
	Fully Refreshed? (3)	Reasonably Clear in the Head? (2)	Stale and Drowsy? (1)	"Drugged" and Confused? (0)		
Amylobarbitone sodium	16	50	33	1	100	1.8
Butobarbitone	25	48	25	2	100	2.0
Methypyrilone	16	53	28	3	100	1.8
Control	11	64	25	0	100	1.9

$\chi^2=10.51$. D.F.=6 (third and fourth columns taken together). $P>0.05$.

The distribution of answers to the three questions is shown in Tables II-IV. Analysis of the answers relating to onset and quality of sleep (Tables II and III) shows a significant difference between the forms of treatment (see χ^2 tests at the foot of each table), which is clearly attributable to the lower score of the control. This is not so for the answers to the question on after-effects (Table IV). In none of the tables are there any demonstrable differences between the three drugs. A similar analysis shows that there is no significant difference between the four nights in any of the questions.

The only side-effect recorded was headache, which occurred twice after each drug and once after the control. Patients sometimes volunteered that a particular night was the best they had had for a long time. They did this five times after amylobarbitone sodium, five after butobarbitone, six after methypyrilone, and twice after the control.

Discussion

Standards of comparison for hypnotics, such as onset and duration of action, quality of sleep, and nature of after- and side-effects are generally accepted, but reports of controlled trials are comparatively infrequent. In hospital it is possible to supplement the patients' own impressions with objective observations. Even the quality of sleep, although usually best judged by the patients themselves, can be assessed with considerable accuracy by a nurse looking after a reasonable number of patients.

An obvious criticism of this trial is that each drug was tried once only on each patient. This raises the question of whether one patient will respond fairly consistently to one hypnotic. If this is so, more information will be gained by studying the effects of each tablet on every patient than by using the available time in any other way. Hare (1955) has made a detailed study of the comparative efficacy of hypnotics in a neurosis unit. He observed 30 female patients for an average time of three to four weeks each. His results show that each patient responded fairly consistently to any one hypnotic, although great variation was found between different patients. This confirms strong clinical impressions from the routine use of hypnotics in the wards.

The investigation of after-effects remains the least satisfactory part of the trial. Many patients found it difficult to distinguish between waking heavy-headed as a result of excessive sedation and waking tired as a result of lack of sleep. On other points the patients proved reliable witnesses. With a few notable exceptions, their impressions corresponded well with the nurses' observations.

As equivalent doses of the three drugs were deliberately chosen it is not surprising that the results were similar, but the high figures for the control are interesting. It would probably have been worth while to include a fifth night without any tablet, but co-operation for this might sometimes have been more difficult to enlist, especially on the day after the operation, when the wide difference between the control and the drugs (Table I) would seem to show that a hypnotic is a valuable part of treatment at this time.

The present trial has shown methypyrilone to be a reliable hypnotic of comparable efficacy and onset and duration of action to amylobarbitone sodium and butobarbitone. If subsequent investigation confirms the rarity of side-effects found by previous workers, methypyrilone should prove a valuable addition to the non-barbiturate hypnotics.

Summary

Methypyrilone, a piperidine hypnotic, was investigated in 100 patients in the ear, nose, and throat wards of a general hospital. The onset and duration of action, quality of sleep, and nature of after-effects were compared with those of amylobarbitone sodium, butobarbitone, and a control. Nurses' observations supplemented and were usually consistent with patients' impressions. No significant difference was found between the three

drugs. The score of the control was not greatly lower, but the difference was statistically significant.

Methypyrilone is a reliable non-barbiturate hypnotic of comparable effect to amylobarbitone sodium and butobarbitone.

The patients in the ear, nose, and throat wards were under the care of Mr. C. P. Wilson, Mr. J. P. Monkhouse, and Mr. D. Ranger, and I thank them for permission to carry out the trial. I also thank Dr. J. D. N. Nabarro for his criticisms and encouragement in the preparation of the paper; Mr. M. P. Curwen, of St. Bartholomew's Hospital, for his invaluable help with the pre-statistics; Dr. Margaret Briggs, of Roche Products, for the preparation and dispensing of the tablets; and the night sisters and their nursing staff, whose enthusiastic co-operation made this trial possible.

TOXIC EFFECTS AND SIDE-EFFECTS OF METHYLPENTYNOL

BY

EDWARD MARLEY, M.D., M.R.C.P.Ed., D.P.M.
Senior Registrar, Professorial Unit, Maudsley Hospital

AND

JOHN S. W. CHAMBERS, M.B., B.Chir.
D.Obst.R.C.O.G.

Formerly Registrar to the Obstetric and Gynaecological Department, Southampton General Hospital

Novelty has all the appeal of invention, and it is common experience that newly introduced drugs pass through a phase during which they are esteemed too highly. Methypentynol ("oblivon") has been no exception, for early reports were unanimous in emphasizing its distinct paucity of toxic complications (Allen and Krongold, 1951; Hirsh and Orsinger, 1952; Malone *et al.*, 1952).

Margolin *et al.* (1951) studied the acute toxicity of the drug with animals and found that the LD₅₀ ranged from 600 to 900 mg. per kg., whereas chronic toxicity experiments disclosed no gross or microscopical changes following the daily oral administration of 200-300 mg. of methypentynol, an equivalent of seventy times the recommended human dose. The drug has also been given daily by mouth to human subjects in a dose ranging from 0.1 to 1.5 g. for six months without any undesirable side-effects (Chevalley *et al.*, 1952), although Schaffar-zick and Brown (1952) reported that two out of six epileptics given the substance developed a strongly positive cephalin flocculation reaction. As a corollary, it was noted that the livers of rats given methypentynol in their drinking-water exhibited a diminution of hepatic cell cytoplasmic basophilia.

The effect of single doses of methypentynol has been assessed by Trotter (1954), who found that speed of reaction, concentration, and co-ordination were either unimpaired or enhanced after 500 mg. of the drug. Sinton (1954) was also unable to detect any deleterious result from 1 g. of methypentynol, although Macdonald (1955), using half this dose, noted an 8% deterioration on a numerical test.

In view of these predominantly eulogistic appraisals, it is hardly surprising that a wide field of application has been found for methypentynol: for example, as a

hypnotic for elderly patients (Simpson, 1954), as a pre-operative sedative for tonsillectomy (Simmons, 1954; Gusterson, 1955), for allaying apprehension before dental operations (Trotter, 1953), as a prophylactic against nocturnal attacks of asthma (Bendkowski, 1955), and for reducing anxiety at childbirth (Bourne, 1954).

Recently attention has been directed to the drug's potential toxicity. May and Ebaugh (1953) noted drowsiness, ataxia, and slurred speech in five patients who had ingested between 3.89 and 10.16 g. of methylpentynol during periods ranging from two to six days. They also described a confusional episode in a woman who had swallowed at least 10 g. of the drug. Glatt (1955a) referred briefly to the appearance of a "confused and highly emotional state with slurring of speech and ataxia" in alcoholics after taking up to 20 capsules (each of 250 mg.) daily for two to three days. He amplified this subsequently (Glatt, 1955b), describing the cases of 15 patients who after excessive doses of methylpentynol presented a picture of "gradually increasing confusion with lack of concentration and attention, tearfulness, depression, speech difficulties, and ataxia." Diplopia, nystagmus, and slight ptosis were each seen separately in three patients, while visual hallucinations were also encountered. Cares *et al.* (1953) reported a death after a dose of 4.5-6 g., and it is also on record following 2.25 g. of methylpentynol in conjunction with 20 pento-barbitone sodium ("nembutal") tablets (*British Medical Journal*, 1955). Recovery after 8.75 g. and 10 g. of methylpentynol has been noted respectively by Lemere (1952) and Brown and Ellis (1955); and Lovelace and Roith (1955) documented an attempted suicide with a combination of methylpentynol and "persomnia" (carbromal and bromvalerone). Recently, two youths who had each taken 0.75-1 g. of the substance were involved in a motor accident associated with a fatality (*Lancet*, 1955).

Case Histories

Eight brief illustrative case histories of toxic reactions to methylpentynol are described, followed by a synopsis of the side-effects—as distinct from toxic phenomena—observed in two groups each of 15 patients, the one given therapeutic doses of methylpentynol (0.5-2 g. a day) for one to six weeks, and the other receiving larger doses of methylpentynol (approximately 5 g.) during labour.

Case 1

An unmarried woman aged 24, suffering from an anxiety state, had taken eight capsules of methylpentynol (2 g.) daily for four days. She now complained of feeling cold and shivery, of declining appetite, and of being unsteady on her feet.

On examination the positive abnormalities consisted of unsustained nystagmoid jerks on conjugate lateral deviation of the eyes, loss of tone in the facial musculature, dysarthria, and tremor of the protruded tongue. The gait was ataxic and Romberg's sign positive. There was a static tremor of the hands, with cerebellar defects in both upper and lower limbs, including ataxia on the finger-nose, heel-shin tests, and dysidiadokinesis. The tendon reflexes were diminished, and were associated with an overall reduction of tone. The urine was normal.

Her mood was one of depression and, although denying hallucinations, she appeared to be hallucinated one evening, insisting there was a woman standing beside her bed. Orientation was correct, but she performed only moderately at serial sevens (the subtraction of serial sevens from 100), the digit span (number of correctly repeated non-consecutive digits in same or reverse order as given by the examiner) being seven forwards and six backwards. She

remarked that her body felt unreal as if "belonging to someone else" and that it seemed to be "light and floating." She noticed, too, that the passage of time was accelerated.

Three days later she had recovered apart from residual mild depression. The digit span had increased to eight forwards and six backwards, while serial sevens were accomplished accurately. No withdrawal phenomena occurred, although there was a partial amnesia for events relating to the toxic episode.

Case 2

This patient, an unmarried woman aged 43, was referred to hospital after having taken 26 capsules of methylpentynol (6.5 g.) during the previous six days. She was drowsy and complained of loss of appetite and the recent onset of double vision.

The physical signs included bilateral ptosis, pupils reacting sluggishly to light, and suffused conjunctivae. There was loss of tone in the facial musculature, dysarthria, and ataxia of gait, with a positive Romberg's sign. Muscular tone and the deep reflexes were decreased, although there were no cerebellar defects in either the upper or the lower limbs. She was obviously depressed and expressed suicidal ideas. Hallucinations were denied and orientation was intact. The digit span was six forwards and three backwards, combined with impairment of attention and concentration. She stated that since she had been on the drug "time seemed to pass more swiftly." The serum bromide was less than 25 mg. per 100 ml., and the urine gave a positive Rothera reaction persisting for two days.

Within three days the physical signs vanished, serial sevens were performed accurately, and the digit span had risen to six forwards and backwards. There were no withdrawal features, but mild depression persisted for a further four weeks.

Case 3

A man aged 46, suffering from paranoid schizophrenia, swallowed 10 g. of methylpentynol during a period of two days, at the same time taking phenobarbitone, 2 gr. (0.13 g.) at night. Twenty-four hours later he showed rhythmic nystagmus on conjugate lateral deviation of the eyes, with diplopia in all directions of gaze, as well as right-sided ptosis. The gait was ataxic with a negative Romberg sign. Muscular tone was increased with positive Hoffmann and Wartenberg signs, together with augmented deep reflexes. The urine was normal. Mentally there was affective blunting and ideas of reference, but no hallucinations. Orientation was intact, but the patient failed badly on serial sevens, the digit span being six forwards and five backwards.

A week later there were no abnormal neurological signs, but the affective blunting and ideas of reference remained. He was still unable to manage serial sevens, but the digit span had increased to eight forwards and five backwards. There was a patchy amnesia for events during the toxic episode.

Case 4

A married woman aged 36 became noisy and excited after taking 1.5 g. of methylpentynol daily for four days, together with a small quantity of alcohol.

On examination the pupils were dilated and reacted sluggishly to light, there was rhythmic nystagmus on conjugate lateral deviation of the eyes, and dysarthria was present. Her gait was ataxic, Romberg's sign was negative, and the deep reflexes were just present on reinforcement. The urine was normal. Her mood was one of elation, and, curiously, she showed no apprehension even when insisting there were black spiders climbing up the walls and that there was a cow in the room. The hallucinations—or possibly illusions—occurred during both day and night. Orientation was correct, but both attention and concentration were impaired. The serum bromide was less than 25 mg. per 100 ml.

Four days later the neurological abnormalities had disappeared but she remained drowsy. Her mood was now one of mild depression combined with irritability. There were

no hallucinations, and memory-testing revealed a selective amnesia for the toxic period. Attention and concentration were good.

Case 5

A primigravida aged 23 was admitted to hospital on account of persistent tachycardia at rest (pulse rate 140–160 a minute). No cardiac abnormality was discovered, but in view of her apprehension she was prescribed 0.5 g. of methylpentynol three times a day for eight days, the resting pulse rate falling to 92 a minute. The patient then went into labour, receiving a further 5.5 g. of methylpentynol during the subsequent 24 hours. Within the next eight hours she was reported as "feeling drunk."

On examination there was rhythmic nystagmus on conjugate lateral deviation of the eyes, bilateral ptosis, loss of tone in the facial musculature, dysarthria, and tremor of the protruded tongue. She complained also of double vision on lateral and vertical gaze. There was ataxia on the finger–nose and heel–shin tests not compensated for by vision, and the gait was ataxic. Romberg's sign was positive, both muscular tone and the deep reflexes being within normal limits. The corneal reflexes were absent and the jaw-jerk barely elicitable. The urine was normal.

The patient was paraphasic and euphoric, but there were no delusions or hallucinations, and orientation for time, place, and person was intact. Nevertheless, attention and abstract thought were impaired, as she was unable to attempt serial sevens or interpret proverbs. The digit span was five forwards and four backwards.

Two days after delivery the neurological signs had disappeared and the mental state was normal, the digit span now being eight forwards and six backwards.

Case 6

A primigravida aged 18 was admitted in labour and during the next 48 hours the following were prescribed: a total of 200 mg. of pethidine, heroin $\frac{1}{2}$ gr. (11 mg.), quinalbarbitone sodium ("seconal"), 3 gr. (0.2 g.), and potassium bromide, 30 gr. (2 g.), with chloral hydrate, 30 gr. (2 g.). As she still remained tense, 1 g. of methylpentynol was given, this dose being repeated after an interval of four hours. Soon afterwards she was reported as being very drowsy.

On examination the pupils reacted sluggishly to light, accommodation, and convergence, and sustained rhythmic nystagmus on conjugate lateral deviation of the eyes, bilateral ptosis, loss of facial muscular tone, dysarthria, and nominal dysphasia were present. Rapidly alternating movements were performed clumsily; there was static tremor of the fingers and marked ataxia on the finger–nose and heel–shin tests not compensated for by vision. Muscular tone was increased, Wartenberg's and Hoffmann's signs were positive and were associated with sustained bilateral patellar and ankle clonus and augmented deep reflexes. The urine was normal.

The patient, who was now lethargic, denied hallucinations, was orientated correctly, but unable to attempt serial sevens or comprehend simple proverbs.

Within three days the neurological signs had abated and the mental state was normal apart from impaired retrospective memory for the toxic episode.

Case 7

A man aged 28 became unsteady on his feet after taking 6 gr. (0.4 g.) of phenobarbitone and 1.5 g. of methylpentynol.

On examination the only physical abnormalities were dysarthria and an ataxic gait. The serum bromide was less than 25 mg. per 100 ml.

He was drowsy, paraphasic, and euphoric, denied hallucinations, and was orientated correctly although attention and concentration were impaired. He slept a great deal the next two days, and afterwards remarked that during this period he had seen a "vision" of two men and had felt "someone he could not see tugging at his bedclothes."

After a further 48 hours the physical signs disappeared, the mood was within normal limits, attention and concen-

tration improved, and the digit span increased. Retrospective memory for the period of illness seemed excellent.

Case 8

A man aged 42 had been taking 5–6 methylpentynol capsules daily for 10 months. Three days after stopping the drug he suddenly felt tense and unwell. He began to have shivering attacks, palpitations, and recurrent nightmares. There was marked loss of appetite. He saw "writing and figures on the wall" during the day, and on other occasions "it seemed that a stream of people filed into the room behind his back and beckoned to him." These abnormalities persisted for a week before abating.

Side-effects

Dizziness and light-headedness were the most frequent of the side-effects noted in the 30 individuals not exhibiting toxic reactions to the drug. Even so, the most prominent feature was deviation of the mood pattern, ranging through elation, euphoria, and irritability with feelings of anxiety and tension, to apathy and even depression. Motor activity and congruence with the mood change, elation being associated with overactivity and reduction of activity with depression. Likewise, heightening of mood went with increase of appetite and a decrease with depression. A number of patients commented spontaneously that the passage of time seemed accelerated and mild body-image disturbances were noted, including increase or decrease in weight or size of either the whole body or its various members.

Discussion

One of the striking features of the case histories epitomized above is the facility with which toxic reactions to methylpentynol might result from the ingestion of small quantities of the substance. The clinical picture so produced emulates that seen in acute alcoholic intoxication, and, for that matter, methylpentynol belongs to the series of higher alcohols. Howells (1952) depicts the findings in 40 persons suspected of being under the influence of alcohol, these including dilatation of the pupils with impaired reaction to either light or accommodation, suffused conjunctivae, nystagmus, and ataxia with a positive Romberg sign. Identical phenomena have been elicited in either acute or chronic barbiturate poisoning, and Isbell and White (1953) have pointed to the similarity between alcoholic and barbiturate intoxications.

In our series a fairly characteristic indication of overdosage with methylpentynol was loss of tone in the facial musculature together with unilateral or bilateral ptosis. Other abnormalities on examination of the cranial nerves were dilated pupils reacting sluggishly to all stimuli, sustained rhythmic nystagmus on conjugate lateral gaze, diplopia, ished corneal reflexes, suffused conjunctivae, in the dysarthria, and fine tremor of the protruded tongue. In the light of recent work by Howells (1956) nystagmus is probably one of the earliest of these signs to appear.

When present the ataxia was of either cerebellar or posterior column variety, or an admixture of the two. In consequence, muscular tone was usually decreased but could be augmented, with clonus and positive Hoffmann's and Wartenberg's signs. Similar findings were reported by Hirst (1955). In the same way, Isbell (1950) found that chronic barbiturate intoxication might occasionally present with transient ankle clonus and extensor plantar responses.

Paraphasia or nominal dysphasia was also evident with sufficient frequency to be worth comment. Curran (1944), who believed he could distinguish features specific to drug intoxications, stipulates that paraphasia is one of the hallmarks of bromide delirium, although Mayer-Gross *et al.* (1954), who are of a dissentient opinion, allude to its occurrence in delirium tremens. Weinstein and Kahn (1955), arguing from a holistic viewpoint, have preferred to regard these phenomena as a mode of adaptation to illness rather than individual defects.

One of the other diverting facets to the action of methylpentynol was its ability to produce differential mood alterations. This aspect has excited little comment hitherto, but was seen both in the toxic reactions and in those patients on a regime within the prescribed therapeutic dosage. The spectrum of mood deviations ranged from elation to depression; moreover, it seemed that depression might be induced *de novo*, or a pre-existing depressive mood be so intensified that the patient expressed suicidal ideas. Such affective changes were reversible, usually disappearing within a few days of withdrawing the drug. Alterations in motor activity and appetite were subordinate to the particular mood deviation. It is pertinent that Bourne (1954) remarked on a "pleasantly carefree attitude" in patients after taking methylpentynol, and of interest that hypomanic mood disturbances were noted by Curran (1944) in some instances of chronic barbiturate poisoning. Non-specific alterations of mood pattern by drugs has also been recorded by Thorner (1935), Cleghorn (1952), and Wikler (1952).

Disorientation, amounting to confusion, was another of the features reported by some authors in their cases after overdosage with methylpentynol (Hollander, 1954). Levin (1951) formulated the entity of "partial delirium," which depended on the fact that orientation for time, being an abstract concept, was more vulnerable and consequently more likely to be upset than either orientation for place or for person. However, none of our patients exhibited any disturbance of this modality, although attention, concentration, and abstract thought were impaired. Reduction of digit span occurred in most cases, this being a recognized concomitant of drug intoxications. Hoch (1906), in an analysis of the defect, found that the average number of numerals retained was only four.

Visual hallucinations were also noted. In a discussion on the nature and non-specificity of deliria, Wolff and Curran (1935) pointed out that the dysfunction was characterized by being worse at night than during the day, that visual hallucinations were frequent, that defects in grasp and sustained attention were prominent, and that, on recovery, recall was usually good. Our patients showed all or most of these aspects, apart from a patchy amnesia for events during the illness, a discrepancy which may be related to the amnesia ascribed by Bourne (1954) to the action of methylpentynol itself.

In all groups of patients occasional abnormalities of "ego-function" were seen, including mild depersonalization and derealization, *déjà vu* phenomena, time distortion, and body-image disturbances classifiable into Bonnier's (1905) category of paraschemata, the best examples of which are usually seen in drug intoxications (Critchley, 1950).

Withdrawal symptoms after discontinuing methylpentynol occurred in one instance. The time sequence of the development of these is important, as Isbell *et al.* (1950) noted with barbiturate addicts that anxiety, tremor, loss of appetite, and insomnia appeared during the first 24 hours after stopping the drugs, whereas hallucinations, illusions, or delusions became evident only after a lapse of three days. A similar continuum of events seems to have befallen our patient.

No patient showed any skin reactions to methylpentynol as have been reported by DeLamater (1952).

A criticism that could be raised at this stage is that for three patients the toxic reaction followed the combination of methylpentynol with other drugs, and in another case appeared to be precipitated by the consumption of alcohol. Nevertheless, the clinical picture was identical with that seen in those patients following the ingestion of methylpentynol alone and similar to that due to methylpentynol intoxication previously reported (Marley, 1955).

Finally, as Perlman and Johnson (1952) and Perlman *et al.* (1953) have shown, methylpentynol does not accumulate in the human body, so the paradoxical situation of toxic reactions developing with therapeutic doses of the drug is probably attributable to unusual sensitivity. In view of this,

and as methylpentynol is an important sedative (Sears, 1956), factors contributing to susceptibility are now being examined.

Summary

Eight case histories of methylpentynol intoxication are described, presenting with pupillary abnormalities, nystagmus, diplopia, ptosis, loss of facial muscle tone, dysarthria, tremor of the protruded tongue, and cerebellar ataxia in the limbs or admixtures of this with posterior column ataxia. Muscular tone, although occasionally augmented, was usually diminished. Plantar reflexes were flexor and sensation remained unaffected.

Mood change, particularly depression, dominated the accompanying mental state. Orientation was preserved even in a setting of impaired attention and concentration. Nominal dysphasia, paraphasia, distortion of subjective time experience and body image were noted. Illusions or possible hallucinations were common, as was impairment of memory for the toxic episode. Withdrawal features were seen in one instance.

Side-effects in a further 30 individuals were confined to minor alterations in the mental state.

The resemblance to barbiturate or alcoholic intoxications is emphasized, as is the small dosage and brief duration of therapy which precipitated toxic reactions. This was particularly valid for the patients with psychiatric disorders.

We thank Drs. C. P. Blacker, A. D. Leigh, and E. Stengel, of the Maudsley Hospital, Mr. D. R. Kilgour, of the Southampton General Hospital, and Dr. G. Hirst, general practitioner, Thornton Heath, for their kind permission to publish these cases.

TROPICAL PULMONARY EOSINOPHILIA

BY

ROSEMARY DAVIES, M.D., M.R.C.P.Ed., D.C.H.

Assistant Chest Physician, South Warwickshire Hospitals Group

Although tropical pulmonary eosinophilia is common in certain parts of the world few cases have been reported in this country. Since, however, it appears to be a disease in which relapse is not infrequent, and as a steadily increasing number of Indians are coming here to seek employment, it is likely that cases will be encountered more frequently.

Case Report

A Hindu aged 31 came to England for the first time in February, 1955. He had spent his childhood in the Punjab and then lived in Calcutta. Shortly after his arrival here he caught a cold and developed a troublesome cough; the coryza disappeared after a week or two, but the cough persisted and became particularly disturbing at night; it was usually non-productive, but occasionally he had a little viscid sputum. Apart from his cough he felt well and his general health remained good. He first sought medical advice in October, 1955. No abnormality was found on clinical examination at that time, but an x-ray film of the chest showed a diffuse mottling throughout both lung fields. The opacities were rather coarser than those of miliary tuberculosis; both lungs were equally affected, and the middle and lower zones were involved more than the apices. Repeated sputum examinations were negative for tubercle bacilli, he was afebrile, and his sedimentation rate was normal. The total white cells numbered 21,100 per c.mm. (polymorphs 23%, lymphocytes 13%, monocytes 2%, eosinophils 62%).

On admission to hospital he first denied any previous illnesses, but subsequently said that he had suffered from "eosinophilic lung" in the past and gave the following history. In November, 1951, he developed what he thought to be an ordinary upper respiratory infection; however, it persisted, and he soon developed a cough which was dry initially but later productive of a little viscid sputum. After a few weeks he noticed he was having attacks of dyspnoea and wheeziness at night. When he had had symptoms for about three months he asked his doctor if he could have a blood count, since his symptoms were so similar to those of a friend who had recently been diagnosed as having tropical eosinophilia. His blood count showed an eosinophilia and he was given five injections of arsenic. He rapidly improved after the first injection and was symptom-free by the end of the course. Thereafter he was well until September, 1953, when he developed a pyrexial illness which lasted a few days and left him with a cough and nocturnal wheeziness. At this time a chest radiograph showed "numerous small opaque shadows along the increased bronchial markings, suggesting an eosinophilic lung condition." He was again given five arsenic injections, and subsequently remained well until shortly after his arrival in this country some 16 months later.

After his admission to hospital in October, 1955, repeated blood counts showed a persistent leucocytosis with a high eosinophilia. He had scanty sputum, which contained eosinophil cells on several occasions, and fat globules were present in every specimen examined. Several 24-hour specimens of sputum were examined for mites, but none were found. In view of the paucity of his sputum, bronchoscopy was performed and a trap specimen of bronchial secretions was obtained and examined for mites, but with negative results. Gastric aspiration was attempted on several occasions, since it was thought that mites might be swallowed and therefore be obtainable in the fasting gastric juice, but the patient steadfastly refused to swallow a Ryle tube and

the attempts had to be abandoned. Repeated stool examinations were negative for parasitic ova and cysts, and the blood Wassermann and Kahn reactions were negative.

It was concluded that he was suffering from a relapse of his tropical pulmonary eosinophilia, and treatment with oral arsenic was begun on November 25. He received 0.26 g. of acetarsol twice daily for four days, followed by two days' rest and then a further 0.26 g. of acetarsol twice daily for six days. For a few days after the course of arsenic his cough was rather worse than formerly, but it then started to improve and had completely disappeared about three weeks later. He was discharged from hospital in December and has remained well since. Serial chest radiographs showed progressive clearing of the lesions, and in February, 1956, his chest x-ray film appeared normal. His blood count slowly returned to normal (see Table).

Date	Total W.B.C. per c.mm.	Eosinophils	
		%	No. per c.mm.
31/10/55	21,100	62	13,000
21/11/55	17,900	61	10,919
25/11/55	17,000	72	12,240
25/11/55	Acetarsol commenced		
28/11/55	19,000	68	12,920
5/12/55	22,500	60	13,500
6/12/55	Acetarsol discontinued		
8/12/55	18,400	74	13,616

8/2/56	9,100	3	273

Discussion

Historical.—Tropical pulmonary eosinophilia is a well-recognized disease. Although commonly known as Weingarten's syndrome the first description of the disease was given by Frimodt-Møller and Barton (1940).

Aetiology.—Carter, Wedd, and D'Abrera (1944) suggested that tropical pulmonary eosinophilia is due to pulmonary infestation with various species of mites. This theory has received considerable support (Soysa and Jayawardena, 1945; Carter and D'Abrera, 1946a, 1946b), but it has not been universally accepted (Ball, 1950). An allergic basis has been suggested (Chakravarty and Roy, 1943; Lal, 1945), but the eosinophilia is much higher than is commonly met with in allergic diseases and there is usually no personal or family history of other allergic manifestations.

Geographical, Racial, and Seasonal Incidence.—The disease occurs mainly in India and Ceylon, but cases have been reported from other Asian countries, Africa, South America, and the West Indies (Parsons-Smith, 1944; Wilson, 1945; Stephan, 1946; Soysa, 1949). A pulmonary condition associated with eosinophilia is common in Samoa (Thompson, 1950). Cases occurring in this country have been reported by Apley and Grant (1944), Hunter (1946), and Hall (1946); most of their patients had been overseas, but in one of Hall's cases the disease appears to have originated in this country. All races are susceptible to the disease, the different racial incidence being accounted for on a geographical basis. The symptoms may start during a period of wet weather, or if symptoms are already present they may be aggravated if the humidity of the atmosphere increases (Ball, 1950).

Age, Sex, Family, and Occupational Incidence.—The disease occurs in all ages and in both sexes. It is much commoner in men than in women, probably owing to occupational factors. There is no familial predisposition to the disease (Weingarten, 1943). Although in many cases the patient's occupation has no bearing on the development of the disease, it has been noted that many of these worked in dusty atmospheres and among food, and the mites usually recovered from the sputum are of species which are commonly present in stored products (Carter *et al.*, 1944; Soysa and Jayawardena, 1945).

Symptomatology.—Characteristically the illness starts with lassitude, slight fever, and coryza. After a week or two a

cough develops (typically worse at night), and there is usually a little viscid sputum. The patient gradually becomes wheezy, and attacks of nocturnal asthma develop after the illness has lasted for several months; physical examination may be negative, but there are usually signs of bronchitis.

Blood Changes.—A massive eosinophilia in the peripheral blood is a constant finding. The degree of eosinophilia varies from case to case, and from time to time in any one case; it is not proportional to the severity of the symptoms, and may be found before the clinical features and x-ray changes have fully developed; it may persist while the symptoms are in natural remission (Soysa, 1952) and is commonly the last feature of the disease to disappear (Menon, 1945). The erythrocyte sedimentation rate is sometimes raised. A positive Wassermann reaction is a frequent finding (Menon, 1945; D'Abrera and Stork, 1946), but this is usually associated with a negative Kahn test. A high titre of cold agglutinins is found in some cases (Ball, 1950).

Radiological Changes.—Typically, a diffuse miliary mottling is seen in both lungs; the miliary nodules are never confluent and are often most numerous in the perihilar regions; the lower zones are usually more affected than the apices. These appearances are present in only about 50% of cases (Soysa, 1949; Ball, 1950). In other cases there may be no radiological changes, or only some increase in the bronchial markings.

Differential Diagnosis.—In allergic asthma there may be a slight eosinophilia, but it is never as high as that which occurs in tropical pulmonary eosinophilia. It must be remembered that nocturnal asthma may be a symptom of tropical pulmonary eosinophilia. Loeffler's syndrome is probably an allergic phenomenon in which transient pulmonary infiltrations and a slight or moderate eosinophilia are associated with little in the way of constitutional disturbance. Infestations with helminths may be associated with asthmatic attacks and a slight eosinophilia. In these cases ova are recovered from the stools and the condition responds to the appropriate anthelmintic treatment. The radiographic appearances may be confused with those of miliary tuberculosis, pneumoconiosis, sarcoidosis, and chronic pulmonary changes due to long-standing heart disease. Sarcoidosis is the only one of these diseases in which an eosinophilia may occur, and, if present, it is usually only of slight degree. There is an uncommon condition of pulmonary eosinophilia with asthma which occurs mainly in women and is often associated with polyarthritis (Crofton *et al.*, 1952). Its cause is unknown. Abnormalities are sometimes seen in the chest x-ray film in polyarteritis nodosa, and a blood eosinophilia may occur in this condition. Eosinophilic leukaemia is the only disease where the eosinophilia in the peripheral blood may exceed that which may occur in tropical pulmonary eosinophilia (Weingarten, 1943). As the other features of the two diseases are distinctive, difficulty in diagnosis should not arise.

Prognosis and Treatment.—Tropical pulmonary eosinophilia is a benign condition, but if untreated it may run a prolonged course (Lal, 1945). It invariably responds promptly to treatment with arsenic, either by mouth or by injection. A temporary exacerbation of the symptoms and of the eosinophilia may occur shortly after treatment is started, but there is a rapid improvement with the continuation of treatment. Treu (1950) estimates the relapse rate at 20%, but a case that has relapsed responds to arsenic as well as one that has not previously been treated.

Summary

A case of tropical pulmonary eosinophilia is described. The patient, a Hindu, first had symptoms in 1951 and subsequently had two relapses—in 1953, and again shortly after coming to England in 1955. The clinical course of his illness in 1955 is described, together with the radiological and haematological changes at that

time. Repeated examinations of his sputum failed to reveal any mites. He responded well to arsenic.

The literature on the disease is briefly reviewed and the various aetiological theories are discussed. Tropical pulmonary eosinophilia is widely considered to be due to pulmonary infestation with various species of mites, but this cause has not been universally accepted. Although the disease occurs mainly in India and Ceylon, cases have been reported from many other countries. Relapse is common, and may occur after the patient has moved from a tropical to a temperate climate.

My thanks are due to Dr. A. P. Prior for carrying out the pathological investigations.

Medical Memorandum

Bilateral Thrombosis of the Renal Artery

Spontaneous thrombosis of both renal arteries is extremely rare, and I can trace only two recorded cases. Below is a report of a third case.

CASE REPORT

A man aged 63 was admitted to hospital with a diagnosis of anuria of unknown aetiology. His only complaints were that he had not passed urine for 33 hours, and that he had had slight pain in his loins for 36 hours. He had had angina pectoris for five years, and both the right and the left leg had been amputated for senile gangrene 16 and 6 months previously respectively. He had made uneventful recoveries from these operations, had two artificial legs, and enjoyed fair health up to the time of the present illness. He developed pain in the left loin 36 hours before admission, and developed pain in his right loin shortly after. The pain was never severe, and, although still present on admission, it had eased to but a slight ache. He had never felt ill, vomited, or been nauseated. There was never any abdominal pain. He had passed urine normally 33 hours before admission, but since then had been able to pass only a "teaspoonful of cloudy, muddy" urine.

On examination he was a fairly healthy-looking, well-nourished man, with an appearance no older than his age. Both legs had been amputated above the knee and the stumps were healthy. His temperature was 101.2° F. (38.4° C.) and pulse 110. The tongue was slightly coated, but moist, and the breath clean. Examination of the abdomen revealed no abnormality. There was a little tenderness in the right renal angle, but none in the left. Rectal examination revealed a slightly enlarged smooth prostate but no tenderness. His pulse was regular, with a palpable radial artery. The B.P. was 170/105. The apex beat was displaced to the left, but no abnormality was noted on auscultation of the heart. The lungs appeared to be clear. A straight x-ray film of the renal tract showed no radio-opaque calculi. On catheterization no urine could be obtained.

A provisional diagnosis of anuria due to an acute pyelonephritis was made, and intramuscular streptomycin therapy was begun along with an intravenous drip of sodium sulphate solution. There was no change in the patient's condition whatsoever until he suddenly collapsed six hours after admission and died within a few minutes.

At necropsy, examination of the abdominal aorta revealed that just above the origin of the renal arteries the lumen was occluded by an ante-mortem thrombus which was attached to the wall and extended down to the iliac bifurcation. It also extended about 0.5 cm. into each of the renal arteries and into the root of the inferior mesenteric artery. The thoracic aorta showed many atheromatous plaques. The coronary arteries were greatly narrowed by atheroma and only just patent. Both kidneys showed some scars from previous small infarcts, and the whole substance of both of them was rather plum-coloured, with loss of normal definition, and appeared to be in the early stages of necrosis. The other viscera showed no significant pathology save that the lungs were the site of an early bronchopneumonia.

COMMENT

An appreciable number of cases have been recorded (McKenna, 1928) of bilateral thrombosis of the renal artery occurring secondary to multiple embolism, but a spontaneous thrombosis of both renal arteries due to atherosclerosis is extremely rare. The first of the two recorded cases was reported by Halperin (1908). A man of 44 presented with a similar history to the case reported above, but the pain was severe and was associated with vomiting and headache. The pain did, however, in this case also gradually subside. The patient survived six days with an almost complete anuria. Necropsy revealed thrombosis identical to that of my case. It is noteworthy that this case also had had a leg amputated 18 months previous to his renal thrombosis. The other case was reported by Oudenal and Hulst (1925). A woman of 67 was seen complaining of anuria of two days' duration. She never at any time complained of pain. She was reported as being alert and showing no signs of uraemia, comparing with the identical circumstance of my case. Further, her temperature was similarly somewhat elevated, and a diagnosis of urinary sepsis was made. She eventually passed into uraemia and died six days later, after an operation to decapsulate the left kidney. Necropsy findings were as in the other two cases.

None of these three cases was diagnosed clinically, but this is probably because renal artery thrombosis is a diagnosis the clinician seldom considers. Wolffe (1943) maintains that thrombosis of a single renal artery is quite a common condition, and urges that it is one that should be far more often diagnosed and treated. The three cases described, however, suggest that the clinical picture can be very variable, systemic upset and the onset of uraemic symptoms being inconstant. Goodyear and Beard (1947) admit the very variable and inconstant findings in unilateral renal artery thrombosis, but assert that severe pain is one consistent feature. This is quite contrary to the findings in two of the three bilateral cases described.

The diagnosis in bilateral thrombosis might be regarded as of only academic interest anyway. But with the great advances being made in the techniques of arterial grafting, especially in the use of synthetic cloth prostheses, operative treatment of such cases, if diagnosed early, might now be within the bounds of possibility.

I am grateful to Mr. J. I. C. Mason for permission to publish this case report.

Reviews

REFRESHER COURSE

Refresher Course for General Practitioners. Specially Commissioned Articles from the British Medical Journal. Third Collection, April, 1952, to September, 1953. (Pp. 548+xvii; illustrated. 25s.) London: British Medical Association. 1956.

This is the third collection of Refresher Course articles for general practitioners. The articles appeared in this *Journal* in 1952 and 1953, and have been revised by their authors. The editor is to be congratulated on his selection of subjects. They cover a wide range. There are chapters on antenatal care by Professor Nixon and on death certification by Dr. Logan, ranging literally from conception to the grave. All the subjects are of importance to general practitioners, and each has been written by an expert. It must be unique in medical literature for so many experts to be gathered within the covers of three comparatively slim volumes, all dealing with general practice. One of the objects of such a course is to refresh the general practitioner's mind on the diagnosis and treatment of emergencies. Articles by Dr. Wallace on resuscitation after drowning and by Professor Glaister on the treatment of accidental poisoning will remind him of the advantage of the Holger Nielsen method of artificial respiration and of the importance of keeping an emergency bag for the treatment of poisoning.

Medicine and medical treatment are changing daily, so that a particular method of treatment may be out of date by the time it appears in print, but the ideas which lead to the changes are often less impermanent. For instance, it has long been known that shock and sepsis are the chief causes of death in burns, and that whole-skin burns take a long time to heal and cause serious scarring. The virtue of the chapter on the treatment of burns by Dr. Bull and of the chapter on the treatment of burns by Dr. Bull and Mr. Jackson of the Medical Research Council burns unit of the Birmingham Accident Hospital lies not so much in the particular antibiotics used but in the lesson that infection of burns can be prevented, that shock can be treated by transfusion, and that whole-skin burns can now be grafted at once. This is also an example of the increasing responsibilities of the general practitioner to-day, for he must decide whether a burn on the finger has caused full thickness or partial thickness skin loss. A wrong decision may cause permanent crippling in his patient. The general practitioner will find another aspect of the widening scope of his responsibilities in an excellent article by Sir Harold Whittingham on the medical aspects of air travel. Then, of course, there is cancer. Surgeons expect general practitioners to diagnose cancer just after, if not before, it occurs. Two surgeons—Mr. Malcolm Donaldson, who writes on irregular vaginal bleeding, and Mr. Atkins, on carcinoma of the breast—question the validity of recent statistics which appear to disprove the value of surgical removal of cancer. However that may be, it seems certain that statistics based on the survival rate after operation have little or no importance. Whether he agrees or disagrees with modern ideas, it is important for the general practitioner to know what his consultant and specialist colleagues are thinking and doing even when their thoughts are faintly patronizing. Professor Nixon must surely know that many general practitioners were regularly getting chest radiographs of all their expectant mothers well before 1947, and that they are more in sympathy with his ideas on the emotional aspects of pregnancy and labour than are many of his consultant colleagues.

This volume contains a classified list of the articles in all three volumes. Classification of such diverse subjects is difficult, but it is not easy to understand why Dr. L. B. Cole's thoughtful and helpful article on prevention and treatment of tetanus should be listed under general surgery and under tropical medicine. Perhaps in future editions it might be possible to have an alphabetical list of authors

with their contributions. When all is said, it remains true that this is a remarkable collection of opinions on modern medicine which will be invaluable to the general practitioner.

C. W. WALKER.

DEVELOPMENT OF THE CHILD

Discussions on Child Development. Edited by J. M. Tanner, M.D., Ph.D., D.P.M., and Bärbel Inhelder. Volume 1—Proceedings of the First Meeting of the W.H.O. Study Group on the Psychobiological Development of the Child, Geneva, 1953. (Pp. 240. 25s.) London: Tavistock Publications Ltd. 1955.

This is an account of the papers and discussions of a Research Study Group on the Biological, Psychological, and Cultural Aspects of Human Behaviour and Development, under the auspices of the World Health Organization. It is the first volume, and a second volume is being prepared. Among the participants in the meeting were such experts as Bowlby, Fremont-Smith, Inhelder, Lorenz, Margaret Mead, Piaget, Tanner, and Grey Walter. The subjects discussed included the physical, physiological, and psychological aspects of child development, comparative behaviourology, the behaviour of anencephalic monsters, and electroencephalography. Piaget's criteria of the stages of mental development and Wallon's description of motor development are discussed in detail. Each chapter is opened by a short paper, which is followed by many pages of discussion. The papers and discussions are full of interest for those who are concerned with the development of normal children and who have made psychology a special study. The book is not one to which a practising paediatrician would refer for help with individual problems, but he would find it of interest for its theoretical explanations of child development.

Drs. Tanner and Inhelder are to be congratulated on making this valuable book so readable and for providing us with such important material which otherwise would not be readily available, because of language difficulties. One looks forward to reading Volume II.

R. S. ILLINGWORTH.

PAEDIATRIC ALLERGY

Allergy in Childhood. By Jerome Glaser, M.D. (Pp. 529 +xxii; illustrated. 90s.) Springfield, Illinois: Charles C. Thomas. Oxford: Blackwell Scientific Publications. 1956.

This book represents the amplification of a series of lectures given by the author to paediatric house-staff and medical students as a course in paediatric allergy, established at the University of Rochester School of Medicine and Dentistry since 1931. A wide range of problems is covered and the book is reasonably balanced. Almost 100 pages are given to bronchial asthma and just over 100 to the allergic dermatoses and allergy to drugs and vaccines, nearly 50 being devoted to atopic dermatitis. Gastro-intestinal allergy is discussed in 35 pages; the history, examination, and skin-testing in 25 pages; and pollinosis in 18. Other subjects include allergy in early life, the incidence and progression of allergic syndromes in children, psychosomatic aspects of allergic diseases in infancy and childhood, allergy to insect bites and stings, and the prophylaxis of allergic diseases. The chapters are conveniently short, and each is followed by a well-chosen bibliography. The sections describing the differential diagnosis and management of bronchial asthma and the allergic dermatoses are well done and will interest all who have these problems to deal with.

The most difficult section of the book to assess is that dealing with the role of foods as allergens. Dr. Glaser has himself devoted much time to this subject and is an advocate of the importance of foods as allergens: opinion on this, however, is far from unanimous, and it is doubtful whether many in this country would agree with all that he says. With this reservation, the book can be recommended as giving much practical advice on the diagnosis and management of allergic conditions in childhood.

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY DECEMBER 22 1956

RESPIRATORY TRACT VIRUSES

Respiratory disease continues to be a major cause of morbidity. Recent investigations in the United States¹ have emphasized that so far as the family is concerned "common respiratory disease" accounts for the greater part of respiratory illness, particularly among the younger members of the family. Acute respiratory infections of this sort are apt to be attributed to viruses, particularly if no immediate response to antibiotics is forthcoming, and thoughts turn towards immunization as a method of control. But before this can be attempted the disease to be prevented must be clearly defined and the agent responsible isolated in the laboratory, as has been done for influenza. Virus infections of the respiratory tract are a mixed bunch, and, though progress has been made in distinguishing them clinically and epidemiologically, work in the laboratory, on which the ultimate aetiological diagnosis depends, has usually been hampered by inability to transmit the causative agents to laboratory animals.

As influenza came to be more clearly defined, so did the existence of acute undifferentiated respiratory disease or febrile catarrh become more noticeable.² In 1947, at a time when all attempts at animal transmission were unsuccessful, the U.S. Commission on

Acute Respiratory Disease was able to transmit "acute respiratory disease" to human volunteers by instillation of sterile filtrates from acute cases.³ And it appeared from their studies that both the original and induced disease were immunologically distinct from the severe common cold and primary atypical pneumonia.⁴ With the introduction of tissue culture into virus research there seemed little doubt that new viruses would be recovered from the respiratory tract, and so it has proved to be. The first group of interest are the A.P.C. viruses,⁵ or adenovirus as they are now called.⁶ In 1953 W. P. Rowe and his associates described a virus, the adenoid-degenerating agent, which produced spontaneous degeneration of human tonsils growing in tissue culture,⁷ and within a short time other workers had recovered similar agents in a variety of acute respiratory illnesses.⁸ Despite their different names these viruses are closely related and have a number of common properties which serve to identify them. They grow well in tissue culture, particularly of human origin, and produce characteristic cytological changes visible under the microscope. They are non-pathogenic for laboratory animals, and, though they share a common soluble antigen, many immunological types exist. Serological evidence indicates that infection is widespread and acquired initially at an early age. Studies in Washington, D.C., showed that 50% of infants from 6 months to 1 year had antibody to at least one type, and by the age of 15 antibody to several types was present.⁹ As to the part these viruses play in human disease, more information is needed before their exact role can be defined. Nevertheless, certain alignments of immunological types have been noted. For instance, types 1 and 2 have been found or unmasked more frequently than other types from human tonsils and adenoids.⁸ Type 3 has been found in association with cases of acute pharyngitis and pharyngo-conjunctival fever,⁹ and a type 8 virus from cases of epidemic kerato-conjunctivitis.¹⁰ But the most clear-cut association appears to be between types 4 and 7, and to a less extent type 3, with outbreaks of acute respiratory disease seen in Service recruits.¹¹ In confirmation of this comes a report from J. H. Dingle and others¹² that sera taken from volunteers, and since stored, during the 1947 investigation into acute respiratory disease showed a rise in antibody titre to type 4 adenovirus, whereas cases of severe common cold and atypical pneumonia showed no such rise.

As to preventive measures, the role of adenoviruses in acute respiratory disease of Service recruits seems sufficiently well established for immunization to be tried, and a start has already been made in the United States. R. J. Huebner and others showed that an

inactivated monovalent vaccine (type 3) produced a degree of protection in volunteers to inoculation of live virus swabbed on to the palpebral conjunctiva.¹³ M. R. Hilleman and others selected types 4 and 7 adenoviruses for a similar type of vaccine prepared in monkey-kidney tissue culture.¹⁴ One dose of vaccine given before the onset of acute respiratory illness conferred a remarkable degree of protection. The incidence of illness in 311 vaccinated recruits was 4.8% and 23.8% in a control group of 313 recruits. Furthermore, the degree and rapidity with which protection was afforded with one dose of vaccine suggested that vaccination produced a recall type of response in individuals with at least some previous immunity. J. A. Bell and others gave a similar type of vaccine incorporating types 3, 4, and 7, and were also able to record protection in a trial in U.S. naval recruits.¹⁵

With mounting evidence that the adenoviruses were associated with various respiratory illnesses, it seemed possible they might be concerned in the aetiology of the common cold. There is no evidence yet that this is so. Earlier reports by C. H. Andrewes and his colleagues¹⁶ were hopeful that the virus could be grown in tissue culture of human embryonic lung, but identification of the virus is extremely difficult because no cytological changes are produced, as with the adenoviruses, and human volunteers are still required to test material for virus infectivity. There are many difficulties in interpreting the findings. Only some of the induced colds "take"; resistance from natural causes and acquired immunity have to be considered and are hard to define. Virus propagated in this way may also become so attenuated as to be non-pathogenic to its human host. Finally, it is clear that there are many causes of the non-febrile cold. A. B. Fuchs¹⁷ draws attention to the importance of allergic rhinitis as the cause of symptoms in many cases indistinguishable from the common cold. In a recent investigation, in which live adenovirus was given to volunteers by nasal instillation, J. A. Bell and others¹⁸ found that a number of colds developed both in those receiving live virus and in those receiving virus-free maintenance fluid. All this work goes to emphasize the need for a method of handling the common cold virus or viruses in the laboratory.

Though the original RI-67 strain of virus, now known as adenovirus type 4, was recovered from a case of primary atypical pneumonia, there is no evidence that these viruses are the causative agents of primary atypical pneumonia in which increased cold agglutinins are commonly encountered. A number of viruses from this disease have been described, but interest has mainly centred on one described by

M. D. Eaton and his colleagues.¹⁹ Serial transmission and recognition of this agent was difficult because of its low pathogenicity for the cotton-rats and chick-embryos infected with it. By means of the fluorescent antibody technique, virus antigen has been demonstrated in fertile eggs infected with this virus recovered from cases of atypical pneumonia.²⁰ More recently, reports from the children's hospitals in Toronto and Cincinnati suggest that viruses may also have been isolated from cases of laryngo-tracheo-bronchitis²¹ and from infantile croup.²² There seems little doubt that tissue-culture methods are going to provide the means for further study of respiratory-tract viruses and perhaps a step towards their ultimate prevention.

SPEECH PROBLEMS IN CHILDREN

Speech problems are common in children, but relatively few papers are written about them—perhaps because they are so difficult to write about. Outstanding recent papers were that of Professor D. Court and his associates¹ and the review by J. Eisen-son² of the psychological factors in speech disorders. Elsewhere in this issue of the *Journal* (p. 1455) Dr. C. H. M. Walker and Miss P. R. Languth describe their study of 52 children at the Hospital for Sick Children, Great Ormond Street, in whom speech was delayed or arrested for reasons unassociated with deafness or cerebral palsy. Much support will be found for their principal conclusions, though not all will agree that cases of delayed onset of speech, arrest of speech development, and dyslalia can be grouped together. Neither has it been clearly established that there is a close connexion between the amount of vocalization in infancy (termed by the writers "babbling")—even if there were a means of estimating it—with subsequent speech development in a child with normal hearing. An interesting part of their paper is devoted to psychological factors associated with speech disorders: they found that in 33 of the children there were faults in the environment which could have been operative in causing delay or arrest in speech development. Elsewhere they say, "The large proportion (80%) suffer from arrested development, probably the result of non-specific psychological factors, operating between the age of 1 and 2 years." This is a difficult point to prove. It is fashionable to say that some children are late in learning to

speak because they are jealous of the new baby, or because their parents do not talk to them enough, or because they (or the siblings) do everything for them so that they do not have to bother to speak. There may be no more than a grain of truth in these ideas. Certainly severe emotional deprivation may retard speech—particularly if the child is so badly treated that he hardly ever hears anyone talk—but that must be very rare. There is no evidence for the popular belief that children do not talk because they are “lazy” and because everything is done for them. Many parents have been instructed to refuse to do things for their child unless he speaks properly, and as a result behaviour problems are precipitated, because the child’s lateness in speech was due not to the fact that he would not speak but to the fact that he could not—because his nervous system was not ready for it. Such advice is harmful. As for jealousy, all children are jealous, and it is indeed difficult to prove that lateness in speech is due to jealousy. Most children from homes which are badly mismanaged or having parents who are themselves emotionally disordered speak normally, though one of the mysteries of psychological medicine is the way in which one child will react to insecurity by a tic or bed-wetting while others will react by any of a score or more of other behaviour problems. Some, therefore, might well react by delay in learning to speak, but this must be very rare. The matter is still a controversial one and awaiting the collection of evidence, though no one would doubt that stuttering is often related to insecurity.

The commonest cause of lateness in the development of speech is mental retardation. Most mentally backward children are relatively more retarded in speech (and subsequently in reading) than in other fields of development. Hence the essential step in determining the cause of lateness in speech is an assessment of the child’s mental development, based on the history, the physical examination, and the interpretation of the findings.³ If the child is found to be up to the average in other respects, concentrates well on his toys, and shows a good interest in his surroundings, mental backwardness need not be further considered as a cause of his lateness in speech. It may be noted, in passing, that Einstein caused his parents grave concern because of his notable backwardness in speech at the age of 4. The next step in the diagnosis is the elimination of deafness, partial or complete. Severe deafness may be suggested in infancy by the child’s general indifference to sound, by his lessened vocalization in play or otherwise, and by his screaming in his efforts to express pleasure or annoyance. He may show exaggerated alertness to gesture

and movement. High-frequency deafness is more likely to cause indistinctness of speech, because of the omission of certain high-pitched sounds such as consonants, and particularly the “s” and “f,” which children do not hear in the speech of others. Expert examination is needed to detect this form of weakness.

Most workers will agree with the finding of Walker and Languth that crossed laterality is of little importance in these children. Delay in the establishment of handedness is probably of equally little importance. Tongue-tie never causes delay in the acquisition of speech, and it is a very rare cause of indistinctness of speech, intelligent children learning to compensate for the slight mechanical difficulty.

A related problem to that of retarded speech, but one of less importance, is the occurrence of a lull in the development of speech. A child begins to talk at the usual time and learns to say a few words, and then makes no apparent progress for a period of varying length, often five or six months. He then suddenly makes rapid progress, catching up to the average level in a very short time. These lulls in development have interested many workers, including Gesell. There is no evidence of a psychological cause for them, and they need not occasion anxiety. The child will be found to be progressing normally in other ways, and in particular in his understanding of words, so that he may understand the meaning of scores of words without being able to articulate more than five or six.

All will agree with the emphasis placed by Walker and Languth on the importance of early treatment in dyslalia and stuttering, though no amount of speech therapy can make a child learn to talk until his nervous system is ready for it. It is useless, therefore, to refer a child to a speech therapist because he is a late talker. This does not apply to deafness: the sooner a deaf child is treated the better. Even at the age of 9 months he may be helped by the fitting of a hearing-aid. Speech therapy should begin at the age at which speech is normally learnt—certainly by the first birthday. If, on the other hand, the child is able to talk but his speech is indistinct and remains so, the speech therapist should certainly be asked to help, so long as the child is old enough and has the requisite intelligence. Many children go through a stage of lisping, substituting “th” for “s,” and in nearly all of them this cures itself without treatment. Many other children go through a stage of stuttering, particularly between the age of 3 and 4, but grow out of it provided that the parents show no anxiety about it and make no attempt to treat it. When a speech defect is persistent, however, it should be treated. It is likely that the longer the speech defect is estab-

lished the longer will be the time required for its correction. R. M. Chadsey⁴ went further, writing, “It is criminal negligence to wait for a child to grow out of a defect.” There is some difference of opinion about the age at which treatment should be instituted. This must depend in part on the child’s intelligence: at all events he should be treated for a persistent defect by the time of his fourth birthday, because it is so important that he should speak normally when he starts school and so escape the harm resulting from being teased and ridiculed by other children. Some recommend that treatment, especially for stuttering, should begin somewhere between the child’s third and fourth birthday, but that would probably mean treating many who would right themselves if left alone.

A certain amount of dyslalia may be due to post-nasal obstruction by adenoids, leading to the substitution of the letter “m” for “b”: this may be corrected by surgery. The speech defect may persist for a few weeks after the operation because of habit, but usually it cures itself quickly when the postnasal obstruction is removed. Malocclusion may also cause some dyslalia, and should be corrected by the orthodontist. A cleft palate does not delay the development of speech, except in so far as subnormal intelligence is more often found in these children than in others,⁵ but it does lead to dyslalia until treated by the plastic surgeon and speech therapist.

In all cases of retarded speech or speech defects it is wise to relieve the parents’ anxiety and to stop them causing worry and insecurity in the child by their efforts to make him speak clearly and distinctly, or by teasing and ridiculing him. Perfectionism, over-protection, and excessive discipline should so far as possible be corrected.

ANTIBIOTIC HAZARDS

How dangerous are our antibiotics? A few years ago this question was hardly being asked. Now the literature is full of reports of disasters or disorders following their use. But when we try to estimate how great these dangers are, surprisingly little is known. These and many other problems are discussed in a recent volume of nearly 1,000 pages containing some 250 papers and of three panel discussions on the long-term and prophylactic use of antibiotics, penicillin V, and the true significance and real incidence of reactions following clinical use of antibiotics.¹ There are many ways in which antibiotics may be dangerous—because of their direct toxicity, because they give rise to hypersensitivity

(allergy), because of the development of drug resistance in the patient’s organisms, through use of the wrong or misuse of the right antibiotic, or through use of antagonistic combinations. But many antibiotics are fairly specific not only in their action on micro-organisms but also in their harmful effects on patients, and it may be useful to outline some of the main dangers of the most important antibiotics.

Penicillin is still perhaps the safest of them all, but cases of hypersensitivity ranging from skin rashes to anaphylactic death are being increasingly reported. A report of three deaths from penicillin in Denmark² draws attention to the need to avoid prescribing it for anyone who is known to be sensitive to it. It is stated that penicillin V (phenoxymethyl penicillin), which is suitable for administration by mouth, is about eight times less toxic than penicillin G (benzyl penicillin) and much less likely to give rise to hypersensitivity. Development of drug resistance is not a serious problem with penicillin except for staphylococcal infections. This is rapidly becoming one of the major problems of cross-infection, and was discussed in these columns recently.³

The dangers of streptomycin therapy are rather different. Hypersensitivity reactions may be serious, but the most dangerous sequelae are the well-known damage to the eighth nerve following prolonged treatment and the rapid development of drug resistance which occurs with a wide variety of infections originally susceptible to it. This is particularly common in infections of the urinary tract and in tuberculosis, though combined chemotherapy has greatly reduced its frequency. Of the so-called broad-spectrum antibiotics chloramphenicol has fallen into disrepute because of the presumed association between it and the development of blood dyscrasias. The cause of these has never been clearly established; they may be a special form of hypersensitivity reaction, since cases seem to have occurred most commonly in patients who have had the drug before rather than in those who have had long continuous treatment. But the pendulum has swung back somewhat. Certainly chloramphenicol is a valuable drug, remarkably free from toxicity in other ways and often indispensable not only in typhoid fever but in staphylococcal and other refractory infections. The most conspicuous danger of the tetracycline group of drugs (aureomycin, terramycin, achromycin) is their liability to cause gastro-intestinal disturbance. Usually this is troublesome rather than dangerous, but sometimes fulminating enteritis develops and the patient dies in circulatory collapse. Often in this condition the bowel is found to be heavily infected with *Staphylococcus pyogenes* resistant to terramycin. From the short history in the fulminating cases it seems clear that the patient must have been infected from some outside source with staphylococci which were already drug-resistant, and the problem of eliminating sources of such staphylococci is causing increasing anxiety to surgeons and others.

The dangers of our modern chemotherapy are not confined to antibiotics. Synthetic drugs like the sulphonamides are certainly not blameless—rashes, agranulocytosis, renal failure, drug resistance, are a few of their

¹ *Antibiotics Annual 1955-6*, ed. Welch, H., and Marti-Ibanez, F., New York.
² Andersen, A. H., *ibid.*, p. 814.
³ *British Medical Journal*, 1956, 2, 867.

more important complications. In the treatment of tuberculosis *p*-amino-salicylic acid and isoniazid, besides producing toxic effects, are readily made ineffectual by the development of drug resistance during treatment. Some of the less commonly given antibiotics are so toxic that their use is warranted only in special circumstances—for example, neomycin and cycloserine. As many lives may be lost by the indiscriminate use of antibiotics and other drugs as by failure to use them when they are urgently needed. But it is not easy to assess the risk when there are so many gaps in our knowledge. We need much more information about the frequency of dangerous reactions to penicillin, of fulminating gastro-enteritis following the use of tetracyclines, of blood dyscrasias following chloramphenicol, and of many other hazards of antibiotic therapy. No single individual can collect personally more than a fraction of the experience needed in this field; that is why publications such as the *Antibiotics Annual* fill an urgent need. For only when he is given such information can the clinician hope to steer a sensible course between exuberance and timidity in his prescribing of antibiotics.

PUBLIC HEALTH IN 1955

The general death rate in England and Wales has shown little change since the end of the second world war. After allowance is made for changes in the age and sex structure of the population, it was 80% of the 1938 rate in 1948 and 81% in 1955. But the Chief Medical Officer of the Ministry of Health is able to report that 1955 "had many favourable features, which directly or indirectly contributed to the public health." These included a sunny summer, plenty of food, and work for all.¹ The expectation of life at birth remained the same as in 1954—namely, 68 for boys and 73 for girls. For people aged 65, however, the expectation of life has hardly changed this century, being in 1955 12 for men and 15 for women, only a year or so more than before the first world war. This means that, while many more people are reaching old age, the psalmist's three-score years and ten gave what is still a good estimate of the span of human life.

Man has been so strikingly successful in taming the jungle of disease in the last two decades that few sectors remain where he fails at least to hold his own. Yet there are several where at any rate urban man seems to be losing ground. The incidence of cancer of the lung continues to rise sharply, an increase that remains after allowance is made for changes in the population. It is known to be associated with air pollution and excessive cigarette smoking, and the Chief Medical Officer suggests, in a cautiously worded phrase, that "it would be a good thing if the two main suspects could receive increasing attention." The connexion between lung cancer and these two agents is of a statistical nature, sometimes lightly dismissed as being only statistical. But the connexion between a cholera outbreak in London a hundred years ago and the water delivered from Broad

Street pump was of much the same kind. John Snow noticed that the disease was rife among those citizens who took their water from the pump, rare among those who did not. It was thought advisable to remove the pump's handle, if somewhat belatedly.² Though suffering an attack of cholera depended on being infected by vibrios in the water, whereas to be attacked by cancer of the lung does not necessarily depend on being a smoker or living in a city, the line of reasoning which led to the pump being closed is one that the smoker might consider before dismissing it as only statistical. Prohibition of smoking in cinemas and public transport vehicles is a suggestion put forward by the Chief Medical Officer.

Among the communicable diseases, food-poisoning and Sonne dysentery continue to make headway against all the sanitary and educational measures taken to prevent them. The Chief Medical Officer attributes the rising incidence of food-poisoning to "the increasing practice of communal feeding and the consumption of pre-cooked foods," but it is odd that the exceedingly strenuous efforts made to improve the public health should be so ineffectual in stemming the advance of these microbes. Sonne dysentery, "now the bane of day and residential nurseries," causes much inconvenience and even suffering, yet "efforts to curb its spread have so far been singularly ineffective." Against these, one notable success may be mentioned: deaths from whooping-cough, 88 in 1955, were less than a quarter of what they were only five years previously. The fatality of the disease is now mainly confined to the first year of life, and 25% of the deaths were concentrated on children under 3 months old.

STIFF-MAN SYNDROMES

A curious condition of progressive, fluctuating muscular rigidity and spasm has recently been described³ by F. P. Moersch and H. W. Woltman, of the Mayo Clinic, as the "stiff-man" syndrome. They have observed 14 cases of this type during a 30-year period, 10 in males and 4 in females. Usually the condition began in the fifth decade of life with muscular stiffness and rigidity, gradually increasing in severity and punctuated by intermittent painful spasms. These spasms could be precipitated by noise or by sudden movement; the rigidity and immobility so produced often caused the patient to fall. In 6 cases the muscles of the trunk were first affected, in 4 those of the neck and shoulders, and in 4 those of the limbs. Invariably the condition spread to involve other muscles, but always it affected proximal limb muscles more than the distal. Generally the rigidity gave rise to kyphosis or lordosis and to a characteristic awkward shambling gait with poverty of all voluntary movements. On examination the affected muscles were usually rigid and boardlike, though there was often some fluctuation in severity, while frequent spasms could be evoked by external stimuli or by unduly rapid movement by the patient. Although tendon reflexes were generally brisk, no other

neurological signs could be demonstrated. Numerous biochemical studies, examination of cerebrospinal fluid, and myelography in some cases gave no consistently abnormal findings, but 4 patients were found to secrete reducing substances in the urine though levels of blood sugar were normal. Electromyographic recording from rigid muscles in 5 cases gave a normal pattern of volitional activity, and 2 patients were subjected to muscle biopsy with negative results. Eleven cases were followed up for periods of from two to fifteen years, and during this time there was a steady increase in the severity and extent of the muscular rigidity. Treatment with barbiturates, cortisone, and a variety of antispasmodic and relaxant drugs had no significant effect on the course of the disease or even on the predominant symptoms.

Moersch and Woltman confess that they have no evidence on the nature of this curious disease. They point out that it shows certain resemblances to chronic tetanus, but that the almost invariable sparing of the jaw muscles as well as the duration and progressive nature of the disorder are sufficient to rule out this diagnosis. Because of the fluctuating course and the reducing substances found in the urine of 4 cases the authors suggest that the syndrome may result from a specific metabolic defect. However, it is difficult to see why they exclude torsion spasm (dystonia musculorum deformans) as an explanation for this syndrome. This condition is known in many cases to be due to degenerative changes in the basal ganglia. While it usually gives rise to gross involuntary movements rather than generalized muscular spasms, a so-called myostatic form has been described⁴ which may be of late onset; marked fluctuations in course, even with arrest, may occur, or the condition may simply produce progressive muscular rigidity with alterations in posture.⁵ It therefore seems possible that the "stiff-man" syndrome may be an atypical form of dystonia, but so little is known about the aetiology of dystonia, but so little is known about the aetiology of extrapyramidal syndromes developing in middle and late life that a metabolic cause, as suggested by Moersch and Woltman, cannot be excluded. The biochemical origin of Wilson's progressive lenticular disease has now been amply confirmed, and possibly further cases of the "stiff-man" syndrome will repay thorough biochemical investigation.

CONTRASTS IN MENTAL HEALTH SERVICES

A speaker at the Royal Society of Medicine the other evening offered an interesting if somewhat tendentious explanation of why American reports of the effects of tranquilizers such as reserpine are so much more enthusiastic than experience in British mental hospitals would justify. He put it in terms of differences between the mental hospitals of the two countries. Mental hospitals in the U.S.A. have been much shorter of trained nursing and medical staff than ours, and their psychiatric outlook has been dominated by psycho-analytic ideas, to the relative neglect of physical methods of treatment. In consequence the American chronic mental patient has been in a state of greater neglect,

and the improvement he has shown when someone has taken an interest in him, and even given him a few new tablets, all the greater.

A report from the Department of Mental Hygiene of the State of New York¹ helps to illustrate the differences. In the 20 or so hospitals of the state there are about 95,000 patients with only 1,500 nurses (or 1 per 60 patients) and 12,000 "attendants." The medical staffing is relatively more satisfactory—about one doctor for every 190 patients. British mental hospitals are worried about the lack of trained nurses, but the American plight is evidently much worse. Perhaps linked with this is the apparent necessity for repressive measures which are vanishing from British mental hospitals. The number of voluntary patients is falling annually and was roughly only 6% in the year under review. The photographs of new buildings show great austere blocks with large small-paned windows. All this contrasts with the British aim to have mostly voluntary patients and open wards, to abolish the padded cell and all other methods of restraint, and to have modest-sized hospitals split into separate villas, so that the patients live in small groups like very large families or the "houses" of a public school. The British mental hospital in fact owes a good deal to the British public school—and to the British Army—in the formation of its traditions. Dr. Ernest Jones once told a story of how he was rung up long ago by a medical superintendent who was looking for a new doctor for his staff: "I don't expect him to be interested in psychiatry, of course, but he must be good at cricket."

On the other hand we can have nothing but praise for the fact that nearly half the New York patients now have occupational therapy. This sixfold increase in numbers in the last seven years is partly due to the fact that all staff get two weeks' training in the teaching of "O.T." and it was not left entirely to the occupational therapists, of whom there were as many as 64. Again, an allocation by the state of almost two million dollars for psychiatric research illustrates the difference between the British and American attitudes to scientific medicine. As for the patients themselves, their illnesses seem similar, though alcoholic psychoses, as expected, bulk much larger than in Britain. But New York, too, has a great influx of elderly patients with cerebral arteriosclerosis, and also notes a great diminution in the numbers of cerebral syphilitics (G.P.I.), a decline which was noticeable in 1940 and is nothing to do, therefore, with penicillin. The sort of people who come to a mental hospital will vary according to the public's attitude to mental illness and to the reputation of the hospital, as well as to the existence of alternative asylums like the workhouse. Conditions vary greatly from country to country, and comparisons can be very instructive. But it seems likely that in spite of financial stringency and a preference for practice rather than theory the British mental health services need not fear comparison with any others in the world.

ACUTE RESPIRATORY INFECTIONS

A SYMPOSIUM FOR GENERAL PRACTITIONERS

[FROM A SPECIAL CORRESPONDENT]

A highly topical discussion was held at the Institute of Diseases of the Chest on December 4, when an audience of general practitioners gathered to hear a symposium on acute respiratory infections. The speakers were two chest physicians, a bacteriologist, and a general practitioner.

Respiratory Tract Viruses

Dr. NEVILLE OSWALD opened with a review of our knowledge of the viruses that affect the respiratory tract. Although virology was still a very young science, it was of particular importance to the general practitioner, he said, since it had been estimated that 25% of all his work was concerned with these respiratory infections.

Studies on viruses had proceeded in four ways. Transmission to animals was one of the first techniques used. In the early 1930's the common cold was successfully transmitted to chimpanzees, and influenza to swine and ferrets. Antibody tests, using agglutination and complement-fixation procedures, had first been developed against influenza A; but now such tests were available against influenza B and C, Q fever, ornithosis, the adenoviruses, and certain non-specific disorders in which there was a marked rise of cold agglutinins in the blood and in those where a high titre developed against the streptococcus MG. Their exact value was uncertain. Probably a positive result was significant, but a negative result was much less practical help.

Techniques of microscopy were being rapidly developed, and with the electron microscope some of the intracellular activities of the viruses could now be observed. But probably the greatest advance in virology in recent years was the growth of viruses by tissue culture. From the original fertile hens' eggs viruses could now be grown on a variety of media, such as monkeys' kidneys and He La cells (live cells of a carcinoma of the cervix that were originally taken from an American negress named Helen Lane). Respiratory viruses such as the adenoviruses, Cocksackie viruses, Echo viruses, and poliomyelitis viruses could all be grown in this way. The present situation was in a state of flux; new viruses were being isolated, but their identification and significance were taking time to work out. An important practical matter was the possibility of developing vaccines against these viruses, but here again there must, of necessity, be some delay.

Patterns of Lung Involvement

Dr. J. G. SCADDING, dean of the Institute, described the various patterns of lung involvement.

Pneumonias in the course of acute respiratory infections could be caused in a number of different ways. Certain organisms had a special predilection for the lungs—the pneumotropic organisms—and these could be bacterial or viral. Thus acute specific pneumonias could be caused by pneumococci, haemolytic streptococci, *Staphylococcus aureus*, and Friedländer's bacillus; in addition, viruses of the ornithosis group could also cause such infections.

Viruses might also pave the way for secondary bacterial invasion, and in as many as 50% of pneumococcal pneumonias there was a definite preceding history of an acute upper-respiratory infection. Influenza was another example of the association of virus and bacteria. There were two danger periods in influenza so far as lung involvement was concerned—one in the early stages when secondary staphylococcal infection was possible, resulting in a very severe illness; the other danger period was at the fourth or fifth day, when a somewhat less severe pneumonia might follow secondary infection by a variety of bacteria. Measles was another example where a virus infection was associated with secondary bacterial involvement of the lungs. Here the haemolytic streptococcus was the usual invader.

Pure virus pneumonias were rare but possible, as in psittacosis. The position of the unidentified pneumotropic viruses was at present a little confusing.

In addition to these specific pneumonias there was a very large group of lung infections which resulted from a breakdown in the natural defences of the respiratory tract. These infections followed aspiration of infected material into the broncho-pulmonary segments, which might set up diffuse, local, or suppurative reactions. It was this type of infection that probably accounted for many of the acute exacerbations in chronic bronchitis and in children.

The patterns of lung involvement caused in these various ways were confusing in their variety, and this confusion was not diminished by the fact that even with every assistance from the laboratory it was only possible to obtain objective evidence of a specific cause or causes in less than half the cases. Nevertheless, in spite of this confusion, clinical considerations often allowed a reasonable assessment of the general group to which the case belonged, and satisfactory treatment could be based on this assessment.

Limits of Laboratory Aid

Dr. J. R. MAY, as a bacteriologist, gave his views on the help that the laboratory can give in the investigation and management of these infections. Although theoretically the scope for these investigations was extensive, there were certain practical drawbacks, he said, particularly in the delay before some of the results became available and also in the collection of specimens such as blood and sputum.

Bacteriologically, sputum culture and throat swabs were the most useful methods of investigation. A pure or almost pure culture of a pathogenic bacterium from the sputum was highly significant. The most common pathogenic bacteria associated with acute respiratory infections were in pneumonias—pneumococci, *Staphylococcus aureus*, Group A haemolytic streptococci, *Haemophilus influenzae*, and Friedländer's bacillus; in acute and chronic bronchitis the most common organisms were *Haemophilus influenzae* and pneumococci.

Viral studies could still be carried out in only a few centres, and their practical value was considerably limited by the time needed for a positive result. The isolation of viruses could be carried out from throat washings, sputum, or blood in the first two or three days of the infection, the material being sent to the special centre in a sterile container. Of more practical use were serological procedures which estimated the levels of antibodies as a result of the infection, but even the value of these was limited by the fact that it was 10–14 days from the start of the illness before results became available. Two specimens of serum were required, one at the onset of the illness and the other after 10–14 days, a positive diagnosis being made on the demonstration of a fourfold rise in antibody titre. These tests might be used when influenza, Q fever, psittacosis, or other virus infections were suspected.

Problems in Practice

Dr. JOHN FRY spoke as a general practitioner on the practical problems raised by acute respiratory infections. The general practitioner, he said, was really a specialist in the various common respiratory infections, for they were by far and away the most common group of illnesses in our community, accounting for one-third to one-quarter of all his work. In an average-sized practice (2,500) the family doctor must see between 50 and 60 new cases of acute pneumonia and acute bronchitis every year. But in spite of this prevalence many problems still remained. Nomenclature, for one, was still most confusing and vague, probably because it was not based on any sound knowledge of exact aetiology and pathology. Terms such as "bronchitis" and "pneumonia" meant different conditions to different doctors.

Diagnosis in general practice was bound to be based essentially on clinical methods. But, if high standards were to be maintained and advances made, the practitioner must

have unrestricted access to pathological and radiological facilities. Only in this way could he correlate his clinical findings with the more accurate radiological appearances.

In arriving at a diagnosis it was necessary to consider the past history of the patient, particularly the history of chest illness; the general condition and degree of illness; and the local physical signs. Physical signs fell into a number of set patterns, the significance of which was uncertain. There might be a diffuse and bilateral involvement of the broncho-pulmonary tree, with scattered rales and rhonchi (the acute wheezy chest), or the signs might be unilateral and local, in which case a localized area of moist sounds at one or other base was the most usual finding. The classical lobar pneumonia with clinical consolidation—i.e., dullness and bronchial breathing—was an extreme rarity in practice to-day. The most useful investigations were a radiograph of the chest, which could be carried out at home as a domiciliary visit by a consultant, and bacteriological examination of the sputum. Virus investigations were of academic interest, but as yet had little practical value.

With regard to treatment certain principles should be remembered. The vast majority of these cases could be treated adequately at home (over 90%). The patient must always be considered as a whole. No set and rigid routines should be adhered to; instead an elastic outlook should be maintained. "Courses" of antibiotics were unnecessary, for instance; strict bed rest for more than a few days might be harmful in the elderly; and the value of cough medicines was, to say the least, uncertain.

Since the exact aetiology was uncertain, treatment had to be empirical, and thus the rational use of antibiotics was of prime importance. Not all acute respiratory infections required these potent drugs; the proportions requiring them varied with the different clinical groups. Penicillin was still the most useful antibiotic, and should be administered by intramuscular injection when indicated. Long courses were usually unnecessary, satisfactory results being obtained with 3 or 4 daily injections of the longer-acting preparations. Streptomycin and the tetracyclines were often more useful in the management of acute exacerbations in chronic bronchitis.

Discussion

In the subsequent discussion speakers voiced their feeling that oral penicillin was too uncertain in the treatment of the more severe infections, and were doubtful if it was really indicated in the less serious infections. Sulphonamides were noted as still valuable in the treatment of pneumococcal pneumonias—the most common type of bacterial pneumonia. It was agreed that long-term treatment of chronic bronchitis with tetracyclines helped about 20% of chronic bronchitis—namely, those with persistent purulent sputum; but there was a real danger of promoting the development of resistant strains of *Staphylococcus aureus*, and these might be spread into the community at large.

FACIAL INJURIES

Speaking at a clinical meeting at the Institute of Laryngology and Otology on December 7, Mr. CHARLES L. HEANLEY, plastic surgeon to the London Hospital, discussed some of the principles underlying the repair of facial injuries such as lacerations and broken noses. After disclaiming any ability on the part of plastic surgeons to make invisible scars—"No incision can be made without leaving a scar"—he went on to outline some of the ways of reducing them to a minimum.

Cuts on the Face

By attending to certain principles, scars could be made less noticeable, said Mr. Heanley. Incisions should not be made at points such as the prominence of the cheek, where it was known the scar would be bad. The direction of the incision was important. If a perfect circle was drawn

on the skin and the enclosed piece of skin excised the shape of both the raw area and the piece of skin removed would become oval. This was because tension in the skin varied with the direction. Incisions must be made in lines parallel to the direction of greatest tension, along the so-called Lange's lines. These lay chiefly in the flexion and skin creases. On the forehead they were horizontal, except low down in the midline; where they were vertical. On the nose and eyelids they were transverse; but an incision on the nose must never be extended on to the face, or it would web. Around the mouth they were circumoral and in the lines of the nasolabial folds.

Absence of tension was an essential to minimum scarring. If necessary the skin must be undercut widely, at even depth. Sutures should be inserted, the point of the needle travelling away from the cut edge as it entered the undercut, so that when tied they everted the skin. They should be tied loosely, as the tissues would swell. Their object was simply to hold the tissues together in apposition while they healed. Tight stitches would impair the blood supply, at the best leaving stitch marks and at the worst a line of sloughs. Multiple fine stitches meant that each had less pull on it and so caused less necrosis. Finally, stitches should be removed early. The essentials for success were freedom from infection, an ample blood supply, and close coaptation of epithelium. Unfortunately, in excising scars on the face (or pigmented tumours, for that matter) the direction of the excision was predetermined, and this prejudiced the result from the start.

The typical case that came to the surgeon—the person who had fallen off a bicycle on to a tarry road—had a lacerated face and a broken nose. If the cuts were contaminated with tar or bitumen it was disastrous to let them heal without proper cleaning. The girl with a centimetre-square cut on her upper lip which had been allowed to heal with tar in it was badly marked for life. An initial toilet would reduce the deformity more than any subsequent surgery. Wounds impregnated with tar should first be washed with soap and water to remove the gross dirt and grit, and then anaesthetized by rubbing in a topical application of lignocaine and cleaned with a tar solvent, such as oil of eucalyptus, turpentine, or even petrol. If no surface anaesthetic was to hand, a general anaesthetic was justified.

Broken Noses

If the case was seen early while swelling was still minimal ice packs should at once be applied to the damaged nose. As soon as possible afterwards, with a general anaesthetic and an intratracheal tube and pack, the septum and nasal bones should be deliberately restored to position. With comminuted fractures it might be necessary to pack the nose with a B.I.P.P.-impregnated gauze pack, which could be left in place for a week or more. In spite of what was usually taught, this was quite safe provided the risks were remembered. The ideal, then, was to click back into place displaced cartilage and bone before swelling prevented it, and apply a plaster support.

Where the case was seen early but after the initial swelling had occurred the first step was to do all that was possible to reduce the swelling by applying first cold and then heat. Oral cortisone for four days, 25 mg. twice a day, also helped. As soon as the swelling was down reduction of the fracture should be undertaken deliberately, under full anaesthesia as in the early case. The quick snatch without adequate anaesthesia was to be condemned. If lacerations were also present the time to treat them was the day they were inflicted.

In cases seen late, with a malunited fracture, the treatment of nasal obstruction was a necessity and of the deformity desirable. But which was better—to do a sub-mucous resection first, or to correct the airway and the shape of the nose in a single operation? Each case must be treated on its own merits. If the septum was not distorted and had simply been displaced with the nasal bones, it could be straightened at a single operation.

The septum should be detached (cartilage and vomer) from the maxilla below and from the nasal bones above, and, after fracturing posteriorly, placed in position. At the same time the external deformity could be corrected. This was done by mobilizing the frontal nasal processes and the attached nasal bones with saw cuts, as described by Joseph, and, if necessary, removing some bone on the side from which the nose had deviated. In cases where the septum was distorted, being curled on itself, often with spurs, two stages were necessary. A submucous resection, which usually restored the airway, should be done as the first stage, the shape being attended to later. In some cases where the nasal bones had been displaced into the airway, nasal refracture would be required at a later stage to restore the airway.

For saddle noses Mr. Heanley had been using for the last six years a polythene inlay, cut and shaped from a solid block, which was inserted through a vertical columella incision. Children with saddle-nose defects due to trauma or sepsis must be treated in infancy. Unless there was stuffing in the nose to fill it out, it would not grow. In the traumatic type, with nasal obstruction due to septal impaction, the septum must be thinned first. The unfortunate child with a saddle nose who was told to come back for treatment when it was 18 years old presented an impossible problem, as there was too small an area of skin over the nose. Progressively larger inlays were required as the child grew.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Cardiac Arrest

SIR,—In your annotation (*Journal*, November 17, p. 1165) you outlined the various methods of resuscitation that are available in the event of sudden "cardiac arrest." There is one particular aspect of this problem that I should like to emphasize—namely, the difficulty in differentiating a heart that is beating with an unrecordable blood pressure from one which is either fibrillating or at a standstill. In all probability most cases pass through a phase of tachycardia, low cardiac output, gross hypotension, and coronary insufficiency before finally the ventricular muscle fibrillates from anoxaemia. The number of cases of sudden onset of cardiac standstill due to vagal over-activity is probably extremely small.

Anaesthetic and surgical procedures still remain one of the commonest causes of "cardiac arrest" in a relatively healthy heart, and, equally important—if energetic steps are taken—they carry the best ultimate prognosis. In a recent report¹ based on anaesthetic mortality the Association of Anaesthetists found that nearly one-fifth of all such deaths could be attributed to the injection of thiopentone sodium. In such a case, soon after the injection the patient is found to be apnoeic, pulseless, without audible heart-sounds, and with an ashen-grey appearance of the skin. The accepted treatment for such a case would be inflation of the lungs with oxygen and cardiac massage. I would like to suggest one modification.

About five years ago noradrenaline was first used in this country as a vasopressor agent and found to be immensely powerful, without the same risks as adrenaline. Its great disadvantage in an emergency was that it had to be given by intravenous infusion, and this was far too time-consuming. However, with the co-operation of the makers, it was possible to provide a small ampoule containing 200 µg. in 2 ml. which was suitable for direct intravenous or intracardiac injection in an emergency. During the past five years these ampoules have been available in the theatres at St. Thomas's Hospital in case of a sudden "cardiac

arrest." There have been three cases in which, following the induction of anaesthesia, there was no clinical evidence of heartbeat, either by palpation or auscultation. Immediate steps were taken to begin cardiac massage, and at the same time 200 µg. of special noradrenaline solution was drawn up into a 2 ml. syringe; $\frac{1}{4}$ – $\frac{1}{2}$ ml. (50–75 µg.) was then injected into a brachial or jugular vein and the contents massaged towards the heart. In each instance a firm pulse-beat was palpable within sixty seconds of the injection, though in one case the surgeon had made the initial incision for cardiac massage, which fortunately proved unnecessary.

The decision to request cardiac massage is always a difficult one, and some anaesthetists may be tempted to delay a little in the hope that the clinical condition will improve. The injection of such a dose of noradrenaline gives an immediate indication of whether the heart is beating or in a state of fibrillation or standstill. I believe the risk of converting a normally beating heart into a fibrillating one is small and insignificant, in comparison with the danger of delayed treatment for the patient. The increased peripheral resistance and consequent rise in the coronary blood-flow, together with the bradycardia, produced by the noradrenaline probably more than compensates for its direct stimulating action on the anoxic myocardium.

The injection of nikethamide or desoxyephedrine in such cases is usually found to be without effect. The former drug has enjoyed many years of grace as the time-honoured remedy in cases of acute surgical emergencies. It is to be found in nearly every emergency tray in operating theatres throughout the country, yet the use of an analeptic to reverse a state of circulatory arrest might be described as a "long shot." Very often it is given with one eye focused on the impending report to the coroner: there are many coroners who still appear to believe this is an essential part of the pre-mortem therapy. Desoxyephedrine has the disadvantage that it sometimes fails to produce a satisfactory pressor response and may on occasion cause a severe increase in heart rate, which suggests that the direct action on the myocardium is greater than that on the peripheral vessels. In conclusion, I would like to recommend that the intravenous injection of $\frac{1}{4}$ – $\frac{1}{2}$ ml. (50–75 µg.) special noradrenaline solution should be included as one of the essential measures in all cases of "cardiac arrest."—I am, etc.,

Pavlov's Works

SIR,—I was most interested in Dr. Macdonald Critchley's review of Pavlov's works (*Journal*, December 8, p. 1352), and in his account of the development by Russians of a philosophy in relation to Pavlovian teaching. It seems important not to be prejudiced against Pavlov's contributions because we may object to their political exploitation. Thus it may be suggested that, if we have to choose between brain physiology and psychology as a basis for national education, the former is likely to be much the more valuable. Thus the psychologist tends to advocate a somewhat negative attitude on the basis that, if "trauma" is avoided, Nature will do the rest and all will be well. The brain physiologist, on the other hand, says that here is a wonderful machine, the brain, and if you want to make of it something worth while you must adopt a strongly positive attitude towards the development of desirable behaviour patterns. It is easy to see how a philosophy may be built round an energetic approach of this kind, whereas in this regard psychology has little to offer. Indeed, the effect of psychology on education may at times be harmful, as it belittles the value of traditional disciplines which play an important part in character formation.

Pavlov's writings are now almost as much out-of-date as Freud's, but his positive approach to the subject of living seems to be vastly preferable to anything psychology can

offer, if we have to choose between the two. On the other hand, the ideas of brain physiology are greatly assisted by the psychologist's studies concerning the early development in infants of behaviour patterns which may persist throughout life.—I am, etc.,

W. RITCHIE RUSSELL.

Shadow in the Lung

SIR,—Reading the letter of Mr. E. K. Gardner on shadow in the lung (*Journal*, October 27, p. 998), I am reminded of the clinical trap in which we have been victims. In our unit, on the day following admission, patients are screened in the morning before the ward round starts. On three occasions I have seen a shadow in the lateral part of either lung field (which occupied the region to a variable extent) having a clear medial border parallel to the chest wall; the shadow having generalized haziness gave an impression of ? pleural thickening ? pleural effusion. The clinical history, in such patients was fever of sudden onset, occasional cough, pain in chest, and inability to breathe deeply, resembling very much that of acute pleurisy. Because the patients could not breathe deeply due to pain, the air entry on the same side was diminished. On careful inspection of the chest wall, it was found that there was a smooth, warm, tender swelling on the chest wall extending from axillary region to the lower part of the chest, and from the scapular region behind to the mammary region in front. The margins were diffuse and the bulge not very apparent, especially if the patient was well nourished. (In our first patient we had even done pleural tapping, as on the first day the bulge was not very evident and apparent. Needless to say, no fluid was obtained from the pleura, and fortunately the patient did not develop any empyema.) It was the abscess of the chest wall which, on fluoroscopy done before thorough clinical examination, gave the picture of pleurisy.

It will be interesting to note if other clinicians have had similar experience in the past.—I am, etc.,

Bombay.

Acute Respiratory Obstruction

SIR,—About 30 years ago there was a brief enthusiasm for subcutaneous oxygen, and in both medical treatment and resuscitation successful cases were reported. If it is still effective, might not this method be of some help in such cases as that reported by Dr. A. E. W. Gregson and Mr. A. J. Gunning (*Journal*, November 17, p. 1150)?—I am, etc.,

London, N.W.8.

R. J. CLAUSEN.

Glycyrrhetic Acid

SIR,—My letter (*Journal*, November 10, p. 1113) was intended to encourage the publication of controlled trials, large or small, with glycyrrhetic acid. Then, by pooling of results, a firmer opinion could be obtained of the value of this drug.

The present position can be summarized as follows: Glycyrrhetic acid was found to be no better than the base alone by Warin and Evans¹ (19 patients); Bettley² (22 patients); Donaldson and Duthie³ (30 patients); and McCallum⁴ (9 patients). Quentin Evans⁵ got slightly better results with glycyrrhetic acid than with hydrocortisone (13 patients). I found glycyrrhetic acid ineffective when compared with hydrocortisone (15 patients). Warin and Evans also found it less effective (8 patients). Dr. George Wells obtained the same answer in a different way. At the Anglo-French reunion, held after the annual meeting of the British Association of Dermatology last July, he described experiments (to be published shortly) in which he traumatized the skin by applying Scotch tape and stripping it off. The application of hydrocortisone ointment had the effect of markedly suppressing the resultant inflammatory reaction. The application of glycyrrhetic acid had no such action. Drs. Quentin Evans and Colin-Jones⁶ criticize my conclusions because they are based on observations of only

15 patients; but it is not always necessary to observe a large number of patients before deciding on the worth of a remedy. A short controlled pilot trial may indicate a clear yes or no. The same question was asked 15 times. Is glycyrrhetic acid comparable to hydrocortisone in efficiency in lessening this patient's inflammatory skin condition? The answer was 13 to 3 in favour of hydrocortisone for patients improved; and the 3 patients who improved with glycyrrhetic acid had to be balanced against 4 who worsened, giving a net deficit. I interpreted this as a firm no to the pilot trial, not warranting a more extensive trial. A less conclusive result would, of course, have necessitated the observation of more patients in proportion to the conclusiveness of the results.

Drs. Quentin Evans and Colin-Jones also observe that better results were obtained with hydrocortisone in this trial than in the previous more extensive trial of hydrocortisone in which I participated.⁷ That trial was designed to find if hydrocortisone was effective, and, if so, in what conditions. It was pointed out at that time that the trial was of limited value in Besnier's prurigo (22 cases), because the hydrocortisone had to be used sparingly and was only applied to the worst areas. The same remarks apply to infantile eczema (12 cases), concerning which Dr. Colin-Jones queries our results. In the present trial the patients had lesions of limited extent which might usually be expected to respond to hydrocortisone (and to glycyrrhetic acid if equally effective). Dr. Colin-Jones may be correct in his belief that glycyrrhetic acid is "of great value for the subacute and chronic conditions, whereas hydrocortisone excels in the acute case where glycyrrhetic acid is not so effective," but he has not yet demonstrated this in a controlled trial.

The first use of glycyrrhetic acid as a topical anti-inflammatory agent was based on the report of Molhuysen *et al.*⁸ that liquorice had a deoxycortone-like action, but I do not know of any reports suggesting that deoxycortone has an anti-inflammatory action when applied to the skin. It certainly does not follow because liquorice has a deoxycortone-like action that it also has a cortisone-like action or a hydrocortisone-like one. The structural formulae of glycyrrhetic acid and hydrocortisone show considerable differences.—I am, etc.,

BRIAN RUSSELL.

SIR,—In response to Dr. Brian Russell's request (*Journal*, November 10, p. 1113) for publication of the experiences of other clinicians using glycyrrhetic acid as a topical agent in the treatment of irritating inflammatory conditions, I am sending the results of a number of cases included in a controlled trial. Each patient served as his own control, and 2% glycyrrhetic acid ("genodex"), the base alone, and 1% hydrocortisone ointment in the same base were used in differing sequences. All the patients were suffering from one or other of the conditions for which Dr. Russell and his colleagues¹ found hydrocortisone to be beneficial, and none had been previously treated with hydrocortisone or glycyrrhetic acid ointments. Results were assessed both subjectively, by means of "record of itching" cards similar to those used by Dr. Russell, and objectively. The results obtained were:

	Greatly Improved	Some Improvement	No Change	Worse
Hydrocortisone	12	6	10	2
Glycyrrhetic acid	1	5	21	4
Base	2	5	19	

Whether this state is curarization in the accepted sense is questionable, in view of the circulatory deterioration and of the unconsciousness that may be found to persist despite elimination of all narcotic agents and correct pulmonary ventilation with oxygen. Again, it may be found that the inadequate improvement produced by initial doses of neo-

stigmine is transient, and subsequent doses may reverse this improvement—a neostigmine-potentiated depression. Experimental work on the blood-brain barrier permeability carried out in the department of anaesthesia, Liverpool University,¹ indicated that minor degrees of potassium depletion might render this barrier incompetent, according to the methods used by Hurst and Davies² in rats. This may indicate a mechanism whereby relaxants can produce persistent apnoeic states by an abnormal central action.

As noted by several of your correspondents on this subject, the use of suxamethonium preceding an anti-depolarizing relaxant was a common feature of all Dr. Hunter's cases. This would seem only another way of emphasizing the important role played by potassium depletion in abnormal responses to curare: the depolarizing relaxants are known to produce a substantial loss of muscle potassium.^{3,4} To cause such a muscle loss in an already depleted patient may well carry him past a dangerous borderline. Thus it would appear potentially hazardous to give curare or gallamine after suxamethonium. The reverse sequence, however, may not be so dangerous, as even subparalytic doses of curare have been found, in dogs, to limit the muscle potassium loss produced by a subsequent dose of suxamethonium.⁵

Although curare may depress blood cholinesterase activity,^{6,7} it is difficult to see that this could be sufficient to reactivate and prolong the action of a small dose of suxamethonium already largely degraded: in all Dr. Hunter's cases breathing had returned after the suxamethonium before the anti-depolarizing relaxant was used. Patients with pre-existing low serum pseudo-cholinesterase levels might be anticipated to show a curare resistance rather than a prolonged paralysis.⁸ Thus does it appear that potassium depletion is the factor to be incriminated in perhaps all these cases. In the diagnosis of such a state the history may be of more value than the blood potassium level. Potassium losses may be so great that treatment will require doses of potassium ordinarily regarded as heroic.

In a case recently seen a man of 51 years had prolonged apnoea after the use of 35 mg. D-tubocurarine and 40 mg. of gallamine with nitrous oxide. A test dose while he was conscious before induction had revealed no relaxant hypersensitivity. He had gangrene of the appendix and caecum of long standing with ileus. Neostigmine had an initial reversal effect, but subsequent doses definitely were depressing, both of his respiration and of his degree of unconsciousness (10 mg. of neostigmine over 1½ hours). The apnoea and the unconsciousness responded dramatically to the rapid intravenous infusion of 250 ml. of normal saline, to which had been added 20 ml. of 20% potassium chloride and 30 ml. of 10% calcium gluconate. Half this volume was given in 15 minutes, with full return of muscle power, breathing, and awakening. The absence of dangerous cardiac depression by potassium in this case may have depended upon the inclusion of a calcium salt, since calcium is known to protect against many of the toxic effects of potassium.^{9,10}—I am, etc.,

Bellville, S. Africa.

Hydrocortisone for Buccal Ulcers

SIR.—The excellent article on ulcerative colitis treated with local hydrocortisone by Dr. S. C. Truelove (*Journal*, December 1, p. 1267) prompts me to record experiences in the past year with similar treatment for the so-called recurrent aphthous ulcers of the buccal-lingual mucosa.

The analogy and obscure aetiology in both conditions cannot be disregarded, as both offer a hypothesis of a psychosomatic disorder, often associated with a history of stress and strain, with possible coexistent corticosteroid

imbalance related to higher centre influences. As in ulcerative colitis, oral cortisone does not benefit these cases of buccal ulcers. However, 2½% hydrocortisone incorporated in an ointment with a broad spectrum antibiotic is effective when applied to the ulcers by direct innunction. Local application of antibiotic alone proved to be ineffectual, but its inclusion was thought necessary as hydrocortisone is a spreading factor and could not be introduced lightly into a cavity with a mixed bacterial flora. The following is an example of one case in a limited series.

A woman, aged 40, gave a history of an anxiety state dating from childhood and recurrent buccal ulcers for the past five years, becoming more frequent and severe in the last year. There was no history of vulval lesions. Her previous treatments were varied, but none limited the recurrence and severity of the condition. Direct innunction with ointment on the ulcerated mucosa was continued six times daily for seven days. After each application the patient was told to hold the saliva in the mouth for as long as possible before swallowing to maintain a reasonable concentration of the hydrocortisone on the ulcerated mucosa for short periods. On the third day the pain and discomfort had subsided, and at the end of seven days the ulcers were in the process of healing. Within the ten days they were hardly visible. One month after initial treatment there was a mild relapse, but this time the ulceration consisted of pin-point lesions and were less painful. A further fourteen days of similar treatment was instituted, and to date there has been no further relapse.

It is not claimed that local hydrocortisone innunction is a cure for these troublesome buccal ulcers, but an important advance in the therapy of immediate alleviation of this painful condition.—I am, etc.,

Liverpool, 16.

S. HILLMAN.

Pyrimethamine Poisoning

SIR.—I have to report the death of a child of 1 year from acute pyrimethamine ("daraprim") poisoning. The child is believed to have swallowed between 25–30 of the tablets from a bottle, and was admitted to hospital about an hour later in a state of generalized convulsions resembling status epilepticus—the fits occurring about every two minutes. Treatment, including, of course, stomach wash-out, was of no avail, and the child died apparently from respiratory failure about seven hours after taking the tablets.

The makers of daraprim tell me that for home use they now supply packets with each tablet separately sealed. It does seem to be vitally important to use this means of packing, in any house where there are young children, for this tasteless but potentially dangerous drug.—I am, etc.,

Kampala, Uganda.

IVOR CHANCE.

Malaria in African Infants

SIR.—The authors of a recent paper on effects of heavy and repeated malarial infections on Gambian infants and children (Drs. I. A. Macgregor, H. M. Gillies, J. H. Walters, A. H. Davies, and F. A. Pearson, *Journal*, September 22, p. 686) deserve sincere congratulations for their comprehensive study of the host-parasite relationship in a holoendemic area of West Africa. Though many of their findings are new, some results reported in the paper are confirmatory of earlier work carried out independently in East Africa and West Africa.

It is perhaps unfortunate that little of the previous work on the African continent was either discussed or quoted by the authors of this paper. It should be pointed out, in justice, that in Kenya Garnham¹ recorded that African infants in holoendemic areas react comparatively mildly to malaria, and, though a number of these children die, the majority recover rapidly and develop a considerable degree of tolerance. General features of malaria immunity in African children, based largely on observations made in Tanganyika, were described by Wilson, Garnham, and Swellengrebel,² who concluded that by the age of 2–3 years the majority of the children jump the parasitic hurdle and establish some *modus vivendi* with *P. falciparum*. In Uganda, Welbourn³ produced a series of weight curves of

infants in relation to malaria infection which are very similar to those recorded by the authors of the report from the Gambia.

In Nigeria, Bruce-Chwatt⁴ investigated for 1½ years a sample of African infants and produced a series of individual weight curves in relation to the first infection with malaria. These curves indicated that, while 65% of the infants showed a more or less marked effect of the infection on their growth and development, in nearly 20% the first encounter with the malaria parasite showed little visible impairment of general health and provided indirect evidence of inherited, transient immunity to malaria.

The results of all these studies have preceded some of the Gambian authors' recent conclusions and at least that about malaria in children from holoendemic areas exerting its main effect in the first two years of life.—I am, etc.,

L. J. BRUCE-CHWATT.

Yaba-Lagos, Nigeria.

Diesel Fumes

SIR.—Further to the correspondence by Mr. B. T. Commins, Mr. R. E. Waller, and Dr. P. J. Lawther (*Journal*, November 24, p. 1235), I should like to give the reasons why the investigations reported in "Smoke in a London Diesel Bus Garage" (*Journal*, September 29, p. 753) seem to me to be invalid. I intended to imply (*Journal*, November 3, p. 1058) that the conduct of these experiments, though excellent, gave no useful information on the general atmospheric pollution by these fumes for the following reasons: (1) Perfectly adjusted diesel engines (and 10% derated at that) do not emit any benzpyrene. (2) They do not emit any appreciable amount of soot. (3) Under garage movements they would emit CO, CO₂, some nitrous fumes, aldehydes, and probably a little unburnt fuel.

I do not therefore consider it likely that men working in such places are exposed to any undue risk. They are certainly not exposed to high concentrations of the more dangerous exhaust products. Production of these in higher concentrations is dependent upon the degree of maladjustment, power produced, and phase of function. I submit that intake on the road, close behind maladjusted vehicles so operating, may produce very much higher concentrations of soot, aldehydes, nitrous fumes, benzpyrene, and unburnt oil within following vehicles. That this is not an occasional occurrence any main-road motorist well knows.

Mr. Commins is to be congratulated on the most interesting results of his City tests, and these are revealing. One would like to know at what level they were sampled. The CO concentration is a highly variable factor, and one would like to know more about soot content, unburnt fuel, and aldehydes present. I feel confident that the ultimate verdict of research into this subject will substantiate the fact that oil soot plus its concomitant contaminants is an extremely dangerous pathogenic complex.—I am, etc.,

HANDLEY HOWELL.

Pregnancy Sickness

SIR.—Having recently had a first baby and suffered greatly from pregnancy sickness, I wonder if my observations might be of use in suggesting a new field of inquiry to the obstetricians? Till this experience, I regarded these cases, as most doctors seem to, as almost entirely a psychological problem, but my own case has convinced me that it is a question of hormonal imbalance. I had exactly the same sensations of nausea suddenly one morning in the puerperium as I had had early in the pregnancy, when the vomiting was at its worst. To my surprise, I actually did vomit that morning when I got up to wash. On trying to work out the cause, I found the only thing to blame was that I had been given a large dose of oestrogen (stilboestrol, I believe) late

the previous evening and had no food until 14 hours later. No other drugs were being taken. Obviously there is a relationship between the length of time without food and the sudden change of posture such as getting up involves, and this I well knew from attempts to eliminate all possible causes in the pregnancy, but I feel that my experience was conclusive proof that the trigger factor, in some cases at least, is hormonal, not mental.—I am, etc.,

London, N.11.

DOREEN S. BALL.

Apartheid in Blood Transfusion

SIR.—With reference to the correspondence which has recently been appearing in the *Journal* about apartheid in blood transfusion, it may interest your readers to be informed that only a few years ago, after having spent much time in persuading a Kikuyu woman to have a blood transfusion prior to undergoing operation of hysterectomy, I arranged for a trained Jaluo hospital assistant to give a pint of his blood. When he arrived for bleeding he saw the patient and exclaimed, "What, give good Jaluo blood to a Kikuyu woman; not me," and he turned round and walked away and we could not persuade him to change his ideas.

I have found that Hindus will not give blood for Mohammedans nor receive blood from them, and vice versa. I know of Europeans who are horrified at even the idea of being given African blood. During the recent second world war I heard of two Nazi soldiers who refused blood transfusions because they might be given Jewish blood.—I am, etc.,

Nairobi, Kenya.

P. G. PRESTON.

Sampling from the Electoral Roll

SIR.—I am pleased to see that the bias in Mr. P. D. Oldham's sampling method (*Journal*, November 24, p. 1241) has not affected the conclusions reached in his inquiry (*Journal*, October 20, p. 904). However, there are two points in his letter which I must correct, since they might encourage others to use this biased method in more dangerous circumstances. Mr. Oldham suggests that, if the correct method of sampling had been used, twice as many houses would have to be visited to obtain a sample of the same size. This is quite incorrect. The number of houses to be visited will be about the same: it might even be less. And to draw the sample of addresses correctly is so easy. If, instead of visiting the houses of all persons selected at random from the Electoral Roll, he had visited only those where the person selected was the first person listed at that address, he would have got an unbiased sample of houses. (In this way each house has an equal chance of being selected instead of a variable chance.) Thus there is no justification whatever for using the biased method.

My second point concerns "diversification." A sample obtained by taking all persons of a given age group from a correctly chosen sample of houses may be less diversified than a corresponding sample of these individuals taken purely at random, but it is not biased. All that it means is that the tests of significance require modification and that a rather larger sample may be required to do the work of a corresponding simple random sample. The bias in Mr. Oldham's sample has nothing to do with diversification, which is a quite separate and, in his case, a negligible problem. The bias arose because the houses were incorrectly selected.—I am, etc.,

London, W.C.1.

P. G. GRAY.

Enzyme Test for Glycosuria

SIR.—As a diabetic the thing that impresses me most is the speed and simplicity of the test, particularly for the male patient. Although the "clinitest" technique is an improvement on methods requiring some external form of heat, it still necessitates collecting a specimen in a suitable container, measuring out the correct number of drops of urine and water, unscrewing and securely screwing up again the bottle of reagent tablets, and finally, after waiting for

the reaction to take place, rinsing out the test-tube and original container. With the enzyme test I merely touch the flowing stream of urine with the test paper—the reaction occurs at body temperature, surely the best temperature for an enzyme reaction to take place—and the result is generally known for all practical purposes before micturition has been completed. Furthermore, it can be carried out in a lavatory isolated from any wash-basin or similar water supply. It seems a pity that it is not yet available on an E.C.10 form.—I am, etc.,

T. H. GILLISON.

Ilkeston.

Alternative Approach to the Prostate

SIR,—It is amusing to see a coming generation making an immediate muddle of nomenclature over the work left to those of my age by our teachers. Professor Wells writes a book about the Hey operation and it is promptly called the Wells operation. Moreover, the operation which Mr. G. T. Watts describes (*Journal*, December 1, p. 1283) is so little different from Ogier Ward's capsular prostatectomy that it could reasonably bear the same name. A surgical wit once said that the only reason why such or such an operation was called the Smith procedure was because it had been introduced by Jones. But in these three recent prostatectomies the error can still be rectified—Millin, Ward, and Hey, I think.—I am, etc.,

Manchester, 3

OLIVER JELLY.

Itchy Measles

SIR,—With reference to Dr. Eric J. Trimmer's letter (*Journal*, December 1, p. 1299) regarding intense irritation in measles, I have always found that a fairly high proportion of the patients complain of this symptom. I wonder if he found it in children with hot, dry skins, and not nearly so often, if at all, in those with moist skins.—I am, etc.,

Wellingborough.

JOHN T. CORBETT.

Twopenny-halfpenny Advertising

SIR,—As an emigrant pathologist I have been reading with weekly sympathy the letters to your *Supplement* about conditions in the N.H.S. They arouse a sincere anxiety for those of my profession who chose to stay in the land of their birth because their attachments are so strong.

Nevertheless, the querulous complaints of certain of your correspondents about advertising matter gave rise to concern about an acquired atrophy of both their senses of humour and of proportion, a very serious disease of the times, which is considered to be incurable. I may say that in this country we receive most interesting coloured postcards and foreign stamps in a series from a single firm, and I enjoy them immensely. The letter from Dr. Owen McDonagh (*Journal*, November 17, p. 1176) restores the full standing of the British gift for laughing at themselves. I would be glad to exchange with Dr. McDonagh my scenic collection for his young ladies.—I am, etc.,

Miami, Florida, U.S.A.

MAX MILLARD.

Adrenochrome and Adrenolutine

SIR,—Dr. C. Allen in his letter (*Journal*, September 29, p. 767) refers to the hallucinogenic properties of adrenochrome and adrenolutine. Adrenochrome¹ and adrenolutine,² both oxidized derivatives of adrenaline, induce changes in volunteers which bear some resemblance to schizophrenia. Adrenoxine, a substance postulated to be present in deteriorating adrenaline solutions by Heirman,³ has not been isolated or characterized and no study of its psychological properties is possible. However, it has been postulated that it, too, will have psychotomimetic properties.^{4,5} Recently, Leach and Heath⁶ have found that adrenaline is converted in blood into a substance having a peak absorption in the DU spectrophotometer at 395, and that the degree of conversion is greater in schizophrenic blood than in non-schizophrenic blood. We have found⁷ that adrenolutine has

the same peak absorption at 395, and we suggest that there is a conversion of adrenaline to adrenolutine.

Dr. Allen's letter will again bring attention to the importance of physiological factors in psychoses. Certainly the adrenal gland is important, but, as it is not the only source of adrenaline and noradrenaline, even more important is the whole sympathetic nervous system.—I am, etc.,

Facial Palsy

SIR,—The article by Mr. Terence Cawthorne and Dr. D. R. Haynes (*Journal*, November 24, p. 1197) contains so much valuable information about facial palsy and its prognosis that I hesitate to be critical. Nevertheless, their advocacy of surgical treatment for certain cases of Bell's palsy would be strengthened if they could produce a strictly controlled series. They recommend that surgical exposure of the facial nerve in the Fallopian canal should be considered whenever there is total paralysis with loss of electrical conductivity after one month. Since natural recovery from Bell's palsy sometimes begins to be evident only after several weeks, and since electrical activity in the degenerating nerve is often first lost only two or three weeks from the onset, the decision to operate after four weeks seems unduly precipitate.

According to their own figures, 83% of patients with loss of response to faradism show subsequent full or partial recovery of function, and 94% of patients in whom Bell's palsy is complete eventually make either a full or partial recovery. Unfortunately, the degree of recovery after operation is not given in comparable terms, but the results are classified as good in 86 cases, fair in 21 cases, and poor in 3 cases. We may thus assume that recovery was full or partial in 97% of the patients who were treated surgically after one month. Where prognosis is uniformly favourable this group may well include patients who would have recovered spontaneously. On the other hand, if exposure of the nerve leads to regeneration, it must be done early enough to be effective.

The case for surgical decompression of the facial nerve in Bell's palsy has yet to be proved, and, in order to be convincing, it must be supported by a parallel series of control cases. In this condition it is difficult to choose cases which are exactly comparable, and it is of course impossible for a patient to act as his own control. If, however, a group of patients showing complete facial palsy with electrical evidence of nerve degeneration after four weeks (or any other set time) were to be selected, and if alternate patients in this group were treated surgically and non-surgically, it would be interesting to know whether there was any significant difference in their degree of recovery one year later. Possibly Mr. Cawthorne and Dr. Haynes have already made a careful comparison of this sort.—I am, etc.,

London, W.1.

ERIC C. O. JEWESBURY.

SIR,—For the past 29 years patients with this condition have been referred in increasing numbers to our physiotherapy department at the East Suffolk and Ipswich Hospital, and rarely a week passes now without my being called on to see or review several of these cases. In the course of years, considerable experience has been acquired. I have read with interest the paper by Mr. Terence Cawthorne and Dr. D. R. Haynes (*Journal*, November 24, p. 1197), and I agree with many of their observations.

Regarding physiotherapy, these cases may well be grouped into: (1) Simple—that is, where the faradic response is normal at three weeks after the onset; (2) severe—that is, where there is a reaction of degeneration present. In simple cases

it is our practice to apply short-wave therapy daily, accompanied by massage and facial exercises, for a period of two to three weeks. A number of these patients are fully recovered and discharged within this period. On the other hand, it is recorded in the article I have referred to that 6% of cases in this group do not make a full recovery. A certain number of these patients complain of earache, and this generally subsides after a few applications of short-wave therapy. In the opinion not only of myself but of all the physiotherapists who form our team, I can say there is a general feeling that short-wave therapy has accelerated the recovery of these cases and I think has probably avoided the necessity of more severe manifestations in a certain number.

In severe cases, once a reaction of degeneration is established, short-wave therapy is continued on alternate days accompanied by labial galvanism. This may be continued for many weeks, and is usually only terminated when the mouth on the affected side has almost approached normal. I refer to this point below. It is very rare indeed for any cases, however severe, to conclude treatment without having a mouth that is symmetrical at rest.

Some degree of earache is frequently present. This usually responds well to short-wave therapy. Watering of the eye on the affected side is always present and may persist for several weeks. Suitable eye drops are given. In severe cases the position of the angle of the mouth must be carefully watched. In these cases there is always a tendency for this to contract in subsequent months or years, and in certain instances short courses of short-wave therapy combined with massage directed to stretching these muscles is of considerable benefit to these patients. When I review a severe case, before asking the patient to move his mouth I may have to refer to my notes before deciding which was the affected side.

I think it will be seen that the main difference in my views to those of your correspondents is the benefit derived from short-wave therapy. I agree that in many instances the trouble is caused by pressure arising within the Fallopian canal. Those of us who have practised and studied the effects of short-wave therapy in other regions know that, when properly applied, this measure diminishes congestion as well as effectively controlling pyogenic infection, and I am convinced that it is from these effects that the beneficial results are obtained.—I am, etc.,

Ipswich.

C. H. C. DALTON.

Pitfalls in Medicine

SIR,—May I correct the interpretation Dr. Paul Cave (*Journal*, December 1, p. 1299) has given to my remarks (*Journal*, October 27, p. 958) about the value of the barium enema? I neither stated nor implied that this examination was not of the greatest importance in suspected colonic disease—of course it is. I did, however, lay stress on the unwisdom of not carrying out a complete barium-meal examination in the belief that colonic disease is unlikely to be detected thereby. I can assure Dr. A. Robinson Thomas (p. 1298) that this fallacy is held more widely than he thinks.—I am, etc.,

London, W.1.

A. H. DOUTHWAITE.

Making Champions

SIR,—The annotation in your issue of November 24 (p. 1229) raises a topic of much current interest. Your readers may like to know that the Central Council of Physical Recreation, through its medical advisory panel, is working in close co-operation with the British Association of Medicine and Sport, with the aim, among other things, of stimulating interest in the subject of sport and medicine.

At a meeting held recently, attended by representatives of these two bodies and the physical education departments of Manchester and Leeds Universities, it was agreed that there is a lack of liaison between the medical profession, the physical education profession, and sports coaches, and

that, while physical education departments at universities would welcome research workers, few young medical men can be found who are prepared to work in this field. The meeting recommended that a step in the right direction would be the establishment of research scholarships at selected university departments of physical education. It was felt that research might profitably be directed towards: (1) vital statistics of young people—measurements, dimensions, capacity, strength, speed, endurance, etc.; (2) methods of physical education as applied to sports and athletic events; (3) fundamental physiological mechanism in relation to exercise; (4) sports injuries and their treatment.—I am, etc.,

London, W.C.1.

G. A. MCPARTLIN,
Senior Technical Adviser,
Central Council of Physical Recreation.

Toxic Effects of Meprobamate

SIR,—I wish to comment on your annotation entitled "Toxic Effects of Meprobamate" (*Journal*, November 24, p. 1227). You are incorrect in stating that meprobamate is advertised to the public in the United States. Federal law prohibits the sale of this drug without a prescription, and any displays that may have come to your attention were not advertisements but notifications of its availability for filling outstanding prescriptions written during a period of shortage.

I also wish to take exception to your statement that meprobamate has caused "widespread skin reactions." The drug has certainly caused skin rashes, but their incidence appears to be lower than that observed with other widely used drugs. The papers reporting these and noted by you have been written to make the point that a drug even as harmless as meprobamate may occasionally produce a skin rash. Some thirty-odd additional papers reporting on the effectiveness of the drug and its relative freedom from side-effects are not mentioned in your annotation.

Future research will no doubt clarify the differences between the action of sodium amylobarbitone and meprobamate. In the meanwhile, let us remember that barbiturates are the most commonly used suicidal agents both in Great Britain and the United States. Many of these suicides are unintentional, the subject taking additional drug in the confused state resulting from the previous doses. There is no evidence that meprobamate produces confusional states. In addition, all subjects who have tried to commit suicide with meprobamate have been unsuccessful. This would indicate that meprobamate is considerably less toxic than the barbiturates. A good deal of additional evidence has also already been published to show that there are other differences between barbiturates and meprobamate than cost.—I am, etc.,

New Brunswick, N.J., U.S.A.

FRANK M. BERGER,
Medical Director, Wallace Laboratories.

Diagnosis of Early Pregnancy

SIR,—The letter from Dr. T. David Lambert on diagnosis of early pregnancy (*Journal*, November 10, p. 1118) contains a statement which I find surprising: "Leaving aside those several cases seen each year in general practice where one must consider advising a therapeutic abortion, the general practitioner will at any given time in a large practice have anything up to half a dozen cases on his hands of patients who are terribly anxious to know early on whether they are pregnant." As the number of births per annum in the United Kingdom totals some 460,000, and as there are about 20,000 general practitioners, it follows that on an average each general practitioner sees some 23 pregnancies per year.

Now what real medical reasons are there for advising therapeutic abortion? De Lee and Greenhill¹ have this to say: "Therapeutic abortion is rarely indicated and medical therapy has improved so much that few affections justify its performance." They then list the possible indications: (1) Hyperemesis gravidarum: I performed therapeutic abortion for this condition once in 15 years. Probably once too often. (2) Advanced tuberculosis: Since the research of Cohen at Black Notley Sanatorium this has ceased to be

Obituary

Dame EDITH BROWN, D.B.E., M.D., M.R.C.O.G.

Dame Edith Brown, principal emeritus of the Women's Christian Medical College, Ludhiana, Punjab, died at Srinagar, Kashmir, on December 6. She was 92 years of age.

Edith Mary Brown was born on March 24, 1864. From Croydon High School she obtained a scholarship to Girton College, Cambridge, where she took second-class honours in the Natural Sciences Tripos in 1885, only a year or two after women were first admitted to the honours-degree examinations at Cambridge. After leaving Cambridge she became a teacher in the hope that she would be able to save enough money to enable her to become a medical student. Fortunately a wealthy friend, recognizing her potentialities, came to her assistance, and she entered the London School of Medicine for Women, taking the Scottish triple qualification in 1891 and the Brussels M.D. in the same year. Immediately after qualification she went to India as a medical missionary—always her ambition—under the Baptist Zenana Mission, and began work at the Charlotte Hospital, Ludhiana, Punjab. After a year there, during which she learnt Urdu, she was moved to Palwal, also in the Punjab, where she studied another language, Hindi. It was about this time that she began to plan a Christian medical school attached to one of the mission hospitals for the training of suitable Indian girls as medical assistants as well as missionaries. After she had stated her case to the Surgeon-General of India and obtained his approval, she convened a conference of all the women medical missionaries in the Punjab, the North-West Provinces, and Rajputana, and as a result of the decisions then taken the school was established, in 1894, in an old school-house at Ludhiana, with Edith Brown as its first principal. In 1898 a new wing was added, but she was still short of her final objective—a school with a standard of teaching high enough to enable students to qualify for the M.B., B.S. degrees. Ultimately, in 1915, women students were transferred from Government College, Lahore, to Ludhiana, which was then recognized as the Women's Christian Medical College and with which was incorporated the Punjab Medical School for Women. From then on the college was training upwards of 300 women students in the medical, nursing, pharmacy, and maternity schools. In recognition of her public services Edith Brown was awarded the silver Kaisar-i-Hind medal in 1911 and the gold medal in 1922, and in the 1932 Birthday Honours she was appointed D.B.E. She was elected M.R.C.O.G. in 1937.

In November, 1941, 50 years after her arrival in India, Edith Brown relinquished the post of principal of the college and was succeeded by the late Dr. Aileen Pollock in the following year. But she never completely severed

[Hay Wrightson]

an indication. (3) Heart disease: The incidence is about 2% in all pregnancies. Rarely is it an indication for abortion. (4) Kidney disease, with retinitis: Twice in 15 years did I have to procure abortion for that reason. (5) Pernicious anaemia and chorea: I have never seen either condition end in abortion. (6) German measles contracted before the end of the third month: Considered nowadays to be a real reason; nevertheless exceedingly rarely encountered as an obstetric problem. I was twice consulted for that reason, so far as I can remember. (7) Nervous diseases such as multiple sclerosis: Perhaps a reason, but nervous diseases are very rare, and pregnant women with nervous diseases are rarer still. (8) Diseases of the ovum—hyatidiform mole, for example: I think that I treated personally some half a dozen cases in 15 years.

You will notice that De Lee and Greenhill do not even mention mental disease. This may be a reason, but in my own experience it resulted in my having to empty the uterus only three times in 15 years. In conclusion, these are the figures of a busy hospital consultant obstetrician on the staff of some nine hospitals, and carrying out antenatal examinations on some 2,500 patients per annum, apart from cases of difficulty that inevitably are referred. I can conceive of no good reason for "advising a therapeutic abortion" in "those several cases seen each year in general practice," and Dr. Lambert's statement cannot hold water when it is considered beside the true obstetric facts.—I am, etc.,

Praa Sands, Cornwall.

D. G. WILSON CLYNE.

Directory of Medical Libraries

SIR,—Early in 1957 the medical section of the Library Association intends to publish a *Directory of Medical Libraries in the British Isles*. To collect information for this we have sent questionnaires to all the libraries that we know of, but, as there has been a rapid increase in their numbers in recent years, we may have unwittingly overlooked some of the newest ones. In order that our directory may be as complete as possible, I should be glad to hear from the librarian-in-charge of any medical library that has not received one of our questionnaires. I should also like to ask any librarian who has not yet completed and returned the form to do so at once, as we hope to go to press in January.—I am, etc.,

London, W.1.

G. J. HIPKINS,

Hon. Secretary.

Medical Section of the Library Association.

POINTS FROM LETTERS

Advice from Hospital Doctors

Dr. T. L. C. DALE (Gateshead) writes: For some time now I have noticed a tendency for hospital doctors to give the general practitioner quite unnecessary information and advice in their letters to him. Probably the commonest example of this is to be told that one's patient smokes too much, drinks too much, or weighs too much. Recently I received a letter about a woman with long-standing rheumatoid arthritis. I quote: "I think she should discontinue her physiotherapy now after a prolonged course of treatment, and it will probably be as well to put her on regular doses of aspirin, which has a mild analgesic effect" (my italics). Was there ever a better case of teaching grandma to suck eggs?

Cigarette Filters

Dr. R. THORNE THORNE (Woking) writes: In 1894 I was working as a student in the laboratories of University College, London. At that time the authorities were testing a pipe and cigarette filter, called the "bitor," made of absorbent blotting-paper. They found that the filter absorbed 84% of the products of the tobacco smoke. At the same time, Sir William Ramsay and Lord Rayleigh were working in the science laboratory on the discovery of argon. For over 50 years I used the filters, and in my opinion they improved the taste of the smoke as well as purifying it. They have now ceased to be made, but I believe that there are others obtainable.

her connexion with Ludhiana, even after her retirement to Srinagar, where, living in a house-boat, she continued to work as a missionary. On her retirement from Ludhiana she had been given the title of emeritus principal of the college and hospital, and she remained in constant touch with the staff and old pupils to the end of her life. She lived to see the Charlotte Hospital replaced by the Women's Christian Medical College and Hospital, and, in 1952, to see the launching of an appeal for funds for a new 500-bed hospital, the foundation stone of which was laid by the Indian Minister of Health in 1954, on Edith Brown's 90th birthday. In the previous year the college admitted for the first time fifty students (men and women) to the first year of the M.B., B.S. course.

While Edith Brown had the satisfaction of seeing the gradual realization of her early dream and the transformation of a small mission hospital into a modern hospital and medical school, the older people in Ludhiana still spoke of the buildings as "Miss Brown's Hospital"—a fitting monument to one who never wavered in giving practical expression to her Christian faith.

Miss M. H. PRITCHARD, secretary of the Ludhiana British Fellowship, writes:

Pioneers are people of vision and determination—vision that looks ahead of their generation, and singlemindedness that translates vision into action. Dame Edith Brown was a pioneer.

She first went to India in 1891 with Dr. Ellen Farrer, the first two women doctors sent out by the Baptist Missionary Society, and she soon realized how limited her medical-missionary work would be without trained Indian workers. A few Indian women were studying medicine in the Government colleges, but they were very few. Dr. Brown envisaged a medical school for women, and in 1894 it opened its doors in Ludhiana with four Indian medical students who were Christians and two dispensers, using for clinical work a thirty-bed hospital run by another pioneer, Miss Greenfield. Together these two courageous women worked to build up from small beginnings what is known to-day as the Christian Medical College and Memorial Hospital. Dr. Brown remained principal of the college until 1942, and thereafter became principal emeritus. She served on various outside bodies, being a member of the Punjab University Senate and Medical Faculty, the Punjab State Medical Faculty, the Punjab Medical Council, and the Punjab Nurses' Registration Council. She was a member of the Ludhiana Municipal Council and so was fully in touch with civic activities. Her skill as a surgeon was widely recognized, and much of the college and hospital was built with the fees she received from wealthy patients. There were few Indian States to which she had not at some time been called to attend the women of the ruling houses. Her patients to love her, and one only had to say to strangers in a railway train or anywhere else that one had come from Ludhiana to hear the question, "Do you work in Miss Brown's hospital?"

Dr. Brown was a splendid teacher, and her students through the years marvelled at the simplicity and ease with which she imparted knowledge. She was personally interested in them, and after they qualified took every opportunity while travelling on business or holiday to break journey in towns and villages to see the graduates. She was a champion of the villagers of India, urging that the best medical aid be sent to them. She put forward a suggestion for rural medical units some 20 years ago, by which a doctor, health visitor, and dispenser should live and work in a village; but the project was considered too expensive. She herself, however, staffed and equipped two such centres which served local areas until 1948. One of the first domiciliary midwifery services in India was introduced in Ludhiana.

A tremendous worker, making great demands on her staff, frugal in her living, and careful to see that not an anna was wasted in the work, Dame Edith Brown combined great faith in the God whom she served with complete dedication of her life to the cause of Christian medical education, and in her death at the age of 92 the medical profession loses one of its outstanding members. The Christian Medical College and the new 500-bed hospital now being built in Ludhiana will be her living memorial, and the work of her graduates her greatest honour.

G. W. WATSON, M.D., F.R.C.P.

Professor G. W. Watson, emeritus professor of medicine at the University of Leeds and consulting physician to the General Infirmary, died at his home in Leeds on December 11 after a long illness. He was 79 years of age.

George William Watson was born at Cowling, near Keighley, on August 9, 1877. Philip (afterwards Lord) Snowden, who became a Chancellor of the Exchequer, was born in the same village, and the two remained firm friends until the death of Lord Snowden. George Watson was educated at Keighley Grammar School and at the Yorkshire College, Leeds, to which he won a West Riding county scholarship. Graduating M.B. (London) in 1901, he proceeded to the M.D. in 1903. After qualification he held a series of resident posts at the Leeds General Infirmary and was then appointed medical registrar there. He took the M.R.C.P. in 1905. After holding the post of resident medical officer at the Chelsea Hospital for Women in London, he continued his post-graduate studies at the Middlesex Hospital and in Vienna.

Returning to practice as a physician in Leeds, he was first appointed demonstrator in medicine at the university and then clinical lecturer. In 1912 he joined the staff of the General Infirmary as honorary assistant physician. During the first world war he served in the R.A.M.C., being registrar at the 2nd Northern General Hospital from 1915 to 1918. He was promoted to the brevet rank of lieutenant-colonel in 1917. On his return to civilian practice he became full physician at the General Infirmary in 1919, and five years later was appointed professor of clinical medicine at the University. In 1933 he became professor of medicine. Among other hospitals to which Professor Watson was attached were the St. James's Hospital, Leeds, and the Dewsbury General Infirmary, and he was an honorary physician to the Leeds Public Dispensary.

Professor Watson was a general physician of the old school, interested in medicine in its widest aspects. For many years he worked as honorary physician to the Leeds Tuberculosis Association. His written work was mainly in the form of reports of cases of unusual interest. He contributed such reports to this *Journal* about parenchymatous nephritis and leptospiral jaundice. Elected to the Fellowship of the Royal College of Physicians in 1915, he served for a number of years on the Council of the College, and was an examiner in medicine to the Conjoint Board. He was also a member of the Empire Rheumatism Council. On his retirement in 1938 the title of emeritus professor was conferred on him by the University of Leeds. During the second world war he acted as consultant adviser in medicine in the Emergency Medical Service. He married Miss May Isabel Armstrong Nicholson in 1919, and there were two sons of the marriage.

GEORGE WILKINSON, M.B., F.R.C.S.

Mr. George Wilkinson, consulting surgeon to the Sheffield United Hospitals, died in Sheffield on December 5. He was in his 90th year.

George Wilkinson was born at Kingston-upon-Hull on February 4, 1867. Both his father and his grandfather were doctors. From Hull Grammar School he won a scholarship to Emmanuel College, Cambridge, where he obtained first-class honours in the Natural Sciences Tripos in 1888. He went on to St. Mary's Hospital as a university scholar and qualified in 1890. A year later he graduated M.B., B.Chir., and took the F.R.C.S. in 1894. He first went to Sheffield in 1892 as house-surgeon at Sheffield Royal Hospital, after which he was in general practice for a short time until, in 1898, he was appointed general surgeon to the hospital. In 1894 he began a connexion with Sheffield University and its forerunners which was to last for half a century, and the medical school owed much to his labours. He was demonstrator in practical pathology from 1894 to 1899; lecturer in practical surgery from 1899 to 1909; lecturer in diseases of the ear, nose, and throat from 1909 to 1927; and lecturer in the history of medicine from 1923 to 1945. When the British Medical Association held its Annual Meeting at Sheffield in 1908 he held office as president of the Section of Laryngology, Otology, and Rhinology. Otology always absorbed much of his time. When, in 1909, a special department for diseases of the ear, nose, and throat was set up at the Royal Hospital, Mr. Wilkinson became its first honorary surgeon. During the first world war he was general surgeon to the 3rd Northern Military Hospital at Sheffield, with the rank of major in the R.A.M.C. In 1927 he retired from the active staff of the Sheffield Royal Hospital, but, still abounding in zeal and energy, he initiated and was in charge of a special department at the Derbyshire Royal Hospital, Chesterfield, and he worked there for seven years.

He contributed various articles on his specialty to the *Journal of Laryngology*. The theory of hearing was the subject which interested him most, and in 1924, with A. A. Gray, of Glasgow, he published *The Mechanism of the Cochlea*, in which he made out a case, on physical grounds, in support of the Helmholtz theory of sound perception, basing this work on his studies of the anatomical structure of the cochlea. In 1925, at the International Congress of Otology in Paris, he demonstrated a model, constructed by himself with painstaking care, to support his views. At the age of 85 he published a penetrating review entitled "How We Hear" in the *Journal of Laryngology*.

V. T. writes: George Wilkinson was a pioneer in ear, nose, and throat work in South Yorkshire, and was an outstanding example of the medical man who enhanced the usefulness of this specialty from the time of its separation from general surgery. The undoubted success which he achieved with his cases was due to his sound clinical judgment and to the scrupulous care which he showed in the management of them: no detail was too insignificant to merit his attention. He had the facility of distinguishing the evanescent and fashionable from those advances which were likely to be of permanent value, and, provided he was convinced the latter quality was there, no one would embrace a new approach or idea with more enthusiasm. The duties involved in his hospital appointment were most conscientiously observed, and he was unsparing of himself where the needs of his hospital patients were concerned. The hospital management recognized this in naming after him a ward in a new block. On first acquaintance and to those who did not know him well, Wilkinson might appear an austere figure: he exacted high standards from himself

and expected the same from others. But, the border crossed and acceptance gained, a breadth of kindness, generosity, and human sympathy was uncovered. This was the basis of his character.

In spite of his hospital work and a busy private practice, Wilkinson's interests outside medicine were wide. Of general history and church architecture he had a great knowledge, and it was an experience to converse with him on those subjects. He greatly enjoyed fishing. Walking on the noble hills and moors which surround Sheffield gave him an opportunity to indulge his sensitive appreciation of the countryside. At a time when it was unpopular to be so, he was a champion of the Victorians. Indeed, he showed forth in himself many of the characteristics of that great era. Unobtrusively he exerted a profound influence on those around him. The loss in 1948 of his wife, by whom he had one son and three daughters, and to whom he was devoted, was a severe blow from which he never really recovered. Our sympathy goes out to his family in their loss.

J. I. MILNE, M.B.

Dr. J. I. Milne, who was a well-known general practitioner in Manchester, died at his home on December 9 aged 60 years.

John Irvine Milne was born at Aboyne, in Aberdeenshire, on July 2, 1896. From Robert Gordon's College he went on to study medicine at Aberdeen University, where his prowess in athletics and games won him a notable reputation. His studies were interrupted by the first world war, during which he saw active service as a surgeon probationer in destroyers. Often he would look back on those days of adventure on the high seas with nostalgic pleasure, thankful that he had not been appointed to a large ship with rigid discipline but to a smaller vessel with a greater sense of freedom and comradeship. In 1921, not long after his return to civilian life, he graduated M.B., Ch.B. After a period as house-surgeon, first at the Aberdeen Royal Infirmary and then at Bootle General Hospital, he settled in general practice in an industrial district of Manchester, and for some years he also held an appointment as anaesthetist at the Ancoats Hospital. It was not long before he identified himself with the activities of the British Medical Association to such an extent that he was at first joint honorary secretary of the Manchester Division and then honorary secretary for 25 years, relinquishing that office to become chairman for another eight years, for six of which he was a member of Council for the South Lancashire and East Cheshire Branch, of which he was president in 1953-4. During the second world war he was honorary secretary of the local medical war committee. He was also a member of the local medical committee and later its chairman. Before 1948 he was a member of the Manchester Insurance Committee, and, after the appointed day, of the executive council and its various subcommittees. In addition he was for many years a representative of his Division at Annual Meetings of the B.M.A. Other activities included membership for many years of the Manchester Medico-ethical Society, of which he was president in the year 1948, and vice-presidency of the Manchester and Salford District Nursing Institute. He took an interest, too, in the St. John Ambulance Brigade, being a divisional surgeon. When Dr. Milne gave up the secretaryship of the Division in 1950 he and his wife received a presentation from their many friends in the profession as a mark of appreciation of his services.

C. V. B. writes: We in Manchester are indeed saddened by the death of Dr. J. I. Milne, who for many years gave the greater part of his leisure hours to the service of the profession and the public. As a chairman, he was tolerant, kindly, wise in judgment, and fulfilled his many duties

quietly and without any sign of ostentation. He had an amazing grasp of the complexities inherent in the many regulations which govern professional life and even of our own organization, and would attend meetings and committees well prepared—in fact it was obvious that he had often spent many an hour in quiet preparation for such events. It will thus be seen that his work on our behalf was occupied by far the greater part of his spare time, yet he was widely read, deeply versed in philosophy, and interested in archaeology. In his younger days he loved the countryside of the mountainous regions of Scotland, and often recounted to me the joys of tramps on Dee-side or the Cairngorms. He never quite lost his early love of the sea, and only during his last illness lent me—a mere landlubber—a seafaring narrative to read, as he had enjoyed it so much. Such was the man we mourn—a life of service, for which we are deeply grateful, given unsparingly to his fellow men—and the profession has indeed suffered a grievous loss in his passing. Our deepest sympathy goes out to his wife and two daughters.

Sir LIONEL WHITBY, C.V.O., M.C., M.D., D.Sc.
LL.D., F.R.C.P.

The obituary of Sir Lionel Whitby was printed in the *Journal of December 1* (p. 1306).

