President and Prime Minister

DURING the visit of the Prime Minister to the United States last month India and America wrote a new chapter in the chequered history of their relations over the past nine years. The meeting was one between the head of the world's strongest military, economic and political State and an Asian leader who guides the destiny of a potentially major power with a legacy of moral authority. The outcome of the meeting, yet unspecified, can best be declared in the Prime Minister's own words. Addressing on his return anxious pressmen in Bombay he said that he found a great deal of common ground "in our approach and outlook on many things". In this sub- normal summary of a momentous meeting, one might hope that the seeds of history are carefully concealed.

There have existed between the two countries friendly and cordial relations before India became independent. Indians as the Prime Minister said more than once will always remember that in the struggle for freedom they received from the U.S. the fullest measure of sympathy and support. But since Independence, more especially since the Korean War, the policies of these two biggest democracies seemed to run, from time to time, at cross purposes. It, however, was largely due to their different methods of achieving world peace. The U.S. believing in the efficacy of balance of power,

16624

tried to build up coalitions of States bound together by military alliances, as a deterrent to aggressive Communism. India, on the other hand, considered a military balance of power, and a multiplication of military alliances dangerous. Its policy was the conference table and Panch Shila. Not Arms but the Man.

Not that India had a liking for Communism. It was the first Asian country to establish democratic institutions and rule of law and reject the idea of totalitarian planning. It was critical of military alliances because it believed, among other things, that the nature of warfare in the atomic age had made military alliances anachronistic: no power, howsoever heavily armed, was likely to do anything to provoke a world war. Atomic war would mean the annihilation of the aggressor and the victim alike; indeed of mankind itself. Also, in India's view military alliances defeated their own purpose. Such alliances only provoked an armament race, which led often to panic and a feverish search for security and inevitably to the extension of the cold war. As Mr. Nehru once remarked, a cold war is only better than a hot one; but it is no substitute for peace.

The Indian argument on military alliances is not, in *The Eastern Economist*'s view, wholly sound. But it is growing sounder as time goes on. The chain of mutual distrust and uncertainty these pacts create prevents the development of the freedom from fear which the small and the backward nations need for their advancement. In fact they may create more problems than they solve. Because of this, India has always held that disarmament and the sense of security resulting therefrom represent an effective way of preserving peace. But, of course, how can one disarm unilaterally without creating more insecurity?

These differences, how encouraging it is to note, only concealed the fact that both the U.S. and India were actually working for the same end: world peace, democracy, and the right of self-determination of nations. This fundamental identity of aim was lost in their different approaches. The apparent disagreement was exaggerated as much by interested parties, Communists mainly, as by the suspicion that each entertained about the other. While many Americans suspected that India was pro-Communist and was aiding Russian interests as against America's, many Indians suspected that the U.S. was tending to become aggressive, and that it gave support to the colonial powers.

The two tragedies in Egypt and Hungary in recent months brought the basic similarities between India and America to the surface and drew Delhi and Washington closer. The Prime Minister has acknowledged how the United States has added to her prestige by upholding worthily the principles of the U.N. Charter, in its bold stand on aggression by Britain and France, its own allies. But for America's determined attitude it is doubtful if the U.N. could have brought about the withdrawal of the aggressor forces. The U.S. foreign policy was revealed by the Egyptian tragedy to be more or less in harmony with Bandung Asianism. It did not fail to impress India and other Asian countries, and gave them assurance that Washington accepted the idea of a world community in which even the smallest and weakest States would enjoy their sovereign rights. It also convinced the Asians that America's military alliances were not weapons of imperialist aggression and aggrandizement, but merely defensive arrangements.

The Soviet Union's aggression in Hungary and its refusal to obey U.N. decisions provided, on the other hand, a glaring contrast. It uncovered for the Asian peoples the real nature of the Soviet State. In the psychological climate that the two grim events produced the prestige of the United States has improved considerably as a recent poll of the Indian Institute of Public Opinion conducted in Calcutta and Delhi has shown. India's unequivocal condemnation of the Russian aggression belied, in turn, American suspicions that Nehru's India was assisting Communism. To match this there has been a marked decline in American suspicion of Indian neutralism. From his discussions with the President, Mr. Nehru said, he had gathered the impression that the U.S. had a "flexible policy towards neutralist nations" and was adapting itself to circumstances in a changing world. He further observed that there was "more understanding and appreciation" of India's non-alignment policy: "I have found there is so much in common, even though we are separated by half the world. It was gross exaggeration for anyone to declare that great or vital differences exist between the U.S. and India".

It may be observed that the Nehru-Eisenhower meeting coincided with a new basis of co-operation within the United Nations. All that transpired between the two is secret; not even the traditional enterprise of American journalists has so far produced an authentic-sounding leak of the conversations. We may well have to wait for great memoirs to find out what actually transpired. The communique issued after their meeting acknowledged that there had been full and frank talks over a wide range of subjects of "common interest and concern" to both India and the U.S. which have confirmed "the broad areas of agreement between the two countries". Though the frontiers of this area have been left undefined, the accent is unmistakably on accord. That in itself is significant. It is the general belief here that, despite lack of any agreements, commitments, promises and pacts between the two countries, a new era has dawned in Indo-American relations after the quiet, informal, exploratory, and extensive talks between President Eisenhower and Prime Minister Nehru. All available evidence also points to the fact that the two leaders have established close personal relationship and have, as a result, come to accept the other as a force for peace. The very fact that they have begun to appreciate each other's bona fides and devotion to peace is a major gain for the whole world. The new relationship is sure to mark a turning point in modern history.

Political observers in the Indian capital feel that in future Washington will consult New Delhi more frequently now on important matters of common interest. For some time to come one of the world's most significant diplomatic activities may be exchange of private messages between President Eisenhower and Prime Minister Nehru as both believe in "personal diplomacy". The possibilities of the New Delhi-Washington entente are doubtless immense; but it would be foolish to expect a harvest too soon. The result of these developments will be reflected only in the events to come. But one thing is certain: now that the forces of peace, with the Indo-American ties reforged, are stronger than ever before, the world can face the future with more hope and confidence. The New Year begins on a happy note; a meeting ground between East and West has been found.

JL.

The Congress Platform

THE principal political parties in the country are bracing themselves for the coming battle of the ballot-box, and their respective platforms are just revealed to the public. The Congress Party's draft manifesto, awaiting formal approval at Indore, is easily the best of them all in the sense that it bears the impress of the ruling party's mature experience and sense of responsibility. While it makes no extravagant promises for the immediate future, neither does it make any secret of its intention to take the country, by democratic stages, to the promised goal of a "full socialist order of society". The ultimate goal of full socialism may or may not be reached, but so long as the Congress is wedded to democracy, Nehruvian socialism is bound to be gradual and evolutionary in its course and without the uglier manifestations of class conflict. Be that as it may, what is currently important is that the Congress takes its stand largely on the second Five-Year Plan which is already well begun. It is on that basis that that party "seeks again a renewal from the people of India of that faith and confidence which they have given it in such abundant measure in the past". Which also appears to convey that if the Plan is to be successfully implemented, there should be no change of horses in mid-stream.

To go from the general to the particular. The manifesto rightly emphasises that the second Plan is a flexible one and that it will have to be adjusted from time to time as the resources of the country permit. Realism may well ordain that the Five-Year Plan should become a Six-Year or Seven-Year Plan, and this is implicit in the statement. Similarly the experience of East European countries has persuaded the Congress leaders to believe more strongly than ever that head-long industrialisation to the neglect of agriculture would throw the body-economic out of balance. An equilibrium sense is thus in evidence where the manifesto underlines the need for a proper balance between industry and agriculture and between heavy, light and small-scale industries. And a balancing sense is in evidence where the document emphasises that centralisation which is 'inevitable in modern life' has to be counter-balanced by decentralisation 'in so far as this is possible'. What is still more, a human approach is in evidence where the manifesto states that higher techniques of production are to be encouraged in industry and in agriculture in such a way that they would not involve unemployment. The balancing or reconciling of conflicting factors and interests is by no means an easy task, however desirable it may be. There is no gainsaying that the Congress is a fit national-political instrument —perhaps the fittest in India today—to attempt it. Success in this direction may not be entirely in man's hands. However, such an honest attempt may at least invite the operation of that higher moral law which slowly but surely impinges itself on the minds of rulers.

For its part the private sector—which is as much national as the public sector—may have some just cause for anxiety on the score of a few planks in the Congress platform. The manifesto states that "it is not intended to nationalise the existing private industries except where such nationalisation is considered necessary in terms of planning or where they occupy a strategic position in the economy of the country". The nationalisation of the Imperial Bank and of life insurance is also welcomed on the ground that "this is another step towards a socialist pattern and it gives a greater measure of strategic control for planning and other purposes of the State". At the same time the assurance is given that "private industry will be encouraged, but always in the context of the Plan". Private industry does not object to operating 'in the context of the Plan' if the resources pool from which both the public and the private sectors have to draw is adequate for the purposes of both the sectors. Where it is not so adequate will the State lay its hands on banking in general and on some other industries for the purpose of getting non-tax revenues with which the public-sector projects could be partly financed? Will the words "a greater measure of strategic control for planning and other purposes of the State" be stretched or interpreted to mean that the success of the public-sector part of the Plan is more important than its private-sector part? The element of uncertainty is thus still there despite the assurance. Or, perhaps, the assurance itself may only be a conditional one. It would be unfortunate if private industry's anxiety were to be attributed to sectional self-interest for it is now increasingly recognised that the welfare goals of socialism can be achieved without increasing public ownership. It is also noteworthy that "the *identification* of socialism with nationalisation, or with planning, is rejected firmly and without compunction" in current Western Socialist thought. "The idea of the public sector as a continuing series of state-owned monopolies to be increased in number.....until the whole economy has been nationalised, is as dead as a dodo".

Two more planks in the Congress platform—namely, egalitarian taxation and workers' participation in the management of industry—are also of concern to private industry. The proposal to reconstruct the tax-structure with the twin object of spreading out the tax-burden in such a way as to make it fall chiefly on those in a better position to bear it and of reducing disparities in income and wealth is, no doubt, in line with the current socialist thought in the well-developed economies of the West. Whether it can wholly apply to an under-developed economy is the question. Here what is relevant to consider is not whether a few rich individuals can bear a heavier burden, but whether private industry as a whole can bear a heavier burden without detriment to its resources for further development. As for workers' participation in the management of industry, it can only be a long-term goal and need not be taken seriously at the moment. But in so far as this line of thought derives from the jettisoning of the 'class struggle' concept and conjures up visions of workers' co-operation in industry, it merits objective consideration and not outright condemnation. The wisest thing to do in this connection would be to leave it to the workers and managements themselves to take to it *voluntarily* as the TISCO is now doing experimentally. As the Congress manifesto firmly states that co-operation in agriculture should be essentially *voluntary*, there is no reason why the contemplated industrial democracy should not also be an equally voluntary process.

Escape? **Impossible!**

Liquids, steam and gases cannot escape from stuffing boxes, glands and cocks if they are sealed with Turner's "Firefly" asbestos packing. Use it and your worries about leakages are over.

By arrangement with Turner Brothers Asbestos Co. Ltd., England, we make "Firefly" Packings. We spin asbestos fibre into yarns, and then plait these yarns into packings which provide the perfect seal, unaffected by the temperatures and pressures normally encountered in industry.

Turner's "Firefly" Packings are just one of the many technical asbestos products that we at AM & FM make to meet the needs of India's industry. The increasing use of Asbestos is an index to India's industrial progress.

Where There's Industry There's Asbestos

We supply:
'FERODO' BRAKE AND CLUTCH LININGS
'FIREFLY' ASBESTOS PRODUCTS
SPRAYED 'LIMPET' ASBESTOS
'NEWALLS' INSULATION MATERIALS
'PATTINSON'S' BRAND MAGNESIA CHEMICALS
'SINDANYO' ELECTRICAL INSULATING BOARDS

THE WEEK'S NOTES

ECONOMIC GROWTH AND INCENTIVES

IN HIS presidential address to the annual conference of the Indian Economic Association, Dr. S. K. Muranjan drew attention to the fact that though there is a choice today between economic growth under conditions of free enterprise and competition, and planned economic growth, "the line of demarcation between the two is not distinct and it will never be distinct and it is largely a question of degree." This statement is of considerable validity in the context of the ceaseless controversy over the role of the public and the private sectors in the development of an underdeveloped economy like India. Dr. Muranjan reminded that there was no ideal ratio of economic activities between the two sectors. While in the first Plan, out of the total investment of Rs. 3,100 crores, the Public Sector was responsible for Rs. 2,000 crores, in the second Plan it accounts for Rs. 3,800 crores out of the proposed total investment of Rs. 6,200 crores. The proportion is thus slightly more in favour of the public sector in the second Plan which is largely explained by the bias in favour of heavy industry and such other forms of investment as require huge resources. The private sector is thus left with the residuary field covering industries calling for smaller investments. With the emergence of perspective planning, however, investment would naturally tend to be governed by long-period perspectives and the entire process would have to be looked upon as a joint social responsibility with a view to the rapid development of the productive potentialities of the economy. Viewed from this point of view, the types of conflict that are normally attributed to a stagnant economy leading to a kind of scramble for a greater share between the two sectors loses much of its force.

The central fact to be recognised is that assuming that the State is committed to the goal of a mixed economy, no useful purpose will be served by any dogmatic type of distribution of responsibilities. The proper approach, on the other hand, would be that as many opportunities as possible are afforded to the non-State sector in the form of encouragement through various types of incentives, which are quite considerable, like provision of technical advice and sharing of resources from foreign assistance and so on. In the matter of entrepreneurial talent and technical skill as well as managerial personnel, there is enormous room for mutual give and take. Thus seen, a vista of vast possibilities emerges and the challenge thrown for innovators can be taken up by the private as well as the public sector. It is a challenge to the State sector also because that sector has to be equipped for the new responsibilities that devolve upon it, which means not only adjustment with regard to training of personnel but the evolution of appropriate principles of operation of public enterprises.

LABOUR MINISTERS' DECISIONS

IT WAS an act of wise statesmanship on the part of Mr. Khandubhai Desai, Union Minister for Labour, not to press forward the I.N.T.U.C. chant for general increase in wages at the Labour Ministers' Conference as a 'quid pro quo' for labour's co-operation with the second Plan. There can be no doubt that any increase in wages which is not related to productivity is bound to make a spiral of what the Finance Minister has acknowledged as an 'incipient inflation' at the present time. In the interests of the country's economy, it is desirable that the wage structure for the Plan period should be such that it is rational, practical and realistic. In this context while the establishment of Wage Boards in a few selected industries is to be welcomed, it has to be recognised that they could function satisfactorily only if the Wages Commission (the appointment of which is now given up) had done some spade work by way of collecting data on existing wage rates and recent wage trends. For it is only from a full appraisal of the existing conditions in each industry that indications as to future policies can be obtained. This preparatory work, it is to be hoped, may be now done by the Wage Boards themselves. While keeping in view the long-term objectives of industrial democracy, one hopes that the Wage Boards would be guided in their work by the inescapable need to correlate wage rates with productivity and the capacity of the industry to pay.

Concerning the exciting issue of workers' participation in management, it would be much better to implement the scheme after a careful study of the conditions at home and the experience abroad. The approach to this problem at the Labour Ministers' Conference is indeed to be commended. The experiment of the Tata's at Jamshedpur need to be carefully watched before the whip is applied to the private sector en masse to introduce workers' participation in management, which the state apparently is not very keen on having within its own domain, particularly the Railways.

The decision to provide training courses in sound trade union ideals and practices to workers and their leaders is perhaps the most outstanding contribution of the Conference to industrial peace. But the approach to labour legislation in taking out of the purview of ordinary courts all matters relating to labour legislation and to place them under the jurisdiction of permanent labour courts seems rather unwise. There is always a risk of these sepecialised courts taking a narrow view of labour problems where a wider comprehension may be in the interest of the community as a whole. Another decision of the Conference—namely, to raise the provident fund contribution from 6¼ per cent to 8-1/3 per cent—may, it is feared, increase industrial costs.

COUNCIL OF APPLIED ECONOMIC RESEARCH

THE FORMAL opening by the President last month of the National Council of Applied Economic Research is a major event in the onward march of applied research in this country. The Council has come into existence not a day too soon. The second Plan has already begun and will soon gain momentum and with it a number of problems will crop up clamouring for solution based on scientific study. Though there are a number of research bodies in the country, they do not command adequate resources to function on an all-India basis to meet the heavy demands of an expanding economy. Moreover by being a non-governmental body, the National Council can be entirely objective and even be critical of Government policy. Its services will be available not only for Government but for industry as well which is also confronted with various techno-economic problems which can only be handled by research. Thus the Council has before it several distinct but interdependent responsibilities to attend to.

Speaking on the occasion, the Union Finance Minister drew attention to the fact that planning in India should be in tune with demand patterns in the community. The fundamental problem before an underdeveloped country like India is to integrate the economy of rural India with the rising industrial India and as a sequel a major issue that will have to be resolved successfully is how to integrate small and large industries. It is appropriate, therefore, that one of the projects that the Council has immediately taken on hand is 'problems connected with small-scale industry'. The other problems like energy demand, transport, study of taxation in India and in the capital-exporting countries affecting foreign investments in India, are all virtually concerned with the fulfilment of the second Plan.

The Council will thus have an opportunity to dedicate its skill and its resources to an ever-expanding public service. The fact that it will have the close co-operation of the Stanford Research Institute, California, invests it with added prestige. One can look forward with confidence to the research activities of the Council for contributing to the general welfare.

ASIAN WRITERS' CONFERENCE

NEW DELHI has in recent years been the venue of many conferences and seminars. The latest was the Asian Writers' Conference, which met towards the end of December. It was unique, being the first conference of Asian writers ever to have been held. Having been sponsored and nurtured by Dr. Mulk Raj Anand, a prize-winner of the Communist-sponsored World Peace Council and Mr. Sajjad Zahir, former Secretary of the Pakistan Communist Party, it was expectedly Communistic. Mostly, Communists and fellow-travellers and writers who subscribed to an identical political faith were invited. The Conference was, therefore, hardly a platform for genuine writers to discuss their problems. This was mitigated to a certain extent, however, by the inclusion of some non-Communists in the Indian delegation, prominently among them being Mr. S. H. Vatsyayan, Mr. Humayun Kabir and Mr. Prabhakar Padhye. The result was a coming together in a single delegation of inflexibles.

As was to be expected, differences, often sharp, arose at the Conference, especially in the discussion on Freedom and the Writer. The question of relationship of the writer to freedom cannot be answered with platitudes or effusive sentiments. The Communists emphasized that a writer must think of and write for the betterment of the society. This, in Communist practice, means that a writer is an accessory of a monolithic Party or State, and should propagate its current ideology. The non-Communist writers resisted such a definition. They stressed that it was the writers' privilege and duty to preserve freedom, and therefore a civilised tradition, against the encroachments of totalitarianism. The voluntary discipline of an artist should alone be his limitation.

The fact that young Indian writers generally raised their voices in support of complete freedom for the writer gives a clue to the way in which literary trends are moving in this country. These trends are apparent in the vague report of the Commission on "The Writer and His Freedom"—vague because it was, doubtless, a compromise. It stated that "society should depend on the conscience and goodwill of the writer" and that he should not be unnecessarily burdened with "extraneous obligations".

The same inclusion of some convinced non-Communists in the Indian delegation seems to have frustrated an attempt to make the Conference the usual Communist show. The present-day democrat as well as the future historian, musing over the coming-together and the deliberations of the Conference, may well discover the need and virtues of organisation among non-Communists: it is well-known how effective Communist organization and propaganda have inavariable been in the past. The Conference has offered ample evidence that Communist organisation and propaganda can be matched.

YUGOSLAVIA AND HUNGARY

YUGOSLAVIA'S STAND on the Hungarian situation has been criticised in certain democratic circles as rather one-sided and partial to the Russians. Vice-President Edvard Kardelj's recent speech in the Yugoslav National Assembly, can, perhaps, be considered an unbiassed assessment of the developments in Hungary. His view is that the new trend in Communism, which was initiated by Yugoslavia as far back as 1943 and for which favourable circumstances were created by the decisions of the 20th Congress of the Soviet Communist Party, is catching on in the Eastern European countries, and should be recognised as such. As Tito had said earlier, the trouble is not strictly the cult of the individual, but rather the system which nurtures such a cult. A socialist democracy should be primarily concerned with human beings and only secondarily with factories and production targets. Along with social ownership of the means of production, there should be a parallel development of specific forms of democracy, if socialism is to progress. Bureaucratic despotism is not conducive to the flowering of the social genius of any country. In the final analysis democracy cannot be divorced from socialism, because the masses, who constitute society, should be active participants in the country's progress not only by physical efforts but also by discussion and analysis. It is fallacious logic, alien to Marxism, that a party or state can build socialism without the working class or against the latter's will. Both Hungary and Poland have proved this. It is in fact the workers' councils and the communes, which are the standard bearers of socialism and democracy, and not any party, which may have brought about the proletarian revolution.

NORTHERN RAILWAY
NOTICE

The following changes will take effect in Time Table on and from the 1st January, 1957.

(I) **Existing Trains extended.**

(a) Nos. 2UD 1UD (Old Nos. 2UN 1UN) Ambala Nabha Shuttles extended from and to Dhuri.

(b) Nos. 5PB 6PB Pathankot Baijnath Paprola Passengers extended to and from Joginder Nagar, and renumbered as 5PBJ 6PBJ.

(II) **New Connections secured.**

(a) No. 3SL with 3LC at Lucknow.
(b) No. 348 Dn with 62Dn at Ambala Cantt.
(c) No. 407Up (Old No. 419Up) with 4BSH and 2BHS at Sadulpur.

(III) **Additional train halts provided.**

(a) No. 305Up at Narela and Sonepat.
(b) 72Dn at Mehrawal and Danwar.
(c) No. 353Up at Madrak, Chamrola and Wair.
(d) No. 70Dn at Rasulabad.
(e) No. 354Dn at Chamrola.
(f) No. 1LC 2LC at Ajgain.
(g) No. 232Dn at Patel Nagar.
(h) No. 48Dn at Rasulabad.

(IV) **Existing train halts cancelled.**

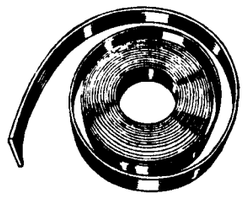
(a) No. 305Up from Subzi Mandi.
(b) No. 353Up will halt at Stations where 108Up is stopping at present on Lucknow Kanpur Central Section & No. 108Up will stop at all stations on the Lucknow Kanpur Central Section.
(c) No. 1BDL from Palam, Baijwasan, Garhi Harsaru, Patil, Pataudi Road, Khalilpur, Nangal Mandi, Dahina Zainabad, Kaninakhas, Bogawas, Zerpur Pali, Nanwan, Satnali and Sohansara.
(d) No. 2BDL from Khalilpur Pataudi Road, Patli, Garhi Harsaru, Bijwasan and Palam.

For timings at intermediate stations reference should be made to the Station Master concerned.

A revised edition of the Time Table priced at -/4/- per copy will be available for sale at bookstalls of important stations shortly.

CHIEF OPERATING SUPDT., NEW DELHI.

TURNING A NEW ROLL



We have turned a new roll; and it has cost us three and a half crores of rupees.

To what purpose, pray ?
At the end of the rolling, we get coils of flat, steel strip—skelp, as the steel man calls it. The skelp is passed on to the Indian Tube Company, which welds it into tubes.

So what ?
Merely that steel tubes pipe up water from deep inside the earth to parched fields, helping to grow a rich harvest. In the cities, countless homes receive a protected supply of water through these pipes.

Soon, a new plant will turn out the kind of steel tubes that go into the making of bicycles. Remember also that the locomotive speeding along the track is kept going by steel tubes which hold the steam.

Tata Steel's new Skelp Mill, the first of its kind in India, has a capacity of 200,000 tons. When there is enough steel, this mill will roll all the skelp and strip the country needs.

TATA STEEL
SERVES THE NATION

TN 1037 R

"...and a bonus of goodwill to the management
—for installing the
'Tushar' WATER COOLER!"

QUICK DIVIDENDS in improved staff relations — and greater efficiency! That's what investment in a TUSHAR Water Cooler brings you.

The TUSHAR provides a constant supply of cool, hygienic drinking water for your staff and clients. It's easy to operate and most economical to run. Why not get in touch with Voltas Limited, and order a TUSHAR now?

With the TUSHAR you get

- A continuous supply of instantly-cooled water at the touch of a button — no unhygienic refilling or storing.
- A choice of two handsome models.
- Ease of installation.
- Economical to run.

'Tushar'
WATER COOLERS
A modern must for factories, offices, schools, hotels, hospitals and colleges

SARVODAYA: UTOPIA ATTAINABLE

By

ODYSSEUS

FOREIGN READERS need to know that the protagonists of the Bhoodan (land-gift) movement do not regard it merely as a way of getting land for the landless but as a means of achieving Sarvodaya, the Indian Socialist, co-operative, welfare commonwealth outlined here last time.

The idea of Bhoodan came to Acharya Vinoba Bhave when, on April 18, 1951, he was visiting the village of Pochampalli in the Telengana area of what was then Hyderabad. Landless Harijans begged him to get land for them. A local landowner spontaneously offered 100 acres. Vinobaji felt that he had stumbled on to something. Within two months he had collected 12,000 acres, and this eased the tension in Telengana. Within a few months, Bhoodan had gathered such impetus, and struck the headlines to such effect, that Pandit Nehru invited Vinobaji to discuss village welfare with the Planning Commission in New Delhi. A good part of Bhoodan's success in gaining support among all parties arose because whereas many political leaders hesitate to commit themselves to Sarvodaya, nearly all admit the practical possibilities of Bhoodan.

From Bhoodan, Vinobaji proceeded to Koopdan (gifts of wells), Baildan (gifts of bullocks), and Sampattidan (gifts of wealth) which enabled city dwellers to share in promoting Sarvodaya. Sampattidan is to declare one's income and to pledge a proportion of it — usually one-sixth — to Vinobaji for welfare objects. There is also Jeevadan (gift of life) for those who wish to dedicate their lives to constructive work towards Sarvodaya. Gramdan is the gift of whole villages by land-owners to the villagers for development in common ownership.

Gramdan has made most progress in Orissa where over 900 villages had been collected in two districts by the beginning of last year. In view of the fate that has overtaken similar attempts at voluntary common ownership and working in other countries at various epochs, it is to be hoped that some foundation, such as Tatas or Ford, will make a grant for an authoritative study by disinterested scholars of this notable experiment in Orissa, Kerala, and elsewhere.

At first, the politicians saw Bhoodan essentially as a method of solving problems of land reform, but the Bhoodan leaders retorted that while the equitable distribution of land was important, their basic object was, through Bhoodan and Sampattidan, to secure a revolutionary change in India's social structure. What shape Sarvodaya would take in the cities where social relationships are complicated, they did not as yet foresee, but in the villages they claimed that there were already indications of the society of the future.

THE HINDU SCRIPTURES RE-INTERPRETED

One of the strengths of Sarvodaya is that it enlists the support of the orthodox and traditional, powerful elements in Indian life which are so often antagonised by progress when preached in Western terms and concepts. Most Sarvodaya leaders expound their ideas in Hindu scriptural language, adapting phrases and aphorisms as familiar to the rural masses as the language and stories of the Bible are to the Christians of the West. Margaret Fisher and Joan Bondurant, the authors of "Indian Approaches to a Socialist Society" (Berkeley University. $1.50) which is a collection of extracts from the Indian press, say that when the use made by Vinobaji of the scriptural allusions, and his reinterpretation of classical stories and precepts, is analysed, the basic elements of this indigenous "Indian Socialism" are seen to be dictated by modern needs and to reflect the influence of Western rationalism and humanism. Indeed, these two sympathetic observers argue that the apparent inconsistency both of the teachings of Gandhiji and Vinobaji often arise from adapting an old rule, custom, or moral, to fit a new social or economic need.

In so doing, Gandhiji and Vinobaji are but following the examples of the great prophets of the past. Buddha and Jesus, for example, were each men with a new message and one of the secrets of their success was that they used the myths, fables, and folklore, with which their audiences were familiar so that they would see the point at once. The university philosopher with a message, like Kant, or T. H. Green, or A. N. Whitehead, expounds his logical and systematised views in abstract thought to the few. The prophet reaches the multitudes with his homely illustrations and his poetry. It is a mistake, however, to conclude that the one method is necessarily better than the other. The prophets need the systematic thinkers to co-ordinate their ideas and the philosophers need the prophets to spread their findings far and wide.

These points must be emphasised because, since the language and form of Sarvodaya make a strong appeal to orthodox Hindus, some foreign observers write Sarvodaya off as a retrograde or reactionary symptom. The shortest refutation of this, however, is to point out that the terms Yajna, Dan, Yatra, are traditionally associated with strivings towards personal salvation, whereas Vinobaji is using them to express a movement with a social objective. Sarvodaya, moreover is for everybody. When certain orthodox Hindus objected that atheists should not be allowed to participate in Bhoodan, Vinobaji said that all were welcome provided they were sincere workers for Sarvodaya. Vinobaji is no more a protagonist of orthodoxy than was Gandhiji. However traditional the framework within which Vinobaji has set Sarvodaya, he insists that human reason and will power can solve social problems. "No problem frightens me," he has said, "for I believe that there is no human problem but can be solved by human intelligence."

The Sarvodaya ideal is a stateless society attained by steady attenuation of the role of the central authority. The aim is a nation of self-governing villages, depending on the observance of a moral law which, it is said, can be effective only after members of society have matured to the point of recognising their responsibilities.

In the preceding articles of this series, the percipient reader will have noted the conflict in my mind as I have outlined Sarvodaya's aims. The conflict arises because my education having been of the Western type, and most of my experience having been derived

in the highly developed and complicated Westernised industrialised societies that exist in cities, I have the Western intellectual approach to these problems, so that I am constantly aware of what seem to me the weaknesses of Sarvodaya, which is based on an opposite approach and on an experience of a life in which rural existence is the rule and urban the exception. On the other hand, it is important that the Westernised university type who (a) for the most part governs India today, and (b) constitutes the majority of foreign observers, should not dismiss Sarvodaya without a real effort to understand it. One of the important facts about it is that it represents a contribution from responsible and serious strata of thought and experience which are apt to be pushed aside in modern states and prevented from making their full contribution. Secondly, even if ultimately one is led to criticise some of the arguments for Sarvodaya, the very effort to do so makes for clarification of thought.

One fact stands out. The concept of a stateless society made up of self-governing villages is not wholly a poet's vision of the future, for the India of the past, and other vast tracts of the world, have passed through phases closely resembling it.

REPERCUSSIONS OF MODERN COMMUNICATIONS

Railways, telegraphs, fast ships, radio, newspapers, and international division of labour leading to an international link between markets and to a virtually world-wide spread of international credit, were among the causes which led the influence of government in India under British rule to be increasingly felt throughout every village, and the same causes have continued and strengthened this central influence under independence. But the empires of Asoka and of the Mughals did not have all these modern means of communications. At the height of their powers, the influence of an Asoka or an Akbar was felt, negatively, by the maintenance of peace in the country and, positively, by the periodical gathering of taxes. Their empires, by and large, were essentially tax-gathering machines for the maintenance of peace. Beyond that, their influence on village life was negligible, and the villages were economically self-contained, politically self-governing, units of the type envisaged by Vinobaji. Moreover, the villagers observed a moral law. The concept of duty, of individual responsibility to the community, rested on the Hindu "natural" law known as Dharma. Sarvodaya holds up Dharma, which embraces the entire range of duty with an implied religious sanction, as the ultimate government of a highly decentralised society. But this was precisely the law enforced by custom in the self-governing villages of India before they were brought under a central government equipped with modern means of enforcing central policies.

To me, therefore, Sarvodaya is by no means the dream of an impossible Utopia. It has existed in India, Asia, Africa, and Europe, at various epochs of recorded history. Nor, to be effective, does it even require the members of society to have "matured" to some hitherto unattained degree of moral responsibility. The point is important because one of the lines of criticism of Sarvodaya is to urge that its ideals of non-violence render it impossible of attainment so long as human nature remains what it is. I argued this myself here only last time. I still maintain that absolute devotion to non-acquisitiveness and non-violence are so contrary to all experience of human nature as to be unattainable in any foreseeable future. I even add that I am not convinced that they are really desirable ideals. But their unattainability does not mean that Sarvodaya is unattainable — only that a lower or, as I would say, a more human level of it can be achieved, as it used to exist before modern communications destroyed it.

But if Sarvodaya, defined as economically self-sufficient and politically self-governing villages, is attainable, it is, I suggest, only compatible with an infinitely lower material standard of living than is possible when villages form units in an economy of national specialists dividing their labour, and sharing the division internationally with specialists abroad, able to borrow the surplus saving of other countries, which involves the use of internal currency and international exchanges and credit — all of which are repudiated by Sarvodaya.

Moreover, unless some form of central state (a) exists to gather taxes to maintain national defence in a world that will remain predatory in any foreseeable future, the self-governing villages will be subject to interference from abroad, like the satellite states of Eastern Europe, or Kashmir, or Tibet; and (b) exists to conduct trade and other relations with foreign countries on behalf of the villages, no international trade will be possible.

To sum up the argument so far: Sarvodaya, like other varieties of Socialism, is workable and attainable, but seems to me replete and complete with every modern inconvenience.

That I do not, however, regard Sarvodaya as a system that can be ignored is perhaps suggested by the title of the following article: "The Practical Aspects of Sarvodaya".

THE PRACTICAL ASPECTS OF SARVODAYA

By

ODYSSEUS

THE EARNEST FOREIGN STUDENT of Indian affairs may obtain a better grasp of the significance of Sarvodaya by noting the criticisms of the Western Socialist or Welfare state made by Sarvodaya leaders.

The essential difference between the Western and the Sarvodaya approach is that the Western Socialist state is a centralised institution, concentrating more and more power in its own bureaucratic hands in order to confer the maximum material benefits on the people, in education, medical attention, old age pensions, paid holidays, full employment, enforcement of hygienic industrial conditions, and so on. The Western Welfare Socialist bureaucrat is intent on doing good to the people (that, at least, is the theory).

Whereas the Sarvodayan aim is to get the people to attain all these welfare objectives by their own joint personal efforts.

In place of bureaucrats administering centrally devised schemes from huge all-India offices, the Sarvodayan wants the villages to be as economically self-sufficient as possible, and to be politically self-governing through panchayats for political organisation and through community committees for co-operative economic organisation.

The Sarvodayan Socialist is alarmed at the loss of personal freedom and industrial initiative in the Western Welfare state—a point on which this column has been sounding the alarm for years. As P. Srinavasachari wrote in 'Harijan' on November 5, 1955, (quoted in "Indian Approaches to a Socialist Society", published at $1.50 by Berkeley University, Cal., a wonderful quarry of official texts on our topic): the common man in the West "is much more conscious of being governed than of governing," whereas in the Sarvodaya state "as more power is vested in the units, every person takes an active interest in day to day administration...The governing authority does not impose its will but carries out the decisions of the popular will." Again, K. G. Mashruwala wrote in "A Vision of Future India" (Ahmedabad: Navajivan, 1953) that every citizen ought from birth to death to enjoy the benefits of the Welfare state, "but if this can be done only by making him from birth to death something like an A, B, or C class prisoner of the State, under the outward semblance of democracy (and the USSR also regards itself to be a democracy of our type), it is much better to live, as we have lived from the birth of humanity till now, in some sort of hard struggle for existence than be just comfortable animals, well-kept by a small powerful group of our own species".

Jayaprakash Narayan himself has repeatedly expressed the fear that the Welfare state "in the name of welfare, threatens as much to enslave man to the State" as any totalitarian state.

All this is admirable. The next step in the Sarvodaya argument, however, seems to me to be a false one. The Sarvodaya leaders fear that the obvious imperfections of human nature stand in the way of the achievement of a society of self-governing villages. Vinobaji thinks that a "parental" form of government is necessary in a society in which the people are ignorant of their responsibilities and have not attained a capacity to think. As the people progress in understanding and as social co-operation develops, the need for government will be less and less. "Then government will not remain an institution which will order people about but will become one which will only advise them." As moral levels rise, the power of government will decrease and ultimately the state will wither away.

As I have ventured to point out earlier, the foregoing argument is open to dispute on historical grounds. Before the Western industrial revolution of the nineteenth century endowed governments with means of communication that annihilated space and time and brought their centralising influences to bear in the remotest village, the greater part of the world lived in rural economies the chief feature of which was the self-governing community, untouched by the government of the state except for periodical visitations of the tax gatherer who collected revenues on behalf of a king or emperor whose economic and political justification was that he existed to maintain peace and defend the state from external aggression. I submit also that all the evidence of anthropology and history suggests that as far back as we can discern recognisable human beings they have shown themselves to have attained a sufficient sense of social co-operation to manage to govern themselves reasonably well in small communities.

I cannot help thinking that the root fallacy that has misled Vinobaji into believing that a higher degree of moral and social consciousness is necessary before Sarvodaya can be attained arises from a failure to grasp that what does need a higher social consciousness to make it work successfully is not the village but the highly complex society based on large-scale industrialisation and modern communications.

WHY THE WEST HAS HIGH STANDARDS OF LIVING

I repeat that life in small village communities does not call for any substantially greater moral development in man than exists already. The need for a greater sense of individual responsibility and social obligation begins to be felt more and more as the unit of self-government enlarges itself and becomes more complicated. Life in an isolated, self-sufficient village is simpler than life in which the economy and the administration covers two or three neighbouring villages. Why, then, do men not stick to the self-sufficient single village and avoid entanglement with others? For a variety of practical reasons. First, because it is virtually impossible for any village to live entirely without contacts with neighbours, and such contacts open up problems of joint-relationships; secondly, defence against outsiders is strengthened by joining up with others; and above all, thirdly, because joint action leads to greater wealth. The smaller the self-sufficient village economic unit, the lower its standard of living is likely to be. London and New York have extraordinarily high standards of living because they are units in vast, highly complicated, organised national economies, which in turn are dependent on the elaborate ramifications of the international division of labour, which involve such headaches as the Suez Canal and Arabian oil.

SHOULD NEW DELHI WITHER AWAY?

There is no reason why Vinobaji should not achieve Sarvodaya and why the Government of each Indian state and of New Delhi should not be made to wither away in accordance with Sarvodayan doctrine. But these states were called into being to discharge an enormous variety of functions which will come to a dead stop if they wither away, because they are not the sort of functions that small village panchayats or co-operative committees can tackle. To give but two concrete examples, no village panchayat could organise the Damodar Valley scheme, and no village co-operative committee could make the international arrangements that led to British, Soviet, and German aid in building three socially owned steel plants.

Moreover, however successful the Sarvodaya leaders may be in raising the moral stature of India's rural masses in such ideals as non-acquisitiveness and non-violence (which, as we have said is an important part of their programme), unless simultaneously they have inculcated these ideals into the whole of Asia (at any rate as a start, and before they launch out on the other five continents), an organised modern state, equipped with armed forces, and with diplomatic agents to secure material aid from allies abroad to make good any lacks in our resources, will be necessary to defend India's several hundred thousand self-governing villages against envious marauders from abroad. If you've forgotten Genghis Khan, remember Babar. If you've never heard of Hitler, don't forget Stalin and General Tojo.

If I thus point out what seem to me to be weaknesses in the theory of Sarvodaya, it must not therefore be assumed that I am wholly hostile to it. On the contrary, I believe that entangled with the Utopianism, there is a substantial element of truth and sound common sense in the Sarvodaya movement.

The fatal weakness of the Western Welfare state is that it is undermining the self-reliance, initiative and sense of individual responsibility of the masses, and teaching them to rely on the state to feed, clothe, educate, and provide comfortable and easy work for them from the cradle to the grave. There is no future for any nation whose people expect to have no difficulties, problems, or hardships in their lives.

The strong point of Sarvodaya is precisely that it does not look to the State to take the initiative in any-

thing and that it is, on the contrary, preaching self-reliance and self-help to the people. In this, it is, as far as I know, unique today in all the world.

If I do not myself believe that Sarvodaya's ultimate ideal of a stateless society can be reconciled with a high standard of living, and that in present circumstances it is therefore unlikely to be attained, I certainly do believe that the more successful that it is in spreading the gospel of Bhoodan, panchayats, Gramdan, and local co-operatives, the more dynamic, progressive, healthier and happier, morally and materially, will the lives of the rural masses become. But this does not mean either that large-scale state industrialisation will be scrapped or that all Private Enterprise will disappear, and there is no reason why it should. Nor is the State likely to wither away and the denizens of New Delhi's North and South secretariats sent to rehabilitation centres to learn how to plough, sow, reap, and adapt their red-tape for use on village panchayats.

There are reasonable prospects that Sarvodaya will attain a large measure of success in its practical uplift aims because (1) its leaders, Vinobaji, Jayaprakash Narayan, and many others, cannot be dismissed as mere visionaries. They are men of outstanding calibre and ability, and (2) the Congress Party, which remains the most powerful organised political force in the country has recognised the value of supporting Bhoodan and Sarvodaya, and through them strengthening the Congress hold on the mass of the electorate.

Nor, in this Sarvodaya-Congress relationship are the benefits all on one side. The traffic is two way. If the Sarvodaya leaders benefit in a variety of practical ways by official support, the Congress Party cannot profess sympathy for Sarvodaya without helping forward certain aspects of its programme.

Next week's final article will be entitled: "Pandit Nehru's Socialism".—Ed.]

MEN WHO WILL MOULD OUR FUTURE

Our scientists are the pilots of our destiny . . . the men who will chart our industrial progress. And in order to provide them with every equipment and facility, 11 National Laboratories were established in the First Plan. In the second Five Year Plan over Rs. 20 crores will be spent on scientific and industrial research.

In the work of our scientists, as in the training of research students in our universities, paper will play an important part. In laboratories all over the country paper will provide the means of computation and instruction.

AGONISING REAPPRAISAL IN WEST GERMANY

(From Our Special West European Correspondent)

PARIS, December 15.

THE violent upset in international relations which began in the summer has left no country unaffected. Every nation in Europe has now to devise a foreign policy based on a totally new calculus of powers and probabilities. The Federal Republic of Germany is no exception, for events in Poland, Hungary and Egypt have shaken the foundations of Konrad Adenauer's foreign policy, presenting West Germany with some new hopes and several new dangers.

The first new element, and in the long term probably the most significant, was the peaceful anti-Russian revolution in Poland which brought to power a more liberal and more independent regime under Gomulka. This change meant that if and when Germany is reunited she will have for her eastern neighbour not a ruthless Communist dictatorship or a Russian puppet, but a more civilised government whose independence of Moscow the West might seek to increase by generous and friendly treatment. This is important for Germany because Poland today includes one-fifth of the territory of pre-Hilter Germany, the lands beyond the Oder-Neisse line where once lived nine million Germans who were expelled after 1945. This post-war border between Poland and Germany is juridically provisional, for there is yet no German peace treaty, but in reality it is quite irrevocable unless there is another world war. As long as the cold war continued and as long as the Warsaw Government was a Russian puppet-show, West Germany could pretend not to recognise this piece of reality and verbal irridentism could flourish without any of her Western allies daring to say that the Oder-Neisse line was permanent.

The revolution in Poland puts a new complexion on matters. In Warsaw is developing a regime that is considerably more liberal than Tito's, and whose stabilisation and independence are as important for the democratic West as for the Communist East. To strengthen the ties of the new Poland with the West and to decrease her reliance on Russia, it is necessary that Poland feel as secure on her western frontiers, with Germany, as on her eastern frontiers, with Russia — and that involves the final surrender by Germany of all claims to a restitution of the Oder-Neisse lands. Not that the time is yet when Germany will or should publicly announce surrender of those claims, because obviously the Germans must keep all their bargaining counters in their hands until the moment for a full settlement arrives. But West German foreign policy has to begin evolving toward that possibility and public opinion must be prepared for what will be a considerable emotional sacrifice. Already last week, Herr Wilhelm Grewe, Director-General of Political Affairs in Bonn's External Affairs Ministry, wrote discreetly: "It will be of the highest importance to convince the Poles that they have no need to seek the protection of the Red Army to secure their State against (a reunited) Germany. Speeches and slogans will not convince them. We must have clear ideas on the question of our eastern frontiers". Which is as near as a West German official can safely go to admitting that irridentist claims must be abandoned.

West Germany had barely begun to digest this fact when the revolution in Hungary transformed the international scene even further, and brought with it a grave and immediate danger. The first reaction of the Bonn Government, which is composed of Europe's most convinced Christians and anti-Communists, was naturally to exploit this demonstration of Russian barbarism as proving their case against Communist tyranny and as revealing what sort of "popular democracy" must really prevail in East Germany. It happened that the Bonn Government was at the time seeking to hurry through parliament the law for a new German army, against socialist opposition, and the reawakening of the Russian menace to West Europe came as a convenient argument in this debate. But as the horror of the Hungarian tragedy developed, a new mood of caution was felt in Bonn, and we had the curious spectacle of even Dr. Adenauer and President Heuss declining to take part in a meeting in West Berlin in support of German reunification. The Minister that they sent along to that meeting, Herr Kaiser, made a most pacifying and moderate speech which contrasted sharply with all his previous utterances on this subject and which included the significant remark: "Our whole reunification policy has to be revised in the light of world events".

Elsewhere, Dr. Adenauer went even further and not only toned down all references to German reunification but abated his anti-Communism to the extent of urging the Germans in eastern (Communist) State to "stay quiet". This sudden soft-pedalling on the major themes of West German politics is to be contrasted with the indignation that shook the Federal Republic in June, 1953, when Russian tanks put down the workers' rising in East Berlin. The reason is not far to seek. It had occurred to the leaders in Bonn that if a Hungarian-type revolution were to break out in Communist East Germany, as it easily could even now, not only Germany but Europe and the whole world would find itself on the verge of war. The West has stood by and watched the slow and brutal murder of the Hungarian people — but it is quite improbable that the West Germans, whatever their Government might say, would stand by and watch a similar genocide in East Germany. A popular rising in East Germany would bring brutal Russian repression, that in turn would surely bring popular intervention from West Germany, and since West Germany is a member of NATO and the station of many American troops, the third world war would as good as have begun.

It cannot be too strongly emphasised that this danger has by no means passed. The 17 million Germans in the east have suffered much the same treatment as the nine million Hungarians who still today are struggling against Russian tanks. The same centres of opposition as existed in Hungary in the last days of Rakosi exist today in East Germany. The Ulbricht regime is making the same desperate efforts at repression as Rakosi made. If the East Germans are not up in arms today it is only because they had a taste of Russian repression in June 1953 and because they see what is happening in Hungary. But the hopeless, deathless determination of the Hungarians shows us that we cannot rely on the victims of Communist oppression to lie low merely because the cause is impossible — and in the case of the East Germans the knowledge that intervention from the West would be almost inevitable might serve as an encouragement rather than the contrary. This is why the advocates of anti-Communism and German reunification in Bonn are now in the odd position of hoping that the Pankow Communists remain safely in power for some considerable time yet.

Another plank of Dr. Adenauer's foreign policy that has cracked this autumn is European unity. After his brief but acid quarrel with the USA some months ago, Dr. Adenauer turned with renewed vigour to the campaign for a united Europe including Britain, seeing in

this a hope of more consistent support than Germany could expect from Washington, where the main consideration sometimes seems to be an agreement with Russia over the heads of the second and third class European powers. This campaign was just set going when the two main partners in any possible united Europe, Britain and France, suddenly and without consulting the other European nations, launched on the disastrous Egyptian expedition. This was not merely directed against a nation with whom the West Germans had been sedulously cultivating commercial and political relations (the Germans hoped to get a major share of the Aswan dam orders) but showed that anti-colonialist Germany would be in danger within a united Europe of being drawn into the colonial adventures of her major European allies.

From the beginning of the Suez dispute, West Germany had taken a line that was nearer Egypt's than the Franco-British case, and there is no doubt that if she had been a member of the United Nations she would have voted, as Italy did, against the French and British. West German industry has throughout been solidly pro-Nasser and is now seeking Italian and American support in an effort to replace the original Franco-Anglo-German consortium that was to build the Aswan dam. Not only in Egypt, but elsewhere in the Middle East, West German industry is eagerly seizing the opportunities opened by the loss of Franco-British prestige. In Jordan, orders for roads, refineries and the port at Akaba have lately been taken up by the Germans, and in the Sudan, German industry now has a good chance of getting a share in the irrigation project between the White and Blue Niles, a position that hitherto seemed secured by the British. These activities may be all very well from a general point of view, but they would make nonsense of a "united Europe" such as Dr. Adenauer promised to work for in the summer.

But are they even all very well from a general point of view? The Bonn Government is beginning to have doubts. Though violently disagreeing with the Franco-British reaction to the Suez nationalisation, Bonn realises that events in the Middle East oblige it to reconsider its grandiose plans for aid to under-developed countries, for example along the lines of Krupp's "Point Four-and-a-half". Such plans involve financial support from the West German Government and when agreements are open to the sort of treatment the Suez agreement got from Nasser, such support can be dangerous. Herr Hermann Abs, who is President of the Sud Deutsche Bank, is also financial adviser to Dr. Adenauer, and it is significant that he said last month: "If investment conditions in these countries (Herr Abs had just referred to certainly newly independent States who "violate international law") continue to deteriorate, then Western governments will have to consider seriously whether they should continue to impose on their own economies the risks that result from this". And Herr Abs advocated European unity on the question of safeguarding investments in under-developed countries. It appears that Bonn is having misgivings about the daring lone-wolf policies of German industry in regions where France and Britain have lost credit.

German reunification, the return of the Oder-Neisse lands, European unity, the close alliance with Washington, and finally Germany's independent future as the industrial support of backward Asia — all these foundations of West German policy have been rudely shaken in the past few months. Little wonder that, although she has not been directly involved in any of the violent commotions of this tempestuous year, the Federal Republic is as confused about the future as any European State.

WORLDGRAM

AGRICULTURE

Farm Output in China: China's agricultural production for 1956 showed an overall increase over last year despite natural calamities. Grain crops, including wheat, rice and soyabeans, were up more than 10 million tons, while cotton production rose by about 60,000 tons. But although production exceeded the original targets for 1957 — the end of the first Five-Year Plan — grain production was about 4.5 million tons less, and cotton about 200,000 tons less, than was estimated earlier this year. Nevertheless, ambitious targets have been set which would raise grain production by 14 million tons and cotton by about 300,000 tons. Statistics given by the Agrictultural Ministry of China put 1955 grain production at 184 million tons, 1956 production at 194.5 million and the 1957 target at 208.05 million. Cotton production in 1955 was given as 1,518,000 tons, in 1956 as 1,575,000 and the 1957 target as 1.8 million. Soyabeans output this year — which was included in the grain total — reached an unexpected 10.25 million tons, an increase of about 1 million tons.

*

Punjab's Cotton Crop: The total area under cotton crop in Punjab has risen from 7,45,000 acres in 1955-56 to 8,49,000 acres in 1956-57 according to the second official forecast of the crop. The total area sown this year is shared by 'Desi' and American cotton with 2,09,000 acres and 6,40,000 acres as against 2,03,000 acres and 5,42,000 acres respectively, in the last year.

INDUSTRY

Indo-British Venture: To build a heavy engineering works in the vicinity of Durgapur, West Bengal, a new company formed of British and Indian interests is planned. An announcement in London says that the Associated Cement Co., Ltd., of Bombay with Vickers, Ltd., and Babcock & Wilcox, Ltd., of London, have concluded arrangements for the formation of a company to be known as ACC-Vickers-Babcock Private Ltd. (A.V.B.). The new company plans to build a heavy engineering works to manufacture cement-making machinery, mining machinery, large pumps, heavy gears, steam generating plant of all types, pressure vessels, cranes, and mechanical-handling equipment. Construction of the A.V.B. works will begin as soon the Government of India's approval — now begin sought — has been obtained.

*

Ammonium Sulphate Production: The Sindri Fertiliser Factory exceeded its production target of 30,000 tons of ammonium sulphate for the calendar year 1956 by 1,725 tons, it is officially learnt. For the third time in succession Sindri has exceeded its production target. The production of ammonium sulphate for the calendar year 1955 and the financial year 1955-56 were 21,363 tons and 26,062 tons respectively, the target being 320,000 tons. The production of ammonium for the calendar year 1955, financial year 1955-56 and calendar year 1956 were 90,847 tons, 92,288 tons and 94,444 tons respectively. The production of ammonia for the calendar year 1956 is the highest so far achieved, exceeding the production for 1955 by 3,597 tons. Ammonium sulphate despatched during the calendar year 1956 to various States was 73,921 tons, the highest on record.

*

TISCO Production: The results of the working of the Tata Iron and Steel Company for the quarter ended September 30 show production of pig iron at 283,800 tons, steel ingots at 267,500 tons, and of saleable steel at 192,300 tons, 49,800 tons of it being semis and 142,500 tons finished steel. Despatches during the quarter were 26,200 tons of pig-iron, and 193,600 tons of saleable steel, 55,800 tons of it being semis and 137,800 tons finished steel. The net value of the materials despatched after deducting from the invoices the rebate payable to Government, freight on outward traffic, commissions discounts and rebates paid to other parties, amounted approximately to Rs. 862 lakhs. The figure of net realisation includes approximately Rs. 50 per ton to be credited, after taxes, to a separate development fund earmarked specifically for capital expenditure on the expansion programme of the company under the relevant agreement with the Government.

*

Wrought Aluminium Standards: The Indian Standards Institution has published two Indian standard specifications — IS: 739-1956 for wrought aluminium and aluminium alloys, wire and IS: 740-1956 for wrought aluminium and aluminium alloys, rivet stock — for general engineering purposes. These standards form part of a comprehensive series of eight Indian standards for different form of wrought aluminium and aluminium alloys for general engineering purposes now under preparation. Each of these standards is divided into two parts. Part I includes clauses on general requirements, such as terminology, freedom from defects, provision of test pieces, mechanical tests etc., while Part II covers specific requirements such as chemical composition, condition and mechanical properties of the relevant materials.

*

Ceramics Factory for Jammu: The Kashmir Government has decided to establish a ceramics factory at a cost of Rs. 30 lakhs at Jammu. The Industrial Research Department has completed the necessary survey and negotiations for machinery from abroad have begun. The factory estimated to produce about 1,200 tons of ceramics, utility and sanitary were annually. The project is expected to be completed in two years.

*

Steel Plant in Pakistan: Pakistan has sought a loan from the World Bank to finance the establishment of a steel plant in West Pakistan estimated to cost about Rs. 17 crores. The proposed steel plant will be set up in Multan. It is reported that Swedish experts who visited this country recently have studied the proposal first made by German experts. The German experts had recommended the feasibility of establishing a steel plant in Pakistan.

TRADE

Anglo-Polish Trade Pact: Britain and Poland signed a three-year trade agreement in Warsaw recently according to Board of Trade announcement. Under the agreement import quotas will be negotiated annually and both countries undertake not to discriminate against the other's shipping.

*

India's Imports: India's imports during the six months April to September 1956 reached a record level of Rs. 476.8 crores representing an increase of Rs. 122 crores over the corresponding period a year ago, and the exports at Rs. 288 crores showed a small decline of Rs. 15 crores, while net invisibles and official grants were larger by about Rs. 11 crores, according to an article in the latest issue of the Reserve Bank of India Bulletin. The article states that the rate of imports almost wholly explains the deficit of Rs. 125.9 crores during the period, resulting in a depletion of her sterling balances, the main component of her foreign exchange reserves by Rs. 130.8 crores. The second Five-Year Plan visualized imports of the order of Rs. 783 crores in 1956-57 and an average of Rs. 868 crores for the whole of the Plan period on the basis of the average prices prevailing during April-December, 1955. The

actual performance during the half year April-September 1956,however, shows an annual rate of imports of Rs. 953 crores at prices which are about 1 per cent higher. Regional analysis of transactions shows that the deficit of Rs. 125 9 crores on current account was distributed in all areas, but was mainly concentrated in transactions with the sterling area and the OEEC countries. The payments position with the sterling areas changed from a surplus of Rs. 6 crores in April-September 1955, to a deficit of Rs. 21.5 crores; that with the dollar area showed a deficit of Rs. 70 lakhs as against a substantial surplus of Rs. 17.3 crores; with the OEEC the payments gap widened from Rs. 36.7 crores to Rs. 94.6 crores; and with the rest of the non-sterling area, the surplus of Rs. 12.6 crores was transformed into a deficit of Rs. 9.1 crores.

*

Mineral Khaki Drill Export: A trade notice issued by the Joint Chief Controller of Exports, Bombay says: Allocation of quotas for export of mineral khaki drill will be made in this variety on a quarterly basis in proportion to the production of the same during the calendar year 1953. The quarterly quota will be calculated at the rate of 40 per cent of the average quarterly production during the calendar year 1953. The average quarterly production of 1953 will be equal to 25 per cent of the total production during that year. If the production mineral khadi drill in any quarter during January-June 1957, is excess of the average quarterly production in the year 1953, the mill concerned will be granted an additional allotment for mineral khaki drill equal to 75 per cent of the excess production over the average production in 1953, says the trade notice. As announced earlier, adds the trade notice, mills which have started manufacturing mineral khaki drill after 1953 will also be allotted a quota for export of mineral khaki drill. They will be given quotas for this item on quarterly basis equivalent to 40 per cent of their first year average quarterly production or current production. Mills which have started production of mineral khaki drill after 1953 and before January 1, 1957, will also be entitled to an additional quota calculated at 75 per cent of the excess production in any quarter during January-June, 1956 over the average quarterly production during the first year of production for the purpose of claiming ordinary or additional quota. Export quotas for mineral khaki cellular shirting and mineral khaki other fabrics, will be issued to the mill manufacturing the particular variety. Allotments will be made quarterly on the basis of actual production of the respective variety during the first three months out of the four months immediately preceding the quarter to which the quota relates.

*

British Aviation Exports: Britain's aircraft-industry export figures for November, just published, highlight the fact that the industry's annual rate is running at over £100,000,000. The November figure is £7,961,692, and the total for the first 11 months of 1956 is £97,314,399. A breakdown of the figures for the 11 months shows that the United States bought aircraft and parts worth £15,400,000, and was the United Kingdom's best customer in this field.

FINANCE

Portugal's Budget: Portugal's budget, which has been balanced since 1928-29, shows an estimated surplus of Escs. 5 million for 1957. Ordinary revenue is put at Escs. 6,303 million, or £79 million (against Escs. 5,886 million, or £74 million in 1956) extraordinary revenue at Escs. 1,699 million (£1,794 million). Ordinary expenditure is budgeted at Escs. 6,193 million, or £77 million (Escs 5,817 million, or £73 million), extraordinary at Escs. 1,799 million (£1,354 million).

*

Finance Corporation for Kashmir: The Kashmir Government has decided to set up a State Finance Corporation in order to meet a long-felt need. The Finance Corporation will have a share capital of Rs. 50 lakhs and a paid up capital of Rs. 25 lakhs. The State Government will contribute Rs. 19 lakhs. The Corporation will meet the requirements of not only the private sector but will also help to finance deserving industries in the public sector.

*

Central Aid for Khadi Industry: The Government of India have sanctioned further financial assistance to the All-India and Village Industries Board for the development of the traditional khadi industry. The Board will provide loans to registered institutions and societies for purchasing and stocking raw materials like cotton, wool and silk cocoons, implements, chemicals, dyes and other materials required for the production of traditional khadi. The Board has been sanctioned Rs. 1.4 crores to be given as loans to registered institutions and societies recognised by it. On the recommendation of the All-India Khadi and Village Industries Board, loans amounting to Rs. 1 crore have been sanctioned directly to six institutions. They are Bihar Khadi Gramodyog Sangh, Muzzaffarpur; Gandhi Ashram, Meerut; Punjab Khadi Gramodyog Sangh, Adampur Doaba; Khadi Ashram, Ambala; Rajasthan Khadi Sangh, Chommu and Sarva Seva Sangh, Wardha. For subsidising half of the cost of implements and accessories for the production of khadi, a further sum of Rs. 2 lakhs has been placed at the disposal of the Board for distribution through the Khaddar Bhandars and centres recognised by the Board. For popularizing improved implements and guiding workers in their use, mobile parties are organised by the Board. A sum of Rs. 1,62,000 has been sanctioned to the Board for organising these parties who will train people in spinning and weaving. The Board has been permitted to re-utilize during the current financial year the revolving capital of Rs. 1.5 crores sanctioned earlier. This and an additional amount of Rs. 50 lakhs will be used by the Board for the marketing of traditional khadi.

*

South African Reserves Up: South Africa's total gold and foreign assets in the week ended December 21 amounted to £133,251,000, compared with £130,379,000 a week earlier, the Reserve Bank disclosed on December 27, 1956. The latest total comprised £79,216,000 in gold coin and bullion, £43,450,000 in foreign bills, £5,080,000 in foreign securities and £5,506,000 in other foreign assets. The ratio of gold reserves to public liabilities was 59.0 per cent.

GENERAL

Technical Bulletin on Propionaldehyde: A new technical bulletin on propionaldehyde has been issued by the Chemicals Department of Union Carbide International Company, a division of Union Carbine and Carbon Corporation. Information is included on physical properties, specifications, shipping data, applications, and toxicity. A number of typical reactions are also given. Propionaldehyde is a chemical intermediate for the manufacture of polyesters and other plastics and resinous compounds. It is also used to make pharmaceuticals, rubber accelerators, iron exchange resins, demulsifiers, and perfumes and flavours. Propionaldehyde is useful in the electrolytic purification of zinc and in photographic developing processes. Copies of this technical bulletin are available from the Chemicals Department, Union Carbide International Company, 30 East 42nd Street, New York 17, U.S.A.

NEWS IN BRIEF

INDIAN

The packing charges for cement for next quarter commencing from January 11, 1957, have been revised and fixed at Rs. 13-2 per ton. The above packing charges are applicable to cement packed in new bags only.

*

The Punjab Government has decided to levy sales tax at the rate of Re. 1 per cent on ornaments and jewellery and annas eight per cent on bullion instead of Rs. 6-4 per cent on the former and annas four per cent on the the latter.

*

Cotton hard waste and soft waste including silvers, roving ends and bondas will continue to be licensed freely for export till June 30, 1957.

*

Umbrella cloth of the medium category will continue to be licensed freely for export up to June 30, 1957 to all permissible destinations except Tibet and the Portuguese possessions in India, according to trade notice issued recently by the Joint Chief Controller of Exports, Bombay.

*

The Saurashtra Cement and Chemical Industries Ltd., which is to set up a cement plant near porbunder with a daily capacity of 560 tons, has placed orders for its plant and machinery with a leading Italian firm.

*

The Central Silk Board has drawn up a comprehensive plan costing Rs. 668 lakhs for the development of the silk industry under the second Five-Year Plan.

*

The department of Atomic Energy, Government of India, will purchase lithium ore (Lepidolite) containing 2 per cent or more Li2/0 available with mine owners and dealers in the country to the extent of 500 tons of lithium at a price of Rs. 25 per lb. of contained lithium, the price being granted for a period of five years.

*

A nine man committee to review the progress of coal production plans in the private sector and to suggest ways and means for achieving the targets set for the industry has been set up.

*

The provisional figures of foreign sea and air-borne trade of India on private and Government accounts during November 1956 totalled 12.358 lakh rupees, according to the data so far available in the Department of Commercial Intelligence and Statistics, Calcutta.

*

The Madhya Pradesh Government has decided to advance a loan of Rs. 2.51 lakhs to the newsprint factory at Nepanagar in the State. The factory went into production in April 1956. Its production is 50 to 55 tons of newsprint a day.

*

The Indian Standards Institution has published an Indian standard for general requirements and methods of test for porcelain insulators for overhead lines with a nominal voltage of 1,000 volts and above.

FOREIGN

In the first eleven months of 1956 Britain's office-machinery industry set up a new annual export record, the eleventh in succession since the war.

*

Turkish and West German interests have signed an agreement for the joint exploration of wolfram deposits in the Ula-Dag area near Bursa, in Turkey.

*

A new Franco-Japanese financial agreement for settlement in sterling transferable francs has been signed. The new agreement replaces the 1948 pact, under which settlement was in dollars. Under the new pact authorised French banks may open foreign Japanese accounts in francs in the name of residents in Japan.

*

Latin America has trebled its steel consumption during the past 20 years, according to the current issue of the Latin American Business Highlights, 'The Chase Manhattans Banks' — Quarterly Review.

*

The Majlis (Lower House) has approved a Bill *authorising the Iranian Government* to borrow $75 million (£26.7 million) from the World Bank, which has already agreed to lend the money. The loan will supplement oil revenues devoted to development projects.

*

According to official data, industrial production in the first ten months of 1956 in Yugoslavia registered the highest growth in the Republic of Bosnia and Herzegovina, in central Yugoslavia, where an 18 per cent increase was registered, followed by the Republic of Serbia and Macedonia where a 12 per cent increase was registered.

*

Swedon increased her oil imports in November, 1956 despite the Suez crisis. She imported 921,000 tons compared with 869,000 tons in October. Her total imports in November were valued at Kr. 1,098 million (£76 million) compared with Kr. 1,093 million (£75.6 million) in October. Her total exports were Kr. 978 million and Kr. 947 million respectively.

*

Tea production in Indonesia during 1956 is estimated to have fallen by 15 per cent. Since 1940 production has approximately been halved.

*

Northern Rhodesia's mineral production in the first 10 months of 1956 reached a record value of £107,949,882 — £11.7 million more than in the corresponding period of 1955 and only £12.6 million short of the annual total for 1955.

*

Negotiations have been completed between Onoda Cement Company and Brazilian interests for the establishment of a Joint Cement Plant in Brazil. Onoda is expected to provide 48 per cent of the capital, largely in equipment and technical aid and the Brazilian side the remainder, principally land and construction materials. Onoda will also supply technicians to operate the plant.

*

The value of world export of manufactured goods in the first nine months of 1956 is provisionally estimated at $23.118 million in terms of U.S. currency.

*

Preliminary figures released recently by the Japanese Ministry of Finance show Japan's foreign exchange holdings as of November 30, 1956 at $1.389 million.

The New DeLuxe Champion Tubeless Tyre gives you and your family protection never before provided in any tyre at any price. Ends fear of blowouts, gives longer, safer mileage, and has astounding non-skid qualities. It is truly the only tyre with *built-in peace of mind.*

THE ROLE OF RAILWAYS—II

By

J. E. CASTELLINO and Prof. A. S. DESHPANDE

IT is in this context that the demand for a flexible rating structure acquires meaning and finds expression. Routine dulls initiative; audit rules ensure a play for safety. Experimentation is at a discount. How can there be progress without encouragement for experimentation? And how can there be experimentation without the risk of mistake? Is it a shameful exercise in flimsy casuistry to plead that commercial officers are handicapped by accounting procedures?

There is in the minds of the public a popular conception that the Finance Officer is the watch-dog of the administration. Whether it be true or not, there is ample evidence that the Accounts Officer has come to interpret his role as being primarily that of a person whose function it is to point out financial irregularities. In the course of years, he has developed the traits of a watch-dog, which are primarily to inspect everybody, to discourage the passer-by, to frighten the curious, to block the entrance, to guard against intrusion—in short to prevent activity and to eliminate progress! This negative aspect has unfortunately obtained complete predominance, often to the exclusion of any other characteristic. It is not his fault! It is a misfortune for the administration that such a tradition should have been built up. Nowhere is this form of blight more felt than in a commercial organisation of Government. Railways are 'par excellence' the largest of the commercial undertakings and if there has been a gradual lessening of initiative and a gradual increase in "play-safe" tactics, the responsibility must be placed on the negative role of Accounts and Audit.

The paralysing effect of this attitude is felt in no greater measure than in dealing with requests for concessional rates. It was true—alas!—the Chief Commercial Manager could, within the maximum and minimum laid down by the Railway Board, offer any reduction. That is the flexibility for which there is public clamour. Gradually the powers have been curtailed and today no reduction can be effected, even within the maximum and minimum, without the prior concurrence of the Accounts Department. On paper, this seems to be a nominal requisite; in practice, it is the biggest handicap. For the accounts man is not commercial-minded. To him risk is anathema. He deals with facts and figures, not with probabilities and possibilities. The realm of adventure, the joy of experiment, the sanity of calculated risk—all is to him a closed book. The Commercial Manager cannot be a prophet. He cannot ever guarantee that additional net earnings will be obtainable; but being a sort of a business man, he is prepared to experiment, to make an intelligent guess, to risk his knowledge and experience, to trust in his faith. Unfortunately, governmental procedure is such that even this right is now denied.

Commercialism has been described as an attempt to secure 17 annas of revenue today in place of the 16 annas received yesterday. The Chief Commercial Manager must seek additional traffic, in parliamentary language, with the assiduousness of a Cassanova searching for a new bride. This is, at all times, an exciting process, but tameness is introduced by two factors: inability to carry all the traffic that is offering, and lack of competition by alternative means of transport. So long as capacity falls short of demand, there can be no zeal for commercialism on railways.

The "masterly inactivity" which is a feature of any governmental agency, thus finds a favourable climate and healthy breeding-ground, even without the potency of the Accounts Department's motivation which has brilliantly been summarised in the momentous motto: "oppose, expose, depose"! Red-tape is a familiar cliche. Sometimes, it is propitious to cut the red-tape; but who is there to legislate that red-tape should never be supplied to Governmental Economic Departments—those dealing with industry, trade and commerce—and those dealing with communications—the posts and telegraphs—the railways and the air services.

It is correctly said that an exception only proves the rule. If there is, with one solitary and strange exception, unanimity on any point, it is on the vital necessity for a flexible rating system which can promptly meet the needs of trade and industry. The former Government of Saurashtra were alone in their suggestion that the grant of concessionol rates should be the function, not of individual railway administrations, but of a centralised office. Says the Memorandum:. "We have not advocated a wide range of Station-to-Station rates and where such appear to be justified, we have suggested the creation of a Special Committee or Tribunal for speedy redress and decisions. It is feared that any excessive use of ad hoc decisions will open wide the doors to favouritism and its twin brother, corruption. The present structure should ordinarily obtain in all cases....."

This verdict must indeed make strange reading. The suggestion is worth consideration, but its raison d'etre is questionable. Perhaps, the ex-Saurashtra Government were not aware of the functioning of the Railway Rates Tribunal, where one of the diseases, favouritism, is likely to receive short-shrift. Perhaps, the State Government, recalling the vagaries of policy that governed the many ex-Rulers' Railway systems, pins its dubious faith on a Centralised Committee. Moreover, the suggestion must be viewed in the context of the perennial complaint that "the Railway Board, as at present constituted, has failed to meet the requirements of the business community. This is due to the spirit of ultra-conservatism which pervades the entire bureaucratic system of this country.....". References are frequent and continuous to the contemptuous disregard of public opinion, to the absence of free, dispassionate and progressive mind, to the lack of subservience to the fiscal policies of the country.

Governance by Committee is a device familiar to the Indian people: why not a Committee for deciding on railway commercial policy? The Railway Board could function only as an executive; the individual railway could deal with strictly local demands for aid by way of freight reductions; and this central body could be entrusted with the task of shaping the over-all commercial policy of railways. Such a division of functions would neither decrease nor increase the existing responsibility, now devolving upon the Railway Board and the different railway administrations. To stultify the initiative of the Chief Commercial Superintendent, to deprive him of his responsibility, and to detract from his main function—this would be fatal to the efficiency of a railway. But so to limit his sphere of activity to local problems is to enlarge his opportunity for really effective usefulness to the country of

the area his system serves. Similarly, the removal of responsibility for policy decision would leave the Railway Board free to devote greater attention to executive function. Finally, the setting-up of such an authoritative and independent body would ensure well-balanced co-operation between the Tariff Commission which is the champion of nation-building industries and the Railway Board which controls the most potent and important transport agency in the country.

There is another way of looking at the problem. A multiplication of semi-independent bodies may not be conducive to the inducement of a healthy and dispassionate outlook: there may be a tendency towards holding one's own, an attitude unavoidable when there is too much outside scrutiny and criticism. On that account, to restrict the area of conflict and to induce the urge for co-operation, the enlargement of the scope of the Railway Rates Tribunal may be most salutary. After all, in dealing with a complaint of the unreasonableness of a rate 'per se,' a fairly detailed knowledge of the internal working of railways is obtained. To achieve the objective of solvency, an intimate study of the methods of obtaining revenue as well as of controlling expenditure is necessary. What better agency than the Tribunal to undertake the examination of a recommendation of the Tariff Commission or a resolution of a Federation of Industries, or a request from a State Government? Such an amplification of powers seems eminently desirable in the interests of the railways, of the users, and of the nation.

If this involves too drastic a change, if it has the effect of diminishing the responsibility of the Ministry and of stultifying the powers of individual railway administrations, if it imposes another tier in the already multiple hierarchy of organisation, then the least that must be done is to infuse enthusiasm for judicious risk-taking and experimenting and to kindle the torch of initiative that has been dimmed by antiquated procedural and accounting methods. The tempo of development is going to be fast, and a failure in transport is unthinkable. Prices will rise; and railway freight charges must also go up, not, of course, 'pari passu' with the index of prices but inevitably and perceptibly following the rising curve. The expansion in the network of railways will impose a severe strain on finance: replacement costs will be heavy, and the temptation to link freight with capital expenditure will be great. At the outset, income will not keep pace with expenditure; the increase in traffic will be slow and, perhaps, the increase in revenue will not be proportionate with the rise in traffic; there will also be the heavy burden of interest charges and of depreciation costs. But not for a moment must the public utility character of the railways be forgotten nor must the narrower interest of the railways be allowed to dominate over the wider needs of the country. If the railways can achieve a synthesis of the commercial efficiency of a private undertaking with social obligations of a nationalised industry in a welfare State, then indeed will they deserve well of the country.

India is now on the threshold of an era of development. Politically, the people have come into their inheritance; socially, there is an inspiring awakening; economically, industrialisation and higher living standards are the objectives. None of these ideals can be realised without an efficient railway system. The services which railways can render in annihilating distances, in preventing famines, in facilitating commerce, in fostering industries, in eradicating social prejudices, in assisting the administration of government—these services are incalculable in their worth.

For transport, there are many symbols of progress. There is speed—for faster tempo of life; there is availability—for prompter response to varying needs; there is power—for greater capacity; there is economy—for cheaper satisfaction of demands; there is safety—for freedom from fear; there is profit—for social gain; and there is service—for better living. To the people's railways, these symbols represent both a fulfilment and a challenge!

DEFICIT FINANCING

(CONTRIBUTED)

DEFICIT financing is a concept which has played an important part in economic literature and policy during the inter-war period. In economically advanced countries it has traditionally been associated with war finance or as a weapon for fighting depressions by compensating deficiencies in private investment. It is only recently that deficit financing has come to be widely regarded as a method of financing development of economically backward areas for reasons which are now well known.

The failure of real income, employment, and output to keep pace with the increased money incomes is more marked in an under-developed economy. The reasoning advanced is two-fold: in the first instance the demand generated by investment in such economies is very large due to the high marginal propensity to consume. Secondly, output also responds less to changes in effective demand due to the predominantly agrarian nature of these economies where production is for self-consumption rather than sale in the open market, and the absence of excess capacity in consumption goods industries and the inelasticity of the supply of working capital required to increase production. These two assumptions however require qualification. Even though the demand generated by increased money incomes tends to be large, if stocks are available to soften the impact of the first round of expenditure, then increased supplies for the succeeding rounds can be got by using for this purpose the very additions to investment which generate the increased demand.

Yet the inflationary potentialities of deficit financing should not be underestimated either. In the ultimate analysis the effectiveness of deficit financing will depend on the relevant answers to the following questions. (1) If prices rise, who will get the inflationary profits and what will they do with it—spend it on consumption, speculation, fixed capital, hoarding, or on government bonds? (2) Can the output of consumer goods expand rapidly or will the first stage of inflation be too long? (3) Can the prices of essential commodities be controlled easily? (4) Is there a strong trade union movement which will turn a demand inflation into a cost inflation? (5) Can the foreign exchange situation be safeguarded? (6) Can the tax structure mop up a large proportion of money income as fast as it is generated? (7) What is the pattern of investment and what is the gestation period between the undertaking of investment and its fructification? It is against this theoretical background that we have to study the effects of deficit financing in the second Five-Year Plan.

Out of the total proposed investment of Rs. 4,800 crores in the public sector, 2,050 crores or 40 per cent remain uncovered on the basis of existing income. Of this 450 crores are expected to be covered by additional taxation and 1,200 crores by deficit financing. The Plan does not however indicate how the remaining 400 crores is to be raised.

The estimate regarding taxation appears somewhat optimistic. It has been estimated that during the last 5 years, the Government has increased revenue by about Rs. 78 crores i.e. an annual rate of increase of about 13 crores. But if Rs. 850 crores is to be raised by revenue measures this means that the rate of increase must be raised to 11 times this level. This will be very difficult considering that national income will rise by only 25 per cent during the next 5 years. Moreover the State Governments, it is estimated, cannot raise more than Rs. 160 crores, thus leaving 600 crores to be raised by the Central Government through additional taxes. Expert opinion however has been that additional revenue cannot exceed Rs. 400 crores—thus leaving the estimated uncovered amount at about Rs. 1,650 crores or Rs. 330 crores per annum.

The prospect of meeting such a considerable gap through deficit financing has naturally evoked keen discussion, and the consensus of opinion has been that the amount envisaged is beyond the economy's absorptive capacity. It must be remembered here that the secondary expansion of credit by banks must also be considered when estimating the impact of deficit financing. It has been estimated that if the present ratio between currency in circulation and deposit money remains unaltered, money supply will increase by about 66 per cent during the Plan period while national income will increase only by 25 per cent. Thus even if we allow for increased monetisation of the economy and increased demand for cash as levels of incomes and standards of living improve, and the holding of cash comes within the reach of a larger number of people, the inflationary potentialities of deficit financing are considerable.

The extent to which deficit financing can be used in the second Plan without fear of inflationary consequencies will depend, on numerous factors such as the scale of investment through deficits, the purposes for which these deficits are incurred, the extent to which additional incomes are mopped up by increased taxation, loans etc., the response of consumer goods production, the response of money wages to prices, and the effectiveness of control of the prices of basic necessaries during the period of investment. The scale is also likely to be governed by the effect on the demand for imports and value of exports.

Of all these conditions, the most crucial is that of the supply of consumer goods especially of food and cloth which cover more than 70 per cent of the average family budget. The recent revision of the target of food production from 18 to 40 per cent serves to emphasise the fact that the importance of food stocks is realised. If these targets are achieved then the danger of a rise in food grain prices will not be great. But the position regarding textiles is, however, less encouraging. The ability of the recently announced textile policy to meet the increasing demand seems very doubtful. Apart from the fact that the postulated compromise between the mills and handloom industries may prove unworkable, great practical difficulties will also have to be faced, as regards installing the requisite number of Ambar Charkhas and powerlooms on a decentralised basis. This may seriously jeopardise the supply of cloth in the domestic market or reduce exports at a time when our export earnings are already inadequate. Even with regard to other consumption goods, the dependence on small-scale and cottage industries seems rather excessive, since the impact of this programme will be slow in manifesting itself and may not keep pace with the rise of incomes. This serves to highlight the need for commodity balances and the necessity for the State to have detailed data regarding the expected increase of disposable income and the consumption habits of different consumers. It is necessary, therefore, to undertake detailed studies of consumption habits of small groups of consumers rather than only on an all-India basis. If targets for commodity production are based on this, the results are likely to be more satisfactory.

We now come to another factor on which depends greatly our ability to curb inflationary pressures resulting from deficit financing. This factor is the extent to which additional incomes can be mopped up through taxes and loans. In this year's budget, in spite of various changes in direct and indirect taxes, the total addition to revenue is expected to be only Rs. 35 crores. This shows that with the existing tax structure, the scope for augmenting tax revenues is not very great. Here Prof. Kaldor's suggestions are of considerable significance. He points out that despite a reduction of the marginal rate of income tax from 92 per cent to 45 per cent, there is scope for increased tax revenue by about Rs. 800 crores. His proposals need examination.

Coming to price control, we find that the need to reorientate the existing price policy is imperative. Our price policy should aim at preventing sharp fluctuations in the general price level, to stabilise prices of certain important agricultural commodities within reasonable limits, to maintain parities between agriculture and industrial prices and to reduce seasonal fluctuations. This implies that the present policy of watching only the wholesale price index must be replaced by a policy which watches other indices such as prices of important manufactures demanded by agriculturists, the cost of production, wages, cost of living etc. In any price control scheme, buffer stock administration and provision of warehousing schemes are also of crucial importance. For the efficient administration of controls, the training of personnel is essential since an efficiently administered price control policy will not only check prices but also increase the marketable surplus in the agricultural sector. As a last resort the Government must be ready to adopt physical controls like rationing, procurement etc.

The role of monetary policy is also of great significance in this context. Far-reaching changes have been introduced in the powers of the Reserve Bank of India by the Reserve Bank of India Amendment Act, 1956. This Act endows the Bank with a greater degree of flexibility by freeing gold and foreign exchange reserves from the rigid relationship with note issue. As the powers of banks to increase credit will progressively increase under the impact of deficit financing, the Reserve Bank has been armed with new powers to fight the inflationary expansion of bank credit—greater variability of reserve ratios has been allowed (5 to 20 per cent for demand deposits and 2 to 8 per cent for time deposits). The Act does not however endow the Bank with powers of selective credit control. This seems a regrettable omission since without this the Bank cannot exert pressure or provide relaxation at strategic points.

With the relatively meagre data available it is obviously difficult for us to say with any degree of precision whether the volume of deficit financing in the second Plan is too large or not. But we can safely say that the increasing requirements of a developing economy, the spread of the monetised sector, the expanding employment and real income provide a reasonable guarantee against a very rapid rise of prices. In fact, the danger of an inflationary spiral impeding the implementation of development plans is less than the danger that investment in certain projects may have to be curtailed due to administrative and technical bottlenecks and non-availability of foreign exchange resources. This is a problem which deserves greater attention and consideration.

Letters to the Editor

THE END OF THE DETENTE

Sir,

The column by your "Special West European Correspondent" is a reliable source of mental stimulation for the student of international relations. If I were a high-ranking U.S. State Department Official, I would be especially grateful to this correspondent, for in such articles as "The End of the Detente" (Nov. 16) one finds just the sort of neat generalizations and tidy historical thesis for which we in America have been so eagerly groping during the past several years in our efforts to construct an intelligent foreign policy.

I wish, however, that you would instruct the columnist to write at lease one more article in this fascinating series. He might entitle it "Uniform Levels — or, where will Africa, Asia, and Europe be when Russia and America have finished with them?" I am sure that Soviet and American policy-makers both would appreciate his dealing with such a topic, because they must be wondering just exactly what is to be done with Africa and Asia, when, as a result of gift-giving competition, these areas have developed into strong economic, political, and military units.

Admittedly such a discussion would stray slightly from purely West European subjects, but since your columnist has implied that Europe is ultimately to be dumped into the same bin with Africa and Asia, there is conceivably some topical connection, and, moreover, the basic problem in dealing with these areas will be the same: namely, how to control dynamic peoples.

"The Eastern Economist" would be rendering a great service — in a truly neutral fashion — by charting out for us that last phase of long-run world policy. Its presentation is eagerly awaited.

Yours faithfully,

JOHN K. ARMSTRONG

DELHI.

November 21, 1956.

THE COMMONWEALTH

Sir,

I do not agree with you when you say in your edition of December 7, that "serious cracks have appeared in the Commonwealth structure." Australia and New Zealand have voiced no criticism of the British action in Egypt, neither has South Africa nor have the West African territories now on the threshold of Commonwealth states. It is true that the Canadian Government was critical but what you do not say is that it was roundly condemned by the Canadian Opposition, and by a large section of the Press and public opinion. Both Mr. Casey of Australia and Mr. Bandaranaike of Ceylon disagreed with Mr. Lester Pearson on this very point in a television programme in Canada. So where are the serious cracks? It is true that India has been most critical. It is also true that India and Mr. Krishna Menon have denied Britain and France the understanding so readily given to Russia over affairs in Hungary. Every untruth or half truth concerning the motives for, and the achievement of the British action in Egypt, has received wide publicity in the Indian Press but only nominal space has been accorded to the British view and the statements of British Ministers.

What do you think should have happened? Accepting the build-up of Russian Military Equipment in Egypt and elsewhere in the Middle East, the declared Egyptian policy of liquidating Israel, the fact of the Israeli advance into Egypt and the success of its arms there; would you have accepted an invasion of Egypt across the Canal and the certainty of a general war in the area with Russian participation, while Mr. Krishna Menon droned on and the United Nations passed resolutions as powerless to influence the antagonists as the resolutions condemning Russian action in Hungary? I agree that there is a debating point to be made about the lack of previous consultation, but I should have thought the record of Sir Anthony Eden and the British people was sufficient to earn for them with the Indian Government and the Indian Press at least, an acceptance that the motives which prompted the action were not the base ones that have so readily been attributed to them.

Nowadays, it is generally agreed that Britain and France should have gone to Czechoslovakia's aid in 1938; at the time many honest men disagreed as to this. I think that history will show that the action taken by Briain and France in Egypt was the right one.

Yours faithfully,

P. A. F. LUGG

KANPUR,

BUSINESS NOTES

AUSTERITY IN IMPORTS

AN AUSTERE policy for import licensing during the first half of 1957 was a foregone conclusion in the light of the trend in the deliberations at the last meeting of the Import Advisory Council. The fundamental reason necessitating the application of severe cuts to the import bill is the rapid decline in India's sterling balances which fell from Rs. 742 crores in January to Rs. 536 crores in November last year. The widening gap between imports and exports—reckoned at Rs. 189 crores in the first eleven months of 1956—is partly due to the declining level of exports in value but essentially to the pressure of developmental imports. The statistical position demonstrates that vigilance was not relaxed in import licensing last year and priorities as well as allocations of foreign exchange were prescribed with due care and prudence.

If it has become incumbent to apply the axe ruthlessly to over 500 import items, it is because import licensing in the current half-yearly period must be related strictly to reasonable anticipations regarding the holdings of sterling and export stimulation. Eight more items have been brought under the export promotion scheme. Effective remedy, however, is to be sought in curbs on imports. The hammer has fallen heavily on the liberal licensing scheme and new-comers. All in all, a saving of Rs. 30 crores is expected in the import bill during the six-month period. The cuts have been determined to a certain extent with reference to the potential of the indigenous industry to fill the gap in supply, stocks presumed to be already in hand and shipments due under licences already issued. The first factor really matters from a long-run view. It is to be trusted that no assistance will be spared to stimulate home production. Import austerity in the consumer sector imposes a task on the Government to keep a firm grip on the price line.

CLOTH POLICY

IN HIS address to the annual general meeting of the Delhi Cloth and General Mills Co., Ltd., Sir Shri Ram has taken pains to do some plain speaking with regard to the cloth position in the country. He has referred to certain basic facts which certainly need reiteration. The cotton textile industry, as one of the more important foreign exchange earners, has now a greater responsibility as the anticipated gap in the foreign exchange resources for the second Plan has further widened. But while production has gone up year after year, exports have been declining and indications are that in 1956-57 the country will export only about 127 out of every 1,000 yards of mill-cloth produced as compared to 151 yards in 1954-55. One reason for the decline in export is obvious. It is the rising demand in the home market making it more profitable for mills to sell there. At the same time, the policy of the Government in not allowing the expansion of the mill industry on the weaving side has prevented the supply of mill cloth from expanding in proportion to the growth of internal demand. Hence the paradox of the urgent need for more cloth exports and the continuing diversion of exports to the home market eager to devour the ever-larger supplies.

What is the remedy? It obviously lies in raising the target to at least 20 yards per capita in 1960-61 instead of the 18.5 yards as a result of the upward revision now announced. All arrangements must be made to achieve the target which must include sanctioning of new weaving capacity in the mill sector for the home market, say about 30,000 looms, both plain and automatic. Sir Shri Ram also suggested that while this policy to increase production of mill cloth was being worked out, it was necessary to maintain and add to exports. Export performance must not merely be the sum total of the efforts of a few units, but the reflection of an industry-wide effort. It means that the task of exporting cloth should be distributed more equitably among all composite mills by insisting on the export of a certain minimum percentage of output of cloth. The Government's policy of allowing installation of 14,600 automatic looms earmarked for exports is a step largely in the right direction though several months may pass for the output of these looms to be fully available for export. It is time Government saw its way to a more realistic policy to increase production of mill cloth for satisfying internal requirements. Present preoccupation with providing artificial restraints on the mill industry cannot but injure the larger national interests.

TELCO FACES A CONFIDENT FUTURE

INFORMED OPTIMISM was the key-note of Mr. J. R. D. Tata's presidential address to the last annual general meeting of the Tata Locomotive and Engineering Company. The Tariff Commission's report on the inquiry into the prices of locomotives and boilers manufactured in Telco should serve to demonstrate that the difficulties of the factory arise mainly from historical reasons in so far as the labour element of costs is concerned as well as from the present inadequate scale of manufacture. The Tariff Commission has accepted the Company's contention in regard to the incomparability of costs of imported locomotives with those of Telco. Comparison with Chittaranjan's costs has disclosed that Telco's costs are higher and efficiency of labour is lower. Re-deployment of excess labour and reduction in certain incentives to labour has been urged. The former course would not be necessary in view of the possibility of absorbing surplus force in the expansion programme and as for improved efficiency active co-operation of labour and the trade union is to be sought. The Tariff Commission has fixed the prices for the past two accounting periods of dispute as also prices for the next two years ending March 1958 on a sliding scale on assumptions as to increasing output and productivity. Mr. Tata feels confident that unless unforeseen factors intervene the cost and output targets laid down by the Commission should prove capable of achievement.

The programme of expansion to achieve an annual target of production of one hundred complete locomotives is in progress at a satisfactory rate. The most outstanding development is the steel foundry which will go into production in mid-1957. Imported steel castings will be substituted by the foundry's own products. The management can claim legitimate credit for its prudent financial policy in building a depreciation fund on an adequate scale throughout the past. The shareholder's prospect of dividend does not stand obscured by accumulation of arrears on this count. The expansion programme would necessitate additional capital to be raised with Telco's performance promises to attract. The Tariff Commission's findings have fully established that the concurrent operation of automobile division has not caused any harm whatsoever to the manufacturing programme of locomotives and boilers. On the contrary, it has been of great value in absorbing part of the overheads. An impressive phase of expansion awaits the automobile section. Telco faces the challenge of the future with confidence and determination in both the loco and auto divisions.

PROBLEMS OF CHEMICAL INDUSTRY

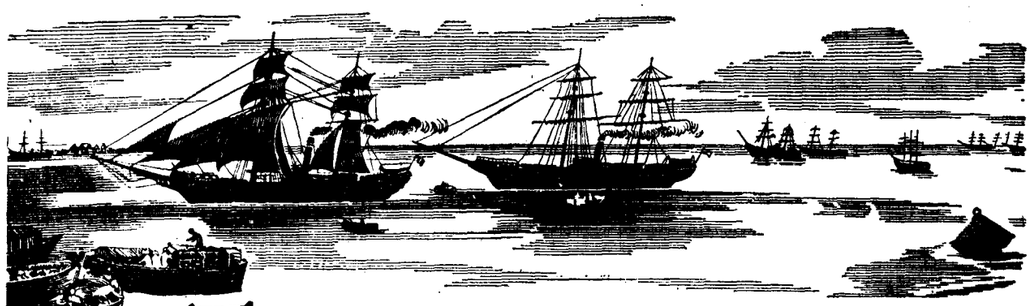
THE UNION MINISTER for Heavy Industries, while inaugurating the sixth annual session of the Indian Chemical Manufacturers' Association, emphasized that the country was entering a new chemical era under

the second Five-Year Plan. The fact that the investment outlay on chemical industries in the second Plan is Rs. 125 crores as against Rs. 26 crores in the first Plan tells its own story. The rate and quantum of progress desired are thus a challenge to the industry that will have to strain every resource to fulfil the targets under the Plan. It is to this aspect and the various problems confronting the industry that Lala Charat Ram, President of the Association, turned his attention in his comprehensive and cogently argued presidential address.

The chemical industries achieved a great measure of diversification during the first Plan period and the broadening of the base has been accompanied by an impressive general growth in output and installed capacity. Just to mention two examples, the output of nitrogenous fertilisers rose from 9,000 tons in 1951 to 85,000 tons in 1956 and that of phosphatic fertilisers from 9,000 tons to 20,000 tons. The President explained that by 1960-61 a better balance 'inter se' and a manifold increase in capacity and output of different types of chemicals will have been achieved. But many of the targets in the nature of things could only be tentative. For example, the upward revision of food production targets may step up the targets for fertilisers and similarly an increase in the per capita cloth supply will push the targets for dye-stuffs, caustic soda, etc. further. He, however, expressed confidence that flexibility was the strength of the Plan and the chemical industry in the private sector would be in a position to meet the demands made on it.

Reviewing the problems facing the chemical industries, Lala Charat Ram pleaded that restrictions on import of dye-stuffs should be imposed after ascertaining the capacity of a plan to produce after due inspection rather than by demanding prior accumulation of physical stocks as at present. The present practice undoubtedly caused much hardship for the industry and retarded the rate of development. With regard to the pharmaceutical industry, the President referred to the alarming rate of registration of patents by foreign manufacturers and the excise regulations which are often vexations in operation. Considering the substantial contribution made by the industry in many lines of manufacture, it would be but proper that Government should give greater encouragement to its consolidation and further progress. On the question of plant capacity, Lala Charat Ram pleaded for a bold approach. Small-sized chemical plants, he averred, were expensive in their original cost, continuously expensive in the cost of their output and a permanent liability to the country. Hence his suggestion was that the conception of economic size of plants should be stepped up considerably even though for some years there was some idle capacity in the developing economy of the country.

INDIA STEAMSHIP: EXPANSION PROGRAMME



HAVING CONSOLIDATED its position on every front, India Steamship is now forging ahead with a vigorous programme of expansion. Its financial performance during the year ended March 31, 1956, is reassuring. It discloses that the company has emerged through the phase of tightness. Sir A. Ramaswami Mudaliar broke the happy news to shareholders at the last annual meeting that total dividend, including the interim dividend, of Rs. 1-0-0 per ordinary share would be paid for the last year. This is a significant feature in the company's finances following an interlude of no-dividend for two years. The freight earned improved from Rs. 4.01 crores in 1954-55 to Rs. 5.26 crores in 1955-56. Net profit amounted to Rs. 38.73 lakhs after providing the full depreication amount of Rs. 41.50 lakhs. The increase in freight earnings is attributable partly to the larger fleet and in a lesser degree to quicker turnround of ships. Slight improvement is visible in regard to dock labour consequent on the implementation of the Vasist Committee's recommendations. The piece-rate system of wages is yileding encouraging results in Bombay, but it has not been extended to Calcutta and Madras. The Government need to take serious note of the Chairman's warning that quicker improvement in dock labour's attitudes, berthing facilities and rationalistation of cargo clearance are conditions precedent to a bold programme of industrialisation.

Sir Ramaswami Mudaliar has devoted a good part of his speech to accelerated expansion of Indian mercantile marine. India Steamship provides an encouraging instance of development with stability. While it can look forward confidently to fulfilling its target of 18-ship fleet before 1960, its financial management is well tuned to meeting its growing obligations. The Chairman has urged the Government to accede to the demand of shipping companies for further liberalisation of the terms of loans. Future development of the country's merchant shipping is to take place essentially in the direction of distant waters. The progress which has been recorded so far by Indian shipping against all odds is proof that the requisite elements of dynamism are present in it.

STRUCTURAL ENGINEERING WORKS

STRUCTURAL ENGINEERING WORKS LIMITED offer a typical case of the achievement of free enterprise in the medium sector of industry. Its performance over the period of the last thirteen years certainly entitles it to appreciation. It is generally assumed that success in medium scale units is a matter of comparative ease. The tribute which Mr. A. D. Shroff, Chairman, paid to the founder and the company in his annual presidential speech on December 31 last is richly deserved. What is more important, however, is the fact that the struggle which this company had to wage should serve to demonstrate the inequity of bringing companies like this under what Mr. Shroff was constrained to call 'the mischief of section 23-A of the Indian Income-tax Act'. He is right when he says that a distinction must be made between such companies and companies which are formed basically to avoid payment of larger direct taxes. In the same way the experience of this company also demonstrates that the penal super-tax on dividends, unscientific and illogical as it is, ignores the average return earned by shareholders over a period of years.

The directors of the company have recommended a dividend of Rs. 15 for the ordinary share for the year ended June 1956. This dividend is below the expectations of a section of the shareholders. Since the start the average dividend distributed comes to 4.61 per cent. Mr. Shroff has emphasised that the stringent conditions in the money market and difficulties of getting adequate funds for new capital and working capital from the banks have made it obligatory to plough back substantial part of the profits into investment. An important phase of expansion awaits the company in the immediate future. It is proper that shareholders should be asked to make sacrifice in the interests of the expansion and future prosperity of the company. The production capacity of the unit is to be increased, according to present indications, from 350 tons per month to 750 tons per month. On the scores of quality and types the company's products have given satisfactory account. It is because of this high standard of production that it has been able to negotiate on its own contracts for the manufacture of a sizable quantity of pipes with several municipalities.

This story begins in 1888...

The world still awaits the adventure of Wireless . . . it's the age of the horse-drawn carriage. And people who talk of flying aren't airmen as yet; they're poets.

Calcutta is India's capital, and at one of its busy wharves, there's a picturesque mailboat from England, self-conscious in its new power of Steam. Look away for a moment to something else that is new. There ! In those crates . . . the first few cakes of a new soap: *Sunlight*. The crates say: 'Made in England by Lever Brothers.'

Bobbing away on porters' heads, the cakes go off to some obscure bazaar of old Calcutta and from there . . . on to journey's end : the homes for which Levers have made the soap.

That's how it was one summer day of 1888. Lever Brothers (then, a three-year old British enterprise) thought the world of *Sunlight*. Soon, thousands of bazaars were stocking 'the tablet that foamed'—and families became converts for good.

Little by little, the motor car arrived (the model with the turkey-croak hooter) ; then the telephone began to jangle in Indian homes. And in those homes, time wasn't standing still either. People were asking for new and varied products to meet their changing needs. So, Levers—developing in step with them—produced for the home such things as *Lifebuoy* . . . *Vim* . . . and *Lux Toilet Soap*. This is becoming a story of familiar names, isn't it ?

In 1922, Levers started making soaps in Calcutta—encouraged as they were by the increasing demand for their products. In 1934, a second factory went up in Bombay.

In 1926 came Dalda Vanaspati from Holland. And, with it, there started a revolution in India's nutrition—the use of a hardened vegetable oil for cooking. To manufacture *Dalda* in India, a new Lever Company was born in 1932: 'HVM'—the Hindustan Vanaspati Manufacturing Company Limited.

And still the Indian home called for newer and 'different' products. And so there came to India *Pears Soap*, *Erasmic* and *Gibbs* products, *Himalaya Bouquet* toiletries, *Rexona Soap*—familiar members of the Lever family. Marketing of these products led to the formation of yet another Lever Company in 1935: 'UTL'—United Traders Limited.

Now, you can't separate the tale of these products from the tale unfolding *within* Levers. The people in their factories and offices were changing, for one thing. Foreign experts were joined by the young men of India and today over four-fifths of Levers' executives are Indians.

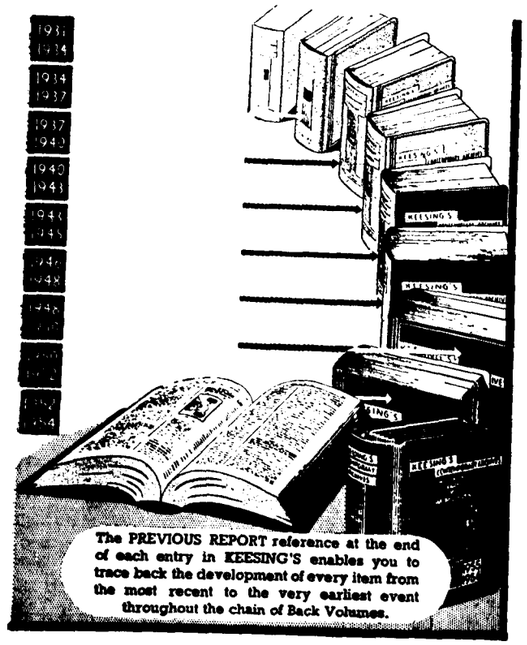
Meanwhile, Levers were buying all the raw materials that India could offer. These purchases grew as manufacture expanded—till, in 1955, about 88 per cent of the oils and fats that Levers needed was supplied by India's fields and coconut groves.

An international partnership—that's what soon grew up in Levers. Foreign technical and marketing experience linked up with the talents and resources of India. Result ? The Indian housewife today is supplied with products that are among the world's best.

Today, we are sixty-nine years from the crate of soap that, almost unnoticed, started Levers in India. Today, a new chapter in our story has opened with the association of Indian and foreign capital in Levers. Indian and British Directors work together on the Board, too. Here's a joint venture that serves the nation and advances with it.

Yes, the future arrives with each tick of the clock. And Levers face that future with a new name: 'HINDUSTAN LEVER LIMITED.' So the stories of HVM and UTL end, in a sense—because they've merged with 'Lever Brothers' to form Hindustan Lever.

But the Lever story goes on. For India's story goes on, and Levers have grown with India's needs and progress. As it has done for sixty-nine years, Hindustan Lever will continue to serve the Indian home.



HINDUSTAN LEVER SERVES THE HOME

HLL. 1-84

Company Meeting

TATA LOCOMOTIVE & ENGINEERING CO., LTD.

Speech delivered by the Chairman, Mr. J. R. D. Tata, at the Annual General Meeting of the shareholders of the Company on Friday, the 28th December, 1956.

Ladies and Gentlemen,

It has been a matter of satisfaction to my colleagues and to me that after the long period which it has taken the Company to surmount the manifold problems which beset its development and the more recent uncertainties in respect of the prices for locomotives and boilers, we have been able to present to you this year a report and accounts which, I am sure, will have met with your approval.

I wish, at this stage, to thank the shareholders for their continued confidence and support notwithstanding the disappointingly long period they have had to wait before they could earn a return on their investment. While we live in uncertain and changing times, during which it pays to be cautious, I believe that the shareholders may henceforth view the future with some measure of confidence. One of the most encouraging elements in the situation, from the shareholders' point of view, is the fact that the Company has been able throughout to make full provision for depreciation so that there is no burden of arrears of depreciation to come in the way of a fair and steady return on the shareholders' investment. At the same time, it is necessary to be realistic in any assessment of dividend potentialities in the immediate future. For instance, in comparing, the financial results now before you with those of the previous years, and in basing on them any estimate of future earnings, shareholders should remember that the report and accounts for 1955-56 include the whole of the profits and some of the overheads of the Locomotive Division in respect of two years. They should also keep in view the fact that the Company faces a heavy programme of capital expenditure in the next few years and that, because of the nature of its business and operations, it will require an exceptionally large amount of working capital. Both these factors will necessitate conservation of resources.

The most important development since we met last year has been the final settlement of the disagreement which had arisen between the Railway Board and the Company on locomotive and boiler costs and prices to which I devoted a large part of my speech last year. As you were then informed, the matter was, by agreement between the Railway Board and the Company, referred to the Tariff Commission.

In view of the importance to us of this inquiry and the Commission's findings, I think you would wish me to amplify here the brief references made in the Directors' Report to the principal findings and recommendations of the Tariff Commission.

With the assistance of an expert adviser, the Commission made a thorough and detailed investigation of the operations of your Company's Locomotive Division. We are grateful to them for their impartial and constructive approach to the problems placed before them and for the sound and practical recommendations they have made. The inquiry has served a valuable purpose not merely in bringing about a settlement between the Railway Board and the Company in the matter of prices for locomotives and boilers but also in clarifying a number of points about which considerable misunderstanding had prevailed in the past in some quarters and in setting at rest, once and for all, doubts about the Company's progress and efficiency.

In these days, when Government has almost unlimited powers with which to enforce its will, it is gratifying and re-assuring to note that, in an industry in which Government is itself a competitor as well as the sole customer, it decided to refer a dispute about costs and prices to an impartial statutory inquiry and abided fully by the resulting recommendations even though they went, to some extent, against its views.

We have all along been anxious to serve Government and the country well in regard to the supply of locomotives to the Indian Railways and we deplored, no less than the Railway Board did, the causes, mostly beyond our control, which delayed the full fruition of the project and resulted in relatively high costs. This detailed inquiry has largely cleared the air between the Railway Board and ourselves and we look forward to a period of close and fruitful co-operation in the further development of the locomotive industry.

Coming specifically to the findings and recommendations of the Tariff Commission, the Commission have supported the view I expressed in my speech last year that there was no sound or fair basis for comparison between the cost of production at Tatanagar and the prices of imported locomotives. The Commission therefore examined Telco's operations and costs of manufacture with reference to those at Chittaranjan. On this footing, they have come to the conclusion that, by and large, and making proper allowance for all relevant factors, Telco's costs do not compare unfavourably. The inquiry has, however, revealed that labour efficiency in our Works is lower and labour costs are higher than they are at Chittaranjan. The Tariff Commission has therefore suggested that there is need to re-deploy excess labour and to reduce the level of incentives paid to some of the workers. We were aware of our shortcomings in this respect which were largely due to historical reasons, and we hope that our workers and the Union will co-operate with us in removing the causes for the unfavourable comparison which has been drawn between their productivity and that of their brother workers at Chittaranjan.

The report has fully established that the manufacture of locomotives and boilers has at no time suffered from the concurrent undertaking of other lines of production about which doubts had been expressed in the past. In fact, the inquiry has shown that such additional activities have been helpful in absorbing a substantial portion of factory overheads which otherwise would have been an additional burden on locomotive costs.

The Tariff Commission have recommended and Government have accepted certain prices for locomotives and boilers not only in respect of the previous two periods on which the Railway Board and the Company failed to reach agreement but also for the subsequent two years ending 31st March, 1958. These prices have been fixed after making allowance for a rise in output and productivity as well as for the cost-reducing

advantages of long-run orders for locomotives to be placed on the Company. The prices, which are on a sliding scale, will secure to the Railway Board a progressive reduction in the cost of the locomotives purchased from us while enabling the Company to make a reasonable profit. Prices for deliveries after March 1958 will be fixed after another cost investigation at the appropriate time.

Before I leave the subject, I may say that, barring unforeseen circumstances or delays in the delivery of equipment and materials over which we have no control, we are confident of achieving the targets of production and costs set before us by the Tariff Commission. The expansion of the locomotive Division to a capacity of a hundred complete locomotives per year, to which a reference was made in last year's Report, is well under way and is now expected to be completed a few months ahead of schedule. It will play an important part in reducing costs.

The steel foundry, which will also reduce costs and end our dependence on imported steel castings, has made excellent progress during the last year and is expected to start production towards the middle of 1957. In fact, the melting furnaces have already started producing steel ingots. I regard the establishment of this steel foundry as an important landmark in the development of the Company's overall activities. Steel castings form an increasingly important proportion of heavy engineering products and the existence of a modern and highly equipped steel foundry in India, capable of turning out large and intricate castings of the highest quality, will render valuable service to the Indian heavy engineering industry.

India is today one of the few countries left in the world still dependent mainly on steam for its rail traction. In most parts of the world, steam locomotives have given way to diesel locomotives with either electric or hydraulic transmission. It seems inevitable that a similar change over will in due course take place in India, although the process may be spread over many years. With the versatility built into our plant and the human skills and experience we have developed over the years, our Company will be especially well fitted to play an important role in the "dieselisation" of the country's railroad system and I hope, when the time comes, we shall be given an opportunity to do so.

The Automobile Division has continued to make satisfactory progress. The output of Tata-Mercedes-Benz truck and bus chassis has shown a steady increase. The target rate of 6,000 units per year has been attained, and in fact exceeded since the close of the year under review. The demand for Tata-Mercedes-Benz vehicles continues to outstrip supply. In view of this and of the growing need for additional road transport under successive Five-Year Plans, we are, at the instance of Government and in consultation with Messrs. Daimler-Benz, framing a scheme for increasing further the capacity of the Auto Division.

We are continuing, year by year, to install the most modern equipment and machinery, including highly specialised machine tools, as part of our phased programme of manufacture. A start has been made with the construction of the engine shop. As stated in the report, the capacity of the alloy iron foundry which is expected to come into operation early in 1958, has been substantially increased in view of the growing demand for the Company's trucks and our plans for further expansion. We have so far fully lived up to the promises we made to Government in respect of the content of indigenous manufacture in our five year phased programme, and I have no doubt we shall adhere to that programme in the future.

The gratifying progress the Automobile Division has made is in no small measure due to the continued assistance we are receiving from our partners, Messrs. Daimler-Benz, to whom I take this opportunity of expressing our thanks and appreciation. Our thanks are due also to the Government of India for the realistic and far-sighted policies they have adopted towards the automobile industry. The progress made by the industry in general and by our Automobile Division in particular provides, to my mind, a remarkable example of what can be achieved with the help of well conceived and consistently applied policies.

Government have rightly left this industry to free enterprise. They have set phased targets for indigenous production, controlled imports and granted both assistance and adequate freedom of action to individual manufacturers to exercise independent judgment and initiative in their respective fields while retaining a valuable element of competition within the industry. I earnestly hope Government will adhere in future to these policies which are best calculated to promote the rapid development of industry, to conserve foreign exchange, to supply a vital transport need of the country and to protect the user from unduly high prices.

Now that the initial technical and staff problems concerned with the establishment of the automobile and locomotive industries have largely been solved with the assistance of our partners Messrs. Daimler-Benz and our technical consultants Messrs. Krauss-Maffei and Messrs. Henricot, we anticipate no serious technical difficulty in the further development of our activities. Our main problems in the coming years will lie in the procurement of adequate finance and in the development of technical and managerial personnel.

Between the existing programmes and the expansion schemes already launched and under contemplation, the Company will require, within the next five years considerable additional funds for capital expenditure and working capital. While a major portion of the requirements will be found from allocations to depreciation and other reserves and, in respect of working capital, from borrowings, some addition to the Company's share capital seems inevitable in due course. Proposals in this regard will be considered by your Directors during the coming year.

As regards the development of technical and managerial skills, the growth of our business and its value to the community will depend largely on the reputation we establish for our products over the years. This reputation will itself depend on the skill and integrity of the many individual engineers and craftsmen engaged in the manufacture of our products. The importance, not only to ourselves but to the industrial development of our country as a whole, of the creation of such men cannot be over-emphasized. If lasting success is to be achieved in India's industrialisation, resources must be developed in men as well as in raw materials and equipment. No effort should therefore be spared in inculcating in our workers, engineers and industrial administrators the sense of responsibility, the integrity of purpose and the dedication to, and pride in, high standards of quality and precision which create the traditions and reputation of a country's industrial products throughout the world. This is one of the most important and difficult tasks facing any country attempting to force the pace of its industrialisation and we have, from the start, attached a great deal of importance to this task in our own organisation. We have achieved a fair measure of success and we shall continue our efforts.

The Company's relations with labour continues to be reasonably satisfactory. I have already referred to Tariff Commission's finding that, in certain sections of the Locomotive Shops, there is an excess of labour and efficiency is low. As our workers have, by now, acquired the skills and experience required for their particular jobs, the need for additional men to maintain output no longer exists. Fortunately, our expansion in various directions provides opportunities for deploying excess labour where it exists. I hope that in their own interests as well as those of the country our workers will appreciate the importance of achieving an improvement in productivity.

An efficient and well led organisation requires amongst the many elements that make for contentment, adequate housing and town services. Although the provision of such housing and services is a particularly heavy burden on new and growing industries, it cannot be evaded and we have consistently provided, alongside our programme of Works development, a housing programme to keep pace with the requirements of our employees. We have already spent approximately Rupees two crores on our township. We shall need to add further to the township during the next five years.

In conclusion, it is my privilege once again to express my thanks and those of my colleagues to all members of our staff, from the General Manager downwards, for the year's excellent work. Their initiative and the hard work they have put in have been principally responsible for the Company's progress reflected in the Report and Accounts before you.

NOTE: This is not a report of the proceedings at the above Annual Meeting.

Company Meeting

THE STRUCTURAL ENGINEERING WORKS LTD.

Speech of the Chairman Mr. A.D. Shroff at the Annual General Meeting of Structural Engineering Works Ltd., on 31st December, 1956.

The Directors' Report and Andited Accounts for the year ended June 30, 1956, have been in your hands for some time and I am sure you will find the results satisfactory.

As pointed out in the Directors' Report, both the Works at Sewri and Mulund continued to be fully occupied. As a matter of fact, the demand for structural fabrication capacity in the country has been insistent and your Directors are seriously considering increasing the capacity from 350 to 750 tons per month. The Mulund Works are busily occupied with the completion of the Vaitarna-cum-Tansa Pipeline Scheme. I am glad to inform you that the Company has been able to secure by direct and independent negotiations with the Bombay Municipality the work relating to the fabrication and laying of pipes for the third stage for about 15½ miles. It is a matter of considerable gratification that the authorities concerned have been fully satisfied with the type and quality of work executed on this pipeline scheme. Besides, the Company is negotiating with other municipal authorities in the country for substantial contracts of a similar nature, some of which are likely to fructify before the end of this official year.

The Company has now completed its thirteenth year and it would not be inappropriate if I refer to some of the salient features in its operations during this period. I am confident that the shareholders of this Company will look with pride upon the success of this Company as an achievement of free enterprise in the medium-scale industry. It must, however, be put on record that this achievement is very largely, if not entirely, due to the enterprise, pioneering spirit and faith of Mr. N. B. Bhagat, the founder of this Company. Starting with very modest means and with the assistance of the late Mr. M. C. Ghia and the Investment Corporation of India, the embarked on this industry in 1943 when, being unknown to the investing public, he could not gather sufficient capital. But his faith in the ultimate success of the Company and the persistance with which he fought the difficulties in the initial stage have fortunately brought this Company to its present stage of strength and prosperity. Perhaps it may not be generally known that in undertaking the Tansa Pipeline Project, he mortgaged his personal properties to raise additional finance supplementary to banking facilities to cope with the increasing funds required for the execution of the contract. Men of Mr. Bhagat's courage and faith in the industrial development of the country are contributing towards raising the status of India as an industrial country.

Your Directors are recommending the payment of a dividend of Rs. 15 per ordinary share, which is fully justified by the results of the last year. As a matter of fact, some shareholders have complained that the dividend recommended is disproportionately low and I have full sympathy with them realising that since the inception of the Company the average dividend distributed to shareholders only comes to 4.61 per cent. I, however, want the shareholders to appreciate that in view of the number of projects, both expansion and new, the Directors are compelled to plough back a substantial amount of the profits to enable the Company to successfully implement them. It is the general experience of all industries in recent months that the availability of funds, both in the shape of new capital and working capital from Banks, is definitely diminishing and I shall be very unhappy if, for lack of finance, this Company is precluded from completing the various projects under the consideration of your Directors.

From other platforms I have earnestly pleaded with the Finance Minister for examination of the position of Companies like these which come under the mischief of Section 23-A of the Indian Income-tax Act. There are good and sound reasons rooted in the historical background of a number of smaller medium-scale industries with justify a differential treatment from those companies which have been essentially formed to avoid large payment of direct taxes. Similarly, the history of this Company confirms my plea that the penal super-tax on dividends is both illogical and unscientific as it completely ignores the average return earned by shareholders over a period of years.

I am glad to say that our relations with our workers have been very happy and satisfactory throughout the year.

I wish to take this opportunity of expressing our gratitude to all those who have rendered such devoted and loyal services to achieve the results of the last year and I am sure the shareholders will join me in paying this tribute to our entire staff.

COMMODITY NEWS AND NOTES

INCREASE IN JUTE PRODUCTION

The All-India Final Estimate of jute for 1956-57 puts the current year's area and production at 1,883,000 acres and 4,221,000 bales (of 400 lbs. each) as against the Partially Revised Estimate of 1,739,000 acres and 4,197,000 bales respectively for 1955-56, according to the Directorate of Economics and Statistics, Union Ministry of Agriculture. This shows an increase of 144,000 acres or 8.3 per cent in area and 24,000 bales or 0.6 per cent in production over last year. The overall increase in acreage during the current year has been reported mainly by Bihar and to a smaller extent by Tripura due generally to favourable climatic conditions at the sowing time. The increase in acreage has, however, been offset to some extent by decreases registered mainly in West and to a lesser extent in Assam, Orissa and U.P. The increase in production has also been shared mainly by Bihar and to a lesser extent by Tripura.

SLIGHT INCREASE IN MADRAS COTTON ACREAGE

The area sown with cotton in the State of Madras up to the end of September 1956 is estimated at 1,02,900 acres. Compared with the area of 1,00,900 acres estimated for the corresponding period last year and an average area of 90,100 acres calculated for the previous five years ending 1955-56, the present estimate is an increase of 2.0 per cent and 12.6 per cent respectively, says the second forecast report on cotton for 1956-57.

SAGO EXPORT PERMITTED

The Government of India have decided that the export of tapioca clobules (sago) will be licensed freely on shipping bills against valid firm sale contracts, without any quantitative restrictions, to all permissible destinations, excluding the Portuguese possessions in India, up to the end of December 1957, according to a trade notification by the Joint Chief Controller of Exports, Bombay.

SUGARCANE ACREAGE INCREASES

The all-India second estimate of sugarcane, 1956-57 puts the current year's area and production at 4,532,000 acres and 58,914,000 tons of cane as against 3,945,000 acres and 50,455,000 tons of cane for 1955-56, says a Press Note issued by the Ministry of Agriculture. This shows an increase of 587,000 acres or 14.9 per cent in area and 8,459,000 tons or 16.8 per cent in production over last year. The area under sugarcane at the second estimate stage during the current year is the highest on record.

EXPORT OF ANGOLA IRON ORE

Some 500,000 tons of iron ore annually will soon be available for export from the Portuguese province of Angola. By July of next year, the Mocamedes Railway will have been extended to a point 400 miles from the port of Mocamedes and this will make possible the effective exploitation of iron deposits at the Cassinga mines.

CHINESE RUBBER INDUSTRY

China's rubber industry is reported to have reached the target level of output for the first Five-Year Plan at the end of October, a year and two months ahead of schedule. Heavy-duty tyres, passenger car tyres, weather balloons and surgical gloves are included in the 308 kinds of new rubber products successfully trial-produced during the Five-Year Plan.

INDIA'S WOOLLEN TRADE

India's woollen textile industry has been showing an all-round improvement during 1956. According to the figures up to the end of September, the output of woollen and worsted fabrics has totalled 11.97 million yards against 9.36 million yards in the corresponding period of the last year, while the output of yarn has amounted to 18.72 million lbs. against 13.91 million lbs. last year. Increased internal supplies of raw wool and larger imports of foreign raw wool and wool tops seem to have helped the industry. Despite this increase, production is still much below the rated capacity of the industry, which is estimated at 48 million yards per annum on a double-shift basis.

INDONESIAN TEA OUTPUT LOWER

Tea production in Indonesia during 1956 is estimated to have fallen by 15 per cent. Since 1940, production has approximately been halved. It is stated that rising labour costs are responsible for the fact that estates with an output of less than 700 kilograms per hectare are no longer a paying proposition.

The Falling Sickness

THE Stock Exchanges of India have been visited in the last month by a serious attack of the falling sickness. The trend of share prices since the Finance Minister introduced his two Finance Bills in December has been steadily downward until, at the time of writing, the leading counters in the Stock Exchanges, Tata Steel and Indian Iron, are quoting below Rs. 170 and Rs. 28 respectively. It is not only the speculative counters that have been deeply affected; the whole range of investment buying has come under pressure, more disturbing than anything seen in recent Stock Exchange history. There has been a failure or two in Bombay imposed on a technically "overbought" situation and, in spite of the fact that over a month has elapsed since the Finance Bills were introduced, distress selling continues at a significant rate. There is no doubt that the situation reflects a disorder which is deep, and may take some considerable time in correction.