Major-General R. E. BARNESLEY writes: May I be permitted to add a very short postscript to the many eloquent tributes which have been paid to the memory of the late Sir Lionel Whitby, as it seems to illustrate yet another facet of his many-sided character? During the war, as D.D.M.S., Southern Command, I was privileged to have many contacts with the blood supply depot at Bristol. Some years ago a leader-writer in *The Times* wrote, "An Army doctor belongs to two professions; if he fails in either he fails in his duty." In these terms Sir Lionel was indeed the complete "Army doctor," for during the war he was always the soldier, and the medical services had no finer commanding officer in the Command. Many distinguished visitors, both military and civilian, came to visit the depot from time to time. They would nearly always stipulate that their visit should not upset the routine of the organization, and many arrived expecting to be ushered into a laboratory and to be greeted by a white-coated professor looking up from his microscope. This would never do for Sir Lionel. In every case he would be there waiting outside his office, together with his staff, immaculately dressed, with his gloves, cane, and glossy Sam-Browne belt. The same high degree of military efficiency was apparent throughout the unit under his command, and, it need scarcely be added, the men and women of all ranks worshipped the ground he trod on.

Dr. ALFRED FESSLER, who held appointments as a venereologist under the Manchester Regional Hospital Board, died suddenly on November 13, eleven days before his sixtieth birthday. Alfred Fessler was born in Austria on November 24, 1896, and graduated M.D. at the University of Vienna in 1922. After holding a number of postgraduate appointments he became assistant at the pathological institute and senior medical officer in the dermatological and V.D. department of the Wilhelmina Hospital, Vienna, where he began to practise as a consultant dermatologist and venereologist in 1933. At the time of the *Anschluss* he was one of the victims of Nazi persecution, but after arrest and trial he escaped to England late in 1938. He then studied at Queen's University, Belfast, and took the M.R.C.S., L.R.C.P. in 1941. An assistantship in general practice followed, and in 1943 he became medical officer of the venereal diseases clinics administered by Lancashire County Council, with dermatological duties in the council's school health and child welfare services. Since 1948 he had worked as venereologist in the Manchester area. His wide interests and broad knowledge in the field of dermatology and venereology were apparent both in his clinical work and in his numerous publications in both German

and English. In the past decade his studies of medical history culled from the Poor Law and other old records of Lancashire in the seventeenth and eighteenth centuries proved both fruitful and interesting and established him as an authority on these matters; at the Royal Society of Medicine he was a welcome speaker in the History of Medicine Section. He had been engaged in writing a book on these historical researches for some time before his death. Dr. Fessler was a prisoner in the first world war, and was fortunate to escape with his life when he fled from Vienna in 1938. He arrived penniless in England, suffered much anxiety before his wife eventually made good her own escape, and he had then to begin his professional life over again. With all these misfortunes behind him it would have been excusable if he had been embittered and dispirited. But this was not the case, and he was kind and pleasant to patients and staff alike. His quiet, rather shy manner tended to conceal his warm and friendly personality, and he was a congenial and loyal colleague. Much sympathy is felt for his widow and son.—S. M. L.

Dr. I. F. THOMSON died at his home at East Finchley, London, on November 19 at the age of 38. Ian Fream Thomson was born on September 5, 1918, at Jammalamadugu, in Madras Presidency, S. India, where his parents, Dr. T. T. Thomson and Mrs. Thomson, were medical missionaries. He was educated at Eltham College and Mill Hill School, from which he went on to St. Bartholomew's Hospital, graduating M.B., B.S. from London University in 1942. From 1943 to 1946 he served in the R.A.M.C., attaining the rank of temporary major. He landed in Normandy shortly after "D" day and had served as a regimental medical officer for less than a week when he was wounded and invalided home. For the excellence of his work during this short time he was mentioned in dispatches in 1945. After demobilization Dr. Thomson worked for a short time at Hammersmith Hospital, and it was there, at the end of 1946, that he first noticed symptoms of the disease with which he was to live for the next 10 years. After an operation and radiotherapy he returned home, and, greatly supported by a devoted family, he improved steadily. By 1950 Ian Thomson was able to join his father in general practice at Islington Medical Centre, and for over three years he took a very full share in the work. During this time he achieved notably good relationships with his patients: his consultations combined a scrupulous medical examination and assessment with a real sense of sympathy and love for the patient. He had a particularly happy touch with children and the aged, and brought to many parents and old people the sense that their doctor was personally concerned in their difficulties. The basis of his whole attitude was a deep Christian faith which had been and was being tested and tried in his own illness. Towards the middle of 1954 his right hand became increasingly weak. He carried on until he could no longer work efficiently. Since then he must have known the outcome of his condition, but he hardly ever referred to himself. He found joy in the company of his wife and daughter and his family and friends, and he was happy to know how his old patients constantly inquired after him and hoped for his return. Ian Thomson epitomized the best in general practice. He had very high medical standards and combined these with a deep concern for the whole man. His work and his influence remain. He was truly "Christ's faithful soldier and servant to his life's end."—P. F. J.

Dr. M. W. WILLIAMS died at his home in Swansea on November 21 at the age of 84. He was in general practice in near-by Morriston for forty-seven years before his retirement nine years ago. Morgan Watkin Williams was born at Cefn-coed-y-cymmer, Breconshire, on July 20, 1872, and was educated at Greenstreets School and at University College, Cardiff. He then entered Glasgow University, and, after graduating M.B., Ch.B. in 1900, held the appointment of resident medical officer at Carmarthen Infirmary before settling in practice at Morriston. While at Glasgow he gained a first-class honours certificate in both the junior and the senior courses in anatomy and gynaecology and the senior

prize in clinical surgery at the Western Infirmary. In addition to the work of his practice Dr. Williams also acted as medical officer to the Post Office and as surgeon to steel and tinplate and other works in the district. He was elected the first chairman of the local medical committee established under the National Insurance Act of 1911 and was chairman of the local insurance committee. During the second world war he was chairman of the Swansea medical board for the examination of Service recruits. As a family doctor he worked, as one of his patients wrote, quietly among the people, never seeking the limelight, content to do good by stealth. "He symbolized the old family doctor in the best tradition. . . . Many have reason to be grateful to this fine gentleman, who always put service before self." He was a countryman at heart, and his chief joys were shooting and fishing: he was never so happy as when casting a fly on the lovely waters of the Cothi at Brechfa or battling with a salmon in the Junction Pool on the Towy at Nantgaredig. To the sorrow of all his many friends his declining years were marred by recurrent bouts of intense suffering. He is survived by a widow and one son, who is a surgeon in Portsmouth. His second son, also a doctor, was killed in an accident in 1946.

The obituary of Dr. C. E. BEVAN, who was murdered by terrorists in Cyprus, was published in the *Journal* of November 17 (p. 1181).

Dr. J. E. O'N. GILLESPIE writes from Cyprus: Charles Bevan was examining a supposed patient, when he was shot through the back of his head and died instantly. This moment dramatized his mode of living—to carry on regardless of what was happening around him. He died at the height of his abilities and died as he would have wished, doing his duty without fear. To many doctors and others who visited Cyprus in happier times the hospitality of Dr. and Mrs. Bevan will be remembered with the greatest pleasure. Dr. Bevan's enthusiasm in entertaining was a part of the enthusiasm he spent on everything he did. He enjoyed life and lived it to the full. He did much to reduce tuberculosis in Cyprus and to refit his patients for return to a normal life. The craftsmanship of the workshops which he had created flowered under his care, and in this, as in everything he did, he lavished care and aimed at perfection. But memories alone, however numerous and happy, do not fill the vacant chair nor light the children's eyes.

A colleague writes: The murder of Dr. Charles Bevan by terrorists in Cyprus must come as a profound shock and cause of grief to numerous colleagues past and present who regarded him with so much admiration and affection. Charles Bevan represented what is best among progressive and intellectual medical men of the present century. His cultured and scholarly background coupled with his enthusiasm for advance and improvement made him an ideal leader in any government medical service. His devotion to the cure of the individual sick and his careful regard for the scientific details of modern medicine could well be emulated to a much greater extent by many medical administrators. Charles Bevan gave freely of his time, his experience, and his knowledge to aid his colleagues as well as his patients. Early in the last war, when substantial forces of the British Army arrived for the defence of Cyprus, many of the troops succumbed to sandfly fever, malaria, and other pyrexial illnesses. The numbers of blood films sent to be examined by those with as yet relatively little experience in the rapid diagnosis of malaria were quite formidable. I well remember Charles Bevan working during the stifling night hours in the blacked-out laboratory on film after film. Thus he gave the inestimable benefit of his knowledge and his time after the end of a day's work loaded by other commitments, always with the brightness, efficiency, and modesty which were such typical features of his whole character. To see his tireless, unrelenting, and highly successful efforts in instituting modern treatment of tuberculosis on the island was indeed a privilege. The high degree

of popularity and affection in which he was held by the people of Cyprus was especially evident. This insensate murder of one so noted for benefiting the Cypriot people stamps the killers as the despicable agents of a small political clique actuated by the basest motives of personal self-aggrandizement. However, when such self-seekers have vanished into merited oblivion, the outcome of Bevan's work and policy for the health of Cyprus will continuously be remembered.

The obituary of Colonel P. S. LELEAN, emeritus professor of public health in the University of Edinburgh, was printed in the *Journal* of November 24 (p. 1243). Mrs. MARGARET PYKE, chairman of the Family Planning Association, writes: As one of those hundreds who, looking back twenty years, do indeed murmur, "Well done and thank you," to Professor Lelean, may I add something to your moving tribute? You refer to his concern with some of the main problems of family life—sex relations and birth control—but it may not be well known that in 1936 he joined the brave small band of medical men, led by Lord Horder, who gave public support to the then infant Birth Control Association, and remained vice-president of the Family Planning Association until his death. I well remember his characteristic reply to my first very tentative approach to him: "Your work is so important that it is I who am gratified to have my name associated with it."

Medical Notes in Parliament

More Money for Hospital Building

For the financial year 1958-9 it is proposed that £20m. shall be spent on capital developments in the hospital service in England and Wales. This was announced by the Minister of Health on December 12. The sum compares with £13m. in the current financial year and £18m. proposed for next year.

Mr. R. H. TURTON stated that hospital boards had already been informed of their individual allocations within the £20m. total for the modernization of mental hospitals, for the replacement of obsolete plant, and for ordinary capital expenditure. In addition, the programme of major building projects announced by his predecessor would be extended. The programme already announced included the first phases of a number of large schemes. He hoped to authorize a further phase of the new Greaves Hall Mental Deficiency Hospital to be begun next year, and further phases of some other projects in 1958-9, including Balderton Mental Deficiency Hospital and the West Wales General Hospital, Glangwili. In that year also some big schemes already announced but not ready to begin earlier were expected to make a start.

As well as this, he was inviting the boards concerned to bring to completion the planning of a number of additional major projects on the assumption that they could be started in 1958-9. These included the first phase of a new hospital at Slough; a new dental hospital at Birmingham; the reconstruction of Hillingdon Hospital; extensions to the St. Helen Hospital, Barnsley, the Orsett branch of the Tilbury and Riverside General Hospital, Poole General Hospital, Bridgend General Hospital, and Lea Castle Mental Deficiency Hospital near Kidderminster; additional hospital facilities at Kettering, extensions to the Luton and Dunstable Hospital, and new out-patient departments at the Royal Northern Hospital, Oldchurch Hospital, Romford, and Selly Oak Hospital, Birmingham. These major projects were additional to the building which would be undertaken by boards from their own share of the funds available for capital expenditure. They were a further stage in the plans to meet the need for major developments in the hospital service, and with the projects already announced constituted a programme of substantial improvements in each hospital region in England and Wales.

Hospital Extensions in Scotland

An increase in the total provision for capital expenditure on hospital building in Scotland was announced by the Secretary of State, Mr. JAMES STUART. The total would be raised from its present level of £2,200,000, he said, to £2,500,000 in 1957-8 and £2,700,000 in 1958-9. From these sums approximately £1,300,000 would be available to regional hospital boards for their ordinary building programmes. Allotments of £350,000 and £300,000 were being made in the year 1957-8 and 1958-9 respectively for the special programme of plant renewal. The balance of the money would be allocated to further the progress of those major building schemes at present under construction and to begin six new major schemes.

At present work is being carried out on eight schemes, the total estimated cost of which is £3,250,000. These schemes are: radiotherapy institute at the Western General Hospital, Edinburgh; neurosurgical unit at the General Hospital, Edinburgh; reconstruction and modernization of Westgreen Mental Hospital, Dundee; extension of Victoria Hospital, Kirkcaldy; new maternity hospital at Bellshill, Lanarkshire; extension of Ladysbridge hospital at Bellshill, Lanarkshire; extension of Hospital for Mental Defectives at Banff; extension of Hospital for Mental Defectives, Dundee; extension of the Royal Scottish National Institution (for mental defectives), Larbert. In 1957-8 it is proposed to start three projects with a total estimated cost of £1,010,000: further extension of the Royal Edinburgh Mental Hospital; new extension of the Royal Glasgow Mental Hospital; reconstruction of the Glasgow Victoria Infirmary. In 1958-9 it is proposed to start three further schemes with a total estimated cost of £920,000. The schemes are: radiotherapy institute in Glasgow; reconstruction and modernization of Westgreen Mental Hospital, Dundee; new maternity hospital in Glasgow.

Half-hearted Thanks

Mr. HENRY BROOKE, Financial Secretary to the Treasury, told Mr. K. ROBINSON (St. Pancras North, Lab.) on December 11 that hospital capital schemes costing less than £60,000 would no longer require individual approval by the Treasury. Mr. ROBINSON said that regional boards would tender half-hearted thanks for the Chancellor having gone half-way to meet the recommendation of the Guillebaud Committee. But why had it not been possible to go the whole way to the committee's recommendation of £100,000? Mr. BROOKE pointed out that £60,000 was double the previous limit, and was also the limit applied to most other civil and defence building paid for by the Exchequer.

Poliomyelitis

Mr. S. P. VIANI (Willesden, West, Lab.) asked the Minister of Health how many cases of paralytic and non-paralytic poliomyelitis at ages 2 to 9 years had been recorded since June 30, 1956, to the latest date available, in children who had one or two doses of poliomyelitis vaccine, and in children who remained unvaccinated, respectively, and in what towns or villages the cases were reported, with the number in each area. Mr. TURTON informed him on December 11 that in the September quarter the corrected numbers of cases of poliomyelitis notified at ages 2 to 9 inclusive were 262 paralytic and 390 non-paralytic. During the same period medical officers of health reported to the Ministry no confirmed case of poliomyelitis among vaccinated children. Three paralytic poliomyelitis among vaccinated children. Three cases of non-paralytic poliomyelitis were reported, 2 in Manchester and 1 in Tooting Urban District.

Hungarian Refugees

Mr. FRANCIS NOEL-BAKER (Swindon, Lab.) asked the Minister of Health on December 10 if he would arrange for all camps accommodating Hungarian refugees to be visited by a mass radiography unit, in view of the danger of the spread of tuberculosis. Mr. TURTON stated that he did not consider that there was any need for such special measures.

INFECTIOUS DISEASES AND VITAL STATISTICS

Summary for British Isles for week ending December 1 (No. 48) and corresponding week 1955.

Figures of cases are for the countries shown and London administrative county. Figures of deaths and births are for the 160 great towns in England and Wales (London included), London administrative county, the 17 principal towns in Scotland, the 10 principal towns in Northern Ireland, and the 14 principal towns in Eire. A blank space denotes disease not notifiable or no return available. The table is based on information supplied by the Registrars-General of England and Wales, Scotland, N. Ireland, and Eire, the Ministry of Health and Local Government of N. Ireland, and the Department of Health of Eire.

* Measles not notifiable in Scotland, whence returns are approximate.

† Includes primary and influenzal pneumonia.

§ Includes puerperal pyrexia.

Vital Statistics

Poliomyelitis Vaccination Again

Regular supplies of Salk-type poliomyelitis vaccine are expected to be available from the middle of January, 1957, according to the Ministry of Health. General practitioners as well as local authority medical officers will be able to carry out vaccinations. Vaccination will for some time be confined to the 1½ million children born during 1947-54 who were registered earlier this year but who have not yet been vaccinated, though children who have had one injection should be given priority. Medical officers of health are asked to discuss with representatives of the local medical committee arrangements whereby general practitioners who wish to do so can vaccinate children in their care. General practitioners may decide individually whether they wish to take part in these arrangements; they will be required to send to the local health authority a record of each vaccination, for which a fee of 5s. is payable.

The vaccine is to be stored in a refrigerator at 0-4° C. (32-39° F.), and during use it must not be exposed to temperatures over 20° C. (68° F.).

According to the Ministry no pattern of reaction has emerged which can be associated with use of the vaccine, and it has been remarkably free from reaction. "Such evidence as is available does not support the occurrence of provocation paralysis at the site of inoculation." Intramuscular injection is slightly better than subcutaneous, but the difference is not so great "as to warrant the use of one route to the exclusion of the other." The method of disinfecting syringes advocated is by autoclave or hot-air oven. If they are not available, or if glass-metal syringes are used, sterilization by boiling for not less than five minutes is the method of choice, though it cannot be relied upon to destroy all spores. Alcohol is not recommended, since traces of it may destroy the antigen.

Smallpox vaccination and other types of immunization should not be given within a fortnight of poliomyelitis vaccination, and for B.C.G. or yellow fever the intervening period might well be three to four weeks. No special contraindications are known, but only general ones as for other immunizing procedures, such as illness or constitutional disturbance. Full details of the vaccination programme have been sent to the local authorities.

Infectious Diseases

The largest variations in the notifications of infectious diseases in England and Wales during the week ending December 1 were increases of 460 for measles, from 4,054 to 4,514, 131 for dysentery, from 596 to 727, and 88 for whooping-cough, from 2,027 to 2,115.

The largest increases in the incidence of measles were 135 in Staffordshire, from 138 to 273, 127 in Essex, from 241 to 368, and 64 in Lancashire, from 1,179 to 1,243. The largest rise in the number of notifications of whooping-cough was 48 in Lancashire, from 215 to 263; the largest falls were 41 in Yorkshire West Riding, from 177 to 136, and 33 in London, from 115 to 82. 806 cases of scarlet fever were notified, 9 fewer than in the preceding week, and there were no large fluctuations in the local returns. 7 cases of diphtheria were notified, being 5 more than in the preceding week; 3 of the cases were notified in Birmingham C.B.

72 cases of acute poliomyelitis were notified, and these were 3 fewer for paralytic and the same for non-paralytic cases as in the preceding week. The largest returns were London 15 (Battersea 3, Chelsea 2, Hackney 2), Lancashire 8 (Liverpool C.B. 2, Oldham C.B. 2, Clitheroe M.B. 2), Middlesex 8 (Ealing M.B. 2, Harrow M.B. 2, Hornsey M.B. 2), Surrey 5, and Sussex 5 (Portsmouth-by-Sea U.D. 2).

The only large new outbreak of dysentery during the week was 42 in Hertfordshire. The chief centres of infection were Yorkshire West Riding 147 (Leeds C.B. 23, Colne Valley U.D. 19, Bradford C.B. 14, Keighley M.B. 14, Meltham U.D. 14, Sheffield C.B. 13, Rotherham R.D. 11,

Huddersfield C.B. 10), London 94 (Islington 40, Hackney 12), Lancashire 64 (Liverpool C.B. 18), Glamorganshire 43 (Aberdare U.D. 34), Surrey 43 (Woking U.D. 14, Farnham U.D. 12), Hertfordshire 42 (Hertford R.D. 41), Warwickshire 40 (Coventry C.B. 16, Birmingham C.B. 13), Essex 33 (Romford M.B. 18), Durham 32 (South Shields C.B. 10), Nottinghamshire 26 (Nottingham C.B. 18), Kent 24 (Chislehurst and Sidcup U.D. 14, Bromley M.B. 10), and Somersetshire 22 (Bath C.B. 14).

Graphs of Infectious Diseases

The graphs below show the uncorrected numbers of cases of certain diseases notified weekly in England and Wales. Highest and lowest figures reported in each week during the nine years 1947-55 are shown thus -----, the figures for 1956 thus ———. Except for the curves showing notifications in 1956, the graphs were prepared at the Department of Medical Statistics and Epidemiology, London School of Hygiene and Tropical Medicine.

Medical News

Nuffield College of Surgical Sciences.—Next month the residential part of the Nuffield College of Surgical Sciences will be opened to postgraduate students of the Royal College of Surgeons of England and visiting doctors. The accommodation comprises some 80 bedrooms, lounges, a billiard room, and a squash court. The terms are £7 5s. a week, which includes bed, breakfast, and dinner. Inquiries about

residence should be made to Mr. W. F. DAVIS, deputy secretary, Royal College of Surgeons of England, Lincoln's Inn Fields, London, W.C.2 (telephone: HOLborn 3474). The illustration above shows the Nuffield College of Surgical Sciences and a part of the Royal College of Surgeons as seen from Lincoln's Inn Fields. Besides the residential accommodation, the Nuffield College will house on its ground floor the administrative offices of the College of Surgeons and the Institute of Basic Medical Sciences, and on its top floor the College of Surgeons' department of anaesthetics. The official opening of the Nuffield College of Surgical Sciences will be performed by Lord FREYBERG, V.C., on April 5, 1957.

R.C.O.G. Library.—Last month the Royal College of Obstetricians and Gynaecologists put on show its valuable library of early works on obstetrics and gynaecology. To draw attention to the collection and to encourage interested fellows and members to fill some of the gaps in it, the College's consultant librarian, Mr. W. J. BISHOP, has now prepared a short-title *Catalogue of the Library up to 1850*, which the College has published. The nucleus of the library was the large collection bequeathed by the College's founder and first president, Professor WILLIAM BLAIR-BELL. A-though largely composed of modern works, this included a number of early obstetrical items. The historical part of the library was enormously enriched by the Roy Dobbin collection in 1938, since when this part of the library has been gradually built up by gift and purchase. The historical collection now contains some 621 volumes, among them many of the classics of obstetrics and gynaecology. It is the library committee's aim to make this collection as complete as possible within its special field.

British Tuberculosis Association.—At a symposium on the proper use of mass radiography, held in London on November 23, the opening speaker was Professor KARL WEGELIUS, medical director of the Swedish National Mass X-ray Surveys. He is a radiologist, and he discussed some of the technical aspects of the problem. He stressed the value of taking two views, a lateral as well as a postero-anterior. This, he said, would increase the discovery of abnormalities by 16%. He also raised the question of whether both high- and low-voltage pictures might not be needed to detect all abnormal pulmonary shadows. So far as the dual reading of radiographs was concerned, contrary to many, he thought it was probably only necessary during the

period of training. Experiments in his own department suggested that people were inherently either good or poor readers of films. The latter should find other employment. The other speakers at the symposium were Dr. F. A. NASH, director of the S.W. Metropolitan Mass X-ray Unit, and Professor J. W. CROFTON, of Edinburgh.

Rockefeller Aid to Hungarians.—The Rockefeller Foundation has made a first allocation of \$600,000 for the immediate relief of Hungarian scientists, scholars, and artists. Emphasizing that the Foundation did not expect to embark on a programme of general relief, Dr. DEAN RUSK, the president, said that in view of the Foundation's special experience relief would be concentrated "upon those whose intellectual and cultural contributions should be encouraged for the benefit of all." The Foundation will allocate funds to universities receiving Hungarian students and provide fellowships and grants-in-aid for advanced study where needed.—*New York Times*, December 8.

Ipswich and East Suffolk Hospital.—On December 8 Mr. T. M. BLAND, chairman of the hospital management committee, opened a new x-ray department in the Anglesea Road Wing. Except for the reception bureau the unit is an entirely new building, whose cost (about £40,000) has been provided from the "free moneys" of the hospital. The director is Dr. C. H. C. DALTON. The department is designed to serve not only the in-patients of the Anglesea Road Wing but also the greater part of the out-patient and casualty service for the whole area. There are four radiographic rooms communicating with a dark-room, all air-conditioned. Two of the radiographic rooms will have high-voltage transformers to diminish the radiation received by patients in abdominal investigations.

Trade Effluents.—Sir FREDERICK ARMER, chairman of the Board of Control and formerly deputy secretary, Ministry of Health, has been appointed chairman of a subcommittee set up by the Central Advisory Water Committee to inquire into the law dealing with trade effluents. Any person or body wishing to give evidence to the subcommittee should send a memorandum to its secretary, Mr. H. R. POLLITZER, Secretary, Trade Effluent Subcommittee, at the Ministry of Housing and Local Government, Whitehall, S.W.1. The committee has the following terms of reference:

(1) To examine existing legislation and the operation of the common law respecting the disposal from trade premises of liquid effluents (including solids in suspension), not being radioactive effluents; to examine the problems, including financial problems, arising therefrom; to consider whether farm or any other premises should be designated as trade premises for the purposes of disposal of such effluents; and to make recommendations.

(2) To examine the position respecting Section 8 (2) of the Rivers (Prevention of Pollution) Act, 1951 (which requires the consent of the Minister before a River Board may take proceedings under Section 2 or Section 3 of that Act), and to advise whether it is desirable to suggest the extension of the operation of that provision beyond the term of seven years from the passing of the Act and, if so, for what period.

Butterworth Gold Medal.—This award is presented annually to the College of General Practitioners by Messrs. Butterworth and Company, the medical publishers, for an essay by a member or associate of the College on a subject connected with general practice. The subject for next year's essay is "The Science and Art of Prognosis in General Practice." Essays, identified by motto only (with the author's name and address in a sealed envelope) and not exceeding 10,000 words, should be submitted to the chairman of the awards committee, College of General Practitioners, 14, Black Friars Lane, London, E.C.4, not later than September 16, 1957.

Directory of British Research.—The Department of Scientific and Industrial Research's annual directory of scientific research—including medicine and its related sciences—in British universities and university colleges for the 1955-6 session has lately been published (H.M.S.O., price 21s. net). For the first time the volume is printed.

The first 277 pages are occupied by a summary of the research being carried out, with the names of the permanent staff concerned, classified alphabetically by university and department. Then follow a 52-page name index and a 39-page subject index. In addition to information about research in the various medical faculties and schools, details are given about investigations at the Postgraduate Medical School of London, the institutes of the British Postgraduate Medical Federation, the Lister Institute, and the London School of Hygiene and Tropical Medicine. The entries are based on information provided by the various departments to the British Council.

Proctology Award.—The International Academy of Proctology invites applications for its annual \$100 prize and certificate of merit for 1956-7. The award, which is for the best unpublished contribution on proctology or an allied subject, is open to physicians in all countries, whether or not affiliated with the International Academy of Proctology. The Academy reserves the right, however, to publish all entries in its official publication, the *American Journal of Proctology*. Further details may be obtained from the International Academy of Proctology, 147-41, Sanford Avenue, Flushing, New York. The last date for entries is February 1, 1957.

Instrument Design.—The Royal Society recently announced grants of £2,000 and £1,500 made by the R. W. Paul Instrument Fund Committee. This fund exists to support British research workers engaged in the "design, construction, and maintenance of novel, unusual, or much-improved types of physical instruments and apparatus for investigations in pure or applied physical sciences." Details may be obtained from the secretariat of the Royal Society, Burlington House, London, W.1.

Consultant to the Army.—Professor A. W. WOODRUFF, Wellcome professor of clinical tropical medicine at the London School of Hygiene and Tropical Medicine, has been appointed honorary consultant in tropical diseases to the Army at Home. He succeeds Sir NEIL HAMILTON FAIRLEY, F.R.S., who retires under the age limit.

Edinburgh University.—Mr. I. S. KIRKLAND, F.R.C.S.Ed., paediatric surgeon to the Northern Edinburgh hospital group, has been appointed assistant director of the Postgraduate Board for Medicine. Dr. MARY MOSS has been appointed an assistant in the General Practice Teaching Unit, and Dr. F. ALBERT-RECHT lecturer in the department of clinical chemistry.

Dr. J. S. M. Pollock, formerly public health administrator at the W.H.O. regional office for South-east Asia, has been appointed chief of the health division of the United Nations Relief and Works Agency for Palestine Refugees. He graduated at Glasgow.

Dr. Jean M. Mackintosh, of the Birmingham maternity and child welfare department, is to be president of the Section on Health and Welfare of the Family at the Royal Society of Health's annual congress next year.

Dr. L. F. Freed, lecturer in social medicine and psychiatry at Witwatersrand University, has been elected a fellow of the Royal Society of South Africa. He graduated at St. Andrews.

COMING EVENTS

Hospital Coccal Infections.—The Association of Clinical Pathologists is holding a symposium on "Hospital Coccal Infections," January 2, 10 a.m. to 6.15 p.m., at the London School of Hygiene and Tropical Medicine. The meeting is open to anyone interested. Programmes from Dr. J. N. CUMINGS, National Hospital for Nervous Diseases, Queen Square, London, W.C.1. who would like to know the number of those proposing to attend so that tea may be provided.

Training of Microbiologists.—A joint meeting of the Society for Applied Bacteriology and the microbiology group of the Society of Chemical Industry will discuss "Training of Microbiologists," January 9 at 2.15 p.m., at the Beveridge Hall, Senate House, London University. Members of the two societies may take guests. Details from Mr. D. H. F. CLAYSON, 2, Old Field Close, Stanmore, Middlesex.

Sherrington Lecture.—Professor WILDER PENFIELD, O.M., F.R.S., will deliver the Sherrington lecture at Liverpool University (Arts Theatre, Victoria Building) at 5.15 p.m. on January 29. His subject will be "The Cerebral Cortex of Man: An Interpretation of Responses to Electrical Stimulation."

First International Congress of Neurological Sciences.—Those from Britain wishing to attend this congress (Brussels, July 21-28, 1957—see *Journal*, December 8, p. 1380) should apply for further details to Mr. VALENTINE LOGUE, F.R.C.S., Maida Vale Hospital for Nervous Diseases, Maida Vale, London, W.9, and not to the secretary-general of the congress as previously stated.

NEW ISSUES

British Journal of Ophthalmology.—The new issue (Vol. 40, No. 11) is now available. The contents include:

STEREOPSIS AND DEPTH PERCEPTION AFTER TREATMENT FOR CONVERGENT SQUINT. E. J. Naylor, T. E. Shannon, and A. Stanworth.
STANDARD CURVE AND THE PHYSIOLOGICAL LIMITS OF DARK ADAPTATION BY MEANS OF THE GOLDMANN-WEEKERS ADAPTOMETER. P. Dietzle and E. Gordon.
BEHAVIOUR OF PS. PYOCYANEA IN DIFFERENT CONCENTRATIONS OF PENICILLIN. E. G. Millwood and M. Klein.
ANAESTHESIA FOR INTRA-OCULAR SURGERY. J. Kennedy Harper.
STERILIZATION OF INTRA-OCULAR ACRYLIC LENS PROSTHESES WITH ULTRAVIOLET RAYS. C. D. Binkhorst and F. P. Flu.
LYMPHOCTOMA OF THE ORBIT. B. K. Das Gupta, G. C. Sen, and R. K. Basu.
EPIPHORA AND THE BONY NASO-LACRIMAL CANAL. Calbert I. Phillips and Marian George.
PLASMOCYTOMA OF THE ORBIT. John F. Coran.
PROGRESSIVE EXTERNAL OPHTHALMOPLAGIA. F. D. McAuley.
KERATO-CONJUNCTIVITIS IN CEYLON. Lloyd M. Weetikon.
EFFECTS OF CONTACT LENSES ON SHORT-WAVE FIELD DISTRIBUTION. B. O. Scott.
METHOD OF CUTTING LAMELLAR GRAFTS. P. Sivasubramaniam.
METHOD OF REMOVING WOODEN SPLINTERS FROM THE CORNEA. J. Moss.
CERTAIN MODIFICATIONS IN MINOR LACRIMAL INSTRUMENTS. John Foster.
BOOK REVIEW, OBITUARY.

Issued monthly; annual subscription £4 4s.; single copy 8s. 6d.; obtainable from the Publishing Manager, B.M.A. House, Tavistock Square, London, W.C.1.

BIRTHS, MARRIAGES, AND DEATHS

BIRTHS

Gabriel.—On December 6, 1956, in Edinburgh, to Dr. Elspeth (formerly Davie), wife of Dr. Ronald M. Gabriel, 16, Coltbridge Terrace, Edinburgh, a son—Stephen Grant Julian.
Mills.—On November 23, 1956, to Mr. and Mrs. R. B. Mills (Sheila I. Haldane, M.B., Ch.B.), c/o B.P.M., Pladju, Sumatra, Indonesia, a daughter—Alison Sheila.
Palmer.—On November 8, 1956, at Tremayne, Bearsted, Kent, to Patricia (formerly Thould), wife of Dr. D. L. Palmer, a brother for Kevin—Martin Graham.
Price.—On December 1, 1956, at Masjid-i-Sulaiman, Abadan, Iran, to Kate and John Price, a son.

MARRIAGES

Goode-Smeed.—On December 8, 1956, at St. Bartholomew-the-Less, London, E.C.4, Dr. John Howard Goode, of Oaklands, North Holmwood, Dorking, Surrey, to Dr. Inez Mary Patricia Smeed, of 26, Tisbury Road, Hove, Sussex.

DEATHS

Dewar.—On November 25, 1956, in Glasgow, Alice Mary Shirra Dewar, M.B., Ch.B., D.P.H., of 23, Doune Terrace, Glasgow, N.W., formerly of Newport, Mon.
Prat.—On November 23, 1956, François Roger Marie Michel Prat, M.B., B.S., of Victor, New York, U.S.A., formerly of 22, Blythwood Road, Pinner, Middx. aged 29.
Rabey.—On November 19, 1956, at the Royal Sussex County Hospital, Ernest Frank Rabey, M.R.C.S., L.R.C.P., formerly of Manor House, London, N.
Scott.—On November 20, 1956, at the Imber Cross Hotel, Thames Ditton, Surrey, Noel Archibald Scott, M.R.C.S., L.R.C.P.
Thomson.—On November 19, 1956, at his home, 7, Twyford Avenue, London, N., Ian Fream Thomson, M.B., B.S., aged 38.
Waddy.—On November 21, 1956, Sidney Hill Waddy, L.R.C.P.&S.Ed., F.R.F.P.S., of North Lodge, Leicester Road, Branksome Park, Bourne mouth, Hants, late of Huddersfield, Yorks.
Wheeler.—On November 8, 1956, Robert de Courcy Wheeler, M.D., of Monkstown Castle, Dublin.

Any Questions?

We publish below a selection of those questions and answers which seem of general interest. It is regretted that it is not possible to supply answers to all questions submitted.

Pelvic Radiography Late in Pregnancy

Q.—Is there any risk in routine radiographs of the pelvis during the last month of pregnancy? If so, what is the order of the risk, and how does it compare with similar investigations in the first trimester?

A.—The order of the risk resulting from exposure of the pelvis during pregnancy to ionizing radiation depends on the dose given. The Medical Research Council report on *The Hazards to Man of Nuclear and Allied Radiations*¹ states: "There is considerable evidence, both from the case records of patients treated with radiotherapy and from reports published by the Atomic Bomb Casualty Commission, that heavy irradiation of pregnant women can lead to the birth of children who are either abnormal at birth or who later develop in an abnormal way." One abnormality which appears to be associated with such heavy irradiation is the microcephaly. In the same report it is stated: "The evidence from Hiroshima suggests that children irradiated between the twelfth and eighteenth weeks of intrauterine life are more likely to develop microcephaly than children irradiated either before or after this period."

Such abnormalities of the foetus would be caused, however, only by heavy doses of irradiation, much greater than would be delivered in a single radiographic examination, and the risk of foetal abnormality from pelvic radiography is very slight unless repeated examinations are undertaken. The risk of foetal abnormality would be still less if radiographic investigation was confined to the last month of pregnancy. The report quoted above does, however, point out that there is, in addition to the risk to the health of the individual, a risk of genetic damage from exposure of the gonads to any form of irradiation, and recommends that there should be a control of the total dose to the gonads received by the individual from conception to the age of 30 years, the most likely child-bearing period. X-ray examination of the pelvis of a pregnant woman at any stage of pregnancy will give an undesirable gonad dose both to the mother and to the foetus, and for this reason, if radiography is necessary, the technique should be such that the least possible dose is delivered.

Onychomadesis

Q.—A baby of 1 year lost a fingernail when 2 months old which has never regrown, and it has now lost another on the other hand. No cause is visible; the nails just loosen and drop out. The skin of the finger whose nail was the first to be shed is now continuous over the nail fold. What are the possible causes, prognosis, and treatment?

A.—Temporary, repeated, or permanent loss of nails, without inflammatory or other cause, is a rare congenital abnormality that sometimes is familial. Nothing can be done to avert the condition. The affection seems to be analogous to the falling of hair, and has in fact been reported in severe cases of alopecia areata. In epidermolysis bullosa, another congenital and often familial disease, characterized by blister formation from negligible trauma, falling of nails and their ultimate loss is common. In that condition the loss seems to be determined by trauma to the nail matrix following slight trauma on the nail. However, spontaneous blistering does occur in epidermolysis bullosa,

and also apparently spontaneous loss of nails. It may be that the condition of onychomadesis—loss of nails—is a *forme fruste* of epidermolysis bullosa.

Prostatic Cancer: A Question of Diagnosis

Q.—Four years ago a man of 60 was diagnosed on clinical grounds as having carcinoma of the prostate (he had rectal pain, a firm but not hard nodular prostate, no micturition symptoms, and a serum acid phosphatase level of 3 units). Since then he has had 30 mg. stilboestrol daily. Now, there is still no evidence of secondary deposits and the serum phosphatase is at its previous level, but micturition symptoms have developed and fairly severe congestive heart failure. (1) Is the clinical diagnosis of prostatic cancer still tenable? If it is doubtful, what investigations are indicated? (2) Could the cardiac failure be accounted for solely on the basis of the sodium-retaining properties of the stilboestrol?

A.—The clinical diagnosis of prostatic cancer at an early stage is notoriously difficult, and there would seem to be a reasonable amount of doubt in this particular patient whether that diagnosis is correct. The failure of a serum acid phosphatase level to fall even from 3 units after the amount of stilboestrol that has been taken is a point against the diagnosis of carcinoma. The most useful investigation now would be an examination of a smear after prostatic massage. This must be done by a pathologist who is accustomed to the technique of exfoliative cytology. It would also be as well to take a plain radiograph of the pelvis and lower lumbar spine if this has not already been done.

The cardiac failure may be due in part to the stilboestrol. The dose of stilboestrol should be drastically reduced, say, to 5 mg. daily, and the cardiac failure treated on the usual lines. If the micturition symptoms are obstructive and if they persist after the control of the cardiac failure, surgical treatment of the prostate in one form or another is indicated.

Selenium Poisoning

Q.—What are the clinical features of selenium poisoning, and how should it be treated? What are the main causes of selenium poisoning?

A.—Workers using selenium and selenium compounds may notice a metallic taste, a garlicky odour of the breath and perspiration, and irritation of the nose and throat. Many selenium compounds are acid and cause blistering of the skin, and hydrogen selenide causes intense irritation of the mucous membranes which may last for many days. The garlicky odour of the breath is particularly unpleasant, and men who work with selenium and selenium compounds are often shunned even by their families, so that they become anxious and embarrassed.

Burns, dermatitis, and paronychia have been reported in workers exposed to selenium dioxide in the manufacture of telephone apparatus, and the fingers, teeth, and hair may become stained red. Finely divided selenium dust may cause irritation of the nasal mucous membrane resulting in catarrh, epistaxis, and anosmia. Hunter¹ describes an incident in which men engaged in melting scrap metal were exposed suddenly to high concentrations of selenium fume. This was intensely irritating to the eyes, nose, and throat, and the premises were rapidly evacuated. All the workers exposed noticed the immediate and intense irritation of the eyes, nose, and throat, and an unpleasant, sour, garlic-like odour to the fume; some complained of a severe burning sensation in the nostrils, dryness of the throat, and headache; and all noticed an unpleasant taste in the mouth and an odour of the skin and clothing. All recovered within three days, and there were no sequelae.

Animals grazed on vegetation grown on soils with a high selenium content develop acute or chronic selenium poisoning. The effects of ingestion of selenium compounds by man

have not been fully investigated, but gastro-intestinal symptoms and garlicky breath are found among inhabitants of the highly seleniferous areas of South Dakota and Nebraska.

The treatment of acute poisoning is symptomatic. Ascorbic acid in doses of 10 mg. per kilogram of body weight given daily may remove the garlicky odour from the breath.

The main causes of selenium poisoning are accidental exposure to unusual concentrations of dust, fume, or vapour containing selenium compounds. Selenium is used in the manufacture of the selenium cell and for producing hard durable rubber; it is added to glassware, coloured inks, paints, and plastic. The machining properties of stainless steels and commercial copper are improved by alloying with selenium. Sodium selenate has been recommended for use as an insecticide, but it is an extremely toxic substance and certain plants may concentrate selenium picked up from treated soil.

Occult Blood in the Faeces

Q.—What is the best method for testing for occult blood in the faeces? Is it necessary to restrict the ingestion of meat? What are the fallacies in the usual tests?

A.—The method we have found most satisfactory, because it can be adjusted to the degree of sensitivity needed, is that using *o*-toluidine instead of benzidine. A 4% solution is made in alcohol, which keeps well, particularly in a refrigerator. One part of this is mixed with two parts of 50% glacial acetic acid on the day it is required for use.

To perform the test, four drops of the diluted toluidine solution and one drop of 10 vol.% hydrogen peroxide are placed in a clean test-tube and allowed to stand for one minute to see if the tube is really clean. If there is no colour, then one drop of a faecal suspension is added and the test read in one to two minutes: blue colour is positive, green colours are ignored. The faecal suspension is made by placing a piece of faeces, about the size of a pea, into 5 ml. of water and boiling. This test is rather sensitive, and, if it is desired to reduce the sensitivity so as to avoid getting too many rather meaningless positives, 2% toluidine solution can be used in the initial mixture. This has the added advantage of not crystallizing out in the cold.

With the technique described above, unless a considerable amount of meat has been taken, a positive (blue) test will not be obtained. Similarly, taking iron will not give a false positive. The test can be made more sensitive, and then it is possible to detect the small amount of blood in meat. It must be remembered that a very much more important fallacy is the ingestion of blood from other parts of the alimentary tract, such as the gums and nose, and the use of glassware which is not absolutely clean.

Spanking Children

Q.—What is the current view on corporal punishment for children? It seems very difficult to avoid giving an occasional spanking. Does it do any permanent psychological damage?

A.—Present-day views about corporal punishment vary from total prohibition to the attitude of "It made me what I am." It is indeed difficult to avoid an occasional spanking, and parents, when tried too far, should not feel too guilty about this, provided that it really is occasional: the more one spans, the more one tends to spank. There is no evidence that in moderation it does permanent psychological harm to children. However, spanking should be regarded more as a relief for parental tension than as a useful procedure in bringing up children. Except in a very limited sense—for example, during the actual presence of a parent—it is not a particularly effective deterrent, and like other forms of punishment there is always the risk that if

given in excess it will provoke rather than deter. In the long run more amiable methods show far greater civilizing effects. Parents should not hit their children after adolescence is reached, whatever the provocation. There is always the risk of coming off worse.

NOTES AND COMMENTS

Cheeses for Reducing Diets.—Professor JOHN YUDKIN (London, W.8) writes: In your reply concerning cheeses for reducing diets ("Any Questions?" November 10, p. 1131) you discussed the matter entirely from the point of view of calorie content. This, as you say, depends mostly on their content of fat. May I remind you that there has been considerable work in recent years indicating that it is not only calories which should be considered in reducing diets? In particular, it has been shown that diets with the same number of calories are more effective in reducing when the proportion of fat is high rather than low. In addition to the references in my previous letter in "Notes and Comments" (November 19, 1955, p. 1282), may I refer you also to the paper by Professor A. Kekwick and Dr. G. L. S. Pawan?¹

¹ Kekwick, A., and Pawan, G. L. S., *Lancet*, 1956, 2, 155.

OUR EXPERT replies: The question was answered in general terms, and not on Professor Yudkin's implied assumption that the amount of cheese eaten would vary inversely with its calorie content. Admittedly the point which he raises would have to be considered if the cheeses were to be rationed according to a pre-decided number of calories. In our answer this restriction was not visualized, and it was stressed that the amount of cheese accepted as an adequate portion would be an important factor. Factors determining the amount eaten, such as taste, might therefore be just as important as the calorie content. It is difficult, therefore, to understand Professor Yudkin's comment that only the calorie content of the cheese was considered.

Spontaneous Cure in Diabetes.—Dr. J. A. CHALMERS (Worcester) writes: With regard to spontaneous cure of diabetes mellitus ("Any Questions?" November 10, p. 1131), your reply makes no reference to the spontaneous remission which may occur in the diabetes which sometimes occurs during pregnancy. We have seen several cases which have been confirmed by sugar tolerance tests and where the pregnancy has been complicated by foetomegaly, toxæmia, etc., which have subsequently shown a complete remission, even in respect of a post-natal sugar-tolerance test. I believe these to be genuine cases of diabetes mellitus and expect the patients to develop the condition within the course of a few years. The effect of the pre-diabetic state on pregnancy is well known, and it is probable that the same factors that produce pregnancy changes may in certain instances produce a manifest diabetes mellitus.

OUR EXPERT replies: It is well known that pregnancy may be associated with the appearance of diabetes which disappears after the pregnancy is over, only to recur in subsequent pregnancies and ultimately become permanent. Dr. Chalmers's observations are therefore in complete agreement with the experience of many others who have worked and written on this subject.

Books of "Any Questions?" and Refresher Course Articles.

The following books are available through booksellers or from the Publishing Manager, B.M.A. House. Prices include postage. *Any Questions?* Volumes 2 and 3 (8s. each); *Refresher Course for General Practitioners*, Volumes 2 and 3 (26s. 6d. each inland, 26s. overseas); *Clinical Pathology in General Practice* (22s. 3d. inland, 21s. 9d. overseas).

All communications with regard to editorial business should be addressed to THE EDITOR, BRITISH MEDICAL JOURNAL, B.M.A. HOUSE, TAVISTOCK SQUARE, LONDON, W.C.1. TELEPHONE: EUSTON 4499. TELEGRAMS: *Altology, Westcent, London*. ORIGINAL ARTICLES AND LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated.

Authors desiring REPRINTS should communicate with the Publishing Manager, B.M.A. House, Tavistock Square, W.C.1, on receipt of proofs. Authors overseas should indicate on MSS. if reprints are required, as proofs are not sent abroad.

ADVERTISEMENTS should be addressed to the Advertisement Director, B.M.A. House, Tavistock Square, London, W.C.1 (hours 9 a.m. to 5 p.m.). TELEPHONE: EUSTON 4499. TELEGRAMS: *Brimedads, Westcent, London*.

MEMBERS' SUBSCRIPTIONS should be sent to the SECRETARY of the Association. TELEPHONE: EUSTON 4499. TELEGRAMS: *Medisecra, Westcent, London*.

ANNUAL REPRESENTATIVE MEETING, BRIGHTON, 1956

The Annual Representative Meeting opened in the Dome, Brighton, Sussex, on Thursday, July 5, and continued on July 6, 7, and 9. The Chair was taken by Dr. I. D. GRANT (Glasgow), who was supported by Dr. T. C. ROUTLEY (President), Dr. E. A. GREGG (Chairman of Council), Sir JOHN MCNEE (Immediate Past President), Mr. L. DOUGAL CALLANDER (Treasurer), and Dr. A. BEAUCHAMP (Deputy Chairman of the Representative Body).

Over 400 representatives from home constituencies attended, and there were about 40 representatives from overseas. In addition members of Council who were not representatives were present, and there were four representatives of the Public Health Service.

More than 350 motions and amendments were on the main agenda, but a number of motions and amendments of similar tenor were grouped and one of them was "starred," so that discussion took place on the "starred" motion.

FIRST DAY

Thursday, July 5

The representatives assembled at 10 a.m. The CHAIRMAN (Dr. Grant), before the usual preliminary business, expressed appreciation of the recent Honours List awards to two of the Association's past presidents. Sir Henry Cohen, who was now to go to the Lords, would contribute to the debates in that Chamber his well-known characteristics of sincerity, wisdom, and statesmanship. The award of a knighthood to Mr. Tudor Thomas would give great satisfaction not only to his colleagues in Wales but to every member of the Association.

The Secretary would be instructed to send messages of good will and congratulations to both.

The CHAIRMAN then extended a warm greeting to Sir Henry Newland, "Grand Old Man of Australia," and the Association's most recent gold medallist.

Sir HENRY NEWLAND extended greetings from the B.M.A. in Australia, which, he said, was going from strength to strength and had, through its negotiations with the Government in the last few years, produced a medical service which was thought by those who had seen it working to be one of the best in the world.

A Protest

The CHAIRMAN OF COUNCIL (Dr. Gregg) entered an energetic protest against the action of the *News Chronicle* in

having distributed at the doors of the meeting a Gallup poll document relating to the National Health Service.

"We take strong exception to the action of the *News Chronicle* in this particular matter," he said. "This document is headed 'British Medical Association Conference, Brighton . . .'; we have nothing to do with it."

The heading gave the impression that in some way the document had been issued by the Association for the information or guidance of representatives, but in fact it was the product of purely private action by the newspaper.

The CHAIRMAN appealed to representatives to be brief in their speeches in order to expedite the business of the conference, there being 359 items on the agenda, as against 296 last year.

PRELIMINARY BUSINESS

Statement by Chairman of Council

The CHAIRMAN OF COUNCIL said he was happy to have the opportunity of saying in the presence of Dr. Routley that those who were privileged to attend the joint meeting in Toronto a year ago would never forget the wonderful kindness of Canada. (Applause.) Every effort would be made to return that kindness when Canadian colleagues joined the Association in Edinburgh in 1959. "We look forward also with the greatest pleasure to the first meeting in New Zealand, to be held in Auckland in 1961," he added. "It is our aim to foster friendly relations with our professional colleagues not only within the Commonwealth but also in foreign lands." Last autumn the Association had the pleasure of entertaining six distinguished doctors from the Soviet Union, and the Council had gratefully accepted an invitation to send six British doctors to the U.S.S.R. in August this year. In the second week of the conference the Association would welcome in Brighton the delegates of twelve foreign medical associations, and Professor L. A. Hulst, of Utrecht, the distinguished delegate of the World Medical Association, of which he was a Past President, was to be present as an observer. (See foot of next page.)

Last year there was an important debate on the threatened prohibition of the use of heroin in medical practice. Later it was discovered that the action proposed by the Government appeared to be illegal. For the subsequent events, which culminated in an important change of Government policy, much credit was due to the Public Relations Officer and his staff. (Applause.) It was to be hoped that nothing

would again be heard of any such plan to restrict the clinical freedom of the medical profession in this country.

In the field of hospital and consultant services new ground had been broken in two important ways. First, there had recently been held at B.M.A. House, under the extremely efficient chairmanship of a Vice-president and former Treasurer, Mr. A. M. A. Moore, the first annual conference of consultants and specialists. Secondly, the Joint Consultants Committee had joined the General Medical Services Committee in presenting a claim to the Government for a long overdue adjustment of the betterment factor for general practitioners and all grades of hospital medical staff in the National Health Service. The Council regarded that joint action as a most encouraging example of co-operation between two major sections of the profession, and, despite the present economic difficulties of the country, no apology was made for supporting the demand that the Government should fulfil its obligations to the profession. The Spens Committees were expressly directed to pay due regard to the desirability of maintaining the proper social and economic status of the medical profession, "and we should be failing in our duty both to ourselves and to posterity if," continued the Chairman of Council, "when the incomes of so many other sections of the community are being adjusted to keep pace with the fall in the value of money, we made no effort to recover the ground that we have lost since our remuneration was adjusted in the light of the Danckwerts Award."

Health Service Problems

Representatives would have observed that many problems which they had discussed in recent years appeared once again in the present agenda—the problem of the general structure of hospital medical staffing, the particular problems of the whole-time hospital officer and the S.H.M.O. and the junior resident, the problem of obstetric beds and other hospital facilities for the general practitioner, the problem of drugs under the National Health Service for private patients. The annual reappearance of those and other matters in the discussions of the Representative Body was evidence both of the imperfections of the Health Service and of the enormous difficulties that were encountered in the first attempts to effect major improvements. A leading article in *The Times* last January stated that, at a first glance, the Report of the Guillebaud Committee might seem to be "a bluebook full of whitewash." Whatever the views of the Guillebaud Committee, it was certainly not the business of the British Medical Association to whitewash the National Health Service. There was no room for complacency, but it would be wrong to adopt an attitude of despondency or defeatism. "We must continue the struggle with all the force at our command in the hope that ultimately we may succeed in moulding the Service nearer to our heart's desire," he continued, and expressed the hope that, despite the many problems that remained unsolved, Representatives would find in the Council's annual report evidence not only of much hard work but also of solid achievement in various spheres. He commended to their special attention the report on remuneration policy and the other important reports contained in the appendices. The Constitution Committee was completing its difficult task, and its recommendations would be submitted to the Representative Body next year. Two other valuable contributions had recently been published in booklet form. The first was the report on "Divine Healing and Co-operation between Doctors and Clergy," and the second was the report on "Cruelty to and Neglect of Children." The importance of the latter report was publicly acknowledged by the Minister of Health on his recent visit to the Conference of Representatives of Local Medical Committees.

The Representative Body had shown a keen interest in the care and treatment of the aged sick, and it had been satisfactory to learn that its recommendations on that subject, and the proposals contained in the Report of the Joint Subcommittee on Geriatrics, had secured the general

approval of the Ministry of Health and would be implemented as far as economic circumstances allowed.

One of the problems of geriatrics was that of providing suitable employment for the elderly. In the agenda of the meeting there was some suggestion that too much employment was being provided for the elderly in the General Medical Council. He did not desire to anticipate the debate on the subject, but it might perhaps be remarked that it was the Representative Meeting last year which decided of its own free will to select for the support of the Association in the General Medical Council election a number of persons who, whatever their mental agility, could hardly hope to be "seeded" for the Centre Court at Wimbledon.

There was much more that could be mentioned if time permitted, but the Chairman of Council said he would only refer to the important advance in relationships with the Press which had resulted from the initiative of that ever-young veteran, Dr. H. G. Dain, in arranging discussions with representatives of Press organizations, with special reference to the publication of news from hospitals. (Applause.)

"Quite naturally and rightly, we are much occupied with medico-political affairs," he concluded, "but do not let us underestimate the value of the immense amount of work that we undertake each year in the scientific and ethical and medico-social spheres. When I hear a member asking in a querulous tone, 'What do I get for my subscription?' I wish that he would give some thought to another question—'What do I give with my subscription?' One of the things he gives is power to the Association not only to promote and safeguard the interests of the doctors of this country but also to play a worthy part in advancing the welfare of the general community. The Council is not ashamed to present to the Representative Body, with all proper modesty, the account of its stewardship during the past session."

Election of President

Dr. GREGG moved on behalf of the Council that Mr. Weldon P. T. Watts, M.S., F.R.C.S., of Newcastle-upon-Tyne, be elected President of the Association for 1957-8.

The motion was carried by acclamation.

Mr. WELDON P. T. WATTS, in response, thanked Representatives for the great honour which they had done him and the North of England in electing him President for 1957. Newcastle, he said, had everything to make a successful meeting from business, scientific, and social angles, and his colleagues in the North would do everything they could to receive the Association with a real Tyneside welcome.

Toronto Meeting

On the motion of Worcester and Bromsgrove the Representative Body placed on record its appreciation of the hospitality extended by the members of the Canadian Medical Association and the Ontario Medical Association on the occasion of the Joint Meeting in 1955.

Dr. BLUNDELL WILLIAMS (Worcester and Bromsgrove) said that one of the members of his constituency had been fortunate enough to be present at the Joint Meeting in Toronto last year, and he could not speak highly enough of the friendliness with which he was greeted and the wonderful hospitality which he received there. The Council had already expressed thanks to Dr. Routley and his colleagues of the Canadian Medical Association, and it was the unanimous opinion of the members of Worcester and Bromsgrove that it would be most appropriate to accord thanks at the Annual Representative Meeting.

The vote of thanks was carried unanimously, with acclamation.

The CHAIRMAN introduced Professor L. A. Hulst, of Utrecht, delegate of the World Medical Association, who had arrived a little earlier than was expected in order to attend a meeting of the Representative Body, and invited him to say a few words.

Professor HULST (Utrecht) brought greetings on behalf of the World Medical Association, and expressed the hope that the annual meeting would be a great success. (Applause.)

Attempted Ban on Heroin

Dr. J. A. MCCALLUM (Westminster and Holborn) moved: That, following the recent attempt by the Government to ban the prescription of heroin, this Meeting affirms, as a matter of principle, its determination to preserve the right of any individual doctor to prescribe what he thinks is in the best interest of his patient.

He said that it was desired to avoid any repetition by any Government in the future, of whatever complexion, of the previous year's disastrous attempt to ban the prescription of heroin.

Among the many statements made and letters written on the subject, he had been struck most by one statement made by a person who advocated the banning of heroin. It was: "Doctors have a fundamental belief that no one should interfere between a man and his patient." That belief was true, and must remain true for the future whatever expediency dictated in other directions.

It was a question of advice which was given to the Government, and the point about advice given to the Government on clinical matters was that it was still only advice. He had never met a committee yet, however distinguished, whose advice on clinical matters he was prepared to accept unless he agreed with it.

During his effort in December Mr. Pringle would have had greater assistance if M.P.s had received letters on the subject from members. There was little doubt that in that way the Public Relations Department would have been helped earlier to get the matter settled.

Smoking in the A.R.M.

At this point the discussion was interrupted by a motion that Standing Order 70 (forbidding smoking in the meeting) be suspended.

Dr. J. O. McDONAGH (Perth) moved an amendment that Standing Order 70 be not suspended to-day. He said that the moving of the suspension of this Standing Order got the meeting every year; so far the meeting had been going for earlier every year; so far the meeting had been going for 40 minutes. There was no doubt that smoking had something to do with disease, and he thought the A.R.M. should show the measure of its concern for the promotion of health by not smoking for one day. *Family Doctor* was a journal of the Association; it took the subject of smoking seriously enough to devote the first three pages of the issue which had been distributed in the meeting to the question of stopping smoking, suggesting that a "ginger group" was needed. What better ginger group could there be than the British Medical Association itself?

Dr. R. COVE-SMITH (Marylebone) thought it was of importance that the British Medical Association should give a lead in this matter, and he asked the delegates to have the courage of their convictions and show the public that they were sufficiently controlled to restrain themselves in the interests of their own health and the health of the public, and to show that they really did practise what they preached regarding smoking.

Dr. L. M. JOHNSTON (Wallasey) said that he had come to the rostrum to speak about heroin, but he would say that smoking was a drug habit, and anyone who smoked was a drug addict. Doctors gave a shocking example to their patients by drugging themselves with tobacco all the time. "I think it is the biggest killer in the business, not only from lung cancer, but coronary thrombosis and bronchitis are undoubtedly brought on by smoking. We are guilty of infamous conduct in a professional respect by smoking."

The CHAIRMAN said that he did not propose to allow a scientific discussion on the pros and cons of smoking. He would put the amendment to the meeting.

Dr. R. P. LISTON (Tunbridge Wells) asked, if the amendment was carried, what the Chairman would regard as a quorum? (Laughter.)

The amendment was put on a show of hands and the result was not clear. It was then put, "Do you wish to have any smoking at all to-day?" but the CHAIRMAN called for a count and announced the result: "I am sorry, you cannot smoke to-day."

CIVIC WELCOME

The MAYOR OF BRIGHTON (Alderman Lewis Cohen), accompanied by the Town Clerk, attended to give a civic welcome to the Association. He said that it was his pleasing duty to welcome to Brighton one of the most important, if not the most important, conferences Brighton was to enjoy during this year. Brighton was highly honoured that the British Medical Association had decided to come to Brighton for its annual meeting.

Brighton was in a peculiar position in welcoming the British Medical Association, because Brighton also claimed a medical degree, but it could be used in ways not permitted to the profession, for Brighton could advertise its efforts on behalf of health. Brighton prided itself in being able to give a measure of health with its air, sunshine, and sea and its recreations.

The Mayor hoped that Brighton hospitality would be unsurpassed. It was very proud that the President this year was a resident of Hove, Brighton's sister town. All appreciated the work which the medical profession did for the country, and he hoped the deliberations this time would go some way towards dealing with the two worst diseases at present affecting mankind, cancer and rheumatism.

The CHAIRMAN, thanking the Mayor for having attended and for his gracious welcome, said all would agree that "Doctor Brighton" had for many years been recognized as one of the country's most effective physicians, particularly when dealing with convalescent cases.

The debate on heroin was then resumed.

Heroin (Debate Continued)

Dr. C. W. WALKER (Cambridge and Huntingdon) thought that all would agree with the second part of the Westminster and Holborn motion, for "to prescribe" formed part of "giving advice." But to say that what was prescribed must be made available was infringing the principle that the patient had a perfect right to accept or refuse what was prescribed. The first part of the motion, however, was wrong. The Government had made no attempt to ban the prescription of heroin; it had merely attempted to ban its production. If a patient refused to follow the advice of his doctor it was the doctor's duty to try to persuade that patient that he was wrong. The Association, having felt that it was right to keep heroin, had therefore been right to go for the Government, and the Government had been only too glad to get out of the situation on a legal technicality; but it had not been wrong in principle for the Government to attempt to ban heroin if it had taken the view that it should be banned, and situations of that sort would arise again. The medical profession had never claimed that everything that was prescribed must be available to the patient. It had often been realized in the old days that patients could not afford something which was good for them.

Dr. P. PHILLIPS (Bristol) said that the ban on manufacturing heroin would immediately create a black market in that commodity—a situation which had arisen in the United States, where addiction to heroin was much more common than in this country. Heroin, too, was one of the easiest things to manufacture "on the side."

The Westminster and Holborn motion was carried.

Dr. R. P. HENDRY (Rugby) moved a resolution of protest in the strongest possible terms against any Government action aimed at curtailing the freedom of a registered medical practitioner to prescribe—under suitable agreed safeguards—whether under the N.H.S. or privately, whatever he thought was best for his patient until and unless there was some absolutely overwhelming reason to the contrary which had been agreed between the profession as a whole and the Minister.

He said that some official form of protest was called for. He thought that the profession should agree to consider any representations that a drug should not be prescribed, which was different from agreeing that it should not be prescribed. In his own view, heroin was a very valuable drug, and he cited the case of a patient who had responded to it, having

failed to respond to 24 other drugs. There were, however, other types of drugs which might be the subject of consideration as a matter of principle.

The Rugby motion was carried.

"Book of Valour"

The CHAIRMAN OF COUNCIL moved that there be instituted a Book of Valour, to be permanently on view at B.M.A. House, in which should be recorded, by decision of the Council, heroic deeds performed by medical practitioners, and that in each case a copy of the record be presented to the practitioner concerned or to the next of kin.

Mr. D. S. PRACY (Nuneaton and Tamworth) moved as an amendment that instead of the presentation of a copy of the record a medal suitably inscribed be presented.

He welcomed the first part of the motion, but thought that the proposal in the second part was unworthy of the Association. He recalled that in 1877 the Association's medal had been instituted for distinguished merit on the part of anyone—not necessarily a member of the Association—who raised conspicuously the character of the profession by extraordinary professional services or scientific merit, or special services to the profession. The first awards for heroic deeds had been in connexion with colliery disasters. It had been awarded on all three grounds from time to time. The last awards for heroism had been in 1915 and 1919, to Major Arthur Martin-Leake and Captain N. G. Chavasse, respectively, both of whom had been awarded the V.C. and Bar. The second part of the motion sought to substitute for a gold medal a piece of paper or parchment of no intrinsic value. The profession's recognition of valour ought to be something obvious and enduring. He did not think that the recipient of a posthumous award would prefer a piece of parchment. He knew of many cases where medals were treasured possessions of the relatives.

Dr. J. H. LANKESTER (Reigate) thought that the whole subject needed further consideration. While all would feel the urge to honour those who had performed acts of bravery, he doubted whether the proposed scheme had been well worked out. Did it apply to military bravery as well as civilian bravery, to wartime as well as peacetime? Would members of all races be eligible and members of the medical profession throughout the whole Commonwealth, he asked, or those who had performed brave acts in scientific research? The greatest difficulty was to decide who should receive the awards, and it seemed at present that the Council would be faced with the invidious task of making that choice.

Dr. J. A. PRIDHAM (Council) opposed the amendment. He said that the Council had taken the view that to have different medals for different subjects would lead to confusion and invidious comparison between one medal and another. The Gold Medal was the Association's supreme honour; he asked that it might be allowed to remain as such. In any case, the existing proposal did not preclude the recipient from being awarded the Gold Medal as well.

Dr. J. B. W. ROWE (Council) asked what Dr. Pracy had meant by "value." A gold medal that was only for show was not of much intrinsic value to the relatives. An illuminated parchment address was much better than any medal could be, because it had no intrinsic value which would attract burglars, but was of sentimental value to the recipients.

The CHAIRMAN OF COUNCIL, opposing the amendment, said that the proposal had been related to certain cases of outstanding valour by doctors in the discharge of their professional work, and there were already two names which it was proposed to inscribe should the motion be accepted. A Book of Valour would seem to be a natural complement to that other book in which were recorded the names of those who had fallen in the war. He did not understand why a piece of vellum with the citation recorded on it and presented to the person most concerned or his relatives should be less treasured than a bit of metal. There was a great deal to be said for giving a special character to a

matter of this sort and not following old-fashioned stereotyped lines. In every one of such cases there was the possibility that the recipient would get recognition of some other sort, such as the George Medal. It was not possible in such matters to avoid the old trouble of people disputing awards and saying that somebody else should also have received recognition. Hundreds of V.C.s were earned for every one awarded.

Mr. PRACY, in reply, said it had been decided in 1877 that the Gold Medal should be awarded by the Council; it could therefore be taken that due consideration would be given to the matter and that the medal was not awarded unworthily. With regard to posthumous awards, the whole point of the amendment had been that a token of something outstanding would be much better if it was of intrinsic value.

The Nuneaton and Tamworth amendment was lost.

Dr. L. B. PALING (South Staffordshire) moved to instruct the Council to include in its Annual Report a tabulated list of resolutions affecting policy adopted by the previous Annual Representative Meeting, including those on which no action had been taken.

The parallel he had in mind was with local authorities, whereby matters were kept on the minutes until they had been disposed or revised.

The CHAIRMAN OF COUNCIL said he did not understand the motion, as there already existed a tabulated list setting out references to particular minutes. The proposed action would involve waste of time and paper. Last year's meeting had unanimously resolved that the Spens Report should remain the basis of all negotiations on remuneration in any branch of the N.H.S. That still remained the Association's policy. The position taken with regard to autonomous bodies was also firmly maintained. These were the only policy resolutions of last year on which the Council had not reported this year. There was nothing more to be said about them.

Dr. PALING, in reply, said that as only two matters were involved there would be no waste of paper. It was those very things on which action had not been taken that it was desirable to keep in mind and readily accessible so that they might be considered if necessary.

The amendment was lost.

The CHAIRMAN OF COUNCIL then moved that the remainder of the Annual and Supplementary Reports of Council under "Preliminary" be approved.

Politics and the National Health Service

Dr. B. HIRSH (Manchester) moved as an amendment "That the action of the Council reported at para. 73 of the Annual Report of Council is gravely unsatisfactory." He drew attention to the resolution carried last year instructing the Council to take such action as would cause the Health Service to be removed from the political arena. The Council stated that it was unable to recommend any satisfactory alternative to the existing arrangements, and this, he submitted, was gravely unsatisfactory. The Council was instructed to take action and all they got was a lot of talk. The suggestion was not impracticable; it worked perfectly well with the B.B.C., and there was no sense in congregating at Brighton at considerable expense to pass resolutions and then be told by Council that it did not agree. The constitutional position was clear: the resolution had not been rescinded and still stood. The handling of resolutions by Council in the past had often caused grave disquiet, and the handling of this particular resolution did not allay this disquiet.

Dr. F. M. RIFKIN (Salford) seconded.

The CHAIRMAN OF COUNCIL suggested that the mover of the amendment had not read the paragraph, which was as follows:

The Council believes that it is impossible to divorce the Health Service, with an annual expenditure in the region of £400m., from Parliamentary control, and, as is the case in other national services—the armed Forces, national insurance, etc.—it must

from time to time be the subject of political controversy. For this reason the Council is unable at present to recommend any satisfactory alternative to the existing arrangement. It considers, however, that the position should be carefully watched and that it rests with the profession to strengthen its position and to take every possible step to prevent the Minister from effecting proposals concerning the Service without adequate consultation with the profession.

That did not say that nothing would ever be done, or that an opportunity might not present itself in which action would be possible, but it did bring the matter to reality. Fortunately with a party system such as obtained in this country there was bound to be some kind of move or action by one or another of the political parties in some way related to a particular service. "We care not which party," and he suggested that nothing more appropriate or helpful could be said in relation to the resolution passed last year than the paragraph he had quoted. If the mover of the amendment could suggest something else he hoped he would do so.

Dr. A. V. RUSSELL (Council) said that the Amending Acts Committee considered this problem at considerable length, but it was realized that at this present moment none of the suggestions which were made were practical. The Amending Acts Committee tried to discover some method of taking the Health Service out of the ambit of party politics. That medicine should be to some extent bedevilled by politics was a bad thing. The Committee was still exercised with this particular position and intended to make every effort to find a solution to the problem, but it was forced, through its chairman, to report to the Council that so far no possible solution had been found. He assured the meeting that the solution would go on trying, but, as the Chairman of Committee had said, where the financing of a service came from Treasury funds there had to be Parliamentary control.

Dr. HIRSH, in reply, said that the replies from the distinguished speakers did not satisfy him. If the Health Service was divorced from politics it need not cost £400m. The Council was given specific instructions; it was not asked to recommend alternatives, and nothing had been done. The Council could have called a conference of the political parties; it could have approached the Prime Minister and the Leader of the Opposition, and it could have adopted publicity and informed the public that the profession was tired of being the football of the two political parties.

The amendment was defeated, and the remainder of the Council's report under "Preliminary" was adopted.

"FAMILY DOCTOR"

Dr. O. C. CARTER (Chairman of the Family Doctor Committee) presented the report under this heading. He said that the publishing industry had passed through a very difficult period in the last twelve months, firstly because of the railway strike and secondly because of the printing strike, and now the credit squeeze which was affecting the revenue from advertisements. Normally a commercial publishing house was content if a brand-new magazine appearing in the early days of *Family Doctor* the Committee was advised that the magazine would never pay if the high ethical standard aimed at was maintained. For the second time, however, he was able to report that *Family Doctor* ended the year with a surplus, this time of £2,561. The circulation continued to rise in steady fashion, which augured well for the future. The increased size had been widely welcomed by readers, advertisers, and retail distributors, and the distribution of the magazine had been further helped by the expansion of the van service. Last year there were eight vans, four in the provinces and four in London; now there were 12, eight in the provinces and four in London, and they were doing very valuable work.

The policy of publicity in various ways had been continued. This year there had been little funds to engage in much publicity, but if publicity was not continued the clock soon began to run down and the effects were felt from

month to month. Next year it would be highly important for *Family Doctor* to engage in bigger publicity than this year. All these activities came out of revenue.

Dr. Carter then referred to the campaign carried on by *Family Doctor* on the fundamentals of nutrition which was trying to develop nutritional teaching at the shop-counter level, where the average woman spent her housekeeping money. There was an effective display at last year's Ideal Home Exhibition which took the form of a street of shops called "Family Doctor Street for Better Living." Articles which were popular in the magazine had been reprinted in the form of pamphlets which were distributed over the whole country, and a series of booklets were being got out on various matters relating to health which would be on sale in September. Articles on common ailments were being published showing that they were often brought about by an individual's way of living and were not cured essentially by medicine or surgery.

Another very encouraging aspect was the growing interest in the magazine by all sections of the community. At the same time, *Family Doctor* had a growing circulation abroad and was read by all kinds of workers in the general health field.

It was perfectly clear that no magazine could ever be the work of one man or one committee. It depended on a continued sense of loyalty and the devoted work of a small highly skilled staff, and in that respect *Family Doctor* was very fortunate.

From the vast number of letters received and expressions of appreciation it was also clear that *Family Doctor* was meeting a long-felt need of the community. Indeed, it had been estimated by experts that the actual readership each month was somewhere about 500,000.

As he had said on previous occasions, the Representative Body were themselves the proprietors of the Association's publications. Not only that, but they were responsible for seeing that *Family Doctor* was faithfully discharging the trust reposed in it to promote and to conduct health education over the widest possible fields and in all directions open to it, and, at the same time, to safeguard and maintain high ethical standards. Dr. Carter said he believed that had been and was being done.

So far as finances were concerned, the Representative Body could be assured that this year, as in the last two years, the intention was to produce the magazine—indeed to improve it—not only at no cost to the Association, but with a small surplus.

Dr. H. H. D. SUTHERLAND (Kensington and Hammersmith) moved that in order to maintain prestige of the B.M.A. and increase the value of *Family Doctor* to the public, more care should be taken to improve the quality of the blocks and general layout of all the material used in the production of the magazine.

He said that there was no doubt that *Family Doctor* was a wonderful production which had given much pleasure and interest to many people up and down the country; the motion was intended as a critical appreciation and was in no way meant to suggest destructive criticism. The quality of the paper, blocks, and layout of the material used in the production of *Family Doctor* still left some considerable need for improvement, so far as competition from other journals was concerned.

Dr. CARTER, in reply, said that he welcomed the motion, provided the words "more care" were deleted, because the most scrupulous care was taken in the production of *Family Doctor*. Two difficulties had been the strikes and the necessary change from flat to rotary press. The Committee and the editor had been dissatisfied with the results, but the matter was well in hand and he assured Representatives that no stone would be left unturned to produce the finest possible magazine. He would accept the motion if the words "more care" were deleted.

Dr. SUTHERLAND said he would be glad to substitute the words "continued care" instead of "more care" if that were agreeable to the meeting.

The Kensington and Hammersmith motion was lost.

new to put forward he thought they should be heard. The Chairman of the Journal Committee would also wish to speak.

Dr. C. P. WALLACE (Guildford) felt that one point which had not been sufficiently emphasized was the importance and value to this country of the freedom of the Press, and it was because the motion before them tended to interfere with and to limit that freedom that most of them were opposed to it. He would add that the freedom of an editor was something even more sacred than the freedom of the Press itself. As Dr. Hale-White had said, they must either find another editor or else leave him free. He had on a previous occasion compared the editor's position to that of the bishop in his diocese, the judge on the bench, and now he would add, the headmaster in a school who is appointed by governors but was left free to exercise his authority as headmaster. Fortunately, on this occasion they had an editor in whom they all had confidence. ("Agreed.") He could not feel that anything that the editor had said would be likely to interfere with the interest that Sir Russell Brain had expressed in the problem of the remuneration of the profession.

Dr. A. M. MAIDEN (Lincoln) said he had been instructed by his Division to speak against the motion, and he would only say one thing—we can surely put up with the Gold-Headed Cane if we have a copper-bottomed editor.

Dr. J. G. M. HAMILTON, chairman of the Journal Committee, said that there were several points put by Mr. Langston which had not been replied to by the speakers. The leader "The Gold-Headed Cane" represented legitimate comment on the current field. Criticism of institutions by the Press and other institutions was one of the most important functions of the Press and was an invaluable characteristic of free societies. The freedom of the medical press was no less precious than the freedom of the general press, and was to be guarded as zealously. Article 46 which was before them on the agenda laid down, of course, that the editor was responsible for all the matter which was printed in the *Journal*, except for announcements and material which he was instructed by the direction of Council to publish. The same Article laid down: "That the Editor shall be appointed by and be subject to the control of the Council." Everybody with any sense realized that the interpretation of the word "control" here must be the financial and disciplinary control of the Council. The editor could not be under the journalistic control of the Council, when in the previous section of the Article it was laid down that he was personally responsible for all that was published. The word "control" meant the ordinary control exercised by an employer over an employed person, and the employer who paid was the one who sacked. The editor, like any other official, like all other persons in the Association, was expected to work, and had done nothing else than work, within the framework of the policy laid down by the Representative Body. That was a positive statement with a negative side, in that the editor, like the other officials, must not advocate a policy which was contrary to that which had been laid down by the Representative Body, and the editor had not done so.

Did this article infringe any policy? The question had been asked, and it has been answered in the obvious "No." The timing of the leader had been criticized and, indeed, there being no case for infringement of policy, it was only upon timing that the criticism could stand. It was held to be inopportune, in that the new-found co-operation between the General Medical Services and the Joint Consultants Committees so heartily acclaimed by all sides, not least, let him remind his audience, in the editorial columns of the *Journal*, was claimed to have been jeopardized. It was said to be wrong to criticize any part or activity of a companion institution. Because a joint remuneration claim was likely all criticism must be silenced in the immediate interests of money—but who made the claim, or was it a threat that co-operation was in jeopardy? The President of the Royal College of Physicians of London, in making a reply to the leader, attacked the British Medical Association on grounds quite unrelated to anything in the

so-called offensive leader. He attacked the British Medical Association not only in the *Journal* but in the *Lancet*. The Association was accused of wishing to take over the whole business of financial negotiation, and it had, it was claimed, jeopardized co-operation.

Divisions up and down the country had called for the British Medical Association to make itself responsible for all financial negotiations. Representatives had sought—not this year yet, but in previous years—to advocate this course, and later on in the agenda there was a motion on the paper for discussion in this general sense. There was evidently a fair volume of opinion amongst members of the British Medical Association in favour of the Association endeavouring to take over the whole job of remuneration negotiation.

This was the accusation of the President of the Royal College of Physicians against the British Medical Association. This was what was claimed to prejudice co-operation. There was no reference to this in the leader under discussion, yet the editor was being censured for it. There was little chance, fortunately, of this co-ordination being broken. The General Medical Services Committee and Joint Consultants Committee, and the respective chairmen, knew perfectly well that the success of the claim was in large measure dependent upon it being a joint one, and who was going to break the co-operation under these circumstances? The threat came from outside; it was not intrinsic in the material published.

"May I ask the meeting's permission to say one or two words on what I regard . . ." (Cries of "No, no," and "Vote"). "I advise the Representative Body to object to this motion wholeheartedly."

Mr. LANGSTON, replying, reiterated that this resolution in the view of those who supported it was in no sense meant as a vote of censure in any way upon the editor of the *Journal*. He thought that it had been largely admitted that the article was published at an inappropriate time, but it went further, it was an attack on one College which had, for the first time since the National Health Service had come into being, joined action with the Association and the other Royal Colleges on the remuneration issue, a policy which Dr. Hamilton himself strongly advocated at the Glasgow meeting. He submitted that such an article might well have led to a dissolution of the recently formed negotiating committee, and it was an article which affected policy. He agreed with Dr. Hamilton that the leading article did lead to the issue being widened and to other issues being drawn in which they, on the side of the British Medical Association, would have hoped would have disappeared; it sharpened the divisions which could exist, and drew attention to them and might have affected in this way general policy. Dr. Langston still asked the meeting to vote for the resolution. The motion was merely asking for the issue to be re-examined and that there should be a careful integration between what was stated in the *British Medical Journal* and the policy of the Association.

In conclusion, he stressed again that many members of the medical profession regarded the *Journal*, as it said on the cover, as the journal of the Association, and the leading articles as expressing the policy and views of the Association and its Council. If there was nothing wrong with that article why did the Council find it necessary to dissociate itself from the article and to publish its dissociation from the article in the columns of the *Journal*?

The motion was defeated by an overwhelming majority.

The Supplement

Dr. L. J. BARFORD (Reigate) moved that the *Supplement* be published in separate form or that it form the centre pages of the *Journal*. He said that it was important that as many members of the Association as possible should know what was in the *Supplement*. A few years ago it was separately bound and issued weekly with the *Journal* and one could carry it about in one's pocket and read it at odd moments. While it was part of the *Journal* it was difficult to tear it out without destroying the *Journal* to some extent. He thought some of the surplus could be used for the purpose.

Dr. E. TOWNSEND (Cornwall) supported the motion in the hope that the question would be rediscussed. His Division had sent forward several suggestions; one was that the *Supplement* should be a different colour, that the edges should be marked in colour, or that the pages should be put in as an inset. The Journal Committee had replied that it would cost money and that it could not be done in the present method of putting the *Journal* together, but he still did not see why the position of the *Supplement* should not be altered.

Mr. A. LAWRENCE ABEL (Marylebone) supported the motion but suggested that the motion should be referred to Council so that the Journal Committee might once more consider it from a sympathetic point of view.

Dr. HAMILTON said that the Journal Committee would not be doing its work if it did not give consideration to these matters from time to time and it would look at this again if the mover referred the matter to Council. Separate stitching of the *Supplement* would cost about £5,500 over and above the present cost, and it would mean almost inevitably that the *Journal* would arrive later than it did now because of the mechanical and human difficulties which would be experienced by the printing works. It would also be offensive journalistically to put the *Supplement* in the centre, as it would divide the editorial pages. The object of the Journal Committee was to produce an article of the highest standards.

Dr. BARFORD said that he had heard arguments about the expense, but he was not convinced by the arguments against putting the *Supplement* into the middle part of the *Journal*. He would accept the suggestion that the matter be referred to Council.

Greetings from Irish Medical Association

A telegram was read from the Secretary of the Irish Medical Association sending all good wishes for a successful and enjoyable meeting.

ASSOCIATION FINANCE

Mr. L. DOUGAL CALLANDER (Treasurer), presenting the Financial Statement for 1955, said that, having practised every economy and particularly by careful budgeting, the Association had experienced a reasonably good financial year in 1955. Subscription income, after allowing for losses and exchange, had been slightly short of £260,000, representing an increase of £7,809 over the previous year. During 1955 the Association had attained its highest membership in its history.

Mr. Callander paid tribute to the excellent work of secretaries and members of executive committees of Divisions in interviewing non-members and members in arrears as a result of his own appeal at the last A.R.M. There were now 5,560 members paying their subscriptions by way of banker's order, which guaranteed a very considerable income on January 1 of each year. He was pleased to report that membership continued to increase.

There had been a slight increase in rents from tenants in B.M.A. House. Interest on investments was up because considerable sums of money had been obtained at the beginning of the year which had not been needed until later. The line had been taken of investing in Treasury Bills for periods of 91 days so that they fell in at various periods with interest of 5 to 5½% without any risk of loss of capital. Last year some £1,700 of income had thus been obtained which the Association had hitherto never had. Total expenditure, he said, had increased from £227,000 in 1954 to £243,000 in 1955. Against this, there had been received from the Government a grant of £10,100 towards the Central Medical Recruitment Committee, while there had been a surplus on the publications of the Association.

He hoped the Representative Body would feel that the past year had been satisfactory, but, turning to the present, he regretted that the picture was changing. At the beginning of the year increased expenditure had been anticipated, the exact amount of which had not been possible to foretell,

but it had been anticipated that there would be a balance of £20,000 to be earmarked for the general reserve at the end of the year and a surplus on publications. The budget had already had to be amended, due to increased printing costs and the prolonged printers' strike, which had affected advertisements, particularly in *Family Doctor*. It was already evident that the surplus on publications would be materially reduced from last year. A few weeks ago the Council had been obliged to meet a quite proper claim by the clerical staff for a cost-of-living bonus, which had cost £8,524, more than absorbing the contingency figure of £5,000. There would be other increases in the remainder of the year which it was not yet possible to assess.

The future promised an estimated surplus of anything from £5,000 to a doubtful £15,000 against last year's £47,000—not enough for an association of the size of the B.M.A. if it were to avoid the unhappy experience of a few years ago. It left the Treasurer with too little surplus to meet the unforeseen or indeed the foreseen rising costs due to inflation. Inflation was still going on, and it was affecting everything at Headquarters. It was his duty as treasurer to sound a serious note of warning. Every item of expenditure would be carefully scrutinized and every step taken to introduce economies where they could be introduced without loss of efficiency. It was quite clear that the Association could not entertain any large item of new expenditure at its present subscription income. While he would be the very last person in the world to recommend an increase of subscriptions, he was obliged to point out that unless it was possible to widen the margin between income and expenditure it might be necessary in the future to take that unpleasant step. The income from subscriptions, rents, and interest on investments was just enough to run the Association in its present form. He trusted that all members would appreciate in all seriousness the existing situation. It would be his own unpleasant duty at the very first meeting of the Council after the A.R.M. to suggest economies that might be made, but he was not prepared to suggest economies which would in any way reduce the efficiency of the Association. There was only one B.M.A., as the Chairman had so often said. To keep it in its present form he feared would require extra money to run it in the way that would be desired by all.

In reply to a question about Dr. Boyd's bequest, he said that he had only ten days ago given instructions for the payment of death duty on a sum of money which would eventually come to the Association, and a statement on the subject would be made at Monday's Council meeting. He assured the meeting that, without any doubt, the original intention of Dr. Boyd with regard to Manchester would be honoured.

Subsistence Allowance

Dr. E. TOWNSEND (Cornwall) moved that, the principle having long been approved as the policy of the Association, the time had arrived when subsistence allowances should become payable to members when attending centrally arranged meetings for which they have been elected.

He said that, while it was proposed to spend money on many social amenities which were much to be desired, such things were not as important as implementing a proposition which had been agreed to in principle as long ago as 1951. Not only must the Association afford to do it; it could not afford not to do it. It was wrong that members who were willing to attend centrally arranged meetings should be prevented from doing so because they could not afford to. The quality of representation would deteriorate in the very near future unless something was done. If necessary, third-class instead of first-class travel might be authorized. He inquired how many members of the Association travelled first-class at any time when not attending B.M.A. meetings.

Dr. O. C. CARTER (Bournemouth) said there had been a breach of faith in the matter of subsistence allowances, the principle having been agreed by Council so long ago. The present income of the Association was £68,000 above the 1951 figure and last year there had been no deficit on the publications. The Representative Body was the custodian

of the Association's money. However desirable certain other activities might be, priority should be given to the claim of Representatives to subsistence allowance, which, averaging £5 per Representative, would cost a little over £2,000 for each meeting.

Dr. W. N. LEAK (Mid-Cheshire) said that, while the inconvenience of the claim was thoroughly realized, it was surely not to the honour of the Association, with its 60,000 members and six-guinea subscription, that it could not afford to pay the expenses of those who served it so well purely in an honorary capacity.

Dr. M. R. SHERIDAN (North Middlesex), supporting the motion, said the democratic foundations of the Association were in danger under the present system. The active members of the Division made up, in great part, the Division's executive committee, but it was not really the active members that went as Representatives to the Representative Body, for they had to be able to afford to leave their practices and pay a locum.

Dr. R. B. L. RIDGE (Enfield and Potters Bar) said that the proposal should be put into effect at once, although he appreciated that the Association would have difficulty in affording it. His Divisional meeting had expressed willingness to accept an increase in subscriptions in order to provide the allowances.

Dr. ST. G. B. D. GRAY (South-West Essex) suggested that the allowance should be one or two guineas per day.

Dr. F. P. RUST (Harrogate) thought it was generally believed that the central body was constantly keeping under its eye the various suggestions that were made. He thought it was possible for Divisions to be properly represented. It cost very little per head in a Division to send a Representative to the meeting, to pay a subsistence allowance, and to pay a locum, if necessary.

The TREASURER agreed that something should be done about the matter, especially in to-day's altered conditions, but was reluctant to commit himself until he had a better idea of what the financial position in the current year would be. He suggested that the meeting should refer the matter to Council, not for it to be deferred until next year but to be dealt with in the early autumn.

Dr. E. TOWNSEND (Cornwall), in reply, said that the Association must put first things first, for its future would depend on having the best representatives available.

The Cornwall motion was carried.

Dr. M. MACLEAN (Inverness) formally moved that consideration be given to reducing the B.M.A. annual subscription to whole-time salaried practitioners in the National Health Service.

The motion was not carried.

ASSOCIATION ESTATES

Mr. DOUGAL CALLANDER presented the report of Council under "Estates," and gave details of the redecorating and alterations which, he said, would improve, among other things, the ventilation and acoustics in the Council Chamber. He also gave details of negotiations with the lessees of the adjoining site in Tavistock Square concerning the installation of a series of windows in the south wall, and referred to the Burton Street site.

The report under "Estates" was approved.

PRIVATE PRACTICE

Dr. A. BROWN, chairman of the Private Practice Committee, moved the report under "Private Practice."

During the last year, he said, efforts had been maintained to get the fees paid to medical men stabilized, and the only matter outstanding was the payment by the Treasury of two guineas to medical officers instead of 25s., for which the Committee had asked. It was also hoped that improvements would be effected so far as the question of the remuneration paid to civilian medical practitioners undertaking work for the Air Force and the Army.

Other matters being dealt with were parking in cities and towns, private beds, and the allowances for medical wit-

nesses appearing in court cases, which had been increased from £5 to six guineas for a full day, and from £2 10s. to three guineas for a half-day.

On the question of drugs for private patients, Dr. Brown said that there had been a very satisfactory interview with the Minister, who had been sympathetic. The members of the delegation used every argument which had been used before in the Representative Body and the Council in support of the claim, and in his view some progress was made. The delegation was informed that the door was not closed, and the Minister went even further and agreed with the principle that private patients had a right to free drugs under the N.H.S.

It was clear from the agreed statement published in the *British Medical Journal* that the Minister had two general principles in mind. The first was the right of the public to choose what service they would take, or whether they would take any at all under the National Health Service, and the other was that the Minister could not interfere with the right of any doctor in his treatment and prescribing for his patients. At the same time, the Minister said that the present was not a very suitable time in which to go forward with an amending Act, which it would mean. To begin with the Minister said it was a highly controversial question which might lead to a great deal of discussion in the House. Secondly, he said that the legislative programme was already heavily overladen and he did not see any immediate prospects of getting an amending Act to the National Health Service Act put before the House. Thirdly, he said it would mean some increase in expenditure. The delegation endeavoured to point out to the Minister that it did not necessarily mean that. Then the Minister said that he thought there were other things requiring to be done in the National Health Service which had higher priority. He did not specify them, so the delegation had no chance of arguing the matter. Finally, the Minister suggested discussions with his officials on how the business of drugs for private patients could be carried out; and the first thing to be discussed, said the Minister, was the size of the problem, the second the estimation of the cost, and the third the administrative procedure.

The Minister also stated that a joint body would have to consider what the effect on the method of calculating the remuneration of general practitioners would be. He had pointed out that any increase in the number of patients receiving service privately instead of under the Service would mean some alteration in the pool. The delegation had agreed and pointed out it would mean a difference in the £2m. allowed for private practice in calculating the moneys already received by doctors. The Minister said that it might go further than that, and that a substantial increase might mean the whole method of calculating the pool would have to be altered, and instead of calculating on the number of doctors in the Service it might have to be calculated on the number of patients in the Service.

It was necessary, in Dr. Brown's view, to exercise great care in considering the problem. "Do not let us rush wildly in deciding what course should be adopted," he said. Accepting the Minister's statement that there was no chance of getting an amending Act on to the Table of the House for some considerable time, there was plenty of time in which to discuss the whole problem, and he suggested to the Representative Body that they should leave it to discussions in the two main committees concerned, to subsequent discussion in the Council, and then ultimately by the Representative Body when a report was made. He urged the Representative Body to accept some of the motions which came later as reaffirmation of a policy which the Association had always followed.

Drugs for Private Patients

Dr. R. GREEN (Brighton and Mid-Sussex) moved:

That the Representative Body notes with satisfaction that a further meeting has been held with the Minister of Health on the question of allowing private patients to obtain drugs, appliances, and dressings through the National Health Pharmaceuti-

cal Service. It again emphasizes the importance it attaches to this matter of principle and urges the Council to continue to seek a successful solution to this long-standing grievance.

He confirmed that the Minister had accepted the views expressed on behalf of the Association and had listened very attentively, and in securing recognition of those facts a definite advance had been made.

It must be recognized that there were some people who had not realized that there was a difference between a White Paper and an Act, and it was not therefore just a question of the proclamation of rights, because they had to be obtained by an Act of Parliament.

Another point about which the Minister was concerned was the control of prescribing and the difficulty of imposing penalties. However, the delegation told the Minister that their view was that it could be surmounted, and the fact that the Minister had suggested that it should be discussed must be regarded as encouraging.

So far as paragraph 4 was concerned, it might well be argued that the acceptance of the principle that private patients were entitled to a right to drugs under the Health Service and its possible implementation by legislation should have no bearing at all on the question of remuneration of Health Service practitioners. It would appear that the Minister considered that the granting of that facility would automatically increase the amount of private practice as a whole. That was an unjustifiable assumption at the present time, for the results were quite unpredictable. It was, of course, regrettable that in something which it was believed should be to the advantage of the medical service and to the benefit of patients it was apparently not possible and to keep away from political considerations. "However, the ultimate settlement of the grievances depends upon ourselves," said Dr. Green. "This year we have been told that the idea is not repugnant to conservative principles. We have had some frank discussions and, what is important, an invitation by the Minister to sit down and talk to Ministry officials and work something out. We have been told also about certain difficulties which we have recognized, and to overcome them will require statesmanship. Do not be put off by anything that is agreed, and let us get on and work it out and do it."

Dr. G. S. R. LITTLE (Greenwich and Deptford) said that his Division's motion supported the motion by Brighton; it deplored the continual refusal of the Minister to supply drugs to private patients. He was not criticizing the Private Practice Committee or the Council, but he felt the Association was being side-tracked by the Minister. He would suggest that they should not be side-tracked by the issue of remuneration or by the question of lack of Parliamentary time. The Government never did find Parliamentary time for something which concerned a minority, and this concerned a minority of people who wished to receive their medical treatment from a private practitioner and whose financial burden was added to by the fact that they had to pay for their drugs. Many people were being deprived of their rights in this respect because they had to pay for their drugs and appliances.

Dr. H. M. GOLDING (Bristol) asked why there had to be an amendment of the Act. He understood that it was a ruling of the first Health Minister that the general medical and pharmaceutical services should be taken as one part of the Act.

Dr. BROWN, Chairman of the Private Practice Committee, replied that not only did the first Minister say so, but the Association's own lawyers said so.

Mr. M. D. THAKORE (Doncaster) asked if this applied to all drugs and appliances or to drugs only.

The CHAIRMAN replied that it applied to drugs and appliances.

Dr. R. HALE-WHITE (Marylebone) said that if this matter continued to drag on it would come to a stop altogether. He was a little distressed to hear the chairman of the Private Practice Committee talking about leaving the matter until next year. It was obvious that the present Minister had

done what his predecessors had done in a more subtle way. He did not want a debate in the House, nor did anyone else. The excuse of a heavy legislative programme had been the excuse for five years. This had nothing to do with priorities in the N.H.S.; it had nothing to do with the N.H.S.—it was private practice. It had nothing to do with remuneration, though that might be a problem which would crop up if a substantial increase was likely. No one could say by how much private practice would increase if this went through; it might increase very little indeed, and there would be no need to worry about the boggy of remuneration of doctors who had no private patients. He thought the matter would be in better perspective if they stopped talking about it as a concession: it was no more a concession than the redemption of any other promise.

Dr. E. C. WARNER (Marylebone) said that Mr. Iain Macleod, when Minister of Health, stated that private practice was part of the National Health Service. He had gone to the trouble of finding out what this would cost, and it was very much lower than the Minister had said—something of the order of £500,000. No one turned a hair at the loss of £30m. on the British Transport Commission and he could not see why they should worry about £500,000. There was a proportion of the public who wanted this, and it was for the Annual Representative Meeting to pass the resolution and support those who wished to have this type of practice.

Dr. A. V. RUSSELL (Council) said that this was purely a reaffirmation of something which had been the policy of the Association since 1948. "Let us go on record as standing up for the rights of our patients."

The motion was carried.

Dr. J. C. A. NORMAN (Bournemouth) moved to instruct the Council to take steps to ensure that any further deputations to the Ministry to secure the right of private patients to obtain drugs and appliances through the N.H.S. should be more closely identified with private practice. He said that this was a corollary to the previous motion. His Division was very exercised by the fact that no member of the recent deputation to the Minister was engaged solely in private practice. It was said that the Minister suggested that a discussion should be held to determine what adjustment should be made in the Central Pool if a number of patients at present on the N.H.S. lists became private patients because they could obtain their drugs on E.C.10. All the members of the deputation were on the N.H.S. list and had private practices as well, and would be divided in their interests. It was not in the province of the General Medical Services Committee to approach the Minister on this matter, but the Private Practice Committee. On any other deputation there should be representatives of people closely identified with private practice. There were nearly 700 doctors in private practice alone, and they should be represented on any deputation.

Dr. A. TALBOT ROGERS, chairman of the General Medical Services Committee, said that it was the Council who decided that it was important that the deputation should represent the Private Practice Committee and the General Medical Services Committee, because nothing could be decided which would not affect practitioners in the National Health Service, the majority of whom had private patients also. It was therefore decided that the deputation should be chosen from the two committees, it being left to the two Chairmen to make the choice. It was hoped that it would be possible to include a doctor who was a private practitioner, but he was not prepared to go as a representative of the General Medical Services Committee although he would have been introduced to the Minister as a private practitioner. If he had done so the deputation would have been stronger. All the arguments which could have been put forward to the Minister were put forward very ably by Dr. Brown and his colleagues; there was nothing left unsaid which could be said.

Dr. Rogers hoped the resolution would not be accepted. A joint meeting of the two committees was to be held to see if the many difficulties could be thrashed out and a scheme acceptable to both put forward. The deputation told the Minister that, so far as the profession was concerned,

there was no reason whatever why drugs should not be supplied to the private patients.

Dr. NORMAN, in reply, said that Dr. Talbot Rogers said he was in favour of the resolution but asked the meeting to reject it. The resolution was a suggestion for strengthening future deputations and would satisfy the people in purely private practice.

The motion was carried.

(Dr. A. Beauchamp, Deputy Chairman, took the chair at this point.)

Dr. J. W. RIDLEY (Cleveland) moved that the fee for reports to Government departments at present standing at 5s. be increased to 1 guinea in conformity with the fee paid by insurance companies for reports without examination, without comment.

Dr. BROWN, while in sympathy with the amendment, said that there was no agreement with life assurance offices that the fee should be £1 1s. Members had been advised that in the opinion of the Committee the fee should be one guinea. The amendment was carried.

Telephone Charges

Dr. J. A. WAKES MILLER (Rugby, with South Warwickshire) moved: That this meeting is amazed at and dismayed by the new and heavy charge for switching telephone calls during temporary absence. If most doctors are to continue to give the 168 hours per week service which was morally though not legally expected, then this particular charge should be either paid directly by the Health Service on presentation of the telephone account or else the charge withdrawn. He said that his Branch had had a fair amount of correspondence on this issue with the Postmaster-General, the executive council, and other interested bodies, and it was hoped that something could be done to obviate them.

Dr. I. M. JONES (Sunderland) hoped that the motion would be turned down. The matter had been gone into in great detail with the Postmaster-General, and from the examination made by the Private Practice Committee certain things became clear. First of all, even the amended charges were below the actual cost of the service. To pay 5s. was not the cheapest way of doing it if a doctor used the service regularly. It would cost at least 5s. to have a sitter-in, but there were cheaper arrangements. To pay £2 a quarter meant that the telephone could be transferred as often as one wished, so that it need not cost more than £8 a year, and this was allowable for income tax. On the other hand, if the telephone was consistently transferred to a specified number an entry could be made in the telephone directory for a small fee. This motion would, in effect, ask the Government to create another subsidy, which he did not think the profession had any right to do. There would be difficulty in distinguishing between this profession and other professions which might say that the telephone was essential to their business.

Dr. J. G. R. CLARKE (South Bedfordshire), while agreeing that it was not right to expect a subsidy to deal with the problem, said that nevertheless the Association was facing an increasing gap, which would not be readily closed, between income and expenditure. It was true that increased expenditure would go towards the tax expenses total, but in ordinary private enterprise a man was in most cases able to pass on an increase in cost fairly rapidly to the consumer—in the case under consideration, the patient—which the medical profession could not do.

Dr. A. B. DAVIES (Walsall and Lichfield) said the increased telephone charges were always heavily subsidized in the doctor's favour. Those assessed on Schedule D—as were most G.P.s—received 100% allowance on all telephone charges. The charges that remained to be paid by all G.P.s in the kingdom were added together and considered in that proportion of the claim for remuneration which went for practice expenses, so that although the individual may not see his money back directly, within two years the whole of the G.P.s did receive back by way of an increase in their practice expenses ratio the whole amount that they had individually and collectively paid on the increased telephone charges.

Dr. A. BROWN said that the telephone service was a national service and the cost per quarterly charge was £2 10s. over the whole country. For a little over 3s. a week, or 6d. a night, a doctor could get his telephone transferred to a partner or neighbour throughout the year. He asked if anyone could think of a cheaper service.

Dr. S. NOY SCOTT (Council) said that "paid directly by the Health Service" could not mean anything but "paid by the Government." He did not see why they should pay for calls which might be private calls. To allow the principle that the Government should pay 100% on any one of the practice expenses was to put another nail in the coffin of the ordinary service and was simply asking for a Government whole-time State service.

The Rugby amendment was lost.

Medical Examination of Elderly Drivers

Dr. F. P. RUST (Harrogate) moved that when the medical examination of elderly drivers was requested by insurance companies it should be carried out by an independent doctor for a similar fee to that for life insurance, and this fee should be payable by the insurance company. He said that the mere form in which such a patient requested a certificate suggested that he expected a favourable report, and, because he was paying for it, it savoured rather of bribery.

Dr. A. BROWN said that the Accident Insurance offices had been approached, and had expressed the view that it was up to the individual who wanted an examination for the purpose of driving his car to get that examination and report at his own expense. The Council would be prepared to have another try, but that had been the attitude of the companies so far.

Dr. R. W. McCONNEL (Buckinghamshire) said that surely the doctor should not run away from his responsibilities. If the suggestion in the motion were adopted, patients might get the impression that some special doctor was required to give an insurance examination and that the general practitioner could not do it. He thought that the ordinary type of certificate should be given by the patient's own doctor.

Dr. RUST, in reply, emphasized that the question of unfitness to drive was an important matter and a half-crown certificate was very easily given without a complete examination.

The Harrogate motion was carried.

Fees for Practitioners Called in by Police

Dr. A. BROWN moved as a recommendation of Council the adoption of the revised scale of fees for payment to practitioners in England and Wales called in by the police. (The scale was published in the Annual Report.)

The recommendation was adopted.

Dr. R. M. WARREN (Southampton) moved strong support of the Council's action in making a claim for increased fees for payment to practitioners called in by the police, and called upon the Council to pursue its claim with the utmost vigour.

This was agreed to without discussion.

Medical Examinations for Life Assurance

Dr. R. P. HENDRY (Rugby, with South Warwickshire) moved that if, after a report on a medical examination for life assurance had been received, further medical evidence was considered necessary by the office's chief medical adviser, then that evidence should be obtained at the office's expense, not at the expense of the patient.

He said that his Branch had taken umbrage at the attitude of insurance offices in requiring a special examination and not being prepared to pay for it.

Dr. A. BROWN said it had been made perfectly clear to the insurance offices that any extra information required, provided the original report had been filled up correctly, should be paid for, and the offices had agreed to pay for such extra information. They had since said that there were a certain number of very low premium policies which could afford a 2-guineas fee but not an extra fee for further

information; if that extra information was not conveyed by the proposer to the company he might find himself being refused insurance, having to pay an increased premium, or be at some other disadvantage. By insisting that the company should pay for this extra information, therefore, the doctors might be penalizing some of their own patients.

Dr. J. B. WRATHALL ROWE (Harrow) said that, as an industrial medical officer in a factory where the staff were x-rayed on entry and at certain other times during the year, he was often asked to supply information regarding the chest x-rays of employees after local practitioners had examined them for private life insurance—a request with which he had always complied. He was now wondering whether that ought to be done, thereby giving those companies free information.

Dr. HENDRY said that to reject the motion was, in effect, expecting the consultants to subsidize insurance branches. It meant that if the companies could not afford to do it they had to beg, borrow, or steal the money from the medical profession to make good the deficiency.

The motion was carried.

Certificates in Respect of Absent Voters

Dr. R. P. HENDRY (Rugby, with South Warwickshire) moved that the medical certificate at present required with an application to be treated as an absent voter was entirely unsatisfactory, and should read: "I certify that in my opinion it is undesirable on medical grounds that this applicant should go in person to the polling booth, and that this state is likely to continue (for . . . months) or (indefinitely)."

He suggested that many practitioners on filling up the certificate referred to in the motion must have committed perjury in the past, and that the wording that he suggested would be more appropriate.

The Rugby motion was carried.

Certificates for Short Illnesses

Dr. T. MOONEY (Cumberland) moved to request the Council to approach industry in general with a view to abolishing the requirement of medical certificates for short illnesses.

Dr. J. C. ARTHUR (Gateshead) opposed the motion, pointing out that there was no definition of a short-time illness. It would be throwing away a legitimate form of remuneration, which was one of the few private forms of remuneration left.

Dr. R. S. V. MARSHALL (South Staffordshire) suggested that there was a debasement of medical certification because of the unnecessary certificates asked for by industry. In his view something could be done locally about the matter.

Dr. J. B. WRATHALL ROWE (Harrow), in opposing the motion, said he had asked the mover what he meant by a "short illness," and the reply was one or two days. Generally speaking, in industry one or two days' absence was allowed without question. (Cries of "No.") Unless there was a sick-pay scheme those two days were covered.

Dr. R. WEBB (East Suffolk), supporting the motion, said that the N.H.S. was never designed to deal with the mass of certification which agreements regarding pay arrangements entailed. The extra work that would be thrown on the Service would be very great, and the treatment of the sick would be rapidly subservient to the consideration of certification.

Dr. R. H. MOORE (North Middlesex) asked whether it was not a fact that certificates for short-term illnesses were really required by companies for audit purposes. They acted as vouchers for payment to men who said they were sick.

Dr. J. S. M. ORD (Glasgow) asked the Representative Body to support the motion and thereby get rid of the nuisance of unnecessary certification.

Dr. A. BROWN said it would be very difficult to get rid of the certificates. "If you are to say that all industry should abolish this demand," he said, "you will have to

start at home, because I understand that the B.M.A. demand from the clerical staff a certificate after an absence of two days."

Dr. T. MOONEY (Cumberland), in reply, said that the point was a simple one. "We have all sampled the pudding and we know what it tastes like," he said.

The motion was carried.

PUBLIC HEALTH

Dr. J. B. TILLEY (chairman of the Public Health Committee) presented the report under "Public Health." He referred to the previous year's decision that steps should be taken by the Association to raise the low level of remuneration in the public health service, and said that the matter had been considered by the Public Health Committee during the year. The view of the Council on the appropriate action to be taken was that an independent committee of inquiry should be set up. It was of interest to report that the last industrial court award had now been implemented by all but eight local authorities out of 1,600 authorities in this country. The Public Health Committee had felt that it could do no other at the moment than move to obtain an increase in remuneration on the grounds of the cost of living since the last award, and agreement was reached in Committee C in April. The figures were accepted with some regret, but as they were related to the increase in the cost of living they did not seem unreasonable. It was made perfectly clear to the Management Side, when the claim was made, that it did not for one moment mean that the public health service accepted the last award of the Industrial Court as being a proper level of remuneration for public health medical officers.

On the question of appeals, there had been 30 successful appeals, and all but one had been implemented by local authorities. That exception was Middlesbrough. Whilst it would appear that the Council so far had done all in its power to get Middlesbrough to implement the appeal, it might be that in the course of the ensuing 12 months Council could give some attention to the possibility of bringing pressure to bear. In that particular instance the Management Side of the Whitley Council concerned had been as helpful as possible.

Turning to appeals machinery elsewhere, he reminded the Representative Body that in Northern Ireland there was no adequate appeals machinery at all, and Council decided that a deputation should wait upon the Ministry in Northern Ireland, after consulting with the Northern Ireland Branch, in order to see what improvements could be made. In view of the special circumstances, it was felt difficult to have a regional appeal in Northern Ireland, but it was hoped that before long appropriate machinery would be available for the men in the hospitals and public health service who had outstanding cases for appeal.

The question was considered of medical officers of health acting as medical referees at crematoria, and in those cases where medical officers of health accepted posts of referees at crematoria they should be entitled to a regrading of their salary.

Dr. Tilley went on to move as a recommendation of Council:

That it be the policy of the Association that no woman doctor should be disqualified from obtaining a public medical appointment or be dismissed from such an appointment simply by reason of marriage.

This was agreed to.

Pure Milk

Mr. A. LAWRENCE ABEL (Marylebone) moved that the meeting would welcome next year a report from the Council on the subject of pure milk for the nation.

Ten years ago, he said, Marylebone took a great interest in the question of clean milk for the nation. It was the duty of the Representative Body to keep an eye on the question of clean milk, and everything that could be done to upgrade dairy stock should be done. "In Marylebone we have been asking ourselves—and we have not got the

answer—whether the Ministry of Agriculture and Fisheries is good enough to supervise cows, cowsheds, udders, and milk," he said. "Do our colleagues, the medical officers of health, get enough ingress into cowsheds to supervise the production of pure milk as they should? What encouragement do good farmers have for producing upgraded herds and producing better milk?" Although there had been some improvement there were too few benefits for the good farmers and too little encouragement. A report from the Council was requested so that the profession could keep an eye on the extremely important subject of national health.

Dr. H. D. CHALKE (Council) said there was a Gilbertian situation in the country at the present time. The inspection of cows and cowsheds was the responsibility of an officer from the Ministry of Agriculture, whilst milk in transit and in shops was the responsibility of the local health authority. The position was absurd. There must be one milk which was satisfactory for the public.

Dr. F. E. GRAHAM-BONNALIE (Exeter) said he did not believe the "dirty milk story." He visited farms very frequently, and the "dirty" farmers had now been put out of business. There were a number of farmers in Devonshire who were not allowed to sell milk any more.

Dr. W. S. PARKER (Public Health Service) disagreed with the previous speaker, and said that, of 2,000 samples of raw milk which came into Brighton from various dairies, one in three was unsatisfactory on the methylene blue test, and one in seven of T.T. samples was unsatisfactory on the same test. There was one inspector at the Ministry of Agriculture and Fisheries for 900 farms which supplied the milk.

The motion was carried.

Annual Leave of Public Health Medical Officers

Dr. S. J. FIRTH (Brighton and Mid-Sussex) moved that the terms and conditions of service of public health medical officers should be reviewed with the object of relating them more closely to those pertaining in the hospital services in regard to annual leave. He said that it appeared to be the practice to relate the amount of annual leave in the National Health Service to the amount of the salary paid in particular grades. Even in the clerical grades the amount of annual leave was based on the amount of earnings. If doctors contributed to the local health services they contributed as doctors, and their remuneration and conditions of service should be kept within the ambit of the Whitley Councils.

Dr. TILLEY said that the Brighton delegate spoke of medical officers of health and counties and county boroughs only, but this should apply to all medical officers in the public health service.

The motion was carried.

Air Pollution

Dr. D. S. ROBERTSON (City of Edinburgh) moved:

That this meeting views with grave concern the continued menace to the health of the people caused by air pollution; welcomes the passage of the Clean Air Bill through Parliament; urges the Government to implement its provisions vigorously; and wishes particularly to impress upon local authorities the urgent need to use to the full the statutory powers given to them to declare smoke-control areas.

He said that he had learnt before coming to Brighton that the death rate in 1954 for bronchitis was 29 per 100,000. In Oldham it was 139 per 100,000, nearly five times as much, and there were other figures which could be quoted to show the difference between chronic bronchitis in places such as Brighton and industrial areas. Medical opinion was becoming more and more firm that this difference was due to atmospheric pollution by smoke. It was remarkable that everyone in the community was careful about the purity of the water they drank, but careless about the purity of the air they breathed into their lungs. Bronchitis was regarded as an everyday commonplace; it was insidi-

ous, inexorable in its course, and inevitable in its results. It was a disease for which little could be done. The introduction of the antibiotics had done very little to reduce the ultimate mortality from chronic bronchitis. Medical opinion was sure that it was the result not of chronic infection but of chronic irritation, and the chief chronic irritation was atmospheric smoke. There was an excellent leader in the *British Medical Journal* of April 21 (p. 906), following a discussion at the Royal Society of Medicine, which finished up with the words, "Abolition of atmospheric pollution may prove to be the most important single factor in bringing this about"—that is, of a substantial fall in the incidence of chronic bronchitis.

There was at present a Clean Air Bill before Parliament. He was not quite sure what stage it had reached, but it was an excellent Bill, provided it was implemented, and one should congratulate the Government on bringing it forward. Too many of these Bills were not mandatory; in this one local authorities might set up smoke-controlled areas and pressure must be brought to bear on them to institute smoke-controlled areas in all large cities. He was told that this would be very expensive, and subsidies would be required to reduce the price of smokeless fuel and furnaces to burn it in, but air pollution was costing the country £150m. per year in the upkeep of buildings, and who could estimate what it cost in terms of ill-health? Edinburgh felt that it was the duty of the Representative Body of the doctors of Great Britain and the Commonwealth to declare that it was the inalienable right of the people of this country to breathe clean air.

Mr. A. LAWRENCE ABEL (Marylebone) emphasized what the last speaker had said. The head of the National Industrial Fuel Efficiency Service said that hot air was costing the nation £35m. a year—that was the mere heating of houses and factories—and the Coal Research Board had shown what a vast amount of heat from coal went up the chimneys, leading to pollution of the atmosphere. Two or three days' fog in London a few years ago caused the deaths of 4,000 more than the average. Clean air was a sound and economic proposition as well as a sound medical one. He hoped the meeting would pass the resolution.

Immigrants with Communicable Diseases

Dr. J. G. FREEMAN HEAL (Willesden) had a motion expressing alarm at the continued influx of immigrants found to be suffering from communicable diseases, and instructing Council to explore the problem with a view to necessary action.

Of the three main types of communicable disease, tuberculosis was the most outstanding and the most readily disseminated. Figures were not yet available to any impressive extent, but a report was being prepared by the Joint Tuberculosis Council which would possibly contain the necessary statistics to crystallize the experience of general practitioners, tuberculosis clinics, and hospitals that cases of tuberculosis were entering the country in far greater numbers than the Ministry of Health was willing to admit. At one clinic in N.W. London, of 78 beds provided for the treatment of pulmonary tuberculosis one-third were permanently occupied by Irish immigrants. There appeared to be no effective statutory power to prevent the entry into the country of persons suffering from active pulmonary tuberculosis. Britain was almost alone in the Commonwealth in not requiring an examination and certificate of fitness from prospective immigrants before leaving the country of origin.

Apart from all other considerations, economic common sense demanded that adequate legislative measures should be taken to prevent the importation of communicable diseases into Britain.

Dr. H. D. CHALKE (Council) said that the Council had gone into the matter and had learned some months ago that the Minister had been advised that there was no problem. The Minister had been given figures which the Council had considered were not sufficiently up to date or wide; they had taken a lot of trouble to get information from all parts

PUBLIC HEALTH

The debate on the section under "Public Health" was resumed.

Tetanus Immunization

Dr. A. M. MAIDEN (Lincoln) moved to urge the Ministry to consider the advisability of encouraging active immunization against tetanus as a public health measure.

Many of the tragic deaths of young children could be avoided, he said, if, through the passing of the resolution, the matter were brought to the notice of the Ministry for the latter to make up their minds and give some guidance. Tetanus among young children was a killing disease, especially in the south, and very often arose from the most trivial injuries. The present treatment was not particularly effective, and it was rather difficult to get accurate statistics, because tetanus was not a notifiable disease. There had been some 200 cases in England and Wales last year, resulting in some 80 deaths. The anti-tetanus serum was not without its dangers—a point which had to be considered by general practitioners and casualty officers when administering it for trivial injuries. Even if it were given for every injury the death rate from the complaint could not be reduced by more than 20%. The solution was to promote the widespread use in infancy of the toxoid which was at present available. It was safe to use and easy to administer in combination with the whooping-cough and diphtheria injections. The immunity lasted from 5 to 10 years, but in some cases there was the possibility of immunization for life.

Dr. W. S. PARKER (Public Health Service) said that, on behalf of the public health service, he endorsed the resolution. Twelve persons died in this country every day from tetanus for every one who was hanging by the neck through judicial execution. If it were possible to divert Parliament for a day in order to deal with social misfits, it ought to be possible to divert the country in order to get tetanus immunization. Tetanus was responsible for fifteen times as many deaths as was diphtheria.

Dr. J. S. M. ORD (Glasgow) opposed the resolution on the grounds that it had come 20 years too late. With the passing of the horse, he said, the dangers of tetanus infection had been to a great extent minimized. (Cries of "No.") Furthermore, it was customary, in the case of street accidents, for the hospital authorities to give the anti-tetanic serum, and if a doctor was in doubt about the effect when a patient had been injured he could get the serum from a chemist. Such immunization was purely voluntary, and he thought it would be better to concentrate on the more important immunizations against diphtheria and poliomyelitis and vaccinations against smallpox.

Dr. MAIDEN, in reply, emphasized that the proposal had world-wide support. Even if the measure were 20 years too late, it was time a move was made.

The Lincoln motion was carried.

Dr. R. P. LISTON (Tunbridge Wells) had a motion deploring the failure of the Ministry of Health to carry out its proper duty of educating the public in everyday matters of health.

His Division decided upon the motion during a meeting at which some of the members deplored the needless time-consuming calls on their services, and continuing demand of their patients to be supplied with a bottle, whatever the reason which might have prompted their attendance at the surgery. It was felt that that attitude towards the service was not entirely the fault of the patients, as they had been led to believe that it was a free service and what they demanded they should receive. The root cause of the trouble was lack of publicity in regard to the true functions of the doctor and the real role which a health and not a disease service should play.

The public required educating on the proper use of the National Health Service, and that education should start in the infant and nursery schools, continuing throughout school life. In 1954-5 £70,000 only was spent by the Government on information services relating to health

of the country, and had had no hesitation in recommending as strongly as possible that there was in fact a very big problem. They had not agreed that there were great difficulties in solving it. It was not only the West Indies who were responsible; there were friends living near this island who were probably more responsible. It was not possible to go to the Dominions or the United States without having an x-ray taken. He hoped representatives would agree that it would be perfectly simple for immigrants to be x-rayed before entering the country. Tuberculosis mortality had fallen rapidly; some hoped that its elimination was just round the corner; but there were now little foci of infection instead of large-scale infection; by a little administrative action those foci could be ringed round and eliminated.

"Our friends from the West Indies have not been inculcated in health habits as we have," he said. "They do not go to the chest clinic when they are told."

Through the courtesy of the Joint Tuberculosis Council the document which they had prepared had been submitted to the General Medical Services Committee, which had wholeheartedly supported everything in it and had asked the Tuberculosis Council if they could in any way reinforce the Association's recommendations and transmit them to the Government. He hoped that the Representative Body would support as strongly as possible the excellent resolution from Willesden.

Dr. J. BALLANTINE (Coventry) said that during 1955 and the first few months of this year there had been 118 instances in which people from Ireland had been found to be suffering from tuberculosis in the Coventry Division. All immigrants ought to have a chest x-ray before leaving, or, preferably, be treated in their own countries. If they had to come to this country, the chest clinic and their own practitioners should have the essential information so that they could help in their future health.

Dr. H. GUY DAIN (Council) said that all representatives, as doctors, would be enthusiastic on the issue and that he would be very surprised if there was anything other than unanimous support for the resolution. Not only doctors but the public should understand the importance of the problem, because all that had so far stood between this resolution and its implementation some time ago had been the ever-open-door policy to immigrants from practically all over the world to this country. So long as the country was prepared to accept refugees from all sorts of places without medical examination, that ever-open-door policy would be maintained. In 1949 the Minister of Health's Advisory Council had suggested that immigrants should be examined for infectious diseases of various sorts, but nothing had ever been done about it. Every Government had taken the view that they were not prepared to undertake the political side of it, which would mean putting some obstruction in the way of refugee immigrants from other countries, while, during the war and until recently, large numbers of immigrants had been needed to increase the labour force of the country.

Dr. J. B. WRATHALL ROWE (Harrow) spoke of the high incidence of a disease popularly known as "worms" among immigrants from tropical countries who were employed as porters in kitchens and restaurants, particularly in the West End, and in some canteens. People responsible for their employment had a duty to make sure that they did not increase this danger.

The Willesden motion was carried.

The meeting rose at 6 p.m.

SECOND DAY

Friday, July 6

The meeting recommenced at 9.30 a.m., with Dr. I. D. GRANT in the chair.

Messages were read from Sir Henry Cohen and Mr. Tudor Thomas acknowledging the congratulations of the meeting on their recent honours.

matters, whereas in the same period over five times that amount was spent on propaganda for national savings.

Dr. H. D. CHALKE (Council) said that, while he agreed with the sentiments of the motion, it should not be accepted in its present form. It was not the Ministry of Health only which was responsible for health education. Hundreds of organizations were involved, and the Association's own *Family Doctor* was becoming a potent source of education in health matters in this country.

Dr. J. B. TILLEY (Council) said that the motion, as at present worded, did not truly reflect the position. Health education was something on its own and should not appear to be bedevilled by the question of saving money. The Council should consider the matter, but in his view the Representative Body should not pass the motion in its present form.

Dr. LISTON, in reply, said that the Association was, it was true, playing a very important part in educating the public in health matters, and was doing the Government's job. He would be prepared to accept any amendment of the wording which would make the motion all-inclusive.

The motion was accepted as a reference to Council.

Health Nurses

Dr. J. S. HAPPEL (Winchester) moved that "health visitors" should be re-entitled "health nurses."

"We think that the name 'health visitor' is a bad one," he said. It sounded too officious and suggestive of a Government snooper or some other official busybody, and the reaction to it was unfavourable. The term "health nurse" was much better, as it described what the person was—a "super nurse," specially trained and specially qualified. People would much more readily accept the advice of a nurse than an official visitor.

Dr. A. G. HERON (Bristol) asked the meeting to reject the motion. It would, he said, be a mistake, particularly as things were at present, to change the title, because these visitors, owing to their training, could not be said to know anything about health. Secondly, in Bristol at all events, they did no nursing; and, thirdly, if they were called "health nurses" it would be an insult to the district nurses.

Dr. R. G. GIBSON (Council) said that a health visitor had been posted to his partnership by way of experiment for six months, and it had been very successful. The nurse was of the greatest help, and in the end was facing more work in one day than she could possibly handle. One snag was, however, that the experiment did not work until the term "visitor" had been got rid of. He hoped that Council would suggest to the Minister that the word "visitor" did put off the average patient and that it should be changed to "nurse."

Dr. N. NELSON (Dundee City) commented on the fact that in Scotland it was necessary to pay for nurses to work in practices, whereas in other parts of Britain it would seem that some practices were subsidized in that connexion.

Dr. J. S. NOBLE (Blyth, with Morpeth) suggested that there had been a slur on health visitors. His experience was that they were excellent. They were completely trained nurses, most efficient, most kind and understanding, and he regretted any slur which might appear to come from the meeting on the great work which those women carried out.

Dr. A. BARKER (Council) said that in his view the health visitor was performing a most valuable service. She was a fully trained nurse and a fully trained midwife.

Dr. I. M. JONES (Sunderland) supported the motion if for no other reason, he said, than the work which the health visitor could do with regard to the geriatric service generally. Old people regarded the health visitor as a nurse, and the resolution put the matter into proper perspective and accorded her a title which was honourable and fitting.

Dr. J. B. TILLEY (Council) said it did not really matter whether the motion was passed or not. The important thing was the remarkable support there had been for the health visitor. The term "health visitor" was statutory at the moment, and there was little likelihood of the term being changed for some time.

Dr. HAPPEL, in reply, said that the public did not like the name and it should be changed. They did not know whether she was a nurse or not, and it ought to be made clear that she was. There was no question of a slur on the visitors.

The Winchester motion was carried.

Dr. A. J. R. F. JOHNSON (East Norfolk) moved that in country districts the duties of health visitors should be combined with those of district nurses, each with smaller areas.

There was, he said, a great shortage of practising midwives all over the country, and the motion was submitted in order to try to create the most efficient service with the number of midwives there were. Most health visitors in his district were also fully qualified midwives, and in the country areas it had been very successful when the district nurse combined her duties with those of the district visitor. Owing to the fact that the district visitors possibly had a little more money and leisure, the district nurses were taking a short course, qualifying, and going into the health nursing service, leaving a shortage of district nurses.

Dr. W. S. PARKER (Public Health Service) said that nothing but good could come of a careful reading of the Working Party Report just issued by the Government, and he would commend it to every member present. He appreciated the problems facing the Norfolk doctors—his last appointment was on the borders of their Division in the Fens. The circumstances of rural areas were not uniform. General practitioners would be able to confirm this in their own practices, and the premature adoption of a rigid scheme tying the hands of the Association in its policy might offer a solution to one part of Norfolk, but it would limit special schemes by local authorities in other parts of the country. He suggested that the proper solution was achieved not by this method but by creating a state of active liaison between the medical officer of health, the health department, the State, and the local general practitioners. He would ask the meeting to reject this as premature; he felt that it was too sweeping.

Dr. F. GRAY (Council) supported the motion. It was thoroughly practical. Just outside the borders of the County Borough of Brighton this was being operated in East Sussex. It was advantageous for everybody concerned; the health visitor's duties tended from time to time to become a little monotonous, and to combine the duties gave her a little wider scope. When she went to a house the people knew that she came to help and were willing to listen to advice from somebody who helped them when they were ill. From the patient's point of view there was still another advantage. The district nurse and health visitor never gave contradictory advice when they were one and the same person. From the doctor's point of view there was an enormous advantage that one person should work with him as a district nurse and know his methods.

Administrators said that it was difficult and could not be done, but if it was going to be good for the district nurse, health visitors, the patients, and the doctors, the convenience of the administrators must take second place. He thought the meeting would say that this was one of the great opportunities of repairing the breaches between the different parts of the service bringing preventive and curative medicine together.

Miss GLADYS M. SANDES (Marylebone) supported the resolution. She had watched with interest the change of the attitude of the members of the Representative Body for the last few years towards health visitors. In one area the combination of these duties had been going on for some time, and she was impressed by the way the county officers had gone ahead with this in spite of officialdom. In the cities there was still the older type of health visitor who had been taught that she must educate the people and that she was not a nurse. One could not expect these women to turn round and change their outlook; they had already been asked to extend their duties to visiting the aged and so on. She thought the combined offices should have the name "health worker" instead of "nurse" or "health visitor." She would, however, plead for flexibility in the interim period; in ten years everything would be amalgamated and

these different types of work would be associated in the same person. That would be the only way to stop the drift from district nursing and midwifery in the homes.

Dr. F. A. BELAM (Guildford) did not think this proposal was possible. The health visitor's work was full-time work in health education. Not only did she tell mothers how to feed their children, but she was able to prevent the break-up of families, by giving proper advice to people who trusted her. She visited old people and did it very well indeed. The health visitor was a trained nurse and certified midwife.

Dr. J. B. TILLEY, chairman of the Public Health Committee, opposed the motion on one ground only—that of uniformity. The Working Party agreed that there should not be compulsory uniformity throughout the country on this matter, but that where it was found best to work the system it should be adopted. The motion should not be adopted as Association policy for universal adoption.

Dr. A. J. R. F. JOHNSON (East Norfolk), in reply, said that Dr. Belam implied that a district nurse was not able to give education to mothers, but this was not so. The district nurse was probably the hardest-worked nurse in the community. (Applause.) He asked the meeting to support the motion.

After asking for a show of hands, the CHAIRMAN called for a count and announced the result as follows: for 134, against 135.

The motion was therefore lost.

CHAIRMAN OF THE REPRESENTATIVE BODY

The SECRETARY announced that there was only one nomination for Chairman of the Representative Body for the next session, Dr. Ian D. Grant, and he was therefore declared elected. (Applause.)

Dr. GRANT thanked the meeting for their continued confidence in him.

Smoking

The suspension of Standing Order 70 was moved and seconded. The CHAIRMAN reminded the meeting that it required a three-quarters majority, and the motion was lost.

An amendment was then announced: "That in the event of Standing Order 70 not being suspended, pipe smokers and cigar smokers be permitted to smoke." This was also put to the meeting amid laughter and was lost.

The Chairman then said he had a request from a delegate to be permitted to smoke his anti-asthmatic cigarettes "prescribed by an N.H.S. doctor," but this also was lost.

Time Limit to Speeches

A motion to cut down the time of speeches to twelve, five, and three minutes was carried.

ORGANIZATION

Dr. I. A. PRIDHAM, chairman of the Organization Committee, presented the sections of the Annual and Supplementary Reports under "Organization." He said that he had a certain amount of pride in introducing this Report because it contained a lot of information and there were few motions or amendments affecting it, which suggested that Branches and Divisions supported it. The Committee regarded itself as the back-room boy of the Association; it did not come into the limelight, but its work affected the Association at every point.

The membership was continuing to rise in spite of a good many adverse circumstances. The only way to compare progress year by year was to take a similar date, and taking the date of July 3 this year with July 3 last year there was an increase of 1,336 in membership, which was satisfactory.

This brought him to the work of the honorary secretaries. Once again it was his duty to ask the Representative Body to pay a tribute to this magnificent band of workers. For the past 124 years there had been a band of men and women ready to sacrifice their time and energies to do this work, and it was partly to them that this increase was due. (Applause.)

The Committee had a subcommittee known as the Newly Qualified Practitioners and Medical Students Subcommittee, to whose work he would draw attention in order that the younger members might become aware of its existence. Under the chairmanship of Dr. W. E. Dornan it did a great deal of work for the young doctor, including watching most carefully the issue of the certificates of satisfactory service after the pre-registration year. In one case where there was a refusal the subcommittee was able effectively to intervene. There was an urge to make this subcommittee more important, and possibly convert it into a main committee of the Association. If this happened he doubted whether it would do better work, but a change of status might bring it more to the fore.

Autonomous Bodies

Dr. PRIDHAM moved as a recommendation of Council:

That the autonomous powers of the General Medical Services Committee and the Central Consultants and Specialists Committee be renewed in respect of the year 1956-7.

That the Representative Body looks to these Committees to ensure that no action be taken by either which may prejudice the interests of another part of the profession without full prior consultation with the appropriate interests, and that their autonomous powers will be used so as to expedite and not delay the work of the Association.

This was carried without comment.

Roll of Fellows

Dr. PRIDHAM moved as a Council recommendation:

That steps be taken to recognize, by the award of a special distinction, distinguished service given by members of the Association to their Division or Branch;

That for this purpose there be established a Roll of Fellows of the British Medical Association, admission to which shall be governed by regulations.

He said that he was very happy to move this item. He wanted the meeting to understand that this was not a sudden brain-wave on the part of any Committee or Council. For a great number of years there had been a move to get something of this sort, and he hoped it would be possible to get it going this year. As there were no motions or amendments upon it he did not feel it necessary to develop any argument, but he would draw attention to the fact that those who did great and valuable work for the Association in the provinces were equally doing it for the Association as a whole, and the Council put forward this suggestion that they should be honoured at the periphery, in the provinces, and centrally. The method of recognition had been debated most carefully, the form of words and so on, and he hoped it would be accepted with unanimity.

The resolution was carried unanimously.

It was next proposed to take steps to amend By-law 85 in order to give more latitude to Branches and Divisions in respect of expenditure of Association funds on social amenities.

Dr. PRIDHAM, in moving this, said the object was to encourage more members to join the Association. No lavish expenditure on such things as cocktail parties was envisaged, but merely the provision of refreshments at meetings such as tea or coffee. Branch secretaries had been found to be extremely economic people who could be relied upon; and, in any event, the expenditure would be subject to scrutiny by the Organization Committee.

Dr. A. P. HICK (Trowbridge) moved, as an amendment, to add the words, "but that, in view of the present high rate of the annual subscription to and the need for economy by the Association, increased expenditure on social amenities should not be incurred under the amended by-law for the time being."

He thought that the provision of tea, coffee, and cakes at meetings would be an extravagant outlay if spread over the whole country.

Dr. R. G. GIBSON (Council), speaking as a member of the Organization Committee, referred to the difficulty which had been experienced of encouraging the younger people

to join the Association. The present rules and regulations hampered honorary secretaries in their efforts to entertain and attract such people. He supported the proposal and said there was no question of it being done without the expenditure being carefully watched. It was the smaller Divisions that were particularly hampered in the matter through having no contingency or entertainment fund.

Dr. R. W. McCONNEL (Buckinghamshire) described the amendment as "shilly-shallying." If the meeting did not want this expenditure they should vote against it. He, however, supported the motion. It would be useful encouragement and only a small amount of money would be involved.

Dr. F. A. BELAM (Guildford) thought it was right that a speaker who was asked to come down from London to give an evening talk should be offered some food.

Dr. PRIDHAM asked the meeting to reject the amendment.

Dr. HICK denied that the object of the amendment was "shilly-shallying." It had been designed merely to bring to the notice of members that such expenditure was proposed to be undertaken at this particular juncture.

The Trowbridge amendment was lost and the Organization Committee's recommendation was carried.

At this point the business was interrupted to take the section under "Overseas."

OVERSEAS

Major-General J. C. A. DOWSE presented the sections of the report of Council under "Overseas."

He first extended a hearty greeting to the overseas representatives, of whom almost a record number were present.

Dealing with Overseas Civil Service matters, he reminded representatives of the Colonial Secretary's statement in Parliament last May outlining two main provisions of the Government's policy regarding the future organization of the Overseas Civil Service: the intention to create a pool of persons with exceptional administrative and professional abilities recruited and employed by the U.K. Government and seconded for service with the Colonial Governments as and when required; secondly, the intention to compile a special list of officers at present serving in the Overseas Civil Service and a special list of those employed by the U.K. Government to be seconded to the Colonial Governments when necessary. It was hoped that these measures would remove the feeling of insecurity affecting members of the Overseas Civil Service, particularly in Nigeria, all of whom would presumably be given the option of transferring to the special list. These arrangements, he said, could be applied to other Colonial territories as well.

There were, however, certain doubts about the efficacy of the new arrangements. Some assurance was required of continued employment, because the introduction of the National Health Service in the U.K. had made it very much more difficult for a doctor returning from long service overseas to obtain medical work—a problem to which the White Paper at the moment provided no solution.

It was gratifying to be able to put before the meeting a slightly more favourable picture of the situation in Cyprus. As a result of the long representations by the Cyprus Branch, the Government there had offered improved salaries for its medical staff which were almost *in toto* acceptable to the Association. It thus appeared that the five-year-old battle with the Cyprus Government was at last to be settled satisfactorily. At the present juncture he had no desire to increase the difficulties of that Government, but they had in the past shown themselves to be peculiarly stubborn in their attitude towards the medical profession, and he expressed the hope that that attitude was on the way to rectification.

He went on to say that the report dealt with a very serious dispute between the Government of Malta and the medical profession there. The small medical profession in Malta had found itself faced with the threatened reorganization of the medical services, on lines which could not commend themselves to the profession, without the doctors themselves having been in any way adequately consulted.

The Malta Branch of the B.M.A. and the Medical Officers' Union had joined forces to offer resistance to the Government's plans. The small body of Maltese doctors had put up a very stout resistance which would evoke the admiration of all. (Applause.) The Association's Malta Branch had appealed to the parent body for help, a very considerable amount of which had been immediately furnished. The Assistant Secretary, Dr. E. Grey-Turner, and the Chairman of the Overseas Committee had flown out on separate occasions; large sums of money had been sent and many other things had been done in an effort to settle the dispute. The Government medical officers had been obliged to take the drastic step of resigning collectively from Government service for nine days and had organized an emergency medical service during that time. An agreement had then been reached giving practically everything for which the doctors had been asking. The main feature of the agreement had been the decision to set up an outside commission nominated from eminent members of the profession and others in the U.K. to examine the Maltese Government medical service and to make recommendations for its future organization. This was a very important achievement. He trusted that the outcome of the Malta controversy would be a lesson to a great many people throughout the British Commonwealth.