It is important, if a remedy is to be applied, first to diagnose the disease. There is probably no dispute on the point that the highest share figures of last year were unduly inflated, and certainly concealed an element of undesirable speculation. This speculation was partly based on

the near certainty of an early inflationary movement, part of which was already under way before November. It was also in part a reflection of undue optimism on the volume of deficit finance as against the volume of taxation prescribed in the second Five-Year Plan. This latter cause of bullishness was a true miscalculation, since it was always on the cards that an inflationary spell would be met by a reduction in deficit financing and an increase in taxation. Some correction in stock prices would need in any case to have occurred with rising taxation, and no fault should be found with the Finance Minister for becoming an instrument of arresting undue and, on the whole, unhealthy expectations in regard to the limited character of taxation on Government financing of the Plan. What seems, however, to be properly a complaint to be laid at the door of the Finance Minister is the break of confidence, which has not merely reduced inflated stock values to a reasonable level, but has driven them to a floor which, even at the present time, does not look strong enough to hold further adverse pressures.

Thus one might conclude that the technical weaknesses of the market before the Finance Bills are not major explanations of the current disorder. The present debacle is due to a loss of confidence, which is primarily due again, not to the specific measures which the Finance Minister introduced in the Finance Bills, but his repeated warnings, after they were introduced, that there was worse, and indeed indefinitely worse, to come. It was a mistake for the Finance Minister to have reiterated his intention of taxing several times in the year and to arm himself with indeterminate powers, seeing that, in any case, his measures will have to be placed before Parliament within a week of its meeting. The truth seems that the business community has read the Finance Minister's utterances and the Finance Bills with so deeply a pessimistic note that a serious psychological malaise has been imposed on the unhealthy technical situation which prevailed in the market before his hammer fell.

In one sense, the Finance Minister must be held solely responsible for the situation that has now been created. He has not been content with uttering warnings in regard to taxation of personal incomes; or reiterating the demand for the liquid resources of industry. He has shown no clear line of policy in the public sector, on which the country could be assured that it will successfully overcome the problems of the Plan. For example, the hamstringing of the private sector is not to be compensated by a movement in terms of generous credit by the Reserve Bank of India and the State Bank of India. It would be natural to expect, at a time when deterrents are placed on private enterprise, that public enterprises should be suitably adapted to fill any vacancy which the reduction of private enterprise made obvious. But the Finance Minister has not merely turned on the private sector; he has turned on his own instruments of finance, the Reserve Bank of India and the State Bank of India. He has spoken of one as too "reserved", the other as too "imperial". These instruments operate under his direct orders, and the conclusion has been drawn that, if the instruments which he has in his hands are conceived to be unequal to the task, there is really no acceptable agency in the country to fill the gap. Thus, there has spread in the Stock Exchanges the belief that the Finance Minister has, in fact, no solution to his present monetary difficulties. The resignation of the Governor of the Reserve Bank of India has added to the feeling that the Government of India has stresses and strains of its own, quite apart from the hunger for "resources" which the Finance Minister has displayed.

It is not necessary that one should attach to the withdrawal of the head of a nationalised institution the weight one would normally attach to the resignation of the Governor of a Central Bank differently conceived. Nevertheless, one cannot view the current arrangements in the Reserve Bank of India as being designed to lead to additional confidence, since the implication now is that every Governor of the Reserve Bank will sign meekly on the Finance Minister's dotted line. Thus one possible corrective to mistaken notions in Delhi will have been removed. Not, indeed, that for many years the Reserve Bank of India had the power to operate monetary credit policy on its own. But the Governor of the Reserve Bank of India was never the cipher to which he is now to be reduced.

Because the present trouble is mainly psychological, the remedy must be conceived in psychological terms. Some gestures must be made to business sentiment to assure it and the public authorities in the State Bank of India and the Reserve Bank that the Government of India is not a creature of chance, but a rational, even if hasty, instrument of policy-making and policy criticism. Much may still be done by way of clarification, particularly under the rules for the Capital Gains Tax and the rules regulating deposits of corporate funds, to show that the Finance Minister is aware of the extent to which he has alarmed and disturbed the sensitive outlook of the market-place. It was helpful to have a clarification of the Capital Gains Tax in the course of this week by a senior officer of the Finance Ministry. The feeble response given by the market to this clarification shows not that this move was mistaken but that many acts of this kind will be required if confidence is to be restored.

There should be no suggestion at this time that the Finance Minister, although he has erred, is necessarily wrong in every detail. All financial policy needs a longish period in which to work itself out. The Finance Minister can ask very properly for a reasonable time. But it cannot be implied that a short-period disorder can be left untreated. It is certainly to be hoped that the Finance Minister will recognise that the signs of distress which have appeared in the last two weeks need short-period treatment, even while he pursues a long-period policy which helps his "resources", and prevents inflationary influences from reasserting themselves during later months of this year. No one should complain to the point of adding new diffidence to this situation. There must be a feeling of patient co-operation with the Government at a time when the whole nation has necessarily to face the stresses of the second Five-Year Plan. It is to be remembered that the Finance Minister's difficulties are those of the nation. The nation must strive with him for their solution; he must strive, and he will need to strive hard, for better understanding without which he will certainly fail.

Indore and After

INDORE, like Avadi, constitutes a distinct landmark in the history of the Congress. The Party has now pledged itself, in its constitution, to a "socialist co-operative commonwealth". This is a more felicitous terminological alternative to a 'full socialist order of society' as propounded in the latest election manifesto. But neither the one nor the other is precisely defined. The implication is that Nehruvian Socialism is something flexible. (Mr. Nehru himself wonders why he should be asked to define socialism in rigid terms when it is something that should not be rigid). Perhaps it is thought that in this flexibility lies its persuasive strength. Mr. Nehru may decline to define Socialism, but the outlines of a definition can be pieced together all the same. The ends of Congress Socialism are to be achieved only by peaceful democratic means. This socialism involves no compulsion and force on the people. It postulates a psychological revolution by which the minds of the people could absorb the new conception. And that means time—may be 20 years. Congress Socialism, again, would be wholly an indigenous brand. It would not be doctrinaire or dogmatic, but pragmatic. It would not accentuate class conflicts which are already there. It would reduce gross inequalities in income and wealth, but it would not rob the community of the incentive to work by imposing ceilings on incomes or merely levelling down the rich. It might lean more on the side of Gandhiji's conception of Sarvodaya. Above all, it would be based on the dictum that "even a correct thing done at the wrong time and in a wrong way becomes a wrong thing and brings harm in its trail". This realistic approach would apply in particular to demands for expropriation of British and other foreign concerns in India, nationalisation of big industries, ceilings on incomes, etc.

If the kind of socialism that the Congress stands for is this and no more, then why not put it down in a definitive statement in the place of Nehru's extempore expositions? If the Congress does not want to do this, there must be some deeper reason for it. The reason is to be found in the history of the Congress itself. Ever since the Lucknow Congress of 1936 Mr. Nehru has periodically created an emotional 'climate for socialism' in his own vague, inimitable way. This 'climate' has invariably served as an electoral asset *wholly* for the Congress except during the last General Elections when the Socialist and Communist parties too turned it partly to their advantage. Since then vagueness in Congress Socialism has been partly replaced by some specific socialist measures—promised or performed—in the light of the election results. Still there is an overall vagueness which, perhaps, can be dissipated only at the risk of exposing 'Congress Socialism' as a 'milk-and-water' kind of socialism. This the Congress has chosen not to do. But the emotional 'climate for socialism' would still have its electoral potentialities although it is conceivable that this time it may be less of an asset for the Congress than for the Communist Party.

Herein lies the possible danger of a vague socialist platform against which the Communist Party is able to pit a concrete platform with a bewildering array of socialist planks. These planks are meticulously designed to reap by way of votes what the Congress sows by way of socialist ideas in men's minds. Where the hollowness and contradictoriness of the Communist planks cannot be easily exposed in the context of a 'socialist climate' created by the Congress itself, there may be a good case for a *frankly* liberal programme. Such a programme could be an even greater electoral asset in the context of Nehru's undiminished personal popularity, the Gandhian heritage, the Congress organisational strength, the first and the second Plans and, above all, its transparent realism and sincerity. The *basically* anti-Communist role of Hinduism (as a system of philosophy, as a system of religion and as a system of social and family organisation) would also be there as an invaluable asset.

It is, of course, too late in the day to hope for any such programme for the elections are just round the corner. What is of immediate interest is the platform of the Communist Party which still presents the most determined opposition to the Congress. Their manifesto may be (as in fact it is) a bundle of lies, half-truths and quarter-truths. Parts of it may be so many examples of '*suppressio veri, suggestio falsi*.' In its totality it may be an insult to a thinking citizen's intelligence. But not all citizens think discriminately at election-time in India, and considerable groups especially in the rural constituencies are prone to be swayed by a 'something-to-everybody' programme that the C.P.I. presents. When that Party has the audacity to take credit for all the good things the Congress has done, when it draws a lurid picture of poverty and misery and when it promises something concrete to each economic group, the Congress would be hard put to it in its propaganda to wean away the gullible and the dupes whose number is not inconsiderable in rural areas.

It is thus in the rural areas that the Communists may continue to exert their greatest influence. This influence stems from their Kisan organisations which are largely composed of evicted tenants and landless labourers. The economic position of these groups is so deplorably low that at their level only local economic problems are likely to command their whole attention. It is here that the C.P.I. has a rural plank intelligible to them precisely because of its local colouration. 'Land to the tiller' still has a powerful appeal—all the greater because landless agriculturists in their millions continue to be land-hungry and the Congress holds out no definite hope of what Prof. D. G. Karve calls 'land redistribution at a high level of public support'. The Communist promises to scale down peasants' debts, to cancel the debts of agricultural labourers, to restore evicted tenants to their holdings, to distribute cultivable waste lands to landless labourers, to impose comparatively low ceilings on existing landholdings and to distribute the excess lands and, above all, to extend co-operation in the spheres of rural credit, marketing and supply of implements, fertilisers, seeds, etc., *but not in the sphere of farming as such*—all these constitute an intelligible (though not wholly sound) programme which, objectively speaking, is distinctly better than the Congress counterpart. If, in these circumstances, the Communist Party comes to garner a rich harvest of votes (though not of seats) in some significant States, it may be no surprise. What is probable may yet be prevented from happening if the Congress happens to adapt its agrarian programme to the local requirements in different States.

A New Deal for the Middle East

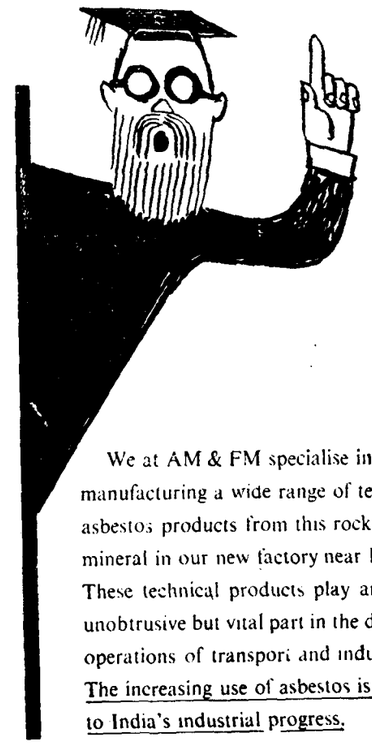
SINCE 1948 an uneasy peace and a sham stability have prevailed in the Middle East. With the Anglo-French misadventure in November last finally disappeared the last remnants of the restraining British influence in this region, creating a serious power vacuum. Nothing could have been more appropriate, as suggested by Prime Minister Nehru, than to allow the various Arab nations to fill the vacuum by their own "strength and progress". But such a policy could be followed only if the big Powers accepted unreservedly a "hands off" policy in the region.

Russia, which has for centuries looked at the area longingly, is surely not likely to give up the recently-won advantage which even the powerful Czars and the all-powerful Stalin failed to achieve in spite of their various stratagems and conspiratorial machinations. Thus the prospects of the Soviet Union honouring scrupulously a "hands off" policy are dim. Soviet infiltration would be a political disaster for the nations of the Middle East because then these nations, like the European satellites, would lose national sovereignty which they so zealously cherish and which they are beginning to exercise. Economically also, Communist domination would be disastrous for the nations of the Middle East. The principal asset of the area is oil for which only Western Europe can offer an adequate market.

It is, however, fortunate that the danger of Communist infiltration and subversion has been noticed at a time when there is uncertainty in Russia itself and when there is robust confidence among the Arab nations in the anti-imperialist policy of the United States of America. Having taken a leading part in the solution of the recent Middle East crisis, it was natural for the United States to decide to face up to its responsibility for dealing with the still more dangerous aftermath. The Eisenhower Plan for the Middle East is, therefore, neither unexpected nor unnatural; and in view of America's unblemished record during the Egyptian crisis, the Middle East countries will be less than justified to regard American intentions with suspicion. In fact, in view of the Russian action in Hungary a guarantee of American military and economic assistance, if and when required, should be welcome to the Arabs.

Under the present plan, the President has asked Congress for standby authority to use United States troops, if necessary, to resist Communist aggression or an "overt armed aggression" by a nation "controlled by international Communism". To guard against the use of the troops in pursuit of some devious motive, it is obligatory on the President to act only when there is a specific request for military assistance from a Middle East country threatened with Communist aggression. Again, the proviso that the United States troops should be used "in accordance with the United Nations Charter" and "subject to the overriding authority of the Security Council" ensures that the United States President would think twice before doing anything likely to provoke world-wide criticism like the one lately levelled against Britain and France. This departure from the classical American thinking in the face of Communist threats, which expressed itself in NATO and SEATO, is obviously a concession to India's susceptibilities and seems to be the first fruit of Mr. Nehru's visit to Washington.

In giving notice that the United States will "resist any Communist aggression" in the Middle East, Washington is justified to the extent that the Soviet Union itself has issued a similar notice against any kind of Western influence in Hungary which it regards as strategically important. It will deter Soviet military intervention and also limit the tendency of those among the Middle East States who may think in aggressive terms on the strength of Russian support. Such a plan was also necessary because, before long, the British would be cutting off their overseas military and financial commitments for economy as well as adjustment with their new role in world politics.



In addition to military aid, economic measures of helpful nature are proposed to eradicate those economic conditions which "make Communism an attractive alternative." It is reported that a Nile river development programme to reclaim vast tracts of land throughout most of North Africa is being considered as part of President Eisenhower's Plan for the Middle East. The programme envisages a series of dams, irrigation networks and power plants. The project will usher in the long deferred industrialization of the region.

If the Eisenhower Plan is accepted by the Arab nations, as it seems likely, it would also incidentally bridge the gap in the Western defences between the NATO and SEATO lines, which have become vulnerable with the abrogation of the Anglo-Egyptian Treaty of 1954. With that treaty, which allowed Britain to maintain agreed installations in the Canal zone, has gone the supporting structure of the Baghdad Pact. It has thus disrupted the "good work" done by the Western strategists under the leadership of the United States.

It cannot, therefore, be denied that the American motives are sound. In the degree, therefore, that the Plan provides a "security shield", it is bold and imaginative; and the guarantee, supplemented as it is by economic aid, would constitute an adequate "shield" behind which the Middle East countries would achieve full-fledged nationhood thus filling in course of time the "power vacuum" themselves.

But it cannot, also, be denied that the Eisenhower Plan has apparently not paid the full attention to the basic problems bedevilling the Middle East—problems relating to the Suez Canal and the relations between Israel and the Arab States, for instance. Thus, the problems which resulted in the abortive Anglo-French gunboat diplomacy and opened the flood-gates for the Communist penetration in the region have been left untouched. Moreover, the Plan seems to visualize the Soviet Union as the sole source of aggression and ignores threats likely to develop from different directions. The Plan also does not appear to be foolproof against indirect Soviet intervention such as internal subversion. For example, if say, Syria asked for Soviet military and technical aid and the same was granted, America would have no grounds for intervention. Even if America found some legal justification for intervention, it would be difficult for her to secure the sanction of the Security Council or the General Assembly because of the likely hostility of the Arab and the Asian nations. If, on the other hand, the United States were to act without any sanction from the United Nations, then it would be doing precisely that for which it castigated Britain and France in November last.

"Hydrated Magnesium Silicate..."

...a fibrous mineral possessing resistive properties to combustion, corrosive liquids and other chemical and physical phenomena. ...or just asbestos...one of the most useful minerals known to man. It is made up of millions of tough, thin, tightly-compressed fibres, and is acid and fire-resistant.

We at AM & FM specialise in manufacturing a wide range of technical asbestos products from this rock-like mineral in our new factory near Bombay. These technical products play an unobtrusive but vital part in the day-to-day operations of transport and industry. The increasing use of asbestos is an index to India's industrial progress.

Where There's Industry There's Asbestos

"or just asbestos"

Around India with Brooke Bond

Harnessed to prosperity—**Hirakud Dam**

A remote village in 1946 on the banks of the Mahanadi, Hirakud today assumes new importance. For here a mighty dam tames the turbulent river, harnessing its power to create prosperity. Over a million acres of land will be irrigated, and the power generated at Hirakud —123,000 KW—will feed many new industries, light lakhs of homes.

The Hirakud dam is just one of the many nation-building projects which are helping to make our country stronger, more prosperous.

Around here, as everywhere in India, fresh Brooke Bond Tea is made available through a unique system of fast distribution from factory to shop. Brooke Bond is the only tea firm with five blending and packing factories, each serving its own part of the country, from which fresh stocks are rushed to every shop.

Brooke Bond Tea

FRESH and GOOD

THE WEEK'S NOTES

A GREAT CONSTRUCTION PROJECT

NEWEST AMONG the temples of New India in the making is the Hirakud Dam Project which is to be inaugurated by Prime Minister Nehru on January 13. The story of Hirakud is also the story of the greatest era of construction projects after a hundred years of modest effort in irrigation under British rule. Sixteen miles from end to end on the Mahanadi in Orissa State, the dam at Hirakud is claimed to be the world's largest main-stream dam. This is only the first of a series of three dams designed for the integrated development of the Mahanadi basin and it has involved an enormous outlay of Rs. 54 crores from 1948 to March 1956 out of an estimated total outlay of Rs. 71 crores which, however, does not cover subsidiary power and delta irrigation schemes. With the eventual construction of the other two dams, the turbulent waters of the Mahanadi will have been systematically tamed to serve the people of Orissa.

The magnitude of the Hirakud Dam (which is a composite dam of earth, masonry and concrete) may be known from some details about its reservoir. The reservoir, when full to its maximum capacity, will have a water spread of 288 sq. miles. The storage capacity is 6.6 million acre feet of water of which a capacity of 4.72 million acre feet will provide sufficient reserve for flood control and 'live storage' for irrigation and power generation. The canals taking off from the dam will irrigate 454,000 acres in the net or 672,000 acres in the gross. The power house at the dam and the subsidiary power house will have an installed capacity of 232,500 kw.

In the case of this project the capital outlay per net irrigated acre works out to a little more than Rs. 1,000. This suggests that the Hirakud Project is a very costly affair for it is generally estimated that the average capital cost of a major irrigation project is around Rs. 500 per acre. Perhaps in the case of Hirakud the gain to tens of thousands of acres on account of flood control would partly offset the high cost of irrigation. As the project will also help stabilise irrigation in the Mahanadi delta, the comparatively less costly scheme (just approved and costing Rs. 15 crores) for the delta irrigation could be considered a part of the Hirakud Project. In which case the irrigated area will add up to a total of about 2.25 million acres and the capital outlay per acre of irrigated land will come to about Rs. 300 only. This compares very favourably with the cost of a little more than Rs. 500 per acre in the case of the Lower Bhavani Project in Madras State.

WHITHER P.-S.P.?

THE ELECTION manifesto of the Praja-Socialist Party, especially its economic plank, does not seem to offer much or anything very different from what the Congress Party has laid down in its platform. And it is a pity, even considering from the point of view of its modest aim to provide "an effective opposition to whatever Government be put in power". Ever since Avadi, when the Congress stole the Socialist thunder, the P.-S.P. has been passing through a period of listlessness and one would have expected that on the eve of the elections at least, the party will come out with a well-defined and practical programme that will invest it with enough prestige as an effective Opposition Party. But what does one find in its manifesto? Its assertion of its faith in democratic Socialism as the 'sole programme of tomorrow' is not very different from the basic objectives of the Congress which are defined as 'Democracy and Socialism'. Nor is there anything original or novel in the statement, that "the economic policies of the P.-S.P. are directed to raising the living standards of the people and assuring them of employment and expanding opportunities" which is what the Congress apparently aims to do by declaring that the "major problem of India is to fight poverty and unemployment and to raise the standards of our people". Some of the other panaceas of the P.-S.P. are land reforms, which include making the tiller of the soil its owner, ceilings on holdings and land distribution, share to industrial workers in management and the provision of housing and social security to the middle classes, and all these, it is well known, have been held out by the Congress for long.

Where then lies any novelty in the P.-S.P. manifesto? Perhaps in the confusion that arises from its overvaulting ambition! In one breath, the party swears by decentralisation to the extent of making every village a republic. At the same time it calls for immediate nationalisation of banks, mines, plantations and wholesale and foreign trade in selected commodities. It is really hard to understand how the "evils of Statism and authoritarianism" could be put an end to when the party asks for so much to be taken over by the State. A similar fallacy is noticeable in its approach to taxation. It expresses 'deep sympathy' with the people "groaning under the crushing load of taxes" but it is not clear what solution it has to lighten the burden. On the other hand, it pins its faith on the simultaneous employment of the Kaldor devices to correct the "embedded inequalities of our society". The Kaldor proposals may serve as attractive electioneering propaganda, but the economic realism of the party will not be enhanced if it tries to outdo the Congress in attempting to 'soak the rich', because what effect the proposals will have on incentives for both enterprise and accumulation in the private sector is a subject that deserves greater examination. The P.-S.P. manifesto is thus, unlike the curate's egg, not even good in parts. While part of it is imitation, the rest is governed by unreality or woolliness. Yet the party appeals to the people to rally round its banner and co-operate in the creation of a new social order. And what is that 'order'?

THE JAN SANGH MANIFESTO

THE JAN SANGH'S manifesto touches on almost every important domestic and foreign policy issue in a negative way. Its appeal is more to sentiment than to reason. It seems to have stolen as much from the left parties as from the Congress. The only original item in the Sangh's programme appears to be the promise of a Unitary State to the people of India towards which they are least inclined. A Unitary State demand by Jan Sangh is to be discarded straightway as it accentuates provincialism—the greatest enemy of national unity in this country.

The manifesto makes large promises but does not precisely indicate how they are to be implemented. It promises free and compulsory education at the primary and secondary stages, no retrenchment without alternative employment, free insurance for workers under the State Employees' Insurance Scheme, unemployment allowance for involuntary unemployment, fixation of the maximum salary at Rs. 2000 per month and the minimum at Rs. 100 and of landholdings at 20 acres and 5 acres respectively, reduction in land revenue, abolition of the sales tax on the necessaries of life, the limited use of indirect taxes like excise duties and the sales tax and an overall reduction in Government expenditure which has risen in recent years. In the face of large social services promised

on a comprehensive and generous scale and the raising of the minimum salary to Rs. 100, one wonders how the reduction in expenditure can be brought about. Is there any indication as to how the Jan Sangh will raise revenues to fulfil these promises? While the manifesto seems catchy in its suggested solutions for the problems of food, clothing, housing, unemployment and refugee rehabilitation, and of self-sufficiency in defence, producer goods and goods for consumption, it does not squarely face the problem of capital formation on which our economic development mostly depends. Surely, compulsory loans from multi- millionaries is not going to solve the problem.

KASHMIR AGAIN

IT IS no surprise that Pakistan's request to the U.N. Security Council to discuss the Kashmir issue has caused as little concern in this country as interest in the U.N. It is now known that Mr. Nehru's recent tour abroad as well as the personal visits to Kashmir of some of the Western leaders have considerably cleared the clouded issue and resulted in a better appreciation of India's position. This has always been that Pakistan has committed aggression against Kashmir which has been admitted by U.N. representatives. The aggression is in some respects as serious as that in Korea or Egypt, and if the U.N. did not take similar action in Kashmir at the time India lodged her complaint, it may be attributable to the peculiar circumstances in which Pakistan had been created shortly before. In the long and arduous debates that followed, Pakistan largely succeeded in distorting the picture by every means, not always commendable. It was inevitable as well as appropriate for the U.N. to stress that in the interest of a speedy resolution of the tangled problem, the issue be decided between the parties concerned. While, in the meantime, Pakistan has been insisting on a plebiscite, which was voluntarily promised by India as an act of goodwill, she has been, conscious of her weak position, deliberately putting obstacles in the way by not only not withdrawing her forces from the occupied areas, which is a necessary pre-condition, but also reinforcing her military might by foreign assistance. The only course thus left open for Kashmir was finally to integrate with the Indian Union and avoid the feeling of indefinite insecurity and instability.

Since a plebiscite under the present conditions is to be ruled out, the debate is very likely to be much as usual, with little new to be added. Even if conditions become conducive to its holding it would be vain of Pakistan to hope for a good showing. The people of Kashmir remember too well the atrocities Pakistani hordes committed on them, irrespective of their religion or political affiliations. They are now enjoying an all-round prosperity so far unknown to them. The remarkable speed and vigour with which the initial errors in welfare schemes, trade and commerce and land reforms have been corrected during the last three years has finally cleared the doubts of the sceptics. It is inconceivable that any sensible Kashmiri would intend to change the present position for the chaos as represented by 'Azad Kashmir'. In fact it is this prosperity and freedom on this side that generates discontent across the border and impels many Kashmiris to dodge the Pakistani patrols in order to cross over.

It would be wise of the present rulers of Pakistan to realize that the Kashmir question has been used so much during the last nine years to tide over their internal difficulties that it has ceased to command any more force. Indians and Pakistanis are basically friendly to each other and would like good relations to be established. India has already offered concessions and has even expressed willingness to consider a permanent settlement on the basis of the present ceasefire line. This is more than what Pakistan could have hoped for. If, however, Pakistan is really convinced that any further negotiation with India is pointless, then all that the U.N. can possibly do is to take up afresh the basic issue of aggression, and, once the aggressor is named again, proceed as it has done in other similar cases. Since this is unthinkable and since India in any case would not cherish such an extreme course, it is only proper that Pakistan should grasp the extended hand as a friend and help in arriving at an acceptable solution.

THE RUSSIAN POLITICAL CIRCUS

THE LATEST in Russian political acrobatics is the backward somersault of Mr. Khrushchev and Co. They have decided to "give up" the policy of de-Stalinization. Mr. Khrushchev is reported to have told guests at a New Year reception in the Kremlin that all the Soviet leaders were Stalinists when it came to "fighting the imperialists". The statement has, it is hoped, broken the illusions of the more obstinate political innocents. But to political observers, who are not in need of more cognition, the somersault was neither original nor polished enough. It would be absurd to isolate Stalin from the system he created.

That system, to repeat what has become a truism, is based on a totally planned economy, which is inconceivable without rationed consumption, commandeered labour and regimented production. The absence of any one of these three would render such planning impossible. It would be fatal for the plan to be left at the mercy of the whims of consumers. Similarly, planned economy of the Communist type is unimaginable without conscription of labour. The freedom to move from one job to another would lead to anarchy in the plan of production. The old principle — "he who does not work shall not eat"—has to be replaced by a new one—"he who does not obey shall not eat". The Marxian concept of "freedom of necessity" means, in truth, denial of choice and transformation of the free proletariat into slave labour in practice.

Totalitarian planning, unlike democratic planning, also involves a rigid order of priorities of different claims. It thus presupposes an agreement on all values between the State and the people. Such an agreement actually does not exist. It is not possible, considering the total nature of the State, and its need to rise to exigencies: dictation is necessary to efficiency in total planning. In order, therefore, to determine the relative importance of different groups and persons, the just price of their produce and fair wages, and what men should believe in and fight for, education is standardized and mass suggestion through press, radio and platform is resorted to. Regimentation of thought is the "legitimate child" of totalitarian planning. As conditions of existence determine consciousness, it is futile to expect freedom of speech, press or assembly in a Marxist society like the one artificially created in the Soviet Union. A true Communist - whether Stalinist or not — will not hesitate to sacrifice anyone or anything that he thinks might help to realize his dream.

In view of the absence of any change in the economic and political structure of the Soviet State only a knave or a fool could have believed in the Kremlin's professions of de-Stalinization which the wishful-thinking democrats unwittingly equated with liberalism. The real nature of Soviet professions became visible when Russian tanks suppressed the Hungarian people's revolt in a truly Stalinist fashion. Stalin is dead, but Stalinism will continue to live so long as totalitarian planning is not given up and one-party rule is not abolished. It is, therefore, not surprising that Peking, Prague, Sofia and Budapest should have, once again, begun emphasising the 'positive' aspect of Stalinism.

Completely at ease in one of Pan American's *Super* Stratocruisers to the U.S.A.

RELAX— you're on

the World's Most Experienced Airline

Enjoy yourself. You're surrounded by comforts and services unmatched anywhere in the air. Luxuries that are solidly backed by an unequalled record of air pioneering and accomplishment.

You're flying with the only airline that has made over 60,000 Atlantic crossings, over 40,000 Pacific crossings and over 2,700 Round-the-World flights.

Pan American has carried 13 million passengers overseas in dependable speed and comfort—has flown over *one billion* miles overseas—and has 1200 pilots who have flown over one million miles each, 100 who have flown over *three million miles.*

This record is unmatched by any airline anywhere. So next time, choose Pan American—the only airline that gives you the priceless advantage of Round-the-World experience on every Tourist and First-class flight.

Let your Travel Agent arrange your trip— his services are free. Or call Pan American in :

"...and a bonus of goodwill to the management —for installing the 'Tushar' WATER COOLER!"

QUICK DIVIDENDS in improved staff relations — and greater efficiency! That's what investment in a TUSHAR Water Cooler brings you.

The TUSHAR provides a constant supply of cool, hygienic drinking water for your staff and clients. It's easy to operate and most economical to run. Why not get in touch with Voltas Limited, and order a TUSHAR *now?*

With the TUSHAR you get
- A continuous supply of instantly-cooled water at the touch of a button — no unhygienic refilling or storing.
- A choice of two handsome models.
- Ease of installation.
- Economical to run.

'Tushar' WATER COOLERS
A modern must for factories, offices, schools, hotels, hospitals and colleges

PANDIT NEHRU'S SOCIALISM

By

ODYSSEUS

ONE REASON WHY foreign observers find it difficult to understand Indian Socialism, and easy to fear India as a field for investment, is that India speaks about Socialism with two voices. The voice that emanates from the government, and from the ministries in New Delhi, is the voice of, so to speak, India's head and is all sweet reasonableness and light, from Pandit Nehru downwards. Downwards, that is, to a certain level when you begin to hear the voice of India's heart. This is loud among the Congress party's parliamentary supporters and often in the popular press. This voice rarely speaks any good of Private Enterprise, and the mere mention of "Socialism" sends it off into transports of uncritical applause.

"Socialistic" or "Socialist"? Which is which? What is the difference?

A "Socialistic" person is pragmatic, evolutionary, and, while insisting on a certain minimum pace of centrally planned economic development, is not faddy about doctrines but is ready to live and let live. His test as to whether to accept any proposal is whether it seems likely to add to the national income or not, e.g. to nationalise the existing steel companies would cost the taxpayer money and add nothing to wealth; on the other hand, Private Enterprise has not the resources to build up three great new steel plants with a capacity of 6,000,000 tons; so Government action is justified. Pandit Nehru is "Socialistic".

A "Socialist" is a dogmatic type whose sole test of any proposal is whether it is orthodox Socialism. Substantial numbers of the Congress parliamentary rank and file are Socialists.

A characteristic reaction to these Socialists of a moderate, and not in the least "anti-Indian", foreign observer is that of Stephen Garvin who says of them in his booklet "India: A Survey for British Firms" (F.B.I. London, 1956. 4sh. 6d.) that every enlargement of the public sector tends to be uncritically hailed, and references to privately controlled industry are persistently belittling and frequently downright hostile. It is not surprising, therefore, that the business community in India, both Indian and British, should be frequently annoyed or alarmed, and that it should be easy for foreign observers to get the idea that India is a thoroughly unsuitable field for investment.

Pandit Nehru's approach is in striking contrast. Again and again he has stressed the importance of avoiding dogma and doctrine. Argument about "Socialism, Communism, Capitalism, Gandhi-ism, Private Enterprise," he told the National Development Council on November 9, 1954, has assumed a "rigid, dogmatic, semi-religious outlook, i.e. holding fast to a set idea, some slogan and trying to fit your thought to that slogan."

NEHRU CASTIGATES SOCIALISTS

Explaining his policy to the Congress Parliamentary Party, Pandit Nehru went out of his way to castigate the Socialists for doctrinal rigidity. His policy was not nationalisation for the sake of nationalisation. India's problem was to produce more wealth and to distribute it equitably. His Government was not going to lock its limited financial resources up in buying going concerns but would use them to launch new ventures. Nor should existing concerns be expropriated without compensation: this was contrary to the Constitution and to his policy.

Whereas the doctrinaire Communist planners of the U.S.S.R. concentrated on raising the industrial potential of their essentially agricultural economy regardless of the "enormous misery" (Pandit Nehru's words) which that policy imposed, Pandit Nehru, while convinced that "real progress must ultimately depend on industrialisation," holds there must be a vast development of small-scale and cottage industries to reduce rural unemployment. It is here that the practical aspects of Sarvodaya, Bhoodan, and Gramdan (outlined here on January 4, 1957) have, I believe, great possibilities. I venture the prophecy that, on the one hand, true Sarvodaya — non-acquisitively, non-violently minded, self-governing villagers, dwelling in a Stateless society without all-India organisations or planning, unprotected by armed forces — is unlikely to be achieved, but, on the other hand, I see no reason why rural India should not pullulate with self-governing village communities, with flourishing farms and local industries run by co-operatives, whose products would be complementary to large national industries, some run by the State, others by Private Enterprise.

Reverting to Pandit Nehru's views (which have been usefully collected together in the admirable booklet "Indian Approaches to a Socialist Society", Berkeley University, California. $1.50, a storehouse of facts on which I have drawn freely in this series), the Prime Minister believes that to follow either "the American outlook" or "the Communist outlook" in economic matters would be harmful. It should, he thinks, be possible to profit by the experiences of America, China, and the U.S.S.R. In Pandit Nehru's view capitalism is like feudalism: it once served a useful purpose but is now out of date. Here I join issue with him. Capitalism as practised in the nineteenth century is dead, but the contemporary experience of North America and West Germany — the world's most flourishing and dynamic economies — shows that, when streamlined by modern techniques that ensure competition and incentives, Free Enterprise (as I prefer to call it) remains the most efficient road to high prosperity — in an already industrialised society. I add the last five words because I recognise that Free Enterprise would have difficulty in setting a tolerable pace in developing India's economy unless it were to rely on foreign investment, particularly American, to an extent which would be unacceptable to national sentiment. But I believe that once a certain level of economic development has been achieved, the planners and the national boards of control will be hindrances rather than helps. Without them, the cumulatively multiplying development which takes place in any dynamic Free Enterprise society would leap ahead.

I submit that it is one of the strongest "selling points" about India's Socialistic pattern that it keeps a place for Free Enterprise. "Undoubtedly Private Enterprise is useful," Pandit Nehru told the National Development Council. The Government wished to "encourage" it (although the dominance once exercised

by private enterprise throughout the world "is no more").

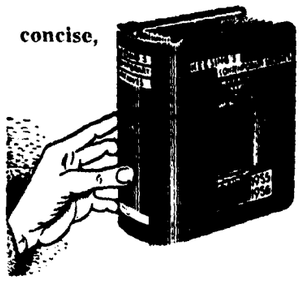
WHY FOREIGN INVESTORS ARE NERVOUS

India needs, and would welcome, substantial foreign investment, but there can be no doubt that publicity given abroad to such events as the amendment to the Constitution passed to remove compensation for nationalisation from the jurisdiction of the courts, the nationalisation of the airlines, of the Imperial Bank of India, and of life insurance, was largely ensured by what Stephen Garvin describes as "the chorus of dogmatic approval with which these acts were greeted by legislators", so that the special "reasons which existed in each of these cases could hardly be heard in India itself and never made any impact abroad". For example, the Indian airlines were nationalised not because they were being inefficiently run by private enterprise but because they would have required government support for the replacement of aircraft on such a scale that they would have remained private in name only. In other words, the development of civil aviation in India does not differ from the experience of many other countries, and if it had not been for the howl of Socialist triumph with which nationalisation was greeted, nationalisation of the airlines would have attracted no more attention among foreign investors than a re-organisation in British Overseas Airways or Air-France.

If India wants foreign investment, it is important that the Socialists in New Delhi should keep calm and let the Government get on with its Socialistic pattern industrial policy which lays down perfectly clear, and not in the least frightening, aims. Mr. Garvin points out that ministers are wisely reluctant to indulge in glosses upon it in public, and well-meaning persons who often urge this course on them in the interests of the "investment climate" do not always realise that common sense and pragmatism in individual cases, of which the Indian Government has shown itself well capable, are of far more benefit to private industry than vague reassurances which invite controversy.

It is of high significance that Mr. Garvin, writing in his capacity as an adviser to the Federation of British Industries, declares that nationalisation is a red herring in the study of India's industrial prospects. The real difficulties for private enterprise in India, in his view, arise from income-tax policy.

India now taxes personal incentive in industry higher than any other country in the world.



On a net basis, comparing the situation of a married man with two children, income-tax in India in the middle managerial ranks, and even more in the higher, is heavier than in Britain and, what is more, the cost of living to a foreigner is far higher in India than in Britain. From Rs. 2,000 a month, Indian income-tax is increasingly higher than British and the 1955 budget taxed perquisites which, although taxable in the U.K., mean infinitely more to the foreigner in India and are indeed "inescapable adjuncts" of salary to anyone working outside his own country, such as home leave passage costs, rent free, or concessional rent, accommodation, educational allowances and personal transport. For any country seeking to attract foreign investment it is, in view of Mr. Garvin (who, it should be stressed, is most sympathetic towards Indian affairs) "impossible to over-estimate the folly" of these taxes. It is precisely in these fields in which India is anxious to develop industrially that managerial manpower is desperately short in the U.K., and in other Western industrialised countries, and India cannot hope to attract foreign firms if they cannot pay their employees enough. Rs. 2,000 a month in India cannot be made to do the work of £150 a month in the U.K. and no person who can find employment elsewhere will come out to India as long as it is made impossible for him to educate his children in his own country or for his wife to travel reasonably often between her husband abroad and her children at home.

EUROMARKET AND THE COLONIES

(From Our Special West European Correspondent)

PARIS, January 4.

THE revival of support for European unity has given an impetus to the planning of a common market or progressive customs union among the six powers of Little Europe, and it is now hoped here in Paris that some sort of a treaty will be ready for submission to parliaments by the end of this month. I say "some sort of a treaty" because many important difficulties have not yet been settled and the document is likely to be rather vague where it refers to them. But the crusaders for European unity are in a hurry, and the more fervent of them seem to imagine that their cause will have been advanced if six nations sign a treaty that leaves all the basic problems unmentioned. And perhaps they are right: on the most optimistic view, Euromarket will take 12 or 15 years to establish, so maybe the important thing is to get started as soon as possible and hope that difficulties will be resolved gradually.

One of these difficulties, which will probably be responsible for one of the vaguest passages in the forthcoming treaty, concerns the problem of how the colonial dependencies of Europe are to be associated with the free-trade area. I outlined the nature of this problem in two despatches last year (June 22 and November 2) but there has been much hard bargaining since the issue was first raised last May in Venice and the nations concerned have been gradually shifting their ground. They have not yet succeeded in finding an agreed way of bringing the colonies into the free-trade scheme, and it is possible that the Euromarket treaty will simply say that the colonies will be included "on terms to be agreed later". If you are British you will think this is an admirable example of "empiricism"; if you are not, you will think it is a very foolish example of nations walking blindfold into insoluble difficulties.

It should be emphasised that this question concerns only colonial dependencies; it does not concern sovereign states outside Europe even if they belong to a monetary area such as the sterling bloc or franc zone. There has been confusion about this in India where newspapers have discussed the problem of whether India should join Euromarket. The question does not arise. The British Government certainly consulted Delhi, and the other sterling area capitals, when London began to consider joining Euromarket but this was merely to discuss how Britain's dual obligations would be reconciled; there was never any suggestion that India or the others should have anything directly to do with a free-trade area. The problem does concern the colonies because, not being sovereign and thus having no independent economies, they can be co-opted into the free-trade area by the metropolitan country. And in the event, it concerns mainly the French Empire because the Belgian Congo is already by international treaty a free-trade area and other colonial dependencies of Europe are of minor importance. (I am assuming, what is certain, that Britain will never become a full member of Euromarket).

So the issue can be simplified into this question: is France going to throw open her colonies to free trade with the other European countries and if she does what return will they give her for this access to hitherto protected markets? Indeed, since West Germany will be France's biggest partner in Euromarket, we can simplify it even further: what price in the shape of investments is West Germany willing to pay for the right to sell goods in French colonies on equal terms with French industries? At present French industry derives very considerable benefits from the hermetic sealing of the colonial empire, for it thus has a market of 48 million people from which all foreign competition is virtually excluded. But it pays a high price for this benefit: firstly, it has to pay fancy prices for the exports of these colonies, and secondly, the French state has to meet all the costs of administration in these territories and moreover has to supply the increasing amounts of investment capital needed for their development.

Naturally, the French argument is that if French industry is to surrender the privileges of this protected market, then the main beneficiaries — namely, the Germans — should in return put up some of the investment capital required in the colonies. Paris has regarded this as one of its main bargaining counters in the negotiations about a common market, and French negotiators have been saying in effect: "The rest of the members of Euromarket are offering only their own domestic markets to the common pool, but we are offering France (population 43 millions) plus the overseas dependent territories (population 48 millions). What price do you offer for our extra contribution?" Somewhat to her surprise, the other partners have not been willing to offer very much at all.

Let us try to put a money value on what France is offering Euromarket, and on what she expects in return. The market she offers is at present worth about 500 milliard francs a year, or about Rs. 685 crores. That is, the French overseas territories now buy 500 milliard francs worth of their imports, out of total imports of 700 milliards, from France herself. If the colonies were included in the free-trade area, this volume of commerce would be open to the competition of West Germany and the other European partners.

What does France pay for this privilege — that is, what is the burden she can expect her partners in Euromarket to share in return for access to this market? First, she has to meet the costs of sovereignty — administration, education, defence and so on — which in a normal year (apart from such extra expenses as the war in Algeria) run to around 160 milliard francs. Secondly, she has to supply literally all the public investment in the colonies most of which is not profitable: roads, hospitals and the like; this runs to about 200 milliard francs a year, and of course, it will increase rapidly as the colonial populations grow and as their development needs rise. Thirdly, she has to pay an excess over free world market prices for the goods she imports from the colonies, and in fact she buys most of their exports; no exact figure can be given for this burden but it runs to some tens of milliards of francs. Lastly, she has to buy, in order to subsidise certain colonial industries, goods she does not need at any price, such as North African wines and spirits. That we cannot put a precise value on the third and fourth items is not important because these burdens

would presumably cease to exist if the colonies joined Euromarket, when they would have to sell at competitive prices, though the French Government might have to pay subsidies to compensate certain affected industries.

In all then, we can say that France is paying over 400 milliard francs a year for the privilege of selling 500 milliard francs of goods in the protected colonial market. (Incidentally, it is plain that this is very bad business but then there never was any money in imperialism, and only ignorant Leninists ever imagined that colonial powers showed a profit on their ventures. The main economic market in imperialism is that certain metropolitan industries make a profit at the expense, not so much of the colonials, as of the other metropolitan taxpayers). The present question is, how much of this 400 milliards a year can France unload on to her European neighbours in return for the market of 500 milliards a year?

Now, obviously, the other European nations are not going to subsidise favoured colonial industries, they are not going to pay special prices above world levels and they are not going to pay any part of the expenses of sovereignty, at least as long as France remains the sovereign. So we can write off 200 milliards out of 400, as impossible to share among France's partners. There remains the 200 milliards a year (Rs. 274 crores) required for public investment in the colonies. The first French suggestion was that all the members of Euromarket should contribute to this sum on a pro rata basis in proportion to their national incomes. This, the other nations refused. Then the French suggested that they would put up half this sum, if the others between them would find the other 100 milliard francs a year. This was refused too.

Paris then dropped its price considerably, by suggesting that France would put up the whole 200 milliards if the other European nations would add to this a lump sum of 70 milliard francs a year. This was a large retreat from the second plan because it would mean that France was supplying 75 per cent of the public investment capital and the others only 25 per cent. It was an ever larger retreat from the first suggestion because it would mean that France was contributing 3 per cent of her national income while the Germans were contributing 0.3 per cent of theirs, or one-tenth. The latest information is that even this modest contribution is being refused and that is why, if a Euromarket treaty is drawn up within a month, it will leave this whole issue in suspense by saying the colonies will be included "on terms to be agreed later".

The French, of course, are disappointed that their partners are unwilling to pay a price for their extra contribution. But look at it from the point of view of the Germans and you will see that what France is trying to sell can be had for nothing anywhere else. For what are the French really offering: only a collection of backward countries which now absorb a certain volume of trade and which will absorb much more if sufficient money is invested in their development. But that can be had anywhere in Asia, Africa and Latin America. Undeveloped economies that only need substantial investments to become markets for European manufactures are today two pence a dozen. Colonies cannot be put up for sale because, however much they may be worth to the metropolitan power, they are worth nothing to anybody else — unless they have oil resources, in which case they are not put up for sale.

WORLDGRAM

AGRICULTURE

Increase in Rice Acreage: The area under rice cultivation is up by three million acres during the current year—1956-57. Last year 76.3 million acres were under rice. The increase in the acreage is reported to be mainly in the States of Orissa, Andhra, Bihar and U.P. The crop being harvested in many parts of the country is good, particularly in Madras, Andhra, Orissa and U.P., according to latest reports. It is expected to be better than that of last year when the yield amounted to 25.3 million tons. Market reports show a decline in the price of rice in most parts of the country. Compared to the price ruling in October and November, prices in many States show a downward trend. The fall in prices range from a few annas to a rupee a maund. The downward price trend is attributed to the build up of stocks by Government from internal production and imports.

*

Rajasthan Land Reforms Bill: The President has given his assent to the Rajasthan Land Reforms and Resumption of Jagirs (Fourth Amendment) Bill, 1956. The Bill seeks to define the types of jagirs which are to be exempted from the application of the Rajasthan Land Reforms and Resumption of Jagirs Act, 1952. The Act exempts from its purview jagirs granted for religious purposes but difficulty was experienced in determining which of the jagirs fell under this category. The present Bill clarifies the position.

*

US Farm Surplus: The United States has concluded an agreement with Brazil whereby she will supply $138.7 million (£49,536,000) of agricultural products, mainly wheat, during the next three years under the Agricultural Produce Act. Brozil will pay in cruzeirs, the bulk of which she will retain as a long-term loan for development projects. It was announced that these loans would be applied mainly to hydro-electric power development and railway improvement. Although earlier Brazilian quarters had maintained that under the agreement they would be free to use these cruzeirs anywhere for the purchase of capital equipment, it is likely that American suppliers will be the essential beneficiaries. The agreement provides for the supply of 1.8 million tons of wheat or flour, valued at $111 million (£39,643,000), 15,000 tons of lard, 4,000 tons of vegetable oils, and $2.2 million (Nearly £800,000) worth of milk products. Goods other than wheat will be supplied during the current year. It is officially estimated that freight involved in the agreement will amount to some $19 million (nearly £6.8 million) which will be financed by the US. It is also estimated that products to be supplied to Brazil will cost the American Government about $222 million (nearly £80 million).

INDUSTRY

Anil Hardboard's New Venture: Production and manufacture of Hard Board and allied products from indigenous materials on a large scale for meeting the increasing building requirements of the country is being undertaken by a new venture of the ANIL HARDBOARDS LTD. The promoters of this venture Mr. R. L. Khanna, Director of Willcox (Buckwell-India) Private Ltd., New Delhi and Mr. G. R. Jolly, Managing Director of Jolly Bros. (Private) Ltd., Bombay have already finalised arrangements with Messrs. AKTIEBOLAGET DEFIBRATOR, Stockholm (Sweden) for the supply of machinery and installations for the factory. AKTIEBOLAGET DEFIBRATOR, Stockholm (Sweden) are a firm of international repute responsible for the installation of more than 75 per cent of similar hard board factories all over the world.

*

Thai Steel Plant Project: The Government of Thailand has signed an agreement with Messrs. Fried Krupp of Essen|Ruhr under which the West German firm would explore the possibility of erecting a steel plant in the country. The agreement follows a preliminary report made by Krupps experts on the iron and coal deposits in North Thailand early this year. On completion of a detailed survey, the Ministry of Industry is expected to enter into a new contract with Krupps for the setting up of a joint undertaking to exploit the iron and coal resources of the country.

*

Hindustan Machine Tool Factory: The State owned Hindustan Machine Tool Factory at Bangalore is to undertake, for the first time, in India, the manufacture of milling machines of the latest improved type. A contract for technical collaboration has been signed with M|s. Fritz Werner of West Germany. The factory will make 6 types of milling machines which will meet the demands of the Indian Railways, Defence Factories and new industrial projects like steel plants, the Heavy Electrical Equipment Factory and the jet engine project. It is expected that the production of these machines will begin in about 10 and 12 months from now. The Hindustan Machine Tool Factory, which is the only factory of its range and scope in India, produced for the second month in succession 24 high-speed precision lathes in December 1956. The factory has thus attained an annual rate of 300 lathes as against the original target of 57 lathes for the financial year 1956-57. Under the original programme, the target of 300 machine tools per year was to be reached in 1959-60. Technical Collaboration Agreements with other firms of repute for the manufarture of radial drills and circular grinders are under negotiation.

*

UK Steel Demand by 1962: An annual demand of 28,000,000 tons of steel by 1962 is envisaged by the United Kingdom steel industry. This forecast is made by the British Iron and Steel Federations quarterly Steel Review. In 1957 five new blast furnaces are due to be completed and eight new open-hearth farnaces are expected to come into operation as well as Bessemer and electric steel developments. No fewer than 358 coke ovens are scheduled for completion, of which 192 are for replacement. There are a number of important rolling mill developments. Looking further ahead, the Review says that full use of the facilities at present available, together with the new plant due to come into production, would make possible an output of some 23,500,000 tons in 1958. This is nearly 4,000,000 tons higher than actual output in 1955, and 7,000,000 tons more than in 1952 just before the second post-war development plan began.

*

Production of Bicycles: The production of bicycles in India in 1956 is estimated at over 6,15,000 as against 4,91,000 in 1955, and 3,72,000 in 1954. These figures do not include the production of the small-scale sector. Considerable progress has been made in the last six years in the bicycle industry which is one of the youngest industries in the country. In 1951, there were only two units engaged in the manufacture of bicycles with a rated capacity of 1,20,000 and actual production of 1,01,000 bicycles per year. There are now 65 large and small factories producing bicycles in the country. Of these 16 are in the Punjab, 13 in Delhi, 9 in Bombay 7 in U.P., 6 in West Bengal, 5 in Madhya Pradesh, 4 in Rajasthan, 2 in Madras and one in Bihar. The average daily employment in the large-scale sector of

the industry was 8158 in 1956 as against 6,493 in 1955 and 5,077 in 1954. It is estimated that about 6,500 persons are employed in the small-scale sector.

TRADE

Trade between Portugal and Germany: A considerable influx of German capital into Portuguese industry is expected within the next few years. This is the result, to a large extent, of the growing unbalance of trade between the two countries. In the first 10 months of 1956 imports from Western Germany were valued at 1,609 million escs. (£20 million) while the value of Portuguese exports to Germany amounted to only 464 million escs. (£5.8 million.) Trade discussion held in mid-December with representatives of the West German Government—with a view to increasing Portuguese exports, principally of wine to that country—reached no satisfactory solution, despite an urgent appeal to Bonn from German trade interests in Portugal for greater leniency with regard to imports from Lisbon.

*

Ceylon's Trade with Czechs: Ceylon has agreed to the establishment of a Czechoslovak trade mission in the island, the first trade mission from a Communist country to be set up there. The Czech Chamber of Commerce proposes to hold an Industrial Exhibition in Colombo on March 2, 1957, to last about three weeks. It is designed to acquaint business and industrial circles in Ceylon with present developments in Czech industrial products.

*

'Bidi' Exports Fall: Bidi exports from India are steadily declining. In the six months April to September, 1956, erports amounted to 1,100,000 lbs., against 1,200,000 lbs., in the corresponding period of last year. The quantities exported in 1954-55 and 1955-56 were 2.900.000 lbs., and 2,700,000 lbs. respectively. The fall in exports was mainly due to the lower offtake by Ceylon, the main customer. Exports to Pakistan also have been showing a sharp fall. The value of bidi exports by the land route to Eastern and Western Pakistan was about Rs. 10,500,000 in 1952-53 but it declined to a nominal figure of Rs. 1,764 in 1955-56.

FINANCE

Rise in UK Gold and Dollar Reserves: The United Kingdom's gold and dollar reserves rose by $168,000,000 last month, and stood at $2,133 million on December 31, the Treasury announced in London on January 3. During the month drawings on the International Monetary Fund (IMF) amounted to $561,000,000, and defence aid estimated at $6,000,000 was received from the United States; $49,000,000 was paid in gold or dollars to the European Payments Union (EPU) in respect of November, $3,000,000 was paid to creditors of EPU in bilateral settlements, and $189,000,000 was paid in respect of US and Canadian debt service, of which $104,060,000 is being held in special accounts. On the provisional figures for the month, the United Kingdom had a deficit of £8,000,000 with EPU which will fall to be settled in January, 75 per cent in gold or dollars and 35 per cent by increase of debt to EPU.

*

Israeli Budget: An overall increase of 10 per cent to 1,£850 million (£168 million) in both income and expenditure during the coming fiscal year is foreseen in the draft budget for 1957-58 recently approved by the Israeli Cabinet. The increase in income is not to be obtained by a new taxes but from larger income-tax yields—resulting from higher wage levels—and increased customs duties caused by larger imports. On the expenditure side, the allocation to development projects will be relatively smaller than in 1956, being up by only 8 per cent (to 1.£352 million), whereas ordinary expenditure is to rise by 13 per cent (to 1.£306 million).

Sterling Area's Gold Reserves: Following Britain's withdrawals from the International Monetary Fund the sterling area's gold and dollor reserves rose by $168 million during December to reach a total of $2,133 million—slightly higher than that at the end of the previous year. This offsets the month's trading deficit and also covers the $49 million payment to the European Payments Union. A Treasury spokesmon said Britain had a further credit with the Monetary Fund and the offer of a loan from the Export-Import Bank to the total value of $1,239 million. An additional $104 million will revert to Britain's reserves if her request to be excused payment of interest on her American and Canadian loans was granted.

*

New Companies Registration: During the first five months of the current financial year, 321 new companies with a total authorized capital of Rs. 64.05 crores have been formed as against 578 companies with an authorized capital of Rs. 52.3 crores during the corresponding period of the preceding year. Of the 321 new companies registered up to the end of August 1956, 31 were public companies, as against 79 registered in the first five months of 1955-56. With three more big and giant floatations in August, the total number of such companies having an authorized capital of Rs. 50 lakhs and above comes to 11. A notable floatation of the month is the Heavy Electricals Private Ltd., registered in Bhopal with an authorized capital of Rs. 30 crores. The sponsor is the Central Ministry of Production and the company is the biggest to be formed so far during the rurrent fiscal year, the other two Government companies having a very large capital base being the State Trading Corporation and the Western Shipping Corporation with authorized capital of Rs. 1 crore and Rs. 10 crores respectively.

*

UK-Japan Sterling Payments Pact: Britain and Japan have prolonged their sterling payments agreement, which was due to end in December by another one month. The extension would cover the final stages of the review talks which are expected to conclude by January 20. Under the old arrangements, Japan and the Sterling area, of which Britain is the banker, had expected to balance their trade during the past 12-months period at about £255 million each way.

GENERAL

Electricity Output: During August, 1956, public electricity supply undertakings in India produced 792.1 million kilowatt hours, of which 650.0 million kwh. were sold to ultimate consumers, 796.5 million kwh. were generated during the previous month. One diesel generating undertaking and four purchasing undertakings were the new additions during the month. The Diesel undertakings is situated at Chopan in U.P. and the purchasing undertakings at Ulhasnagar in Bombay, Jagatsingur in Orissa and Bari and Sirhind in Punjab. The output and sale of power in August, 1955, were 706.3 million kwh. and 574.4 million kwh. and in August, 1939, 213.1 million kwh. and 177.4 million kwh. respectively.

*

Employment Statistics: An increase of 2,721 in placements within a month was recorded by the employment exchanges in India which secured jobs for 16,889 registered unemployed during November 1956 as against 14,168 during the previous month. According to an official press release the number of registered unemployed at the end of the month dropped by 16,252 to 7,60,505. Fresh registration totalling 1,23,976 were effected by the employment exchanges during November, 1956, as against 1,20,683 during the previous month, showing an increase of 3,293. The number of employers who used the exchanges during the month was 5,293 as against 4,964 during October, 1956. The number of vacancies notified by them was 24,507 as compared to 22,663 during October 1956.

NEWS IN BRIEF

INDIAN

The estimated total output of iron ore in India increased to 380,186 tons in October, 1956 from 344,605 tons in September 1956, according to official statistics released by the Chief Inspector of Mines.

*

At the request of the Government of Ceylon the Government of India has decided to release some quantity of potatoes for export to Ceylon as a special case. Export of potatoes will be allowed from the port of Madras only.

*

Export of Indian cotton sewing thread and cotton thread other than sewing thread (including embriodery and crochet threat) within a ceiling of 4,33,000 lbs. and 67,000 lbs., respectively has been permitted to all permissible destinations excluding Tibet and the Portuguese possessions in India during the period January to June, 1957.

*

The export from Delhi of wheat products such as maida, suji, rawa, wholemeal atta, resultant atta and bran has been banned.

*

The production of aluminium in India in the first nine months of 1956 amounted to 4,227 tons compared with 5,300 tons in the corresponding period of 1955. Total production in 1955 was 7,225 tons, against 4,486 tons in 1954.

*

The Rajasthan Government has constituted a Committee to promote the cultivation of better quality cotton and suggest measures to increase cotton producion in the State.

*

The President has given his assent to the Uttar Pradesh Industrial Disputes (Amendment and Miscellaneous Provisions) Bill, 1956. The Bill seeks to amend the U.P. Industrial Disputes Act, 1947 with a view to bringing it in conformity with the Central legislation on this subject.

*

Production and despatches of sugar from indigenous factories amounted to 2.65 and 2.18 lakh tons up to December 15, 1956, in the current season as against 1.91 and 1.87 lakh tons respectively in the corresponding period of last year.

*

A Trade and Goodwill Delegation from Denmark will arrive in India on January 14, at the invitation of the Government of India. The Delegation during its tour will see the progress made in the various sectors of the industry in India and explore the possibilities of industrial collaboration and expansion of trade between the two countries.

*

A draft Indian standard method for detection and estimation of damage in cullulosic textile materials due to micro-organisms, has been circulated by the Indian Standards Institution for eliciting comments.

*

Salt production in India reached 119,000,000 maunds in 1956, the highest ever achieved by the industry, according to official estimates.

FOREIGN

Britain has made available to the U.S. $81.6 million (£29,143,000) in interest charges on the World War II Lend-Lease debt and post-war loan of $3,750 million (£1,340 million).

*

Indonesia has signed a contract for the purchase in Italy of machinery for the construction of a plant for prefabricated houses and their parts in Sumatra, for a total value of 2,000 million lire.

*

Pakistan's reserves fell by about Rs. 123 million (nearly £10 million) during July-September, 1956, according to official figures. The balance-of-payments deficit according to the Ministry of Finance was due to a substantial increase in imports of food grains as well as to a seasonal fall in the volume of exports.

*

In the 1956-57 financial year, direct taxes in Denmark increased by 6.5 per cent to a record of Kr. 4,278 million distributed as: personal taxes Kr. 3,326 million and company taxes Kr. 430 million.

*

Denmark exported machinery and electrical equipment worth Kr. 816 million up to November 1, 1956. This item is now second on the export list, preceded only by bacon and pork — with Kr. 984 million for the first ten months of 1956 — and before butter, with Kr. 700 million.

*

It is reported the first Joint Trade Agreement between Denmark and the Beneluxe countries has been signed.

*

By the end of November 1956, Yugoslav exports amounted to $281 million, the planned level for the whole of 1956. Exports in November, 1956 totalled $28.3 million which is $3.3 million more than at the same month in 1955. The value of imports in November totalled $38.9 million against $28.3 million in November, 1955.

*

The United States has released aid funds totalling 6,000 million dinars (about £7.2 million) for the development of Yugoslav territory which was part of Italy until the end of World War II.

*

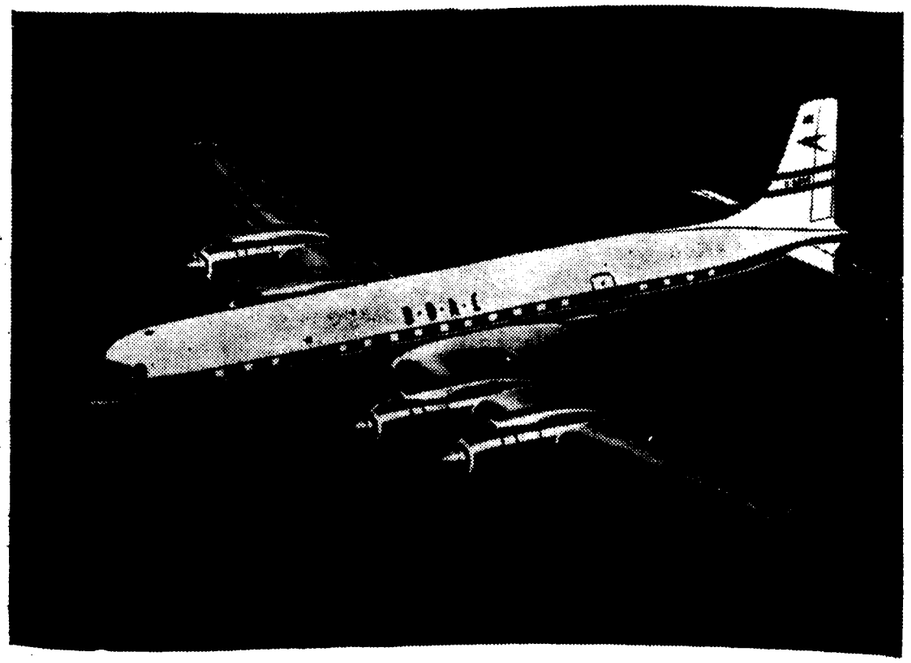
Mercury has been added to the list of Turkish raw material which may be exported for processing abroad.

*

The Agriculture Department of U.S.A. predicts that world exports of cotton will total about 14.5 million bales of 500 lbs. each during the marketing year ending next July 31.

*

The Brussels steel cartel has, with immediate effect, raised the prices of steel exporetd to countries outside the coal and steel pool area.



*

The International Co-operation Administration has announced a $4 million (£1,428,500) loan to Iceland to finance essential general imports.

*

The price of high-grade lubricating oil in West Germany for turbines, transformers, etc. — and that of fuel oil for use as raw materials for the pharmaceutical and allied industries has been raised from £5 to £7 per ton.

LONDON—NEW YORK NON-STOP

B.O.A.C. are now progressively introducing their magnificent new DC-7C airliners on First and Tourist Class services London—New York *non-stop*. This long-range B.O.A.C. airliner offers you the *fastest* trans-atlantic travel for business or pleasure. And the DC-7C is equipped with the latest radar for fair-weather flying all the way. Book "B.O.A.C. plus DC-7C." First Class single fare Delhi—New York Rs. 4,576/-, return Rs. 8,237/-. Tourist Class single fare Rs. 2,796/-, return Rs. 5,033/-, available until 28th February, 1957.

Consult your local Travel Agent or B.O.A.C., Speedbird House, Service Road, Connaught Place, New Delhi-1. Phone: 43978, 44234, 45085 & 47356

FORWARD TRADING IN NON-FERROUS METALS

REGULATION of forward trading on an all-India scale has started in this country with the coming into force of the Forward Contracts (Regulation) Act of 1952. The Forward Markets Commission was established to assist the Central Government in the administration of the Act. Prior to the inauguration of the new Constitution, it must be noted, the Central Government did not have the necessary legislative powers to regulate forward trading in the whole of the country.

The services rendered by a forward market are many. Essentially, it operates as a mechanism for co-ordinating the community's current plans and future expectations and it makes for an integrated price structure throughout the country subject only to frictional differences. It also introduces an element of stability in the trend of prices by smoothening out rapid and violent fluctuations and enables buyers and sellers to insure themselves against price uncertainties arising from frequent changes in market supply or demand. The Forward Markets Commission is mainly entrusted with the task of making a study of the forward market in a particular commodity with a view to inquiring whether the market should be brought within the regulatory provisions of the Forward Contracts Act and to enquire into the claims of various associations for recognition to conduct forward trading.

During the course of 1955, the Commission submitted seven reports on the recognition of associations relating to 10 commodities as follows: (1) Cotton (2) Castorseed and castor oil (3) Linseed and linseed oil (4) Cottonseed (5) Groundnut and groundnut oil (6) Turmeric and (7) Coconut oil. Last year, it submitted a report to the Government on the recognition of associations in respect of forward contracts in copper, zinc, lead and tin. It has argued cogently the case for permitting futures trading in these four commodities which the Government have now accepted.

There are certain essential factors to be taken into account while considering the suitability of a commodity for the purpose of futures trading. They are: it should be capable of being graded and standardised; its supply should be large enough to prevent its being cornered by a small number of operators; it should have a wide demand so that the market would not be influenced unduly by monopolistic forces; it should not deteriorate and should be capable of being stored for long periods; and there should preferably exist a tradition in futures trading in the commodity. It must also be noted as a general rule that during situations of pronounced imbalance between supply and demand, futures markets have a tendency to accentuate the rise or fall in the price of the commodity to the detriment of the interests of the community and it is not desirable to permit trading during such situations. So, the various factors affecting supply and demand have to be carefully examined before permission for trading can be granted and these include the level of current stocks, imports and exports, supplies available for internal consumption, trend of prices at home and abroad and so on.

In India, there has been no ban at any time on forward trading in non-ferrous metals and the trading, which has been traditionally confined to copper, lead, zinc and tin, has been conducted on an organised basis for the last 30 years at Bombay. These commodities fulfil the conditions necessary for being traded in a futures market. They are homogeneous in character and the varieties in which they are marketed are standardised and graded before sale. Also, they are capable of being stored for long periods and the quality does not undergo deterioration. The demand for these metals springs from fabricating, rolling, drawing and manufacturing industries located all over the country and it is large and steady. Though indigenous production is relatively small, sufficient imports are generally obtained to provide adequate supplies of the metals for the requirements of the country.

All the participants in the metal industry—producers, smelters and refiners, consumers, manufacturers, scrap merchants, stockists and merchants and others—are enabled by the futures markets to effect whatever "covering" transactions their business calls for and quickly to adjust their metal position. They are thus enabled to avoid losses arising out of fluctuations in raw metal prices and to concentrate on their mining, smelting, manufacturing, merchanting or other activities. Another advantage is that the futures market facilitates the fixation of daily prices arrived at as a result of the free inter-play of international factors of demand and supply. Copper, zinc, lead and tin are produced in various parts of the world under varying conditions and India has to depend largely upon its imports from those countries. The provision of a definite and agreed price basis, objectively and impartially registered, is therefore a distinct necessity to facilitate business at all stages in the non-ferrous industry. In the UK and USA, futures markets have been established for handling commodities which are not locally produced and which are largely imported and so in India too, in the case of copper, zinc, lead and tin, which are largely imported, a futures market can be utilised for minimising losses arising from price fluctuations. The increase in the risks of trading will naturally give rise to a comparative increase in the demand for hedging facilities. The regulation of such a market is also of prime importance as it is more susceptible to fluctuation.

In the location of the futures market, certain factors have to be taken into account like nearness to producing areas and consuming centres, transport and communication, storage, banking and insurance facilities, general commercial importance of the locality and the tradition in futures trading. Bombay city as a centre of the non-ferrous metal industry satisfies many of these conditions and hence it has been selected as the suitable centre for location of a futures market in copper, zinc, lead and tin. As regards recognition of an association, it is governed by the requirement that it should be in the interest of the trade and also the public. The fact of recognition confers on the association concerned a special privilege inasmuch as forward contracts entered into between members of the associations not so recognised become illegal. The association selected for recognition should not only be representative of all the interests concerned and possess the necessary financial resources, but should also have the experience of dealing in the commodity concerned. The Bombay Metal Exchange Ltd., which was the only the applicant and fulfilled these conditions, has thus been given recognition. The Bombay Metal Exchange Ltd. is the successor to the Metal Traders' Association Ltd. and the Metal Exchanges' Association Ltd., which have been amalgamated to form one body, and the members of these associations have had experience of futures trading in copper, zinc, lead and tin for almost 20 years.

This article can appropriately end with a brief discussion of the importance of these non-ferrous metals

in the economy of a country set on a course of rapid industrialisation. Copper, zinc, lead and tin are also strategic metals stockpiled by countries like the USA. The United States ranks first and produces about one-third of the total world production of copper, which was estimated at 2,700,000 tons in 1955. India produced 7,192 tons of copper ingots and this indigenous production just satisfies about 28 per cent of the total demand in the country. The present overall demand for copper is estimated at about 25,000 to 30,000 tons per annum and the large hydro-electric schemes, the projects for rural electrification, manufacture of boilers, cables etc. would give rise to a considerable expansion in the demand for copper.

In zinc also, the US ranks first and accounts for about 20 per cent of the total world production estimated at 2,803,000 tons in 1955. In India, the production of virgin zinc is not undertaken on a commercial scale as the quantity of zinc concentrates having a zinc content of about 55 per cent is only 5,000 tons and this has been considered uneconomic for establishing a smelting unit for producing virgin metal. The present overall demand for zinc is estimated at about 30,000 tons per annum and it is chiefly consumed by the iron and steel industry for production of galvanised sheets. Its demand is also expected to increase considerably with the industrial expansion of the country.

In the production of lead, USA, Canada, Mexico and Australia account for nearly half of the total world production which was 2,932,000 tons in 1955. India's production which was 2,375 tons satisfies about 14 per cent of the total demand. The chief users of the metal are the pigments, telephone, electrical and chemical industries and the present overall demand is estimated at about 15,000 tons per annum. Consumption of lead in the various industries is likely to increase due to large hydro-electric schemes, projects for rural electrification, atomic energy plants, telephone equipments industry, plastic industry and other industries.

Malaya ranks first and produces about one-third of the total world production of tin which was 167,000 long tons in 1955. Production of tin in India is, however, negligible. Because of its good resistance to corrosion under many conditions, tin has been able to find extensive uses in the manufacture of tin plates and alloys. Tin and its alloys find a variety of uses in many industries and the present overall demand in the country is estimated at about 4,000 tons which is bound to increase with the further rapid industrialisation of the country.

GROWTH OF INDUSTRIAL TOWNS IN INDIA

(CONTRIBUTED)

THE term "industrial town" is used frequently, although there is no widely accepted definition of it. It is, therefore, desirable to define it so as to help anybody to ascertain on the basis of easily available data, which town is industrial and which is not. The phenomenal increase of urban population during 1931-51 is attributed to a large extent to rapid industrialisation. Improvement in social services also might have contributed to the growth of population in towns. Industrial progress might have facilitated improvement in social services. The relation between the growth of population and the livelihood pattern of population is very complex. An attempt is made here to study this phenomenon. Census data of 1951 are used, although they have certain limitations. But they help us to understand the conditions in 3,018 towns.

Towns are of two types — relatively industrial towns and relatively service towns. After defining the term "relatively industrial town" there will be no difficulty to define "relatively service town". Some of the relatively industrial towns can be said to be absolutely industrial towns. Before we proceed to define these terms, it is necessary to mention that the 1951 census data regarding means of livelihood have been presented under eight groups — (i) Cultivators of land wholly or mainly owned, (ii) Cultivators of land wholly or mainly unowned, (iii) Cultivating labourers, (iv) Non-cultivating owners of land and other agricultural rent receivers, (v) Production other than cultivation, (vi) Commerce, (vii) Transport and (viii) Other services and miscellaneous sources. The last category includes persons whose means of livelihood are health, educational and administrative services, non-agricultural rentiers, pensioners, miscellaneous income recipients etc. These data can be used to determine the nature of each town.

A town may be said to be relatively industrial if the population whose means of livelihood is "production other than cultivation" (i.e. group v) is larger than the population in any one of the remaining seven groups. In Banaras "production other than cultivation" was the means of livelihood for 35.4 per cent of the population, while commerce was the means of livelihood for 24.8 per cent, transport for 6.1 per cent, other sources and miscellaneous means for 30.7 per cent and agriculture (groups i to iv) for 3 per cent of the population. According to this definition Banaras is an industrial town. Out of the 558 Indian towns, each with a population of 20,000 and above 97 only are relatively industrial. The rest are service towns, prominent on account of Government offices, commercial establishments, educational institutions etc. Allahabad, Cuttack, Lucknow and Madras are not relatively industrial towns. Bhadravati, Gadag, Kamarhatti, Sagar and Tuticorin are relatively industrial. In the 97 relatively industrial towns the percentage of population whose means of livelihood is production other than cultivation ranges from 26.6 in Yadgir, a town with a population of 22,039, to 74.8 in Titaghar, a town with a population of 71,622. In Kothagudem, a town with a population of 50,194, production other than cultivation was the means of livelihood for 77.2 per cent. It may be having many industrial units with labour-intensive technique of production. Capital investment and production in Kothagudem may be insignificant compared with those in Titaghar. On the basis of census data we cannot separate industrial towns with labour-intensive technique from towns with capital-intensive technique. Another serious limitation of the census data is that a person who both makes and sells a commodity is shown under production other than cultivation, while a person who sells only is shown under commerce. In Ahmedabad production other than cultivation is the means of livelihood for 52.0 per cent of the population, while in Malegaon it is the means of livelihood for 58.0 per cent. In Malegaon many may be both weaving and selling cloth, while in Ahmedabad a negligible number may be both weaving and selling cloth.

A town may be said to be absolutely industrial if the population whose means of livelihood is "production other than cultivation" is larger than the population in all the remaining seven categories put together. It means that more than 50 per cent of the population have production other than cultivation as means of livelihood. According to this definition, Budge Budge is an absolutely industrial town, while Bombay is not. Bombay is a relatively industrial town, because production other than cultivation is the means of livelihood for 35.0 per cent of the population, commerce for 24.3 per cent, transport for 8.4 per cent, other services and miscellaneous sources for 31.7 per cent and agriculture for 0.6 per cent. Out of the 558 towns each with a population of 20,000 and above, 28 only are absolutely industrial. Out of these 28, Titaghar, Kolar Gold Field, Jamshedpur, Sholapur, Ahmedabad, Mettur and Bhadravati are well known. The remaining 21 are probably important on account of Cottage and Small-Scale Industries.

There is no difficulty to trace the growth of population in each of the 558 large towns and the remaining 2,460 minor towns and townships. But it is extremely difficult to trace the changes in the livelihood pattern of poulation in even half a dozen towns. The eightfold classification of the means of livelihood was adopted in 1951 census only. Some arbitrary principles have to be followed for grouping various subgroups of occupations in earlier census years and bring them to a basis comparable to that of 1951. Data regarding these towns are scattered in different district and state reports. We shall, therefore, study the livelihood pattern in 1951 in relation to the nature of growth of population during 1931-51. The hypothesis underlying this is that the changes in economy of the town determine the nature of the movement of its population. The movement of population in the past explains the present pattern of livelihood and indicates the future.

The growth of population since the beginning of the present century may be taken into consideration. Population in seven towns increased during 1901-51 by more than 400 per cent. The rate of growth in many towns during 1901-31 was not significant, while the rate of growth during 1931-51 was significant in most of the towns. Out of the present 97 relatively industrial towns 76 only were in existence in 1901 and 85 in 1931.

Out of these 85 towns existing in 1931, the population of 5 towns increased by more than 200 per cent. Because there were more towns in 1931 than in 1901, and because the growth during 1931-51 was more significant than in earlier decades., study of the growth of population since 1931 is preferred to that since 1901. The following table shows the distribution of towns according to the rates of growth of their population during 1931-51:

S. No.	Percentage rate of growth	Number of towns	Percentage of towns to total
1	2	3	4
1.	Below 30	6	7.0
2.	30 — 39	6	7.0
3.	40 — 49	10	11.9
4.	50 — 59	9	10.6
4.	60 — 69	7	8.2
6.	70 — 79	4	4.7
7.	80 — 89	5	5.9
8.	90 — 99	8	9.4
9.	100 — 109	6	7.0
10.	110 — 149	11	13.0
11.	150 — 199	8	9.4
12.	200 and above	5	5.9
	TOTAL:	85	100

There is no special reason for adopting the above groups of rates of growth. In groups 6, 7 and 12 there are a few towns.

The following table shows the livelihood pattern of population in different groups of towns:

S. No.	Percentage rate of growth of population	Production other than cultivation	Percentage of population with means of livelihood. Commerce and transport	Other services and miscellaneous sources	Agriculture	Total
1	2	3	4	5	6	7
1.	Below 30	37.7	23.9	20.6	17.8	100.0
2.	31 — 39	41.7	25.5	25.6	7.2	100.0
3.	40 — 49	41.5	25.6	24.5	8.4	100.0
4.	50 — 59	46.2	20.5	22.0	11.3	100.0
5.	60 — 69	41.0	26.7	24.0	8.3	100.0
6.	70 — 79	37.2	31.7	26.4	4.7	100.0
7.	80 — 89	49.2	20.3	22.5	8.0	100.0
8.	90 — 99	45.9	23.1	26.0	5.0	100.0
9.	100 — 109	48.2	22.9	26.7	2.2	100.0
10.	110 — 149	41.8	27.9	28.3	3.0	100.0
11.	150 — 199	46.7	24.7	25.5	4.1	100.0
12.	200 and above	53.3	17.0	20.2	9.0	100.0

Figures in cols. 3 to 6 are the averages of the towns in corresponding groups. Towns in the first group have a remarkably large percentage of population depending on agriculture. The growth of their population was not much. It appears they had practically no industrial progress and no immigration. Livelihood pattern in towns in group 3 is not quite different from that in towns in group 2. Towns in group 4 also have many persons having agriculture as means of livelihood. Probably many of those having non-agricultural production as means of livelihood were processing foodstuffs, fibres and products of the animal kingdom. It appears that the growth of population in towns in group 10 was facilitated more (or equally) by some increase in commercial, transport and other services than by the establishment and expansion of establishments of non-agricultural production. Local enquiries are essential fully to explain the conditions. It is also probable that progress in non-agricultural production leads to an increase in commercial, transport and other services. It appears that even in relatively industrial as well as in absolutely industrial towns improvement in services contributed to the growth of population.

It is too well known to explain that there is a relationship between the secondary sector of economy and the tertiary sector. Livelihood category 8 includes persons whose means of livelihood is public administration, health and educational services also. This category has no direct relation with non-agricultural production. A town with many government offices and schools may have just a few establishments of non-agricultural production. But the relation between production other than cultivation and trade and transport is intimate. We shall, therefore, examine the population in these three means of livelihood. The following

table shows (1) the population in production other than cultivation and (2) the total of population in commerce and transport:

S. No.	Town	Secondary	Tertiary
1	2	3	4
1.	Yadgir	5,859	5,983
2.	Sikandrabad	6,162	8,299
3.	Kovilpathi	8,944	8,967
4.	Damoh	11,532	13,268
5.	Gondia	11,881	14,155
6.	Trippur	18,879	16,817
7.	Ratlam	19,840	21,917
8.	Mirjapur	21,148	27,820
9.	Jhansi	33,857	35,336
10.	Tuticorin	35,817	36,620
11.	Moradabad	49,339	48,422
12.	Salem	92,418	50,381
13.	Surat	98,021	62,883
14.	Indore	128,320	71,519
15.	Madurai	140,639	94,389
16.	Howrah	143,939	158,889
17.	Kanpur	269,063	181,023
18.	Ahmedabad	409,597	193,942
19.	Bombay	994,102	929,311

We have selected these 19 towns with the purpose of understanding the relation between the two sectors. These towns fit into a straight upward curve. Thirteen of these are very important industrial towns, while the rest are small, probably typical of rural India. The above data show a strong correlation coefficient of more than 0.97. If Bombay is kept out, the correlation coefficient works to about 0.94. If Bombay and Ahmedabad are kept out, the correlation coefficient works to about 0.95. The correlation coefficient in the group of the first six towns, which are not well known, is a little more than 0.94.

The remaining 78 industrial towns show no relation between the secondary sector and the tertiary sector. The probable reason is that cottage and small-scale industries are of importance in those town. In such towns secondary and tertiary sectors overlap.

The upshot of the above analysis is that some towns are relatively industrial, while some of them are absolutely industrial. We may define the relatively industrial town as one wherein the number of persons whose means of livelihood is non-agricultural production is larger than that in any one of the remaining seven categories of the means of livelihood. We may define the absolutely industrial town as one wherein more than half the population have non-agricultural production as means of livelihood. It appears towns with a population increase of less than 30 per cent during 1931-51 did not have much industrial progress. In them many persons continue to have agriculture as means of livelihood. It appears towns with a population increase of 110 to 149 per cent during 1931-51 had considerable improvement in social services, besides industrial progress. In 19 out of 97 relatively industrial towns there is a strong correlation coefficient between the secondary sector of economy and the tertiary sector. In the remaining towns the two sectors overlap.

BOOK REVIEWS

COMPANY LAW

The Companies Act, 1956: T. R. Srinivasa Iyengar, B.A., B.L.: Madras.: Rs. 22-8.

This is a publication brought out by Mr. T. R. Srinivasa Iyengar, a leading advocate of Madras. There is a foreword to it by the Chief Justice of Madras. As has been mentioned in the Foreward itself, the book under review does not offer an exhaustive commentary on the new Company Law. The subject-matter has been so arranged as to include references to the corresponding sections of the old Act, as also the English Act of 1948. There is an exhaustive introduction which narrates how the new Act came to be passed. The publication also includes, by way of appendices, important extracts from the Company Law Committee Report, Companies Regulations, 1956, Central Government Rules and Forms, sections relating to the Central Government and its powers, documents to be kept by a company and to be filed with the Registrar, offences under the Act and sections relating to Private Companies.

It is most unfortunate that none of the books which have so far appeared on this subject, including the one under review has dealt with the new sections except in just a cursory way. In writing commentaries, it seems to be often forgotten that the new Act, which both amends and consolidates the law, contains several complicated provisions which require explanation and on which the company management is in dire need of light and guidance today. It is precisely by throwing some light on these dark nooks and corners of the Company Law that the commentary can help and, only to the extent that it succeds in this task, it makes the book useful and of practical value. Too often, the authors are content with quoting relevant extracts of the Company Law Committee and the Report of the Joint Select Committee.

Apparently because of the ready market for books on Company Law, a number of books on the subject have appeared. Several of them have little or no comments to offer on controversial sections which have baffled company managements, nay even the Company Law Administration. One would, for example, expect a well-informed comment on that tricky individual called an 'associate' of the Managing Agent. The vast number of relatives and the impossible task assigned to a director to find out who these relatives are and to keep a vigilant eye on their connections with the company on all matters have greatly bewildered those whose task it is to find a way out of this vast mass—or is it mess?—of legislation. What the company management wants to know is the exact implications of the term 'associate' of the Managing Agents.

Similarly, the provisions of Sec. 314 also require to be explained. Even a simple matter like whether, in computing the number of private and public companies of which an individual can be a Managing Director, private companies are to be excluded has not been answered by writers on Company Law as yet. Another question which has troubled company managements is whether contracts under Sec. 299 require to be placed before the Board for approval. The circumstances in which a person will be deemed to be a director of another company too need to be explained and elucidated. Again, take the question: when does a director become a Managing Director? The Act says that the conferment of any power of management would make a Director a Managing Director. In their many interviews with individuals and associations, those concerned with the administration of the Act have attempted to offer some explanation, which only boils down to this: "each case has to be judged on its own merits!" But, then, how long is one to wait because a public company cannot appoint a Managing Director without previous approval of Government? To wait for judicial decisions on the subject and then to incorporate them in the commentary would take years. Meanwhile, a learned commentator can considerably ease the task of business men by giving his own reasoned interpretation of the new provisions.

To say that the author of the publication under review has failed in this task is only to show that, so far, no commentator, including those of repute, has actually gone into this matter. Failure to do so means that publications of the kind go only to add to the number of ordinary books on the subject without being really useful. It is, indeed, time that somebody undertook the task of writing a commentary on the new Company Law with a view to helping the business man exactly on those points on which he feels a little lost at present.

THE SPIRIT OF OUR TIME

Spirit of Our Time: A collection of essays edited by Prof. Joginder Singh and Desh Raj Goel: Publishers Jiwan Prakashan, Delhi: Pp. 400: Price Rs. 10.

Independence and security — that is the spirit of our time. And that is the basic theme in this remarkable collection of 53 essays and discussions. Though written by different people at different times and in different contexts, and each essay being naturally complete in itself, a collected reading facilitates deeper understanding for there is a common thread running through the whole fabric. The authors inclue eminent thinkers in different fields like Jawaharlal Nehru, Dr. S. Radhakrishnan, Jaya Prakash Narayan, Ilya Ehrenberg, H. J. Bhabha, Philip Spratt. M. R. Masani and many others covering diverse, wide range. The subjects, brought within the covers of a single book, relate to all sorts of problems from politics to literature, from philosophy to administration, from science to religion, from economics to culture. In presenting this collection, essentially for intelligent students of contemporary affairs, the Editors seem to have the purpose of acquainting them with what is happening in the world around us and how various influences determine the shape of things. It becomes clear that, in order to make continuous progress, it is imperative to keep the mind open and not let it be obsessed with any one aim or course of action. In the essays the emphasis is on the importance of moral and ethical responsibilities of man if he is to emerge successful out of the crisis that the world of today presents.

Appropriately enough, the volume contains the bulk of articles either concerning India or what is applicable to India. To that extent it is highly useful to persons preparing for competitive examinations. It is, nevertheless, equally useful and stimulating for students abroad who want to keep in close touch with the latest currents in thinking. Rich in content, this new kind of anthology should find its place in all good libraries.

COMMERCE

Commerce — 1956 Annual Review Number: Published at Brady House, Veer Nariman Road, Bombay: Editor: S. V. Rayan. Pp. 220: Price Rs. 7-8-0.

This is the biggest Annual Number ever produced by our contemporary, 'Commerce' of Bombay. This bumper Number contains 48 special articles on a wide

range of subjects of current importance, besides a review of all aspects of Indian economy in 1956. Among the leading contributors are Mr. A. D. Shroff, Mr. Robert L. Garner, Mr. L. K. Jha, Dr. Chandrasekhar, Dr. P. S. Lokanathan, Dr. D. T. Lakdawala, Mr. C. H. Bhabha, Mr. H. M. Patel, Mr. S. V. Ramamurthy, Mr. P. N. Thapar and Mr. T. Viswanatham. The leading article is entitled "1956 in Retrospect". Mr. A. D. Shroff and Mr. Tulsidas Kilachand deal with free enterprise and India's economic philosophy respectively. Mr. Robert L. Garner, President, International Finance Corporation, emphasises that the attitudes and actions of State are important in the creation of conditions for development through private enterprise. Mr. L. K. Jha deals with machine-building industries. Dr. P. S. Lokanathan, in discussing the need for foreign aid, observes that India should not be apologetic in seeking it. Dr. Lakdawala analyses the Kaldor proposals for tax reform and rejects the ones for an expenditure tax and a tax on wealth as unacceptable.

Dr. Zahid Hussian, Chairman, Planning Board, Government of Pakistan, outlines the philosophy and basic features of his country's first Five-Year Plan 1955-60. Mr. B. T. Thakur analyses the causes of our financial and credit insufficiency. Mr. V. R. Sonalker discusses the question whether commercial banks should make medium-term advances to industries. Among the other subjects covered are: Private enterprise in the second Plan, External Resources, Cottage Industries, Branch Banking, Life Insurance Corporation, India's Public Debt, Indo-British trade, Russian trade offensive, Agricultural Taxation, Recent trends in Capital market, Road Transport, Chemical Industry, Coal transport, Rubber goods industry, Soap Industry, Water-power resources, Oil Industry, the new Company Law, Aluminium Industry, Engineering Industries, sugar industry etc. The subjects covered are so many that they can only be just mentioned in this brief review. As so much care has gone into the preparation of this valuable Annual Number, it merits equally careful study.

CAPITAL

Capital — Annual Review of Commerce, Trade and Industry, December 1956: Published at 5, Mission Row, Calcutta: Editor: George Barrell: Pp. 148: Price Rs. 5|-.

The latest Annual Number of 'Capital' containing feature articles on a wide range of subjects of topical importance, maintains its usual high standard and utility as a source of reference. Among the contributors are such well-known names as Joan Robinson, V. T. Krishnamachari, Geoffrey Tyson, Neil McInnes, Dr. V. K. R. V. Rao, P. R. Brahmananda, Tulsidas Kilachand, Naval H. Tata, P. C. Jain and Prof. B. R. Shenoy. Mrs. Robinson's critical piece finds the first place in the Number. It deals with the second Plan's approach to unemployment and contends that full employment is possible even within the short duration of the Plan if investment is made in correct techniques. In her view, "there appears to be a deep-seated contradiction in the conception of the Plan. On the one hand strong emphasis is laid on the importance of building up capital-good industries, and on the other hand conditions of surplus labour, which indicate restraint upon the installation of the capital equipment which those industries can produce, is expected to persist. The relevant question to ask is: How many quinquennia are to pass before full employment is reached and how soon will equipment begin to be produced?" The question may be embarrassing to the Planners, but it has to be answered.

Mr. Geoffrey Tyson deals with the European common market idea and the changing pattern of Commonwealth trade. Mr. Neil McInnes analyses the social costs of economic progress; in a highly thought provoking essay he spotlights the various kinds of conflict in an industrialising society like India's. Dr. V. K. R. V. Rao describes the foreign exchange needs of the second Plan. Prof. P. R. Brahmananda pleads for a revision of the second Plan so as to place greater emphasis on consumption goods. Mr. Naval H. Tata pleads for closer collaboration between public and private enterprise. Prof. B. R. Shenoy, in analysing the prospects of the second Plan, concludes that "if market prices must be restrained, the programme of investment under the second Plan must be revised downward so as to prevent further deficit financing. Alternatively foreign aid must be stepped up to match the gap in real resources." No review of this kind can do full justice to a valuable Annual Number which contains a wealth of articles. It would amply repay study.

WAGES

Wage Policy in Outline: By Sri R. G. Gokhale: Publishers: The National Institute of Labour Management, Bombay: Pp. 40: Price 12 as.

There is no gainsaying the appropriateness and timeliness of a pamphlet on wage policy, especially today when persistent agitation is going on by workers and their organisations for an upward revision of wages, and also when the problem of formulating a National Wage Policy is steadily looming up. The delicate vessel of Industrial Peace, which is of paramount importance for the success of our second Five-Year Plan, may well founder on the deceptive rocks of unsolved and insoluble wage disputes, if adequate care is not exercised in regard to this question. Nothing but a sound wage policy, based on a real assessment of the needs of the worker, on the one hand, and his precise contribution to industrial production on the other, as the author rightly observes, can ensure industrial peace. With the rich and varied experience he possesses, Mr. R. G. Gokhale, Chief Labour Officer to the Millowners' Association, Bombay, is among the very few in India who are competent to write dispassionately on labour problems. He is not just a Labour Officer but a keen student of several years' standing to boot of labour-management problems. By bringing out this pamphlet, he has, in a way, provoked the policy-makers, the industrialists and the trade unionists to turn their attention to the several aspects of this vital issue.

The pamphlet under review highlights not only the various important facets of the problem, but shows that the different theories of wages, like the Subsistence Theory and the Marginal Productivity Theory, do not even take account of the many factors involved in the formulation of a proper wage policy. Hence his terse thesis, to put it in a nutshell, that a wage policy, the formulation of which is by no means easy, should take into consideration several factors, such as the capacity of the industry to pay, the price policy of the Government, the productivity of labour, the kind of employment, the production plans, the human needs of the workers, and so on.

Even within the brief compass of a small pamphlet of but 40 pages, Mr. Gokhale has admirably outlined, in a very lucid and comprehensive way, an important and baffling problem such as wage policy. No earnest student of labour can afford to miss such a pamphlet.

The Business World

WILL THE U.K. TEXTILE DELEGATION FACE FACTS?

By

(CROESUS)

AS these lines are being printed, the UK cotton industry delegation, headed by Sir Cuthbert Clegg, will probably have begun its round of discussions with representatives of the Indian cotton mill industry in Bombay for the restriction of Indian cotton textile exports to the UK. It should be obvious to any dispassionate student of the whole gamut of Indo-British trade relations that this demand of Lancashire textile interests is hardly tenable, especially today, whatever may have been the justification for it at the time—there was none at any time, as far as we can see—the demand was originally made, namely in the second quarter of 1955. The utmost that could be said for the demand is that it is understandable, coming, as it does, from Lancashire, which once exported 3000 million yds. of cloth to India. Conditions have greatly changed and these changes must be accepted by all, as much by Lancashire as by India and the rest of the world. But Lancashire apparently is in no mood to do it, which is not only not realistic but is also not prudent.

What is at once intriguing and interesting is that almost the entire British Press—in particular the financial Press—has joined in this agitation and has been vigorously supporting the stand of Lancashire. Even the team of British editors who were recently invited to this country to study at first hand the working of our Five-Year Plans lost no opportunity to canvass Indian support to what they called a scheme of voluntary restriction by India on exports of her cloth to the UK. Evidently, the industry in that country, as also the British Government, has briefed the Press fully on the subject. This is rather in striking contrast to the strange silence that the mill interests—save for one honourable exception—the articles of Mr. Neville Wadia (but this in his individual capacity) in the 'Manchester Guardian'—and mill associations in our country, not to speak of our Government, on this undoubtedly vital issue. Not only have they not taken the Press into confidence—not that this was called for when the Indian case is an open book and also crystal clear—but they have consistently pleaded for, and have been responsible for, concession after concession to Lancashire interests, perhaps to keep in tune with the spirit of the old and memorable Mody-Less pact. It is because of the extremely reasonable and accommodating attitude of our mill interests and our Government that, first, even the preferential import duty on British textile imports into India was reduced sharply and, secondly, the quota restrictions were abolished, which had particularly beneficial effects on Britain's textile exports to this country. In fairness to the more understanding Britons, it must be mentioned here that Mr. Angus D. Campbell, who led a delegation to India early in 1955 to have a market survey of British textiles and to secure a reduction of Indian import duties thereon, went back fully satisfied and after expressing the hope—which has since nearly materialised—that Lancashire would be able to send between 10 and 15 million yds. of cloth to India. On the basis of figures of imports of cloth from the UK into India for the first ten months of 1956, it would appear that the UK's share in the approximate total imports of cloth into India of some 12½ million yds. will be nearly 10 million yds.

It is no doubt unfortunate for Lancashire that her position as a textile exporter to India has been reversed to that of an importer of Indian textiles. It is also possible that, to some extent at least, the Lancashire interests have suffered. But neither of these two facts can justify Lancashire's repeated agitation against imports of India's textiles, as though this was the only circumstance that has brought Lancashire to its present pass. Nor do the two facts justify Lancashire looking at this single angle, ignoring the Indo-UK overall trade picture and pattern. Also, just as in the case of the UK, any action that India takes is, and has to be, determined in the light of the economic situation as it develops from time to time. Presently, the Indian cotton mill industry has to face the competition of the State-favoured handloom industry at home and the keener competition abroad of not only old and resurrecting giants in the field like Japan and Germany but also new and vigorous entrants to the ranks of textile-manufacturing countries like Pakistan, Brazil, and Egypt. Being a member of the Commonwealth and bound by a mutual arrangement under the GATT of 1947, which we suppose is still operative, it is only natural for India to look to a relatively sheltered Commonwealth market like the UK for a reasonable increase in her textile exports. Notwithstanding all these, we concede that India cannot, and, indeed, must not, "dump" her textiles, as alleged, into the UK market and cutting Lancashire's own home market. But this does not seem to be the case. For Lancashire imports only coarse and medium grey cloth which is reprocessed and re-exported to other countries by the UK. This means that the imports of Indian cloth, far from adversely hitting Britain's economy, are actually assisting it, first by providing employment to Lancashire importers and her finishing trade and secondly by earning valuable foreign exchange for the UK. It is significant that finishing and importing interests have not joined in this agitation of Lancashire, which suggests that, if Lancashire restricts imports of Indian cloth, whether by law or by a voluntary agreement with India, these interests would replace Indian imports with Japanese imports. The anomalous result would be that, while avoidably displeasing a sister country of the Commonwealth, Lancashire would be inviting a definitely more powerful non-Commonwealth competition. These are glaring facts.

Now for a few fictions, which Lancashire interests have sedulously set afloat. We would particularly refer to the most glaring of these, namely that the Indian mill industry enjoys an "unfair advantage" or gets a "concealed subsidy" because of access to cheap home-grown cotton and low wages to its workers. These have been effectively exploded ere now, and that in the British Press itself, by Mr. Neville Wadia and, if only because of this, as also because we have termed these as fictions, we do not feel called upon to dwell upon them at any length here.

Finally, let us conclude and clinch this issue by quoting what a cable from London to our Calcutta contemporary has to say whilst announcing the visit of the Cuthbert Clegg delegation. Here is what that cable says: "Lancashire cotton circles—although relieved of many anxieties by the current boom on the home market and by the fact that Lancashire cotton textiles are now more competitive with Indian textiles—are still pressing for talks with India for the restriction of Indian textile exports to the UK." Perhaps they think it would be improper to call off the arranged for talks, notwithstanding the non-existence of even the alleged factors which prompted Lancashire interests to bring pressure at the highest level thus.

PREMCHAND HOUSE— AN EVENTFUL CENTURY

By

(CROESUS)

THE Private Sector has become the target these days of so much attack from several quarters, more especially official, that the spokesmen of Free Enterprise have almost ceased to speak of their past achievements and seem content to point only to their most recent concrete contribution to the economic prosperity of the country, namely, their role during the first Five-Year Plan. This is presumably done, in the belief, at any rate in so far as this generation is concerned, that seeing is believing. The tendency is greatly to be regretted, for, in the process, one may cease to hear any more about the great exploits of the giants in the business world of India of old, when Indians were still under foreign domination and could not have their own way. Some of these constitute the saga of Free Enterprise, of which, I dare say, even that great land of Free Enterprise, the USA, might feel proud, and which I have heard recalled with a rare gusto, yet devoid of anything bordering on vulgarity. Such has been the dignity and decorum of the private sector, but all this looks like being forgotten and the failings and foibles of only the few newly-turned rich with no antecedents or background are held up to justify making a scapegoat of the private sector as a whole.

These thoughts were prompted when I attended last Monday a reception at the Taj Mahal Hotel to celebrate the centenary of the well known firm of Messrs. Premchand Roychand and Sons. Among others, the story of the Premchand House demonstrates beyond doubt that Free Enterprise does not mean freedom to amass wealth by any and every means conceivable and that, without being content just to feather its own nest, Free Enterprise has always believed in raising the standards of living of everybody around. Otherwise, why should a young man from Surat intent on making a living for himself go all the way to Bombay, perhaps on a bullock cart—and not unlikely on foot for some of the distance at least—and think of reclaiming the sea years before the Government of the day thought of it? Or why should the father of Premchand Roychand, the founder of the House, have been so strict as not to countenance the first deal of his enterprising son until he was satisfied that the profit was "strictly legitimate"? Financial rectitude and business integrity were—and have continued to be—thus considered to be the essential traits of a successful business man. Nor could the business men of India of old be accused of narrow regional or communal considerations. If so, the Bombay University would not have had the city's greatest land mark of all times, the Rajabhai Clock Tower, not to speak of the University Library adjoining it, and the Calcutta University's cherished scholarship, the Premchand Roychand Scholarship. It requires men of vision and broadmindedness to make such munificent gifts as would last for generations. Giving away of money to good causes thus was as much the virtue of a successful business man as it was his vocation to make money.

It is, indeed, a good vocation to make money, but not all can make money, and fewer still can make money after once losing the last pie. It demands rare courage, presence of mind and confidence in oneself and in the futures of one's country to be able to do this. And all these were found in the great founder of the Premchand House in an abundant measure. It may not be known to many—not even to our most rabid left-wingers of today, who merely press for confiscation of all foreign companies—that it was this House that blazed the trail for repatriation of foreign-owned investments in India. The credit for arranging the purchase by Indians of the sterling BEST company of old goes to this House. The Premchands were, in fact, the first to start repatriating foreign-held utilities. Those who can take a dispassionate view would certainly not grudge this Houst tribute for singling out utilities in preference to the undoubtedly more lucrative trading, monofactorying or plantation companies. Since then, the Firm has been responsible for underwriting scores of corporate issues and handling some of the major flotations of recent years. A cursory glance of over a generation's record in this one sphere enables me just to recall such diverse issues as the financing of the Patiala Railway, arranging for improvement trust and municipal issues, of underwriting debentures and preference issues of the Ahmedabad Electricity Company, the Scindia Steam Navigation Co., the Bombay Steam Navigation Co., the Kesar Sugar Works, among others, and the handling of such big issues as the Rallies and the Hindustan Levers (to bring the last uptodate). It is not surprising that several Governments of the erstwhile Indian States vied with one another to enlist the services of this House.

Founder Premchand, I am told, used to be introduced to eminent foreign visitors by their resident countrymen in India as "the giant in the great share marina of the sixties". Few, if any, could have had the courage in those days to launch on what must have then seemed a wild goose chase but what was destined later on to be a great blessing to Bombay and yet create so much public confidence as to take the Rs. 100 shares to the dizzy heights of Rs. 8,000 per share! How many must have blessed Premchand Roychand to see so much of capital appreciation? There must have been as many who would have cursed him when these very shares fell to Rs. 80, although the worst sufferer was Premchand himself as he had a very large holding. But the true gentleman he was, he met his commitments to the last rupee of his life's earnings to that day. He was in his sixties then, when any other person would just have collapsed, but not indomitable Premchand who merely said: "I suppose I shall have to start all over again". And start he did again to recover the same eminence in his field as before and to leave for his successors who have been carrying on splendidly the old traditions of the House. His sons, Sir Kakibhai who did so much to consolidate and expand the business—and who is alas no more—and Mr. Maneklal have distinguished themselves by an unsullied record of work as brokers, financiers and investment experts. Today, the latter who shoulders the responsibility is ably assisted by his highly qualified son, the eighth direct living descendant of the family, Mr. Kishore Premchand. Well may any business house be proud of such long and illustrious record. And the secret of this success lies in the great adaptability to the changing conditions of the times. Mr. Maneklal pithily summed up this last week, when he met at a function, representatives of all those associated with his firm's business for the past so many years, when he said: "what is required today is adaptability to the new conditions. We shall continue to carry on the Firm's activities with the same traditional sincerity and integrity as we have done in the past". May the Firm flourish and live to celebrate many more centenaries.

IMPLICATIONS OF COMPULSORY DEPOSITS

By

(CROESUS)

FROM almost the start of the calendar year, generally, it has become a hoary annual for business men to bother themselves about the Central Budget. This year, however, the new Union Finance Minister has spared them this bother, thanks to the forthcoming General Election. Nevertheless, Mr. T. T. Krishnamachari cannot be said to have allowed business men to have a peaceful time of it. His surprise essay at tax-gathering no sooner than he took over the finance portfolio, as though to make certain that he has, in fact, done so, has left the commercial community in no doubt as to the nature of the budgets they can expect from him in future, assuming that he will be re-elected and re-appointed as the Union Finance Minister (about which, however, there is hardly any room for doubt, at any rate, as things stand today).

Oddly enough, it is not so much his new tax proposals as such as the new sub-section—sub-section 3—which he has added to Section 10 of the Income-tax Act that has given the jitters to the business community. It might seem to a casual observer that these fears are unwarranted, but anyone who takes the trouble to analyse the actual implications of the seemingly innocuous new sub-section will not fail to recognise the potential harm of this move not to the business community alone but to the country at large.

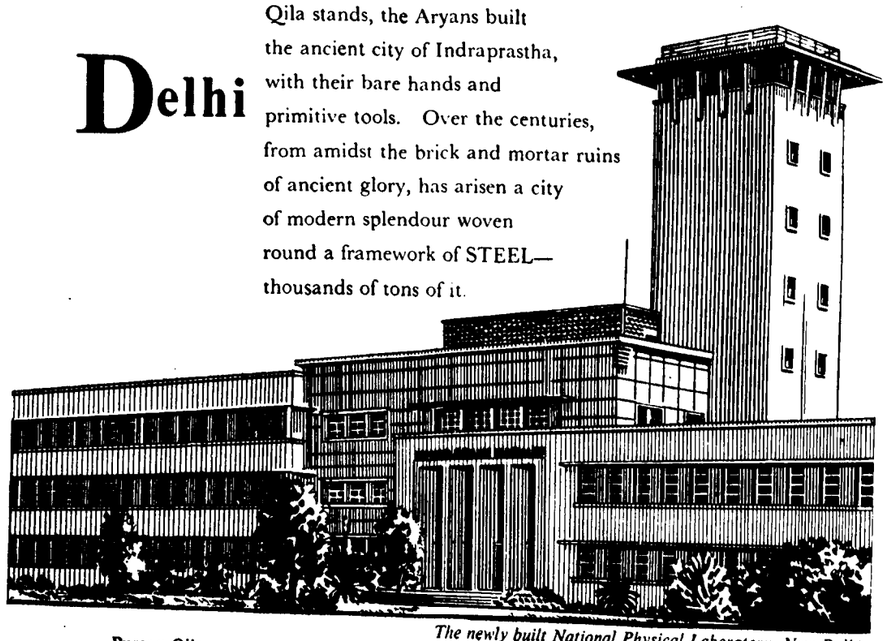
Broadly speaking, this new sub-section threatens to add back development rebate and depreciation allowances that are being allowed in the computation of the income of companies, unless the latter (the companies) deposit with the Government 25 per cent of the accumulated profits and reserves on a given date and 75 per cent of their assessable income as reduced by income and super taxes, dividends declared and one lakh of rupees, in each case, in addition to the sum of the several allowances made under the relevant clauses of section 10 of the Income-tax Act. The ostensible objectives underlying the above compulsory deposit proposal, in so far as such can be judged from the speeches of the Finance Minister, are to prevent the surplus funds of a company, if any, from being frittered away and to the extent that the funds are prevented from being so frittered away, to take them for financing the second Plan. No one can blame the Minister for this intention of his. But the question is whether, in the form in which the proposals stand at present they will achieve this innocuous objective, without, at the same time, adversely affecting the private sector. If companies with accumulated resources which are not represented by fixed assets are called upon to make a deposit as proposed, it is bound to give rise to a situation in which they will have to pay into the public exchequer whatever surplus resources they may have, even when these are required for their working capital from day to day and go to the open market to raise money for working capital. Even normally, such a situation would cause difficulties, but, at a time when money and credit are so stringent as they are now, the incidence of this compulsory deposit may create a crisis in the money market, notwithstanding the assurances of the Finance Minister at Calcutta that the provisions of the new sub-section would be administered very liberally.

It is well known that the scheduled banks are not in a position to cope with the heavy demand for funds today. They cannot simply afford to reduce the ratio of their cash balances to total liabilities further without grave risk to the credit mechanism of the country. They can only turn to the Reserve Bank for accommodation, which means that the companies deposit their money with the government at a given rate of interest, go to the banks to raise money that they require for their working capital by paying a very much higher rate of interest and the banks, in turn, go to the Reserve Bank, in the absence of adequate resources, for accommodation. In other words, the companies would be borrowing their money as it were and yet pay interest thereon! This is, indeed, a curious remedy to ward off the bogey of a supposed evil.

I have tried to assess the effects of the compulsory deposit proposals in respect of some companies, particularly cotton mills in Bombay. On a rough estimate, applying the results of my random sample to the industry as a whole, I find that a very large number of mills not only utilise their resources, wherever they have these, for financing the purchase of raw materials and stores but also borrow to an appreciable extent from outside to finance their purchase of stores and raw material. A reliable private estimate puts the number of cotton mills who have to borrow either partly or wholly to finance their purchases of cotton, dyestuffs, etc, at anywhere above 80 to 85 per cent. It is not difficult then to imagine what effect the concerted demand of all these mill companies on the banks would be, if they had to turn to the banks for financing the purchase of their essential requirements thus. It is common knowledge that mill companies generally hedge their sales of production by purchasing in the forward market their raw materials, in particular cotton. Many of them have to keep stocks enough to last them for at least three months, which would entail locking up of considerable funds. Furthermore, from past experience, it is found that cotton mills tend to concentrate their purchase of cotton, imported and indigenous alike, in the very month in which the deposits have to be made, namely June. The awkward embarrassment of these companies when they are called upon to foot two such heavy items of outlay at about the same time can well be imagined.

There is then the case of companies, in respect of which the proposed compulsory deposits have to be calculated on the position which prevailed anywhere between six months and a year, depending upon the period of their closing of accounts. Now it is quite possible that some of these companies may have already invested money, which is now liable to be deposited compulsorily, on some project or other. Perhaps if these investments are in conformity with the pattern of the second Plan outlay, the Government may be expected to take a liberal view of it and relax the provisions. But, then, what of companies whose investments do not fall in this pattern? To the extent such unfortunate companies have to pay deposits, it would only drive them to sell away whatever investments they may have and thereby further depress the investment market. Is it wise to risk this today, one may ask.

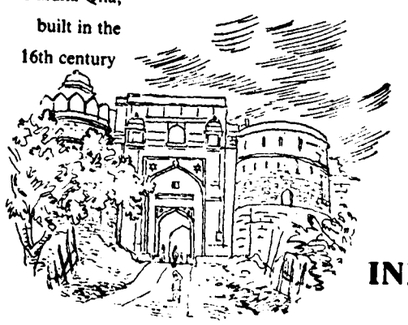
In view of all these difficulties, it is of the utmost importance that the provisions of the new sub-section should be used with the utmost care and sympathy, judging each individual case strictly on merits and not on the thumb rule of whether or no it comes within the purview of the second Plan. Even if it is assumed that this will apply only to manufacturing industries, as would appear to be the impression that official spokesmen seem to give, the first thing that should



be done is to exempt companies which have already launched on any schemes of plant rehabilitation or modernisation. It should be noted that such rehabilitation would not have been attempted, had the authorities themselves not given their approval. Secondly, in the case of even companies which have embarked upon projects which conform to the pattern of the second Plan, the rules should clearly provide that such companies must be exempted and, what is more, they should be allowed to deduct the provision for depreciation while calculating the surplus for the current year. Business spokesmen who may be expected to have given serious thought to the implications of the new sub-section are convinced that, if at least these concessions are not shown, the private sector would be hard put to it even to maintain production, let alone augment it. When inflation is peeping from the corner, as it were, it would be suicidal to do anything that would adaversely affect production, especially of consumer goods. Even if it is the intention of the Finance Minister to prevent a few people from making a wrong use of the funds of companies under their charge, should the entire private enterprise be subjected to such a severe blow, I wonder.

" Where now the city stands,

there was once naught but the city's site. " OVID



Delhi

It was eight centuries before the birth of Rome. On the banks of the Jamuna, where the Purana Qila stands, the Aryans built the ancient city of Indraprastha, with their bare hands and primitive tools. Over the centuries, from amidst the brick and mortar ruins of ancient glory, has arisen a city of modern splendour woven round a framework of STEEL—thousands of tons of it.

BUSINESS NOTES

PROSPECT FOR COFFEE

THE SPEECH of Mr. R. C. Paterson, Chairman of the Consolidated Coffee Estates (1943) Ltd. at the annual general meeting of the Company (extracts from which appear elsewhere in this issue) highlights the dilemma confronting the coffee industry today. It is a strange irony that even while reviewing with satisfaction the activities of the company during the year under review—the year constituted a record not only for the coffee crop harvested which for the first time since the inception of the company had passed the 2,000 ton mark but was also a record in regard to the gross profits earned—the Chairman should express considerable anxiety about the future and feel apprehensive that their very success may recoil on their heads. For one thing, there is always the possibility of interference in the price structure as well as increase in excise duties or reintroduction of export duty and for another increasing production costs that create a state of uncertainty from day to day. The Tribunal's award in Madras sanctioning an increase in wages to labour by as much as 70 per cent with retrospective effect for four years, though now before the Supreme Court, it is feared, may tilt the balance in costs heavily. But more important still is the report of the Plantation Enquiry Commission on Coffee to an examination of which Mr. Paterson devoted a considerable part in his speech.

The essence of the Commission's recommendations as the Chairman rightly pointed out lies in the fact that it contemplates nothing short of complete collectivisation of the coffee industry on a co-operative basis —co-operatives for the management of the smaller estates, co-operatives for the curing of coffee, co-operatives for the selling of estate supplies, co-operative warehouses, control even over the sale of properties, all managed under the aegis of the Coffee Board. The functions assigned to the Coffee Board are thus truly astonishing and it is anybody's guess how it can succesfuly undertake them. Mr. Paterson also dealt with one or two main accusations against the industry and explained how they were far from true, illustrating from the company's own record.

First of all, there is the question of replanting and the Enquiry Commission has stated that in regard to non-Indian companies 75 per cent of the area under coffee is in urgent need of replanting within the next ten years and 38 per cent in regard to Indian-owned properties and hence has recommended a complete replanting programme to be introduced on an industry-wide basis. In refuting this suggestion, which would mean that much of the area under coffee will be worthless within the next 10 years unless something is done about it, Mr. Paterson has shown from the record of the company that slightly over two-thirds of the mature acreage has in fact been replanted with new bushes in the past 13 years. Far from 38 per cent of their coffee being old and in urgent need of replanting over the next 10 years, most of the coffee seems to be virile and responding to the intensive treatment it has received. The Commission's contention that 40 years old coffee is past its peak and should be uprooted and replanted also seems to go counter to their experience because with proper attention, even 40 years old coffee can produce more than satisfactory crops. In view of this the suggestion for the building up of a general compulsory replanting fund to be lodged with the Coffee Board, which will not be required for many years ahead if at all or if made available could not be used, seems quite unnecessary and it is obvious that the freezing of funds in this manner would virtually amount to expropriation.

With regard to the charge that the coffee companies have been profligate in their financial policy Mr. Paterson has shown from the accounts of the company how it is far from true. The reserves of the company have no doubt been used over buildings and equipment of estates. But on that score it cannot be called a sterile asset because money spent on godowns and manure sheds and housing labour are legitimate expenditure. Also the land, which is the fountain from which all else flows, has not been neglected which alone explains the substantial increase in crops during the past few years.

Mr. Paterson also did well in pleading for an active export policy. The difference, he explained, in foreign exchange between a thousand tons of Plantation A exported and a thousand tons of Robusta is the equivalent of over Rs. 30 lakhs gain or loss. There is no reason why Indian coffee should not be given a chance to provide real financial help in the implementation of the second Five-Year Plan.

BALANCE OF PAYMENTS: APRIL-SEPTEMBER 1956

THE MAJOR conclusion which the Reserve Bank of India's analysis of the balance of payments of this country in the first half of the current financial year underlines is the swing which the deficit on current account took from Rs. 80 lakhs during April-September 1955 to Rs. 125.9 crores during April-September 1956. Taking into consideration the net capital account, the decline in the total foreign exchange reserves came to Rs. 129.5 crores. It is pertinent to recall here that the half yearly post-war peak in the deficit on current account was reached at Rs. 130.8 crores during April-September 1949. The character of the deficit in the first half of 1956-57, however, is radically different from that of the peak deficit. In essence, the current deficit has been incurred to finance imports for the development projects in the Plan.

Imports during April-September 1956 rose steeply to Rs. 476.8 crores which showed an excess of Rs. 122 crores over the corresponding period of the previous year. A quarterly break-up of the value of imports since 1955-56, the final year of the first Plan in which development activity got into maximum tempo, discloses a marked rising trend. Thus imports rose from Rs. 176 crores in the first quarter of 1955-56 to Rs. 246.6 crores in the second quarter of 1956-57. Exports, however, have not been able to register improvement. In the first six months of the current financial year they underwent a small decrease of Rs. 15 crores to Rs. 288 crores. This marginal decline was due primarily to a fall in the volume of exports which is obvious from the fact that while the index of value of exports remained steady at 90 during the first six months of the current and last financial years, the index of volume slided from 108 to 102. Imports of the value of Rs. 476.8 crores during April-September 1956 show an annual rate of Rs. 953 crores as against the assumption of Rs. 783 crores for the whole of 1956-57 made in the Plan. The austerity imposed on import licensing for the current licensing period of January-June 1957 is explained by these trends. Nevertheless, the improvement expected from import economies and export promotion will make but a modest impression on the payments position. This is not inconsistent with the estimate of foreign exchange for the second Plan. The gap must necessarily be filled by external assistance.

The region-wise position of the balance of payments on current account is set out in the table on the next page.

(Rs. crores)

	April-September 1956	April-September 1955
Sterling Area	— 21.5	+ 6.0
Dollar Area	— 0.7	+17.3
OEEC countries	— 94.6	—36.7
Rest of non-sterling area ..	— 9.1	+12.6
TOTAL	—125.9	— 0.8

OUTLOOK FOR BURLAP IN THE US

THE YEAR-END survey for 1956 in respect of the market for burlap in the United States reveals expansion of exports from India and reassuring prospect for the current year. Since 1948 which was the last post-war year of stockpiling activity at a high tempo in that country, the consumption of burlap was at its best in 1956. Demand had kept on increasing progressively during the last two years at a rate of about 7 per cent above the preceding year. Analysing the trends in American imports in 1956, the Vice-President of the Burlap Council of the Indian Jute Mills' Association emphasizes the fact that the higher levels of offtake represent a stable feature of the American market. The actual statistical position available for the period January-November 1956 shows that consumption was 53.4 million yards in excess of the consumption during the identical period in 1955. Aggregate consumption in the whole of 1955 was 825.2 million yards and it may be taken as an assured outcome that the figure for the complete year will show a comfortable margin of excess in 1956 above the previous year. A factor making for stability in American offtake of burlap is the behaviour of prices. At present levels burlap prices are competitive and free from violent swings of fluctuations. Over the year as a whole prices took a better turn from 10.3 cents per yard for spot goods of the standard 10 oz. construction in January to 12 cents per yard in December.

The value of the US market for the Indian jute industry springs not only from the prospect of acquisition of dollar exchange but from the position of this country as a supplier to the extent of 86 per cent of its offtake. Continuous flow of supplies and stability in prices are the determining factors in the expansion of Indian exports. Raw jute supplies for the manufacturing mills in India promise to be adequate, but it is somewhat early to suggest a forecast about raw jute prices. The general trend is to defer it until more accurate information becomes available. Nevertheless, it is a safe projection to advance that the popularity which burlap is recapturing will be maintained and further augmented. In agricultural packaging, there is an increasing demand from the feed industry while the 50 lb. burlap bag for potatoes is registering its appeal. Industrial textile consumers are showing increasing interest in burlap for packaging. Combined with this market is the success which the drive for new uses of burlap is achieving steadily. The overall outlook is one of a rising volume of demand.