"We pride ourselves on being reasonable people with a reasonably high standard of public service," he said, "and we can put up with a good deal; but when we are subjected to conditions which are quite intolerable we had a perfect right—of which the Maltese profession has taken advantage—to take steps to try to rectify the matter in the most efficient way."

He hoped that the situation would be an example to those politicians throughout the world who seemed so anxious to interfere and even work a dictatorship in medical matters.

He concluded with a warm expression of thanks to Dr. Grey-Turner for the enormous amount of work which he had done on so complex a subject.

Greetings from Overseas Representatives

Dr. H. W. HORN (Queensland) conveyed, on behalf of the representatives from Australia, greetings and best wishes for a successful solution to the problems of which he had become so well aware during the meeting. He said that there were many problems common to the U.K. and Australian medical professions, including the subject of remuneration, which was a worry in all national health services.

Dr. J. M. TWHIGG (New Zealand) said it was very gratifying to know that the Council had accepted an invitation to hold the annual meeting in New Zealand in 1961.

Association affairs in New Zealand were working smoothly, and over 90% of the medical practitioners in New Zealand were members.

Dr. V. TABONE (Malta) brought greetings from colleagues in the island. The doctors of Malta, he assured the Representative Body, were in good heart, and, convinced as they were of the goodness of the cause and backed by the magnificent support of the large body of British doctors, they would manage to survive and to keep high the name of the profession as well as its independence.

Dr. P. T. O'FARRELL (Republic of Ireland), in conveying the greetings of the Irish Medical Association to the British Medical Association, wished the parent body a very prosperous future and pleasant meeting.

Rev. Dr. C. W. SILK (Bahamas) brought greetings from the "baby of the Association," the Bahamas, which he held to be a most desirable place of retirement for elderly doctors.

Dr. MARY L. GROVE-WHITE (Malaya) thanked the Association for its kind hospitality and brought cordial greetings from Malaya.

Overseas Bureaux

Dr. H. GUY DAIN, on behalf of the chairman of the Committee of Management of the Empire Medical Advisory Bureau, moved the report under that heading.

He said that every year the activities of the Empire Medical Advisory Bureau increased and became more widely known. The efforts of the Director, Brigadier H. A. Sandiford, were appreciated abroad, and the enthusiasm with which references to the Bureau were received in Canada last year would have heartened all members. The Director, to whom he paid a tribute for his excellent work, was keeping up to date a summary of the courses and diplomas available to people coming for postgraduate training to this country.

Dr. Dain, again on behalf of the chairman of Committee of Management of the International Medical Visitors' Bureau, spoke of the work of the Bureau.

He said that it was part of the work of the same office, and Brigadier Sandiford had established equally friendly relations with foreigners who came to this country and who required assistance.

ORGANIZATION (resumed)

Affiliated Membership

Dr. PRIDHAM moved as a recommendation of Council that affiliated membership of the Association be restricted to those members of an affiliated body temporarily resident in the area in which the affiliated membership would operate.

He explained that the purpose of the motion was to put right an anomaly which was explained in the report, and he urged the Representative Body to support it.

This was agreed.

To remedy an inconsistency in the Articles affecting practitioners whose names had been erased from the *Medical Register* for conduct detrimental to the profession, and had been subsequently restored, an amendment of the relevant Articles was proposed so as to make them apply equally to those who had and had not formerly been members of the Association.

The amendment was agreed to.

Subject to an alteration in one paragraph regarding eligibility for membership, it was agreed that the Articles and By-laws be altered in the manner shown in Appendix VI attached to the Annual Report of Council and that the amendments to the Articles be submitted to an Extraordinary General Meeting.

The remainder of the report under "Organization" was approved.

Quorum at the A.R.M.

Dr. R. P. HENDRY (Rugby, with South Warwickshire) moved that the quorum of the Representative Body should be 50; the present by-law requires one-half of the number of appointed representatives to be present to constitute a quorum.

He said that by-laws were a necessary evil, but the present By-law 50 was rather evil in that it was an old English custom that one just ignored these things and that to raise the matter of a quorum was rather pernicious. The present law set too high a standard and it should be materially reduced. It might be said that 50 was too low a standard, but if 40 out of 640 paid Parliamentarians could constitute a quorum he suggested that 50 out of 450 unpaid philanthropists could constitute a quorum.

Dr. O. C. CARTER (Council) moved as an amendment that in view of the impending report of the Constitution Committee no action should be taken on this motion at this meeting. He said that the motion raised a matter of importance. There was the implication that a Representative Body with only one-ninth of its members present could decide matters of major policy. He hoped the meeting would not come to any decision at this stage.

Dr. R. G. GIBSON (Council) seconded.

Mr. H. H. LANGSTON, chairman of the Constitution Committee, supported the amendment. The Committee had given a lot of thought to this subject and it would be included in the Committee's report in due course.

Dr. J. A. PRIDHAM (Council) hoped the meeting would accept the amendment, and Dr. HENDRY asked leave to withdraw the motion as the matter was *sub judice*, which was agreed to.

CONSTITUTION OF THE ASSOCIATION

Mr. H. H. LANGSTON (chairman of the Constitution Committee) submitted the sections of the reports under this heading.

The Committee, he said, was nearing the completion of its work and had already presented its draft report to the Council, the discussion on which was fully reported in the *Journal*. As the Constitution Committee was set up by the Representative Body with the proviso that no more than 50% of the Committee should be members of Council, the Council had decided that it would be appropriate if the final report of the Constitution Committee be submitted unamended to the Representative Body but accompanied by such comment as Council thought fit to make. In the view of the Council as expressed at the last Council meeting, it appeared that it would probably be necessary for a special Representative Meeting to be held to consider the report of the Constitution Committee. Before such a special Representative Meeting was called the report of the Constitution Committee would be circulated accompanied by Council's comment to all Divisions and ample time would be allowed for full consideration of its recommendations.

The motion was carried.

SCIENCE ACTIVITIES

Mr. J. R. NICHOLSON-LAILEY, chairman of the Science Committee, presented the report under "Science."

The Committee was investigating accidental deaths from coal-gas poisoning by a special subcommittee. The work was not yet finished, but he hoped the report would be available by the next annual meeting. The Committee was also concerned about the increasing problem of drug addiction, and a special subcommittee, which had become an *ad hoc* committee of the Council, had been set up to investigate all the difficult aspects of this problem. It would be some time before there was any report.

Referring to the Library, Mr. Nicholson-Lailey said he did not think the Association realized what a valuable instrument it had in the Library. It was being used increasingly, but it could be used much more than it was. The Library had recently been valued, and if all the books were sold £26,000 would be obtained, and to replace them would cost £63,000. That gave some idea of what a collection it was.

One of the duties of the Science Committee was to organize the examinations for the various Association prizes and to decide the names to be recommended to Council for the awards. These names were announced in the Report, but he would specially mention one or two. The Sir Charles Hastings Clinical Prize competition was open to general practitioners, and the examiners were very impressed with the high standard of the entries. He would also mention the Stewart Prize on Epidemiology, awarded not by competition but on the recommendation of a panel of experts in this field who advised the Association on who they thought had undertaken the most valuable and important work in this field during the year. It spoke highly for general practice that it was decided to recommend that the award be made to Dr. Hope-Simpson, who practised at Cirencester in the south-west of England. He would like to thank all those who gave up their time to the arduous task of examining the entries and making reports.

There had been 140 B.M.A. Lectures given during the year. Every Division was entitled to ask for and have one B.M.A. Lecture during the year. He felt that more use should be made of this concession. At two of the most successful of these lectures which he had attended an informal dinner was given at which the guest speaker was present, and he gave his talk directly after the meal with everybody sitting comfortably. He found that these talks were very well received and there was a large attendance. Doctors were encouraged to bring their wives.

Finally, he would refer to the Sir Charles Hastings Lecture. This was usually given in London, but this year the experi-

ment was tried of holding it in a provincial centre—at Leeds—and it was a resounding success, the lecture being given by Sir Henry Cohen.

New Drugs

Dr. I. P. W. SKINNER (Oxford) moved:

That the profession would welcome some degree of restraint in the use of new drugs whilst therapeutic trials are in progress provided that such trials are supervised by some central body.

He said that in 1938 the Council decided against setting up special machinery, and in 1956 the Council was considering reopening the matter and perhaps the meeting could give a lead. Delay in the availability of new drugs during therapeutic trials was a very different matter from governmental planning of drugs. Both the American Medical Association and the New Zealand Medical Association had bodies to supervise trials. It was nearly 20 years since Council reached a decision, 10 years before the National Health Service came in, and now there were three new factors—first, the great multiplicity of new drugs, secondly, the high cost of many of them, and, thirdly, that as the taxpayer had to pay for them there should be some more modern method of assessment to replace the haphazard individual try-out in general practice or in hospital. Did the general practitioners prescribe these drugs for their Health Service patients or for their private patients, or did the latter get the free sample? He suggested that the matter would be better mooted by the profession rather than applied by governmental or political pressure. A good drug was not likely to be condemned out of hand and some of the useless ones might cease from troubling.

Dr. R. W. MCCONNELL (Buckinghamshire) seconded. The rising cost of drugs in the National Health Service was very serious. If it went on one could see what would happen, and they did not want the Government to bring out lists of drugs which could be used and which not. This was an alternative idea, and it was very important that the profession should supervise the trying of these drugs. If the Council instituted some body which would organize and supervise the control of these trials it should be advertised to the doctors which of the drugs were being tried, and when they had been tried which they should use.

Dr. G. CORMACK (Newcastle-upon-Tyne) hoped the meeting would turn this down. If the Association permitted the establishment of any controlling body to evaluate drugs sooner or later the Government would get its hands on it and everyone knew what would happen then. Politicians could be unscrupulous in these matters. There had been the example of aureomycin, which was available for a long time in countries abroad before it could be obtained here. It was extraordinarily difficult to get at the truth of the matter about drugs; it was not the sort of thing which a committee could sit down and do; and he hoped that the meeting would turn this down.

Dr. A. REZLER (City) also opposed the motion. It would be the beginning of the end of general practice, which was becoming narrower and narrower because of increasing specialization, and to have a restriction on prescribing would be intolerable.

Dr. J. S. M. ORD (Glasgow) said that there was a degree of restraint in the use of new drugs and doctors could exercise this restraint. No doctor would use a drug until he knew that it would be of therapeutic value. He asked the meeting to reject the motion.

Mr. J. R. NICHOLSON-LAILEY said that the Science Committee had considered this question for over a year and had not got very far. It was extremely complicated. Neither the Committee nor the Council would be a party to setting up any body which would control in any way the clinical responsibility of any doctor or specialist. The whole idea of this would be merely to help and give a little advice and save practitioners from wasting their time using unsatisfactory drugs. He would be pleased to accept this as a reference to Council because it would give the necessary authority to go on considering the matter.

Dr. SKINNER, in reply, said that the motion was intended primarily as a reference to Council and to elicit information. Anything of this kind could only be carried through by the Council, which would give all the necessary safeguards.

The motion was accepted as a reference to Council.

Diesel Fumes and Cancer of the Lung

Dr. R. COVE-SMITH (Marylebone) moved that, in view of the possibility that exhaust vapours from road vehicles may cause very serious disease, the Government be requested to secure obedience to the existing law in respect of such fumes until such time as a possibility of medical harm therefrom may be disproved. "We want, if possible, to clear this rather sickening stench from our cities," he said.

The Fuel Research Council were studying the extent of pollution from exhaust in the London streets under different weather conditions and concentrations of vehicles. Diesel engine exhausts could be a serious nuisance, being discharged at low level, and could reduce the field of vision of the traffic behind; they also caused objectionable deposits which were difficult to remove on windows, windscreens, and the glass of street lamps. Diesel smoke was unnecessary and could certainly be reduced if the machines were properly controlled. The present law on the subject was pretty explicit. Drivers who produced excessive smoke could be prosecuted. The local authorities ought to be able to help in enforcing this law.

Mr. A. DICKSON WRIGHT (Marylebone) said the pollution in question was particularly wanton. It was possible to stand in the road and get the full blast of a charabanc exhaust which was the carcinogenic equivalent of perhaps 100 cigarettes. Factory chimneys were difficult to control because interference with them meant interference with industry. Tobacco was a thorny question, for those who did not smoke had to inhale second-hand smoke produced by those who did. He suggested that the motor and oil industries should devote some research to the subject.

The Marylebone motion was slightly amended by Southport, and in the amended form, as follows, was carried:

That in view of the obnoxiousness of exhaust vapours from road vehicles and the possibility that they may cause very serious disease, this meeting considers that it is its duty to request the Government to secure obedience to the existing law in respect of such fumes.

Dr. St. G. B. D. GRAY (South-west Essex) had a lengthy motion noting that the incidence of cancer of the lung had increased, that the increase occurred to a greater extent in urban than in rural areas, that it could not be attributed solely to tobacco smoking, and that exhaust fumes from internal combustion engines, including diesel engines, contained known carcinogens. It went on to call for further research into the possible dangers of fumes from these engines, and requested the Council to recommend to authorities operating transport systems that in urban areas no further replacement of electric passenger vehicles by diesel-engined vehicles occurred until the harmlessness of the latter had been proved.

"If we are not careful we shall have the country flooded with fleets of diesel motors and we will be able to do nothing about it," he said.

Mr. J. R. NICHOLSON-LAILEY reminded the meeting that a similar resolution had been passed last year. The Science Committee and the Council, in making representations to the proper authorities, had been unable to produce scientific evidence that a properly controlled and driven diesel engine was the danger that it had been alleged to be. Much research was being carried out on the subject and there did not seem to be any need to supplement it. The motion was an attempt to suggest that a properly used diesel engine was not a safe thing to use—something of which he doubted whether it would be possible to convince any local authority, Government body, or private company.

The meeting decided to proceed to the next business.

Crash Helmets

Dr. R. WEBB (East Suffolk) moved to press the Ministry of Transport to enforce the use of crash helmets of approved pattern for motor-cyclists.

Miss GLADYS M. SANDES (Marylebone) said that improvements in design were proceeding and a further issue of approved patterns was on the way.

Mr. A. LAWRENCE ABEL (Marylebone), who excited laughter by appearing on the platform wearing a crash helmet and motor-cyclist's coat, said that not more than 25% of motor-cyclists wore crash helmets. Every day four young men between 18 and 28 died in this country from motor-cycle injuries, 93% of which were due to head injuries—1,300 a year. Many of those could have been prevented if a suitable crash helmet had been worn. But it must be of good quality and approved design. Four types of helmet had recently been tested for the B.M.A. by the Road Research Laboratory of the Department of Scientific and Industrial Research, of which only one had been found to meet the test requirements.

Mr. Abel recalled that last year he had gone with a deputation to the Customs and Excise in an effort to get purchase tax taken off crash helmets; after nearly 12 months it had been reduced from 25% to 10%.

Mr. Abel next referred to defective crash helmets sold by H.M. Government as Government surplus stocks. There were at least four different sorts. They were traps, because a young man wearing one of them would think he was safe when in fact he was not, and would take more risks, so that he was worse off than before. There had recently been many instances reported in the Press of the sale of Government surplus goods; this was another one. It was a case of one Government department bulk selling and another of one Government department condemning what was sold as unsafe.

This was the only nation in Europe that had a dent in the graph of the expectation of life between 18 and 28. There was the cost of those 1,300 young lives. There were 17,000 serious injuries, and there were 70,000 lesser injuries. There were 1,800 hospital beds occupied all the year round by those with injuries due to motor-cycle accidents, 50% of which had head injuries. The cost of all that could be saved by the wearing of crash helmets.

"I do not like compulsion any more than you do," he said. But what was the alternative when there were stage-coach roads in a speedway age? It was either to make crash helmets compulsory or to dump all the motor-bikes in the sea and go back to the days of George III. Mr. Abel said he desired to add as a rider to the motion:

That a deputation should go to the appropriate Ministry to protest against the sale of dangerous Government surplus.

This amendment was accepted by East Suffolk.

Dr. J. C. ARTHUR (Gateshead), opposing the motion, asked the meeting to consider how it might strike the ordinary man. For the last 15 years, he said, the populace had been man. Apart from the laws of decency, the population had not been regulated in its wearing apparel before. Again, there was the question of where it would end. What constituted a motor-cycle? A number of old men and women rode power-assisted cycles which could be described as "motor-cycles," and the process would continue until it included push-bikes. He lived on a busy part of the Great North Road and he had dealt with more accidents from push-cycles than from motor-cycles. By all means ensure that crash helmets conformed to a high standard, but their use should not be made absolutely imperative and compulsory.

Dr. WEBB, in reply, asked the meeting not to pay too much attention to that which Dr. Arthur had said. "If you do not like wearing a crash helmet then do not ride a motor-cycle," he said.

The motion by East Suffolk with the rider was carried.

Dorset moved that the postal charges made by the Association library should be abolished as a compensation to members living at a distance from London who were not able often to enjoy the amenities of Headquarters.

Dr. A. G. CHAMBERLAIN, in moving, said that country members seldom visited London and should enjoy the amenity suggested in the motion.

Mr. J. R. NICHOLSON-LAILEY said he was not sure what the mover required. Recently a decision was taken to pay the postage of all library books outside the London postal area, but members were expected to bear the cost of postage in returning them. The concession would now cost the Association something like £1,000 per annum in view of the increased postal charges.

The motion was agreed as a reference to Council.

Mr. J. R. NICHOLSON-LAILEY moved that the remainder of the Annual and Supplementary Reports of Council under "Science" be approved. He drew attention to the fact that the Government's action in removing the subsidy from wheat and flour would result in the white loaf being the only bread available. That was in direct contradiction to the advice the Government received from the committee which considered the matter. The public would get an inferior article for an increased price.

Dr. A. N. MATHIAS (Council) expressed the hope that the Representative Body would support Mr. Nicholson-Lailey in what he had said. It was incomprehensible that the Government should deliberately flaunt the vast mass of professional opinion in this country who felt that the proposed action was wrong.

The motion to approve the remainder of the report under "Science" was carried.

GENERAL MEDICAL SERVICES

Dr. A. TALBOT ROGERS, chairman of the General Medical Services Committee, presented the Annual and Supplementary reports under "General Medical Services."

In asking the Representative Body to receive the report, he said it would probably be agreed that it showed evidence of sustained effort by the Committee during the year—effort which had not been without its reward. That was not surprising when it was remembered that the Committee had been for a part of the time under the acting chairmanship of Dr. S. Wand. It was fortunate that in a changing committee there was a hard core of members who were well versed in all the intricacies of National Health Service law and practice. He acknowledged with gratitude the help he had received from Dr. Wand, Dr. H. G. Dain, and Dr. E. A. Gregg in the work of the Committee.

With regard to the problem of getting drugs for private patients under the Health Service, the matter was still outstanding and would be followed up. It was hoped that it would be possible to report better progress at the next Representative Meeting. The General Medical Services Committee welcomed the opportunity for co-operation in the matter between the two major committees of the Association.

On the question of the joint remuneration claim, Dr. Talbot Rogers said that it was a strong claim but not one in which the Association could be said to be grasping. It set out the extra amount which needed to be added to remuneration if the Spens recommendations were to be fulfilled. It was true that if the claim were worked out as a global sum to be paid out of the Exchequer, it seemed considerable, but that was an index of the restraint which had been shown over the years in not asking earlier for money which had been the right of the profession for a long time. Even if granted to the full it would cost the country less than if the Minister had been able to reply in the affirmative when asked in 1953 and 1954 to implement Spens, in accordance with the changes in the value of money up until then. The claim had now gone in and the Minister's reply was awaited. The Negotiating Committee had been advised that the chance of a successful outcome of the

claim would best be served by awaiting the written observations of the Minister before publishing a detailed account of the claim, and before promoting a discussion upon it in the Representative Body or in the Press.

"I assure you that it is the intention of the Negotiating Committee to give the profession the fullest possible information about the claim and the statistics upon which it is based at the first advisable moment," he concluded.

Remuneration

Dr. H. M. GOLDING (Bristol) moved:

That this meeting welcomes the proposal for a joint approach by the General Medical Services Committee and the Joint Consultants Committee to the Minister on the question of remuneration of members of the profession.

He said that the intention of his motion, and of others which would follow, was to strengthen the strong right arm of the Council. The most important aspect was the historic action of combining the G.M.S. Committee and the Joint Consultants Committee in the approach to the Minister.

Dr. R. P. LISTON (Tunbridge Wells) said his Branch welcomed the joint approach because it felt the overriding consideration to be the obtaining of unity of action within the profession. He regarded the decision as perhaps the most encouraging and fundamental event which had occurred to the profession since 1948, the first concrete, unmistakable sign that, in spite of the many difficulties and interests involved, the profession had at last determined to speak with one voice. The introduction into the deliberations of the medical officers of health was a good augury for the future, for they were the Cinderellas of the profession, dealing as they did with local authorities and not central government. The significance of such action would not be lost on those with whom the profession would have to negotiate. It was necessary for everyone to realize that there were tremendous issues at stake apart from remuneration.

The Bristol motion was carried *nemine contradicente*.

Dr. R. P. HENDRY (Rugby, with South Warwickshire) had a motion wholeheartedly welcoming the joint approach, warmly congratulating those responsible for this unity of action, and expressing the hope that in any such activities in the future the public health services may be fully represented. "We are all doctors; we are all in this together; there is one B.M.A.," he said.

Dr. A. TALBOT ROGERS said the only reason why the claim had not been advanced for all three parts of the profession was that it had been felt that to include the public health side at the moment would jeopardize the obtaining of any improvement at all. The whole basis of the claim was the legal argument that both those in the hospital services and the general practitioners were not being paid what they should be paid under Spens and were going together to their employer, the Ministry of Health.

There had also been some adjustments in public health payments at various times which would not allow of everyone having the same datum line in making the claim. It had therefore been decided, after careful thought, that it would be better to go on with the claim for the two parts of the profession, at the same time keeping the public health doctors informed of what was being done, seeking advice from them about the repercussions that the claim would have on them, and including them in the Negotiating Committee. If success was achieved, it was the intention to do everything possible as a united profession to bring the public health remuneration into line with what the others would then be receiving.

The Rugby motion was carried.

Dr. H. SOUTHWORTH (Blackburn) moved that, in the case of the Government not honouring its financial commitments as laid down in the Spens report and reiterated in the Danckwerts award, strong consideration should be given to a call for mass resignation from the service.

Dr. A. TALBOT ROGERS thought that, however strongly people might feel on the subject, it was unwise to start making threats about resignation. It was better to refer the

matter to the Council to take strong action at the appropriate time should the appropriate time arise.

It was agreed to pass to the next business.

Dr. H. G. St. M. REES (West Suffolk) moved that the period of two years should be the maximum between each adjustment of the contract. The principle, he said, had been accepted by the B.M.A., but he doubted if it had been accepted by the Ministry. While the motion might seem a little premature, it was as well to have some idea of the period at which adjustments might be made. Inflation was a creeping evil which had passed the doctors and had left them behind in the last few years. Had there been periodic adjustments over the past few years, that would not have happened.

Dr. A. TALBOT ROGERS said he did not regard the motion as premature. It was probably true that had the concession referred to been obtainable before there would not now be the necessity for large-scale negotiations. But the Association was guided by experts in statistical work and was satisfied that the claim, delayed as it was, was being presented at the moment when the most authoritative evidence in its favour was available. There had not yet been wholehearted agreement by the Government that the profession was entitled to a periodic review. That was one of the things that it was hoped to win from the claim, and, if obtained, it would be one of the strongest things to be got, of more value than the actual money which the claim itself would bring. To tie the period down to two years might not react entirely to members' advantage. It might not be possible to produce strong enough evidence at the end of a particular two-year period, and there was yet no knowledge of the economic future of the country. It was to be hoped that the inflationary period would end. If there were a fall in prices and an increase in the value of money it would work to the disadvantage of doctors to be tied to a two-year interval.

The West Suffolk motion was lost.

Dr. G. S. R. LITTLE (Greenwich and Deptford) moved to urge that negotiations concerning monthly payments to general practitioners be expedited.

He said that the matter had become more urgent since last year, as there had been a further credit squeeze. There were many doctors in the National Health Service, young and old, who relied entirely on their quarterly payment for their source of income. It was totally unreasonable that they should be asked to go cap-in-hand to their bank managers, and it was totally unnecessary and rather degrading for them to have to go to the executive councils pleading hardship. A monthly payment on account and a quarterly settlement system would keep the bank managers quiet.

Dr. L. J. STOLL (Hampstead) said, amid cries of dissent, that the consultants always got paid monthly. It was unfair that general practitioners who wished to have a little extra money at a particular time should have to pay interest on overdrafts.

Dr. A. SMITH (Lanarkshire) said that consultants could be paid monthly if they so desired. Speaking as a consultant himself, he urged acceptance of the motion.

Dr. ANNIS GILLIE (Council) said that every doctor had a right to be paid monthly and that negotiations to this end should be expedited. However, in view of the amount of work with which executive councils had to cope, the best thing would be to expedite negotiations for monthly payment for those who desired it and leave the normally quarterly cheque system in operation for those who did not desire the monthly basis.

Dr. A. TALBOT ROGERS explained that the matter had been discussed by the G.M.S. Committee last month, when it had been decided to ask that the general practitioners should receive, as a right, a monthly payment which should be part of their quarterly payment, and that at the end of the quarter there should be a settlement of what was remaining during the period.

Dr. LITTLE asked who would pay the bank charges at the end of the quarter.

The motion was carried.

Supplementary Annual Payments

Dr. J. S. NOBLE (Blyth, with Morpeth) moved that to obtain supplementary annual payments the qualification of having been in that practice on March 31, 1953, be altered to include all single-handed small-list practitioners who have a static or increasing list irrespective of the date of entry into the practice.

He said that the regulations were by and large fair and elastic and provided for the elderly or already established practitioner and an adequate appeal system. But there was one point: the small-list practitioner who was appointed to a small list since April 1, 1953, did not receive any supplementary payment. In some areas it might be advisable to encourage additional small lists, but not in over-doctored areas. If it was undesirable to encourage the small list the doctor should not be appointed; if he was appointed it meant that he was required and there was no reason why he should not have a supplementary payment. It was an injustice to suggest that a young man appointed to a vacancy should not be entitled to the same pay as his predecessor. He might even be making less than the man with the initial practice allowance next door.

Dr. A. TALBOT ROGERS said that it was difficult to make a quick decision about this. At the time supplementary payments were set up those responsible were anxious that no injustice should be done to doctors already established, especially those who had been receiving a fixed annual payment. The regulations were carefully watched to see that those doctors did not suffer materially as a result of the new method of payment.

In so far as people who were not then in the scheme were concerned in the new method of distribution, it was hoped to attract doctors to areas where there was a likelihood of their building up a reasonable practice within a reasonable time, and the initial practice allowance was brought in to help them, but it was no part of the scheme to encourage small practices in well-doctored areas if it was not going to prove to be a good proposition.

The speaker had made a case for doctors who had been invited to apply for a practice not so small that it had been decided to disperse it, though he knew that it did not have a large list. The General Medical Services Committee was always willing to look again at a problem like this and see its repercussions. One of the repercussions was that these supplementary payments were not extra money, they all came out of the central pool, and hasty decisions could not be made that every case would be assisted. If the motion was passed as a reference to Council the matter would be studied during the coming session.

Dr. W. E. DORNAN (Council) hoped the meeting would pass this as a reference to Council. Not only was he well aware that there were practices in which supplementary payments were being made at this time coming out of the central pool, but as a result the Ministry had ceased paying an equivalent sum which should have been paid out of the inducement fund. There were practices to which doctors had been appointed since 1953 which could attract an inducement payment from Treasury funds. If this was passed without the General Medical Services having a look at it the Ministry would say that these were cases for a supplementary hardship payment.

Dr. NOBLE said that he would move it as a reference to Council and it was so carried.

Inflation of Lists

Dr. R. REID (Nottinghamshire) had a motion expressing the view that N.H.S. numbers are a less reliable means of establishing identity than dates of birth and should be abolished forthwith, and that the custom of inserting the patient's date of birth on his medical card should be replaced as a matter of medical importance. He said his object was to try to make things simpler and save money for the health services. Blood transfusion centres had found it sufficient identification to state a person's date of birth.

Dr. R. H. MOORE (North Middlesex) said that if this was passed the confusion would be made worse. It was possible to have two people born on the same day with the same name. He suggested that if four figures were added to the date of birth—there were 2,000 babies born every day in England—it would be a positive means of identification for man, woman, and child.

Dr. A. TALBOT ROGERS said that this problem was discussed with the Minister in view of the Guillebaud report recommendation that there should be a fresh method of identification to limit the possibilities of inflation. There were several ways in which this could be done. The G.M.S. Committee was in favour of an alphabetical index; the Executive Councils Association was in favour of one based on the date of birth; there had been suggestions for the extension of the index of the Minister of National Insurance. Discussions were going on with the Ministry, and the Minister had promised to let the Association have his reactions during the coming session. It was hoped that there would be something more to report next time.

Dr. REID, in reply, asked why the establishment of an identity should be made complicated?

The motion was lost.

Reinstatement of Ex-Service Men on Doctors' Lists

Dr. J. B. WRATHALL ROWE (Harrow) moved that it be arranged with the Ministry that the names of men called up for national service be left on the list of their doctor and that the men's records remain in the doctor's care until they change their doctor or move away from the district. He pointed out that the only transaction then necessary would be the deduction of the capitation fee during the two-year period of service, with restoration of the fee at the end of that time. As an industrial medical officer he frequently saw ex-National Service men who had not troubled to rejoin the doctor's list after their national service. The man who was discharged was given a leaflet and an E.C.13 form in order to complete the doctor's list. Few of them went at once to the doctor. Harrow made some inquiries as to what happened when a man was called up, and found that the doctor was requested to send his record to the executive council, who, in turn, sent it to Southport. It was kept there until the man applied to go again on a doctor's list on leaving the Forces, when on the putting into motion of E.C.13 the file was sent back from Southport via the executive council to the doctor. Some 150,000 men were called up and another 150,000 were discharged every year; this meant that 1,200 cards had to be dealt with every day, and probably the full time of seven or eight Civil Servants was occupied in dealing with them.

His Division asked whether the matter could not be dealt with by leaving the man's records with the doctor and deducting the capitation fee for two years.

Dr. R. H. MOORE (North Middlesex) supported the motion. He added that there had been instances of records sent in with important documents which when the file was returned had been lost.

The CHAIRMAN OF COUNCIL said that if there had to be some communication from the executive council it should be of such a character and size that the doctor could fasten it on the outside of the Form of Medical Record for identification purposes.

Dr. ST. G. B. D. GRAY (South-west Essex) said that in many cases when patients returned after being off the list for two or more years the practitioner did not get back the original wallet, which contained important notes about what had happened during the patient's childhood.

Dr. R. S. V. MARSHALL (South Staffordshire) said he hoped that the Representative Body would not pass the motion. It sounded simple, but he foresaw all sorts of complications. The plea by the War Office that they were unable to do anything should not be accepted. The War Office did it during the war and should be capable of doing it now.

Dr. A. TALBOT ROGERS said it would be agreed that a new idea had been explained clearly, and he suggested that the matter should be referred to the Council.

Dr. WRATHALL ROWE, in reply, said that the question of people with temporary residence had been answered. As to the number of people who might be affected, it worked out at about 7½ persons per practice.

The motion was agreed to as a reference to Council.

Dr. A. J. R. F. JOHNSON (East Norfolk) asked the Council to press for the adoption of the Scottish method of filling practice vacancies. The chief difference, he said, was that in England the candidate for the vacancy was interviewed by a committee of the local executive council, short-listed, and then sent up to the Medical Practices Committee, which made the final decision. In Scotland the candidate was selected by the local executive council, and the Medical Practices Committee acted as an appeal tribunal if required.

Dr. J. S. HAPPEL (Winchester) opposed the recommendation, stating that as one who had been interviewed under both systems he preferred the English method.

Dr. A. TALBOT ROGERS said there was no harm in referring the matter to the Council for consideration. Although the Scottish Act was drafted in a similar way to the Act for England and Wales, the Scottish Department of Health had taken certain powers to enable them to fill practice vacancies in that way. They were powers which could be questioned, and the Ministry of Health in England was not prepared to act under those same powers. If there were to be any alteration in the way in which practice vacancies were filled in this country it could be done only by an amending Act, with all its attendant difficulties.

This was agreed to as a reference to Council.

Assistants in General Practice

Dr. F. BOOTH (Mid-Cheshire) had a motion suggesting that, in the model form of agreement for use between principal and assistant, the number of weeks relating to absence and illness on the part of the assistant should be left blank.

It was felt, he said, that the form of agreement between principal and assistant might penalize the assistant. There might be some legal reason for the figure of 14 days and the other time of four weeks, but the assistants felt that those figures should be a matter for private arrangement between the principals and themselves.

Dr. ALISTAIR R. FRENCH (Marylebone), in supporting the motion, said he had had practical experience of difficulties which arose between principal and assistant, and emphasized that there was a danger in the model form of agreement. It was a legal contract and it must always be freely negotiated between the two parties. There was a danger in using the model form that the young man, and even the principal, might think that it was a matter of law. It was not. Both parties must remain absolutely free to negotiate to their mutual satisfaction an agreement to control the relationship between them.

Dr. F. GRAY (Council) said that the assistants in Cheshire appeared to have different views from those of assistants elsewhere. The model form had been closely scrutinized by the Assistants and Young Practitioners Subcommittee of the G.M.S. Committee, and it had taken no exception to it. The model form was one which could be altered, and he would have thought that principals and assistants with an agreement would realize that, while it was a basis, it would in all cases be advisable to get a solicitor's opinion on their particular case. Secondly, the agreement set out to offer something which, on the face of it, was fair to both parties. That was why figures had been put in, and if they were not inserted the Assistants and Young Practitioners Subcommittee would certainly have some strong criticism to make.

Dr. BOOTH, in reply, said he hoped that the meeting understood the importance of representatives giving the views of the assistants when talking about them. The opinions which he had given earlier were those of the assistants. In view of what had been said he suggested that it might be a good thing if the figures were left in as they were, but that a

footnote, if any, should indicate that they were suggested as suitable figures.

The motion was lost.

A motion was moved on behalf of Essex that the meeting, while appreciating the action taken in pursuance of Minute 60 of the A.R.M., 1955, felt that even greater pressure should be brought to bear to get more G.P. obstetric beds as soon as possible.

Dr. A. M. GOLDTHORPE (South-east Essex) said it would appear that out of four divisions only one had any maternity general-practitioner beds. Essex desired to ask the G.M.S. Committee what was the nature of the improvement referred to and how many more beds had in fact been opened up in the time given.

Dr. M. P. K. MENON (North Middlesex) supported the motion. It was evident, he said, that maternity practice was being taken away from the hands of medical practitioners. It had been suggested that nearly all cases had to be dealt with in hospitals.

Dr. A. TALBOT ROGERS said that there was every advantage in passing this motion. He could not answer the Essex question as to what was the improvement in their part of the world, but the figures showed that there was a slight improvement overall in the number of beds available for general practitioners. However, the number of beds was far from satisfactory.

The motion was carried.

Dr. F. LISHMAN (Bishop Auckland) moved to deplore the shortage of maternity beds, which in turn created a shortage of general-practitioner beds. He said that only 40% of cases in his area were confined in hospital because of shortage of beds.

The motion was carried.

Miss GLADYS M. SANDES (Marylebone) moved to reiterate the resolution of last year that, in view of the wide variation in different executive council areas of criteria for admission to the obstetric list, any duly qualified registered medical practitioner who applied to go on the list should be placed on it without further question. She added that in some cases extra experience in the pre-registration period might be advisable in order to supply additional skill. Her Division felt that a properly trained practitioner should be allowed to do obstetrics if he wished, and there should be no invidious distinction against him.

Dr. R. WEBB (East Suffolk) opposed the motion. The average newly registered doctor was not competent to deal with the emergencies which the duties of a general-practitioner obstetrician entailed. He could not be expected to command the respect of experienced midwives who might ask for his help. In midwifery emergencies occurred quickly; the general practitioner should be prepared to give plasma transfusions and he should be more experienced in antenatal care. The two previous resolutions were being endangered if high standards were not exacted in obstetrics—the present standards were too low.

Dr. A. TALBOT ROGERS said that the present resolution confirmed the present policy of the Association. The Minister of Health had set up a new committee to go into the whole question of the provision of maternity services in this country composed of obstetricians, midwives, general practitioners, and lay representatives, one of the general-practitioner representatives being the Deputy Chairman, Dr. Beauchamp. During the course of the coming year it would be the duty of the Association to present its evidence to this very important committee, which might very well shape the whole picture of midwifery in the years to come. Therefore it was important that the meeting should vote on this in such a way as to define an up-to-date policy.

Dr. L. I. FREEMAN (St. Pancras) strongly opposed the motion for three reasons. First, from the national point of view the practice of good midwifery would lead to healthy mothers and babies and encourage mothers to have them at home. Secondly, the B.M.A. was obliged to raise the standard of medical practice, and this resolution would not do this. The Royal College of Obstetricians and

Gynaecologists had fought hard to raise the standard of teaching and practice of obstetrics in this country, and to support this motion would be to defeat that object. ("Why?") He asked if any one of them would be happy to put the women members of their families into the hands of any "duly qualified registered medical practitioner" who applied to go on the obstetric list. He did not feel that such a man was capable of tackling this part of the work.

Dr. J. S. M. ORD (Glasgow) hoped the meeting would support the motion by Marylebone as strongly as possible. While these restrictions remained general practitioners lost patients every day to the hospitals. He could foresee that in ten years there would be a domiciliary midwives' service with a hospital for the consultant cases. The general practitioner would be looking from the corner for the scraps to come his way.

Dr. J. S. NOBLE (Blyth, with Morpeth) absolutely disagreed with the last speaker. The only danger of practitioners losing midwifery was from the lack of standards. To pass this motion while the commission was sitting was most dangerous; it meant that they said that every practitioner was completely competent to conduct any midwifery cases which cropped up, and if such a statement was made the commission would ignore it. There must be standards, and certain people must have a little more experience before they could be allowed to practise midwifery.

Dr. CATHERINE HARROWER (Glasgow) said that in Scotland the selection was made entirely by the doctors, the list was self-selected, and obstetrics in Scotland had always been extremely good. She was sure it would be a good thing if the English list was made on the same lines.

Dr. J. C. ARTHUR (Gateshead) said that when a doctor qualified in medicine he did so in medicine, surgery, and midwifery and gynaecology; surely he was qualified to do midwifery. If not, it was the fault of the teaching. For years there had been a tendency on the part of the obstetricians to take more and more for themselves and leave less and less for the general practitioner, and this was reflected in the teaching of students. However, that did not alter the fundamental principle of the resolution.

Dr. J. G. R. CLARKE (South Bedfordshire) doubted the wisdom of a declaration of policy on the matter. He suggested that it should be treated as a reference to Council.

Dr. ALISTAIR R. FRENCH (Marylebone) said it was not a question of deciding policy; the policy had already been decided at the last A.R.M. During the intern year it was compulsory to do at least six months in surgery and six months in medicine, but midwifery and obstetrics could be taken as an alternative to one of those subjects. Parliament had given to the General Medical Council the duty of deciding what standard of training in medicine, surgery, and obstetrics was required to allow a doctor to practise freely. Why should any body of men sitting in a little local area have the right to say that the standards laid down by the G.M.C. as approved examination standards were wrong? (Applause.)

Dr. C. R. G. BARRINGTON (Bromley) doubted if many doctors obtained extra qualifications in midwifery before starting in practice. It was a great mistake to have a list of extra qualifications and should not be tolerated.

Miss GLADYS M. SANDES (Marylebone) said the intention of the motion was not to reduce the standards of midwifery but merely to support the policy of the Association that the general practitioner who wished to do midwifery could get his name on the obstetrics list. Listening to some of the speeches on the subject she had wondered whether there was a return to the old days when the general practitioner was supposed to be a sort of Sarah Gamp. It was undisputed in some quarters that general practitioners were letting midwifery slip and sending cases to hospital for various reasons. That was one of the reasons why the district cases were being done by midwives and pupil midwives instead of in the teaching hospitals. That was a very retrograde step, for which she feared the general practitioners had themselves to blame.

The Marylebone motion was carried.

Post-mortem Examinations

Dr. A. FULLERTON (Dewsbury) moved that active steps be taken to establish a system whereby the family doctor, having obtained the consent of the next of kin of the deceased, could call in a consultant pathologist to do a post-mortem examination on any of his patients who had died of natural causes and for whom he could issue a death certificate in the usual way.

The motion, he said, was not concerned with cases referred to the coroner, who could order a post-mortem or not as he thought fit, but to those cases where there were circumstances of special interest arising in a case of death from natural causes.

Dr. A. TALBOT ROGERS said that agreement on the matter had been reached with the Ministry in a manner which he thought was likely to meet any such cases in which trouble had occurred.

Dr. R. COVE-SMITH (Marylebone) supported the motion.

Dr. FULLERTON said the matter had been referred to Council before and very little had happened. The body had to be removed from the patient's house to the mortuary. The motion was carried.

It was also agreed, on a motion by York, that transport should be available for the removal of corpses for post-mortem examination at public expense at the request of a general practitioner.

COMPENSATION AND SUPERANNUATION

The order of business was varied to permit of motions under "Compensation and Superannuation" being taken.

Dr. A. N. MATHIAS, chairman of the committee concerned, moved the sections of the report under this heading.

He said that since the last A.R.M. the whole question of the early repayment of compensation, the present inadequacy of the rate of interest thereon, the very narrow scope of the Ministry's definition of "hardship," and other matters had been under consideration. Discussions had been held with officials of the Ministry and all proposals had been met with a blank refusal. This time, if there was to be the slightest hope of success, especially as some of the proposals required legislation, it was felt that the best advice should be available in putting the case and that the approach should be to the Minister himself. Early last session a special committee consisting of senior members of the G.M.S. Committee and of the Superannuation and Compensation Committee had been formed which had decided to retain the services of the same team of advisors that had been employed by the Joint Negotiating Committee. As the remuneration claim had naturally taken priority the preparation of the compensation and superannuation case had been delayed, but Professor Allen had indicated the lines on which he thought the matter should proceed. In equity there was a cast-iron case. He hoped he would later be in a position to report progress in at least some directions.

With regard to the superannuation of part-time clinical assistants, difficulty arose only in those cases where a person held a part-time appointment but no other post in the Health Service, or had had a disqualifying break with, perhaps, even the return of his contributions. The Ministry had said that actuarially it was not possible for such people to enter the scheme on a part-time basis. The matter would be raised again: it involved ministries other than the Ministry of Health.

Regulation 85, giving the Minister absolute power to determine a question arising for decision under the Act in respect of superannuation, had been challenged in the courts last year, and, although there was no doubt that in law such power existed, the remarks made by the judge in the court of first instance had caused the Minister seriously to think whether something resembling the Medical Advisory Committee should not be set up to deal with the matter.

The Ministry had said that it was actuarially impossible for further options to be given eight years after the Health Service had started because some people felt that the conditions under which they had exercised their original option had

changed adversely in their particular case. The provisions of the Finance Bill at present before Parliament implemented to a certain degree the recommendations of the Millard Tucker Committee on Annuities and Retirement Arrangements for Self-Employed Persons. He asked representatives not to effect any new plan in their annuity arrangements until the Bill became law and its very complicated provisions were thoroughly understood and appreciated; neither should they give up or change any of their existing policies.

Advance Payment of Compensation

Dr. G. CORMACK (Newcastle-upon-Tyne) moved:

That the Council should press for payment of compensation adjusted to take into account the fall in the purchasing price of the pound and press for immediate payment; and that until such time as full payment of compensation is made the rate of interest be raised to current levels.

It might seem a commonplace proposition that whatever money was owing to doctors for the capital value of their practices ought to be paid; yet all sorts of excuses for non-payment had been made, some, regrettably, by members of the Representative Body and other members of the Association. Before the N.H.S. had been set up it had been agreed that the capital value of the practices involved was of the order of £66m. Whether or not that had been accurate, doctors should not go back on the agreement, but it represented the value of goods and services in 1947 or 1948, which had since been subject to a steadily depreciating currency. To buy the same amount of goods and services to-day would require perhaps twice as much. Hence the need for the adjustment in the capital value. Depreciation in value was a national problem, but there was no need to be too sympathetic towards those who had created it.

"We are in effect the only important nationalized group which have not received compensation, either in cash or in negotiable securities," he said. Doctors were required to make what was really a compulsory loan to the Government at a very low rate of interest. The fact that they had retained their jobs was not material; many other people in nationalized industries had retained their jobs and had got the money as well.

Dr. D. W. K. BUCHANAN (Dundee City) described the situation as "probably the greatest swindle of all time."

Dr. O. C. CARTER (Bournemouth) said he was concerned with the enormity of the injustice towards those who were in the Service. He asked whether it would be good for the status of medical men and women or for the welfare of medicine if, by the time compensation was paid, the value had dropped so much that it would be necessary for a large number of practitioners to seek help from public assistance.

Dr. A. N. MATHIAS said that all the arguments that had been advanced would be incorporated in the case to be put to the Minister.

The motion was carried unanimously.

Dr. A. COLEMAN (North Glamorgan and Brecknock) moved to request the Council to press for the payment of compensation moneys, or alternatively that it should be possible to convert compensation moneys into any other Government stocks.

He said that his Division desired to provide the possibility of half a loaf should it not be possible to obtain a full loaf. If the portion remaining of the global sum were to be converted into suitable stocks, such as Exchequer stocks, then with the capital appreciation which would fall to such stocks there would at least be some possibility of offsetting the grave decrease in capital values.

Dr. A. N. MATHIAS expressed the hope that the Representative Body would pass the motion unanimously.

The motion was carried unanimously.

Dr. LESLIE W. JONES (North-west Wales) moved that in cases of proved hardship doctors should be allowed to draw out their compensation money.

He quoted the experience of one member of his Division whose income had dropped by £1,500 per annum. Under

the present regulations he was debarred from making an application for compensation, and it was urged that there was every reason for the payment of compensation now.

Dr. A. N. MATHIAS said that pressure would be exerted for a wide broadening of the definition of "hardship."

The motion was carried.

Dr. J. W. RIDLEY (Cleveland) moved to ask the Council to review the superannuation and pensions schemes, with special reference to the responsibilities of the young practitioner with less than ten years' service.

He said that the young practitioner who qualified after a course lasting six years was then required to do one year in hospital before registration, during which time he paid the normal 6% superannuation on his salary. That was followed by two years' National Service, during which time he had the option of continuing to pay superannuation at the same rate as in his hospital job. That was normally followed by further hospital appointments. If he should become permanently incapacitated through accident or injury sustained in the discharge of his duties or by disease contracted because of exposure to it in the course of duty, he would be entitled to an injury pension. The important point in that connexion was that with the accident pension there was no qualifying period. If on the other hand a young practitioner of less than 10 years' standing was permanently incapacitated by injury or disease not contracted in the course of his job, then his only entitlement was the return of his 6% contributions plus compound interest. It was at a time when the young man was unable financially adequately to cover himself by insurance, and it was a matter of concern.

Dr. A. N. MATHIAS accepted the motion as a reference to Council. The working of the scheme and its funds had to be reviewed every seven years by statute, and they were at present being reviewed by the Government Actuary. When the results of the first seven years' working were known and possibly surpluses known, the Association would be in a strong position to make representations to see whether it was possible to get the benefits increased.

The motion was carried.

Dr. J. S. NOBLE (Blyth, with Morpeth) moved that the present ruling whereby women practitioners may draw widows' pensions in respect of their husbands but hospital officers may not is unfortunate and should be retrospectively altered forthwith.

"What sort of Treasury is this we have when they withhold from us our rightful moneys and then they snatch from the hands of our widows the paltry crumbs which they are entitled to?" he asked. He urged the meeting to pass the motion and press for an alteration in the ruling immediately.

Dr. ANNIS GILLIE (Paddington), in supporting the motion, said that it should be known that the proposer's wife was actually in full-time hospital salaried service, and if some catastrophe overtook him she would not be able to enjoy her husband's pension.

Dr. A. N. MATHIAS agreed that there was an anomaly and said he was grateful to Morpeth for having pointed it out. The motion was carried.

Dr. J. C. ARTHUR (Gateshead) moved that full pension benefits should be available to practitioners who wished to retire after 20 years' service, even if they had not reached the age of 60 years.

When the scheme was started in 1948, he said, the average doctor's age was in the forties. He did not contemplate putting in much more than 20 to 25 years' service anyway, but now the young man coming in might be faced with doing something like 35 years' service before he got pension rights. That represented a fairly "long sentence" in the National Health Service.

Dr. A. N. MATHIAS said that the question was based solely on actuarial considerations, and if the meeting were agreeable it could be looked at again and a report made next year.

The motion was carried as a reference to Council.

GENERAL MEDICAL SERVICES (resumed)

Fees for Maternity Medical Services

Dr. J. J. COSGROVE (Londonderry, with North-east Ulster) moved that the Association press for an increase in the fees payable to general practitioners in the maternity medical service.

He pointed out that the maternity fees had remained the same since 1948. The position was that a man in practice who did a considerable amount of midwifery was at a disadvantage as opposed to the man who did not. He received an inferior rate for the job.

Dr. A. TALBOT ROGERS said that the Representative Body ought first to consider where the money came from. It was not, of course, a question of asking the Government to provide extra money for the general medical services of the country. Whatever was paid for maternity services came as a first charge on the pool. He was doubtful whether the present was the best time to do it in view of the imminent general review of the way in which maternity services were provided.

The motion was lost.

Service Committees and Tribunal Regulations

Dr. R. S. V. MARSHALL (South Staffordshire) moved that amendments to Service Committee regulations should include:

- (1) The requirement that a précis of the evidence given by each witness be prepared and signed by the witness;
- (2) Proceedings against a doctor should only be in respect of a breach of the regulations, and the doctor be notified in advance of the inquiry of the regulation of which he was alleged to be in breach.

There were two other conditions laid down in the original resolution, but they required suspension of standing orders, which the meeting did not concede.

There seemed to be some difficulty as to whether the actual précis was in fact a correct record of the evidence which was given. It was suggested that if witnesses signed a précis of the evidence there would be some record, and there would not be the feeling of dissatisfaction.

Dr. ROBERT FORBES (Council) expressed the hope that the Representative Body would hesitate a long time before giving approval to the motion in its present form. "Those giving approval to the motion in its present form. 'Those of us who have seen these medical services committees in operation over a period of years are satisfied that the procedure that is being followed—and it will be improved—is a reasonable procedure which does not stand in need of further modification,'" he concluded.

Dr. ALISTAIR R. FRENCH (Marylebone) confirmed what Dr. Forbes had said. So far as point (2) was concerned, it was a fact that the executive council must inform a doctor charged with a breach of his terms of service specifically what particular paragraph of his terms of service it was that he was alleged to have broken.

Dr. H. GUY DAIN (Council) said that the suggestion under (1) was impracticable. At a meeting of the Medical Services Committee a shorthand note was taken and was available afterwards for reference, and it would be impossible to prepare a précis at that time. It would have to be circulated and agreed by the doctor and the patient. It would be of no advantage to the Service to do something which would be impracticable. With regard to (2), there was no question of regulations being broken. It was a question of terms of service, which was quite different.

Dr. B. HIRSH (Manchester) said there were many aspects of the resolution which he strongly supported. Medical services tribunals were examples of amateur justice at its worst. They followed no rules of evidence, and no man should be brought up before a tribunal unless he had committed a specific offence against the regulations which should be clearly stated. Those amateur tribunals were something which was repugnant to the whole conception of jurisprudence. On the one side—the doctor—there were duties and

no rights, and on the other side there were rights and no duties. It was contrary to the basic conception of justice in England.

Dr. MARSHALL, in reply, said that he had never seen full shorthand notes taken at an inquiry, as Dr. Dain had asserted. He was also informed that the notes would not be available.

The motion was carried.

Practice Accommodation

Dr. P. PHILLIPS (Bristol) moved to ask the Council to inquire into the unsatisfactory position in certain local authority areas with regard to tenancy terms for houses and surgeries rented by general practitioners on new housing estates. He said that it was an essential social need that practitioners should be able to obtain houses on the new housing estates. In his area the question of the doctors' accommodation was taken up with the local authorities and after some time the type of doctors' houses was agreed to. Three doctors' houses had been built and were now occupied and three doctors' surgeries were in occupation. The building was proceeding rapidly, but the complaint he made was in connexion with the terms offered to practitioners. The model plans were approved at a rental of approximately £328 per annum, but the increased cost of labour and materials had raised the cost of building to £6,000, and the Ministry of Health insisted that they must be let at an economic rent, and £400 barely covered it. At no stage would the doctor be permitted to buy the house; he was on a yearly tenancy with six months' notice on either side, so that he had no security of tenure; nor was it at all certain that his successor would be allowed to occupy the premises, either the house or the surgery.

Dr. A. TALBOT ROGERS said that this was an item which had been under the special consideration of the G.M.S. Committee through a subcommittee which had been examining the question of accommodation for doctors. A large number of problems had been discovered of different types and kinds. Information was coming in from executive councils and it was part of their intention in the new areas to try to find ways and means in which help could be given. The type of thing which the speaker from Bristol had outlined was the kind of information which was needed.

Dr. A. G. HERON (Bristol) supported what Dr. Phillips had said. The local authorities would not allow the houses to be purchased and the doctor was saddled with this £400 outgoing for the rest of his life. It was a terrible burden on the young doctor. Working and living on these estates was an arduous and lonely business for a doctor and his wife and children. He asked Council to find some means of ensuring security of tenure to these doctors working on the new estates.

The motion was carried.

DEPUTY CHAIRMAN, 1956-7

It was announced at this point that Dr. A. Beauchamp, of Birmingham, had been returned unopposed as Deputy Chairman of the Representative Body for the coming session.

The CHAIRMAN having announced that the meeting would have to sit until 6.45 p.m., a motion to suspend Standing Order 70 was accepted and carried with acclamation.

Employment of General Practitioners in Hospitals

Dr. A. A. VICKERS (Worcester and Bromsgrove) moved that there be an interim increase in remuneration of general practitioners doing sessional work in hospitals pending any final reorganization of hospital staff gradings following the Strachan proposals. He said that the 1954 award did not take into account general practitioners doing sessional work in hospital. The Strachan Report might be under discussion for years, and that was an unreasonable time for general practitioners in hospitals to have to wait.

Dr. A. V. RUSSELL (Council) supported the motion by Worcester and Bromsgrove. He hoped that in the negotia-

The meeting rose at 6.58 p.m.

THIRD DAY

Saturday, July 7

The Representative Meeting reassembled at 10 a.m., with Dr. I. GRANT in the chair.

GENERAL MEDICAL SERVICES

The debate was resumed on the sections of the report under General Medical Services.

National Insurance Contributions

Dr. R. P. HENDRY (Rugby, with South Warwickshire) made a motion which described as "noxious" the present practice of requiring a full week's National Insurance contribution for any portion of a week for which a person, not otherwise exempt, was certified. It contributed materially, said the mover, to some fantastic figures, such as those for final certificates received at National Insurance offices, Rugby, during the four weeks ending October 1 last. The figures showed that the day on which patients would be fit to return to work would be Monday in 250 cases, Tuesday in 57, Wednesday in 27, Thursday in 22, Friday in 17, and Saturday in 13. The motion went on to instruct Council to reopen the matter with the Ministry in the light of these figures, with a suggestion that persons certified fit to resume work on a Monday or Tuesday pay the full contribution, on Wednesday or Thursday half the normal rate, and on Friday, Saturday, or Sunday be exempt for that week.

Dr. I. M. JONES (Council) said that the motion sounded reasonable, but was in fact quite impracticable on several counts. First of all, the Ministry's contention that it was not feasible on actuarial grounds was quite correct. If the motion were implemented it would result in the insurance moneys of the Government being depleted to the tune of an average of about one week's contribution for each absence of ten days. Actuarially that would be little different from increasing sickness benefit by about 8s. a week.

Dr. R. H. MOORE (North Middlesex) said it was not the Ministry of National Insurance which was at fault. It was spread around various organizations and individuals—sick clubs, employers who had a fixed staff week, and the understanding foreman who told the employee not to return to work until he was thoroughly well.

Dr. HENDRY, in reply, pointed out that, if an employee returned to work on the Friday and did not make any contribution for that week, he did not get his 12s. 9d. or whatever benefit he happened to be drawing for those two days, so there was a saving on those days. He did not agree that it would increase by 8s. a week the amount of benefit. It was true that many firms started their working week on other days than a Monday, but the National Insurance week as such started on a Monday.

The motion was lost.

Supplementary Ophthalmic Services

Dr. R. B. L. RIDGE (Enfield and Potters Bar) asked the meeting to express the opinion that the grounds for altering the validity of Form O.S.C.1 were insufficient to justify the proposed change. There was, he said, confusion as to the proper use of Form O.S.C.1. At the same time, the big demand for forms at the outset of the Service tended to reduce the issue of the forms to a mere formality, a practice which had continued ever since. While the form might have some potential value, in everyday practice it was largely regarded as a formality and, as such, was of no value. It was proposed that the form should be required not only for the first eye test but for every subsequent test as well.

Dr. C. WATNEY ROE (Chelsea and Fulham) opposed the recommendation. Speaking as an ophthalmic practitioner, he said it was necessary to convince members that their services were more valuable than those of sight-testing opticians.

Dr. R. W. McCONNEL (Buckinghamshire) urged the meeting to reject the recommendation. Every practitioner, he said, should be able to decide whether a patient should be

sent to a consultant at hospital or to an optician. That was the value of Form O.S.C.1.

Dr. R. H. MOORE (North Middlesex) gave an instance of a patient who delayed consulting him because he had been to an eye centre, assuming that the centre knew more than the practitioner. He pleaded that doctors should be allowed to do their job thoroughly.

Dr. A. TALBOT ROGERS said that the matter had been considered, and he expressed the hope that the amendment would not be passed.

Dr. RIDGE, in reply, said that the decision taken on the amendment would affect every general practitioner every working day of his life. It was an example of the way in which wool had been pulled over the eyes of the Committee and the Council. The proposal would not in practice, however right in theory, achieve its objective. It called in question the integrity of the opticians, and it was not in keeping with the dignity of the Association to do this or to have an ulterior motive for a clinical proposition.

The Enfield and Potters Bar amendment was lost.

Economy in Prescribing

Dr. R. S. V. MARSHALL (South Staffordshire) moved that in order to assist practitioners to know the cost of drugs random selection of E.C.10 forms issued by them should be returned to them as soon as the Pricing Bureau had completed its work.

Most of the difficulties about the cost of prescribing were due to the fact that the doctor did not know what the cost of the prescriptions was.

Dr. ST. G. B. D. GRAY (South-west Essex) supported the motion.

Dr. A. TALBOT ROGERS commended the idea as something worth looking into. He asked that it be referred to Council.

The motion was carried as a reference to Council.

Dr. ST. G. B. D. GRAY (South-west Essex) had a motion suggesting that it was impossible for doctors to co-operate fully in the medicine economy drive because most advertisements do not state the price of drugs advertised. All medical advertisements to the profession should give an indication of the basic cost.

He said that most doctors had little idea of what the various drugs cost.

Dr. A. TALBOT ROGERS thought that the position was improving. Over the last five years there had been an increasing tendency in advertisements to provide references to the cost of the drugs.

Dr. R. H. MOORE (North Middlesex) thought that the manufacturers could help by standardizing the size of their advertisements in loose-leaf form so that they could be looked up easily and the price list more easily consulted.

The motion was carried.

Dr. A. REZLER (City) moved that the present method of penalizing doctors whose prescribing costs are above the areal average would result in a progressive deterioration in therapeutics and a fear in the N.H.S. patient that he might not receive adequate treatment for his illness.

He said his Branch felt that there was a point of principle at stake. At the present time doctors had not freedom of action in prescribing, which caused anxiety in the profession. The Cohen Committee had concluded that, generally speaking, it was undesirable to interfere with prescribing, though they had still set out some ways of doing so. Since then the matter had got worse. Not many doctors had had money deducted so far, but a great many had been subject to investigation and had been intimidated in an effort to force the profession to toe the party line. The present method of stifling doctors with higher than average costs endangered the maintenance of good therapeutic standards and was a mischievous substitute for the proper solution, for it would lead to standardized prescribing—in which case, why not go the whole hog and have the standardized doctor?

There was some anxiety among local medical committees that increased latitude in prescribing would give licence to

the scallywag. There had so far been inadequate study of the general-practitioner prescribing, and it was not the first time that the profession had had to look to non-medical experts to put the medical house in order. There were many factors which would repay further study. Because, over some years, the average prescription cost in Scotland had been about a shilling more than in England and Wales, was it right to suggest that the Scots were just throwing the money around?

Dr. B. HIRSH (Manchester) asked the meeting to reject the motion, on the ground that it contained a number of dangerous fallacies. The prescription of fancy and expensive drugs was not synonymous with good therapeutics, and the doctor who prescribed them let down his colleagues in the neighbourhood. The present drug bill was running at the rate of £52 million a year, for which figure there was little justification. The acceptance of the motion was to bring the cost still higher. Not only should the doctor who prescribed fancy and expensive drugs be penalized; there should be a bonus for the doctor whose prescription costs were well below the area average.

Dr. B. BURNS (Sheffield) said that, the populace of the country having been incited to become drug addicts, the doctor was now to be pilloried for prescribing what he had advised the patient to ask for. To penalize the doctor was merely a matter of the convenience of the executive council, thus perpetuating injustice. He thought that the whole trend of the service should be revised, particularly on the question of excessive prescribing.

Dr. N. NELSON (Dundee City) quoted figures showing that drug costs in Dundee were low.

Dr. R. H. MOORE (North Middlesex) said that regard should be had to the standard of a doctor's work and the results that he obtained. At present the doctor who did his work properly was penalized.

Dr. F. GRAY (Council) reminded the meeting that prescribing costs were sent out first of all for information, and every doctor should be glad to receive it. He denied that there was any penalizing of doctors because their costs were above average, but admitted that certain cases were picked out for investigation where a doctor was costing more money than others. The matter was then investigated by the local medical committee. The matter could be taken to referees if there was any dispute. No doctor could be "convicted" by the Ministry unless it were proved that there had been unnecessary cost.

"We have a responsibility to our patients, to our profession, and to the State that we prescribe reasonably," he said. "We have all the remedies in our own hands."

He asked the meeting to throw out what he described as "this inaccurately worded motion."

Dr. REZLER, replying to the debate, said it was interesting that doctors seemed always to refer to overprescribing done by other doctors but never by themselves. They seemed to feel that there must always be blacklegging somewhere—never mind if the whole profession suffered. He expressed surprise that Dundee's costs were so low and wondered what they were actually cheating on.

The City motion was lost.

Dr. W. B. ADAM (Tunbridge Wells) moved that, until such time as the pricing average figures are reliable, it is a waste of time and money sending R.M.O.s to interview general practitioners on this matter.

Dr. H. B. MUIR (Fife) said there was a common misconception that the high cost of prescribing was due to the prescribing of expensive drugs; the real cause was the frequency of prescribing.

Dr. A. TALBOT ROGERS said that such figures were things that doctors themselves asked for so that they might become aware of their own prescribing habits. R.M.O. visits had been carried out even before the area averages had been instituted, when a series of outstandingly expensive drugs had been found to have been prescribed. The initial visit was quite informal, often in the nature of a suggestion that some prescriptions might have been unnecessary and that the doctor might alter his prescribing habits without detriment

to his patients. It was only some six months or so later, when another check was made, that he got a further visit; if he had not by then done anything to improve the position he might be reported to his colleagues on the local medical committee, and it was then for them to decide whether or not a penalty should be suggested in his case. He thought there were pretty good safeguards and that not many were deterred from prescribing what they thought was right by the thought of area averages. Even in the past, before the days of area averages, considerable savings had often been effected as a result of R.M.O.s' visits. In some cases as much as £1,000 a year had been saved without any appreciable detriment to the doctor's method of practice in that way.

Loans for Provision of Surgery Accommodation

Dr. E. I. GARRATT (Dudley) moved that the Minister be pressed to increase the scope of interest-free loans for the provision of new surgery accommodation, to include all practitioners, either in single practice or in partnership, where such application is endorsed by the local medical committee and the executive council. He said that his Division was anxious to widen the scope for the issue of interest-free loans for the building of new surgery premises. They were aware that the idea of interest-free loans first came into being as a condition of the Danckwerts award in order to encourage the formation of group practices, but five, six, or seven doctors practising together was not always a feasible or desirable proposition. Owing to the credit squeeze it was not easy to get loans from banks, and many young doctors were finding it difficult to establish themselves in practice and find suitable accommodation. The Group Practice Loans Committee had laid down the minimum standards which it considered should apply to surgeries, but his Division was anxious that a young man starting off in practice should be able to begin under the best conditions; a measure of this nature would encourage these high standards.

Dr. A. BROWN (chairman, Private Practice Committee), speaking as a member of the Group Practice Loan Committee, said that the establishment of this fund was a condition of the acceptance of the Danckwerts award, which provided that £100,000 was to be put aside to enable the formation of group practices. The Group Practice Loans Committee consisted partly of doctors and partly of lay officials who had to be satisfied that a group practice did exist and that it would be served by an interest-free loan before this was granted. The scheme had been running for four years, and there would be no money left for any other purpose unless more money was taken out of the Pool. He thought it would be advisable not to accept this motion.

Dr. GARRATT asked if it could be accepted as a reference to Council, and this was agreed to.

Insurance Benefit During Part-time Employment

Dr. R. W. McCONNEL, on behalf of Reading, moved to ask for discussions with the Government departments concerned as to whether National Insurance benefit, even at a reduced rate, could be payable for a limited time during part-time employment preliminary to resumption of full-time. It was felt that this would facilitate the gradual return to full-time work which is desirable after certain illnesses. All doctors had patients who could not go back to full-time work after long illness and they stayed away in order that their benefit should continue. It would be an economy if they were able to go back on part-time work and were paid partly by the employers and partly by the Government. Many of these patients would benefit by doing a little work.

Dr. H. ALEXANDER (Council) said that the motion was a very important one. It was bound up with the wider problem of rehabilitation. Some two years ago a special committee was set up to prepare a memorandum of evidence for submission to the interdepartmental committee on the rehabilitation and resettlement of disabled persons (the

Piercy Committee); this was published and was a valuable contribution to the subject. The Committee drew attention to the fact that the general practitioner had the choice of only two things for the patient—that he was fit for work or was unfit for work. It dealt with the question of admission to industrial rehabilitation units for which the patient must have a certificate, and it was suggested that a certificate of partial fitness might be introduced so that the patient would get into the unit more quickly. The reaction of the Piercy Committee to that remained to be seen.

The purpose of the Reading motion was even more precisely urged in a memorandum by the British Council for Rehabilitation. It was pointed out that recovery from sickness or injury was gradual and could not accurately be forecast when the period of incapacity ended or the period of fitness started. The scheme provided for the full co-operation of the doctor, the patient, and the employer for an earlier return to work. This was considered by the Rehabilitation Committee and approved. No doubt there would be administrative difficulties, but anything which would encourage the convalescents in industry to co-operate in their own rehabilitation must be worthy of serious consideration.

The motion was carried.

Appliances

Dr. I. M. JONES (Sunderland) moved that Council be asked to consider the practicability of permitting general practitioners to prescribe on Form E.C.10 replacements of those appliances which were at present available only through the hospital service. He was concerned with the group of appliances which were prescribable originally by consultants. Some were now permitted to general practitioners on E.C.10. A typical anomaly was that a general practitioner could prescribe the replacement of an appliance for suprapubic transitional hernia, but he could not prescribe for the replacement of an appliance for epigastric transitional hernia. These anomalies caused unnecessary references to consultants. He asked that Council should review these regulations with a view to eliminating these anomalies.

Dr. A. TALBOT ROGERS thought Council might do this, but he hoped a list of the type of appliances could be supplied. The Ministry could not be expected to agree to a wholesale permission, especially when it was borne in mind that many of the appliances ordered were for a specific period to deal with a transient condition.

Mr. H. H. LANGSTON (Council) said that this concession if granted would bring relief to many orthopaedic surgeons and it would save time, but he did not think it could be applied in the wholesale way the motion suggested. The present was an opportune time to raise this issue because, whereas appliances had been supplied through the Ministry direct, now this would have to be done through management committees.

The motion was carried.

Dr. A. M. MAIDEN (Lincoln) asked the meeting to agree that oxygen, blood, and other therapeutic substances required by a general practitioner in an emergency should be conveyed to the patient at the public expense, and without charge to the doctor. He said that there appeared to be no fund out of which the transport of oxygen, blood, and therapeutic substances could be conveyed to a patient's house in an emergency. In a case of post-partum haemorrhage blood wanted quickly was sometimes brought to the house by ambulance. When oxygen was needed it was the duty of the patient to arrange the transport, which was not always easy in a country district in the middle of the night. In his Division hitherto these things had been paid for by the executive council and an application made to the Ministry to pass it: it had done so, stating that the item must be shown as a bad debt in the audited accounts. In the last two years, however, the Ministry had not allowed any of these payments to be made, and the health committee of the Lincoln County Council had informed the profession

that it would send the bill to the doctor. That had been done in two cases recently. Some method should be evolved whereby the doctor should not be penalized.

Dr. A. TALBOT ROGERS said that this would be taken up again with the Ministry. Previously the Ministry had said that there was no fund out of which such payments would be met, and payment depended on the good will of the county council.

The motion was carried as a reference to Council.

National Insurance Certificates

Dr. J. S. NOBLE (Blyth, with Morpeth) moved that practitioners should at their discretion be permitted to issue first or any subsequent National Insurance certificates for a period of up to four weeks. If this motion were accepted it would save the time of the patients, that of the other patients, and of the doctor. It might be said that there would be some abuse, but the Ministry had enough R.M.O.s to deal with cases of that kind.

Dr. A. TALBOT ROGERS said that the Conference of Local Medical Committees passed a similar resolution and the matter would be taken up with the appropriate authorities in the coming session.

The motion was carried.

Dr. NOBLE further moved that the Ministry of National Insurance be empowered to issue copies of National Insurance certificates on request from the patient. He said that it would be a considerable saving in work if the Ministry issued these certificates instead of the doctors.

Dr. W. B. PEMBERTON (Camberwell) said that after the 1948 Act income from private practice fell to nothing except the small amount one received for issuing private certificates. This meeting had shown in no undecided fashion that incomes should be raised, and he asked that this motion should not be passed.

Dr. G. CORMACK (Newcastle-upon-Tyne) thought this would create a thoroughly bad precedent. Clerks should not be permitted to issue certificates for anything they thought fit.

Dr. R. COVE-SMITH (Marylebone) also opposed the motion, which was defeated.

Medical Practices Committee Certificates

Dr. J. S. MOFFAT (Cumberland) moved that the meeting recommend that section 35 (9) of the National Health Service Act, 1946, be more clearly defined, so that, just as the granting of a certificate of valuation protected the practitioner at law, the refusal of such a certificate should legally imply that the law had been broken. The motion went on further to recommend that the Medical Practices Committee should be answerable at law for failure to carry out their statutory duties.

Dr. Moffat gave an account of a case in which a difficult situation arose from the fact that section 35 of the Act provided that doctors in possession of certificates of valuation were protected and those who had been refused were not protected. A doctor to whom a certificate had been refused might not know where he stood until he found himself in the criminal court. His Division submitted that a practitioner who could prove that the valuation certificate was refused to him should equally be protected at law, and the Medical Practices Committee should be answerable at law for failure to carry out their statutory duty.

Dr. W. E. DORNAN (Medical Practices Committee) said that, although the facts had been accurately stated, the section laid down that the certificate was valid only in respect of a proposed transaction. The unfortunate doctor in question had entered into his transaction and completed it by signing his agreement to purchase the house before he went to the Medical Practices Committee for a certificate, and in those circumstances the Committee was unable to issue a valid certificate. (Cries of "Why?") "Because the section of the Act lays it down quite clearly that the certificate is only valid in respect of a proposed transaction

and not a transaction which has been completed. The terms of the Act are quite explicit on that."

He said the Committee was anxious to be helpful and went to the valuation department at Somerset House for their opinion. If a satisfactory answer was given by the valuation department a letter could have been sent to the doctor enabling him to satisfy the building society that the transaction was not one which could be questioned. If the motion was passed it would put on a doctor charged the onus of proving his innocence instead of it being on the prosecution to prove his guilt once the certificate had been refused to the doctor.

Dr. J. A. PRIDHAM (Council), reinforcing Dr. Dornan, said he hoped the last thing the meeting would wish was for the Medical Practices Committee to have the power asked for, which would alter the whole aspect of the certificates. Representatives would be fastening a chain on themselves if they passed the motion, and would be asking the Committee to take over the powers of the courts and the public prosecutor. He asked the meeting not to be misled by one unfortunate case.

Dr. H. GUY DAIN (Council) suggested that the motion should be accepted as a reference back to Council.

The motion was carried as a reference to Council.

R.M.O. Examinations

Dr. W. MORGAN EVANS (South Middlesex) moved that in the opinion of the meeting the local National Insurance officer should be required, three weekdays before sending Form R.M.3D to a patient, to notify in writing the practitioner in charge of the case.

Dr. A. TALBOT ROGERS suggested that the motion should be referred to the Council, which would do its best to carry it out.

Dr. EVANS said it was a straightforward issue and that the meeting should be able to say yea or nay to it.

The motion was carried.

National Health Service and Foreign Nationals

Dr. A. W. HENDERSON (Oxford) moved that access to the National Health Service should not be available to foreigners on holiday in this country except in the case of nationals of countries with which there are reciprocal arrangements.

He said the motion was not intended to apply to foreigners who were resident in Britain for a long period or were studying, but to visitors for a few weeks, many of whom were abusing the Service by getting free treatment, including dentures and spectacles.

Dr. H. G. DOWLER (Gloucestershire) said it distressed him to find Oxford putting forward such a motion. One realized that there were abuses, but surely one should err on the side of giving the benefit of the doubt. (Cries of "No.")

Dr. J. S. M. ORD (Glasgow) expressed the hope that the meeting would turn the motion down. It was against the whole spirit of the Act, and affected those people visiting this country who were suddenly taken ill or who were involved in an accident for which they were in no way to blame.

Dr. L. ZEITLINE (Paddington) expressed surprise that such a large city as Oxford should have tabled such a minute and unworthy resolution. He urged the meeting to put down the motion on two grounds: the first was that it was against the general principle that the National Health Service was open to all foreigners, and, secondly, the number of "temporary residents" constituted a substantial part of the practitioner's income in certain cases.

Dr. R. H. MOORE (North Middlesex) asked the meeting to turn the motion down.

Mr. H. H. LANGSTON (Winchester), speaking in support of the motion, recounted how some 18 months ago six American ladies were taken into Southampton Hospital with fractured femurs due to a rough crossing of the Atlantic. It was felt that one of them, after an eight-weeks stay in the hospital, was fit enough to go home, but she said she could not afford the treatment in the United States, and at the end of 14 weeks she flew back to San Francisco.

Dr. C. W. WALKER (Cambridge and Huntingdon) said that the motion from Oxford was thoroughly mean. "Why should we not offer hospitality, poor and ill equipped as we are?" he asked. "Is it not a matter of pride that we should be allowed to offer hospitality to those who come here?"

Dr. C. R. G. BARRINGTON (Bromley) said that many friends on the Continent had expressed to him surprise that foreigners should be allowed free treatment when in Britain. It was an absurdity which had gone far enough.

Dr. A. TALBOT ROGERS, in reply to a question, said that the amount which was spent on the free treatment was much less than was generally thought, and an effort would be made to obtain the figures. The small amount which had been spent had been one of the best advertisements for this country in spreading good will outside Britain. It was not true that a patient could come from another country deliberately to have treatment here. A practitioner was entitled to refuse to treat any person whom he believed had come deliberately to have glasses or teeth. The service was legal only for those people who fell ill when in Britain.

Dr. HENDERSON, in reply, maintained that in many instances it was difficult to refuse treatment to those persons who demanded it.

The Oxford motion was lost by 135 for and 155 against.

MEDICAL ETHICS

Indirect Methods of Advertising

Dr. ROBERT FORBES, chairman of the Ethical Committee, presented the report under "Medical Ethics." He immediately proceeded to move approval of the Report on Indirect Methods of Advertising, which forms Appendix V of the Annual Report of Council, and further moved, as a recommendation of Council, the insertion of the following sentence after para. 14(v) of the report which lays down the general rule of anonymity for practitioners appearing in "sound" or "visual" broadcasting programmes:

There may be exceptional circumstances when a departure from the foregoing rule is justified—for example, when a practitioner broadcasts in an official capacity on medico-political matters of national interest.

Since 1953, he said, pressure had been brought to bear upon the Central Ethical Committee to consider again its attitude in the matter of broadcasting by radio and television. Letters had appeared in the press maintaining that anonymity should be relaxed. Some eminent members of the profession flouted the earlier expression of opinion by the Representative Body and appeared under their own names when dealing with medical subjects on sound and visual broadcasts. The situation called for re-examination by the Committee. The Committee went into the matter very fully and reported to Council that the rule of anonymity should be continued. It was felt that any relaxation of that rule might make the situation much worse, and might be used by practitioners as an excuse for doing things which they themselves knew to be unlawful and probably wrong. The Council had asked the Committee to consider taking the matter back and reviewing it once more, suggesting that if the absolute rule of anonymity were to obtain it would be impossible for any member of the B.M.A. Council or any members of the staff, or any prominent member of the profession outside those already mentioned, to appear on television or to speak on the radio on a matter of national or medico-political importance. It was suggested that something was lost by merely saying that the person who was speaking was "a spokesman of the British Medical Association."

The Committee were loath to concede that point of view, but it went as far as it dared and added the words: "There may be exceptional circumstances when a departure from the foregoing rule [the absolute rule of anonymity] is justified." It had been made clear at the top of the document which dealt with indirect methods of advertising that the ultimate decision in all matters must rest with the individual concerned, but practitioners who were in any difficulty in deciding upon their course of action should seek guidance from the Secretary of the Association.

Dr. C. P. WALLACE (Guildford) congratulated Dr. Forbes and his committee on having moved one inch forward.

He disagreed with the statement that anonymous medical broadcasts had gained the confidence and approval of the public. Nothing could be worse than that the public should be conditioned and educated into receiving their information on medical matters from anonymous sources. He also disagreed with the view expressed in the statement that "the authority in the circumstances cited above derives from the standing of the organization or the newspaper concerned." He was unable to think that the Representative Body wished that the medical instruction of the public should be influenced by the so-called standing of the newspaper concerned. What really mattered was the circulation of the newspaper concerned.

The motion was carried.

Mr. J. C. GIBSON-MOORE (Hendon) moved as an amendment that the policy of the Association as expressed in the resolution by the Representative Body in 1951 be reaffirmed. This resolution called for a close liaison between the B.M.A. and the B.B.C. to control the selection of subjects and the scope of material presented to the public, and that practitioners approached to appear in such programmes, whether sound broadcasting or television, should insist on anonymity as part of the contract.

Dr. R. P. LISTON (Tunbridge Wells) said there were two schools of thought on the matter. The diehard school felt that any departure from the accepted policy was fraught with danger and that in no circumstances should doctors speak in their own names on medical matters on the wireless; the modern view was that people should speak in their own names with their full titles and appointments; it was felt, quite rightly, that every opportunity should be taken to educate the public in medical matters. The difference of view arose on where such information could be authentic only if the doctor giving the talk were identified. But was anonymity really a bar to authenticity? The demand for names surely did not come from the public. The man-in-the-street did not really care who spoke to him on the wireless on medical matters so long as it was a doctor.

Dr. S. NOY SCOTT (Council) hoped that the meeting would reaffirm the 1951 decision. The more the recommendation was examined in cold blood the more insidious it appeared. Once the door was opened one inch, before long there would be a flood. When a practitioner broadcast in an official capacity on medico-political matters, in nearly every case he would be either an officer or an official of the Association. Surely, that should be sufficient to show his status. He could see no conceivable way in which the naming of the doctor could help.

Dr. F. GRAY (Council) said a little bit of fact was worth more than a lot of theory. Many years ago the Council had deliberately broken its rule of anonymity by asking Lord Horder to broadcast. That was one of those exceptional instances where it had been absolutely necessary for it to be put across to the public that a certain step should not, for medical reasons, be taken, and it would not have had the same effect had it been done by an anonymous doctor.

The recommendation merely embodied the principle laid down by the G.M.C. that a doctor should not do anything to attract patients or promote his professional advantage.

Dr. F. M. ROSE (Council) said that too great a degree of rigidity in the construction of the motion was likely to defeat its own purpose.

Dr. WALLACE pleaded that the meeting should hesitate before supporting the amendment, for it would introduce a degree of rigidity into the practice of the profession with regard to broadcasting which was wholly undesirable. He said that those who, with him, were strongly in favour of a greater degree of freedom were perfectly prepared to attribute the highest motives to those who held differing views, but did expect at least to be given credit for having equally high motives. It might be worth while for the Ethical Committee, or even another committee, to consider

whether a similar arrangement be adopted for medical broadcasting to that which was in operation for religious broadcasts. The churches, especially those who subscribed to very dogmatic teaching, were in much greater danger every time a minister entered the B.B.C. pulpit, but few would be prepared to maintain that religious broadcasting suffered by the name of the preacher being announced.

Dr. R. G. GIBSON (Council) hoped that the meeting would stick to the 1951 decision. There had to be absolute anonymity or no anonymity at all.

The Hendon motion was carried.

Mr. J. C. GIBSON-MOORE (Hendon) asked the meeting to express the view that all articles by registered medical practitioners appearing in *Family Doctor* should be anonymous.

To the argument, which he said had sometimes been advanced, that it was the practice for doctors to write under their own names in publications such as the *B.M.J.*, he said that the *Family Doctor* was a publication for the general public, framed in simple, non-medical terms, and contained certain non-medical articles.

In reply to a question by Dr. ROBERT FORBES (Council), the CHAIRMAN ruled the Hendon motion out of order.

HOSPITAL AND CONSULTANT SERVICES

Mr. T. HOLMES SELLORS, chairman of the Central Consultants and Specialists Committee, presented on behalf of the Council the Annual and Supplementary Reports under "Hospital and Consultant Services," together with the memorandum of his committee on the report of the Bradbeer Committee on the internal administration of hospitals (Appendix III).

He first paid tribute to his predecessor, Dr. Rowland Hill, as chairman and to those others who had assisted in the work. He said that the report indicated progress in some directions and sustained but incomplete action in others. Real unity had been achieved with those in the practitioner field in at least one important respect which he hoped would be the herald of many others. His committee had always stood in a rather unusual position. The consultant approach to the Ministry came from the Joint Committee. Its association of unity with the Royal Colleges and the Royal Scottish Corporation had added weight to all the deliberations and actions that the Committee had taken. It had felt that the repeated suggestion that it should increase its individual membership or make alterations in its particular form of representation to represent sectional interests was not necessary. It was quality, not quantity, that counted.

The construction of the Whitley B Council had been carefully considered. The Whitley machine did present a certain number of safeguards, including the right to claim arbitration, which would be granted if the other side agreed. That could work both ways, because arbitration could be refused by the Association as well as by the Management Side. There might otherwise be imposition from above by various directives which would nullify any safeguard that arbitration or any other discussion in the Whitley machinery could achieve. The situation was not felt to be entirely satisfactory, but there had been definite progress and a good deal of understanding had been achieved between both sides of the table.

He paid tribute to the hard work done by the various subcommittees. Satisfactory progress had been made in establishing, if not officially, hospital medical advisory committees at all levels except on the regional hospital boards, and strong efforts were being made to overcome that last hurdle. The appeals machinery had worked well. There had been one instance in which a board which had not taken notice of its findings had been directed to do so by the Ministry. Permission had been obtained for whole-timers or newly elected consultants with a substantial number of sessions to opt for maximum part-time save in exceptional circumstances. Whole-timers had been permitted to undertake paid domiciliary consultants' work after submitting to a quota of unpaid work.

The whole question of hospital medical staffing was still in the melting-pot, bound up with the very important question of the S.H.M.O.s. The Committee had listened to the advice of all branches of the hospital medical staffs and had brought every possible sectional interest into the orbit of its discussions.

Remuneration of Hospital Medical Staff

Dr. C. H. STRACHAN (Oldham) moved that the Joint Negotiating Committee should, in the event of any increase in the betterment factor being granted by the Ministry, consider some means by which members of the hospital and consulting services who retired prior to the granting of the last increase in remuneration should now benefit in their pension.

He said the motion bristled with difficulties, but it would be a pity if it were rejected on that account, and asked that it should be referred to the Council.

The motion was carried as a reference to Council.

Mr. J. DUNBAR (Glasgow) moved that the Council consider the desirability of abolishing the merit award scheme for members of hospital staffs, unless in very exceptional cases, and replacing it by a system allowing for responsibility payments.

He said that 90% of consultants were dissatisfied with the present position. A consultant applying for a merit award who was given one of the lowest grades was left with a feeling of frustration and inferiority and there was much unhappiness amongst specialists and consultants. A special committee had been appointed to consider who should get merit awards, but nobody knew who were the members of it or who appointed it, and there was a great deal of secrecy about the matter at the highest level. He said he knew of no other profession in which public money was dispersed secretly. Before 1948 the incentive for consultants to gain promotion was prestige. Nowadays prestige carried money with it, and to get among the money a man needed promotion. He believed that money was still a great incentive. This age was a very materialistic one, especially among the younger members of the profession, who saw that promotion would not necessarily increase their salary, and if merit awards were given for responsibility it would restore a great incentive. Someone who did outstanding work should receive an appropriate award free from secrecy, and this should be seen and known about, not left to surmise.

He asked that the motion should be referred to Council.

Professor P. C. P. CLOAKE (Birmingham) pointed out that the merit award scheme was recommended in the Spens Report as part of the basis upon which the Committee considered the wise administration of Ministry funds in the Hospital Service would be well directed, and for that reason alone he felt that the meeting should consider very carefully before chiselling away at that Report. It had been approved and was regarded as the keystone of their stand on remuneration. He did not agree that there was much unhappiness about merit awards; he had never met it and did not believe it to be true to say so. It was true that there was a certain secrecy, which was in some respects undesirable. It was desirable, however, because it had been felt by consultants themselves that they did not wish to have the giving of a merit award to an individual blazoned abroad. He was sure prestige was still the basis; prestige could be assessed and was investigated before an award was given. He asked the meeting to reject the motion.

Mr. G. E. MOLONEY (Oxford), supporting the motion, said that general practitioners were paid on a per capita basis, which ensured that the amount of payment bore some relation to the amount of work done. The payment to a specialist or consultant bore no relation to the work done; he could work the time or pass the time; the number of patients dealt with in any one session did not matter. The qualities distinguishing one consultant from another were obscure. To be known in the right circles appeared to count for a lot; in fact, it had become almost a vicious circle. Consultants' private earnings in State hospitals were assessed on output, and it would, he said, be quite easy to assess their

National Health effort in the same way, which could be rewarded by bonus money. The higher grades of award were being used to add to the salaries of many university professors. It did not need a secret cabal to decide who were the "blue-eyed boys." He believed discerning family doctors made a better job of it, and to be consistent there should be a merit award for G.P.s or the meeting should pass the motion.

Dr. W. N. LEAK (Mid-Cheshire), commenting on the reference to merit awards being used to help increase the salaries of university professors, pointed out that if it were not for the merit awards it would be impossible to maintain the standard of medical education, because suitable people would not accept such appointments.

Mr. H. H. LANGSTON (Council) said it was not correct to say that consultants' remuneration bore no relation to the amount of work done. All consultants had a contract for a certain number of sessions, which were worked out and bore a close relationship to the work done. The suggested alternative would involve a detailed investigation of exactly how much each consultant did at each session, which was a thing about which the Consultants and Specialists Committee had been alarmed. There had been a tendency in that direction, and it was the last thing the Committee would want. He pointed out that if there had been a great deal of disquiet about the present position there would have been resolutions on the subject at the Central Consultants and Specialists Committee; he could not remember one for a very long time, and such motions as had been proposed had always been defeated. He agreed with Professor Cloake that it would be highly dangerous to try to remove one part of the Spens Report when their case was that the whole of their remuneration was based on that Report.

Mr. T. HOLMES SELLORS (Council) said that the Central Consultants and Specialists Committee had agreed to look into the matter as a result of resolutions passed at the conference. He added that they had been led to believe that if alterations were wanted the sum of money might very well be taken away altogether.

Mr. G. J. CLELAND (Ayrshire, with West Wigtownshire), supporting the motion, said the important consideration was the feeling that it was an obnoxious principle that such a subject should be completely secret.

Mr. DUNBAR, in reply, said that whenever anybody tried to do anything they were told, "Don't interfere with Spens." He thought they need not be bothered about the threat that the money would be taken away. In fact, they would rather have the money removed and be in the open than have the present position. What was under consideration was payment for responsibility, not for the amount of work done. As to the suggestion that there was no unrest, he wondered how many men who had not got a merit award would be willing to say so openly.

The motion was carried.

Dr. J. B. S. MORGAN (Derby, with Derbyshire, West) moved that the constitution of the Joint Committee be so amended or its number increased, as to include direct representation for both full-time (non-teaching) consultants and S.H.M.O.s in order to give adequate consideration of the viewpoint of both these grades in all future negotiations and discussions.

He said that the motive underlying the amendment was not necessarily dissatisfaction with the result achieved by the Joint Consultants Committee or with its individual membership. It was simply a widespread dissatisfaction throughout the 4,700 members of the two grades that their voices were not heard directly on that vital committee. It was not an attempt to secure proportional representation on the Committee, but only to obtain some representation which would give confidence to the negotiators. Dr. Morgan gave details of the constitution of the Joint Consultants Committee and pointed out that there was no S.H.M.O. representation. If the amendment were accepted, he said, it would give immense satisfaction and confidence throughout the ranks of the full-time consultants and S.H.M.O.s.

Mr. J. R. NICHOLSON-LAILEY (Council) said he hoped the meeting would not accept the amendment. In the first place the constitution of the Joint Committee was settled by treaty which was agreed between the Colleges and the Central Consultants and Specialists Committee, and in that treaty both parties could, if they so desired, dissociate themselves and proceed separately to negotiation, and so far that right had not been exercised. The Central Consultants and Specialists Committee felt that it did not require more than the present six members to represent it. In addition there were members of the Central Consultants and Specialists Committee who sat on their own as representatives also of the Royal Colleges. Of those six people, one was appointed as a full-time representative to begin with, one came from Scotland, and the other four, chairman and vice-chairman, were members, which left two seats to be filled. It was difficult to see how, in order to fill those two seats, one could indulge in the luxury of sectional representation.

The amendment was lost.

Dr. D. H. ANDERSON (Sheffield) moved that the representatives appointed by the Central Consultants and Specialists Committee to the Joint Committee should always include one whole-time consultant, one consultant from a provincial non-teaching hospital, and one S.H.M.O.

It was felt, he said, that the present numerical representation on the Joint Committee enabled the Central Consultants and Specialists Committee's influence adequately to be exercised in the deliberations of the Joint Committee. Sheffield did not necessarily wish to see numerical representation on the Joint Committee increase provided that the main groups of the specialists body could be represented. One important body not represented on the Joint Committee was that of the S.H.M.O.s, and it was felt that that lack of representation was unjust and unfortunate.

Professor P. C. P. CLOAKE (Birmingham), in asking the Representative Body to reject the motion, pointed out that the principle of election throughout the consultants representation was one of freedom.

The Sheffield amendment was lost.

Hospital Medical Staffing

Dr. V. COTTON-CORNWALL (Liverpool) moved that the meeting most emphatically take the view that the Council had failed to implement certain of the resolutions passed at the last Annual Representative Meeting on S.H.M.O. appointments and on one recommendation of the Bradbeer Committee, and, furthermore, that in its comments on these subjects in the Annual Report it had weakened the policy laid down last year.

He said that the idea behind the motion was not to reopen the discussion on the resolution passed in 1955. It sought to ask the Representative Body to re-emphasize that it was the policy-forming body of the B.M.A., and therefore resolutions passed at an Annual Representative Meeting were not suggestions or views with which Council agreed or disagreed. They were the policy resolutions of the Association, and it was binding on the Council to attempt to implement them. It followed, therefore, that the Council should not use language which could be interpreted as disagreeing with or modifying any resolutions passed at the A.R.M.

Mr. T. HOLMES SELLORS (Council) said that so far as the recommendations made by the Representative Body were concerned, where attempts to get them implemented had failed it was due to those with whom the Association were negotiating. If a direct negative were received from the Ministry there was nothing that could be done, except to report back to the A.R.M.

Dr. COTTON-CORNWALL, in reply, said that his point had not been answered. He had pointed out that in the report the Council talked about "suggestions," and he wished to emphasize that resolutions which were passed were not suggestions. Council were not justified in saying in the Annual Report that "suggestions" were made at an A.R.M., when in fact they were resolutions.

The Liverpool amendment was carried.

(At this point the business of the meeting was interrupted to allow the Chairman of the Journal Committee, Dr. J. G. M. Hamilton, to introduce to the Representative Body Mr. Harry Cooper.)

Mr. Harry Cooper

Dr. J. G. M. HAMILTON said he was grateful for the opportunity of performing what was for him personally and, he felt sure, for the Representatives a very pleasant duty.

"Since this meeting began," he said, "there has been sitting in front at the table occupied by our silent and efficient friends, the Press, Mr. Harry Cooper, reporting for the *British Medical Journal*. Mr. Cooper attended his first annual meeting as a reporter for the *Journal* in 1907, and, unless the arithmetic which has been done behind the scenes is wrong, this is the fiftieth year of his attendance at our annual meetings." (Applause.) Throughout that half-century, continued Dr. Hamilton, Mr. Cooper had by reason of illness been unable to attend only on one occasion. "I am describing for you what is obviously a wonderful performance." Not only, however, had Mr. Cooper exhibited that remarkable endurance, but his work as a reporter had throughout that time been illuminated by certain very personal characteristics which had been outstanding. The clarity, effectiveness, and economy of his reporting had been quite notable, "and if I say to you that Mr. Cooper seems to be one of a rapidly diminishing band of people who can write decent English," he continued, "you may perhaps realize that I certainly am paying one of the highest compliments that I can."

Mr. Cooper had exhibited throughout his long period of service an assiduous devotion to the Association which had far surpassed that which had been exhibited by most of the members of the Association. He was present to-day reporting for the *Journal* in spite of the handicaps of tedious and painful ill-health.

"Mr. Chairman," he concluded, "I should like now formally to introduce Mr. Harry Cooper to the Association which he has served so faithfully and to such satisfaction on our part for such a very long time."

Mr. HARRY COOPER, who rose amid prolonged applause, said that members of the Press present at the meetings were not supposed to be heard and scarcely to be seen, but he desired to be permitted to say two sentences in order to express his deep gratitude for the too kind words which had fallen from Dr. Hamilton. "I remember hearing one famous figure in medicine in his day, Sir StClair Thomson, say that the poorest way of gaining a reputation is to survive one's contemporaries, but, apart from any question of merit in survival, that survival, when it has been a question of association with the people in the B.M.A. and its *Journal*, has been an experience well worth while." He said he had never felt such pride and satisfaction as he had felt in the work which he had done for the *Journal* during a succession of editors from Dawson Williams and a succession of secretaries from Smith Whitaker.

During the last six months Mr. Cooper said he had seen doctors from another angle, and whatever cynicism a journalist might acquire—and journalists always did acquire some cynicism—had been eliminated by seeing doctors from the point of view of the patient, and realizing how kind and patient they could be.

"I wish to thank Dr. Hamilton and everybody here for their overwhelming kindness, which is quite unexpected on my part," he concluded, "and I feel sure you will pardon my embarrassment. Thank you very much."

The meeting rose to its feet and gave Mr. Cooper a prolonged ovation.

(The business of the meeting was resumed.)

Dr. A. BEAUCHAMP took the chair.

Dr. K. C. BAILEY (West Somerset) moved an amendment that the Meeting disapproved of the action of Council in not accepting the resolution dealing with hospital medical staffing as official policy of the Association, and that it should be implemented in any discussion of the Bradbeer Report.

He pointed out that the resolution referred to in 1955 was not a reference to Council, therefore it was not for Council to say what should be done about it. It was an instruction to Council from the Representative Body. The Representative Body represented all members of the profession, and having decided on policy the Central Consultants and Specialists Committee were expected to honour their dues. If, however, that Committee could not agree with the Representative Body, then the Council must accept the decision of the Representative Body and not the Central Consultants and Specialists Committee's decision in working out the policy of the Association.

Dr. A. F. DUNN CARRIE (Manchester) supported the amendment, stating that Manchester felt strongly on the matter. It concerned not only hospital staffs but also every general practitioner.

Professor P. C. P. CLOAKE (Birmingham) asked the meeting to reject the motion. If the tripartite arrangement were to be denied it would, he said, be handicapping the methods of administration in many of the largest and most important hospitals over the last fifty or hundred years.

Dr. V. COTTON-CORNWALL (Liverpool) said that the amendment did not ask the Representative Body to condemn tripartite administration at all. What the resolution of the previous year did was to call for reaffirmation that of the medical side of administration, which should be primarily the Medical Advisory Committee, was paramount, because it was the only side which knew what was in the best interests of the patient.

The amendment was carried.

Mr. J. C. MCMASTER (West Somerset) moved that a review of S.H.M.O.s was now overdue. It should be undertaken by a newly constituted central committee of agreed composition, and the criteria should be known and accepted in advance.

The startling point, he said, was that it was admitted by the Ministry of Health that 257 of the minority of 3,000 were actually doing the work of consultants. Some of those men had faced grading committees three or four times, and whoever, in the ordinary administration of justice, had heard of a court of appeal being presided over by the same judge who presided over the earlier hearing? It was preposterous. The proceedings of the committees had been conducted in a hole-and-corner manner, and it was impossible to find out what the criteria of such committees were. It was essential in future reviews that the constitution and procedure of those committees should be radically altered.

"The S.H.M.O. is a forgotten man," he concluded, "and I do appeal to the meeting to pass this and let some clear light into this murky business."

Dr. F. E. GRAHAM BONNALIE (Exeter), supporting the motion, gave one instance of what was happening at present. A member of the profession employed by 49 medical practitioners to do their gynaecology and obstetrics was condemned, because he was an S.H.M.O., for the rest of his professional life to earn a little less than half of what he earned as a general practitioner. He should at least be brought up to the level of the general practitioner.

Mr. T. HOLMES SELLORS (Council) said that the Committee was very much in sympathy with the position of S.H.M.O.s. Repeated applications had been made to the Ministry for review and it had been repeatedly refused. Reviews had been asked for from time to time for various sections of S.H.M.O.s. There was a possible way out of the difficulty: the whole question of medical staffing was under review, and the meeting could be sure that the position of the S.H.M.O. was not being forgotten, but it might not see the light for a year, 18 months, or longer.

One of the previous speakers said that the position of S.H.M.O. appeared to be a dead end, but that did not preclude the S.H.M.O. applying for a consultant's post if he felt he was competent to do so. Once he was in the post he was on the way, and there were a number of opportunities which might be given to him. But if he wanted to resign as S.H.M.O. he must stand in open competition for a post;

but a number had not felt that the risk was worth taking. To ask for a national review of S.H.M.O.s just now would be futile.

Mr. MCMASTER asked the meeting to express its view that the demand for this review, even though the Ministry had previously refused it, should be pressed to the limit. They should not always accept what the Ministry said. The other point was that his Division felt the method of review should be radically different, and that position had not been touched on.

The amendment was carried.

Mr. J. C. MCMASTER (West Somerset) next moved on behalf of Reading (1) that the post of S.H.M.O. be abolished forthwith, or failing this, as an alternative, (2) that no further S.H.M.O. posts should be established and that the present position be subject to biennial review. (3) That S.H.M.O.s should have the full right to be eligible for membership of all hospital committees and out-patient clinical lists on a par with their consultant colleagues.

Dr. W. E. BOWDEN (Warrington) said that it had been agreed that a review of S.H.M.O. posts should be made as soon as possible, but there should be a certain number of S.H.M.O. posts, under either that name or some other name, because there might be some other practitioners who failed to get the higher qualifications necessary for a consultant post but wished to remain in the hospital service. If this resolution was passed they would have to remain as registrars or join some other branch of the service. He asked that the amendment should be rejected.

Mr. H. H. LANGSTON (Winchester) also asked the meeting to reject the motion. An agreement was reached between the profession and the Ministry some three or four years ago regarding these branches of specialist practice in which S.H.M.O. posts were justifiably created. The circular which was issued as a result was issued after full consultation with the consultant branch of the profession. Therefore the profession, without breaking faith, could not now suddenly announce that it would not agree that any further appointments in the S.H.M.O. grade should be made. They were profoundly dissatisfied with the way in which the circular had been set aside; it had been pointed out to the Joint Committee that there was evidence of abuse, and if that abuse continued it would be right to ask for the circular to be withdrawn or advertisements would not be accepted. No advertisements for S.H.M.O.s were accepted for the *Journal* without full inquiry and approval by the regional committees.

Dr. A. SMITH (Lanarkshire) said that this motion asked for abolition of the grade, and then later that no posts should be established and that there should be biennial review. This should be left until the question of hospital medical staffs had been considered.

The first part of the motion was defeated.

With regard to the second part, Mr. MCMASTER said that it was essential to keep this under constant review.

Mr. A. STAVELEY GOUGH (Council) thought it was important that the meeting should realize that this could not be accepted at the moment. The Strachan Report made it clear that a grade under that of consultant was necessary in the hospital field which should be more closely related with the consultant and the present S.H.M.O. grade; that that grade should be the normal avenue for consultants. This would be the grade substituted eventually for S.H.M.O.s. It was hoped that there would be a revision of S.H.M.O.s who were doing consultants' work so that they became newly established consultants, and the field would then become open to all others to get into the line of promotion to consultancy. In the meantime it would be foolish to prevent any registrar from getting an S.H.M.O. post provided it was one which the regional committee approved.

The proposal that there should be a biennial review was adopted, but the last part of the amendment was defeated.

Dr. CLAUDE H. DAVIES (Swansea) moved that the Meeting recommend that the salary of the S.H.M.O. grade should be raised to 80% of the consultant salary throughout the whole scale.

There was considerable dissatisfaction among the grade over salaries. The minimum was 35% of the consultants' minimum while the maximum was 64% of the consultants' maximum, causing the ironical position that the S.H.M.O. with 10 years' experience received only 64% of what his consultant colleague received and less than that of a newly appointed junior consultant. His proposal would do something to facilitate future discussions on the subject, and would avoid that prolonged discussion and arbitration which had ended with the 1954 award. There was already a close link clinically and administratively between the two groups.

Mr. T. HOLMES SELLORS (Council) said the Association had been able to take the matter to arbitration recently on a salary scale adjustment of relativity, but the increase granted had been £75 per annum instead of the hoped-for £200.

The amendment was carried.

Dr. W. D. GRAY (Liverpool) moved that in a new system of hospital medical staffing the opportunity should be taken to upgrade all S.H.M.O.s to consultant rank, but in the meantime protection should be given to their existing status and rights in any new hospital staffing structure.

The grade, he felt, was a thoroughly bad one. He did not believe that it had ever been envisaged that 3,000 of the 10,000 specialists in the country would be permanently left in the grade. The general practitioner got his second opinion in the hospital from the S.H.M.O. in the same way as from the consultant. If the former were precluded from doing consultant's work the latter would have to do 50% more than at present. Professor Strachan had said that there was no intention of downgrading any S.H.M.O., but the report implied that the intermediate grade was to be a fully supervised one. If the report were to be implemented they would be senior assistants, perhaps. It was therefore necessary to protect them from what would in effect be a substantial downgrading in status. Many S.H.M.O.s were transferred officers from the local authority service who had run their own clinics for years without interference; many still did so even though the regional boards had appointed a consultant colleague. The consultant might share the work but the supervision was purely nominal.

Dr. A. SMITH (Lanarkshire) said it would create an impossible situation, when an attempt was being made to negotiate a new structure in staffing, to demand that all S.H.M.O.s should be upgraded; the request should apply to "all suitable S.H.M.O.s."

It was agreed to pass to the next business.

Mr. J. C. McMASTER (West Somerset) moved that all S.H.M.O.s engaged in consultant work unsupervised should be remunerated at consultant rates.

The Ministry of Health itself admitted that about 257 S.H.M.O.s were doing consultants' work without supervision, taking full clinical responsibility for what they did. Their top salary, even after the last increase of £75 for full-time work, was £2,025—an insulting remuneration for the responsibility undertaken. Furthermore, retirement from the consultant service was compulsory at 65 and therefore the pension rights earned were far below what they should be. If the S.H.M.O.s were not worthy to do the job they should be discharged; otherwise, they should be given the top rate for the job.

Dr. W. B. ADAM (Tunbridge Wells) supported the motion. Mr. T. HOLMES SELLORS (Council) said that if the motion were accepted the matter would be carried forward. It would not be for the first time.

The motion was carried.

Dr. J. A. RIDDLE (Dartford) proposed that no further advertisements should be accepted for S.H.M.O. posts by the *British Medical Journal* pending the decision as to the future of this grade.

He said that the *Journal*, the official journal of the Association, was being thus used to seduce doctors into posts of which the Association did not approve.

Dr. A. V. COTTON-CORNWALL (Liverpool) said that, it having been agreed that the posts should be continued, it

would be wrong to decide that they should not be advertised in the *Journal*. If the word "fresh" had been introduced it would have been a different matter.

It was agreed to pass to the next business.

Dr. F. M. ROSE (Council) asked the meeting to affirm that the house officer grades in hospitals are relatively and absolutely underpaid and to call upon Council to press for substantial increases in remuneration of these grades.

Those men were "pressed men," he said, being in the hospital because they had no other choice, and the scale of salaries was low by any standard, very much so in comparison with the senior house officer. House officers were the heart and soul of the hospital, working very strenuously, many of them having wives and children. Twenty to thirty years ago similar posts were paid at £150 with free lodging.

Mr. R. H. J. M. CORBET (Preston) referred to the extremely long hours which house officers had to work—in some cases as much as 168.

Dr. J. S. NOBLE (Blyth, with Morpeth) said it was no more nor less than sweated labour, and each of them were being asked to pay large sums out of their salaries for what was in many cases indifferent accommodation. "I would say for the unity of this profession that if we give these people a leg up it will be the best possible advertisement for membership of the B.M.A.," he said.

Mr. T. HOLMES SELLORS (Council) said that house officers were absolutely underpaid everyone would agree. At the beginning of the Service the Association had gone carefully into the relative payments of the various grades, and there had not then been a great deal of argument about discrepancies in salaries. House officers were included in the claim which was to be put forward for increased remuneration, and if success were achieved that would be the time to consider the position.

Dr. ROSE, in reply, said he hoped the Association would not wait for the upgrading but would vote for a relative grading up of the salaries of hospital officers.

The motion was carried.

Domiciliary Consultation Arrangements

Dr. L. A. GIBBONS (Council) on behalf of Reigate, moved that it should be open to the general practitioner under the domiciliary consultation scheme to call in the services of a specialist anaesthetist, not necessarily a consultant.

Mr. R. H. J. M. CORBET (Preston) supported the amendment.

Mr. T. HOLMES SELLORS (Council) said it had been agreed with the Ministry that the calling in of a specialist anaesthetist was permissive in certain cases; they had said it should be a consultant anaesthetist, but if one was not available an S.H.M.O. should be able to carry out the work. The amendment was carried.

An amendment by East Herts and Reigate asked that the Association should press for the payment of domiciliary consultation fees to whole-time consultants without restriction.

Dr. J. S. ROSS (East Herts) said that, while appreciating the achievements of their negotiators, he thought the present compromise, that the first eight domiciliary visits in each quarter should be free, was quite illogical and unsatisfactory. Most general practitioners hesitated to call in a whole-time consultant when they knew he would not be paid, which was to the detriment of the service and the patient, who would otherwise be treated at home, and it often resulted in the unnecessary use of hospital beds. The new procedure created an embarrassing situation. Were whole-time consultants to be asked whether they had done eight visits or only one?

Mr. T. HOLMES SELLORS (Council) said that if an attempt were made to get a wholesale domiciliary consultation allowance for whole-timers their duties would inevitably be reassessed, and possibly alterations would be made in their contracts. It had been hard work to get any concessions for paid domiciliary consultation for whole-timers; the Management Side of the Whitley Council always argued that it was

impracticable to adjust a man's duties so that consultations were not carried out in his own time, and to have got over the first hurdle was an achievement. The matter could be pressed again, but it might do harm.

The amendment was carried.

Dr. A. W. RIDDOLLS (York) had a motion deploring that the Ministry differentiated between domiciliary visits by whole-time and part-time consultants. The non-payment clause for the first eight visits in each quarter should be abolished, and the differential payment for distant visits should be made to whole-time and part-time consultants.

Dr. A. V. RUSSELL (Council) supported the amendment.

Mr. T. HOLMES SELLORS (Council) said that it was extremely unlikely that any further concessions would be won easily.

The amendment was carried.

Dr. D. H. ANDERSON (Sheffield) moved that a chest physician should receive a fee for a domiciliary consultation for a patient on the tuberculosis register of a chest clinic if the circumstances are such that a fee for the visit would be payable to any other physician.

He said that a chest physician had exactly the same obligations to treat a patient suffering from pulmonary tuberculosis as he had to treat one suffering from any other chest illness, no more and no less. He had certain public health obligations in the prevention of tuberculosis and aftercare, but those obligations were covered by one of the limitations which applied to all specialists. If he initiated treatment or advised on treatment carried out by the practitioner in a domiciliary case he was not entitled to payment, because he was under the same limitation as all specialists that a visit in connexion with treatment initiated by the hospital and followed up did not qualify for payment. Many patients were on the tuberculosis register of a chest clinic for up to ten years, and if some other factor arose during that time so that a chest physician was called in by the practitioner he should be paid for it.

Mr. T. HOLMES SELLORS (Council) said that the question of domiciliary visits was one of considerable difficulty, largely because of the legacy left by the old domiciliary service. An attempt had been made to differentiate between a visit that was part and parcel of the treatment of the tuberculous, which was originally statutory, and domiciliary consultation which they all recognized in the general sense. The Staff Side of Committee B had agreed to ask the Chest Group Committee for figures to show the effect of the restriction. If there were figures to show that the system was working adversely to chest physicians, the Committee would take it forward.

Dr. ANDERSON replied that if the Minister got away with it in this instance it would be found that in future diabetics and geriatrics would be excluded.

The amendment was carried.

Dr. D. W. K. BUCHANAN (Dundee City) moved that the principle by which domiciliary consultation fees are payable to full-time consultants should be extended to include also those honorary consultants employed by regional hospital boards but remunerated by universities.

This was referred to Council.

Dr. M. J. EVANS (South-west Wales) moved that in a scattered area, where a sole consultant has of necessity to perform a large number of domiciliary consultations, consideration should be given to extending the number of visits per quarter for which remuneration is allowed.

Mr. J. R. NICHOLSON-LAILEY (Council) suggested that, as the motion raised a number of points which required examination and was not something on which a decision should be taken out of hand, it should be referred to Council.

This also was referred to Council.

Study Leave

Dr. J. E. MORRISON (Stirling) moved again to request the Council to approach the Ministry and the Department of Health for Scotland on the subject of making study leave available to hospital officers, pointing out that some hospital boards do not supply a locumtenent for an absent officer

and require the remaining officers to cover the duties of the absentee. Such conditions could not be fulfilled in many smaller provincial units and there were instances where hospital officers had to delay or forfeit their right to study leave.

He said that it was particularly difficult for young men working in small hospitals to get study leave, which they urgently required to enable them to take higher qualifications, and they were debarred from doing so for a long period. So far as could be judged, regional hospital boards were quite complacent about it, and did not seem to realize that future consultants must be bred and nourished.

Dr. A. SMITH (Lanarkshire) supported the amendment.

Mr. H. H. LANGSTON (Winchester) hoped the Representative Body would support the amendment. When the Health Service was first talked about great stress had been laid on the opportunities that would be given for study to doctors, but it was now very difficult to get study leave from some boards, or, if it was given, to get an expense allowance for it. If consultants working in the Health Service and S.H.M.O.s were to do their job properly they must get appropriate opportunities for study, and money must be made available for it.

Mr. T. HOLMES SELLORS (Council) supported the amendment, with the proviso that there was no definite right to study leave. There should be opportunities for study leave.

An alteration on these lines was agreed to and the motion was carried.

Whole-time Officers and Income Tax

Dr. J. C. MACARTHUR (Lanarkshire) moved that further representations be made to the Government for the provision of income-tax relief for whole-time members of the hospital service for motor-car costs and depreciation and other essential expenditure.

He said that this sought to remove an anomaly which existed between whole-time and part-time hospital staffs. The former appreciated the efforts made by the Joint Committee on their behalf, but so far there had been little satisfactory result. This was the policy of the Association and he would ask the Representative Meeting to give the Joint Committee support for further representation.

Mr. T. HOLMES SELLORS (Council) said that one of the difficulties had been the actual wording of the law "wholly, necessarily and exclusively"; Counsel had been consulted and his opinion was awaited.

The motion was carried.

Dr. D. W. K. BUCHANAN (Dundee City) moved that it be made a condition of service by regional hospital boards that the use of a car and a telephone was obligatory. He said that this was intended to get rid of the anomaly referred to in the last motion. How many whole-time consultants could continue their work satisfactorily without a car or a telephone? The income-tax authorities would not accept that he required a telephone or a car while no obligation was put on consultants by the hospital boards that they should have them.

Mr. T. HOLMES SELLORS (Council) said that this was due to the law. In general the Whitley Council expressed the view that it was undesirable for this to be made a condition of service and the Minister agreed. The only method by which there might be income-tax exemption might be through the Royal Commission on Taxation, which expressed the opinion that reasonable requirements should be allowed in the course of duty. It was the law which was being unreasonable about this.

Dr. J. M. ALSTON (City) said that he was a consultant and knew that a great many consultants did not require a car if they lived near the hospital. They could arrange for a car if they needed it.

The motion was carried.

Dr. J. L. McCALLUM (Westminster and Holborn) moved to request the Council to reopen with the income-tax authorities the question of tax relief on subscriptions of membership of learned societies, medical books, and journals

for public health medical officers and other full-time medical practitioners. He said that this was really Association policy. Obviously people who belonged to learned medical and other societies and read their books and journals would be better at their job.

The motion was carried.

Mr. A. LAWRENCE ABEL (Marylebone) moved to recommend that a reasonable standard of accommodation and feeding be provided for hospital residents.

He said that a small subcommittee was considering this question and he asked for the support of the meeting.

The motion was carried, as was a further motion, also moved by Mr. LAWRENCE ABEL, recommending that charges for hospital residents' board and lodging should not be increased until agreement had been reached through "Whitley."

Geriatric Units

Dr. J. W. MCCARTHY (Hendon) moved:

That while strongly supporting the views of the Association as incorporated in the recommendations of the Geriatric Joint Subcommittee the Council be urged to keep these matters continually under review and to take further urgent action to secure their implementation by the Ministry at an early date.

Dr. J. L. MCCALLUM (Westminster and Holborn) said that some good work was done at Glasgow on this matter, and in the two years since there had been no repetition of people being put out of the common lodging houses into the street.

Dr. H. D. CHALKE (Council) said he was glad that this question had been put before the meeting. The Ministry was asked what its intentions were with regard to the recommendations in the report of the Geriatrics Subcommittee and they promised to do what they could when the occasion arose. This was a most vital problem for the aged and something should be done about it. There might be a need for more beds, but it was not a question of hospital beds but immediate accommodation for people who could not be kept at home and yet should not be in hospital.

Dr. ELSIE WARREN (Kensington and Hammersmith) said that the service was improving too slowly. They wanted accommodation for their aged patients. The matter was urgent.

The motion was carried.

Dr. K. C. BAILEY (West Somerset) moved that it was vitally important that there should be adequate geriatric consultants in all areas, which was carried.

Dr. H. J. BROWNE (North Staffordshire) moved to request the Council to explore the possibility of the chronic sick and Part III accommodation being brought under the local health authority.

He said that there was often difficulty if one wanted to get a patient into hospital. One had to get into touch with the local medical officer, who sent a health visitor, and then a report had to be sent to the regional hospital board. If the idea of a single authority appealed to the meeting he hoped they would support the motion.

Mr. J. R. NICHOLSON-LAILEY (Council) asked if the mover would agree to this being a reference to Council. They wanted to avoid the possibility of divorcing the chronic sick from the general hospitals. Geriatrics must be brought in as part of general medicine administered by the regional hospital board. He was not at all sure that that would be achieved if this were carried out in the terms of the amendment.

Dr. CHALKE said that this was one of the recommendations of the Geriatric Subcommittee, and he gathered that the Association policy was that all hospital accommodation should be controlled by one doctor, whatever the accommodation.

The mover indicated that he was willing that the amendment should be regarded as a reference to Council, and this was carried.

Dr. A. G. CHAMBERLAIN (Dorset) moved to ask the Council to reconsider its decision not to accept for publication in the *Journal* advertisements for combined appointments in

dermatology and venereology in the grades of consultant, S.H.M.O., or senior registrar.

He said that he was a general practitioner, but the consultants and specialists in his Division felt strongly about this subject and had asked him to move the amendment on their behalf. Since the introduction of antibiotics there had been a progressive decline in the incidence of the more serious venereal diseases and this would continue. There would soon not be sufficient work to occupy a full-time venereologist. The combined appointment was already operating in some quarters. There would continue to be outbreaks of these diseases and a residue of latent disease which would require the attention of someone trained and experienced in their treatment and management. The only solution was that training in venereal diseases should be accompanied by training in some other specialty, and the combination of posts of venereologists with some other field was inevitable.

Dr. K. M. TOMLINSON (Gloucestershire), speaking as a dermatologist, recalled that this matter was discussed by the Dermatologists Group when a combined post was advertised. It was the dermatologists' view that combined posts should not be put forward at present. He understood that venereologists were anxious to get wider areas. If there was not sufficient work for a whole-time venereologist surely there would be a clinic for a part-timer.

Miss GLADYS M. SANDES (Marylebone) supported the motion. Years ago at the London Lock Hospital venereologists were trained in venereology and one other subject.

Dr. R. M. WARREN (Southampton) said that the venereologists were against combined appointments and he thought the solution was to employ existing venereologists in wider areas.

Mr. T. HOLMES SELLORS (Council) said that the Joint Committee had promised to give this consideration. He understood that it was the view in the Venereologists Group that venereology should be combined with general medicine. On a show of hands, a count was called for and the motion was lost.

Whole-time Consultants

Dr. J. B. S. MORGAN (Derby, with Derbyshire, West) called for an increased representation of whole-time consultants and specialists on the Central Consultants and Specialists Committee.

He said that there were roughly 9,000 consultants and specialists, approximately half of whom were full-timers, yet in a membership of 75 only 12 of the Committee were full-time men.

Dr. A. SMITH (Lanarkshire) said that members of the Central Consultants and Specialists Committee were chosen on merit and were elected on a regional basis.

Mr. T. HOLMES SELLORS (Council) said that there were 30 whole-time consultants and S.H.M.O.s out of 64, including the nominated and representative members. The association of whole-time officers were invariably satisfied with the hearing they got from the committee.

The amendment was lost.

Acute Mental Illness

Dr. DORIS M. ODLUM (Bournemouth) moved a resolution deprecating the fact that mental welfare officers (laymen, without any recognized training or qualifications) had, in their capacity as duly authorized officers, power to overrule the opinions and advice of general practitioners and consultant psychiatrists regarding emergency admissions under the Lunacy Acts. She asked the meeting to deplore the lack of standardized training for mental welfare officers, including duly authorized officers, and to instruct Council to press the Ministry to formulate a national scheme of training for these officers and put it into operation without further delay.

She said it might seem so obvious that the Ministry would be prepared to do what the motion asked that it was waste of time to bring it before the meeting. In fact, the exact opposite obtained. The question of basic training had again

and again been shelved by the Ministry of Health. Many representations had been made by a great number of bodies with the same result. They were now asked to await a report from the Working Party on the Recruitment and Training of Social Workers, which would take two years to appear, and no one knew how long to implement. Last year's A.R.M. had shown, by its response to a resolution from Wandsworth, how disturbed it had been at the fact that such untrained people could override the opinions of doctors regarding emergency admissions.

Dr. J. B. WRATHALL ROWE (Harrow) said the first part of the motion quite rightly deplored the power which the duly authorized officers possessed, but the second part suggested that they should have standardized training. If they had that, they might well be able, with justification, to override that which was referred to in the first part.

Dr. K. C. BAILEY (West Somerset) said that many of the people referred to had been former relieving officers with little experience of psychiatry and realized themselves that they needed training; yet the Ministry was not prepared to give it to them, for reasons which were not readily known. The Bournemouth motion was carried.

Cleveland asked the Council to examine the question of attributable illness in reference to all members of the profession.

Mr. T. HOLMES SELLORS (Council) said the matter had already been taken to Committee B and had received sympathetic consideration. He could not be answerable with regard to its application to other branches of the profession.

The Cleveland motion was carried.

Pre-registration Posts

Dr. P. PHILLIPS (Bristol) moved that representations be made with a view to altering the Medical Act, 1950, so that a practitioner be allowed to spend a period in general practice during the course of the pre-registration year. It was becoming more important than ever that the teaching hospital atmosphere should become more and more rarefied in these days of whole-time teachers, later specialization, and selected out-patients. For a prospective general practitioner, he said, a few months in hospital in a post of some responsibility should be quite enough, and the sooner he did it and got on with his chosen work the better. With regard to the prospective specialist there could be no doubt that a few months in general practice would be of inestimable value to the man himself, to his future general-practitioner colleagues, and to his future patients.

Dr. F. M. ROSE (Council) agreed that all doctors, whether intended for general practice or not, should have some experience in it, but he thought that the year of training in hospital was essential, being the completion of the three clinical years that had already been spent. The general practitioner who did not have such training would feel the lack of it during the whole of his professional life.

Dr. R. W. McCONNEL (Buckinghamshire) said it would be satisfactory to combine six months in general practice and six months in hospital, for both the potential general practitioner and the potential specialist. The latter should have some inside knowledge of general practice, but did not need a whole year.

Mr. J. R. NICHOLSON-LAILEY (Council) opposed the motion on the ground that it might upset the whole of the Act. It was necessary to maintain the junior resident establishment in hospitals. If these people were taken out and put into general practice it would make an already difficult position even worse. Experience in general practice could help only those who were going to do either general practice or consultant work in future. The trainee-assistant scheme already existed for those who wished to get general practice experience. It was up to the potential consultant to decide whether he wanted to do some general practice; to inflict an additional period of time on him would either put extra time on his pre-registration year or deprive him of his hospital resident experience.

Dr. ALISTAIR R. FRENCH (Marylebone) pointed out that the 1950 Medical Act contained a provision for the period of

"apprenticeship" to be spent in general practice, in an approved hospital or institution or health centre. At present no health centres had been recognized and approved by the G.M.C. for that purpose, but they were written into the Act and it only required action by the G.M.C. to implement that provision.

Dr. W. E. DORNAN (Council) asked that the matter should be referred to Council. The time was particularly favourable for Council to look at the Medical Acts because of the Medical Consolidation Bill. Young men were all too afraid of an addition to their pre-registration year, and were mortally afraid that if the matter was pressed it might result in a further pre-registration year.

Dr. PHILLIPS, in reply, said that Bristol was fortunate in having the rarefied hospital teaching atmosphere, but it was also aware of the facts. Mr. Nicholson-Lailey obviously wanted to perpetuate the system of cheap labour. Nobody had suggested that any additional time would be taken up. Those who were going to be specialists would spend all their lives in hospital anyhow, so that three months in general practice would do them no harm. For the general practitioner, nine months in hospital, without attendant responsibility, would be quite enough.

The motion was lost.

Bristol further moved that posts in the mental hospitals service should be included among approved house appointments for the pre-registration practitioner.

This motion was carried.

West Somerset asked that the Council should keep under constant review the question of the time taken to fulfil the pre-registration posts required by the Medical Act, 1950.

This was referred to Council.

Medical Auxiliaries

Dr. O. C. CARTER (Bournemouth) had a motion welcoming the proposed statutory registration of medical auxiliaries provided that:

- (1) the medical profession maintains some control of the training standards to be aimed at and general ethical conduct, and
- (2) that the medical auxiliaries retain their present description and are not given independent status as belonging to professions associated with medicine.

The training of such people was largely in their own hands, and the local practitioners in the area would have practically no say in determining their standard of qualification. If some control could not be gained in the matter, then it was up to the profession to say that they would not employ such people until they had some idea of the standards they had achieved or the syllabus of their training.

Mr. T. HOLMES SELLORS (Council) said that the Joint Committee had discussed the matter with the Ministry. The point had been strongly taken by the Ministry that the auxiliaries should have maximum independence and that their status should be upgraded by the use of the word "professional." The Association had resisted that; the matter was still under discussion on a relatively confidential basis. The Joint Committee was pressing very strongly that all medical representation should be at as high a level as possible, and that their instruction and general training should not pass out of the hands of the doctors who would be working with them.

Dr. CARTER, in reply, said that Sir Zachary Cope had expressed the hope that the Representative Body would deal with the matter in the way he had suggested in moving the motion.

The motion was carried.

Cremation Certificates

Nottinghamshire moved that resident hospital staff should not be debarred from receiving a fee for completing Part B of cremation certificates.

Dr. R. E. G. SMITH, who was making his twenty-first appearance as a representative at the A.R.M., urged the meeting to pass the motion.

Dr. L. A. GIBBONS (Council) recounted an instance of a doctor in Surrey who was called to the house of a patient who had died. He charged a fee for attendance and the executive council allowed it, but the relatives appealed. It was taken as far as the Minister, who ruled that as the patient was dead he was no longer in the National Health Service, and therefore allowed the fee. If a patient died in hospital, surely he was no longer under the Hospital Service and a similar position should obtain.

Mr. T. HOLMES SELLORS (Council) pointed out that there was an obligation to supply a certificate in the case of death. All it required was removal, under paragraph 14 of the terms of service, from category I to category II.

The motion was carried.

Patients in Nursing-homes

Dr. ETHELBERTA LYNTON-LOW (Lewisham) moved that, as patients in maternity nursing-homes are entitled to obstetric domiciliary consultations under the N.H.S., the Minister be asked to allow all patients in nursing-homes full access to the complete range of consultant domiciliary service.

She said that the reasons for submitting the motion were that Lewisham considered that to withhold the service was illogical, unjust, and uneconomic. It was illogical and unjust because it presupposed that all patients in nursing-homes were wealthy, whereas that was not by any means the case. It was also illogical to permit domiciliary visits to patients in maternity homes and not to those in other nursing-homes. It was uneconomic to refuse domiciliary visits to patients in nursing-homes, because the alternative in many cases must mean the transfer of the patient by ambulance to hospital, and a bed had to be occupied.

Mr. J. R. NICHOLSON-LAILEY (Council) asked whether the motion could be accepted as a reference to Council. When the matter was originally brought up the Joint Committee approached the Ministry and asked for an extension of domiciliary consultations to patients in nursing-homes, and it was refused. In his view circumstances had changed a good deal since then and the matter might be looked at again.

The motion was carried.

Legal Responsibility of Senior Hospital Doctors

Dr. J. M. ALSTON (City) moved that by legislation or otherwise it should be ensured that senior hospital doctors should once more be held solely responsible in law for their own actions.

He reminded Representatives that on the first day of the meeting the Representative Body took very firm action to ensure the independence of action and freedom in his duties of the Editor. That was one of the best things which the Representative Body had done so far. He now asked the meeting to pass the motion which would enable hospital doctors to be assured of the independence and freedom of their actions, and of their single responsibility for their work. It was something which did not concern general practitioners directly, but the law courts had recently come to the conclusion that the state of the law was such that doctors working in hospitals were the servants of their regional board, and if there were any claim against a surgeon or physician the claim must lie against the regional board, possibly with the surgeon joined in. But the surgeon had no longer the single responsibility.

"What we are afraid of," he said, "is that if regional boards are responsible, they will tell us how to do our duties. What we want is some means of retaining and regaining our independent responsibility."

Dr. A. SMITH (Lanarkshire) moved as an amendment "That this Representative Body believes that it is not in the best interests of British medicine and the British people that the hospital doctors of the country should have the legal status of technical servants of the hospital authority."

He said that, of all the things which had been discussed, obviously the principle involved in the amendment under discussion was the most important principle to be considered.

It was no less a principle than that the hospital doctor should be in direct professional relationship with and have charge of his own patient, or whether he would be a technical assistant of the State.

In Scotland, before 1948, there was no doubt about the position at all. It was clear that the hospital doctor was in charge of his patient, and that the hospital authority merely provided the board, lodgings, and the necessary equipment. Fortuitously it came about that the laws were completely altered by the 1948 Act. In Scotland the matter was regarded as so very serious by those concerned, including the Consultants and Specialists Committee in Scotland, that a circular was sent round to all members asking for an expression of opinion whether they liked the old legal status or not. There were replies from more than 50% of those circularized, and the Department of Health took the view that that was an excellent response. Recently the matter was placed before the Central Consultants and Specialists Committee of the United Kingdom in London, and a resolution was carried which was now before the meeting in the form of the amendment.

At no point was he at issue with his colleague who had spoken before him, "but we have been informed," he said, "that if we can get a substantial volume of professional opinion behind us, then by legislation—perhaps by a Private Member's Bill—we can have the whole legal position of the doctor restored; but we should have to show a substantial amount of professional opinion behind it. We have that opinion behind us. We have the whole of the consultants in Scotland behind us and the Central Consultants and Specialists of the United Kingdom. We are now asking that this Body will endorse this general opinion that hospital doctors will not be technical assistants of the Minister but will be responsible for the people under their care."

Mr. J. R. NICHOLSON-LAILEY (Council) formally seconded the amendment.

Dr. ROBERT FORBES (Council) opposed the amendment, stating that it was a matter upon which the Representative Body should have adequate information before taking action. The defence bodies were seriously involved in a decision of that kind. The defence bodies had been looking at the matter for two or three years and had arrived at certain decisions. Dr. Smith had told the meeting how the decision was reached in the Consultants and Specialists Committee, but he did not state that the Chairman of the Medico-legal Subcommittee of the Consultants and Specialists Committee put forward very cogent arguments why that particular proposition should not be endorsed. "I plead with you," he concluded, "not to be rushed into a decision of this kind to-day. I ask that this matter be referred to Council for a full report at your Representative Body next year, so that you will have all the facts clearly in front of you before you are asked to take a decision on this important issue."

Dr. J. G. M. HAMILTON (Council) said that the arrangements which existed in England with regard to the apportionment of damages which might be awarded in cases of negligence naturally affected the function of the defence societies, but it affected them favourably, for in whatever proportion it might be there was a proportion which was paid from Exchequer funds and was therefore spared from the defence societies' funds.

The Representative Body was in possession of all the necessary facts and information to affirm the principle which was involved. It did not need to concern itself with ways and means of putting that principle back into effect, but if representatives were satisfied that there was something in the amendment which was of fundamental importance, and that the legal status of technical servants was undesirable from the medical and social aspects, then they would be able to make up their minds clearly and no doubt vote for the amendment.

Dr. ALISTAIR R. FRENCH (Marylebone) said he desired to refute the suggestion of Dr. Hamilton that the defence bodies had approached the matter and come to a decision with a prejudice connected with their financial position. "I assure

you," he said, "that the councils of the defence bodies, who are all colleagues of yours, have one consideration only in mind when looking through cases where a doctor's competence has been impugned. It is to vindicate the doctor regardless of any financial considerations."

Dr. SMITH, in reply, said he desired to make it clear that he had every confidence in medical defence societies, but the principle of freedom was involved and not a principle of legality. The desire was to restore the former position where the doctor had a single responsibility. If that position was not restored, it would not be long before executive councils gave directions as to the treatment of patients. The amendment was adopted as a reference to Council, and was carried in this form as the substantive motion.

Advertisement of Hospital Consultant Appointments

Dr. J. M. ALSTON (City) moved: That it is the policy of the Association that vacancies for hospital consultant appointments of more than one session a week should be advertised in the medical press.

Mr. H. H. LANGSTON (Winchester) asked the Representative Body not to pass the motion in its absolute form. He said there were occasions when it was to the benefit of younger consultants and S.H.M.O.s for a regional hospital board to offer a small number of vacant sessions to someone already in their employ. An elderly consultant or S.H.M.O. holding only one or two sessions might retire, and it was possible to add those sessions to those of a young consultant who had only five or six sessions, perhaps in an area in which there was not much private practice, thereby giving him an adequate remuneration.

Dr. V. COTTON-CORNWALL (Liverpool) supported the motion, and suggested that it should be referred to Council.

Mr. T. HOLMES SELLORS (Council) endorsed what Mr. Langston had said, and said that giving a few sessions had saved many young consultants from considerable hardship.

The City motion as a reference to Council was carried. Mr. A. LAWRENCE ABEL (Marylebone) moved to recommend that sufficient hospital residents should be apportioned so that each hospital resident doctor should work less than 168 hours per week.

He said he had been told that 15% of these men developed tuberculosis. He asked how the enormous increase of charges of negligence could be explained if it was not that many young residents were overworked, overtired, underfed, and working in many cases, up to 168 hours a week. Many hospitals were understaffed and the claims on men's time were exorbitant.

Mr. HOLMES SELLORS pointed out that if anything like a shift system were adopted, with residents working eight-hour shifts, the medical profession would be flooded. Entry to the profession was very carefully controlled, and care should be taken not to flood the profession.

The motion was carried as a reference to Council. Mr. LAWRENCE ABEL further moved that all medical grades of so-called "whole-time" hospital staff should be allowed to pursue the practice of their profession in their off-duty hours.

This was carried.

Remuneration Policy

Dr. J. G. M. HAMILTON, chairman of the committee charged to make recommendations designed to establish a general Association policy on remuneration, submitted the report forming Appendix IV of the Annual Report of Council, and a long series of Council recommendations as follows:

- (1) That the Association affirms its adherence to the principle that medical men and women, in whatever form of medical practice or service they are engaged, should be remunerated as doctors, and that their remuneration should not be determined by relation to that of lay personnel employed in the same sphere.
- (2) That where it can be shown that in any particular sphere of practice the levels of remuneration are such as to constitute a deterrent to recruitment, the Association take steps to promote or support negotiations for improvement.

(3) That, since the two Spens Reports have established agreed levels of remuneration for general practitioners and hospital medical staffs, and indirectly for most other sections of the profession, the Association reaffirms its policy to maintain these reports as the basis of professional remuneration.

(4) That the Government be urged to set up an independent committee of inquiry to consider what should be the range of remuneration of medical officers in the public health service, having regard to the remuneration of other sections of the profession and the desirability of the public health service maintaining its power to attract a suitable type of recruit.

(5) That, for the time being, it be left to the individual sections of the profession themselves to decide whether to continue negotiations within the Whitley Council system or to withdraw from the system, but that the position be carefully watched and reviewed from time to time, regard being paid to:

(a) the experience gained as a result of the present joint negotiations (outside Whitley) on behalf of general practitioners and all grades of hospital medical staff;

(b) the view that it might be preferable to retain the Whitley system for minor questions, leaving matters of major national financial importance to be dealt with by direct negotiation.

(6) That further efforts be made to secure a more satisfactory alternative to the Industrial Court as a means of settling disputes by arbitration.

(7) That the Association take all possible steps to promote an effective system of negotiation whereby decisions reached upon appropriate salary ranges for medical teachers will be binding upon the universities concerned.

(8) That the Association develop a policy whereby the Council will come to assume fuller responsibility for all future claims submitted by any section of the profession.

(9) That the various sections of the profession be informed of the Council's preparedness to negotiate directly at the request of any section.

Dr. HAMILTON said that since the establishment of the Remuneration Policy Committee at Glasgow two years ago there had sometimes seemed to be an idea that the Council, through the medium of the Committee, was going to produce a scale of payments of earnings of salaries for everybody, and indeed achieve rises all round. Put that way, it was ridiculous, and it was quite clear that the Committee and the Council had attempted nothing of the kind. After a detailed examination of remuneration in all the types of medical service, the Committee came to the conclusion (which was endorsed by the Council) that to attempt to draw up detailed scales of remuneration for the various medical services in such a way as to attempt to equate in terms of money one post in one service with another post in a different service was invidious and impossible, bearing in mind the complexity of the unmeasurable factors involved. It would have involved an extremely difficult, if not impossible, comparison, between different posts with different hours of work, different degrees of responsibility and different forms and lengths of training required, different perquisites in the way of climatic conditions, difference of superannuation, income tax, and allowance arrangements. These were so diverse that the Committee and the Council had decided to abandon a comparison between the posts and their salaries, and turned their attention to considerations of policy which might be set forth in a series of recommendations to the Representative Body in broader terms.

Referring to recommendation (1), he said he was sure it would meet with the approval of the Representative Body, and that the thought behind it was apparent to all present.

Dealing with recommendation (2), Dr. Hamilton said that the Remuneration Policy Committee, in attempting to come to grips with its rather difficult remit, rapidly decided that scales of remuneration in different services must be looked at in connexion with their power to attract recruits to different services. The power of a scale of remuneration to attract recruits was another way of naming the career prospects in the service, and the Committee was concerned to try to assess the career prospects. It had been decided to recommend that a principle which might be affirmed was that where in any service it could be shown that the levels of remuneration were such as to constitute a deterrent

to recruitment, the Association should take steps to right that wrong. The Association, he continued, owed a duty to its members to do its best to ensure that their remuneration was proper for the work they did; but the Association also had a duty to the public to do what it could to ensure that the various forms of medical service were properly staffed, and if it was decided that they were not properly staffed because of inadequate remuneration the Association had a duty to take the necessary steps.

Turning to recommendation (3), Dr. Hamilton asked for the reaffirmation of what had been confirmed and reaffirmed before, that in remuneration matters generally what could be conveniently called the Spens-Danckwerts standards should be those upon which claims should be based.

Recommendations 1, 2, and 3 were carried without discussion.

Dr. HAMILTON, dealing with recommendation (4), said that in considering career prospects in various medical services and the adequacy of remuneration in them, it was evident that, in the public health service, not only was there a general inadequacy of salary level, but the organization of the service was faulty. Of those in the service 50% were on salaries of less than £1,100, and 75% on salaries of less than £1,250, leaving 25% only on salaries above £1,250, with a few on salaries of £3,000 or somewhat above. The career prospects in the public health service were, he said, quite shocking, which was reflected in the decline in the quality of entrants, so that, while there were not many posts unfilled, many were filled with people who had not what was generally regarded as the necessary qualifications, including the Diploma in Public Health. There had been a notable decline in the number of medical graduates entering for courses leading to the Diploma in Public Health.

This service, he continued, was the Cinderella, but it would not be restored to a proper status by successive claims for general upgrading of salaries. The Committee and the Council felt that what was needed was a reorganization of the Service as well as an improvement, and perhaps a notable improvement, in remuneration levels so that the time would come—and the sooner the better—when the public health service, with the tremendous potential and actual value it held in the country, would once again become attractive to medical people as a sphere of work because it again exhibited some of the characteristics of a desirable career. None of those characteristics, he submitted, were exhibited now.

To achieve that happy state, he said, no better way could be seen than the Association pressing vigorously for the institution by the Government of a Public Health Service "Spens" Committee. If such a committee of inquiry (with terms of reference similar to those of two previous sub-committees) were set up, one of the bodies asked to give evidence to it would, presumably, be the Association—"And by golly! we could give them some."

On recommendation (4) Torquay moved to insert the word "forthwith" after the word "up" in line 1, and this insertion was accepted.

Dr. J. B. TILLEY (Newcastle-upon-Tyne) said the profession had been accused on many occasions of dividing itself into fragments. The public health service welcomed the affirmation that the profession would stand together. On behalf of the public health service and the Public Health Committee of the Association he wholeheartedly supported the recommendation.

Recommendation (4), as amended, was carried.

Dr. HAMILTON, in moving recommendation (5) said that the Council had been obliged to give considerable and detailed consideration to the negotiations. It was unnecessary to emphasize to the meeting the amount of criticism which there had been at various times and in various places about the working of the Whitley machinery. His committee had invited the opinion of the Staff Sides of the Whitley Committees on its function; there being no functioning Committee A, this had meant Committees B and C, the Staff Sides of both of which had confirmed the view that there were advantages of considerable magnitude in

advising the profession to continue financial negotiations through the Whitley machine, while recognizing that there were still unsolved and indeed notable disadvantages to the Whitley organization. The first and perhaps the most important advantage was the existence of the Regional Appeals System within the Whitley system to which Dr. Tilley had made some reference on the first day of the meeting, the Association acting as the appellant's professional organization. Of those appeals all but one or two had been successful. Any other form of remuneration negotiations would not necessarily carry with them the regional appeal system. The committee had decided not to advise the Council to advise the Representative Body to advise the profession to abandon Whitley. The first drawback was that negotiations in the Whitley Council, in the ordinary sense, did not happen. Perhaps the chief drawback was that although application for arbitration by the Industrial Court had always been granted, that court was not considered suitable for dealing with professional matters, being by design and training an industrial court. In course of time the profession might come to appreciate that the Whitley system was suitable for decisions upon comparatively small and even local affairs, whereas for financial matters of a major and national kind some sort of direct or *ad hoc* negotiations might well turn out to be better.

The recommendation was carried.

Recommendation (6) was carried without discussion.

In moving recommendation (7), Dr. Hamilton said that in so far as the public health service was the Cinderella of the profession the medical teachers for universities were Cinderella's little sister. University teachers' salaries were paid at the sweet will of the universities, which to a large degree drew their funds from the Exchequer from the University Grants Committee, but there was nothing binding upon them to accept anybody's recommendation as to scales of salaries which they did in fact pay. The Committee suggested, through the Council, that the Council should attempt to achieve some form of negotiation with the University Grants Committee to obtain proper salaries for university medical staffs, including research workers and people in preclinical departments, and that the Association should endeavour to obtain some system whereby negotiations of that kind should result in something which would be binding upon the universities to apply uniformly.

The recommendation was carried.

In moving recommendation (8) Dr. Hamilton said it had been noticeable that over the years—especially since the N.H.S. had started and since autonomous bodies had played a large and important part, rightly, in financial matters in connexion with the appropriate sections of the profession—the Council seemed to have lessened its firm grasp on and even displayed a declining interest in claims and in their prosecution. That was only natural, since the sectional experts had been engaged and had done a lot of the work for the Council, which, in any event, had a great deal of other work to do. But the Council had been reminded of that tendency and asked to apply its mind more closely to remuneration problems, including the actual promulgation of claims. It was embarking on delicate ground. There were other people involved in negotiations on remuneration. In the hospital field in particular there were colleges and corporations to which the Association was under treaty of union in the form of the Joint Committee. However, it was suggested that the Council should always be aware of what was going on.

Dr. T. D. F. MONEY (Norwich) moved an amendment asking the Association to develop a policy whereby the Council would come to assume complete responsibility for all future remuneration claims submitted by any section of the profession and that this unity be achieved by having a single negotiating committee. He expressed regret that the Remuneration Committee's report should have come up at so late an hour with so few people to listen to it. Speaking to his amendment, he said the final answer to the situation must be a committee answerable to the Council, representative of all sections, and capable of putting up claims on a

just basis, avoiding jostling, leapfrogging, and a sense of being left out which the smaller sections of the profession felt.

Dr. HAMILTON asked that the amendment be rejected, not because he was out of sympathy with what it suggested but because it asked for a certain step to be taken which he regarded as inopportune. "We must concern ourselves not only with ourselves," he said. "We must realize that we are partners with other people." He hoped the Representative Body would not be over-impressed with the reference to the smaller sections being left out in the cold. He felt that to have been an overstatement, but, if even if it was not, the Council's policy, which up to the present the meeting had been good enough to accept, governed the matter.

Dr. S. WAND (Council) described the amendment as self-contradictory. He asked how the Council could assume responsibility and then leave it to a single negotiating committee. To place all matters in the hands of one single responsible negotiating committee—although it might for particular purposes delegate it—would defeat the object of the main motion.

The Norwich amendment was lost.

Dr. HAMILTON, in moving recommendation (9), said the Council would be at pains to offer its services in every way to sectional propositions, but it would naturally be appreciated that those services could not be offered unless the Council felt the claim to be a proper one.

Recommendation (9) was carried.

Dr. H. H. GOODMAN (Newcastle-upon-Tyne) moved that these recommendations on remuneration policy be accepted and implemented with the least possible delay and that special emphasis should be placed on the policy outlined in the first recommendation that medical men and women should be remunerated as doctors.

This was carried.

Dr. J. W. MCCARTHY (Hendon) moved that, while welcoming the principles enunciated in the report on remuneration, the Council nevertheless be requested to prepare a scale of salaries appropriate for research workers so that suitably qualified practitioners will continue to be attracted to this important branch of medicine.

He said that research workers were being lost to other posts because of the higher remuneration offered, but he accepted the references to their situation which Dr. Hamilton had already made.

Dr. HAMILTON said the Council was aware of the inadequacy of such payments and reference had already been made to the matter during the course of the meeting. Action had already been started in regard to full-time non-professional medical teachers and research workers.

The motion by Hendon asking the Council to review the remuneration of research workers "so that suitably qualified practitioners will continue to be attracted to this important branch of medicine" was lost on a technicality. But it is understood that this motion will be considered by the Council in due course.

The meeting rose at 6.45 p.m.

ELECTIONS

During the course of the meeting the following results of elections were announced:

Chairman of Representative Body: Dr. I. D. Grant (unopposed).

Deputy Chairman: Dr. A. Beauchamp (unopposed).

Ten members of Council by Representative Body as a whole: Mr. Lawrence Abel, Dr. H. Guy Dain, Dr. Robert Forbes, Dr. F. Gray, Dr. Annis Gillie, Dr. I. M. Jones, Mr. H. H. Langston, Dr. J. A. Pridham, Dr. S. Wand, Mr. A. Dickson Wright.

Two members of Council by representatives of Scottish constituencies: Dr. G. W. Ireland, Dr. J. C. Macarthur.

One member of Council by representatives of constituencies in Wales: Dr. T. W. Davies.

REPRESENTATIVES AT DINNER

At the end of the first day of the Annual Representative Meeting the representatives dined together at the Hotel Metropole under the chairmanship of Dr. I. D. Grant. The President of the Association, Dr. T. C. Routley, was present.

Dr. JACK MILLER, one of the Glasgow representatives, proposed the health of the Chairman. He said that the choice of a Scot to propose the health of a fellow Scot showed that the Scot was highly respected in his own land. The Association in recent years had had in its councils many distinguished Scotsmen—he mentioned the names of J. B. Miller, Walter Jope, George C. Anderson, W. M. Knox, Catherine Harrower, and others. They had given great service to the Association, and they were proof that medical politics was very much in Scottish blood. Glasgow, indeed, might compete with Birmingham in the number of those who had held high office. Dr. Ian Grant, their present Chairman, who was born 65 years ago, showed his strong sense of the fitness of things by choosing Glasgow as his university and afterwards as his field of professional activity. He had qualified in 1913, and after service in the first world war he settled down in practice in Glasgow, where he had proved to be the family doctor *par excellence*, the guide, philosopher, and friend of many, and had built up a large industrial practice. His interest in medical politics began at an early stage in his career. He had been chairman of the Scottish Committee of the Association, and a member for many years of the General Medical Services Committee and of its forerunner the Insurance Acts Committee. His recent election as a member of the General Medical Council was yet another manifestation of the regard of his colleagues. The chairmanship of the Representative Body was one of the greatest honours the Association could confer, and on entering his third year in that exalted position they extended to him their best wishes for his continued success and health and happiness.

The toast was enthusiastically drunk, and Dr. GRANT, in reply, spoke of the great privilege and honour it had been to him to be Chairman of the Representative Body for a second year. With the help of his Deputy Chairman, Dr. A. Beauchamp, and the excellent secretaries he could not go wrong in matters of procedure, and the Representative Body had proved to be a very warmhearted and understanding company, as well as the effective mouthpiece of the Association. He commented on the fact that, he believed for the first time, they had a father and son in the Representative Body, their old friend and former Chairman Dr. S. Wand, and Dr. L. G. R. Wand. They trusted that the son would in future years play as distinguished a part in Association affairs as his father had done. Service for a body like the Association had its rewards, especially in the evolution of one's outlook from a local or parochial to a national one. He concluded by thanking them for the kindness they had invariably shown him, not least on the present occasion.

After the dinner the representatives joined their ladies, who had been dining together elsewhere, and a dance took place in the Winter Garden of the Hotel Metropole.

REPRESENTATIVES' LADIES' DINNER

Mrs. Clarence Routley presided over the Representatives' Ladies' Dinner in the Hotel Metropole on the same evening as the Representatives' Dinner. Mrs. Alexander Hall proposed Mrs. Routley's health, and in doing so paid tribute to the warmth of the hospitality that all who had been in Canada last year had enjoyed. Mrs. Hall hoped that those who came to Brighton to work would profit from the meetings and that the others would enjoy the entertainment arranged for them by the Ladies' Committee which had worked so hard on their behalf. Mrs. Routley replied, and after some entertainment provided by Vernon Lee the ladies joined their menfolk in dancing until midnight. To Dr. C. Lamorna Hingston, honorary secretary of the Ladies' Committee, goes much of the credit for the successful evening.

ANNUAL GENERAL MEETING

The 124th Annual General Meeting of the British Medical Association was held at the Dome, Brighton, on Monday, July 9, 1956, at 12.30 p.m., with the retiring President, Dr. T. C. ROUTLEY, in the chair.

The notice of the meeting, which was published in the *Supplement to the British Medical Journal* of June 16, 1956, was taken as read.

The Minutes of the last Annual General Meeting held in London on June 4, 1956, as published in the *Supplement*, were signed as correct.

The Balance Sheet and Income and Expenditure Account for the year ended December 31, 1955, were adopted without discussion.

The Auditors, Messrs. Price Waterhouse and Co., were reappointed Auditors until the next Annual General Meeting at a fee of 650 guineas.

It was announced that the President for 1956-7, Dr. Alexander H. Hall, O.B.E., M.D. (Hove), would be inducted into office at the adjourned Annual General Meeting later in the day. It was also reported that Mr. Weldon P. T. Watts, M.S., F.R.C.S.Ed. (Newcastle-upon-Tyne), had been elected by the Representative Body as President of the Association for 1957-8.

Dr. ALEXANDER HALL, President-elect, said that by reason of the ravages of old age the old Brighton banner hanging in the Great Hall of the Association was in danger of disintegration, and the Brighton and Mid-Sussex Division, determined to keep the flag flying, had had a new and beautiful banner prepared which he asked the President to accept for the Association. "I assure you that all members of this Division are marching solidly behind it."

Dr. ROUTLEY, on behalf of the Association as a whole, said that he felt it a distinct privilege and pleasure to accept this banner to hang in the Great Hall in London. He thought history would record that the heart and soul and character of an individual or an institution were symbolized in the flag which flew from the mess tent, and the same could be said of a banner. He was sure that the beautiful banner which had been presented this morning typified the character, ideals, and aspirations of the men and women who constituted the Division, and they were entrusting it to the safe keeping of the body as a whole in order that their character might become part of that great institution along with the flags and banners from other parts of the world.

He would assure Dr. Hall that the banner would be well taken care of; it would occupy a proud place in the Great Hall; and on behalf of the Association of all its officers and members he thanked the Division most sincerely.

The meeting then stood adjourned until 8.15 p.m.

EXTRAORDINARY GENERAL MEETING

An Extraordinary General Meeting of the British Medical Association was held in the Dome, Brighton, on Monday, July 9, at the conclusion of the first part of the Annual General Meeting, with Dr. T. C. ROUTLEY, President, in the chair. The following resolution to amend Article 3 of the Articles of Association was carried without discussion:

After "eligible as an ordinary Member of the Association" and before "subject as aforesaid" insert "Provided always that no person shall be eligible for membership of the Association without the previous sanction of the Council if (had he previously been a member) his membership would automatically have terminated under Article 10 (c)."

The proceedings then concluded.

OPENING OF TRADE EXHIBITION

On Monday morning the President-elect of the Association, accompanied by other officers and a large number of members, opened the exhibition of pharmaceutical products, instruments, appliances, and medical publications at the Corn Exchange, Brighton. The opening of the Representative Meeting had been postponed for one hour in order to permit of the largest possible attendance.

Dr. ALEXANDER HALL said that it was with pleasure that he welcomed to the exhibition so many old friends and also some new ones exhibiting for the first time. The Annual Meeting would not be complete without the exhibition, which enabled so many members to review this magnificent and representative display of surgical instruments, drugs, books, etc., all under one roof. There was only one regrettable absence and that was a new and powerful medium for the control of a weeping sky. He congratulated the exhibitors on the manner of presentation, so clear and so attractive that even he who ran might read, but it was hoped that the proximity of the building to that in which the meeting was being held would mean that most of the members would be able to review it in a much more leisurely way than usual with benefit to themselves and to the exhibitors.

It was with pleasure that he declared the exhibition open and wished it every success.

The exhibition was well attended at an early hour, and much interest was shown in the many novelties exhibited. The stands numbered over fifty and were predominantly pharmaceutical. They included also some very effective food exhibits, and the surgical exhibits of Down Bros. and Mayer & Phelps Ltd. and other surgical firms attracted much attention. A preview of the exhibits was published in the *Supplement* of June 30 (p. 411).

Several book stands added to the interest of the display, and there were exhibits by such bodies as the Board of Medical Auxiliaries, *Family Doctor*, the National Association for the Prevention of Tuberculosis, and the N.O.T.B. Association.

"IN BRIGHTON LAST WEEK"

Cocktails

How things begin is a good guide to how they will continue, and the cocktail party given by the Brighton and Mid-Sussex Division on the eve of the Representative Meeting was an excellent augury. Dr. C. Barrington Prowse (Chairman of the Division) and Mrs. Barrington Prowse received the guests. There was a mingling in good strength of members of the host Division with visiting representatives, the result being a crowded, talkative get-together, which was precisely what was intended. Dr. John Beynon and Dr. Guy Daynes were mainly responsible for the arrangements.

Another, more intimate, cocktail party was that given by the Sussex Association of the Medical Women's Federation on Friday, July 6, at the New Sussex Hospital for Women, for women representatives and medical women accompanying representatives. The President of the Sussex Association, Dr. M. I. Neal Edwards, received some ninety guests, and Dr. Margaret Paul, the honorary secretary, was largely responsible for organizing this enjoyable event.

Sheltered Waters

The all-day steamer trip from Portsmouth down and around the Solent arranged for Sunday, July 8, indeed provided the sheltered waters that had been promised the more fearful among those who had booked passages. Alas, a blanket of fog descended as soon as the good ship *Whippingham* left harbour and anchor had to be dropped. The British Railways had thoughtfully provided a pamphlet—"Welcome Aboard"—describing the landmarks to be seen on the voyage, but though an occasional freshening of the

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Social Workers

SIR,—I have read with interest the letter from the Chairman, and the Chairman of the Training Subcommittee, of the Association of Psychiatric Social Workers (*Supplement*, July 7, p. 4) in which certain criticisms were made of the evidence given by the B.M.A. to the Working Party on Social Workers.

The primary concern of the Subcommittee which prepared the B.M.A.'s evidence was the health needs of the community, and considerable attention was given to the means whereby the social services can be utilized to the best advantage by the general practitioner. There is abundant evidence that homes are being over-visited by members of statutory and voluntary organizations alike, and the Subcommittee made recommendations to aim at its prevention.

The B.M.A. Subcommittee did not suggest that all social problems should be treated by doctors and nurses, although it was unanimous in its view that these problems cannot be considered in isolation and that proper co-ordination of work is essential. It is a little surprising to find disagreement with the view of the B.M.A. that some training in sociological work should be given to those whose work brings them into the homes of the people. It was, of course, not intended to include in this category trained and experienced social workers, but only those others whose work is not "social work" in the accepted sense who would be enabled to perform their duties to better advantage if they were given some basic instruction in the elements of medico-social work. The Subcommittee certainly did not group rent collectors, insurance agents, and others with trained social workers.

The Subcommittee gave most careful scrutiny to syllabuses of training for degrees or diplomas in social sciences, and came to the conclusion that as these are constituted at present, and without practical training, they do not provide adequate preparation for social work in the field.

The writers of the letter consider that an increase in practical training would be a retrograde move, but this was most certainly not the view of the Subcommittee, who are of opinion that at present an essential part of the training of the social worker which makes her fit to carry out her duties is that which she obtains after she has received her degree or diploma. It is the health visitor, working in close co-operation with the general practitioner, who is the essential family social worker. Her duties have now been widened to include the whole family. Illness and accompanying social problems in one member inevitably affect the rest of the family. That is why the Subcommittee is anxious to see that the family health visitor should be the one who, when she encounters conditions which she feels require expert and specialized additional social help, should be able to call on the services of a suitably trained social worker.—I am, etc.,

H. D. CHALKE,
Chairman, Social Workers
Subcommittee, B.M.A.

London, W.C.1.

Consultant's Contract Terminated

SIR,—In April, 1955, a committee visited a certain hospital to review the establishment of medical consultants at the instigation of the finance and general purposes committee of the South-west Metropolitan Regional Hospital Board. The visitors were two retired consultants, who were strangers to the hospital, and the deputy senior administrative medical officer of the board. The consulting staff of the hospital was invited at short notice to meet the review team over "a glass of sherry" at 12.45 p.m. in the office of the physician superintendent. The team had already discussed their business with the physician superintendent, who had been only 18 months in the hospital. It is understood that for most of

Concert at the Dome

A concert was given for the Association in the Dome on Sunday evening, July 8, by the Southern Philharmonic Orchestra, under the direction of Mr. Herbert Menges. This event, which was attended by a large and appreciative audience, was made possible by the sponsorship of Ciba Laboratories Limited, Horsham. Appropriately, the main work of the evening was Rachmaninoff's Piano Concerto No. 2 in C minor, as it is dedicated to the doctor who helped the composer over his nervous breakdown. The soloist was Peter Katin, and his brilliant playing was warmly applauded.

CONDITIONS OF SERVICE OF PUBLIC
HEALTH MEDICAL OFFICERS

COMMITTEE C AGREEMENT

Committee C of the Medical Whitley Council has reached agreement about an addition to the annual leave arrangements where a medical officer falls sick during a period of annual leave, and about the employment of married women officers, and has recommended all local authorities to make effective forthwith the following revised arrangements.

Annual Leave

In the event of a medical officer falling sick during the period of his annual leave, and provided he produces at the time a medical certificate, he shall be regarded as on sick leave from the date of his medical certificate and further annual leave shall be suspended from that date.

Marriage Bar for Women Medical Officers

No woman doctor should be disqualified from obtaining employment in the public health service or be subject to dismissal from employment in the public health service simply by reason of marriage.

COMPETITION FOR MEDICAL FILMS

The Council of the British Medical Association is prepared to consider the annual award of two prizes of fifty guineas each, with certificates, for 16-mm. medical films. One prize will be for commercial and the other for non-commercial film producers. The first competition will be held next year, and the closing date for receipt of entries is September 30, 1957.

The choice of subject is left to the competitor. The judges will pay special regard to the value of the film to the B.M.A. Film Library, and the likelihood of its frequent use. For example, a film showing a broad clinical presentation of a subject is likely to be more acceptable than one limited to a demonstration of operative technique.

Full details of the competition may be obtained from the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1.

HOSPITALITY

A French boy aged 19 would like to stay for three months with a British medical family on an *au pair* basis. A French boy aged 13 would like to arrange a holiday exchange with a British boy between July 20 and August 20. He would like to stay near the sea.

Would anyone interested please get into touch with Brigadier H. A. Sandiford, International Medical Visitors Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

the team's visit the chairman of the medical committee and the group secretary were present as observers. A copy of the review committee's report to the board was received by each of the hospital's consultants on August 18. The post held by a certain consultant who had happened to be away on leave at the time of the team's visit was considered in the report to be redundant, and it was recommended that the work needed could be done on an on-call basis. This consultant had received no intimation that the team was making a report of this kind. Again without further communication, the regional board sent a letter dated August 30 terminating the consultant's appointment on November 30, 1955. The group medical committee held a well-attended meeting at the earliest opportunity on October 5, and all present, except the physician superintendent, voted for a strong protest to be made to the board against the decision of redundancy. This protest was unanimously supported by the hospital management committee. The visiting team's advice of redundancy had been given as the result of the physician superintendent's figures of the consulting and operating work done during 1954. The consultant had not kept a record of the numbers of patients seen as in-patients, out-patients, and as requested by other members of the staff, and does not agree with the superintendent's assessment. The consultant has kept a full record of the numbers of patients seen and treated since December, 1955, until the end of May, 1956, and this showed that a considerable portion of the work had not been included in previous official records.

An appeal by the consultant to the Ministry of Health was heard in January, 1956. The previous medical superintendent of the hospital and three members of the medical committee voluntarily attended at the Ministry and supported the appeal. The board's decision was upheld, but the Ministry instructed the board that it was morally responsible to provide comparable alternative employment. The board has not yet done this, and the consultant, after 17 years' service at the hospital, has lost pension rights and the status of a consultant in the hospital. The physician superintendent has stated that he considers much of the work which the consultant did previously to be within the scope of his own duties as a consultant.

An occurrence such as this is, of course, uncommon, but it must be utterly condemned, because doctors cannot be expected to work well in such circumstances. If the action of the board in terminating a contract in this way is not repudiated a very damaging degree of mistrust between superintendents and their colleagues in hospitals and between hospital doctors and regional boards will certainly follow. The procedure began by a consultant's contract being terminated without any hearing by a regional board, on the report of two strangers to a hospital who received information from only the physician superintendent. Is this some new form of justice—to condemn a person unheard and then leave him to get the conviction reversed if he can? I think not. It is simply one of these administrative blunders which the Lord Chief Justice recently stamped on.—I am, etc.,

London, W.I.

J. M. ALSTON.

Emergency Call Service

SIR,—I have read, more with sorrow than anger, of the antagonistic opinion of the General Medical Services Committee about the new wireless emergency service. Is this not like King Canute, who tried to stop the sea, or the present trade unions with their opinion of automation?

Although I personally am not interested in this new wireless emergency service, being resident outside the area, I do think, as a practitioner of many years' standing, that it is an excellent idea. Especially so as I read in the brochure that postgraduates are to be employed. This surely is one way of introducing the specialist-to-be to types of cases with which the G.P. deals, thus achieving the result of G.P.s and future consultants working harmoniously again, as used to be the case before the 1948 National Health Service.

I would suggest that the General Medical Services Committee should welcome this with open arms, especially as it would give the G.P.s some time off for relaxation, thus reducing to a certain extent the increase in the death rate of comparatively youthful G.P.s. Also, if this new scheme comes under the auspices of the G.M.S. Committee it would prevent any abuse which might arise from its use.

This or a similar service is bound to come in the near future, despite the ostrich's opposition, whether we G.P.s remain on the capitation fee as at present or if a full-time salary service comes into being one day. I would therefore suggest humbly that the G.M.S. Committee reconsider the matter now whilst it is still new and not wake up one day to find it is an established fact which has to be accepted, whether it is good or bad.—I am, etc.,

London, S.E.6.

R. G. WIGODER.

Branch and Division Meetings to be Held

- CHESTERFIELD DIVISION.—At Chesterfield Royal Hospital, Thursday July 19, 8.30 p.m., annual meeting.
- HUDDERSFIELD DIVISION.—At Huddersfield Royal Infirmary, Monday, July 16, 8.15 p.m., annual general meeting.
- MAIDSTONE DIVISION.—At Royal Star Hotel, Maidstone, Friday, July 20, 7.30 for 8 p.m., annual dinner; 9 p.m., A.G.M.
- NORTH STAFFS DIVISION.—At Cheshire Joint Sanatorium, Market Drayton, Thursday, July 19, 2.30 p.m., cricket match. Also facilities for tennis and swimming. Short clinical address by Dr. P. W. Edwards. Friends and relatives are invited.

Meetings of Branches and Divisions

BIRKENHEAD AND WIRRAL DIVISION

A combined meeting of the Birkenhead and Wirral Division and the Birkenhead Medical Society was held on March 3. Twenty-one members attended the meeting, which was preceded by dinner. The guest speaker, Dr. W. H. McMenemey, addressed the meeting on "Charles Hastings and the Early Days of the British Medical Association."

A meeting was held on May 2 at the works of the Associated Ethyl Co. Ltd., of Ellesmere Port, at the invitation of Dr. P. S. I. Barry, deputy chief medical officer. Eighteen members attended, and the invitation was extended to the Chester and Wallasey Divisions. After lunch talks were given on the production of tetraethyl lead and its medical considerations and hazards by Mr. Smith, works manager, Dr. Boyd, chief medical officer, and Dr. Barry. After a visit to the medical centre and tour round the works Dr. Thelwall Jones gave an address on "Medicine in Industry." The meeting concluded with a cocktail party at the Grosvenor Hotel.

British Medical Association

ANNUAL REPRESENTATIVE MEETING, BRIGHTON, 1956*

FOURTH DAY

Monday, July 9

The Representative Meeting reassembled for its final session at 10 a.m., with Dr. I. D. GRANT in the chair.

VOTES OF THANKS

The CHAIRMAN moved that the cordial thanks of the Representative Body be conveyed to the following for the help they had given towards the success of the meeting:

The Mayor (Councillor Lewis Cohen, J.P.) and Corporation of Brighton.

The Chairman of the Publicity Committee of the Corporation, the Director of Publicity (Mr. G. E. M. Johnson), and his staff.

The Director of the Royal Pavilion Estate (Mr. Clifford Musgrave, F.L.A.) and his staff.

The Chief Constable of Brighton.

The Parks and Gardens Superintendent and his staff.

The Automobile Association.

British Railways.

All who had provided hospitality for overseas visitors.

All who had provided hospitality for the ladies, including the Eastbourne Division of the B.M.A.

Ciba Laboratories, for the Sunday Concert.

The Brighton Philharmonic Society, for providing stewards for the Sunday Concert.

The Sussex Association of the Medical Women's Federation.

The Brighton and Mid-Sussex Division of the B.M.A. for the cocktail party.

The Local Executive Committee.

The Ladies' Committee, and all others who had contributed to the comfort and entertainment of the representatives and their ladies.

OTHER MOTIONS BY DIVISIONS

Summary of Annual Report

Dr. D. L. GULLICK (East Herts) moved:

That in addition to its Annual Report, the Council be asked to consider the publication through the medium of its Public Relations Department of a short summary of that report for issue to all members.

The Public Relations seemed the obvious department to deal with the matter. He reminded the meeting that, while

*The first part of this report appeared in last week's Supplement.

the Association possessed an excellent public relations department, each and every member was individually a public relations officer for the Association and would all be glad of instruction from the experts.

The motion was carried.

Date of Annual Representative Meeting

Dr. R. M. S. MCCONAGHEY (Torquay) moved that the Council be asked to consider changing the date of the A.R.M. from early summer to the autumn.

After the Torquay meeting it had been felt that resorts were unhappy about having conference meetings in late June or in July, especially if the conference was of any size. Members, too, would probably be just as happy to meet in the autumn.

Dr. J. S. M. ORD (Glasgow) objected because members would have so many other commitments in the autumn. Further, attendance at a June or July meeting could be combined with an annual holiday.

Dr. MCCONAGHEY, in reply, said that if the meeting were held in the autumn members would be fresher after their annual leave.

The motion was carried.

Accommodation at 1958 Annual Meeting

Dr. ELSIE WARREN (Kensington and Hammersmith) moved:

That the Council be asked to consider whether more could be done to help members who wish to have their children staying at Margate during the Annual Meeting there in 1958.

She said something should be done to enable more young fathers to attend.

Dr. A. BARKER (Council) assured the meeting that the East Kent Division would do their best to accommodate everybody.

The motion was carried.

Medal of the Association

Mr. D. S. PRACY (Nuneaton and Tamworth) moved that the meeting, remembering that the first object for which the Association was established was to promote the medical and allied sciences and to maintain the honour and interests

of the medical profession, was disturbed that the Council had not exercised its powers for many years to recognize the distinguished merit of the scientific work of many members of the profession by the award of the medal of the Association. It considered that attention to that matter should be given by the Council.

The last award, he reminded representatives, was in 1926, and if the Association had continued and had bestowed it upon the discoverers of insulin, the sulphonamides, and penicillin it would have honoured itself. The medal could be awarded to a person who was not a member of the Association, and its award was not limited to people of British nationality.

The CHAIRMAN OF COUNCIL informed the Representative Body that the matter was under consideration.

The Nuneaton and Tamworth motion was carried.

Convalescent Homes for Doctors

Dr. JOAN CHAPPELL (North Middlesex) moved that the Council be asked to consider ways and means by which a convalescent home or homes could be established for the use of members of the medical profession and their immediate relations. She said that the Association could not use its own funds for the purpose, but medicine was the only profession without that amenity.

Dr. R. H. MOORE (North Middlesex) seconded the motion, which was carried.

Medical Implications of Modern Weapons

Dr. J. S. HAPPEL (Winchester) formally moved that, as any future war was likely to start with little warning, it was essential that members of the medical profession should understand the medical implications of modern weapons. The Government should arrange courses in those subjects. The motion was carried as a reference to Council.

National Major Casualties Service

In moving on behalf of Mid-Cheshire that the meeting considered that the Council should discuss with the Government the formation of a major "Casualties Service" covering the whole country, with special reference to the position of medical practitioners, Dr. W. N. LEAK expressed the hope that Council would take notice of the letters which he had written on the subject and which had been published in the *Journal*, because they were based on experience and not on fancy.

The motion was carried.

Medical Acts Consolidating Bill

There was a motion by Hendon that, in view of the decision of the General Medical Council to promote a consolidating Bill for the approval of Parliament, the Council be requested to examine and report on the working of the Medical Acts, 1858-1950, with special reference to the difficulties attendant upon provisional registration, disciplinary procedure, and elective representation of the profession, and to take any urgent action that appeared necessary and desirable.

In moving it, Dr. ROBERT FORBES said that at the moment there was a consolidating Bill going through the House of Lords which sought to consolidate some twenty Medical Acts, and it was desirable that special attention should be paid to difficulties which had emerged in the operation of provisional registration, and that consideration should be given to disciplinary procedure with respect to some difficulties which had been encountered, and to elective representation of the profession. He suggested that some suitable proposals might be prepared for consideration at the next Representative Body.

Dr. H. GUY DAIN (Council) said that the consolidating Bill was only a consolidating Bill and did not introduce any new problems. It was an attempt to gather all the Acts together and bring them completely up to date. The

drafters of the Bill had been most insistent that there should be nothing new in it, and it would not give any opportunity to make any alterations in the existing law. It was only in 1950 that there was a Medical Act, and it would be many years before any alteration could be effected.

The motion was carried.

Consultation with Profession

Dr. R. P. HENDRY (Rugby, with South Warwickshire) moved to express the earnest hope that in future any medical committee or council which advises or acquiesces in any major change in medical or medico-political policy will either take steps to ascertain the views of the profession as a whole or else make it clear that the opinion expressed is solely that of the individuals forming the committee, etc., and by no means necessarily that of the profession as a whole.

He said that this was prompted by the heroin controversy. There was a little trouble in Dublin because of the issue of the report on marriage and divorce before the Council had ratified it. The World Health Organization had raised the heroin controversy by asking for the Government's views and the views of the medical profession, and those views should have been taken into consideration. The purpose of the motion was not to put any pressure on any committee to agree with the view of the British Medical Association, but it should be made clear that it was their views and not necessarily the views of all the members of the profession.

The motion was carried.

Mr. D. S. PRACY (Council) said that he had been asked to move, on behalf of Rugby, that the Council should obtain from members nominated by it to serve on statutory committees an undertaking that if matters affecting medical practice are discussed or appear on the agenda they will press for an adjournment of the matter or item until steps have been taken to ascertain the opinion of the medical profession in this country. As the form of the motion might make it too rigid he asked that it should be accepted as a reference to Council.

Dr. C. W. WALKER (Cambridge and Huntingdon) said that this really would not do. He was nominated to serve on the Central Health Services Council as a general practitioner and he was asked not to consider himself as a representative of the B.M.A. but to say and think as he liked, and he had done so. It was important that members nominated by the Association to serve on these statutory committees should feel free to express their own views freely and frankly. Such members had a lot to learn; they got glimpses of the workings of a Government department and to know and like their medical colleagues in the Ministry.

Dr. B. HIRSH (Manchester) said that the question of the relationship between the statutory committees and the Divisions had been dealt with by the Council, but the ramifications of the question of the relationship between the statutory committees and the local Divisions had never been clarified. The local medical committee was being built up and the Division was struggling to keep alive. Two conferences had discussed the problem and had come to different conclusions. The first duty of members of the B.M.A. was to the B.M.A., and he hoped that B.M.A. members who were members of statutory committees would not act to the harm of the Association.

Dr. E. A. GREGG (Chairman of Council) said that this was always a difficult position. Certain things could happen and the individual member was obliged, during a discussion, to come to a decision. On the other hand, he was there because the Association understood him to be a person who was imbued with its views and principles. It was sometimes difficult to remember what view was expressed by the Association on a particular matter, or whether a definite policy had been laid down by it. However, he thought there was much in this resolution. It was important that the Association's nominees should bear in mind the warnings which had been given.

OCCUPATIONAL HEALTH

Dr. J. A. L. VAUGHAN JONES, chairman of the Occupational Health Committee, presented the sections of the report under "Occupational Health." He said that two years ago he informed the Representative Body that the policy of the Association was that the Ministry of Health should exercise general supervision over all health services. That did not mean direction. Last year he again pointed out that the Association still had the same policy.

In the current year he had to report that, if there were no greater interest in the occupational health services shown by the Ministry of Health than they had made apparent in the past two years, then the Association would seriously have to reconsider the present policy, because the Ministry of Labour and National Service, although in a somewhat limited field, had, by the establishment of its Industrial Health Advisory Committee, shown a real and continuing interest in occupational health and its services. The circumstances had been somewhat complicated by the late Minister of Health's becoming the Minister of Labour and National Service.

The Committee had not embarked on any further large-scale planning because of the surveys of industry undertaken on behalf of the Industrial Health Advisory Committee of the Ministry of Labour and National Service. The first survey was of all the industries in the town of Halifax to try to find out the extent of the problem of health in industry, to what extent services were already provided, whether those services were adequate, and, if not, what additional services were desirable. That survey had taken almost twelve months and the report should be available in October.

The second survey was that of an industry. The chosen one was the pottery industry, which was known to present certain hazards, though much had already been done to eliminate the known hazards. The area chosen was Stoke and district. Even though that did not cover all the establishments of the industry, it could be accepted as a representative sample.

The work in both those surveys had been undertaken by the medical and lay inspectorate of the factory department of the Ministry of Labour, a department which worked under a continuous burden of understaffing, but achieved a great deal of first-class work. With the inadequate staffing it was impossible for the department to fulfil all its normal obligations to industry, and in spite of economic crises it was false economy to try to save at the expense of the staff. When it was realized that 20 million days' work were lost yearly because of industrial accidents and a mere 3½ million due to strikes, it was clear that there was room for much greater efforts on the part of the Safety, Health, and Welfare Division of the Ministry of Labour and National Service to save the country's economy.

When the reports of those surveys were available it might be possible to assess the requirements of industry in terms of medical and other facilities. From that, it was wise that progress should be made by a process of evolution rather than revolution.

If there was a sudden demand for a large number of additional medical officers for industry, it was not certain that adequately trained medical personnel would be available. "That brings me to the question of training," he continued. "It is impossible to add to the already overburdened curriculum, but at least we should again endeavour to persuade our clinicians in teaching hospitals to relate the effects of sickness to the question of work and resettlement rather more effectively than was done at present." Most of the additional work in industry should be done by general practitioners on a part-time basis, and the Council had invited medical schools to provide full-time and part-time postgraduate courses to enable general practitioners to be competent as well as willing to undertake the responsibilities which an appointment in industry entailed. Those were not jobs which could be

Dr. C. P. WALLACE (Guildford) said that he hoped this motion would be rejected. Great care should be taken to send forward people whose views were known and about whose principles there was no doubt. The Association should nominate men who would give their best services to these statutory committees but not act as stooges.

Dr. ROBERT FORBES (Council) moved that the meeting proceed to the next business, which was seconded and carried.

Accidents to Doctors

Dr. W. N. LEAK (Mid-Cheshire) moved to ask the Council to discuss with the Government the matter of compensation for doctors injured or who lost their lives in attending accidents. He said that the legal position was that if a doctor in the N.H.S. was called upon to attend a National Health Service patient he had to go. If he lost his life there was a pension for his widow, at the discretion of the fund, based on his length of service. If he got pneumonia or some other disability he got nothing. At the time of an accident the doctor did not think about such things, but it was the Association's duty to think for him. The award of a medal would not sustain him for the rest of his life.

Dr. E. A. GREGG (Chairman of Council) suggested that it would be better to let the Council consider this and then decide whether to go to the Government or come back to the Representative Body first. He proposed that this should be a reference to Council.

It was agreed that the motion should be treated as a reference to Council, and it was carried in that form.

Statutory and "Item of Service" Fees

Dr. J. C. ARTHUR (Gateshead) moved that these fees should be reviewed in the light of 1956 values of money. He said that piecemeal reviews were going on all the while, but the Division felt that the time had come when the whole of these fees should be looked at *en bloc*, and he understood this was being done. If so, this resolution would only reinforce that action.

Dr. A. BROWN (Cambridge and Huntingdon) said that this review was being made, and when something definite was settled a statement would be issued to the profession.

The motion was carried.

Dr. J. C. ARTHUR (Gateshead) also moved that a small booklet listing briefly all statutory, agreed, or recommended "item of service" fees be made available. He understood that this also was being done.

The motion was carried.

Fire Dangers in Home and Factory

Miss GLADYS M. SANDES (Marylebone) moved to call attention to the urgent need for much more intensive propaganda to inform members of the community of the dangers of auto-inflammable materials and other fire dangers in the home and factory. She said that new materials were being evolved very quickly, and development and research in man-made fibres was far in advance of scientific investigation. This was one of the causes of the increased number of accidents of this type. At the moment she understood there was no time for further legislation, and it was therefore very important to press for propaganda on this subject.

The motion was carried.

Association Tie

Dr. H. A. FAULKNER (Willesden) moved that the Association, having acquired a coat-of-arms, should now acquire a tie.

He said that during the last few days all present had felt themselves to be members of a brotherhood. He proposed that that brotherhood should be "tied" with a B.M.A. tie.

Dr. J. G. M. HAMILTON (Council) trusted that the B.M.A. would not indulge in this kind of stupidity.

The CHAIRMAN OF COUNCIL also opposed the motion, as did Dr. J. B. WRATHALL ROWE (Harrow).

Dr. FAULKNER, in reply, said he did not see why the harmless idea of a tie should be attacked.

The motion was negatived.

lightly undertaken, "and we must show ourselves fully capable of giving the very real assistance which we can contribute to a healthy working environment and a happy and contented working population. This is a matter of mental as well as physical health." More full-time officers and more specialists in occupational health would also be required.

Automation was not a popular term, but the issue had to be faced that there would be redeployment of personnel in industry and eventually shorter working hours. Practitioners could assist considerably in that redeployment.

He appealed to representatives to try to develop more Occupational Health Advisory Councils, particularly in the industrial areas of London, the Midlands, Lancashire, the North-east, and Scotland and Wales. Joint consultation was a major function in industry, and with the addition of the doctors much could be achieved in promoting a better understanding of the problems which would always arise.

The pattern of worker, employer, and doctor sitting together had been followed in the Industrial Health Advisory Committee of the Ministry of Labour and National Service; practitioners must take the initiative in promoting those councils locally, and in inevitably improving the industrial atmosphere by frank discussion of each others' difficulties.

"May I most earnestly ask for your support in this established concept?" he concluded. "You can achieve locally what is being achieved centrally, and the decisions arrived at centrally will be much more easily applied in the periphery if similar discussions have already taken place. The Council hope to see at least ten new advisory councils in the coming year, but it all depends on the initiative of local Divisions."

Dr. W. S. PARKER (Public Health Service), in reinforcing what Dr. Vaughan Jones had said about the Occupational Health Advisory Council, said that it consisted of four members of the local B.M.A. division, four employers, and four employees with power to co-opt. In the coming winter his own Joint Advisory Council was organizing a half-day conference of 250 people, including doctors, employers, and employees, the subject being occupational dermatitis. Such meetings helped to reduce hazards and cut down industrial accidents. It was a tragedy, he said, that there were only eleven such councils in the country.

Administration of Morphine by Nurses in Industry

Dr. ALISTAIR R. FRENCH (Marylebone) moved to express astonishment at the refusal of the Home Secretary to legalize the administration of morphine by competent nurses in serious industrial accidents, and instructed the Council to press for this essential medical service to industrial workers.

He explained that a deputation from the Royal College of Nursing and the Association went to see the Home Secretary, and requested an amendment in the law (it could be amended by regulation) to provide that competent nurses employed in industry should be responsible persons to administer morphine in cases where there was likely to be delay in getting a doctor to the scene. To the great surprise of many, the Home Secretary, after consideration, replied that he could not agree to extend that concession to responsible nurses in scheduled factories where severe accidents were likely to occur. The Home Secretary considered that the proper way to provide for a serious accident was to ensure that there were arrangements for securing the early attendance of a doctor.

Dr. R. P. HENDRY (Rugby, with South Warwickshire) pointed out that it was merely a matter of acting in emergency in specified, predetermined agreement with the industrial medical officer who had advised it. Admittedly it could conceivably have some dangers, but he considered that the chance of a nurse being guilty of an error of judgment was slight. The advantages far outweighed any disadvantages in his view.

Dr. J. S. NOBLE (Blyth, with Morpeth) said that the motion placed upon their excellent nursing colleagues one extra bit of responsibility which fundamentally was the responsibility of medical practitioners, and he did not consider that they would be quite fair in doing that. A shocked patient required intravenous morphine in many cases, and that was not the job for a nurse to carry out. "We are making too many exceptions with regard to the use of dangerous drugs," he concluded, "and I ask the meeting to reject this motion, not to cast a slur on the nurses but rather to safeguard them."

Dr. VAUGHAN JONES said he hoped that the meeting would pass the motion, because it would reinforce the Committee when a visit was made to the Ministry. So far as the question of responsibility was concerned, the Royal College of Nursing was combining in the visit to the Ministry, and the point could be submitted that it was a realistic and practical scheme.

Dr. FRENCH, in reply, asked the meeting to pass the motion unanimously, remembering that it was not a question of whether nurses were capable of accepting responsibility. If midwives were considered sufficiently competent to administer pethidine, there was little reason why nurses in industry should not administer morphine in emergencies.

The motion was carried.

First-aid Manuals

The CHAIRMAN, formally on behalf of Gateshead, moved that the statement that the Association was taking an interest in the preparation of a textbook for first-aid workers was to be welcomed, and urged that consultation with the Association was desirable in the preparation of all books of this nature claiming to be standard teaching manuals.

He said that in his view it was unnecessary for the Association to prepare a textbook for first-aid workers of their own when there were two perfectly satisfactory ones already in existence.

Dr. J. A. L. VAUGHAN JONES (Council) said that in his opinion Gateshead had got hold of the wrong end of the stick. When the first-aid book first came along it was to be a tome of some 700 foolscap pages, and if one believed all it said the impression would be gained that doctors were not needed in industry at all. It had been reduced to reasonable proportions, and it was felt that the Association had an interest in the production of any manual on industrial first aid.

Dr. C. P. WALLACE (Guildford) said it was not the function of the Association to try to usurp the position of an organization such as the British Red Cross or the St. John Ambulance Brigade. There was a tendency to suggest that the Association should be doing this, that, and the other thing—the jobs of other organizations—and he urged the meeting to reject the motion.

Dr. G. S. R. LITTLE (Greenwich and Deptford) said he had been associated with the St. John Ambulance Brigade for some twenty-two or twenty-three years, and recently with the British Red Cross, and he was filled with admiration for both organizations; but the motion merely stated that the Association was taking an interest in the preparation of a textbook on first aid, and if the motion was rejected it would be tantamount to saying that the Association did not take an interest. In spite of the St. John Ambulance Brigade and the British Red Cross it was desirable that the Association should take an interest.

The motion was carried.

Use of Antibiotics by Nurses

Dr. H. WALKER (South-west Essex) moved that nursing staff employed in industry should follow hospital practice and never use antibiotics or chemotherapy in any form without the express instructions in writing in each case of a registered medical practitioner.

This was agreed.

MEDICAL FILMS

Dr. R. P. LISTON, chairman of the Film Committee, presented the Annual Report under "Medical Films."

He expressed his committee's thanks for the gifts of films which had been received.

He said that the Academy of Medical Sciences of the U.S.S.R. had presented to the Association a film on "The Circular Vascular Suture" and that the Association had given the Russian visitors a copy of a film on "Corneal Grafting."

The Council had agreed to the holding of an annual film competition, details of which would be published in the *Journal* in due course.

The revision of the film catalogue had been undertaken on lines which it was thought would provide an easy and acceptable guide.

The report was approved.

MEDICAL BENEVOLENCE

Dr. H. M. GOLDING, chairman of the Charities Committee, presented the report under "Medical Benevolence."

He expressed the committee's gratitude for the increased income amounting to £45 over last year's, but pointed out that it represented only £45 on £12,000. He said that their appreciation was a little tinged with fear because in these times of rising costs there were more claims than ever, especially for children going to school. He entered a special plea on behalf of elderly and lonely people, who, he said, greatly appreciated a little company. "We have often been accused of excessive prescribing," he said, "but we shall never be brought to book for giving too much of the mixture of sympathy, friendliness, and thought for others." He appealed to the whole profession to take a wide conception of benevolence so that the needy should find sustenance, the elderly and lonely comfort, and the disabled and sick encouragement to endure.

Dr. J. T. BALDWIN (East and Midlothian) expressed special appreciation of the excellent work of the Ladies' Guild, and asked that there should be some reference to that in the committee's report.

Dr. GOLDING said that his committee was in no way unmindful of the wonderful work of the Guild. The difficulty about referring to them in the report was that they did most of their visiting to those who needed financial assistance, and it was feared that in some parts of the country, even where the Guild were very active, some cases might be missed. He had no wish to say anything which would in any way detract from the value of their work.

The report was approved.

PUBLIC RELATIONS

Dr. H. GUY DAIN, Chairman of the Public Relations Committee, presented the sections of the report under "Public Relations."

The department had had an excellent and busy year; relations with the public had been enormously improved since its introduction. It was continuing to answer questions from the public and the Press on all matters of general interest, and could deal with all sorts of quaint and curious queries with the least possible delay.

During the year the department had seized its opportunities cleverly and effectively to advance the point of view which the Association wished to get over to the public. Very well attended press conferences had been called to deal with reports on such questions as hypnotism and divine healing and on homosexuality and prostitution. It was not necessary to point the moral of the effectiveness of the work of the department on heroin.

After the tremendous excitement in one or two hospitals where conjoined twins had been born and the whole public relations of those hospitals had broken down, the department had invited the Press to come and discuss the matter.

The invitation had been received with great enthusiasm and the committee had been extremely gratified with the importance in the press world of those who had attended. The Ministry had ultimately agreed to issue to hospitals a code of behaviour between hospitals and the press which it was hoped would smooth relations between the two, helping the Press to get the information which it properly should have and enabling the hospitals to give it with the least possible difficulty. The committee had received the greatest possible help from the Press, particularly from the president of the Press Council, Sir Linton Andrews (editor of the *Yorkshire Post*). It was proposed to have continually in existence a body to which difficulties could be referred. It was hoped to improve still further the relations between the hospitals and the Press.

A disappointing feature of the past had been the lack of support for the Hastings Lectures. The Yorkshire Branch had very kindly undertaken to organize a meeting for the provinces, and the result had been a most gratifying success for the lecture, which had been given by Sir Henry Cohen.

Dr. C. P. WALLACE (Guildford) paid a warm tribute to the work of Mr. Pringle, the Public Relations Officer. He expressed disappointment that the Council should have turned down a resolution calling for an effort to be made to educate the public on the primary responsibility of people for their aged relatives. There were strong reasons why the matter should be pressed home, including the shortage of hospital beds and the straining of the resources of the already over-taxed nursing profession.

Dr. F. A. BELAM (Guildford) protested against the iniquity of medical officers of health having to implement compulsory removal of patients from their homes—a thing which he had always done with the utmost reluctance, for it often resulted in the very imminent death of the patient. The best person to bring influence on the relatives in the matter was the family doctor, and he ought to do it.

Dr. W. WOOLLEY (Council) said that neither the Council nor the Public Relations Committee had opposed the resolution mentioned by the last speaker. All that had been said was that the individual doctors were already doing the necessary work and would go on advising and doing all they possibly could, but that if there was to be mass propaganda to induce people to look after their aged relatives it was better undertaken by the Government, the churches, or other organizations. Meanwhile doctors, as individuals, would continue to do their best in individual cases.

The report was approved.

ARMED FORCES

Major-General J. C. A. DOWSE, chairman of the Armed Forces Committee, presented the sections of the report under "Armed Forces."

He said that the Committee disagreed with the Waverley Report on three points. First, the Committee thought it entirely wrong that there should be two lines of promotion, one for the professional side and one for the administrative. Other methods should be employed to give the professional side adequate financial inducements. Secondly, the Waverley Committee did not appear to realize the vast problem of preventive medicine in the armed Forces, and the Armed Forces Committee had stressed to the Minister of Defence that the mere possession of a D.P.H. was not a qualification for the higher work of preventive medicine. Finally, in a memorandum to the Minister of Defence it had been pointed out that doctors in the armed Forces should be paid at rates comparable with those in the Civil Service.

The report was approved.

SCOTLAND

Dr. W. M. KNOX, on behalf of Council, presented the report under "Scotland" and the memorandum of evidence by the Scottish Committee on Medical Participation in the Control and Management of Hospitals, which forms Appendix VII of the Annual Report of Council.

The report was approved.

WALES

Dr. T. W. DAVIES, chairman of the Welsh Committee, presented the Annual Report under "Wales." The report was approved.

INTERNATIONAL RELATIONS

Dr. J. A. PRIDHAM, chairman of the International Relations Committee, presented the Annual Report under "International Relations."

He said that the cornerstone of their international relations was the World Medical Association, which, he stressed, was a voluntary organization, and should not be confused with the World Health Organization, which was supported entirely by Government funds and run by Government officials. He pointed out that the World Medical Association was started in B.M.A. House in 1946, although born officially in Paris in 1947, and the B.M.A. had played a large part in its formation and in supporting it. At present, he said, 80% of its funds were contributed by America, and the aim was to increase the contribution of the rest of the world to 50%. He pointed out that the work of international organizations affected everyone; they passed resolutions and drew up conventions which Governments were persuaded to honour, and cited that on heroin as a recent example. The W.M.A. had a permanent medical observer at Geneva so that national associations could be kept fully informed of what was happening. It had been decided by the Council, at the request of the W.M.A., to start a British supporting group either in the autumn or early in the following year.

The PRESIDENT (Dr. T. C. Routley) said that the W.M.A. owed a great debt of gratitude to the B.M.A. If there were not a World Medical Association, he said, one would have to be invented.

Dr. J. S. HAPPEL (Winchester) moved to instruct the Council to continue to press the Government to ratify the Geneva Convention of 1949.

This was carried and the report was approved.

REFORM OF THE NATIONAL HEALTH SERVICE

Dr. H. H. D. SUTHERLAND, chairman of the Amending Acts Committee, presented the Annual Report under "Reform of the National Health Service."

Referring to a suggested code of conduct for patients, he said for it to be enforced and mandatory there would have to be statutory provisions and certain penalties, which neither Parliament, the people, nor the Press would approve.

Code of Conduct for Patients

Dr. M. R. SHERIDAN (North Middlesex) moved on behalf of Cumberland a motion regretting that the Council had discontinued consideration of a code of conduct for patients, and urging that the matter should be pursued further.

He said there was a minority of patients who were more than just uncooperative, who would be anything from an irritation to an intolerable nuisance. The few doctors who were found to be in breach of their terms of service could be dealt with before tribunals, and he suggested that what was sauce for the goose was sauce for the gander. He agreed that at present the making of an enforceable code of conduct for patients was problematical, but the motion was a suggestion as to the direction in which the matter should be pursued.

Dr. R. H. MOORE (North Middlesex), supporting the motion, said that the success of the National Health Service depended on a gentleman's agreement between patient and doctor, which at the moment was one-sided, as only the doctor signed it.

Dr. C. P. WALLACE (Guildford) supported the view of Council as expressed in para. 74 of the Annual Report of Council. "For goodness' sake let us look after our own code of conduct and let us do all we can to encourage a sound code of conduct among our patients. Do not let us try to put them in strait-jackets and then take them out because of some breach of etiquette because of the heat of

the moment." All doctors had suffered from patients, but they forgave them and he hoped they would continue to do so. The large majority of patients were co-operative. That must never be forgotten. The one thing which mattered was the doctor-patient relationship; that had been stated over and over again in these meetings and that must be one as between friends and not one caged by rules of ethics.

The CHAIRMAN said that Manchester objected to their motion under this heading being included in the starred motion, as they were entitled to do, and it would be taken separately.

The Cumberland motion was lost.

Dr. B. HIRSH (Manchester) asked the meeting to say that, in view of the fact that savage penalties were inflicted on doctors for infraction of their terms of service, there should be some penalty for patients who abused it. He said he thought it was tragic that one of the most important resolutions at the meeting should be carried on in an atmosphere of rush and excitement, for this affected every doctor in the country. The duty of the Association was to protect the interests of the doctor, but one sometimes got the impression that it was protecting the public. If anyone ever needed the help of his organization it was the doctor. His terms of service covered 24 hours a day, seven days a week, and 365 days in the year. His life was spent in an atmosphere of sickness and tragedy. Owing to the great advances of medicine it was assumed, if anyone died, that someone had been negligent. There were three tribunals, the Medical Services Tribunal, which he had already mentioned, the High Court of Justice, and the General Medical Council. The doctor was unique in that he could be punished three times for the same offence. The patient received tremendous benefits, but what protection had the community against abuses by the patient? None. He could send for the doctor 50 times a day, get him out maliciously at night, but there was no punishment for that. On one occasion a doctor under provocation told the patient to go to hell; he was fined £10. What would have been the fine if the patient had told the doctor to go to hell? None at all. The paragraph said that the problem was not a large one and that a code of conduct would not serve any practical purpose. The patient was so perfect that he did not need any rules, while the doctor needed three courts of correction. Somebody would say that it could not be done, but the Ministry of Pensions and National Insurance warned members of the public that false statements calculated to obtain benefits were liable to be dealt with as a criminal offence. There should be a similar warning for patients who abused the medical services. Most people would agree that under the Act no patient could do anything wrong and no doctor could do anything right.

Dr. A. BARKER (Council) said that the meeting had listened to a very dramatic speech which he hoped would not be taken too seriously. ("Why?") Because it was not true.

Dr. C. V. BROWN (Manchester) said that doctors were under contract to the Ministry, but the patient was not. The practical solution would be to compel patients making complaints to lodge £2 with the executive council, which would only be refunded if the complaint was substantiated. He urged the meeting to maintain the self-respect of the profession by supporting this motion.

Dr. A. V. RUSSELL (Council and Amending Acts Committee) said that he felt great sympathy with the Manchester motion. It was true that doctors had duties and patients had rights, but politics was the art of what was possible. The Amending Acts Committee spent many hours over the problem and had come to the conclusion that with the present set-up the patient was in the position of being able to swing votes one way or the other, so that in the political arena the Association would not get the assistance of any political party on the suggestion that patients should be punished. Many suggestions were discussed as to the action which could be taken, but were rejected; the suggestion just made by Dr. Brown was valuable and the Amending Acts Committee might well consider it. He asked the meeting to reject the motion.

Dr. ST. G. B. D. GRAY (South-west Essex): As we treat our patients so they treat us. I have no trouble with my patients.

Dr. H. H. D. SUTHERLAND (Council) said that this was a small problem, and they must avoid getting into the position of being inflamed by a political type of speech.

Dr. HIRSH, in reply, said that he had not been convinced by the arguments against the motion. Dr. Russell said that there was no likelihood of its being accepted by the political parties; but that "should not concern us: it is our job to protect the doctors."

The motion was carried.

Dr. ANNIS GILLIE (Paddington) moved that the attention of the Government should be drawn to the need for continuous education of the public, both in youth and in adult life, in the constructive and responsible use of the National Health Service.

Dr. H. H. D. SUTHERLAND accepted it on behalf of Council and it was carried.

Dr. R. H. MOORE (North Middlesex) moved that the right of buying and selling of the goodwill of practices should be restored. He said that this would be the means of restoring to them, their children, and those who followed after, the right of freedom of movement. At the moment a doctor was forced to accept the conditions of his practice. If he was getting old and the local council built ten-story blocks of flats without a lift, or if his health was not equal to carrying on a large practice, he could not go to a smaller or easier one. The Act had been devised with that end in view. One Minister of Health had said that he would never be satisfied until he had the medical profession under his thumb; but the initiative was still with the profession, it was not entirely under the thumb of any politician, and he would suggest that they should break the shackles on them. He asked that the amendment should be passed by the necessary two-thirds majority, because this was a change in Association policy.

Dr. ST. G. B. D. GRAY (South-west Essex) said that it was only in the British Commonwealth of Nations that the buying and selling of practices existed. Their colleagues in other countries looked upon it as unethical, even immoral. When the Act was discussed in the House of Commons in February, 1948, not a single word was raised in the House of Commons in defence of the buying and selling of practices. The House of Commons was a pretty good cross-section of public opinion in the country ("No"); therefore it appeared to him that the buying and selling of practices was frowned upon in every part of the world except the British Commonwealth, and also by lay persons.

Dr. A. M. MAIDEN (Lincoln) said that the resolution of the Glasgow Meeting in 1954 had been framed in such a way as to say that it was impracticable to seek the regaining of goodwill but had done nothing to negative reopening the matter if at any time the political climate changed. It had seemed that such a possibility was at least practicable.

The present motion was rather clouding the issue. Association policy was, "Goodwill: we are sorry about it; let us leave it at that." The motion sought to reopen the matter. He thought it was far better left as it had been at Glasgow.

Dr. L. J. BARFORD (Reigate) said that doctors no longer owned their practices, despite the fact that they had so far not been paid for them. They should remain the property of the doctor until they had been paid for. If it was possible to sell goodwill the changing of practices would be much easier. An old partner might be encouraged to retire if his junior partners were able to purchase his share, and it would be more valuable to him if the compensation was due to him.

A Representative spoke from the floor proposing that the meeting pass to the next business "before any further damage is done."

Dr. MAIDEN asked whether the acceptance of the motion would alter the position in relation to the Glasgow resolution. The CHAIRMAN said the Glasgow resolution would then be overruled.

It was agreed to pass to the next business.

OTHER ASSOCIATION ACTIVITIES

The CHAIRMAN OF COUNCIL moved the reports under "Other Association Activities," together with the report of the Committee on Medical Education (Appendix VIII) and the Evidence submitted by the Association to the Working Party on Social Workers.

Dr. DORIS M. ODLUM (Bournemouth), speaking as chairman of the Joint Committee of Doctors and Magistrates, called attention to that committee's report on "Cruelty to and Neglect of Children."

Dr. C. P. WALLACE (Guildford) expressed his great disappointment that the Council had not had time to report on the important finding of the Guillebaud Committee. There had never been a better example of the mountain being in labour and bringing forth a mouse! It was a most unfortunate report and one with which he could not feel that the Association would agree. He expressed the hope that the Council would address themselves to it in the very near future.

Elections to G.M.C.

Dr. F. MCC. THOMPSON (Wembley) moved that the meeting viewed with concern the advanced average age of the B.M.A. nominees for election to the General Medical Council.

All members would be fully conscious of the debt which was owed to the Association's representatives on the G.M.C. for their expenditure of time, energy, and experience on behalf of the members of the profession, but he felt that there ought to be a leavening of younger practitioners nominated by the Association, perhaps some of those more actively engaged in National Health Service practice. He reminded the meeting that the G.M.C., in addition to being a disciplinary body, was concerned with medical education, and it was therefore important to have a representation of younger men when day-to-day problems were under consideration.

Dr. C. WATNEY ROE (Chelsea and Fulham) agreed. He said there had been some dissatisfaction after the last G.M.C. election. He wished to make it clear, however, that the elder statesmen were very valuable indeed, and that the profession was most grateful to them for all that they did.

Dr. R. P. HENDRY (Rugby, with South Warwickshire) asked that the meeting should throw out "such a noxious motion." It should be ability, not age, that determined who should be elected. There was a lot to be said for having younger people, but it was up to Divisions to nominate them and persuade the Representative Body in five years' time that the people they nominated were better than those who had borne the burden for so many years.

Dr. A. BROWN (chairman of Private Practice Committee) explained that when the elections became imminent the existing candidates were asked if they wished to stand again. Notices were then sent out to all Divisions asking them to make nominations, and the names came up to the Representative Body. If it was felt that the ages of the candidates were too great, that they were in danger of getting into senile decay, the remedy was in the hands, first, of divisions, and, secondly, of the Representative Body.

Dr. THOMPSON, in reply, said he agreed with everything that Dr. Brown had said.

The motion was lost.

Dr. A. BARKER (Council) suggested that Association Headquarters should circulate to members the names and a short history of all candidates nominated by Divisions for election to the General Medical Council, and that the B.M.A. nominations should not be limited to the number of vacancies on the Council.

He said that East Kent had no criticism of the personalities or age of representatives on the General Medical Council, but it was felt that, although the present method of selection was democratic, there was a danger that some extremely able man might not get the votes he should because he was not known.

This was carried as a reference to Council.

Undergraduate Training in General Practice

Dr. ETHELBERTA M. LYNTON-LOW (Lewisham) moved that the General Medical Council be requested to consider including a period of training and instruction in general medical practice in the curriculum of medical students.

She said that her Division was of the view that a short period should be devoted during the final year of all students to general practice, whether or not they were to become general practitioners. Some knowledge, even if slight, of conditions, problems, and pitfalls of general practice would help to establish a better understanding between hospital staff and general practitioners, and it would give the student a better opportunity of deciding rightly whether he or she was suited for general practice or not.

Dr. F. M. ROSE (Council) said it might not generally be known that arrangements were already being made practically all over the country between local general practitioners and medical schools so that such training was available to a certain number of final-year students. In his view it was important that those who were not going in for general practice should still avail themselves of the opportunity to gain an insight into general practice. He would not ask that it should be made compulsory at the present stage.

Dr. E. C. WARNER (Marylebone), speaking as the dean of one of the medical schools, expressed the hope that the meeting would pass the resolution. It was becoming the policy of all the medical schools to introduce a period of training in general practice, and that policy was appreciated greatly by students and doctors alike.

The motion was carried.

The "National Formulary"

Dr. D. PATON (Buckinghamshire) formally moved that the Ministry be urged, through a central testing organization or otherwise, to make one more effort to bring the *National Formulary* up to date, so that a practitioner, keeping in step with medical research and progress, was not compelled to prescribe a proprietary preparation for lack of a *Formulary* equivalent.

Dr. A. B. DAVIES (Walsall and Lichfield and National Formulary Committee) said that the *National Formulary* did not pretend to teach people how to prescribe nor did it tell them to prescribe economically, though it might assist in both respects. When a new preparation was launched it could of course be prescribed, whether it was a proprietary product or not. It merely had to be justified. If attempts were made to produce an equivalent to the proprietary product, it did not necessarily follow that the new official preparation would be any cheaper than the original; in any case, much time was taken in attempting to produce an equivalent. Generally only the original producers had the "know-how." As soon as a preparation had been standardized the Formulary Committee issued supplements, which were sent round to practitioners and inserted in the *Formulary*; and in any copy of the *Formulary* in Schedule A there were listed no fewer than 240 equivalents of proprietary preparations, and in another list in Schedule B all substances which had exactly the same pharmacological effect. In his view the National Formulary Committee was doing all it could to meet the matter and assist the practitioner in his prescribing.

The motion was lost.

Cases of Attempted Suicide

Dr. DORIS M. ODLUM (Bournemouth) moved a resolution which noted with concern the fact that in recent years a large number of people had been imprisoned for attempting suicide. She called upon the meeting to support the statement of the Joint Committee of the B.M.A. and the Magistrates' Association in 1947 that "there is a strong case for amendment of the law so that attempted suicide (excluding suicide pacts or incitement of another person to commit suicide) would not be dealt with as an illegal offence," and expressed satisfaction that the committee was giving further consideration to this subject.

The matter, she said, was serious, and in support quoted the following figures. In 1953, 563 people were brought before the courts, charged, and convicted of attempted suicide. In 1954, 577, of whom 391 were men and 172 women, were similarly dealt with. In 1953 a number of people were imprisoned without the option of a fine for attempted suicide. There were 32 men and 6 women, and in 1954 there were 37 men and 9 women. In one case a sentence of imprisonment of two years was passed, and on appeal it was reduced to two months by the Lord Chief Justice, who spoke of the unsatisfactory position of the law. Great Britain and Poland were the only two countries in the world in which attempted suicide was an indictable offence, and Bournemouth asked the meeting to support the statement of the Joint Committee of the B.M.A. and the Magistrates' Association made in 1947 that there was a strong case for amendment of the law so that attempted suicide (excluding suicide pacts or incitement of another person to commit suicide) would not be dealt with as an illegal offence.

Dr. W. M. FORD-ROBERTSON (Middle East) supported the motion, and pointed out that even in countries which were unenlightened in psychiatric and mental-health knowledge attempted suicide was not treated as a criminal offence.

Dr. J. S. M. ORD (Glasgow) thought that more consideration should be given to the motion, and said that a great many attempted suicides were young people who, if they were sent for psychiatric treatment, would have a stigma attached to them, sometimes making it difficult to obtain a job.

Dr. ODLUM, in reply, said that, although the Joint Committee had been informed by the police that when they were brought in by a general practitioner their powers were used only in order to help patients who had no relatives or friends, in view of the number of attempted suicides given terms of imprisonment it was difficult not to believe that some of those cases were being treated as criminals and not in the interests of their health.

The Bournemouth motion was carried.

A motion by West Somerset, that as a matter of urgency Council should consider the need for further discussion with the Magistrates' Association of the treatment of attempted suicide, particularly as the majority of these cases were in need of psychiatric treatment, was carried.

The Chronic Alcoholic

West Somerset moved that the problem of the chronic alcoholic patient with regard to discharge from treatment and subsequent relapse should be a matter for consideration between the B.M.A. and the Magistrates' Association with a view to alteration of the law.

The motion was carried.

Chairmanship of Council

The CHAIRMAN said he was sure every representative would regret to hear that Dr. E. A. Gregg did not propose to seek re-election as Chairman of Council. Dr. Gregg had been one of the outstanding personalities of the British Medical Association, first as Chairman of the Insurance Acts Committee, then as Chairman of the Representative Body, and more recently as Chairman of Council. He had been unstinting of his time and energies, having travelled all over the world on behalf of the Association, whose reputation he had enhanced by his charm, tact, courtesy, and knowledge. His name was synonymous with that of the British Medical Association. The Chairman concluded by expressing the hope that Dr. Gregg would continue to give the Association the benefit of his wisdom and sound judgment for many years to come.

The motion was carried by a standing vote, the Representatives rising and applauding.

Dr. GREGG said it was an embarrassing moment. The picture painted by the Chairman was one of considerable exaggeration. (Cries of "No.") He added that he appreciated all that had been said and the kind way in which the meeting had received it.

Dr. J. M. ALSTON (City) moved a vote of thanks to Dr. I. D. Grant. He said that in many years of service Dr. Grant had been known to everyone as a fine man and a fine friend, able and skilled in the business of the Association.

The motion was carried with acclamation.

The CHAIRMAN thanked the Representative Body for their reception of Dr. Alston's speech, and went on to express his thanks to Dr. A. Beauchamp, his deputy, who had taken the chair on several occasions.

He also expressed the sincere thanks of the meeting to the secretariat, who had worked tremendously hard in preparing the agenda, to the clerical staff, who had worked long hours and performed their duties so pleasantly, and also to Dr. Clegg and the *Journal* staff, whose work, done ungrudgingly and demanding many hours of overtime, was of tremendous importance. He said he was sure the meeting would want to send a message of congratulation to Dr. Agnes Kelynack, assistant secretary, who had recovered from an illness, and whom they would all be glad to see back at work with the secretariat.

The meeting terminated at 1.45 p.m.

THE ANNUAL DINNER

The Annual Dinner in connexion with the 124th Annual Meeting of the Association was held at the Hotel Metropole, Brighton, on Tuesday, July 10, when the President, Dr. ALEXANDER H. HALL, O.B.E., presided over a company of some 350 members and guests. The names of the more prominent of the guests appear in the ensuing report. They included the MAYOR OF BRIGHTON (Councillor Lewis Cohen), the APOSTOLIC DELEGATE (The Most Rev. Gerald O'Hara), and the HIGH SHERIFF OF SUSSEX (Colonel Swanston Lees).

The toast of "The British Medical Association" was proposed by Sir SEYMOUR HOWARD, Bart., a former Lord Mayor of London. He spoke with admiration of the way in which the Association had conducted its business during the days it had spent in Brighton. It had furnished an example to politicians and trade union leaders, and he proceeded to draw certain parallels between the task of those in commerce and industry in the City and those in the world of medicine. There was at the present time a certain moral sickness affecting the body politic. So many unknown factors had yet to be discovered that he was afraid they could not expect to reach a solution of the labour problems at the moment. There were too many politicians who were eager to resort to the knife, ready "to operate on Russian influenza and try to remove it like an appendix," and at the other extreme there were those who trusted to magical formulae which were called slogans. In the City they had to deal not infrequently with rising temperatures, but they used the gavel rather than the clinical thermometer. The perfect bedside manner was as difficult to acquire in City affairs as it must be sometimes in medicine—it was one of those things which one had to be born with or not have at all.

Nevertheless, he assured them that the world of business had an immense respect for the medical profession. It was the profession above all others in which more was freely given to the public out of the generosity of their hearts and their wisdom and experience than in any other profession in the world. "The fact that large numbers in this land rise up and call you blessed is worth more than money can buy." Many in other walks of life could never expect to see the result of their labours, but the members of the medical profession had the satisfaction in many cases of witnessing the restoration of grateful patients.

He coupled with the toast the name of Dr. Alexander Hall, who, he was sure, would fill the presidential chair with very great distinction. He had heard it said that whoever was President of a body such as this did not really matter because he was so well buttressed by the expert advice and knowledge of permanent officials that he could never put a foot wrong. That was a wrong way of look-

ing at the matter, because when a man of great distinction like Dr. Hall filled the presidential chair he invested it with something of his own personality. They were very proud in Brighton to have Dr. Alexander Hall as President of this great Association, and they were sure that he would bring new lustre to bear upon the position.

The PRESIDENT, in responding to the toast, suitably thanked the proposer, and spoke of his eminence in civic affairs and his recent extensive travels, which had included visits to Russia and to Canada and the United States. Dr. Hall went on to say that the Association, although it was 124 years old, had no geriatric problem of its own. The public were apt to think of them, disregarding their work in scientific medicine, as fully occupied with conditions of service and rates of pay; others confused the Association with the General Medical Council. But the Association was a voluntary body with no statutory powers, though it did maintain its standard of professional conduct. More and more their efforts were directed towards prevention, and it might be that at some future time clinicians would find themselves in a minority.

A Successful Meeting

Many months of strenuous effort had gone into the preparation for the Brighton Meeting. It would be impossible to mention all who had worked for its success, but mention must be made of Dr. John Beynon, honorary secretary of the local executive committee, and of Dr. H. G. McGregor, the science secretary. The executive officer, Mr. G. A. Peck, and the several local sub-secretaries deserved high praise, as well as many friends, both medical and lay. They had had the most loyal co-operation from the officials and other public bodies. From the time the meeting was first mooted three years ago they had been briefed in the most friendly way by Headquarters, from which a steady stream of guidance had come. He mentioned in particular the helpfulness of the Secretary of the Association, Dr. Angus Macrae, the Assistant Secretary, Dr. Walter Hedgcock, and the Editor, Dr. H. A. Clegg. Finally he mentioned the work of Dr. Lamorna Hingston, the hon. secretary of the Ladies' Committee, and the many other ladies who had acted with charm and efficiency. A special debt of gratitude was due from him to his predecessor, Dr. T. C. Routley, from whom he had learned much.

The Guests

The CHAIRMAN OF COUNCIL (Dr. S. Wand) proposed the health of the guests, but before doing so he spoke of the outstanding work of his predecessor in the chair of the Council, Dr. E. A. Gregg. He had served in the chair for a period that had been only twice exceeded in the history of the Association, and both occasions were exceptional. The first was the long chairmanship of the founder, Sir Charles Hastings, and the second instance occurred during the first world war. Dr. Gregg had led them with conspicuous ability, and he felt that in that assembly they should offer thanks to him as had already been done in the Council and in the Representative Body. He also referred to the devotion with which Miss Gregg had assisted her father on social occasions during his chairmanship.

Dr. Wand went on to refer to the honour recently accorded to one who was with them that evening, Sir Tudor Thomas, and who earlier in the day had received the accolade.

Three members of the Association were present that evening who were present when the Association last met in Brighton in 1913. They were Dr. Helen Boyle, Dr. W. Barrington Prowse, and Dr. L. A. Parry. Many of them recalled Dr. Parry's membership of the Council, and it was delightful to meet again one who had given such service to the Association.

Among the guests they welcomed the Mayor of Brighton, without whose help and that of his corporation the arrangements for such a meeting as this would have been impossible. Another notable guest was the Apostolic Delegate, the Most Rev. Gerald O'Hara; yet another was the Ambassador of

the Dominican Republic, H.E. Dr. L. F. Thomen, a medical colleague whom they were very glad to welcome. The guests also included the High Sheriff of Sussex (Colonel Swanston Eeles) and many other notable persons associated with Brighton and the county. To the director of the Royal Pavilion Estate they were specially indebted for the excellent setting of the Representative and scientific meetings. The President had already made reference to the local secretaries, whose work had been magnificent, and to the co-operation of the ladies, but he had omitted to mention Mrs. Hall, who had presided over the Ladies' Committee with such distinction. An unusually large number of delegates were present from overseas. Among those who came from kindred associations in foreign countries he must mention one name, that of Dr. L. A. Hulst, of the World Medical Association. It was a good thing to have this interchange of delegates. Medicine had no national boundaries. It was a universal brotherhood. Among their colleagues from overseas Branches and affiliated associations he must mention Sir Henry Newland, of Australia, Dr. J. H. Struthers, President of the Medical Association of South Africa, and Dr. J. C. McFeely, President of the Irish Medical Association. He extended a warm welcome to all their colleagues and looked forward to meeting them again.

The MAYOR OF BRIGHTON (Alderman Lewis Cohen), in reply, congratulated the Association on the organization of its meeting and the catholicity of its discussions. He referred to the great change which had come over the medical profession and the attitude of the public towards it since the Association last met in Brighton 43 years ago. The profession had wholeheartedly co-operated in the National Health Service, and he hoped to see yet further extensions of medical care.

Sir HENRY NEWLAND, who also responded, said that he was no stranger to Brighton; he was there as long ago as 1889. Later on, in the first world war, he was attached to the Australian General Hospital in Brighton, and now he was here again enjoying the hospitality of the Association. He rejoiced in the spirit which had been manifest throughout that meeting.

Dr. JOHN BEYNON, the local general secretary, and Dr. H. G. MCGREGOR, the science secretary, also briefly acknowledged the compliments which had been paid to them.

ADJOURNED ANNUAL GENERAL MEETING

The Adjourned 124th Annual General Meeting was held in the Dome, Brighton, on the evening of Monday, July 9. A distinguished company assembled under the chairmanship of the retiring President, Dr. T. C. ROUTLEY, who installed his successor, Dr. Alexander Hall, as President of the Association for 1956-7. Among those on the platform were the Mayors of Brighton and Hove.

Dr. Routley said that Dr. Hall needed no introduction to a Sussex gathering. After serving in the first world war as medical officer in the R.A.M.C. in France and Mesopotamia, and engaging in other service abroad after the war had ended, he started in general practice in Hove in 1923. He quickly gained a reputation, and was honoured by his fellow practitioners, whom he served in several executive positions. When the meeting at Brighton was proposed he was chosen by them as worthy of the highest office in the Association, a choice which was ratified by the Council and the Representative Body. Dr. Routley concluded by expressing the hope that during the coming year Dr. Hall would experience as much joy and satisfaction as he himself had done during his year of office. Dr. Hall was then invested with the presidential badge, and Mrs. Hall with the President's lady's badge.

Dr. S. WAND, Chairman of Council, moved a vote of thanks to the retiring President. The past year, he said, had been a memorable one in the annals of the Association, especially for the meeting in Canada, of whose Medical Association Dr. Routley also was president. They were very grateful for the hospitality shown to those of them

who made the journey to Canada last year. He himself first came across Dr. Routley many years ago in Geneva, and admired his gifts of chairmanship, in which he created order out of chaos. He played a very important part in the formation of the World Medical Association. In his own country he had been for many years secretary of the Canadian Medical Association, and his experience of medical affairs was very wide. About ten days ago Dr. and Mrs. Routley celebrated their fortieth wedding anniversary, though no one would think it to look at them. On taking leave of Dr. Routley as President he called upon the meeting to accord him a hearty vote of thanks.

The vote of thanks was enthusiastically given.

Introduction of Delegates and Representatives

The following delegates from kindred associations were then introduced to the President by the Chairman of Council:

Professor Dr. L. A. Hulst (World Medical Association), Dr. A. J. Bedell (American Medical Association), Dr. E. F. Crutchlow (Canadian Medical Association), Professor O. E. R. Abhayaratne (Ceylon Medical Association), H.E. Dr. Luis F. Thomen (Medical Association of the Dominican Republic), Dr. Rudolf Weise (West German Medical Association), Dr. R. K. Bhandari (Indian Medical Association), Dr. P. Noack (Medical Association of Israel), Dr. W. J. Royaards (Royal Netherlands Medical Association), Dr. J. Haffner (Norwegian Medical Association), Dr. J. H. Struthers (Medical Association of South Africa), Dr. V. Manilovic (Union of Medical Societies of Yugoslavia).

The following representatives of Overseas Branches were next introduced:

Dr. W. S. Haynes (Kenya), Dr. A. G. M. Davies (Uganda), Dr. Baden R. Cooke, Dr. B. R. Morey, and Dr. R. R. Winton (New South Wales), Dr. H. W. Horn (Queensland), Dr. E. P. Cherry, Dr. Malcolm Cockburn, and Dr. F. K. Muggford (South Australian), Dr. K. Melville Kelly and Dr. Jean M. Gunson (Tasmanian), Dr. D. A. Carter and Dr. Keith H. Hallam (Victorian), Dr. Ralph H. Crisp (Western Australian), Mr. H. H. Barnett, Mr. A. Perry, and Dr. J. M. Twigg (New Zealand), Dr. K. J. Dunlop (Assam), Mr. A. R. Hodgson (Hong Kong and China), Dr. Mary L. Grove-White, Dr. H. A. Reid, and Dr. Thelma M. Ward (Malaya), Dr. P. Moran and Dr. J. C. McFeely (Branches in the Republic of Ireland), Wing Commander H. B. Kelly (Aden), Dr. W. M. Ford-Robertson (Middle East), Rev. Dr. C. W. Silk (Bahamas), Dr. C. Gun-Munro (Grenada), Mr. N. J. L. Margetson (Leeward Islands).

The Association Prizes were then presented by the President:

Sir Charles Hastings Clinical Prize to Dr. W. A. Brown, of Peterlee, Co. Durham; Charles Oliver Hawthorne Clinical Prize to Dr. T. J. C. Warriner, of Surbiton, Surrey; the Nathaniel Bishop Harman Prize to Mr. T. L. Dormandy, of London; the Stewart Prize to Dr. R. E. Hope Simpson, of Cirencester.

Prizes were presented to the following nurses: Student nurses' first prize, Julie M. Jerrett, Cardiff; second prize, Margaret S. Clay, Lincoln; State-registered nurses working in hospital: first prize, Peggy E. Gowing-Scopes, London; second prize, Arthur Whitehead, Bradford; State-registered nurses working outside hospital: first prize, Margery Hodgkinson, Lewes; second prize, Flora M. Farnsworth, South Petherton, Somerset.

Medical students' prizes: Mr. D. C. Thomas, Trinity College, Dublin; Mr. S. J. Steele, Middlesex Hospital.

President's Address

The PRESIDENT then delivered his address from the chair. It was published in the last issue of the *British Medical Journal*.

Dr. I. D. GRANT, Chairman of the Representative Body, proposed a vote of thanks to the President for an inspiring and stimulating address. The *motif* that had run through the address was the responsibility of the family doctor in the working of the National Health Service. The President

had posed many questions, and to some he had himself given the answer. It was absolutely essential that the general practitioner should take his rightful place in that service. He must never surrender his responsibility. Ultimately the welfare of the patient must lie in his hands.

The vote of thanks was accorded with prolonged applause. The whole company then adjourned to the near-by Royal Pavilion, where members and guests were received by Dr. Pavillon, where members and guests were received by Dr. and Mrs. Hall. At one time the queue waiting to be received must have numbered many hundreds. A marquee had been erected in the gardens, and the floodlighting and the academic robes of many of those present made an animated and colourful spectacle.

RELIGIOUS SERVICES

BISHOP OF CHICHESTER ON SPIRITUAL HEALING

A service for the British Medical Association was held at the parish church of St. Peter, Brighton, on July 10, when the preacher was the Bishop of Chichester, the Rt. Rev. G. K. A. Bell, D.D. Members robed in St. Peter's Church Hall, York Place, and walked in procession to the church. The Mayor of Brighton also attended.

The lessons were read respectively by the Chairman of Council (Dr. S. Wand) and the President of the Association (Dr. Alexander Hall), and among the hymns were "All people that on earth do dwell," "Praise, my soul, the King of Heaven," and the *Te Deum*.

Promotion of Health

The BISHOP OF CHICHESTER, whose text was, "I came that they might have life," asked the congregation to consider certain special ways in which Christ and the doctors, the Church and medicine, had common ground. "I can do so more readily in view of the recent publication of the special committee on divine healing. I should like to pay my tribute to that report as a real step forward."

The most significant development in twentieth-century medicine was the widening of horizons in regard to health and healing. Modern medicine was much more concerned than of old with the promotion of health as opposed to the mere alleviation of disease. It was also to an extent not realized before social in character, dealing with the individual in relation to his social environment. Finally, modern medicine laid greatly increased emphasis on mental, moral, and spiritual factors in human life.

Medicine now treated man as a whole human being. It attacked disease as a revolt against the sound and right order of living. Christ treated the human being as an integrated personality, and when He preached the gospel of the Kingdom He was extending the rule of God over the spiritual and physical alike. With regard to the profoundly social character of modern medicine, they knew now much better than their fathers how greatly environment affected the health of the individual. This was indeed the message of the Bible. The claim for social justice lay at the very heart of the prophetic writings of the Old Testament. Christ spoke of His mission to proclaim release to the captives, the recovery of sight to the blind. He spoke of those who had given food to the hungry and clothes to the naked as inheritors of the kingdom prepared for them from the foundation of the world. Paul continually emphasized the dependence of all members of the body upon one another. The mental, moral, and spiritual factors were now acknowledged to be the common concern of religion and medicine. In a review of the present state of public health as a world problem Dr. Winslow, of the World Health Organization, had pointed to mental and emotional diseases as the basic factors in man's ill-health. The memorandum of the Special Committee of the B.M.A. had pointed out how greatly physical health was influenced by human relations and personal and emotional factors. It was everywhere made clear in the gospels that faith was a condition of health.

"I came," said Christ, "that they might have life, and that they might have it abundantly." The first vital difference between human beings was between those who did not and those who did believe in a creative living God. The first type of people were willing to believe that God created the world, but they took the view that once it was brought into being it was left to itself. In the realm of nature they claimed that every event could be explained in the terms of manifest cause and consequence, and that there could be no intervention from the spiritual world. The second type of people believed not only that God made the world but that He was constantly remaking it, that it was not a system controlled by unchangeable law, but that there was a moral order in the universe with intervention from the spiritual world and unrelenting action against evil.

Healing of Sickness

This great power of God operated through the skill of the medical profession and of nurses, but it operated also through the ministry of religion in what was known as divine healing. The minister of religion must always have as his chief aim the bringing of the whole being of the patient into union with God. The memorandum he had quoted also said that we could not afford, especially in critical illness, to discard any means at our disposal which might lead to restoration. All the functions of the personality reacted upon one another. The Committee itself had mentioned prayer, the laying on of hands, and unction. All these were aimed at the recovery of the patient. They were part of the regular ministry which the Church had used since Christ gave to His disciples the command to heal all manner of diseases and sicknesses in response to faith.

Summing up, Dr. Bell said, "I believe that it is part of the function of the Church of Christ not only to give people comfort in the narrow sense of that word, but also true spiritual ministrations, always in full co-operation with the members of the medical profession. Religion and medicine have been too long divorced. The Church was once afraid of science; let it be so no longer. But neither let scientific medicine be shy of the Church. Science and religion are indispensable for the treatment of any human being as a whole, and each will help the other."

At the end of the service a collection was made for medical charities.

ROMAN CATHOLIC SERVICE

Roman Catholic doctors of the B.M.A. attended Mass at St. Joseph's Church, Brighton, on July 8. The celebrant was Father Leahy, parish priest, assisted by Father Munns.

The APOSTOLIC DELEGATE, the Most Rev. Gerald O'Hara, D.D., preached a sermon on St. Matthew vi. 15-20. It was, he said, indeed fitting that the Catholic members of the B.M.A. should assemble and before the altar of God pray, in the course of their important conference, for His Blessing on the conference so that it would lead to the benefit of all those to whom the medical and surgical professions were called to minister. The eyes of the world were focused on their deliberations, and he hoped that no resolutions would come from these which were at variance with God's Holy Ordinance.

His Grace paid public tribute to the Catholic members of the medical profession in England and throughout the world, because of that spirit of lively faith with which they were upholding, often against opposition, the standards and the law of Christ in that field to which they had dedicated their lives and their talents.

The Catholic doctor never took a materialistic view of the human body on which he exercised his art. He saw in the human body, however loathsome it might appear, the tabernacle of a soul, the temple of the living God, that was destined after life in this world to be united with the soul in Heaven.

To-day, it was necessary to be on guard against the wolves in sheep's clothing referred to in the Gospel. There were

some medical schools and some of the most renowned universities the world over where such were to be found. Operations and treatments were practised which were opposed to the Word of God, which said: "Thou shalt not kill." The Archbishop criticized some of the textbooks which students were compelled to study. One on physiology said that the human ear was such a faulty instrument that a second-class plumber could have devised a better one, thus speaking blasphemy of the Creator. The Catholic doctor knew that he was called on to save life, never to kill or to mutilate unless, as His Holiness the Pope had said, certain operations were necessary.

Science and Religion

The Roman Catholic doctor was the true scientist. He knew that there could never be a conflict between the real truths of science (as distinct from pseudo-science) which had God as their author. Credit must be given to the scientist when he was in his own field and proposed truths about that field. But it often happened that when a scientist acquired world-wide prestige he was asked to give his view about religion and faith, on which he was abysmally ignorant.

The Apostolic Delegate appealed to doctors and surgeons to stay close to the sanctuary. The better Catholics doctors were the deeper their faith, and not only would they be better men, they would be better healers of men. Many a sick man had learned to think of his own soul. Doctors had many opportunities not only to apply the remedies of their profession, but, like priests, of saying the good word which could be like balm to souls.

In giving his blessing to Catholic doctors, His Grace said that the church was proud of them. He knew that they would always be true to the teaching of the faith and would merit the richness of the bounty of God.

The service was followed by a reception at the Royal Pavilion Hotel by invitation of the Sussex Branch of the Guild of SS. Luke, Cosmas and Damian, and a luncheon.

SERVICE FOR JEWISH DOCTORS

On the morning of July 7 a service for Jewish doctors was held in the Middle Street Synagogue, Brighton. The Rev. I. N. Fabricant, minister of the Jewish community in Brighton, welcomed Jewish members of the Association to morning service and gave a brief address on "The Jews and Medicine." The service was followed by a reception in the vestry room.

MEDICINE AND THE CHURCH

BISHOP OF DURHAM ON SPIRITUAL HEALING

There was a large attendance of doctors and clergy for the discussion on "Medicine and the Church" organized by the Churches' Council of Healing in connexion with the Association's Annual Meeting. It was held at the Hotel Metropole, Brighton, on July 6 and was preceded by a reception for doctors and ministers. The principal speakers were the Bishop of Durham (the Rt. Rev. Maurice Harland) and Dr. Mary Esslemont, who was chairman of the committee which prepared the B.M.A.'s evidence to the Archbishops' Commission on Divine Healing.

The BISHOP OF LEWES (the Rt. Rev. Geoffrey Hodgson Warde), who presided, said that it had long been his earnest wish and prayer that the time should be reached when there was a complete partnership between the parish priest or the hospital chaplain and the doctor.

Co-operation Growing

Dr. ESSLEMONT outlined the findings of the B.M.A. Committee and confirmed that there was evidence from all parts of the country that co-operation between doctors and clergy

was growing. She instanced the recent invitations to the Association to send two representatives to the Hospital Chaplains' Conference at Oxford.

Doctors felt it important that clergy and public should understand the ethical rules of the medical profession and the fact that they were designed to keep up the standards of the medical profession, not to protect the practitioner.

To some chaplains who found they were not always welcomed in hospitals, she pointed out that not even general practitioners were always welcomed there. They ought not to blame the hospital staff. The fact was that often general practitioners and visiting clergy visited at a time which was convenient to them, and not at a time convenient to the hospital staff and the patients.

Divine Healing

The BISHOP OF DURHAM announced that the Archbishops' Commission on Divine Healing, of which he is chairman, would not be in a position to publish a report for the next 12 months.

"Spiritual healing" was a term open to grave misconceptions. His lordship preferred "divine healing," which, although not adequate, did imply that healing was divine and that those who were engaged in combating disease and promoting health were continuously trying to do the will of God. He was convinced that any consideration of divine healing which did not fully recognize the work and ministry of the medical profession was false and dangerous.

Dr. Harland believed that our Lord's command, "Heal the sick," was directed to the medical profession, the clergy, and Christians as such—to all three. The Church believed that there were "diversities of gifts" and that those called to the medical profession were consciously or unconsciously obeying the divine vocation. Man was, roughly speaking for convenience, a trinity of body, mind, and spirit—the physical, the mental, and the spiritual—and all three were closely interwoven and subject to disease and illness. His lordship, as a Christian, believed that everything turned upon the right relationship with God and faith in Him, and that the Church's ministry to the sick must be devoted to establishing this relationship.

In his ministry to the sick he always tried to turn their attention away from being obsessed with their illness, and to concentrate upon the loving presence of our Lord, His power and His will, in perfect trust that He was fulfilling in them His purpose and love. He had known persons make a wonderful recovery. Far more remarkable in his experience were those who knew that they would not recover yet were made whole.

The subject of divine healing was large and complex. There were many who claimed to be healers and to be able to cure diseases. How far their claims were true still remained to be seen. As the Bishop saw it, the question was not whether this and that disease could be cured by spiritual ministrations, but how men and women could be brought to the condition in which they were able to receive the power and love which fulfilled their particular and real need. They sought to heal the patient, not primarily the disease. The fact could not be overlooked that man's purpose in this world was to die and so enter eternity. There was a mystery about pain and suffering which could not be understood, especially the suffering of little children and innocent people.

Medicine and the Church, working together, should encourage a dynamic philosophy of health which would enable every citizen to find a way of life based on moral principle and on a sound knowledge of the factors which promoted health and well-being.

Discussion

In reply to a question why the speakers disliked public healing meetings, the Bishop of Durham spoke of the damage done in a parish in which he had been where

there were services advertised: "Faith Healing Mission. Bring your sick to be healed." The people went full of faith; they came back disillusioned. The sort of service which whipped up the emotions could be very impressive, and all knew of cases of people throwing away their crutches and walking off the platform—and being as bad again two hours afterwards. Wholly right and proper, however, were services of divine healing where people came by invitation after being prepared.

Dr. P. W. R. PETRIE said that faith which removed fear helped recovery. He believed that this was a mission of healing not only for the individual but for the community as a whole. Many of the strain-and-stress diseases were due to frustration, because people had no purpose to-day except material ends.

Dr. J. S. NOBLE endorsed, as a general practitioner, the reference to the terrible psychological effects of some of these mumbo-jumbo healing sessions. He also endorsed the value of a partnership between the clergyman and the doctor.

Dr. R. R. WINTON referred to the miracles of our Lord. The BISHOP OF DURHAM replied that the Church had never lost the power of performing miracles.

Rev. C. C. BURNHAM, Heathfield, spoke of his collaboration with a local doctor. Once a week at early celebration they prayed for his patients. In one case in which the doctor and he were concerned a child was said to have only an hour to live. He blessed the child—and the child was still alive. Was faith on the part of the individual necessary? He often prayed and laid hands on people who had no faith at all.

Dr. BERTHA UPTON-JONES, a general practitioner, said that the opposite of love was fear; therefore, if these states were brought on by fear, one could heal by bringing in love again.

In thanking the speakers, Dr. E. E. CLAXTON, Assistant Secretary, B.M.A., said that he was sure that neither Church nor Medicine was satisfied with helping the individual only. He believed that a divided Church was no answer to a divided world.

PROCEEDINGS OF COUNCIL

The last meeting of the retiring Council was held at the Royal Pavilion, Brighton, on July 7, Dr. E. A. GREGG presiding. The meeting was devoted to the clearing up of outstanding business and lasted only one hour, preceding the resumption of the Representative Meeting.

The deaths of two former members of Council, Dr. A. J. Drew, of the West Indies, and Dr. H. B. Morgan, of London, were reported, and letters of condolence to the relatives were authorized.

The names of the several members of the Association upon whom honours have recently been conferred were read and the congratulations of the Council were extended to them.

Correspondence on a proposed review of part-time fees paid by local authorities was laid before the Council, and it was agreed that the matter be pursued further by interview rather than by letter.

A number of matters were left over to the new Council. These included an invitation to the Association to give written evidence to the Maternity Services Committee set up by the Ministry of Health under the chairmanship of Lord Cranbrook to review the present organization of maternity services in England and Wales.

A question arose on the medical membership of hospital administrative bodies, and the recommendation of the Guillebaud Committee that the total number of medical members on a regional board or management committee should not exceed 25% save in quite exceptional circumstances. Mr. LAWRENCE ABEL pointed out that it was important to make sure what proportion of doctors on these committees were chosen by the profession and what proportion were selected by the Government. It was re-

ported that the Joint Consultants Committee would be considering the matter on July 25, and it was decided to invite the Joint Committee to receive representatives of the General Medical Services and Public Health Committees.

Various invitations to appoint delegates to conferences or meetings of kindred associations were considered and in most cases accepted.

Awards in the B.M.A. prize competitions, recommended by the Science Committee, were approved.

Discussion took place, at the instance of Dr. VAUGHAN JONES, on the remuneration of university medical teachers, but was adjourned to the first meeting of the new Council.

The report of the Private Practice Committee, presented by Dr. A. BROWN, with certain recommendations for the amendment of fees for examinations was adopted.

Other reports presented and approved were from the Committee on Medical Education, the Edinburgh Meeting (1959) Steering Committee, the Central Ethical Committee, the Armed Forces Committee (with a draft letter to the Ministry embodying comments on the Waverley report), the Overseas Committee (with a report by Mr. J. L. GILKS, the chairman, on his visit to Malta), the General Medical Services Committee, the Legal Actions Committee, and the Journal, Family Doctor, and Finance Committees.

At the close of the meeting Dr. E. A. GREGG intimated that, having served as chairman for more than the usual term, he did not propose to allow his name to go forward for re-election as Chairman of the new Council. He spoke appreciatively of the kindness and co-operation he had received on all sides.

Widespread regret was expressed at this decision, and several members spoke in terms of high appreciation of Dr. Gregg's exceptional services, their remarks being endorsed by the whole Council.

FIRST MEETING OF NEW COUNCIL

Election of Dr. S. Wand to the Chair

The first meeting of the new Council was held at the Royal Pavilion, Brighton, on July 9, immediately on the conclusion of the Annual Representative Meeting.

Dr. A. BEAUCHAMP proposed the election of Dr. S. Wand as Chairman for the next three years. The nomination was seconded from several places in the Council, and, there being no other nomination, Dr. Wand was unanimously elected amid repeated applause.

Dr. WAND thanked the Council for this extreme honour. When he came to his first Annual Representative Meeting he had never thought the time would come when he would stand in this position. He would do his best, and if his best was not good enough he hoped that members would not hesitate to let him know. He would be very fortunate in Council in having the advice of two distinguished past Chairmen (Dr. H. G. Dain and Dr. E. A. Gregg). He wished to pay a tribute to Dr. Gregg for his past services. He had led them with great wisdom and understanding. He had given his services in the most unselfish way and had earned their admiration, and they would hold him for all time in great affection.

On the motion of Dr. ROBERT FORBES it was resolved to place the Council's appreciation of Dr. Gregg's services in a formal minute.

The Chairman welcomed two new members of Council—Dr. E. A. Gerrard, of Manchester, and Dr. Catherine Harrower, of Glasgow.

The Council then turned to the business of electing its representatives on the Standing Committees, the appointment or reappointment of many Special Committees, and the representation of the Association on outside bodies.

Various Business

The SECRETARY reported that he had arranged that the delegation which was shortly to visit the U.S.S.R. should

take as a present to the Russian Academy of Medical Sciences a gavel and block made from a tree which grew in the garden of Tavistock House, the residence of Charles Dickens, Dickens being a figure well known in Russia.

Dr. J. A. PRIDHAM, chairman of the International Relations Committee, read a letter from Dr. Donslorst, professor of medicine at Belgrade University, who had arrived at the end of the Representative Meeting. It was the first time that such a contact had been formed with Yugoslavia, and it was suggested that the letter should be embodied in the proceedings of Council. It ran as follows:

"As the delegate of the Union of the Medical Societies of Yugoslavia and your guest I have the honour to greet the 124th Annual Meeting of the British Medical Association and to wish you great success in your further work. Connexions between the English and the Yugoslav people during the past two wars, in which we had a common enemy, and the help which we received from you in defence of our liberty and the independence of our citizens we respect and appreciate deeply. We, the doctors of Yugoslavia, as well as all our people, owe special thanks to English doctors, members of your Society, as well as to the other medical workers of England, who gave us help and support in the heaviest hours of our history. Our country wishes to develop and to deepen the friendly connexions between the doctors of our two countries.

"Finally, in the name of all the doctors of Yugoslavia, in the name of the Medical Societies of Yugoslavia, whose secretary I am, in the name of the Serbian Medical Society, whose general secretary I am, and in my own name, I wish all doctors of England, members of your Society, great success in their further work in the advancement of English medicine. The progress of English medicine is of great importance in the development of our medicine, as well as in that of medicine throughout the world."

The Council returned to the subject of the remuneration of university medical teachers—a matter left over from the old Council. Dr. VAUGHAN JONES said that medical teachers wished to be separately represented in negotiations with the University Grants Committee. They did not regard the Association of University Teachers as the appropriate organization to represent them. It was high time they had a permanent negotiating committee. Dr. J. G. M. HAMILTON said that they were under an obligation to take action in this matter. The Council had before it a memorandum dealing with the remuneration of university medical teachers and research workers and a recommendation that it be approved. It was important that any representations they wished to make should be made soon, although the memorandum had not been the subject of detailed consideration in Council. In any approach to the University Grants Committee he suggested that they should be represented by the Chairman of Council and by Mr. Holmes Sellors, chairman of the Central Consultants and Specialists Committee, in addition to five members whom it was proposed should form the deputation. This was agreed to, as also was a motion by Dr. Vaughan Jones that approaches should be made with a view to establishing permanent negotiating machinery on behalf of medical teachers.

Dr. T. C. ROUTLEY, Immediate Past President, said that this was the last occasion on which he would have the opportunity of meeting the Council as one of its members, and he wished to say how greatly he had enjoyed the privilege of sitting on the Council and in the Representative Body. He found the business here handled in very much the same way as it was in Canada. He also expressed his thanks to Sir John McNee, who had stood in for him on many occasions as President when he could not be in this country, and to the Secretary and Editor, who had kept him fully informed of affairs.

The CHAIRMAN thanked Dr. Routley in the name of the Council for his devoted service.

BRITISH MEDICAL GUILD

The meeting of Council was followed by the annual meeting of the trustees of the British Medical Guild, Dr. Wand presiding. Dr. Wand was appointed chairman of the Board, and the other officers and staff and executive

committee were reappointed and the financial statement approved. It was reported that the trustees of the General Medical Services Defence Trust had placed at the disposal of the Guild a sum of £5,000 to be used for assisting the practitioners in Malta in the dispute with their Government. From the Guild Trust Fund, thus augmented, £1,200 had been sent to the defence fund of the Medical Officers' Union of Malta and was gratefully acknowledged. In April agreement was reached between the Government of Malta and the medical profession, and up to the time the agreement was signed it had not been necessary for any part of the £1,200 sent for the assistance of the doctors in Malta to be used.

OVERSEAS CONFERENCE

The Overseas Conference in connexion with the Association's Annual Meeting was held at the Hotel Metropole, Brighton, on July 11, with Mr. J. L. GLKS, chairman of the Overseas Committee, in the chair. The Chairman of Council and the Chairman of the Representative Body attended the Conference.

White Paper on H.M. Overseas Civil Service

Dr. E. GREY-TURNER, Assistant Secretary, referred to the recent White Paper (Cmd. 9768) on the organization of the Overseas Civil Service, an extremely important document for those in Government service in the Colonies. In 1954 an earlier White Paper was published which led to the foundation of H.M. Overseas Civil Service. That was merely a change of name, but still it revealed the direction in which the mind of the Government was moving. The change of name was welcomed by the B.M.A., but a few months ago the Overseas Committee felt that the situation was still obscure and asked for a deputation. It was requested to wait until the Secretary of State had made a statement in Parliament, and in due course the statement was made and the new White Paper was published.

His Committee had a number of comments to make on it, but he would confine himself to one. Good as were the proposals in many respects, they had one major defect: they did not give any reasonable assurance of a full career in medicine overseas. A man might enter the Government service at the age of 28 or 30, and hope to spend his working life in overseas territories, but, with political developments, the country of his choice might suddenly be made self-governing, and he would be out of a job, perhaps with generous compensation, but having lost his career in the middle of his life. The National Health Service made it almost impossible for a doctor from overseas to get a job here, and the White Paper offered no solution to that problem.

Turning to other matters, Dr. Grey-Turner referred to the Malta dispute as the kind of thing that might happen elsewhere. In Malta there were certain circumstances which enabled the doctors to put up a resistance, but it must not be assumed that that would happen in other cases. There were two medical bodies in Malta—the Malta Branch of the B.M.A. and a Medical Officers Union. The latter was able to do things which the B.M.A. could not do, and there were other things which could be done better by the B.M.A., and as the two bodies had an almost identical membership it was a very strong combination. The B.M.A. had been able to help Malta through the British Medical Guild, whose operations he described.

Dr. Grey-Turner circulated to the Conference a list of nine points of procedure to be recommended to overseas Branches in conducting negotiations with their Governments. He drew attention especially to five of them: (1) to take whatever steps were possible to obtain information of any plans that the local Government might have; (2) to ask the Government to receive a deputation; (3) possibly to enlist the support of other professions; (4) to inform the

Government that the profession's views on its plans would be communicated to the public; and (5) to inform the local press.

Changing Conditions Overseas

Dr. A. G. M. DAVIES (Uganda) said that he was instructed by his Branch to pay a tribute to the work of the Overseas Committee and Dr. Grey-Turner. He did not think the answer to the problem raised in the White Paper would ever be produced by Government departments. The position was roughly that there were a large number of doctors who were having to decide whether or not to retire from overseas service at 45 with some chance of getting a job in this country or to go on to 55 with a slightly increased pension and no chance of a job in this country. The White Paper offered a form of limited charity—charity in the sense of pay without work when necessary, and limited in that it stopped at 50 years of age. He thought the conception of a unified service based on this country was an excellent one. He went on to refer to an experiment which was being carried out in Uganda—an arrangement with Great Ormond Street whereby a senior registrar in paediatrics and two nursing sisters went out to Uganda for a two-year period, becoming to all intents and purposes members of the service there, but still technically on the staff of Great Ormond Street. It seemed to him that they might be able to arrange some similar system of seconding with regional hospital boards.

Dr. MARY L. GROVE-WHITE (Malaya) said that it was the opinion of the committee of the Southern Division of her Branch that Headquarters should press the Colonial Office to offer to extend the option of conditions of service similar to those now applied in Nigeria. They should press in particular for an extension of the period of employment. The age of 55 was far too young to contemplate retirement even in tropical countries.

Dr. KEITH HALLAM (Victoria) said that he had been interested in hearing about the short-term service of colonial medical officers. Many of these medical officers came to Australia and found a very happy life and conditions which suited them. There was opportunity in Australia for suited doctors. In Victoria a survey had shown a considerable shortage both in general practice and the public services. The picture might change during the next five or ten years, but there was opportunity at present for middle-aged doctors—men and women aged between 40 and 50—to practise in Australia.

Professor D. E. C. MEKIE (Council) said that doctors were in danger of being offered up on the altar of political expediency. It was not satisfactory for any doctor to know that he could be chucked out of his career in mid-life, even with generous compensation. Until a few years ago a doctor who went into the Colonial Service could be retired at about 50 and then come to this country and make an income. That prospect had been taken away by the introduction of the National Health Service. The whole question of conditions of employment of ex-Service officers in the Colonial Medical Service was critical, and the B.M.A. should if necessary do more than merely make representations to the Colonial Office.

Dr. I. D. GRANT (Chairman of the Representative Body) said that the chance of getting employment in this country even at 35, still less at 45, was very slight. By the method of appointment to general practice and to hospitals here, the average young man found when he qualified that he must on no account lose his place in the queue. If he went away for five or six years, no matter how capable he was, his chances of getting back into the queue were very slender.

Dr. DAVIES (Uganda) pointed out that so far as colonial governments were concerned it was actually to their advantage for it to be difficult for a returning doctor to get a job in this country.

Dr. GREY-TURNER remarked that his Committee had asked to have a representative of the Ministry of Health present at the next deputation to the Colonial Office. In reply to Sir TUDOR THOMAS, he said that the number of members who

were ex-patriate officers in H.M. Civil Service was probably 600 or 800—an important group, but a small number relatively to the overseas membership.

The CHAIRMAN remarked that the fact that this White Paper had been issued indicated that Government departments were not very happy about the conditions.

The Rev. Dr. C. W. SILK (Bahamas) asked whether the White Paper referred to the Bahamas, and went on to describe the peculiar conditions in that colony, where there was a "closed shop," so that if a doctor was out of his present job he would have no right whatever to practise in the Bahamas.

Dr. T. C. ROUTLEY (Canada) spoke of the movement in some quarters towards a whole-time State-salaried medical service. He came from a part of the world where they would never bring in such a service.

Procedure in Conducting Negotiations

The Conference considered the list of recommendations to Overseas Branches in conducting negotiations with their Governments. Dr. MARY GROVE-WHITE (Malaya) said that in Singapore the new Minister of Health decided to set up a Medical Advisory Council to which the Branch made certain nominations, but in the event only one representative of the B.M.A. was chosen. It seemed most desirable in such cases to secure adequate representation of general practice. Dr. P. HARNARAYAN (Trinidad) said that it had been found an advantage in Trinidad to enlist the support of members of the legal profession. He also mentioned that in Trinidad the Minister of Social Services had set up a committee to investigate the working of the National Health Service in Great Britain. They in the B.M.A. Branch had already drawn up a plan under the guidance of their honorary secretary, Dr. J. A. Waterman.

An Australian delegate said that there was a movement in some quarters to put specialists such as radiologists and pathologists on a whole-time salaried basis. If one section of the medical profession was made an entirely salaried service it would not be long before the movement extended to the whole fabric.

Dr. D. P. STEVENSON (Deputy Secretary) said that the major parts of the service in Great Britain were the general-practitioner and hospital service. The hospital service was in the main part-time, and if it was found that the number of whole-time appointments was going up they would continue to do all they could to ensure that the great majority of consultants who were part-time should go on being so if they wished. So far as the general practitioner was concerned, he did not think the Government itself would consider the establishment of a whole-time service. From time to time letters appeared in the *Journal* from young men who desired a whole-time salaried service, but there was no question that the overwhelming majority were against it. The parent body was four-square on this subject, and would resist any attempt to have a whole-time salaried service.

Dr. L. A. GIBBONS (Council) supported what Dr. Stevenson had said. He hoped that in time a Commonwealth Medical Association would be formed.

Dr. GROVE-WHITE (Malaya) said that Malaya was considering resolving itself into an incorporated Branch, probably to be called the Malayan Medical Association.

The question was raised by Dr. DAVIES (Uganda) whether anyone employed in Government service who became secretary of a Branch had the right to speak in public as secretary of the Branch on Government policy. Dr. GREY-TURNER said that there had been one case in which a member had been reprimanded by his Government for his remarks at a former Overseas Conference which were reported in the *Supplement*. One way of overcoming any difficulty in this respect was to ensure that the secretary of the Branch was not in the Government service, but even so with Government officers on a Branch Council it was necessary to walk warily.

Sir HENRY NEWLAND said that under the constitution of Australia the medical profession could not be nationalized.

After the war, the Labour Government then in power brought in a referendum one part of which laid it down that there should be no industrial conscription in any shape or form. The Government introduced a Bill which embodied a whole-time salaried service. The B.M.A. Branch raised an objection, and a test case was brought to court. The verdict of the High Court was that a nationalized profession as proposed by the Government was a form of civil conscription and was against the constitution, and that was why the service in Australia to-day was a voluntary one.

The CHAIRMAN OF COUNCIL (Dr. S. Wand) pointed out that if in some of the overseas Branches the vast majority of members were in a national service it would become increasingly difficult to get a Branch secretary who could speak for the doctors. With regard to the proposal of, for example, Malaya to turn itself into a Federal Council there might be a danger of the Branch becoming more or less hamstrung because its secretary and most of its members were in full-time Government employment. It would thus have difficulty in speaking on behalf of the profession, and Headquarters might have to be informed at a much earlier stage so that if necessary the steps that were taken might emanate from London.

Dr. GROVE-WHITE said that the Government was likely to have more sympathy with a national organization than with a Branch of the B.M.A.

Dr. W. M. FORD-ROBERTSON (Middle East) gave an interesting brief description of the development during the past five years of a Branch in a region full of strong nationalistic feelings. The Middle East Branch, reorganized in 1951, was different from others in that its territory of operation was entirely in foreign lands. It lay in the Arab world of Lebanon, Syria, Iraq, Jordan, and Kuwait on the Persian Gulf. The membership had risen to between 220 and 230. It had been found that meetings taking the form of symposiums, with papers, business discussions, and social events, served best to stimulate interest, and such meetings had been held at Bagdad, Damascus, Kuwait, Teheran, and Beirut. Men from the different countries continued to work together with a common basis of interest and co-operation, and this had been a conspicuous element in the success of the Branch. The "king pin" of the meetings had been the presence of several distinguished medical colleagues from the United Kingdom as guest speakers.

The luncheon to Overseas representatives was held at the Royal Albion Hotel on July 6, when 64 representatives were present. The Chairman of the Representative Body, Dr. I. D. GRANT, welcomed the visitors, and Dr. W. M. FORD-ROBERTSON, of the Middle East Branch, replied. Sir HENRY NEWLAND, a Vice-President of the Association, also spoke.

At the close of the Conference, which was one of the best attended since the series started at the Centenary Meeting of the Association in 1932, the members and other guests were entertained at an "At Home" for overseas visitors given by the Empire Medical Advisory Bureau. The Medical Director of the Bureau, Brigadier H. A. SANDIFORD, received the guests.

Corrections.—In the report of the A.R.M. under the heading "Immigrants with Communicable Diseases" (*Supplement*, July 14, p. 20) it should have been stated that Dr. R. S. Rudland (Coventry) spoke on the question of x rays for immigrants, not Dr. J. Ballantine. The motion under the heading "Air Pollution" (p. 20) moved by Dr. D. S. Robertson (City of Edinburgh) should have been reported as having been carried. In the section of the report under the heading "R.M.O. Examinations" (p. 39) the name of Dr. C. D. Meadowcroft should replace that of Dr. W. Morgan Evans. Under the heading "Domiciliary Consultation Arrangements" (p. 44) the East Herts and Reigate amendment asking "that the Association should press for the payment of domiciliary consultation fees to whole-time consultants without restriction" should have read "... fees to whole-time specialists up to the permitted maximum."

CHRISTIAN MEDICAL FELLOWSHIP BREAKFAST

MAKING MEN WHOLE

The annual breakfast of the Christian Medical Fellowship, which has long been a feature of the Annual Meeting, was held at the Hotel Metropole, Brighton, on July 12, when the chair was taken by Dr. ALEXANDER H. HALL, President of the British Medical Association. The address was given by Dr. D. MARTYN LLOYD-JONES, who spoke on "Medicine and the Whole Man," basing his remarks on the story of the ten lepers who were cleansed, only one of whom turned back and glorified God, and of him it was said, "Thy faith hath made thee whole." A partial idea of man, said Dr. Lloyd-Jones, was often current. But it was now becoming recognized, not by religion only, that the whole man had to be taken into account, and always if that were done he must be considered in his relation to God. As St. Augustine said, "Thou hast made us for Thyself, and our hearts are restless until they rest in Thee." Man was not a mere animal but reflected the life eternal. There was that in man which was always calling out for something bigger, because he had been made by God and for God and could not function without correspondence with his Maker.

Nothing but Christianity could deal with the whole man. That was the peculiar character of the Christian faith. This leper who turned back had something which the others did not possess. They had got rid of their symptoms, but he was made whole. Many members of the medical profession had regarded the Christian Church as a kind of special department of the hospital, much in the same way as they would regard the radiological department. The Church was thought of as offering a type of psychotherapy. He protested against that idea. The Church of the Christian faith could never be a department of medicine. Instead of the State taking over medicine, medicine should be taken over by the Church. The Church was too often thought of as offering some benign institutional aid, as the home of kindness, sympathy, and understanding. It was all that, but it was much more. It existed not merely for the relief of symptoms but for making men whole through faith by reconciliation to God.

"IN BRIGHTON LAST WEEK"

Receptions and Dances

The glories of old Brighton—the Brighton of the Regency, and of an even earlier time when in the eighteenth century the Royal Pavilion, a fabulous palace of domes and minarets, first astonished the Sussex coast—seemed to be revived for some of the social events of the Annual Meeting. After delivering his uncommonly stimulating address last Monday, the President, Dr. ALEXANDER HALL, and Mrs. Hall gave a reception at the Pavilion. This exotic building, with its Oriental architecture, bamboo banisters, and walls and ceilings lavishly painted with a tropical flora, contrasted strikingly with the mediaeval if colourful academic robes worn by many of the guests. On Wednesday the same perfect setting was provided for the civic reception given by the Mayor of Brighton (Alderman Lewis C. Cohen) and Mrs. R. H. Coleman-Cohen, who received many hundreds of guests. It was attended by the President and officers and members of the British Medical Association and their ladies, as well as by a large assembly representative of the public and social life of Brighton and the county. The museum, the art galleries, and the assembly rooms of the Royal Pavilion, and the floodlit gardens made a splendid setting for these memorable occasions, and dancing continued into the night.

While Brighton's claim to be one of the healthiest spots in England is unchallenged, it can surely have few rivals, too, for architectural and natural beauty. Tours to the country-

side north of the city included visits to Lewes and near-by Glynde, the Devil's Dyke, and, further afield, Arundel and the Hastings area. The chalk downs have changed much in appearance since the absence of rabbits allowed the grass to grow tall, though from the distance the contours are seen to give an unchanging shelter to the Domesday villages among them. The main festivities concluded with the B.M.A. supper-dance at the Hotel Metropole, and the Brighton Division earned the congratulations of all who were fortunate to attend this happy function.

Golf Competitions

The Leinster and Childe Cup golf competitions were played on Wednesday, July 11, at the West Sussex Golf Course, Pulborough. The winner of the Leinster Cup was Dr. W. L. James (South-east Essex Division) and of the Childe Cup Dr. P. S. Steen (South Essex Division).

The Notts Ladies' Challenge Cup was played on July 11 at the East Brighton Golf Course. The winner was Mrs. Alexander Hall, of Hove.

The Treasurer's Cup was played on Thursday, July 12, at the West Sussex Golf Course, and was won by Dr. S. H. Martin (Nuneaton and Tamworth Division).

The Minister of Health has approved revised salary scales and conditions of service for administrative and clerical staff. A memorandum (H.M.(56)44), together with a copy of A.C. Circular No. 50, setting out the revised scales agreed by the Administrative and Clerical Staffs Council of the Whitley Councils for the Health Services, has been circulated to hospital authorities. The revised scales take effect from February 1, 1956.

THE REMUNERATION CLAIM

MINISTERS' REJECTION

As stated in the medical press a fortnight ago (*Supplement*, July 7, p. 2), an outline of the case for an adjustment of the betterment factor for general medical practitioners and all grades of hospital medical staff in the National Health Service was recently sent to the Minister of Health and the Secretary of State for Scotland. The full text will be published in next week's issue.

The following reply, dated July 13, has been received by the Secretary of the Negotiating Committee from Sir John Hawton, Permanent Secretary of the Ministry of Health:

Déar Dr. Macrae,—On June 14 you wrote to me, and to the Secretary of the Department of Health for Scotland, enclosing a memorandum outlining the case which the Negotiating Committee wished to present to the Minister and the Secretary of State for Scotland, concerning remuneration.

The memorandum has been submitted to the Ministers.

We are asked by them to say that they do not accept the premises on which the memorandum is based. In their view the remuneration of the medical profession, like that of others, must be determined from time to time in the light of all relevant circumstances. The Ministers have asked us to say that in present circumstances they would not feel justified in giving consideration to any claim for a general increase in medical remuneration. In view of this they feel that the Negotiating Committee may wish to defer sending their proposed deputation at the present time.—

Yours sincerely,

(Signed) JOHN HAWTON.

NEGOTIATING COMMITTEE'S STATEMENT

The following statement has been issued on behalf of the Negotiating Committee:

The doctors of the country will be astonished by the flat rejection of a claim which in justice and logic cannot seriously be challenged. The members of the medical profession have borne without complaint the steady decline in the real value of their incomes during the past five years, even though some of them are suffering hardship, and during recent years have refrained from adding to the Government's difficulties by putting forward a claim. This year the profession was at last driven to request an adjustment. The Minister's curt dismissal of that request will shock the profession, and will be regarded as a poor recognition of the restraint it has shown.

The claim is based on the decline in the value of money since April 1, 1951. The claim is that the remuneration of all members of the medical profession whose case is covered by the two Spens Committees (General Practitioners and Hospital Medical Staffs) should, as at April 1, 1956, be increased by not less than 24%, which is the amount by which their real incomes—taken as a whole—have declined in value since 1951.

The claim in no way runs counter to the recent plea by the Chancellor of the Exchequer for a halt in new wage and salary claims, for the simple reason that the claim is merely one for the implementation of a contractual obligation already in existence and which has been so since 1948. Having entered the National Health Service at the Government's invitation, the medical profession inevitably and for all time thereafter entrusted to the Government the maintenance of its economic status. The discharge of that trust is a responsibility that was undertaken by Parliament and the nation as soon as the National Health Service was established.

The Negotiating Committee is meeting at once to consider the action it must take.

ANSWER TO PARLIAMENTARY QUESTIONS

We print below the reply given by Mr. R. H. Turton, the Minister of Health, to Lieutenant-Colonel Lipton on

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Improving General Practice

SIR,—The writer of the poignant first leader in *The Times* of July 3 states that the cause of our country's faulty economic trends lies in a discrepancy between the conception on which the economy is based and the structure by which it operates. Basically, the recent article by Dr. J. R. F. Jenkins (*Supplement*, June 16, p. 351), and the observations of your correspondents upon it, draw attention to exactly the same tendency in general practice, and I beg to suggest that the same insidious downward trend in quality of work in this branch of medicine will inevitably follow.

The conception of good general practice, epitomized in the recorded work of the late Sir James Mackenzie, was one in which vision and originality of thought and action played a large part. Translated into present-day conditions, it follows that the practitioner must be in a position to carry out work to the limit of his ability and must have time and adequate encouragement so to do. If financial reward is to encourage this end, then it must be vehemently stated that the capitation fee does not serve this purpose. Breadth of vision and originality cannot be equated with numbers on a list; in fact, large numbers discourage these very traits which have embellished general practice in the past. There is here surely a deep gulf between concept of purpose and structure in practice. It is further confirmed by the fact that proved originality in general practice by published work does not help a man to settle in practice these days; this is probably because ability to maintain or increase a list—rightly or wrongly—not considered necessarily synonymous with such a quality. Furthermore, if it be true that hospitals are intended to serve general practice and not replace it, as this month's *Practitioner* propounds, then it follows logically that recognition of the practitioner, and his being enabled to carry out minor investigations and procedures therein, should be the rule and not the exception.

I submit, Sir, that the same divergence between concept and structure is beginning to pervade general practice just as it is the economics of the country, and in both cases encourages a rigidity which can never lead to progress. Any attempt to improve structure which is inconsistent with the furthering of an envisaged ideal can only be one of symptomatic expediency.—I am, etc.,

Colwyn Bay.

D. S. CRAIG.

Training Scheme for Registrars

SIR,—I view with great concern Professor Alexander Kennedy's suggestion (*Supplement*, July 7, p. 5) for overcoming the shortage of psychiatrists, for the following reasons.

(1) The shortage is more apparent than real. At the present time it is by no means certain that experienced S.H.M.O.s and senior registrars who have been in psychiatry for seven or more years will obtain consultant appointments, unless the Government greatly increases the consultant establishment, which is most unlikely. There is no doubt that the mental health of the country demands such an increase. However, public opinion does not yet fully recognize it, and, even if it did, the economy of the nation could not support such an increase, either now or in the near future.

(2) Although there are notable exceptions, the majority of those who have a training in general medicine, paediatrics, and especially neurology are quite unsuited temperamentally to become psychiatrists. The practice of good clinical psychiatry is primarily dependent on the ability to develop "empathy" with patients, which can only be done by those whose own personalities are sufficiently flexible to accept the

insights of analytic psychiatry, whether Freudian, Jungian, Sullivan, etc. Disappointed physicians and neurologists usually possess a resistance to such concepts which could only be overcome by a training analysis. A practical impossibility.

(3) The possession of widespread experience in other specialties in no way justifies shortening the period of training required. I would almost suggest that it requires a lengthening of training in order to overcome the "organic" prejudices of the other specialties. The possession of an M.R.C.P. sometimes constitutes a stumbling-block to the practice of good psychiatry. The present tendency of boards to demand the possession of such a degree is as irrational as expecting all physicians to have the D.P.M. Dynamic psychiatry, and in particular the work of John Bowlby² and Spitz,³ has perhaps suggested that a knowledge of personality development is of more value to the physician than is the knowledge of obscure biochemistry or advanced medicine to the clinical psychiatrist.

Psychiatry is a specialty in its own right, and, rather than general medicine providing a good basis for the practice of psychiatry, I suggest that dynamic psychiatry is the basis of good medicine. Physical methods of treatment, including the latest batch of tranquillizers, are quite secondary in importance to an analytic approach. They are useful, but only as a means of facilitating empathy and psychotherapy in its widest sense. Seven years in psychiatry, including two years in North America, only confirm my opinion that, however valuable an organic approach may be, it is no substitute for an approach based on an integration of the great analytic schools and learning theory, whether one's work is in the so-called back wards or in acute neurosis units.—I am, etc.,

Wakefield.

Return of Goodwill

SIR,—If one takes notice of recent letters published in the *Supplement*, it is clear that frustration, discontent, and hardship are becoming commonplace in general practice. The grumbles can be briefly summarized as follows: (1) the farce of a 1948 compensation figure not tied to the prevailing value of the pound (what would our private fees have been now in comparison with 1948?); (2) the niggardly interest rate given on our compensation; (3) the heartbreaking pension figures afforded to those who were middle-aged at the inception of the Service; (4) the utter frustration at the loss of freedom of movement; (5) the difficulty of entry of the younger man into general practice.

To all these complaints I would add yet a further injustice—the complete absence of financial value put upon experience. A young man who is lucky enough to be allocated a practice immediately starts at the same income level as his fellow G.P. with the same-sized practice but who has been in practice for 15 to 30 years or more. Surely this is an utter farce. It is difficult to imagine any other profession or trade which would tolerate this state of affairs. Perhaps this anomaly is the one and only point in favour of a salaried service—one would at least (we hope) receive increments of pay for length of service.

But the most frustrating factor of all is the loss of freedom of movement. In the "bad old days" of ownership of goodwill, an ageing G.P. in a busy industrial practice would "sell out" and buy a less arduous, albeit less remunerative, practice in surroundings more congenial and kinder to his and his family's health. This system had the twofold advantage of creating advertised openings for the younger man who was prepared to take on a busy (and remunerative) practice, and at the same time allowing the older man to "get out," and scale down the tempo of his work. In addition, the incoming doctor had the advantage

of a few months' introduction to his practice by the vendor. To-day, in a nutshell, the younger man cannot "get in" and the older man cannot "get out." All that the ageing man can do to ease his work is to take in a partner at the cost of a third to a half of his income and continue to live in the same place.

It is indeed a solemn thought for the young G.P., who has no compensation at stake and who has just started in practice, that he will, most probably, live and work in the same place for the rest of his days, and that at the end of his working life he will be in receipt of approximately the same income as the day he started. The only possible answer to this frustrating state of affairs lies in the return of the right to buy and sell our practices once again. It is utter nonsense to talk of the "buying and selling of souls." There is a world of difference between the "old-fashioned" idea of an introduction by a vendor to his successor and the present impersonal system of executive council vacancy advertisement (in many of which neither house nor surgery premises are available). The sooner goodwill is returned the better for all—young and old.

But, alas, this is only just one more letter to the *Journal* bellyaching about our complaints. There have been many before, and undoubtedly there will be many to follow. The important point is this: just how many of us does a letter such as this truly represent? If it represents the majority of us in general practice, then strong and resolute action is called for. Many, far too many, high-sounding words about the abstract idealism of medicine have been written in the past in the *Journal*; much, far too much, has been written in consideration of our patients. It is high time for charity to begin at home and to consider our own lives, our wives, and families before it is too late. It is essential for us to become realists in thought and action if we are not to become abject automatons without any will, life, or future of our own.

And who is to assess whether all these letters to the *Journal* are just the outbursts of a minority of frustrated cranks or whether they are genuinely representative of a cross-section of G.P.s as a whole? It is quite plainly the B.M.A.'s duty to investigate and to find out just how deep is this discontent and frustration in general practice to-day. The B.M.A. alone has the facilities to carry out such an investigation. This could be achieved by a questionnaire sent out to all those in practice. This should be very simple and to the point. Because it is from the loss of goodwill that all the evils I have mentioned above arise, there should be one question only: "Are you in favour of the restoration of the right to buy and sell practices?" If such a questionnaire shows that we are solid in our demand for reform, then the B.M.A. must act for us in a strong, forthright, and uncompromising manner. With the assurance of adequate backing from the main mass of G.P.s it should not be beyond the powers of our representatives and leaders to present a cast-iron demand on our behalf.

Should this plea for a lead—i.e., a questionnaire—fail, then we must remember that it is still in our hands, should we wish it, to put formal resolutions for such an inquiry through our various Divisions. Apathy, apart from converting us into prematurely aged paupers, will get us nowhere.—I am, etc.,

Glossop, Derbyshire.

H. M. R. WADDELL.

Economical Administration?

SIR,—Each political party assures the electorate that it wishes the nation to have a first-class health service. One might thus assume that the voters supporting these parties would try to see that the service is economically run and that no restrictions on effort put up its cost or reduced its efficiency.

Would it not be useful to have the proportions of clerks, porters, telephonists, and other lay personnel related to the number of doctors and nurses employed, these figures to be published regularly? Was it necessary, when the Service

Monday, July 16, who asked the Minister of Health on what grounds he refused to disclose the increases in doctors' pay asked for by the British Medical Association.

Mr. TURTON: Because, so far, there has been no claim published by the profession. The communication on this subject has only been in the form of a preliminary memorandum sent to my Department and to that of my right hon. Friend the Secretary of State for Scotland. To this a reply has now been sent stating that, in the present circumstances, my right hon. Friend and I would not feel justified in giving consideration to any claim for a general increase in medical remuneration.

Lieutenant-Colonel LIPTON: Before we can decide whether that reply was justified or not, can we not be told what the doctors asked for? Why all this secrecy? If trade unionists want something the whole world knows about it; why cannot we be told what the doctors want?

Mr. TURTON: There has been no claim published by the profession. As I said last week, I must act in accordance with what I believe is the proper procedure in this matter, and not anticipate publication when I have received what is in fact only a draft memorandum.

Lieutenant-Colonel LIPTON: In view of the unsatisfactory nature of the reply, I beg to give notice that I will raise the matter again.

MEDICAL ETHICS

INDIRECT METHODS OF ADVERTISING

At the Annual Representative Meeting at Brighton Dr. ROBERT FORBES, chairman of the Central Ethical Committee, presenting the Council's report under "Medical Ethics" (*Supplement*, July 14, p. 39), moved the approval of the Report on Indirect Methods of Advertising which formed Appendix V of the Annual Report of Council. The motion was carried. Dr. Forbes then went on to move the recommendation that the following paragraph be inserted after para. 14 (v) of the report which lays down the general rule of anonymity for practitioners appearing in "sound" or "visual" broadcasting programmes:

There may be exceptional circumstances when a departure from the foregoing rule is justified—for example, when a practitioner broadcasts in an official capacity on medico-political matters of national interest.

After Dr. Forbes had spoken to the recommendation Mr. J. C. GIBSON-MOORE (Hendon) moved as an amendment that the policy of the Association as expressed in the resolution by the Representative Body in 1951 be reaffirmed. After a discussion the Hendon amendment was carried, which meant that the recommendation moved by Dr. Forbes on behalf of the Council was negated.

The wording of the report in the *Supplement* on this part of the proceedings of the Representative Meeting made it appear as if the recommendation was carried.

HOSPITALITY

A French doctor's son would like to spend 6 to 8 months as a paying guest with a medical family living near London or Cambridge. A French doctor's daughter, aged 14, would like to spend one month by the sea with a medical family in this country on an exchange basis. The British girl would stay partly in Paris and partly by the sea.