A.I.M.O. ON ECONOMIC POLICY

AN EDUCATED electorate is the bedrock of democracy. Illiterate people, who are, for the most part, ignorant about the character of the national economy, are naturally liable to be carried away by ideological slogans which seldom correspond to reality. In India, where a majority of the voters know almost next to nothing about internal or international matters, the need to educate them, especially on vital economic issues, particularly at this "crucial moment" is very important. It is the paramount duty of all organisations to educate or make the masses well informed. This does not mean that it is the prerogative of only political organisations to prepare manifestos and present these to the voters. In a democratic set-up every organisation representing particular sectors of national life should endeavour and put before the people their respective view-points dispassionately and in a realistic way. The responsibility of organisations engaged in economic activities such as production, distribution, transport, etc. is all the greater as it is the economic policy of the country that forms the most vital issue today. It is in the fitness of things, therefore, that the All-India Manufacturers' Organisation which represents the industrial sector of the economy should have prepared and presented its own policy statement if not a manifesto, covering a wide range of economic issues, such as planning in democracy, the problem of foreign exchange, participation of labour in the management of industries, the question of employment, place of foreign capital etc.

More particularly, the A.I.M.O. economic policy statement deals, among other things, with three main issues which in our view, deserves serious consideration at present by the electorate and the would-be policy-makers alike. In the first place, the statement argues that, after the country has accepted mixed economy as "the solvent of the country's economic ills" it behoves both the sectors — private and public — to co-operate actively in the interest of the nation and its future progress and prosperity. Accordingly the A.I.M.O. welcomes the second Five-Year Plan with its new outlay of Rs. 7,700 crores, and what is more, unlike many other organisations, urges that this has to be carried through. This in the opinion of this organisation needs two things namely, incentives and adequate finance. While the latter can be had by adopting appropriate fiscal policy, it feels, the former can be provided by following such economic measures as do not lead to the "concentration of economic power in a steel-framed bureaucracy". Perhaps some more stress on this point would not have been misplaced here.

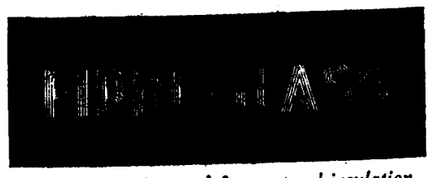
Secondly, in keeping with the other bodies, the A.I.M.O. also asks for a dispassionate re-appraisal of the role of free enterprise in the light of its performance not in the hoary past but in the most recent years, that is during the first Plan and the immense potentialities it has for the future.

Finally, the A.I.M.O. lays strong emphasis on preservation of democracy and the democratic way of life. "Democracy", says the Organisation, "in the present materialistic age, in which economic development plays a very important role in the life of nation should not only vest the ultimate political sovereignty in the hands of people but also vest **economic power** (emphasis ours) and wealth in the hands of the people at large". Unfortunately, many policies pursued by the Government of India not only lead to the accumulation of immense economic power in few hands but also to regimentation of free enterprise, thereby "crippling the economic growth of the country". Experience elsewhere bears ample testimony to the fact that concentration of economic power in the hands of those who already possess unlimited political power will not only lead to suppression of democracy but also sap individual initiative and enterprise and ultimately the human spirit itself which is held in high esteem in this ancient land of ours. In other words, if any warning were appropriate in the context of the trend one perceives today, it is that well-known saying that "power corrupts and absolute power corrupts absolutely".

A CORRECTION

STRUCTURAL ENGINEERING WORKS LTD.

In the issue of "The Eastern Economist" dated January 4, 1957 on page 29 at the end of the Chairman's speech the following note was not inserted due to oversight. The error is regretted. The speech should be read subject to the insertion of the note as follows:



"Note:—This is not a report of the proceedings at the above Annual Meeting."

We can solve your problem...

When at Bridge you've overbid your hand
And the highest in dummy's a "jack",
You can't just sweep away the cards
And start re-shuffling the pack.

if it is INSULATION

For heat, cold, sound & structural insulation

But FIBREGLASS *can* sweep away your insulation problems. Whether the trouble is thermal, acoustic or structural insulation, FIBREGLASS has the answer — in homes, factories, buildings and auditoria.

COMMODITY NEWS AND NOTES

MORE ACREAGE UNDER MAIZE

The All-India First Estimate of Maize for 1956-57, puts the current year's area at 8,223,000 acres as against the Adjusted First Estimate of 8,173,000 acres for 1955-56, according to the Directorate of Economics and Statistics, Union Ministry of Agriculture, Government of India. This shows an increase of 50,000 acres or 0.6 per cent in area over last year. A small increase in the overall acreage during the current year has been shared by Uttar Pradesh, Punjab, Hyderabad, PEPSU, Himachal Pradesh and Vindhya Pradesh and has been attributed to favourable climatic conditions at the time of sowing. The present estimate generally covers the period up to the middle of October, 1956. Till then, the condition of the crop was reported to be generally satisfactory in most of the States.

INCREASED PRODUCTION OF SUGAR

Production and despatches of sugar from indigenous factories amounted to 2.65 and 2.18 lakh tons up to December 15, 1956, in the current season, as against 1.91 and 1.87 lakh tons respectively in the corresponding period of the last year. The stocks with the factories on December 15, 1956, stood at 5.74 lakh tons as compared with 4.15 lakh tons last year.

INDIAN JUTE GOODS FOR EGYPT

India was the sole supplier of jute fabrics to Egypt during the first half of 1956 and also the chief source for the supply of sacks, according to the Indian Central Jute Committee. Of the total Egyptian imports of jute sacks and bags estimated at 10.5 million kgs. of the value of £E. 1.2 million during the first half of 1956, 8 million kgs. were of Indian origin and 1.5 million kgs. were French. During the same period of 1955, total imports were 9.8 million kgs. (£E. 1.1 million) of which 8.3 million kgs. came from India and 600,000 kgs. from France. Jute fabrics imported totalled 2.2 million kgs. (£E. 200,000) during the first six months of 1956. The entire quantity was imported from India, compared with the total of 3.1 million kgs. (£E 300,000) during the comparable 1955 period when 2.9 million kgs. were imported from India.

U.K. STAPLE FIBRE OUTPUT

The British output of synthetic staple fibre reached 23,300 lbs. in November beating the October total by 1,700,000 lbs. and nearly equalling the record of 23,600,000 lbs. reached in March. So heavy is the demand for staple fibre that some manufacturers cannot promise to deliver orders in less than 20 weeks.

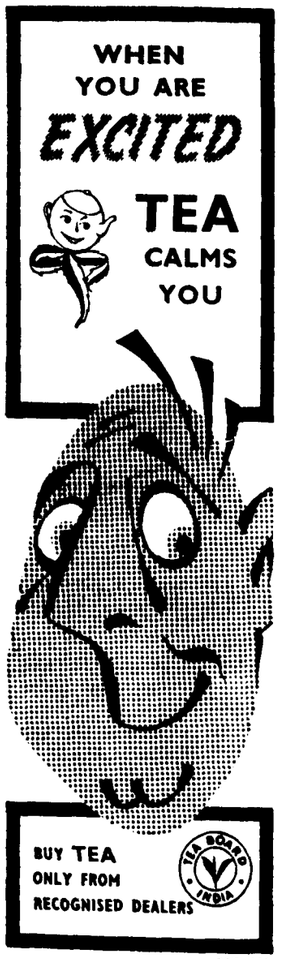
EXPORT OF CLOTH TO NEPAL

Export of all varieties of cloth marked for export other than the restricted varieties will be allowed freely to Nepal till June 30, 1957, according to a notification issued by the Joint Chief Controller of Exports, Bombay. The export licences will be valid only for export to Nepal and not to any other permissible destination.

GINGER EXPORTS

There has been a steady increase in the export of ginger from India. According to official figures, the value of ginger exported from India rose from Rs. 69.32 lakhs in 1954-55 to Rs. 90.85 lakhs in 1955-56. In the six months ended April to September 1956, exports amounted to Rs. 54 lakhs against Rs. 20 lakhs in the corresponding period of 1955. The main markets are the countries of West Asia, particularly Aden and Saudi Arabia.

RECORD SALT PRODUCTION



Salt production in India reached 119,00,000 maunds in 1956 the highest ever achieved by the industry, according to official estimates. India attained self-sufficiency in salt for the first time in 100 years in 1951. Since then, production began to increase steadily till 1954 when it declined to 74,000,000 maunds from 86,000,000 maunds in 1953. However, production improved in 1955 to 81,000,000 maunds. The industry now is not only able to meet India's salt requirements, but also is exporting it to foreign countries, Japan being the principal market.

CANADIAN IRON ORE RECORD

Iron ore deliveries from Canadian mines reached a record 19.1 million tons in the first ten months of 1956, a gain of 35 per cent over the previous year's ten-month total of 14.1 million tons. Iron ore deliveries have set consistent records in recent years as the pig Iron Ore Company of Canada's Ungave properties have started full production. Most of the ore was exported with shipments in the period under review up about 35 per cent to 17.4 million tons as against 12.9 million tons a year ago. Domestic deliveries also rose sharply increasing 44 per cent to 1.7 million tons from 1.2 million in the corresponding 1955 period.

AUSTRALIAN OIL SEARCH WIDENS

The search for oil in Australia will be extended to central Australia this year. Three permits have been issued by the Department of Territories for petroleum prospecting in the Alice Springs district. Prospecting activity generally will probably reach a new high in 1957.

COMPANY AFFAIRS

THE INDIAN IRON & STEEL CO., LTD.

The accounts of the Company have been prepared in accordance with the provisions of the new Companies Act, though they cover the year ending March, 1956, which was prior to the commencement of the new Act.

Two new items of Reserve—(1) Extensions Special Reserve and (2) General Development Reserve—appear in the accounts. The first amounting to Rs. 29,47,338, is in accordance with the requirements of the Government that the amount arising from the effective increase over the 1954-55 retention prices shall, after allowance for taxation, be transferred to a special fund to be utilised solely for the purpose of financing expansion programmes. The second is a transfer of Rs. 7 lakhs, representing the approximate tax saving by reason of the Development Rebate applicable in respect of plant and machinery installed during the year. Relative to the profits earned, the amount is small, but the Directors have thought desirable to institute the reserve in view of the large Development Reserve likely to accrue in future as the various stages of the expansion programme are completed. As in the previous year, a sum of Rs. 59.50 lakhs has been transferred to Plant Rehabilitation Reserve comprising the amounts of Rs. 52 lakhs for the Steel Plant Rehabilitation and Rs. 7.50 lakhs for the Kulti Blast Furnaces Rehabilitation to be set aside in accordance with the recommendation of the Tariff Commission.

After providing for depreciation (Rs. 1.20 crores), taxation (Rs. 2.88 crores), debenture interest and sinking fund, labour and staff benefit schemes, and all other charges as well as the reserve allocations mentioned above, there is left a balance of profit, for the year under review, of Rs. 2,50,18,391, and allowing for the usual dividend of Rs. 13,49,770 on preference shares, there remains an amount of Rs. 2,36,68,621. Out of this, Rs. 1 crore has been set aside for Works and Ores Mines New Extensions Reserve, and Rs. 85 lakhs transferred to General Reserve. Adding to the balance Rs. 4,64,401, being the amount brought forward, it totals Rs. 56,33,022. Having failed to obtain Government's approval to the proposal of raising the dividend on ordinary shares, the Directors have been obliged to recommend the previous years' rate of Re. 1 per share or 10 per cent. The ordinary dividend will absorb a sum of Rs. 51,83,708 and the balance of Rs. 4,49,314 is to carried forward.

The production figures of the Company's Burnpur Works Iron Section and Kulti Works for the year under review, show marginal decreases in pig iron, coke, coal raisings, coal tar, sulphuric acid and sulphate of ammonia, as compared to the previous year. In castings, however, there is some increase. Despatches of iron, excluding that used in the Company's own foundries have registered an increase in export and local, while for steel making there is a decrease. In the case of steel ingot production is higher while saleable steel is lower than the previous year. Despatches of steel bars, black sheets and rails are more as compared to 1954-55 figures, but of other items like structurals, galvanised sheets, blooms and slabs and billets, the figures are slightly lower than those of the year before.

Steady progress was maintained on all sections of the 1953 extensions and work is proceeding according to schedule. As a part of the country's programme for the increase of steel output capacity under the second Five-Year Plan, the Company's Directors have approved a further expansion of Burnpur Works to a yearly output of one million tons of ingot steel and financial arrangement to cover the cost were in process. It will be remembered that recently the World Bank sanctioned a very large loan to the Company for its expansion programmes. The commencement of production of large diameter spun cast iron pipes up to 27 inches diameter, at Kulti, is expected in the second half of this year. The initial expansion is expected to raise the capacity from 4,500 to 12,000 tons of pipes per month and finally to 20,000 tons per month.

THE ASSOCIATED CEMENT COS., LTD.

The Company's working for the year ended July, 1956, after meeting all expenses of operation and management, and after allowing for depreciation (Rs. 1,33,64,493), taxation (Rs. 1,16,99,000) and bonus to employees, shows a profit of Rs. 2,53,38,245. This shows a marginal increase of Rs. 2.68 lakhs over the previous year's figure, even though the salaries and wages bill as well as the cost of raw materials, etc., have also gone up slightly as compared to the previous year. The sales of cement for the year have also registered a rise from Rs. 21.23 crores in 1954-55 to Rs. 22.13 crores in the year under review.

Together with the previous balance of Rs. 5,62,770 brought forward, the profit amounts to Rs. 2,59,01,015. Out of this, the appropriations made are: (i) general reserve Rs. 7,37,500; (ii) reserve for plant reinstatement Rs. 55 lakhs; (iii) development reserve Rs. 32 lakhs; (iv) reserve for deferred taxation Rs. 19.15 lakhs and (v) reserve for gratuities Rs. 15 lakhs. That leaves a balance of Rs. 1,30,12,515, from which the Directors have recommended payment of a dividend, free of income-tax, for the year under report, at the rate of Rs. 10 per share absorbing Rs. 1,27,18,547. The balance of Rs. 2,93,968 is to be carried forward.

From July, 1956, the Government of India introduced State trading in cement, and from then on, the entire production of the cement industry is being acquired by the State Trading Corporation, with each producer allowed a fixed price per ton, ex-works. In the case of this Company, the price is Rs. 54-8 per ton exclusive of packing charges and excise duty. The production of the Company is being marketed by the Corporation through the selling agents of the Company, M/s. Cement Marketing Co. of India, who have been appointed selling agents for cement at a remuneration of Rs. 1/8 per ton. Despatches of cement last year were 28.22 lakh tons (including 16 months' despatches of the Bhupendra Works) as against 29.62 lakh tons this year. Production costs increased appreciably during the year as a result of increase in labour charges, coal, royalty, etc. The Company's efforts in improving efficiency are thus being largely offset by increases in costs over which it has no control.

The construction of the new Cement Works at Sindri was completed during the year, and the first unit with an annual capacity of one lakh tons per year was commissioned in September, 1955, and a second similar unit in December the same year raising the capacity of the works to two lakh tons. Expansion and development work at other factories progressed satisfactorily throughout the year which is expected to deliver in due course. Also, the Company has made a beginning with its plans for supply of bulk cement at construction sites in Delhi by the installation of a bulk cement depot.

Company Meeting

THE CONSOLIDATED COFFEE ESTATES (1943) LTD.

Extracts from the Chairman's Speech delivered at the Thirteenth Annual General Meeting of the Company held on 29th December, 1956.

Gentlemen,

On behalf of the Board of Directors I welcome you here today on the occasion of the Thirteenth Annual General Meeting of the Company. The year has been a most successful one and it constitutes a record not only for the coffee crop harvested, which for the first time since the inception of the Company has passed the 2,000 ton mark, but it is also a record in regard to gross profits earned. Cardamoms have proved a satisfactory source of revenue. Pepper produced an average crop and we have now sold most of the balance stock in hand at prices slightly above valuation. Revenue from Oranges has more than doubled. Our paddy crop harvested was a good one. Our entire production as in the previous year was retained as a strategic reserve for issue to our labour in case of need.

Our accounts this year are presented to you in a different form so as to comply with the regulations of the new Companies Act. You will notice that a very considerable increase in Provision for Taxation has been necessary. Now that Coorg is part of Mysore State reservation has been made for Agricultural Income-tax at Mysore rates. Not only is the standard rate for companies As. 5 in the rupee as against As. 4 in Coorg but total Depreciation Allowances are also less. No special depreciation allowance is now granted as was the case under the Coorg rules. Provision for Indian Income-tax is also much higher due to the incidence of the Bonus Issue Tax and Dividend Tax in regard to the business portion of the Company's profits.

No settlement has yet been reached regarding the structure of the basic price. The present system of marketing if anything exaggerates fluctuations in coffee prices. We are always faced with the possibility of interference in the price structure as well as increase in Excise Duties or reintroduction of Export Tax on the one hand and increasing production costs on the other. We do not therefore known how we will stand from one day to the next.

Two items of vital importance to the future of the Coffee Industry have recently been brought pertinently to our notice. You will no doubt have heard of the recent Madras Tribunal Award, which not only granted an astronomical increase in rates of pay to subordinate staff but awarded an increase in wages to labour as much as 70 per cent with retrospective effect for 4 years. Although Coffee Estates in Coorg are not directly affected by this award its indirect impact is immense.

In November the Report of the Enquiry Commission on Coffee was placed on the table of the Lok Sabha in Delhi. Its final recommendations however are obvious and are nothing more than the complete collectivisation of the coffee industry on a co-operative basis....under the aegis of the Coffee Board. Little thought would appear to have been given as to how the Coffee Board can undertake such a colossal programme. The report has castigated all the larger interests—the planters; the curers—in special measure; the merchants; the traders in fertilisers and even the Coffee Board itself. Some of the suggested opportunities for malpractice are so far-fetched as to be absurd.

This is not the place for me to defend general accusations against the industry as a whole, but in the light of the aspersions made it would be my duty to give you a picture of how our Company stands in relation to the claims made in the Enquiry Commission's report. It has been stated that Coffee Companies have been profligate in their financial policy and have frittered away their resources in large dividends which have been concealed from their real worth by Bonus Issues.

Our position as at the closing of the books is that 96.3 per cent of the Ordinary Capital is owned by Indians. There are today 1952 shareholders on our Ordinary Share Register, the largest individual interest being 22,500 shares. The average is 366 per shareholder. In acreage for coffee this works out to about 3½ acres per head. If ever there was a co-operative undertaking in the real sense of the word it is your Company. The Directors are two-thirds Indian and one-third European. The covenanted staff comprise 8 Europeans, of which 3 only are Senior Managers, and 13 Indians, of which 4 are Senior Managers. Since the Company was formed in 1943 the division of our profits has been as under:

Total Gross Profits	.. Rs.	2,08,56,995
Allocation to Reserves	.. „	84,73,821
Ordinary Dividend	.. „	74,19,952

Preference Dividend, Taxation and Carry Forward account for the balance. I do not think that by any standard it can be claimed that our dividend policy has been other than most conservative.

The Enquiry Commission have stated that in regard to Non-Indian companies 75 per cent of the tea area under coffee is in urgent need of replanting within the next 10 years and 38 per cent in regard to Indian owned properties. The Commission has further recommended that a complete replanting programme be introduced on an industry-wide basis and to finance this a special fund be created with a compulsory contribution of Rs. 37-8 per acre per annum to be surrendered to the Board which will be refunded as and when replanting takes place.

If we take into account what the previous owners did in the way of pest control and also the 246 acres of immature coffee that was handed over by them in 1943, I would venture to suggest that far from 38 per cent of our coffee being old and in urgent need of replanting over the next 10 years, most of our coffee is virile and responding well to the more intensive treatment it has received. I would also question the Commission's sweeping conclusion that 40 years old coffee is past its peak and should be uprooted and replanted. Certainly that is not our general experience. With proper attention even 40 years old coffee can produce more than satisfactory crops.

It may be agreed that the ideal is to own young coffee but that is a very different question to the destruction of profitable old coffee. Many think that we are in our infancy in regard to knowledge of coffee plant and I am firmly convinced that the problem is not one that can at all be dealt with on mass production lines. The building up of a general compulsory replanting fund to be lodged with the Board, which will not be required for many years ahead if at all or if made available could not be used seems to me to be quite unrealistic. According to the Enquiry Commission's recommendation it would appear that your company would have to contribute to this Fund some Rs. 2½ lakhs a year. The build up of this over a few years would be quite fantastic. It represents further an initial expenditure on something like 250-300 acres per year if not more, an acreage which under no stretch of ordinary circumstances would be possible for the Company to undertake even if a replanting programme on such a scale was necessary. Such freezing of funds would almost have the equivalent effect of expropriation.

The Battle for Energy

THE New Year has begun well, at least on one war front—the Battle for Energy. Trombay, rightly hailed as a victory for Free Enterprise, has brought into play, ahead of schedule, 100,000 k.w. with another 100,000 to follow in the year. Since action and reaction must be deemed to be equal and opposite, the public sector has responded with the promise of 123,000 k.w. from Hirakud before April 1 and a doubling before 1958. Progress on power projects has thus been well sustained in both the private and the public sectors, at least so far as electricity is concerned. It is important to remember, however, that electricity still provides, so far as primary energy is concerned, less than a tenth of the coal equivalent of our total energy demand. Electricity contributes even less at the present time than petroleum products and, as far as one can see, electrical energy will always take third place in the energy race. It is important, therefore, that we should not look upon our new electrical power stations as major solvents of the steeply rising demand for

primary energy. Nor does atomic energy, a unit of which is being formally inaugurated on January 20 by the Prime Minister at Trombay, alter the character of the energy problem of our generation. The mighty atom has not yet acquired a footing in the Indian commercial field.

Partly because coal is the most important element in "commercial" energy, one can hail with satisfaction the news published this week that a recent Geological Survey of India disproves the pessimistic estimates of reserves in the Raniganj coalfields made in 1928. The latest survey in regard to this coalfield shows that there is no danger at all of a quick depletion of our coking coal; current proved reserves are over 13,000 million tons, twice the 1928 figure. And as proving goes on, the reserves will certainly rise. This is so significant a conclusion that it might lead to further complacency and criminal waste by utilisation of coking coal for railway engine boilers. Provided this major error is avoided, one can look on the present information with nothing but gratification. It is clear now that India has all the materials for an almost unending steel industry at some of the world's lowest prices on all basic raw materials.

Unhappily the discovery of new coal reserves does not solve the immediate energy problem. The utilisation of the new coal requires new investment on a scale which does not look as if it can take place in the second or even the third Five-Year Plan. It is this consideration which makes oil—the residuary and most mobile fuel—the most substantial basic element in filling the gaps in energy demand which are likely to appear in the next fifteen years. This point comes opportunely. Since the elements of oil demand and supply are so little understood in the country, Burmah-Shell has done well to issue this week for public study some substantial information on the character of recent demand and supply, particularly as it affects this company's operations. So far as the Indian Union is concerned, the demand for oil products would appear to be rising now at the rate of about five to seven per cent on petrol, about 13 to 15 per cent on kerosene, 12 per cent on high speed diesel oils, and 42 per cent on bitumen. This complicated diversified picture might, perhaps, be simplified by saying that one might expect oil consumption in India to double over the next seven years, as, indeed, it doubled between 1948 and 1955.

The fact that the oil demand picture has become so clear now places a firm responsibility on the Planning Commission and the Government of India to arrange supply in a manner that these demand figures, which if anything represent a floor, are matched suitably on the supply side. Therein lies the rub. Unhappily, oil finance, as well as oil pricing policy, has been the subject of so much controversy that it is becoming impossible to avoid a political or, at least an ideological slant in approaching the supply problem. The Ministry of Natural Resources is not the only victim of political myopia generated by an overdose of oil economics. There is widespread misunderstanding in both official and non-official circles of the character of oil investment and of oil profits. Conditions naturally differ from company to company; some companies are more affected than others by the risks of exploration. It is significant, however, that even when "risk" provision is not being made for exploration, as in the case of the Burmah-Shell Oil Storage and Distributing Company of India Ltd., the net profits, whether on capital employed or on total trading receipts, are not higher than in any normal business in the Indian Union.

For example, in the case of the Burmah-Shell Oil Storage and Distributing Company of India, the total trading receipts in 1955 were Rs. 106.53 crores. Earnings in India on this figure were Rs. 3.52 crores after payment of taxes, or only 3.3 per cent of the total trading receipts. Incidentally, of these receipts, 29 per cent were paid into Government accounts, and only 35.8 per cent represented the f.o.b. value of oil. Put otherwise, the earnings of the company for the period 1949 to 1955 were 57.95 crores; the net earnings after taxes were Rs. 23.03 crores, significantly less than the figure of Rs. 28.84 crores for Indian taxes. Not only has the whole of the figure of net earnings after taxes been re-employed in the business, but this particular company has had in these five years to obtain from external sources additional capital of Rs. 8.93 crores. Thus, nothing has been taken out of the country by this foreign company since Independence and, indeed, this oil company has, in the last eight years, more than doubled the value of its Indian assets which stood at 1949 at only 21.56 crores by "total" reinvestment of its earnings plus new capital from abroad.

Whether or not the price of petrol is appropriate must be judged in terms of circumstances such as these. Surely, however, the most significant element in the price of oil today within the control of the Government of India is the figure for taxes which, as has been said before, are 29 per cent of receipts. It might be added that internal freight represents another substantial element of Government earning in the distribution picture. Whichever way the figures contained in this study are read, it is the Indian public sector which is the main beneficiary of the operations of the oil companies; to what extent will be a matter of surprise to most persons, even those reasonably conversant with oil problems. There should be no dispute on the place of the private sector here. Its net profits are only one-eighth of the public sector's haul.

In view of these facts it should be obvious the question of oil supply is not an ideological one. On the face of it, the foreign private sector's operations in oil have been strongly in the national interest, bringing in foreign money into the country and revenue on a phenomenal scale to the Government. The rates of profit, whether on capital employed or on turnover, are also shown to be so reasonable that a great deal of the "oil debate" must now be deemed redundant. It is sincerely to be hoped that, now the facts have been presented in the clearest possible manner, the true challenge in the battle for energy, which is the matching of steeply rising demand with equally rising supply will be undertaken in a spirit of earnest attack on the bulging energy gap. The Battle of the Energy Bulge will last for many years. Is it not time we had a strategy for its containment?

Indo-Pakistan Trade

THE negotiations for a fresh trade agreement between India and Pakistan which started here on Tuesday this week have evoked considerable interest not least because of alarums elsewhere. There is a strong current of feeling, quite noticeable in official and business circles in both the countries, that a determined effort must be made to put trade on a stable and expanding base. The conviction is even gaining ground on both sides that trade must steer clear of political whirlpools and in course of time assist relations between the two countries in other spheres. The significance which the two governments attach to the current negotiations is apparent from the strength of their delegations.

The frontiers of the two countries do not follow any natural demarcation. In this respect their division closely resembles the division between Canada and the United States. This parallel should set the pattern for Indo-Pakistan trade. In spite of their legitimate aspiration to widen the horizon of their commerce, the basic need to develop good neighbourly relations in this vital field cannot be ignored. Evidence of this attitude is to be found in dissatisfaction on either side with short-term agreements of one year which neither ensure continuity nor remove uncertainty. In his inaugural address Mr. Abul Mansur Ahmed, leader of the Pakistan delegation, made a timely plea to aim at a three-year pact. It gives concrete expression to the changing attitude.

The current agreement was concluded against the background of Pakistan's tight foreign exchange position. But the revision of the par value of the Pak rupee which coincided with its formal commencement was expected to remove a real impediment to trade and give a stimulus to it. This expectation was not realised. During 1955-56, the total value of Indo-Pakistan trade rose to a little above Rs. 35 crores in spite of the fact that an omnibus provision in this pact permitted automatic validation in the two countries of all export-import licences for non-dollar area irrespective of the fact whether or not the commodities were specifically included in the agreement. Considering the fact that the value of trade ranged in the neighbourhood of Rs. 28 crores in the two previous financial years during which a stalemate prevailed in the absence of a general trade agreement, the level reached last year hardly marked real progress. In the first half of the current year 1956-57, trade flowed at a still lower annual rate of Rs. 23 crores.

India has a traditional adverse balance of trade with Pakistan which was erased only once in 1952-53. Last year her offtake of raw jute, hides and skins, and fish and eggs was the highest since 1952-53. But except for coal and chemicals, drugs and medicines, Pakistan's imports continued to decline. This decline was conspicuous in the case of cotton textiles. There is a facile tendency in this country to attribute the overall decline to a political twist supposed to have been given by Pakistan to her trade policy vis-a-vis India. Political relations no doubt produced a certain strain on trade. But there is little appreciation here of the strides which Pakistan has made in industrial expansion part of which impinges on India's export industries. It is, however, true that in her attempts to diversify the pattern of her trade, Pakistan placed reliance on the technique of single country import licences in pursuance of her bilateral agreements with certain countries. Its impact on India could not be regarded as abnormal.

Industrialisation and diversification as planks influencing the trade policy of Pakistan follow the universal post-war trend in underdeveloped regions. India herself presents a case in point. While the pattern of trade must inevitably undergo change everywhere, higher volumes which are implicit in developing economies should provide room for adjustments. The current trade negotiations are being held in an atmosphere which is propitious for renewal of expanded trade. Pakistan's general balance of payments position which took a decisive turn for the better in 1955 with a surplus of over Rs. 28 crores has since been improved. A new element has entered into the situation with the Suez crisis. It has exposed the vulnerability of external trade to a potential source of uncertainty and stressed the relative gains in the long run in strengthening trade relations with neighbouring areas where these are immune from abrupt and violent upsets. The import policy of Pakistan for the shipping period of the first half of 1957 has reduced single country licensing to the solitary exception of France. The area of co-operation in trade certainly admits of enlargement. Happily both the delegations have shown a realistic attitude for a better understanding in their enlightened self-interest.

The course of balance of trade between India and Pakistan over the last nine years represents the basic pattern. It is not argued on behalf of this country that a nice equilibrium in the two-way traffic should be the objective of the bilateral pact. India aims at relative sufficiency in her raw jute production and her target of 5.5 million bales at the end of the second Plan frankly concedes the necessity of imports of the order of 1.7 million bales. Hides and skins, fruits, vegetables, fish, eggs and seeds represent a variety of the imports she obtains from Pakistan. India's contention in respect of the selective export duties on raw jute, which in effect throw a real burden on her, needs to be redressed. It should be possible for her to agree to an offtake of rock salt if in return accommodation is made for export of sea salt to East Pakistan or the ban on re-export is removed.

But, by and large, the negotiations now under way will have to arrive at a reasonably exhaustive schedule of imports into Pakistan. Coal is Pakistan's major import for which a competitive alternative source of supply is not available. But its value which does not normally exceed Rs. 3.25 crores underlines the necessity of adding definite items. Fine and superfine varieties of cotton textiles, worsted fabrics in a limited measure, art silk fabrics, sugar, hydrogenated oil, a range of engineering goods particularly for East Pakistan, hardware, soap and toilet requirements should find a place in the new agreement. It would be in the interest of traders if yearly quotas are prescribed to indicate the magnitude of demand. Border trade on the eastern frontier has been freed for holders of A Category visas and it may be presumed that its scope, at present severely restricted, will be liberalised. In fact the two Bengals reiterate the complementary nature of the economies. It is time the principle of mutual benefit was applied to the whole sub-continent.

Amalgamation in Haste

THE principle of amalgamation of small collieries into sizable units is no longer in dispute. The question has been debated in this country for over thirty-five years. The need to take positive action for amalgamation was hardly appreciated before with a sense of urgency that is being displayed now in the context of scientific planning and development for intensive exploitation of resources to satisfy the fast growing demand. The Committee on Amalgamation of Collieries was charged with the task of preparing a scheme of integration, which, while removing the impediments to planned development raised by the continuance of small units, would keep clear of pitfalls of possible upsets in the working of the industry at a time when it is called upon to undertake an ambitious programme of expansion. It will be bold to say that the Committee has acquitted itself well of its charge.

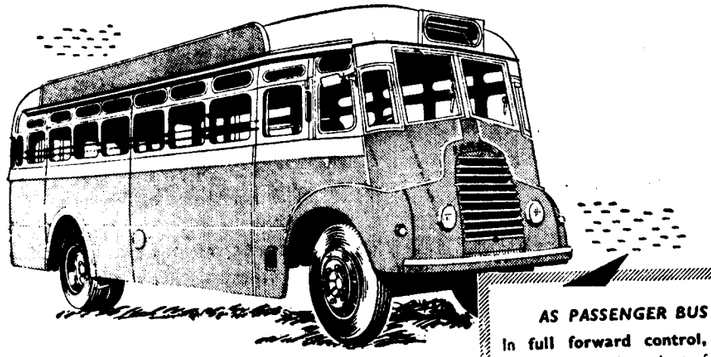
In its enthusiasm for amalgamation on a bold scale at one stroke, it would appear, it has paid less than due consideration to the overriding necessity of ensuring minimum dislocations of transition which coincides with an important phase of the industry's expansion. It has frankly recognized the inevitability of amalgamation by legislative compulsion in a majority of cases. The only instance where this technique was attempted is provided by the United Kingdom. There, however, it was tried over long years with methods far less drastic than those recommended by the Committee. But it failed and nationalisaton came to the rescue. The drawback of the Committee's plan consists, in essence, in the criteria laid down for the minimum size of units and in the failure to tackle realistically the problems of financial resources.

The Committee has fixed the optimum size of collieries on standards which are high in the Indian context. The minimum requirements for a colliery to exist as an independent entity, as recommended, are output of 10,000 tons per month, area of 100 acres and reserves sufficient to last for 50 years. On these tests, 666 collieries out of a total of 734 in Bengal and Bihar, to which the enquiry was restricted by the Committee's terms of reference, will come in for amalgamation. The Committee has attempted a statistical investigation into the problems of small collieries, which, incomplete as it is, is confined to collieries with a monthly output of 2,500 tons or below. There is no indication whatsoever in the report that it was in possession of information relating to collieries producing between 2,500 tons and 10,000 tons per month. The views of experts tendered before it on the area, shape and output for units of proper size are widely divergent. It is difficult to comprehend why it has made a categorical commitment on a minimum output requirement of 10,000 tons.

Two notes of dissent appended to the report cogently argue the arbitary nature of the proposed limit regarding output and highlight the fact that output is conditioned by extraneous factors—demand and availability of transport. The concept of small collieries has not been defined. Nevertheless, under conditions obtaining in this country the limit of output of 2,500 tons per month would appear to be acceptable as the first stage in amalgamation. The trend of the departmental classification for the purpose of administering the Mines Act and the Indian Coal Mines Regulations is to treat units with output in excess of 2,500 tons in one category. Any criticism of woeful lack of technical management has little application to collieries producing more than 2,500 tons inasmuch as they are placed under an obligation to engage persons with first class colliery manager's certificates of competency. The primary tests to be applied in the determination of proper size would really be those relating to reserves and area. A rigid insistence on output is most certain to introduce a large element of complexity in the implementation of a fair and workable programme of amalgamation. Even as it is, with a floor of 2,500 tons of output, 495 collieries accounting for one-sixth of the production in the two major producing States will be covered by integration. It is not as if the larger collieries will be immune from the effects of amalgamation. The Committee has made the candid and most significant observation that amalgamation and adjustment of boundaries will affect almost all collieries and particularly the 664 units in the strategic coalfields at Jharia and Raniganj.

The weakest part of the report is the one which purports to deal with finance for the amalgamated units. The formula approved for compensation to amalgamating units bears technical scrutiny. But even if its propriety or otherwise is left out of consideration, it should be obvious that the Committee is treading on very unsure ground—for lack of adequate data, of course. In case certain collieries to be merged refuse to participate in the amalgamated units, as many would choose to do, the remaining colliery owners are to be called upon to pay compensation to the non-participants, or failing these, third parties are to be invited. As a last resort, the Government is to step in, ignoring the plain fact that the share already assigned to the public sector in this industry is much larger than its allotted resources can absorb. The problem of finance does not end with payment of compensation. Amalgamation will not have justified itself unless the integrated units take to exploitation of deeper virgin seams now left alone by small owners.

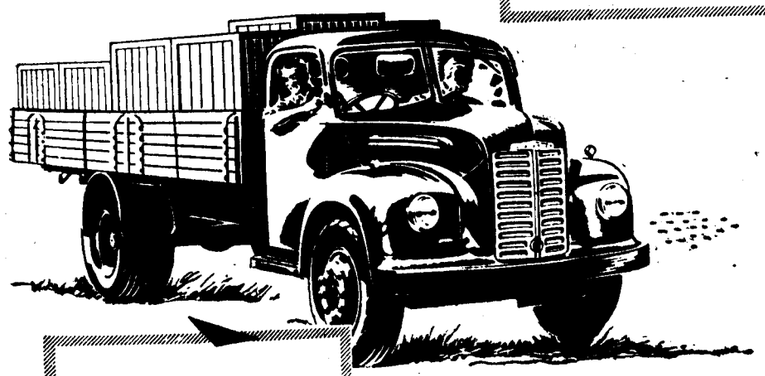
The magnitude of finance that will be required whether for fixed investment or working capital, even immediately on amalgamation has not been assessed. The Industrial Finance Corporation, the Industrial Credit and Investment Corporation, and the National Industrial Development Corporation will find claims of other industries for which they have to cater too onerous to strain their resources. It is problematical whether they can accommodate the amalgamated collieries. As a final recourse, the establishment of a special Finance Corporation is urged to assist the collieries. Resources for it are to be raised by a new cess on the industry at the rate of eight annas per ton of coal dispatched—a device which completely ignores the growing burden on the industry.



It does not appear to have been realised fully that amalgamation on the scale proposed will add confusion right in the midst of the second Plan in which the private sector has to raise resources for nearly half of the additional coal target of 22 million tons and the public sector has not been provided with one-third of the total outlay of Rs. 60 crores it needs.

Trustworthy

FARGO



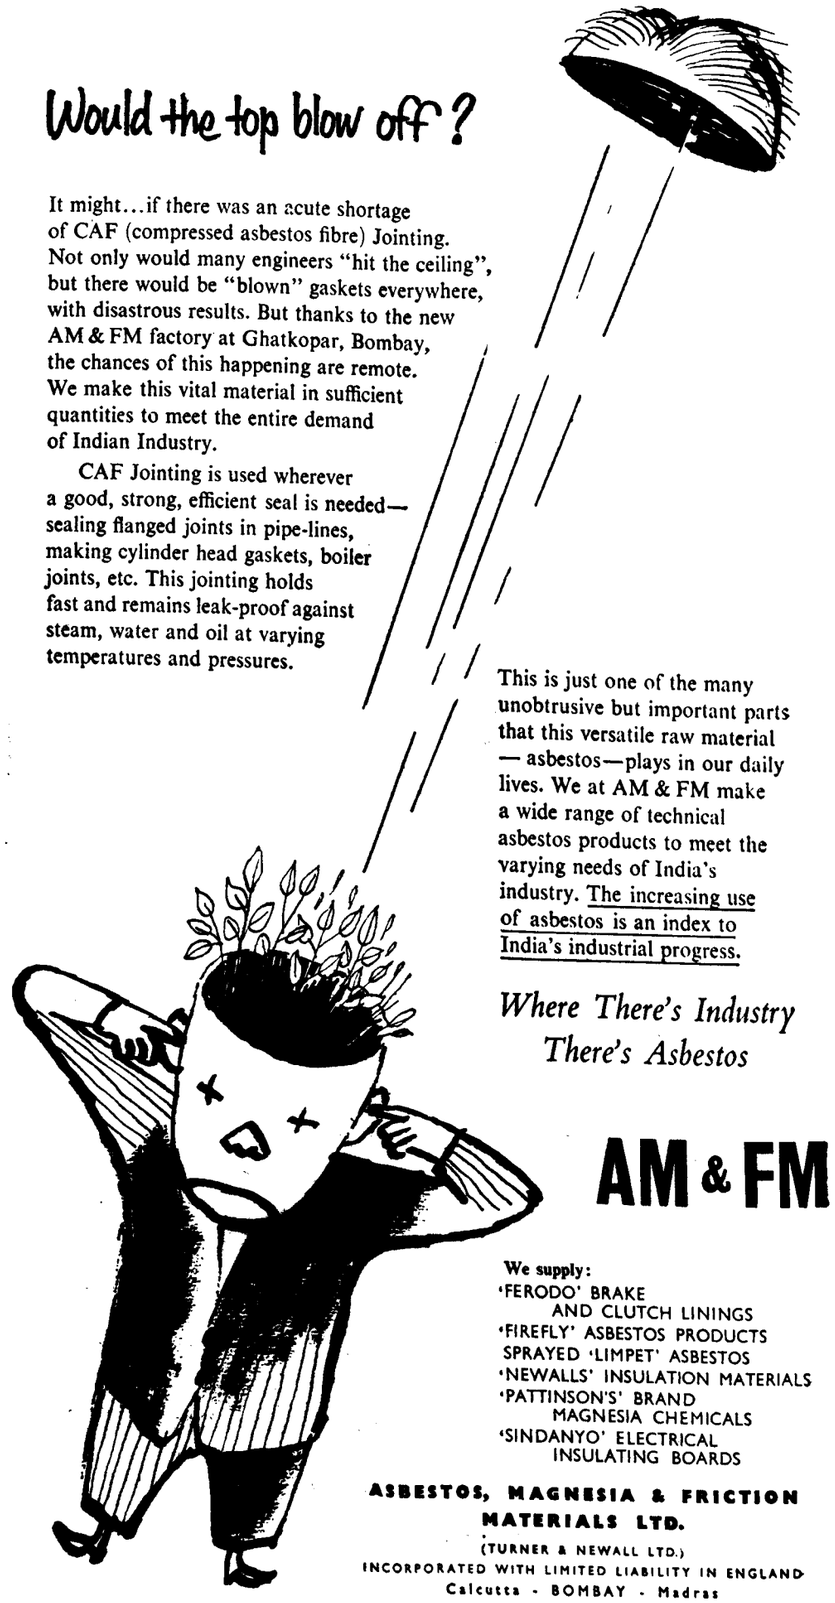
DIESELS

TWO STURDY MODELS: 165" wheelbase truck chassis, 5-ton load capacity, designed for goods transport. 190" wheelbase bus chassis, with full forward control, for passenger transport.

AS PASSENGER BUS

In full forward control, the engine is brought right in front, providing larger passenger space, greater driver vision. Economical to run. Ideal weight distribution.

AS LOAD CARRIER



With Fargo truck, you carry more load at lower fuel cost as compared to a petrol truck. Its sturdy frame is built for longer life and more efficient hauling on all kinds of roads.

Would the top blow off?

It might...if there was an acute shortage of CAF (compressed asbestos fibre) Jointing. Not only would many engineers "hit the ceiling", but there would be "blown" gaskets everywhere, with disastrous results. But thanks to the new AM & FM factory at Ghatkopar, Bombay, the chances of this happening are remote. We make this vital material in sufficient quantities to meet the entire demand of Indian Industry.

CAF Jointing is used wherever a good, strong, efficient seal is needed—sealing flanged joints in pipe-lines, making cylinder head gaskets, boiler joints, etc. This jointing holds fast and remains leak-proof against steam, water and oil at varying temperatures and pressures.

This is just one of the many unobtrusive but important parts that this versatile raw material — asbestos—plays in our daily lives. We at AM & FM make a wide range of technical asbestos products to meet the varying needs of India's industry. The increasing use of asbestos is an index to India's industrial progress.

Where There's Industry There's Asbestos

THE WEEK'S NOTES

US AMBASSADOR TO INDIA

THE APPOINTMENT of Mr. Ellsworth Bunker as USA's Ambassador to India has been viewed in this country with great satisfaction. The first democrat to be appointed by Mr. Eisenhower to a key diplomatic post, Mr. Bunker is a person of sensitivity and experience. Like his predecessor, Mr. Sherman Cooper, Mr. Bunker is an exceptionally able man, who has had experience in the fields of business, economic studies, administration and diplomacy. As president of the American Red Cross since 1954, Mr. Bunker is well versed in vital human problems. Though he had no opportunity to visit India, he has been following with a sympathetic interest India's struggle for independence and her efforts to develop her resources and the living standards of her people. From what he has been saying in public one infers that Mr. Bunker is very much interested in India's second Five-Year Plan and is likely to press for more American economic assistance to India during the next five years.

It goes without saying that India and the United States share common goals and principles even though they may approach them from different directions. According to Ellsworth Bunker, the world's two largest democracies, India and the USA, can jointly strive for a great human objective with the faith "that individual liberty and dignity can flourish, and that improved living standards and social justice can be attained under democratic institutions". It seems quite logical not to agree on every point or method in order to work for the same goal, as an essential in a free society is the freedom to dissent. So long as the principles of conduct and human values are the same, it matters little if the ways are not always identical. In this spirit of democracy, Ellsworth Bunker looks forward to the opportunity to interpret America and its ideals to the Government and people of India, and in turn to interpret India to the American people. This eminently human and democratic approach on the part of the Ambassador-designate to India's problems is a happy augury for stable Indo-American relations.

MANIFESTO OF LOHIA SOCIALISTS

THE 6,000-WORD manifesto of the Socialist Party of India, led by Dr. Ram Manohar Lohia, the stormy petrel of Indian politics, promises to the electorate almost everything under the sun. It promises total prohibition; elimination of English from all Governmental and public use; creation of a four-pillar State (by dividing power at the village, district, State and Central level); abolition of death penalty, and of "indirect, unjust and irksome taxes"; separation of judiciary from executive; discontinuance of privy purses to the princes; cheaper and quicker justice; codification and simplification of laws; removal of disparity between industrial and agricultural prices; promotion of co-operative farming and marketing; liquidation of agricultural indebtedness; suspension of production of luxuries; nationalization of key industries, foreign capital and import and export trade; "adequate and effective representation" of the workers in all nationalised concerns; amalgamation of dearness allowance with the basic pay; opposition to intensification of work-loads or introduction of costly labour-saving devices; payment of "reasonable relief" to the unemployed; and the acceptance of "house for house" principle in the flood-hit areas. It rejects "glamourous modernization of large-scale industry" as well as "wasteful cottage craft". Moreover, in order to "level the deep depressions of poverty", the Socialist Party will "demolish the lofty peaks of accumulating riches and wealth".

Few people will be averse to the Socialist programme in its theoretical form. But theorizing (or promising) is one thing, practice another. The expansion of the public sector and the extension of social services are incompatible with the substantial tax relief, as promised. These tall promises seem to have been made because the Socialist Party is reasonably certain of not capturing power in any State, and therefore not being faced with the awkward problem of implementing its programme. This explains, doubtless, also why the Socialist Party has tagged on a post-election plan to its election manifesto! According to that plan the Socialist legislators will fight against "Governmental and non-Governmental tyranny, colossal waste and corruption" and the consequent "collapse of social conscience" within the legislatures, and, if need be, outside them. The party, therefore, "invites" people to join its "Satyagraha army". But can methods of democracy and the kind of civil disobedience advocated by the Socialist Party at all go together?

However, the Socialist manifesto does also have points which merit consideration, such as the observation that "the way the law and order is implemented does not do credit to the land and principles of Mahatma Gandhi". Its criticism about the manner in which finances are being raised to meet the cost of the various schemes under the second Five-Year Plan is also justified to a large extent.

A SOCIOLOGICAL SURVEY

TO THOSE who are apprehensive of the prospects of democracy in this country, the report of the recent survey in U.P. cities by the J.K. Institute of Sociology should provide some comfort. The survey, which was directed to finding out who are the people who matter, count in society and can in a way be described as the governing class, records the view that judging from the information gathered in Lucknow, the 'elite' of U.P., or its directing or ruling groups come from all levels and strata of society and in fact the composition of the 'elite' discloses a diffusion of power along the most democratic lines. The only hurdle, it feels, to orderly democratic progress lies in caste hegemony as it finds that 75 per cent of the 'elite' are from the ranks of the upper caste Hindus. Otherwise, according to the survey, there is nothing in theory at least in the present social structure to bar progress by reformist means or through evolutionary development. It is no doubt a truism that a caste-ridden community denies the very postulates of democracy, but in the absence of a fuller report it is not known on what basis the 'elite' that seems to form the governing class was selected. Democracy in the ultimate analysis cannot succeed unless there are deep-rooted traditions genuine to the soil backed by proper leadership. More than caste (which may take a long time to disappear) the real bar to orderly democratic progress seems to lie in the vast illiteracy embracing about 80 per cent of the population. It would, therefore, be true to say that the future of democracy seems to lie more in the way illiteracy is conquered and proper men put in the government of the country who can work the democratic institutions with normal efficiency than in any theoretical 'diffusion of power among the different strata of society'.

The survey reveals that 95 per cent of the 'elite' are males and women seldom occupy positions of power and influence. It must come as a shock to our 'feminists' that women even in the uppermost layer of society

should be treated as ignorant beings and at best as "learned ignoramuses", knowing little outside their domestic sphere. Even in some Western countries though legal discriminations have been removed, public opinion seems to be rather unfavourable to political activity by women and after the first exultation of the grant of political and legal rights, women themselves seem to be lukewarm in their exercise. It is not known whether their counterparts in India will fare very differently. Anyhow, it will be interesting to watch whether the Congress Party would be able to get suitable women candidates (to the extent of 15 per cent of all its candidates) to contest the coming elections. The chances do not seem to be particularly bright even here.

Another interesting aspect of the survey relates to the attitude of the 'elite' towards the problems of the country. As many as 40 per cent of them, it states, regards the affairs of the country in general as "less than satisfactory" and only some eight per cent are "very much satisfied" about it. This indeed is a healthy sign and augurs well for the future of democracy in the country when one often sees a sense of smug complacency that pervades generally among the powers-that-be.

EDEN'S EXIT AND AFTER

SIR ANTHONY EDEN, once the "golden boy" of British politics, has generally received nothing but unqualified condemnation even after his resignation. Most newspapers in India at any rate have recalled only his misadventure in Egypt. His distinguished service to his own country and the free world generally, in nearly a lifetime of public career, had practically been lost sight of. Mr. V. K. Krishna Menon, has therefore, rightly recalled Sir Anthony's "great contribution to peace" in the initiative he took to avoid what might have become a world war in Indo-Chnia and the "great part" he played in attaining a settlement there. Sir Anthony, Mr. Menon reminds us, has also been a "true friend of India."

Before the second world war, Sir Anthony made his mark as a champion of peace, internationalism, and the League of Nations. In 1935, at the age of 38, he became Britain's youngest Foreign Secretary since 1851. Convinced that Britain's duty was to stand up to the dictators, he resigned that post three years later as a protest against the "appeasement" policy of Mr. Nevil Chamberlain, the then Prime Minister of England. As Foreign Secretary in the Churchil Cabinet of 1954, he negotiated the agreement with none other than Colonel Nasser for the withdrawal of British troops from the Suez Canal Zone. He succeeded Sir Winston Churchil in April 1955, and in the general election of May 26, 1955, led the Conservative Party back to power with an increased majority. But soon after, it may be recalled, the cry "Eden Must Go" was raised even among the Tories, and he had to deny officially any intention of resigning. Probably, it was to frustrate the intrigue of his opponents and to demonstrate that he was still an ardent opponent of "appeasement" that he took recourse to gunboat diplomacy, which brought to an abrupt end his long and distinguished public career. Now, that his "tough" policy has ended in a disaster, the diehards inside his own party seem to have sacrificed him in the hope of maintaining their party's power, despite the fact that several attempts by the Opposition to shake his majority in Parliament had failed to bring about his downfall. Posterity will probably have a more favourable judgment of Sir Anthony Eden than his contemporaries.

But if Sir Anthony Eden has been made a scapegoat to retrieve Britain's position in the eyes of her friends and allies, this is hardly likely to achieve the desired result. The choice of Mr. Harold Macmillan, as the new Prime Minister, amounts to a refusal on the part of the Conservative Party to abandon the policy which Sir Anthony pursued with such tragic result for himself, for his country, for the Commonwealth, and for the free world. Doubtless, Mr. Macmillan and most of the members of his Cabinet have indelibly been associated with Sir Anthony's ill-fated excursion into the Suez—a fact least likely to inspire confidence either at home or abroad. The contrivance to which the Conservative Party has resorted to does not seem to involve any admission of political error or repentance since logic demanded that the entire Cabinet responsible for the policy attributed to Sir Anthony primarily should have resigned. It may be, therefore, rather difficult for Egypt to let bygones be bygones. Prospects of healing the breach in Britain's alliance with America also seem to be remote. In any case it is doubtful if America will like to associate itself with any direct British moves in the Middle East. A meeting between the American President and the British Prime Minister at this juncture may arouse unnecessary suspicions in the Middle East countries about the Eisenhower Plan.

Moreover, to remove Sir Anthony Eden from the scene and let the machinery that formulated the tragic policies continue, is perhaps not the best way of demonstrating concern for democracy at home. The Egyptian episode has been so serious for Britain, both economically and politically, that it would have been better to afford an opportunity to the British nation to give its verdict on the old policy.

YEMEN CRISIS

IT IS, indeed, disturbing that fighting has flared up again in the Beihan area of the Western Aden Protectorate. Who is to blame for this situation, it is difficult to say? The welter of charges and counter-charges make it all the more difficult to assess the rightness or wrongness of what is happening in Yemen. The complaint of the Yemenites is that Britain is trying to federate by force the British-protected Arab States that make up the Aden protectorate. Britain is also accused of aggression against the Yemen's borders from the Protectorate. Whatever be the charges, the root cause of the trouble goes back to four years when the Yemen laid claim to the so-called protectorate area of Aden. The Yemenites have been asserting that the lands of the protectorate area form part of southern Yemen, which claim has been vehemently resisted by the British authorities. British interest is deep-rooted in the sense that she has set up a five-million-ton oil refinery in Aden. Britain has also entered into treaty agreements with the nearby Sheikhs and Sultans for developing the hinterland. The situation seems to be getting more complicated with the Arab League offer of support to Yemen and the latest move of Yemen to invite Russian volunteers for the defence of its territory. To what extent the USA would act in the event of this threat may be difficult to predict but the trouble in the Red Sea definitely provides the first test of the value of the Eisenhower doctrine. Perhaps, the USA could help in assisting the Yemenite economy which, it is alleged, has been disrupted as a result of the disturbances on the Yemen border. Incidentally the news is reassuring that British and Yemen officers will meet to discuss disturbances which have broken out recently on the frontier between Yemen and Aden. That may help in pacifying matters but is in no way going to solve the basic problem. The best way is to refer the matter to the United Nations.

steel brings you the news

Yes, that paper you are reading owes its existence to steel. It is steel that helped to manufacture the paper, did the printing and even helped to collect the news that it carries. There is hardly any facet of life where steel does not play a part in one way or another.

TATA STEEL
SERVES THE NATION

Steel, today, is very much to the fore in the nation's thinking. India's steel-making capacity is being rapidly enlarged to provide a sure and solid basis for the country's advancement.

How banking helps the MINING INDUSTRY

AN important part of India's mineral wealth is found in the South. From mines in South India come gold, magnesite, bauxite, iron, manganese and many other vital minerals.

The mining industry in South India employs about a lakh of people, and has an annual output worth Rs. 10 crores.

Banking has greatly helped the growth of the mining industry. The facilities and guidance of a good bank, such as the availability of ready funds when needed, and the collection of dues in any part of the country, are an essential part of good organisation in the mining industry.

We at Palai are proud that important firms in every field of business and industry in South India employ the *complete* banking service we offer:

Current Accounts—Demand Drafts—Telegraphic Transfers—Investments—Letters of Credit—Bill Collection—Deposits—Loans and Overdrafts—Confidential Credit Reports, etc.

If you have business interests in the South, it will pay you to open an account with us. Our 25 branches are strategically located, 23 in important South Indian business centres and two in Delhi and New Delhi; and we have correspondents in all important Indian cities. We offer a comprehensive banking service at each office.

Our clients can make deposits at any of our correspondent banks, situated in all important Indian towns, and have the amounts credited to their accounts at any of our branches.

South Indian miners working on a vein of crude magnesite

PALAI CENTRAL BANK LTD.

Head Office: PALAI, TRAVANCORE-COCHIN
Branches at: Madras, Madurai, Cochin, Quilon, Trivandrum, Mangalore, Bangalore, etc. Also at: Delhi and New Delhi

A LEADING BANK IN SOUTH INDIA

PC 1993

A Window on the World

THE U.K., THE COMMONWEALTH AND THE COMMON MARKET

By

ODYSSEUS

MY DISTINGUISHED COLLEAGUE, Our Special West European Correspondent, who is based on Paris, wrote a striking dispatch entitled "Build Europe, Build the Bomb", published on December 7, which aroused attention not only in India but in informed circles in the UK. He reported that in effect the Franco-British set-back over Suez had given impetus to the various plans for promoting European unity now under study and that certain circles (which I presume to have been mainly French) believed that if the European Atomic Energy Authority and the European Common Market had already been in existence, European interests would have been more powerfully defended in the Middle East. He outlined reasons for believing that it was an illusion to think that European unity would enable the older democracies to take a more independent policy in a world dominated by the USA and the USSR. The tenor of his report was that European unity was reactionary and A Bad Thing.

Now, it is not the function of this column to read neighbouring columns with any other object than to enjoy them. In any case this column, not being resident in Paris, is in no position to attempt a refutation of a report from that centre, even if it wished to, which it most emphatically does not. I cannot, however, ignore the topic of European economic unity, which my West European Colleague raised so resoundingly, because in the next few weeks the UK will be feverishly debating its pros and cons as a prelude to deciding whether to join in, or to stay out of, a common European market. And as this column is, for the time being, hatched in London, I conceive it to be my duty to report British views and reactions to you.

The first point, therefore, that I need to make is that while the common market proposals, as seen from the UK, cannot fail to carry some political overtones, they present first and foremost an economic problem of the first magnitude, and of the most fateful consequences both for Britain and for the commonwealth of which India forms a part.

Responsible circles in government and industry with whom I have discussed Our West European Correspondent's dispatch dissociate themselves from any in Europe who may be prompted to work for greater European unity by the idea that a united Europe could have successfully carried out the recent Franco-British Middle Eastern coup that ended in failure. There are plenty of people in the UK who disagree with Sir Anthony Eden's methods of policy. But my British friends argue that because some people are inspired by doubtful motives to work for a cause, that does not mean that all the people who are working for it are inspired by the same motives, or that the cause is bad in itself.

FREE TRADE vs. PROTECTION

The suddenness with which the decision as to whether the UK should join a common European free trade area has been sprung has taken most people by surprise. It has aroused echoes of the Free Trade vs. Protection controversy which raged in the years of depression and which was settled—once and for all, as was thought—in favour of Protection in 1932, when Imperial Preference was inaugurated at the Ottawa Conference.

Was the 1932 decision in favour of Protection right or wrong? If right, ought the UK to stay out of the common European market? If wrong, and the UK joins, won't an inrush of cheap foreign imports disrupt the UK's present pattern of trade, causing bankruptcies, keeping wages down, and creating unemployment?

The first point that commentators are hammering home is that what is happening is not a revival of the old Free Trade vs. Protectionism debate.

The question in the 19th century was whether Britain could afford to remain a free trade nation while all its competitors were protectionists putting up tariffs against British exports. Today the question is whether Britain can afford to remain protectionist when Western Germany, France, Belgium, the Netherlands, Luxemburg, and Italy (which together constitute the most important industrial bloc in free Europe) are about to abolish all tariffs among themselves, thus opening up a single "home" market bigger than that of the USA, while retaining their tariffs against Britain and any other European country not prepared to join them.

These six countries are known as the "Messina" countries because it was at a conference at Messina, Sicily, in June, 1955, that their governments took the momentous decisions (1) to go ahead with a detailed plan for a common market between themselves and (2) to set up a European Atomic Energy Authority ("Euratom").

Little notice was taken of the Messina proposals at the time because most observers in Britain thought that they would peter out in talk, like so many other starry-eyed post-war resolutions for European unity.

However, the under current of European "federalism" had all the time been growing stronger, as the conviction spread among many statesmen, industrialists, trades unionists, publicists, and other national leaders, that West Europe splintered into a dozen small national divisions would have no future whatsotver in a world on the brink of an era of mass production by atomic energy and by automation which can only be really successful in large markets. The result was that under the imaginative leadership of M. Paul Spaak, Belgian Foreign Ministry, the Messina committee produced in April, 1956, a blue-print for a European customs union.

When the Messina committee's report was considered in July, 1956, by the Ministerial Council of the Organisation for European Economic Co-operation, all Europe—the British government included—awoke to the fact that the Messina countries had a practicable plan for a custom union, and looked all set to go ahead with it, whether or not Britain and the rest decided to come in.