A Danish doctor's son, aged 17, would like to arrange a holiday exchange of 4 to 6 weeks with a British doctor's son in July.

A Yugoslav medical student, aged 20, would like to arrange a holiday exchange with a British student living in the vicinity of London.

Would anyone interested please get into touch with Brigadier H. A. Sandiford, International Medical Visitors Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

began, to double, treble, or even quadruple certain categories of the former?

One might assume that a ward sister, charged with observation of the sick, might easily deal with less serious matters. But one, in a teaching hospital, tells me that she cannot be entrusted with spare electric bulbs or curtain hooks for the ward. I just wonder what restrictive practices lie behind this. Is it really necessary, as she informs me, for two men to appear to change a bulb which she could do herself from a stock held on her account?

If this is a union rule, does the union defend a procedure putting up the cost of the Service and do the politicians condone it? It seems a small matter, but does it not indicate much more waste of public money?—I am, etc.,

Hitchin.

H.M. Forces Appointments

ROYAL NAVY

Surgeon Commander W. G. C. Fitzpatrick has retired.

ROYAL NAVAL VOLUNTEER RESERVE

Surgeon Captain J. V. Williams, Q.H.P., has retired.

Surgeon Lieutenant G. L. Bolt to be Surgeon Lieutenant-Commander.

ROYAL ARMY MEDICAL CORPS

Captains J. Thompson and N. C. Rogers to be Majors.

REGULAR ARMY RESERVE OF OFFICERS

Major-General W. E. Tyndall, C.B., C.B.E., M.C., late R.A.M.C., having attained the age limit of liability to recall, has ceased to belong to the R.A.R.O.

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonel (Acting Colonel) E. M. Elmhirst, T.D., from A.E.R.O., to be Lieutenant-Colonel, and has been granted the honorary rank of Colonel.

Major W. R. Cunningham, E.R.D., having attained the age limit of liability to recall, has ceased to belong to the R.A.R.O., retaining the rank of Major.

ARMY EMERGENCY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonel H. K. Meller, M.B.E., T.D., has been granted the acting rank of Colonel.

Captain (Acting Major) L. J. Rubinstein, from A.E.R.O., National Service list, to be Captain, retaining the acting rank of Major.

Association Notices

Diary of Central Meetings

JULY

- 23 Mon. Staff Side, General Whitley Council (at 14, Russell Square, W.C.), 10.30 a.m.
23 Mon. Full General Whitley Council (at 14, Russell Square, W.C.), 2.30 p.m.
24 Tues. Staff Side, Committee B, Medical Whitley Council, 10.30 a.m.
24 Tues. Chest Services Subcommittee, Central Consultants and Specialists Committee, 2 p.m.
24 Tues. Full Committee B, Medical Whitley Council (at 14, Russell Square, London, W.C.), 2.30 p.m.
24 Tues. Medical Whitley Council (at 14, Russell Square, London, W.C.), 2.30 p.m.
25 Wed. Joint Consultants Committee (at Royal College of Surgeons of England, Lincoln's Inn Fields, W.C.), 10.30 a.m.

Branch and Division Meetings to be Held

DORSET DIVISION.—At Digby Hotel, Sherborne, Tuesday, July 24, dinner for members and their ladies.

NORTH-EAST SUFFOLK DIVISION.—At Wherry Hotel, Oulton Broad, Thursday, July 26, 7.45 for 8 p.m., dinner and presentation to Dr. S. B. Hughes.

NORTH OF ENGLAND BRANCH.—At Northumberland Golf Club, High Gosforth Park, Thursday, July 26, 12 noon, annual meeting; 1 p.m., lunch.

SOUTH MIDDLESEX DIVISION.—At Casino Hotel, Tagg's Island, Monday, July 23, 9 p.m., meeting.

WEMBLEY DIVISION.—On Wednesday, July 25, 2.30 p.m., visit to Wander Factory and Ovaltine Farms, King's Langley, Herts. Friends and children invited.

Meetings of Branches and Divisions

BOLTON DIVISION

The annual meeting was held on May 25 in the Victoria Hotel. Nine members were present. The following officers were elected:

Chairman.—Dr. E. P. Johnson.

Vice-chairman.—Dr. I. Affleck.

Secretary and Treasurer.—Dr. M. S. Rowley.

CHELSEA AND FULHAM DIVISION

The annual general meeting was held on June 1 at Fulham Town Hall. Lieutenant-Colonel W. L. Harnett took the chair and 12 members were present. The following officers were elected:

Chairman.—Lieutenant-Colonel W. L. Harnett.

Vice-chairman.—Dr. C. Watney Roe.

Joint Honorary Secretaries.—Drs. C. Watney Roe and D. J. Thomas.

A motion was formulated: "That some of the candidates for election to the G.M.C. sponsored by the B.M.A. should be considerably below the present average age."

DORSET DIVISION

A meeting was held at the Chest Clinic, Dorchester, on May 25. Dr. T. V. Cooper was in the chair and 19 members were present. Dr. D. G. Vulliamy gave a talk on "Enuresis."

EAST YORKSHIRE BRANCH

The annual general meeting was held on May 9. The following officers were elected:

President.—Dr. I. G. Innes.

President-elect.—Dr. L. Bellman.

Immediate Past President.—Mr. G. Griffith.

Vice-president.—Dr. C. Groves.

Honorary Secretary and Treasurer.—Dr. K. W. Beetham.

FOLKESTONE AND DOVER DIVISION

A general meeting was held on May 25 at the Esplanade Hotel. Six members were present, and Dr. Broatch was in the chair.

GLASGOW DIVISION

The annual meeting was held in the Glasgow Regional Office on March 23. Mr. John Dunbar was in the chair, and 63 members were present. The following officers were elected:

Chairman.—Mr. John Dunbar.

Vice-chairmen.—Drs. J. S. McL. Ord, Wm. S. Gardner, and J. Inglis Cameron.

Honorary Secretary.—Dr. J. Baird Forrester.

Deputy Secretary and Honorary Treasurer.—Dr. M. M. Garrey.

MOMBASA DIVISION

A meeting was held at the Pandya Memorial Clinic on May 25. Mr. C. J. Patel was in the chair, and nine members were present.

REPORT ON HEALTH CENTRES

LONDON LOCAL MEDICAL COMMITTEE'S STUDY

Describing it as "a modest first instalment of this study" the London Local Medical Committee has sent a report on the health centres to the London Executive Council for forwarding to the London County Council. The report, which is based on information obtained on four health centres (Woodberry Down, London; Harold Hill, Essex; John Ryle, Clifton, Nottingham; and William Budd, Bristol) and a group practice of three partners working in a Victorian building converted by the group into a practice centre. The committee gives its conclusions on the facts as it sees them.

Salient Features

The report summarizes the committee's observations on the salient features of the four centres and the group practice studied.

Relation to New Housing Estates.—In each case the health centres were planned in relation to a new housing estate. At Nottingham the centre was opened by the time 10% of the houses were built, but at London, Harold Hill, and Bristol not until after the estate was completed (at Bristol, long after). The group practice premises are the site of an old-established practice in an area long completely built up.

Accommodation.—The number of G.P. suites varies—six at Bristol and London, four at Nottingham, three at Harold Hill, and two in the group practice. Each suite consists of consulting-, examination-, and waiting-rooms, except at the group practice, where a waiting-room is shared between the two suites (most of the patients are seen by appointment).

Ancillary Help.—This appears to be adequate and satisfactory in all health centres except Nottingham, where it is minimal. In the group practice the staff might well suffice for double the number of doctors and patients.

Partnership.—In two of the health centres some of the doctors are in partnership with each other, in the other two they are all in competition. Broadly speaking, in all the health centres the doctors practise independently of each other. In the group practice all three doctors are in partnership.

Other Surgeries.—All the health centres are branch surgeries; the group practice is the only surgery for the group.

Local Authority Services.—There is accommodation for these in all the health centres. In Bristol the local authority uses the general-practitioner suites; in Nottingham the accommodation is minimal; in London it is lavish. There is no local authority accommodation in the group practice premises, but the doctors hold an antenatal clinic for their own patients every week. They also give advice on infant welfare, although at the moment they do not have a fixed session for this.

Capital Costs.—Comparison of costs is influenced by certain facts. The health centres have all been built since 1948: the group practice premises are a converted Victorian house. Bristol

and Nottingham centres are housed temporarily in their present buildings: London and Harold Hill centres are permanent. In Bristol the same premises are used by the general practitioners and the local health authority, and the cost of the general-practitioner unit is the cost of the whole building.

The capital costs of the general-practitioner units are set out in the following table.

	Cost of G.P. Unit	Cost per Suite	Cost per Doctor
London	£ 57,000	£ 9,500	£ 9,500
Harold Hill	15,000	5,000	1,666
Nottingham	6,000	1,500	1,500
Bristol	16,000	2,666	1,777
Group practice	7,500	3,750	2,500

Running Costs.—The running costs per annum are compared in the following table:

	Cost of whole G.P. Unit	Cost per Suite	Cost for each Doctor	Cost to each Doctor	Cost per Attendance
London	£ 5,850	£ 975	£ 975	£ 350	s. d. 4 4
Harold Hill	4,200	1,400	466	111	4 11
Nottingham	1,400	350	350	104	2 9
Bristol	6,700	1,116	766	100	4 0
Group practice	2,900	1,450	966	966	3 0

NOTES: Cost to Each Doctor.—In all the health centres this is the cost for a branch surgery, and the doctors have other surgeries to pay for; in the group practice this is the only surgery.

Cost per Attendance.—There are no nurses at Nottingham; this lowers the cost per attendance both by increasing the number of times the doctors see patients and by the absence of nurses' salaries from the total running costs. At Harold Hill the higher figure appears to be due solely to the fact that the doctors do not attend daily.

Five Major Issues

The report refers to five major issues raised by the Minister of Health in a letter to the London County Council on the future of health centres. These are (1) reduction of capital cost; (2) association of general medical and local authority services; (3) restriction to areas of large-scale housing development; (4) reservation of sites for health centres; (5) group practice loans as an alternative to the provision of health centres.

Reduction of Capital Costs

The committee agrees that a large reduction in capital cost could and should be made. Making full use of the

rooms provided would be the most important step towards economy. For a G.P. suite to be used for approximately six hours a week is a waste of expenditure. The committee does not think that it would be possible in all cases for doctors to close their outside surgeries and practise solely from a health centre, but a doctor in a centre should expect to have a regular morning and evening surgery. Moreover, if two doctors using a health centre were in partnership they could use the same suite of rooms at different times, at all events in the mornings. Another economy in use of rooms would be effected if the G.P. suites were used for local authority clinics in the afternoons.

Association Between Local Authority M.O.s and G.P.s

The committee considers that the assumption that when two services are housed in the same building there will be co-operation between them automatically is fallacious. In the committee's view the essence of co-operation is to see that the same patient does not receive advice on treatment and advice on prevention which are contradictory, and the best way to achieve this is for the advice in both cases to be given by the same doctor.

The report goes on to say: "We think, therefore, that all general practitioners who wish to do so should hold infant welfare clinics for their own patients, at which they would be assisted by health visitors. We see no reason why these clinics should not be held in the general-practitioner suites of health centres, as they are in Bristol, but we consider that the right to hold them there should not be restricted to the doctors who practise from the centres, as it is in Bristol."

Co-operation between general practitioners who do not wish to undertake all personal health services for their patients and the local authority doctors who do this work for them, the committee states, is essentially a matter of personal contact rather than architectural planning.

Siting of Health Centres

The committee disagrees with the Minister's view, expressed in his letter to the L.C.C., that appropriate conditions for the provision of health centres exist only in areas of large-scale housing developments. In its view conditions are also appropriate where there are no suitable premises or premises that can be made suitable. This definition includes (1) certain built-up areas, and (2) areas of large-scale housing development where there are no premises at all. These latter areas are of two types: (a) new housing estates, and (b) areas of large-scale rebuilding. Different considerations apply to the two types.

New housing estates take several years to build. It would be wasteful of medical manpower to introduce, say, four doctors when at first one only was needed, let alone the great difficulty that each doctor would have in making a living. On the other hand, if doctors were introduced into the health centre as the need arose (1 for each 2,500 is the figure accepted by the Medical Practices Committee) other difficulties would arise. The doctor who started first would have an advantage over his colleagues who follow. Would they all pay the same rent?

Furthermore, while the committee does not regard it as essential that all the doctors working in a centre should be in partnership, it thinks it essential that those who use the same suite should be, since full use cannot be made of the room space unless each suite is occupied by more than one doctor. It follows that the doctor who first occupies the suite must be free to choose the partner to share it with him, and to benefit from being the senior partner. Thus some of the doctors starting practice on a new estate would benefit much more than others.

In areas of large-scale rebuilding in already built-up districts these problems would not arise. In these areas there would be established practitioners who would be losing their existing surgeries, and, if there were enough of them willing to enter a health centre and willing to co-operate, the committee thinks that a health centre could well be established.

Reservation of Sites

The only feasible way, in the committee's opinion, of solving the difficulty of sites reserved for health centres lying unused for years is by adopting what it describes as "the Nottingham plan in reverse." The Nottingham health centre was built with a view to its being converted into dwelling-houses if it was no longer required for its original purpose. In reverse, the committee suggests that the ground floor of a block of flats might be so built that the flats could be converted into health centre suites if required in future.

Group Practice versus Health Centres

In the committee's view the purpose of health centres is to achieve: (1) adequate and suitable premises for doctors to work in; (2) provision of ancillary help—nursing, clerical, etc.—to relieve doctors of work which others can do equally well; (3) bringing together general practice and preventive medicine; and (4) accommodation for several doctors to work in the same building, and to co-operate and consult together.

How far, it asks, are these purposes achieved by health centres on the one hand and group practice premises on the other? As regards premises the health centre is more costly, but probably better adapted. Ancillary help is provided in both. But in a group practice the doctors do not have the assistance of midwives and health visitors, which, the committee thinks, is wrong. As for co-operation between doctors, the committee believes that the fullest co-operation and consultation will only be achieved if they are in partnership, and in this respect the group practice is superior to the health centre. The committee summarizes its views as follows:

Group practice premises start with the doctors, nearly always in partnership, and proceed to the site and the building. Health centres start with the site and the building, and then attempt to bring in the doctors. Group practices give a more flexible approach, and much less costly results, but the local health authority is excluded from the picture. We think this is a most unfortunate result, and we hold that there is an urgent need for the erection in London of other health centres of modest proportions, where, if possible, all the doctors would be in partnership, and where they would provide preventive as well as curative services for their patients, with the co-operation of health visitors and midwives.

Attitude of Patients

The committee finds that so far patients have not shown any preference for the health centre as against the private surgery, yet the success of group practices disproves the theory that patients so prefer one doctor's private surgery that they will never take to a health centre or any other type of large central surgery. Why, the committee asks, has the group practice which it studied been more successful than any of the four health centres? The answer, it concludes, is that the patients of the group practice are receiving a better service—in the form of extended hours of consultation, in the use of an appointment system, and in infant welfare and antenatal care, all from the same three doctors—than is available at any of the four health centres. But the committee sees no reason why a group of doctors in partnership should not provide an equally good service at a health centre. Until patients have received the full services which a health centre could provide no one can say what their attitude would be to it.

The committee's main general conclusion is that up till now too much attention has been paid to buildings and too little to the people who work in them and to the people who use them.

Recommendations

The report concludes with the following recommendations:

- (1) That the initial cost of health centres should be greatly reduced.
- (2) That the scheme for the reservation of sites suggested in the report be explored by the London County Council, and, if found practicable, be immediately extended to the whole country.

(3) That health centres of modest proportions be erected as soon as possible.

(4) That doctors working in a health centre should be consulted on the appointment of their ancillary staff.

(5) That the London County Council should make available the services of health visitors at all group practices and to all other general practitioners, as far as possible, to assist in providing personal health services for their patients.

(6) That the London County Council, the London Executive Council, and the London Local Medical Committee should take steps to foster and increase co-operation between general practice and preventive medicine.

GENERAL MEDICAL COUNCIL MEDICAL DISCIPLINARY COMMITTEE

A session of the Medical Disciplinary Committee of the General Medical Council was held on July 17 and 18, under the chairmanship of Professor Sir DAVID CAMPBELL.

The case of DAVID PHILIP LEWIS-BEDGETT, registered as of Mossley, Manchester, was called on the ground of a conviction at Loughborough magistrates' court in 1951 of being in charge of a motor-car when under the influence of drink or drugs, and a similar conviction at Lancashire county quarter sessions in 1955 of being in charge of a county motor vehicle when under the influence of drink, on which later occasion he had been fined £100 and disqualified from driving for three years. The respondent did not appear before the Committee, but a letter was read from his doctor stating that he was ill and quite unfit to travel to London, and in view of the nature of the inquiry he would like to and be present in person when the case was heard. The Committee agreed to postpone the case to the next sessions.

The Committee considered a case in which judgment had been postponed in May, 1954, May, 1955, and May, 1956, against WILLIAM FRANK CRUICKSHANK, registered as of West-muir, Brechin, Angus, concerning whom it had been found that he had been convicted in 1954 at Coventry of being drunk and disorderly; that on frequent occasions from December, 1952, to February, 1953, he had failed without reasonable cause to attend at his surgery at Brechin during consulting hours or to make any arrangements for the treatment of patients attending his surgery, and that in three named cases he had failed without reasonable cause to visit or treat patients when their condition so required, and for whose treatment he was responsible under the National Health Service, in spite of requests that he should do so. In May, 1956, after two postponements of judgment, the Committee was informed that in January of that year Dr. Cruickshank had been convicted at Marylebone magistrates' court of driving a motor-car when under the influence of drink and had been fined £15, disqualified for driving for 12 months, and ordered to pay ten guineas costs.

Dr. Cruickshank was present, but not legally represented. He addressed the Committee and expressed his great regret, and spoke of his hopes for his establishment in practice in London.

The Chairman said that the Committee had decided to give him a further opportunity of considering his conduct, and to postpone judgment again for a year, until May, 1957. At that time he would be required to furnish the names of professional colleagues who would be prepared to testify from their knowledge as to his conduct in the interval.

Alleged Canvassing

The Committee considered the case of CORNELIUS O'BRIEN, registered as of Walton Breck Road, Liverpool, 4, M.B., B.Ch. 1943, N.U.Irel., who appeared on the charge that, between September, 1954, and April, 1955, he had canvassed persons living in the Millpark Estate, Eastham, Cheshire, with a view to persuading them to become his patients, and that in relation to the facts alleged he had been guilty of infamous conduct in a professional respect.

The complaint was presented by Mr. E. B. McLellan, counsel, and Dr. O'Brien was legally represented by Mr. J. Tarsh.

No witnesses were called, and the case rested upon a number of statutory declarations, from which it appeared that Dr. O'Brien had canvassed for patients on a new housing estate which was receiving an overflow population from Liverpool and other centres. Statutory declarations were also put in on the other side, some of them from Dr. O'Brien's professional colleagues, testifying to his excellent character. He was 38 years of age and happily married.

After a short deliberation in camera, the Chairman announced that the Committee had judged Dr. O'Brien to have been guilty of "infamous conduct in a professional respect," and they were unable to regard the circumstances as affording any justification for his conduct. But having regard to assurances which he had given and the testimonials produced in his favour, they hoped the warning he had received would be effective, and had not directed the Registrar to erase his name from the *Medical Register*. This closed the case.

Not Guilty of Canvassing

The Committee proceeded to consider a charge against ALLAN CHARLES ARTHUR, registered as of Lanark Road, Edinburgh, 11, M.B., Ch.B. 1945, U. Glasg.; M.B., B.Chir. 1946, U. Camb.; M.R.C.P. Edin. 1948, that since November, 1955, he had advertised for the purpose of obtaining patients, and promoting his own professional advantage by exhibiting notices outside premises at 76, Wereton Road, Audley, and 123, High Street, Halmer-end, in excess of anything reasonably necessary to indicate to those seeking his surgeries the places and times at which they were held, and further that at dates in November, 1955, and on subsequent occasions he had canvassed persons who were the patients of Dr. J. R. F. E. Jenkins, with a view to inducing such persons to become his patients, and that in relation to the facts alleged he had been guilty of infamous conduct in a professional respect.

Complainant's Case

The case was presented on behalf of the complainant, Dr. Jenkins, by Mr. L. Thompson and Mrs. M. Riseborough, counsel, instructed by Messrs. Knight and Co., solicitors, and the respondent was legally represented by Mr. Leigh Taylor, solicitor, of Hempsons.

Mr. Thompson said that Dr. Arthur in the autumn of last year replied to an advertisement by Dr. Jenkins, of Audley, for a partner in his practice. At that time Dr. Arthur was in Edinburgh. After an interview with Dr. Jenkins he said that he would like to join in partnership with him. A difficulty arose over housing accommodation, and for a time Dr. Arthur lived in a near-by house. No actual date was fixed for the partnership to come into operation, and from the advertisement it was evident that there would have to be a probationary period of six months. The usual undertaking not to establish himself in opposition to his late partner at the conclusion of the practice was required.

After a time some dissatisfaction arose and the partnership was terminated on November 26 last. It was alleged that since then Dr. Arthur, having established himself in the vicinity, had visited patients who were on Dr. Jenkins's list and had canvassed them with a view to transfer to his own. He had also exhibited notices at his surgeries which gave information in excess of what was usual in such announcements, as, for example, the telephone number at which messages would be received after a certain hour when he was no longer at the surgery. The notices were afterwards suddenly taken down, perhaps because it was realized that they were not ethically proper. It was claimed that Dr. Arthur had set out on a course of action to attract patients to the practice he had started at Audley, notwithstanding the usual undertaking in such circumstances.

Dr. Jenkins gave evidence in support of the complaint, and related the circumstances attending the negotiations for

a partnership and the final breakdown. He produced photographs of the notices which Dr. Arthur had put up at the surgeries.

In cross-examination by Mr. Taylor, Dr. Jenkins denied that it was he who was in a hurry to get a partner. Much of the cross-examination turned upon conversations and letters between the parties. Dr. Jenkins was asked whether he had ever said anything derogatory about Dr. Arthur, whether he had told patients that he was not a competent doctor, and whether he had said to one patient that Dr. Arthur was not fit to be a doctor and that he was going to get him struck off the Register. Dr. Jenkins denied both in cross-examination and re-examination that he had said anything derogatory of Dr. Arthur or decried his professional ability.

Six patients on Dr. Jenkins's list then gave evidence on conversations they had had with Dr. Arthur. One of them said that Dr. Arthur had asked whether he was satisfied with his doctor. Another was understood to say that Dr. Arthur had stated that he could do more for him than Dr. Jenkins had done. The conversations all seemed to turn on the possibility of transfer from one doctor's list to another.

The Defence

Dr. Arthur then gave evidence on his own behalf. In answer to Mr. Leigh Taylor he said that he was married and had two children. He had an interview with Dr. Jenkins with a view to partnership in September of last year. Dr. Jenkins made no complaint about his work as a partner or prospective partner, but on October 26 he received a letter from Dr. Jenkins's solicitor requiring him to move out of Dr. Jenkins's house, which he was then occupying. This was contrary to his understanding of what was agreed between them, and he had to consider his future. He had been brought into this area expecting a partnership, and he suddenly found himself without a house to which to move his family. He obtained some premises at a distance, in a district where Dr. Jenkins, so far as he knew, had no patients. With regard to the notices he put up on the premises, he did not think them improper. They contained only information on where he could be found at certain hours. He disputed the statements which the witnesses had attributed to him. His purpose in calling was in some cases to say good-bye or to give a promised certificate, and so on. He had not canvassed for patients. Dr. Arthur was altogether 3½ hours in the witness box.

Mr. Leigh Taylor, in a final speech for Dr. Arthur, said that this case seemed to have been pressed with extraordinary vigour. Slight incidents had been magnified and built up so as to suggest a canvassing campaign. But the Committee would now see both sides of the picture. Dr. Arthur had been brought into this area in the expectation of a partnership which had come to nothing. It would have been wiser if after its termination he had decided not to remain in the neighbourhood, but there was an area which he thought satisfactory and in which Dr. Jenkins had not practised. The conversations of the witnesses were capable of different constructions, including perfectly innocent ones. Accusations had been made which had not been substantiated.

After a brief private deliberation the Committee's decision was announced by the Chairman as follows:

Mr. Arthur, I have to announce that the Committee have determined that the facts alleged against you in the charge have not been proved to their satisfaction, and accordingly that you have not been guilty of infamous conduct in a professional respect. That closes the case.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Southwark.
Non-County Borough Councils.—Crewe.

REMUNERATION CLAIM DEPUTATION TO MINISTER

The following representatives of the Negotiating Committee met the Minister of Health on Wednesday afternoon: Sir Russell Brain, Dr. A. Talbot Rogers, Dr. S. Wand, Dr. J. D. S. Cameron. They were accompanied by Sir James Millard Tucker, Q.C., Mr. S. B. R. Cooke, Q.C., Professor R. G. D. Allen, with the Association's solicitor and members of the secretariat.

JOINT CONSULTANTS COMMITTEE'S PROTEST

The following is the text of a statement issued to the press on July 25 on behalf of the Joint Consultants Committee, representing the Royal Colleges, the Scottish Royal Medical Corporations, and the Central Consultants and Specialists Committee of the B.M.A.

The Joint Consultants Committee, representing the 18,000 doctors who staff the hospitals of the country, has heard with indignation of the Government's brusque refusal to consider the fair and reasonable claim put forward by the medical profession for an adjustment in its remuneration. The claim is no more than a request for a fulfilment of the solemn promises made to the medical profession when it entered the National Health Service. No section of the community in recent years has exercised greater restraint than the medical profession in asking for adjustments in its earnings to meet the falling value of money. Like professional workers in general, they are a minority in the community. That is no reason why, the value of their earnings having been whittled away by inflation, the reasonable claim they have at last been driven to make should be given this contemptuous dismissal. The Negotiating Committee presented to the Ministers a long, reasoned document which they have abruptly rejected in a few words without the courtesy of explaining their reasons for doing so.

The Committee wishes to associate itself fully with the protest against the Government's decision already made by the General Medical Services Committee (*Supplement*, July 28, p. 84), representing the 20,000 family doctors of the country. Like the General Medical Services Committee, it pledges its wholehearted support to the Negotiating Committee in whatever steps may be necessary to secure that the Government reconsiders this decision.

PUBLIC HEALTH MEDICAL OFFICERS MOTOR-CAR ALLOWANCES

To the revised motor-car allowances for public health medical officers set out in M.D.C. circular No. 29 (*Supplement*, July 28, p. 86) should be added the following lump sum allowances and rates per mile which replace those given in paragraph 2 of the enclosure to M.D.C. circular No. 15:

	Not Exceeding 10 h.p. or 1,199 c.c.	Exceeding 10 h.p. or 1,199 c.c. but not Exceeding 12 h.p. or 1,399 c.c.	Exceeding 12 h.p. or 1,399 c.c. but not Exceeding 14 h.p. or 1,599 c.c.	Exceeding 14 h.p. or 1,599 c.c.
Lump sum allowance ..	£54	£60	£66	£72
Rate per mile for first 7,200 miles per annum	5½d.	6d.	6½d.	7d.
Excess over 7,200 miles per annum ..	3½d.	3½d.	4d.	4½d.

M.D.C. Circular No. 29 refers only to England and Wales. The position in Scotland has now been referred by Committee C to the Scottish Advisory Committee and it is understood that the matter will be receiving consideration shortly.

As a result of arrangements made by the Ministry of Health in conjunction with the Department of Health for Scotland and the Ministry of Health and Local Government, Northern Ireland, with manufacturers of fluorohydrocortisone, topical preparations of this substance may now be supplied on prescription.

Correspondence

Remuneration Claim

SIR,—Our Negotiating Committee is reported as saying that doctors will be astonished by the Minister's flat rejection of the claim for increased remuneration, and that an increase of not less than 24% was sought as from April 1, 1956, this being the amount by which the real incomes of general practitioners and of hospital medical staffs have declined in value since 1951. This is the first published information on the extent of our claim, and I believe that doctors will be astonished less by the rejection than by the moderation of the claim.

Those of us present at the Conference of Consultants and Specialists on June 20 last heard the opinion stated that the claim for increased remuneration should represent what we thought we might get, rather than what we thought we really deserved. Surely the published report of the claim indicates that even this moderate opinion was further watered down in the final preparation of the claim. This present claim appears to disregard the fact that nobody—not even the Ministry of Health—pretends that the financial recommendations of the Spens Reports were fully implemented in 1951. It does, however, arise from the continuing fall in the value of money since that year. The claim should therefore be presented in the form of a year-by-year statement, covering each year from 1951 to 1956, and setting out the amount by which our advisers estimate remuneration to have fallen short of true money values (in relation to the Spens recommendations) in each of the years.

Our Negotiating Committee is composed of men who, by virtue of their seniority, experience, and attainments, are, medically, second to none. It is, however, possible that these very attributes prevent them from ridding themselves of the traditional professional distaste for arguments over money matters. I am sure that the Committee is aware of the financial embarrassment existing in a high proportion of practitioners of every category, but I cannot help feeling that the profession's financial future would be better assured by the inclusion on the Negotiating Committee of a few men whose bellies have become filled with fire for want of more satisfying material.

Whether we like it or not, we have to face the fact that the problem of remuneration by the State will always be with us. The N.H.S. is still in its childhood, and it is our present responsibility and obligation to establish financial precedents which will enable the profession to survive and to attract suitable recruits from future generations. To succeed in this, we must prepare a just claim—and press it hard. Such a claim should be accompanied by a time-limit (of, say, three months) and the statement that, within that limit, the claim must either be met or be submitted to arbitration. With presentation of the claim, the united profession should state its intentions in the event of settlement not being reached within the time-limit.

Our claim must be almost unique in that we cannot give increased productivity or efficiency in return for its being met. We can, however, offer the satisfied loyalty and co-operation without which the N.H.S. cannot survive. Although patients can receive treatment without an N.H.S., that service cannot exist without the co-operation of doctors. As the Negotiating Committee has stated, we have a claim which in justice and in logic cannot seriously be challenged. The people of this country are not slow to recognize claims of this nature which are properly placed before them: in this respect, good public relations would be of great importance.

Finally, it is to be hoped that on this occasion the Negotiating Committee will not have to compete with secret diplomacy, and that it will refuse to entertain any offer which it cannot place before the profession.—I am, etc.,

Bristol.

V. TORRY BAXTER.

SIR,—For those of us who face thirty years or more in the National Health Service the issue is simple. We must know the basis of our remuneration. Mr. Bevan, when Minister of Health, accepted the Spens report (subject to negotiations as to its implementation) as the yardstick (on December 1, 1948, in answer to a question from Sir Ernest Graham-Little in the House of Commons). If the present Minister does not now accept this as a premise, then we must withdraw our services from the N.H.S. and negotiate afresh before rejoining. I feel that the younger doctors will support me when I say that we must expect a redeployment of available funds to entitle us to a reasonable remuneration and stop this nonsense of running the N.H.S. on the sense of vocation of the medical profession.

I must couple this with the demand that we do away with the secrecy which has surrounded all negotiations with the Ministry on matters of pay. It is manifestly absurd that we, who are supposed to understand the most difficult and complicated problems in medicine, problems related to running our practices, and problems of Schedule D, should be considered by our own confreres incapable of following the progress of negotiations on our own pay. It may not be realized, but it is a fact, that the full Dankwerts Award and its detailed implications have never been published to the profession in an intelligible form. When it was announced by our spokesmen recently, in connexion with this present claim, that the net income of the average G.P. was £2,200, all expenses paid, the average doctor looked at his actual net income and laughed. This is very bad for our P.R.O., apart from making the doctor have to explain an impossible position to his friends, relations, and patients.

The way forward is plain. No secrecy and no quarter.—I am, etc.,

London, W.C.1.

J. L. MCCALLUM.

SIR,—I have read with dismay of the blunt refusal by the Minister of Health to consider an increase in our pitifully small salaries.

Sir, the Association should act strongly, decisively, and at once. I consider that the time has come when no gentlemanly action should be called for, but that the medical staff in every hospital in the country should be ordered to boycott the National Health Service. There should be a general close-down of all the routine clinics and out-patient departments, and also stop all routine hospital admissions until such time as the salary dispute is settled well in our favour—yes, settled, not just under negotiation. I trust the Association will for once act immediately and strongly, and not miss this opportunity.—I am, etc.,

Manchester. 8

G. M. M. WATTS.

SIR,—The lack of wisdom of our policy of restraint has been underlined by the Government, and its futility underlined by Mr. Horner, of the Mineworkers' Union, who said that he could not control prices but he would see that the miners' wages kept pace.

May I suggest that the B.M.A. seriously consider a whole-time service as an answer to the many ills that affect us. The scheme, run at health centres, would be in shifts, 8 a.m. to 4 p.m., 4 p.m. to midnight, and a skeleton service from midnight to 8 a.m. The advantages to the doctor would be: (1) A longer working life. (2) Opportunity to work overtime and to do private practice in his spare time. (3) The profession would be tied to the cost of living and increases in pay would be automatic. (4) The younger men and women would have no worries about unemployment and the cream would be retained in this country, to the benefit of this country. (5) The doctor's wife, if she so wished, could go out to gainful employment. (6) No worries about locums.

The disadvantages to the doctor would be: (1) An increase in bureaucracy. All countries, however, are increasingly aware of this danger, even totalitarian countries—e.g., Poland, where it was given as an excuse for the Poznan riots. No doubt in this country it would be kept under control.

(2) The small minority of doctors who exploit their junior partners and/or assistants would have to return to general practice.

The advantages to the State would be that the drug bill could be cut by at least 50%. The disadvantages to the State would be: (1) The scheme would cost three times what the general practitioner service costs now. (2) There might be a decline in quality, as in all nationalized concerns, but that is the least of a planner's worries.

In any case, let us not permit the Government to use a whole-time scheme as a bogey with which to threaten us, but let us use it as a stick with which to beat them.—I am, etc.,

London, S.W.6.

G. ROSEMONT.

SIR,—As usual, we appear to have received a polite "brush off." According to my morning paper the Minister states he cannot consider at the present time the request of the medical profession for the application of the betterment factor. The question arises, at what other time could he possibly consider it? We would have no grounds for making such a request had the value of money not deteriorated since 1951, so the implication appears to be that the *status quo* will remain indefinitely, however much the pound slides down in value.

The country as a whole is being asked to exercise restraint in its demands for wage increases, and I am sure that the medical profession sincerely subscribes to the wisdom of following such a request, but it should not be forgotten, as it is apparently by the Minister, that we are not asking for any advance on to-day's just income, but that our five-year lag should be rectified to bring us to that point at which we might reasonably be asked to exercise restraint in common with our luckier fellows.

Now, if ever, we must show firmness and unity in our dealings with the Minister.—I am, etc.,

Birkenhead.

E. G. WATSON.

SIR,—In your leading article, "The Ministers' No!" (*Journal*, July 21, p. 144), you rightly declare that "all the profession is asking for is the fulfilment of contractual obligations accepted by the Government of the day in 1946 and 1948." It seems to me that this point cannot be too heavily stressed, yet few, if any, of the lay public seem to be at all aware of it. Why? We have a P.R.Q. at Headquarters, and I believe that each Division appoints someone to deal locally with public relations. Are our spokesmen being deliberately muzzled by the whole press?—I am, etc.,

Launceston, Cornwall.

DONALD M. O'CONNOR.

SIR,—What a wonderful example our medical pseudo-legislators give at Brighton of straining at gnats and swallowing camels.

Smoking undoubtedly does harm to the small number who have become sensitive. But why should the representatives of the largest medical body in the country seek more pay, when the obvious and only way for this country to survive is for every one of us to be content with our wages and work our best and hardest for the common good.—I am, etc.,

Birmingham, 14.

J. FRASER KERR.

SIR,—I am almost stunned by the reply from the Government to our memorandum on remuneration as published in the *Supplement* (July 21, p. 71). The Government makes no mention of a meeting for discussion of what is a very vital question to so many. It seems that Spens is definitely repudiated by one side, and that side, in a way which could not be bettered by Mr. Stalin, requires only its own statement to make this incontrovertible. The other side is not asked if it agrees. In any case, agreement or the opposite have equally no weight.

The statement goes on, "Remuneration . . . must be determined . . . in the light of all relevant circumstances." Who

is to determine what are relevant circumstances, and when? Why did no meeting with the Negotiating Committee take place, as the commonest courtesy would suggest? Surely no one higher up than a junior office boy could have compiled such nuclear material. I was neutral up till now, but not any longer. Conceit and intolerance could hardly be more naked.—I am, etc.,

Middlesbrough.

J. DURIE.

SIR,—We, the undersigned medical practitioners, deprecate the attitude adopted by the Minister towards a responsible memorandum sent in by the profession. We desire the Negotiating Committee to press on with our claim with the knowledge that the profession is wholeheartedly behind it in any measure it may think fit to take, no matter how severe.—We are, etc.,

T. BRANDRETH.	A. HALL.	GUY PIMBLETT.

Sleaford, Lincs.

General Practice To-day

SIR,—I have noticed the many articles and letters in your *Journal* which blame the N.H.S. for "bad" general practice. I have worked in general practice in the old private days and also under the N.H.S., and cannot see that general practice now is any worse than it ever was. It is generally admitted that lack of time to deal with individual cases is the great enemy of "good" general practice. The causes of this lack of time are to-day the same as they were 10 years ago: (1) (a) Lack of good records. Every minute taking notes of a patient will save many later on. (b) Not reading the patients' records through before treating them. Of course, some patients acquire such enormous dossiers that this is impossible, but it is well worth while occasionally to make a summary of these dossiers for quick reference. (2) Not making good use of: (a) adequate secretarial assistance, (b) the excellent district nursing service, (c) pathological services, both hospital and domiciliary, (d) mass x-ray units. (3) Bad organization: (a) Lack of a proper rota system to enable the G.P. to have adequate relaxation and keep fit for his job. (b) Being too mean to pay for adequate help and thus avoid tackling enormous surgeries on one's own to the detriment of the patient. As regards this district, the N.H.S. seems to have given a stimulus to the operation of rota systems which were never there before; and also to the taking on of partners and assistants.

Every G.P. needs the mental stimulus of some contact with hospital staffs and other G.P.s. I cannot agree, however, that it is necessary, in order to be successful as regards capitation payments, to over-use the consultant services. "Successful" as well as "good" general practice depends upon the amount of time, trouble, patience, and interest taken by the practitioner in each individual case. Failure in any of these qualities cannot be compensated by alteration in the general scheme of practice.—I am, etc.,

Wolstanton, Staffs.

ANNE M. TOMS.

SIR,—In 1953 I returned to general practice after an absence of seven years. On resuming work these were the changes I noticed most: (1) More diseases could be satisfactorily treated at home, thanks to antibiotics and other modern drugs. (2) Clinical pathology service freely available (it seems this is not so in all districts—it certainly should be). (3) Domiciliary consultations—their value to patient and G.P. cannot be overrated; I find each a postgraduate tutorial. These changes (not, of course, all directly due to the National Health Service) make it possible to treat in their homes patients who would otherwise have had to go to hospital, and make general practice more satisfying. A fourth change was the large increase in surgery attendances for trivial complaints. This was the only disagreeable

feature of general practice directly attributable to the National Health Service. If the G.P.'s status has been lowered I have not been conscious of it.

It sometimes looks as if observers like Dr. Alexander Hall (*Journal*, July 14, p. 57) compare the best of pre-1948 practice with the worst of present-day. Friends who did locums in pre-war industrial practices have macabre stories of what went on in the "good old days" (I myself did a locum in a practice of the "better sort," where no notes of any sort were kept). Dr. John Fry and others have shown what great scope there is in general practice to-day. As for the waiting-room crowded with patients with trivial complaints, I am sure we could do more to educate patients out of the bottle of medicine habit. Many of them, for instance, after the initial shock, are prepared to accept the idea that no medicine is needed for the common cold. It has often never been pointed out before.—I am, etc.,

Birmingham, 29.

PATRICIA ASHER.

Return of Goodwill

SIR,—I was much interested in Dr. H. M. R. Waddell's letter on the return of goodwill (*Supplement*, July 21, p. 73). As he says, the loss of the freedom of movement of doctors virtually imprisons a practitioner in one area for life, with incalculable disadvantages not only to his family and himself but to the community at large, by limiting medical experience. This is plainly a political matter. It arose in the first place as a piece of doctrinaire Socialism. What then can a Conservative Government do to counteract the evil?

I do not think it is possible now to restore the former procedure, when practices were bought and sold through agencies and so on. I have, however, given much thought to the matter, and offer the following solution. Let practices be bought and sold through the Ministry of Health. For example, the Ministry, or its appointed agents, could maintain a list of available practices, and any young doctor would simply buy one as before. Similarly, an established doctor wishing a transfer could use his compensation money as part of the price, as also his present practice's value. I believe the details of such a scheme could easily be worked out by any Minister who had the welfare of doctors at heart. The beauty of it from a political point of view is that the Government could obtain a percentage of the purchase price, etc., as agents. The doctors could thus move about the country as they wished, and the Government would get a rake-off. And so everybody would be happy. What about it, Mr. Turton?—I am, etc.,

Herne Bay.

C. T. H. WHITESIDE.

Merit Awards

SIR,—At the Annual Representative Meeting in Brighton a resolution was passed requesting that "Council consider the desirability of abolishing the merit award scheme for members of hospital staffs . . . and replacing it by a system allowing for responsibility payments" (*Supplement*, July 14, p. 41).

Many consultants not conversant with B.M.A. procedure, of whom I am one, do not understand the competence of the A.R.M. to make such a recommendation. There is a general impression among many that I have spoken to that such matters are the concern of the Central Consultants and Specialists Committee, an autonomous body that does, in fact, represent the consultants and specialists; and not an amorphous collection of delegates, many of whom are in no position to form a judgment on a matter which does not affect them; who do not represent any organized collection of consultants; and who may have no mandate to pronounce in the way that they do.

And what is the next step? Presumably, Council must proceed to act upon the motion? Is there any likelihood of its consulting the Central Consultants and Specialists Committee before determining its policy, or any compulsion to abide by what that committee shall decide?

I am not concerned at the moment with the merits or demerits of the hospital staff award scheme, but only with the steps by which official policy is arrived at. The publication of information on the matter might help to allay some general ignorance and disquiet.—I am, etc.,

Brighton.

H. G. MCGREGOR.

Fees for Private Operations

SIR,—I think it is high time that the schedule of fees for private operations in pay-bed accommodation in hospital was revised or abolished altogether. Except for certain slight increases for long-stay cases and specialized cases, like thoracic operations, this schedule is the same as it was in 1948.

The other alternative, of course, would be for surgeons to become once more members of the Hairdressers Union, and revert to being barber-surgeons, as we have been told in the newspapers of a well-known hairdresser being paid £2,500 to fly the Atlantic, complete with 18-carat gold scissors, to do a small surgical operation (not mentioned in the National Health Service schedule of fees) on the hair of a well-known blonde film-star.—I am, etc.,

Newcastle, Staffs.

G. GORDON CROWE.

A Pathologist's Pay

SIR,—I have discontinued my membership of the B.M.A., as I have come to the conclusion that it fails to act in the best interests of the profession. My reasons for relinquishing my membership were not entirely due to the fact that I am no longer engaged in the medical profession, and I am willing to rejoin if I can be convinced that the Association is making some effort to help my many friends who are living in straitened circumstances.

I wished to become a pathologist when I qualified in 1952, but found that at no time in the ensuing seven or eight years was I likely to earn £1,000 per annum. I therefore entered the family business, where I pay a good representative over £1,000 per annum, plus car, plus expenses. Our travellers have no technical training and their only qualification is that they can sell our goods. It seems altogether wrong that if I were to offer them the salary of a doctor with higher qualifications working as a registrar they would leave forthwith.

Most young men qualifying in medicine desire to get married, have a home, a family, security, and freedom from debt. Can you say that the work of your Association has brought them that? What hope have they got of obtaining luxuries like a car, a television set, or a public school education for the children? I would have preferred to earn my living in my profession, but I wished to marry and felt that I owed my family a minimum standard of living not obtainable as a registrar and certainly beyond the scope of a house officer. Worse still, there was precious little hope for the future, for even if I had higher qualifications what chance had I of obtaining a consultant's post?

Do not think that I am grumbling, for I am happy with my lot. I feel strongly that those in the profession whose position is secure and remunerative are continuing to be favoured at the expense of those who have little in the way of remuneration or security. The purpose of this letter is to judge whether the B.M.A. is worth supporting, and my conclusions are that it has been weighed in the balance and found wanting.—I am, etc.,

Manchester, 3.

A. S. NICHOLAS.

Crash Helmets

SIR,—Our representatives at Brighton appear to have allowed an amusing masquerade to blind them to the dangers of enforcing the use of crash helmets by motor-cyclists. The loss of valuable young lives in motor-cycle accidents is appalling. No one doubts that efficient crash helmets may reduce this loss, and Mr. A. Lawrence Abel is to be congratulated on his efforts (*Supplement*, July 14, p. 27) to have

purchase tax removed from them; any step that encourages their wider use should be supported. But to ask for legislation to enforce their use is to seek to limit the freedom of the individual to an unwarrantable degree.

Freedom to endanger one's fellows must be limited, but to limit a man's right to risk his own neck is another matter. It is true that a motor-cycle accident may involve others beside the motor-cyclist, but a crash helmet protects only the wearer and not his victims. Indeed, Mr. Abel said himself that a motor-cyclist so protected would feel safer and so take more risks. This, of course, increases, not diminishes, the danger to other road users.

Allow the principle that men must be protected against themselves, and what follows? The prohibition of rock-climbing in our mountains? Such a course has already been suggested in the press. Will some doctor stamp on to the rostrum next year in nailed boots and with a coil of rope around his shoulders to jolly his colleagues into urging a ban on rock-climbing? Every summer swimmers are drowned. Which of our Representatives will appear on the platform next year wearing bathing trunks and water-wings, in order to stop this shocking waste of young lives? It is the nature of the State to limit ever more narrowly the freedom of the individual. Such liberties as remain must be constantly fought for. Any least encroachment, however trivial, however well meant, must be resisted. A great deal was said at the A.R.M. about liberty and freedom for our profession. We should save our energies for the struggles that these involve instead of urging restrictions for others and the creation of new classes of offences.

The arguments urged in favour of crash helmets can be urged with equal validity for safety belts in cars. Perhaps safety belts in cars would be a good thing. But compulsory ones? And a policeman to stop your car to see that you have the belt fastened? And a fine if you haven't? Mr. Abel deserved his laugh; not the vote.—I am, etc.,

Ulverston, Lancs.

T. I. WATKINS.

Centralizing Pathological Services

SIR,—Bureaucrats in hospital administration are trying to centralize the pathological services in large laboratories which are staffed by several pathologists and serve several hospitals. It is claimed that this increases efficiency and reduces costs. Neither of these, I believe, result, but only harm to the service and to the profession.

Highly specialized tests, such as the W.R., animal inoculation, virology, and pregnancy tests must be sent to special centres; but I am convinced that, as far as practicable, the pathological work of a hospital should be done on the premises. A single large centralized laboratory serving several hospitals makes an artificial and harmful division between clinical medicine and pathology. It reintroduces all the defects of "postal pathology" which have been so widely condemned. Postal pathology is bad for the pathologist, because, if he is to function as a consultant medical man, he must be in constant touch with his clinical colleagues and the wards. The pathologist who does not visit the wards is like the clinician who never visits the post-mortem room; from being a medical man he soon degenerates into a technician living in an ivory tower remote from the day-to-day problems of living pathology; he cannot easily see the more interesting or puzzling of the patients; he ceases to regard them as human beings but only as cases; he automatically churns out reports on patients he rarely sees to clinicians he seldom meets; his reports are wooden, his interpretations relatively valueless. A laboratory sited away from the hospital is bad for the pathologist and for the clinician; if the pathologist is any good his clinical colleagues will value opportunities for discussing their problems, to their mutual advantage. This desire to discuss problems with the pathologist is more marked among the junior medical staff and among the young consultants, who are increasingly laboratory-minded and dependent.

Surgeons recognize the importance of close contact between the clinician and pathologist such as is only possible if the laboratory is sited in the hospital it serves.

This is exemplified in the new regulations for the F.R.C.S.(Eng.) for overseas students which lay down that the candidate be asked for details of "the opportunities for close liaison with the pathological department of the hospital in which he has worked" (*Journal*, May 12, p. 1095). There can be no close liaison if the laboratory is sited miles from the hospital.

A laboratory away from the hospital means delay in receiving the specimens and in sending reports; delays mean slower turnover of patients and so inevitably increased costs. It is a tragic commentary on our profession that a lay Minister of Health upgraded the pathologist, making him equal to his clinical colleagues; now the bureaucrats of the profession are doing their utmost to degrade him from the position of consultant medical man to that of a back-room laboratory worker. This must, I suggest, inevitably result in great harm to the status of the pathologist and to medicine in general.—I am, etc.,

Worthing.

R. AIDIN.

Credit Due

SIR,—In the *Supplement* of July 14, in the report of the A.R.M., sub-title "Cremation Certificates" (p. 47), you report "Dr. R. E. G. Smith, who is making his twenty-first appearance as a representative at the A.R.M. . . ." This should read Dr. E. Bertram Smith. As Dr. E. Bertram Smith has been such a loyal and devoted supporter of the B.M.A. for so many years, and as I am a comparative newcomer, I do feel that the credit should be given in the right quarter.—I am, etc.,

Nottingham.

GORDON SMITH.

Association Notices

ARMED FORCES COMMITTEE

Election of Direct Representatives

The constitution of the Armed Forces Committee provides for a retired medical officer from each of the following branches of the Services to be elected to it:

Medical Branch, Royal Navy.
Medical Branch, R.N.V.R.
Royal Army Medical Corps.
R.A.M.C. (T.A. or A.E.R.).
Medical Branch, Royal Air Force.
Medical Branch, R. Aux. A.F. or R.A.F.V.R.

There are six vacancies to be filled for the 1956-7 session. Members of the Association, at present serving on the active lists of each of the above branches and corps, are invited to nominate a retired medical officer (who must also be a member of the Association) of their own branch or corps as a candidate for election.

Nominations, on forms to be obtained from me, must reach me by Monday, September 3. Voting papers will be issued where more than one candidate is nominated.

A. MACRAE,

Secretary.

Meetings of Branches and Divisions

SOUTH-WESTERN BRANCH

The 111th annual meeting of the South-western Branch was held at Newquay on June 9. Lunch was provided at the generous invitation of the President-Elect, Air Vice-Marshal T. C. St. C. Morton, at the St. Rumons Hotel. More than a hundred members and their ladies were present.

At the annual meeting in the afternoon the outgoing President, Mr. K. G. W. Saunders, invested Air Vice-Marshal Morton with the President's Badge. The President then delivered his address under the title of "Tropical Disease at Home and Abroad." After an interval for tea Dr. Robert Forbes gave a spirited and witty speech entitled "Medical Litigation."

Dinner in the evening was attended by a distinguished company of professional associates and more than a hundred members and their friends.

Afterwards Dr. Michael Ward gave an illustrated lecture on the Everest Expedition, to which he was medical officer.

The social arrangements were carried out by Dr. Eric Townsend, honorary secretary of the Cornwall Division, to whom the thanks of the Branch were given for the highly successful meeting.

REMUNERATION CLAIM

As announced in last week's *Supplement* (p. 92), representatives of the Negotiating Committee met the Minister of Health and the Under Secretary for Scotland on August 2. After the meeting the Ministry of Health issued the following statement: "Representatives of the Negotiating Committee met the Minister of Health (Mr. Robin Turton) and the Under Secretary for Scotland (Mr. J. Nixon Browne) on to-day about their claim for increased remuneration on behalf of general practitioners and all grades of hospital medical staff. The meeting was adjourned pending the submission by the Committee of further particulars as to the legal aspects of their claim."

CENTRAL HEALTH SERVICES COUNCIL ANNUAL REPORT FOR 1955

The Central Health Services Council for England and Wales (Chairman, Sir Frederick Messer) has made its report¹ to the Minister of Health on its proceedings, and on those of its standing advisory committees, for the year ending December 31, 1955. A report of a special subcommittee of the council, under the chairmanship of Lord Cohen, on the medical care of epileptics² has already been published and was discussed in an annotation in the *Journal* (June 23, p. 1476).

Fluoridation of Water Supplies

In his foreword to the report the Minister of Health says that the council has helped to advance "what I am satisfied is the right policy by recording their conclusion, and that of the Standing Medical Advisory Committee, that despite many years of observation and investigation there is no scientific or medical evidence available which suggests that there is any risk in drinking water containing fluoride in the low concentration proposed."

The council discusses in detail suggestions of possible toxic effects from fluoridation. It states that, apart from the effect of acute lethal dosage, which for adults is several thousand times the proposed fluoridation dose and for children several hundred, the effects of fluoride can be divided into those seen in high-grade industrial or natural fluorosis and the possible effects of artificial fluoridation of the order of 1 p.p.m.

¹ Central Health Services Council. Report for the Year Ended December 31, 1955. 1956. H.M.S.O., London.
² Central Health Services Council, Report of the Subcommittee on the Medical Care of Epileptics, 1956. H.M.S.O., London.

U.S. Investigations

A comparative study had been made of two areas in Texas, one with a natural fluoride content of 8 p.p.m. and the other with 0.5 p.p.m. In each over 100 individuals were studied who had lived in the area continuously for at least 15 years at the start of the study. They were examined physically, radiologically, pathologically, and dentally, first in 1943 and again in 1953, when the minimum exposure to these levels of fluoride was at least 25 years. Apart from dental mottling, the only statistically significant differences between the two areas was a slightly higher rate of cardiovascular abnormalities in the low fluoride areas and some unimportant changes in the blood picture. Regarding criticism that the numbers were too small to show up differences unless these were very marked indeed, the council points out that exposure to fluoride was so much higher than that entailed in artificial fluoridation that anything to be expected at 1 p.p.m. should have been shown greatly magnified at 8 p.p.m. "The fact that there were no relevant differences than dental mottling seems to justify the conclusion that no significant changes in health are seen after 25 years' exposure to this very high level of fluoride."

It was sometimes suggested that the fluoride which is added to water supplies is not the same as that occurring naturally. Apart from the fact that the active particle is the fluoride ion, which is the same from any source, all "artificial" fluorides are prepared from naturally occurring minerals. The studies on American fluoridation projects showed that the artificial substance behaved in exactly the same way as the natural one.

The council mentions that dental caries affects 98% of the population, and even at 5 years of age children already have, on average, five to six defective teeth. It had never been suggested that fluoridation was the only means of preventing caries, but so far it has proved the most effective.

Ethical Issues

The council records that "it is the ethical issue on which opinions differ most widely—namely, the question whether an authority is justified in treating the public water supplies, as a measure of prophylaxis in the interests of public health, in view of the fact that it may be difficult or impossible for an individual to avoid using the supply, or to find an alternative if he objects to the measure." In making arrangements to demonstrate the value and the technique of fluoridation, the council felt that the safeguard for the individual's true rights lay in ensuring that any decision made by an authority was taken in compliance with proper constitutional procedure and in the light of well-informed opinion. By

accepting the recommendation of the United Kingdom Mission sent to the U.S.A. in 1952 that before any general introduction of fluoridation there should be study demonstrations in selected areas, the Government had taken steps to ensure full opportunity for the development of well-informed opinion. Without these studies it might not have been possible to produce the conditions necessary for a proper demonstration, but the authorities concerned had been left free to decide whether or not to take part in them. In each instance the proposal to introduce fluoridation had been duly considered by the health and water authority and had been the subject of a formal resolution made in the normal manner. It now remained for the studies to go forward and for individual authorities to decide, in the light of these demonstrations and the emerging results, whether or not to fluoridate their own supplies.

Smoking and Lung Cancer

In his foreword the Minister recalls the advice he had received on the question of smoking and lung cancer. After referring to his statement in the House of Commons on May 7, he adds: "I shall take such steps as are necessary to ensure that the public are kept informed of all the relevant information as and when it becomes available. This will enable every smoker and, perhaps more important, everyone who is thinking of starting to smoke, to make up his mind for himself on the evidence we have, but I do not consider that the present state of our knowledge is such as to justify my accepting the advice of the Standing Medical Advisory Committee, now endorsed by the council, and undertaking a national publicity campaign."

Medical Staffing of Mental Hospitals

Among special reports is one dealing with the medical staffing of mental and mental deficiency hospitals. "Basically the problem of medical staffing is one of numbers, but a factor of cardinal importance is quality of staff," it is stated. Mental hospitals were changing in character as the new outlook on mental illness became more widely accepted and prejudices against treatment lessened. Admission rates were climbing steeply. But these tendencies, encouraging in themselves, were developing in circumstances of great difficulty for the hospitals. Most of them were built in the last century and their design was not in accord with modern ideas of the needs of medical or social treatment. These conditions constituted a challenge alike to hospital committees and their staffs, and credit was due to them for succeeding in the face of all difficulties in improving the services available to the community.

The overall shortage of medical staff based upon the vacancies in medical establishments at March, 1954, was about 20% of establishments. The replies to a general questionnaire to regional hospital boards on the subject of medical staffing showed that the reasons commonly given for the shortage were: (1) Specialists (consultants and S.H.M.O.s): Shortage of people with the requisite qualifications and experience; limitation of hospital finance; working conditions in some hospitals; lack of housing; in the case of medical superintendents, absence of any financial inducement to assume additional responsibility; and unpopularity of the S.H.M.O. grade (regarded by some as a dead end). (2) Senior registrars and registrars: Unsatisfactory working conditions; lack of housing; varying rent charges at different hospitals; lack of training facilities in hospitals remote from training centres; difficulty and expense of extended leave to obtain training; preference for teaching hospitals; no attraction to a doctor holding the Diploma in Psychological Medicine to take a senior registrar post when he can obtain a post as S.H.M.O. (3) Junior hospital medical officers and senior house officers: Absence of or otherwise poor housing conditions; high residential charges; isolated hospitals; inadequate salary; lack of promotion prospects; no security.

Council's Advice

Advice for improving the position offered to the Minister by the council includes the recommendation that courses of training in medical administration should be instituted and priority given to provide accommodation for some members of each medical grade, both senior and junior, especially where hospitals are in isolated surroundings. The council believes that an outstanding reason for failure to recruit and retain sufficient medical staff is the shortage of houses and flats for married officers. It thinks it important that senior registrars should complete full training as such if they aspire to consultant rank. To provide the requisite number of places, the establishment for them should be expanded. It should be realized that fully trained senior registrars can be promoted to consultant rank without intermediate service in the grade of S.H.M.O. The council states that the absence of a sufficient number of psychiatric consultants is related to the insufficient number of entrants into the specialty, and draws attention to the fact that some universities have no chair in psychiatry.

The Minister in his foreword indicates that he is considering the recommendation relating to the training of medical staff: "In particular the Standing Mental Health Advisory Committee has drawn my attention to the importance of maintaining the quality of medical superintendence at both mental and mental deficiency hospitals, a matter I am considering in the light of the recommendations of the Bradbeer and Guillebaud Committees. I recognize that there is a special case for provision of accommodation at hospitals which are remote from the community. The committee also makes a number of recommendations, which I am considering, regarding the training of medical staff. Since its report, the establishment of senior registrars has been increased, and I am at present studying again the adequacy and distribution of senior registrar posts in psychiatry."

Maternal Deaths

The views of the Maternity and Midwifery Advisory Committee on antenatal care related to toxæmia are put on record. These were sent by the Minister to all local health authorities on May 25 (*Supplement*, June 16, p. 362, and *Journal*, p. 1415) for discussion locally between professional representatives of family doctors, hospital obstetricians, and local health authority medical staff. Meanwhile a committee under Lord Cranbrook has been set up to review the organization of the maternity services as recommended by the Guillebaud Committee.

It is pointed out that, while the maternal mortality rate has, since the turn of the century, been lowered from five to under one per 100,000, there still remains a substantial proportion of the present 500 or so maternal deaths each year which must be regarded as avoidable. From a Ministry of Health inquiry into the cause of maternal deaths, it was already clear that toxæmia of pregnancy was the principal cause of avoidable maternal death in this country, and it had been shown that it was also a major cause of stillbirths and neonatal deaths.

"The time seems to have come," the council states, "when a concerted effort should be made by all three parts of the maternity service of the nation to tackle the problem of toxæmia of pregnancy. This will mean not only research by specialists in hospitals into the cause or causes and the prevention of toxæmia, but also a thorough overhaul of the antenatal care provided by the general practitioners, midwives, local authority clinics, and hospitals."

Antenatal Care

The report then outlines what in the council's view constitutes good antenatal care. Among other things it says that any evidence of malnutrition, renal disease, heart disease, pulmonary tuberculosis, or other serious illness in the past, or any complications in a previous pregnancy are

reasons for seeking a hospital booking. It is desirable where practical that all primiparae over the age of 30, all multiparae over the age of 40, mothers having their fourth or more confinement, and those with multiple pregnancies, as well as all cases of social need, should have their babies in hospital. A policy on these general lines should be worked out in detail in each area and should be clearly understood.

General assessment of the mother's health and nutrition is important, especially as heart disease and anaemia still remain prominent contributory causes of maternal death. The council advises x-ray examination of the chest in all cases. Between examinations given by the family doctor, hospital, or clinic medical staff, preferably with the midwife present, the midwife should see the mother at short intervals to check blood pressure, urine, and weight. Any mother showing signs of a rising blood pressure, excessive gain in weight, oedema, or other abnormality should be referred to the appropriate doctor. It is advisable that the midwife should see her patient monthly until the 28th week, fortnightly until the 34th or 36th week, and then weekly. It is essential that there should be free interchange of information between midwife and doctor, and this should always be arranged as part of the plan for antenatal care made at the time of booking.

With regard to antenatal records, the council says that it is essential that every doctor and every hospital or clinic providing antenatal care should have an efficient filing system with good, clear records. Arrangements should be made to see that reports are exchanged between all concerned with the care of the mother, both before and during labour. Hospitals which do not do their own antenatal care should make certain they receive all information before the mother is admitted. In domiciliary practice there should be a free interchange of information between the doctor and midwife. One person, usually the midwife, should be responsible for the prompt follow-up at home of any woman who fails to attend at the appointed time for antenatal care. The council urges that the pattern of supervision a mother is to receive should be mapped out at the first visit by the hospital staff, family doctor, or midwife with whom the primary booking is made, although the plan was always subject to modification in the light of events.

Once early toxæmia and other abnormalities have been recognized there are three essentials for a good service: a constant watch on all patients, especially non-attenders; adequate numbers of antenatal beds so that treatment may be started as early as possible; and for the multipara a good home-help service so that the mother, whether resting at home or admitted to hospital, is not worried about her home and children. The number of antenatal beds should bear a relation to the needs of the population served and not to the number of lying-in beds. The number of cases of toxæmia in similar communities is likely to be similar whether the area has many or few maternity beds.

What is required, the council feels, is not so much the establishment of new services as a proper use of those already existing, and it has therefore readily endorsed the recommendation of the Standing Maternity and Midwifery Advisory Committee that the Minister should circulate to all the appropriate authorities a memorandum advising them to review and organize their services on the lines indicated.

Classification of Proprietary Preparations

The Joint Committee on the Classification of Proprietary Preparations, appointed in 1954 by the Central Health Services Council and the Scottish Health Services Council, met twice during the year and continued its work of classifying proprietary preparations into the categories recommended by the former Joint Committee on Prescribing on Form E.C.10. About 300 new preparations were classified, and the classification of other preparations was reviewed on further evidence. Where requested, the committee met manufacturers' representatives who were not satisfied with

the committee's decisions on their written representations about the classification of particular products. As a number of drugs and preparations were deleted from the *British Pharmaceutical Codex* in 1954, and from the *National Formulary* in 1955, therefore ceasing to be "standard" or "official" drugs and preparations, the committee found it necessary to review independently the therapeutic value of such products before deciding whether or not to change the classification of proprietary preparations containing them.

Joint Committee on Poliomyelitis Vaccine

In 1955 the council appointed a second joint committee with the Scottish Health Services Council, with the following terms of reference: "To advise generally on the conditions which should govern the use of poliomyelitis vaccine in mass immunization and specifically on such questions as Ministers may refer to them." It consists partly of members of the two councils and partly of outside members with special experience in the production and use of poliomyelitis vaccine and is under the chairmanship of Lord Cohen.

The Joint Committee met three times during 1955. It had recourse to information on what had been undertaken and planned in the employment of poliomyelitis vaccines in other countries, and to certain proposals for the application and use of vaccines which would become available in this country in the spring of 1956. While no formal decision was taken, the general feeling of the committee at its meeting in December favoured the use of poliomyelitis vaccine in Great Britain, to take place in May-June, 1956, on the basis of a plan prepared by the Medical Research Council's Committee on Clinical Trials of Poliomyelitis Vaccine, provided that the practical, administrative, and financial difficulties were not insuperable.

HOSPITAL MEDICAL STAFF BOARD AND LODGING CHARGES

The Management Side Secretary of Committee B of the Medical Whitley Council has written to the secretaries of hospital authorities to inform them that Committee B agreed on July 24 to amend paragraph 17 of the Terms and Conditions of Service to provide for charges to be made for board and lodging for hospital medical staff at a fixed rate according to the grade of the officer concerned.

The rates are: senior house officers, £150 per annum; J.H.M.O.s and registrars, £170 per annum; senior registrars, £200 per annum; S.H.M.O.s, £350 per annum; consultants, £400 per annum.

HOSPITALITY

A French girl aged 22 would like to spend her holidays from August 10 to August 30 with a British medical family as a paying guest. Her sisters, aged 16 and 14, would like to stay as paying guests with different medical families.

A specialist in otorhinolaryngology in Mannheim would like his daughter, aged 19, to arrange a holiday exchange for two months with the daughter or son of a doctor living in Oxford, Cambridge, or London. The British boy or girl would have the opportunity, while staying in Mannheim, of attending the University of Heidelberg.

Two Swiss doctors would like to receive U.K. doctors' daughters, aged about 18, to stay for about six months on an *au pair* basis, to help with children.

A French doctor living in Paris would like to arrange a holiday exchange for her son, aged 17½, during September. She would not be able to receive an English boy until October.

Would anyone interested please get into touch with Brigadier H. A. Sandiford, International Medical Visitors' Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

Remuneration Claim

SIR,—If the rebuttal of our claim to a cost-of-living adjustment was disappointing to most doctors, let it be remembered that it seems to verge on the calamitous to all except the most recently appointed registrars. Many of us have known no increment for two years, and it is common knowledge that four or six years is the least time likely to be spent in the grade nowadays, in spite of the roseate "normally held for two years" of the terms and conditions of service. It is more than high time for these outmoded gradations to be revised—objections to "dilution of consultant labour" are invalid, for consultant labour is *de facto* already diluted by superannuated trainees. If the Ministry refuses to create the necessary posts, at least those who are waiting for vacancies can be granted a fair return for their annually increasing experience and the accumulation of higher and differential qualifications.

The public are being seen, examined, treated, advised, anaesthetized, and operated upon by a large proportion of doctors who are living from hand to mouth, with little or no security of tenure, on remuneration which compares unfavourably with that of 21-year-old car sprayers, stevedores, and espresso-bar operators, to quote but three authenticated examples. The public, who place their trust in these doctors, respect them, and are thankful for their ministrations, do not know that their "specialist," some eight years qualified or more, possibly with one or more higher qualification, at least "deeply studied in physic" if not "groundedly learned," is still being moved about every two years and is still being paid as a second-year trainee.

Assuming that the work done by registrars is there to be done, and while awaiting the only real solution of the problem—the creation of sufficient consultant posts—some equitable makeshift should nevertheless be pressed for, if only for the *ad hoc* relief of hardship. Annual increments for additional years in the grade, with special increments for the higher or differential qualifications as they are obtained (as holds in other fields such as engineering and teaching), seems to be an answer to the problem. The argument that this would create a "sub-consultant" grade seems spurious, as the people who would constitute the grade already exist, and are working in a "sub-consultant" capacity already, with no early prospect of betterment apart from such a change in their grading. If this is doubted, let each consultant insist on actual supervision of the work of his registrar(s); he would soon find the need to be in two places at once; waiting-lists would grow; and we might even see the Minister volunteering the increase in the consultant establishment which is so obviously needed.—I am, etc.,

London, E.11

J. D. KEITH PALMER.

SIR,—Perhaps the recent rejection of the claim for increased remuneration will bring home to doctors their lack of strength as a negotiating body.

Let them ask themselves what safeguards exist in connexion with: (1) remuneration, (2) working hours, (3) working conditions. What is to prevent the Government from continuing to refuse any increase in pay, and in fact what is to prevent them from actually cutting that pay down? Secondly, what is to prevent demands on doctors by patients from increasing until saturation point is reached and passed? Thirdly, what possibility is there of working conditions being improved when no safeguards exist in relation to the above factors?

In six years the standard of living of the medical profession has dropped by one-quarter. Over the past 20 years the demands on doctors by patients have increased by about

250% (this figure is an estimate). If the doctors do not attempt to alter this position for themselves no one else will do it for them. The machinery is there. It needs only radical alteration in its use for it to become effective. The time for this is now.—I am, etc.,

Cheadle, Staffs.

R. DEAN JONES.

SIR,—The remuneration issue is not one for complacency. It is now more than two weeks since Mr. Turton made his utterly outrageous statement in the House of Commons. It is therefore time for our negotiators to tell Mr. Turton that he must take steps to implement Spens now or the Association will start at once to organize a mass resignation from the N.H.S. Last time we had endless delaying tactics by the Minister before Mr. Justice Danckwerts made his arbitration decision. Let us for goodness' sake "get cracking" this time.—I am, etc.,

Edinburgh, 11.

R. C. McLAREN.

SIR,—The trick of timing employed by the Minister and the letter to a popular daily newspaper claiming that doctors are grossly overpaid should sweep away the last of our illusions. We are dealing with a politician ready to take a leaf from Adolf Hitler's book and quite unconcerned with the justice of our case. Our ability to embarrass the Government by causing a breakdown in the N.H.S. is our only bargaining asset in the eyes of officialdom, since only then would the main body of the general public evince any interest in our conditions of service and remuneration.

A token strike is an excellent idea, but, if it falls short of achieving its object, what next? The answer is that we must then realize that we are fighting for our very existence and not be squeamish about employing full strike action. This would mean casualties, but such methods would only need to be used once, since future Ministers would show a marked willingness to negotiate. Remember: if we fail it will only be a few years before we are degraded to the level of hewers of wood and drawers of water.—I am, etc.,

Leeds, 16.

CLIFFORD T. ROBERTS.

SIR,—Now that some retaliatory measures are being discussed with regard to our rejected claim for increased pay, I consider it both foolish and unethical to penalize our patients, either in the form of reduced surgery hours or by refusal to sign certificates, as suggested by some of your correspondents. Surely we should "strike," but let it be against our employers—i.e., the administration.

What better method could we employ than collectively to withhold payment of part or the whole of our income tax, until such a time as our just demands are honoured. Let us see whether our masters will proceed to prosecute or imprison 22,000 general practitioners. And if they do, let us by all means face a spell of imprisonment. It may, to some of us at any rate, prove a welcome rest and a relief from running a busy general practice. And at least I do not suppose we shall get any night calls.—I am, etc.,

Tadworth, Surrey.

J. R. ELWELL.

SIR,—The refusal by the Minister to accede to the request for a 24% pay increase for doctors has already provoked indignation in your columns. Before condemning his action, let us consider this claim and its implications.

The profession, through its leaders, has said in effect that all doctors are entitled to an increase of 24% in their earnings to offset the increased cost of living. But, in general practice at least, is this true? Would a general increase of 24% in capitation fees give more money to those who need it? Would all doctors benefit? We consider that the answer is "no" in each case.

The earnings of general practitioners are extremely varied, from the small-list man whose practice expenses are a very large part of his income to the doctor with a large list and many outside sources of income, who on no reasonable standards can be said to be underpaid. If a general uniform increase were granted, the bulk of it would be absorbed in

making large incomes larger, and those doctors who are in greatest need of more money would get little. As no provision is made, either in Spens or by the profession, to better assistants' salaries, they would probably get nothing. This is a fundamental fault of the present system of distribution, and must have been obvious to the Minister, perhaps even a major reason for his decision, which in our opinion was fully justified.

We suggest that, to justify a claim for more money in the general-practitioner pool, the profession must first make clear where any increase would go, and also take steps to ensure that such money would be spent where it is needed, and not on any arbitrary betterment applied to the existing scheme, with the shortcomings of the present one thus exaggerated. A case for more money could be made out if it were to correct some of the faults of the present system which are dependent on the system of remuneration—head-hunting and competition for patients, oversize lists, and poor standards of practice.

We should like to draw attention to a recent resolution of the General Practice Reform Association calling for loading the capitation fee from zero instead of from 500. We most believe that such a loading would give help where it is most needed—that is, to doctors with smaller lists who have the highest expense ratio—and would also make entry into new practice easier by reducing the financial barrier to new partnerships. If, in addition, the maximum permitted size of list, and the size of the extra list allowed for an assistant, were reduced, the profession would be in the strong position of having made constructive proposals for raising standards of practice and helping to get into practice some of the many doctors who are badly needed but unable to obtain entry, and of asking for the funds necessary to carry out these reforms.—We are, etc.,

A. C. J. SAUDEK.

H. P. HILDITCH.

London, N.W.6.

Economy in the N.H.S.

SIR,—In recent months there have been many statements in the press by ministers, officials, and the like on the increasing bill the Government has to pay for drugs and other sectional items of the N.H.S. and Ministry of National Insurance. I am the first to admit that the bill is a high one and higher than is warranted by the needs of the population on whom the money is spent. It is most unjust that the blame for this state of affairs should be laid on the medical profession, or indeed that they should be expected to find the remedy for it.

The Government could, if it had the political courage, make these economies itself. Because it is unwilling to take the political risk is no reason whatsoever for the medical profession to take the responsibility on the Government's behalf.

If the Government wishes to economize it has only to undertake a few measures, which would, I have no doubt, be unpopular, because they would remove many of the over-inflated ideals which politicians are so fond of maintaining before the electorate. (1) It should issue a list of drugs which can be supplied to patients free of charge under the N.H.S., and any drugs not on the list would be unobtainable except by purchase. After all, why should a doctor who undertakes to give his patients the best available treatment require his patients to take some cheap, unpalatable remedy in the place of some more elegant but more expensive product? (2) While the general practice side of the medical profession is paid on the capitation basis every G.P. is to an extent blackmailed into sometimes providing treatment against his better judgment. He is in fact in a very awkward predicament: if he insists on the most stringent economies in prescribing he may lose his practice, and if he does not he is liable to fine or censure. It is quite noticeable that G.P.s practising in an area where there is little competition with other G.P.s are able to achieve much more significant economies than those in active competition. (3) A similar situation exists in regard to the ambulance service, parti-

cularly in rural areas. The Government ordains that there should be a free ambulance service, the criterion for the use of which is that a G.P. shall certify that the patient is unfit to travel by public transport. The practitioner is in a dilemma. If he wishes to keep his practice together he must err on the generous side.

I think it should be obvious that the real economy in the N.H.S. lies in realistic action on the part of the Government. If it is afraid to tell the public what has to be done, why should we? A list of drugs was prepared, some of which we were advised not to prescribe, but of course we could if we thought them to be necessary. If these drugs are too expensive for the N.H.S. then the Government should say so, and if we thought our patients required them we could tell them that they were necessary but must be paid for.

If the Government would lose its political timidity it would be much easier for the medical profession to make a very clumsy N.H.S. work economically.—I am, etc.,

Steaforth, Lincs.

H. WILSON.

Where the Money Goes

SIR,—It has just been brought to my notice that when a home help is needed, and this is supported by a medical certificate to that effect, the patient is visited by a health visitor on whose report the necessary help is furnished or otherwise. This to me seems a waste of public funds and time.—I am, etc.,

London, N.4.

T. H. K. MACLAUGHLIN.

Consultant's Contract Terminated

SIR,—We read Dr. J. M. Alston's letter (*Supplement*, July 14, p. 53) with concern, and have delayed writing about the matter until we could make some further inquiries. Having done so, we feel that it is our duty to say that we are in full agreement with the final paragraph of Dr. Alston's letter.

We trust that the Negotiating Committee will not let the matter rest but will make a vigorous protest to the Minister about the manner in which this contract was terminated, and ask that further inquiry may be made. Our chief concern is to ensure that, where medical administration is in being at any hospital, this type of administration should be clearly seen to be sound and above reproach, especially by our medical colleagues.—We are, etc.,

G. MCCOULL,
President.V. COTTON-CORNWALL,
Chairman of Council,
The Medical Superintendents' Society.

Prudhoe-on-Tyne.

Hospital Medical Staff Board and Lodging Charges

SIR,—Notification has been received from the Management Side Secretary of Committee B of the Medical Whitley Council that the Committee has agreed to amend paragraph 17 of the Terms and Conditions of Service to provide for charges to be made for board and lodging for hospital medical staff at a fixed rate according to the grade of the officer concerned. The rates are: senior house officers, £150 per annum; J.H.M.O.s and registrars, £170 per annum; senior registrars, £200 per annum; S.H.M.O.s, £350 per annum; consultants, £400 per annum.

As there is wide variation from hospital to hospital in the value of amenities of resident medical staff, it is astonishing that the Staff Side of Committee B of the Medical Whitley Council should have agreed to figures so high for the senior grades, and to assessment on the basis of a flat rate for each grade, no matter how little is received in return. This latter principle is obviously most unfair, and my own case, I think, demonstrates this point.

In the Alder Hey Children's Hospital all medical and surgical staff whose contracts require them to be resident (and this includes myself) share exactly the same amenities as regards dining-room, food, and service. Under the municipal authority the assessment of the value of these emoluments was: house officer, £100; registrar, £130; deputy medical superintendent (who has a sitting-room),

£160. As an S.H.M.O. I am paying, under the new assessment, an additional £190, although the amenities themselves have remained unchanged. I believe that this represents a gross overcharge, but am apparently without redress. My present amenities being adequate for my needs, I do not seek additional services. Why, therefore, should I be compelled to pay disproportionately more solely on account of my grade?

The new scale of charges is hardly calculated to induce senior medical staff to live in hospital if they can avoid it. Have the negotiators so long forgotten their own hospital days that they are unmindful of the value of resident senior medical and surgical staff, or is this new agreement a move to diminish their number in order that the lay authority may further progress towards totalitarian power?—I am, etc.,

Liverpool, 12.

R. J. DERHAM.

Convalescent Homes For Doctors

SIR,—I was pleased to read in the *Supplement* of July 21 (p. 56) of the carrying of a motion proposed by Dr. Joan Chappell at the Annual Representative Meeting at Brighton, asking the Council to consider ways and means by which a convalescent home or homes could be established for the use of members of the medical profession and their immediate relations.

I brought this subject to the notice of the profession in a letter which you were good enough to publish in the *Journal* of December 22, 1951 (p. 1524). In my letter I drew attention to the existence of a convalescent home owned and run by the Pharmaceutical Society of Great Britain for the benefit of their members and wives or husbands. The structure is a fine example of the smaller type of English country mansion, built of stone about 55 years ago, standing in its own grounds in a country district of Derbyshire. Various rooms have been adopted by branches of the Pharmaceutical Society, who have raised funds from their members to defray the cost of furnishings. Other branches give separate items of equipment, both for the house and for the grounds. It is under the supervision of a lady warden, and the charges are nominal—1½ guineas per week.

There are various other bodies who possess convalescent homes for the benefit of their members. Why should we be the exception? What greater pleasure and comfort could we have than the knowledge that we might, should the occasion arise, be restored to health in our own establishment, and amidst the company of our colleagues? There must be several buildings in the kingdom one or more of which could be capable of adaptation for use as a convalescent home. With wide support of this laudable object, the purchase price and cost of maintenance should be within the profession's capacity.

I sincerely trust that the idea of a convalescent home owned and conducted by and for the benefit of members of the medical profession will not be allowed to lapse, and that the Council will in due course bring this project into being.—I am, etc.,

Kilburn, N.W.6.

JOEL GREEN.

Medical Auxiliaries

SIR,—I read (*Supplement*, July 14, p. 47) that at the A.R.M. a motion was carried welcoming the proposed statutory registration of medical auxiliaries provided that (1) the medical profession maintains some control of the training standards to be aimed at and general ethical conduct, and (2) that the medical auxiliaries retain their present description and are not given independent status as belonging to professions associated with medicine. I was not present at the A.R.M. and do not therefore know anything of the discussion which took place. The following points may have been ventilated, but, even if they were, will not be known to the profession at large.

Medical auxiliaries include very diverse types, some of whom, like laboratory workers, do not "practise." They investigate and test but do not treat—that is, they have no

personal responsibility to patients. Others, such as the chiropodist, are practitioners in their own right. They treat and have a personal responsibility for their patients. Some practise in clinics and hospitals; some are private practitioners with their own surgeries; others do both. By the very nature of their work they cannot be other than "independent." The terms of the second part of the motion as applied to them make nonsense. Their training has long been "controlled" by the medical profession. Their practice is something that medical men refuse to touch (one might add it is something that most medical men know little about). Their practice deals direct with their patients. We cannot possibly deny them professional status. They have it already. The Association must think again. It has sponsored them in the past. It must support them again.—I am, etc.,

Salford, 3.

W. SAYLE-CREER.

Naming the Doctor

SIR,—The *Star*, and perhaps other national newspapers, continually advocates that the names of doctors penalized for breach of the terms of service should be made public, the reason given being that it would be doing justice to the very large majority of doctors who are not guilty of any such breach and who may be suspected by their patients as possibly being the unnamed "Dr. X."

I do not consider this to be a reasonable reason for making the names of the very few guilty doctors public. In the first place, I do not think that patients would have it in their mind that their own doctor may be the "Dr. X." Putting myself in the position of a patient, I cannot imagine myself for a moment thinking that my doctor may be the "Dr. X." Secondly, "Dr. X," if his name is made public, after paying fully the penalty imposed upon him, is in real danger of losing very many of his patients—in fact, his livelihood—nearly as much as if he had been struck off the *Register*. Such a terrible punishment would be, of course, most unfair, and such as was, of course, never intended should be imposed. A doctor who has a sum of money deducted from him as a penalty would in all probability never again, having learned his lesson, be guilty of a breach of the terms of service, and thus continue to be a valuable member of the medical profession, whereas publicity of his name would most likely ruin his practice.

I fear that, with some of the press continually advocating the publicizing of "Dr. X," public opinion may in time be so unjustifiably swayed as to bring about by an Act or otherwise the naming of doctors who are penalized for a breach of the terms of service. I therefore feel that the advocacy of the press, which is continual and persistent, should be answered by the British Medical Association by direct approach to the editors of such newspapers.—I am, etc.,

London, N.W.1.

Association Notices

Diary of Central Meetings

SEPTEMBER

20 Thurs. G.M.S. Committee, 10.30 a.m.

Branch and Division Meetings to be Held

NOTTINGHAM BRANCH.—At E.N.T. Department, Nottingham General Hospital, Thursday, August 16, 8.30 p.m., meeting. Talk by Mr. E. J. G. Glass: "The Problems of Deafness in Practice."

Meetings of Branches and Divisions

SOUTH STAFFORDSHIRE DIVISION

The annual general meeting was held on May 29, 1956, in the executive council office, Wolverhampton. Mr. R. L. Benison took the chair and 28 members were present. The following officers were elected:

Chairman.—Dr. S. A. Scott.

Vice-chairman.—Mr. R. L. Benison

Honorary Secretary and Treasurer.—Dr. L. C. Rutter.

Honorary Assistant Secretary.—Dr. H. R. Chapman.

TAX ASSESSMENT OF PART-TIME CONSULTANTS

SPECIAL COMMISSIONERS' DECISION

The Association, in conjunction with certain other bodies, including the three medical defence organizations, recently supported five part-time consultants in appeals against the assessment of the remuneration received from their hospital appointments and from domiciliary consultations under Schedule E of the Income Tax Act, 1918, as amended by the Income Tax Act, 1952. As a result of the assessment under this Schedule the narrow rule governing expenses applicable to Schedule E operated upon the bulk of the consultants' professional expenses.

The appeals were heard in April by the Special Commissioners of Income Tax. The hearing lasted six days, and the appellants were represented by Sir James Millard Tucker, Q.C., and Mr. John Creece.

The Special Commissioners announced on July 31 that they had allowed all the appeals and held that the consultants should not have been assessed under Schedule E but under Schedule D, both on the remuneration of their hospital appointments and on fees paid for domiciliary consultations. In the Special Commissioners' opinion the consultants' part-time hospital appointments were a necessary part of the exercise of their profession and merely incidental thereto, notwithstanding that a great deal of their time was thereby taken up.

The Crown have 21 days in which to appeal to the High Court against this decision.

ST. GEORGE-IN-THE-EAST HOSPITAL

CLOSURE DECISION

St. George-in-the-East Hospital, Stepney, is to be closed on September 30, 1956. The Minister of Health has informed the North-east Metropolitan Regional Hospital Board that he has decided to close the hospital after careful consideration of the board's proposal to do so and of the objections raised by a number of bodies against the proposal.

Following protests by the London Executive Council and the London Local Medical Committee (*Supplement*, April 7, p. 182) the board issued a statement (*Supplement*, April 21, p. 204) that its proposal was based on a shift of population away from the area and growing staffing difficulties. It said it was satisfied that the diminished demand on the hospital's services would be permanent. The board has now arranged in consultation with the Stepney Group Hospital Management Committee and the neighbouring Bow Group Hospital Management Committee, that adequate hospital and specialist services will be available in near-by hospitals for the people of Wapping and Shadwell.

MEDICAL PRACTICES COMMITTEE

AMENDMENT OF CLASSIFICATION OF AREAS

The following areas have been reclassified by the Medical Practices Committee as "designated":

Essex.—*Borough of Dagenham (except Marks Gate Estate).
Lancashire.—*Heywood.
London.—Borough of Islington: *St. Mary's and St. Peter's Wards.
Middlesex.—Borough of Enfield: *Green Street and Ponders End Wards; Borough of Willesden: *Brondesbury Park Ward.
Darlington.—*Whole of County Borough.
Preston.—*Whole of County Borough.
Sheffield.—Gleadless Valley Area (previously shown as Gleadless (Woodseats Area) and immediate surrounding districts).

The following areas have been reclassified as "intermediate":

Lancashire.—Chorley.
Middlesex.—Borough of Enfield: Ordnance and Enfield Wash Wards; Borough of Harrow: Roxbourne and Roxeth Wards.
Yorkshire (W.R.).—Urban District of Horbury; Urban District of Hoyland Nether; Parishes of Hatfield and Stainforth (Thorne Rural District); Scholes, near Leeds (Tadcaster Rural District).
Sheffield.—Attercliffe; Woodseats Area.
Wakefield.—Whole of County Borough.
Monmouthshire and Newport.—Rural District of Magor and St. Mellons.

The following areas have been reclassified as "restricted":

Buckinghamshire.—Colnbrook.
Dorsetshire.—Wareham and District.
London.—Borough of Wandsworth: Bedford Ward.
Yorkshire (W.R.).—Wetherby Rural District (except Harewood and Clifford); whole of Wetherby Rural District now restricted.
Denbighshire and Flintshire.—Abergele.

PUBLIC HEALTH MEDICAL OFFICERS

AMENDED SICK PAY SCHEME

Committee C of the Medical Whitley Council has agreed on certain amendments to the sick pay scheme applicable to public health medical officers, and has recommended local authorities to put this agreement into effect.

The present sick pay scheme for medical officers in England and Wales is the scheme set out in paragraph 10 of the Second Schedule to the Memorandum of Recommendations of the Joint Negotiating Committee for Chief Officers of Local Authorities, dated September 12, 1950. Committee C has agreed that the sick pay scheme for public health medical officers should be amended to incorporate amendments which have been made to the sick pay scheme for chief officers of local authorities since September, 1950.

The revised scheme is set out in M.D.C. circular No. 30. Medical officers of health should have a copy of this circular.

HOSPITALITY

A Belgian doctor's daughter, aged 20, and son, aged 17, would like to arrange holiday exchanges, preferably with families near London or in the south of England. The daughter would stay with a medical family on an *au pair* basis and help with children if an exchange is not possible.

A French doctor's son, aged 24, would like to stay as a paying guest with a medical family living in the London area. He wishes to stay 6 months, arriving in August.

A young French E.N.T. specialist would like to stay with a medical family as paying guest for the month of September in order to improve his English.

A French girl would like to stay on an *au pair* basis during October with a British family living in the London area.

A British doctor living in Lausanne would like to exchange flat with a doctor in London from September 10 to October 10. He would require bedroom, sitting-room, bathroom, and kitchen. Flat in Lausanne accommodates three adults and one child.

A French doctor's daughter would like to visit a British medical family for one month between August 23 and September 23 on an *au pair* basis or as a paying guest.

Would anyone interested please get in touch with Brigadier H. A. Sandiford, International Medical Visitors' Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

Remuneration Claim

SIR,—I have read with amazement the leading article published in *The Times* of August 9 on doctors' pay. No mention is made that much of this so-called increase will simply recompense us for the severe reduction in our incomes due to the increase in our expenses over recent years.

May I express the personal opinion that since the N.H.S. I have had no time to keep up with the Joneses? What concerns me is simply that rising costs have left me with a reduced income to meet them, and in this respect our profession is almost unique. Had there been no N.H.S., of course, our fees would have been raised to meet these increases. The Spens reports guaranteed the protection of the profession against a loss of freedom in a National Health Service to maintain its own status by adjusting fees, and it was because the Government accepted these reports that a reluctant profession was persuaded to enter the Service. The Government is not being asked for money to keep pace with the Joneses, but to compensate for our inability to raise fees.

However, surely it is not too late. The country can apparently no longer afford us. Let both sides be frank. Let the profession therefore no longer be a burden to the Government but return to the old system, and then disputes need never again occur. To most of us the N.H.S. has meant loss of freedom, increased work, interference by unqualified persons, loss of status, and a feeling of insecurity about our financial future which we should never have had while we could charge for our services on a supply and demand basis.—I am, etc.,

Southall, Middlesex.

C. A. PRAGNELL.

*Comment on *The Times* article will be found at p. 406 of the *Journal*.—Ed., B.M.J.

SIR,—Stung by the leading article in *The Times* of August 9, I write to suggest that it is high time our case received better publicity. The general public is abysmally ignorant of a doctor's life and conditions of work; the popular press seems to think we are more than adequately paid for a cushy job, and now *The Times* comes forth with the opinion that we are the spoilt darlings of the professions, having already been awarded an increase in pay well in excess of others, that we are leading handsomely in the race for increases and still want more, and that it is time that the whole system of payment as based on Spens should be reviewed. This may seem all very well from the remote, comfortable fastnesses of Printing House Square, but before such lofty sentiments are expressed the author should try the hurly-burly of general practice for a little while. Meantime, to be going on with, here are a few matters he might ponder over.

The doctor, after a long and expensive training, at the age of about 25 or 26 starts earning the princely salary of about four or five hundred pounds a year. This continues until he is lucky (?) enough to land a job as an assistant, when at the age of say 28 or 30 he might get £1,000 per annum—about what a window-cleaner gets for a five-day week. After a few more years he may be appointed to a practice vacancy, but it will probably be a long, long time before he achieves the so-called average net income, after expenses, of £2,222. As the expectation of life of a doctor is one of the shortest, he will probably die early, and will thus have had a relatively brief earning period in which to make provision for his dependants.

During his short career he will have the privilege of being on call, day and night, seven days a week, 365 days a year. His evenings will be disturbed with monotonous regularity—and in any case his evenings do not start until late—often 8 p.m. He will be called from his bed on icy nights. Unless he is lucky enough to join a rota, he will never have a week-end off. For his holidays, if he can afford any, he will have to pay a locum, caretakers, and provide board and lodging for them all, and a car for the locum. His unfortunate wife will share this "cushy" life. Domestic help, even if he could afford it, is practically unobtainable. His wife, therefore, will be an unpaid slave, tied to the house and the telephone, lucky if she gets a few hours' fresh air in the week. Unlike the wives of other men, she will be precluded from getting a job to augment the family income.

For this responsible and arduous life he will be paid the magnificent sum of fivepence gross per week per patient—the price approximately of two cigarettes, or one and a quarter packets of potato crisps, or two "iced lollies," or a quarter of a pint of beer, or two local telephone calls, or the cost of posting two letters. Such, in terms of everyday things, is the value placed upon our services. Now, the increase asked for by general practitioners is about 16 million pounds, of which about five millions would go back in tax, costing the Exchequer therefore about eleven million pounds net. Eleven million pounds represents about one penny per head of the population per week.

It should not be forgotten that out of his gross pay the doctor has to provide and maintain a larger house than would be needed for purely residential purposes. Two rooms have to be set aside for surgery and waiting-room, and these must be kept in a condition which meets with the approval of the inspecting squad when it comes round. Heating and lighting must be provided, a reliable car kept, telephone laid on, instruments renewed. Having been delivered, bound hand and foot, into the hands of the Government, doctors cannot, as can other professions, increase their charges to meet their ever-increasing expenses. They must rely on the tender mercies and good faith of the politicians, notable in all times for their evasiveness and their broken pledges.

From letters and comments in the daily press it is apparent that there is little public sympathy with our claim. I believe this is due largely to ignorance on the part of the general public, most of whom seem to think that the whole of their National Insurance contributions go to "the doctors," and that they have bought us body and soul. I submit that the

AUG. 18, 1956

CORRESPONDENCE

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL 105

time is ripe for a publicity campaign. Let us forget for a time our "noble ideals" and hire a full page in, say, the *Daily Express* and the *Daily Mail*, and state our case. Or perhaps we could have a mass meeting at the Albert Hall, and all have a day off to attend. We should then see how the public would like, even for one day, the absence of their normally always available family doctors.—I am, etc.,

H. T. CHILTON.

London, N.18.

SIR,—Surely there is more to this than a mere refusal on the part of the Minister to put a few extra pounds into our pockets, after the Chancellor has had his cut. The battle would appear to centre round the legal implications of the Danckwerts award and the findings of the Spens Committee, but the real issue must lie in the attitude of the Government to the professional classes. While the two main political parties remain so equally balanced, the majority of the electorate will be wooed, and the minority burden on the minority will be introduced infrequently and with reluctance. We cannot put our trust in the politicians. Their every action is governed by the recurrent nightmare of a fall from power, or, in the case of the Opposition, by the glowing prospect of becoming the masters again. Dr. Edith Summerskill was quick to plead our case in Westminster last week. Does it require any great stretch of the imagination to see the same good lady rejecting a future claim out of hand, and without discussion, with an indignant Mr. Turton on the Opposition benches condemning her cursory treatment of "a noble profession"?

As a Government-employed professional body, we run a grave risk of becoming a political football, to be kicked and willy-nilly from Westminster to Whitehall and back, and the more obvious that tendency becomes the more will we have ourselves to blame. And by ourselves I mean each individual practising doctor. There is nothing to be gained at this time by throwing brick-bats at the B.M.A. and resigning membership as a token of no confidence, as Dr. A. S. Nicholas decided (*Supplement*, August 4, p. 95). On the contrary, never was it more vital than now that each and every doctor give full and active support to his representative body. No battle was ever won from an arm-chair.

We are traditionally individualists and politically disinterested. I suggest we can no longer afford to be described as such. We live in the trades union era, and if we choose to shun their methods we must suffer the consequences—namely, loss of status, professional, social, and economic. If we lose this fight, Heaven help us. The next one will be infinitely tougher, and bloodier.—I am, etc.,

LOGAN MITCHELL.

Leicester.

SIR,—Legally I think there is no doubt about the justice of the doctors' claim for their 24% increase in remuneration, though successive A.R.M.s have realized that such claims were inconvenient for the Government, and never more so than to-day. We do not know what the Negotiating Committee is doing, but it is noteworthy—though so far it has not received notice—that the Minister's reply was not a blank negative but the refusal of a "general increase in medical remuneration."

It would, in fact, be difficult in present circumstances to justify a flat increase all round, but Spens does not require that either. It has been realized from the beginning that the capitation fee was not an ideal method of payment, and before opinion hardens on a flat increase of 24% some thought should be given to methods which might with benefit supplement the capitation fee without diminishing its advantages. This might enable doctors to make interim proposals more acceptable to the Government and more beneficial to the service. Indeed, now is the time for some real hard thinking, because in July, 1958, a large number of doctors will become pensionable and many will certainly retire from the Service, thus altering drastically the whole man-power problem in general practice anyhow.

So let us start with the doctors near retiring age. Their pension depends entirely on how much they receive in the first ten years, and the fall in value of the pound is for them a most serious matter and makes retirement look bleak for them or their widows—which I am sure is not what their patients would wish. At the same time few if any of them are really in immediate need, and probably most of them would be willing to forgo the 24% increase for the next two years if given a firm promise that when they do retire the income on which their pension will be paid will notionally be grossed up to make allowance for the reduced value of the pound each year since the Danckwerts award. The compensation fee payable should be similarly adjusted. This would be a voluntary sacrifice by the doctors concerned, but it seems justifiable in view of the present strenuous efforts to stop inflation, and it should help the Government very considerably.

In actual fact the final cost to the Exchequer will probably not be as much as if they were dealing with non-medical pensioners. I, in common with a number of my contemporaries, spent several weeks in hospital last year—a clear indication that though my parents were octogenarians I am unlikely to last so long, the result of two world wars and living nearly thirty years at the end of a telephone for 24 hours a day. This steadily wearing pace is not good for doctors or for their doctoring, though it diminishes their chance of drawing pensions, and, while quite a number of doctors are relatively comfortably off, a large number do really find life a struggle. If, as the Minister states, a "general increase" could not be considered there is a very strong case for help where it is most needed. I suggest that a really useful payment of, say, £200 to £300 per annum for each dependent child would go a long way to meet this need and be a biologically sensible way of exercising the flexibility which the Spens formula allows. It would, incidentally, be in line with much social and industrial thinking. It would, of course, apply to all those in medical practice, G.P.s, M.O.H.s, consultants, professors, etc.

Thirdly, any increased payments should do something to raise the standard of practice, for at present the highest incomes bear no relation to the best work. Here I suggest that the new College of General Practitioners might help in the way I propounded when it first started. Membership or Fellowship of the Royal Colleges is not paid for, but is, in fact, the passport to higher-paid appointments. If a general practitioner from his thirties to his fifties got an extra salary he would probably spend it on his family and its bearing on his standard of practice would be negligible. I suggest that a somewhat modified membership of the College of General Practitioners—in time I hope a Royal one—should carry with it the right that his executive council would pay £100 to £200 each year (preferably twice that sum in a two-year period) on any project which was approved by the College. This would enable him, without feeling that he was depriving his family of a penny, to engage in special courses of study, foreign travel, attend conferences, or, if he knew how to use them, purchase expensive equipment such as x-ray plant or electrocardiograph. This would involve friendly supervision by the College of its members, and the possibility that if a member did not attend his membership might lapse, but at least the money spent would definitely improve his capacity to serve his patients. For the fellows, who would be a smaller and senior group, I suggest a straightforward emolument of £1,000 per annum or more, which would help them to take assistants or partners, give them time to think and opportunities of meeting their equals in the other branches of medicine, passing on any ripe wisdom they may have obtained and bringing back to meetings of the College anything they can learn. The actual cost to the Exchequer of some such system would be only a small fraction of the cost of the Health Service, probably less than £500,000, but its value in raising the standard of medical practice throughout the country would be inestimable and continuing.

These three suggestions would, I think, go far to enable the Government to meet the doctors' demands at the present

time without too great an immediate call on the national finances. They would improve the service and thereby help the public. They would be interim proposals to help the Government in its present policy of controlling inflation, offered without prejudice to the justice of our demands for the full implementation of Spens and in the realization that with the exit of many doctors in two years' time conditions will alter considerably.—I am, etc.,

Winsford, Cheshire.

W. N. LEAK.

SIR,—Never in the history of this country has a just application been turned down in such a dictatorial way. That it should be so done to an "honourable profession" shows the decline we have in the type of men now in power in our country.

We shall doubtless hear, during the next few weeks, many public statements about the dictatorship of Colonel Nasser and his failure to stand up to agreements, and yet here we have our Government acting in the same way at home. As we are now using strong-arm methods on Nasser, why do the medical profession (who, if so minded, could cripple this country in three days) not take strong action in some of the various ways suggested in the *Supplement* of July 28, many of which would be effective.

At the Conference of Local Medical Committees in June, the Minister appeared and asked for the co-operation of the profession, and within a month he has shown us that he himself is not willing to co-operate, but he still goes on allowing large amounts of money to be squandered on projects put up by county councils and the health authorities, many of which in our eyes are unnecessary, or at least could wait until better times. One can foresee in these things that the day is not long distant when we shall be entirely controlled by the Minister of Health rather than the B.M.A.

Now is the time for great leadership in the B.M.A., and in the re-election of Dr. Talbot Rogers as chairman of the G.M.S. Committee I, for one, can feel the greatest confidence that the outcome will be successful.—I am, etc.,

Bilford-on-Avon,
Warwickshire.

M. V. MURRAY.

SIR,—The following resolution was passed unanimously at a special meeting of the Blackburn Division on August 3: "That this meeting of the Blackburn Division of the B.M.A. wishes to express its deep indignation at the Minister's flat refusal to consider the just claim of the profession for implementation of the Government's promises in respect of remuneration. It pledges its full support to the Negotiating Committee and urges that the strongest possible measures be adopted to secure the just settlement of our claim."

We trust that other Divisions throughout the country will be quick to follow our example.—I am, etc.,

Blackburn

T. J. BURKE,
Hon. Public Relations Officer,
Blackburn Division, B.M.A.

SIR,—By what means can so large and important a body of men and women as the medical profession make the Government and public at large aware of the deep resentment they feel at the summary rejection of their moderate and just claims, claims made only after a prolonged period of exemplary self-restraint?

It is time now to start immediately to determine what action we should take and to prepare for such action. We should study, too, the probable effects of such action upon the doctors and upon their patients. We could, by careful preparation in good time, do a lot to mitigate any ill-effects and a lot to demonstrate any benefits that are likely to accrue. It is very likely that refusal by us to comply with certain important terms of service for a sufficient period of time will be sufficient to convince the Government that we mean business. It is possible, however, that we may have to resort to mass resignation from the Health Service. It is even possible that the Minister of Health will accept our resignations. We cannot start preparing too early.

There are thousands of younger medical men and women who have had no experience of private practice, and who look upon the possibility of having to resort to such with doubt and trepidation. We should take steps to deal with such doubts and fears well in advance and to demonstrate some of the undoubted benefits of universal private practice both to the doctor and the patient. The time for useless recrimination and for letters of shocked indignation is past. Let us start to prepare now for all eventualities and, by so doing, show the Minister of Health that we have learnt the lessons of the past.—I am, etc.,

Salford.

F. M. RIFKIN.

SIR,—I received to-day a letter from my M.P. stating that the doctors' claim could not be met because of the "effort to stabilize prices and prevent further inflationary pressures in our economy." To-day I also heard that the salaries of the senior Civil Servants are to be increased by £900-£1,500 per annum.

I expect the Negotiating Committee will be faced with similar arguments when they meet the Minister and hope they will ask him to comment on the above-mentioned pay increase.—I am, etc.,

Bishop's Stortford

I. D. PATERSON.

SIR,—Now the Government has refused our claim, we are at a vital crossroads in medicine, and if we show the same apathy as in 1948 then our position must steadily decline from now on. If the Government can repudiate its side of the agreement then we can justifiably repudiate ours. The only way to do this is for all general practitioners to resign. At the moment we all render an average of five to six items of service per patient per year for a gross 3s. per item—less tax and expenses, and we are almost at the "bob-a-job" level. With the high incidence of coronary thrombosis amongst doctors I feel this situation is intolerable.

I suggest we offer the same services as at present for an annual premium of £5 per patient (or 9s. per month or 2s. 6d. per week), payable by the patient direct to us—not an exorbitant sum remembering doctors' "clubs" were run for 1s. per week before the war. With lists reduced to 1,500 to 2,000 this would give a gross income of £7,500 to £10,000. We could pay the chemists direct monthly, and, from the present national drug bill, this would work out at at least £1,800 to £2,400 for the size of lists suggested. We could all have full-time nurse secretaries, which would cost at least £600 per annum. We should all have two sessions of two weeks each postgraduate study, the cost allowable as legitimate expenses. Add to this our present expenses and we should be left with a taxable income of £4,000 to £5,000. We should then be able to afford better equipment (even portable x-ray or E.C.G. apparatus for those interested), have time for complete overhauls of patients, for minor surgery, and for all preliminary investigations. This is bound to relieve the strain on hospital out-patients.

For the whole population this scheme costs about £250 million—about £50 million more than at present, but a large proportion of this extra amount would come back to the Government as extra taxation. Therefore a part or the whole of each person's premium could be returned by the Government by existing machinery (decreased insurance contributions, increased family allowances, and increased old age pensions). No Government preaching social service could refuse to make some compensation, and in one fell swoop would go this nonsensical idea of a "free" medical service, and we would be for ever lifted out of the political arena.

This is not against the recent idea of a united action in the profession, because general practice would once more be a really worth-while job, and the hospitals would be hard put to find staff unless the Government was prepared to pay competitive salaries. A wider dissemination of the knowledge of the British United Provident Association would help our part-time consultant colleagues. On a given date—say January 1—there could be a smooth change-over

with no question of a strike and no necessity to withhold certificates. If we had all resigned from the National Health Service the public would have no option—treatment would continue, but on our terms. With courage and united action we could lift ourselves out of this futility into which we have allowed ourselves to drift.—I am, etc.,

Tunbridge Wells.

A. E. LODEN.

SIR,—At a meeting of the Kesteven Division of the British Medical Association, held on August 6, 1956, the following resolution was unanimously adopted:

That full support be given to the Negotiating Committee in their endeavours to impress on the Minister of Health the fact that the profession insists on the full implementation of the Spens Report, since the Minister's acceptance was one of the main conditions that persuaded a reluctant profession to enter the Health Service.

It was strongly urged that the Association have in readiness plans for action if the Minister should prove to be recalcitrant in this matter. All present were in favour of resignation if the Minister failed to implement the Spens Report.—I am, etc.,

Grantham.

F. J. JAUCH,
Hon. Secretary,
Kesteven Division.

SIR,—When, some months back, the Joint Negotiating Committee informed the Government a claim was pending to compensate for the fall in the value of money in recent years, *The Times* commented that such a development was "inevitable." In the leading article of August 9, although there is confirmation of Governmental acceptance of the two Spens Reports proposals, the writer goes on to say: "It [the pledge] should never have been given in so unconditional a form and with so little regard for its implications."

Without such "pledges" it is certain that the profession would not have entered the Health Service and co-operated as has happened. This leading article implies that undertakings which subsequently prove inconvenient should not be binding. The one redeeming feature is the suggestion in the last two sentences that "some more practical and durable method of reviewing remuneration from time to time is required." Under our existing "treaty" with the Government a good case has been made out for an increase of 24%, much of which should be back dated far beyond the April 1, 1956, suggested.

This claim should be pressed, and any counter proposals considered on their merits. Should it be possible to obtain a somewhat lower immediate payment in return for an undertaking to review the cost of living adjustment automatically at, say, three-year intervals, and outside the sphere of politics, it would then be up to the profession to accept or reject the offer. Unless acceptable negotiations result within three months a united profession should demand arbitration on the "pledges" as they stand and take whatever steps prove necessary to secure that arbitration is granted. I do not remember the days of 1946 and 1948 as "wildly optimistic" (*Times* wording), and, however much statistics and arguments may cloud the issue, the middle class has had a raw deal ever since 1939. As a profession doctors did not seek nationalization, and do not see why, when wages have increased faster than the cost of living, the premises on which they agreed to enter the Health Service should now be deemed "unrealistic." We have endured inflation with patience since 1952. Events may prove Mr. Turton's blunt refusal not only unjust but the start of the landslide of his party. Let us hope he will think again, and soon.

The Health Service, as it stands, is a success. With a profession smarting under a sense of injustice it could not remain so. The whole economic future of doctors is now at stake. Degrees of hardship may vary, but let us not be fobbed off with placebos for the hardest hit. Upward adjustment must apply to all.—I am, etc.,

Dorchester.

T. V. COOPER.

A Pathologist's Pay

SIR.—Dr. A. S. Nicholas's conclusion (*Supplement*, August 4, p. 95) that the B.M.A. "fails to act in the best interests of the profession" appears entirely justified so far as the registrar grades are concerned. At no time before the recent general claim did the Association press for their salaries to be raised to a minimum of £1,000—surely not an unreasonable demand for a professional man some ten years after commencing his training. Nor, to the best of my knowledge, has it fought very vigorously for an alteration in the iniquitous ruling whereby doctors in hospital practice are not allowed textbooks and journals as expenses for tax purposes, quite apart from the question of a car allowance.

It is small wonder that most of the younger doctors feel that the Association is not particularly concerned with their interests, and is run by and for the established practitioners. In fact, I doubt whether many members of Council could detail accurately off-hand the present rates of hospital pay. When the Minister of Health stated recently in the Commons that the average remuneration of general practitioners is £2,222 per annum net, this figure was widely publicized in the national press. The fact that many doctors earn less than half this amount appears to have been conveniently forgotten.—I am, etc.,

Liverpool, 18.

M. GOLDMAN.

SIR,—Dr. A. S. Nicholas's account of why he left the medical profession (*Supplement*, August 4, p. 95), so widely publicized by the daily press, is a misfortune for all of us, the more especially as our claim for adjustment in pay is still at issue.

However much may be said about Spens and contractual obligations, the only true justification for our recent claim is that many of the younger members of our profession are suffering real hardship as they gamely struggle up the medical ladder. Dr. Nicholas contrives to give a totally different impression—namely, that doctors are dissatisfied because they cannot get rich quick, and are not so well rewarded as the business man. The general public, their minds firmly fixed fifty years behind the times and convinced that all doctors are grossly over-paid, will be more unsympathetic than ever to us. Without public support, our cause is a hopeless one. What a disservice Dr. Nicholas has done us! —I am, etc.,

Stockport.

G. SCLARE.

Board and Lodging Charges

SIR,—Many honorary secretaries of Branches and Divisions must feel, like myself, unhappy both about the decision of Medical Whitley B Committee on board and lodging charges and the manner in which the announcement of the decision is made. The British Medical Association is, as usual, being blamed, and the hospital resident staff, especially the juniors, are saying once again that the B.M.A. is not interested in their welfare and only cares about established consultants and general practitioners.

Although the B.M.A. at its Annual Representative Meeting has reaffirmed the autonomous powers of the Central Consultants and Specialists Committee and that body in turn has delegated the duties of negotiation for hospital staff to the Joint Negotiating Committee, the Branches and Divisions of the B.M.A., and of course the Council, must accept some responsibility for the action of the Staff Side of Committee B and ought to feel concern that that body has agreed to the principle that the hospital resident staff be charged for their board and lodgings on the basis of their salaries and not on the accommodation provided. At the Annual Conference of Honorary Secretaries, both last year and the year before, there was general agreement that lodging charges should be linked with accommodation provided, some of which is definitely bad, and that generous allowance should be made for the benefit to the hospital of having medical staff living in. I for one thought that at this

year's conference an assurance had been given that the Staff Side of Whitley B accepted this principle and had it constantly in mind in their negotiations. The result of these negotiations, as announced in the *Supplement* of August 11 (p. 99), makes curious reading in the light of that assurance.

With regard to the manner of the announcement, one must feel even greater disquiet, for it is symptomatic of the way negotiations are carried out on our behalf. The Staff Side agreed on July 24 to changes being made on August 1, and the announcement of the change first appears in the medical press on August 11, those affected having been already notified by lay administrators of the change at the end of July. Surely our representatives should keep us informed of what they are doing on our behalf and not leave us to get the information first from others.

One final but important point is that when negotiations are being carried out, and the negotiators themselves are not personally affected, representatives of those who will be so affected should be consulted by the Staff Side before accepting any decision.—I am, etc.,

Liverpool, 9.

V. COTTON CORNWALL.

Stamped Prescription Forms

SIR,—It was usual, when doctors wrote prescriptions, to put the address of origin at the top and a signature below the document.

But now that these unimportant details are to be added to the forms for selecting treatment from the *N.F.*, we find them relegated to the back of the note as an addition to the "general information" (wash the bottle: take this anywhere you like), pride of place on the front being held by "Form E.C.10," and "— Executive Council."—I am, etc.,

West Bromwich.

A. C. V. JONES.

Merit Awards

SIR,—Your correspondent Dr. H. G. McGregor (*Supplement*, August 4, p. 95) does not appreciate the great interest and wide implications that attach to the merit award system. Its application to the pay of consultants must be regarded merely as a pilot scheme. If this ingenious idea—the fine flower of Lord Moran's subtle genius—is a success, its benefits must in equity be extended to the whole profession. From a nationalized profession to other nationalized undertakings, and indeed to the whole field of industry is an inevitable progression. Like automation, Lord Moran's plan—at once so simple and so imaginative—may well herald a new era in industrial relations. The institution of secret committees for individual industries empowered to distribute Government money to anonymous employees (without public accountability) should serve to maintain a new and salutary discipline among industrial workers.

Dr. McGregor does less than justice to the Annual Representative Meeting in calling it "an amorphous collection of delegates, many of whom are in no position to form a judgment on a matter which does not affect them." The question is not one of technicalities but of simple ethics. The principle involved is so well defined and its implications of such far-reaching importance that many consultants will be profoundly grateful for the considered opinion expressed by the A.R.M.

There can be no possibility of compromise. This remarkable system is either brimful of the most exciting potentialities or else it is inherently vicious and demoralizing. If the latter, then it should be scotched before it spreads its clammy tentacles too far.—I am, etc.,

Sudbury, Suffolk.

H. BATHURST NORMAN.

SIR,—Dr. H. G. McGregor, in his letter on merit awards (*Supplement*, August 4, p. 95), states that the delegates at the B.M.A. conference were "an amorphous collection . . . many of whom are in no position to form a judgment on a matter which does not affect them." He errs grievously.

It affects them in two ways: (1) as taxpayers they have every right to resent the secret doling of public money; (2) as representing a profession they have a duty to protest against one section of it receiving secret pensionable sinecures.

In your account of the debate on the relevant motion (*Supplement*, July 14, p. 41) several consultants spoke, but it is not stated whether they disclosed if they had a personal monetary interest in the matter, nor does Dr. H. G. McGregor disclose whether he has such an interest. I can see no reason why in financial matters medical debates should not conform to the legal requirements of municipal and parliamentary debates. As to the clandestine central committee with this enormous patronage in its hands, with its secret agents and dubious methods, it is high time that its activities were investigated by a judicial body and a small section of the community was subjected to the disciplines of orthodox finance.—I am, etc.,

Beckley, Rye.

C. G. LEAROYD.

Conduct of Patients

SIR,—In view of the fact that no regulations or sanctions can be applied to patients whose behaviour is unsatisfactory, because lapses in good manners manifested by impertinent, uncollaborative, or inconsiderate behaviour are not illegal, surely the remedy for our troubles lies in a return to the old robust customs of ordinary society. If two people cannot get on, provided they do not endanger the Queen's peace or infringe the law of the land, the business or professional association ceases. It is childish, and a reflection on the lack of stamina in the population, that if a doctor is in fact rude, or is thought to be rude, the patient has the right of complaint to a committee. This right should be removed and restricted to serious matters. If doctor and patient cannot patch up a squabble due to fatigue or irritability on either side, the patient should select another doctor and that should be an end of the matter. It is quite preposterous that a doctor can be reported and fined for bad manners, especially as we all endure bad manners in one form or another every day. Incidentally, any attempt at reprimanding a patient for tiresome conduct is at once seized on as "rudeness." We do not want more regulations for patients, but fewer of these impositions for doctors.—I am, etc.,

Reigate, Surrey.

L. DULAKE.

Maternal Deaths.—The Ministry of Health points out that in its summary of the report for 1955 of the Central Health Services Council the reference to the maternal mortality rate should have read: "the maternal mortality rate has, since the turn of the century, been lowered from five to under one per 1,000" (not "per 100,000").

Meetings of Branches and Divisions

MERSEYSIDE BRANCH

The annual general meeting was held on June 6 at the Liverpool Airport Hotel, Speke. Members were entertained to lunch by Evans Medical Supplies Ltd.; Dr. D. Riding, medical director of the Evans Biological Institute at Runcorn, presided. After the meeting members visited the factory at Speke. The day concluded with tea at the Liverpool Airport Hotel, where members were joined by their ladies, who had been entertained at Speke Hall by the Automatic Telephone and Electric Co. The following officers were elected:

President.—Dr. P. J. Gibbons.

President-elect.—Dr. L. Crawford.

Vice-presidents.—Mr. D. R. Owen and Dr. C. W. Warner.

Honorary Secretary and Treasurer.—Dr. V. Cotton Cornwall.

TAX ASSESSMENT OF PART-TIME CONSULTANTS

CROWN APPEAL

The Crown has appealed against the decision of the Special Commissioners of Income Tax on the assessment of the remuneration of five part-time consultants (*Supplement*, August 18, p. 103), and the appeal will be heard in due course by a judge of the High Court.

SUPPLEMENTARY OPHTHALMIC SERVICES

FLAT LENSES

The following is the text of a letter (E.C.L. 49/56) from the Ministry of Health to clerks of executive councils.

I am directed by the Minister of Health to refer to the provision of the Statement of Fees and Charges that flat lenses are to be supplied for reading glasses unless curved lenses are prescribed as necessary, or are supplied at the applicant's request on an additional payment by him.

The Minister has been informed that a large part of the present manufacture of flat lenses will cease in the near future, and he is considering whether this will involve provision in the Statement of Fees and Charges for the supply of curved lenses for reading glasses without limitation. In view of existing stocks of flat lenses, which are less expensive than curved ones, he does not, however, propose to alter the present provisions immediately on the cessation of production, and I am to emphasize that the requirements about supply of flat lenses with reading glasses should be observed unless and until they are modified. It is most undesirable, for the sake both of fairness between patients and of use of existing stocks of lenses, that any tendency should develop among prescribers of prescribing as a matter of course curved lenses for reading glasses as "necessary." If, therefore, the Ophthalmic Services Committee have reason to think that such a tendency is developing either generally or on the part of individuals, they will no doubt approach the persons concerned and explain, in so far as the change in procedure appears to be connected with an expectation that flat lenses will go out of use, that a change of practice on such grounds is not in accordance with a reasonable interpretation of the prescriber's current responsibilities under the Statement of Fees and Charges and is unfair to other prescribers and their patients, and that the Committee are informed that stocks of flat lenses are ample for the time being.

Should there be any signs of a general tendency to prescribe curved lenses as necessary for reading glasses, the Ophthalmic Services Committee should consider sending a circular letter to prescribers explaining the position and, where opticians are concerned, of enlisting the help of the local optical committee.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Keeping Up With the Times

SIR,—Frederick Scott Oliver is a safe man to quote, and *The Times* is to be congratulated upon going to this source for the conclusion of their leading article on Suez. You, Sir, are to be congratulated and thanked for repeating it (*Journal*, August 18, p. 406).

I wonder if your readers are familiar with another quotation from F. S. Oliver, which at the present time seems more appropriate to our own professional troubles. It runs as follows: "When lawyers monopolize political power—even when they merely preponderate, as of late years they have seemed to do more and more in all democratic countries, whether of the monarchical or republican type—they invariably destroy by insensible gradations that which is most worth preserving in man or State, the soul. Their method is to strangle slowly like ivy."—I am, etc.,

Selby, Yorks.

JOHN C. GILLIES.

Remuneration Claim

SIR,—Unlike some of my colleagues who have written to the *Journal* recently regarding remuneration, I am neither surprised nor dismayed by the rejection of our claim. I am not surprised, because the Government is at long last supposed to be trying to do something positive to halt inflation: extra-special appeals for restraint are being made, and, though these will be ignored by trade union leaders, it would be impolitic to grant an increase in remuneration to doctors with all the publicity that this will entail. In this regard the B.M.A. is much to blame. It held back, with its mistaken policy of restraint, when claims were being made by other professions, and being granted.

Neither am I dismayed by the Minister's rejection. What I expected from a politician, and what would have dismayed me, would have been the embarkation upon prolonged negotiations which would have gained for us some derisory increase in 1960 or maybe 1961. Now at least we know where we stand. I expected some sort of declaration and lead from the B.M.A. before this time. Is the B.M.A. waiting for our indignation to subside? Are we going to plead with the Minister that we should at least be allowed to start negotiations? If we do start negotiations there must be a definite foreseeable date by which time they shall be

complete, and there must be no equivocation about the amount of the claim. If negotiations are not completed by a certain date the arrangements must have been made by that date for a mass resignation. The public will suffer, but that is one of the reasons why pay claims are settled quickly.

I am reminded of a pay claim by nurses in a mental hospital in, I think, Brisbane. Negotiations dragged on for two years, until one day the nurses did not turn up for work. The Minister of Health visited the hospital and agreement was reached in two days. There is a moral in that somewhere.—I am, etc.,

London, W.1.

A. W. BEARD.

SIR,—I am in full agreement with the proposals put forward by Dr. A. M. Goldthorpe and Dr. S. T. Pybus (*Supplement*, July 28, p. 87). These letters have had some publicity recently in the lay press. There are many aspects of the Service which are contradictory to the glowing Guillebaud report. For example, recent statistics show that by far the greatest number of Health Service patients seek their family doctor's care for antenatal treatment. Public health authorities are rather "alarmed" about these facts. It is obvious that the vast sums of money squandered on public authority antenatal clinics might be at least curtailed. Other examples can easily be cited where facts prove that there is a great deal of unnecessary expenditure in the administration of the Service. How long is the doctor and his family to suffer our collective "kid glove" tactics with a Ministry persisting indefinitely in the Alice in Wonderland role? The B.M.A. will certainly have to reassess its powers (if these are not in its present constitution) to withdraw services and to plan for this type of action. Certainly the present situation warrants this all the more, and future troubles with a lay Minister may well make this an imperative decision. It is up to every medical practitioner to support B.M.A. action, and more especially is it true that every young graduate should seek its membership. It is very urgent indeed that the B.M.A. presents a tougher attitude to cavalier treatments and willy-nilly attitudes of Ministers, who are essentially, at any rate, party politicians. And is not the whole tempo of the N.H.S. (as we have come to experience it) in its gross inefficiencies due mainly to the considerations of party politics?—I am, etc.,

Birmingham.

J. J. BROOKS.

SIR,—It is a pity that Drs. A. C. J. Saudek and H. P. Hilditch (*Supplement*, August 11, p. 100) should choose to stir up internal controversies at a time when it is vitally necessary for the profession to be completely united. It might have occurred to them that such unity is not likely to be achieved if thousands of those concerned are to be excluded from any benefits that may accrue from a successful fight on the remuneration issue. It is, of course, nonsense to suggest that the Minister's attitude is being determined by the methods that the profession chooses to distribute the available money, and any attempt at this point to forward sectional interests could only end in defeat for us all.

There are a number of fallacious statements in their letter which, through constant repetition, may be accepted as true unless they are actively contradicted. First, let it be firmly stated that large-list doctors do not, for the most part, have large incomes; relatively large maybe, but still small compared with those earned in other professions and in business. Most of them have commitments proportionate to the level of their incomes, and the inflation of recent years has placed many in a difficult financial position. Furthermore, they have not obtained their status by "head-hunting and poor standards of practice," but by hard work, ability, willingness to practise in undesirable areas, and reputations built up through the years. Finally, young doctors must realize that there is nothing new in having to make do on a small income in one's early years of practice. This was certainly the case when I first started; however, in those days it was the custom to get established first and get married afterwards, so that we did not suffer so much hardship.

Surely the thing to realize is that all of us, young and not quite so young, general practitioners and consultants, established and unestablished, are all relatively hard up, and that we must concentrate all our energies and thoughts to the common good. Otherwise we shall certainly get nowhere at all and we shall have to consider giving up medicine for some more remunerative occupation or, at any rate, taking good care that our sons do not follow in our footsteps.—I am, etc.,

Margate

M. CURWEN.

SIR,—Our profession appears once again to be meekly accepting the adroit handling of the Minister of Health, aided and abetted by his lay staff. The Negotiating Committee, having talked of firm action, is now in conclave working out legal arguments which should provide the Minister with debating points for many months to come. Further, it is holiday time and Parliament does not reassemble until October, so why rush? Our esteemed *Journal* even tells us to enjoy our holiday. Among associates one begins to detect an attitude of "The Minister has done it again, and wangled out of commitments as in previous times." This easy acceptance, surprisingly enough, comes from practitioners who are the first to grumble about their compensation and the many inadequacies of the Service but once more seem to be mildly bending their heads to the ministerial yoke.

I suggest we decide whether, in the light of present conditions and previous authoritative promises, we consider increased remuneration justifiable and necessary. If the answer is yes, then we should not allow the Minister to dilly-dally but should tell him we insist on a proper scale of payment being made. This must date from April, 1956, and must be accepted within one month. If the Minister is on holiday then his staff, who answered so off-handedly before, can do his thinking for him and implement our proposals. If we are not united in this purpose then we waste our time, but if we are then we should have a definite line to follow to ensure results. The British Medical Association should advise all area secretaries to call branch meetings in September, and, again provided the profession considers its claim reasonable, I suggest the following points be voted on: (1) The profession should give one month's notice of their intention to stop issuing National Insurance certificates. (2) If after one month of refusal to issue certificates our claim has not been met the profession should give a stated time, say four months, after which there should be mass resignation from the Service. In the meantime the public be warned of this likelihood and insurance companies approached to try to work out some insurance scheme for general health purposes. There would be no question of refusal to treat anyone who was ill.

The opportunity should also be taken to make the Minister and his Civil Service advisers realize that the profession are the important workers of the Health Service, and that, while the public is the first consideration, the profession comes next, and the ministerial staff a very low third. In this way we can control our own affairs and make sure the doctor knows of any advances, schemes, or changes before the public. We do not begrudge the Minister his television appearances, but we should control them when medical matters are involved.

I agree that many improvements are necessary in the general running of the health scheme, and also in the method of remuneration, but our first consideration at present should be the implementation of our claim and the insistence on control of the working of the scheme. Any alterations in the present National Health scheme system can then be made by a united profession striving to reach an efficient peak of service, both from the doctor's and from the patient's point of view.—I am, etc.,

Luton, Beds.

ANDREW JACKSON.

SIR,—The newspapers and our own P.R.O. tell us that we, as G.P.s, receive an average net income of £2,222. Some of us are mystified, as we only have the evidence of our

quarterly cheques to guide us, and they seem to tell a different story.

In front of me I have a quarterly statement from our executive council concerning a colleague, not in my partnership. His figures read as follows:

	£	s.	d.
List of 2,164 at 4s. 3d.	459	17	0
Loading	125	0	0
Superannuation	37	8	10
Temporary residents	11	1	0
Total	633	6	10
This equals £2,533 7s. 4d. per annum gross.			

The practice expenses incurred are not likely to be less than 30% of this figure, which gives a net income of roughly £1,774. Now the point of interest to all of us is: What happens to the very substantial difference? Most of us in working-class practice have no private work.—I am, etc.,

J. W. SIMPSON.

Harrow.

SIR,—I noticed in Sir Anthony Eden's broadcast he mentioned the sum of £70 million compensation that Colonel Nasser had promised to pay to the Suez Canal Company when he nationalized the canal. The Prime Minister has no faith in this being paid. I do not think he has much to criticize on this score when you consider the £66 million still due to the medical practitioners after 10 years of nationalization. All we get is a meagre 2½% interest, and income tax is deducted from this. It would appear that the Egyptian president is taking a leaf out of the Government's book. I suggest that the Prime Minister should clear his own debts before criticizing others.

I hold no brief for Colonel Nasser, as I dislike Fascists and Communists as much as any other man, but I did want to draw your attention to Sir Anthony's statement. Maybe some use could be made of it in the negotiations.—I am, etc.,

H. W. DAVIS.

Huddersfield.

SIR,—Each week the letters in your columns regarding the remuneration claim stimulate many of us to almost fighting pitch, but frustration follows when no action results. I suggest that the B.M.A. forms an "action committee" which must decide on some form of token strike—e.g., refusal to sign National Insurance certificates. Ballot forms should be sent to all doctors concerned, and, if the method is approved by the majority of us, it should be implemented without delay. It seems that some form of token strike is needed and many of us are only awaiting a decisive directive as to how and when. Let the B.M.A. give it soon.—I am, etc.,

C. R. LYNN.

Harold Wood, Essex.

SIR,—The Minister of Health and his Scottish colleague appear to have timed their reply to our claim (if such it can be dubbed) with some care, so as to postpone the inevitable clash between the profession and the Government. Is it not possible for us to turn the Ministers' dilatoriness to our advantage? I submit that, by affording us more time, the Ministers have offered us the opportunity of strengthening our case, and that we would be most ill-advised not to take advantage of this.

In the first place, we can now launch a vigorous national publicity campaign disabusing the public of the widely held view that we are already well off and only making an unnecessary and unjustifiable fuss. This should be conducted through the media of press, radio, and television. We could also strengthen our bargaining position in two ways. We could, in the next two months, make a formal and urgent approach to the representative bodies of other professions, with a view to bringing into play collective pressure in excess of that possible with our meagre numbers, pledging mutual support between the professions; and we could initiate a nation-wide effort to become somewhat less dependent on the Government for our livelihood (and there are ways of achieving this which are perhaps best left unpublished at present).

Finally, we can prepare a definite, albeit flexible, schedule of measures to be brought into play in its entirety or piecemeal, as the Ministers' attitude demands, each measure applicable to an anticipated obstructive manoeuvre on the part of the Government. As I see it, without such a plan we are doomed to being out-generalled by Ministers who have at hand not only the big guns but the inclination to turn them on us.

Is it not possible, Sir, for the Council of the B.M.A. to consider these with the other suggestions that have been made, to institute immediate emergency action, and, above all, to inform the profession what manner of additional armaments it has been possible to muster, before joining battle in October? Failure to seize this opportunity now cannot but jeopardize our negotiating committee's position in two months' time.—I am, etc.,

JOHN K. PATERSON.

Union, Hunts.

Emergency Call Service

SIR,—Recently the Duke of Edinburgh, when he opened the Study Conference on Human Problems in Industry, said: "It may not be very easy to decide what we are aiming at in this modern world of ours, but whatever the target we must take into account that all people are primarily citizens, and not just workers with a bit of private life."

The present-day G.P. is a worker with about as much private life as a battery hen. Our patients also are not over-contented with things as they are. How often does a patient get "tided over for the night" with some tablets, when he would have much preferred a visit? Since the G.M.S. Committee has condemned the Emergency Call Service, I wonder if an alternative scheme would be acceptable. The public health services have been evolved to meet the needs not met adequately by other agencies, and until recently were always in a constant state of extension and development. A salaried night service, run by the public health authorities, would no more be in competition with the family doctor than the present school medical service. Indeed, it might well be initially recruited from doctors in the school medical service assisted by the health visitors.

Why cannot the London Emergency Call Service be regularized and expanded on the above lines, and the whole country enjoy its advantages?—I am, etc.,

D. S. PORTER.

Caterham, Surrey.

Health Centres

SIR,—I would like to express my pleasure at the report of the London Local Medical Committee (*Supplement*, August 4, p. 89), for I am in complete agreement with their conclusions. In my opinion the only intelligent method of conducting general practice these days under the National Health Service is from a health centre. It is only in this way that our full potentialities in the realm of preventive medicine—surely our ultimate aim—can be realized.

Most of the recommendations in the report are already in effect at the William Budd Health Centre, which was built by the Bristol local health authority and has been running since July, 1953. Here I must say that, despite some early misgivings from our colleagues, we have had every help and encouragement from the local authority and especially from the medical officer of health, Dr. R. C. Wofinden. The building is of modest proportions, doctors are consulted over all staff appointments, and they work in close co-operation with the health visitors and other local authority workers who use the consulting-room suites in the afternoons. The doctors hold their own infant welfare and antenatal sessions at the centre. The reason why doctors outside the centre are not invited to share in these facilities is quite simple. The centre is fully occupied daily from 8 a.m. to 8 p.m., and it would just not be possible to hold any further sessions. The answer is for outside doctors to get together and agitate for more health centres.

Group partnerships in which there is a limited amount of specialization have their advantages, but at the William Budd the absence of such a partnership is not found to be

in any way a drawback. Doctors do see each other's patients in emergency and call each other into consultation over puzzling or interesting cases.

Under the National Health Service Act the health centres, of course, must be provided by the local authority. I am afraid that the loan scheme for group practice will not attract more than a few groups of doctors. After all, we have to buy our own houses, and that means a capital investment of between £3,000 and £4,000, and I feel sure most doctors would be unwilling or unable to invest any more money into group practice buildings. On the other hand, the local authorities could take over and convert large houses in built-up areas at minimal expense.

The doctors at the William Budd pay only a nominal rent, and that, in my opinion, is as it should be. We are not engaged in "business" nor does the better service we provide increase our remuneration, although it takes up far more of our time. Physicians and surgeons working in hospitals do not pay for their consulting-rooms, theatres, and so on. Unfortunately we are too often bedevilled by the question of costs, and yet the balance sheet can be most misleading. The William Budd on that score looks expensive to run, but the money is spent for the most part on wages and salaries of people who would be doing that work anyway, and in premises which would otherwise be empty for many hours each day. The allocation of costs between the general practitioner and local health authority branches of the service is purely nominal on a two-thirds to one-third time-user basis, but in fact is quite unrealistic, for such is the integration achieved that it is impossible to separate the two on a proper actuarial basis. It is also impossible to assess the benefit to the patients from what is undoubtedly a higher standard of medical service.—I am, etc.,

Bristol, 4.

J. SLUGLETT.

Subsistence Allowances

SIR,—Will you allow a very old member to comment on the recent A.R.M.? I have read the accounts of the meeting with interest, but regret some of the decisions come to, and particularly the vote in favour of subsistence allowances (*Supplement*, July 14, p. 15). Some of the arguments put forward in support are far from convincing. I cannot think that the quality of representation, or the democratic foundation, is threatened. The meeting itself contradicts any such fear, for there is said to have been keenness on the part of representatives, both young and elderly, and the speaking was on a high level. This does not suggest difficulty in enlisting suitable representatives, or any reluctance to serve. The chairman of the Organization Committee spoke of many men and women ready to sacrifice their time and energies in the work of the Association, and this applies to representatives as well as to those engaged in other activities; and may this happy position long remain.

I ask: Is it necessary to upset the finances of the Association by this new expense? So as not to seem entirely obstructive I suggest that a Division wishing to contribute towards its representative's expenses could do so through a local voluntary fund, many of which already exist. One speaker proposed an allowance of two guineas per day, and on the present basis of representation that means less than 5s. per member, which should be willingly subscribed.—I am, etc.,

Sheffield.

HENRY BROWN.

Board and Lodging Charges

SIR,—Recently the appropriate Medical Whitley Council has agreed that board and lodging charges for resident medical officers be standardized at all grades throughout the country (*Supplement*, August 11, p. 99). For senior house officers—of which I am one—the sum is £150 per annum.