In or out, epoch-making policy decisions were necessary. If Britain decided to participate, a whole lot of economic problems would have to be thought out and solved. If Britain decided to stay out, another

whole lot of measures would become urgent. The one course that was not possible was to do nothing.

It cannot be too emphatically stated that from the British viewpoint the question—"to join or not to join"—is not seen in terms of Egypt, Suez, and oil, of Conservative or Labour, or even of Free Trade vs. Protectionism. The Messina plan is only beginning to be discussed in the press, but it occupies front place in innumerable studies that are being made behind the scenes in the Treasury, the Board of Trade, the Commonwealth Relations Office, the Colonial Office, the Foreign Office, the Federation of British Industries, the Trades Union Congress, and scores of chambers of commerce up and down the country. To all these groups, struggling to grasp the complex tecnhical recommendations made by the Messina powers and by the OEEC experts, the question basically presents itself as the purely practical one.

EFFECT ON INDO-BRITISH TRADE?

If the UK were to stay outside a European Customs Union tariffs against German goods for example, would eventually disappear inside Europe while tariffs against British goods would continue. Could the UK afford this? If, on the other hand, the UK joins, how can her abolition of duties against the rest of the world be squared with the vast proportion of her trade that is done with the Commonwealth? What effect on Indo-British trade, for example, would the imposition of a common European tariff have?

Mr. Macmillan saw a way out of this dilemma by proposing that there should be a European free trade area for countries which wished to retain their existing tariff arrangements against the rest of the world. The effect of this would be that at the end of the 12 to 15 year period by which the Messina plan envisages the total abolition of all internal European trade barriers (tariffs, quotas, subsidies etc.) Britain would have three groups of tariff arrangements: (1) The highest level as today levied against imports from the USA and all other non-Commonwealth countries outside the European common market. (2) A lower level applied to Commonwealth members. (3) A complete free list of imports from European countries.

This would still have hit Commonwealth trade severely because 90 per cent in value of UK imports from the Commonwealth consist of drink, tobacco, and foodstuffs (raw, processed, or manufactured) which could not compete with similar exports entering duty free from neighbouring Europe. So Mr. Macmillan concluded that the basic condition of UK adherence to the common market must be the total exclusion of agricultural and horticultural products from the scheme. This leaves 90 per cent of UK Commonwealth trade unaffected, and of the remaining 10 per cent that could be affected, it is reckoned that scarcely any would be affected.

Not least of the reasons for the British government's sympathetic attitude towards the European common market is the consciousness that the Sterling area must disintegrate, to the detriment of all its members, unless the UK can find capital to invest in the Commonwealth. The British government believes that participation in the European market will expand the UK's national income and therefore provide a bigger margin for investment in the Commonwealth.

British circles whom I have consulted readily agree with Our West European Correspondent that national economic unity depends on a single economic and monetary policy and that would doubtless be many decades before, if ever, Europe could attain a unity to match the national economies of the USA and the USSR, but they do not agree that, because so great a measure of unity cannot be attained, therefore the expansion of markets, lower costs, higher productivity, and rising standards of living, attainable by a lesser measure of unity should be rejected. And while their primary pre-occupations are economic, they see no reason to deny that a common market would have political repercussions, and while it would admittedly not enable Europe to compete on equal terms with the USA and the USSR owing (a) to raw material and other economic deficiencies and (b) to the survival of some tensions in a loose political federation, they argue that a greater measure of unity would add just so much to Europe's influence and bargaining power, and they cannot see any reason to apologise for this. The similar creation of common markets in Asia, Africa, or South America, would have the same effects. Are Asians, Africans, and South Americans therefore to be warned off any steps towards a measure of co-operation which would increase their international influence?

THE ARABS OF THE WEST

(From Our Special West European Correspondent)

PARIS, January 11.

LAST October Habib Bourguiba, the Premier of Tunisia, launched the idea of a "North African ensemble" which would link together in a sort of little Commonwealth or federation France and her two former protectorates (Tunisia and Morocco) and Algeria. A few days ago he revived this idea, giving it an ever wider extension to include Libya, but still keeping it deliberately vague so that the prospective members of the federation would feel that Mr. Bourguiba was not formulating a plan so much as opening a discussion. The treaty of friendship that Mr. Bourguiba signed this month with the Premier of Libya was described by the former as possibly the first step toward the realisation of this North African federation, which Mr. Bourguiba calls "L'Occident arabe" — the Arab West. The point of this latter expression is to mark the fact that the Islamic peoples living to the west of Egypt should form an alliance or union distinct from, and in some ways opposed to, the "Arabs of the East" now more or less united in the Arab League. But the reference to the West in Mr. Bourguiba's proposal is not only geographical: it is meant to suggest an ideological difference also. Mr. Bourguiba has in mind that the Muslims of North Africa should "look West", to France and the USA, rather than look East to Cairo and Mecca.

Vague and grandiose plans for super-national unions are no new thing in the Islamic world. Indeed, dissatisfaction with the nationalism invented by the Europeans and since adopted in most other parts of the world is one of the constant themes of Muslim ideology today. This accounts both for much of the political instability of Islamic states, and for that sentimental pan-Arabism which is mistaken by Europeans for a new imperialism. It is difficult to say how much this persistent desire to go "beyond nationalism" depends on the universal aspects of the Mohammedan religion and how much it depends on the evident economic inadequacy, as a basis for nationalism, of any one territory in the Middle East or North Africa. Materialists and idealists can make their own guess about this, but the fact is there.

So one might be tempted to put Mr. Bourguiba's proposal in a class with the other sentimental dreams of super-national Arab brotherhood. But the Tunisian leader's plan has more positive features, which entitle it to closer attention. Firstly, it has the prime requisite of any union or alliance: it is against something. Specifically, it is against Egypt, and the Arab League of which Egypt has now become in some measure the pacemaker. In Cairo is centred and nourished the opposition to the moderate regimes of Morocco and Tunisia, and from Cairo are promoted the violent, extremist movements against Western influence not only in Algeria but in all African Islam south of the Sahara. Now the Muslims of the Maghreb ("the west" in Arabic) feel themselves culturally and economically superior to the eastern Arabs and especially to the Egyptians, who now pretend to Islamic leadership. They are convinced (and this conviction is shared by Mr. Bourguiba and the Sultan of Morocco) that they have nothing to learn from the "medieval" petrol kingdoms and nothing to gain from the belligerent adventurism and Communist flirtations of Nasser. The North African ensemble suggested by Mr. Bourguiba would thus be not simply a rival or junior Arab League but would represent a different and more progressive policy.

Writing of African Islam in the 'Manchester Guardian' lately, Thomas Hodgkin said: "The habit the French have of trotting out some old-fashioned traditionalist commissioned to express his unshakeable fidelity to the West and his distaste for the Arab League deceives no one but themselves." But it is clear that neither Mr. Bourguiba nor the Sultan of Morocco are old-fashioned traditionalists, and they are neither trotted out nor commissioned by the French to do anything. Their distrust of the Arab League and their preference for the West (meaning not only France but the USA) are genuine and natural, and if the French deal liberally with the Algerians similar sentiments will appear there. This is a suitable point to remark that the organs of Leftist or liberal opinion in Britain are a wonderful source of misinformation on anything to do with North Africa.

But the union of North African states is not only against something; it is a proposal based on certain positive economic and political facts. The first of these is that the present division into states and colonies of the Mediterranean and Atlantic littorals of Africa is a pure accident of imperialism and does not express any cultural or economic realities. Because Tunisia, Algeria and Morocco could form separate administrative units within the French Empire, it does not mean that each can exist separately as an independent nation. I have made this point here before in demonstrating that there is no "Algerian nation" to which the French can give national independence, any more than there was a Hyderabad nation which the British could liberate as a viable unit. Mr. Bourguiba's proposal is intended to recognise this fact. The Moroccans and Tunisians have had their independence long enough now to know that their poor, small states make no economic sense by themselves and have to continue to depend for money and every sort of technique on France. The recent visits to the USA of Mr. Bourguiba and the Sultan's son reinforced this lesson, for Washington emphasised that US aid to their countries would depend for its efficacy on their continued association with France.

That is why Mr. Bourguiba is suggesting not that the North African territories pool their separate poverties, but that they form a type of federation with France in which each member is politically free—or at least free to make political concessions—while co-operating economically and otherwise. It is felt in Tunis and Rabat that if each relies separately on Paris for money, technique and defence, then neither is fully free; but if the exchange takes place within a federation, their political independence will have been consolidated while their social and economic progress has been guaranteed.

It is of course a pre-requisite to this plan that France find some liberal solution for the Algerian conflict. Morocco and Tunisia cannot co-operate with France as long as Algeria is politically part of the metropolitan country, for that would be sanctioning and confirming imperialism. At the same time, the

Tunisian and Moroccan leaders realise that it is literally impossible for France simply to "get out" of Algeria as the British walked out of India, for one-eighth of the population is French. But Mr. Bourguiba thinks that his proposal offers the French a solution to this problem. Paris cannot and never will desert a million Frenchmen in a free and independent Algeria, but she could accept the political autonomy of Algeria within a union of which France herself remained an equal member with Tunisia and Morocco. The safeguard of the rights of the two communities in Algeria (Muslim and French) could best be guaranteed if Algeria formed part of a federation which included two independent Muslim nations and France herself as the senior partner.

Mr. Bourguiba's plan is obviously very vague and could not be instituted next week by a couple of proclamations. It pre-supposes much intricate negotiation, not least because France is concurrently negotiating a rather similar union in Europe itself, in the form of the Common Market and Euratom, and therefore the question would arise of how these two loose federations were to be connected. But the surprising thing is that the present French Government has shown so little interest in a plan which presents it with such magnificent opportunities. Paris is still at the stage of resenting any Moroccan or Tunisian interest in Algeria as an "intervention" in internal French affairs. This attitude is justified with regard to Egyptian or American meddling in Algeria, but it is absurd to pretend that Morocco and Tunisia are not as vitally concerned with Algeria as France herself is.

The Sultan and Mr. Bourguiba were going to discuss this plan for a North African union at their meeting in Tunis last October and it is perfectly possible that their talks would have contributed to a settlement in Algeria; M. Mollet hoped so at the time. But the kidnapping of the Sultan's guests, the Algerian rebel leaders, at the instigation not of Paris but of the French authorities in Algiers, aborted that conference and seemed to signify that France was not interested in any joint settlement in North Africa such as Mr. Bourguiba is proposing. Since then the situation in Algeria has further deteriorated and once the UN debate is past, France might begin to pay some attention to Mr. Bourguiba's suggestions.

Meanwhile the progress of French plans for exploitation of the Sahara Desert has given an added interest to the North African union. Such oil as the desert may prove to cover will have to be piped to the coast through the territories of Tunisia or Morocco; France now has the choice of preparing for herself the sort of trouble the oil-producers have had in the Levant with the transiting powers, or of associating the littoral states with the whole venture of exploiting the Sahara. Independent French development of the Sahara will not be as trouble-free as the technicians in Paris once imagined; Moroccan claims to ownership of vast areas of the desert have already given a foretaste of what might follow if the Sahara really proves to be a source of great wealth. Joint development through a North African federation under French leadership would in no way lessen France's profits from the venture (which in the event would not be so much business profits as the advantage of getting oil payable in francs) and would rule out many political complications.

Economic Report from the U. S.

THE FEDERAL BUDGET

(BY GUY SIMS FITCH)

WASHINGTON, Jan. 16.—The Federal Budget for 1957-58 which President Eisenhower submitted to the Congress today is balanced in more ways than one. Most obviously, it is balanced in terms of receipts and expenditures; in fact, for the third straight year, a significant surplus is to be achieved. Beyond this, according to the President and his economic and fiscal advisers, the budget also has been "carefully balanced" with regard to the programme it presents and the fulfilment it seeks for the "needs of the present and the future."

It is well to remember in this connection that the booming economy of the US is straining the nation's resources in men, money and materials. As the President points out in his message on the budget to Congress, these strains have made it necessary for the administration to give priority to projects—both national and international—which are the most essential ones, and to postpone plans of less immediate importance. But even with this qualification, the Budget submitted calls for the expenditure of $71,800 million for the fiscal year ending June 30, 1958, a rise of $2,900 million over fiscal 1957. This would make it the fifth largest spending budget in the nation's history, exceeded only by three years of world war two and the Korean war year of 1953.

It is always difficult to make plans and forecast expenditure a year or more in advance. This is particularly true, however, at this time, when uncertainties abound in the world and when the American economy is undergoing continuous change and development. But the President and members of his administration believe that reasonable realistic estimates can be arrived at if certain guide posts are kept in view. These include the postulates of domestic economic well being and fiscal integrity, the need for military strength sufficient to deter aggression, the need for economic and military assistance to friendly nations and for the promotion of international trade.

The expenditures planned for the fiscal year 1958 include $38,000 million for the Department of Defense, an increase of $2,000 million over fiscal 1957; the continuance of military assistance to other countries at the 1957 level of $2,600 million; an increase of $300 million to a total of $1,800 million in economic assistance to other countries; and a rise of $400 million, to a total of $2,300 million for atomic energy. A goodly sum in this latter item goes to such peaceful atom uses as the building of nuclear power reactors, the development of new industrial, medical and agricultural applications of the atom and to sharing the nation's civilian atomic energy progress with other countries through the atoms-for-peace programme. Another $16,900 million will be spent on "civil benefits". Projects of this order will be undertaken, whenever possible, in co-operation with States and local communities, free of paternalist interference by the Federal Government, and together with private industry. To aid agriculture, for instance, it is proposed to set up new marketing, research and service facilities, to expand programmes for watershed protection, and to seek answers to the problems of drought, wind erosion and flood.

In the field of transportation, improvements are proposed in airway traffic control. Private financing of housing for elderly couples, co-operatives and other groups will be encouraged by special government sponsored mortgage programmes. Construction would be started on a number of new water-resource projects for flood control, navigation, irrigation, power and water supply. Outlays would be increased for programmes of health research and grants to hospitals, clinics and diagnostic and rehabilitation centers. The proposed budget also includes an expenditure of nearly $7,400 million for government interest payments, a rise of $100 million, reflecting higher interest rates due to the heavy demand for credit and capital throughout the prosperous American economy.

Expenditures for miscellaneous federal operations amount to some $1,800 million. This represents a sizable decline from 1957 due to the progress made in achieving greater economy and efficiency of government management functions. Despite increased expenditures, the budget makers estimate that the surplus of receipts over outlays will come to $1,800 million, a slight gain over the expected 1957 surplus. Estimated 1958 receipts come to $73,600 million, a gain of $3,000 million over the current year. Administration officials expect to apply the surplus to a reduction of the public debt. The debt now stands at $270,000 million, after being reduced by some $4,000 million in the past two years.

A Letter to the Editor

CRUDE OIL PRODUCTION IN INDIA

Sir,

A small point for the record, referring to "Estimated Crude Oil Production — India" on page 1005 of the Annual Number of 'The Eastern Economist'. The correct figures are considerably in excess of those given and are, in fact,

	(Long Tons) Digboi	Nahorkatiya	Total
January - June 1955 . .	133,354	33,325	166,679
July - December 1955 . .	124,543	40,745	165,288
January - July 1956 . .	175,290	47,947	223,137

(1 long ton = 1.01605 metric tons)

Yours faithfully,

A. C. Gowan

NEW DELHI,

January 15, 1957.

[The error is regretted. 'The Eastern Economist' figures were taken from a usually reliable source which has apparently not received the latest revised figures —Ed.]

The Call To Save

As citizens of India, you are called upon "to work wholeheartedly for the full and timely realisation of the tasks, targets and aims of the Second Five Year Plan."

The Plan has been embarked upon. Its success depends upon your providing capital for its working. In this effort no amount is too small—the man who saves a rupee and the man who saves hundreds—both are rendering national service.

Save as much as you can and entrust your savings to the nearest office of your Bank. In doing so you will help to build a new India and also create a valuable estate for yourself and your family.

The State Bank's branch at Delhi, one of the more than five hundred offices waiting to take care of your savings throughout India.

SISTA'S SB-7

WORLDGRAM

AGRICULTURE

Research Stations for Oilseeds: The setting up of 17 composite regional research stations for cotton, oilseeds and millets at an estimated cost of Rs. 75 lakhs during the second Five-Year Plan period will be discussed by the Indian Central Oilseeds Committee at its tenth annual and eighteenth ordinary meeting on January 23. The meeting which will be presided over by Dr. M. S. Randhawa, Vice-President of the Indian Council of Agricultural Research and Additional Secretary to the Union Ministry of Agriculture, will examine ways and means for increasing the present production, of oilseeds in the country from 55.96 lakh tons to 76 lakh tons by the end of the second Plan period. Sir R. Sankaran, Secretary of the Indian Oilseeds Committee revealed that during the second Plan period it was proposed to spend Rs. 1 crore on the various research and development schemes connected with oilseeds.

INDUSTRY

Soda Ash Factory: A soda ash-cum-ammonium chloride factory involving a total investment of about Rs. 2 crores, will be established this year at Mughalsarai. The Union Government has granted licence to a Calcutta firm to run the factory which is expected to produce 120 tons of soda ash and 120 tons of ammonium chloride per day. The factory will employ over 300 skilled and 350 unskilled persons on permanent basis, in addition to other staff in the supervisory scale.

*

Diesel Engine Industry: The diesel engine industry in India is making steady progress. Production has recorded a sharp increase from 3,720 engines in 1953 to 10,000 in 1955. The output in 1956 is estimated at 12,000. The quality of diesel engines has shown considerable improvement in recent years. To encourage indigenous production, the Union Government has instructed State Governments to give preference to Indian diesel engines whenever they make purchases for their agricultural and industrial programmes.

*

Industrial Units Making Steel Forgings: By a notification issued in May this year, the Government of India brought industrial undertakings pertaining to the steel forgings industry within the scope of the Registration and Licensing Provisions of the Industries (Development and Regulation) Act, 1951. All industrial undertakings engaged in the fabrication of steel forgings, which employ 50 or more workers with the aid of power or 100 or more workers without the aid of power, came within the purview of the provisions of this Act. Government have now issued a notification which makes it clear that steel forgings, manufactured with the aid of power, for sale to the public would alone be covered by the Registration and Licensing provisions of the Industries Act. As a result, only those industrial undertakings which employ 50 or more workers with power and make steel forgings for sale to the public need apply for registration or licence as the case may be. Any undertaking which makes forgings for the production of articles, for which it is already registered or licensed under the Industries Act, need not apply for registration or licence unless its forging capacity is such as would enable it to effect sale of forgings as such to the public, in addition to meeting its own requirements.

*

Draft Standards for Muscovite Mica: The Indian Standards Institution has circulated three draft Indian standards relating to muscovite mica for eliciting comments. The standards are for definitions of mica terms, methods for grading and classification of muscovite mica blocks, thins and condenser films, and methods for grading and classification of muscovite mica splittings. These draft standards are the draft revisions of the two Indian standards published in 1949, namely IS: 13-1949, tentative Indian standard methods for grading processed mica and IS: 14-1949 tentative Indian standard classification of processed muscovite mica which have now been split up into three. Comments on the drafts may be sent to the branch office of the Indian Standards Institution, P-11 Mission Row Extension, Calcutta-1, before March, 1957.

*

Revised Draft Standards for Sodium Thiosulphate: The Indian Standards Institution has issued a draft revision of the specification for sodium thiosulphate (IS: 246-1950) for eliciting comments. The draft standard covers technical, photographic pure and analytical reagent grades of the material. Although the original standard, which was issued in 1950 as a tentative standard, prescribed the requirements of the pharmaceutical grade also, this grade has been deleted from the draft. In the revised draft, the limits for pH value and procedure for the determinations of sulphates anad sulphites (os SO4) have been modified. Comments on this draft revision may be sent to the Indian Standards Institution, 19, University Road, Delhi-8, before March 20, 1957.

*

Development Council for Non-Ferrous Metals: A Development Council for Non-Ferrous Metals has been constituted by the Government of India under the Industries (Development and Regulation) Act, 1951. This is the 11th Development Council set up so for. The Council will recommend to Government targets for production of non-ferrous metals, co-ordinate production programmes and review the progress of the industry from time to time. It will also suggest norms of efficiency with a view to eliminating waste, obtaining maximum production, improving quality and reducing costs. The Development Council will recommend measures for securing the fuller utilisation of the installed capacity and for improving the working of the industry, particularly of less efficient units. Among its other functions will be promotion of standardisation of the industry. It will also promote measures for increasing the productivity of labour and for general labour welfare.

TRADE

Foreign Trade of India by Land during November, 1956: According to the land-borne trade returns received in the Department of Commercial Intelligence and Statistics, the provisional figures of total value of foreign trade of India by land with Pakistan, Afghanistan, Iran and Burma during November, 1956, are as follows:

Merchandise			
Exports to Eastern Pakistan	..	Rs. 28	lakhs
Exports to Western Pakistan	..	„ 14	„
Exports to other countries	..	„ 6	„
Merchandise			
Re-exports	.. .. ..	Nil	
Merchandise			
Imports from Eastern Pakistan	..	Rs. 148	lakhs
Imports from Western Pakistan	..	„ 9	„
Imports from other countries	..	„ 26	„
TRADE TOTAL	.. ..	„ 231	„
TRADE IN TREASURE	.. ..	Negligible	

Balance of Trade

The total value of exports including re-exports fell short imports by Rs. 135 lakhs.

USSR-Afghanistan Trade Pact: A protocol on trade between the USSR and Afghanistan for 1957 and 1958 was signed in Kabul following talks between representatives of the two countries, according to a "Tass" news agency release. The protocol, the release said, provided for the further development of trade and extension of commodity lists. Under it the Soviet Union would increase substantially its deliveries of motor vehicles equipment, oil products and ferrous metals of Afghanistan. It would also export building materials, cotton fabrics and other goods. Afghanistan under the protocol would increase its deliveries of cotton, wool, hides, dried fruit, oil seeds and other traditional Afghan exports to the USSR.

*

Pakistan-Austria Trade Agreement: A trade agreement between Pakistan and Austria was signed in Karachi on December 24. The agreement is valid for a period of one year. The main items of imports from Austria include pig-iron, aluminium and aluminium alloys, asbestos sheets, building and engineering materials, machinery and millwork, diesel tractors, chemicals and photographic instruments. Exports from Pakistan include jute, cotton, hides and skins and certain manufactures thereof, sports goods and santonin.

*

UK's Radioisotope Exports: The United Kingdom maintained its position as the world's biggest exporter of radioisotopes in the year ended September 30, 1956, by exporting a record total of 8,617 consignments of radioisotopes, worth over £100,000, to 47 countries. Of these, 101 consignments were sent to India. These exports were part of a record total of 22,069 consignments produced during the same period—3,830 more than produced in the previous year. These facts have been revealed by the United Kingdom Atomic Energy Authority. The Federal Republic of Germany was Britain's best customer for radioisotopes, taking 1,266 consignments, followed by France with 1,051 and Sweden with 1,022.

FINANCE

New World Bank 4½ Per Cent Bonds: A new issue of 100,000,000 dollar twenty-year 4½ per cent bonds of the International Bank for Reconstruction and Development, generally known as the World Bank, was being publicly offered on January 10, at a price of 100 per cent plus accrued interest. The issue was designated as the "twenty-year bonds of 1957", due January 1, 1977. Marketing of the new bonds was being handled by a nationwide underwriting group in the United States of 161 investment firms and banks headed jointly by Morgan Stanley and Co. and the First Boston Corporation. This marks the first public offering of World Banks bonds in the United States since January 12, 1954.

*

Aid for Development of Handicrafts: Schemes for the establishment of twelve training centres for the development handicrafts in Kerala have been approved by the Government of India. The Union Ministry of Production, on the recommendations of the All-India Handicrafts Board, has sanctioned a sum of Rs. 1,25,830 as grant to Kerala, for the purpose. Four centres for training 60 students in the screwpine and koragrass mat weaving industry are to be set up in the four districts of Trivandrum, Trichur, Quilon and Kottayam. A training-cum-production centre is to be established in the State for the fibre industry. Training in new techniques and modern designs in fibre industry will be introduced at the centre. A training centre for the development of brassware and bell-metal industry is to be set up in the State. For the development of dyeing and printing, a training centre is to be established to provide training to 12 persons for a period of one year. A training centre for the development of the conceshell industry is also proposed to be established in the State.

French E.P.U. Deficit: France had a deficit of $39,022,000 with the European Payments Union in December compared with a deficit of $93,015,000 in November, Comtel reports from Paris. Belgium's E.P.U. deficit in December was $4,360,000 against a November surplus of $7.4 million. Switzerland had a deficit of Frs. 74. million with the E.P.U. last month, in November there was a surplus of Frs. 9.3 million, Holland's deficit of $1.5 million in December compared with one of $2.1 million in November. The Dutch claim on E.P.U. at the end of 1956 was $109.9 million.

*

Franco-Japanese Financial Agreement: A new Franco-Japanese financial agreement providing for settlement in sterling or transferable francs has been signed. The new agreement replaces the 1948 pact, under which settlement was in dollars. It came into force on January 1, 1957, and lasts for one year. It is renewable by consent for a similar period. Under the new pact authorised French banks may open foreign Japanese accounts in francs in the name of residents in Japan. The payments agreement was reached after negotiations since June 18. Talks for the conclusion of a Franco-Japanese trade agreement are still in progress.

GENERAL

Schemes for Installation of Powerlooms: Schemes from five States—Bombay, Kerala, Rajasthan, Bihar and Madhya Pradesh—for the installation of 6,055 powerlooms have been approved by the Government of India. This is the second batch of such schemes, so far approved, since the Government of India decided to introduce 35,000 powerlooms in the country during the current and the next financial years. Schemes from other States for setting up powerlooms are under scrutiny. The Bombay scheme envisages the installation of 2,500 powerlooms in the co-operative field in the State. The State Government has been sanctioned a loan of about Rs. 23,30,000 and a grant of over Rs. 1,73,600. The scheme for Kerala is for the installation of 2,000 powerlooms and for the training of 20 instructors for six months. The State has been given a grant of Rs. 2,06,000 and a loan of over Rs. 19,33,300. In Rajasthan 800 powerlooms are to be installed in the co-operative sector and six instructors are to be trained. The State gets a loan of about 7,17,000 and a small grant. In Bihar, 300 powerlooms are to be installed, in the co-operative sector and 455 powerlooms in Madhya Pradesh. Bihar gets a grant of Rs. 46,000 and a loan of about Rs. 3,13,500, while Madhya Pradesh has been sanctioned a loan of over Rs. 4,31,500 and a grant of over Rs. 28,000. The first batch of two schemes for the installation of 500 powerlooms in the Punjab and 600 looms in Saurashtra area of Bombay were approved in November, 1956.

*

State Social Insurance for Cyprus: A new social-insurance law for Cyprus—the first State-sponsored insurance scheme in that colony—came into force on January 7. It provides benefits of marriage, maternity, unemployment, sickness, old age, widowhood, and death. The scheme is based upon that in force in Britain, with workers, employers, and the State each bearing part of the cost. At the outset, the workers' contribution will be just over 1s per week, women paying slightly less. Benefits for sickness, unemployment, widowhood, and old age will be £1 4s. per week, with additional allowances for dependents. The maternity grant will be £5, and the marriage grant £10. Nearly 50,000 workers, including 12,000 civil servants, have been enrolled under the scheme. Eventually it is expected that 100,000 will register.

NEWS IN BRIEF

INDIAN

The Government of India and Italy are actively considering a proposal for a bilateral agreement envisaging Italian help in India's programme of expansion of shipping during the second Five-Year Plan. The Italian Government is also likely to assist in the field of heavy industries.

*

The Government of India has invited tenders for the supply of railway equipment, the value of which is placed at Rs. 28 million. The equipment includes eight narrow-guage locomotives, 70 locomotive boilers, all-metal lightweight rail cars and 32 steam diesel operated cranes.

*

It is reported that the Indian Standards Institution is now working on an extensive project for economy in the use of steel through standards at the instance of the Planning Commission.

*

Earnings from fish exports from India recorded a sharp increase to Rs. 21,700,000 in the first six months of the current fiscal year from Rs. 14,200,000 in the same period last year. In 1954-55 the value of fish exported from India amounted to Rs. 44,900,000 but it declined to Rs. 37,600,000 in the next year.

*

The third Commonwealth Standards Conference will be held in New Delhi from January 21 to February 3, 1957. General questions of policy will be reviewed in separate sessions where problems of common interest like the metric and the inch-pound systems of measurement, certification marking, standards for consumer goods, general alignment of standards and terminology will be considered.

*

It is reported imports of both rice and wheat will be stepped up by the Government of India during the current year in order to prevent any rise in the prices of food grains in the country.

*

Drilling for oil operations in the Bengal basin area is expected to commence within the next three months. The first drilling operation would start somewhere near Burdwan, 60 miles west of Calcutta.

*

A few more sugar factories, apart from the four co-operative sugar factories to be established by the U.P. Government under its second Five-Year Plan, are likely to be allotted to the State by the Government of India.

*

It has been decided to continue to issue licences for import of raw cotton stapling 1-3/16 inches and above from soft current licensing period. Licensing will be done on "first come first served" basis within a limited ceiling.

*

The Government of India has decided that throwstors silk waste, silk waste of Jammu and Kashmir and Punjab origin and silk waste of Bengal, Bihar, Assam and Madhya Pradesh origin will continue to be licensed freely for export up to the end of December 1957 to all permissible destinations other than the Portuguese possessions in India.

*

In 1956, the production of electric fans is estimated to have risen to 337,000 from 282,000 in 1955, 236,000 in 1954 and 206,600 in 1953.

FOREIGN

Despite import restrictions, Australian Customs and Excise revenue collections in the first six months of the financial year totalled £A144,841,124 compared with £A125,282,266 for the first six months of the previous year.

*

It is reported American-owned companies in Chile produced about 440,000 metric tons of copper in 1956.

*

In the closing months of last year total production in the United Kingdom was running at about 2 per cent below the peak reached at the end of 1955.

ECONOMIC ANALYSIS IN INDUSTRY *

By B. H. TRENEAR-THOMAS

ONE of the primary functions of higher business management is to look ahead; it is not enough for a major commercial undertaking to concern itself merely with today's sales and tomorrow's raw material requirements. Though this has always been true, the growing complexity of our civilisation and the rapidly increasing scale and scope of modern industrial activity has introduced a new decision for management — that of establishing the methods required to enable itself to be informed of probabilities on a suitable time scale and in the requisite detail and accuracy. It might be said that the problem resolves itself into that of avoiding the element of surprise, and ensuring the maximum economic deployment of the resources available to the organisation. The length of the view taken in the time-scale may be governed largely by the degrees of dependence on further capital investment, and as oil concerns have to work much farther ahead and cover far more fields than most firms in other industries, they are perhaps good illustrations of the general principles involved.

To ensure supplies of the right kind at the right place oil companies must constantly take a view of demand five, ten and fifteen years ahead. The oil industry does in fact engage itself in what is now called perspective planning and virtually for the same reasons as Government. Economic analysis is also of short term value to management and has a wide field of activity in the primary function of keeping management informed of the current climate of trading conditions, as a background to their day to day executive decisions. However, it is principally in the important function of forecasting that the following remarks are addressed.

Since the future is unknown, and in the strict sense unknowable, long term forecasting is inevitably a hazardous business. An expectation of events can reasonably be said to be the projection of past trends, suitably modified. The influences which may be at work to promote modifications can be, and generally are, highly complex and the technique of the forecaster lies in applying economic analysis to measure the forces at work, though finally there is no substitute for experience and judgment when relating together these forces in scale of importance to give a balance prediction of probability. Certain major influences that can occur must be disregarded; for example, the course of international tensions are essentially unpredictable both in direction or strength of effect up to the level of major war, and major financial crises on a global scale must reasonably be disregarded in a long term estimation as essentially unpredictable. On the other hand very substantial influences may modify the natural growth of demand and which lie much nearer home, though outside the immediate business of the industry. Examples would be policies adopted by Government to restrain an impending foreign exchange crisis or increases in taxation designed to raise revenue for prosecution of national plans. Here it might be said that these coming events may throw a long and possibly predictable shadow in advance, and the timing or extent of measures taken could be considered as predictable through economic analysis of the impending situation. Any such judgment must also be assessed in the light of practical politics by answering such question: "How has Government reacted previously when under pressure from similar situations?", or, "Has Government been seeking advice from sources with particular known solutions to particular problems?" And, "Is the Government in the habit of following the practice in certain countries as a precedent when specific situations develop?"

The oil industry faces some unusual problems. It is required to supply a wide range of products which enter into many fields of activity but which come from a raw material of varying quality. To minimise the hazards economic analysis must cover the many factors affecting the main markets in question, and for the oil industry these move across the whole structure of economy. The basic fact for recognition is that the industry sells energy, and the release of this energy takes place through many channels. In India the biggest single channel is that of release as light; for the greater part of India's millions kerosene is the only practical illuminant, but it is steadily increasing in importance in that other sector of the domestic front — as a cooking fuel. Measurement of this movement is, therefore, of immense practical importance when one realises that though India is among the lowest consumers of oil products per capita in the world she is the world's largest civilian consumer of kerosene in total. The analysis of the factors involved in kerosene consumption is of great interest and they are many — national income and purchasing power, the pattern of priority in spending, the employment sectors of major kerosene demand, the future availability and price levels of possible alternatives, availability of equipment and others. For kerosene as a domestic cooking fuel other factors enter the picture such as the effect of Community Development and basic agricultural policy on the availability of the major domestic alternatives, dried animal wastes, wood and charcoal.

Applied power can reach the consumer through a most versatile medium — electricity, but electricity is only the channel of communication not the source; that lies in the falling water, coal, oil or the forces in the atom. The growth of total applied power through the expansion of electrical service is a most interesting study both in total and broken down into the component parts of the different basic methods of generation from the primary sources. By reason of the immense capital required to construct the huge civil engineering works associated with hydro-electric schemes, the forward pattern of these systems is visible well in advance and as producers of prosperity are frequently associated with massive irrigation schemes; they are factors of great importance when assessing relative changes of purchasing power of the population in an area over a period of time. Big thermal generating stations burning coal or fuel oil play a different role but they are again essentially large units and, therefore, the growth of this system must be planned well in advance. The big thermal network in the U.K. is planned forward on a twenty-year basis. In India the decentralised sector for electricity demand in townships and villages is fed through the most versatile machine, the diesel generator. For many years there will be virtually no alternative to the diesel for village service and to supplement shortfalls in major consuming areas; a situation which is now arising in the Delhi area and was essentially predictable. An

* A paper read at ATIRA's Management Conference January 4 to 6, 1957.

analysis of the potential demand for this type of power is necessary if forward supplies are to be maintained.

In agriculture India has shared the load of effort for centuries between man and the animals. But there are sound economic reasons for replacing animals by mechanical means for water lift for example. Similarly India is increasing her use of machines for the actual preparation of the land and the subsequent processing of food in her thousands of grain and oil mills. As India is basically an agricultural country of great size the movement of the forces at work in agriculture are clearly of great importance to the oil industry. Any movement towards mechanisation is capital intensive, in a sector which is notorious for its inability to accumulate adequate quantities of capital, to such a degree that even the basic banking system required has not developed beyond the rudimentary stage. Here, close measurement is required of the effects of the development of co-operative credit systems and the Community Development movement.

In transport there is a reasonable predictable demand developing in the future for increased main service transport requirements. Part of this will be met by the railways to an extent limited by public finance available, ability to execute the works required for expansion, and a factor for improved efficiency. The balance of demand must be met by increased roal haulage, and this is largely dependent on the use of liquid fuels. This is valid approach and as an aid to forecasting would yield sensible results, but it is not the whole story. As prosperity at village level rises, both through agriculture and decentralised industry, and as roads are constructed locally by the people themselves, a demand is generated for inter-village movement and in the local gathering systems round railheads. The type of equipment required is different to the long distance systems and subject to different rates of growth.

There are many other fields of activity which concern us such as the use of fuel oil for industrial process heat, particularly in the mill industry of Bombay, and the problem is essentially that of recognising and measuring the fields of social and industrial activity which generate demand. This clearly cannot be done without constructing a model of the economy at a future date, and therefore, close study of the Five-Year Plan and the perspective targets on a national stage are required, under the main subheads of development expenditurfe, together with an objective assessment of the probabilities of success. The crudest methods of analysing future demand are those which merely project past trends and which, therefore, rest on the implicit assumption that the relevant casual factors will continue as before. In practice this is seldom true, and for a situation of striking change such as that impending for India at this stage in her development there is no substitute for the laborious, but far more accurate, methods of objective analysis of the variables at work in the many fields of demand. In this the business forecaster does not work alone as he can draw on the estimates of Government economists and forecasters working in other fields.

There is no effective substitute for the laborious process of detailed assessment product by product, and area by area, against projected national development and targets in the future, but the results in total can be examined against the trend lines in the past and by a further process of elimination. This method attempts to establish a total demand for energy in the future and then examines the practical contribution which can be expected from alternatives such as coal and electricity etc. and concludes that the balance would have to be provided by oil. Any result which is achieved by showing a balancing item after a series of calculations may be subject to a wide margin of error and, therefore, valid only as a cross check. It is, however, a method that is proving valuable and adopted in highly industrialised areas where energy consumption is found to have well established relationships with the rate of rise of industrial production, which can be a function of investment rate, etc.

In India we must still look on this method as experimental in view of the shifting balances as a young industrial power begins a rapid growth in an age-old agricultural civilization. Finally, the real practical check on all these processes lies in the views of the commercial staff; they are frequently accused of being incurably optimistic, but in the oil industry events have shown a persistent tendency virtually world wide to underestimate the long term strength of demand. Recognition must be made of the fact that one of the strongest forces behind this growth is technological and the effects of technology are remarkably self-sustaining in advancing at compound rate of increase.

It was mentioned earlier that the requirements of capital investment dictated the application of economic methods to forecasting and also set the time scale ahead for examination. Some illustration of this might not be out of place. The oil industry as a whole will be investing between Rs. 3,000 and Rs. 4,000 crores equivalent this year. The Shell Group alone will be investing about Rs. 400 crores. Capital of this order can only come from the world's markets to a small extent, between 10 per cent to 15 per cent, the rest must be internally generated. However, carefully and wisely this money is put to work we are perennially short of the caiptal required for all the work that needs to be done. If an order is placed for a tanker now, delivery cannot be expected inside four to five years, a refinery takes at least three to four years to plan and build, certain special equipment and pressure vessels even longer.

Behind this activity goes the greatest share of the outlay; that required to maintain long term production and new discoveries. But the longest task of all is perhaps to select and train the staff so that their accumulated skill is ready when their maximum effect is required in twenty and more years from now. The scale of our modern industrial activity sets such a penalty on error that here lies the real target for the work we are doing — the elimination of surprise.

MORE ON CO-OPERATIVE FARMING

"MUCH more is at stake in the current debate on co-operative farming than many participants in it realise — not only the growth of agricultural output but the freedom and dignity of the peasant, the relationship between the peasantry and the city gentry, social stability, the future of our nascent democracy and the vital rural roots of our culture and civilisation. ..... The time has now come for co-operators to have the courage to say 'where co-operation shall stop, and where the State shall stop,' lest in the name of co-operation, and using its terminology and apparatus, the State should gradually reduce the peasant to a new servitude".

These words conclude a valuable and timely monograph on 'Co-operative Farming' just brought out by the "Research and Education Division of the Indian Co-operative Union", New Delhi. It is particularly timely because the Patil Delegation to China on Co-operative Farming do not appear to have submitted their report yet to the Government of India. Perhaps a serious debate is still going on among the members of the Delegation, for on an issue of this kind violent differences of opinion are bound to manifest themselves. The monograph in question should greatly help in the deliberations of the Delegation.

Whatever the Delegation may or may not say on Chinese co-operative farming or co-operative collective farming, the Congress Party has already taken a certain stand in the matter of organising the co-operative movement for agricultural production in India. This stand, which is contained in that Party's latest election manifesto, is: "Co-operation is essentially a voluntary effort, and without the active participation of the people no amount of Government direction will yield adequate results.....Co-operation, therefore, has to be developed as a popular movement 'with the help and guidance of the State.' This is not only necessary for the purposes of higher production, but also to develop that way of life which is based on individual freedom as well as co-operative effort". The quoted words convey that the ruling party is now fully aware of the stakes involved and that it does not intend to hustle things in this delicate field, although at one time in the last few months it looked as though Indian co-operation might receive a Chinese orientation and the Congress-proposed co-operative farms might be so fashioned as to slide into collective farms ultimately.

It may be recalled incidentally that 'The Eastern Economist' has drawn pointed attention on different occasions in recent months to the undesirability (from more than one point of view) of co-operative farming with a collectivist slant. But the arguments advanced by us from different angles need not be repeated here. Suffice it to say that men in power appear to have been influenced, to some extent, by a large section of the Indian Press and, to a greater extent, by their own shrewd political instincts. As the class of landowning agriculturists represents an enormous voting population of about 90 million in the entire country, the Congress Party's current soft-pedalling on the issue of co-operative farming is understandable. It is true that the Party's enthusiasm for co-operative farming has not wholly waned. But the significance behind the omission of a co-operative farming plank from the Communist Party's election manifesto may not be lost on the shrewd political strategists of the Congress. Surely the Congress Party's open announcement of the ultimate goals of agrarian reorganisation cannot be more frightening than the Communist Party's studied concealment of its ultimate agrarian goal of collectivisation. So long as parilamentary democracy based on adult franchise continues to prevail, there is no very great danger of a democratic party like the Congress resorting to undemocratic methods in the matter of agrarian co-operatives. The point need not be laboured here that the Congress may scrupulously avoid such methods for the simple reason that the Communist Party could easily make political capital out of them and emerge as a powerful party in the conditions of our parliamentary democracy.

In this context, therefore, the words "with the help and guidance of the State" have no ominous ring about them. Also, it is well known that Indian co-operation in its various spheres has all along been a voluntary movement helped, guided and, to some extent, regulated by the State. If co-operation in spheres other than farming has not made any phenomenal progress in the country even with State help and encouragement, there is no reason to believe that co-operative farming (which involves pooling of land and joint management and which is, therefore, an inherently more difficult affair) would make greater strides in the absence of a degree of direct or indirect compulsion and pressure. But fortunately the Congress is not capable of exerting this kind of compulsion and pressure for the simple reason that it does not have and will never have at its disposal millions of trained party cadres as the Chinese Communists have. In any case 'state help and guidance' is by no means an alarming prospect for "especially in the under-developed countries it would appear that the agricultural population is often not in the position to launch co-operative endeavours on an effective scale without some guidance and assistance from the State". ('Progress in Land Reform', United Nations).

But in India 'state help and guidance' in the matter of co-operative farming is bound to be extremely limited in any case on account of inadequate resources in the foreseeable future. It is, therefore, not surprising that during the entire period of the second Plan, only about 5,000 co-operative farming societies are proposed to be organised throughout the country. And these societies are to get subsidies for administrative expenses, credit on liberal terms, preference in consolidation proceedings, technical assistance and supply of seeds, fertilisers, etc., and special financial and technical assistance for developing ancillary occupations. As these farming co-operatives are to be organised in National Extension Blocks they are likely to work better than the 1,000 and odd co-operative farms already in existence? The case studies (carried out by the Indian Co-operative Union) of three such societies probably confirm the obvious impression that almost all the existing societies should be functioning badly. As these societies were formed in a haphazard manner and at a time when the highly educative Community Development programme was unknown, they were probably foredoomed to failure. Perhaps a similar fate may not overtake the 5,000 societies to be organised in the National Extension Blocks. This is just an experiment. If it fails even in the Community Project and National Extension areas, co-operativisation of farming as a long-term objective in agricultural policy may be slowed down. Even if it succeds, it can only be a partial success and is least likely to be extended in one gigantic sweep to all the 500,000 villages in the country.

As no conclusive lessons can be drawn from the working of such defectively-organised societies as now exist, final evaluation of co-operative farming techniques in Indian agrarian conditions might have to await the completion of the second Five-Year Plan. This, however, does not mean that the pros and cons of co-operative farming need not be studied now in the light of such data as can be assembled. The Indian Co-operative Union's monograph presents an array of arguments against the very concept of co-operative farming. They are partly based on the sorry experience of co-operative farming (even where voluntarily organised) here and elsewhere and partly on the assumption that individual peasant-farming can be rendered more efficient and remunerative for the farmer with the aid of service co-operatives. This is a powerful, though partly theoretical, case. The public debate is on and will continue till the last word on the second Plan experiment is said. The Co-operative Union's monograph is a timely contribution to this debate and is, therefore, doubly more valuable.

The Co-operative Union's case against co-operative farming is as follows: (1) The continuing multiplication of small holdings in India certainly militates against rational agriculture. But there is no direct remedy for it within a democratic framework until industrial growth brings about a substantial reduction in the manpower dependent on agriculture. The proposal to combine or co-operativise all holdings below a specified size by law is impractical, but the enforcement of a 'floor' is a more difficult affair than the enforcement of a ceiling inasmuch as it would affect almost half of the peasant families in India. The im-

position of 'ceilings' will not facilitate the imposition of 'floors' for it would not release more than 5 per cent of the total cultivated land for redistribution. If landless workers are given a prior claim on it, the land likely to be available for enlarging the smallest holdings would be negligibe.

(2) A programme of 'voluntary' co-operativisation is advocated as the next best alternative to capitalist estate farming which is rejected in spite of its economic merits. Co-operativisation cannot alter the basic man-land ratio significantly. The enlargement of the size of the farming unit would be more imperative if land and capital were abundant relatively to labour and it were possible to mechanise agriculture on a large scale. But the scope for mechanisation is extremely limited in a labour surplus country like India. A more rational use of labour made possible by co-operativisation would bring out the under-employed as wholly unemployed. This would be unfortunate when the rate of labour absorption in industry is severely limited due to other factors. As the size of the unit increases, the difficulties and costs of management also increase faster in agriculture than in industry. The workers are spread over a much wider area and the supervision required is much closer than in industry. The diseconomies of large-scale management in agriculture offset the other economies of scale fairly soon. That is why money returns per acre on smaller family farms are often higher than on large-scale farms.

(3) There are many practical difficulties of running a joint farming co-operative. The measurement and evaluation of different types of farm work is extremely difficult. Where management is democratically elected, discipline is poor and efficiency suffers. Where management is authoritarian, co-operatives lose their co-operative character. On all accounts, the co-operatives are afflicted with discontent and dissension. In India dissensions which would normally arise due to purely economic reasons multiply manifold on account of casteism and the indiscriminate mixing of landless labourers, tenants, and small and medium landowners which must take place in co-operative farms. Hired workers or members of large co-operatives can hardly be expected to cultivate the soil so intensively and well as peasant-proprietors or tenants with secure long-term rights. The sense of property is so deep-rooted in the psychology of the Indian peasant and his attachment to land is so strong that any proposal which deprives him of independent rights of cultivation arouses his instinctive hostility. Where even the members of a joint family—a natural co-operative—would seldom keep their holdings together for joint cultivation, large numbers of unrelated families are still less likely to do so. There is no evidence that farmers have been or can be enthused about joint farming except under extraordinary conditions and for short periods. The record of the co-operative farming societies started in India shows that except in a few cases it has been found necessary to revert to individual farming. The attitudes of the refugee or the landless worker settled on land through such societies are not relevant for determining whether co-operativisation can be an answer to the problem of small holdings. It is the attitude of the peasant-proprietor that matters.

(4) As persuasion can modify the attitudes of the Indian peasants only in certain respects and to a limited extent and as coercion (and administrative preferences and pressures amounting to coercion) should be ruled out in a democracy, the commercial and financial economies of scale should be brought to the small farmers by purchase, sale, credit and service co-operatives. Their incentives then would remain unimpaired and cultivation intensive and they could not only raise more produce per acre but also reduce their money costs and increase their money returns substantially.

Some of the above arguments are valid and sound, while some others are logically contradictory. But even the sound ones can be countered by equally sound arguments from the other side. However, the balance of economic advantage certainly appears to be on the side of individual peasant-farming if it could be rendered more efficient and remunerative with the aid of service co-operatives. This is precisely the view that 'The Eastern Economist' has been canvassing. But this economic consideration alone may not decisively weigh with a political party like the Congress. Only political factors are likely to weigh decisively with the Party in its ultimate rejection or confirmation of co-operativisation. If co-operativisation is not to be confirmed, the alternative should be politically acceptable to that Party. The political acceptability of the alternative may depend on some kind of modification of the land tenure structure. Such reformation can have a liberal orientation and be also politically attractive even though it would involve no radical reconstruction. Economic researchers may well set themselves to think anew, however reluctant they may be to reconcile themselves to the regrettable (but unalterable) fact that the country is passing through a period of history when no economic problem can have a straight economic solution.

STABLE BLEACHING POWDER

U.S. COTTON EXPORT POLICY FOR 1957

By

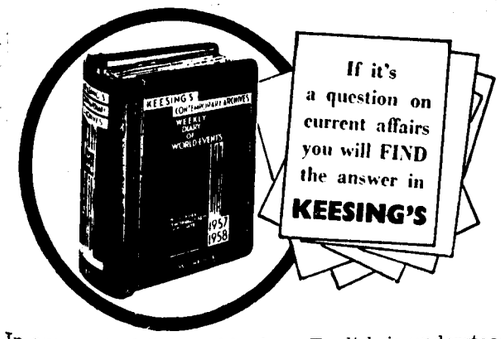
(CROESUS)

IN view of the trade agreement between India and the USA, whereby India is expected to import quite a sizeable volume of American cotton during the next three years, cotton interests in this country are keenly awaiting the terms and conditions of the new export drive of the United States Department of Agriculture, especially with regard to the export of America's surplus cotton. Towards the end of 1956, there were clear evidences to show that the US cotton export programme was going to be stepped up considerably. Thus, during October, over one million bales were sold, while, in the following month, a further 837,000 bales were contracted for, bringing the aggregate to over six million bales, which left a balance of just 732,000 bales with the Commodity Credit Corporation.

Various factors have contributed to the large-scale offtake of American cotton by several countries thus. In the first place, there has been a distinct improvement in the textile outlook of some cotton-importing countries, India being an exception, having to contend with the whimsicalities of the Government's textile policy; secondly, there has lately come to prevail a greater confidence in the general trend of cotton prices. America, however, did not wait for these favourable factors to bring about a more sustained demand for her cotton. With characteristic business acumen, the United States Department of Agriculture and the Cotton Council International launched an intensive sales promotion, especially in Japan, where there was an appreciable increase in domestic sales by textile manufacturers in the first half of 1956. As textile sales expanded, Japan found that there was also the need to increase her import of cotton. A similar programme of sales drive has been in operation in France and Spain which too may be expected to yield similar results.

The U.S.D.A. and the C.C.I. have also jointly taken upon themselves the task of helping the US cotton industry in developing and promoting new and expanded uses for cotton in foreign countries. By pooling their funds, the joint organization is enabled to hold exhibitions at International Trade Fairs, as also to plan out large-scale sales campaigns by featuring the various uses of cotton. That the U.S.D.A. is quite earnest in accelerating the tempo of American cotton exports is evident from its sustained campaign of sales promotion and market research thus. It has, as is to be expected, gained fresh confidence in its ability to dispose of American surplus cotton by the phenomenal success which has attended its extended export sales programme during the 1956-57 cotton season. On December 31, 1956, total exports under this programme amounted to 6,230,000 bales; the volume of exports during August and September, 1956 was easily the highest on record since the pre-war period, inasmuch as it amounted to 928,000 bales, as against the unusually low figure of 177,000 bales recorded during the corresponding period in 1955. According to private estimates, exports were well over 1.5 million bales during October-November, 1956 compared to only half a million bales during the same period in 1955.

It is against this background that one has to view the details of her export programme in respect of cotton for the New Year which America is shortly expected to announce. The Commodity Credit Corporation, it may be noted, has already taken possession, on January 1, 1957, of as much as six million bales of the 1955 cotton crop, which will have to be catalogued. Now, it would seem that there are to be two separate stages in the general export programme. The first is expected to cover cotton to be shipped prior to August, 1957, while the second will relate to cotton to be invoiced to shippers on August 1, 1957 and to be exported within the following six or nine months. There are rumours that shippers will be given the option of purchasing under the same minimum price terms as for the 1956-57 stocks, provided shipment is effected not later than August 15, 1957, or, alternatively, of having the cotton invoiced to them on August 1, 1957 for shipment over a subsequent defined period, subject to a reduced price 'floor'.



Now, what effects would the anticipated increase in the tempo of American surplus cotton exports have on cotton exports from other cotton-producing countries? In providing an answer to this poser, an undoubtedly important determinant is the trend of consumption, as also that of stocks, in the countries concerned. Thanks to the improved level of world economy, consumption of cotton has been, and is expected to be, maintained at a high level, which means that stocks in general would necessarily be on the decline. In fact, stocks in the net importing countries were generally at or near the minimum levels, so that there is bound to be an expansion of consumption leading to an increase in imports by these countries. Demand from Communist countries also has been on the increase since recently, and this too may be expected to contribute to the general increase in the export of cotton. Aggregate free world exports, which were 11.6 million bales in the 1955-56 season, are accordingly expected to set a new post-war high during the 1956-57 cotton season. This is a view held by such authoritative sources as the International Cotton Advisory Committee, Washington, which points out that "the effects of the US export policy on other countries" exports this season may be moderated by the probable rebuilding of stocks in importing countries. "But", as the ICAC has rightly taken care to warn, "this is not a continuing process and might mean a reduced total volume of exports next season. If this is so, then heavy exports from the US next season may pose more of a problem for other countries". This can only be prevented by either the US further reducing its acreage under cotton effectively to lower production—which seems improbable, despite the success of the Soil Bank programme—or by all the countries interested in cotton, whether as exporters or as importers, meeting at a world conference to thrash out this intriguing problem.

In any part of the world where English is understood men and women in search of factual information on current affairs will instinctively turn to KEESING'S for rapid reference or leisured reading.
Wherever you see a volume of KEESING'S, there you will find people fully au courant with contemporary Politics, Economics, Social Questions the world over.

● ● ● ***because***

The famous KEESING'S, specially designed for quick reference, is the unbiased documentation of present-day developments **on a global scale:** completely objective, scrupulously accurate, permanently up-to-date **(through the addition of a fresh supplement every week),** and scientifically indexed for ease of reference when filed in the special binder.
The publication is neither costly nor clumsy. It looks back upon 25 years of specialized experience in authentic recording of world events and previous volumes are still available. A light-weight edition of the current service is obtainable by Air.

BUSINESS NOTES

SUGAR DEVELOPMENT COUNCIL MEETS

A GOOD deal of light was thrown on various aspects of the sugar industry when the Development Council for the Sugar Industry met in Walchandnagar (Poona) last week-end (January 12). While the need for raising the production target for the sugar industry for 1957-58 was generally accepted as being within the easy reach of achievement and, was, therefore, fully justified, the equal urgency to explore fresh avenues, especially in reference to certain technical matters, as, for instance, increasing the sugar content of the standing cane crop, pre-harvest special spraying with a view to accelerating the maturity for the cane, was not overlooked.

The Development Council began by first approving of a plan for the sugar industry for 1957-58, which aims at a production target of 2.16 million tons, the estimated production during 1956-57 being 2.05 million tons. For the materialisation of this plan, the installed capacity of the industry is required to be raised by 0.35 million tons, and this is expected to be brought about by providing for the establishment of 22 new factories and the expansion of 17 of the existing factories. This scheme of setting up new units and expansion of old ones is estimated to entail an additional investment of Rs. 24 crores, Rs. 19 crores on new factories and Rs. 5 crores for purposes of expansion of existing (active) units. Although the increase in production aimed at is only 1.1 lakh tons thus, it remains to be seen how far this will be achieved in view of most of the new factories being co-operative units.

Two other important questions which the Council spotlighted related to the encouragement of exportable surplus of sugar and the issue of having uniform wage scales and allowances to workers in the sugar industry. As regards exports of sugar, it was disclosed at the meeting that the Government of India have, on the recommendations of the sub-committee of the Development Council for the sugar industry, decided to allow exports of sugar up to 50,000 tons for the present. The export of any commodity at this time of scarce foreign exchange is to be welcomed and encouraged. Moreover, the time is propitious now. According to the Joint Secretary of the Union Ministry of Agriculture, Mr. Puri, who addressed the Council, exports of sugar could now be attempted without any loss; until lately, sugar from India could only be exported at a loss of Rs. 4 to Rs. 5 per maund after allowing for the rebate of excise duty. The Council, naturally enough, commended this decision of the Government.

Examining the question of providing uniform wage scales, it was suggested by the Council that a sub-committee be set up to study the problem. In this connection, however, Mr. Puri, drew pointed attention to the proposal to set up a tripartite wage board on an all-India basis for the sugar industry, with an independent chairman, three independent members and three members representing both employees and labour. He further observed: "The proposal from the Labour Ministry which has been concurred in anticipation of the approval of the Council, it is hoped, will go a long way in removing the inequalities and improving the relations between the employers and employees of the industry which is so necessary for raising efficiency".

On the production front also, the performance of the sugar industry has been quite encouraging, especially following the prolonging of the season in parts of the Punjab, the U.P. and Bihar which enabled the industry to produce in 1955-56, 50,000 tons more than in the previous season. In furtherance of this expanded production, a policy of licensing additional capacity has been followed. It is proposed to do this by both setting up new factories and expanding existing factories. It is relevant to note here that the grant of licences for new new units in sugar industry has been reviewed and that 54 new factories were licensed, as many as thirty-eight of these being established as growers' co-operatives. As a result of these measures, it is expected that the sugar industry would be able to report a production of the order of 25 lakh tons per month by the end of the second Plan.

Production of sugarcane, so important for the development of the sugar industry also has been quite promising. The development work "is proceeding satisfactorily" observed Mr. Puri. As a result of the development schemes during the first Five-Year Plan, the per-acre yield in the development zones went up to 30 per cent. It is now proposed further to intensify this development programme to cover the entire sugarcane crop by 1960-61.

Soil survey too figured in the discussions of the Development Council, even as it did at the 22nd meeting of the Indian Central Sugarcane Committee at Dalmianagar towards the end of December, 1956. Referring to the need for undertaking soil survey work, Mr. Puri drew pointed attention to the work done in this behalf by the trained staff of the Indian Institute of Sugarcane Research, Lucknow and commended the utilisation of their services to sugar factories.

PROGRESS IN RAIL TRANSPORTATION

THE GENERAL Managers of Railways who meet periodically to take stock of the situation had a reassuring report of progress to tender at their conference held here last week-end. The detailed review of transport position on individual railways revealed that measures for improving operating efficiency were achieving success gradually. Scientific loading of wagons was being introduced at points of high traffic density and better loads per wagons were being secured. Open wagons now being used more intensively with tarpaulins for larger volumes of goods were adding to available capacity, steps were being taken to ensure maximum loads on trains, the period of detention in workshops for repairs was being systematically reduced and working efficiency of wagon chasing organisations was being raised. While these general assurances of improvement in load carriage and capacity are encouraging in themselves, statistical measurement of performance would have helped to give a tangible idea of progress actually recorded. Sustained strides in operating efficiency is an integral part of the drive for securing larger transport capacity and it is to be trusted that additional measures of qualitative improvement will be put through when the report of the American team of experts is made available.

This progress, however, is capable of bringing only a modest addition to transport capacity. The review made by the General Managers discloses that handicaps in physical resources are proving difficult to be removed. Steel, especially, is in short supply. It would appear that proposals to expedite imported supplies of cheap steel which were explained last year to the Estimates Committee have not been implemented. In consequence, a number of expansion projects were being delayed. It is rather disturbing that this stalemate is arising at a time when a general feeling prevails that the programme of imports of steel has been accelerated somewhat with impatience without

full regard to its inflationary effects. Delays caused by dilatory procedure for indenting of stores and devices to use substitutes for materials in short supply are of secondary importance. The hard core of the present difficulties cannot be resolved by palliatives. The process of setting up planning cells in each railway right up to the divisional level is under way. This is indeed a step in the proper direction. Assuming that these cells function with alertness and keep the Railway Board continuously posted with periodical progress, the Railway Board will find its hands strengthened in the fight for resources which it will inevitably have to wage ceaselessly in the second Plan period.