I further understand that no abatement is allowable on account of annual leave. In spite of this, in some hospital groups the residents are rebated while on holiday. I have benefited from this in the past. Now I am in a group where

the rebate is not allowed. This is according to regulations, and one cannot object. However, I do query the fact that locumtenents are also having their board and lodging subtracted. This means that this hospital is not only taking from each S.H.O. post at £150 per annum but an extra £15 from the locum—a total of £165. If by chance the senior house officer decides not to take a holiday I wonder how the hospital explains that it has only extracted £150 from the post—or if he does take a holiday and gets a locum, does the extra £15 go down as "capital gains"? At any rate, it does not seem to me to be a "fair deal." I would be very grateful if anyone can enlighten me.—I am, etc.,

London, N.W.1.

W. M. E. TWEED.

A Pathologist's Pay

SIR,—Dr. A. S. Nicholas (*Supplement*, August 4, p. 95), who entered his family business instead of trying to specialize, chose the better part. He was lucky to have so readily available an alternative to the prospects of the registrar grades. His analysis, made in 1952, remains accurate, with the amendment that the decline in the purchasing power of our salaries has accelerated since then.

The position of a registrar in any specialty is grim. Pathology, at one time one of the least crowded, is now rapidly filling up, and the position in general medicine and surgery should be too well known to require re-emphasis. Many of us, by the time we reach senior house officer or registrar status, desire to marry, and some are so rash as to have children. The married registrar must face life in rented accommodation for several years, as moves are too frequent to make house purchase practicable, even if the capital can be borrowed. Such accommodation is hard to find in our larger cities, often unsuitable for young children, and ruinously expensive. In addition, the family must face at least three moves, for a change of post often involves a change of residence.

Prospects of ultimate advancement do not compensate for these immediate hardships. That of achieving consultant status is poor, and is governed by a sum so simple that it does not seem to have entered the calculations either of the Ministry, which is only to be expected, or of our own Association, which might be presumed to give some thought to its younger members. Each consultant has an assistant, of one or other of the trainee grades. It takes at the most ten years to pass through all the trainee grades and attain the recommended age for consultant status. But most consultants can be expected to hold their posts for thirty years, from age 35 to 65. Therefore, each consultant is training three successors for his own post. I have yet to hear any credible explanation of what happens to the other two.

The favoured position of Dr. Nicholas and our other contemporaries "in business" needs no emphasis. They have their expense accounts and "company" cars, and often assistance with removal expenses and financing of house purchase. Some even get assistance with their children's school fees. It is obvious that the young doctor is valued by the community at less than the commercial traveller, and much less than the production engineer. The corollary is also obvious; in a few years' time there will be a lot more competition for the post of commercial traveller, and a lot less for that of trainee specialist. The first-class men will not be content to subsist, and see their families subsist, at a lower standard of living. Medicine will not attract first-class men to second-class pay and third-class prospects; a worth-while, interesting job, and service to the community, are satisfying things, but they do not pay the rent, let alone for a car.

There seem to be two ways out of the impasse; out of the profession for which we have been trained, or out of the country. Dr. Nicholas has testified to the former, and a large number of your correspondents during the last two years have borne witness to the latter. Many of my contemporaries have been in the latter group, and next month I am taking their advice and emigrating to Canada. I

Association Notices

SIR CHARLES HASTINGS AND CHARLES OLIVER HAWTHORNE CLINICAL PRIZES, 1957

The Sir Charles Hastings Clinical Prize Competition is established by the Association for the promotion of systematic observation, research, and record in general practice. The competition has been extended by the addition of a second prize known as the Charles Oliver Hawthorne Clinical Prize. The following are the regulations governing the awards:

1. The Sir Charles Hastings Clinical Prize, consisting of a certificate and £75, will be awarded for the best entry.
2. The Charles Oliver Hawthorne Clinical Prize, consisting of a certificate and £50, will be awarded for the second best entry.
3. Any member of the Association who is engaged in general practice is eligible to compete for these prizes.
4. The work submitted must include personal observations and experiences collected by the candidate in general practice, and a high order of excellence will be required. If no work entered is of sufficient merit no award will be made. Candidates in their entries should confine their attention to their own observations in practice rather than to comments on previously published work on the subject, though reference to current literature should not be omitted when it bears directly on their results, their interpretations, and their conclusions.
5. Essays, or whatever form the candidate desires his work to take, must be sent to the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1, not later than December 31, 1956.
6. A prizewinner in any year is eligible for an award of either of the prizes in any subsequent year. A study or essay that has been published in the medical press or elsewhere will not be considered eligible for a prize, and a contribution offered in one year cannot be accepted in any subsequent year unless it includes evidence of further work.
7. If any question arises in reference to the eligibility of the candidate or the admissibility of his or her entry the decision of the Council on any such point shall be final.
8. Preliminary notice of entry for this competition is required, on a form of application to be obtained from the Secretary.
9. Each entry, which should be unsigned, must be typewritten or printed on one side of the paper only and accompanied by a note of the candidate's name and address.
10. No definite limits are laid down as to the length of the work submitted, but the Council anticipates that for this competition 3,000 to 10,000 words would be suitable.
11. Inquiries relative to the prizes should be addressed to the Secretary.

OCCUPATIONAL HEALTH PRIZE

The Occupational Health Prize was established by the Association for the purpose of encouraging interest and research in the field of occupational health. The Council of the British Medical Association is prepared to consider the award of this prize, which consists of a certificate and £50, in the year 1957. Any member of the Association who is engaged in the practice of occupational health, either whole-time or part-time, is eligible to compete for the prize. Candidates may select their own subject.

Entries should be submitted in a form suitable for publication and must include personal observations and experiences collected by the candidates in the course of their work. If no entry is of sufficient merit no award will be made. Candidates should confine their attention to their own observations rather than to comments on previously published work on the subject, though reference to current literature should not be omitted when it bears directly on their results, their interpretations, and their conclusions.

Essays, or whatever form the candidate desires his work to take, must be sent to the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1, not later than January 31, 1957. No study or essay that has been published in the medical press or elsewhere will be considered eligible for the prize, and a contribution

understand that in the Dominion the conscientious practice of medicine is rewarded by a standard of living not widely different from that of the average commercial traveller.—I am, etc.,

Birmingham, 15.

H. E. EMSON.

Economy in the N.H.S.

SIR,—I hope that the advisers to the Minister of Health and the Secretary of State for Scotland will take note of the excellent advice given by Dr. H. Wilson (*Supplement*, August 11, p. 101).

Why should we, as doctors, be trammelled with the responsibility of saving Government money? Why should we be obliged to make ourselves unpopular for the sake of the Government? Our concern must be with therapeutics. The cost involved is a matter which should be arranged between the patient and the State. In other words, it is a political problem.

Several years ago, in a letter in your columns, I advocated that a list of essential medicines should be drawn up and that only those drugs should be supplied free. A doctor would prescribe what he thought fit, but the patient would pay for anything not on the list. The list of free drugs would be reviewed frequently and revised according to current opinion. A scheme such as this would create no real hardship and I feel sure would be willingly accepted by the people. Local medical committees would be relieved of the need to scrutinize their fellow practitioners' prescriptions and would apply themselves rather to the constructive work of recommending to the central committee which drugs should be added from time to time to the "free list." This would evoke stimulating discussions on practical therapeutics in place of the unrewarding, exasperating, and often futile investigation of high prescribing costs.

Much the same can be said of the ambulance service. Prior to 1948 our local nursing association financed an ambulance and car service. It was not abused, because the committee defined clearly which type of case should have free ambulance or car. Doubtful cases were brought before the committee and rulings were established for subsequent usage. The service given was efficient and economical. Nowadays cars are not used for transporting patients in my area. If a patient requires transport an ambulance must be used, although we all know that a car is often suitable and always more economical; and yet, at the same time, we are constantly exhorted to economize.

The shilling tax and the Cohen Committee reports have both failed in their intended purpose, but they clearly indicate that the Government no longer accepts the "free for all" principle in the National Health Service. The way for all is clear for another step along the lines suggested. I am convinced that this would bring economy as well as a worth-while improvement in the Service.—I am, etc.,

Fire.

JAMES B. FLEMING.

Charging Each Other

SIR,—In a letter received some weeks ago from the British United Provident Association there occurs this statement: "In the conditions of to-day, however, we find that medical men often receive accounts from their colleagues, more particularly where services are rendered to dependants." Elsewhere in the same communication one notes that "dependants" are defined as (1) wife or husband, (2) all children under 18.

A few years ago when I offered a fee to a specialist he said with some show of indignation: "It has come to some-thing if we have to make a living out of each other." And it is indeed deplorable if we have now come to that. One would like to think that this business of charging each other fees, which is akin after all to making a living by taking in each other's washing, is only practised by some of the younger members of the profession who have little respect for what one has always regarded hitherto as part almost of the Hippocratic Oath.—I am, etc.,

Brighton.

G. L. DAVIES.

offered in one year cannot be accepted in any subsequent year unless it includes evidence of further work. A previous prizewinner is not precluded from entering. If any question arises in reference to the eligibility of the candidate or the admissibility of his or her essay, the decision of the Council on any such point shall be final.

Preliminary notice of entry for this competition is required on a form of application to be obtained from the Secretary. Each entry must be typewritten or printed on one side of the paper only, and accompanied by a note of the candidate's name and address. No definite limits are laid down as to the length of essays, but the Council anticipates that, for this competition, essays should consist of between 3,000 and 10,000 words. Inquiries relative to the prize should be addressed to the Secretary.

PRIZE ESSAY COMPETITION FOR PROVISIONALLY REGISTERED PRACTITIONERS, 1957

The Council of the British Medical Association is prepared to consider the award, in 1957, of prizes to provisionally registered practitioners for essays submitted in open competition. The subject of the essay is: "Medicine is an Art as well as a Science."

In awarding the prizes due regard will be given to evidence of personal observation and experience. No study or essay that has previously appeared in the medical press or elsewhere will be considered eligible for a prize.

Any provisionally registered practitioner in the pre-registration year at the time of submission of the essay is eligible to compete for a prize. If any question arises in reference to the eligibility of a candidate or the admissibility of his or her essay, the decision of the Council of the British Medical Association shall be final. Should the Council decide that no essay entered is of sufficient merit, no award will be made. At least one prize of £50 is offered. In determining the number of prizes to be awarded, the Council will take into consideration the number and standard of essays received.

Essays must not exceed 5,000 words, and must be typewritten or legibly written in the English language on foolscap paper, on one side only, must be unsigned, and must be accompanied by a note of the name and address of the entrant. Notice of entry for this competition is necessary and a form of application can be obtained from the undersigned.

Essays must be forwarded so as to reach the Secretary of the British Medical Association not later than January 31, 1957. Inquiries relative to the competition should be addressed to the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1.

KATHERINE BISHOP HARMAN PRIZE

The Council of the British Medical Association is prepared to consider an award of the Katherine Bishop Harman Prize in the year 1957. The value of the prize is £75. The purpose of the prize, founded in 1926, is the encouragement of study and research directed to the diminution and avoidance of the risks to health and life that are apt to arise in pregnancy and child-bearing. It will be awarded for the best contribution submitted in open competition, competitors being left free to select the work they wish to present, provided this falls within the scope of the prize. Any registered medical practitioner in (a) the British Commonwealth and Empire or the Republic of Ireland and (b) any member of the British Medical Association wherever resident is eligible to compete.

Should the Council of the Association decide that no contribution submitted is of sufficient merit, the prize will not be awarded in 1957, but will be offered again in the year next following this decision, and in this event the money value of the prize on the occasion in question shall be such proportion of the accumulated income as the Council shall determine. The decision of the Council will be final.

Each contribution must be typewritten or printed in the English language, and must be accompanied by a detachable slip bearing the candidate's name and address. The Council anticipates that contributions should be between 3,000 and 10,000 words, although no definite limits are laid down. Preliminary notice of entry is required and a form for this purpose can be obtained

from the Secretary. Entries must be forwarded so as to reach the Secretary, British Medical Association House, Tavistock Square, London, W.C.1, not later than December 31, 1956. Inquiries relative to the prize should be addressed to the Secretary.

PRIZE ESSAY COMPETITION FOR MEDICAL STUDENTS, 1957

The Council of the British Medical Association is prepared to consider the award, in 1957, of prizes to medical students for essays submitted in open competition. The subject of the essay is: "The Medical Student and Research—Past Achievements and Present Opportunities."

Any medical student who is a registered member of a medical school in the United Kingdom, Commonwealth and Empire, or the Republic of Ireland at the time of submission of the essay is eligible to compete for a prize. Previous prizewinners are eligible for a second award. If any question arises in reference to the eligibility of a candidate or the admissibility of his or her essay, the decision of the Council of the British Medical Association shall be final. Should the Council decide that no essay entered is of sufficient merit, no award will be made. The prizes offered will normally be of the value of £25, but, in determining the number and exact amount of prizes to be awarded, the number and standard of essays received will be taken into consideration by the Council, which reserves the right to vary the number and amount of the prizes.

Essays must not exceed 5,000 words, and must be typewritten or legibly written in the English language on foolscap paper, on one side only, must be unsigned, and must be accompanied by a note of the name and the medical school of the entrant. Notice of entry for this competition is necessary and a form of application can be obtained from the undersigned.

Essays must be forwarded so as to reach the Secretary of the British Medical Association not later than January 31, 1957. Inquiries relative to the competition should be addressed to the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1.

A. MACRAE,
Secretary.

Diary of Central Meetings

SEPTEMBER

- 5 Wed. Coal Gas Poisoning Subcommittee, Science Committee, 2 p.m.
- 12 Wed. Occupational Health Committee, 10 a.m.
- 19 Wed. Emergency Call Subcommittee, G.M.S. Committee, 2 p.m.
- 20 Thurs. G.M.S. Committee, 10.30 a.m.

Branch and Division Meetings to be Held

SOUTH WARWICKSHIRE DIVISION.—At Board Room, Warneford General Hospital, Leamington Spa, Thursday, August 30, 8 p.m., annual general meeting.

Meetings of Branches and Divisions

SALISBURY DIVISION

The annual general meeting was held at Salisbury Infirmary on June 22, 1956. The following officers were elected:

- Chairman.—Dr. J. C. Brown.
- Vice-chairman.—Dr. A. L. Leigh Silver.
- Secretary.—Dr. I. E. Jameson.
- Treasurer.—Dr. P. S. Allenby.
- Public Relations Secretary.—Dr. G. W. Newton Dunn.

SOUTH ESSEX DIVISION

The annual general meeting was held on June 1 at the White Hart Hotel, Romford. Dr. W. J. Smither was in the chair. The following officers were elected:

- Chairman.—Dr. W. J. Smither.
- Vice-chairman.—Dr. P. S. Steen.
- Honorary Secretary and Treasurer.—Dr. J. Fife.

Correction.—The report in the *Supplement* (May 12, p. 280) of the Award by the Industrial Court of an increase of £75 in the remuneration of S.H.M.O.s should have stated that it was operative from April 26, 1956, the date of the Award, not, as stated, from April 13, the date of the hearing by the Court.

MEDICAL MANPOWER

FUTURE RECRUITMENT OF THE PROFESSION

The British Medical Association submitted a memorandum of evidence to the departmental committee (the Willink Committee) appointed by the Minister of Health and the Secretary of State for Scotland to estimate on a long-term basis the number of medical practitioners likely to be engaged in all branches of the profession in the future and the consequent intake of medical students required. For this purpose the Council of the Association set up a special committee consisting of the principal officers and the chairmen of all interested committees.

At the outset an important caveat is entered. The Association feels that any decision about the future size of the profession should evolve largely from conditions of supply and demand. The size of the profession should be self-adjusting through the maintenance of a high standard of general education, or scientific training, and of personal qualities. The interest of the Minister in medical recruitment is limited to the provision of doctors for the National Health Service, which is only a part—although a large one—of the activities of the profession.

In 1910 the population of Great Britain was 40.5 million. It has increased since then by 10 million, or 25%, and, what is perhaps more important from a medical point of view, it has increased disproportionately in the older age groups. Of the present population of 49.63 million, 6.89 million are males over 65 or females over 60. In 1964 the Government Actuary estimates that of a population of 50.86 million, 7.75 million will be in that over-65 or 60 category, and in 1979, with a population of 52.23 million, the number will be 9.5 million.

Doctors Available

While the population has increased by about 25% since 1910, the number of medical practitioners has risen by nearly 80% (from 34,000 to 61,000), though by no means all the doctors on the *Medical Register* are fully occupied in the doctors' practice in this country. This increasing number of active practice in the Association's view, the higher standard of service provided and a greater demand for doctors' services. Calculations, which must be treated with reserve because some unknown factors enter into them, suggest that the number of doctors actively engaged in general practice is 23,100; in consultant work, 8,849; on hospital staffs, 10,057; and in the public health service, 2,490.

In general practice many older practitioners who entered the National Health Service in 1948 will be eligible for a pension in 1958, but the number who may retire immediately can only be conjectured. It may well be smaller

than might be supposed because the pension will not be large and the value of the compensation for loss of goodwill of former practices which they receive on retirement will have fallen with the decline in money values. It must be expected, therefore, that many practitioners will continue to work after 65.

Whatever the result of the arithmetical calculations, the Association would be opposed to the setting of an upper limit to the number of entrants to the profession. Sufficient doctors must be available to meet a changing and expanding service and the possible shifting of balance between the different branches of practice. Advances in therapy, the possible appearance of new specialties, the emphasis in modern medicine on prevention and detection of disease in the early stages, the early recognition of deviations from mental health, the treatment and aftercare involved in the new concepts of social medicine, the rapid developments in occupational health—all these factors call for consideration, and a further important factor is that the doctor should be given time to keep abreast of modern knowledge and methods. A ceiling for medical entry is therefore undesirable or even out of the question.

No Substantial Unemployment

It is believed that any allegation of substantial unemployment in the medical profession is unfounded. The overcrowding which is sometimes alleged is fictitious. It is true that appointments in surgery and medicine are not easy to obtain, but there is believed to be no shortage of vacancies in anaesthetics, psychiatry, and radiology. Medical men are badly needed in the medical branches of the armed Forces and in the Oversea Civil Service.

The trend for many years until 1954 had been for the numbers of general practitioners to fall while the population rose. During the first seven years of the post-war period doctors who would have liked to enter general practice were deterred by what they considered inadequate financial reward, especially as it became clear that the Spens recommendations were not in fact being fully implemented. The Association holds the view that during the next ten years an increase in the number of general practitioners will be necessary.

It is also impossible to estimate how far future advances in medicine will affect the character and scope of hospital practice. Among other things the memorandum points out that greater provision should be made for the employment of suitably trained and experienced general practitioners in hospitals. It is emphasized that the field of specialist practice should be considered as a whole rather than the different specialties in isolation. Taking everything into consideration

tion, the following rough estimate of the total number of hospital staff in the consultant and S.H.M.O. grades likely to be required in the next ten or twenty years is given in the memorandum:

	Whole-time Equivalent	Whole-time and Part-time
Present establishment (1954)	7,124	9,708
Estimated future requirements	9,435	12,974

While bearing in mind the possibility of alterations in the public health service, it is felt that the total number of medical officers required is unlikely to be altered materially, unless the Government envisages a complete reorganization of the service as a whole.

Between 600 and 700 general practitioners are believed to be engaged predominantly in private practice. This number is likely to remain fairly stationary, though, should the Government accept the Association's policy of securing for private patients the right to obtain medicines in the service, the number of patients privately treated and of practitioners to attend them would doubtless increase.

The memorandum includes a brief reference to the requirements in wartime (in cold, warm, and hot war), but the surplus of doctors who would be required in nuclear warfare is beyond estimate.

Conclusion

Summarizing its conclusions, the memorandum repeats that any calculation of the actual number of doctors required during the next ten or twenty years is subject to many unpredictable and imponderable factors. Not the least of these is the rapid change in the scope of medicine. Any figure can be only a rough estimate, and, in any event, mere numbers are not the criterion of the standing of the profession or the value of its work. It is much more important that the new entrants should be of high calibre and should feel a vocation for medicine.

PUBLIC HEALTH MEDICAL OFFICERS IN SCOTLAND

AMENDED SICK-PAY SCHEME

Committee C of the Medical Whitley Council has agreed on certain amendments to the sick-pay scheme applicable to public health medical officers in Scotland, and has recommended local authorities to put this agreement into effect.

The present sick-pay scheme for medical officers in Scotland is the scheme set out in paragraph 14 of the Scheme of Salaries and Conditions of Service for Administrative, Clerical, and Technical Staffs (April, 1949) adopted by the National Joint Industrial Council for Local Authority Services (Administrative, etc., Staffs) with amendments which had been agreed subsequently by the Council up to February 5, 1951. Committee C has agreed that the sick-pay scheme for public health medical officers should be amended to incorporate amendments which have been made to the sick-pay scheme for other local authority officers since February 5, 1951. The revised scheme with the new additions side-lined for reference is set out in M.D.C. circular No. 31, and supersedes the arrangements set out in paragraph II (b) of appendix B to M.D.C. circular No. 2. Medical officers of health should have a copy of M.D.C. circular No. 31.

On July 11 Dr. J. Stanley Thomas, retiring honorary medical secretary of the East Ham Local Medical Committee, was presented with a silver salver by Dr. John Sullivan, chairman of the Committee, on behalf of his medical colleagues, as a tribute "not just for services rendered, but a sincere and grateful acknowledgment of his wise and friendly help at all times and his concern for the well-being of the general medical services in the area." Dr. Thomas has recently been appointed chairman of the East Ham Executive Council. The presentation was made before general medical practitioners of East Ham, their wives and guests, in the out-patient department of the East Ham Memorial Hospital.

WAS IT A DRUG?

Regulations 16 and 17 of the National Health Service (Service Committees and Tribunal) Regulations, 1948, provide that where a practitioner prescribes under the National Health Service preparations which are not drugs or medicines, and therefore outside the scope of the Act, the executive council may recover their cost from him. If he challenges their action, the matter may be referred to the local medical committee, with the possibility of appeal to referees.

The findings of the referees in a recent appeal under the Regulations are reported below. The decision in this, as in all cases, is related to the circumstances of this particular case only and is not binding on the referees who may hear other cases.

"Formulac"

Dr. X prescribed formulac for two patients, both suffering from hiatus hernia and one of them being pregnant at the time. The executive council decided that formulac was not a drug which they were bound to provide in these two cases. Dr. X appealed to the local medical committee, who upheld the decision of the executive council. He then appealed to the referees.

Appeal Hearing

At the hearing before the referees Dr. X said that there was no drug which will cure hiatus hernia, but the symptoms could be relieved by an antacid, demulcent, bulk-occupying substance taken in a recumbent position. Formulac was a combination of milk powder and methyl cellulose, aluminium hydroxide, magnesium trisilicate, and ascorbic acid. He relied on the collective action of these ingredients to attain his purpose. The nutritive value of the milk powder was insignificant, being equivalent to 25 calories in one dose, against 200 calories in a glass of milk; the dose was one tablespoonful once a day. The powder, as he used it, was the vehicle only for administering the drugs with which it was combined.

The local medical committee gave the referees the reasons for its decision. It considered that, though other substances were added to the milk powder, formulac was basically a food and used as a substitute for other foods. If it were allowed to be prescribed for its vitamin content a loaf of vitaminized bread should also be allowed. The local medical committee conceded that the addition of magnesium trisilicate and aluminium hydroxide might counteract any uncomfortable symptoms caused by the food content of the powder, but the same effect could be obtained with a partially digested food.

Referees' Findings

The referees were of the opinion that it was no part of Dr. X's purpose to provide his patients with nourishment, or even extra nourishment. Milk powder was not a concentrated food, and one tablespoonful a day could have no appreciable effect on the patient's diet. The local medical committee seemed to have thought that the magnesium trisilicate and aluminium hydroxide were intended to counteract any uncomfortable symptoms caused by the food contained in the powder. The referees, however, were satisfied that the intention was to counteract the symptoms caused by the disease and the presence of food taken by the patient in the ordinary way to sustain life. The methyl cellulose, the magnesium trisilicate, and the aluminium hydroxide could have been prescribed as a separate mixture directed to be taken with a glass of milk or a tablespoonful of milk powder, but the referees thought that the importance of the milk powder in relation to the admittedly pharmaceutical elements in the preparation was so small that the nutritional value of the powder could be ignored, and the purpose of the prescription as a whole could fairly be regarded as medicinal. If it were held that the preparation was a compound of food and medicine the proviso to Regulation 17 (2) of the National Health Service (Service Committees and Tribunal) Regulations would require that

the value of the food and the value of the drugs should be separately ascertained. The referees doubted whether this would produce any significant result. They decided that in all the circumstances formulac, as used in this case, was a drug which the executive council was bound to provide.

Questions Answered

National Insurance for Part-time Employees

Q.—What is my National Insurance liability as an employer of part-time domestic help for which I pay 16s. a week?

A.—A person employed on domestic work for less than eight hours a week by any one employer is not insurable as an "employed" person, though that person is insurable under the Industrial Injuries Act. In this case the employer would not be liable to pay any contributions towards the National Insurance scheme—neither the employee's share nor the employer's share. The employer should, however, stamp a card weekly with 7d. stamps to cover contributions to the Industrial Injuries scheme. Threepence of this should be deducted from the 16s. paid. If, however, the domestic work occupies more than eight hours a week the worker is insurable as an employed person and stamps to the full value (employer's and employee's share) should be placed on her card weekly. The employee's share can be deducted from the 16s. paid, but if this is not done it is the employer's responsibility to make up the full amount. The Regulations make it quite clear that once the weekly wage has been paid it is legally impossible for an employer to obtain from the employee any contribution which should have been deducted but was not.

Fees for Hospital Patients' Certificates

Q.—As a full-time senior house officer am I entitled to charge a fee for "works notes" certifying that persons are in- or out-patients of the hospital and thereby unable to attend work?

A.—A report to a patient who is under observation or treatment at the hospital comes within the scope of a doctor's duties under the terms and conditions of service of hospital medical staff in the N.H.S. when the information required can be given without a special examination of the patient by reference to hospital records or from knowledge acquired in the course of attendance on the patient. In these circumstances a fee cannot be charged for the report. This arrangement also covers the furnishing of a report on the patient, with his consent, to an interested third party, for instance an employer. When the patient is no longer under observation or treatment at the hospital when the report is asked for, or if a special examination is required, the work is outside the practitioner's contract and a fee may be charged.

During 1955 about 86,000 pensioners of the 1939-45 war were examined by medical boards and about 68% had their current assessments continued unaltered. The total number of examinations by medical boards was over 108,000. These figures are given in the Report on War Pensioners for 1955 (House of Commons Paper No. 331 of session 1955-6, H.M.S.O., price 4s. 6d.) issued jointly by the Ministry of Pensions and National Insurance, the Ministry of Health, and the Secretary of State for Scotland. In England, Wales, and the Irish Republic nearly 11,000 in-patients were discharged after treatment in hospital in 1955, and out-patient attendances totalled about 8,000. At the end of 1955 1,516 war pensioners were being treated as hospital in-patients and 6,422 as out-patients. In Scotland 1,248 were treated in hospital in 1955. In Northern Ireland the number was about 920.

HOSPITALITY

A French doctor's niece, a widow, would like to stay in a doctor's house in London on an *au pair* basis for a year in order to improve her knowledge of English.

Two French girls would like to visit families living in the London area. They are willing to care for children.

A German doctor's daughter and a girl friend would like to arrange exchange with a British doctor's daughters for six months or a year and would be willing to help in the house. They wish to study English and prefer somewhere near a language school.

A Yugoslav doctor's daughter, aged 17, would like to arrange a holiday exchange in 1957. The Yugoslav family live in a comfortable house with a garden, in a small town. The British girl would have a room of her own during her stay. She would be taken to the sea by the parents, who also speak English. Photographs are available.

A doctor from Hamburg would like a holiday exchange for his daughter, aged 11, for her summer holiday in 1957.

Would anyone interested please get into touch with Brigadier H. A. Sandford, International Medical Visitors Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Keeping Up With the Times

SIR.—Every member of our profession who sits back for a moment to contemplate where the present N.H.S. is taking us will heartily applaud your leading article entitled "Keeping Up With the Times" (*Journal*, August 18, p. 406).

Your correspondence columns show how deeply the profession has been stirred by the refusal of the Minister even to consider a claim for increased remuneration. We have every right to insist that the Government of to-day keeps the pledges of its predecessors. Against its better judgment (as expressed by the plebiscites of 1948) the profession agreed to accept service in the N.H.S., with remuneration on the basis of the two Spens reports: We have kept our part of the bargain and it is up to the Government to do the same.

We shall, however, be making a great mistake if we allow the daily press to give the impression that we are simply out for more pay: every time such headlines appear our professional status declines a stage further in the eyes of the public. Let us make it known as widely as possible that the anxieties so widespread in the profession are not due simply to problems of remuneration. They are basically due to our realization that, under the N.H.S. as at present constituted, we are progressively losing our freedom and our status as a learned profession, while being forced to accept the dictates of the politicians. Would the Minister have dared to speak to the profession in 1948 as he has done in 1956? The Guillebaud Committee, set up by the Minister, makes it clear what is in store for us when it states: "Longer experience of the working of the Service and the gradual emergence of a new generation may make comparatively simple many things which now appear difficult or impracticable."

We have had over eight years' experience of working in the N.H.S. We have seen how we are made a political pawn as (in your words) "rival political parties feverishly search for methods of bribing the voter, and do not hesitate to use Medicine in this unholy game." We must look afresh at those methods which gave us independence of action in the past: you mentioned the surrender of the right to buy and sell goodwill—for a sum which has proved quite unrealistic. Unfortunately we allowed the N.H.S. to include

100% instead of 90% of the population—an alternative which would have allowed sufficient independent practice for us to be able to withstand this domination of our profession—and, if a sacrifice is needed to secure the future, we must be prepared to face this.

The leaders of our profession must get busy and tell us how to escape from the net which is closing ever more closely around us. Your leading article is a clarion call for us all to wake up and to act quickly now—to-morrow will be too late.—I am, etc.,

London, N.W.1.

E. C. WARNER.

Keeping Records in General Practice

SIR,—Not very long ago in your columns you printed certain communications on records in general practice. I wonder whether you would be interested in a method which, while not only ensuring good record-keeping of patients who are visited, also saves the G.P. and his secretary a great deal of time. Two of us have worked this system for eight months and have found it very satisfactory.

Most G.P.s keep a visiting book which entails re-writing visiting lists at intervals and arranging the order of visiting by various annotations in the visiting book. If record cards are entered up, this entails additional work in getting the cards out of the files before visiting and returning them to the files afterwards. What we have done is to use the patients' record cards as a visiting list, thus dispensing with a visiting book.

In the surgery we keep a filing box of the Post Office sorting pigeon-hole type, with a compartment for each day of the week. If a patient is seen on a Monday and requires another visit on the Wednesday his record card is put into the Wednesday compartment after the Monday visit.

The next problem to be met is if the patient needs a visit next week or in two or four weeks' time. To overcome this we number the weeks. If this week is week 1, then next week is week 2, the following week is week 3, and the next week is week 4. One month from week 1 is again week 1; one month from week 2 is again week 2; and so on. A calendar is kept in the surgery with all the weeks in the year so numbered. Thus, if a patient is seen in week 1 on a Monday and requires a visit on a Wednesday in a fortnight's time—i.e., week 3—then a figure 3 is entered on the top right-hand corner of the patient's record card and the card is filed in the Wednesday compartment in the surgery filing box. A chronic patient who is visited every fortnight throughout the year will have (for example) the figures 1, 3 or 2, 4 entered on his record card. In the doctor's car is kept another box with compartments for each day of the week, working on the same principle. This box, of course, is quite small—about the size of a small basket.

The surgery box is capable of various refinements. Each doctor working in a partnership can have one column in the box so that each doctor's visits are kept separate. Alternatively, if zoning by geographical areas is employed, then the box can be constructed with as many columns as there are zones. Before starting the day's visits, all that is required is to arrange the record cards in order of sequence of visiting. The secretary does not have to get all the cards out of the main files, as the majority will already be in the surgery box. All that she has to do is to get the cards of new visits for that day.

With this system (which we have christened "the Kirone system") whenever a patient is visited all his records of past illnesses and present illness are *always* at hand. Visiting books (with all their attendant writing up) need not be kept at all. If a patient is seen by one doctor one day and another doctor the following day, it is an easy matter to transfer the record card from the one doctor to the other. The system itself costs nothing to run and is very simple to use. It has frequently withstood the strain of 25-30 visits per day per doctor, the area of visiting covering about

100 square miles. We also employ a similar system for surgery attendances which we have found very satisfactory.—We are, etc.,

Cheshire, Staffs.

J. M. KIRKWOOD.

RICHARD D. JONES.

Remuneration Claim

SIR,—Would it not be useful, in discussing the remuneration issue, to publish a few earnings in other occupations? One may quote these: cleaner in a motor factory, £16 a week; labourer on hydro-electric scheme in Scotland, £18 a week; girl of 22 making costumes, £12 to £14 a week.

Not only is it useful to give such figures for purposes of comparison but also to illustrate how our own expenses, from the high payments quoted, have risen. And another illustration might be interesting. If we consider a working family of six persons, the parents and two children employed, their combined visible income may easily lie in the range of £1,000 to £1,500 yearly. Though they do not usually, in presenting wage demands, quote or remember the fact, such a family is often receiving a large "hidden" income in the form of subsidies on education, housing, and so on. This corresponds to a much larger gross income, which may lie in the range of £250 to £500.

It is thus evident that without the years of training, of large expenditure, and intellectual work of a professional man, the family reward is often as good as his. And with this there is no need for such professional and social expenses.—I am, etc.,

Hitchin, Herts.

G. C. PETHER.

SIR,—May an interested outsider have the courtesy of your columns to make an observation on the current wage dispute? I am at a loss to understand why so many writers to the *B.M.J.* insist on making excuses as to why they want more money. Surely the medical profession should be the highest-paid group in any country. Is there a more important group? Does anyone have a more exacting job, or more responsibility than a doctor? Does a politician? a civil servant (so often uncivil)? an innkeeper? a coalminer?

To be effective a doctor has to be respected. People do not respect nor do they seek the advice of a man who is financially embarrassed. This may be an unpleasant thought, but it is nevertheless true, regardless of socialist ideology.

This is indeed the age of the trade union, and the British medical profession certainly seems to need one. The B.M.A., which led a blind and bewildered profession into the National Health Service, is obviously doing very little. A new organization is needed. One which will demand and not go "cap in hand" to ask on the basis of this report or that report. If the demands are not met, and promptly, then mass resignation from the Service is indicated. Why there has not already been mass quitting of the Health Service I find it difficult to understand. I feel, however, that the first step to improve the lot of the British doctor should be the formation of an organization or union with power to ensure collective action. The time for circumlocution, quibbling about ethics, and "holier-than-thou" attitudes is past. A "get tough" policy is needed.

This fight is one which doctors everywhere may one day have to face. I hope the leadership which the world has come to expect from British medicine will be shown in this struggle.—I am, etc.,

Alberta, Canada.

A. P. N. LEE.

Charging Each Other

SIR,—Although I should imagine that no one could have received more generous kindness from colleagues than my family and I have done, I doubt if "despicable" is quite the word to be used if an account is rendered.

Circumstances differ so widely. I have had at least one present which must have cost much more than if I had sent in a bill. The late Dr. Whitfield told me that his house

R.A.M.C. Golfing Society

SIR,—At the annual general meeting of the Royal Army Medical Corps Golfing Society in June alterations were made in the rules so that all commissioned officers of the Corps, serving or retired, including those who held emergency commissions, would be eligible for full or associate membership of the Golfing Society.

Meetings are held in spring, summer, and autumn, and matches are played throughout the year. The accent is on the opportunity to renew old friendships more than on the quality of the individual golfer. The autumn meeting will be held on Thursday, October 4, at Woking Golf Club. All officers of the Royal Army Medical Corps, serving or retired, interested in joining the Golfing Society should write to the honorary secretary, Major-General E. Marsh, M.C., 14, Orchard Rise, Kingston Hill, Surrey, or to the captain, Brigadier R. Phillipson, O.B.E., the War Office, A.M.D.7, Lansdowne House, Berkeley Square, London, W.1.—I am, etc.,

London, W.1.

R. PHILLIPSON.

H.M. Forces Appointments

ROYAL NAVY

ROYAL NAVAL VOLUNTEER RESERVE

Surgeon Commander V. S. Hughes-Davies, V.R.D., has retired. Surgeon Lieutenant K. S. Stewart to be Surgeon Lieutenant-Commander.

Acting Surgeon Lieutenant J. C. Campbell to be Surgeon Lieutenant-Commander.

ARMY

Colonel C. H. K. Smith, O.B.E., M.C., late R.A.M.C., has retired on retired pay, and has been granted the honorary rank of Brigadier.

ROYAL ARMY MEDICAL CORPS

Captain B. A. Gavourin to be Major.

ARMY EMERGENCY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Captain B. R. Frisby, from R.A.R.O., Class III, to be Captain, and has been granted the acting rank of Major.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Major E. M. Wright, T.D., has retired, retaining the rank of Major.

Captains Sir James D. Fraser, Bt., and J. R. Murdock have been granted the acting rank of Major.

TERRITORIAL ARMY RESERVE OF OFFICERS: ROYAL ARMY MEDICAL CORPS

Brigadier A. L. Crockford, C.B.E., D.S.O. M.C., T.D., Q.H.S., from Active List, to be Brigadier.

Colonels W. E. Tucker, C.V.O., M.B.E., T.D., C. W. Arnot, O.B.E., M.C., T.D., G. B. Mitchell-Heggs, O.B.E., T.D., F. R. Langmaid, O.B.E., T.D., Q.H.P., and R. Mowbray, from Active List, to be Colonels.

Lieutenant-Colonels G. E. David, M.C., T.D., T. P. Sewell, T.D., and F. J. G. Slater, M.C., T.D., from Active List, to be Lieutenant-Colonels.

Majors (Honorary Lieutenant-Colonels) C. E. W. Bower, T.D., J. A. W. Segerdal, T.D., and F. H. Hollingshead, O.B.E., T.D., having attained the age limit of liability to recall, have ceased to belong to the T.A.R.O., retaining the honorary rank of Lieutenant-Colonel.

Major J. R. Hamerton, T.D., having attained the age limit of liability to recall, has ceased to belong to the T.A.R.O., retaining the rank of Major.

Majors G. R. Fryers, F. W. Newby-Good, T.D., and J. A. Paterson, from Active List, to be Majors.

Captain (Honorary Major) A. M. W. Thomson has ceased to belong to the T.A.R.O., retaining the honorary rank of Major.

Captains (Honorary Majors) N. J. Crawford, W. N. Chisholm, M.B.E., T.D., and A. G. McCallum, having attained the age

was full of fountain-pens. His neighbour said to me: "If you must give me a present do let it be a cheque." One may hesitate to go to the best man in a specialty simply from reluctance to accept his charity. Some of us have joined a provident society chiefly in order that the specialist may receive some recognition in addition to our gratitude; must we be disappointed and our intention frustrated?

As between general practitioners, I think that the position is usually different. Here most of us, all of us I expect, feel that the greatest compliment one can receive is to be called in by one's neighbour, and the question of finance therefore can arise only in very exceptional cases.—I am, etc.,

W. MAXWELL PENNY.

Beckenham, Kent.

New Partnership Surgery Premises

SIR,—I was interested in Dr. E. Anthony's description of the above (*Supplement*, September 8, p. 121), and I will be grateful if you can spare space enough to air a sense of injustice with the Ministry of Health over the financial aspect of such desirable premises.

My partner and I opened a very similar "surgery" in July, 1955, though somewhat smaller and costing us, with out furniture and equipment, something over £3,000. The Ministry refused our appeal for financial aid by reason of our not being a large enough "group" practice (we were a "group" of three). Being in a rural district we are most unlikely ever to become a large group. It appears that the latter are, or may be, advanced a large proportion of the cost of such premises free of interest by the Ministry. Surely such discrimination is grossly unfair, additionally so in that the cost to the individual diminishes proportionately with the numbers of his partnership.—I am, etc.,

Sunninghill, Berks.

C. MATTHEWS DUNCAN.

Board and Lodging Charges

SIR,—Recently the Government urged the freezing of prices to halt the upward trend of the cost of living. Following upon this, on July 9, the Minister of Health refused to discuss an adjustment in pay for medical staff whose remuneration has fallen below the standard promised at the inception of the National Health Service. A fortnight later insult was added to injury when we received a memorandum with details of increased charges for residential emoluments. The statutory one month's notice was not given nor any guarantee of minimum standards of accommodation.

The new charges involved a loss of £40 per annum to the registrars in this hospital at a time when all prices are rising. It is in the interests of the patients and hospital that registrars are resident. Other occupations requiring people to reside away from their homes subsidize them for so doing. Don't let us be penalized for being instantly available by day and by night.—We are, etc.,

B. G. HAGGART.

A. LL. OWENS.

T. H. MARMION.

S. E. PREBBLE.

J. B. MONTGOMERY.

Prescot, Lancs.

Waiting-room Rhyme

SIR,—From time to time there comes to my mind the rhyme quoted below, but my memory fails me concerning its source. Albeit of equivocal literary merit, it seems to me the most apposite and quaint of waiting-room furnishings, and I am curious to know the name of the author, as I feel that a measure of credit is due to him. Perhaps one of your readers is able to enlighten me. The verse, as I recall it, is as follows:

"While in this room you wait,
Read, knit, do crosswords or just meditate.
Read, knit, do crosswords or just meditate;
Good work takes time, to shirk is sin;
Have patience, sitter, and exchange a grin."

—I am, etc.,

DENNIS J. STAYTE.

Bristol, 2.

limit of liability to recall, have ceased to belong to the T.A.R.O., retaining the honorary rank of Major.

Captain (Acting Major) R. Cutts, from Active List, to be Captain, and has been granted the honorary rank of Major.

ROYAL AIR FORCE

Group Captain G. A. M. Knight, C.B.E., to be Air Commodore.

Wing Commander G. Gilchrist to be Group Captain.

Wing Commander J. H. Neal has retired.

Squadron Leaders E. C. B. Bramwell, C. R. Griffin, and S. E. Cupples to be Wing Commanders.

Flight Lieutenants R. S. Wambeck, D.F.C., I. R. Lindsay, E. L. Gilbert, D. W. Atkinson, Agnes R. D. Bartels (Woman Medical Officer), F. J. Davies, M. A. de Chenu, G. K. K. McKay, A. D. Moore, and A. J. Merrifield to be Squadron Leaders.

Flight Lieutenants D. D. Forbes, A. D. Mason, R. A. Davidson, M. H. Gough, E. J. McCabe, and A. J. Rowland have been transferred to the Reserve, retaining the rank of Squadron Leader.

P. D. L. Roper to be Squadron Leader.

ROYAL AIR FORCE RESERVE OF OFFICERS

Squadron Leaders J. D. Milne and C. N. Young have relinquished their commissions, retaining the rank of Wing Commander.

Squadron Leader J. L. Brown has relinquished his commission, retaining his rank.

ROYAL AUXILIARY AIR FORCE

Flight Lieutenant M. Y. Paget to be Squadron Leader.

ROYAL AIR FORCE VOLUNTEER RESERVE

Squadron Leaders K. G. Bergin and J. Jamieson have relinquished their commissions, retaining the rank of Wing Commander.

Squadron Leader B. H. Pickard has relinquished his commission, retaining his rank, on appointment to the R.A.F.V.R.

Squadron Leaders A. J. Beddie, T. S. B. Kelly, D. A. Davies, G. D. Elphick, R. G. D. Forward, K. V. Jackson, L. S. Calvert, J. Evans, P. T. D. Lynch, J. C. McGregor, H. G. Magill, and A. J. McKendrick have relinquished their commissions, retaining their rank.

Flight Lieutenant W. E. Gibb has relinquished his commission, retaining the rank of Wing Commander.

Flight Lieutenants G. H. B. Roberts, A. L. Alban, N. J. Burnand, J. E. Cawthorne, W. J. Lynd, J. McA. McArthur, J. L. Morgan, A. M. Howard, J. P. Kelly, and C. W. R. Rayne-Davis have relinquished their commissions, retaining the rank of Squadron Leader.

HER MAJESTY'S OVERSEA CIVIL SERVICE

The following appointments have been announced: G. C. Butler, M.B., B.Ch., D.P.H., Senior Medical Officer (Administrative), Northern Region, Nigeria; A. J. Evans, M.B., B.S., D.A., Specialist (Dermatologist and Venereal Diseases), Western Region, Nigeria; C. R. Jones, M.B.E., M.B., B.Ch., Assistant Health Adviser, Eastern Aden Protectorate; J. D. Llewellyn-Jones, M.B., B.Ch., M.R.C.O.G., Specialist Obstetrician, Federation of Malaya; W. Puleston-Jones, M.R.C.S., L.R.C.P., D.P.H., D.T.M.&H., Administrative Medical Officer, Grade A Supernumerary, Federation of Malaya; A. K. Kouppas, M.D., D.M.R.D., Specialist (Radiologist), Cyprus; J. J. MacPherson, F.R.C.S.Ed., Specialist Surgeon, Grade B, Federation of Malaya; R. J. K. Tallack, M.B., Ch.B., D.P.H., Senior Medical Officer, Kenya; T. Wilson, M.D., D.P.H., D.T.M.&H., Director, Institute for Medical Research, Federation of Malaya; C. M. Bahemia, L.R.C.P.&S.Ed., Medical Officer, Health Department, Mauritius; F. P. Brown, M.B., B.S., D.R.C.O.G., Medical Officer, Kenya; R. H. Currie, M.B., Ch.B., D.P.H., Medical Officer, Special Grade, Tanganyika; W. P. Hadlow, M.B., B.S., Medical Officer, Somaliland Protectorate; J. A. Kay, B.M., B.Ch., Medical Officer, S.P.H.S., Fiji; Ann H. Low, M.B., B.S., D.C.H., Lady Medical Officer, Uganda; H. J. Marrable, M.B., Ch.B., Medical Officer, S.P.H.S., Fiji; N. O'Beirn, M.B., B.Ch., Medical Officer (Tuberculosis), Western Region, Nigeria; R. O. Parnis, M.D., F.R.C.S., Specialist Surgeon, Western Region, Nigeria; K. D. Ray, M.B., F.R.C.S., Medical Officer, Special Grade, Northern Region, Nigeria.

Dangerous Drugs Act: Restoration of Authority

The Home Office announces that the authorities granted by the Dangerous Drugs Regulations under the Dangerous Drugs Act, 1951, have been restored to Dr. Richard Morton Geldart (Dorset).

Branch and Division Meetings to be Held

BOURNEMOUTH DIVISION.—At Board Room, Royal Victoria Hospital, Boscombe, Friday, September 28, 8.15 p.m., meeting. Address by Dr. T. J. B. Geffen: "Aetiology of Hypertension."

ESSEX BRANCH.—At Palace Hotel, Southend-on-Sea, Saturday, September 29, 12.30 for 1 p.m., official luncheon; members' wives and friends invited; 2.30 p.m., annual general meeting. Address, followed by questions and answers, by Dr. Donald Hunter: "Diagnosis."

LONDONDERRY DIVISION.—At Londonderry City and County Hospital, Friday, September 28, 8.15 p.m., annual general meeting.

MID-HERTS DIVISION.—At Wellington Court Clinic, Brickett Road, St. Albans, Friday, September 28, 8.45 p.m., meeting.

READING DIVISION.—At Royal Berkshire Hospital, Wednesday, September 26, 8.30 p.m., meeting. Lecture by Dr. S. F. Logan Dahne: "B.M.A. Conference at Toronto, 1955, and Visit to Eastern States of U.S.A."

SOUTH ESSEX DIVISION.—At Oldchurch Hospital, Romford, Friday, September 28, 9 p.m., Medical Brains Trust. Panel: Drs. R. C. S. Benson, W. J. S. Ewan, A. S. Mason, and F. McL. McGown.

SOUTH WARWICKSHIRE AND RUGBY DIVISIONS.—At Clarendon Hotel, The Parade, Leamington Spa, Tuesday, September 25, 8 for 8.15 p.m., informal supper; 9 p.m., joint meeting.

TOWER HAMLETS DIVISION.—At Mile End Hospital, Bancroft Road, E., Friday, September 28, 3 p.m., clinical meeting.

Meetings of Branches and Divisions

HAMPSTEAD DIVISION

The following officers were elected at the annual general meeting held on May 23, 1956:

Chairman.—Dr. Lionel J. Stoll.

Vice-chairman.—Dr. Arthur Dalby.

Honorary Secretary and Treasurer.—Dr. E. Donald Page.

Assistant Honorary Secretary.—Dr. John Etheridge.

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY SEPTEMBER 29 1956

Retirement Pensions for the Self-employed	139	"Bigger Than Life"	141
Occupational Health Committee	140	Correspondence	142
Occupational Health and Industry	141	Association Notices	145

RETIREMENT PENSIONS FOR THE SELF-EMPLOYED

PROVISIONS OF FINANCE ACT

[FROM A SPECIAL CORRESPONDENT]

Two sections of the 1956 Finance Act may prove of great assistance to members of the medical profession in providing for retirement. The first applies only to those who derive the whole or part of their earned income from non-pensionable employment, while the second benefits everyone intending to purchase an annuity by a capital payment.

Section I—Providing a Pension out of Income

Proposals made in the Act are designed to enable those persons with earned income derived from non-pensionable employment to provide pensions for themselves on the same favourable terms as regards taxation as are already enjoyed by contributors to approved pension schemes. Hitherto the person not entitled to the benefits of such a scheme has not had this advantage in respect of his private arrangements for setting money aside for retirement. The maximum relief that he has been able to claim is relief of income tax on two-fifths of his contribution if his savings take the form of life assurance policies.

Two questions arise: (1) Who are eligible? and (2) What are the benefits for those who are eligible?

Those Eligible

(1) *Full-time Practice Under the N.H.S.*—Doctors who practise wholly under the National Health Service and are also members of the N.H.S. Superannuation Scheme will not be affected by the proposals.

(2) *Local Government and Other Pensionable Employment.*—Doctors working whole-time for local authorities or for private firms and participating in approved superannuation schemes are not affected by the proposals.

(3) *Private Practice.*—Doctors, the whole of whose earned income is derived from private practice, will be eligible.

(4) *Part-time Health Service (or other Pensionable Employment) and Part-time Private Practice.*—Doctors so engaged will be eligible to benefit in relation to their earned income from private practice within certain limits as defined below.

(5) *Practice (Whole- or Part-time) under the N.H.S. where a Doctor has Opted out of the Health Service Superannuation Scheme from Inception.*—The position of doctors who

opted out of the N.H.S. Superannuation Scheme is not yet clear and is under discussion with the Ministry. It may be that some rearrangements will be possible as a result of which they may be able to benefit from the new proposals.

Benefits for Those Eligible

The advantage to those who are eligible is that they will be able to make provision for their retirement in such a way that the money they set aside out of their earned income from year to year will not be taxed. However, the manner in which they do this will be very closely controlled.

The type of policy to be approved is one under which premiums are payable up to the age chosen for retirement, and in consideration for which a pension in the form of an annuity then becomes payable to the policyholder for the remainder of life. The benefits must be taken as a pension which will be taxed as earned income, and the chosen retirement age must not be earlier than 60 nor later than 70. The policy must not provide for payment of any lump sum in addition to or in lieu of pension. The only occasion on which a lump sum may be payable is by way of a return of premium in the event of the death of a policyholder before reaching pension age. The policy may provide for the payment of a pension to a widow, but in that case the pension may not exceed that payable to the policyholder.

Contributions per annum are permitted within the following limits and will rank for full relief of income tax and surtax:

(1) In the case of purely private practice, premiums up to a maximum of 10% of eligible private earnings or £750, whichever is the lesser.

(2) For part-time Health Service (or other pensioned employment) and part-time private practice, premiums up to a maximum of 10% of total eligible earnings or £750, whichever is the lesser, less one-tenth of pensionable emoluments for the year of assessment.

(3) Older entrants are permitted to increase their maximum contributions in both categories (1) and (2) in accordance with the following scale:

Year of Birth	Max. Sum	Percentage
1914 or 1915	£825	11
1912 or 1913	£900	12
1910 or 1911	£975	13
1908 or 1909	£1,050	14
1907 or any earlier year	£1,125	15

It is important to note that if any pensions are being received or pension rights retained from previous employment

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Remuneration Claim

SIR.—Dr. I. Goldblatt's letter (*Supplement*, September 15, p. 130) advocating a plebiscite or questionnaire on the desirability of introducing a per-item-of-service payment for general practitioners is most timely. For it is only at this time, when the insecure position of our profession has been so vividly illustrated by the Minister of Health's rebuff, that there is any hope of overcoming the usual apathy and inertia in our own minds, so often so unfairly attributed to the B.M.A. The very least that such a plebiscite could do would be to alert the Government to the expediency of implementing the remuneration claim before any major change in the Health Service was contemplated by the profession.

The only arguments against "per item" payment which I have ever heard advanced are that it would lead to abuse, and that it would entail more record-keeping and clerical work. Neither of these objections is of any moment, for the system works well for dentists, and it would entail no more clerical work than the sending of bills in private practice. Per-item payment is the natural procedure in any profession. It is so universal that it hardly needs advocacy, while the weird Chinese system of capitation payment is totally unpredictable and has been applied in Great Britain for the sole purpose of obtaining the services of practitioners as cheaply as possible. It succeeds in this alone. Per-item-of-service payment would do away with this foolish attempt to define the average patient and the average doctor. This attempt has resulted for eight years in gross underpayment for proper medical care and the encouragement of clerical medicine—i.e., the substitution of prescription writing and letters to hospitals for the practice of medicine as taught in the medical schools.

A demand for per-item-of-service payment would represent the first serious attempt by the profession to grapple with the problem of "unemployment and underemployment" in its own ranks. Payment for work done would inevitably enable large-list doctors to reduce their lists even on a basis of pre-war payment, for surgery attendances and domiciliary visits. In our own partnership payment at the rate of 5s. and 7s. 6d. respectively would have more than trebled the income last year. The status of the profession would be partially restored by per-item payment. At the present time an annoying minority of patients waste surgery time and disturb leisure hours with the most trivial and unreasonable demands. A small token charge would obviate this, but, since the Government is motivated by political expediency rather than common sense, this will never be done—unless a per-item-of-service payment necessitates it.

Finally, it is important that we should realize that our power in negotiations decreases every year. Not only is the die for the present pattern set harder, but the older men are leaving our ranks. These in most cases represent the financially secure elements, who are more independent of the Government and N.H.S. and more likely to press claims. Moreover, the day that compulsory National Service ends there will certainly be unemployment in our profession unless we act now. Too many doctors will mean loss of status, loss of negotiating power, and a salaried service within two years.

It is high time this matter was fully aired and the opinion of the profession measured by a plebiscite. Expenses could be met by a small optional postal order accompanying each vote.—I am, etc.,

Bingley, Yorks.

S. ADRIAN PRICE.

SIR.—We are informed that the average net income of the general practitioner is £2,222, but like Dr. H. T. Chilton

(*Supplement*, September 8, p. 124) I am extremely sceptical of this figure, and your footnote to his letter only deepens the mystery. What on earth is this formidable "£573 in respect of income from other sources"? I have never met another doctor who gets such an enormous sum. Who and where are they?

Let us analyse the sources as given in the *Supplement* for March 3 (p. 70): Private practice is now almost dead, effectively killed by the politicians' refusal to let private patients have free drugs like anyone else. There may be a few fortunate practices with a large private list, but the average must be very small. As regards maternity services, I suppose the average G.P. is lucky if he gets 12–15 domiciliary confinements a year. This certainly could not account for more than £100. It is absurd to include payments to dispensing doctors, as out of this they have to pay their steadily mounting drug bills, which leaves little, if any, profit. Very few G.P.s are lucky enough to have hospital appointments now, and the number is gradually getting less. Payments for training grants, for sight testing, and from Government departments affect only a small minority of us. This leaves only payments from local authorities for notifications, inoculations, and vaccinations consisting of the odd few pounds.

"Most of us would be very interested to know how this huge figure of £573 has been arrived at. Or is it a figment of the statisticians' imagination? One thing I think is certain. If we really got an average of £573 from "other sources" in 1953–4 then we are definitely not getting it now, and in a few years it will have shrunk to a fraction of what it was. But can we convince the politicians and public of this fact? If we can it will be a great help in gaining support for our claims.—I am, etc.,

Merioneth.

C. C. M. WATSON.

SIR.—I do hope that the leaders of the British Medical Association have taken note of Dr. I. Goldblatt's letter (*Supplement*, September 15, p. 130), because it contains the most important suggestions which have been made in recent letters.

It is of fundamental importance that representatives of any body should be in possession of the opinions of those they represent. At the present moment it is impossible that this state of affairs exists, and therefore I consider that without delay a questionnaire should be sent to every doctor in the country in an endeavour to establish what every man or woman is thinking at the present time. The primary question is: "What do you think of the National Health Service in its present form?" If the reply to this question is that it is bad and not in the best interests of the country or the profession, then steps should be taken at once for either extensive reform or withdrawal from the Service in the event of unreasonable obstruction from the Government.—I am, etc.,

London, S.W.16.

D. G. ALLEN.

SIR.—Dr. C. R. Barker (*Supplement*, September 15, p. 130) has given us the Government's answer. But you will note this extract from Miss Hornsby-Smith's letter: "... we would not be justified in giving consideration to any claim for a general increase in medical remuneration." Perhaps optimistically, I feel that consideration might be given to those practitioners whose income is below the oft-quoted figure of £2,222 net. It would indeed be interesting to know how many have incomes of less than £2,222 gross.

One cannot expect the Government to feel indulgent towards the practice with the maximum list of 3,500 patients. Such a practice attracts its quota of midwifery cases and temporary residents. Let us face facts. The crux of the matter is the totally unrealistic maximum figure of 3,500. The Ministry knows full well that a desperate struggle for existence is going on in general practice. I have not yet been asked for the suit off my back, but my doorbell attracts its share of beggars. Recently I lost a family of six because I lent the mother a shilling to purchase medicine. Rather

than pay me back she changed her doctor. Was I right or wrong?

The Ministry knows only too well the financial state of general practice, and of the many whose only break from the tedium of work is the occasional refresher course—when a locum can be found. The Negotiating Committee must think again, or engage a lay expert to advise how general practice can be saved.—I am, etc.,

Barrow-in-Furness.

J. H. C. CORR.

Women Doctors Exist

SIR.—I have had, in most respects, a very clear and business-like communication from an honorary official of the B.M.A. There are, however, one or two curious points about it. I am on the envelope addressed by my Christian name (correctly) as "Agnes." Inside I am addressed as "Dear Sir." I am then asked to bring my "wife" to a luncheon. Later I am told "we shall join the ladies." Where I and other doctors of the female sex have been in the meantime is not stated.

Is it not time that even the honorary officials of the B.M.A. (to whom we all owe so much) should know there are such beings as women doctors? I have already suggested to a local honorary official that "your spouse" should be substituted for "your wife," and "join our friends" for "join the ladies," but apparently without effect.—I am, etc.,

Colchester.

AGNES ESTCOURT-OSWALD.

Board-and-Lodging Charges

SIR.—The statement in Mr. Roger Brearley's letter (*Supplement*, September 8, p. 126) that the new scale of charges for registrars is subsidized is open to some doubt when considered in relation to certain comparative costs which I shall mention. But I leave that to the judgment of residents of his own group. There is, however, no doubt that the charges for senior staff are grossly excessive.

As Mr. Brearley points out, under paragraph 17 of the Terms and Conditions of Service, hospital management committees were required to fix their own charges "equal to the value of the service provided," and the prescribed principle was to charge in full. In 1949 management committees were determined charges according to this paragraph, but now we are faced with new charges which represent over 100% increase on charges covering the full cost in 1949. When this increase is compared with the increase over the same period of the cost-of-living indices of about 38%, cost of hospital meals of 23%, and rise in salary of S.H.M.O.s of 16%, the full extortionate nature of the new charges will be appreciated. The average purchase cost of food in hospital per person per annum is currently about £65. Furthermore, if a hospital resident were, for full value, to eat four hospital meals per day for 365 days a year, the total cost of his individual meals as cooked and served, based on the recently introduced rate of charges for officer grades, would be £146 per annum. It is thus apparent that charges of £350 and £400 leave a totally exorbitant margin for the rent of the rooms provided, especially in view of the nature of the accommodation generally available and the poor situation of such a high proportion of our hospitals from the point of view of residential amenity, factors which are not likely to be remedied in the foreseeable future. It is in the general interest of the service as well as in the particular interest of those concerned that these charges be reviewed.—I am, etc.,

Croydon, Surrey.

J. J. LINEHAN.

Doctors' Earnings

SIR.—Recent correspondence about doctors' net earnings has at least revealed the prevalent confusion about some of the real issues involved.

The doctor is not free to use his so-called net earnings for the private purposes of himself and his family. A substantial slice of his net earnings is still exacted by his N.H.S. practice. Unlike the schoolteacher, for instance, who is under no necessity to provide his own school premises, a doctor must acquire premises to be used either wholly

or in part for N.H.S. practice. Such premises must be paid for—normally under a mortgage agreement—involving a charge upon the doctor's net earnings over many years. Is such a charge to be recognized as a legitimate expense for his N.H.S. practice net earnings, or is it to be regarded as a levy upon his private charity for the benefit of the public? Or the doctor's car, in these days a must, not a luxury: running expenses are taken into account, but what of capital depreciation over and above the proportion allowed by the Inland Revenue? But how many doctors recognize this as an expense on their net earnings?

The net earnings of many, perhaps most, doctors suffer further diminution because they do not claim, and indeed are not even aware of, the full legitimate expense charges upon their income. They do not, for instance, take account of items of outlay which are in fact incurred in the daily routine of their N.H.S. practice—e.g., damage to a suit from bloodstains in cases of immediate urgency, or from canine enthusiasm, or loss of their pens, gloves, hats at their N.H.S. patients' homes, or damage to spectacles or watches. Such and many other items may amount over a period to a considerable sum. But in how many cases do they enter into the reckoning? The services of the doctor's wife, who is exploited to the uttermost day and night—services which in the business world command a salary of at least £500 per annum. In how many cases is an adequate claim made under this head?

If the doctors had only made themselves conversant with the full reductions and allowances permitted by income-tax law, there could never have been published so generous an official estimate of their average net earnings as has in fact appeared.—I am, etc.,

Birmingham, 32.

R. M. HOWSON.

Was It a Drug?

SIR.—I recently had occasion (*Supplement*, January 14, p. 11) to draw your attention to the unsatisfactory manner in which decisions on whether a substance is or is not a drug are made. In your issue of September 15 (p. 129) you report yet a further example of this form of petty tyranny. In this case a doctor had ordered "casilan" (1) for a patient dying of carcinoma of the bronchus, where, one would have thought, the only possible effect it could have would be a nutritional one—yet the referees decided it was a drug; (2) for a patient with cirrhosis of the liver, where nutrition was already specially provided by a suitable diet, where this substance was ordered in the hope of producing a therapeutic effect over and above that, and where, therefore, it might with some reason have been recognized as a drug—yet the referees (albeit with one dissentient) decided it was not.

I have no wish to question these decisions, dubious as they are, on the basis of the brief summary of the facts that appears in the *Journal*, but I feel that I am speaking for more than one prescribing practitioner if I say that it makes me tired when I am told that local medical committees and referees decide each case on its merits—as though there were some special virtue which made this a worthy and ideal method. Not only is this by no means the case, but it has been freely recognized that some principles should be laid down which should serve as guidance in these matters. In fact, a special committee was set up which made a report on the principles by which drugs may be distinguished from foods and toilet preparations. A comprehensive extract of this report appears in the *Handbook for General Medical Practitioners*, presumably for their guidance.

However, neither local medical committees nor the referees take any notice of these principles, nor do they publish others (if any) that they are prepared to recognize. They prefer to hide behind the unchallengeable curtain of "considering each case on its merits." Now, to cap it all, the referees have plainly stated that the Definition of Drugs Joint Subcommittee does not mean what it says, or if it does this is inconsistent with the Act. Anyway, they have

openly discarded it. The practitioner is thus completely in the dark. There is no one who dares advise him on what he may or may not prescribe. Ordinary common sense does not appear to apply, and even if he decides to chance it (at the risk of his pocket) in any given case this does not preclude an opposite decision in the next apparently identical case.

This attitude of "We are not going to tell you what the law is, but heaven help you if you break it" is a piece of unwarranted arrogance. Local medical committees have a duty to their electorate, even if the referees and executive councils have not. I challenge any of them to pretend they are representing the doctors in their area (the sole reason of their existence) if they continue as they do at present.—I am, etc.,

London, W.9.

A. LEWIS.

Cost of the N.H.S.

SIR,—There is a genuine need for an incentive for the G.P. to prescribe with economy and to resist the demands of certain types of patients. This would be provided if the funds allocated for the provision of drugs were divided amongst practitioners in proportion to the size of their lists and the doctor provided his own prescription forms and paid the chemist direct. The staff employed to sort and price prescriptions would become redundant, the doctor and chemist would regain some of their independence, and the right to prescribe as we think fit would be safeguarded.—I am, etc.,

Sheffield.

IAN A. WOOD.

What is Excessive Prescribing?

SIR,—The suggestion in my article (*Supplement*, September 1, p. 115) that there might, in comparable hospitals, be a real association between the cost per head per week of drugs and dressings and the average length of stay per case seems to have aroused some interest, and two or three friends have asked if I am sure of my data. So it may be well to set the figures out in more detail. In the following I use "high cost" and "low cost" solely in relation to the weekly cost of drugs and dressings. All figures relate to "acute" hospitals with 300–900 beds.

I quoted the figures for hospitals in the Manchester Group. Certain other groups show a similar, though less perfect, gradation.

	Average Stay per Case (Days)	Average Weekly Cost per Head of Drugs and Dressings
South Western Group:		£ s. d.
Royal Devon and Exeter	13	1 4 5
Royal United and Manor	15	1 2 3
Taunton and Somerset	15	1 1 11
Southmead	16	1 1 4
Frenchay	23	19 2
Oxford Group:		
Northampton General	10	1 9 0
Royal Berkshire	10	18 5
Stoke Mandeville	27	12 1
Birmingham Group:		
Coverley and Warwickshire	11	1 17 10
North Staffs	15	1 6 6
Dudley Road	14	1 1 8
Gulson	12	1 0 6
Wordley	18	18 7
Hallam	17	16 11
Little Bromwich	22	9 9
The large London teaching hospitals:		
St. Mary's	14	2 5 3
King's College	15	2 3 9
West London	14	2 3 6
St. George's	15	1 18 7
Middlesex	19	1 18 2
St. Thomas's	16	1 17 6
London	18	1 16 8
Westminster	18	1 14 11
Barts	19	1 12 3
Hampstead General	17	1 11 4
Guy's	17	1 11 3
Hammersmith	18	1 10 10

Only the Middlesex is notably out of place.

In the S.E. Metropolitan group the two lowest-cost hospitals have long stay and the two highest cost have short stay.

	Average Stay per Case (Days)	Average Weekly Cost per Head of Drugs and Dressings
St. Alfege's	16	£ s. d. 1 4 3
St. Giles'	18	1 5 2
Pembury	19	17 0
Southern	23	16 8

In the S.W. Metropolitan group the range is from Royal Hants County, 12 days, £1 6s. 5d., to Lambeth, 22 days, 16s. 2d. In between the gradation is irregular. In the N.E. Metropolitan group the range is from Oldchurch, 16 days, £1 7s. 7d., to Mile End, 22 days, 14s. 9d.

The figures for the Leeds Group are:

	Average Stay per Case (Days)	Average Weekly Cost per Head of Drugs and Dressings
Huddersfield R.I.	14	£ s. d. 1 5 0
Bradford R.I.	17	1 10 8
Pinderfields	31	16 7

The three hospitals in the Liverpool group are much on a par as regards cost and length of stay.

In the remaining four groups, East Anglian, Newcastle, Sheffield, and Welsh, there is little regularity in cost and length of stay, though a tendency for high-cost hospitals to have shorter length of stay is still visible.

Reviewing the whole field, the data, I suggest, give sufficient support to the suggestion that there is real correlation between drug costs and length of stay to warrant further investigation. Speaking broadly, it costs as many pounds to treat and maintain a patient in hospital per week as it costs shillings to supply him with drugs. It might seem, therefore, a case of spending shillings to save pounds. Hospitals who pride themselves on low drug expenditure may be doing a disservice to both patient and taxpayer, as also may Ministerial pressure to work to a tight budget on drugs.

The Department is introducing next year a new system of cost accounting in the larger hospitals. Opportunity might be taken to go more fully into the matter.—I am, etc.,

Horsham, Sussex.

F. F. MARCHBANK.

Health Centres

SIR,—As chairman of the professional committee of the Harold Hill Health Centre, Romford, I consider it necessary to point out that in the report on health centres (*Supplement*, August 4, p. 89) it is stated that there are three suites occupied by general medical practitioners, whereas the accommodation consists of three suites each providing consulting-room, examination- and waiting-rooms, and a further consulting-room with which is shared one of the three waiting- and examination-rooms. In effect, therefore, there are four suites fully occupied, and any costs should be based on the provision of four suites and not on three as quoted in your tables of capital and running costs.

Further, although in the table of running costs the cost to each doctor is given as £111, the actual cost is £125 per doctor by reason of the fact that, although nine doctors actually hold sessions in the centre, two of these practitioners are in partnership, and, as they share the sessions applicable to that partnership, they are for costing purposes regarded as one unit. I would also point out that the total amount payable in respect of the rent and facilities applicable to general medical services is £1,000, or £250 per suite,

which is the amount that would have been payable by each doctor had four doctors each exclusively occupied one suite.

I trust you will publish this correction, as the computation of costs on three suites instead of four creates a much higher cost per suite than is actually the case.—I am, etc.,

J. GORDON FIFE.

Romford, Essex.

Association Notices

SIR CHARLES HASTINGS AND CHARLES OLIVER HAWTHORNE CLINICAL PRIZES, 1957

The Sir Charles Hastings Clinical Prize Competition is established by the Association for the promotion of systematic observation, research, and record in general practice. The competition has been extended by the addition of a second prize known as the Charles Oliver Hawthorne Clinical Prize. The following are the regulations governing the awards:

1. The Sir Charles Hastings Clinical Prize, consisting of a certificate and £75, will be awarded for the best entry.
2. The Charles Oliver Hawthorne Clinical Prize, consisting of a certificate and £50, will be awarded for the second best entry.
3. Any member of the Association who is engaged in general practice is eligible to compete for these prizes.
4. The work submitted must include personal observations and experiences collected by the candidate in general practice, and a high order of excellence will be required. If no work entered is of sufficient merit no award will be made. Candidates in their entries should confine their attention to their own observations in practice rather than to comments on previously published work on the subject, though reference to current literature should not be omitted when it bears directly on their results, their interpretations and their conclusions.
5. Essays, or whatever form the candidate desires his work to take, must be sent to the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1, not later than December 31, 1956.
6. A prizewinner in any year is eligible for an award of either of the prizes in any subsequent year. A study or essay that has been published in the medical press or elsewhere will not be considered eligible for a prize, and a contribution offered in one year cannot be accepted in any subsequent year unless it includes evidence of further work.
7. If any question arises in reference to the eligibility of the candidate or the admissibility of his or her entry the decision of the Council on any such point shall be final.
8. Preliminary notice of entry for this competition is required, on a form of application to be obtained from the Secretary.
9. Each entry, which should be unsigned, must be typewritten or printed on one side of the paper only and accompanied by a note of the candidate's name and address.
10. No definite limits are laid down as to the length of the work submitted, but the Council anticipates that for this competition 3,000 to 10,000 words would be suitable.
11. Inquiries relative to the prizes should be addressed to the Secretary.

KATHERINE BISHOP HARMAN PRIZE

The Council of the British Medical Association is prepared to consider an award of the Katherine Bishop Harman Prize in the year 1957. The value of the prize is £75. The purpose of the prize, founded in 1926, is the encouragement of study and research directed to the diminution and avoidance of the risks to health and life that are apt to arise in pregnancy and child-bearing. It will be awarded for the best contribution submitted in open competition, competitors being left free to select the work they wish to present, provided this falls within the scope of the prize. Any registered medical practitioner in (a) the British Commonwealth and Empire or the Republic of Ireland and (b) any member of the British Medical Association wherever resident is eligible to compete.

Should the Council of the Association decide that no contribution submitted is of sufficient merit, the prize will not be awarded in 1957, but will be offered again in the year next following this decision, and in this event the money value of the prize on the occasion in question shall be such proportion of the accumulated income as the Council shall determine. The decision of the Council will be final.

Each contribution must be typewritten or printed in the English language, and must be accompanied by a detachable slip bearing the candidate's name and address. The Council anticipates that contributions should be between 3,000 and 10,000 words, although no definite limits are laid down. Preliminary notice of entry is required and a form for this purpose can be obtained from the Secretary. Entries must be forwarded so as to reach the Secretary, British Medical Association House, Tavistock Square, London, W.C.1, not later than December 31, 1956. Inquiries relative to the prize should be addressed to the Secretary.

PRIZE ESSAY COMPETITION FOR PROVISIONALLY REGISTERED PRACTITIONERS, 1957

The Council of the British Medical Association is prepared to consider the award, in 1957, of prizes to provisionally registered practitioners for essays submitted in open competition. The subject of the essay is: "Medicine is an Art as well as a Science."

In awarding the prizes due regard will be given to evidence of personal observation and experience. No study or essay that has previously appeared in the medical press or elsewhere will be considered eligible for a prize.

Any provisionally registered practitioner in the pre-registration year at the time of submission of the essay is eligible to compete for a prize. If any question arises in reference to the eligibility of a candidate or the admissibility of his or her essay, the decision of the Council of the British Medical Association shall be final. Should the Council decide that no essay entered is of sufficient merit, no award will be made. At least one prize of £50 is offered. In determining the number of prizes to be awarded, the Council will take into consideration the number and standard of essays received.

Essays must not exceed 5,000 words, and must be typewritten or legibly written in the English language on foolscap paper, on one side only, must be unsigned, and must be accompanied by a note of the name and address of the entrant. Notice of entry for this competition is necessary and a form of application can be obtained from the undersigned.

Essays must be forwarded so as to reach the Secretary of the British Medical Association not later than January 31, 1957. Inquiries relative to the competition should be addressed to the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1.

SCHOLARSHIPS IN AID OF SCIENTIFIC RESEARCH

The Council of the British Medical Association is prepared to receive applications for research scholarships as follows: an Ernest Hart memorial scholarship, of the value of £300; a Walter Dixon scholarship, of the value of £300; four ordinary research scholarships, each of the value of £200.

The scholarships are given to candidates recommended by the Science Committee of the Association as qualified to undertake research in any subject (including State medicine) relating to the causation, prevention, or treatment of disease.

In addition, applications are invited for the award of the following research scholarship: the Insole scholarship, of the value of £250, for research into the causes and cure of venereal disease.

Each scholarship is tenable for one year, commencing on October 1, 1957. A current scholar may apply to be re-appointed for a further year, though no scholarship will be renewed more than twice. A scholar is not necessarily required to devote the whole of his or her time to the work of research, but may be a member of H.M. Forces or may hold a junior appointment at a university, medical school, or hospital, provided the duties of such appointment will

not, in the opinion of the Science Committee, interfere with his or her work as a scholar.

Applications for scholarships, including renewals, must be made not later than March 1, 1957, on the prescribed form, a copy of which will be supplied on application to the Secretary, British Medical Association House, Tavistock Square, London, W.C.1. Applicants are required to furnish the names of three referees who are competent to speak as to their capacity for the research contemplated.

OCCUPATIONAL HEALTH PRIZE

The Occupational Health Prize was established by the Association for the purpose of encouraging interest and research in the field of occupational health. The Council of the British Medical Association is prepared to consider the award of this prize, which consists of a certificate and £50, in the year 1957. Any member of the Association who is engaged in the practice of occupational health, either whole-time or part-time, is eligible to compete for the prize. Candidates may select their own subject.

Entries should be submitted in a form suitable for publication and must include personal observations and experiences collected by the candidates in the course of their work. If no entry is of sufficient merit no award will be made. Candidates should confine their attention to their own observations rather than to comments on previously published work on the subject, though reference to current literature should not be omitted when it bears directly on their results, their interpretations, and their conclusions.

Essays, or whatever form the candidate desires his work to take, must be sent to the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1, not later than January 31, 1957. No study or essay that has been published in the medical press or elsewhere will be considered eligible for the prize, and a contribution offered in one year cannot be accepted in any subsequent year unless it includes evidence of further work. A previous prizewinner is not precluded from entering. If any question arises in reference to the eligibility of the candidate or the admissibility of his or her essay, the decision of the Council on any such point shall be final.

Preliminary notice of entry for this competition is required on a form of application to be obtained from the Secretary. Each entry must be typewritten or printed on one side of the paper only, and accompanied by a note of the candidate's name and address. No definite limits are laid down as to the length of essays, but the Council anticipates that, for this competition, essays should consist of between 3,000 and 10,000 words. Inquiries relative to the prize should be addressed to the Secretary.

PRIZE ESSAY COMPETITION FOR MEDICAL STUDENTS, 1957

The Council of the British Medical Association is prepared to consider the award, in 1957, of prizes to medical students for essays submitted in open competition. The subject of the essay is: "The Medical Student and Research—Past Achievements and Present Opportunities."

Any medical student who is a registered member of a medical school in the United Kingdom, Commonwealth and Empire, or the Republic of Ireland at the time of submission of the essay is eligible to compete for a prize. Previous prizewinners are eligible for a second award. If any question arises in reference to the eligibility of a candidate or the admissibility of his or her essay, the decision of the Council of the British Medical Association shall be final. Should the Council decide that no essay entered is of sufficient merit, no award will be made. The prizes offered will normally be of the value of £25, but, in determining the number and exact amount of prizes to be awarded, the number and standard of essays received will be taken into consideration by the Council, which reserves the right to vary the number and amount of the prizes.

Essays must not exceed 5,000 words, and must be typewritten or legibly written in the English language on foolscap paper, on one side only, must be unsigned, and must be accompanied by a note of the name and the medical school of the entrant.

Notice of entry for this competition is necessary and a form of application can be obtained from the undersigned.

Essays must be forwarded so as to reach the Secretary of the British Medical Association not later than January 31, 1957. Inquiries relative to the competition should be addressed to the Secretary, British Medical Association, B.M.A. House, Tavistock Square, London, W.C.1.

A. MACRAE,
Secretary.

Branch and Division Meetings to be Held

DARLINGTON DIVISION.—At Darlington Memorial Hospital, Tuesday, October 2, 8.30 p.m., meeting. Lecture by Dr. C. E. Kellett: "Aspects of Complement."

DARTFORD DIVISION.—At Out-patient Department, West Hill Hospital, Dartford, Tuesday, October 2, 8.30 p.m., clinical meeting.

DERBYSHIRE BRANCH.—At Temple Hotel, Matlock Bath, Sunday, October 7, 3 p.m., annual meeting. Address by Dr. Robert Forbes: "Recent Developments in Medical Litigation."

EAST HERTS DIVISION.—At Hertford County Hospital, Thursday, October 4, 8.30 p.m., meeting. Annual B.M.A. Lecture by Mr. R. J. McNeill Love: "Some Common Abdominal Conditions" (illustrated by lantern slides).

GLASGOW DIVISION.—At Glasgow Regional Office, 234, St. Vincent Street, Glasgow, Thursday, October 4, 8.30 p.m., meeting, followed by film show.

GRIMSBY DIVISION.—At Grimsby General Hospital, Thursday, October 4, 7 p.m., clinical evening, followed by annual general meeting.

GUILDFORD DIVISION.—At Milford Chest Hospital, Godalming, Thursday, October 4, 8.30 p.m., clinical meeting.

HARROW DIVISION.—At Rayners Hotel, Rayners Lane, Tuesday, October 2, 8.30 p.m., annual general meeting.

HASTINGS DIVISION.—At Royal East Sussex Hospital, Hastings, Tuesday, October 2, 8.15 p.m., meeting. Address by Dr. David Rice: "Some Legal Aspects of Psychiatry."

LEWISHAM DIVISION.—At Lewisham General Hospital, Tuesday, October 2, 8.30 p.m., meeting. B.M.A. Lecture by Sir Russell Brock: "Basic Principles in the Diagnosis of Diseases of the Lungs."

LINCOLN DIVISION.—At Saracen's Head Hotel, Lincoln, Thursday, October 4, 7.30 for 8 p.m., dinner; address by Dr. Hugh Clegg (Editor, *British Medical Journal*): "Some Problems of Editing and Publishing." Following his talk, Dr. Clegg will answer any questions on current topics. All medical practitioners, whether B.M.A. members or otherwise, are invited.

NORTH-EAST ESSEX DIVISION.—At Essex County Hospital, Colchester, Tuesday, October 2, 8 p.m., clinical meeting.

PRESTON DIVISION.—At the Winckley Club, Preston, Thursday, October 4, 7 for 7.30 p.m., Annual Dinner. Ladies invited.

STIRLING BRANCH.—At Stirling Royal Infirmary, Thursday, October 4, 8.30 p.m., scientific meeting. Lecture by Dr. Magnus Pyke, D.Sc., Ph.D.: "Chemicals in Food."

SWANSEA DIVISION.—At Langland Bay Hotel, Thursday, October 4, 7.30 for 8 p.m., dinner. Chairman's address by Dr. I. P. G. Howells: "The Changing Scene of General Practice."

WEST MIDDLESEX DIVISION.—At Paul's Restaurant, New Broadway, Ealing, W., Thursday, October 4, 8.30 p.m., meeting. B.M.A. Lecture by Mr. John Howkins: "Criminal Abortion." Members' wives, members of adjacent Divisions, and members of the local section, B.D.A., are invited.

GENERAL MEDICAL SERVICES COMMITTEE

THE REMUNERATION CLAIM

An all-day meeting of the General Medical Services Committee was held at B.M.A. House on September 20, with Dr. A. TALBOT ROGERS in the chair. Dr. F. M. Gould, Birmingham, a new member, was cordially welcomed to the Committee.

The meeting was saddened by the announcement of the death of Dr. D. F. Whitaker, who had been a very valuable member of the Committee and certain subcommittees and liaison committees for some years. Tributes to his modesty and effective work were paid by the CHAIRMAN and by Dr. C. M. SCOTT, and members stood in silence as a token of respect.

A letter was read from Dame Enid Russell-Smith, thanking the Committee for its congratulations and good wishes on her forthcoming promotion to Deputy Secretary of the Ministry of Health, and adding that of the latter she would certainly stand greatly in need.

Five members were reappointed as part of a joint committee to prepare a memorandum of evidence for submission to the Ministry of Health Working Party on the field of work, recruitment, and training of social workers at all levels in the local health and welfare services: they were the Chairman, Dr. J. C. Arthur, Dr. A. Brown, Dr. H. C. Faulkner, and Dr. Kate Harrower. A similar number are appointed by the Central Consultants and Specialists Committee and by the Public Health Committee.

The CHAIRMAN made a brief statement on the progress of the remuneration claim and on a meeting which had taken place between representatives of the Negotiating Committee and the Ministry of Health on August 1. He referred to the statement which had appeared in the *Supplement* to the statement which had appeared in the *Supplement* on September 15 (p. 129), and added that they had now heard that the Minister had lost no time in asking his legal advisers to study the document which had been presented.

The Middlesex Local Medical Committee had forwarded a resolution in which it deprecated the widely published statements about the average net remuneration of medical practitioners, and the inevitable reaction in the public mind as a result of such statements. Middlesex called for a vigorous publicity campaign to explain the true significance of the figures. Dr. S. WAND suggested, however, that the statement complained of was made some time ago and the public had now probably forgotten all about it. The figure was factual and was the basis of the Danckwerts award. After some discussion it was agreed that no further action should be taken along the lines suggested by Middlesex.

The Central Pool

The CHAIRMAN reported on negotiations with the Ministry on the size of the central pool for 1954-5. He was glad to

be able to report that finality had now been reached, and that the final settlement for that year would be paid on January 1, 1957.

Emergency Call Service

The CHAIRMAN invited the Committee to consider another matter arising out of reports in the press about the emergency call services which have been operating in certain parts of London during the year. It would be remembered that a committee was reappointed at a previous meeting to examine the whole problem of deputizing arrangements, with particular reference to those run on a commercial basis.

After a very full debate it was decided to publish the following statement setting out the Committee's view:

The General Medical Services Committee of the Association has been considering the reports which have appeared in the daily and weekly press about the Emergency Call Services which have been operating in certain parts of London during the year.

While it believes that schemes of this kind are open to abuse, the Committee is satisfied that they do not of necessity run counter to the National Health Service Act and its regulations.

The Committee again wishes to emphasize that a general practitioner in the National Health Service is personally responsible for treatment under Section 8 (1) of the First Schedule of the N.H.S. (General Medical and Pharmaceutical Services) Regulations, 1954, and it is therefore the responsibility of every individual doctor to satisfy himself—and his executive council—that he has made adequate deputizing arrangements when he is necessarily absent from his practice.

The Committee believes that the interests of general practice and the public are best served by providing for proper off-duty and leisure time by means of group practice, partnership, and rota schemes. It recognizes, however, that in certain areas it may not always be possible for the individual doctor to participate in such arrangements and, in consequence, an emergency call service may constitute a suitable supplement to the more usual methods of practice. When such a supplementary scheme operates, it should conform with the customary arrangements in the other forms of practice and should not be used as an opportunity to escape a contractual obligation to provide a personal and continuing service or to enable a doctor to avoid all emergency week-end and night calls.

It hopes that the sponsors of the London schemes will now respond to the invitation to meet the Committee for an exchange of views, for until the full details are known it is impossible for the Committee to give an assurance to its constituent local medical committees that the schemes provide all possible safeguards against abuse.

Treatment of Merchant Seamen

A deputation from the Maritime Subcommittee of the Private Practice Committee was received to discuss the N.H.S. fees for attendance on seafarers, in which there were said to be many anomalies at the present time. The deputation consisted of Dr. E. L. Caldwell-Smith, chief medical officer of the Shipping Federation, Dr. D. J. Avery, of London, and Dr. W. Laing, of Birkenhead. It was contended, for example, that while at certain ports the full

temporary resident fee was paid for each seafarer treated, in another the full fee was paid only for the first three men examined in one day, and thereafter was reduced to 5s. for each man. In some areas the full fee was paid only for the first man, and in others the reduced fee of 5s. was paid for each seafarer, no matter how many were examined in one day. It was also mentioned that very often a visit to a seafarer within port limits entailed a long and difficult journey to an isolated quay, a boat trip to a ship moored in the roads, and a hazardous and uncomfortable journey over the side, followed by an examination in cramped quarters. The whole journey and examination took at least an hour.

The DEPUTY SECRETARY, however, pointed out that the regulations were now being amended, that it had been agreed that the 5s. fee was too small and was to be increased to 8s. 6d., and that, moreover, the new regulations provided the right of appeal to the Minister. It was at the discretion of the executive council, with the advice of the local medical committee, to decide what the fee should be.

After considerable discussion it was agreed that the members of the deputation should put in writing to what extent, in their view, the alteration of regulations modified the grounds of their complaint, and whether they wished to submit some alternative proposals.

Inquiry into Cost of Prescribing

A letter was read from the Ministry proposing an independent committee consisting of a lay chairman, five general practitioners representing different areas and types of practice, the dean of a medical school, two general physicians, a pharmacologist, a pharmacist, and a statistician to inquire into the cost of prescribing in the N.H.S. The committee would be expected to tackle the investigation on broad lines, including medical education and training, the influence of hospital practice, the effect of advertising techniques of manufacturers, and pressure by patients.

It was decided to consult with the Chairman of Council and the Chairman of the Central Consultants and Specialists Committee before agreeing to the proposed constitution.

Other Business

Dr. J. A. PRIDHAM, chairman of the Organization Committee, moved that the Committee should be responsible out of its own funds for the payment of subsistence allowances to its members when attending centrally arranged meetings, and to members of subcommittees and of annual or other conferences arranged by the Committee, except where subsistence allowance was paid from any source other than B.M.A. funds. Decision on this matter was deferred until a subsequent meeting.

Dr. F. GRAY, on behalf of the London Local Medical Committee, raised the question of general-practitioner representation on boards of governors of teaching hospitals. He said that there were fourteen such hospitals in London, and a year ago there was a representative of general practitioners on eight and none on the other six. The position had now worsened. There was a representative of general practitioners on only five of the fourteen boards.

It was agreed to make representations to the Minister of Health stressing the need for a representative of general practitioners to be appointed on the board of governors of each of the fourteen teaching hospitals in London.

Dr. PRIDHAM gave a report on the question of general-practitioner maternity beds at Portway Maternity Hospital, Weymouth, which had been brought forward at previous meetings. The question seemed now to have reached an impasse, owing to the necessity for providing improved toilet facilities, accommodation for a premature babies' unit, and rooming-in. The hospital management committee had stated that it would be willing to give the subject of general-practitioner maternity beds the fullest further consideration when circumstances permitted. Dr. Pridham said that the position was most unsatisfactory, and he hoped that matters would be pursued further.

SUPPORT FOR REMUNERATION CLAIM

At a meeting of the South Bedfordshire Division on September 21 at Luton to discuss remuneration, 55 members attended out of a total of 96 and unanimously passed the following resolution:

"That this Division expresses its strongest possible support for the Negotiating Committee in its dealings with the Minister on the subject of remuneration, and pledges its determination to take whatever steps the Negotiating Committee finds it necessary to advise even if that involves resignation in part or whole from the Health Service."

ENTHUSIASM AT DARBISHIRE HOUSE

SECOND YEAR'S WORK

Doctors working at the Darbshire House Health Centre, Manchester, are still enthusiastic about health centres as a base for general practice, according to the annual report for 1955-6, which describes the work done in the centre's second year.

Four general practitioners and one assistant work there with an ancillary staff consisting of one social worker, two full-time and three part-time nurses, one secretary with three full-time and two part-time assistants, one part-time radiographer, one part-time clinical pathology technician, one part-time physiotherapist, and a caretaker and cleaning staff. The doctors report that they "are much impressed by the undoubted benefits of group practice, and would be exceedingly unwilling to return to practice where the advantages of having nursing assistance, x-ray, and laboratory facilities on the premises were absent. Simple physiotherapy has been found of great use. The benefits of having a social worker attached to the centre have been great, both for patients and doctors, and initial scepticism has proved unfounded."

The centre is also used for teaching final-year students from Manchester University "in the art of general practice." The students apparently appreciate the experience, and the doctors too have found it "stimulating, and not without benefit." The patients have raised no objections. An adviser in teaching, appointed by the university (Dr. R. Logan), is available for consultation and is helping the doctors of the centre to carry out clinical investigations, including one into iron-deficiency anaemia.

Each doctor retains his financial independence and sees his own patients, though freely consulting his colleagues. "No attempt has been made at specialization." With each doctor running his practice in his own way "unanimity in general policy is achieved," while "each doctor's individuality in the management of his practice is preserved."

The total number of patients on the doctors' lists was 12,356. Though an appointments system is available, relatively few of them take advantage of it.

HOSPITALITY

A German doctor's daughter, aged 17, would like to stay with a British medical family on an *au pair* basis for about a year. In exchange for board and residence she would be willing to help with light housework or care for children.

An Austrian doctor's family will receive an English girl on an *au pair* basis.

An Italian doctor's son, a medical student aged 17, would like to stay with an English family between November and Christmas this year on an exchange basis.

A Swiss doctor's son, aged 17, would like a holiday exchange with an English boy of the same age. Alternatively, he is prepared to give French lessons on an *au pair* basis.

Would anyone interested please get in touch with Brigadier H. A. Sandiford, International Medical Visitors Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Start Afresh

SIR,—I am extremely pleased that the Government has failed to keep its side of the bad bargain we made in 1948. My only fear is it will have second thoughts and pay us the 24% which is our just due, and leave us with our other serious grievances unredressed.

Sad it is to say, but true nevertheless, the only issue likely to bring unity and strength to our profession is real financial hardship. It is with many of us now, and it will increase and remain for ever as long as we have to rely entirely on the Government to pay us. Since 1911 it has never been convenient for any Government to grant us extra money unprovoked. Every award has required a serious threat of withdrawal of service before it has been granted. It has been a continuous undignified fight. It would be nice to think that reasoned argument would prevail, but the Government always outsmarts us. The Government only gives way when it sees we mean business and are prepared to resign. Negotiations and arguments get us nowhere without this threat. This time, let us hope we have the courage and good sense to carry it out and only re-enter the Service on our own terms. Our grievances go much deeper than the financial ones.

To me, and to many of us, our grievances are not just money. This latest financial swindle is the one chance of uniting the profession to resign. It is quite obvious that the mood of the nation is in favour of a health service of some sort, but let us as a profession only re-enter one on our own terms. For example: (1) We should insist on a service similar to the Australian one. This is not perfect, but it is at least better than ours. (2) We must get rid of the capitation system of payment. (3) We should insist on the optional return of goodwill or immediate payment of compensation based on present-day money value. (4) If drugs are to be free to anyone then they must be free to all. These are only a few of the points to add. Now is the time. It will soon be too late.—I am, etc.,

ANTHONY PARTRIDGE.

Shoreham-by-Sea.

SIR,—The National Health Service is composed of three parties—the insured patient, the Government, and the doctor. So far as the first two parties are concerned it is a service (whether health or not). The patient receives service in return for contributions; the Government receives service for its contributors. It is only for the bulk of the doctors (the general practitioners) that it is not a service but a piece-work job. Yet these are the purveyors of the service, and their quality is the quality of the service provided.

A service means increments according to the length of service, opportunities for promotion to the administrative and other grades, a reserve cadre of 1/7 for relief in sickness and to cover leave of any sort, opportunities for study and research, a pension scheme or contributory provident fund (superannuation). At it stands the medical component of the N.H.S. is a collection of confusions, chiefly because in 1948 it was recruited from the existing (and even then out-of-date) cadres of the profession—the G.P., the hospital doctor, the health officer, the consultant, the research worker, the super-consultant. Each was taken in on different terms, without thought for the overall picture of the future; without, one fears, appreciation of what such compartmentation would do to the quality of the service that would result, the effect upon the individual, the effect upon the whole status of the profession.

We have had a bitter lesson; but have we learned from it? The Service will soon be ten years old, and it is not a remuneration claim that is called for but complete re-planning. It is administrative failure that has brought us

to this pass. We brought too much of the old into the new without paring it to fit the new context. The armour we have built up to protect ourselves—the group practice—is not the true solution.

The doctor is a medical man, the product of a lengthy and costly education, and whether he be working single-handed or in a big group he is entitled to the same standard of living. His income in a national health service should not be dependent upon popularity with patients, and Government should pay either a salaried cadre or, if the capitation fee must be retained, pay 30s. for the first 2,000 patients and 5s. for the rest, per head. This might reduce big lists, which smother initiative and exhaust reason, and set us on our feet again as possible contributors to the problems of medicine in Britain and abroad.

At the same time the G.P. should be encouraged to specialize by (say) a year's study leave every seven years. He should be sure of a month's holiday a year—both these being met from the reserve cadre of doctors in the Service. In the case of those with existing practices at the time the Service was instituted and whose cases might be prejudiced by the suggested changes, could not Government pay 35s. per head for the first 2,000 patients, the additional 5s. representing an annual payment towards the goodwill value of the practice? This would be offset to some extent by the progressive reduction in interest payments and clear the stage for a revision of ideas.

Only when we are prepared to scrap the existing agreements and start afresh in the light of experience can the doctor, as well as the patient and the Government, get a fair deal in the National Health Service. In this context one may say that the doctor has done little to have his point of view made known, and his claim for increased remuneration has suffered thereby. Only the other day in a Scottish newspaper the following statement appeared: "The Joint Under-Secretary of State for Scotland is to make a two weeks' 'see for himself' tour of the Scottish hospitals. He hopes to see on the spot some of the difficulties facing hospital staffs and also to look at the conditions from the patients' point of view." Hospitals and patients! Why not the general practitioner? Could he not be the focus of a "see for yourself" tour? Perhaps his difficulties and problems might take on a more solid aspect with authority if such a thing happened. At present it is only the rare few who fall from grace who appear by name in the news; otherwise a policy partly blurred by ethical standards and partly by exclusiveness has taken us out of the public scene and far away from the national sympathy. Only rarely is a G.P. found taking a prominent part in the social life of the environment, whether town or village. Perhaps if he were less busy, less preoccupied by financial problems, he would regain that esteem and affection which characterized our members in pre-National Health Service days.—I am, etc.,

Crocketford, Dumfries.

L. SUTHERLAND.

Medical Staffing of Mental Hospitals

SIR,—I fully endorse all that Dr. S. Krauss has written (*Supplement*, September 15, p. 130). If the overall ratio of consultants to S.H.M.O.s is as officially stated, then I cannot help thinking that there must be a glut of consultants in other areas to balance the inverse ratio that exists in this one.

At our mental hospital, out of a staff of seven, there are three juniors, three S.H.M.O.s, and only one consultant, and much the same sort of thing goes, as notable if less glaring, for most other hospitals in the area. The area is the South-western Region.

These "degrading" committees (what an appropriate term Dr. Krauss uses) have certainly done a capital job here. They have mowed the grass finely—and kept it mowed—in spite of the most persistent evocations from suitably experienced specialists, graded S.H.M.O. and kept so graded, who have for a great deal of the time been doing consultants' work and doing it apparently with satisfactory efficiency.

doing this work along with their own because there are not enough consultants to go round.

I say—advisedly—with *satisfactory* efficiency, because the labourer is worthy of his hire, and only the really exceptional person, who certainly could not thrive, much less exist, within the levelling-up or levelling-down mediocrity of the National Health Service, could give of his best while suffering so great a sense of frustration, so embittered and resenting. I wonder what the railway worker—or rather his union—would have to say if guards were used to drive the train and still got their old wage? Yet this is what is happening to thousands of disillusioned S.M.O.s, who have in many cases unfairly been stricken down by the regional reaper's hand, all hope and ambition gone.

In this area will be found institutional doctors getting a lower salary than the head male attendant or the matron, to say nothing of the clerk to the hospital, and, more relevant to this issue, there are specialists in this region who are not only doing the so-called consultants' work when consultants are unavailable, including domiciliary visits (a few of the boldest have refused), but who are also regarded as sufficiently knowledgeable to lecture at the nurses' training schools in their specialties, yet not similarly remunerable, for such lectures are valued at precisely three-quarters of the consultants' lecture fee—i.e., they are paid 1½ guineas, instead of the consultants' 2 guineas per lecture.

Such men and others no less deserving have so far failed to persuade their regional boards to up-grade them, in spite of repeated exhortations and the ever-present difficulty of medical staffing in mental hospitals, and the insufficiency of psychiatric consultants.¹

The last review by the regional board was quite a while ago, and another is long overdue. But another will be of little avail so long as our regional benches are constituted as at present. An adequate representation of those who have local knowledge, of local reputations, conditions, and difficulties, is essential. The present juridical benches, born of the cap and gown out of remote control, clearly prefer the callow youth direct from the school of the large teaching hospital (they knew the bright boy in class) with little more experience than that afforded by the nimbus of the midnight lamp, oozing with degrees, and the ability to impress a committee, to those who may well be regarded locally as qualified by performance and a long experience to be consultants.

So long as this is the case, the mental health service with regard to staffing difficulties, from bottom to top, is likely to be "bogged" up. . . . And, of course, in the long run, our mental nurses, in dangerously short supply, already over-worked and understaffed, will have to take the strain, more strain, for a psychiatric consultant's role is primarily a preventive and advisory one—to keep patients out of mental hospitals.—I am, etc.,

Exminster, Devon.

JOHN W. FISHER.

¹ Central Health Services Council. Report for the Year Ended December 31, 1955. 1956. H.M.S.O., London.

Health Centres

SIR.—The facts about the accommodation for general practitioners at the Harold Hill Health Centre, Romford, were fully stated in the report of the London Local Medical Committee on Health Centres—i.e., that there are three suites consisting of consulting-room, examination- and waiting-rooms, and one additional consulting-room. It is true that in the report the Committee reckoned this accommodation as three suites, whereas it would have been more correct to have reckoned it as three and a third, not four as Dr. J. G. Fife writes (*Supplement*, September 29, p. 144). The Committee felt, however, that its comparisons of costs could be only approximate and would not be appreciably affected by the omission of a small fraction.

It may surprise your readers to learn, both with regard to this criticism by Dr. Fife and his further statement that the rent per doctor was given incorrectly, that the report was sent to him in draft before being approved by the

London Local Medical Committee, and his reply was: "The details about Harold Hill are substantially correct."—I am, etc.,

London, W.C.1.

F. GRAY,
Secretary,
London Local Medical Committee.

Branch and Division Meetings to be Held

- ALDERSHOT AND FARNHAM DIVISION.—At Northfield Hospital, Aldershot, Wednesday, October 10, 8.30 p.m., annual general meeting. Discussion on remuneration, to be opened by Dr. R. G. Gibson. Film: "The Twins of Kano."
- BARNSELY DIVISION.—At Queen's Hotel, Barnsley, Wednesday, October 10, 7.15 for 7.30 p.m., dinner and dance.
- BLACKPOOL AND FYLDE DIVISION.—At Savoy Hotel, Blackpool, Wednesday, October 10, 7.15 p.m., dinner; 8.30 p.m., lecture by Mr. R. Thurst: "Some Jewish Laws of Hygiene."
- BROMLEY DIVISION.—At Cray Valley Hospital, St. Paul's Cray, Tuesday, October 9, 8.15 p.m., clinical meeting. Dr. D. F. O'Neill: "Migraine."
- CROYDON DIVISION.—At Mayday Hospital, Thornton Heath, Tuesday, October 9, 8.30 p.m., clinical meeting.
- HENDON DIVISION.—At Heudon Hall Hotel, N.W., Tuesday, October 9, 8.45 p.m., meeting. Dr. Maurice Campbell: "Sherlock Holmes and Medicine." Wives and friends of members are invited.
- KINGSTON-ON-THAMES DIVISION.—At Kingston Hospital, Wolverton Avenue, Kingston-on-Thames, Tuesday, October 9, 7.30 p.m., clinical meeting.
- MONMOUTHSHIRE DIVISION.—At Angel Hotel, Abergavenny, Thursday, October 11, 8 for 8.30 p.m., dinner; clinical meeting. Subject: "Tubercle in Children." Speakers: Dr. S. Rosehill, Mr. T. H. L. Rosser, Dr. T. A. Brand, and Dr. M. I. Jackson.
- NORTH STAFFS DIVISION.—At North Stafford Hotel, Station Road, Stoke-on-Trent, Tuesday, October 9, 8.15 p.m., joint meeting with North Staffs Branch of Pharmaceutical Society. Lecture-film demonstrations by Dr. J. J. Merry.
- PRESTON DIVISION.—At The Playhouse, Market Street, Tuesday, October 9, 8.30 p.m., meeting. B.M.A. Lecture by Mr. Charles Evans: "Kangchenjunga." Ladies invited.
- SCUNTHORPE DIVISION.—At Blue Bell Hotel, Scunthorpe, Thursday, October 11, 7.45 for 8.15 p.m., meeting. Discussion to be opened by Dr. E. Grey-Turner (Assistant Secretary, B.M.A.): "Remuneration."
- SOUTH MIDDLESEX DIVISION.—At Red Lion Hotel, Hounslow, Wednesday, October 10, 7.30 for 8 p.m., Medical Practitioners' and Pharmacists' Joint Annual Supper; lecture by Dr. W. A. F. Macdonald: "Adam to the Atom." (Illustrated by lantern slides.)
- SOUTHPORT DIVISION.—At Nurses' Home, Southport General Infirmary, Friday, October 12, 8 for 8.30 p.m., meeting. Lecture followed by film demonstration on cortisone by Dr. J. J. F. Merry.
- SOUTH-WEST ESSEX DIVISION.—At Sir James Hawkey Hall, Woodford Green, Thursday, October 11, 8 for 8.30 p.m., annual dinner and dance.
- SOUTH-WEST WALES DIVISION.—At Boar's Head Hotel, Carmarthen, Saturday, October 13, 7.30 for 7.45 p.m., annual B.M.A. dinner and lecture. Mr. C. Naunton Morgan: "Advances in the Surgery of the Anal Canal and Rectum."
- STOCKTON DIVISION.—At Stockton and Thornaby Hospital, Tuesday, October 9, 8.30 p.m., meeting. Lecture by Dr. John Burton: "My Recent Visit to Russia."

MEDICAL MANPOWER

SCOTTISH COMMITTEE'S MEMORANDUM

The Scottish Committee of the British Medical Association has submitted a memorandum of evidence to the departmental committee (the Willink Committee) appointed by the Minister of Health and the Secretary of State for Scotland to estimate on a long-term basis the number of medical practitioners likely to be engaged in all branches of the profession in the future and the consequent intake of medical students required.

Broadly speaking, the Committee feels that almost every aspect of the subject is "fraught with prognostic difficulty." It was possible to discern certain trends, but their continuance depended upon factors so unpredictable that "nothing short of efficient crystal gazing could give the answer." However, the Committee has set out those considerations which have enabled it to reach some conclusions.

Historical

The growth in the number of doctors in proportion to the population since the end of the last century is attributed to the developments in medical knowledge and the great expansion of specialism which came with the modern emphasis on the scientific aspects of medicine. The extended opportunities thus created were inevitably reflected in the number of those seeking to make medicine their career. The medical schools long established in the four university centres in Scotland were well placed to meet this situation. As a consequence a high proportion of British doctors were trained in the Scottish medical schools. A substantial proportion of those trained in Scottish schools were not of Scottish origin; nevertheless, even allowing for this, the proportion of young men and women in Scotland seeking to make a career in medicine has for long been significantly higher than in the rest of Great Britain. The Committee believes that this reflects the high esteem in which professional occupations have long been held in Scotland.

Not only has the content of medical practice been greatly altered by the elimination or much diminished incidence of illnesses common a hundred years ago (and to a lesser extent by the appearance or increase of others which were not), but the changes in age distribution of the population, social and economic status, etc., have in turn had an indirect effect on medical practice which is difficult to assess in relation to future trends and requirements.

Present Situation

An assumption that the expected phase of expansion of the profession following the start of the Health Service might

be followed by one of contraction when the declared objects of the Service are attained is not as logical as it appears, the Committee says, because there are many imponderable factors which can influence future developments and make unpredictable demands on medical manpower. It is by no means certain that much contraction can be looked for as a result of an efficient health service or even that such contraction will occur at all.

Some indication of the trends can be seen in the statistics of medical employment in the National Health Service since 1948. In 1948-9 there were 2,419 general practitioners in contract with executive councils in Scotland. By 1954-5 this number had increased to 2,568, an increase of approximately 6%. In 1951 the number of doctors in the Scottish local health authority service was 250. The figure at the end of 1955 had increased by approximately 16% to 291. The numbers in the different grades of hospital medical staff in Scotland at December 31 are shown in the following table.

	1949	1950	1951	1952	1953	1954	1955
Consultant	653	708	731	751	810	835	876
S.H.M.O.	274	301	321	328	316	337	353
Senior registrar	161	191	197	217	213	223	236
Registrar	266	269	208	202	206	246	281
J.H.M.O.	..	..	..	131	163	161	..
S.H.O.	..	..	..	155	174	189	..
H.O.	..	..	..	576	547	579	..

By far the greatest increase in an all-round increase in the number of doctors participating in the Health Service has been in those working in the hospital service. There are approximately 30% more doctors working in the hospitals now than there were only seven years ago. The increase in the amount of service rendered by the hospitals is about 35 to 40%. From this the Committee points out that the staff increase was in no sense a luxury one but came about in response to a genuine demand.

The Committee thinks that the spreading of hospital and specialist service throughout Scotland is well advanced and that any further increase in hospital medical establishments will mainly reflect developments in medical knowledge and practice.

Superficial consideration might suggest that the increase in hospital attendance would lead to a reduction in general-practitioner attendance, but this is not so. The Committee thinks it more likely that the reverse is true, and that it is because people are going more readily to see their family doctors that more of them are being referred to hospital. Whatever may be the actual balance of effect of the Service, there can be little doubt that the percentage increase in the total of general medical services has been substantially

greater than the percentage increase in the total numbers of practitioners.

Both the number and proportion of those with small lists are appreciably less in 1955 than in 1951. This indicates that the capacity of general practice as a whole to undertake more service is to this extent reduced. It is widely, although by no means universally, considered that the permitted maximum for lists is still too high. If this view became more generally accepted the broad tendency, observable since the inauguration of the Service, towards "spreading the load" of general practice is likely to continue. It is highly probable that in such circumstances it would prove necessary to have more doctors engaged in general practice.

Intake of Medical Students

The Committee calculates, very much in round figures, that British medical schools will require to produce enough replacements for a total present medical force of about 66,000 and to allow for an increase during the next 10 to 25 years of about 10%.

Admissions to Scottish medical schools have fallen by about 20%, while applications are not far short of 50% less than they were seven or eight years ago. It is recognized by the Committee that the high level of applications in the early post-war years reflects the backlog of demand created by the war, but it doubts if this factor alone fully explains the large drop in applications in 1951 and 1952. It believes these figures support the fairly general impression that there has been a significant decline in the number not only of those seriously contemplating entry into the medical profession but also of those measuring up to selection committee standards.

Twenty or more years ago the majority of applicants came from professional families, many from medical families. Nowadays, the Committee is informed, such applicants constitute quite a small proportion of the total. Formerly doctors for the most part were pleased when their children elected to follow in the parental footsteps and encouraged them to do so, but now they are much less enthusiastic and sometimes actively discouraging.

Economic factors operate in the same direction. Many professional-class parents, often unable to obtain grants from public funds, find the cost of putting their sons and daughters through medicine under present conditions more than they can undertake.

Apart from their intrinsic importance these aspects are relevant to the practical considerations which have led to the present inquiry. If, for example, there were to be a really serious dearth of suitable applicants, estimates of required intake at which the Committee might arrive could prove to be largely of academic interest. The Committee feels, however, that it is reasonable to hope that any falling off in numbers of suitable recruits to the medical profession is only temporary and that in the long run the high place of medicine as a career of choice will be recovered.

The Future

The factors likely to influence medical requirements seem to the Committee to fall into two interdependent main groups—namely, those immediately and directly affecting the practice of medicine, and those affecting the general level of health in the community and thus indirectly the practice of medicine. Most obvious in the first group are advances in the knowledge and understanding of disease processes and in the means of treating or preventing them. There is no reason at all to suppose that this process of advance will halt, and illnesses which now make heavy demands on medical services may in quite a few years' time have largely disappeared.

A less obvious factor in this group is the system of organizing and financing a medical service which depends for its finance on an annual parliamentary vote. It seems to the Committee that this must have a bearing on the "number of medical practitioners likely to be engaged in all branches of the profession in the future." Under such a system the amount of money to be devoted to the medical

service must be determined, at least to some extent, by considerations unconnected with actual medical need. Secondly, the amount to be spent has to be determined in advance, and of course the decision as to what the nation is to pay for its doctoring has to be a collective, not an individual, one as it is under less highly organized systems. Whatever may be its other merits or demerits, such a system does not make for flexibility of response to changing need, and changes in establishment are consequently rendered less likely than they would be under less centralized arrangements.

This relative inflexibility is likely to affect mostly the situation in the hospital and specialist services. At the same time the Committee finds it easy to imagine that changes in the organization, administration, and financing of the public health and general medical services also could materially affect the numbers of doctors required to undertake them. While it is not at all unlikely that such changes will come about, it seems to the Committee quite impossible at the present juncture to forecast either when they are likely to occur or what form they might take.

The Committee is not entirely convinced that the increasing age of the population more or less automatically results in an increasing need for medical services. Much illness suffered by the elderly is preventable. Much of the thought and effort of the developing specialty of geriatrics is directed to prevention of this kind of illness. To the extent that this objective is attained an ultimate reduction in the demand for medical services for the elderly can be anticipated.

Studies of schoolchildren and young adults over the years reveal evidence of continuing improvement in the general level of physical health among the younger age-groups in the community. This has resulted in the main from the application of medical knowledge to the problems of disease prevention, principally but not exclusively through those practising in the public health service. There remains much scope for fresh developments in the field of preventive medicine, as well as for more effective prosecution of measures already initiated. No one can say with certainty, but it is undoubtedly possible that application of the principles and practice of preventive medicine to the problems of psychogenic disorder might result in improvement in the general level of mental health comparable with that already achieved in relation to physical health. No matter how vigorously this desirable end were pursued, however, it could be achieved neither quickly nor without initially increasing rather than diminishing the need for doctors.

It is the Committee's belief that quantitative limitation of entry, based on population, might well have an adverse qualitative effect on the total recruitment in this country. Should a policy of limitation appear to be indicated as a result of the Willink Committee's inquiry and estimates, this object could be better achieved by raising the standards of entry and qualification in all the schools. Any policy which had the effect of partially dismantling, as it were, the carefully built up apparatus of medical teaching would be most unwise.

Conclusion

In conclusion, it must, the Committee thinks, be anticipated that the number of doctors engaged in all branches of the profession will during the next 10 to 25 years be not less than it is at present and is likely to be more. If, after making allowance for "wastage" (by death, retirement, marriage of women doctors, etc.), an average practising life of 30 years is assumed, the annual number required for replacement would be 2,200. The figure for 1955, by which time presumably adjustment to the new registration requirements had been made, was 2,309. An intake into the profession of this order does not allow a large margin for meeting the increased demand for doctors which the Committee believes is likely to arise in the proximate future. To produce this number of graduates would require an annual intake of students of nearly 3,000 (allowing for a student wastage of approximately one-eighth), a number which is in

excess of the present total intake of the British and Irish schools. From this it seems possible to the Committee to draw at least the negative conclusion that there is no prima-facie argument in favour of quantitative limitation of student intake to British medical schools. At the same time it does not think that positive steps need to be taken now to increase intake, because adjustment will occur without this.

The Committee thinks that some of the factors which could influence future requirements might conceivably be less difficult to assess in a few years' time, and that the Departmental Committee should consider postponing, perhaps for five years, a forecast of long-term requirements. Finally, the Committee thinks that it would be valuable to keep up-to-date the statistical information collected for the present inquiry and to keep the situation under periodic review.

RECRUITMENT TO THE DENTAL PROFESSION

COMMITTEE SUGGESTS REMEDIES FOR SHORTAGE

There is little prospect of any increased entry into the dental profession during the next few years to balance the retirement of the many dentists of advanced age at present on the register. The numbers entering the dental schools during the last five years dropped to their lowest, and even if recruitment is stimulated at once there can be no hope of an increase of substance for at least eight years. This situation is disclosed in the report¹ of the Departmental Committee on recruitment to the dental profession which was set up in 1955, under the chairmanship of Lord McNair, by the Minister of Health and the Secretary of State for Scotland.

In the committee's opinion the profession is failing to attract recruits for three main reasons. The public does not understand the true import of dental health and too little is known of the possibilities of dentistry as a career; many dentists are unwilling to advocate it; parents cannot afford the outlay for training for a profession which is not as attractive as it could be.

Remedies

If appropriate steps are taken to remedy these things, the committee feels that young people will offer themselves in sufficient numbers as recruits. To achieve the aim of increasing the register to 20,000 names an annual intake of about 900 will be needed, compared with about 550 at present. A difficulty would be to increase the accommodation in dental schools in sufficient time, and it is recommended that universities should at once consider how they can provide additional places in the preclinical year. The possibility of developing the facilities of dental departments in general hospitals for clinical training should also be considered. A new dental school or schools for an intake of 200 students a year should be established, and the foundation of a dental school in the University of Wales for an intake of 50 students annually should be expedited.

The establishment of an independent and representative standing committee to secure public awareness of dental matters is recommended. In particular the committee recommends that authorities responsible for publicity should encourage the enlistment of women into the profession.

Professional Discontent

Recognizing that dentists should be the best advocates of their profession, the committee recommends that, so far as possible, the causes of their present discontent should be removed. A thorough review of the whole system of remuneration should be undertaken and consideration given to the correction of the present pattern of earnings whereby

¹ Report of the Committee on Recruitment to the Dental Profession, 1956. H.M.S.O., London. Price 3s. net.

professional income tends to diminish in middle age, regardless of increasing experience. The general sense of financial insecurity should also be corrected, particularly in the way of lessening the financial problems facing dentists on retirement.

The committee also recommends that methods should be examined whereby help can be made available to suitable candidates for dental schools whose parents cannot find the contribution necessary under the present rules for State or local authority grants.

To prevent or mitigate causes of professional irritation the committee suggests that the list of treatments set out in the National Health Service (General Dental Services) Regulations as requiring prior approval should be reviewed now and at two-yearly intervals, so that any treatment which could be an occasion or a source of abuse by either patient or dentist could be removed.

The number of consultant posts should be increased, the committee says, as should also facilities for research and original work.

INDIVIDUAL MEMBERSHIP OF W.M.A.

SECRETARY-GENERAL'S VIEWS

The Secretary-General of the World Medical Association, writing in the *World Medical Journal* for September, states his opinion that the objectives and proper influence of the W.M.A. can be obtained only by support of the doctors in all countries. Mere membership of their national association in the W.M.A. is not sufficient. Support can be given by individual members of the medical profession through membership in a supporting committee or through the latest proposal to establish associate individual membership in the W.M.A. The two methods are not necessarily in conflict. Associate membership can be conferred on supporting committee members.

The Secretary-General goes on to say: "It is essential to arouse the individual doctor if our principles are to prevail. If the standards of medicine are to progress the medical profession must remain free. It can remain free only if it faces the threats of government or outside agency controls with unanimous support of the individual members of the profession." Formerly, doctors could confine their thoughts to scientific medicine. Now the social structure of the world has changed so they must pay attention to medical economics and social changes. If doctors are alert they can guide and control these changes instead of being controlled by them.

The question of associate or individual membership will be discussed eventually by the General Assembly of the W.M.A. after member associations have considered the matter.

EMPIRE MEDICAL ADVISORY BUREAU

FIRST WINTER "AT HOME"

Mr. and Mrs. A. M. A. MOORE received the guests at the first of the "at homes" to be held this winter by the Association's Empire Medical Advisory Bureau. Some 160 doctors, many accompanied by their wives, from 12 Commonwealth countries accepted invitations and were able to meet a number of distinguished medical men in this country who were present. Further receptions will be held at intervals during the winter months. The medical director of the Empire Medical Advisory Bureau is Brigadier H. A. Sandiford.

The Minister of Health has decided to add fluorohydrocortisone preparations to the list of specially expensive drugs, reagents, and appliances for the supply of which doctors receive payment over and above their capitation fees (E.C.L. 53/56). The amendment was effective from September 1, 1956.

SICKNESS CERTIFICATION IN N. IRELAND

SELECT COMMITTEE'S COMMENTS

The number of persons medically certified for sickness benefit in Northern Ireland in 1954-5 was about one and a half times the figure for Great Britain in proportion to the insured population. In its report¹ for that year the Northern Ireland Select Committee of Public Accounts stresses "the gravity of the present position as regards medical certification and the urgent need for improvement."

It is stated in the report that if the rate of certification were reduced to that obtaining in Great Britain payments in sickness benefit would be reduced by more than £1 million a year. So far any improvement from a policy of securing the co-operation of doctors had not been readily discernible, and in the Committee's view, from both the financial and the moral aspects, "the time has arrived when disciplinary action should be taken in the case of doctors who continue to give unjustifiable certificates of incapacity."

B.M.A. FILM LIBRARY

The following films have recently been added to the library:

Circular Vascular Suture.—Black and white, sound, 12 min., made by Professor Vladimir Kovanov, presented by the Russian delegation of doctors, November, 1955. The film demonstrates end-to-end anastomosis of arteries by a method of suture which ensures that the cuff does not interfere with the blood flow and the sutures themselves are not in direct contact with the blood, not even the intima sutures.

Gait.—Colour, sound, 30 min., 1956, made in collaboration with the Orthopaedic Institute, University of London, presented by Imperial Chemical Industries, Ltd. The film is complementary to *Gait*—ICI/M.34. Here an analysis of gait is made on the basis of (1) weakness of muscles controlling joints, (2) disorders of the joints, (3) abnormalities of the bones.

Artificial Respiration.—Black and white, sound, 11 min., 1956, presented by Imperial Chemical Industries, Ltd. The Schaefer and Holger Nielsen methods are described, first on wall charts and then demonstrated by a team of first-aiders on a patient suffering from drowning. The combined method with two operators and the use of "novox" apparatus is also shown.

Examination of the Unconscious Patient.—Black and white, sound, 6 min., 1956, presented by Imperial Chemical Industries, Ltd. Demonstration of a systematic method of examination of an unconscious patient by a first-aiders.

Removal of Clothing and Treatment of Fractured Collar-bone.—Black and white, sound, 6 min., 1956, presented by Imperial Chemical Industries, Ltd. Demonstrates a method of removing clothing followed step by step with the treatment of the fracture.

First Aid for Patient with a Fractured Spine.—Black and white, sound, 8 min., 1956, presented by Imperial Chemical Industries, Ltd. A team of first-aiders demonstrates the correct method of handling and treating such an injury from the initial approach to the eventual removal of the patient on a stretcher.

Rehabilitation at Swindon.—Black and white, sound, 22 min., 1951, presented by the British Transport Commission. The film shows the rehabilitation workshop attached to the railway workshops at Swindon. It consists largely of a series of illustrations of specially adapted machines being operated by injured men so that in working them they will exercise and rehabilitate the muscles related to the injury and at the same time carry out useful work.

Kielland's Midwifery Forceps.—Colour, sound, 17 min., 1955, made by Mr. A. Gunn. It describes the forceps and demonstrates how they are applied to the foetal head. The delivery in a case of transverse arrest is demonstrated.

My First Baby.—Black and white, sound, 30 min., 1955, made by Miss J. R. C. Burton-Brown. The film shows from the expectant mother's point of view the training she receives during the antenatal period and culminates with a normal delivery.

An Operation for Cerebrospinal Fluid Fistula.—Colour, silent, 7 min., 1954, made by Mr. Harvey Jackson. The film gives an account of an operation for a patient who has a cerebrospinal

fluid fistula. The patient is shown demonstrating the leak of C.S.F. before the operation, and then steps of the operation are shown.

Orbital Decompression.—Colour, silent, 9 min., 1954, made by Mr. Harvey Jackson. This film shows shots of a patient suffering from haemangioma in the orbit before and after operation for orbital decompression and removal of a tumour. The steps of the operation are clearly shown.

Congenital Dislocation of the Hip.—Black and white, silent, 7 min., made by Mr. G. D. Rowley. The film shows the clinical examination of a child with congenital dislocation of the hip, followed by a brief outline of the method of treatment.

Scottish News

DRUG BILL IN SCOTLAND

The secretary of the Pharmaceutical General Council (Scotland), Dr. D. McCALL, stated at the Scottish Association of Executive Councils conference in Ayr on October 5, in reply to a reference by Mr. J. NIXON BROWNE, Joint Parliamentary Under-Secretary of State for Scotland, to the "rising drug bill," that he did not consider the drug bill was unduly high. According to a report in the *Scotsman*, Dr. McCALL cited an article in the *British Medical Journal* (F. F. Marchbank, *Supplement*, September 1, p. 115) to show that low cost of drugs meant a high total cost to the State because of longer absence from work, hospital treatment, etc. He admitted there were extravagances which an attempt should be made to reduce. Prescribing of mixtures had fallen from 60% in 1925 to 15% in 1951; in the same period prescribing of proprietary medicines rose from 7% to 30%, and now made up about 45% of all medicaments.

A report of the Scottish Association of Executive Councils conference will be published in a subsequent issue of the *Supplement*.

Questions Answered

We publish below a selection of those questions and answers which seem of general interest. It is regretted that it is not possible to supply answers to all questions submitted.

Locum Rates

Q.—Would you give me particulars of the "B.M.A. rates" for locums?

A.—There are no B.M.A. rates in the sense that the Association has approved a scale of fees for locums. The Association is well aware of the rates usually obtaining and is always willing to advise inquirers on whether a particular proposal accords with usual practice. The ordinary rate payable is 16 guineas a week all found. If the locum uses his own car or is required to do so, he is entitled to a car allowance to cover depreciation, tax, insurance, and maintenance, but not running expenses for professional duties, which are, of course, a practice expense of the principal. This is a generalization. There is nothing to prevent the principal and locum agreeing on a figure to include petrol and oil if they wish to do so. Lastly, if the locum is required to live out, then the principal is responsible for board and lodging. If, on the other hand, the locum lives out at his own request, then he is entitled to the accepted value of "all found," which is three guineas per week.

Correction.—In the report of the G.M.S. Committee (*Supplement*, October 6, p. 147) Dr. F. E. Gould's initials were wrongly printed in the first paragraph.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Starting Afresh

SIR.—The Chancellor of the Exchequer stated at Bromley that since 1951 wages have increased by 47% and the cost of living by 25%. This confirms the B.M.A. figures, over which there need be no further argument, and spotlights the necessity and justice of our cause, apart from its legality. Furthermore, it shows that the money is there in the country. Definitely something must be done soon to ease our position. However, if the Government refuses to keep the agreements made when setting up the present system of remuneration, which necessitates adequate payment at pre-war standards since the individual doctor is required to take the risks of an insurance company without the right to alter the rates in accordance with claims or to reject bad risks, we must seek and demand alternatives.

Dr. F. R. Goodwin (*Supplement*, September 8, p. 124) has suggested one method whereby overtime (evening and night visits) should be charged extra to the patients concerned. Evening surgeries could be earlier to achieve reasonable working hours. But I think that this would lead to many difficulties and disagreements—for instance, as to the time a message was actually handed in. It would be much better and much fairer to insist on a payment per item of service system, as is being worked in other countries. There should be a basic payment of 5s. per consultation at the surgery, and 10s. for each visit, plus mileage. Nobody could but agree that these payments would be reasonable. Nevertheless, every doctor's income would very materially increase, and everyone would receive an adequate return for his work. Though there would be more book-keeping, it would be possible to employ a nurse-secretary-receptionist again to keep the books, who would also relieve the doctor in countless other little ways, leaving him free to attend to his proper calling, the practice of medicine. Moreover, under this scheme, patients would have complete freedom to attend whatever doctor they wished as they wished, subject only to the recognized medical ethics. Panel record cards would be eliminated, each doctor keeping his own records. If he required the previous record of a new patient, he would write for it himself to the old doctor. Thus, doctor would deal direct with doctor, cutting out all the intermediate delays. Large numbers of Ministry staff would become redundant, and doctors would be freed from bureaucracy, and free to have the assistance in their own offices instead of in the Ministry's numerous offices. This saving would go a long way to covering the extra payments to the doctors, and, apart from other countries, we have precedents in paying for services rendered in the dental and ophthalmic services on which the scheme could be modelled. It would be wise for us to demand, if only as a safeguard against the continued rise in cost of living, the flexibility of the French system, whereby if a doctor thinks he is worth more than the basic payment of the Government, and his patients agree, he may charge more, the difference being paid by the patient. Thus may extra skill on the part of a doctor, or better facilities given to the patient, be suitably rewarded.

As mentioned above, I believe that this scheme could bring adequate remuneration to doctors without costing very much more, reduction in Ministry staffs covering much of it. The rest could be covered by restricting free medicines to those drugs and formulae listed in the *National Formulary*. Those patients who desired more elegant preparations could be allowed to pay the difference. Deficiencies in the *Formulary* could be covered by more frequent supplements, and hospital pharmacies would have their freedom (and controls) as at present, so that new expensive drugs ordered or advised by specialists could be obtained through them.

The only objection that can be made to this scheme by the Government is that some doctors might over-visit to line their own pockets. This would be an insult to the profession, and not really to be upheld when one remembers that doctors are already trusted to control large sums of money by their certification. However, an automatic and free control could be had by making part of the fee for a service or a visit payable by the patient, as is done in other countries, if necessary washing out the dispensing fee in compensation to the public. By this means, also, by so adjusting the portion payable by the patient, could the scheme be worked without costing the Government any more than the present system of underpayment, if really necessary. Finally, I should like to put very forcibly the suggestion that only by introducing some such scheme as I have outlined can the profession retrieve its dignity and freedom.—I am, etc.,

Leominster.

C. W. F. MCKEAN.

SIR.—It is time to couple with any claims for increased remuneration a fixed policy for the future. We must not be shortsighted, for with our present economy this subject will become the recurring decimal. We ought, as a matter of obligation, to plan for those who will follow us, and try for their sake to end the need for periodic claims, with all the waste of nervous energy and time that this entails.

Rather than establish a claim now, I would prefer that a firm and fixed principle is evolved which will survive the changes in policy, party, and personalities. We lose prestige every time the endless bickering starts again. None of us knows what will happen to the cost of living, but for some time at least it is going to rise. Are we to lose this present opportunity of reaching a definite agreement with the Minister of Health, which will remove the need for repeated claims and arrive at some adjustment with the cost of living? Or, having won a claim, go through the whole weary procedure in another few years? By that time we shall be well-trained (and well-chained) civil servants.

My finances are such that I should welcome an increase, but if an arrangement could be reached I should feel happier than I do now, with or without it.—I am, etc.,

ShIPLEY.

D. H. JUDSON.

What is Excessive Prescribing?

SIR.—The arguments against economy in prescribing presented by Mr. F. F. Marchbank (*Supplement*, September 1, p. 115, and September 29, p. 144) are so fallacious and misleading that they call for a reply. The data from Germany put forward to support the argument that often it is uneconomical for a doctor to restrict his prescribing of expensive drugs merely result from the fact that those doctors who treat many of their patients at home will obviously thereby spend more on medicines than those doctors who are able to send many of their patients into hospital. The cost of domiciliary treatment, which avoids the enormous overhead expenses of hospital treatment, is, of course, very much less. This is a cogent argument for advocating treatment in the patient's home whenever possible, but not for advocating expensive prescribing as a virtue.

The second argument put forward by your correspondent, based on data from English hospitals, could be summarized as follows: in hospitals where the average weekly cost per head on drugs and dressings is higher, the average stay per case is less—as a result, so we are to infer. Again the cart is put before the horse. In "acute" hospitals the expenditure on drugs and dressings will be greater during the earlier part of a patient's stay (operation, acute stage of illness, etc.) than during the later convalescence. Therefore, the less time each patient spends in hospital the greater will be the average weekly expenditure on drugs and dressings. These hospitals with convalescent units or better facilities for convalescence at home will maintain a brisk turnover of acute cases and will therefore spend more on drugs and dressings. Only if it can be shown that there is a correlation between the amount spent per patient in, say, the first

¹ Government of Northern Ireland, Report from the Select Committee on Public Accounts, 1954-5, 1956. H.M.S.O., Belfast.

week after operation and the total period of convalescence would your correspondent's argument begin to bear examination, but no evidence of this sort has been adduced. It will need better logic than this to convince our consciences that extravagant prescribing is not one of the seven deadly sins.—I am, etc.,

Portobello, Midlothian.

P. R. MYERSCOUGH.

SIR,—On reading Mr. F. F. Marchbank's letter (*Supplement*, September 29, p. 144) I felt it would have been more helpful if he had quoted the *total* cost of drugs received by the patient during his stay in hospital rather than the weekly cost. I calculated these totals from the figures he quotes, and find that the total cost of drugs a patient may be expected to receive is approximately constant, regardless of how long he stays in hospital, and also that a high rate of expenditure does not, in fact, result in a high total expenditure.

This suggests that it would be most economical to encourage hospitals to spend as much as they like on drugs, thus curing their patients sooner and saving the cost of prolonged accommodation, as well as freeing their bed for someone else.—I am, etc.,

Butterknowle, Co. Durham.

N. J. B. ALEXANDER.

Was it a Drug?

SIR,—Having just read the most recent report (*Supplement*, September 22, p. 134) with regard to Regulations 16 and 17 of the National Health Service (Service Committees and Tribunal) Regulations, 1948, I can come to only one conclusion. That is, that we as a profession are stark, staring mad. I am sure our psychiatric colleagues would have a more polite and inspiring phrase, but I am certain it would not be more understandable.

Poor Dr. X, whoever he was in this case, or whoever he might be in future cases, has my profound sympathy and admiration. He must have felt like Alice in Wonderland as he worked his way through committees to appeals and on to tribunals. May I also congratulate him, or his advocate, on the masterly defence put forward for his fiendish crime? In the end it won the day, won his freedom, and cleared his name from the black stain that would have dogged his footsteps for evermore. Oh, you wicked man, Dr. X, this will surely teach you a lesson you will never forget. Do not ever again prescribe a food that might be a drug or a drug that might be a food, or a drug containing a food that might be a food and not a drug, or even a food that contains a drug that might be a drug or a food. To borrow a phrase, "Open the cage, here I come."—I am, etc.,

Hayes, Middlesex.

S. EDELMAN.

Cost of Prescribing

SIR,—We hear a great deal nowadays about excessive prescribing and expensive drugs, and it may be of interest to recall the comparatively generous terms which were offered to practitioners 145 years ago.

Lieutenant-Colonel Gillow, of the R.A.O.C. museum, recently unearthed a circular issued by the Office of Ordnance dated May 8, 1811. This deplures the "exorbitant charges made by several practitioners at several stations for medicines administered to artificers and labourers in the employ of the Ordnance" and goes on to lay down a scale of payments. A curious point about the statement is that a flat rate is laid down for the various medicaments, etc., quite irrespective of their ingredients, with the exception of "powder bark," the scale for which varied from 1s. to 1s. 6d. an ounce according to the fluctuation of the market. "The exhibition [at a shilling a time] of any medicine in the form of draughts, except in cases of absolute necessity" was "totally inadmissible." Mixtures, juleps, decoctions, infusions, etc., ran from 1s. 6d. for four ounces up to 4s. for a pint, while an emetic or aperient went for 6d.

The practitioner was paid 4d. for every dose of medicine taken at short periods—e.g., every three or four hours—whether as pills, powders, or boluses. He received 1s. for supplying a box of pills containing a dozen, while an "ordinary sized blister" brought him 1s. 6d. with dressings. Visits averaged 1s. per mile; night visits were paid at 5s. under two miles and double the day charge for over two miles. For surgical dressings, when the patient was able to attend the surgeon, the latter could receive up to one guinea a month.

When one remembers the relative values of those days it seems that the civil medical practitioner must have done very well if he received 4d. every time a patient on "medicine and duty" swallowed his three-hourly dose, especially if he were able to augment his income with an occasional "ordinary sized blister."—I am, etc.,

Crookham, Hants.

R. E. BARNESLEY.

Remuneration Claim

SIR,—Correspondence in the *Supplement* on the subject of remuneration suggests that the profession is in favour of vigorous action should this prove to be necessary. Before possible battle is joined it would seem prudent to inspect our defences, and, if necessary, take action to remedy any weaknesses. So far as the hospital side is concerned, defence appears to consist almost entirely in the Hospital Medical Staffs Defence Trust, and it seems to me that we should be making every effort to bring the fund up to a worth-while figure. The following observations are intended as a contribution to this objective.

Publicity.—Most of the hospital doctors I have spoken to had never heard of the Defence Trust, and of the few who had heard of it not one had any clear idea what the Trust was supposed to be for. When I asked one whole-time specialist if he would consider subscribing, his reply was: "I think the part-time people do well enough. I do not see why I should be asked to subsidize their income-tax battles. Give me some indication that the same zeal will be shown in righting our problems, then I will subscribe." It seems clear that a short pamphlet clarifying the purpose for which the Defence Trust has been formed should be prepared. If it were then circulated to every consultant and specialist in England and Wales, I feel certain that the return would make the initial outlay very much worth while.