STEPPING UP JUTE PRODUCTION

THE PLANNING COMMISSION envisaged a target of 5 million bales by 1960-61 for raw jute which represented an increase of about 25 per cent over the estimated production of 4.1 million bales in 1955-56. But after the conference of States Ministers of Agriculture at Mussoorie, and subsequent discussions of the Planning Commission with the States, revised targets were arrived at for agricultural production and consequently the target for jute was raised to 5.5 million bales. The estimated requirements of the industry are 7.2 million bales and so even with the increased target, it is obvious that self-sufficiency is not obtainable. The Jute Enquiry Commission stated that the objective of the 'grow more jute' campaign should be attainment of relative rather than absolute self-sufficiency and that the shift in emphasis should be towards intensive cultivation rather than cultivation on a widely dispersed basis.

The position of the jute industry in this country is rather vulnerable, thanks to the competition of Pakistan and countries like Egypt, Iraq, Iran and Burma, which have established small local units, which may affect India's exports. There is hence need for increasing her competitive capacity by modernisation programme and less dependence on imports. On the other hand, there has been a significant rise in internal consumption of jute goods consequent on the higher level of agricultural production and the larger output of sugar, cement and other products.

In view of these, it is, therefore, only proper that the recent conference held at New Delhi on promotion of jute production, should reiterate the revised target and bestow attention on the various measures necessary for the promotion of jute production. These include improved strains of seeds, better cultural practices, line-sowing by seed drills, inter-culture by wheel hoes and judicious application of fertilisers. Dr. Punjab Rao Deshmukh referred to the fact that in China, 150 lbs. of ammonium sulphate and 100 lbs. of super phosphate per acre was the minimum quantity which a cultivator wanting to have a good jute crop used. The Conference, therefore, decided that 50 per cent of the area under jute should be fertilised by the end of the second Plan period. It was also a timely move to have decided to appoint a whole-time co-ordinating officer who will co-ordinate the requirements of each State and assist them in their planning in respect of improved seeds, seed drills, and wheel hoes, manures and fertilisers and plant protection equipment. It is right that the Government's policy on raw jute is placing greater emphasis on quality and intensive cultivation which is what the Enquiry Commission recommended as a priority objective.

FILLIP TO SMALL INDUSTRIES

THE DELIBERATIONS of the Small-Scale Industries Board at Madras last week brought to focus a major defect in the development of small-scale industries, namely, the inadequacy of the field staff at the execution stage. The Chairman of the Board drew attention to the fact that though the Central Government had offered to meet 50 per cent of the expenditure on account of the additional staff appointed by the State Governments, the progress achieved in this direction in most of the States had not been "very encouraging". Progress in the starting of institutes for small scale industries, branches and extension centres had also been rather slow again due to a lack of technical staff. Another difficulty has been the delay in getting the equipment and machinery required for these centres. Added to this is the fact, which the Chairman himself admitted, that the progress of the schemes for small-scale industries in certain States "has not been very heartening."

All these must make one sit up and shed some of the complacency that seems to govern the approach towards small-scale industries development. The second Plan has assigned a 'strategic' place for the small industries not only with a view to providing opportunities for greater employment, but for meeting the rising demand for consumer goods so that the scarce resources of foreign exchange and essential materials may be concentrated on the stepping up of expansion of heavy industries. But great caution is necessary in switching on to a new pattern in the production of consumer goods which will throw up a number of problems hardly thought of adequately before. This not only relates to trained personnel and supply of tools and implements, but a host of others like provision of credit, marketing, facilities for research and so on. The greatest handicap is in the matter of finance where it is necessary to make loans available on a long-term basis and at a low rate of interest. Suitable help must also be given in the matter of procurement of raw materials. It is, however, gratifying to note that the National Council of Applied Economic Research has undertaken a planned research study on marketing. While some of the Government's efforts in the direction of encouraging small industries are commendable (as for example, the proposal to have by the next financial year one major institute for small industries in each State) it is necessary to utter a note of caution that any hasty move towards decentralisation as an ideology without the proper equipment to tackle the various problems that would crop up may cause a setback which would result in shortage of consumer goods and high prices. There is hence need for considerable vigilance and less haste in this sphere so that sentiment may not outrun realism.

BICYCLE INUDSTRY MAKES STRIDES

THE INDIGENOUS bicycle industry has done remarkably well during the period of the first Five-Year Plan. It was visualised by the Planning Commission that by the end of the first Plan the rated capacity and the actual production of the bicycle industry would increase to 530,000 numbers as against a capacity of 120,000 and a production of 101,136 cycles in 1950-51. Actually the targets have been far exceeded. The production of bicycles in 1956 is now estimated at over 6,15,000 as against 491,000 in 1955 and 3,72,000 in 1954 and these figures do not include the production of the small scale sector. In 1951 there were only two units engaged in the manufacture of bicycles, but now there are 63 large and small factories. Of these 16 are in the Punjab, 13 in Delhi, 8 in Bombay, 7 in U.P., 6 in West Bengal, 5 in Madhya Pradesh, 4 in Rajasthan, 2 in Madras and one in Bihar. The industry has now stabilised itself to a degree, where given favourable circumstances to function and expand, it will not only be in a position to meet fully the requirements of the expanding economy of the country but even to contribute towards exports.

COMPANY AFFAIRS

THE INDIAN CABLE CO., LTD.

The results of the Company's trading during the year ended March, 1956, are satisfactory. The net profit (before providing for taxation) for the year amounts to Rs. 1,21,59,493, which is Rs. 44 lakhs more than that of the previous year. This has been attributed mainly to an increase in the sales of the order of more than 23 per cent. Of the profit for the year, Rs. 68 lakhs is absorbed by taxation and Rs. 10 lakhs have been transferred to Basic Stock Reserve. The continued rise in replacement costs of plant and machinery has prompted the Directors to create a reserve on this account and an appropriation of Rs. 5 lakhs has been made for the purpose. An amount of Rs. 7,16,495 has also been provided for Employees' Retiring Gratuities. In view of the expansion in production and consequently increased volume of business, the Directors have added Rs. 3.50 lakhs to the Reserve for Bad and Doubtful Debts.

As a result of increased profits for the year, the Directors have recommended a dividend of 12½ per cent and a cash bonus of 2½ per cent, free of income-tax. The unappropriated balance of profit, after deducting the proposed distribution for the year under review, amounts to Rs. 3,05,752. Adding to this the balance brought forward from the previous year of Rs. 28,98,462, it totals Rs. 32,04,214. This amount is to be carried forward. The most prominent features in the balance sheet are the increase in the values of Fixed Assets as a result of factory expansion, in Book Debts as a result of increased turnover and in the value of Factory Stocks which have had to be maintained at a higher level because of the increase in production.

There were no serious shortages of raw material, but considerable difficulties were experienced with supplies or coal and the congestion in the docks and restriction of rail movement created difficulties in maintaining a continuous flow of raw material to the factory. There was wide fluctuation in the price of copper which touched the peak figure of £438 a ton as against £328 which was the average L.M.E. settlement rate for April 1955. The taking over on January 1, 1956, from British Insulated Callender's Cables Ltd., of their entire selling and engineering organisation constituted an outstanding change in the activities of the Company. Also, satisfactory progress is being maintained in the scheme of expansion on which the Company has embarked. The Rod Rolling Mill, P.V.C. Insulated Cable plant, Rubber Cable factory, production of Paper Insulated wires and strips for transformer windings, manufacture of fully synthetic copper wires with a vinyl acetyl base, etc., all these have either commenced production or are in various stages of development.

McLEOD & CO., LTD.

The Company's accounts for 1955, which are now available, show that the profit for the year has registered a substantial improvement by comparison with that for 1954, due chiefly to improved results from Engineering department and an increase in dividend income. Revenue from the Jute, Tea, and Insurance departments was lower than for the previous twelve months and the shipping department figures were again disappointing. The Agency department shows a loss for the year.

The profit for the year amounts to Rs. 31,89,815 and adding the previous year's balance, etc., it amounts to Rs. 33,79,734. Out of this, the Directors have made a provision for taxation amounting to Rs. 10 lakhs and have set aside Rs. 3.50 lakhs for general reserve, Rs. 3.35 lakhs for investment reserve and Rs. 2 lakhs for convertible notes redemption reserve. From the balance of Rs. 14,94,734 are to be deducted two interim dividends for the year on 10,000, 5 per cent cumulative first preference and 40,000, 5 per cent cumulative second preference shares totalling Rs. 2.50 lakhs, leaving a balance of Rs. 12,44,734. From this, the Directors have recommended payment of dividend at 22½ per cent per annum on 40,000 ordinary shares (or Rs. 22-8 per share) absorbing Rs. 9 lakhs, and 17½ per cent dividend on 50,000 deferred ordinary shares (or Rs. 1-12 per share) for the year, absorbing Rs. 87,500. The balance of Rs. 2,57,234 is to be carried forward.

THE BANK OF INDIA LTD.

The profit of the Bank for the year ended December, 1956, after making the usual provisions for contingencies (subject to audit) amounts to Rs. 1,05,029,924, which includes Rs. 13,26,630 being the amount brought forward from the previous year's account. Out of this amount, provision for income-tax and super-tax has been made at Rs. 28 lakhs. An interim dividend at the rate of 6 per cent, free of income-tax, for the half-year ended June 30, 1956, absorbed Rs. 15 lakhs. That leaves a balance of Rs. 62,29,924 available for distribution.

The Directors have proposed to pay a final dividend at the rate of 10 per cent, also free of income-tax, making 16 per cent for the year, which will absorb Rs. 25 lakhs. A sum of Rs. 8 lakhs has been placed to the Bank's Reserve Fund. There thus remains a balance of Rs. 29,29,924 which has been recommended to be carried forward subject to the payment of a bonus to the staff.

COMMODITY NEWS AND NOTES

RAW COTTON IMPORTS

It has been decided to continue to issue licences for imports of raw cotton stapling 1-3 16 inches and above from soft currency areas, during the current licensing period according to an announcement of the Joint Controller of Imports in Bombay. Licensing will be done on "first come first served" basis within a limited ceiling, the announcement added.

COAL RAISINGS AND DISPATCHES RISE

The raisings of coal from all fields in India during November 1956 rose sharply to 3,324,817 tons from the low level of 3,189,299 tons in the previous month. Total despatches from all mines also improved from 2,931,116 tons in October to 3,028,160 tons during the month under review. Total output of coal in the first 11 months period 1956 was placed at 35,640,000 tons compared with 34,810,000 tons in the same period of the previous year. The despatches were also higher at 31,910,000 tons compared with 30,120,000 tons in the 11 months ended November 1955.

EXPORT OF MILL MOLASSES

Export of mill molasses will continue to be licensed freely to all permissible destinations excluding Portuguese possessions in India against the unutilised portion of free quotas released previously. A press note issued by the Joint Chief Controller in this connection says that licensing will be done up to the end of December 1957 or until the ceiling is exhausted whichever is earlier.

INDIA GETS MORE CLOTH FROM UK

Exports of British cotton piecegoods to India, Pakistan and Ceylon rose last year compared with the two previous years, according to Mr. Frank S. Winterbottom, Chairman of the Indian Section of the Manchester Chamber of Commerce. He said exports to India expanded by 3,600,000 yards and to Pakistan by 3,300,000 yards. The trade with Ceylone rose by 300,000 yards.

PENICILLIN IMPORTS RISE

The value of penicillin and its products imported into India recorded a sharp increase from Rs. 9,400,000 in the first seven months of 1955-56 to Rs. 11,300,000 in the corresponding period of current fiscal year, according to official figures. The value of these imports in the whole of 1955-56 was Rs. 17,900,000 against Rs. 14,700,000 in 1954-55.

RISING DEMAND FOR ELECTRIC FANS

The demand for electric fans in India is steadily increasing. In 1956, the production of electric fans is estimated to have risen to 337,000 from 282,000 in 1955, 236,000 in 1954 and 206,000 in 1953. The industry is mainly concentrated in West Bengal. Of 19 organised units in the industry, 11 are located in this State, four in Bombay, three in Delhi and one in Uttar Pradesh.

RISE IN TEA EXPORTS

Tea shipments from major producing countries, India, Pakistan, Ceylon and Indonesia, in the first nine months of 1956 were higher at 681,720,000 lbs. compared with 566,110,000 lbs. in the same period of the previous year. Of the increase of 117,610,000 lbs. in shipments, more than 100,000,000 lbs. were absorbed by the UK which took 373,890,000 lbs. in the nine months ended September 1956 compared with 272,980,000 lbs. in the corresponding period of 1955. On the supply side, an increase of more than 100,000,000 lbs. was recorded by India alone, total shipments rising from 250,510,000 lbs. in the first nine months of 1955 to 350,950,000 lbs. during the period under review.

MANGANESE ORE EXPORTS DECLINE

At the prevailing high rates, Indian manganese ore is being priced out of the world market, it is learnt. The average export-price of manganese ore in October 1956 was Rs. 200 per ton compared with Rs. 115 in the corresponding month of the previous year. Total shipments of manganese ore from India during the seven months ended October 1956, however, were lower at 359,349 tons compared with 812,906 tons in the same period of the previous year.

CAR OUTPUT IN CANADA

Canada produced a near record number of cars in 1956 and the outlook for the industry is regarded as favourable. The year's total of 472,703 cars and lorries was second only to 1953 aggregate of 481,000 units. Sales for 1956 are estimated at nearly 500,000 cars and trucks with a total retail value of $1,400 million.

CHILE COPPER OUTPUT UP

Copper production in Chile for the year 1956 increased to 443,166 metric tons from the previous year's 390,942 tons. It is expected that the 1957 total could be 500,000 tons or more if no adverse price factors supervene.

US RUBBER ESTIMATE

The US rubber industry should make record sales of $6,000 million in 1957 and reach an annual rate of $7,000 million by 1960, Mr. H. E. Humphreys, President of the US Rubber Company, forecasts. "Passenger car and truck tyre sales will total about 100 million units, compared with an estimated 98 million units for 1956" he predicts.

WORLD OUTPUT OF TIN METAL LOWER

World production of tin metal during October fell 800 tons to 15,200 tons. But consumption in the two main consuming countries, the UK and the US increased during the month, according to figures published by the International Tin Study group. The decrease in tin metal output occurred mainly in the three largest smelting countries, Malaya, Netherlands and the UK.

RECORD OUTPUT OF UK WORSTED YARN

UK deliveries of worsted yarns during last November were at the highest rate since the war. Most other sections of the wool textile industry were also more active during that month according to figures released by the Wool Industry Bureau of Statistics. The rate of delivery of worsted yarns rose by 3 per cent during the month to reach a post-war peak. The previous peak, November 1955, was exceeded by 2½ per cent.

DECLINE IN US CRUDE OIL STOCKS

US stocks of domestic and foreign crude petroleum continue to decline. At the close of the week ended January 5, stocks totalled 259,983,000 barrels compared with 264,241,000 for the preceding week and 260,098,000 barrels for the same period last year. Domestic supplies totalled 248,362,000 barrels down 3,711,000 barrels from the previous week—and foreign supplies dropped 547,000 barrels to 11,621,000 barrels.

Republic Day 1957

REPUBLIC Day should be a day of reckoning as well as a day of rejoicing. It is right that there should be imported into the reckoning a prospect of the future; for nations endure, not for seven years, or even for seventy, but for seventy times seven. It should matter little to those of our generation who are spending themselves in the building of a new India that the reward for their efforts will be found in the lives of many generations to come. For that, indeed, is the meaning of dedication; and, as Mahatma Gandhi showed, it is only out of [illegible]on that there comes life and life more [illegible].

It matters [illegible] of too much, that there are many flaws [illegible] with some outstanding successes since the Co[illegible] was ushered in on the 26th January, 1950. It is right that we should look critically upon the flaws as well as with pride, and humility before God, on our successes. It is not right, however, that we should be cast down by our failures or so elevated by our successes that we are unable to recognise that the major tests of the

Indian Union are still to come. In these brief seven years since the Constitution came into force, we have had only a preliminary canter. The race is still to be run.

No one need assert that the international problems of the Indian Union are nearer solution on this Republic Day. The discussion on Kashmir in the Security Council is bound to raise the question whether our status in the counsels of the world is as high as current Indian opinion too readily believes. Prestige is a dangerous word. It comes and goes with the wind, and it may well be that the courting of other nations — which has been spasmodically and inconsistently done — will need over the next twenty years to receive far more sustained attention than a heavily over-worked Prime Minister and an understaffed Ministry of External Affairs has hitherto been able to give. One can look upon our international course with moderate satisfaction, but with no conviction that our present views are necessarily in the national interest. The Kashmir debate seems to indicate that what we have won on the swings may well have been lost on the roundabouts.

Again, just as Kashmir highlights the extent to which Indian political views are called in question abroad, the orders recently issued in regard to restrictions of imports and utilisation of foreign exchange should have a disturbing effect within. There is no doubt that the recent management of our economic affairs has not been conspicuously successful. Many gaps needed to be filled before a large-scale steel import programme was initiated; the process of correction is likely to be a difficult one even if the World Bank, which has been unduly hesitant in according to India its proper place in loans for economic development, had played a proper and prompter role. It may be that the error in this respect is not entirely with us, but the fact remains that a foreign exchange crisis has been imposed on the Indian Union at an early stage of the Plan. The Government of India cannot be held solely responsible for this course of haste, which represents a true imperative in the minds of the Indian people. If the Indian people ardently desire a rate of economic development which they cannot afford — either because of the shortage of foreign exchange or of the inflationary impact within — they must be willing to pay the prices, and to arrange corrective action in their own lives. Almost certainly the only answer is harder work and greater production of consumer goods. And there is really no answer to our foreign exchange problem in the longer period except production at a significantly lower cost so as to expand our exports. In the shorter period, we will need to be a little more zealous in finding helpful friends abroad. At the present time, both our short and long-period policies are inadequate. If we cannot, over the next twelve months, make a substantial advance on exports, an important programme to sustain total development expenditure in 1957 in all of Rs. 900 crores, bravely planned, will not come into effect. The consequences of this set-back are difficult to estimate.

In the twelve months preceding this Republic Day the country has passed with eclat from the first Five-Year Plan to the second. Although the second Plan got off to a good start from April last, the nine months that followed saw more than one crisis with a direct or indirect impact on the working of the Plan itself. The clouds that gathered over Suez and the blockage of the Canal had (and continue to have) their serious repercussions on this country's foreign trade. The foreign exchange gap widened and the Rs. 200 crores of our sterling balances earmarked for withdrawal over the second five-year period were largely drawn down by December last. The general index of wholesale prices rose sharply from 376 in January 1956, to 428 in December last, and the cost of living index (base: 1949=100) from 97 in January 1956 to 110 in November last. The General Index of Variable Dividend Industrial Securities registered a steep fall from 129 in September last to 113 in January this year.

But these adverse trends may be taken as having been offset, to some extent, by rising industrial production in the past year. The average rate of industrial advance might be reckoned at about 10 per cent per annum against 8 per cent in 1955. The General Index of Agricultural Production, on the other hand, did not record any rise from the 1954-55 figure of 122; it was, however, redeeming that it stood at 120 in 1955-56 which meant that the country had a good agricultural season for the third year in succession. By and large, the tempo of development expenditure created its own opportunities in some directions and its own problems in others.

Thus it is that there are disquieting features both in the political and economic fields. Too little is known of the technical character of our difficulties, whether in international events or in economic affairs, for the great mass of the people who are to cast their votes in the coming elections to judge issues such as these. But there is already a restlessness in the air. The elections themselves present a large domestic problem, for it is clear that the Congress Party, whose prestige seemed to be at its height a year ago, is being called seriously into question in many States of the Indian Union. What might be worse is that those who have seen the giving of tickets in operation for the last three weeks from the Congress High Command's centre of authority in Jantar Mantar Road, New Delhi, have felt a sickening of heart of what must be least edifying spectacles in the history of this organisation. Men and women of the Congress Party have shown a degree of subservience, jealousy and pettiness which seems very foreign to the Congress heritage and the great Gandhian Age.

It would be a mistake, however, because of reverses such as these, to take a bleak view of the future of this great country. It has shown down the years the capacity, when many individuals have failed, to rise in a grand impersonal way above the lowest common denominator of seekers of power. In the Gandhian Age, it was this tremendous impersonal performance of the Indian people which bore the moral stamp of the country to a victorious conclusion. There is time, and there is opportunity, for a great new age of dedication to overtake what is small and petty and mistaken in the Indian scene. There is potential leadership too. One may hope that with the desperate need of the hour, there will also come the men who can give feeling to this amorphous mass of goodness, which came to life so vividly in our great Gandhian Age.

A Voluntary Code

FREE enterprise in India has now awakened to the realisation that its case stands threatened by default if it fails to cultivate informed public opinion on its legitimate place in the economy. In the post-independence period, and most significantly since Avadi, the popular attitude reflected in political speeches has tended to look upon the efforts of business men with a mixture of cynicism and distrust. The fact that the private sector has delivered the goods in production while the public sector has lagged is often forgotten. In India, as in many other democratic countries, free enterprise has been the major force behind the dynamism in the national economy. It is paradoxical that its contribution in the past as well as in the present should be overlooked so easily and its absolute value to the growth of a free society should be ignored. The paradox springs from a misconceived notion of the role of the State in economic activity and an erroneous assumption of the incompatibility of private enterprise with a welfare society which is accepted in this country as the goal to be achieved.

The socialist order of society often continues to be identified in the popular mind with nationalisation of the means of production, notwithstanding the fact that the political and economic context in which nationalisation came to be regarded as an indispensable condition of the achievement of socialism, according to its protagonists, has now lost its relevance. Nationalisation was advocated as the only effective means to ensure social justice. This reasoning may have carried some force when equitable distribution of wealth, elimination of unjustifiable disparities in income, provision of conditions of work consistent with normal standards of human dignity and similar purposes could not be secured except by ownership of the instruments of production in the hands of the State. But in democratically governed countries where the will of the people can be made supreme these objectives can be attained by legislation.

This is not a matter of mere alternatives: it is now tested by experience. Nationalisation in operation has demonstrated all the weaknesses which retard progress in industry — lack of initiative, flexibility, capacity for quick decision and, above all, readiness to bear risk. The conviction that nationalisation is the core of a socialist society is being abandoned and socialist thinking as well as practice are veering round to the view that it is by no means an indispensable ingredient. This spectacular philosophic change has followed the experiment of nationalisation in the United Kingdom and elsewhere. In India too, where Parliament, elected on adult franchise, wields sovereign power, fiscal and industrial legislation of a regulatory nature can secure the desired ends. The industrial policy statement and the Prime Minister's numerous pronouncements in recent weeks now give an assurance that the approach to socialism will be pragmatic; but this is pragmatism with a strong bias.

The Forum of Free Enterprise which appeared on the Indian scene six months ago has taken upon itself the task of interpreting the essentials of free enterprise in the prevailing mood of the community which renders it none too easy. Since its manifesto was released in mid-July last it has done valuable service to the nation by explaining the creed of enlightened private enterprise in New India. Free enterprise as voiced through the Forum holds that democracy is an integral part of the Indian way of life and that free enterprise is an inseparable part of democracy. Free enterprise, therefore, has a place in Indian life by its own right and not on grounds of expediency. Free enterprise accepts planned development of the economy which, in unequivocal terms, means that it willingly accepts all reasonable regulation of its activity to fit into the broad frame-work of development plans from time to time. It believes in social justice and equality of opportunity. It thus becomes by its own choice an enlightened instrument willing to contribute its mite to the progress of the community. It can, as in the United States, attain the welfare State.

The Forum is not unaware of the existence in the ranks of free enterprise of anti-social elements. These constitute but a part. Although the popular tendency to decry the entire free enterprise for the misdeeds of a few is to be deprecated, the Forum takes the correct attitude that a campaign of reform from within must be instituted with vigour and drive. It is easy to argue that a decline in ethical standards is a universal phenomenon in the post-war era, but the Forum desists from a course of extenuation. It is proper that Indian free enterprise should adopt this introspective attitude and respond to the Forum's call for standards and dedication. The call comes in the form of a Code of Conduct for Free Enterprise which it has issued with an appeal to the business community to rise to the occasion. It is hoped that there will be a good response.

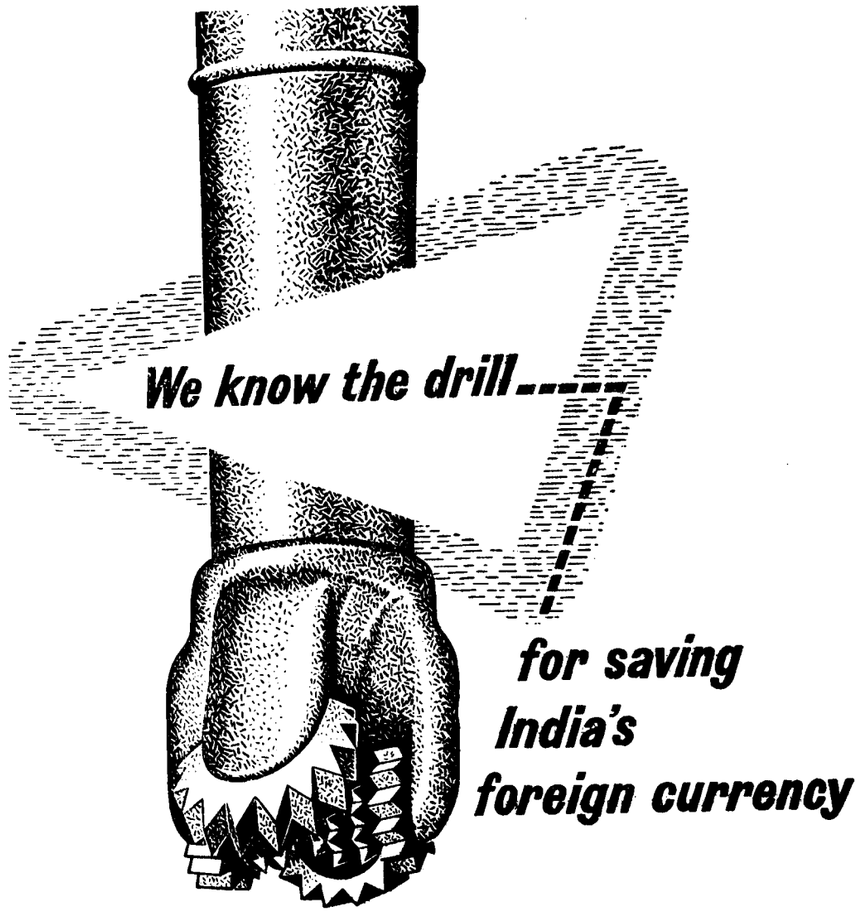
The Code enjoins on each wing of free enterprise obligations appropriate to its role. It calls upon producers and distributors to pay scrupulous attention to the maintenance of standards of highest quality and to charge reasonable prices. It appeals to employers to adopt a policy of fair wages, procedures for removal of legitimate grievances to ensure fair deal to workers and joint consultation as well as labour's progressive association with management to promote productivity. It enjoins on the management the duties of ensuring fair return to the investor and efficient discharge of its functions as a custodian of company reserves. It must redeem its reputation as a class by curing itself of the malpractices which have eaten into vitals, but in laying this obligation the Code issues an indisputable reminder that honest business practices can be promoted in a democratic State by an honest and efficient administration. It urges professional men to uphold the highest standards and traditions in the discharge of their duties. Finally, it condemns tax evasion and exhorts every member of the business community to bear his share of taxes honestly.

This is a good first effort to sustain an internal movement of moral reform. Legislation can never be an adequate and effective substitute for it. Here is an opportunity and a challenge. Freedom of enterprise is one of the most vital freedoms in a democracy. Let free enterprise fight for the preservation of this freedom, but even more let it show that its performance matches its precepts.

India, Syria and the Middle East

THE visit to India of President Shukri Al-Kuwatly of Syria, the third by a leader of the Arab world in recent years, assumes more than ordinary significance because of the disquieting situation obtaining in the Middle East. It is rather strange that the joint statement issued by the President of Syria and the Prime Minister has not touched upon this problem directly. To be sure the statement re-affirms the Bandung principles, which as first principles are acme of good conduct of international affairs. But the statement completely ignores the special problems that have recently arisen in the Middle East and demand immediate attention. "A military approach to the problem of this area" will no doubt "only serve to create further disharmony and instability". But there seems no evidence in the statement of readiness to own responsibility for the nagging problems that call for immediate solution if the danger involved in reliance on military means alone is to be avoided.

Speaking at the civic reception held in his honour, President Kuwatly was more frank. He observed that the conception of "power vacuum" in the Middle East was a "fantastic proposition". To him it would thus seem no problem really exists in his or other Arab countries. While reciprocating the Syrian President's sentiments, Mr. Nehru asserted that the peoples of the Middle East should be allowed to fill the "power vacuum" by their own "inherent strength and power". The Prime Minister's view was therefore not quite the same as that of the honoured guest.



Doubtless, the problems of the Middle East could be ideally solved if the people of that area were really in a position to develop in accordance with their own genius and tradition. But, as the Syrian President himself admitted, even "Syria whose own sources for defence were not adequate, has naturally to look for help from other sources". So the question is not whether the "power vacuum" is to be filled by an outsider or the people themselves, but whether the latter could do so in their present state and in the circumstances now vitiated by the tremendous growth of influence of the Soviet Union. To assert that the problem does not exist or that it can be exclusively solved by the Arab countries themselves is to fly in the face of facts. The blunt truth is that if the Middle East countries were left entirely to their own resources, they may not long be left free.

Russia, which has always coveted influence in this area, has suddenly gained tremendous prestige as a result of the short-sighted and clumsy policy of Britain and France. The Kremlin rulers have already begun dangling economic aid before the people of the Middle East and profess support for Arab nationalism. And Europe has certainly a stake in what happens in the Middle East. Astride the Middle East, the Russians can not only strangle the economy of Western Europe by cutting off vital oil supplies, but can also dictate terms to nations this side of the Suez. Even otherwise, the Soviet ground, naval and air forces are already in close proximity to the Middle East. These forces are of the size, and are so located. that they could be employed for occupation at any time with a minimum of warning. This fact is nothing new; only it has assumed sinister significance as a result of the disappearance of the Anglo-French "protective shield". The closing of the Suez Canal has seriously affected the Egyptian economy; Syria is in no better shape because of the closure of the pipelines and the consequent stoppage of its royalties; Saudi Arabia's national finances are also in a mess due to the current sharp drop in oil royalties. The total effect of these political and economic factors, according to Dr. Charles Malik, Lebanon's Foreign Minister, is that "the position about the Communist infiltration has worsened in recent months."

It is primarily for this reason that the Eisenhower doctrine seems to have been conceived. Through it the United States has underwritten the continued freedom and economic well-being of these countries. The military protection offered is aimed not at dominating but defending the areas, as President Eisenhower has re-affirmed. Such measures "would have to be in consonance with the treaty obligations of the United States, including the United Nations Charter," and any United States action "would be subject to the over-riding authority of the Security Council". It would thus appear that the United States does not intend to supplant the United Nations or to overthrow sovereignty. As at present constituted, the United Nations cannot possibly perform certain functions. Its impotence was exposed on the question of Russian aggression in Hungary.

The Eisenhower Plan ought to deter the Soviet Union or, by implication, any other potentially aggressor country. Similar action by America as applied to Formosa and to Western Europe through NATO, has not been challenged. There is, however, no denying the fact which Mr.Gaitskell has explained that the Eisenhower plan does not deal with the root causes of the Middle East crisis — the Suez Canal question, the Arab-Israeli relations, and ever-present possibility of subversion by Communism. It were these running sores which gave Russia the chance to thrust its power and influence into the area.

The major weakness of the American approach to the Middle East problem is its failure to give due priority to the economic development of the area. The Prime Minister was unmistakably right when he pleaded for the formulation of economic measures of a helpful nature to eradicate those conditions which make Communism an attractive alternative. To be sure, Russia is not likely to precipitate a war for the domination of the area, knowing that this would mean global atomic war. In fact, it has already changed its strategy in deference to the atomic stalemate. Its policy is internal subversion through economic aid and political support to Arab and Asian nationalism. This is obvious from the fact that a total of 800 million dollars worth of credits on easy terms has been granted to nine countries since the "rouble offensive" was launched some two years ago. Perhaps, only a generous offer of economic aid without political strings can disarm the critics of the Eisenhower plan. If that aspect of the plan gets eclipsed by overmuch emphasis on its military aspect, the fears of the Afro-Asian peoples will be strengthened, and may thus open the flood-gates of Communist infiltration and subversion.

Oil from abroad costs valuable foreign exchange. Oil from inside India saves it. And we must have ever-increasing quantities to cope with the expansion of industry and agriculture.

Scientists and engineers are keeping Assam's oil industry working at full pressure to produce as much oil as possible from our own oilfields. Additional wells are constantly being drilled, yet even in an established area they are not always productive; in spite of modern knowledge and equipment, successful drilling still remains something of a gamble.

But no effort is spared to find oil and turn it into the fuel, lubricants and by-products which are so vital to the progress and prosperity of India.

FORUM OF FREE ENTERPRISE

CODE OF CONDUCT

This Code of Conduct for Free Enterprise has been prepared by the Forum of Free Enterprise and is now placed before industrialists, business men and those belonging to different professions and vocations in India in the belief that they will find it worthy of acceptance and of application in their daily activities. The Forum pledges itself to do all it can to create a widespread awareness in the ranks of Free Enterprise of the obligations that are contained in this Code. We feel that Free Enterprise, which has been tested and proved by time and experience of all democratic societies, should maintain its reputation by insisting on high standards of integrity which are dictated by social purpose. Honesty, hard work, courtesy and continuous initiative are the foundations on which the edifice of Free Enterprise rests.

PRODUCERS and distributors owe it to the consumers of their products that they shall always be of the highest quality and available at reasonable cost. They shall maintain fair measure and guard against adulteration. Customers are entitled to courtesy, promptness and good service, and every endeavour shall be made to see that they receive them.

EMPLOYERS owe it to labour to recognise that welfare is not conceived in terms of philanthropy, but as a social obligation. Men and women engaged in production shall do so with dignity, honour and a sense of security. Fair wages should be paid for work done. Working conditions shall be as pleasant as possible. Opportunities should be made available for the worker to gain technical skills and better his economic prospects and social status. Procedures should be instituted for the removal of legitimate grievances so that the employee is satisfied that he gets a fair deal. The employers should welcome the existence of stable and democratic trade unions. They should recognise that in the sphere of employee-management relations, as in other spheres, checks and balances are essential for the working out of rational and democratic solutions. They should accept the role of labour as one of creative co-operation and recognise the need for providing increasing opportunities for consultation of employees and their progressive association with Management to help in the promotion of increased productivity from which all will benefit.

MANAGEMENT owes it to those who invest in their enterprise that they receive a fair return on their investments commensurate with the risk they take. At the same time, reserves must be created for expansion and modernisation of the plant and machinery and in their utilisation the Management remains accountable to the investor. Money must also be provided for research. The earning by the shareholder of a fair return or profit by the entrepreneur under competitive conditions and after payment of fair wages must be regarded as a legitimate reward for the risk and the work of promotion and development which the community urgently needs. Certain mal-practices have crept into the system of company management. They are to be condemned and should be removed. Hoarding, black-marketing and profiteering are anti-social and evil. Honest business practices can be promoted and encouraged by an honest and efficient administration in a democratic State.

PROFESSIONAL MEN—lawyers, teachers, doctors, auditors, or writers—owe it to those who avail themselves of their services to maintain the highest standards and traditions. They should discharge their duties truly and faithfully, and should always subordinate considerations of personal gain to the larger objective of service.

WE ALL owe it to the community that we accept our obligations as good citizens. We shall bear our share of taxation honestly. We condemn unequivocally any attempt at tax evasion. We shall actively participate in the promotion of social, cultural and civic improvements. Wealth or power shall not be a justification for vain-glory or ostentatious display, but an opportunity for rendering service to the community.

THE WEEK'S NOTES

A SANE SUGGESTION

IT IS regrettable that improvement in India's educational system has not kept pace with her economic development and social reconstruction. Those who maintain that the Government of India is building a "first class modern State for third class citizens" are, therefore, not wholly without justification in their complaint. This gap has at last been acknowledged even by the ruling Congress Party in its election manifesto. Now, after ten years of dilly-dallying, the Central Advisory Board of Education has recommended a language policy for the country.

According to the recommendation all students, except those belonging to the Hindi-speaking areas, will have to study three languages: the regional language, Hindi and English. Students in the Hindi-speaking areas will be required to study one modern Indian language. The recommendation in respect of English as the third language is sensible. It is imperative that English continues to be studied in this country if it is not to cut itself adrift from the main streams of international developments in practically every field.

It would not be out of place to recall, in this connection, the observations of Raja Ram Mohan Roy, father of the Indian renaissance movement, on the introduction of English as a medium of instruction. These observations apply with even greater force for retention of the language. In his memorandum to Lord Amherst, the then Governor-General of India, Raja Ram Mohan Roy wrote that the ancient Indian system of education could "only be expected to load the minds of youth with grammatical niceties and metaphysical distinctions of little or no practicable use to the possessors or to society. The pupils will acquire what was known two thousand years ago, with the addition of vain and empty subtleties since produced by speculative men, such as is commonly taught in all parts of India."

It is fortunate that the language policy has been formulated when there is still a chance to persuade our people to be dispassionate and practical in their attitude to English. The "revival" of English does, it is true, seem a little difficult. Apart from the efforts of the fanatics bent on undoing what English has been able to do for the unity and enlightenment of this country there is the acute shortage of teachers in English. At the present time the country's 1,400 colleges are finding it rather difficult to obtain teachers of the required calibre. It was for the solution of this problem that at the instance of the University Grants Commission, the Kunzru Committee was appointed to recommend ways and means of securing adequate proficiency in English at the University stage. It is to be hoped that the Kunzru Committee will also be asked to go into the problem of meeting the demand of 12,000 higher secondary schools for teachers in English. The task is, of course, difficult, but something must be done to stop our educational system from disintegrating; the progress that is taking place in other national fields will be illusory if the gap is left yawning.

SCIENCE AND ETHICS

IN HIS address to the Indian Science Congress, Mr. Nehru referred to an aspect of the role of the scientist that merits particular attention. The recent inventions of science have certainly caused a great dread in the minds of people over the prospect of world peace. More significant is the fact that the extension of scientific knowledge has increased the area of moral choice between good and evil and the Prime Minister, therefore pertinently observed that "if science divorced itself completely from the realm of morality and ethics, then the power man possessed might be used for evil purposes". Hence even a scientist, he said, could not live in a world of ivory tower cut off from the results of his own work "so powerfully affecting the destiny of humanity". Now, no one will deny that scientific research should be related to human welfare. But is it possible for the scientist, (who must be a specialist if he is to be any good) all absorbed in his work, to keep in touch with the repercussions — social and economic —of his activity? Is this not one that should legitimately concern the statesman, the administrator and the sociologist who should determine to what uses the inventions of science must be put? One would, therefore, think that the future of science lies largely in how responsible statesmanship conducts itself in a world where mankind is dominated by strong passions and prejudices.

So far as India is concerned, there is less cause for despair as the scientists here have no need to face any conflicts of choice in view of the essentially peaceful nature of the country's policy, domestic as well as foreign. Scientific progress, it is often stated, is stimulated by the economic needs of a country and with India set on a goal of planned economy, the opportunities for the scientist to concentrate on economic and social improvements are immense. It is in this connection that Dr. B. C. Roy pleaded for original research by the Indian scientists and the adaptation of the results of such research to the conditions obtaining here. What can be more fascinating for the scientist of this generation than to bring his talents to bear in raising the living standards of people and to bring civilized life within their grasp?

WHO WAS RESPONSIBLE?

THE FINDINGS of the Commission which enquired into the circumstances of the accident near Ariyalur on the Southern Railway may bring no comfort to the near and dear ones of the 154 persons who died in the early hours of November 23, 1956. But wisdom after the event is not to be decided for the lessons drawn by the Commission may go a long way in alerting the Engineering Department of the Southern Railway. The Department is, of course, absolved of responsibility for the accident while the poor patrolman on duty, the Permanent Way Inspector, the Station Master and the Regional Engineer at Trichy are singled out for sharing a sense of guilt. The Commission has passed its severest strictures on the patrolman in particular and overruled the opinions of technical assessors in this regard. The findings of the Commission have been accepted by the Government of India, but the fixing of responsibility on certain individuals while the engine-driver and his crew were not alive to give evidence is morally (though not legally) open to question.

To slur over the collective responsibility of the Southern Railway administration in general and its Engineering Department in particular does not sound logical in the light of facts found in the report. These facts would bear succinct repetition. There are about 20,000 bridges on the Southern Railway and each regional engineer is in charge of about 7,000 bridges. The railway bridge on the Marudayar (the cruel jungle stream which took such a heavy toll of life) was completed in 1928. In spite of the heavy floods of 1937 and the subsequent minor floods and in spite of the fact that a portion of the southern embankment of the

Marudayar had suffered a breach necessitating rivetment to the extent of 400 feet in 1941 (when the ex-South Indian Railway was company-managed) no attempt was made to strengthen the southern bank in anticipation of likely damage to that side of the bank in case of heavy floods in future years. Rainfall on the Ariyalur-Kallagam section was very heavy on the night of November 22-23, 1956. The ill-fated Madras-Tuticorin Express crashed into the river at about 5-30 in the morning on November 23, while six other trains had passed over the bridge within the seven hours preceding the accident. The unprecedented and unforeseen floods in the Marudayar and the areas around the embankment of the river caused erosion or scour under and around the southern abutment of the bridge and its approach and when the Express train reached the sopt of the accident, 70 feet of the approach to the bridge collapsed or had already collapsed due to this scour or erosion and this resulted in the accident. The highest flood level in the river was in 1937 when it discharged 16,000 cusecs through the bridge whereas the peak discharge on the night of November 22-23, 1956 was later estimated at 50,000 cusecs. According to the technical assessors, with an ordinary hand signal lamp the patrolman on duty could not have observed or even guessed that the abutment was being undermined. The Permanent Way Inspector inspected the bridge and its protective work on the 22nd November and did not find anything wrong. It rained heavily only from 11 o'clock that night.

Though these facts may speak for themselves, it is necessary to add some comments. The safe running of six trains over the bridge (within the seven hours preceding the accident to the seventh train) should have lulled everybody concerned into a mood of instinctive complacency. It was an act of God that it did not strike any of them that the heavy impact of successive trains might have gradually undermined the approach to the bridge at a time of heavy discharge of water. The Commission itself has admitted that the floods on the Marudayar on the night of November 22-23 were 'unprecedented and unforeseen'. It also holds that it was problematic whether the timely construction of a rivetment or other protective works at or around the southern abutment of the bridge would have been enough to prevent the erosion and avert the accident, the Engineering Department of the Southern Railway could not also be held responsible for the accident. Who, then, was responsible?

ATOMS FOR PEACE

THE PRIME MINISTER'S assurance, while inaugurating Asia's first atomic reactor and the Atomic Energy Establishment at Trombay, that India will never use atomic energy for evil purposes is in consonance with this country's peaceful intentions in all walks of life. That other nations also are veering round to the idea of using atomic energy for peaceful purposes is evidenced by the international collaboration in the establishment of this project set up for the benefit of mankind. Even nations prepared to use atomic energy for destructive purposes are turning more towards its peaceful uses, not only because they are horrified by the scale of possible destruction but also because of the need to find alternative sources of power. Britain, for example, has made a beginning at Calder Hall to double her output of electricity in the next decade and has plans for more nuclear power stations. In India, too, the Government is making heavy investments in this pioneering work. Of the three experimental reactors the first, the swimming pool type reactor, is already functioning; the second, a high flux reactor using heavy water, is to be set up with Canadian help and a third of another type will also be ready by 1958. Besides this, the Atomic Energy Establishment plans to recruit 250 new engineers every year for training at Trombay.

All this is welcome but the pace of development may have to be quickened in the interest of industrializing India for which atomic energy would also be helpful. Fortunately known reserves of uranium and thorium in India are equivalent to more than fifteen times our resources of coal. In the monazite sands of South Travancore we have a rich asset. These could be exploited fully for the development of atomic power. Since cities in India such as Delhi, Bombay and Madras are far away from the coalfields, and the cost of coal transport is high it may be worth while to build a couple of atomic power stations although they may involve some heavy outlays.

SOUTH AFRICA IN THE DOCK

THE RULING Whites in South Africa have year after year, for the last ten years, flouted the verdict of the United Nations Organisation in regard to the position of the people of Indian origin living in that country. The latest resolution once again calls upon the South African Government to sit round a table with India and Pakistan in order to arrive at a settlement. If past experience were any guide — and nothing has since happened to suggest that there has been a change in the attitude of the Government of South Africa — it would be vain of anybody to hope that the discriminatory treatment of South African Indians can be argued out of South Africa even if it is assumed that she would agree to direct talks with the two countries concerned. In point of fact, she has been holding out threats, however ineffective, of not permitting Indian ships to touch her ports, which only shows the working of her mind. For this unreasonable attitude, the feeling cannot be helped that the United Nations is as much responsible as the South African Government. It is hard to think of a reason why the United Nations could not be as effective in implementing its decisions on South Africa as it has been in other cases where the position was positively more delicate. Surely, no member of the United Nations has ever taken seriously the plea put forth by South Africa that the matter is her 'internal affair'. That the situation created by the racial policies of South Africa is perilous cannot be over-emphasised.

The demand for a more human treatment of the people of Indian and Pakistani origin in South Africa forms only a part of the major question of racial discrimination in that country. The Natives and the Coloureds are equally groaning under the worst type of humiliation and suffering. To that extent a solution, even if reached with India and Pakistan, will be only a partial and, therefore, an uneasy solution although it is just possible that a partial solution may help to some extent in the resolution of the general apartheid tangle. It is unfortunate that so far this has not either been sufficiently realized or has not been adequately stressed. (In the long period, not even the Whites would escape the adverse effects, economically, of the extreme steps of 'apartheid', like the Group Areas Act.) It must be clear to India and Pakistan as well as to the United Nations that there is not much scope left for a negotiated or a partial settlement. The time has already arrived for all the victims of apartheid to put up a joint front. That should not only hasten the end of apartheid but also bring about a lasting solution.

Indian Airlines carry over 500,000 passengers every year

India's highway in the sky...

—and it belongs to you!

Servant of modern India, her national airline covers over 20 million miles a year, operates 132 flights each day

EMPLOYING over 9,000 trained personnel, flying over 20 million miles every year and operating 132 daily flights — Indian Airlines Corporation is the largest internal airline in the East . . . and it belongs to the people of India!

Indian Airlines Corporation is a mighty organisation, doing a mighty job — and it is proud of its role in transporting goods and mails, conquering vast distances, bringing the peoples of India ever closer together.

INDIAN AIRLINES CORPORATION

Can your car make a split-second stop ?

As a responsible motorist you know that it should be able to. An emergency may arise any moment...it comes unannounced. *So play safe.* Among other things, see that you have a really reliable braking system.

Wise motorists all over the world have their brakes tested regularly and have them fitted with FERODO—the brake linings that make motoring safe. FERODO Brake Linings are made with asbestos because they have a tough job to do. In an emergency, their unfailing efficiency can prevent disaster.

There are FERODO Brake and Clutch Linings for every type of vehicle in the country—but these are only a part of the wide range of technical asbestos products which we make at AM & FM to meet the needs of Indian industry. The increasing use of asbestos is an index to India's industrial progress.

Where There's Industry There's Asbestos

A Window on the World

MACMILLAN FOR EUROPE!

By

ODYSSEUS

MOST COMMENTATORS in the UK have interpreted Mr. Harold Macmillan's appointment as Prime Minister as a victory for the diehard, right wing of the Conservative party. If so, it only goes to show how far to the Left the British Right is, for, in economic matters, Mr. Macmillan is the author of "The Middle Way", published as far back as 1938, advocating a wide extension of social enterprise and credit, while in foreign affairs so far from being an Imperialist, he was one of the earliest and staunchest supporters of European co-operation and unity, for which he has incurred the strong disapproval of the quaintly old-fashioned Beaverbrook newspapers, virtually the sole remaining upholders of the Imperial idea. In parenthesis, it should be added that their resounding Imperial bark is not worse than their bite because they have no teeth left in any sense that matters in British politics.

In second parenthesis, I may mention that Mr. Macmillan's son, Maurice, by chance lives next door to Mr. R. A. Butler and that during the hours of suspense while the Queen was deciding whether to send for Mr. Macmillan or for Mr. Butler, Mr. Macmillan's small grandchildren chalked out a notice which they put in the window to the large amusement of the curious crowds: MACMILLAN FOR PREMIER! Following this distinguished precedent I am putting up a notice in my Window on the World: MACMILLAN FOR EUROPE!

After these interruptions, I resume my argument: From the viewpoint of all in Britain and in Europe anxious to advance the cause of European co-operation, Mr. Macmillan's promotion is good news.

A recent survey of opinion in nine European countries made by correspondents of "The Times Review of Industry" (December 1956) revealed the importance attached in most of these countries to British participation in the common market plan, chiefly because they fear that without it German industry would dominate Europe. Mr. Macmillan's influence on British policy as Chancellor of the Exchequer was substantial. As Premier it will be greater still. So that the chances of UK participation are now better than ever.

Discussion of the formidable practical problems raised by the creation of a common market continue in the British and US press, but hitherto such discussion has been based solely on brief newspaper summaries of the proposals drawn up by the committee of which M. Paul Spaak, Belgian Foreign Minister, was chairman. These were drafted in French and it has been virtually impossible to get hold of an English translation anywhere in England (although in order to write last week's article here, I did, on your behalf, manage to snaffle a typewritten copy from the British National Committee of the International Chamber of Commerce).

This gap has now been partially filled by PEP (Political and Economic Planning, 16, Queen Anne's Gate, London. SW. 1.) which has issued a 21-page summary (price 2sh. 6d.) in English of the Spaak Report. I believe that a common European market has been brought nearer by Mr. Macmillan's Premiership, but whether or not the plan is eventually carried out, it is going to be ever increasingly debated in the weeks to come. I, therefore, propose to devote some space to outlining it in hopes that, in India at least, the debate will be better informed. We may as well know the facts of what we are supposed to be talking about before we decide to approve or condemn the common market proposals.

BRITISH WORKERS AND EMPLOYERS AGREE

Since its endorsement on May 30, 1956, the Spaak Report has been an official statement of policy by Belgium, France, West Germany, Italy, Luxemburg, and the Netherlands, as a consequence of which they are now drawing up a treaty for a customs union. The UK has taken no decision of policy but has tentatively proposed that any country which wishes to retain its own system of tariffs against the rest of the world should be allowed to join a European free trade area, the nucleus of which would be formed by the six Treaty countries. This proposal has been provisionally welcomed by the Federation of British Industries and by the British Trades Union Congress (don't tell me that the age of miracles is over!).

The Spaak plan creates the common market in three stages of four years each. At the end of the first year, tariffs will be cut by 10 per cent, with two further reductions of 10 per cent at intervals of eighteen months, making 30 per cent in all in the first four years stage. In the second stage, the same process will be followed, producing a total cut of 60 per cent after eight years. The balance of 40 per cent will be eliminated in the final four years.

Although it might seem simplest to abolish a fixed percentage of existing tariffs at each stage, the diversity and widely differing levels of tariffs in the various countries make this impracticable. Instead, there will be latitude in their reduction of specific tariffs, providing that at each stage a weighted average reduction over groups of products agreed beforehand is effected. The difficulties created by the differing tariff nomenclatures used in each country, have been solved by deciding to classify products not by their physical content but simply by the rate of duty that they bear. The average reduction in any one member country will be calculated by weighting the percentage reduction of duties on each product by a factor representing the value of imports of this product from other member countries.

Simultaneously with the abolition of tariffs inside the common market, a common tariff towards the outside world will be worked out as an average of the tariffs of member countries. This is in accordance with Article 24 of the General Agreement on Trade and Tariffs and should reassure Japan, Chile, and the USA, all of which have expressed fears (flattering to European ears) that they might be priced out of a common European market.

If the average reduction were based on the volume of past imports it would produce a false figure because certain imports, e.g., raw materials, are usually duty free, and secondly a common commercial policy could not be based on the separate national policies in force before the creation of the market. If the reduction

were based on the average of previous tariffs and the total volume of imports, or if it varied from product to product, there would be interminable delays in drawing up an agreed nomenclature and deciding whether any product was "animal, vegetable, or mineral".

The Spaak solution is to lay down that in calculating the average reduction, tariffs that exceed certain maximum levels (which are to differ for raw materials, semi-finished and finished goods) shall be treated as if they stood at those maximum levels. Thus, at one fell swoop, unnecessary statistical work is cut out, fair treatment whatever their pattern of imports is ensured for all member countries, and GATT rules fulfilled which lay down that the average of the common tariff shall be no higher than those previously applied.

Quotas will be abolished by enlarging them by 20 per cent per annum. State trading or central buying agencies create a problem here, because an automatic increase in quotas would force the state to buy more than it might need. If centralised buying agencies have not disappeared (happy thought!) before the end of the transitional twelve-year period, the Spaak solution is to set up one central agency to act for all Europe.

BALANCED EUROPEAN DEVELOPMENT

The Spaak plan cuts the ground from beneath the classical Protectionist argument against Free Trade by recognising that the mere removal of trade barriers does not necessarily lead to the most effective division of labour, flow of capital, or economic expansion, and cites the failure of southern Italy to prosper after union with the North in 1860 and the failure of the southern states of the USA to compete with the North after the civil war in 1865. The plan, therefore, envisages that the automatic working of the laws of supply and demand should be supplemented by common market rules and policies. A rational division of labour will not be attained if (1) suppliers can discriminate between customers by refusing to supply them, or by double pricing, or by dumping; (2) monopolies divide up markets; (3) state aid, subsidies, or tax exemptions, etc. persist; (4) a member country compensates for different levels of taxation or other costs by devaluing its currency; (5) transport costs are not harmonised throughout the area; (6) commercial policies are not unified.

To secure these various objectives, the Spaak plan sets up a European Commission nominated by governments, which in certain matters will have executive jurisdiction to enforce the agreed rules of the common market as they apply to the six subjects listed above. In other matters, the Commission will have to formulate policy proposals for approval by a Council of Ministers, a powerful body charged with the co-ordination of national policies with European policy. Its decisions will in principle be unanimous, but in order to prevent any country vetoing progress, differences could be referred to a European Assembly or to a European Court of Justice.

Not least, the balanced development of all areas (backward as well as advanced) of Europe will be promoted by the establishment of (1) a European Investment Fund acting like the present World Bank and (2) a Re-adaptation Fund to help workers who may be temporarily thrown out of work as competition eliminates some less efficient industry.

HOUSES OR MOTOR CARS

(From Our Special West European Correspondent)

PARIS, January 19.

TWO months ago the Continental press was full of the gloomiest forebodings about the economic consequences of the closure of the Suez Canal and the oil pipelines. The gnashing of teeth and tearing of hair was, of course, loudest among the critics of the Eden-Mollet Egyptian expedition; thus in Switzerland and Scandinavia, and in France among the Mendes-France party, economic disaster was promised for the winter as a result of the oil shortage. Even among those who were not hoping that poetic justice would smite the aggressors, there was the expectation that some painful consequences would be felt. It was generally agreed that the expansion of 1956 would be stopped and 1957 would open with a very poor prospect. None of this has happened. On the Continent the economic damage caused by the interruption and slowing down of oil supplies has been minimal — and is in fact very difficult to find. Finance ministers and economic journalists who began writing their New Year prospectuses before the Suez war have had to change very little of their optimistic forecasts since. The expansionist trend in West European economies will continue throughout 1957 and the petrol crisis has done no more than aggravate a few existing difficulties and shift emphasis from some fields to others. And in so far as emphasis is shifted from motor cars to housing, the effects of the petrol crisis may even be beneficial.

This is because the automobile industry in Continental Europe had become not only the pilot sector of the economy but even an unhealthy overgrowth that needed to be curbed. No democratic government was capable of curbing it, as the outcry in France last year against increased motor taxation made clear. The ownership of private cars has vastly increased since the boom began in 1952: over half a million new private cars were sold in France in 1955 and almost three-quarters of a million in 1956. A car is not a luxury any more, nor even a badge of membership of the middle class; most new cars and almost all second hand cars (an immense market this) are being bought by working people. Even a Socialist Government finds it difficult in these conditions to put the breaks on automobile expansion when it threatens to get too far ahead of the rest of the economy; and a government would be slow to admit such a threat when the state itself owns, as in France, one of the biggest automobile plants in the world. Economists — and moralists — were uneasy about this automobile craze but there seemed to be no way of limiting it. The Egyptians and Syrians found one, and thus may have done Europe a good turn.

When the petrol shortage began, the economically ignorant, the moralists and everyone who did not own a car thought that the solution was quite simple — it was just a matter of limiting private pleasure touring. After all, they argued, millions of motor cars are being used in Europe for the most flippant and unnecessary of purposes: Sunday trips in the country, and the vanity of rolling up to office in a horrid little two-horse-power job instead of taking the bus. Cut this out, or even just limit it, voluntarily or by law, for a couple of months and Europe can tell Nasser to clean up his own canal at his leisure. Perfectly correct; if all the alleged Christians in Europe had walked to church on Sundays instead of driving out to visit grandmother the petrol shortage would not have been noticed and industry would have had all the fuel it needed. Perfectly correct but also perfectly irrelevant. Although moralists and socialists find this hard to understand, economics is not about what people need but what people want. And even if their "wants" are idle or foolish luxuries, satisfied at the expense of "needs", industry has to go on meeting those wants, or there is a slump — which means that "needs" cannot be met either. You cannot operate on an economy and amputate the "unnecessary" luxuries without killing the patient.

Thus, a limitation on private motoring in Europe today would not "hurt" anybody directly and most motorists would be better off at home reading by the fire than out cursing fellow-motorists on over-crowded autobahns or cruising endlessly about the city looking for a parking spot. But the indirect consequences would be enormous and possibly catastrophic. A decline in the activity of the automobile industry and all its numerous ancillaries (all of them admittedly working to satisfy a foolish craze) would very quickly produce unemployment and limit the demand for everything else. So, after an attempt at limiting pleasure touring, European Governments have now given up and although there is petrol rationing you can still get petrol (to the moralists' chagrin) to drive out in the country in the midst of a national fuel shortage. Rationing is sufficient to spread inadequate petrol supplies among all users, and the automobile industry is protected by giving special rations to those who buy new (or even second-hand) motor cars. Thus Europe is meeting the crisis fairly easily, by cutting its luxuries no more than its "essential needs".

Now, although economics is about what people want and although the economist or business man has to take wants as given and beyond his control, one is permitted to ask whether it is a good thing morally or economically for one set of quite factiticus wants to hypertrophy beyond all proportion to the rest of our lives. In other words, do the neo-capitalist economics of West Europe have to resign themselves to the fact that people prefer cars to houses, when under suitable conditions the housing industry could provide just as good a "pilot" for the economy as the automobile industry now does? The question becomes all the more urgent if it is realised that some appetities grow on what they feed on — that is, that a preference for cars over houses increases the demand for cars and further handicaps housing. This has happened in Continental Europe where the neglect of housing has combined with rent control to make housing poor and unattractive and expensive. Thus, the French today (and to a lesser extent other Continentals) live in mean and crowded conditions such that make the thought of a Sunday at home almost unbearable, even in winter, and the only solution is to get in a car and go out to the country.

To buy a flat in a European city (most flats nowa-days are bought, not rented) costs at least Rs. 25,000, but a new car can be had for Rs. 6,500, so by the time a family's savings get to Rs. 10,000 it is tired of waiting for a flat and buys a car, whereafter the cost of petrol, upkeep and motor holidays puts an end to further savings. If the family is lucky enough to have a rented flat, rents are controlled at so low a figure that there

is plenty of money left over for luxuries; but it is no use buying furniture because there is no room for it, and not much point spending money on a flat which the landlord neglects because his rent is absurdly low. So money goes to, not the "solid comfort" of the Anglo-Saxon who has a respectable house to keep up and beautify, but less solid consumer goods: food, wine, long-playing records and, of course, motor cars and the holidays that they make possible if not inevitable.