Subscription.—It has been suggested that the minimum subscription should be £3 for a consultant and £1 10s. for an S.H.M.O. Now it has been suggested that this sum would be allowable for income-tax purposes for part-time specialists, but not of course for those employed full-time. If this is so, then it would be fairer to alter the suggested subscriptions so that the actual cost would be fairly equal for each grade. For example, £5 for a part-time consultant, £3 for a full-time consultant and part-time S.H.M.O., and £1 10s. for a full-time S.H.M.O. If the second scheme were adopted, then the Defence Trust would be many thousands of pounds richer, largely at the expense of the Chancellor of the Exchequer, and no doubt we would all agree that that would be a very pleasant state of affairs.—I am, etc.,

Wakfield.

J. A. DICK.

SIR,—Your Canadian correspondent, Dr. A. P. N. Lee, makes a very fair point in his letter (*Supplement*, September 22, p. 136). One of the very weak points in the present claim, as compared with the wage claims which are so freely granted in all other directions, is the constant attempt at justification. We appear to have gone to the Minister in a somewhat apologetic manner, "cap in hand" indeed, presented a long preamble, and then asked if that preamble is sufficient excuse for a request for consideration of a possible increase in pay. Although this method of approach may have appeared to some of our leaders to be right and proper, surely politicians and civil servants must at once have realized that such an approach merited only one answer, for they are more accustomed to dealing with the

unions, with demands bellicosely made and supported with gross detail, rather than with whispered requests and a plethora of figures.

Dr. G. C. Pether, in his letter immediately above the one already quoted, makes mention of "hidden" income which is never quoted in the so-frequent wage claims regularly granted. We, it would seem, have gone to the greatest length to lay every card on the ministerial table, with an inevitable result. Can we stop all this detail and get down to the basic fact that each pound we earn is worth a great deal less than it was, and we must have more pounds in order to keep our place in the community? That is precisely what we want, it is precisely what so many other sections of the community have said in gaining their own wage increases, and it cannot be gainsaid. Had we only started our negotiations on this broad basis our patients would not be under the delusion that each of us has £2,222 per annum as pocket money.—I am, etc.,

Spillsby, Lincs.

C. E. FRISKNEY.

SIR,—For many weeks now we have read a plethora of letters regarding remuneration and what we should do about it. Might it not now be more helpful if we had another series of letters as to how we are to do it; in other words let us come down to brass tacks.—I am, etc.,

Exeter.

F. E. GRAHAM-BONNALIE.

SIR,—When shall we have some action on our side in this interminable pay dispute? Here we are pouring our hearts out each Saturday while for seven days a week we toil and sweat for a salary at the 1952 value of the pound. That pound, as everyone knows, is now worth 13s. 4d.

I am sick and tired of the endless prattle about why we should have an increase in remuneration. That issue is far beyond all doubt. Do we have to enter the public arena and go on strike to get a fair recompense for our toils? I say no, but if by some mischance that becomes imperative we must be united 100%.—I am, etc.,

Leigh, Lancs.

M. J. MCKENNA.

Technicians' Remuneration

SIR,—I feel that the recent flux of correspondence in the *Supplement* concerning the rejection of the profession's salary claim is in many ways both misplaced and misguided at the moment. Whether or not the N.H.S. is providing a good health service is irrelevant, but as long as we are working in it it is surely incumbent on us to concentrate on making that Service as effective as possible and to accept the lost glories of past social position.

In this connexion I feel obliged to write on behalf of those whose position to-day can only be described as deplorable. I refer to the technicians in the ancillary departments. As a radiologist I can only speak from first-hand knowledge of the radiographers. The maximum salary for a superintendent, often of many years' experience, is £680; salaries for radiographers, dark-room technicians, etc., are of course correspondingly more meagre. Consider the fact that the superintendent of a large or busy department, especially if there is no full-time radiologist, is required to have not only technical and organizing ability of a high degree but also an appreciable amount of medical knowledge; his advice is often called for by the junior medical staff in the interpretation of wet films, and he is not infrequently forced to take decisions regarding patients which involve the acceptance of medical responsibility which is in theory beyond the scope of his position. In short, I consider that a post requiring such a degree of ability and responsibility should carry a salary of at least £1,000 to £1,200, with comparable rates for other ranks.

Already x-ray departments are being strained to the utmost due to understaffing, and replacements for resigning radiographers are becoming impossible to find. I consider it an appalling criticism of the N.H.S. that radiographers are becoming commercial travellers and other non-skilled and non-medical workers because they cannot afford to con-

tinue in their own profession. Furthermore, at the present rate it seems inevitable that hospitals will have to reduce the work of, or even close, their x-ray departments in the foreseeable future unless the post of radiographer is made very much more financially attractive, and immediately.

In view of the dependence of modern medicine on its ancillary services to-day, I feel very strongly that the medical profession should campaign for increased salaries for its technicians, without whom we should find it impossible to work and for whom so little has been done. Also I think such a campaign should take precedence over the medical remuneration claim, since even to-day the profession is paid a living wage, and it does not seem that the provision of a health service for patients will fail, at least in the near future, for lack of doctors.—I am, etc.,

London, S.E.10.

DUNCAN IRVING.

Naming the Doctor

SIR,—At any time after Parliament reassembles a Private Member's Bill is to be introduced which would give the Press access to various public bodies. It is not as yet clear whether medical service committees, where cases against doctors for alleged breach of the terms of service are dealt with, would be included in the Bill.

My letter in the *Supplement* of August 11 (p. 102) urged counter-measures against the Press which continually advocated naming the doctors penalized for breaches of the terms of service, and I gave briefly my reasons for my view. I now urge the British Medical Association to ascertain whether access of the Press to meetings of the medical service committee is proposed in the Private Member's Bill, and, if this be so, to organize opposition to this inclusion in the Bill without any delay. Waiting until after the Bill is passed would prove futile. The Member of Parliament who will be introducing the Bill should be approached and all the other Members lobbied or written to, and the Press should be invited to state our side of the case.

I do not wish to repeat what I had written in my letter of August 11 except to emphasize that cases appearing before the medical service committee, in contrast to those appearing before the General Medical Council, are such that directly and intimately cause concern to the patients of the doctor, who, after having been penalized, is in great danger of having his practice ruined if his name is publicized by the Press. I did not mention in my letter that, as employees, any question of failure to carry out our duties, as is the case with employees universally, should be a matter strictly and wholly between employers and employees.

Of course, if the Private Member's Bill does not envisage access of the Press to medical service committees, then the matter I am raising will not arise.—I am, etc.,

London, N.W.1

M. D. RIPKA.

Fining the Doctor

SIR,—When I left Australia in January last and came here, I did have the intention, after a rest, to engage in any kind of professional work which I might have been able to secure only to save me from idleness. What follows explains my strong reluctance to execute that intention.

Correspondence about the N.H.S. in the *Journal* and elsewhere which has been going on for some time gets warmer and more animated, and the humiliation of doctors being subjected to fines strikes me, one who has never engaged in practice of any kind in this country, as the proverbial "last straw." In a recent issue of the *Journal* it was stated that a doctor was fined £250 for not having his records in order, and on September 28 I read in the *Daily Telegraph* of two doctors having been fined £50 and £25 each for high-cost prescribing. As a newcomer I would like to know who does this fining and do they consider this respectable when applied to members of a profession which claims to be learned? Have they ever tried fining a secretary, receptionist, carpenter, decorator, telephone operator, etc., and with what result?

It is difficult for an outsider and a mere spectator to reconcile the great discontent of the profession in the N.H.S. with their submission to such incredible (but true) and obnoxious treatment. There must be some very compensating factor of tremendous value which they are loath to lose and which keeps them in such a service, and if all that one reads is true and correct why does not the B.M.A. do something? Is resignation from the N.H.S. permitted, and if so how many for reasons of discontent have resigned since the inception of the N.H.S.?—I am, etc.,

London, S.W.19.

B. J. BOUCHÉ.

Occupational Health Committee

SIR.—The report of the first meeting of the Occupational Health Committee for 1956-7 (*Supplement*, September 29, p. 140) states that the question of co-opting a woman doctor to the Committee had been discussed but it had been rejected on the grounds that there were few special problems relating to women in industry as opposed to men.

As an industrial medical officer working in a factory with a large female population I cannot agree with this implied principle. Women are fundamentally different from men, both in their physical and in their emotional make-up, and many medical problems arise in their employment. There are to-day in Great Britain approximately 7 million women working outside the home; some 2 million of these are married. There appears to be no immediate prospect of industry being able to dispense with their services, and it is probable that the number of women employed will increase rather than decrease.

The question of whether it is desirable to have a woman doctor on the Occupational Health Committee is for that Committee to decide, but that there are special problems relating to the employment of women in industry must be obvious to all who have given serious study to the question.—I am, etc.,

York.

Branch and Division Meetings to be Held

BLACKBURN DIVISION.—At the Bull and Royal Hotel, Preston, Thursday, October 18, 8 p.m., Annual B.M.A. Dinner and Dance.

CHESTERFIELD DIVISION.—At Station Hotel, Chesterfield, Wednesday, October 17, 8 p.m., dinner dance.

CITY DIVISION.—At Committee Room C, B.M.A. House, Tavistock Square, London, W.C., Tuesday, October 16, 8.30 p.m., meeting. B.M.A. Lecture by Dr. C. Keith Simpson: "It Looks Like Crime" (illustrated by slides). Members of the St. Pancras Division and members' wives are invited.

COVENTRY DIVISION.—(1) At Wine Lodge Hotel, 17, The Burges, Coventry, Tuesday, October 16, 7.30 for 8 p.m., annual dinner. Inaugural address by the Chairman: "Impressions of Witnesses in the Box." Supported by the Chief Constable, Mr. E. W. Pendleton, and Deputy Coroner, Mr. J. Blyth. (2) At Drapers' Club, Bayley Lane, Coventry, Thursday, October 18, 6.30 to 8.30 p.m., reception to members and their ladies. (3) At Styvechale Church, Leamington Road, Coventry, Sunday, October 21, 6.30 p.m., annual church service.

DEWSBURY DIVISION.—At Batley General Hospital, Friday, October 19, 8.15 p.m., clinical meeting.

GRIMSBY DIVISION.—At Winter Gardens, Cleethorpes, Thursday, October 18, 7.30 for 8 p.m., annual dinner.

HALIFAX DIVISION.—At Old Cock Hotel, Wednesday, October 17, 8 for 8.30 p.m., annual supper.

LEICESTERSHIRE AND RUTLAND BRANCH.—At St. Margaret's Church, Sunday, October 21, 11 a.m., annual service for the Medical and Nursing Professions of Leicester.

OLDHAM DIVISION.—At Albion Club, Queen Street, Oldham, Monday, October 15, 9 p.m., meeting. Dr. Don Hilson: "Modern Trends in Everyday Paediatrics."

SALISBURY DIVISION.—At Royal Military Hospital, Tidworth (C Block), Tuesday, October 16, 8 p.m., clinical meeting and discussion.

SCARBOROUGH DIVISION.—At Scarborough Hospital, Thursday, October 18, 8.30 p.m., meeting. Dr. J. H. Cyriax: "Manipulative Medicine."

SHEFFIELD DIVISION.—At University Medical Library, Friday, October 19, 8.15 p.m., general meeting to discuss the recent remuneration claim.

SHROPSHIRE AND MID-WALES BRANCH.—At Royal Salop Infirmary, Shrewsbury, Thursday, October 18, 8.30 p.m., A.G.M.

SOUTH BEDFORDSHIRE DIVISION.—At Luton and Dunstable Hospital, Friday, October 19, 9 p.m., meeting. Miss Rose Heilbron, Q.C.: "Legal Responsibilities of Doctors."

SOUTH STAFFS DIVISION.—At Molineux Hotel, Wolverhampton, Tuesday, October 16, 8 for 8.15 p.m., supper meeting; 9.15 p.m., lecture by Mr. W. Gissane: "An Accident Has Occurred." Members' wives are invited.

SOUTHAMPTON DIVISION.—At Conference Room, Civic Centre, Wednesday, October 17, 8 p.m., ladies' night. Address by Mr. A. Norman Schofield, LL.M.: "A Difficult Problem." A social meeting will follow.

STOCKPORT DIVISION.—At Alma Lodge Hotel, Tuesday, October 16, 8.30 p.m., annual general meeting. Dr. E. E. Claxton (Assistant Secretary, B.M.A.) will be present to answer questions on remuneration.

SUFFOLK BRANCH.—At the Cathedral Church of St. James, Bury St. Edmunds, Sunday, October 14, 3 p.m., a special St. Luke's Day Service. All Suffolk doctors and their families are invited.

SWANSEA DIVISION.—At Swansea Hospital, Thursday, October 18, 7.30 p.m., clinical meeting. Discussion: "The Problems of Anaemia."

TEES-SIDE BRANCH.—At Hemlington Hospital, Tuesday, October 16, 7 p.m., clinical meeting.

TUNBRIDGE WELLS DIVISION.—At Kent and Sussex Hospital, Tunbridge Wells, Saturday and Sunday, October 20 and 21, clinical weekend. Saturday, October 20, 2.30 p.m., Dr. W. Ritchie Russell: "A Clinical Demonstration on Patients Suffering from Nervous Diseases"; 4.30 p.m., Dr. J. H. Cyriax: "A Clinical Demonstration on Patients Suffering from Backache, Fibrositis, and Allied Conditions"; 7.30 for 8 p.m., dinner at Elizabethan Barn; 9 p.m., Brains Trust at Elizabethan Barn.

WANDSWORTH DIVISION.—At St. James' Hospital, Sarsfield Road, S.W., Wednesday, October 17, 8.30 to 10.30 p.m., cocktail party for members, their wives (or husbands), and friends.

WEST HERTS DIVISION.—At Board Room, Peace Memorial Hospital, Rickmansworth Road, Watford, Friday, October 19, 9 p.m., general meeting. Address by Dr. T. W. Preston: "Medical Aspects of Life Assurance." A discussion and questions will follow.

WESTMINSTER AND HOLBORN DIVISION.—At Committee Room C, B.M.A. House, Tavistock Square, London, W.C., Wednesday, October 17, 8 p.m., meeting.

WEST SUFFOLK DIVISION.—At West Suffolk General Hospital, Bury St. Edmunds, Tuesday, October 16, 8.30 p.m., meeting. Dr. D. H. Clarke: "The Management of Minor Neurotic Illness in General Practice." Members of the Nursing Staff are invited.

WIGAN DIVISION.—At Lewis' Restaurant, Wallgate, Wigan, Thursday, October 18, general meeting.

TRAINING OF CONSULTANTS UNDER THE N.H.S.

A SURVEY MADE IN THE S.E. METROPOLITAN REGION

BY

H. G. MCGREGOR, M.D., M.R.C.P.

Consultant in General Medicine; Regional Adviser on
Postgraduate Education, S.E. Metropolitan Region

Since the introduction of the Health Service there has been much discussion and speculation about the training of consultants, the hardships of the training period, and the fate of senior registrars. Figures and facts, however, have been scanty. The purpose of this paper is to show what has been the destination of those senior registrars completing their training in the South-east Metropolitan Region in those eight years; secondly, to show the effect of the regional training scheme on the education of trainees.

The period can be divided into two parts of four years each. From 1948 to 1952 the staffing of hospitals was still largely unregulated and was dependent upon local needs as seen by individual hospitals. Registrar status was undefined, and the previous experience of those that ultimately achieved consultant status was in no way standardized.

In 1952 the Ministry of Health announced a national establishment for senior registrars, linked to the calculated requirements of the future consultant establishments, and the conception of the senior registrar as a trainee consultant was evolved.

"Interchange Posts"

In the S.E. Metropolitan Region the official allocation of senior registrars—namely, 76—was parcelled out between the two teaching hospitals, Guy's and King's, and the regional board's hospitals by mutual consent; roughly half going to the teaching hospitals and half to the regional board's hospitals. Those senior registrars allocated to the board's hospitals were placed in selected hospital groups, the training centres. Wherever possible these training posts —20 out of a possible 35—were permanently linked to similar posts in the teaching hospitals, the holders of each changing over at a fixed time during the four-year tenure of office. Appointment to these interchange posts is made by a joint committee of the regional board and the teaching hospital, on the understanding that part of the four-year period will be held at the teaching hospital and part at the linked regional hospital.

The object of this was to ensure that as many trainees as possible received experience in both teaching and regional hospitals. Those regional posts that remained unlinked were of the highly specialized variety such as plastic surgery or thoracic surgery, which were to all intents and purposes training units in themselves, closely associated with teaching hospitals.

The scheme was introduced in 1952, the interchange posts being created during subsequent years as they became vacant. The task of reducing the regional establishment from the previous level, 71, to the new level, 36, has been gradually achieved by allowing some senior registrarships to lapse where they were not required for training purposes. The products of the earliest interchange posts are, at the end of the first four-year period of the training scheme, just beginning to ascend into the consultant level; at the same time about a third, from both four-year periods, have been lost to the hospital service, presumably by the reduction in establishments. The details are as Table I.

TABLE I.—Destination of Registrars Completing Training
(S.E. Metropolitan Region—Excluding Teaching Hospitals)

	1948-52	1952-6
Completed registrar training	72	67
Became consultant	28	22
Became S.H.M.O.	16	17
Acquired another S.R. appointment	5	9
Lost to hospital service (i.e., wastage):		
To Dominion or another country	5	3
Entered general practice	4	3
Industry or industrial research	1	3
Resigned or appointment terminated	8	8
Returned to country of origin	5	2

It seems that those who have completed their training during this period fall into three categories of approximately equal size: they become consultants; they become S.H.M.O.s; or they are lost to the hospital service. It may not be realized that as many become S.H.M.O. as become consultant.

There is a widespread belief that registrar training, owing to the difficulty experienced in finding suitable employment at the end of it, has since 1948 been a waste of time for many of those that have been through it. Undoubtedly, the proportion of one-third lost to hospital service is too high. But it has been a period of drastic reduction in establishment. The reduction has now been made and the official level reached, so that future years are not likely to see this wastage.

Of the 42 who had been lost to the hospital service, eight in each period (namely, "resigned or appointment

2700

terminated" group) may not have justified the long apprenticeship they have endured. Their destination is not known with certainty. Of the others, who shall say that it is a bad thing that small numbers of our highly trained men have gone to the Dominions, to industry, or to research? And can registrar training really be considered a loss to the small numbers who have entered general practice?

Training Received by Consultants

I will now turn to consider the training received in the S.E. Metropolitan Region by those who have achieved consultant status from it in the two four-year periods (see Table II).

TABLE II.—Training of Consultants

	1948-52	1952-6
<i>Resident or S.H.O. Experience (Junior Level)</i>		
Total receiving training	28	22
Held house appointment at teaching hospital only	25%	0%
Held house appointment at regional hospital only	57%	0%
Held house appointment at both teaching and regional hospitals	7%	100%
<i>Registrar or Senior Registrar Experience (Senior Level)</i>		
Total receiving training	28	22
Teaching hospital only	7.2%	5%
Regional hospital only	50%	30%
Both teaching and regional hospitals	42.8%	65%

Although there is demonstrated here an increased influence of the teaching hospitals in the training of consultants at both junior and senior level, the trend is not only away from the "purely regional experience" but also away from the "purely teaching hospital experience" toward a "joint regional and teaching hospital experience."

Length of Training Period for Consultant Status

In the 1948-52 group an average time of six years was spent in civil hospital appointments, with an additional period of war service which varied between three and seven years. Thus consultant status was achieved at from nine to thirteen years after qualification.

In the 1952-6 group an average of 9.2 years was spent in civil hospitals, with an additional period of war service or national service varying from three to seven years. Consultant status was achieved from 12 to 16 years after qualification.

The time spent between qualification and consultant status was in both groups and in individual cases lengthened exactly by the number of years of war or national service. In other words, the time taken to achieve consultant rank was proportional to the length of time spent in civil hospitals and not proportional to length of war or national service. In future, if national service remains at two years it looks as though on an average about eleven years will elapse between qualification and consultant rank.

Looking back, it appears that during the last eight years the chances of a senior registrar becoming a consultant were about one in three; the chances of his becoming a consultant or S.H.M.O. were about even: in any event he was more than likely to find specialized or highly technical employment in some place other than general practice. Looking forward, it would seem that these chances are likely to be bettered, provided that the present ratio of senior registrar to consultant establishment does not fall, and in so far as the S.E. Metropolitan Region is representative of the country as a whole.

My thanks are due to the S.A.M.O. and the D.S.A.M.O. of the S.E. Metropolitan Regional Hospital Board for their help in making their records available to me.

According to the *Irish Independent*, the Northern Ireland Hospitals Authority has approved a new scale of board and lodging charges for hospital medical staff as follows: senior house officers, £150 a year; junior medical officers and registrars, £170; principal registrars, £200; senior medical officers, £350; consultants, £400.

PUBLIC HEALTH COMMITTEE FIRST MEETING OF NEW SESSION

A meeting of the Public Health Committee was held at Headquarters on October 5. Dr. J. P. TILLEY was unanimously re-elected to the chair. Dr. E. COLIN-RUSS and Dr. K. S. MAURICE-SMITH were welcomed as new members. Discussion took place on the use of co-option to ensure representation of special categories of the service.

The Committee appointed three of its members (Drs. S. C. GAWNE, J. F. WARIN, and ELSPETH M. WARWICK) to join with representatives of other committees in preparing the Association's evidence to the Cranbrook Committee, which is undertaking a review of the maternity services of England and Wales. The resolutions bearing upon public health passed at the last Annual Representative Meeting were considered, and appropriate action was decided.

The Committee had before it a resolution from the Coventry Division which had been sent to local members of Parliament drawing attention to the number of immigrants with communicable diseases. It also considered a document by the Joint Tuberculosis Council on immigration and tuberculosis which had also been considered and supported by the General Medical Services Committee. The Committee decided to recommend to Council that there should be discussions with the Ministry of Health with particular reference to tuberculosis.

It was reported that on the request of the Council of the Association the Joint Consultants Committee had received representatives of the Public Health and the General Medical Services Committees to discuss the representation of preventive medicine services on regional hospital boards. The suggestion had been made that each regional board and board of governors should include a minimum of five consultants, together with a general practitioner and a medical officer of health.

M.O.H. as Consultant in Epidemiology

The question of the medical officer of health as a consultant in epidemiology again came forward. At the April meeting of the Committee Dr. H. D. CHALKE presented a memorandum on the subject, and on his proposal the principle that medical officers of health should be appointed honorary consultants of hospital groups and should serve on medical advisory committees was agreed upon. A recommendation was made that regional hospital boards should be urged to consider such appointments in the interests of all concerned. This, however, was referred back by the Joint Liaison Committee, some members considering that it would not be advisable to press for the appointment as a right of a medical officer of health as an honorary consultant. It was pointed out that medical officers of health already had statutory powers and that there was usually a very happy liaison between the M.O.H. and the hospital staffs. A further point was that status was not at stake so much as a genuinely close association between the parties concerned.

After a wide discussion Dr. Chalke moved that the Committee reaffirm its previous resolution—"he would not take back one word of it." Some alternative wordings were suggested, but the original resolution, on a show of hands, was reaffirmed as follows:

That the Public Health Committee agrees with the principle of medical officers of health being appointed honorary consultants of hospital groups and serving on medical advisory committees, and recommends that regional hospital boards should be urged to consider such appointments in the interests of all concerned.

Remuneration Appeals

It was reported that, with three exceptions, every local authority in the United Kingdom had now accepted M.D.C. circular No. 24 (Industrial Court award No. 2565). A report was also made on the implementation of M.D.C. circular No. 27, of June, 1956, on the remuneration of public health medical officers. On Whitley appeals taken on behalf of public health medical officers during the past session a

ailed report was received, together with a note by the Assistant Secretary (Dr. A. V. KELYNACK) on Whitley appeals procedure. Particular reference to regional appeals was made to cases of medical officers seeking the advice and report of the Association.

It was reported that negotiation would begin shortly in a special subcommittee of Committee C for the revision of the 1947 and 1951 part-time agreements. The staff side of the subcommittee would have representatives of consultants and general practitioners and the public health interest would be represented by the chairman of the Staff Side of Committee C.

Future of Chest Services

A memorandum on the future of chest services was submitted from the Chest Services Subcommittee of the Central Consultants and Specialists Committee. Dr. PETER EDWARDS, chairman of the subcommittee, said that, although there was declining tuberculosis mortality, there was as yet no convincing evidence that the incidence of the disease would diminish at the same rate. Therefore it would continue to be necessary to maintain an organized tuberculosis service based on area clinics. Many patients would continue to be referred to chest clinics, and the fullest facilities should be available. In his memorandum Dr. Edwards sketched the pattern which should be followed and the appropriate medical establishment. It called for an increase of about 40% in the present consultant establishment of the clinics in order to equate the number of consultants in chest diseases with the number in other specialties, and a corresponding decrease in the S.H.M.O. establishment.

The Committee agreed that the principles laid down in the memorandum be accepted and supported.

Other Business

Among much other business which crowded the day's agenda were consideration of the White Paper containing the Government proposals for regulating the provision of slaughterhouses; the responsibility for clean milk, a subject which had previously been before the Committee, together with excerpts from the report of the Arton Wilson Committee; notifications of infectious diseases; and vaccination and immunization record cards.

MEDICAL SERVICE IN MALTA

MEDICAL M.P.'s VISIT

Nothing has been heard yet of the appointment of the commission to review the medical service in Malta. In the settlement which was reached in April in the dispute between the Government of Malta and the medical profession in the island it was agreed that a commission should be appointed "to undertake a comprehensive review of the medical service and to submit recommendations for the future organization and terms and conditions of employment" (see *Supplement*, May 5, p. 263). The members of the commission, to be approved by both sides, were to be from the United Kingdom.

Meanwhile it is reported that Mr. John Cronin, an orthopaedic surgeon and Socialist M.P. for Loughborough, has been invited by Mr. Dom Mintoff, the Prime Minister of Malta, to advise the Maltese Government on the reorganization of the island's medical service. According to *The Times* (October 10) the Medical Officers' Union has said it will not co-operate with Mr. Cronin. The Union notes that Mr. Cronin's terms of reference are almost identical with those of the expected commission, and therefore it does not see the advisability of his visit at this juncture. The committee of the Union has said that the Union will extend to Mr. Cronin, as a member of the profession, traditional Maltese hospitality, but it will not be in a position to discuss those issues which by the terms of the agreement are to be dealt with by the commission, whose appointment is anxiously awaited.

WAS IT A DRUG?

Regulations 16 and 17 of the National Health Service (Service Committees and Tribunal) Regulations, 1948, provide that where a practitioner prescribes under the National Health Service preparations which are not drugs or medicines, and therefore outside the scope of the Act, the executive council may recover their cost from him. If he challenges their action, the matter may be referred to the local medical committee, with the possibility of appeal to referees.

The findings of the referees in a recent appeal under the Regulations are reported below. The decision in this, as in all cases, is related to the circumstances of this particular case only, and is not binding on the referees who may hear other cases.

"Lacidac"

Drs. X and Y, practising in partnership, gave six prescriptions each for three tins of lacidac full cream for a baby who was seriously ill and unable to retain any food but lacidac. The executive council decided that this was not a drug which it was bound to provide. Drs. X and Y appealed to the local medical committee, who upheld the decision of the executive council. The doctors then appealed to the referees.

Dr. X appeared in person on behalf of himself and Dr. Y. He rested his case mainly on the obligation of a general practitioner to follow exactly the directions of a consultant, contending that if the patient died and it was found that the doctor had not fulfilled the treatment advised he could be very seriously reprimanded. This lacidac had been ordered on the advice of a consultant at the hospital where the child had been treated. Dr. X admitted that he and his partner were well aware that lacidac full cream is classed as a food in the First Report of the Definition of Drugs Subcommittee, but, he said, they also knew that the mother could not afford to buy it. He also claimed that the fact that the child recovered justified the prescription.

In their findings the referees stated that the provision of food for infants was not one of the duties which the Act imposed on executive councils, but by section 22 (1) it was the duty of every local health authority to make arrangements for the care of children who had not attained the age of 5 and were not attending primary schools maintained by a local education authority. Care included the provision of suitable food at prices which the parents could afford. Relief of poverty was not a function of the executive councils, and general practitioners had, by their terms of service, no authority to order food for the children of indigent parents at the expense of the executive council.

When a consultant advised that the patient should be given something which the executive council was not bound to provide the general practitioner what he should take, and, in the circumstances were such that the patient could obtain it free from some other authority, by assisting him to do so. The fact that the child recovered had, in the referees' opinion, no bearing whatever on the question before them.

They decided that this lacidac full cream was not a drug which the executive council was bound to provide.

COUNTY BOROUGH OF MIDDLESBROUGH

The Association has been informed by the town council of the county borough of Middlesbrough that it will agree to the reference to arbitration under the Industrial Courts Act of the dispute regarding the remuneration of the medical officer of health. The town council has stated that it will accept the award of the court. This agreement is subject to the Association withdrawing the county borough of Middlesbrough from the *Important Notice* in the *Journal*. This has been done and the county borough has been informed.

Scottish News

SCOTTISH ASSOCIATION OF EXECUTIVE COUNCILS

NINTH ANNUAL CONFERENCE

The Ninth Annual Conference of the Scottish Association of Executive Councils was held in Ayr on October 4 and 5 under the chairmanship of Mr. EDWARD ADAMS, president of the association.

Presidential Address

Mr. Adams based his presidential address on the report of the Guillebaud Committee and stressed the dangers of complacency following its publication. Was all going well in regard to general medical services? If free choice of doctor was accepted as a necessary basic principle, the President's answer was, "All is going reasonably well." But was the price of freedom an ever-increasing drug bill and an undue proportion of certified sick?

It must now occur to many to ask: "If a doctor depended for his livelihood on a salary and not on a number of patients on his list, would he issue the same number of prescriptions, would he certify the same number of persons unfit for work?" These were not new questions.

Certification

In 1931 Mr. D. Bertram, chairman of the Consultative Council for National Health Insurance, had spoken of the problem of certification. In view of a great increase in sickness claims, he had wondered if there was more sickness. He thought not. In his opinion the standard of incapacity had shifted. Then Mr. Bertram had said:

"Who sets the standard? At first thought, the obvious answer is the doctor; but, I am afraid, on further consideration we will have to seek further for the proper answer. . . . By the time the doctor is consulted the incapacity is an accomplished fact. What can the doctor do but acquiesce? You say, 'But he should not.' Well, that again is a statement which may not stand serious examination. First, under the relationship which we all hope to exist between the doctor and his patients, we cannot expect the doctor to act as if he were a careful, suspicious official. His professional reputation is at stake if he curtly told somebody to go to their work and it turned out that there was something seriously amiss, even though he could find no objective symptoms. His income is at stake if he does not satisfy his customers, just the same as any shopkeeper. His relationship with his patients must be one of confidence, not suspicion, if our service is to produce maximum results. Where does all this lead us? To only one conclusion, that it is hopeless to expect rigorously strict certification from our doctors under the present system."

From such a quotation, said Mr. Adams, it could be gathered that the problems of 1931 were in many ways like the problems of to-day.

Free Choice Essential

Mr. Adams was satisfied that, with a salaried service, the number of prescriptions would fall dramatically and that sickness lists would also fall. There would be a very substantial saving of public money. Nevertheless, he was satisfied that the country could not afford to save that money. From a treatment point of view free choice of doctor was essential, and a fair price had to be paid for safeguarding it. When freedom was preached, it should be freedom for all. The freedom of the established doctor should be available to the new doctor. Too few local medical committees and executive councils agreed with the Medical Practices Committee when an area was said to be under-doctored. Yet was there any real reason why anyone should seek to prevent a doctor practising where he pleased?

Economy in Prescribing

Mr. J. NIXON BROWNE, Parliamentary Joint Under-Secretary of State for Scotland, addressing the Conference,

believed that one of the thorniest problems facing the National Health Service was that of controlling the nation's steadily mounting drug bill without interfering with the doctor's clinical freedom. The rising bill was a serious matter indeed. There was no easy answer to the problem. The family doctor was a busy man with many problems other than prescribing. But it was not unreasonable to expect the family doctor, with his trained mind, to remember the prices of at least some of the different types of drugs that he most frequently prescribed. It was on the doctor that the nation relied to bring the drug bill within reasonable bounds.

Reports received from local medical committees revealed that high costs were mainly due to (1) the excessive use of expensive proprietary drugs where cheaper standard ones would have met the patients' needs equally well; (2) the use of drugs of doubtful therapeutic value; (3) the excessive use of antibiotics; and (4) the prescribing of too much at a time and too often. Good medical practice, said Mr. Nixon Browne, was not incompatible with public economy. Doctors of the highest reputation could keep their drug bill at remarkably low levels.

Dr. DAVID MCCALL, secretary of the Pharmaceutical General Council (Scotland), replied to some of the points made by the Under-Secretary of State, and his contention that, although there were some extravagances which should be eliminated, the drug bill generally was not unduly high was reported in last week's *Supplement* (p. 154). Dr. McCall favoured adoption of the French method of not allowing a new proprietary medicine on the market unless it had been shown to be an improvement on medicines already available. He felt that, at present, the medical student's curriculum did not allow him adequate time for the study of organic chemistry. The student was not given sufficient instruction in pharmacology and was not fully qualified to pass an opinion on the many new potent medications reaching the market.

Conference Resolutions

Among motions approved at the Conference were motions calling for (1) payment of travelling and subsistence expenses in excess of £1 incurred by patients from outlying areas in attending at hospitals and hospital clinics; (2) the extension of the present arrangements for the training of assistants so that trainees might be given experience in the work of public health departments, hospital service, and general practice; (3) the opening of negotiations with foreign countries with a view to bringing about reciprocation of provision of health services on an international basis; and (4) inquiries to be made about the amendment of existing Regulations so that change of doctor might be effected without a fourteen-day interval being necessary.

RURAL PATIENTS' COSTLY JOURNEYS

COMMITTEE'S PROPOSALS TO RELIEVE HARDSHIP

Since the Department of Health issued new instructions in September, 1950, payment of patients' travelling expenses to hospitals and clinics is made only in cases of financial hardship. Patients make a claim to the National Assistance Board, which pays the cost of conveyance by public transport only and does not reimburse charges in connexion with hiring: nor is any allowance made for subsistence. No refund is made if a patient has any capital available.

Doctors in the remoter rural areas of Scotland have been disturbed at the hardship which these rules impose on many of their patients, and also that they often benefit the thrifless. Inquiries by the Highlands and Islands Practitioners Subcommittee of the General Medical Services Subcommittee (Scotland) of local medical committees have produced evidence which shows that many patients may be prevented on occasion from using the National Health Service either

because they are too independent to apply for assistance or, knowing that they may be refused assistance, cannot afford the cost involved. A visit to out-patients in certain cases may involve a stay of three nights away from home.

Help for All

Information of this kind from local medical committees in the Highlands and Islands districts has been incorporated in a memorandum of evidence by the Highlands and Islands Practitioners Subcommittee which has been sent to the Standing Advisory Committee of the Health Services in the Highlands and Islands. The memorandum recommends that patients in the Highlands and Islands area residing at a minimum of 10 miles (or less in very special cases) from a hospital or clinic, which they have to attend as out-patients, should be asked to pay £1 towards their expenses—the balance to be defrayed from National Health Service funds—or the amount of the expenses when less than £1; that the ambulance service should be extended by the use of small cars or shooting-brakes for those patients whose travel by ambulance is not essential on medical grounds, but whose travel by public transport would be an unjustifiable risk; and that consideration should be given to the possibility of extending the use of hostels or similar accommodation for the benefit of patients requiring to spend a night or more away from home.

Questions Answered

Psychiatric Opinions

Q.—From time to time cases are referred by magistrates' courts for a psychiatric opinion, the magistrates adjourning their decision pending such a report. These cases are usually seen in the course of an ordinary out-patient psychiatric clinic. Is a fee payable for such a report, and, if so, by whom?

A.—The terms and conditions of service of hospital medical staff contain a schedule of work which, in the Minister's opinion, comes within the scope of the hospital and specialist services provided under the N.H.S. Act. The work which comes within this schedule must be provided by hospital medical staff without additional payment, and the schedule includes examinations and the furnishing of written reports on the mental or physical condition of offenders referred by courts under Sections 24 and 26 of the Criminal Justice Act, 1948. It is assumed that this ruling now applies to cases referred under Section 26 of the Magistrates Court Act, 1952.

Student's National Insurance Contributions

Q.—During my six years as a medical student I was informed that National Insurance contributions were not necessary. Now I find that if I do not pay these six years' contributions it will result in decreased retirement pension, widow's benefit, etc. The sum can be paid up to four years after qualification, but the income-tax authority tells me that no tax relief can be given. This seems unfair, as the contributions must be paid out of present income, which is small following qualification. May I have your comments?

A.—The semblance of inequity in this point is heightened by the fact that payment may be made in later years in which there is some income, but the tax position is quite clear. Tax is assessable on the net income of any one year and the concession as to later payment does not alter the fact that contributions can only be charged against the years in which they accrued. If there is no taxable income for those years there can be no effective tax allowance, as there is no provision for any carry forward in such circumstances.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Senior Registrars and Consultant Appointments

SIR,—As the years pass many senior registrars, excellently trained, are approaching middle age and abandoning hope of obtaining full recognition and employment. Meanwhile, throughout the country, thousands of patients wait many weeks for appointments at hospital; practitioners stop trying to get second opinions in cases where they feel it would be helpful; hundreds of thousands of patients wait many months for admission for operation once they have passed the out-patient barrier. The remedies for this state of affairs are at hand but are not pursued with vigour for a variety of reasons. Some five years ago the Ministry of Health was responsible for setting up authoritative medical working parties which surveyed the consultant services of the regions and made recommendations. Their findings and advice have never been published, but it is known that many extra appointments were advocated.

Some consultants are holding contracts on a part-time basis to a total of 35–52 hours weekly, inclusive of travelling time. The Central Consultants and Specialists Committee is well aware of this situation and has made no serious effort to rectify it. Some of the clinical sessions thus held are only fulfilled in a notional way, while in other cases registrars and clinical assistants carry the whole responsibility, merely referring cases to the consultant on rare occasions. Appointments on a sessional basis are still being sought and obtained by those holding part-time contracts with maximum sessions. An appointing body cannot know an applicant's commitments unless it specifically asks for this information at the appointment committee. Many hospitals refuse to divulge the sessional work of consultants; while some refuse to make any returns of consultants' visits.

These facts do not redound to the credit of the profession and they are associated with a disinclination on the part of some general consultants to advise or welcome appointments in specialties which might encroach slightly on their own provinces. If the Ministry would take the advice of its own appointed advisers, and consultants would adopt a less personal attitude, it is probable that the plight of their senior registrars would be solved, potential patients would gain, and the profession would be more highly regarded by lay administrators, who watch the present situation with a feeling bordering on cynicism.—I am, etc.,

London, N.W.10.

HORACE JOULES.

Political Misuse of Health Services

SIR,—We have just received in the public press a perfect example of the present political misuse of the health services of the country. The Parliamentary Secretary to the Ministry of Health has announced to a Conservative Party conference some figures alleged to result from the trials of polio vaccine earlier this year; these, so far as I know, have not yet been published in the medical press. They were, moreover, presented in a tendentious manner, comparing the total polio cases for a year (2,500-odd) with cases in vaccinated children (10). The statistical relevancy of these two figures would seem to be a little dubious, though no doubt they serve the political purpose for which they were used.

I trust that the M.R.C. is as perturbed as I am at the uses to which its work is put, and that some way can be found to bring home to the Ministry of Health the disgust and contempt with which this sort of action is regarded by the profession.—I am, etc.,

Bushey, Herts.

D. G. WILSON.

Remuneration of S.H.M.O.s

SIR,—There has been considerable correspondence regarding remuneration of the profession, but so far no reference has been made to the earnings of S.H.M.O.s in either the medical or the lay press. This grade, ostensibly restricted, has increased since the introduction of RHB 50/96 at a greater rate in the permitted specialties than the consultant grade, so that now over 3,000 specialists with permanent contracts are S.H.M.O.s. This comprises approximately a third of the specialist service of this country, and a résumé of their earnings cannot therefore be regarded as unimportant or irrelevant. S.H.M.O.s and consultants are intimately related, both clinically and administratively, so that a comparison of their present earnings is justifiable.

A consultant earns £525 more than an S.H.M.O. in his first year, but by the tenth year the cumulative difference is £8,800. If each is appointed at the age of 32 years (the same regulation governs the age of appointment in both grades), the consultant earns £34,675 more than the S.H.M.O. by the time he is 65 years of age. It should be noted that only the basic earnings of the full-time consultant are considered. Fees from domiciliary consultations and merit awards (266 with £2,500 per annum; 665 with £1,500 per annum; 1,330 with £500 per annum) are excluded. A comparison of the salary of S.H.M.O.s and consultants shows a considerable variation since 1948. This is demonstrated in the accompanying table.

	A				B	
	Consultant		S.H.M.O.		Salary Percentage	
	Min.	Max.	Min.	Max.	Min.	Max.
1948-53 (Following award, 1954) 1954-5	£1,700	£2,500	£1,300	£1,750	76	70
(Following award Industrial Court April, 1956) 1956	£2,100	£3,150	£1,500	£1,950	71	61
	£2,100	£3,150	£1,575	£2,025	75	64

Prior to the award of 1954, the maximum salary of an S.H.M.O. was £50 more than the minimum of a consultant. Since then it has remained less, even after the Industrial Court Award of 1956. The ratio between the maximum salary of the S.H.M.O. and the consultant maximum has fallen from 70% prior to 1954 to 64% in 1956. At present entrants into the S.H.M.O. grade receive a salary equal to 75% of that of newly appointed consultants, whereas 10 years later the ratio has fallen to 64%. Two anomalies result: (1) An S.H.M.O. with 10 years' experience or more is still earning less than a newly appointed consultant. (2) An S.H.M.O. suffers with age as far as his life earnings are concerned when compared with the earnings of a consultant, because if the 75% of the minimum end was continued throughout the scale the difference in life earnings would be £17,325—that is, half the present difference.

The value of a fixed salary ratio between the two grades is recognized by the B.M.A., for it would prevent a recurrence of protracted discussions, culminating in arbitration, as ensued following the award of April, 1954. Consequently a resolution "that the salary of the S.H.M.O. grade should be raised to 80% of that of the consultant salary throughout the whole scale" was adopted by the Representative Body in July of this year. The present salary thus envisaged would range from £1,680 to £2,520 with annual increments of £100. Adoption of the above resolution serves no purpose unless it is implemented.

In the opinion of the S.H.M.O. Group, the Joint Negotiating (Remuneration) Committee in its deliberations with the Ministry and other Government bodies should exert maximum pressure to raise the present salary of the S.H.M.O. to 80% of that of consultant—that is, basic salary of the full-time consultant—throughout the whole scale. It is felt that the problem is analogous with that of the general practitioner prior to the Danckwerts Award. This award

not only increased the earnings of practitioners as a whole, but by increasing capitation fees of small practices (500-1,500 on list) beyond those of large practices, went far to correct anomalies within the practitioner service itself. Furthermore, the S.H.M.O. Group Executive Committee was instructed by its Group Council a year ago to aim at a salary of 80% of that of consultant, and the Industrial Court in April, 1956, stated that its award of £75 was without prejudice to further negotiations *re* salary. The Executive believes that should the Joint Negotiating Committee fail to include the previously mentioned resolution in its discussions, then the aim of the S.H.M.O. Group as far as salary is concerned is doomed to failure, as no separate claim on their behalf within the foreseeable future could possibly receive any sympathy from the Ministry, or indeed the profession. S.H.M.O.s should also receive 80% of any sum granted to consultants as a result of the negotiations, so that the final salary is stabilized at 80% of that of consultant at all levels of the scale.

The salary of the senior assistant grade suggested by the Hospital Medical Staffing Subcommittee should not be taken into consideration for the following reasons: (1) The suggested salary scale was relevant to the cost of living in 1954, before a claim on behalf of the profession was contemplated. (2) The senior assistant grade does not exist, and may never be formed. (3) The Minister might accept hospital restaffing but reject the suggested alteration in salary. (4) Although the intention is to abolish the S.H.M.O. grade, this is not synonymous with abolishing S.H.M.O.s. The individuals concerned will remain.

It is felt that the resolution would not seriously complicate discussions, and that it should therefore be adopted as a policy by the Joint Negotiating (Remuneration) Committee. S.H.M.O.s throughout the country hope that the claim of the profession will be successful, and that the relative earnings of S.H.M.O.s and consultants will become realistic.—I am, etc.,

Swansea.

J. H. THOMAS.

Present State of Practice

SIR,—I have never written to the *Journal* before, or voiced my opinions at any meetings, but the time has come, I feel, when more doctors should say or put down on paper what they feel about the present medical service.

There are five main reasons for my anxiety regarding the National Health Service: (1) the degradation of the medical profession to the level of a political pawn or vote-catching institution; (2) the lack of incentive for the general practitioner to use his knowledge or whatever skill he may possess; (3) the paralysing effect on the doctor of the multitude of forms and certificates; (4) the fact that the public is gradually getting into the position of being able to dictate to the doctor; (5) the lowering in status of the individual doctor in relation to the rest of the community.

As regards the governmental reaction to the remuneration claim, it is of course what is to be expected. We have put ourselves in the position of having to approach the Minister cap-in-hand and ask for more money. The threat of strike is unlikely to occur, and therefore the rise in pay is refused, although of course this particular rise has more justification than many others which have been granted.

That is not so important; what I think is very important is that in my opinion the National Health Service in its present form is having a bad effect upon the population and the doctor. I believe it encourages introspection and the cossetting of minor illnesses, and thereby weakening the moral fibre of the people. I believe it has the effect on the doctor of turning his surgery into a sorting office, and thereby discouraging him from doing more useful work and encouraging him to "pass the buck."—I am, etc.,

Uckfield, Sussex.

R. B. TULK-HART.

Admission to Hospital

SIR,—An asthmatic man of 43 years, under treatment for the previous week, went into status asthmaticus which I was unable to relieve. At 10.30 a.m. application for urgent admission to a large local hospital wherein the patient had twice before been treated for this condition was refused, as there were no empty beds in the admitting physician's wards. After some discussion the admitting physician saw the patient with me in domiciliary consultation at 1.30 p.m., and agreed that urgent admission was needed. I hoped, in my simple faith, that some action might now occur, and it did. About 2.30 p.m. the house-physician telephoned and regretted they could not take the patient in, as his chief's wards were full: would I like the case referred to the emergency bed service? I did so like, and about 20 minutes later the E.B.S. telephoned my house and regretted they could not accept the case from a hospital—only from me. I was out, but my wife, after a further telephone call from the hospital, was able to supply the necessary particulars and they agreed to get on with it. It seems that the details supplied by me to the hospital were unacceptable to the E.B.S., but were right enough when re-transmitted by my own telephone. Eventually the patient got into a hospital about seven miles away. I understand from his wife (a nurse) that he was by then in a really ripe condition: he is still, happily, alive.

Next day the consultant's secretary telephoned to inquire what had happened and explained that, as their wards were full, they had to ask leave of the E.B.S. to take a patient into their own hospital, which permission was not granted, presumably before the E.B.S. declined to accept the case for disposal from this hospital. We were all pretty courteous and friendly throughout these transactions and I am not ventilating my criticism against the hospital or individuals concerned, for which and whom I have the highest personal regard. But it is an extraordinary situation when a consultant physician cannot get a case into his own 700-bedded hospital, even though his own beds are full, if the E.B.S. says him nay.

I cannot appreciate this type of improved medical service under the N.H.S., and would much prefer a return to the common-sense independence I remember in the unenlightened past. Sensible administration should aid, not hamper, the practice of medicine, and it is in the hope that a little publicity may prevent further such happenings that I write this letter. I do not want any heads to roll; I only hope that this sort of nonsense may be avoided here, elsewhere, and in the future.—I am, etc.,

London, W.5.

C. J. CORBE.

SIR,—I wish to ventilate that old grievance arising out of the reluctance of hospitals to accept certain types of case.

On October 3 a man in his sixties was visited in the morning and was found to have fractured the neck of a femur some 12 hours earlier. My assistant telephoned to the hospital which receives most of the casualties in this area, and spent some time in an unsuccessful attempt to persuade a house officer to admit this case. As less than 24 hours had elapsed since the accident, it was possible to dial 999 and simply ask "ambulance" to collect the patient. He was taken to the same hospital and was, of course, admitted.

Now, Sir, it is easy to be sarcastic about this sort of thing, but it is indeed a pitiable affair when a courteous attempt to establish contact with another doctor is, in fact, a waste of time. And how misguided is the hospital's attitude! Surely a hospital exists to treat cases which a G.P. cannot deal with a himself, and what case needs expert treatment more than a fractured neck of femur? The sort of person who writes to politicians could obviously stir up a lot of unpleasantness over a case of this sort—and someday someone will. And then authority will direct that all cases presented to a hospital as emergencies shall be admitted without question. Would it not be much better if hospital residents would resolve to it not be much better if hospital residents would resolve to admit every case that comes, if only for one night? After all, if a mistake had been made the patient could go home next day.—I am, etc.,

London, S.W.16.

VINCENT RECKITT.

Unemployment and Under-employment in the Medical Profession

SIR,—In the second survey by Dr. L. S. Potter of unemployment and under-employment in the medical profession (*Supplement*, September 15, p. 127), he includes in his register of doctors regarded as in "dead-end jobs" a number holding appointments outside general practice (for example, registrar) but seeking general-practice openings. Suitable hospital appointments offer the most valuable concentration of experience in subjects of importance to family doctors that it is possible to obtain, and many people consider that the facilities now available in this field should be greatly extended.

I hope Dr. Potter will see fit in future surveys to amend his classification, for it would be a great disservice if the authority of the Medical Director of the Medical Practices Advisory Bureau were to be lent to the thesis that it is a waste of time to take additional hospital appointments in preparation for a career as a family doctor.—I am, etc.,

London, W.8.

DONALD C. BOWIE.

Remuneration Claim

SIR,—I have refrained from entering the fray regarding our remuneration claim, chiefly because most of the letters seem to have been assuming that the Government is a gang of crooks whose one idea is to break an honourable agreement and "down" our profession at all costs. Whether we like it or not, our particular democratic system demands certain procedures, and there is no way of by-passing them. Surely, so far, the Government has not rejected our claims? Am I not right in saying that when the Minister made his statement, which has let loose so much abuse, no claim had been made? I am confident that when all the usual meetings have been held the profession will find, in true British tradition, that we shall receive justice.

I would, in view of my beliefs, like to put forward a serious suggestion regarding the financing of our remuneration. I believe that about 10d. a week is contributed to the National Health Service from the various amounts paid by individuals for National Insurance. I suggest that 3d. a week extra is so contributed and that the present contributions are raised by this amount (1½d. from the individual and 1½d. from the employer). Assuming there are twenty million contributors, this would bring in thirteen million pounds a year. It would, I suggest, have the following advantages: it would be anti-inflationary; it would mean that the individual would be paying more directly for the benefits he obtains; and it would hit nobody, not even the Chancellor of the Exchequer.

May I suggest that, during our own little crisis, "patience and patriotism" should be the watchwords. Do not let us be rushed by hotheads into precipitate action.—I am, etc.,

Newport Pagnell, Bucks.

A. A. CLAY.

SIR,—Much has been written of strike action on the one hand and negotiation on the other, but we appear to be missing the obvious.

A contract can be enforced by law. Action can be taken against the Crown. A contract may be real or implied, and if, by tricks of words, our real contract is not enforceable we most certainly have very adequate proof of an implied contract. As a body the B.M.A. could not take action, but an individual could, and there is nothing to stop a body so vitally interested from providing funds. There must be many of us who would be willing to be the guinea-pig in a test case. I for one am fed up with negotiations with politicians. All the honest ones have hairs growing on the palms of their hands. Last time it took three years—let us invoke the law now. I have no doubt that when the case is won (as I am sure it would be) the Minister would then bring in amending Acts. Then would be the time to have other wrongs put right—if he can alter one bit he can alter the lot.

I would implore our leaders to forsake the kid glove in favour of the mailed fist. It is essential to ascertain if we really have a contract, and the time to do it is now. The place to do it is in a court of law—then there is no doubt in anyone's mind.—I am, etc.,

Walsall.

J. M. LEES.

Closed Shop

SIR,—If the circulation of a plebiscite is being contemplated I submit that B.M.A. owes it to the advocates of the "closed shop" to include a question thus: "Do you believe that membership of the B.M.A. should be made compulsory, so that the Association could control those doctors who act against the common interest?" Headquarters might be surprised at the percentage of answers of "yes," as it is becoming daily more apparent that we must march together or sink to the level of genteel artisans.—I am, etc.,

Dungannon, Co. Tyrone.

Branch and Division Meetings to be Held

BOURNEMOUTH DIVISION.—At Board Room, Royal Victoria Hospital, Boscombe, Friday, October 26, 8.15 p.m., meeting. Address by Dr. W. Fielding: "Points of Departure."

BRIGHTON AND MID-SUSSEX DIVISION.—At Preston Parish Church (St. John's), Sunday, October 21, 6.30 p.m., annual church service.

CLEVELAND DIVISION.—At Hinton's Café, Corporation Road, Middlesbrough, Friday, October 26, 8.30 p.m., meeting. Lecture by Dr. J. H. Cyriax: "Manipulative Medicine."

CUMBERLAND DIVISION.—At Blencathra Sanatorium, Threlkeld, Thursday, October 25, 8 p.m., film: "Conjoined Twins of Kano," followed by annual meeting.

DARTFORD DIVISION.—At Royal Clarendon Hotel, Gravesend, Thursday, October 25, 8.15 for 8.45 p.m., annual dinner. Medical guests are invited.

DUDLEY DIVISION.—At Nurses' Lecture Theatre, The Guest Hospital, Dudley, Tuesday, October 23, 9 p.m., A.G.M.

EASTBOURNE DIVISION.—At Princess Alice Memorial Hospital, Eastbourne, Tuesday, October 23, 8.30 p.m., meeting. B.M.A. Lecture by Mr. A. Lawrence Abel: "Lumps in the Breast," with special reference to cancer, its diagnosis and treatment (illustrated by lantern slides); also a coloured talking cinematograph film: "Breast Self-examination."

EAST HERTS DIVISION.—At Haymeads Hospital, Bishop's Stortford, Thursday, October 25, 8 p.m., clinical meeting.

FINCHLEY DIVISION.—At Finchley Memorial Hospital, Friday, October 26, 8.30 for 9 p.m., meeting. Talk by Dr. A. A. Mason on the use of hypnosis in medicine. To be supported by a short film and demonstration.

GREENWICH AND DEPTFORD DIVISION.—At Miller General Hospital, Greenwich High Road, S.E., Wednesday, October 24, 8.30 p.m., meeting. Dr. C. W. L. Jeanes: "A Chest Physician Visits the New World—a Report on a Four Months' Visit to Canada and the United States of America." Members' wives and other guests are invited, also members of the Woolwich and Lewisham Divisions.

HEREFORD DIVISION.—At County Hospital, Hereford, Wednesday, October 24, 8 p.m., meeting. Address by Professor H. W. Rogers: "Surgery of the Stomach."

HYDE DIVISION.—At Pack Horse Inn, Mottram, Wednesday, October 24, 8.45 p.m., clinical meeting. Talk by Dr. D. Hilson: "A Novel and Useful Congenital Syndrome."

KINGSTON-ON-THAMES DIVISION.—At Tudor Restaurant, Bentalls, Kingston, Wednesday, October 24, 7.30 for 8 p.m., supper dance.

LONDONDERRY DIVISION.—At Londonderry City and County Hospital, Wednesday, October 24, 8.15 p.m., meeting. Lecture by Dr. J. J. E. Merry on the basic principles of therapy with cortisone and related steroids followed by two films: (a) "Therapy with Cortone" (Cortisone Acetate); (b) "Technique of Joint Aspiration and Injection of Hydrocortisone."

MID-ESSEX DIVISION.—At Heybridge Country Club, Ingatestone, Thursday, October 25, 7.30 p.m., annual dinner, followed by annual general meeting.

NORTHERN IRELAND BRANCH.—At Upper Lecture Theatre, Institute of Clinical Science, Grosvenor Road, Belfast, Thursday, October 25, 8.30 p.m., opening meeting of session. Presidential address by Dr. Robert Marshall: "A Visit to Finland." Wives and friends of members are invited.

ST. PANCRAS DIVISION.—At Institute of Ophthalmology, Judd Street, London, W.C., Wednesday, October 24, 8.30 p.m., meeting. Dr. N. H. Ashton: "Oxygen as a Cause of Blindness in Premature Babies." A short film and a practical demonstration will follow. Members of the City Division are invited.

SOUTH-EAST ESSEX DIVISION.—Saturday, October 27, visit to the Houses of Parliament. Coach party to arrive at Westminster at 6 p.m. (approx.). Members, their wives, and friends are invited.

STRATFORD DIVISION.—At King George Hospital, Eastern Avenue, Ilford, Tuesday, October 23, 8.30 p.m., annual general meeting. Address by Dr. D. P. Stevenson (Deputy Secretary, B.M.A.): "Current Events at Headquarters."

TOWER HAMLETS DIVISION.—At St. Andrew's Hospital, Devons Road, Bow, E., Friday, October 26, 3 p.m., clinical meeting.

WEST SOMERSET DIVISION.—At Physiotherapy Department, Musgrove Park Hospital, Taunton, Saturday, October 27, 3 p.m., clinical meeting.

WEST SUSSEX DIVISION.—At Beach Hotel, Littlehampton, Thursday, October 25, 6.30 p.m., general meeting. Mr. Stephen Madden: "Domiciliary Midwifery as Seen from the Hospital."

WINCHESTER DIVISION.—At Royal Hotel, Winchester, Saturday, October 27, 7 p.m., annual meeting; 8 p.m., dinner. Guest of honour, Dr. A. H. Hall, President, B.M.A.

Meetings of Branches and Divisions**LEICESTERSHIRE AND RUTLAND BRANCH**

The annual meeting was held on June 6 at Leicester Royal Infirmary. The chair was taken by Dr. J. Butler, and 36 members were present. The following officers were elected:

President.—Mr. A. L. McCurry.

President-elect.—Dr. J. Cooke.

Vice-president.—Mr. E. R. Frizelle.

Past President.—Dr. J. Butler.

Secretary.—Dr. G. L. Ward.

Dr. G. Waring-Taylor was presented with a silver coffee-pot and milk jug and an inscribed walnut tray and a small cheque as an expression of gratitude for the work he had done as honorary secretary of the Branch for nine years. Dr. O'Donnell showed a colour ciné film of the B.M.A. meeting in Toronto in 1955.

REMUNERATION CLAIM**MINISTER ON CONTRACTUAL OBLIGATIONS**

Addressing the conference of the Executive Councils Association (England) in London on October 18, Mr. R. TURTON, Minister of Health, said that there appeared to be some widespread misunderstandings about the doctors' pay claim. The claim had not been exhaustively examined in all its details and found wanting. "There has been no such examination of the details," he said, "and we have passed no opinion on them."

He stated that the Government had felt that the claim could not be reconciled with its policy of fighting inflation by exhorting all sections of the nation to observe restraint over increases both of prices and of wages and salaries. The Negotiating Committee had therefore been told that in the present circumstances the Government did not feel justified in giving consideration to any claim for a general increase in medical remuneration. He had not been able to accept the claim that there were contractual obligations to give pay increases, but, "far from brushing it aside, we have readily agreed to a request made by the Negotiating Committee that the matter should be referred for legal advice at the highest level. That advice is now being obtained."

Mr. Turton pointed out that the claim was not concerned with any increases in practitioners' expenses. He had seen letters from doctors urging that mounting practice expenses justified acceptance of the claim, but other agreed arrangements existed to cover these, and extra money was being paid to meet them. He said, "Doctors will, I hope, have a pleasant surprise when they receive their December cheques."

A report of the conference of the Executive Councils Association will appear in a subsequent issue.

B.M.A.'s STATEMENT

The following statement was issued to the Press on October 19 by the Public Relations Department of the B.M.A.

"While the profession is still awaiting his considered reply on their main remuneration claim, the Minister of Health is reported as having said yesterday that doctors will have 'a pleasant surprise' when they receive their December cheques, since they will find that the amount allowed for their practice expenses has increased."

"Anyone reading this might suppose that the Government was 'giving' the doctors something extra and something new. It is, of course, doing nothing of the kind. This is the family doctors' own money which they have already spent

on the Service and which has been owing to them for nearly two years. During this time they have been bearing out of their own pockets the rising costs of everything they need to run their practices, from telephone charges to surgery towels. This December at long last these extra costs will be refunded. It is ridiculous to speak of the repayment of this debt as though it were some kind of Christmas box and a 'pleasant surprise.' One might as well say that it should be a 'pleasant surprise' for an employee when his firm makes up to him the bus fares he spent last year on their business. Doctors would be better pleased if Mr. Turton, having admitted that their practice expenses have gone up, would now admit that the value of what they are left with after paying these expenses has gone down and adjust their remuneration accordingly."

Views of Merseyside Branch

The Merseyside Branch of the B.M.A. at its meeting on October 12 expressed unanimous confidence in the negotiators and indignation of the way in which the Ministry had originally dealt with the claim. Members reaffirmed their adherence to the agreement implied and set out in the Spens Report. Members also felt there should be no delay in pursuing negotiations, and suggested a period of from four to six weeks in which it should be possible to indicate to the profession progress made. Failing this, suitable steps should be taken to put the profession in a state of readiness to bring the necessary pressure to bear for a full settlement of the claim.

CENTRAL CONSULTANTS AND SPECIALISTS COMMITTEE**FIRST MEETING OF THE NEW SESSION**

The first meeting of the new session of the Central Consultants and Specialists Committee was held at B.M.A. House on October 11. Mr. T. HOLMES SELLORS was unanimously re-elected to the chair and Dr. T. ROWLAND HILL to the deputy chair. Two members, Mr. C. E. KINDERSLEY and Mr. A. M. A. MOORE, were added by co-option. Six representatives from the Committee, including its Chairman and Deputy Chairman, were appointed to serve on the Joint Consultants Committee for the new session. Some half-dozen subcommittees were reconstituted, and representatives were appointed to other committees of the Association.

The Chairman reported for the Executive and made certain recommendations, which were agreed to, on action to be taken concerning certain resolutions of the recent Annual Representative Meeting and the Consultants' Conference. One of these concerned the "relative and absolute" underpayment of house-officer grades in hospitals, and called upon the Council to press for substantial increases in the remuneration paid to these grades. In deciding to send this to the Staff Side of Committee B of the Medical Whitley Council the Committee pointed out the strong case for an increase in fully registered house-officer remuneration.

The Committee considered resolutions of the Annual Representative Meeting and the Conference relating to the present distinction awards. They decided to seek further information on the operations of the Distinction Awards Committee and the principles on which the machinery for the allocation of distinction awards works.

Private Beds Distribution

Figures showing the occupancy of hospital private beds were extracted from the official statistics of the hospitals services published by the Ministry. These figures showed that, taking the country as a whole, private beds were not fully used for the treatment of private patients. Figures from the provident societies, however, showed that there had been a considerable increase in the number of people making provision through these societies for private hospital treatment.

The CHAIRMAN said that before raising the matter with the Ministry it was necessary to obtain evidence of the demand for private treatment in those areas where it could not be met with the present facilities. He therefore proposed to the Committee—which was agreed—that a letter be sent to the chairman of each hospital group medical committee asking whether experience had shown that the private beds in the hospital group were adequate and appropriately distributed, or alternatively that where it was felt that more private beds were needed sufficient detailed information should be furnished which would enable a case to be put before the Ministry. This followed upon an instruction at the last meeting of the Central Committee instructing the Executive to review the distribution of hospital private beds and to discover what steps should be taken to secure an improvement in the present position where it appeared to be necessary.

It was also agreed that the Joint Committee be asked to reopen with the Ministry the question of the reintroduction of a moderately priced private bed.

S.H.M.O.s

A long discussion on the question of remuneration of S.H.M.O.s took place on the report of the Executive Committee, together with a memorandum prepared by Dr. J. H. THOMAS, who stressed two anomalies, one that the S.H.M.O. with ten years' experience was still earning less than a newly appointed consultant, and the other that the S.H.M.O. suffers with age so far as life earnings are concerned when compared with consultant earnings. Thus an S.H.M.O. appointed at the age of 32 received £1,575 and a consultant at the same age £2,100, a difference of £525, and after ten years the former received £2,025 and the latter £3,100, a difference of £1,075. At the age of 42 the total difference over the whole period would be £8,540, and at the age of 65 it would be £33,265.

The view of the Executive on the future use of the S.H.M.O. grade was that no action could be taken on this subject until the outcome of the discussion on hospital medical staffing. Pending such discussion it would be premature to establish formal machinery for dealing with the problem. In the meantime the proper way of dealing with any difficulties was to maintain vigilance in scrutinizing advertisements for S.H.M.O. appointments to see that they conformed with the appropriate circular.

It was resolved that attention be drawn in the next issue of the *Bulletin* to the desirability of hospital medical staffs bringing to the immediate notice of the Central Committee

any cases in which hospital boards propose to advertise S.H.M.O. appointments which in the opinion of local consultants are wrongly graded, and to ask the Joint Committee to renew its representations to the Ministry that hospital boards be encouraged to consult with representatives of the profession before submitting advertisements of S.H.M.O. posts to the medical press.

Title of the Committee

Mr. H. H. LANGSTON, chairman of the Constitution Committee of the Association, said that it was hoped to make the final report on the constitution in January. Meanwhile the question of the title of the Central Consultants and Specialists Committee had come forward, and his committee had wondered whether in some way "Hospital Services" could be incorporated, making it clear that the object of the Committee was to watch over all engaged in the hospital services, including the junior members of the staff, and using some such title as "Consultants and Hospital Medical Staffs Committee." Dr. Rowland Hill had pointed out that "specialists" had been removed from the documents used in discussions with the Ministry, and it was perhaps an anachronism to leave the word in the title.

It was decided to leave the matter over until the next meeting.

Guillebaud Report

Professor P. C. P. CLOAKE, as chairman of the subcommittee which prepared evidence for the Guillebaud Committee, gave a lengthy report of the result of that body's deliberations. He said that his subcommittee was pleased to note that from the financial point of view the Guillebaud Committee had made so many recommendations which coincided with those of the Central Consultants and Specialists Committee. It would, for example, be seen that medical membership of boards, elected medical advisory committees, and many other fundamental tenets of the Central Committee were strongly supported by the Guillebaud Committee on financial grounds also. But the subcommittee could not accept the final conclusion of the Committee that they had found no opportunity of making recommendations which would either produce new sources of income or reduce in a substantial degree the annual cost of the Service.

The subcommittee was aware of substantial wasteful expenditure which still occurred, and drew attention to certain items of economic reorganization which would undoubtedly result in economies—namely, (1) provision of out-patient facilities of a standard to allow minor procedures to be carried out without having to admit the patient; (2) extended provision and organization of improved ancillary services so that essential investigations could be carried out before admission or with the minimum delay after admission; and (3) provision of a thoroughly adequate service for the elderly and chronic sick in order that their admission might never be needlessly sought nor their discharge needlessly delayed. Professor Cloake dealt in detail with many of the paragraphs of the report, and ended by saying that the subcommittee welcomed the assurance that the importance of medical planning was recognized, and the profession was ready and willing, as it always had been, to accept this responsibility and play its part.

Maternity and Child Welfare Services

Professor G. I. STRACHAN, in presenting the report of the Obstetrics Subcommittee, dealt with the question of preparing a memorandum for inclusion in the evidence to be submitted to the committee set up by the Minister to review the organization of maternity services. On the question of local health authority and child welfare services, the conclusion was reached that the only logical course, particularly as the Guillebaud Committee had recommended that there should be no transfer of maternity hospitals to local authorities, was to transfer the maternity and child welfare functions of the local health authority to the hospital authority, under which they should be integrated with the departments of obstetrics and gynaecology and paediatrics.

respectively. These departments themselves should be as closely integrated as possible.

As to whether local executive councils should or should not retain responsibility for making arrangements with general practitioners for providing maternity medical services, the conclusion was reached that it was logical and would make for better co-operation if the present opportunity was taken to bring the whole of the midwifery services under unified control exercised by the hospital authority. Admission to the obstetric list was, in the opinion of the subcommittee, purely a formality and its continuance would serve no useful purpose.

Disciplinary Proceedings

Dr. S. COCHRANE SHANKS, chairman of the Medico-Legal Subcommittee, presented a draft memorandum from the Ministry on the procedure for investigating complaints relating to professional behaviour or competence. The subcommittee had agreed upon certain amendments and additions to the memorandum, and the document with these amendments was circulated to the Committee.

**S.H.M.O.'s GROUP COUNCIL
REPRESENTATION OF THE GROUP**

A meeting of the council of the S.H.M.O.'s Group was held at B.M.A. House on October 8, when there was a full attendance from the various regions, including the Scottish. Mr. G. WARING ROBINSON (Sheffield Region) was unanimously voted to the chair. The main business of the meeting was the consideration of the annual report of the executive committee.

The CHAIRMAN said that the Group had a satisfactory record of achievement during the 19 months since the Group council had its first meeting. Good work had been done in ensuring that newly appointed S.H.M.O.s were made acquainted with the Group with a view to becoming members. The most appropriate method of representation had been the subject of much debate. An amendment of the constitution of the Group Committee had been proposed which would make the executive a subcommittee of the Central Consultants and Specialists Committee, the Group itself and the Group council still continuing in being. The idea of the Group executive becoming a subcommittee of the Central Consultants and Specialists Committee was not acceptable, however, but a liaison committee was favoured, with representatives of the central committee, to facilitate matters of common interest. The question was still under discussion.

S.H.M.O. Appointments

Much of the report presented to the meeting concerned matters dealt with when a deputation from the Group executive committee met the executive of the Central Consultants and Specialists Committee. On this occasion concern had been expressed to the central committee at the apparent increase in the number of S.H.M.O. appointments. A proposal was made that no new such posts should be created. The central committee, while agreeing that the wording of the S.H.M.O. document which lays down the scope of the grade (circular R.H.B. (50) 96) was unsatisfactory and inviting suggestions on how it might be modified, could not oppose the proper use of the grade. It was reported that dissatisfaction was also expressed to the Ministry from other quarters about the way in which the circular was applied. The view was expressed that consultation with regional consultants and specialists committees should take place on proposals to create new S.H.M.O. posts before submitting advertisements to the medical press for publication. Two members of the Group executive had produced a memorandum on which a document for the committee might be based.

Mr. G. LOWE referred to the length of time that this whole matter had been simmering. The question was, what was

going to happen as between the Ministry and the Joint Consultants Committee? He wanted to get unity in the profession on S.H.M.O. appointments. The position obviously called for clarification. What was wanted was to be sure that there was no downgrading. He moved that the executive be requested to get on with the job in the best way which appeared open to them and at the earliest possible moment. The CHAIRMAN said they would all agree in principle with that, and the meeting signified its endorsement.

G.P. Specialists

Another matter which arose on the annual report of the executive committee concerned representation on the General Medical Services Committee. It was time, said several members, that something was done to encourage the appointment of general practitioners to serve on the staffs of provincial hospitals. A memorandum on specialization in general practice by Mr. Lowe had received the support of the G.M.S. Committee, and had been discussed by a number of interested bodies. The Central Consultants and Specialists Committee had given its approval to a number of principles, such as that general practitioners should be more closely associated with hospital work than at present.

Comparative Earnings

The meeting had before it a memorandum by Dr. J. H. THOMAS on the remuneration of S.H.M.O.s. From the figures which he brought forward he pointed out two anomalies: the first was that the S.H.M.O. with ten years' experience was still earning less than the newly appointed consultant, and the second that the S.H.M.O. suffered with age so far as earnings were concerned when compared with earnings of a consultant. If both S.H.M.O. and consultant were appointed at age 32, the one receiving £1,575 and the other £2,100, the difference was £525, and the accumulated difference after ten years was £8,540, and by age 65 it would be £33,265.

Apart from a most informative report, the agenda contained resolutions from various regions, mostly on matters which were already under the consideration of the Group council or its executive.

BIRMINGHAM MEETING

The Chairman of the Central Consultants and Specialists Committee, Mr. T. Holmes Sellors, is to address the annual regional meeting of consultants and S.H.M.O.s of the United Birmingham Hospitals and the Birmingham Regional Hospital Board on November 28, at 8 p.m., in the board-room of the Queen Elizabeth Hospital, Birmingham. All consultants and S.H.M.O.s are invited.

GENERAL MEDICAL SERVICES COMMITTEE

The monthly meeting of the General Medical Services Committee was held at B.M.A. House on October 18. To the regret of the members a letter was read from the Chairman, Dr. A. TALBOT ROGERS, intimating that he was compelled to enter hospital for an operation, and that he could not expect to resume full duty before the new year. The meeting sent a message of sympathy and good wishes to Dr. Rogers, who, it was stated, was making good progress. In his absence Dr. A. B. DAVIES (Walsall) was elected temporary chairman of the Committee. A message of sympathy in his illness was also sent to Dr. HOWIE WOOD, a member of the Committee. Dr. J. C. CAMERON (Wallington) and Dr. J. M. B. DONALDSON (Belfast) were welcomed as new members.

It was reported that the Scottish Secretary had informed the Department of Health for Scotland that the G.M.S. Subcommittee (Scotland) had agreed to an inquiry on the cost of prescribing on the lines suggested, but felt that any

investigation into prescribing in Scotland would best be carried out by a committee whose remit related specifically to that country. The subcommittee also thought that the investigation should be broadened to include prescribing throughout the Health Service, not restricted to general practice only.

The question of a joint discussion between the General Medical Services Committee and the Private Practice Committee on drugs for private patients, which had been before the Committee on several occasions, was again brought forward. It was agreed that a joint meeting of the two Committees should take place on November 14.

In reply to a question, Dr. DAVIES (from the Chair) said that there was little to add to the statement on the remuneration claim made by Dr. Talbot Rogers at the last meeting. The expected answer had not so far been received.

After some discussion the Committee agreed to recommend to the Negotiating Committee that the supplementary memorandum prepared by the Negotiating Committee's legal advisers should be sent to the medical press as soon as possible.

Health Centres

The Committee had before it from the London Local Medical Committee a document of the nature of a survey of health centres, also a letter from the London County Council to the London Executive Council on the provision of such centres. The London Local Medical Committee document (see *Supplement*, August 4, p. 89) was based on information relating to four such centres and one group practice. It was shown that the group practice had been more successful than any of the four health centres, the reason being, in the view of the local medical committee, that the patients of the group practice were receiving better service over extended hours of consultation, the use of an appointments system, and infant and antenatal care, all from the same three doctors such as were not available to the same extent at the four health centres.

Certain recommendations were made by the London Local Medical Committee: that the initial cost of health centres could and should be greatly reduced; that health centres of modest proportions should be erected as soon as possible; that doctors working in health centres should be consulted on the appointment of their ancillary staff, etc. The document was further expounded by Dr. F. GRAY. The CHAIRMAN said that this was particularly a London matter and detailed discussion should not be necessary at the moment. The findings and recommendations would be carefully considered.

Dr. M. SORSBY said that the purpose of a health centre was (1) to provide suitable premises for doctors to work in; (2) to furnish adequate ancillary help; (3) to bring together general practice and preventive medicine; and (4) to provide accommodation for several doctors to work in the same building and to co-operate and consult together. There was no reason why a group of doctors in partnership should not provide an equally good service at a health centre, and there was a need for further health centres where this experiment could be tried.

Dr. H. C. FAULKNER and others discussed a very useful and factual report.

Pool of Locumtenents

Another document placed before the Committee was by the Medical Practitioners Union on a suggested pool of locumtenents. Dr. B. CARDEW said that doctors had considerable difficulty in getting suitable locumtenents at the moment when they were required. This seemed to reveal that there was not a large pool of doctors who were unemployed and anxious to take any work offered to them. One of the present difficulties in the N.H.S. was that there was likely to be a hiatus between the time when house jobs were completed and the final decision of the doctor to follow a particular career in medicine. If it was possible to create a reasonably well paid job which a doctor could hold for one or two years and in which he could work in a number of departments of medicine it would be an advantage. There seemed, therefore, a need for a nationally organized locum

service which would supply suitable and appropriately qualified locumtenents on demand to the three branches of the service. They would be paid by the service and not by the individual users, who would be charged the economic amount to cover the approximate cost. The service should preferably be run by some body on which general-practitioner interests were predominant.

Dr. L. S. POTTER, medical director of the Medical Practices Advisory Bureau, said that he was not against the idea if anything could be done along these lines, but there were various difficulties. One of them was seasonal variation. The demand for locumtenents varied with the season, and it was exceedingly difficult to keep employed all who desired employment. He saw many difficulties in anything of this sort, and he thought it would require something stronger on the practical, rather than the theoretical, side before it could begin to work.

The CHAIRMAN said that to him it seemed that the scheme was more likely to fall down on finance than on any other point.

The document was received and referred to the appropriate subcommittee for further consideration.

Resolutions of Conference and A.R.M.

The Committee then addressed itself to the task of considering seriatim the action to be taken on certain of the resolutions of the Conference and of the Annual Representative Meeting.

On a resolution of the Conference referring to the Committee the opinion that regional hospital boards and boards of governors should not be permitted to announce the proposed closure of a hospital, or change of use, unless and until an independent inquiry had been held, Dr. SORSBY said that the time had come when no such change should take place without proper inquiry. This view was strongly supported by other members of the Committee, and by Professor P. C. P. CLOAKE, who recommended that it should be brought before the Liaison Committee.

Some discussion took place on a reference to Council by the Representative Body that general practitioners should be permitted to prescribe on Form E.C.10 for the replacement of appliances at present available only through the hospital service. Dr. SORSBY thought that this might well apply to certain appliances, but not to the majority. It was agreed that the final decision in such cases should rest with the consultants.

A resolution stressing the growing importance of geriatric units was endorsed, and the Committee agreed to urge the Council to keep these matters continually under review, and to take urgent action to ensure their implementation by the Ministry at an early date.

Poliomyelitis Vaccination

It was reported that on the invitation of the Ministry the Chairman and other members of the Committee had attended a meeting to discuss the means by which general practitioners might participate in the arrangements for poliomyelitis vaccination later this year. It was stated that it was hoped that regular supplies of vaccine would become available from the beginning of the new year, and these would be distributed to vaccinate, with two injections, all registered children in the local authority area. General practitioners were to be given an opportunity to take part in the vaccination scheme, and local health authorities were being asked to make arrangements accordingly. The medical officer of health should arrange to discuss the matter at an early date with representatives of the local medical committee. It was stated that it would be for each general practitioner to decide individually whether to take part in these arrangements. The vaccine would be obtainable from the local health authority and practitioners would be advised of the special storage arrangements.

A vote of thanks was accorded to Dr. A. B. DAVIES, the new temporary chairman, for his expeditious conduct of the meeting.

Scottish News

GENERAL MEDICAL SERVICES SUBCOMMITTEE (SCOTLAND)

The first meeting of the General Medical Services Subcommittee (Scotland) for the 1956-7 session was held in Edinburgh on September 25. Dr. C. J. SWANSON, Aberfeldy, and Dr. KATE HARROWER, Glasgow, were reappointed Chairman and Vice-chairman respectively.

Various subcommittees were appointed and representatives were elected to serve on other committees.

Prescribing Costs

A letter from the Department of Health concerning a proposed inquiry, on a United Kingdom basis, into prescribing costs was considered. After a lengthy discussion the Subcommittee expressed the opinion that, while they were in favour of the proposal to set up a committee of inquiry, any investigation into prescribing in Scotland should be carried out by a separate committee. It was accordingly agreed that the Department should be informed that an inquiry specifically concerned with conditions of practice in Scotland offered the best prospect of both eliciting the facts and suggesting effective action in Scotland. The Subcommittee were also of the opinion that the basis of the inquiry should be broadened to include prescribing throughout the Health Service.

Emergency Call Service

Information on an emergency call service which is operating in London was submitted to the Subcommittee, and they also had before them an excerpt from the minutes of the September meeting of the G.M.S. Committee in connexion with this matter. Concern was expressed about the possible development of a scheme of this kind in Scotland, because, in the Subcommittee's opinion, it would not be in the best interests of medical practice.

Mileage

Some members expressed disappointment at the lack of a settlement of the long-standing mileage question. It was agreed that the G.M.S. Committee and the Department of Health should be asked for a progress report.

Examination of Inflation

It was reported to the Subcommittee that the Department had been considering the possibility of executive councils removing from doctors' lists the "pre-adoption" names of those children who are adopted under a new name, as a means of reducing inflation. It was agreed that this might be discussed with the Department at the next routine meeting along with the original proposal regarding notification of change of name and/or address, further consideration of which had to be deferred until after the Annual Conference of Local Medical Committees in June last.

Regional Medical Office Service

Edinburgh Local Medical Committee submitted for the consideration of the Subcommittee a suggestion that space for the recording of the date of birth or age, as well as the diagnosis, should be provided on Form R.M.2A. This proposal was approved, and it was agreed to submit it to the Department.

Group Practice Loans

The Subcommittee agreed to a proposal by the Department to amend paragraph (d) of the first clause of the model agreement by adding a clause indicating that the consulting premises for which a loan had been granted could be used for any such other purposes as were provided for in the proposals approved by the Scottish Group Practice Loans Committee.

Correspondence

Was It a Drug?

SIR,—It really was cheering to read Dr. S. Edelman's letter (*Supplement*, October 13, p. 156) about the recent report which you printed in the *Supplement* on September 22 (p. 134). As the Dr. X concerned I should like to thank him. In particular, the penultimate sentence of his letter has a rhythm which enchants, and might become the fighting slogan of practitioners when we make our mass march into Savile Row. Thank you also, Dr. Edelman, for your sympathy. But I did not feel a bit like Alice in Wonderland, unless it was after the affair was over, when it seemed very like a caucus race. Maybe my colleagues would like to have a summary of how the case creaked its way from beginning to end.

1954. In March I twice prescribed "formulac" on E.C.10 forms. Four months later the local executive council sent me notice that the pricing bureau had queried the prescriptions and had referred them to the local medical committee. My comments were requested and I did not delay in sending them.

1955. In February (that is, six months later) the local medical committee gave their opinion that the preparation was a food, but very properly pointed out my right of appeal. I appealed within the month allowed and had a polite letter from the Ministry explaining that "it might be some time before the meeting can be arranged." They were right. There was silence for a year.

1956. In about March a long-distance telephone call to me brought a feminine voice from the Ministry of Health. I was to attend the hearing in Peterborough on a date in the near future. I replied that this I would do if the Ministry would pay my return fare, my expenses, and compensation for time spent away from the practice. The voice sounded shocked; no, that she could not at all promise. Then, I said, the Ministry had better fix a venue in Cambridge. We hung up in mutual sorrow. Three months later the appeal was held in Cambridge, with two doctors and one barrister-at-law as referees. As could be foreseen, they all were courteous, but with the barrister (who was chairman) I felt this courtesy covered a rather hostile forensic probing. One of the disturbing things was that, in my opinion, they did not seem to have an understanding of the preparation I had prescribed, of some of its ingredients, or of the principles concerned. Indeed, in the report they issued later they alleged that I advised the hiatus hernia patient to take his medicine in a recumbent position. (Can I sue for slander?) The chairman made several medical howlers and it was a privilege to correct him. Not until August (two months later) did I have the report that the appeal had been allowed.

One feels for the Ministry, whose two years of correspondence, move and counter-move, expensive telephoning, and employment of professional experts failed to save the 16s., which was the cost of the two E.C.10's. Of course, they will say that it is the principle which matters. Precisely; that is why I went to a certain amount of trouble to see this through. Please may I offer some advice to all future Dr. X's? (1) Never accept a pricing bureau or Ministry condemnation when you know you are in the right. (2) Insist on an appeal, and insist on its being held near your practice. (3) Always attend in person. Do not seek to be legally represented unless you are of an emotional nature and liable to throw things under strain. It is far wiser that you yourself should be able to explain various medical points as they arise. (4) Prepare your case in great detail and come armed with all the pharmaceutical information you can. But be relevant. Remember that the referees have to judge whether the substance was prescribed as a drug for the particular case under discussion, and not whether it can be considered as food or drug in general. (5) Never let the Ministry's ideas override your own considered opinion on how best to practise medicine.

I can reassure Dr. Edelman that I am unrepentant in my wickedness. Indeed, since the matter was brought up I have not hesitated to prescribe the very same preparation whenever I thought a patient really needed it.—I am, etc.,
Cambridge.

A. S. PLAYFAIR.

4. So far as the terms of these personal contracts relating to remuneration are concerned, therefore, they are merely the formal agreement with the individual members concerned of those particular rates of remuneration which, on the last occasion on which the basis of remuneration was reviewed in the light of the Spens recommendations, were found to accord with those recommendations. If, however, the Spens recommendations do in fact require some form of periodical adjustment of the scales of remuneration in certain events, and those events occur, effect would have to be given to that requirement, and the individual personal contracts would then have to be amended accordingly. This follows from the fact that continuing compliance with those requirements still remains as an overriding contractual obligation of the Government to both branches of the profession as a whole. In short, the requirements of the Spens recommendations, whatever they may be, remain at all times the paramount and governing consideration in relation to remuneration. The only question left is, What are the requirements involved in those recommendations?

3. This obligation is therefore a general overriding obligation to the profession as a whole, and one which exists independently of the particular obligations created by the personal contracts which serving members of both branches of the profession have entered into with executive councils, regional hospital boards, boards of governors, and hospital management committees, as the case may be. So far as the rate of remuneration is concerned, all that these personal contracts do, and all that they are intended to do, is to give the individual practitioner or consultant concerned that particular rate of remuneration which will, at the time when such contracts are originally entered into, or are subsequently amended, accord with the requirements of the Spens recommendations. Thus, following the Danckwerts Award, the rates of remuneration previously payable to general practitioners under their personal contracts for the years ending March 31, 1949, 1950, and 1951, were altered by

5. The vital question in issue here is whether the recommendations envisage and require periodical adjustments from time to time of the remuneration in the light of any subsequent changes in the value of money or increases in incomes in other professions that may occur, at any rate where these changes are of a substantial character. The profession submits that they do. On the other hand the view expressed by the Minister at the meeting on August 1, 1956, was that the Spens recommendations only settled the terms of entry into the Service, presumably meaning thereby that once the scales of remuneration (based on 1939 values) had been increased by whatever was the true "betterment factor" applicable at the date of the inception of the Service (July, 1948) there was then a full and complete

2702

implementation of the Spens recommendations as regards the "betterment factor," and no future or further adjustment under that head was either envisaged or required by those recommendations.

6. It is submitted that it can be clearly demonstrated that this view of the Minister is unsound, and that the profession's view is the right one. This can be done in three ways. First, by reference to the actual wording of the Reports and recommendations themselves; secondly, by reference to what has hitherto, and before the present differences arose, been clearly accepted by the Ministers themselves to be their true effect; and, thirdly, by reference to the construction placed upon those recommendations by Mr. Justice Danckwerts in making his award.

7. It is convenient to begin with the first Spens Report relating to the general practitioners. This Spens Committee was appointed in February, 1945, and their terms of reference required them:

(a) To recommend the range of total professional income of a registered medical practitioner in any publicly organized service of general practice; and (b) to frame their recommendations with due regard to the desirability of maintaining in the future: (i) the proper social and economic status of general medical practice (i.e., when operating in a publicly organized service), and (ii) its power to attract a suitable type of recruit to the profession (i.e., when operating in a publicly organized service).

8. Since it was common knowledge when the Committee was set up that the proposal was to bring such a publicly organized service into being as a permanent feature of our national life, but at some then unspecified future date, the wording of the terms of reference makes it abundantly clear that the ranges of professional income the Committee were asked to recommend should be such as would be likely to maintain the proper social and economic status of general medical practice, and its power of recruitment, not merely at the time when the service was brought into being but indefinitely in the future. Clearly, therefore, it was the Committee's task to produce a long-term policy, and the tenor of the whole of the wording of their Report shows that they understood that this was so, and framed their recommendations accordingly.

9. The Committee recognized, however, at the time when they reported, that there had been a change in the value of money as compared with 1939, and, further, that increases had "in fact taken place in incomes in other professions" (paragraph 6 of the Report). They confessed their inability to express an opinion as to what adjustments of pre-war incomes were necessary to produce corresponding incomes at the date of their Report, and therefore said that:

"Throughout this report our recommendations are, therefore, those which it appears to us would have been necessary for the purposes of our remit had we been reporting in 1939."

10. This method of approach provides a valuable clue to the intention of the Committee in relation to the specific scales which they subsequently set out in their formal recommendations. In effect what they say is that our task is to recommend scales which, after the National Health Service comes into operation and the general practitioners' section of the profession becomes engaged in it, will maintain both the proper social and economic status of that section, and also its recruiting power in the future. We were also directed to have due regard to normal financial expectations of general medical practice in the past, and, with the aid of statistics supplied by Professor Bradford Hill for the years 1936, 1937, and 1938 (see paragraph 6 of the Report), we find ourselves able to recommend what the scales of remuneration should have been if this had been 1939 instead of 1946. We will therefore begin with those 1936/1938 scales and first consider those figures (but still as if we were reporting in 1939 and not 1946) in the light of the two objectives of maintaining the proper social and economic status of the profession, and its recruiting power in competition with other professions, as well as in light of length of training period, danger to health, and other matters such as the degree of individual responsibility involved. On that footing their conclusion was (see para-

graph 8 of the Report) that these 1936/1938 scales showed in two respects that they were too low even in 1939, and they said:

"We consider that unless conditions are substantially improved in both these respects, and on the basis of a pre-war value of money, the social and economic status and the recruitment of general medical practice would not, in the long run, be maintained."

The Committee then indicated what adjustments and new scales would have been requisite in 1939 in order to obtain that substantial improvement which they considered necessary for the maintenance of both economic status and recruiting power; but they still did so purely on the basis of a 1939 standard in respect of both these matters, and quite independently of the further adjustments they indicated would also be necessary to translate those new scales into such others as the subsequent change in the value of money and the subsequent increases in income of other professions would make requisite.

11. It is clear, therefore, that what the Committee were in effect saying was this. Our task is to determine "what ought to be the range of total professional income of a registered medical practitioner in any publicly organized service of general medical practice"; that is to say, not merely at some specific time, but generally for the future. The ranges we are to determine must also be such that they will enable both the proper social and economic status of general medical practice and its power of recruitment to be maintained, not only presently but in the future as well. We in fact do this by determining what would have been the proper scales of net remuneration necessary in 1939 to satisfy these last-mentioned requirements, including the future element in them, and we must then leave to others the problem of the necessary adjustment of these scales to present conditions. Therefore, what we determine is that the proper scales of net remuneration in a publicly organized service of general medical practice should at all times be calculated by reference to the 1939 standards we have laid down, and therefore should at all times be whatever are the then equivalents of those 1939 scales, that equivalence to be determined by two factors—namely, the subsequent change in the value of money and the subsequent increases in incomes of other professions; and it is only in this way that the two objectives of maintaining throughout the future both the proper economic status and recruiting power of general medical practice as against other professions will be achieved (see the last sentence of paragraph 6 of the Report).

12. It is submitted that this conclusion is amply confirmed by the fact that in their terms of reference there was a specific direction to the Committee to have due regard "to the desirability of maintaining in the future the proper social and economic status of general medical practice and its power to attract a suitable type of recruit to the profession." These words can only mean that it was the duty of the Committee, in framing their recommendations, to ensure the achievement of these two objectives not merely at the inception of the Service but indefinitely in the future. The words "in the future" are not subject to any limitation, and it would be contrary to common sense and to all sound appreciation of the meaning of language to subject them to some arbitrary limitation which is not contained in the terms of reference themselves.

13. It is further supported by the wording of their first and principal recommendation, which reads:

"(1) A scheme should be devised which will ensure that between 40 and 50 years of age approximately 50% of general practitioners receive net incomes of £1,300 or over, and which will also secure, so far as practicable, that between 40 and 50 years of age approximately three-quarters receive net incomes over £1,000, that approximately one-quarter receive net incomes of over £1,600, that slightly less than 10% receive net incomes over £2,000 and that, in a small proportion of cases, it is possible to obtain net incomes of at least £2,500. . . . Here also, as in the body of the Report, we are expressing our recommendations in terms of the 1939 value of money."

Since this recommendation was expressed on that basis, and also on the basis of 1939 circumstances in general, it

is obvious that the two objectives of status and recruiting power which the Committee designed that it should achieve throughout the future would not in fact be achieved unless the proposed scheme in fact contemplated periodical adjustments for changes in the value of money and incomes of other professions as and when substantial changes of that kind occurred. Throughout the body of the Report the Committee constantly make reference to these two objectives, and it is unthinkable that having deliberately expressed their recommendations in 1939 terms, and as being subject to adjustment to present conditions, the Committee did not intend that these 1939 scales should always be paramount, and so therefore would require to be translated from time to time into such different sums as any subsequent changes of the nature in question might from time to time require.

14. It is also helpful to refer to two other passages in the Report (although there are many others) which demonstrate that, in relation to the two expressed objectives, the Committee must have had in mind the necessity for continuing periodical adjustment of their figures in the light of subsequent changes in money values and increases in other professional incomes:

(1) In paragraph 13 of their Report, the Committee say:

"If the recruitment and status of the profession are to be maintained men must be able to feel that more than ordinary ability and effort receive an adequate reward."

How can that be secured if a reward once fixed in terms of money is permitted to depreciate in real value because the value of money itself has declined, or if no account is taken of increases in incomes of competing professions?

(2) In paragraph 14 of their Report the Committee say that they do not think it necessary that the percentage of incomes over £2,000 should be increased, but that they think it is certainly necessary that this percentage should be maintained. The £2,000 is of course expressed in terms of the 1939 value of money. How can the desired percentage of such incomes be maintained in the absence of adjustments to deal with the changes in the value of money as they from time to time occur?

15. Finally, on this particular aspect of the case, it should be pointed out that the Committee were well aware of the possibility of one type of periodical adjustment that might from time to time become necessary. That is, in connexion with the ratio of practice expenses, to which reference is made in paragraph 21 of their Report. There the Committee point out that their recommendations (on a 1939 standard) are in terms of net, not gross, incomes. In fact, right up to the present day the necessity for periodical adjustment in respect of practice expenses has never been anything but clearly recognized by the Ministers, and the amount of these practice expenses is of course bound to vary with subsequent changes in the value of money as and when such changes occur. The gross amounts payable to practitioners in fact incorporate two factors—namely, a reasonable sum to cover expenses, and the amount they are to receive net for themselves. It would indeed be an odd result if one factor is clearly to take account of all subsequent changes in the value of money and the other is not.

Interpretation Hitherto Adopted by the Parties Themselves

16. In the first place reference can be made to the written "pleadings" of both sides in the Danckwerts adjudication in 1952, when the adjudicator was asked to "determine the size of the Central Pool," not merely at the inception of the service but for all years up to date, the last completed year then being the year ended March 31, 1951.

17. In paragraphs 37 and 38 of their written case before the adjudicator the General Medical Services Committee asked the adjudicator to fix the size of the Central Pool for the nine months ending March 31, 1949, for the year ending March 31, 1950, and for the year ending March 31, 1951. In paragraph 24 (b) they specifically claimed that the amount of the Central Pool as previously fixed for each quarter of

a year was wrong, because it took no account of the extent to which the "betterment factor" varied from quarter to quarter. In paragraph 25 (1), where they state that the amount of the "betterment factor" is one of the points in dispute, they clearly implied that this factor might be different for the different years concerned. It is also clear from paragraphs 38 and 39 that the General Medical Services Committee were contending that the "betterment factor" should be adjusted year by year from the inception of the Service onwards in the light of changes in the value of money, just as the amount paid into the Central Pool in respect of practice expenses requires to be adjusted year by year in the light of evidence as to the proportion of general practitioners' gross receipts which is absorbed by practice expenses. We have been unable to find anywhere in the written case of the Ministers, or in the reported speech of the Attorney-General, any point at which this principle of periodical and continuing adjustment was controverted. The argument of the Government on this part of the case appears to have been confined to disputing the quantum of the adjustments which ought to be made, the suggestion of the Government apparently being that, if the remuneration of the professions generally fails to keep up with the fall in the value of money, the remuneration of the medical profession should not do so either (see the shorthand notes: the Attorney-General at day 3, pages 24 and 40, and Mr. Grant's observations on the fallacies of such an argument at day 1, page 10, and day 3, page 44).

18. In fact, in paragraph 8 of the Ministers' supplemental case (which was a reply to the Committee's main case), it was merely objected by the Ministers that it was not practicable to make an adjustment for "betterment factor" at such frequent intervals as quarterly. The objection in this form is quite inconsistent with the view that, whatever adjustment of the "betterment factor" was to be made, it was a once and for all adjustment, because it amounts to a tacit admission that periodical adjustments are in fact required.

19. Bearing in mind also that the adjudicator was asked to determine the size of the Central Pool for all years up to date, it is not without significance that, in paragraph 49 of their written case, the Ministers gave particulars of the periodical changes in the value of money during the period from July, 1948, up to December, 1951, and also in the Price Index figures from June, 1947, to December, 1951. In paragraph 56 (in relation to increases in incomes of other professions) they also gave the different increases for different dates. Surely these varying figures would have been put forward on the footing that a different "betterment factor" might be shown to apply to each of the separate years concerned in the adjudication.

20. An equally important admission is to be found in the evidence given by Mr. Danielli (Deputy Accountant-General to the Ministry of Health) at day 2, page 49, during his re-examination by the Attorney-General. He was dealing generally with the question of the method of calculating the amount of the Central Pool, and how it was to be done after the adjudication was over. He was asked to explain it in more detail and the answer he gave was:

"What I had in mind was this. After this adjudication was over and the adjudicator had given us a figure which he regards as an appropriate one for the Central Pool, then that figure would be taken as the basis of our pool payments and adjusted to take account of changes in the population year by year, adjusted at certain intervals which we should have to agree with the profession, because you cannot do this sort of thing every five minutes to take account of a major change in practice expenses and again at intervals to take account of any future major change in, shall we say, the value of money. That is what I think we had in mind."

21. That this was no slip on Mr. Danielli's part, but a completely accurate statement, is confirmed by the N.H.S. (General Medical and Pharmaceutical Services) Regulations, 1954 (S.I. No. 669 of 1954), and the March 31, 1955, edition of the Ministry of Health Handbook for General Medical Practitioners. In the case of general practitioners the major

part of their remuneration consists of a capitation payment. This may be enhanced by an additional capitation payment called a "loadings payment," and paragraph 1 of Part II of the First Schedule to those Regulations provides that the amount of both those capitation payments is to be determined by the Minister after consultation with the general practitioners' organizations. Paragraph 178 of the *Handbook* then states that these capitation payments are made out of the Central Pool, and it also states that the method of calculation of the Central Pool was revised as a result of the Danckwerts adjudication in 1952. Paragraph 179 of the *Handbook* then goes on to say that the Central Pool is now calculated on the basis of the net remuneration appropriate for general practitioners in 1939 (as recommended by their Spens Committee in 1946) *together with a betterment factor taking account of changes in the value of money since that time*. It also states that this amount is then adjusted to take account of changes in the number of general practitioners, their estimated practice expenses, their estimated remuneration from other sources, and the superannuation contributions made by the Exchequer. Paragraph 180 of the *Handbook* then goes on to say that, after the payments derived from the Central Pool have been made, any balance of money in the Pool at the end of each financial year is "distributed to doctors in proportion to their respective earnings by way of capitation fees and loadings"; in other words, by way of an additional capitation payment.

22. The significance of this is clear. The major ingredient in the total remuneration payable to each practitioner is obviously the capitation payment, whether general, "loading," or residual. But, since the actual amounts of these capitation payments are not specifically fixed by the Regulations and are payable out of the Central Pool, it must follow that their amount for any year will in the end always depend upon, and be conditioned by, the total amount of the Central Pool itself for that year. And since, as stated in paragraph 179 of the *Handbook*, the amount of the Central Pool itself for every financial year is now to be calculated for that year in accordance with the Spens recommendations of 1946 (including a betterment factor taking account of changes in the value of money since that time), it must equally follow that if and whenever such changes occur the amount of the Central Pool and consequently the capitation payments will change to a corresponding extent. This is therefore what is now publicly represented by the Minister in his *Handbook* to be the present position, and it is in complete accord with the profession's view, and contrary to the view expressed by the Minister at the meeting on August 1, 1956.

Interpretation Adopted by the Adjudicator

23. In his opening speech in the adjudication proceedings (day 1, page 4) Mr. Grant suggested that the Adjudicator might deal with the need for periodical adjustment by laying down a formula. To this the Government objected, but it is quite clear that the objection was not based on the contention that periodical adjustment is wrong in principle (see Mr. Danielli at day 2, page 49, and the Attorney-General at day 3, page 41). Mr. Grant returned to the point at day 3, pages 42 and 43. At the top of page 43 the Adjudicator says that he might have to indicate the appropriate betterment factor for a year earlier than the year ended March 31, 1951. Mr. Grant, agreeing, says that it would be a different figure, and the Adjudicator says: "That is what I had in mind." Thus the Adjudicator was asked (and without any objection from the Government) to indicate not only the appropriate betterment factor for the year ending March 31, 1951, but also that for an earlier year—that is to say, on the basis that this factor might be a different one for different years. This in fact was precisely the basis on which the Adjudicator proceeded in making his award, his betterment factor for the year ended March 31, 1951, being 100% and his betterment factor for 1948 being 85%. The Adjudicator's award is thus a clear and

binding decision, as between the Government and the medical profession, that on the true construction of the Spens Report it requires periodical adjustment of general practitioners' net remuneration in the light of any then changes in the value of money and the incomes of other professions.

24. The Government accepted the results of the adjudication; and as already indicated the current edition of the *Handbook for General Practitioners* (revised to March 31, 1955) states the present position with regard to the betterment factor as one which takes account of changes in the value of money since 1939.

Consultants and Specialists

25. It can now be fairly briefly demonstrated that continuing periodical adjustment of remuneration, in the light of changes in the value of money and changes in incomes in other professions, is also required by the Report of the Spens Committee on the Remuneration of Consultants and Specialists.

26. That Committee was appointed in May, 1947. It also was directed by its terms of reference to have due regard (*inter alia*) "to the desirability of maintaining the proper social and economic status of specialist practice and its power to attract a suitable type of recruit, having regard to other forms of medical practice." These words can only mean that it was the task of the Committee (as it was the task of the corresponding committee on the remuneration of general practitioners) to produce a long-term policy, and again the report of the Committee shows clearly that they addressed themselves to that task.

27. Here also the Committee were instructed to have due regard to what had been the financial expectations of consultant and specialist practice in the past, and they also began with statistics prepared under the guidance of Professor Bradford Hill as to the professional incomes of consultants and specialists in the pre-war period. Although they did not report until May, 1948, they also framed their recommendations in terms of the 1939 value of money, with an almost identical provision as to the adjustments that would be necessary in view of the change in money values and the increases in incomes of other professions. Thus, paragraph 2 of the report concludes with these words:

"We leave to others the problem of the necessary adjustments to present-day values of money, but we desire to emphasize as strongly as possible that such adjustments should have direct regard not only to estimates of the change in the value of money but to the increases which have in fact taken place since 1939 in incomes both in the medical and other professions. In our judgment it is only if corresponding changes are made in the incomes of consultants and specialists that the recruitment and status of the various branches of specialist practice will be maintained."

28. Here again the adjustments the Committee must have had in mind would be those for the time being necessary to maintain the 1939 standards they were laying down, because their recommendations are that all the various grades of practitioners with whom they are concerned "should receive" (which must mean should receive at all times during the existence of the Service) certain specified salaries, which were, however, expressed in terms of the 1939 value of money. It is impossible to give effect to recommendations framed in these terms without continuing periodical adjustment of the actual salaries for the time being paid if those salaries do not at that time properly represent the same salaries expressed in 1939 value of money. Moreover, this requirement must have been an inherent part of the Committee's recommendations, otherwise those recommendations would not have been consistent with the terms of reference of the Committee, because (1) they would have ignored the problem of maintaining the proper social and economic status of specialist practice and its power to attract a suitable type of recruit, and (2) they would have been inconsistent with the recommendations (by that time accepted by the Government) of the Committee on the remuneration of general practitioners. So far from ignoring

the need to keep a proper balance between general practitioners and consultants, the Committee had the point well in mind, as is apparent, for instance, from the second sentence of paragraph 11 of their Report.

29. In fact, the need for continuing periodical adjustments can be shown to be implied in the wording of the Committee's Report, and two examples may be sufficient for this purpose:

(1) In paragraph 9 of their Report the Committee say that in arriving at their recommendations for potential specialists they had in mind that intending specialists who do not possess private means should not be called upon to pass through a stage of comparative penury and hardship or be tempted to spend too much time in supplementing their income from other sources. How can these objectives be secured if the scales which the Committee have fixed are not subject to adjustment from time to time for changes in the value of money?

(2) In paragraph 12 of their Report the Committee justify a maximum figure of the order of £5,000 for clinical work by saying that "if the best possible recruits are to be attracted to specialist practice there must remain for a significant minority the opportunity to earn incomes comparable with the highest that can be earned in other professions." How can this opportunity be preserved if the cash remuneration of that minority of consultants and specialists is not adjusted by reference to changes in the value of money and the effect of such changes on the remuneration of other professions? And how in the absence of such adjustments would it be possible to achieve the Committee's declared object of maintaining the position of British medicine in a competitive market which the Committee pointed out includes the Dominions and the United States of America?

Conclusion

30. Having regard to all the above considerations, therefore, it is submitted that the profession's view on the vital point in issue is right, and that neither in the Reports themselves nor in any of the attendant circumstances in general can any support be found for the contrary view expressed by the Minister at the meeting on August 1, 1956.

EXECUTIVE COUNCILS ASSOCIATION (ENGLAND)

MINISTER AT ANNUAL MEETING

The annual meeting of the Executive Councils Association (England) was held on October 18 and 19 at the County Hall, London, under the presidency of Brigadier W. LESLIE, of Cornwall.

The Conference was addressed by the Rt. Hon. R. H. TURTON, Minister of Health, for the first time since his appointment. He said that when he arrived at his office he found piles of regulations, amending regulations, and amendments amending the amended regulations on every conceivable subject dealt with by executive councils, and a spring-cleaning operation was started to consolidate them. The changes were the result of long and detailed consultations with representatives of the professions engaged in the Service, and he thanked them for their help.

Referring to the conclusion of the Guillebaud Committee that the basic structure of the Health Service was sound, Mr. Turton said that the Government had accepted this conclusion, but, he added, the machinery should be improved. The Committee had acquitted the Health Service of any charge of widespread extravagance, but it was undeniable that the Service had suffered from the country's financial difficulties, and the finding that the level of hospital capital expenditure was well below the pre-war level should remove all complacency from the outlook. His own task was to repair the deficiencies of the Service at a time when the need to economize was greater than before.

The General Practitioner

Generally, continued the Minister, he made it a rule not to deal with questions of remuneration on these occasions, but because there seemed to be some widespread misunder-

standing about the doctor's pay claim he would do so. He then made the statement reported in last week's *Supplement* (page 167). He felt so strongly that the general practitioner was the pivot of the whole Health Service that he regretted that there should be any feeling that he was guilty of ingratitude.

The success of the home health service, Mr. Turton went on, depended on the clinical leadership of the general practitioner, who, for his success, required a team to help him. The key to that success lay in the relations between the general practitioner and other members of the team. The Cranbrook Committee was appointed to review the present organization of the maternity services, which were an example of the difficulty of making the services work as one.

Cost of Drugs

The examination of prescriptions for the first four months of this year showed that in every case there was an increase in cost compared with last year. In April, 1955, the average was 4s. 3½d.; in April this year over 4s. 7½d.

The Minister propounded four questions, the answers to which, if known, might help in finding a new approach to the problem. These were: Does the instruction and training of the medical student and young doctor sufficiently arm him to face the difficulties of present-day prescribing? What is the influence exerted by the hospitals, both on young doctors and on doctors established in practice whose patients are referred to hospital? Should more be done about pressure from patients? What about the pressure on the doctor of the modern methods of salesmanship which the drug houses bring to bear on him?

Health Service Through the Ages

Brigadier LESLIE, in his Presidential Address, first traced the concern of nations for the health of their peoples from the dawn of written history. Looking to the future in this country, he said that the cure of disease was often an expensive process to the nation, as regards both cost of treatment and loss of productive working hours. There was still a great deal of sickness-incidence which might be prevented. The general-practitioner service could, and would if it had the time, do much to educate the public in health matters. With a list of 3,000 patients the general practitioner had all he could do to attend to the immediate needs of his patients; he had no time to do more than the actual treatment demanded. He would like to see a considerable reduction in the numbers of patients for whom the general practitioner was responsible, subject to adequate financial adjustments. By giving more time to the general practitioner to instruct his patients in even the rudiments of preventive medicine, extra expense incurred by the financing of the Health Service would be more than offset by a decrease in the number of working hours lost through illness, and a considerable fall in the drug bill.

FEES FOR LOCAL AUTHORITY WORK

The Association has requested the Associations of Local Authorities to open negotiations on a revision of the part-time fees agreements of 1947 and 1951 on the remuneration for medical practitioners undertaking work for local authorities. It has now been agreed that these negotiations should take place in a special subcommittee of Committee C of the Medical Whitley Council, and the first meeting will be held during November.

The Ministry of Health has notified executive councils (E.C.L. 56/56) that members of executive council staffs who are Army reservists and are called up for service under the arrangements recently announced in Parliament should be regarded as eligible to receive the balance of civil pay under Section 46 of the Reserve and Auxiliary Forces (Protection of Civil Interests) Act, 1951.

PRIVATE PRACTICE

The Private Practice Committee of the Association met on October 17, when Dr. ALEXANDER BROWN, Linton, Cambridge, was re-elected chairman for the ensuing session. The Committee appointed Maritime, Forensic Medicine, G.M.C. Elections, and Private Beds Subcommittees.

Drugs for Private Patients

A joint meeting was arranged at the invitation of the General Medical Services Committee to discuss the matter of drugs for private patients. Action was initiated in connexion with various resolutions of the Representative Body. Problems arising from the medical examination of elderly drivers are to be discussed with the Accident Offices Association. The appropriate associations of local authorities are to be invited to consider the new scale of payments to practitioners called in by the police. Legal advice is to be sought concerning the responsibility for doctors injured while attending accidents.

Car Parking

A reply from the chairman of the expert committee on car parking in Central London to the representations made on behalf of the medical practitioners in the area was considered, as were other matters relating to traffic problems, including the use of special car labels and a report of the recent public inquiry in Wolverhampton at which the local profession had had legal representation provided by the B.M.A. It was decided that no immediate action was called for, but that the position in both areas should be watched.

Approved Schools

Information had been received from a number of medical officers of approved schools which led the Committee to decide to seek forthwith an increase of the remuneration for duties at these schools, which fall outside the scope of the National Health Service.

Hire Purchase Restrictions

It was reported that, as a result of representations made by the Association, the Board of Trade is to permit hospital patients to hire television sets for shorter periods than nine months.

Matters which are still under consideration by the Committee include the remuneration of medical officers of private and public schools, and the stamping of the names of private practitioners on National Insurance certificate forms.

GOVERNMENT MEDICAL OFFICERS
IN CYPRUS

PAY DISPUTE SETTLED

New salary scales for Government medical officers in Cyprus have been agreed upon between the Government of Cyprus and the Cyprus Branch of the B.M.A., with the concurrence of the Association's Overseas Committee. This ends a pay dispute between the B.M.A. and the Government of Cyprus which has been going on since 1951. Advertisements for posts in the island have been the subject of an *Important Notice* in the *Journal* since May, 1953.

The new salaries, which were introduced in September and are retrospective to January 1, 1956, are as follows: senior specialists, £1,900 (fixed); specialists and district medical officers, £1,452 by £48 to £1,644; medical officers class 1, £1,236 by £42 to £1,404 by £48 to £1,548; medical officers class 2, £900 by £30 to £1,020 by £36 to £1,200.

Expatriate officers receive an additional allowance of 20% of salary. Consulting practice is also allowed, and negotiations are still in progress on the proportion of fees which may be retained by the medical officer.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Senior Registrars and Consultant Appointments

SIR,—The subject of increased consultant appointments is certainly a very important one in which many of us are interested. However, it would be a pity if the real issues were obscured by Dr. Horace Joules's letter (*Supplement*, October 20, p. 163). My own experience, in the same hospital region as Dr. Joules, is that the patients' position is nothing like so black as he paints it. In most specialties patients are given early appointments and are admitted expeditiously. I could name several hospitals in which surgical patients are given a date for admission when they are first seen, and where it is exceptional for any patient (other than by his own personal choice) to wait longer than six weeks for even a minor operation.

The North-West Metropolitan Region is probably better supplied with hospital beds than any other region in the country. It may be that more beds are still needed in some areas for some specialties; but, by and large, the problems are due to having beds in the wrong places and also to the uneconomic and inefficient conditions under which many hospitals are compelled to work. Despite this, one is surprised to find how well many of these institutions are coping with their difficulties. Whilst not everyone would support the recommendations of some of the Ministry working parties (many of which had too little time to investigate the real problems of the areas they visited), I am sure that there are many hospitals which could provide more consultant posts. The late Mr. Philip Mitchiner (who was a member of one of the Ministry working parties) told me about the serious shortage of consultant staff in some of the hospitals he had visited. In particular, he mentioned many of the former county council hospitals, in which we agreed that much excellent work was being done under very great difficulties. I note that there are still shortages of staff in many of these hospitals, but I have always understood from the regional boards that their failure to make new consultant appointments was largely attributable to insufficient money being available. I cannot agree with Dr. Joules that the medical profession has resisted the making of new appointments. On the contrary, in all types of hospital and in all types of medical committee I repeatedly hear the strongest possible expressions of opinion about the need for more consultant staff in many branches. There is also widespread criticism of the tendency of the regional boards to secure labour on the cheapest possible basis.

Dr. Joules does singular disservice to his professional colleagues by the tone and gravamen of his letter. His imputations about part-time consultants and the Central Consultants and Specialists Committee are unworthy of the high position which Dr. Joules holds. I myself know many whole-time consultants who do far fewer hours of work for the hospital service than their part-time colleagues. But the conditions in various specialties are so different that it is often unwise to draw such comparisons. It is surely better to subdivide doctors (like the rest of mankind) into good, mediocre, and bad, and to admit that all varieties can be found everywhere. Fortunately, however, ours is still a profession with a high sense of vocation and sound traditions, and most of us try to do our best despite the discouraging conditions with which we are often faced.

The whole of Dr. Joules's letter, but especially the last paragraph, strikes one as sanctimonious and prejudiced. Surely, Sir, if any cynicism exists it is abundantly demonstrated in Dr. Joules's own letter?—I am, etc.,

Radlett, Herts.

R. S. MURLEY.

What is Excessive Prescribing?

SIR,—With reference to the points raised by Dr. P. R. Myerscough (*Supplement*, October 13, p. 155), I do not defend extravagant prescribing. My thesis is that extravagance in prescribing consists, in the main, in writing too many prescriptions and ordering unduly large quantities; and that the discriminating use of "expensive" drugs may, in the long run, prove an economy. "Costly" and "extravagant" are by no means synonymous terms, as the Treasury would have us believe.

With regard to the hospital figures, I remarked that the data were not conclusive, but they seemed to suggest a possible correlation between drug costs and length of stay which is worth fuller investigation. Dr. Myerscough's alternative suggestion may be correct, or may be a contributory factor—the data are not sufficient to decide one way or another. Hence the need for further analysis.—I am, etc.,

Horsham, Sussex.

F. F. MARCHBANK.

Admission to Hospital

SIR,—Dr. C. J. Cobbe's letter (*Supplement*, October 20, p. 165) seems to require some explanation from the emergency bed service. It is true that the E.B.S. is reluctant to accept cases from anyone other than the doctor who has seen the patient, 18 years of experience having shown that to do so results in confusion and difficulty. As the patient was not in hospital, the house-physician should have asked Dr. Cobbe to refer the case to the E.B.S. himself.

Our records show that the house-physician, to whom Dr. Cobbe refers, telephoned the service at 2.46 p.m. to ask for the case to be admitted to some other hospital. Our operator said that she must speak to the patient's doctor first, and at 2.48 p.m. she rang Dr. Cobbe's house. The number was engaged and she rang again at 2.51 p.m. and spoke to Mrs. Cobbe, who had no knowledge of the case. As the case clearly admitted of no delay the operator rang the hospital at 2.53 p.m. and decided to take on the case at once, even though it was not possible to speak direct to Dr. Cobbe. At 2.55 p.m. Mrs. Cobbe kindly rang the service to give information she herself had obtained from the hospital. The service then rang eight hospitals in turn, asking them to admit the patient, and the eighth accepted at 3.34 p.m. An ambulance was called, and at 3.43 p.m. Mrs. Cobbe was informed of what had been done. At 3.50 p.m. Dr. Cobbe rang the service and thanked it for its help.

The fact that it took over half an hour to find a bed, though to be regretted, was unavoidable, but, since the hospital which the patient had been attending apparently did not think that the urgency of the case warranted setting up an extra bed, the service could hardly insist on another hospital doing so. The service therefore made persistent inquiries until a hospital was found which would voluntarily accept the case. This is what took the time.

As to the extraordinary statement that a hospital "had to ask leave of the E.B.S. to take a patient into their own hospital," I can only say that it is wholly untrue.—I am, etc.,

G. F. ABERCROMBIE,

Chairman,

Emergency Bed Service Committee.

London, S.E.1.

SIR,—On reading the letter of Dr. C. J. Cobbe (*Supplement*, October 20, p. 165) and in fairness to the emergency bed service I should like to relate the following experience.

Early this year I was called to see a patient who showed signs and symptoms of a perforated duodenal ulcer. I phoned the E.B.S. from the patient's home asking for urgent admission. Before I had finished writing the letter to the hospital admitting officer the E.B.S. had found a bed at the local teaching hospital and had ordered the ambulance. On leaving the patient five minutes later I was met by the ambulance-men carrying the stretcher upstairs. In my experience this is not an isolated case of E.B.S. efficiency.

On the rare occasions when I have tried to get a patient admitted to hospital without calling on the E.B.S. there has

always been a delay of at least half an hour before the admitting officer could be contacted. In my opinion this is a waste of time, particularly as one can always state a preference for a particular hospital when giving the details to the E.B.S., which I consider a most useful institution.—I am, etc.,

London, W.8.

P. F. LISTER.

Remuneration Claim

SIR,—Dr. M. Curwen's letter on unity in the profession (*Supplement*, August 25, p. 110) should be heeded, but it does not analyse the causes of the situation. Although England is 13,000 miles and 5 months away from me now, recent reaction to the Minister's cunning manoeuvre shows that doctors labouring in the N.H.S. are still as I remember them—frustrated and jealous of each other. One of the few letters you have published from junior G.P.s was mine (*Supplement*, April 28, p. 251), and it may have prompted Dr. Curwen's comment that we "must realize that there is nothing new in having to make do on a small income in one's early years of practice." Surely we all accept that, but before 1948 one factor keeping the income small was the necessity for the purchase of a share of goodwill, and this did mean that after a while the conscientious and popular G.P. owned something of substantial value which had been and could be increased. Now the junior partner has to buy his way into a practice, in effect, by accepting a small share of the income and doing a large share of the work, but at the end of that stage he owns nothing but the right to employ a younger man in the same way. He cannot move to another town without starting at the bottom again.

Practitioners who were principals before 1948 feel, illogically but naturally, that the young partners are being given something for nothing. Incidentally, many laymen have told me they cannot believe that doctors in England are as poor as they claim when they see most of them driving expensive cars.

Young medical friends to whom I have written in the old country are highly impressed when they read that here G.P.s do operations, give anaesthetics, and take x-rays. To do so in the N.H.S. merely takes up time and increases expenses for no financial return. As a result, there is no comparison between the standards of general practice in the two countries.

Payment by service and the right to buy and sell goodwill are two basic essentials which will have to return to make the N.H.S. tolerable.

If any of your readers remain complacent, a brief taste of freedom in a country such as this would certainly change their views.—I am, etc.,

Victoria, Australia.

ARNOLD GEORGE.

Remuneration of S.H.M.O.s

SIR,—In my letter on S.H.M.O. remuneration (*Supplement*, October 20, p. 164) I stated that prior to 1954 the maximum salary of an S.H.M.O. was 70% of that of the consultant maximum. The figure should have been 64%, as the consultant maximum at that time was £2,750. The falling ratio in earnings has therefore existed since the inception of the scheme.

Dr. H. G. McGregor (p. 159) discovered in the S.E. Metropolitan Region that as many senior registrars become S.H.M.O.s as consultants. These well-qualified and well-trained recruits to the S.H.M.O. grade become dissatisfied when they realize that their more fortunate colleagues receive increments $2\frac{1}{2}$ times their own, and that as a result their salary ratio will fall from 75% to 64%.—I am, etc.,

Swansea.

J. H. THOMAS.

SIR,—I should like to congratulate Dr. J. H. Thomas on his masterly review of S.H.M.O. remuneration (*Supplement*, October 20, p. 164). He has lucidly exposed the injustice of the present salary scale, which lets a young S.H.M.O. start on a salary amounting to 75% of a consultant's of the same age, and yet after ten years' experience awards him

D. R. THOMPSON.

present. The following films were shown at the conclusion of the business: "Nephrosis in Children," "An Effective Burn Treatment," "Gait," "How to Catch a Cold."

2703

OPHTHALMIC GROUP COMMITTEE

The first meeting of the new session of the Ophthalmic Group Committee was held on Friday, October 12. Mr. O. GAYER MORGAN was re-elected chairman of the committee, and he welcomed two new members, Mr. Ramsay Garden and Mr. J. Gibson Moore. The chairman was reappointed representative of the committee on the Central Consultants and Specialists Committee, and Mr. W. H. Whiting as representative on the Central Medical Recruitment Committee.

Information to Opticians

The committee considered a request that opticians should be supplied by the hospital ophthalmologist with information about the diagnosis and disposal of cases referred by them to hospital through the patient's family doctor. If such information could be supplied, should the prior consent of the patient be obtained? It was reported that the Central Ethical Committee had considered the matter and come to the conclusion that it would be essential to obtain the consent of the patient and the ophthalmologist before steps were taken to transmit the relevant information to any optician, and failure to adopt this procedure would be highly unethical. A second point to be considered was the burden and expense to the hospital service of writing two letters for every patient. It was pointed out that only the general practitioner could refer a patient to hospital and that the ophthalmic specialist should reply only to the general practitioner, who presumably would exercise his discretion with regard to the optician who had referred the case to him. It was agreed to inform the Ethical Committee accordingly.

Sight-testing of Dependants of Service Personnel

The Committee heard with satisfaction of the proposal of the Ministry of Health that in future the Supplementary Ophthalmic Services machinery should be available to dependants of Service personnel who had been given sight tests by Service ophthalmologists not on ophthalmic lists and who wished to obtain glasses from civilian opticians subject to the conditions and charges applying to the Supplementary Ophthalmic Service. Special forms generally similar to O.S.C.2 (but different in colour) would be issued to ophthalmologists by the Service departments, who would indicate the Service authority for paying claims. The executive council should check the claim forms in the normal way and forward them for payment to the appropriate command or unit. The applicant would pay the optician a charge similar to that authorized by the National Health Service Act, 1951, but O.S.C.15 should not be used for a receipt. The Service ophthalmologist was to be advised of the general conditions which would apply to the testing of sight and the supply of glasses in the National Health Service. It was not anticipated that there would be many cases falling under these arrangements, which would, at the outset, be confined to dependants of men in the Army and Royal Air Force.

Procedure for Investigation of Complaints

It was reported that the Minister of Health had recognized the British Medical Association and the Faculty of Ophthalmologists jointly as an organization for the purpose of making the appointment of ophthalmic medical practitioners to ophthalmic investigation committees. It was also stated by the Ministry that it was likely that these committees would be reappointed annually.

Flat Lenses

It was reported by the Ministry of Health that most of the manufacturers of flat spectacle lenses had announced their intention to cease production of these lenses on September 30, and that the Ministry was going into the

matter with a view to deciding the best method of providing for the change without waste of existing stocks of flat lenses or causing inconvenience to the public and others. The views of the Group were asked for in view of the possible effect of the development on prescribing by ophthalmic medical practitioners. As there appeared to be no adequate alternative source of supply arrangements were being discussed on the assumption that curved lenses would ultimately be provided under the National Health Service, except when flat lenses were advantageous to the patient. Steps were being taken to even up the stocks of prescriptions available, and an amended statement of fees and charges would be issued to come into operation at an appropriate date.

At its last meeting the committee considered a draft revised O.S.C.2 form and put forward various suggestions to the Ministry, some of which had been accepted.

COLLEGE OF GENERAL PRACTITIONERS

MEMORANDUM ON MATERNITY SERVICES

The Council of the College of General Practitioners has submitted a memorandum to the departmental committee of inquiry into the maternity services in England and Wales (the Cranbrook Committee). The College's evidence was prepared by a special committee under the chairmanship of Dr. ANNIS C. GILLIE.

The tenor of the memorandum is that the maternity services would be co-ordinated and improved if general practitioners were encouraged, and given the opportunity, to assume greater responsibility for pregnant women. Views on administrative arrangements are not expressed, the council stating that it has concentrated upon the ways in which the general-practitioner obstetricians can most help their patients clinically.

Recommendations

The closely reasoned arguments conclude with the following recommendations:

That if the family doctor does not wish to attend his patient during delivery he should himself make the necessary obstetric arrangements, and keep in touch with the mother before and after the baby is born.

That in order to maintain their skill general-practitioner obstetricians should be able to admit their patients to hospital and attend them there, with consultant advice whenever this is required. Maternity units with general-practitioner beds should be established where they are lacking.

That the staffing of local health authority antenatal clinics should be by general-practitioner obstetricians; and that health visitors and midwives should attend antenatal and post-natal sessions conducted by doctors in their own surgeries. Further thought should be given to the development of educational and training facilities at local health authority antenatal clinics.

That young practitioners who have not had the benefit of a resident hospital post in obstetrics should be encouraged to achieve obstetric skill by all other possible means.

That particular attention should be directed to schemes which involve admitting patients to hospital for delivery and returning them to their own homes during the next few days.

That an obstetric record card should be used by general practitioners.

That integration of the three parts of the maternity service, which is vital to the interests and security of the mother, should be secured by the family doctor, and that opportunities for his or her contact over patients with the midwife, health visitor, and specialist obstetrician should be developed in every possible way.

TRAINING OF HOME NURSES

A committee is to be set up to consider schemes for the training of home nurses to be submitted by all the training bodies, and to advise the Minister of Health whether he should approve them. In announcing this plan at the annual general meeting of the Queen's Institute of District Nursing held in London on October 30, the Minister said that such schemes would have to be of a minimum length of four months, or three in the case of nurses having certain qualifications and experience. Nurses trained under approved schemes will receive certificates to that effect.

The Minister said he believed one effect of this policy would be that a number of nurses not at present able to get training, because they were employed by local authorities who were neither members of the Institute nor served by associations affiliated to it, would now be able to attend courses approved by the advisory committee. He recalled the Working Party's report on the training of district nurses (see *Supplement*, September 10, 1955, p. 63), which stated that about half the registered nurses in the home nursing service had had no special district training.

Proposing a vote of thanks to the Minister, Mr. A. H. M. Wedderburn, chairman of the general executive committee of the Queen's Institute of District Nursing, said that he had "sounded the death-knell of one of the most cherished ideals of the Queen's Institute." Their earnest hope had been that there should be officially recognized a single and high national qualification for the district nurse. He deplored the fact that there was to be an officially blessed alternative—a "semi-processed article"—to the Queen's training. He reaffirmed the opinion expressed in the minority report of the Working Party, signed by members of the Queen's Institute, that the shorter courses recommended in the majority report were insufficient fully to equip the district nurse without the omission of one or other essential aspect of the minimum content of training agreed to in the majority report.

N.O.T.B. ASSOCIATION

At a meeting of the Council of the National Ophthalmic Treatment Board Association, held on October 12, it was agreed that more should be done to keep the general practitioner fully informed of the facilities available under the supplementary ophthalmic service, particularly the medical eye centres sponsored by the association.

The council received a satisfactory report on the inspection of three N.O.T.B. medical eye centres. These inspections are carried out from time to time by the medical appointments committee without prior notification.

TRADE UNION MEMBERSHIP

The following is a list of local authorities which are understood to require employees to be members of a trade union or other organization:

Metropolitan Borough Councils.—Fulham, Southwark.
Non-County Borough Councils.—Crewe.

A Ministry of Health memorandum (H.M.(56)86) to hospital authorities explains that resident and non-resident hospital staff, if not exempted, are liable to pay the prescription charge for drugs and dressings supplied by the hospital unless they are admitted as in-patients. It is stated, however, that no charge should be made if drugs are administered on the hospital premises as part of immediate treatment to staff who have an accident or become ill on duty; but if further supplies are needed for follow-up treatment at home or in residential quarters the charge becomes payable.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

The Thinking Public

SIR,—Surely it is time that the politicians and the general public realized that the health scheme is functioning comparatively well only through the unflagging efforts of the grossly underpaid hospital staff and the determination of the general practitioners not to allow the work to overcome them.

On being informed one morning by a frequent attender that she had been waiting half an hour in my surgery, I remarked that general practitioners were overworked and underpaid. After careful consideration of my question as to how much she thought we were paid per patient per year, she replied £10 to £12. Such a reply certainly surprised me, so during the course of the following week I asked the more intelligent patients what they thought a G.P.'s remuneration per patient per year was, and the lowest estimate given was £5 to £6 and the highest (on two occasions) was £20. My hairdresser, who said he could do 100 haircuts on a busy day, thought we received £6.

Further inquiries revealed that some patients thought we were paid for each visit and consultation, and others that, in addition to our capitation fees, etc., the benevolent Government paid for our cars, petrol, dispenser, receptionist, and cleaner.

Taking into consideration the overall number of visits and consultations given each patient yearly, 30s. would, in my opinion, be very reasonable indeed.—I am, etc.,

Chesterfield.

K. E. McIVER.

Keeping Up With the Times

SIR,—The Joneses are out of sight. The Government publication *Annual Abstract of Statistics* published recently shows that wages have increased between 1938 and 1955 from £1,920 million to £6,750 million, an increase of approximately 250%, and salaries from £910 million to £3,380 million, a matter of approximately 266%. We may make *The Times* newspaper a present of its figure of 137% as our own increase, and still say that justice has not been done to us.—I am, etc.,

Launceston, Cornwall.

DONALD M. O'CONNOR.

Recruitment to the Dental Profession

SIR,—The report of the Committee on Recruitment to the Dental Profession will be welcomed by many concerned with dental education and practice as a valuable contribution towards the solution of a problem of great public importance. It is, however, regrettable that a little more space was not devoted in the report to the various steps taken to raise dentistry from a trade to a profession in the nineteenth century. Undue compression is probably responsible for statements (appendix VIII, page 60) that are misleading if not quite contrary to fact.

Without minimizing in any way the enormous influence exerted by Sir John Tomes, it would be unjust and historically quite untrue to neglect the contributions of his colleagues. Among the most prominent of these were Sir Edwin Saunders, W. A. Harrison, and T. A. Rogers, all of whom played quite as great a part as Tomes in the foundation and management of the Odontological Society and the Dental Hospital of London. Saunders in particular must be regarded as the "father" of the Dental Hospital of London, and in the sphere of professional organization and educational work his importance is not less than that of Tomes.

The Dental Hospital of London (now the Royal Dental Hospital, not the National Dental Hospital) owed its foundation in 1858 to the Odontological Society, one of

the original aims of which was to establish a dental hospital and school. The Dental Hospital of London opened on December 1, 1858, and the London School of Dental Surgery on October 1, 1859. The National Dental Hospital and School (now University College Hospital Dental School) was not opened until November 11, 1861. It arose out of the Metropolitan School of Dental Science (founded October 5, 1859), which was in turn the protégé of the short-lived College of Dentists in England (founded February 14, 1857). The College of Dentists in England represented one of the two rival groups working towards dental reform in the middle of the nineteenth century, the other being the Odontological Society. In 1863 the College of Dentists, lacking sustained support, amalgamated with the Odontological Society.

If any institution can be regarded as the true precursor of the Dental Hospital of London it is the London Institution for Diseases of the Teeth, founded by Edwin Saunders, W. A. Harrison, and James Snell in 1840. The history of this Institution is obscure, but it lasted for about 12 years and there is definite evidence that it received pupils.² A London Dental Dispensary, established in Clarence Gardens, Regent's Park, in 1855 by Charles James Fox, did good work for some years, but there is no evidence that it served in any way as a teaching centre.

There is no doubt whatever that the first dental hospital (as distinct from small and short-lived dispensaries) was the Dental Hospital of London, and that the first dental school, with a regular curriculum and full facilities for clinical instruction, was the London School of Dental Surgery. These two institutions are now represented by the Royal Dental Hospital and School of Dental Surgery (University of London), the hospital being one of the constituent hospitals of the St. George's Hospital Board and the School being a school of the University of London.

One other point which I might mention here: in appendix III of the report, the number of students shown as qualifying in the year 1953-4 from the Royal Dental Hospital is given as "nil," whereas in fact the number was 62, comprising 61 L.D.S., of whom 15 also graduated B.D.S., and one B.D.S. These figures of degrees and diplomas are available in the Returns of the University Grants Committee.—I am, etc.,

London, W.C.2.

C. BOWDLER HENRY,
Chairman of the School Council,
Royal Dental Hospital of London.

Present State of Practice

SIR,—Your correspondent Dr. R. B. Tulk-Hart (*Supplement*, October 20, p. 164) is anxious about the National Health Service, and encourages doctors to express their views on paper. As a doctor in general practice who qualified since the appointed day, I find I differ from him on all points.

(1) The N.H.S. may be a political pawn, but this does not degrade the medical profession itself, which can still maintain its own standards without political interference. (2) There is in fact a strong incentive to use one's skill and knowledge in general practice, which is a branch of the profession which can utilize both. Financial incentive is not the only one, and a doctor's special interests can usually be indulged if he chooses to see his patients by appointment. (3) I think the statutory forms are designed to cause the doctor the minimum of trouble. His private forms are left to his discretion to issue or not in any form he chooses. (4) There should be no tendency for the public to dictate to the doctor. A doctor who allows his patients to dictate to him has only himself to blame. (5) Any lowering in status of the individual doctor would be as much the fault of the individual doctor as anyone else.

The charge that the National Health Service encourages the cossetting of minor illnesses, and thereby has an adverse

effect on the moral fibre of the people, is a serious one. If by cossetting is meant that the patient is encouraged to seek advice early for minor symptoms, this is surely an excellent thing which has always been encouraged by the profession. If by cossetting is meant the exhibition of elegant placebos and unnecessary certificates, this would quickly help to turn the surgery into a busy sorting office.

At present there is some incentive to listen attentively, examine thoroughly, and treat adequately. Particularly does this apply to the anxiety problems which occur in various disguises in connexion with most illnesses. Inadequately handled, they will develop into more serious neurotic conditions and provide the bulk of practice work. Properly treated, the patient may remain at work and develop sufficient insight for symptoms to disappear, or at least become tolerable. An approach of this sort, which takes the patient's personality into account, does not absolve the doctor from making a thorough physical examination and making any necessary investigations. It does not therefore make him liable to miss symptoms of organic disease. It does mean that he is less likely to miss symptoms of neurosis which, untreated and unconsidered, will quickly breed chronic patients returning week after week to fill the waiting-room.

I believe the task of keeping as large a number of people as possible as well as possible to be useful work, and is the type of work which is practised in and encouraged by the National Health Service.—I am, etc.,

London, N.W.1.

J. MARK HODSON.

Filling of Practice Vacancies

SIR,—Under the present system, applications are received by the local executive councils, who prepare a short list, interview selected candidates, and choose the successful person, whose name is sent to the Medical Practices Committee in London.

A much fairer method would be for applications to be sent in the first place to the Medical Practices Committee in London, who would prepare a short list which could be sent to the local executive council; the latter would interview the candidates advised by London, and make its selection. This would put an end to the canvassing and lobbying that goes on at present, as each candidate's application would receive an impartial scrutiny without any local prejudice or favouritism. It is of fundamental importance that justice should not only be done but should manifestly be seen to be done.—I am, etc.,

Leeds, 7

ISAAC ROSE.

Compensation

SIR,—I feel that the subject of "compensation" for loss of goodwill has dropped out of the picture while we are bargaining with the Minister for a fair remuneration. There is a danger that this may be allowed to go by default, and I beg to bring the following facts to your attention.

A large number of ex-Service doctors somehow found money in 1946 to re-establish themselves in general practice. Let us assume the average amount paid for a practice to be £3,000—i.e., 14 years' gross income. Even accepting the Danckwerts betterment figure of 100% (which is out of date), such a practice would represent a capital asset of £6,000; in other words, there would have been a capital gain of £3,000 on which no tax would have been paid. Instead a paternal Minister has provided us with an "income" of some £80 per annum, from which tax has been deducted at the source.

There can surely be no other section of the community with whose money a Government department has played ducks and drakes with such disadvantage to the recipients. I would strongly urge consideration of the following points. (1) The application of a betterment factor to the compensation figure. (2) The immediate payment of the whole sum to any practitioner taking in a partner and thereby diminishing his income. (3) The provision of a realistic value of

interest on the money that is being withheld by the Minister. In these days it is foolish to consider 2½% as bearing any true relationship to money on loan.—I am, etc.,

I. M. SEGAL.

Seven Kings, Essex.

Emergency Call Service

SIR,—May I express my astonishment at the "concern" of the General Medical Services Subcommittee (Scotland) at their recent meeting, lest the emergency call service be developed in Scotland (*Supplement*, October 27, p. 171)? Is it because changes are distasteful to us conservative-thinking Scots? If not, what are the real objections to such a scheme?

From previous letters published in the *Supplement* it would appear that the London practitioners connected with the scheme are satisfied that it favours everyone concerned: (1) the public, who often, when the occasion might justify a night call, refrain from disturbing their doctor, (2) the practitioner, who would have more leisure and thereby provide more efficiency in his work, and (3) the doctor on call, who might find such duties suitable to his temperament or circumstances or both.

In my humble opinion, it is only a question of time before a readjustment of our working conditions takes place. If we do not bring about changes ourselves, they may be forced on us; nay, we may even clamour for outside intervention, with all its attendant disadvantages.—I am, etc.,

JOSEPH VERRICO.

Glasgow.

Admission to Hospital

SIR,—I read with interest Dr. C. J. Cobbe's letter (*Supplement*, October 20, p. 165), and, while agreeing that this particular case was unfortunate, would like to state my appreciation of the services given by the emergency bed service.

I also remember the days of "common-sense independence" of the past; when I, or my wife, would spend an hour or more at the telephone trying to admit a patient to hospital. I count the E.B.S. as one of the great blessings of present-day general practice. For years I have not had a single refusal for admission, provided I have given a full history of the case in question. Their staff is always courteous and helpful; indeed, it is a pleasure to hear their voices, and in cases of great difficulty the doctor in charge has always managed to arrange things.

In my opinion the E.B.S., the district nurses, the local laboratories, who will often assist with an occasional investigation, and the casualty officer, through whom one can by-pass the long waiting-lists of the out-patient departments, help to make general practice enjoyable.—I am, etc.,

I. J. SACHS.

London, N.W.3.

Technicians' Remuneration

SIR,—I am in complete agreement with every word of Dr. Duncan Irving's letter (*Supplement*, October 13, p. 157) and would like to emphasize the dependence of the medical profession, and particularly the radiologists, on the radiographers. I know that approaches have been made by the radiological societies and the appropriate branch of the British Medical Association, but no reply has ever been received except that "it is in the hands of the Whitley Council." This is quite inadequate, as no real improvement in radiographers' remuneration has ever been made.

There are two further points I would add. First, the retiring age for radiographers is 60, whereas that of nurses and other technicians is 55. This is grossly unfair, as a radiographer's work is extremely responsible and exhausting. Secondly, radiographers are required to be available for emergencies at a rate of pay which is inferior to that of any other grade of hospital employee. Dr. Irving's statement that a campaign for improvement in technicians' salaries should take precedence over any medical remuneration claim is timely and excellent, and I hope that the medical profession will enthusiastically adopt this suggestion.—I am, etc.,

GRACE BATTEN.

London, S.W.10.

Cost of Prescribing

SIR,—Certain aspects of the present drug bill of the N.H.S. would seem to warrant more publicity than they appear to have received hitherto.

Many G.P.s, some of them established in practice for several years, have told me that they have no notion of the cost of the ordinary dressings and drugs as well as the antibiotics, etc., that they prescribe daily. Those of us who are dispensing G.P.s know these costs only too well. Surely it would be worth while to emphasize them to prescribing G.P.s more clearly than at present.

One seldom sees mention of the saving to the Ministry of National Insurance effected by expedited recovery of patients through the use of antibiotics, etc., which saving frequently amounts to many times the cost to the N.H.S. of seemingly expensive remedies. This saving might well be brought to the notice of the politicians.

More publicity should be given to the lot of the needy patient, whether old-age pensioner or otherwise, who is not in receipt of outdoor assistance and at present has to pay the 1s. prescription tax and will presumably have to pay the proposed new additions as well.

It appears to be taken for granted that dispensing G.P.s will shoulder the additional clerical work of more complicated tax-collecting (with still no remuneration or thanks).—I am, etc.,

Desford, Leicestershire.

B. W. THOMPSON.

Remuneration of S.H.M.O.s

SIR,—Dr. J. H. Thomas (*Supplement*, October 20, p. 164) clearly expounds the basis of the dissatisfaction of S.H.M.O.s with their salary scale. It can do no harm to reiterate that not a small minority but some 33% of the specialist service of the country comprises this grade, in which increasing experience is rewarded by diminishing returns relative to our consultant colleagues' scale, and in which the incremental rate of £50 per annum is the lowest of any grade in the hospital service. Theoretically, all S.H.M.O.s are eligible to apply in open competition for consultant appointments, but the majority are fully aware that their present appointments represent, for them, the end of the road. It must be evident that such a prospect, under present conditions, is bound to be a matter of grave concern.

All the disadvantages inherent in the whole-time consultant post apply equally to the S.H.M.O., and those part-time consultants who have recently had experience of the iniquities of Schedule E will readily appreciate what a large difference in financial outlay on telephone and car expenses, etc., this makes. The present mileage allowance, which, I believe, was fixed when petrol sold at 3s. 9d. per gallon, is said to be adequate, on figures supplied by the national motoring organizations. Does this, however, take into account the fact that the whole-time man can claim mileage from home to base only for emergencies and where an official journey from base is made the same day, and then at a reduced rate, whereas the part-time man can claim for every journey at the full rate? Does it, either, take into account the fact that no allowance against income tax on capital depreciation is made to the whole-time specialist?

In addition, we are debarred from merit awards and from private practice, and our first eight domiciliary visits each quarter carry no fee, although there can be few S.H.M.O.s who are asked to do more than eight such visits per quarter. We cannot combat any rise in the cost of living by raising private fees.

The Annual Representative Meeting has adopted the resolution that the S.H.M.O. scale should be 80% of the consultant scale at all points (*Supplement*, July 14, p. 43). This we regard as demanding of urgent implementation before the main remuneration claim of the whole profession is finalized. If the S.H.M.O. scale is not so related by ratio, we fear that the gap between it and the consultant scale will grow wider still. The A.R.M. also adopted two

resolutions of importance to S.H.M.O.s. The first of these (p. 45) urges the abolition of the eight unpaid domiciliary visits. The second, proposed by Mr. Lawrence Abel (p. 49), states: "All medical grades of so-called 'whole-time' hospital staff should be allowed to pursue the practice of their profession in their off-duty hours." This principle, if implemented, would go far towards preventing the introduction of a full-time salaried service for the whole profession, and might possibly furnish grounds for the escape of the whole-time man from Schedule E.

What the members of the S.H.M.O. group of the B.M.A. would like to see is some indication that the deliberations of the A.R.M. are of some influence in improving their lot. Such indication is badly needed to counteract the growing cynicism of the "have-nots" of the profession.—I am, etc.,

Newport.

R. VERNON JONES.

Branch and Division Meetings to be Held

ALDERSHOT AND FARNHAM DIVISION.—At Farnham Hospital, Thursday, November 15, 8.15 p.m., clinical meeting.

BIRMINGHAM DIVISION.—At 154, Great Charles Street, Birmingham, Thursday, November 15, 8.30 p.m., joint meeting with British Dental Association.

BLACKBURN DIVISION.—At White Bull Hotel, Blackburn, Tuesday, November 13, 8.15 p.m., meeting. B.M.A. lecture by Dr. J. H. Cyriax: "Manipulative Medicine."

BLACKPOOL AND FYLDE DIVISION.—At Savoy Hotel, Blackpool, Wednesday, November 14, 7.15 p.m., dinner; 8.30 p.m., lecture by Sir Zachary Cope: "Regional Diagnosis of Acute Abdominal Disease."

BROMLEY DIVISION.—At Farnborough Hospital, Wednesday, November 14, 8 p.m., meeting. Clinical discussion to be introduced by Dr. J. D. S. Hill and Dr. D. I. Williams: "The Mind and the Skin."

CROYDON DIVISION.—At 43, Wellesley Road, Croydon, Tuesday, November 13, 8.30 p.m., general meeting. Address by Dr. W. G. Oakley: "Virtues and Vices of Some Modern Therapeutic Preparations."

EAST HERTS DIVISION.—At Hertford County Hospital, Thursday, November 15, 8.30 p.m., clinical meeting.

EAST YORKSHIRE BRANCH.—At Quern House, 68, Park Street, Hull, Wednesday, November 14, 8.30 p.m., meeting. Lecture by Dr. W. R. Bett: "An Alcoholic Excursion Through the Ages."

ENFIELD AND POTTERS BAR DIVISION.—At Robin Hood, High Street, Potters Bar, Friday, November 16, 8 for 8.45 p.m., meeting. Clinical papers by Dr. E. W. W. Ellis: "Warts"; Dr. J. C. Henry: "Morbus Cordis—Two Interesting Cases"; Dr. R. B. L. Ridge: "Relaxation in Labour."

GUILDFORD DIVISION.—At Royal Surrey County Hospital, Guildford, Thursday, November 15, 8.30 p.m., meeting. Lecture by Dr. F. E. Camps: "Drink and the Driver."

HENDON DIVISION.—At Hendon Hall Hotel, London, N.W., Tuesday, November 13, 8.45 p.m., meeting. Dr. R. A. J. Asher: "See How They Come"—Roundabout Presentations of Illness.

HUDDERSFIELD DIVISION.—At Board Room, Huddersfield Royal Infirmary, Monday, November 12, 8.15 p.m., general meeting.

ISLE OF WIGHT DIVISION.—At St. Mary's Hospital, Newport, Sunday, November 18, 3 p.m., joint meeting with Isle of Wight Pharmaceutical Society. Subject: "Common Problems." All members of the medical and pharmaceutical professions are invited.

KINGSTON-ON-THAMES DIVISION.—At Nurses' Home, Kingston Hospital, Tuesday, November 13, 8 for 8.30 p.m., meeting. Address by Mr. Wylie McKissock: "Intracranial Haemorrhage and Thrombosis."

LEIGH DIVISION.—At Courts Hotel, Church Street, Leigh, Tuesday, November 13, 8.30 p.m., annual general meeting. Address by Dr. J. A. Finnigan: "'Transithal' in Dental Anaesthesia."

LEWISHAM DIVISION.—At Hither Green Hospital, Sunday, November 18, 10.30 a.m., clinical meeting.

MANCHESTER DIVISION AND MANCHESTER LOCAL MEDICAL COMMITTEE.—At Midland Hotel, Manchester, Wednesday, November 14, 8 p.m. to 1 a.m., medical dinner-dance.

NUNEATON AND TAMWORTH DIVISION.—At Red Lion Hotel, Atherstone, Tuesday, November 13, 8.45 p.m., supper meeting. Two short films followed by a talk by Dr. W. Williams: "Antibiotics."

REIGATE DIVISION.—At Redhill County Hospital, Tuesday, November 13, 8.30 p.m., meeting. Dr. D. A. Robertson: "Hypertension." He will open a discussion on the treatment with hypotensive drugs and other methods.

SCARBOROUGH DIVISION.—At Board Room, Scarborough Hospital, Thursday, November 15, 8.30 p.m., meeting. Special B.M.A. lecture by Dr. R. H. Mole: "Radiation and Living Things."

SHROPSHIRE AND MID-WALES BRANCH.—At Board Room, Royal Salop Infirmary, Shrewsbury, Wednesday, November 14, 8.30 p.m., meeting of Clinical and Pathological Section. B.M.A. lecture by Dr. R. Bodley Scott: "Diagnosis and Treatment of the Anaemias."

SWINDON DIVISION.—At Goddard Arms Hotel, Swindon, Wednesday, November 14, annual dinner and dance.

WIGAN DIVISION.—At Haigh Hall, Wigan, Wednesday, November 14, 7.30 for 8 p.m., annual dinner and dance. Non-medical guests invited by members will be welcome.

WILLESDEN DIVISION.—At Physical Medicine Department, Willesden General Hospital, Harlesden Road, N.W., Friday, November 16, 9 p.m., general meeting. Dr. S. Left: "Medicine in the U.S.S.R." (illustrated). Members of Wembley and Hampstead Divisions are invited.

Meetings of Branches and Divisions

DUMFRIES AND GALLOWAY DIVISION

The annual general meeting was held at Ernespie House Hotel, Castle Douglas, on June 24, 1956. Dr. J. Watson was in the chair and 10 members and what the minutes record as "four adherents" were present. The following officers were appointed for 1956-7:

Chairman.—Dr. R. N. Rutherford.
Vice-chairman.—Mr. J. Neilson.
Honorary Secretary, Treasurer, and Public Relations Officer.—Dr. J. B. Wilson.

The secretary of the Danish Society in Scotland, Mr. Lauritz Hvas, gave an address on "Social and Health Services in Denmark." Two films on the treatment of acute respiratory paralysis in cases of poliomyelitis were shown.

NORTH LANCASHIRE AND WESTMORLAND BRANCH

The seventh annual meeting was held at Preston on June 7, 1956. The following officers were elected for 1956-7:

President.—Dr. R. M. Corbet.
Vice-presidents.—Dr. W. A. Simpson and Mr. J. McFadzean.
Honorary Secretary and Treasurer.—Dr. John Wilkie.

Dr. Corbet in his presidential address spoke on "Midwifery—Past and Present."

NORTH WALES BRANCH

The 107th annual meeting was held at the Imperial Hotel, Llandudno, on May 31, 1956. Dr. Ivor H. Davies was in the chair and 32 members were present. The following officers were elected:

President.—Dr. A. Maddock Jones.
President-elect.—Dr. K. Evans.
Honorary Secretary and Treasurer.—Mr. A. H. Holmes.
Joint Secretary.—Mr. W. Macfarlane.

The president gave an address on "Cerebrospinal Fever," which was followed by a discussion.

SWANSEA DIVISION

The annual meeting was held at the Swansea Hospital on June 7, 1956. Dr. Joan C. Owen was in the chair and 32 members were present. The following officers were elected:

Chairman.—Dr. I. P. G. Howells.
Vice-chairman.—Dr. H. William Howell.
Honorary Senior Secretary and Treasurer.—Dr. Idwal Pugh.
Honorary Junior Secretary.—Dr. W. O. Williams.

SUPPLEMENT TO THE BRITISH MEDICAL JOURNAL

LONDON SATURDAY NOVEMBER 17 1956

Proceedings of Council	187	H.M. Forces Appointments	194
Tax Assessment of Part-time Consultants	194	Association Notices	194

British Medical Association

PROCEEDINGS OF COUNCIL

The Council of the British Medical Association met at B.M.A. House on November 7, Dr. S. WAND, Chairman of Council, presiding.

The CHAIRMAN, referring to the absence of Dr. E. A. Gregg, late Chairman of Council, made a sympathetic reference to Dr. Gregg's tragic bereavement.

Later in the meeting Dr. I. D. GRANT, chairman of the Representative Body, said that members of Council would have felt a very deep personal loss by the death of Miss Gregg. It had been suggested that it would be fitting to have some small memorial to her in the House in recognition of her valuable service to the Association, as the Chairman's lady for the past seven years. The Council unanimously decided to associate itself with this proposal, and the details were left to be arranged by the Office Committee.

The CHAIRMAN also referred to the absence of Dr. A. Talbot Rogers, chairman of the General Medical Services Committee, who had had an operation. He was progressing very well indeed and sent his best wishes to the Council. It was agreed to send a message to Dr. Talbot Rogers and to Dr. Mary Esslemont and Dr. J. C. Macarthur, who were also absent through illness.

The CHAIRMAN then welcomed Dr. Arthur Kelly, general secretary of the Canadian Medical Association. Dr. T. C. Routley, Immediate Past President of the Association, was also present from Canada.

Letters of thanks were reported for hospitality during the Annual Meeting, and in commenting on them the CHAIRMAN paid a tribute to the work of members of the staff and their ladies in making overseas visitors feel at home.

The CHAIRMAN said that it had been suggested that the Association might associate itself in some way with what was being done to alleviate the distress in Hungary, and it was agreed to leave it to him and to the office to make inquiries.

Preliminary Business

The election of Dr. S. Wand as Chairman of Council made him an *ex officio* member, and a vacancy in the Council membership resulted. After correspondence with the Association's solicitors, and the obtaining of the opinion of Counsel, it seemed that the only method by which the vacancy could be filled, as Dr. Wand was elected by the Representative Body, was to call a Special Representative Meeting. This being impracticable, the vacancy on the Council would continue until the next A.R.M. The correspondence was passed to the Organization Committee, so that it might consider the amendment of the By-laws to remove the defect which had come to light.

It was reported that Dr. Wand attended the annual congress of the Royal Netherlands Medical Association in

October as the Association's representative, the CHAIRMAN adding that he received warm hospitality.

An invitation was received from the Danish Institute in Great Britain on behalf of the Danish Government for members of the British Medical Association to take part in 1957 in a study tour of medical services in Denmark, the programme to be arranged by the Institute in co-operation with the Danish Medical Association. It was agreed to accept the invitation.

Visit to the Caribbean Branches

The Council had before it the report by Dr. I. D. GRANT of his visit to the Caribbean Branches. It was obvious said the CHAIRMAN, that Dr. Grant had grasped the problems of these Branches in their entirety, and that he was a magnificent ambassador. The Council would offer him its warm thanks.

The report was referred to the Overseas Committee.

Visit to the U.S.S.R.

A report, written by Dr. J. G. M. Hamilton, of the visit to Russia was received. (See *Journal*, November 3, p. 1049.)

The CHAIRMAN paid a tribute to the efficient arrangements made for the visit by Dr. E. Grey-Turner and other members of the staff. Dr. HAMILTON said that the visit was carried through in an atmosphere of cordiality. Those taking part were received most hospitably and their wishes were paramount in the making of arrangements. It was a unique experience, and he was grateful to the Council for being allowed to represent the Association on this occasion.

A report from Professor Charles Wells of his attendance at the Congress of the Pakistan Medical Association was also received with appreciation.

Representation on the British Red Cross Society

The Council was informed that, in response to an inquiry initiated by the Chairman of Council, the British Red Cross Society had invited the Association to put forward a representative to be nominated for election to the Council of the Society. The Council gratefully accepted this invitation, and it was left to the Chairman to select a suitable representative.

Representation on Other Bodies

The Council accepted an invitation to nominate a general practitioner representative to serve on the Medical and Scientific Committee of the National Institute for the Deaf.

Dr. H. H. D. SUTHERLAND was nominated for this purpose, and Dr. ANNIS GILLIE was appointed to represent the Association in connexion with the centenary appeal of the Ranyard Mission. Representatives were reappointed to a number of other outside bodies.

A point had been raised that there was a paucity of academic representation on the Central Medical Recruitment Committee and that the Association in making its own nominations might consider giving specific representation to, or even consulting, university medical opinion. It was agreed that the Minister of Health should be asked to consider enlarging the Committee by the addition of one or two university representatives.

Fifth British Commonwealth Medical Conference

It was reported that the fifth British Commonwealth Medical Conference would be held in London in July, 1957. The Council appointed the Chairman of Council to act as President of the Conference. The Chairman of the Representative Body, Dr. E. A. GREGG, Mr. T. HOLMES SELLORS, and the Editor of the *British Medical Journal* were appointed as delegates.

Future Annual Meetings

It was reported that doubts had arisen as to whether all the necessary accommodation for the Annual Meeting could be provided in Margate in 1958, and the Council decided with regret to abandon the Margate plan and to hold the meeting in Birmingham in 1958 at the invitation (originally made for 1960) of the Midland Branch. An invitation from the Torquay Division to hold the meeting in Torquay in 1960 was accepted.

Remuneration Claim

It was reported that a reply was awaited from the Minister of Health to the Negotiating Committee's document on the legal aspects of the claim (see *Supplement*, November 3, p. 173).

Dr. J. A. L. VAUGHAN JONES said he thought an opportunity had been lost and there was a danger of the profession splitting apart. It should have been the responsibility of the Association in the intervening period to have done something to weld the profession together. He was pleased to see the leading article in the *British Medical Journal* of November 3 (p. 1043). There was a considerable degree of discontent at the way the profession had been left in the dark. It might be said that there was nothing to tell them, but something should have been done to bind the doctors together. At the Council dinner the 70,000th member of the Association was applauded; they had the numbers, but had they the morale? There were a lot of staff officers, but there were not the people to bring the troops up behind. He thought the Council was responsible for bringing the troops into action as and when required, and he would urge the Council to do something to improve the morale of those who must support it.

Dr. A. V. RUSSELL reinforced what Dr. Vaughan Jones had said. In his small area he was asked what was being done; there was a great deal of unrest and uneasiness. He had heard it said, "I suppose the Government will get away with it as usual; we shall never stick together; the Minister will divide the profession and nothing will be done." There was no doubt that a national crisis would be called up as another reason for postponing any settlement or for justifying the Minister's refusal for providing Parliamentary time to consider the problems of the medical profession. "What we require is unity; it is there if you make use of it. The rank and file of the periphery are looking for leadership; they do not know what to do." Dr. Russell added that in the twelve months before the entry into the National Health Service there was an amount of unity in the profession which had never existed before or since. He was sure that the leading article in the *British Medical Journal* would be received as a sign that something was being done, and that steps were being taken to safeguard their interests.

Dr. R. HALE-WHITE said that whatever committee or combination of committees might be considering this remuneration claim he was quite sure that it was to the Council that the members looked for assurance on whether things were going well or ill. The Council had a responsibility to the 70,000 members to tell them what was happening.

Mr. H. H. LANGSTON endorsed what had been said. The time had come when the Council should give a lead to the profession in the sense of initiating local meetings and discussions on the remuneration position. In the consultant field there was a good deal of scepticism and unrest, and questions were being asked whether they would not do better as consultants separately from the rest of the profession. Meetings should be initiated in the Divisions which would keep the members informed and impress upon them that the Association, which represented all branches of the profession, would give a lead and that their best purposes would be served by working together.

Dr. W. E. DORNAN said that he heard the Minister of Health deliver his speech at which he made reference to the remuneration claim. It was an unfortunate place [the annual conference of the Executive Councils Association (England)] at which to make any reference to the remuneration problem, because it had been the custom for that conference to refuse to accept discussion on remuneration in any part of the service. In the absence of the Secretary, he saw the Deputy-Secretary, Dr. Stevenson, and persuaded him to put the matter right if and when he was asked to address the conference. He hoped the Council felt that Dr. Stevenson did right. (Applause.) The same evening there was a divisional meeting in Sheffield which he, Dr. Dornan, addressed, and he was able to bring the members right up to date. As a result the whole meeting passed a resolution backing the Negotiating Committee in every way. If other members of Council did the same thing it would be very helpful.

The CHAIRMAN asked if any member of the Negotiating Committee would like to say something about this.

Dr. A. BEAUCHAMP said that the history was quite plain; it had been published in the *Journal*. When the statement was sent to the Ministry it was referred by the Minister for legal advice at the highest level. That was where the delay had arisen, and not very much could be done about it. Anybody reading last week's *Journal* would realize that the case was quite unanswerable from the legal and moral point of view. He did not think the Negotiating Committee could do any more at the moment than wait for the opinion of the law officers of the Crown.

The curious thing was that criticism had gone outside the remuneration claim, and had become criticism of the service itself. If this was sufficiently widespread—and he believed it was—the Negotiating Committee would have to ask the Council, as representing the British Medical Association, to take some action. He hoped a reply would soon be received; if it was unfavourable when it was received the fight would begin.

Dr. W. WOOLLEY did not think the Negotiating Committee should be criticized. As members of Council they should be kept closely in the picture, and the moment a reply was received every member of Council should be informed.

The CHAIRMAN said that as one of those who went to the Ministry he knew nothing more than anybody who had read the *Journal*.

Mr. H. H. LANGSTON moved that the Council should initiate meetings of the Divisions to discuss the remuneration issue, and that a document should be prepared and circulated as a basis for such discussion.

Mr. S. F. LOGAN DAHNE seconded, stressing the feeling in the Reading Division of deep anger at the attitude adopted by the Minister and his remarks at the Executive Councils Association conference.

Dr. I. D. GRANT could not see any reason for calling meetings of the Divisions until Council members were certain of their own attitude in this matter and until they had some adequate information to give to the Divisional meetings. The Negotiating Committee should do everything possible to obtain from the Minister a definite reply. He should be told that the matter was urgent and that his law officers should give it urgent consideration. When the reply was received there should be a special meeting of Council at which the matter would be discussed fully and completely.

It would then be time to go to the Divisions and consider what should be done.

Dr. BEAUCHAMP said that if this was a proposition he would second it. Dr. RUSSELL said that no one would disagree with what was proposed, but the Negotiating Committee should let the Minister know that the matter was one of urgency, while Dr. F. M. ROSE thought there was no doubt Mr. Langston's suggestion was right. The Minister intended to throw dust in the eyes of the public.

Dr. A. BROWN supported Dr. Grant; it was useless going to the Divisions until the Council knew what it wanted. Once an answer was obtained from the Ministry they could make up their minds what to say to the Divisions.

Dr. H. H. D. SUTHERLAND said that if the legal opinion of the law officers of the Crown was that the Minister had a contractual obligation to fulfil nobody would be more pleased than the Council. But if they said that there was no contractual obligation the difference of legal opinion must go to the highest possible legal authority available for decision.

Mr. LANGSTON said he saw fully the force of what Dr. Grant had said. Perhaps he could withdraw his original motion and suggest that the Minister be asked for an early reply to the documents sent to him, and that this reply be followed by the calling of a special meeting of Council to consider it. This would be followed by special meetings of Divisions to hear the views of Council and if necessary by local meetings convened by the Guild.

Dr. GRANT said he would be willing to accept this. He thought Sir Russell Brain and other members of the Negotiating Committee not members of Council should be invited to attend a special meeting, as well as the Committee's legal advisers.

The CHAIRMAN said that a letter had been written to the Minister within the last few days, urging him to send an early reply. In regard to the Minister's speech at the Executive Councils Association, he referred to correspondence which had taken place between the Minister and himself on the matter. Some of the newspaper reports had conveyed a wrong impression of what the Minister had actually said—perhaps as a result of a highly compressed summary issued by the Ministry to the press. A third point was the present international situation, and to devise machinery at the moment might create difficulties later on. The fourth point was that two autonomous committees had joined together in a negotiating committee, and the action proposed would override the two committees without consultation. He wondered whether that was the intention of Council, or if the intention really was to inform the profession that the Council was determined to proceed with this issue, that all steps had been taken to do so, and that there was nothing more to report except that the Minister was being pressed for a reply. If the reply was unsatisfactory the action to be taken was a matter of common sense and would be carried out if the international situation permitted. Should not the action of the Council be to pass a message to the Negotiating Committee, stressing the urgency of the matter and indicating that the Council was willing and anxious to take such action as it could to facilitate a successful outcome of the claim? The debate would be reported to the Negotiating Committee, and it would be made clear in the *Journal* that the Council was seized of the situation, and would take such action as would bring the whole profession behind it. In the event of an unsatisfactory reply being received from the Minister the Council would be called to receive a report from the Negotiating Committee.

Mr. A. LAWRENCE ABEL said that not only should there be meetings of the Divisions but there should be a mass meeting of the profession.

The action proposed by the Chairman of Council was approved.

Resolutions from A.R.M.

The Council considered the action to be taken on various resolutions referred to it by the Representative Body. The

question of attributable illness in reference to all members of the profession was referred to the Science Committee. With regard to the request to consider ways and means of establishing convalescent homes for members of the profession, counsel's opinion had been obtained, and counsel did not think that the funds of the Association could be expended even in an appeal for funds for such a purpose.

Mr. A. LAWRENCE ABEL thought that the maintenance of the health of the profession was in the interests of the profession and the matter should be looked at again. It was agreed to refer it to the Organization Committee for consideration.

A resolution asking the Council to discuss with the Government the formation of a major "Casualties Service" covering the whole country was referred to the Central Consultants and Specialists Committee.

A request that the Council should examine and report on the working of the Medical Acts, 1858-1950, in view of the decision of the General Medical Council to promote a Consolidation Bill, was considered.

Dr. H. GUY DAIN said that the proposed Bill was putting into order the existing provisions; it was not possible to put in any alterations.

Dr. R. FORBES said that there was a job here to examine the operation of the Medical Acts. A number of criticisms were made against the existing Acts; there were difficulties in relation to their working, and he thought there should be an *ad hoc* committee to look into this and report.

This was agreed, and an *ad hoc* committee was appointed, consisting of the officers of the Association, Dr. A. Brown, Dr. H. Guy Dain, Dr. W. E. Dornan, Dr. R. Forbes, Dr. E. A. Gregg, Dr. R. Gibson, and Mr. A. Dickson Wright, with power to co-opt.

The Representative Body accepted the recommendations of the Committee on Remuneration Policy, among them being a recommendation that the Government should be urged to set up forthwith an independent committee of inquiry to consider the range of remuneration of medical officers in the public health service. Dr. J. G. M. HAMILTON asked if it was suggested that the Minister should be urged to set up a "Public Health Spens." Had any action been taken on this?

The SECRETARY replied that a letter had gone to the Secretary of the Ministry of Health bringing the resolution to his notice, and he had replied that as this was a matter which concerned local authorities, not the Ministry alone, it would be necessary for the Ministry to consult the local authority associations.

Another recommendation of the Committee on Remuneration Policy was that further efforts be made to secure a more satisfactory alternative to the Industrial Court as a means of settling disputes by arbitration, and it was agreed that the Committee on Arbitration Machinery should be reappointed to consider this matter.

Increased Cost of Prescriptions

The CHAIRMAN asked for the views of the Council on the proposals to increase the charges for prescriptions. The policy of the Association was that the charge should be abolished. A local medical committee had sent a resolution protesting against the proposed charge of 1s. per item and stating that any charge should be on the prescription form only.

Dr. F. GRAY said that a deputation from the General Medical Services Committee went to the Ministry on October 31; the deputation included the Deputy Chairman of the Committee (Dr. Davies) and himself. Attention was directed to the proposed method of increasing the payment for prescriptions, and reasons were given why it was considered the method proposed was quite inappropriate. These were that the charges would fall on people according to the sort of illness they had—diabetics, patients with skin conditions, for instance, would find themselves paying a great deal more for necessary medicaments. This was an intolerable burden to place upon them and was a discrimination

between one class of patient and another in a matter quite outside the patient's control. One patient might get a particularly expensive drug for 1s., while another patient needing four or five drugs would pay four or five times as much, perhaps for the whole of his life.

Dr. J. C. ARTHUR pointed out that dispensing doctors would find it difficult to administer this; it was difficult enough with the 1s. charge. Dr. ROSE said that the relationship between the patient and the doctor, and the patient and the chemist, would be affected. Dr. BROWN, as a dispensing doctor, supported this observation. He would prefer an increased charge per prescription.

The CHAIRMAN asked if anyone wished to speak in favour of these charges and the way they were being imposed. Could he take it that the Council was opposed to the charges as indicated by the Minister, and that the points to be pressed were that he did not consult the profession, that the Association was opposed to the imposition of any charge at all, and that if he insisted on increasing the charges it should be in the form of a charge per prescription?

Dr. RUSSELL said that, if the Government wanted to lower the expense of the National Health Service, would it be a possibility to draw up a list of life-saving drugs which would be free to all, leaving other things to be paid for by the patient?

This suggestion was supported by Mr. A. LAWRENCE ABEL.

The CHAIRMAN said that such a suggestion could not be made to the Minister without the approval of the Representative Body.

After further discussion the Council authorized the Chairman to meet the Minister, and, after making it quite clear that the Association's policy was against any charges for prescriptions, to discuss with him possible methods of applying the charges with the least possible hardship to the patient.

COMMITTEE REPORTS

The report of the General Medical Services Committee was presented by Dr. BEAUCHAMP. He drew attention to the Committee's recommendation, which was accepted, that the Council appoint a special committee to prepare the Association's evidence to the committee to be set up by the Minister of Health to undertake an inquiry into the cost of prescribing in the National Health Service. It was also reported that discussions were proceeding between the G.M.S. Subcommittee (Scotland) and the Department of Health with a view to the establishment of a separate committee on similar lines to investigate the cost of prescribing in Scotland.

Agreement had been reached on the method of determining the practice expense ratio, and the final size of the Pool for 1954-5 had been determined. The balance due to the profession was £4½m., and this would be distributed—an average payment of £200 per doctor—at the end of the year.

With regard to the amendment of the N.H.S. (General Medical and Pharmaceutical Services) Regulations, Dr. R. G. GIBSON drew attention to the point that a doctor with patients at a school or institution could be compelled to give a list of such patients periodically to the local executive council, and patients could be removed arbitrarily from the list when pupils left school. Although a pupil might come off the school institution list he might still be the doctor's patient. This was not the doctor's job, it was the executive council's job. They should ask the schools for names of pupils on a doctor's list, and they should tell the doctor if they were about to take a name off his school list in order that it could be put on the list of the family doctor. He hoped the Council would ask the General Medical Services Committee to look at it again and to consider more carefully the effect of some of these regulations.

Dr. BEAUCHAMP said that the Committee had tried to get this altered. It was a method of curbing inflation.

Dr. E. A. GERRARD asked the position with regard to making up the pay of hospital employees who were called up, and the SECRETARY replied that the Ministry had issued a circular with regard to making up the pay of health ser-

vice employees in the hospital service called up as reservists and advised the use of the discretion given under the Act of Parliament to make up civilian pay.

The report was approved.

Central Consultants and Specialists Committee

Mr. T. HOLMES SELLORS moved the receipt of the report. He put forward a recommendation at the request of the Venereologists Group Committee, to which the G.M.S. Committee had no objection, that an inquiry be made of general practitioners and consultants in selected areas—seaports, inland cities, rural areas, and part of the London area—regarding the extent to which treatment of venereal diseases was undertaken outside hospital clinics.

Dr. ROSE drew attention to the resolution of the Representative Body calling upon Council to press for substantial increases in the remuneration paid to house-officer grades in hospitals. The Committee reported that action was being taken to remedy the "absolute" under-payment of house officers. There were good grounds for seeking an improvement in the relative level of remuneration of fully registered house officers, but Dr. ROSE pointed out that those referred to in the resolution were the pre-registration group doing their first two house jobs. If the Committee was not careful there would be a greater difference than now between the groups. The difference in remuneration for the highest of the pre-registration group was more than £200 less than that of the senior house officer. He moved that this be referred back. Dr. GRAY seconded.

Mr. HOLMES SELLORS said that one had no idea what the outcome of the claim for remuneration would be. There was real hardship on the men who had been in the Services and who were wanted back in the hospital service and who were not doing the compulsory pre-registration year. Everyone would like a great deal more than they were getting, but if there was to be any relative increase, if people were to be got back into the hospital service, it should be for the post-registration people.

Dr. ROSE said that the instruction of the Representative Body was to deal with this particular group. He had said nothing about the efforts for a general increase. The position of the young newly qualified doctor was quite serious.

Mr. HOLMES SELLORS said that the committee would have another look at it.

Dr. J. B. TILLEY referred to the Joint Committee's reply to the Ministry regarding the Guillebaud Committee's recommendation that closer liaison should be effected between the hospital and the local authority by the appointment of the medical officer of health, or a member of his staff, as a member of the medical staff of a hospital and as a member of the hospital medical committee. The Joint Committee had agreed upon the desirability of improving liaison between the two services and would support any practical steps to promote it, but it did not consider that it would be attained by this proposal. He said that this view had caused considerable disquiet in the Public Health Committee. The views of various committees had been asked and were reported to the Liaison Committee of the three committees dealing with the health services; no agreement was reached and the matter was referred back to the Public Health Committee, which reaffirmed its views. Although the Association's views had not yet been settled, the Joint Committee had already gone to the Ministry and made representations. He realized that the Council was not responsible for the actions of the Joint Committee, but it was a grave disappointment to find that the Joint Committee did not co-operate.

Dr. H. D. CHALKE said that there was considerable discontent in the public health service as a result of recommendations of this sort. The Society of Medical Officers of Health went to considerable lengths to maintain an excellent liaison with the B.M.A., but insufficient attention was paid to the fact that the B.M.A. was not just an association of consultants and general practitioners. There had been other examples, and it might lead to many people leaving the Association. Much harm had been done.

Mr. HOLMES SELLORS said that this comment of the Guillebaud Committee ran contrary to the whole practice in the past of not allotting a person to a medical committee. It was always hoped to achieve liaison with the public health authorities in the best possible manner, but it was fundamental that a person should not automatically be appointed or directed on to a medical committee.

The CHAIRMAN said he took it the public health medical officers were not so much concerned with what happened in this case as the fact that something had been taken to the Ministry before the Council had had an opportunity of discussing it.

Dr. TILLEY agreed that that was the point.

Dr. CHALKE asked if this could be moved back for further consideration.

Mr. HOLMES SELLORS said that it was an opinion expressed on the Guillebaud Report by the Joint Committee, but he would take it back.

Dr. CHALKE asked that there should be an item on the Council agenda in the near future to discuss the question of association between the Society and the British Medical Association. He was informed that it was open to him to submit notice of a motion in accordance with the Standing Orders.

The CHAIRMAN asked Dr. TILLEY if he would be satisfied if Mr. Holmes Sellors took this back to his Committee and offered comments on it in the near future. Dr. TILLEY said he would accept this. There was no further discussion on the Report, which was accepted.

Public Health Committee

Dr. J. B. TILLEY presented the report of the Public Health Committee. It was agreed that a special committee of the Association should be set up to consider pure milk supplies for the nation, and it was left to the Committee to determine how best this should be done. With regard to immunities how best this should be done. With regard to diseases, grants found to be suffering from communicable diseases, the Committee had studied the report of the Joint Tuberculosis Council and recommended that an immediate approach be made to the Government. The proposals for setting up a two-tier appeals machinery for Northern Ireland had been rejected by the Northern Ireland Government, and they were now back where they started. All the Committee could suggest was that the Northern Ireland Government should again be asked to consider the possibility of an Appeals Committee comparable with the Regional Appeals Committees in Great Britain. As an interim measure it was proposed that the appeals now pending should be heard by an independent arbitrator.

With regard to the appointment by the Home Secretary of the Children and Young Persons Committee (the Ingleby Committee) the Committee was disturbed that the medical membership did not include a representative of the public health service. A recommendation that the Council should urge the Home Secretary to increase the membership so as to include such a representative, and that the Association should present evidence to the Ingleby Committee, was carried, as was a request that the Public Health Committee should be represented on any special committee appointed to prepare the Association's evidence.

The remainder of the Report was accepted without comment.

Private Practice Committee

Dr. A. BROWN, chairman, presented the Report of the Private Practice Committee. With regard to the fee for the examination of emigrants, Dr. BROWN said that the Committee recommended that the Australian and Canadian Governments should be asked to notify intending emigrants that the fee for the examination and report on an adult or an unaccompanied child would be £2 2s.

Dr. A. SCOTT thought this was a wrong policy. If they charged £2 2s., emigrants to Canada would go to Canadian medical officers and have it done for nothing. Dr. HALE-WHITE assumed that this was a suggestion, not a command, that the charge should be £2 2s. Dr. GRANT said that there

was a complete *impasse* with the New Zealand Government on this, and the ultimate agreement was that it should be left to the doctor and person concerned. He suggested that this might be done in the case of Canada and Australia.

Dr. BROWN said that the Committee felt they must stick to their standards, whereupon Dr. SCOTT moved the reference back of this part of the report.

Dr. I. D. JONES said that the Committee had spent considerable time in the last two years settling these fees. The fee to be paid by any member of the public for a comprehensive examination and report should be £2 2s.; whether that fee was paid by the patient was a matter for negotiation.

Dr. GRANT suggested that the Governments of Canada and Australia should be asked to delete the amount of the fee from the form and to say that it was payable by the intending emigrant and leave it to the doctor to charge what seemed suitable, the recommendation of the Association being that it should be £2 2s. He moved an amendment accordingly, and this was agreed to. A similar arrangement was approved in respect of medical examinations carried out for the United Kingdom Commercial Travellers' Association.

Occupational Health Committee

Dr. J. A. L. VAUGHAN JONES presented the report. Recommendations that the 1957 conference of Advisory Councils on Occupational Health be held at B.M.A. House next April, and that active steps be taken to promote the establishment of new advisory councils, were adopted.

Dr. T. C. ROUTLEY informed the Council that at the World Medical Association meeting in Havana a few weeks ago a world committee covering the subject of occupational and industrial health was set up as a result of the representations which Dr. Vaughan Jones had made.

The Report was accepted.

Finance Committee

Mr. L. DOUGAL CALLANDER, Treasurer, presented the report of the Finance Committee. He said that in the majority of instances the budget provision for the "spending" committees and departments had proved to be sufficient, but there was a much smaller balance at the end of August than was expected, because of an overall deficit on the publications and loss on the Catering Department. He was, however, hopeful that there would ultimately be a surplus of £10,000 to £12,000 on the year's working, taking into account the increased cost of salaries and wages, the cost of the General Medical Council election, the visit to Russia, and the subsistence allowances. It was anticipated there would be a surplus of £1,500 to £2,000 from *Family Doctor*, and it was hoped that the catering position would be rectified. With regard to the *Journal*, he would like to point out that every new member increased the cost of the *Journal*. Even with the vast increase in membership the balance of income was not sufficient for the amount of money being turned over. He hoped that the income would be increased next year. As the leases fell in, steps were taken to increase rentals, and the increased subscription income had saved him from having to ask the Council to consider raising the subscription. He would ask the Council to consider very carefully before setting up *ad hoc* committees.

The Report was adopted, as was the report of the Estates Committee. Mr. CALLANDER announced that the London County Council had given permission to proceed with the building on the Burton Street site, but there were still negotiations proceeding with regard to rehousing one or two of the remaining tenants with the local authority. In presenting the report of the Catering Committee, he said that the year had been difficult because of wages and the increased cost of food, and the matter was being watched carefully.

All these reports were adopted.

Organization Committee

Dr. R. G. GIBSON, presenting the Committee's report, paid a warm tribute to Dr. Pridham, who had left the chair of the Committee after 11 years' service. He had carried out his duties in a tactful and able way, and had made the Committee a happy one. There were now 70,400 members of the Association, and the Committee was giving careful consideration to the interests of the young practitioner. Additional activities were being fostered in the Divisions, and it was hoped to encourage young practitioners to take a larger part in the life of the Association.

Recommendations, which were adopted, were put forward in respect of subsistence allowances. Advice had been taken from other organizations, and the Committee believed its proposals to be fair. They were as follows:

Over 8 hours and under 24 hours away from home	12s. 6d.
Over 24 hours or overnight away from home (less a standard deduction of 25s. if sleeper was claimed)	45s. 0d.

This scale was to be put into operation as from the close of the Annual Meeting, 1956, and to be reviewed at the conclusion of the 1956-7 session in the light of experience. The details of the method of payment were to be left to the central office in consultation with the Treasurer. An estimate had been made that the cost would be for Council meetings £350, centrally arranged committee and subcommittee meetings £2,570, and the Annual Representative Meeting £3,900, making a total of £6,820. This did not take into account attendances at meetings of the General Medical Services Committee. It was hoped that, following the procedure adopted for travelling expenses, the cost of subsistence allowances would be met from the National Insurance Defence Trust. If not, the total expenditure from Association funds would be increased by some £500 to £600 per annum.

The Council approved the scheme brought forward by the Committee for the formation of a Roll of Fellows of the B.M.A. It was intended that this would grant a distinctive status for outstanding services given by members to their Divisions or Branches. The Committee also considered a resolution of the Representative Body with regard to changing the date of the A.R.M. to the autumn, and recommended that no change should be made in the existing procedure.

Office Committee

Dr. S. WAND (Dr. Grant in the chair) moved the report of the Office Committee. The Council approved a recommendation that the Gold Medal of the Association for Distinguished Merit be awarded to Sir Henry Hallett Dale, in recognition of his distinguished services to medicine in the field of physiology and pharmacology. A recommendation that the Representative Body be invited to elect T. C. Routley, Toronto, a Vice-President of the Association, in recognition of his distinguished services to the Association was also approved.

Dr. WAND drew attention to the proposals of the Committee to recognize the outstanding services of members of the office staff. Miss G. B. Offord, of the secretarial department, had served for 41 years on the staff of the Association. She had been most loyal and efficient, and had a remarkable record of attendance at work. Mr. G. A. Peck had given notable service which the Committee recommended should be recognized by a gratuity. This was agreed to.

Association's Publications

Dr. J. G. M. HAMILTON, chairman, presented the report of the Journal Committee. He said that the Committee considered the resolution of the Annual Representative Meeting that the *Supplement* should be published in separate form, or that it form the centre pages and be easily detachable for reference. To publish the *Supplement* separately would

cost £6,100 more a year, and the Committee did not consider this additional expenditure to be justified at present. With regard to binding it in the centre pages, such a method would be highly undesirable from a production point of view, and from a journalistic point of view it would be revolting; the combined product would be deplorable because the important centre pages would be broken into by the interposition of the *Supplement*, and those who tried to detach the *Supplement* for filing would invariably tear the adjacent *Journal* pages. Possibly the majority of members would prefer to have the *Supplement* where it was. The Committee recommended that no action be taken in this matter.

Referring to the financial side of the *Journal*, Dr. Hamilton said that unavoidable departures from the budget had been caused by the increase in inland postage, which had cost £1,600 to the end of August, and the need for additional pages in the *Supplement*. Advertisement revenue, however, was higher. There was an increase in printing charges of just over 14% for the *Journal* and between 14 and 20% for the other journals. Wages in the printing industry, subject to a cost-of-living bonus, were now stabilized until April, 1959. Speaking of the position as at October 31, Dr. Hamilton said that the Business Manager had made a cautious guess that by the end of the year there might be a small overall surplus on the publications.

The report was adopted.

Dr. ANNIS GILLIE presented the report of Family Doctor Committee. The Committee had carefully considered its terms of reference, and recommended that they should continue as before, with the deletion of the phrase "as a temporary measure." This was agreed to.

The Committee reported that a new and satisfactory printing contract had been entered into which would come into action in January, 1957. It was hoped that through changes in the type of paper there would be a saving on paper costs. The Committee considered carefully a proposal to print the magazine in Holland, which would effect a very considerable saving on printing costs, and, in reply to questions as to the reason for deciding against it, Dr. GILLIE said that it was felt there was additional security in having the magazine printed in this country from the point of view of the date of publication. There might be delays and heavy cost incurred in getting the copies here at the right time.

Dr. I. D. GRANT asked if the Committee would consider sending copies of *Family Doctor* to the Caribbean; they had never seen this publication, and it might result in some further orders.

Dr. HALE-WHITE asked if the *Family Doctor* publication books and pamphlets, on various subjects, could be purchased on the bookstalls, and Dr. GILLIE replied that that was so, or they could be obtained from the office or from chemists.

The remainder of the Report was approved.

Other Reports

The Chairmen of the Constitution, Amending Acts, Central Ethical, Compensation and Superannuation, Scottish, Charities, Drug Addiction, and the Edinburgh Meeting (1959) Steering Committees reported on action taken and the reports were approved without discussion. Reports of representatives to various conferences were also received and accepted.

Major-General J. C. A. DOWSE, moving the report of the Overseas Committee, drew attention to the view of the Committee that the various overseas branches should be visited at regular intervals by a representative of the parent body. Past experience had proved this to be a valuable means of maintaining liaison and stimulating membership. The Committee recommended that arrangements should be made for such a visit to the East and Central African Branches—Kenya, Tanganyika, Uganda, Zanzibar, Nyasaland, Northern Rhodesia, Manicaland, Mashonaland, Matabeleland, Midlands, and Mauritius—during 1957. This was agreed to with

the proviso that the timing of the visit must depend on the international situation. In response to a suggestion made by General DOWSE, the CHAIRMAN OF COUNCIL expressed his willingness to be the Association's representative.

A report was received of the proceedings of a deputation to the University Grants Committee relating to the remuneration of university medical teachers and the provision of negotiating machinery. It was agreed that the Non-professional Medical Teachers' and Research Workers' Group Committee should in future deal with this matter, with power to co-opt professors if found necessary.

It was also reported that the Special Commissioners of Income Tax had allowed the appeals by the part-time consultants in all five test cases against assessment under Schedule E. The Inland Revenue had appealed against this decision, and the appeal would be heard in due course by a Judge of the High Court.

The Council rose at 7.15 p.m.

COUNCIL DINNER

The State and doctors should do more to foster cultivation of the will to keep fit, said the President of the Association, Dr. ALEXANDER HALL, when he proposed "The Common Health" at the Council Dinner on November 6. In his response the Minister of Health, Mr. R. H. TURTON, described the general practitioner as the only person who could bridge the three "streams" of the National Health Service. The dinner was held in the Great Hall at B.M.A. House, the Chairman of Council, Dr. S. WAND, presiding.

Immeasurable Quality

Dr. HALL, quoting Disraeli's words: "The health of the people is really the foundation on which all their happiness and all their power as a state depend," said he was sure that by the health of the people Disraeli did not mean anything that could be measured against the number of working days that lost through illness or the size of the nation's drug bill. He meant the physical, mental, and spiritual well-being of the people, not a thing purveyed to them by the State but a quality of body, mind, and spirit developing and abiding in them as a reaction to the conditions in which they lived and worked.

The State had done much to improve living and working conditions since Disraeli spoke those words. There was, however, a danger that the State's efforts, while they made for greater happiness, failed to evoke the response which added to the power of the nation. While the happiness of the people might to some extent depend on what they got out of the kitty, the power of the State depended on what people put into the kitty.

In cultivation of the will to be and keep fit, the family doctor, the medical officer of health and his team, the school medical officers, and the industrial medical officers could help. Dr. Hall had been impressed by the universal agreement on the success and value of the method of direct health talks in factories, instituted by the late James McKenzie. Might not similar direct talks in the home, the school, the community centres, and so forth pay equal dividends?

"Do not let us be deluded into thinking that free hospitals, free this, that, and the next thing in the way of medical treatment can alone provide the answer to the problem of the common health," declared Dr. Hall. The Minister in the great department of State, and practising doctors in more intimate touch with the people, had a common purpose. They must do more to foster health culture, both physical and mental, as well as treat the sick.

Team Work

The MINISTER OF HEALTH said that Dr. Hall had recalled the words of that founder of a great deal of Conservative

philosophy, Disraeli. It was in that same speech that Disraeli used the phrase: "*Sanitas sanitatum, omnia sanitas*."

One of the difficulties in the National Health Service was the fact that three streams flowed in parallel lines. In the Minister's judgment, only the general practitioner could bridge those three streams. If there was to be success, he must be the clinical leader. He would do his best to establish the general practitioner in that position. Such leadership, however, demanded considerable qualities.

"I realize," Mr. Turton continued, "that the close relationship between doctor and patient is the most vital principle of your profession. I shall always respect it, and I am sure that no Minister of Health should ever interfere with it." The medical profession and the Ministry could do a great deal if they worked together. The Minister knew that the Association would constantly have disagreements with him—that was inevitable; "but, however much we disagree," concluded Mr. Turton, "I want you to realize that I have complete confidence in your profession and that I am always grateful for the great work which you are doing for the common health."

Seventy Thousand Members

At the conclusion of the Minister's speech a unique ceremony took place. Dr. ALEXANDER RAEBURN GRIEVE, a recently qualified practitioner whose application for membership of the Association in September brought the membership figure, for the first time, to the total of 70,000, was introduced by the Chairman, Dr. WAND, who presented him with a copy of Ernest Muirhead Little's *History of the British Medical Association*.

Retiring Officers

Proposing the toast of the retiring officers, Dr. WAND referred to the long history of service to the Association of Dr. E. A. Gregg, who retired as Chairman of Council in July, and who was unable to be present at the dinner. The words "upright, courageous" described him. The hearts of those present would go out to him over the recent death of his daughter. Sir John McNee, Past-President, was out of the country, on the business of the General Medical Council; he was a man, said Dr. Wand, who had made a great contribution to the science of medicine. Dr. T. C. Routley, immediate Past-President, had made, with Mrs. Routley, his 51st crossing of the Atlantic specially to be present at this dinner. Mentioning Dr. Routley's work for the Canadian Medical Association, the World Medical Association, and the World Health Organization, as well as for the British Medical Association, Dr. Wand remarked that he could truly be called a great man in great places.

In the absence of Sir John McNee the toast was responded to by Lady McNEE. She had been told that it was unprecedented for the response to be given not by the Past-President but by the Past-President's lady. Lady McNEE added that she intended to be even more unprecedented and return thanks on her own behalf. She had had a wonderful time, and the visit to Canada had been the crown of a very happy year.

In his response to the toast Dr. ROUTLEY said that it was not only a high honour to be President of the Association but a rich and rewarding experience. In Canada now they were planning the "invasion" of these islands in 1959. Dr. Arthur Kelly, General Secretary of the Canadian Medical Association, was in Britain discussing plans for the Edinburgh meeting in that year.

The toast of the guests was felicitously proposed by Dr. IAN GRANT, Chairman of the Representative Body. Dr. J. F. LOCKWOOD, Vice-Chancellor of the University of London, responded.

A programme of music was played during dinner by the string orchestra of the Royal Army Medical Corps (by kind permission of Colonel H. C. Benson), under the Director of Music, Major L. D. Brown.

TAX ASSESSMENT OF PART-TIME
CONSULTANTS

COMMITTEE'S INTERIM ADVICE

The Crown have appealed against the decision of the special commissioners that part-time consultants should be assessed under Schedule D in respect of the whole of their professional earnings (see *Supplement*, August 18, p. 103, and August 25, p. 109). The special commissioners now have to state cases for the High Court by whom the appeal will be heard. From the High Court there may be an appeal to the Court of Appeal, and thence to the House of Lords. Thus a considerable time may necessarily elapse before a final decision is obtained.

Following discussions with the Board of Inland Revenue, it is now possible for the Central Consultants and Specialists Committee to advise consultants on the position pending the final outcome of the test cases.

Temporary Status Quo

Save in exceptional cases, those part-time consultants at present assessed under Schedule D will continue to be so assessed and those now under Schedule E will remain under that Schedule. If the special commissioners' decision is upheld, and it is decided that part-time consultants should be wholly assessed under Schedule D, all open Schedule E assessments—i.e., those in respect of which a notice of appeal has been given—will be abandoned by the Crown and the liability will be dealt with under Schedule D. In the meantime consultants under Schedule D will continue to pay tax as before. Those paying tax under P.A.Y.E. will continue to do so and the tax paid will be available, if necessary, to satisfy the Schedule D assessments.

If payment of tax under P.A.Y.E. was not made, substantial arrears might accrue while the test cases were under appeal and consultants might have to find large sums to pay the tax which had mounted up.

Notices of Appeal

Many consultants who have been changed to Schedule E have already given formal notice of appeal against their assessments. Those who have not done so should give notice of appeal to their inspectors within 21 days of the date of the notice of assessment.

In some cases P.A.Y.E. may have been applied but assessments under Schedule E may not have been raised. In such cases notice in writing under Section 158 of the Income Tax Act, 1952, should be given to the inspector. This notice, which should be given by April 5, 1957, should require the inspector to raise a Schedule E assessment in respect of the fiscal year 1951-2, if P.A.Y.E. was applied in that year. When this notice is complied with and the notice of assessment is received a notice of appeal should be sent to the inspector within 21 days. A similar notice should be given by April 5, 1958, requiring an assessment for the fiscal year 1952-3, and again notice of appeal should be given when the notice of assessment is received. The inspector will arrange for a Schedule D assessment to be made for the same year covering all the professional earnings to protect the Revenue in case it is ultimately decided that the hospital emoluments for that year are not assessable under Schedule E. On receipt of this Schedule D notice of assessment the consultant should give notice of appeal to the inspector against this assessment as well.

The Schedule D and E assessments having been made and formal notices of appeal having been given, no further action will need to be taken and the principle of the final decision on the test cases will be applied to every open appeal. Inspectors will be instructed that no steps should be taken to set down the appeals for hearing.

It should be emphasized that payment of tax under P.A.Y.E. is a separate question from assessment to tax and will not prejudice any assessment against which notice of appeal has been given.

Loss Relief Claims

At the hearing before the Special Commissioners it was argued on behalf of the consultants that even if hospital remuneration was properly assessable under Schedule E all the consultant's professional expenses should be taken into account in making the Schedule D assessment on his other professional income. In view of their decision it was unnecessary for the special commissioners to rule upon this argument. However, if the final decision proved to be that the special commissioners were wrong but that the argument referred to above was correct, many consultants would make a loss or an increased loss (for tax purposes) in their private practice. To protect their position, therefore, such consultants assessed under Schedule E should give notice to their inspector of their intention to claim loss relief under Section 341 of the Income Tax Act, 1952. This notice should be given by April 5, 1957, and can only relate to the fiscal year 1955-6. A similar notice should be given by April 5, 1958, in respect of the year 1956-7.

Consultants are advised to refer this report to their accountants.

H.M. Forces Appointments

ROYAL NAVY

Surgeon Commander H. L. Belcher, O.B.E., has retired. Surgeon Lieutenants I. H. Colley, P. R. Morgan, and H. J. McLoughlin to be Surgeon Lieutenant-Commanders.

ROYAL NAVAL VOLUNTEER RESERVE

Surgeon Commander R. G. Reid, V.R.D., has retired. Surgeon Lieutenants W. B. Dawson, C. M. Flood, C. A. Pragnell, and J. F. Adams to be Surgeon Lieutenant-Commanders.

ROYAL ARMY MEDICAL CORPS

Lieutenant-Colonel F. M. Lipscomb, O.B.E. (retired, re-employed), has ceased to be employed as Physician and Surgeon, Royal Hospital, Chelsea, and has been regranted the honorary rank of Colonel.

Major G. F. Anderson has retired. Captains B. J. Mahony, W. J. Gourley, and D. Magner to be Majors.

ARMY EMERGENCY RESERVE OF OFFICERS

ROYAL ARMY MEDICAL CORPS

Honorary Major H. J. Hambury (formerly Emergency Commission) to be Captain, relinquishing the honorary rank of Major.

REMUNERATION CLAIM
MINISTERS' REJECTION

The following letter has been received by Dr. A. Macrae, Secretary of the Negotiating Committee, from Sir John Hawton, Permanent Secretary to the Ministry of Health

"On September 12 a memorandum was submitted setting out further particulars of the Negotiating Committee's views on the legal aspects of the claim for increased remuneration.

"I am instructed to say that this memorandum has now been fully examined. Ministers remain of the opinion that no contractual obligation such as has been alleged by the Negotiating Committee exists and that no action based on such a claim could succeed. If the Committee are not prepared to accept the Ministers' views as to this, no doubt the matter can be brought before the courts for adjudication."

The Negotiating Committee met on November 28 to consider the Ministers' reply.

COAL-GAS POISONING
B.M.A.'s INQUIRY

On March 2, 1955, the Council empowered the Science Committee to set up a subcommittee "to inquire into the problem of accidental death and ill-health from coal-gas poisoning, and to make recommendations." At its meeting on November 7 the Council approved the report,* and a summary of it follows.

In recent years, the subcommittee found, there had been a progressive increase in the number of accidental deaths from coal-gas poisoning in Great Britain. In 1931 there were 175, in 1951 there were 589, and the provisional figure for 1955 is 892. But the increase must be viewed in conjunction with two facts—first the amount of gas sold in Great Britain has increased by 85.7% during 1931-55, and the proportion of old people in the population has also increased.

The toxicity of the coal gas depends on the percentage of carbon monoxide in it. This varies in different parts of the country and at different times. When and where toxicity

*The members of the subcommittee were: Dr. W. N. LEAK, general practitioner, police surgeon, division medical officer, I.C.I. (chairman). Dr. H. D. CHALKE, medical officer of health, Camberwell, and divisional medical officer, L.C.C. Professor ESTHER M. KILLICK, professor of physiology, University of London. Mr. J. R. NICHOLSON-LAILEY, chairman of the Science Committee. Dr. A. LLOYD POTTER, division medical officer, I.C.I. Dr. C. KEITH SIMPSON, forensic pathologist, reader in forensic medicine, University of London. Dr. F. H. TYLER, forensic medical officer, West Midlands Gas Board. The subcommittee co-opted the following: Miss BERYL F. CROUCH, S.R.N., health visitor, L.C.C. Mr. G. H. FUIDGE, chief physicist, South-eastern Gas Board.

is higher, the number of casualties might be higher, and this assumption is being investigated by the Gas Council. During cold and windy weather when windows are closed and ventilation is diminished there is an increase in fatalities. While the percentage of carbon monoxide in coal gas may rise slightly at such times, this alone cannot account for the larger number of casualties. Thus decreased ventilation is a very important factor.

A comparison of the circumstances surrounding gas poisoning deaths in 1934-8 and 1946-50 shows that the biggest percentage increase in the second five years over the first is due to taps being left open on lighting and cooking burners (228 to 937 deaths, or 311%). The next highest percentage increase concerned defective internal pipes, meters, and fittings (66 to 195 deaths, or 191%). Deaths due to taps left open on fires increased from 99 to 269 (172%) and on cooking ovens from 154 to 442 (187%). Deaths associated with flexible tubing increased from 77 to 194 (152%) and deaths due to the mistaking of taps close together increased from 22 to 46 (109%). Escapes of gas outside the home (that is, from main pipes) caused 47 deaths in the first five years and 82 in the second, an increase of 74.5%. Deaths in industry decreased from 100 to 89 (11%).

Liability to Gas Poisoning

Two groups of investigations specially made for the subcommittee show how elderly people are particularly prone to fall victims to gas accidents. The first of these was a survey of a sample of old people living in a metropolitan borough. Nearly all of them used gas cookers; some 19% of these required attention, though only 1½% (4) needed to be replaced because of serious defects. A rough assessment of the old people's capabilities based in part on information from the subjects themselves suggested that 10% were likely to be especially prone to accidents with gas appliances, owing to sensory or motor defects.

The second group of investigations was to determine the sensitivity of old people to the smell of town gas. Between 40 and 50 patients of the geriatric unit of a London hospital were tested for their capacity to detect and identify the smell of gas (as well as other odours). The subcommittee found that the results had to be treated with some reserve, one reason being that some patients who were most anxious to please were prepared to smell gas in any mixture submitted to them. Moreover, most of the patients were in bed and did not find it easy to use the apparatus comfortably. The results suggested, however, that the minimum detectable concentration of gas for women over the age of 65 is much higher (2.5 parts per 1,000) than that for the age 20-50 (0.7 parts per 1,000), and that the variation is very much greater.

Rescue and Prevention

The only safeguard for more than short exposures to gas is an air-line or oxygen breathing apparatus. A canister gas mask is of strictly limited benefit. The main stop-cock in every house should be within easy reach, windows and doors should be opened immediately to allow gas to disperse, and bare lights or sparks must be avoided. Administration of pure oxygen should be started as soon as possible and artificial respiration performed if necessary. The subcommittee suggests that every fire and ambulance station should be provided with a mechanical respirator. The Gas Council is studying the possibility of giving gas a more pungent smell, but it is thought that tear gas would be ineffective as a warning when people were asleep, and a sneezing substance might increase the risk of bronchial trouble after exposure to gas. Communal meters—a known danger—are being rapidly replaced. Taps which have to be pushed in before they can be turned are the safest type. Various automatic devices are being studied or are already on the market to ensure that when gas is emitted it shall be lit. The law makes it mandatory on the local authority to look after the health and welfare of old people, and any changes required to make gas appliances safer, and more handy for these people would be a justifiable expense. The subcommittee's recommendations are given verbatim below.

Recommendations

- (1) The main stop-cock to the gas supply in a house should always be easily reached and well marked.
- (2) The precautions needed to promote safety in rescuing cases of coal-gas poisoning should be more widely known.
- (3) Self-acting artificial respirators should be available at every fire station and ambulance station.
- (4) Research should continue on the practicability of reducing the carbon monoxide content of coal gas and the influence of this on the incidence of coal-gas poisoning.
- (5) The Gas Council should continue its efforts to discover a yet more distinctive or pungent smell to make the presence of coal gas still more obvious.
- (6) Communal meters should be replaced by individual ones as quickly as possible.
- (7) The installation of gas-pipes and appliances by private contractors should conform to the standards laid down by the Gas Council, and the appliances supplied should pass suitable tests for safety in use.
- (8) Attention should specially be paid to flexible tubing and its connexions and any worn or faulty tubing should be replaced.
- (9) Gas boards should cut off the supply of gas when there is any reason to believe leaking fittings or unsafe appliances are being used.
- (10) Safety gas-taps should be fitted to all appliances, and as soon as possible some convention should be adopted by makers of appliances to denote by colour or some other device the tap for oven, hot-plates, etc.
- (11) The proper spacing of taps to avoid confusion should also be attended to, and blind or partially blind people should have appliances in which the various taps are distinguishable by touch as well as by position.
- (12) Automatic ignition and/or safety devices which prevent the escape of unburnt gas if the flames are blown out or the gas is not ignited should be further developed and popularized. Every effort should be made to sell such appliances at prices competitive with those not so fitted. Special efforts should be made to produce for old people who are accident-prone a small oven or cooker fitted with such a device, to be made available on the easiest terms possible.
- (13) The ventilation of old and converted property should receive careful attention.
- (14) People should be warned of the dangers of stopping up ventilators, etc., when coal-gas appliances are used (quite apart from the general danger to health of this practice).
- (15) All over the country steps should be taken to bring the hazards from coal gas to the attention of statutory and voluntary workers among the aged. This could be done through their central co-ordinating bodies, the Women's Voluntary Services, the National Council of Social Service, etc. Meetings should be arranged with the local officers of the area gas boards so that co-operation and collaboration can be achieved.

(16) In the same way, doctors, district nurses, health visitors, and others should be asked to notice the gas appliances used by their patients and be made aware of the willingness of the gas board to correct any defect observed.

(17) All local authorities should do their utmost to see that the gas appliances of old people are properly suited to their requirements, and more use should be made of statutory powers to achieve this result.

(18) Educative but not alarmist publicity should be provided through press, radio, and television to indicate the dangers in the use of coal gas, particularly to the aged and infirm, and also to explain how easily many of these dangers can be avoided. The public should be induced to demand and suppliers urged to provide safety devices which comply with the standards of established safe practice.

FORENSIC MEDICINE

The Forensic Medicine Subcommittee of the Private Practice Committee met recently and reappointed Dr. D. TEARE as its chairman for the session.

Mileage Allowance

In connexion with the Coroners (Fees and Allowances) Rules, 1955, it was learnt that the Home Office had expressed doubt whether the provision of a travelling allowance for the performance of a necropsy could be made in a local authority schedule, as previously was the case. Following representations made by the Subcommittee, it was understood that the Home Office now intended to amend these Rules to provide for these travelling expenses. A deputation was appointed to attend the Home Office to urge that these allowances should be in accordance with Association policy.

Model Schedule

An interview is to be sought with the associations of local authorities to discuss a model schedule of fees, allowances, and disbursements payable by coroners under Section 25 of the Coroners Act, 1887.

It was reported that representations that higher fees should be paid to highly qualified pathologists for post-mortem examinations of special difficulty had not found favour with the Home Office—a view which the Subcommittee deplored.

Appointment of Coroners

The Committee endorsed the view of a B.M.A. Division that the appointment of a whole-time local authority employee to the post of coroner was undesirable, and that the office should be held by an independent person.

Many inquiries had been received whether fees for certificates issued at the request of the police in cases of sudden death should be claimed from the police or coroner. It was the unanimous view of the Committee that until death had been certified the matter could not be one for the coroner, and if the doctor had been called by the police they alone were responsible for his fee.

It was reported that in one B.M.A. Division there had been discussions with the local police, who had experienced difficulty in finding a doctor to examine a person charged with driving a car while under the influence of drink. It was the view of the Committee that the solution was for the police to make police-surgeon appointments remunerated in accordance with the revised B.M.A. scale.

Witnesses' Allowances

Representations are to be made to the Home Office concerning the inadequate fees paid to witnesses called by the prosecution in non-indictable cases in England and Wales.

LIBRARY OPENING HOURS

The need for fuel economy has made it necessary to change the hours during which members may use the Library. Until further notice, the Library will open at 9 a.m. and close at 5.30 p.m.

PRESCRIPTION CHARGES

The London Executive Council passed a resolution on November 22 disapproving the Government's intention to increase the prescription charges from 1s. per prescription to 1s. per item. In the council's opinion the proposal was a serious threat to the principle of a free National Health Service and the additional charges would discriminate unfairly.

SIGHTHILL HEALTH CENTRE

The third annual report of the Sighthill Health Centre, Edinburgh, records the appreciation of the general practitioners of the facilities provided. There has been an increase of 371 in the lists of centre doctors, the total for 11 principals now being 17,100. The scope of the laboratory work has extended from urine testing, haemoglobin estimations, and blood counts, to blood urea and blood-sugar estimations. This year a sterile syringe service has been started under the supervision of the chief pharmacist. Another innovation, not yet fully developed, is an old people's health and welfare club whose 60 members meet one afternoon a week to "play games, take part in Scottish country dancing, listen to talks on health subjects, and see health and other interest films." Admission to membership includes medical examination. Applicants must be recommended by the person's family doctor, and treatment for any conditions discovered is arranged through him.

The centre is said to be becoming the recognized meeting-place of all social workers in the area, and co-operation between them is developing successfully.

PETROL RATIONING

Further instructions on petrol rationing and the medical profession have been issued by the Ministry of Health.

General practitioners should apply for a supplementary allowance to the regional petroleum officer, as stated in last week's *Supplement* (p. 196). Should any difficulty arise, doctors in the National Health Service should ask their local executive council for supporting evidence. It is expected that in such cases the council will consult the local medical committee. Private practitioners should apply for supplementary coupons to the regional petroleum officer. The Association has approached the Ministry of Fuel and Power about arrangements for private practitioners in case of difficulty.

Hospital Medical Staff

Boards of governors and regional hospital boards will be issued with a supply of coupons to cover the various services for which they are responsible. "For private cars used on hospital business . . . by their employees," a Ministry circular states, "a comprehensive allowance will be made." Boards will be responsible for allotting coupons from this comprehensive allowance as seems best to them. Inquiry at the Ministry of Health revealed that the term "employees" covers hospital medical staff. Hospital medical staff should therefore apply to their board of governors or regional board for supplementary petrol coupons for their N.H.S. work.

Consultants and specialists should apply to the regional petroleum officer for supplementary coupons for their work outside the National Health Service. As with general practitioners in private practice, the Association has approached the Ministry of Fuel and Power about arrangements in cases of difficulty. It is hoped that information about this will be available shortly.

Local Authority Medical Officers

Local authority medical officers should draw their supplementary coupons from their local authority.

REGIONAL PETROLEUM OFFICES

Region	Address	Area Covered
London North	Government Buildings, London Road, Stanmore, Middlesex	London north of the River Thames, and the counties of Essex and Hertfordshire lying within the Metropolitan Police area
London South and Eastern	Government Buildings, Ruskin Avenue, Kew, Surrey Block D, Government Buildings, Brooklands Avenue, Cambridge	London south of the River Thames, and the counties of Kent, Surrey, and Sussex The counties of Norfolk, Suffolk, Cambridge, Huntingdon, Isle of Ely, Bedford, and those parts of Hertfordshire and Essex lying outside the Metropolitan Police area

GENERAL MEDICAL SERVICES COMMITTEE**INCREASED COST OF PRESCRIPTIONS**

A meeting of the General Medical Services Committee was held at B.M.A. House on November 15, with Dr. A. B. DAVIES, acting Chairman, in the chair.

It was stated that Dr. Talbot Rogers was making good progress and hoped to be back again in the New Year. Dr. F. G. Tomlins, of Chingford, was co-opted to the committee as a representative of unestablished principals, and Dr. R. D. Jones, of Cheadle, as representative of assistants.

Remuneration

Attention was drawn to newspaper reports of an address given by the Minister of Health to the Conference of the Executive Councils Association (England) (*Supplement*, October 27, p. 167). The Minister had spoken of "a pleasant surprise for the doctors," and this had been taken up by the Press in such headings as the *Birmingham Post's* "Minister's Reply to Doctors' Pay Claim." The Chairman of Council had pointed out to the Minister that such a statement gave the general impression that the profession's claim for additional remuneration had been partially met, whereas the Minister's reference was to the adjustment to present-day values of money of that part of the pool that dealt with practice expenses. This had nothing to do with the present remuneration claim, and indeed was already

provided for under a system of investigation agreed upon with the British Medical Association.

The committee endorsed with applause the prompt action taken by Dr. Wand.

Central Pool, 1954-5

A statement was submitted by the accountants on the calculation of the final settlement due to general practitioners in the National Health Service for the year 1954-5. The amount of the balance due was £4,257m. The number of doctors in the Service during 1954-5 was 21,133. The amount required to provide a net income of £2,222 per doctor was £46,958m., and the amount for practice expenses was £23,549m.—making a total gross income of £70,507m. The remuneration already received was £66,250m.

Charges for Prescriptions

Report was formally made that the Government had decided to alter the basis of the shilling prescription charge, making it payment per item instead of payment per prescription. Representatives of the committee had met the Ministry of Health on November 15, and had protested in the first place that the change in prescription charges had been decided without previous consultation with the profession. It was emphasized that the introduction of the new charges would cause hardship to certain patients. Patients with certain types of illness would be particularly hardly affected by having to make in future a relatively heavy payment solely for several necessary items. Moreover, many patients would not go to the National Assistance Board, however difficult their circumstances. The new charges might well have an effect on treatment, for doctors were bound to take into consideration the financial position of their patients, and might feel debarred from prescribing something because the patient could not afford an extra shilling. The deputation placed on record its opposition to the Minister's proposals, and asked that its views should be made known to the Minister.

In the course of a somewhat lengthy discussion a strong feeling was evident in the committee that the policy that there should be no charge at all for prescriptions should be reaffirmed. Dr. J. A. PRIDHAM urged that persons suffering from specified conditions should be excepted from the new provisions. It was also urged that now was the time to draw up a list of life-saving drugs which would be free to all, leaving other items to be paid for by the patient. The majority attitude was that all drugs should be free.

The Committee then adopted a resolution confirming its adherence to the Association's policy that there should be no charge for prescriptions and that the Committee was therefore particularly opposed to the Government's present proposals which sought to extend the existing charge in a manner which would discriminate against certain categories of patients.

Corticotrophin (A.C.T.H.) Supply

A communication was read from the Ministry of Health pointing out that up to the present A.C.T.H. had been bought by the Ministry direct from the manufacturers and had been issued free of charge to selected hospitals. The Minister was anxious to reduce restrictions on supply so far as possible, but had been advised by experts that, in view of the variability both in strength and in activity of different products and indeed of different batches of the same product, therapy should be controlled by biochemical measures only available in hospitals. In the interests of the patient, therefore, the Ministry could not contemplate a general release, at least for the present.

It was stated that the demand for A.C.T.H. was not great and had tended to decrease. In these circumstances it seemed to the Committee that there could be no objection to such an arrangement.

The Committee indicated its general concurrence, but expressed the hope that a general practitioner could obtain further supplies of A.C.T.H. directly from the hospital in cases where it was known that the consultant in the case wished it to be continued.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Senior Registrars and Consultant Appointments

SIR.—Dr. H. Joules's letter (*Supplement*, October 20, p. 163) regarding the consultants is indeed timely. From my experience I have no doubt that the establishment of consultant physicians and surgeons is too small to deal with the mass of work which awaits their care. The surgical consultants are extended to the full with major operations, while large numbers of otherwise well patients with chronic appendices, herniae, varicose veins, and piles, etc., wait for months, or possibly years, for attention. They are frequently operated on by house officers and surgical registrars where consultants are fortunate enough to have their help. Earnest though these men are, they are often without the necessary training and supervision.

I think that it is a national need that the office of assistant physician and surgeon be reintroduced, and that our registrars, who have carried the burden of emergency and night work for so many years, be given status and reasonable security after their arduous and expensive training. Another factor is that our consultants should not be so fatigued that they lose freshness, and have not time for reading, attending meetings, and contributing to their specialty for which their great experience fits them. I earnestly hope that the appointments of assistant physician and surgeon be revived.—I am, etc.,

London, W.1.

HAROLD DODD.

SIR.—I wish to draw attention to the present-day plight of the so-called trainee specialists of the National Health Service. There is much to suggest that the chances of promotion from senior registrar to consultant are less at this moment than at any time, and, though it is freely stated that in 10 years all will be well, the present situation is none the less critical.

I quote statistics abstracted from "Consultants and Other Specialist Staff in the National Health Service" (*Supplement*, June 30, p. 409).

I have arbitrarily surveyed the state of affairs pertaining to five specialties—i.e., general medicine, general surgery, anaesthesia, obstetrics and gynaecology, and orthopaedic surgery.

The absorption of senior registrars into consultant practice depends on three factors: (1) expected retirement vacancies, (2) unexpected retirement and death vacancies, (3) new appointments. It is obvious that one can only consider appointments resulting from (1) and (3). For the purposes of simplicity a consulting post is accepted as having a nine-session basis. It is noted that there are a limited number of consultants over retiring age with a varying number of sessions.

TABLE I.—State of Affairs at June, 1955

A	B	C	D	E	F	G
Specialty	Total Number of Registrars	No. of Consultants Over Age of 65	No. of Sessions Held by C	Theoretical Number of Posts Held by C on 9-session Basis	Excess Senior Registrars Over June, 1955	Year of Absorption on Basis of Retirement at 65
General surgery...	203	46	246	27	176	1964
...medicine	205	35	206	23	182	1966
Anaesthesia ..	62	13	84	9	53	1961
Obstetrics and gynaecology ..	104	20	144	16	88	1965
Orthopaedics ..	67	12	40	4	63	1967

Table I demonstrates that, on the basis of senior registrars being entirely absorbed by retirement vacancies, at the

best it will be many years before the present senior registrars are absorbed.

TABLE II

Specialty	Absorption Time
Anaesthesia ..	5 years
Medicine ..	10 "
Surgery ..	8 "
Obstetrics and gynaecology ..	9 "
Orthopaedic surgery ..	11 "

Table II considers only the present number of senior registrars, and does not, of course, include any further replacement appointments until such time as absorption is complete.

Following the war numerous new consulting posts were made; this trend is now ceasing. Table III demonstrates that there is a progressive decline in the introduction of new consulting posts.

TABLE III.—All Specialties are Considered Here

	Increase in Number of Consultants Over Previous Year	Percentage Increase
1950 ..	514	8.9
1951 ..	243	3.9
1952 ..	386	6.0
1953 ..	217	3.2
1954 ..	146	2.0
1955 (½ year) ..	80	1.1

If we consider the five specialties analysed here, we find that in 1950 there was an increase of 230 consultants, but in 1954 this number had fallen to 77 (of which 34 were in anaesthesia). Should this trend continue it is obvious that new appointments can have little effect on improving the over-all picture, and, with the present social structure of our country, income tax, etc., it is unlikely that there will be many premature retirements.

It is unnecessary for me further to highlight the unpleasant facts as demonstrated above; it is sufficient to say that drastic action is required now. I have been assured that these facts are widely appreciated. However, I regret that I can find little evidence of any positive action being taken, and this is not a self-resolving complaint.

I suggest the following measures: (1) Some form of guarantee of future employment should be made to senior registrars, and present contracts should be extended beyond the four-year period if necessary. (2) Replacement senior registrar appointments should be reduced to a practical minimum until the present excess is absorbed. (3) A greater number of new consulting posts should be made, which could, if necessary, be made non-recurring. (4) Salary scales should be reviewed. At present there is only slight difference between registrars and senior registrars, but considerable difference between senior registrars and consultants. I would suggest that a suitable salary would be £1,100 on appointment, rising by £200 a year up to £1,700 by the fourth year. (5) Further information should be divulged by the Minister of Health showing his appreciation of the problem and the measures he intends adopting.—I am, etc.,

Oxford

T. H. MORGAN.

SIR.—Of course Dr. H. Joules is right in his letter (*Supplement*, October 20, p. 163) in writing of senior registrars, and so is Dr. J. H. Thomas in his letter on S.H.M.O.s in the same issue (p. 164). My only comment is that they have shown dignified restraint in the expression of feeling.

In this context let me say that the term "exploitation" would best describe the prevailing feeling among too many of our colleagues, not only senior registrars and senior hospital medical officers but non-consultant hospital medical staff at all levels. It is no exaggeration to say that the bulk of non-consultant hospital doctors are frustrated and dissatisfied under the present iniquitous terms and conditions of service. Why do we so complacently tolerate a state of affairs that is in fact intolerable? Some of us strive hard to draw attention to the very real grievances, injustices, and

hardships among our junior colleagues, but unfortunately it is a time-consuming battle against conflicting interests. I hope, however, that the struggle will not be in vain.—I am, etc.,

London, N.20.

F. STEEL.

Admission to Hospital

SIR.—From Dr. G. F. Abercrombie's letter (*Supplement*, November 3, p. 179) it seems clear that a hospital may, without outside authority, set up an extra bed for an urgent admission if it so desires. This is the point I wish to bring out.

I do not criticize the efficiency of the E.B.S. in arranging admissions, and would like to reaffirm in writing my verbal appreciation of that service's help on the occasion I mentioned in my last letter (*Supplement*, October 20, p. 165) and on other occasions.—I am, etc.,

London, W.5.

C. J. COBBE.

Payment of Compensation

SIR.—Now is not the time, I suppose, to push forward salary claims, but I can see no reason why the vexed question of compensation should not be calmly considered again, even in these times. Many doctors with large commitments of various kinds, such as educating their children at university level and employing the various help which is necessary after middle age, find themselves in the "red." This, of course, has been accentuated by the credit squeeze, and they therefore have to find 6% of the amount that they are overdrawn.

The suggestion I have to make is this: Assuming that the compensation amounts to £5,000, the Government should pay back annually 6% of this amount—i.e., £300. The interest for the following year would be reduced proportionately. In this way compensation can be paid back in easy stages and no great strain would be placed on the resources of the Exchequer.—I am, etc.,

Ruthin, Denbs.

TREVOR HUGHES.

Remuneration Claim

SIR.—At a recent Branch meeting I was alone in voting against agreeing to the principle of demanding more pay (although several abstained). To me, it seems obviously unpatriotic to do anything to cause further inflation, and a wage increase for us would do that. I do not see how any Government can honour the Spens recommendations when as policy they are resisting wage claims, and I suggest that it would be a statesmanlike action for us to renounce them. This would also be prudent, as I presume that they can act in reverse, so that the Government could claim on us if there was a slump.

There are, however, several ways in which we could be financially helped without causing inflation; a widows' pension scheme could be introduced so that we could cut down on our insurance policies; our retirement pensions could be increased; interest-free loans could be introduced to cover the purchase of surgery premises, houses, equipment, and even cars; the cost of locums could be provided in cases of sickness and even for holidays. These methods would help to improve the service as well as helping us financially, and I hope would do away with this perpetual bickering over how many decimal parts of a shilling per patient per year the capitation fee should be increased.—I am, etc.,

St. Margaret's Bay, Kent.

R. J. MELHUSH.

Filling of Practice Vacancies

SIR.—Your correspondent Dr. Isaac Rose (*Supplement*, November 10, p. 184) alleges that executive council practice vacancies are filled after canvassing and lobbying in accordance with local prejudice and favouritism. This is a most serious charge, and if Dr. Rose has any concrete evidence he should exercise his right of appeal to the Medical Practices Committee, and bring the facts to its notice. This

would be much better than writing indignant letters to the *British Medical Journal*, which must inevitably leave the suggestion of a sour grape on the mental palate.—I am, etc.,
London, E. 10.

R. A. PARRY.

Remuneration of S.H.M.O.s

SIR,—The report produced by Dr. J. H. Thomas on S.H.M.O.s' remuneration (*Supplement*, October 20, p. 164), in particular the figure showing a difference between the total consultant and total S.H.M.O. salary, is of vital importance. However, the criticism that this figure follows naturally from a difference between two differing grades of pay, and applies equally to any two such grades in medicine or industry, does not stand examination for a moment. Such adjacent grades in industry carry different responsibility in both theory and practice. In medicine this difference in responsibility is purely theoretical. In practice, S.H.M.O.s and consultants work together side by side, often in the same team, with an equal share of responsibility. With S.H.M.O.s doing a third of all the consultant work carried out under the N.H.S., no one could possibly seriously maintain that their third is in any way less important or less responsible than that of their colleagues. In the light of this, the figure of over £33,000 is of importance and is the exact measure of the injustice at present perpetrated on the S.H.M.O.

As originally agreed, the S.H.M.O. grade was to be a dying one. But Dr. H. G. McGregor, in his recent survey (p. 159), has shown that half of the registrars continuing in their specialty have become S.H.M.O.s, and half have become consultants. This makes complete nonsense of the dying-grade claim, and shows clearly that the grade is being used as cheap consultant labour. I commend the consultants' attention to this dilution of their labour. Another criticism of the S.H.M.O.s' claim for better treatment is that this is an inopportune moment to ask for 80% of the consultants' scale. Those who make this criticism have yet to say when an opportune moment may arise. Meanwhile, if we stand aside and await the new medical staffing structure, we can be sure that the Ministry will find a still lower grade of salary and status, instead of a higher one.

Accordingly, I feel that all S.H.M.O.s must keep up their demand for better treatment and for 80% of the consultants' salary scale, and that the best way of doing this is to support the S.H.M.O. Group within the structure of the B.M.A. I have no hesitation in asking those S.H.M.O.s who have not already done so to pay their 6 guineas and join the B.M.A., because the B.M.A., by its efforts through the Group, has already secured an award which those S.H.M.O.s would not have had otherwise.—I am, etc.,

Reading.

J. A. RANKIN.

Notional Lists

SIR,—To precisely what extent do we single-handed practitioners subsidize the "notional list" arrangements, of which our colleagues in partnerships very naturally take advantage? The question arises when one considers the observation of the acting chairman of the G.M.S. Committee (*Supplement*, October 27, p. 169) that, in his opinion, the M.P.U.'s scheme for a pool of locumtenents would be "likely to fall down on finance."

It seems clear that in the majority of cases practitioners in partnership should ordinarily be able so to arrange their affairs that they need not employ locums. Are we not already paying to make this easier for them? There must be many single-handed people like myself who cannot in any circumstances afford an annual holiday. When we do get away we must sponge on the hospitality of our friends because present-day locum fees are so high that we just cannot find the money for hotel charges as well. If the subsidy which perforce we pay amounts to a considerable sum, it would surely be equitable that a similar amount should be used to finance the necessary arrangements to make locums available without charge to single-handed practitioners.

Obviously my suggestion is a very damp squib, if the cost of the "notional list" is negligible, but is it? I cannot remember having ever seen any figures published. It should not be impossible to obtain them.—I am, etc.,

Launceston, Cornwall.

DONALD M. O'CONNOR.

Patients' Beliefs

SIR,—A paragraph in the report of the Edinburgh general practitioners' meeting (*Supplement*, November 10, p. 181) concerning patients' ignorance about the N.H.S. prompts me to report the following incident.

The tax disk on my car bears the letters N.I. (Northern Ireland). A few weeks ago a patient stopped to examine it more closely and then said: "I see the National Insurance people pay for your car as well."—I am, etc.,

Blandford, Dorset.

ASHLEIGH ROUNDHILL.

Increased Prescription Charge

SIR,—Here are suggestions which will satisfy all concerned. (1) Maximum number of items allowed on form E.C.10 to be two. (2) Contract several items which need to be prescribed frequently into prescribing units (counting as one item), thus: "Diabetic outfit No. 1, 2, etc." or "post-operative dressing unit A, B, C," "colostomy dressing unit," etc. (3) Refund charges to those genuinely unable to pay. (4) Inform the public unmistakably and impressively of the small part which "Health Insurance" represents in their weekly contribution to the National Insurance, and point out the large return for it. (5) Relieve the G.P. from all (implied or factual) obligations (a) to consider the cost of drugs, (b) to inquire into the financial status of the patient (quasi means test), (c) to consult the book of categories which allow or forbid prescribing of a drug. These are a waste of time and temper and money, and cause much ill feeling—in short, evil things. May we soon be delivered from them.—I am, etc.,

Hull.

L. M. SEEWALD.

Criticism of the Health Service

SIR,—It is quite apparent that the disquiet felt by many of us since the idea of the Health Service was first mooted, and which has grown with years of working in the Service, is at last coming to the surface. The meeting of general practitioners in Edinburgh voiced this disquiet (*Supplement*, November 10, p. 181), and apparently the Council of the British Medical Association agrees that all is not well (*Supplement*, November 17, p. 187). The time has come now to consider what can be done about it. I think that, as the various Governments have shown that they are not really interested in the welfare of the doctors in the Service, the medical profession should, as a whole, consider how they can make themselves independent of the Health Service and of governments—at least to a certain extent.

I would say that this can only be done by encouraging, in every way, private practice, and we should all consider how this can be done, and should go out of our way to work at all times to increase the public's knowledge of the fact that private practice is still the best relationship between doctor and patient, and always will be. In addition, if the Government will not pay for medicines for private patients, let us try to interest the insurance companies, such as B.U.P.A., in the possibility of launching an insurance scheme for private patients—perhaps to pay the cost of the G.P.'s fees, but certainly to pay for expensive and life-saving drugs and appliances. Coupled with this insurance scheme, of course, should be vigorous publicity for the idea of such premiums being discounted for income tax—a reasonable suggestion in view of the saving to the Exchequer that such a scheme would provide. In addition, the iniquity of the present system of assessing the cost of a private room in hospitals should be exposed. The prices of these rooms should be reduced to make some allowance for the patient's loss in surrendering his right to have free most of those services for which he is surcharged when he chooses to go into a private room.

As doctors, we have worked hard in the Health Service, not because the governments have made us but because we have our duty to our patients, born of long tradition and professional ideals. That is why, to the patients, the Health Service is apparently a success and why it has not ground to a standstill before now. As doctors, however, we have been too quiet about the faults of the system, no doubt because it is difficult to argue against the Health Service without appearing to be mercenary. However, despite the efforts of the administrators to decry us, we are still the experts, and it is our duty to end the "conspiracy of silence." Perhaps the Health Service will be recast; we should work for this also, and this time it should be our scheme that should be adopted. Personally, I would like to see a fee for item of service introduced, and, if possible, that principle should apply also in the hospital service. (How ridiculous it is that we should ever have permitted surgeons, for instance, to be called in at all hours to perform emergency work without special remuneration—and this applies to the general practitioners also.) Nevertheless, even should the Health Service be amended, we as a profession must strive to regain our independence, and the only way that that can be done is by a revival of private practice through all our branches. It was to preserve the independence of the medical profession that men like Lord Horder and many others worked so hard, and we can now see how right they were. Above all, we must realize that, whether we be consultants or general practitioners, medical officers of health or child welfare clinic doctors, the struggle to improve our conditions, if successful, will in the end react to the good of us all, and therefore we must press our case as a united profession.—I am, etc.,

Sevenoaks, Kent.

HUGH R. C. HAY.

SIR,—I have read with interest the criticism of the National Health Service (*Supplement*, November 10, p. 181). Edinburgh is right, medicine should be divorced from politics. The latest example of Government control is the proposed shilling for each item on a doctor's prescription. As far as one can judge by the volume of criticism from doctors in all parts of the country, and from dispensing chemists, this proposal has been made with scant consideration for their views. It has been made because it is in accord with the economic policy of the party in power; its effect on the practice of medicine is evidently of secondary importance.

It is true that the vast majority of patients still labour under the delusion that the weekly stamp covers most, if not all, of the cost of the National Health Service; some speak openly of getting value for their weekly contribution. This was emphasized also in the Guillebaud Report (paragraph 718), but, alas, there was no recommendation with a view to the correction of this horrible fallacy. I believe that, if the finances of the N.H.S. were completely separated from the National Insurance Fund, this would be of benefit to the practice of medicine and ultimately to the Exchequer.

Edinburgh is right—"the present structure of the N.H.S. is fair neither to the patient nor to the doctor." The time has surely come for consideration by the Government and by the profession of the suggestion that a national board or corporation should be established to administer the National Health Service. This suggestion was brushed aside altogether too summarily in the Guillebaud Report, paragraph 730, subsection 5.—I am, etc.,

West Candon, Surrey.

C. P. WALLACE.

Widows' Pensions

SIR,—I feel that there may be many practitioners who are unaware of the precise position of the pension their wives will receive. The very important fact to be remembered is that no widow's pension is payable unless her husband has served ten years in the National Health Service.

Every practitioner who entered the Service on the appointed day (July 5, 1948) still has eighteen months to go

(July 5, 1958) before his wife would be entitled to a pension, should he have the misfortune to die between now and July 5, 1958. By writing to the appropriate authority I have found out that if I die between now and July 5, 1958, my wife would receive no pension at all, but if I died on July 6, 1958, she would receive approximately £270 per annum for life or until she remarried. The discrepancy is very marked.

Until I received the courteous reply to my queries from the authorities I was completely unaware that a widow's pension is one-third of her husband's pension, but it is rated up so that it cannot be less than one-third of that pension a doctor would receive had he served for 20 years. To neutralize the discrepancy I have insured my life from the present time until July 5, 1958, for the sum of £5,500 (this sum invested at 5% would produce £275 per annum) for one premium of £75, and there is some income-tax relief. Lloyds quote 27s. 6d. per cent., but tariff companies quote a higher figure. Obviously the amount varies with the age of the applicant and the sum required to produce on investment a figure equivalent to the estimated pension.

Perhaps most practitioners are more cognizant with the position than I was until I made my inquiries, but should any doctor be made more conscious of some facts of which he was unaware and rectify his affairs by adopting the method I have outlined, for what must be considered a comparatively small sum, then, I feel, this information may be of some help to our profession.—I am, etc.,

Burnham, Bucks.

H. M. JAKES.

POINTS FROM LETTERS

Fining the Doctor

Dr. G. DAVID (London, N.W.4) writes: I have read with interest and amusement Dr. B. J. Bouché's letter (*Supplement*, October 13, p. 157). Overseas doctors view with horror the collapse of the doctor's status in a civilized and cultured country. They wonder how this state of affairs has come about and why we do nothing to remedy it. . . . He who pays the piper orders the tune. We are now . . . subject to the laws, by-laws, and regulations laid down and constantly added to by the Minister. Eight years after the acceptance of the terms of service doctors are being fined and penalized like common offenders of the law. In yet another eight years' time we may be glad to get away with a fine only, for not standing to attention on the entry of one of our registered patients. And why do we not rebel against this not so fantastic prospect? The answer is again a simple one—economic pressure and no guts.

Training of Administrators

Captain J. C. F. HEALEY, R.A.M.C. (B.A.O.R. 26), writes: I note with interest that students being trained for "high administrative posts" in the National Health Service are to receive £520 a year rising by £20 a year. A doctor in his first year in hospital—after six years of training—receives an average of £450. I suppose this might be called the writing on the wall.

H.M. Forces Appointments

ROYAL NAVY
ROYAL NAVAL VOLUNTEER RESERVE
Surgeon Lieutenants K. W. Symons and R. T. Routledge to be Surgeon Lieutenant-Commanders.

ROYAL ARMY MEDICAL CORPS
Captain E. R. Smith-Owen to be Major.

HER MAJESTY'S OVERSEA CIVIL SERVICE

The following appointments have been announced: F. O. Adewole, M.B., Ch.B., D.T.M.&H., Specialist Surgeon, Federation of Nigeria; G. G. Bisley, M.R.C.S., L.R.C.P., D.T.M.&H., D.O., Specialist (Ophthalmic), Medical Department, Kenya; J. O. Mabayoje, L.R.C.P.&S., M.R.C.P., Specialist Physician, Federation of Nigeria; I. H. Marrable, M.R.C.S., L.R.C.P., Senior Medical Officer, Tanganyika; B. Nicholson, M.B., Ch.B., D.P.H., Senior Leprosy Officer, Western Region, Nigeria; D.T.M.&H., M.T. Read, M.B.E., M.C., M.R.C.S., L.R.C.P., D.T.M.&H., Deputy Director of Medical Services, Sarawak (secondment to Brunei); K. M. Basu, M.B., M.R.C.P., H. Wolvetang, M.D.

and M. A. Dalby, M.D., Medical Officers, Gold Coast; H. F. Hamilton, M.B., M.R.C.P., Junior Physician, Medical Department, British Guiana; V. I. Massiah, M.B., B.Ch., I. Dial, M.B., Ch.B., and C. O. King, M.B., Ch.B., Medical Officers, Grade B, Trinidad; K. McCormack, M.B., B.Ch., Medical Officer, Tanganyika; A. E. Norsted-Jorgensen, M.D., Medical Officer, Gambia; L. A. Phillips, M.B., B.S., D.A., Medical Officer (Anaesthetist), S.P.H.S., Fiji; J. A. Sempie, M.B., B.Ch., Senior Medical Officer, St. Kitts Nevis-Anguilla; M. Slade, M.R.C.S., L.R.C.P., Health Officer, Brunei; F. R. Store, M.R.C.S., L.R.C.P., Medical Officer, Cyprus; Janet W. Anderson, M.B., Ch.B., D.Obst. Branch and Division Meetings to be Held

ALDERSHOT AND FARNHAM DIVISION.—At Northfield Hospital, Aldershot, Wednesday, December 5, 8.30 p.m., meeting. Lecture by Mr. W. G. Holdsworth: "Burns."

BARNET DIVISION.—At Barnet General Hospital, Friday, December 7, 8.15 p.m., clinical meeting.

BATH, BRISTOL, AND SOMERSET BRANCH.—At Hawthorns Hotel, Woodlands Road, Clifton, Bristol, Wednesday, December 5, 8.30 p.m., annual general meeting. Presidential address: "The Patient."

BOLTON DIVISION.—At Gymnasium of Bolton Royal Infirmary, Thursday, December 6, 8.30 p.m., meeting.

CAMBERWELL DIVISION.—(1) At Gordon Museum, Guy's Hospital, S.E., Wednesday, December 5, meeting. Talk on Museum exhibits by Dr. C. Keith Simpson. (2) Friday, December 7, luncheon at invitation of Messrs. Arthur Guinness, Park Royal. Leave St. Olave's Hospital, Rotherhithe, S.E., 11.30 a.m. Return 4.30 p.m. Guests are invited.

DARTFORD DIVISION.—At Lecture Theatre of the Nurses' Home, West Hill Hospital, Dartford, Thursday, December 6, 8.30 p.m., meeting. Dr. J. D. Kershaw: "Medical Services in the U.S.S.R." (illustrated by slides).

DUDLEY DIVISION.—At Station Hotel, Dudley, Tuesday, December 4, 7.45 for 8.15 p.m., supper meeting. Address by Professor H. C. McLaren: "Gynaecological Carcinoma." Medical guests are invited.

EAST HERTS DIVISION.—At Teaching Unit, Lister Hospital, Hitchin, Thursday, December 6, 8.15 p.m., meeting. Papers by Dr. J. R. B. Williams: "Peripheral Neuritis"; Mr. G. E. Stein: "Sinusitis." Also short papers by Dr. C. G. Fagg, Mr. J. J. Shipman, and Mr. A. G. Young. Members of South Bedfordshire Division are invited.

GLASGOW DIVISION.—At Hall of Royal Faculty of Physicians and Surgeons, 242, St. Vincent Street, Glasgow, Thursday, December 6, 8.30 p.m., meeting. B.M.A. Lecture by Dr. T. Rowland Hill: "Common Lesions of the Spinal Cord; the Investigation and Management of Cases."

GRIMSBY DIVISION.—At Winter Gardens, Cleethorpes, Thursday, December 6, 8 p.m. to 1 a.m., annual dance.

GUILDFORD DIVISION.—At Royal Surrey County Hospital, Guildford, Thursday, December 6, 8.30 p.m., meeting. Lecture by Dr. Macdonald Critchley: "Corporeal Awareness."

HARROW DIVISION.—At the Tithe Farm House, Eastcote Lane, South Harrow, Tuesday, December 4, 8.30 p.m., meeting. Dr. D. P. Stevenson (Deputy Secretary, B.M.A.): "Some Current Problems, Including Remuneration"; Mr. John Pringle (Public Relations Officer, B.M.A.): "The Public Relations Problem." Members of West Middlesex Division are invited.

HASTINGS DIVISION.—(1) At Royal East Sussex Hospital, Hastings, Tuesday, December 4, 8.15 p.m., clinical meeting. (2) At Marine Court Restaurant, Friday, December 7, 7.30 for 8.15 p.m., dinner dance.

HYDE DIVISION AND GLOSSOP MEDICAL SOCIETY.—At Macclesfield Arms Hotel, Friday, December 7, 8.30 for 9 p.m., annual dinner-dance.

KESTOVEN DIVISION.—At George Hotel, Grantham, Thursday, December 6, 7.15 for 7.30 p.m., dinner. Address by Dr. A. E. Clark-Kennedy: "The Dying Patient."

NORTH-EAST ESSEX DIVISION.—At Nurses' Recreation Room, Colchester Maternity Hospital, Lexden Road, Monday, December 3, 8.30 p.m., meeting. Lecture by Mr. M. Bates: "Early Diagnosis of Cancer of the Lung" (illustrated by slides).

RUGBY DIVISION.—At the Grand Hotel, Rugby, Thursday, December 6, 8 for 8.30 p.m., informal supper; 9.30 p.m., B.M.A. Lecture by Mr. A. Lawrence Abel: "Carcinoma of the Breast."

ST. PANCRAS DIVISION.—At Committee Room C, B.M.A. House, Tavistock Square, W.C., Tuesday, December 4, 8.30 p.m., meeting. Dr. A. A. Mason: "Use of Hypnosis in Medicine." There will be a film and practical demonstration. Members of the City Division are invited.

SALISBURY DIVISION.—At Cathedral Hotel, Salisbury, Tuesday, December 4, 8.30 p.m., meeting. Talk by Colonel Alastair Young, R.A.M.C.: "The Medical Aspects of Nuclear Explosions." All medical practitioners are invited.

SCUNTHORPE DIVISION.—At the Blue Bell Hotel, Scunthorpe, Thursday, December 6, 8 for 8.30 p.m., annual dinner.

SHROPSHIRE AND MID-WALES BRANCH.—At Raven Hotel, Shrewsbury, Thursday, December 6, 7.30 for 8 p.m., annual dinner.

SOUTH STAFFS DIVISION.—At Molineux Hotel, North Street, Wolverhampton, Tuesday, December 4, 8 for 8.15 p.m., supper; 9.15 p.m., B.M.A. Lecture by Sir Francis Walshe, F.R.S.: "Traumatic Neurosis." Members' wives are invited.

TROWBRIDGE DIVISION.—At Roundway Hospital, Devizes, Friday, December 7, 8.30 p.m., meeting. Address by Dr. P. H. Addison: "Professional Negligence." Non-members of the B.M.A. are invited.

WAKEFIELD DIVISION.—At Monk Fryston Hall Hotel, Monk Fryston, near Leeds, Friday, December 7, annual dinner-dance.

WEST MIDDLESEX DIVISION.—At Paul's Restaurant, Broadway, Ealing, W., Thursday, December 6, 8 p.m., short programme of medical films.

WEST SOMERSET DIVISION.—At Out-patient Department, Yeovil Hospital, Thursday, December 6, 8 for 8.30 p.m., clinical meeting. Dr. J. G. Howells: "Family Psychiatry and the G.P." Members of the East Somerset Division are invited.

CENTRAL CONSULTANTS AND SPECIALISTS COMMITTEE

A meeting of the Central Consultants and Specialists Committee was held at B.M.A. House on December 6, with Mr. T. HOLMES SELLORS, chairman of the Committee, presiding. Members stood in silent tribute to the memory of the late Sir Lionel Whitby, formerly President of the Association, chairman of the Joint Consultants Committee, and a member of the Committee.

The CHAIRMAN welcomed Mr. C. E. Kindersley and Mr. A. M. A. Moore, who had accepted the Committee's invitation to serve as co-opted members for the present session.

Resolutions of the Representative Body

The Committee considered a report from its Executive Committee on the resolutions of the Annual Representative Meeting referred to it for consideration.

A resolution that the Association should take active steps to establish a system whereby the family doctor could call in a consultant pathologist to do a post-mortem examination on any of his patients who had died of natural causes and for whom he could issue a death certificate in the usual way, and a further resolution that transport should be available for the removal of corpses for post-mortem examinations at public expense at the request of the general practitioner, were considered. The latter point had already been taken up with the Ministry by the Joint-Committee, and the Chief Medical Officer had said that if the pathologist was satisfied that the interests of research would be served by a post-mortem examination there was no objection to the cost of transport being met by the hospital management committee or the board of governors. On the first point the Executive was doubtful whether it would be practical to press that a hospital pathologist should always be required to carry out a post-mortem examination at the request of a general practitioner. It was decided to ask the Consulting Pathologists Group for its views, however, before the Committee reported to the Council.

Resolutions relating to the employment of general practitioners in hospitals were next considered, and the Executive pointed out that it was the Committee's policy that hospital appointments for general practitioners should be open to all practitioners in the area and filled by competition, except in the case of joint appointments under the trainee-assistant scheme. The report of the Medical Staffing Subcommittee envisaged a much greater use of general practitioners in the hospital service. The Joint Committee had discussed the question with the Ministry, but was doubtful whether more progress could be made until the discussions on hospital medical staffing generally were concluded

and the salaries to be offered to general practitioners working in different capacities in hospitals agreed. Commenting on a resolution that general practitioners should have access to hospital facilities, including beds, the Executive Committee said that this also was the policy of the Committee, but shortage of facilities, and particularly of technical staff, made it impractical for an unlimited ancillary service to be offered at the present time.

The Committee next considered a resolution from the A.R.M. that the Council had failed to implement a resolution passed at the 1955 Annual Representative Meeting which stated that the recommendation contained in the Bradbeer Report (paras. 20-22) for equal tripartite administration of hospitals was not in the best interests of patients, and that under no circumstances should medical and nursing personnel of hospitals be under the control of lay administrators. The Executive recommended that the Central Consultants and Specialists Committee should adhere to the view expressed in its memorandum on the Bradbeer Report: that, while hospital medical staffs must have the final authority in the clinical care of patients, it accepted the principle of tripartite administration in the general running of the hospital. This recommendation was accepted.

The Committee was opposed to a resolution that posts in the mental hospital service should be included among approved house appointments for the pre-registration practitioner, except in cases where there was sufficient scope in general medicine and adequate supervision to justify a house-physician appointment. The Committee promised to keep under review the matter of the length of time taken to fulfil the pre-registration posts required by the Medical Act, 1950. A recommendation that all medical grades on the whole-time hospital staff should be allowed to pursue the practice of their profession in their off-time had already been considered by the Committee and regarded as not being practical.

In reply to resolutions urging that the Council should assume fuller responsibility for all future claims submitted by any section of the profession and that the various sections of the profession be informed of the Council's preparedness to negotiate directly at the request of any section, the Committee decided to inform the Council that in its view the present arrangements whereby each of the main branches of the profession had its own negotiating machinery should be continued. The Committee could not see how the Council could assume a fuller responsibility for Whitley negotiations, but the Council's offer to undertake negotiations on behalf of any section of the profession was welcomed. The Committee would continue to keep the Council informed of matters under discussion in relation to the hospital and consultant services.

PROTECTION OF PRACTICES SCHEME

Following discussions between the G.M.S. Committee and the Minister, regulations for protecting the practices of general practitioners called up for service in the armed Forces during an emergency recognized by the Minister came into effect on December 14.

In general terms, the scheme provides that the number of patients on a doctor's list will remain fixed during his absence, and on his return patients who have left his list but have not changed their address will be encouraged to return to it.

It is assumed that a principal will remain on the medical list and will make, and pay for, all necessary deputizing arrangements. Whilst he is away he will receive his pay and allowances from the Services and his National Health Service remuneration from the executive council. When a doctor joins the Forces the number of patients on his list will be fixed during his absence at a number equal to the average during the quarters beginning April 1 and July 1, 1956, or the two quarters immediately preceding that in which he joined the Forces, whichever is the later. Transfers to the lists of other doctors by patients who have not changed their address will be on a temporary basis. On the doctor's return from the Forces, executive councils will notify all patients, other than those who have changed their address, who were on his list when he joined up but who have transferred during his absence, that their original doctor has now resumed his practice. These patients will be replaced on his list unless they wish to continue on the list of the doctor who has been temporarily attending them. In this event the temporary doctor will be responsible for their treatment, but will receive no capitation fees for them for twelve months. The fees will be paid to the doctor returned from the Forces.

PRESCRIPTION CHARGES

The Ministry of Health has stated that some difficulty has arisen since the introduction of the revised prescription charges because doctors have ordered repeat supplies of a medicine on the initial form.

The correct procedure, which, the Ministry points out, has not been changed by the new regulations, is that when the doctor considers that treatment should continue longer than the first supply of medicine will last he may issue one or more additional orders on separate forms (or carbon copies of the original form) dated at suitable intervals. Each form should be signed. A charge of 1s. is payable in respect of each item ordered on each form.

Certain preparations which are required for immediate and continuous treatment, but which owing to their pharmaceutical nature need to be freshly prepared and supplied in separate containers on successive days, will, as before, be so supplied and only one charge will be payable. These limited types of medicament are those given in Section 4 (viii) and (ix) of Part II of the *Drug Tariff*, and they are those which need special extemporaneous preparation—namely, eye drops, some eye ointments, aqueous preparations of penicillin for external use, and sterile preparations.

HOSPITALITY

A Swiss doctor's daughter, aged 18, would like to visit a British medical family on an *au pair* basis, helping in the house and looking after children. She will be free to come in the spring, 1957.

A Spanish throat specialist's daughter (17) wishes to stay as paying guest with a Roman Catholic doctor's family, preferably in the London area. She would like to visit England after Christmas, and would be willing to arrange holiday exchange with a girl of similar age.

Would anyone interested please get in touch with Brigadier H. A. Sandiford, International Medical Visitors' Bureau, B.M.A. House, Tavistock Square, London, W.C.1.

Correspondence

Because of heavy pressure on our space, correspondents are asked to keep their letters short.

Remuneration Claim

SIR,—A few months ago I supported a small group which considered the economic position of the country unsuitable to allow increased remuneration. Now, though the economic position is worse, I feel that the Minister of Health, by his attitude and manner in refusing to admit the justice of the recent remuneration claim, is forcing the medical profession into the position of a trade union; and that only trade-union methods are likely to be understood by Her Majesty's advisers, who, by accepting the Minister of Health's statement on the claim for increased remuneration, presumably support him. In a word, it is impossible to have a gentlemen's agreement with gentlemen only on one side.—I am, etc.,

West Mersea, Essex.

R. D. REID.

SIR,—Not for the first time I find myself wondering whether I am living with Alice on the other side of the looking-glass. It seems that Sir John Hawton must be there too. What on earth do our negotiators mean by a "contractual obligation" which cannot be "enforced by legal proceedings in the ordinary way"? Surely this is a plain contradiction in terms. By definition a contract must be legally enforceable. If our representatives never thought that we had a strong legal case, have they spent the past few months merely in building up a phony façade?

We were told (*Supplement*, November 3, p. 173) that the Committee was providing a document "setting out . . . the more legal aspects of the case." Did the Committee at that date think that it had in fact no legal basis? Again, Dr. A. Beauchamp is quoted (*Supplement*, November 17, p. 188) as saying that the case was "quite unanswerable from the legal and moral point of view." Was he then of opinion that its justice "could not be enforced by legal proceedings in the ordinary way"?

Must we now face up to the hard fact that the Negotiating Committee fully and freely admits that it has led us into a position where our whole financial well-being depends entirely on the whim of any body of Ministers who may hold office at a given time? If this is so, one is tempted to think of suitable pendant decorations for any lamp-posts which may exist in Tavistock Square.—I am, etc.,

Launceston, Cornwall.

DONALD M. O'CONNOR.

SIR,—With reference to our remuneration, some of us are becoming increasingly confused and irritated by the expressed opinions of the Minister of Health. It should be remembered that on the question of doctors' pay he has to accept the orders of the Treasury. To many of us it seems that the only point at issue is whether the Government is bound by the contract on the basis of the Spens report which it entered into with the profession in 1948. In any other walk of life this could be established by bringing an action to test the validity before the appropriate court of law. This could surely be done by the B.M.A. on behalf of the profession or by one individual sponsored by the B.M.A. What about it?—I am, etc.,

Eastbourne.

P. W. MATHEW.

SIR,—For ten months now investigations of our case and negotiations have been proceeding. The result has been nil. We are now five years behind nearly every other section of the community in regard to our earnings. How much longer is this to be allowed to continue?

Arbitration now will presumably take place on the interpretation of Spens. Let it be at once. If it results in our favour, then we have every right to back pay as from 1951.

DEC. 22, 1956

CORRESPONDENCE

SUPPLEMENT TO THE
BRITISH MEDICAL JOURNAL 225

Also there must be a demand for a considerable reconstruction of the Service to make it workable. If legalities instead of fairness means a decision against us, then we have been led by the nose into a trap against the wish of the majority of us. Let us then resign immediately from the Service, in which there is no possible future for the practice of medicine. We have dallied for five years when it should only have been one. Let us wait no longer.—I am, etc.,

Axbridge, Somerset.

N. H. H. GOLLEDGE.

SIR,—Until recently I was a member of the B.M.A. I cannot afford to continue this membership, as the subscription only adds to my ever-present overdraft. I shall, in the next two months, change my car for one which uses less petrol; I shall have to consider moving house, as I cannot keep up the payments; and I shall have to review my life insurance commitments. I am a "successful" junior partner whose practice has increased steadily in the past four years, but whose net income is worth less than ever.

I, and many like me, are being left in the lurch by the complete inability of the B.M.A. to secure a rapid settlement of a just remuneration claim. I have no doubt that the claim will eventually be met after a weary trail through the courts, but meanwhile I and many others feel rather like those "one-man taxi concerns," whose claims for "hardship petrol" are to be heard in the New Year—long after they have been put out of business.—I am, etc.,

Blackhill, Co. Durham.

F. W. B. BREakey.

SIR,—I am disappointed to find that no one better qualified than I has written about one aspect of the remuneration claim—that is, that the same effect would be achieved by a reduction in taxation.

All of us appear to have got into such a "welfare state of mind" that we have not considered that we, the taxpayers, are paying a vast army of civil servants to take money out of one of our pockets and put rather less into another, because of the cost of the Civil Service administrators. Two examples have forced themselves on my notice, and doubtless there are many others: (1) When a doctor employed by a regional hospital board is ill, he is compelled to claim a sickness benefit. For what purpose? In order that the regional hospital board may deduct from his salary the sickness benefit received. (2) A doctor's wife with a young family is compelled to receive family allowances. For what purpose? In order that the doctor may pay income tax (and possibly surtax) on them.

The purpose of these two "benefits" can only be ease of administration. Any organization administered by civil servants is bound to be arranged according to regulations, framed by civil servants with the object of easing their work as well as achieving uniformity. It is high time that the power and the number of these civil servant administrators was reduced, and the benefit of the consequent economy passed on to the hard-pressed income-tax payers.—I am, etc.,

Swansea.

H. C. M. WALTON.

SIR,—Having long since abandoned any hope for an increase in pay, I had a look at my expense sheet and was horrified at what I discovered. As a rural practitioner I receive a quarterly payment from the mileage fund. The last major revision in its distribution was in June, 1950, when payment by my local executive council was made at the rate of 4.41 pence per unit. At that time petrol was 3s. 1d. a gallon and the price of a typical doctor's car was £550.

Since then there has been a persistent rise in costs, and to-day petrol, as we all know, is 6s. 3d. a gallon and the car sells (to those who can afford it) at £871. Meanwhile the value of my mileage unit has steadily fallen, and last quarter reached a new "low" of 3.91 pence. No doubt you will have had a few letters from some of my richer colleagues impugning my patriotism for mentioning my troubles in a time of national crisis; but there is an old

saying that if the orange is squeezed sufficiently hard the pips will squeak, and I am just a little pip giving vent to a plaintive little squeak.—I am, etc.,

Rye, Sussex.

HUGH MANNINGTON.

Increased Prescription Charge

SIR,—Sir Max Page (*Supplement*, December 8, p. 213) is of course right. Many gallons of useless medicine are poured down many neurotic throats every year. But by and large these throats belong to the middle-aged wives of wage-earners, and a shilling more or less is not going to act as a deterrent. The real worry is the old people. It is not perhaps realized the extent to which this problem has crept up on us in recent years, but it is quite common to find patients of 80 and upwards forming 50% of our daily visiting-list. These poor old things live for the most part on the old-age pension, which allows no margin whatever for shillings, and when their time comes to pass on, whether they die from heart failure or cancer or simply old age, they commonly take about six months to do so. During that time it is our task to ease their passage to the next world with whatever drugs are appropriate, and frequently, as the end draws near, they need quite a number. Many of these people flatly refuse to apply for help to the National Assistance Board, and I am sure that Sir Max would be the first to respect their pride, as we all do. I think we would all be satisfied if the Minister would compromise and allow the shilling to be waived for old people on production of the old-age pension book.—I am, etc.,

Felsted.

PETER A. WALFORD.

SIR,—If Sir Max Page had been in general practice he would not have written the letter which you print in the *Supplement* of December 8 (p. 213).—I am, etc.,

Dorchester.

T. RUSSELL STEVENS.

Central Pool Distribution

SIR,—At the end of this quarter we are to receive from the central pool £44m. due for the year 1954-5. That represents a delay of one and a half years in reimbursing money spent on necessary practice expenses. At, say, 5%, a sum of over £300,000 in interest has been lost to us. No doubt a further sum for the year 1955-6 will be paid in about a year's time, representing another similar sum in interest.

Is there any reason why a considerable portion, say 75%, of the amount due for 1954-5 should not be paid at once as a payment on account of the sum due to us for the year 1955-6? This would enable us to face with a little less dismay the inevitable sharp rise in our expenses now that the price of petrol, among other things, has been substantially increased.—I am, etc.,

Tenterden, Kent.

B. W. WYLLIE.

Shortage of Radiographers

SIR,—May I, as a qualified radiographer and a member of the medical auxiliaries, bring to the notice of your readers the grave shortage of radiographers in the National Health Service which, if allowed to continue, must bring about a breakdown in the diagnostic and therapeutic fields of the Service? It is reported that one of the main causes for this shortage was the very poor prospects offered, together with low salary scales. On November 9, after months of protracted discussions, a new salary scale was finally announced, starting at £420 for a newly qualified radiographer and finishing, after many years of experience, at £750 for a superintendent and £850 for a superintendent in charge of a very large department. Even a teacher of student radiographers receives only £750 at the maximum, and, of course, these salaries are subject to the usual deductions, such as income tax, national insurance, and superannuation. One might argue that it is a fair commencing salary, but what of the married male radiographer who receives only £485 five years after qualifying?

Radiography is certainly an interesting and satisfying job, and one gets a feeling of being a useful and very necessary

member of the diagnostic team—but are these reasons, taken into account with the new but still totally inadequate salary scale, likely to induce modern-day-school-leavers, with certificates in mathematics and physics, to enter our profession? Little is known about us, although it is a plain fact that modern surgery and medicine would be lost without the radiological team. Most hospitals run a 24-hour service, which means that radiographers take it in turn to remain "on call" for emergency duties after the normal working hours. If radiography still fails to attract sufficient new entrants the remaining radiographers will find it is physically impossible to continue this service; in fact, there are at least four London hospitals whose radiographical departments are so understaffed that patients' waiting-lists are growing each day. It is therefore in the public's interest to assist us in our endeavours to make radiography a worth-while career, and so stop the drift of staff abroad and into industry.—I am, etc.,

Berkhamsted, Herts.

R. R. I. BAXTER,
Radiographer.

Widows' Pensions

SIR,—I found Dr. H. M. Jaques's letter on this subject (*Supplement*, December 1, p. 207) most helpful, because I had feared that a great many widows of medical men would only receive a yearly pittance if their husbands died soon after the qualifying date—July 5, 1958. The widows who are bereaved before the qualifying date will receive all the husband's superannuation contributions plus the 8% added by the Government. This sum should lie somewhere between £1,000 and £4,000, so that the doctor wishing to augment this amount to a total of £5,500, as Dr. Jaques has suggested, need only insure for the difference.—I am, etc.,

Slough, Bucks.

N. C. HYPHER.

S.H.M.O.s and Consultant Appointments

SIR,—Dr. C. B. V. Walker's letter (*Supplement*, November 24, p. 199) describes very adequately the undoubted injustice inflicted on 300 S.H.M.O.s who are actually filling posts acknowledged to be of consultant grade. It should not be overlooked, however, that the overwhelming majority of all 3,000 S.H.M.O.s are labouring under equal if not greater injustice. One recalls, for example, men qualified for consultant posts who have been virtually compelled to accept S.H.M.O. jobs because in their specialty no or very few consultant posts were being made, though the work involved would have required this. Additionally, there are many S.H.M.O.s (some of them pre-1948 men) whose posts have never been graded.

Without multiplying examples, I assert without hesitation that the only fair and feasible way to solve the S.H.M.O. problem is for the whole grade to be reviewed collectively and individually with the principle in mind that the grade should never have been established and should be abolished. This is, I believe, the official policy of the S.H.M.O. Group and its executive committee.—I am, etc.,

Derby.

G. D. WILD.

SIR,—Dr. C. B. V. Walker's letter (*Supplement*, November 24, p. 199) was of great interest, but rather stressed the problem of one group of S.H.M.O.s, whom he divided into three sections. It is apparent, however, that he oversimplified the grading of S.H.M.O.s in not taking into consideration the other large groups who also wish to reach consultant status.

The S.H.M.O. problem, with its steadily increasing numbers and the increasing dissatisfaction being expressed in each copy of your *Journal*, demands a speedy solution which can only be brought about by using the already agreed criteria for redistribution into the consultant ranks—i.e., (1) those who were doing specialist work before the appointed day (July 5, 1948) and who subsequently accepted employment in the hospital service under the National

Health Service Act, 1946, in the same specialty; (2) those who have held for a period of five years an appointment (or appointments) in the S.H.M.O. grade which has involved a large measure of personal responsibility in a hospital ward, out-patient clinic, special department, or specialist unit—e.g., mass radiography, blood transfusion; (3) those who have at least seven years' experience in the specialty (as senior registrars or S.H.M.O.s) and have held an appointment (or appointments) as S.H.M.O.s for a period of three years which has involved a large measure of personal responsibility in a hospital ward, out-patient clinic, special department, or specialist unit—e.g., mass radiography, blood transfusion; (4) those who have held an appointment as S.H.M.O. for at least two years and who hold a major higher qualification (M.R.C.P., F.R.C.S., or M.R.C.O.G.).—I am, etc.,

Liverpool, 16.

J. MCCONNELL.

SIR,—I have learned that it is possible to read a paragraph of my recent letter to you (*Supplement*, November 24, p. 199) in a sense which I did not contemplate, and I beg the hospitality of your columns to make clear the meaning which I attach to the paragraph, which is the one in which I attempted to define the second of the three categories of S.H.M.O.s which I listed.

It is fundamental to the understanding of the grievances of S.H.M.O.s that they look to the complete abolition of the grade, and only regard the proposal of 80% of "consultant" pay as a temporary expedient pending abolition. The question then arises of the class into which those who are not already holding "consultant" posts should be assimilated. It is accepted that S.H.M.O.s are fully trained in their specialty, and so eligible to hold consultant posts within any projected establishment. From which it follows that the logical course in any such reorganization is to recognize that the work is of a consultant nature and should be rewarded accordingly. At the same time there is ground for making a distinction between a recently appointed consultant and his senior who during the years has acquired wide clinical and administrative responsibilities, and this may reasonably be achieved by placing them at different levels on the ladder of seniority. It would not be acceptable to create a hypothetical sub-consultant grade which would perpetuate the injustices and frustrations of the present S.H.M.O. grade.—I am, etc.,

Royston, Herts.

C. B. V. WALKER.

Association Notices

Diary of Central Meetings

DECEMBER

28 Fri. Public Health Committee, 11 a.m.
28 Fri. Assistants and Young Practitioners Subcommittee, G.M.S. Committee, 2 p.m.

JANUARY

2 Wed. Medical Act Committee, 3 p.m.
3 Thurs. Maternity Medical Services Committee, 1 p.m.
4 Fri. Overseas Committee, 2 p.m.
4 Fri. Science Committee, 2 p.m.
8 Tues. Training Subcommittee, Occupational Health Committee, 2.30 p.m.
9 Wed. Remuneration Subcommittee, Occupational Health Committee, 10.30 a.m.
9 Wed. Private Practice Committee, 2 p.m.
17 Thurs. G.M.S. Committee, 10.30 a.m.
29 Tues. Arrangements Committee (Edinburgh, 1959), 2 p.m.

Meetings of Branches and Divisions

MIDLAND BRANCH

The Midland Branch held a dinner at the Grand Hotel, Birmingham, on November 10, followed by a lecture by Professor Thomas Bodkin as invited guest speaker; 255 people attended. Professor Bodkin spoke on "The Doctor's Dilemma—50 Years Afterwards." Professor A. P. Thomson proposed a vote of thanks.

WEST SUFFOLK DIVISION

The B.M.A. lecture was given on October 9 at the West Suffolk Hospital by Dr. W. R. Bett, who spoke on "An Alcoholic Excursion Through the Ages." Sixty-five members and guests were present.

INDEX TO VOLUME II FOR 1956

Entries for original articles, leading articles, annotations, and correspondence are indicated by the use of the symbols (O), (L), (A), and (C), respectively. Some subjects dealt with under various main headings in the *Journal*—e.g., "Annotations," "Leading Articles," "Parliament," etc.—are also set out under these headings.

A

- Abdomen, burst, 159
—peritoneoscopy; evaluation, with report of 136 cases (R. S. Handley and A. W. Nurick), 1211 (O)
—*Textbook of British Surgery*. Vol. 1: *The Abdomen* (Editor: Sir Henry Souttar), 347
ABEL, A. L.: Surgery of cancer, 150; 303 (C)

- Plenary Sessions:
Recent advances in the knowledge of cancer (G. Hadfield, A. L. Abel, W. M. Levitt, and A. Haddow), 150
Present position of A.C.T.H., cortisone, and derivatives (Sir Charles Dodds, H. Polley, W. S. C. Copeman, A. J. B. Goldsmith, F. D. Hart, and G. B. Mitchell-Heggs), 151
Handicapped children (N. B. Capon, A. W. G. Ewing, C. T. Potter, Mildred Creak, and W. D. Coltart), 222

- Round-Table Conferences:
Physical treatment of mental disorders, 154
Poliomyelitis, 153

- Section of Anaesthetics:
Anaesthesia for aortic graft (H. L. Thornton), 163
Anaesthesia for fenestration (R. A. Binning), 163
Management of respiratory paralysis (E. A. Pask, R. Bryce-Smith, A. C. Smith, and H. B. Wilson), 162
Neurological complications of anaesthesia (G. Bonney), 163
Recovery rooms (R. M. Davies), 163

- Section of Cardiology:
Aetiology of hypertension (G. W. Pickering), 223
Diagnosis of congenital heart disease (J. W. Brown), 224
Diagnosis of heart disease in infancy (J. D. Hay), 224
Film of cine-angiocardiology (shown by R. Astley), 224
Pharmacology of ganglion-blocking drugs (W. D. M. Paton), 224
Treatment of hypertension (A. R. Gilchrist), 223

- Section of Child Health:
Abnormalities which cure themselves (D. Evans and D. MacCarthy), 164
Accidents in children (Round-table conference), 163
Immunizations in childhood (W. H. Bradley, G. S. Wilson, H. J. Parish, N. Butler, E. T. C. Spooner, and W. C. Cockburn), 224
Therapeutics of childhood (P. Swift and N. M. Jacoby), 225

- Section of Dermatology:
Brains Trust, 226
Corticotrophin and cortisone in dermatology (J. T. Ingram and R. P. Warin), 226
Dermatitis from cosmetics (C. D. Calnan), 226
Nickel dermatitis (G. C. Wells), 226

- Section of Diseases of the Chest:
Prevention of tuberculosis—general measures (F. R. G. Hear), 227
Prevention of tuberculosis—mass radiography (V. H. Springett), 227
Prevention of tuberculosis—B.C.G. vaccination (T. M. Pollock), 227
Problems of chronic bronchitis (C. M. Fletcher), 227
Surgical treatment of asthma (G. K. Harrison), 227

- Section of General Practice:
Catarrhal child (L. W. Batten and others), 166
Education of the general practitioner (R. Whitehead, C. P. D. Grant, R. A. Davison, and G. O. Barber), 93
Hypertension in general practice (R. S. Stevens), 166
Infectious diseases in general practice (G. I. Watson, Liselotte Lennhoff, J. E. Jameson, and H. Paul), 165
Neurological diagnosis in general practice (S. L. Kaye), 165
Sleeplessness (C. A. H. Watts), 166

- Section of Medicine:
Analgesic drugs (S. Alstead), 156
Diagnosis of jaundice (G. E. Beaumont), 155
Epidemic at Royal Free Hospital (N. D. Compston), 157
Illness as a hobby (R. Asher), 157
Iron-deficiency anaemia (W. M. Davidson), 155
Management of asthma (R. S. B. Pearson, D. A. Williams, and D. O. Neil), 156
Management of cirrhosis of liver (Sheila Sherlock), 155
Modern concepts of anaemia (L. J. Witts), 155
Modern views on nephritis (M. D. Milne), 154
Placebos (E. J. Wayne), 157
Recent advances in therapeutics (A. H. Douthwaite), 156
Treatment of chronic leukaemia (R. A. Hickling), 155
Treatment of chronic renal oedema (J. B. Rennie), 154
Use of drugs in neurosis (D. Curran), 157

- Section of Neurology and Neurosurgery:
Benign encephalitis of brain stem (E. R. Bickerstaff), 228
Cerebral manifestations of vitamin B₁₂ deficiency (J. M. Holmes), 228
Denervation for carotid sinus syncope (G. C. Knight and S. Zehrman), 228

BRITISH MEDICAL ASSOCIATION: ANNUAL MEETING, Section of Neurology and Neurosurgery (continued): Hypophysectomy in carcinomatosis (E. J. R. Smith), 229

- Neurological manifestations of endogenous hypoglycaemia (Doreen Moorhouse), 228
Radiological findings in spinal angiomatous malformations (H. W. Davies and H. Jackson), 228

- Section of Obstetrics and Gynaecology:
Diagnosis of ectopic pregnancy (Mary K. Lawlor), 162
Importance of retroversion (K. V. Bailey), 162
Management of hypertension in pregnancy (R. J. Kellar and E. W. L. Thompson), 162

- Sections of Obstetrics and Gynaecology and of Child Health:
Post-maturity (T. L. T. Lewis, J. Walker, T. E. Oppé, G. H. Bancroft-Livingston, and O. D. Fisher), 160
Rhesus factor and the management of haemolytic disease of the newborn (D. C. A. Bevis, P. L. Mollison, B. M. Laurance, A. C. Allison, and Beryl D. Corner), 161

- Section of Occupational Health:
Occupational radioactivity and the general practitioner (Sir E. Rock Carling, E. E. Smith, and A. S. McLean), 229

- Section of Ophthalmology:
Adrenocortical hormones in ophthalmology (C. Cook), 167
Complicated obstructive epiphora and lateral adenectomy (B. W. Rycroft), 167
Modern trends in cataract surgery (J. Foster, K. Wybar, and A. H. Osmond), 166
Visual aids for the partially sighted (P. McG. Moffatt), 167

- Section of Orthopaedics:
Foot-form, function, and footwear in the young (W. H. Gervis, W. Sayle-Creer, and T. T. Stamm), 168
Management of common knee injuries (A. T. Fripp and K. H. Priddle), 169
Painful shoulder (F. A. Simmonds and G. B. Jones), 168
Structural effects of stress (J. C. Scott), 168
Surgery in treatment of spastic children and adolescents (E. S. Evans), 167

- Section of Oto-rhino-laryngology:
Hoarseness (W. A. Mill and J. F. Lipscomb), 170
Nasal obstruction (T. G. Wilson, F. C. W. Capps, and E. Millington), 169

- Section of Pathology:
Detection of endocrine tumours causing hypertension or other circulatory disturbances (M. L. Rosenheim, R. L. S. Bayliss, T. M. Chalmers, R. S. Stacey, and Dorothy S. Russell), 230
Fungous diseases in man (R. W. Riddell, W. St. C. Symmers, and L. J. Rubinstein), 170

- Section of Physical Medicine:
Management of hemiplegia (K. Lloyd, G. O. Storey, W. R. Grant, and H. J. Glanville), 233
Management of rheumatoid arthritis (G. D. Kersley, A. C. Boyle, F. S. Cooksey, and D. A. Brewerton), 232
Prediction and correction of degenerative arthritis (Esther Tuttle), 233

- Section of Plastic Surgery:
“Any Questions?” Panel, 171
Plastic surgical treatment of certain congenital deformities (H. E. Blake), 171
Rodent ulcer (Sir Archibald McIndoe), 171
Treatment of common injuries of face and hands (R. Mowlem), 171

- Section of Preventive Medicine:
Ascertainment and management of defective hearing in the very young (N. L. Crabtree and E. B. Berenice Humphreys), 234
Contribution of preventive health services to the efficiency of hospital practice (J. F. Galloway, A. T. Rogers, and R. L. Newell), 233

- Section of Psychiatry:
Psychotherapy and the general practitioner (M. Balint, P. R. Saville, and A. R. May), 235

- Section of Surgery:
Abdomino-thoracic approach in surgery (R. M. Walker and R. H. Franklin), 159
Aetiology and treatment of renal calculi (F. T. G. Prunty, L. N. Pyrah, F. E. Feilden, and H. S. C. Clarke), 158
Aetiology and treatment of varicose veins (F. B. Cockett, S. T. Anning, and R. B. Wright), 159
Burst abdomen (H. Park and S. Taylor), 159
Conservative resection in carcinoma of the rectum (W. R. Forrester-Wood and E. O. Muir), 158