The result is that on the Continent since the war (this applies to less prosperous economies such as Spain as well as to the booming German, French, and Italian economies) economic expansion has been excessively based on one industry and its ancillaries. The fleet of private cars has outrun the increase in national wealth, the balance of trade, housing construction and the building of roads, especially in Europe's medieval cities. From being a healthy pilot or leader of the economy, the automobile industry has become almost a cancer, and is smothering some forms of activity as much as it is promoting others. The poor relation is housing, particularly in the Latin countries. The building industry is technologically neglected and sticks to traditional methods while engineering is revolutionised. Labour drifts from the scaffolding to the conveyor belt. Government controls are piled on housing, with the intention of keeping rents down so that people can have more to spend on motor cars, and with the effect of making construction unprofitable. Meanwhile Government protection is lavished on the automobile industry, with the result that several European countries (France is the outstanding instance) have as their pilot industry a group of factories that could not stand up to a week's competition under free trade conditions from neighbouring motor industries. The middle classes and the well-paid majority of the workers indulge in the automobile craze while a sort of sub-proletariat gets the worse end of the housing stick and is condemned to live in conditions that are a disgrace to prosperous nations.

The Suez war and the consequent petrol shortage, by putting the breaks ever so gently on this growing disproportion and by showing West Europe how much its prosperity depends on a morally dubious luxury while elementary needs like housing are neglected, have stimulated new thinking about the foundations of the present and continuing economic growth. It is already realised that if the petrol shortage threatens to limit economic activity dangerously, then the slack should be taken up very quickly by stimulating housing construction. But even beyond the temporary shift in emphasis produced by the Egyptians and the Syrians, economists are wondering whether this shift should not be maintained even when petrol supplies are back to normal. That is, whether, without pretending to remodel the European economy on the basis of alleged "needs" instead of real "wants", it might not be possible and desirable to give building a little more of the pilot's role that has since the war been left entirely to the automobile industry.

WORLDGRAM

AGRICULTURE

Viet-Nam's Rice Exports: South Viet-Nam is to export 50,000 tons of rice during the first quarter of 1957. The Department of Economy, announcing the result of conversations between Government officials and representatives of the Association of French and Vietnamese Rice Exporters, forecasts that, for the present, Viet-Nam will be able to export up to 300,000 tons of rice annually. This marks the definite re-entry of Viet-Nam into the world rice market, where she once occupied so pre-eminent a position. Before 1939 the French colony of Cochin China, now the Southern part of the Republic of Viet-Nam, exported nearly 2 million tons rice per annum.

*

Orissa Tenants Relief Amending Bill: The President has given his assent to the Orissa Tenants Relief (Second Amendment) Bill, 1956. The Bill seeks to confer on persons whose lands have been acquired for the Hirakud Project, the right to evict tenants from land which they might purchase after their own land had been acquired. Earlier, special provision was made in the Orissa Tenants Relief Act, 1955, to enable persons whose lands were acquired for developmental purposes to evict tenants from the land they might purchase to replace the land they had to part with. It was, however, provided therein that for the purposes of such eviction these persons should have purchased their new land before December 31, 1955, and the tenants, to be evicted, were to be given notice before March 31, 1956. It has not been so far possible to pay compensation to persons displaced by the Hirakud Project. Hence the Orissa Government consider it necessary that more time should be given to them for acquiring property and evicting tenants, if they so desire. The last date now fixed for purchasing lands is February 28, 1958, and for giving notice to tenants May 31, 1958.

INDUSTRY

Development of Machine Tool Industry: A Development Council has been set up by the Government of India to keep constant watch on the progress of the machine tool industry and recommend measures for its development. The Development Council will recommend targets for production and co-ordinate production programmes for machine tool. It will suggest norms of efficiency to eliminate waste, obtain maximum production and improve quality. Among other functions of the Council will be promotion of arrangements for better marketing and standardisation of the products of the industry. The Council will also promote labour welfare, measures for increasing the productivity of labour and the training of technical personnel.

*

Standard for Cealing Wax: The Indian Standards Institution has published an Indian standard specification for sealing wax. The standard prescribes the requirements and methods of test for compositions which are to be used in the molten condition for putting seals on the joints of any packages made of paper, cotton cloth, hessian or wood and on which some embossed inscriptions are to be put while the compositions are hot. Three grades of sealing wax are recognised for satisfactory adhesion to various types of surfaces. This standard prescribes the methods of sampling and test for determining capability of taking impressions, heat resistance, resistance to heat polymerization, etc. Copies of this standard, are now available for sale from the Indian Standards Institution, 19, University Road, Delhi-8, and its branch offices at P-11, Mission Row Extension, Calcutta, and 40|40A, Cawasji Patel Street, Fort, Bombay-1.

*

Potash Output in Israel: Production of the Sodom potash works has at long last reached a monthly rate of 6,000 tons. While this is still only half the plant's schedule capacity, it does represent a substantial improvement on the monthly average of 3,000 tons attained in the first nine months of last year. Total output in 1956 came to 40,000 tons, of which 35,000 tons were exported to some 15 markets. Britain, Japan, Italy and Ceylon are currently among the principal customers. The company continues to face many difficulties, chief among them the lack of trained technical personnel and low productivity. Good engineers are adverse to working under the unfavourable climatic conditions of the Dead Sea region, while the workmen, housed in camps near the plant, tend to have a high absentee rate. It is proposed, therefore, to start special housing projects at above-sea-level sites for the workmen and their families and to transport them to and from the plant daily. Since this project will take some time to realise, the works are not expected to reach their annual output target of 150,000 tons before 1958 even later. Other unsolved difficulties are an adequate supply of water for the washing of the evaporation pans, though some progress has been made in sinking wells for this purpose, and the high cost of transporting the potash from Sodom to the port of Haifa (partly by road and partly by rail), which accounts for 25 per cent of total production costs

*

Production of Sugar: Production and despatches of sugar from indigenous factories amounted to 4.51 and 3.19 lakh tons up to December 31, 1956, in the current season as against 3.58 and 2.43 lakh tons respectively in the corresponding period of last year. The stocks with factories on December 31, 1956, stood at 6.60 lahh tons as compared with 5.26 lakh tons last year.

TRADE

Australian Trade Mission for India and Ceylon: The Australian Government is sponsoring a trade mission to India and Ceylon. On present indications the party will arrive in Calcutta on March 23, 1957, spend five weeks in India and leave for Colombo on April 30. The mission will comprise mainly manufacturers, exporters and representatives of Australian banks. They will visit Calcutta, Madras, Bombay, Delhi and such other places as may be of special interest to particular members. Australian exports to India, valued at £A11,966,204 in 1955-56, were made up of nearly 300 separate categories of exports which, in addition to food stuffs, wheat and wool, included increasing quantities of manufactured goods. The Australian Government is hoping to increase the volume of trade between India and Australia. In pursuance of the programme of encouraging closer commercial relations with her neighbours, an additional Australian trade representative will be appointed to India when a Commercial Counsellor will take up duty at the Australian High Commission, New Delhi, in a few month's time.

*

British-Polish Trade Agreement: As a result of negotiations conducted in London and Warsaw between the Government delegations of Poland and Great Britain, a new three-year trade agreement between the Polish People's Republic and the United Kingdom of Great Britain was initiated at the Ministry of Foreign Trade in Warsaw on December 20, 1956. This leads to the expansion of Poland's trade exchange with Great

Britain, which occupies at present the fourth place in Poland's foreign trade as far as the value of trade is concerned. During the first three quarters of this year Poland's trade with Great Britain reached the value of some $112,400,000. Of this $63,100,000 represented the value of Polish exports to Britain, and $49,300,000 British exports to Poland. This means a 3 per cent increase in the over-all turnover between the two countries as compared with the corresponding period of 1955.

*

Australia to Relax Import Controls: The Australian Government has decided to relax import controls. Australia will allow the entry of additional imports worth about £(A) 30 million (£24 million) yearly. Full details of the relaxation of import controls will be announced later.

*

Linseed Oilcake Export Quotas: The validity of export quotas of linseed oilcake has been further extended up to the end of March, 1957, from January 15, 1957, according to a Trade Notification issued by the Joint-Chief Controller of Exports, Bombay recently. The export quotas, announced on July 18, 1956, were valid up to the end of December, 1956, and the period was extended up to January 15, 1957, by a Trade Notification issued on January 2, 1957, which said that the Government had decided not to release any fresh quotas for the present.

FINANCE

Aid for Promotion of Sericulture Industry: The Government of India have sanctioned during 1956-57, 138 grants for the development of sericultural industry in India under various State schemes, the total cost of which comes to Rs. 27,98,435. Loans amounting to Rs. 24,92,250 for 12 schemes, which include the establishment of a modern filature at Malda, West Bengal, the establishment of a raw silk marketing society in Bangalore and modernisation of filature machines in Jammu and Kashmir, were also sanctioned. West Bengal tops the list of States receiving grants, with Rs. 4,79,046, while Jammu and Kashmir, Bihar, Assam, Mysore and Madras follow with grants amounting to Rs. 4,23,764 Rs. 367.932, Rs. 338,263, Rs. 2,39,350 and Rs. 2,27,165 respectively. During the first half of 1956, the Silk Board imported 109,916 lbs. of raw silk, of which 108,980 lbs. have been allotted as follows: 30,088 lbs. to States, 22,618 lbs. to silk associations and 40,181 lbs. to actual users, while an allotment of 16,093 lbs. has been made for export promotion schemes.

*

French Reserves: France's official exchange reserves touched a fresh low at the end of 1956, when they fell during December by some Frs. 20,000 million (£20 million) to Frs. 100,300 million (£100 million) owing mainly to the payment of interest on North American post-war loans. The fall of the reserves of the Bank of France during last year thus represents approximately 75 per cent since at the beginning of 1956 they amounted to Frs. 394,000 million (£394 million). At the rate of shrinkage of the last quarter the Bank's exchange reserve will be exhausted around the middle of March. In these estimates no allowance is made for the $262.5 million credit line obtained some weeks ago from the International Monetary Fund, nor for the gold stock of the Bank of France. Frs. 301,000 million (£301 million) which has remained untouched so far. In the final quarter of 1956 the monthly loss of foreign exchange holdings rose to over £40 million as compared with some £20 million in each of the first three quarters.

*

East African Earnings: The total earnings from East African railway and harbour services in November, 1956, were £1,658,000, compared with £1,872,000 in the same month of 1955. Earnings were £203,000 below the level estimated for November, as against a shortfall of £207,000 in October. Total earnings for the 11 months—January to November—were £19,684,000. These compare with £19,523,000 in the same period of last year, but are £275,000 short of the earnings estimated in the revised estimates of revenue and expenditure for 1956. The approximate total railway revenue for November, 1956, was £1,392,851 compared with £1,502,156 for November, 1955—a decrease of £169,305 or 7.28 per cent. The total revenue for the first 11 months of 1956 amounted to £15,717,066 compared with £15,971,081 during the same period of 1955, a decrease of 1.59 per cent. The whole of this decrease was attributable to a decline in the earnings from goods and livestock traffic which were 2.8 per cent less than the earnings during the same period of 1955.

*

Rebate of Duty on Excisable Goods Used in Manufacture of Articles for Export: The Ministry of Finance (Department of Revenue) have already notified the procedure for the export of articles under rebate of duty on the excisable goods used in their manufacture. It has been specified in the procedure that the Central Board of Revenue shall declare, from time to time, to which articles this procedure shall apply. To begin with, the procedure has been made applicable, with immediate effect, to (i) ready-made apparel, (ii) tents, and (iii) sugar products, including biscuits and preserved fruits. Manufacturers of these articles wishing to export them out of India, are advised to contact the Collector of Central Excise in whose jurisdiction their factory is situated, in order to avail themselves of the benefit of the procedure, subject to observance by them of the formalities required under Rule 191-A of the Central Excise Rules, 1954.

GENERAL

Modernising Railway Signalling: The Railway Board has sanctioned a Rs. 22-lakh scheme for improving signalling facilities at the eight stations situated between Wardha and Balharshah on the Delhi-Madras section of the Central Railway. These stations will be provided with modern interlocked signalling. At present, these stations have a signalling system worked by hand levers which severly restricts section capacity, besides prepetuating hazards inherent in non-interlocked working. The interlocking of stations will ensure greater safety and speed in the operation of trains, and also help in stepping up line capacity.

*

Consumption of Oils and Fats: The per capita consumption of oils and fats in India has increased from 10.5 lbs. per year to 11.5 lbs. during the course of the last five years, declared Dr. J. C. Ghosh, Member, Planning Commission, at the special session of the Oil Technologists Association, India. The target of additional production of oilseeds during the second Five-Year Plan period, he added, had received the most anxious consideration both from the point of view of adequate nourishment of the people and foreign exchange earnings and had been finally fixed at 7.6 million tons by 1960-61. This implies an increase of 2 million tons over the present production.

*

Bombay Town Planning Schemes Validation Bill: The President has given his assent to the Bombay Town Planning Schemes (Bombay City Nos. II, III & IV) (Mahim Area) Validation Bill, 1956. The Bill seeks to replace an ordinance which was promulgated last year to remove all doubts and validate proceedings taken by the Bombay Corporation in connection with certain town planning schemes in which some legal formalities were not observed.

NEWS IN BRIEF

INDIAN

The total production of natural rubber in 1956 is estimated at 23,750 tons.

*

At the end of the first Five-Year Plan, power generation had gone up from 6,575 million kilowatt hours in 1950-51 to 11,000 million kilowatt hours in 1955-56 and the installed capacity from 2.3 million kilowatts to 3.4 million kilowatts.

*

India aims at building up a permanent national reserve of 20 lakhs tons of food grains.

*

In the 12 months ending June 1956, the Hindustan Shipyard delivered three modern diesel engine ships, a record performance since the first ship was commissioned from the yard in 1948.

*

The coffee crop during the current year is expected to exceed the harvest estimate of 36,000 tons. Picking of Arabica coffee, which started in November 1956, will be practically over by the end of the current month, while that of Robusta will be completed in March next.

*

According to figures released recently, tea production in December 1956, is shown at 2.9 million lbs against 13.06 million lbs. in the corresponding month of 1955. Total production for the season ended December 1956, amounted to 536.66 million lbs. as against 534.22 million lbs. in the corresponding period of 1955.

*

The Government of India have agreed to give concession to printers to import machinery for the All-India Printers Exhibition scheduled to begin in Delhi from April 2, according to the Delhi Printers Association.

*

It is reported, the production of coking coals of selected "A" and "B" grades in 1957 would be pegged to the overall ceilings of 7.90 million tons, against 7.70 million tons in the preceding year.

*

The Government of India have decided not to permit any further exports of semi-manufactures of copper (sheets, circles strips, plates, bars, rods, pipes, tubes and bare wires).

*

The Forward Markets Commission have announced that on its advice the Government of India had granted recognition to the Indian Pepper and Spice Trade Association for conducting forward trading in garbled Malabar black pepper for a period of three years.

*

The Development Council for Sugar industry has approved of the plan for the sugar industry for 1957-58 which aimed at a production target of 2.16 million tons, the estimated production during 1956-57 being 2.05 million tons.

*

Production of jute goods showed a small rise of 1,100 tons in December 1956, as compared with November. Hessian rose by 900 tons to 37,700 tons probably due to a gradual switch over from sacking to hessian looms and other varieties by 700 tons to 5,900 tons.

*

It is reported a zinc smelter plant would be set up at Udaipur by the Government of India. Other industries proposed to be started in the State are two wagon factories, a pig-iron factory and a soda ash factory.

FOREIGN

Four foreign oil companies—Socony, Shell, Caltex and British Petroleum—have decided to build jointly an oil refinery in Turkey with an output of 65,000 barrels of crude daily. Talks on this matter have been concluded with the Turkish Government.

*

It is reported exports of Australian manufactured and semi-manufactured goods in the financial year 1956-57 would be 30 per cent higher than in 1955-56. The exports of these goods in the last financial year were 25 per cent higher than in the previous 12 months.

*

Cultivation of coffee and Cocoa have become important industries in the Australian-administered part of New Guinea.

*

Quanos Y Fertilizantes de Mexico, S. A. a semi-official body controlled by Nacional Financiera, is beginning construction this month of a new fertilizer plant at Coatzocoalcos (veracruz) at a cost of 30 million pesos. The second plant will be erected at cuautitlan for the production of sulphuric acid.

*

It is reported the Continental steel Cartel in Brussels has raised the export price of hot rolled strip and skelp from $110 to $113 f.o.b.

*

The Central Banking Council in Germany has reduced the discount rate from 5 per cent to 4½ per cent and the rate of advances on securities from 6 per cent to 5½ per cent.

*

South African gold production reached the record total of 15,892,935 ozs. last year. It was 1,290,668 ozs. higher than in 1955, the output for which at 14,602,267 ozs. was the best since the record war-time total of 14,496,761 ozs. attained in 1941.

*

The International Monetary Fund is expected to lend Argentina $575 million early next month after approving the par value for the peso.

*

Australia had a favourable balance in her overseas trade of £A99.7 million (£79.8 million) for the six months ended December 31, 1956. This compares with an unfavourable balance of £A26.6 million (£21.3 million) for the corresponding period of 1955-56 and £A39.2 million (£31.4 million) for the whole of the past financial year.

*

It is reported preparation of the treaties establishing a European Atomic pool and a customs free common market is expected to be completed by early February.

*

The 1956 steel output of the six nations of the European Coal and Steel pool showed a rise of over 4 million tons to a new all-time record total of 56.72 million metric tons.

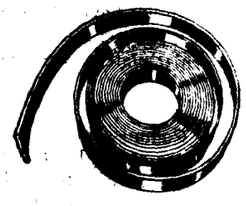
*

According to official figures, tea production in Ceylon during November 1956, amounted to £38.5 million lbs. Output for the period January to November 1956 amounted to 339.6 million lbs. consisting of 140.3 million lbs. high grown 126.7 million lbs. medium and 72.6 million lbs. low grown tea.

TURNING A NEW ROLL

We have turned a new roll; and it has cost us three and a half crores of rupees.

To what purpose, pray?



At the end of the rolling, we get coils of flat, steel strip—skelp, as the steel man calls it. The skelp is passed on to the Indian Tube Company, which welds it into tubes.

So what?

Merely that steel tubes pipe up water from deep inside the earth to parched fields, helping to grow a rich harvest. In the cities, countless homes receive a protected supply of water through these pipes.

Soon, a new plant will turn out the kind of steel tubes that go into the making of bicycles. Remember also that the locomotive speeding along the track is kept going by steel tubes which hold the steam.

Tata Steel's new Skelp Mill, the first of its kind in India, has a capacity of 200,000 tons. When there is enough steel, this mill will roll all the skelp and strip the country needs.

TATA STEEL

SERVES THE NATION

Special Articles

PRODUCTION OF PAPER

IT is now an axiom that the consumption of paper is an index of the advancement and state of literacy of a country. The 'per capita' consumption of paper in India is among the lowest in the world averaging 1.9 lbs. per year. How she stands in comparison with some of the advanced countries is shown below:

Country	Per Capita Consumption in 1954 (in lbs.)
US	383.7
Canada	280.3
UK	164
Australia	130
W. Germany	109
France	84
Japan	46.8
India	1.9

These figures indicate how far the country has to go to catch up with the modern world. However, with the growth in industrial production, rise in the general standards of living and rapid increase in literacy and education, all of which will be the concomitants of the Five-Year Plans, the consumption of paper is bound to increase considerably in the coming years. During the last few decades, the Indian paper industry, in fact, has made rapid progress and today it is one of the major industries. Another significant fact is that it is one of those industries which the Government feels should be developed by the private sector.

Although India was known for hand-made paper long ago, production of machine-made paper started only in 1870. Between 1870 and 1930, there were only five paper mills but on the eve of the first Five-Year Plan, the number of units was 17 with an annual rated capacity of 136,600 tons. The present capacity of the existing 21 units is 211,900 tons. The following figures show the production of paper and paper boards and consumption of paper and paper products (including newsprint) from 1950-51 to 1955-56.

	Production	Consumption
1950-51	114,036	209,110
1951-52	135,091	218,492
1952-53	136,337	229,573
1953-54	137,301	249,204
1954-55	169,090	285,862
1955-56	188,849	317,536

Production has thus increased from 114,000 tons in 1950-51 to 188,000 tons in 1955-56 but it has not kept pace with the growing demand. In spite of the increase of 74,000 tons in production, the country has been importing more paper and paper board than in 1951 and together with 80,000 tons of newsprint and 20,000 tons of old newspapers, used as wrapping paper, the total cost of imports in 1956 was Rs. 15.3 crores. During the past five years, the consumption of paper and paper board increased on an average by about 8 per cent per annum. But consumption is expected to show a progressive annual increase of 10 per cent over the next five years consequent on the rise in industrial production and general standard of living and growth in literacy and it is estimated to be of the order of 350,000 tons by 1960-61, i.e. 50 per cent more than at present. Similarly the demand for newsprint is anticipated to increase from the present figure of approximately 80,000 tons to 120,000 tons by 1960-61 consequent on the additional demand arising from higher standards of living and increased literacy which will be reflected in an expansion of the newspaper reading population.

To meet the requirements of the country in the next five years, the Planning Commission have fixed a target capacity of 450,000 tons a year for paper and paper board by 1960-61 taking the average production at 80 per cent of capacity. This is sought to be achieved by issuing licences for substantial expansion of the existing 21 units and setting up of 22 new units which together, it is estimated, will bring the capacity to 542,196 tons. As for newsprint, the State-aided Nepa Mills (the only one of its kind now in India) which went into production in 1955, has reached a production of over 50 tons per day. When it attains full production, it is expected to supply 30,000 tons per year, thereby saving the country an estimated sum of Rs. 1.5 crores of foreign exchange. In addition to this, Government have plans to set up another newsprint factory in the public sector by the National Industrial Development Corporation at Shakarnagar, near Hyderabad, with a capacity of 30,000 tons per annum.

However, with the demand for newsprint estimated to go up to 120,000 tons by 1960-61, it will not be possible to achieve complete self-sufficiency during the next five years. Though there is scope for two more newsprint factories, the availability of sufficient raw materials may prove a serious handicap. So it may be taken that imports of newsprint would have to be continued at about 60,000 tons per annum during the period of the second Plan. On the financial side, it is estimated that an additional investment of about Rs. 54 crores would be needed to enable the paper industry to achieve a capacity of 450,000 tons of paper and paper board and 60,000 tons of newsprint by 1960-61. Compared with the Rs. 11 crores estimated to have been invested during the first Plan, the figure tells its own story. While the bulk of the resources is to be found from the private sector, they may have to be suitably supplemented by assistance from the Industrial Credit and Investment Corporation and the Industrial Finance Corporation.

The implementation of the various schemes in hand and the further expansion programmes contemplated for manufacture of paper and newsprint would naturally pose problems of availability of raw materials, machinery and equipment and technical manpower. The expansion of the paper industry to its present size can be attributed to the use of bamboos for paper-pulp and today bamboo forms 70 per cent of the total fibrous raw materials used and over 30,000 tons of bamboo are at present annually consumed for paper manufacture. This is likely to go up to 60,000 tons in the second Plan period and hence production of bamboo on a large scale has to be carefully planned.

Next in importance comes 'sabai' grass which is suitable for use in the manufacture of mechanical and chemical pulp. But because of its limited incidence and unsteady supply and the multitudinous uses to which bamboo is put, there is need for pursuing research in the utilisation of alternative raw materials. Attention is now being given to agricultural residues such as sugarcane bagasse which should provide an abundant and sustained source for the manufacture of paper. It is estimated that if all the bagasse from various sugar factories could be harnessed for paper

production, the country can have two million tons of paper per annum from this source alone which is now mostly used as fuel. It has also been found that bagasse pulp is not only cheaper to produce than the usual 'sabai' grass pulp, but it is possible that cheap grade writing and printing paper can be made from bagasse. Grasses and reeds, which have so far been found to be of little economic value, are now being investigated for the production of different grades of paper. There is thus great need for closer co-ordination between the paper industry and the Forest Department for planned plantation of bamboo, eucalyptus, wattle and other broad-based woods, grasses, etc.

The Planning Commission has recommended the reservation of specific forest areas and grant of long-term leases of forests for the paper mills but unfortunately some of the State Governments have followed a restrictive policy by annual auctioning of forest areas and continuous increase in the rates of royalty. It must be realised that only with long-term leases of forests, the industry would be in a position to invest considerable capital and in their own interest undertake proper development of the forest areas. Inadequate information about the availability of raw materials in different regions has also proved another handicap and it is to be seen how far the decision that each State should conduct a survey of its resources of raw materials for the paper industry is being actively pursued. This would help in deciding the future location and size of new units. An ad hoc Committee has also been constituted to co-ordinate measures for the supply of bamboo and other raw materials for the paper industry. Apart from raw materials, there is also the question of adequate supply of coal and water which are essential for the production of paper.

The country's engineering industry is still not sufficiently advanced to tackle such a complicated proposition as paper manufacturing machinery. The second Plan envisages a modest beginning in this respect and the target for 1960-61 is for production of machinery valued at Rs. 4 crores per annum. It is estimated that it will be just adequate to turn out equipment for one paper mill with a capacity of 50 tons per day. Attention must, therefore, be concentrated on creating capacity for manufacture of machinery for the paper industry to achieve self-sufficiency in the course at least of the next decade.

The wrapping paper produced indigenously and the imported variety are both considerably higher in price than the imported old newspaper and this price difference has been the main cause of the increasing use of old newspaper for wrapping purposes. It is, therefore, necessary that special efforts should be made to foster the development of cheap printing paper and cheap wrapping paper. Here, it is useful to examine how far small-scale units with a capacity of one to five tons per day can usefully come into the picture to fill this need, and how far they can profitably utilise the cellulosic raw materials like bagasse, grass and soft woods which are spread out in small and big quantities in all parts of the country. It is pertinent, however, to remember in this connection that no paper unit with a capacity of less than 50 tons per day would be economical due to rising labour and raw material cost and the expansion of the capacity of existing units to 50 tons per day will make then economical and stand future competition.

The employment potential of the paper industry is also not insignificant. In 1950, the total number of persons employed in the industry was estimated at 22,000. By 1961, it would be in a position to engage over 50,000 besides providing further indirect employment for about 20,000. With proper transport facilities and fair distribution of raw materials and with timely assistance from the State, there is no reason why the paper industry should not only be able to achieve the targets under the second Plan (a per capita consumption of 5 to 6 lbs. in 1961 from the present 1.9 tons is a distinct possibility) but what is more, look for a better and brighter future in the successive Plans.

CONGESTION ON SUBURBAN RAILWAYS

EXCESSIVE overcrowding during peak hours in mornings and evenings on suburban railways is a feature common to every country. It is estimated that in foreign countries congestion of passenger traffic during peak hours is of the order of more than 200 per cent of the seating accommodation. In India this problem has assumed great dimensions. The Suburban Train Overcrowding Enquiry Committee was asked to investigate possible remedies to relieve congestion during peak hours on the suburban lines in Bombay, Madras and Calcutta. The Committee's report which was signed and tendered to the Government early in April 1956 was released to the public only last week. The delay in releasing this thin report, which runs into about 100 pages and deals with a secondary problem of railway passenger transport, is probably due to the fact that, on full consideration of the investigation undertaken, Government has come to the unhelpful conclusion that marginal relief is all that seems practicable.

This general assessment of the labours of the Committee may appear somewhat pessimistic, but it is objective. What the Committee has to say about the immediate prospect on the Calcutta suburban railways is undoubtedly a source of much concern. There the existing services and equipment have reached a saturation point. The second Five-Year Plan provides for electrification of the suburban lines on the Eastern Railway and the South-Eastern Railway. These projects are bound to take considerable time for full implementation. In the meanwhile, the attitude of the administrations is to do the unavoidable minimum because of the certainty of substitution of electric train services. The Committee has rightly criticized this attitude. It has recorded its view that lack of provision for improvement of the existing steam train services is not due to an attitude of indifference. It is basically due to imbalance in planning which ignores the urgent problems of the intervening period. This imbalance must be redressed by provision of steam service stock which can be utilised after the lines are electrified on other sections of the railways.

During the war and post-war period, with rapid concentration of populations in the three cities and their suburbs, the volume of suburban railway traffic increased by leaps and bounds. The Committee's report does not give relevant statistics of the expanded volume of traffic on the Calcutta suburban railways, but there cannot be any doubt that its growth has been as rapid as in the case of Bombay, if not more The following table sets out the trends of traffic on the Bombay and Madras suburban railways.

TRENDS IN SUBURBAN RAILWAY TRAFFIC

(Number of passengers in millions)

Year	Central Railway	Western Railway	Southern Railway
1938-39	33.6	47.6	8.49
1939-40	33.9	48.3	8.50
1940-41	36.4	51.1	8.65
1941-42	45.4	59.7	9.68
1942-43	52.4	64.2	13.0
1943-44	70.0	84.3	16.5
1944-45	86.1	100.4	20.8
1945-46	98.0	112.1	25.4
1946-47	97.8	113.7	24.4
1947-48	108.0	128.1	28.7
1948-49	129.9	135.1	27.4
1949-50	143.8	149.8	28.7
1950-51	149.8	157.5	30.7
1951-52	147.0	145.4	28.0
1952-53	147.8	149.4	25.9
1953-54	144.0	153.7	24.9
1954-55	150.3	162.9	27.3

The above table conspicuously brings out the accelerated growth of traffic especially in the post-war period. Only during the three years, 1951-52 to 1953-54, there was a marginal decline in the volume of traffic on all the three railways. But there was a spectacular rise in 1954-55. The increases in each case have been excessive so as to put a heavy strain on the resources of the three railway administrations. The increase has been the heaviest on the Central Railway where it has shot up to 347 per cent in 1954-55 above the pre-war volume. For the Western Railway the increase during the period was 242 per cent, while for the Southern Railway it was 222 per cent. There is reason to believe that this increase is still pursuing a steady course. Economy in time and the attraction of concessional season tickets are bound to maintain traffic on suburban railways at high levels. There is no reason, therefore, to suppose that congestion will be relieved in the near future. It is sometimes argued that the development of townships in the vicinity of these cities will relieve this problem. This argument misses the central point that while the problem of residential accommodation may be eased, the transport problem will remain very largely unrelieved because the townships cannot be expected to be self-sufficient at least in respect of employment.

The important part of the report relates to the recommendations of the Committee for creating additional carrying capacity on the suburban railways. A number of suggestions have been made in this connection. It would be relevant to refer only to the important among them. The Committee has discussed the evidence before it on the possibility of staggering of working hours in the employing establishments. There is a general attitude of opposition to this proposal on grounds of great inconvenience to suburban residents. The Committee feels that if staggering is restricted to modest limits of opening of offices between 9 A.M. and 11 A.M. at half hourly intervals, peak hour overcrowding will be dispersed. This solution may be practicable in the case of those employing establishments which have limited dealings with the public. But in the case of a majority of establishments like business firms its possibilities are remote.

On the suburban railways eight coach trains are very widely employed. An analysis of the total carrying capacity of trains on this standard basis shows wide variations depending on the nature of the stock employed. The capacity is at its lowest in the Sealdah Division of the Eastern Railway at 490 per train. It is at its highest on the Western Railway at 1,568 by reason of the fact that the new EMU Stock has been commissioned there. Electrification would undoubtedly be an aid to quickening the speed of trains and augmenting passenger carrying capacity and likewise marginal improvements can be obtained on electrified sections by using stock with greater width But the one factor which can provide substantial relief by way of higher carrying capacity is the special design of coaches to suit specific conditions of travel in suburban trains. This has been proved by the experiment with the new EMU stock. An analysis of the floor area and passenger accommodation capacity on the stock is interesting. It shows that for 2 unit rakes of 8 coaches, 60 per cent of the floor area is allocated to seating accommodation and 40 per cent to standing accommodation. The results, translated in terms of passenger accommodation, are 54 per cent of the total passengers with seating accommodation and 46 per cent with standing accommodation. Suburban travel is of very brief duration and unencumbered by luggage. Provision of more standing accommodation, therefore, has great potentiality of augmenting passenger carrying capacity with little inconvenience. The Committee suggests that the floor area should be divided between seating and standing accommodation on a fifty-fifty basis. According to this allocation, the net increase in accommodation capacity will be about 12.5 per cent on trains employing new EMU stock. Indigenous production of this type of stock will be possible only after some years and there are obvious limitations on large-scale imports. Provision of larger standing accommodation on the conventional types of coaches will yield, of course, smaller results than the gain of 12.5 per cent with EMU stock.

It would appear that other economies and measures of enlarged carrying capacity have only a limited potential. The Committee has gone into some details of augmenting train loads. On the electrified sections of the railways on the Bombay and Madras suburban sections, this device will yield very poor results because of the limitations of line capacity which is currently used almost to the full. It should be possible to increase the number of fast non-stop trains between distant points after providing passengers at intermediate points with separate services. Some economy in time and capacity is suggested by the use of two engines for steam sections and discarding of tank future. It is sometimes argued that the development remedies. It would appear that the improvements and rationalisation suggested by the Committee will bring an increase of not more than 10 per cent in the present formal carrying capacity of suburban train services.

WHAT HAS HE TO DO WITH CEMENT ?

Cement builds his home. It is in the pavement on which he walks, the school in which he learns the arts of man, the hospital which he may need, the swimming pool, sports track and gymnasium that build his team spirit and his muscle. It is in the dams, power houses, factories, grain silos . . .

CEMENT— more and yet more cement — is the need of his future. The Associated Cement Companies Limited, which has doubled its output between 1948 and 1955, will double its production again during the next five years. The success of the Second Five-Year Plan and the future of India's youth both depend upon Free Enterprise.

The ACC is helping to build his India of tomorrow.

ENERGY FROM ATOM AND OIL

By

(CROESUS)

AS the first editorial in 'The Eastern Economist' of last week observed, the New Year has indeed begun well on the Energy War Front. A unique feature of this battle is that it is multi-pronged, all the four sources of energy, namely, coal, water, atomic power, and oil, being brought under harness. In regard to coal, the battle has begun with the amalgamation of small collieries with a view to intensifying the exploitation of all available coal resources to satisfy the fast-growing demand for high grade fuel, while the recently begun Trombay power station has demonstrated the vast possibilities of thermal power. Yet, when one is told that India has only about 110 tons of coal in the ground per head of population, one cannot fail to appreciate the urgency of the Battle for Energy. The Hirakud Dam Project is but a symbol of the promising big strides in harnessing water to produce hydel power that the country has been making. The second Five-Year Plan, it may be noted here, envisages the starting of 44 new hydro-electric and steam generating stations. Although it is true today to say that the mighty atom has not yet acquired a footing in the Indian commercial field, the inauguration of the 'Apsara', the Swimming Pool type Atomic Reactor at Trombay, by our Prime Minister last week-end marks a right and auspicious start in this direction. Dr. H. J. Bhabha, Chairman of the Atomic Energy Commission, is convinced that "for the long-term industrialisation of India, atomic energy is a necessity", but he only spoke of setting up atomic power stations within the coming five years, although Mr. Gulzarilal Nanda seems to be more optimistic, judging from the proposal he referred to at the All-India Power Engineers' Conference on Monday, of setting up a nuclear power station with a capacity of 140,000 kw. As regards oil, the Government of India's efforts in association with Governments and oil interests of several foreign countries underline the importance of this fuel, which has been appropriately described as "the most basic substantial element in filling the gaps in energy demand which are likely to appear in the next fifteen years".

When I first read the remark quoted above, I frankly thought that it was too tall a claim. But it does seem—notwithstanding all the persuasive pleading of Dr. Bhabha about the economies of an atomic power plant 'vis-a-vis' a thermal plant—that, for at least the next twenty years, oil will have to fill the energy gap in the world. It is interesting to read here the answer to the question as to which of the four sources of energy will supply the growing world demand for energy posed by the latest monthly 'Broadsheet on Britain'. "Water power-hydro-electricity", says this answer, "can only make a small contribution. Atomic power can fill a small part of the gap, but it cannot possibly fill it all. It is unlikely that coal output will rise fast enough. So the energy gap in the next twenty years must be filled mainly by oil". Indeed, oil has been playing this role for quite some time. It is estimated that, in the past twenty years, oil production has gone up nearly four times and that it now provides a third of the world's total energy and power.

But all this is not to minimise the importance of atomic power. Even if it is not likely to fill more than a small part of the energy gap, it is a vital necessity, for, as Dr. Bhabha remarked, "India will be unable to attain a standard of living equal to that obtaining in the industrially most advanced countries today, unless she becomes dependent on fuel imports on a gigantic scale or uses some new source of energy". According to what the A.E.C. Chairman said, atomic energy would be required by India not only as a source for electric power but also to promote its use in agriculture, biology, industry, and medicine.

Immediately, however, public interest is centred on atomic energy as a source for electric power. Personally, I am averse to judging this remarkable achievement of the establishment of the first atomic energy plant in the whole of Asia (excluding Russia) merely from the point of view of the economics of power supply, however important cheap power is for a poor country like ours. Yet, considering the great pains that Dr. Bhabha took to prove that, if we take both capital and running costs into account, we shall not find atomic power to be very costly at all, I feel I must refer to his views on the economics of working an atomic power plant, notwithstanding the fact that, as yet, only one large-scale atomic power station has gone into operation at Calder Hall in the UK, as he himself mentioned. On the basis of this prototype, it was his contention that electricity would be available from atomic energy during the next five years at a cost of not much more or much less than about six annas per unit. This rate, of course, compares favourably with the rate of electricity generated by conventional thermal power stations in India at places remote from the coalfields such as Bombay, Ahmedabad, Delhi and Madras. There are, unfortunately, a number of places in India where the only source of energy—not an alternative source as in Bombay, be it noted—cannot but be thermal power, and it is, therefore, pertinent to compare the rate of energy charged by such stations with that expected to be charged for electric power produced by an atomic plant.

As regards initial capital outlay, it goes without saying—and Dr. Bhabha specifically admitted this—that an atomic power station would require a 50 per cent higher outlay than a thermal station, although he added that the next few years might see a substantial reduction in this. Against this, it is interesting to compare the calls made by a conventional thermal power station of say 140 mega watts or 140,000 k.w. situated away from the coalfields, say at a place like Delhi. Besides an additional mining of some 750,000 tons of coal per day requiring the use of some 1700 one-fifth of that quantity of uranium ore for an atomic power station, such a station would involve transport of coal, over the whole distance, of as much as 2,000 tons of coal per day requiring the use of some 1700 wagons and nearly 30 locomotives. (These ancillary items would entail a capital cost of over Rs. 3 crores, it is stated). For producing the same amount of atomic power, on the other hand, the transport requirements would only be of the order of 50 to 100 tons of uranium per annum. Thus, as against the 50 per cent higher initial capital outlay that an atomic plant might entail, there is a considerable saving not only in the capital to be invested on new mining machinery but also in the transport of the raw material needed. Taking the entire picture, therefore, one is bound to agree with the view of Dr. Bhabha that "it is questionable whe-

ther atomic power would involve any greater burden on the economy as a whole. Indeed, it is possible that it may involve less".

Apart from its potential value such as providing electric power and being useful in agriculture, biology, industry and medicine, the Tromboy atomic energy establishment has proved to the world that, given the opportunities, Indians can hold their own against the nationals of any other country even in such advanced scientific fields as atomic research. It must have afforded not a little gratification to all Indians present —there were at least about a 1000 of them—to be told that this first reactor in Asia was designed, engineered and built entirely by our own people and Indian industry, except for the fuel elements. But it is only fair to add that the success of the achievement was due as much to the willing and wholehearted co-operation of other countries like the UK (through its Atomic Energy Authority), which provided the fuel element containing enriched uranium, the USA (through its Atomic Energy Commission), which has supplied 20 tons of heavy water (the entire output for a whole year expected to be produced by the large plant being set up for the purpose at Nangal), Canada, which has offered to set up the powerful high-flux reactor for conducting engineering research, and France, which provided the process for, and design of, the plant at Alwaye (South India) to treat the well-known monozite sands of the West Coast. This list of foreign countries from whom India has received assistance according to Dr. Bhabha was impressive enough, but our Prime Minister added Russia also with whom he said co-operation would develop in future, perhaps to stress the uninhibited international character of India's essay into this mysterious field. Be that as it may, Mr. Nehru was not content to receive assistance from others thus; he underlined India's traditional greatness when he offered training facilities in this country's atomic energy establishment to all—Asian and Africans. But he drew the maximum applause when he gave the assurance to the world that "whatever may happen or whatever may be the circumstances, we shall never use atomic energy for evil purposes". Will this message of peace be carried and communicated to the people of their respective countries by the scientists from 30 countries that witnessed the inauguration of India's nay, Asia's, first Atomic Reactor?

A Letter to the Editor

LANCASHIRE'S CASE FOR AGREED RESTRICTION OF IMPORTS

Sir,

Your correspondent Croesus considers that the UK cotton textile market should be completely open to duty-free imports from cheap products in the Eastern territories of the Empire, such as India, Pakistan and Hong Kong.

Lancashire believes, on the other hand, that complete freedom of imports will lead to the destruction of the UK cotton textile market to such an extent as to involve heavy unemployment and lack of strategic security in time of war or trade dislocation. It is also thought that the market be so flooded and prices so cut that the business would become of little value even to the Eastern producers concerned. The alternative, which is presumably being offered by the UK textile delegation, is a reasonable agreed limitation on imports to the UK with ample margin to allow for goods which will be re-exported after finishing.

It is a matter of opinion as to which alternative is in the best interests of the Eastern industries and countries concerned and Croesus is entitled to express his views freely. He makes statements, however, which are entirely incorrect.

The facts are as follows:

(1) Lancashire does not allege dumping against India. It is merely pointed out that the low priced cotton supplied to Indian mills gives them a great advantage. At times during the past two years this has amounted to as much as 13d. per lb. Recently the gap almost disappeared. It has now widened again and according to figures supplied by a well-known Indian cotton merchant in Bombay last week, the average would now be about 8d. The exact amount of the advantage varies with the exact grade or type concerned and with the world price of American type cotton compared with the internal price of Indian cotton.

(2) It is totally untrue that Lancashire only imports coarse and medium grey cloth for re-export after processing. Not less than 60 per cent of Indian textile imports are retained for sale on the UK market for home consumption.

(3) It is totally untrue that finishing and importing interests have not supported Lancashire's case. The accredited representatives of these interests were among the unanimous signatories of the "grey book" containing the case presented to the President of the Board of Trade. The Chairman of the Textile Finishing Confederation, Mr. W. Crossley and the Chairman of the Cotton and Rayon Merchants' Associations, Mr. J. S. T. Hawke, are members of the UK textile delegation now in India.

(4) It is totally untrue that Indian imports to the UK would, if restricted, be replaced by Japanese imports. Japanese imports are limited by a trade treaty to a small quota and the UK would certainly not make a new opening for Japan to the prejudice of an empire territory.

(5) It is true that Lancashire experienced a revival of trade at the end of 1956, but this was a temporary upsurge caused by the situation in the Middle East and by a rise in the American raw cotton market. Orders had again dropped off to a very low rate by the first week in January. Over the past few years retained imports have steadily increased and mill activity in Lancashire has steadily decreased.

Yours faithfully

"Fairplay".

22nd January, 1957.

BUSINESS NOTES

INDO-PAKISTAN TRADE AGREEMENT

THE TRADE talks between the delegations of India and Pakistan were concluded here and a trade agreement was signed on Tuesday this week. The agreement is subject to ratification by the Governments of the two countries and is expected to come into force on February 1. The full text of the agreement will be published after ratification, but material particulars are already available from Press reports.

These particulars show that this agreement marks an improvement in some important respects upon the one which is due to expire at the end of this month. The period of the agreement will be for three years. Each country binds itself to extend to the other the most-favoured-nation treatment. Two schedules which enumerate items of export from India and Pakistan respectively are practically the same as in the current agreement. There is no specific mention of cotton textile exports from India. But a special third schedule is to be included which will provide for special arrangements. It relates to coal, hard and soft wood, stone boulders and sea salt for export from India and rock salt and forest produce for export from Pakistan. The quantities or values expressing the maximum limits of their exports will be specified in this special schedule. Under the current agreement 30,000 tons of coal were meant for export to West Pakistan and 48,000 tons for East Pakistan. In the new agreement the share of East Pakistan has been raised to 55,000 tons, while West Pakistan's share remains unchanged. These quantities will be sent by the rail-cum-river routes. In addition 15,000 tons will be transported to both the wings of Pakistan by sea. In so far as raw jute is concerned India will specify by September every year the quantities she would require which will enable Pakistan to plan her acreage of cultivation. India will import from West Pakistan 50,000 tons of cement which will be counterbalanced by the export of an identical quantity from India to East Pakistan. This barter arrangement will help both the countries to make economies in transport costs in the internal distribution of cement.

In one important part the agreement takes a step backward. The Pakistan delegation was insistent on withdrawing facilities of free border trade on the eastern frontier on the alleged ground of smuggling it is said to have encouraged. Total withdrawal of free trade would have resulted in great hardship to people on both the sides of the border and hence after a good deal of bargaining the facility was retained on a restricted scale. Free trade will be allowed within a belt of ten miles from the border. But in place of the maximum quantities of boat-loads or cart-loads of commodities the quantities are reduced to head-loads and only one trip per 'A' category visa holder per day.

IMPORT POLICY — THE OTHER SIDE

WITH THE dwindling down of sterling balances by about Rs. 200 crores during the past twelve months alone and the magnitude of our foreign exchange requirements in the context of our second Five-Year Plan, the import policy announced by the Government of India on December 29, 1956, effecting drastic cuts in imports in the current half-year, was not totally unexpected. The large trade deficit last year, it has been admitted, was due, by and large, to the sharp increase in imports, particularly of industrial raw materials and capital goods and it is probable that this trend bids fair to persist rather than to disappear; at best, it may slowly taper down to more manageable proportions. If this thesis is accepted, the cuts in imports fall into better focus. Yet before effecting such sharp cuts in the import quotas for as many as 509 items, as the Government has done, it cannot be denied that the "serious repercussions" thereof require to be carefully borne in mind. The Secretary of the All-India Importers' Association (A.I.I.A.) in his memorandum to the Government of India on the Import Policy for the January-June, 1957 period, apparently feels this has not been done, which has necessitated his Association to convey its reactions and considered views on the subject to the powers that be. Inasmuch as this Association consists of representatives of a wide cross-section of importing interests in the country, its reactions and views merit notice not only in these columns but at the hands of the authorities concerned as well.

In the opinion of the Committee, the policy of "wholesale tightening of imports and of such an irrational banning or drastically reducing imports of even such commodities which are in short supply and/or which are, at the same time, not at all manufactured in the country, will lead to very serious repercussions." This will lead according to it, to an increase in prices and a scarcity of goods, causing great hardship to the common man in the process. The various commodity markets have already reacted and prices have gone up. Even prices of such daily necessities as pencils, betal nuts, crockery, medicines, razor blades, glassware, cycles, and umbrella ribs have registered sizeable increases in prices.

In this connection, the Association lists the views of some of the trades affiliated to the Association who have been adversely affected, such as bicycles, bicycle parts and accessories, bicycle tyres, paper, mutton tallow, flash light cases, chemicals, acetic acid, umbrella ribs, rayon fabrics, blankets and rugs, woollen piece-goods, etc. and suggests that the "minimum value of an import licence should be raised from Rs. 500 to Rs. 1000". This should not be impossible for the Government to concede, if, as claimed, it affords some relief to an otherwise "disappointed and dismayed importer."

The Association no doubt appreciates that the new import policy is partly at least designed to afford an opportunity for the indigenous industries to develop and establish themselves firmly, but it cautions that there is a danger that the policy will "throw out of employment a large number of middle class people engaged in the import trade". This is unfortunate, but it is extremely difficult to weigh finely the advantages and disadvantages of two equally important alternatives. What the Government is faced with today, in fact, is not even alternatives, but, more or less, a Hobson's choice, which means that there can be scope, if at all, only for small increases, and the A.I.I.A. has wisely and judiciously asked for only that.

THE PROBLEMS OF OILS AND OILSEEDS

WITH THE anticipated increase of 25 per cent in the national income during the second Plan period, the demand for food articles, particularly of items with a low standard of consumption now, is bound to go up. Oils and fats is one such item whose present consumption per capita forms only 25 per cent of what is necessary for a balanced diet. Against this background, the target of 7 million tons in the current Plan fixed for the five major oilseeds — groundnut, sesamum, linseed, rape and mustard and castorseed — shows a modest increase over the 5.5 million tons which was the target of production at the end of the first Plan. Verily this

increase will be absorbed by the rise in population over the period, leaving the per capita consumption to remain at the present low level. Moreover the increasing industrialisation will create larger demands for oils for industrial purposes. Oils and oilseeds are also a source of foreign exchange earning, and the country will need to export more and more in order to minimise the foreign exchange gap. All this leads to the conclusion that the target falls far too short of what the country actually needs. Yet how is the gap to be covered, considering the demands, on the additional acreage, of other crops, in particular of coarse grains?

It has already been pointed out in this journal that a portion of acreage under millets if diverted to the production of groundnuts, which form two-thirds of the country's oilseed production, would bring about a large increase in money terms to the cultivator with a little extra investment. In his inaugural address recently at the Oil Technologists Association, Dr. J. C. Ghosh has suggested that much of the edible oil in the country which is currently being used for non-edible purposes could be spared for human consumption if the resources of the non-edible oil-bearing seeds like those of karanj, neem, kusum and punsi, which now go waste, are utilised for industrial needs. No doubt their collection is rather difficult, but given the large sections of unemployed people, it should not be impossible of achievement, if proper encouragement from the Government is forthcoming. This suggestion holds great potentiality of augmenting output and it is of immediate importance that its practical implications should be worked out. Again, marketing both internally and in the export markets needs to be reorientated. The acreage under oilseed cultivation in the country depends mainly on rain for irrigation which largely reduces the scope of a guaranteed production and this creates chances of fluctuation in the export trade. To overcome this difficulty, Dr. Ghosh has suggested devising some means of an economic method of carry-over. At the present time the advantage of stable markets is difficult to secure on account of inability to ensure continuity of supply. These are some worthwhile suggestions and should deserve proper consideration.

RATIONALISING EXPENDITURE CONTROL

MR. T. T. KRISHNAMACHARI'S plan to reorganise the present system of expenditure control is a variation of the once famous A. D. Chanda report which three years ago precipitated a cabinet crisis. The present scheme, however, differs from Mr. Chanda's plan in one essential respect. While the financial officers envisaged by Mr. Chanda were to be under the departmental control of administrative Ministries, the attached financial advisers — of Deputy Secretary or Under-Secretary status — proposed to be appointed by the Finance Minister will remain under the control of his Ministry. This change makes a vital difference from the viewpoint of accountability to Parliament.

The main features of Mr. Krishnamachari's scheme are the appointment of a Finance Adviser of the rank of Deputy Secretary or Under-Secretary in each Ministry who would assist the Ministry concerned from the very inception of a proposal. The Finance Adviser would exercise functional control over the budget cell in each Ministry particularly in the preparation of the budget, in receiving and reviewing reports of progress of expenditure and in ensuring that expenditure did not outrun the allotments. Apart from attached finance advisers there would also be two or three Joint Secretaries of the Finance Ministry who would deal with major items of expenditure like multi-purpose projects and the public enterprises and important negotiations in connection with projects or programmes.

It is believed that the proposed scheme has been generally welcomed by the Secretaries of the various Ministries. The scheme is expected to lead to a saving of anything between Rs. 5 crores and Rs. 15 crores annually, besides mitigating to some extent the traditional and inherent feeling of antagonism between a spending Ministry and the sanctioning Ministry. The advantages of the Finance Minister's proposals are obvious. Since the Financial Advisers will be associated with the schemes at every stage it would serve the purpose of rationalising the expenditure in the interests of the country's economy, besides expediting the execution of programmes which is sometimes slowed down for reason of procedural delays.

QUALITY CONTROL OVER MARKETING

THE SECOND FIVE-YEAR PLAN has laid stress on the reorganisation of the present system of agricultural marketing for securing to the farmer his due share of the price paid by the consumer and subserving the needs of planned development. It has also recommended extensive introduction of grades and standards in the internal trade of the country and extension of compulsory grading before export to a number of commodities. On the recommendation of the Rural Credit Survey Committee, Government have drawn up a programme for the construction of godowns and warehouses. Grading of agricultural commodities, which would be stored in these warehouses on the basis of prescribed standards, would form an integral part of the warehousing activity. It is well, therefore, that all this work should have been left to be organised in the laboratories to be established for the purpose. While laying the foundation of the Central Agmark Control Laboratory at Nagpur, the Union Agriculture Minister rightly termed the present marketing system as 'antiquated' and clinched the issue by saying that unless measures were taken to promote orderly marketing 'our plans for increased production and those for boosting the exports of our surplus commodities are likely to go amiss'. Standardisation and grading of farm produce, he reminded, were vital adjuncts to orderly marketing and for reorientating the marketing system, the establishment of national standards and national grade designation marks to indicate the quality according to the prescribed standards was essential. There is no doubt that proper grading and marketing of goods will on the one hand assure to the consumer the quality of the goods he is purchasing and on the other assure the producer a fair return commensurate with the quality.

Under the Agricultural Produce (Grading and Marketing) Act passed in 1937, grade standards have been prescribed for a number of items. But the progress so far has not been very appreciable and it must also be noted that most of the agricultural commodities, which account for over 40 per cent of the total export earnings of the country, are exported without any proper grading. It is, therefore, very essential that active steps should be taken for introducing grading on the basis of Agmark grades both for internal and external trade on an extensive scale with the co-operation of the trade. It is in this context that the service of the laboratories will be needed for extensive adoption of grade standards by the growers, processors, exporters and importers in foreign countries and for an efficient grading and inspection service. The Central Control Laboratory, besides co-ordinating and supervising the work of the regional laboratories, will also attend to the work of analysis of control samples collected for prescribing standards.

BOOK REVIEWS

CHINA

Contemporary China (Economic and Social Studies and Documents)—I, 1955: Edited by E. Stuart Kirby, Professor of Economics at the University of Hong Kong: Published by Hong Kong University Press| Oxford University Press: Pages 264: Price 30sh. net.

Contemporary China happens to be Communist China. This stupendous fact explains the outside world's interest in what is taking place in that country. We in India have an additional reason for such interest —the reason being that Communist China has become, for all practical purposes, contiguous China whose impact on this country is not negligible even in the short run. This impact is just incipient, though not decisive, being probably felt in the fiscal and agricultural spheres of our economic planning. This influence may not all be to the good. But what is not good may still endure. If it is not to endure—the long-term economic interests of this country demand that it should not distort permanently the democratic goals of Indian planning—some very reliable and objective knowledge of conditions in China would be required. This requirement can be met in some measure by a wide study of the invaluable research publication under review.

'Contemporary China' is too weighty and objective in its presentation of facts to be ignored. It starts with a historical review of Chinese-Russian relations since the 17th Century. This narrative throws a flood of light on some dark corners in our knowledge of a country which, some facile optimists believe, may fall out with Soviet Russia. This is just not likely to happen, for "the Chinese-Russian relations have always been characterised by a peculiar relationship which might be described as a sort of 'fellow-feeling'. There have been, of course, other factors which have contributed to reasonably stable relations between the two countries. For one thing, "as long as Russia remains essentially a European power, the strategic realities of the situation will prompt her to maintain the 'status quo' along the Chinese borders.... As long as the 'status quo' is maintained, Siberia is safe, and Russia can thus devote her attentions to her more important European areas and borders. A corollary to this axiom is the fact that if there was a threat to Siberia it must come from Japan, a Japan which was simultaneously the major threat to China... Whatever their differences may have been, they were not important enough to bring about a situation which would open the door for an expansionist Japan.....Today, of course, the United States has replaced Japan in the latter's island empire and is, in Communist eyes, the major threat to China and Russia". The review concludes prophetically. "If China and Russia have been bedfellows in the past the 'religion' (of Marxism) they worship in common can only serve to accentuate this situation. In time heresies may develop, and when they do, the repercussions will be great. But until that happens, the Chinese-Russian relations will probably remain firm".

The third section in the publication, dealing with the population problems of China, presents two views, one optimistic and the other sceptical. China's population as of 1954 is 602 million. Whether this is over-population or not is ably discussed. The fourth section dealing with agriculture (as of 1954) is very thin, covering just 3 pages. The spectacular collectivisation drive since launched has drawn worldwide attention. (Incidentally the factual and narrative sections in the Report of the Indian Delegation to China on Agricultural Planning and Techniques are uptodate and deserve close study). The principles of the Economic Policy of Maoism are explained objectively in the fifth section.

The sixth section entitled 'Four Years of Fiscal Policy in Communist China' is particularly relevant for study in India. This is not claimed to be an exhaustive account, but such facts as are given are very revealing. One such fact is that "whereas in 1950 the revenue from State-owned enterprises amounted to 12.5 per cent of the total public revenue, it was expected to reach about 36 per cent in 1954". Another fact is that tax revenue (which accounted for nearly 60 per cent of the total budgetary revenue in 1954) represented a tax-burden equal to about 24 per cent of the national income. As the national income per head in China was as low as Rs. 187 per annum, the tax burden should have been unbearable indeed. (This may be compared with a per capita income in India of Rs. 277 per annum in 1954-55 when the tax-burden was only about 7 per cent of our national income). These facts alone—pertaining to tax-burdens in China and in India—constitute a telling commentary on the inhuman character of totalitarian planning and the human approach of democratic planning.

An even more revealing fact about taxation in China is that the agricultural sector (paying central and local taxes) is one of the main sources of government finance and of capital accumulation, accounting for just under 15 per cent of the total Government revenue. With its differential but still high rates, the grain tax alone amounts to between 15 and 20 per cent of the total agricultural income. If the burden of local taxation is also taken into account, the higher figure of 20 per cent can be clinched as the right one. (This, again, may be compared with the position in India where land revenue including agricultural income-tax in some States and local taxation is just under 2 per cent of the total agricultural income). As for the non-agricultural sector of the Chinese economy, the principal taxes are a turnover-tax ranging from 1 to 3 per cent of the total business revenue and an income-tax varying between 5 and 30 per cent of the income or net profit. As for possible deficit financing in China, it is admitted "that a certain amount of money creation cannot be excluded although the determination of its magnitude would be guess-work".

Perspectives of the industrialisation policy as also the Five-Year Plan in China are succinctly dealt with in two other sections. The facts and figures bearing on these have been covered in some recent issues of 'The Eastern Economist'; no reference is, therefore, made to them in this review. Other sections bearing on the Chinese Eastern Railway, the Planning Structure, China's trade with Japan, the new marriage laws and Communist influence on the Chinese language are also as interesting and illuminating as the other sections. Readers in India may well look forward to the second volume of 'Contemporary China'.

MAJOR INDUSTRIES

Major Industries of India Annual, 1955-56: Editor: M. P. Gandhi: Published by M. P. Gandhi & Co., Jan Mansion, Sir P. Mehta Road, Fort, Bombay-1: Pp. 324: Price Rs. 15|- or £ 1-10 or $4.50.

This is the fifth volume of M.P. Gandhi's annual series dealing with developments in the sector of major industries in India. The Editor points to the 'process of adjustment of mutual altitudes between Government and big business in the last decade' and hopes that his 'Annual' may facilitate 'a more complete understanding between Government and private business'. The exposition of problems and policies bearing on a wide range of industries is expected to achieve this end. But, Mr. Gandhi admits elsewhere in the 'Annual' that 'talks of mixed economy are indulged in for the sake of form rather than out of a recognition of the importance of private enterprise'. Even if this 'importance' is not sincerely recognised now it does not matter much, for he holds out the hope that more responsibilities are likely to devolve on private enterprise 'either because of failure in the public and other sectors like the co-operatives or the cottage industries or for other reasons'. He, therefore, calls on the industrialists 'to seize the opportunities that will be presented not only in the framework of the Plan but also by the lacunae which the actual working of the Plan may reveal'. It is thus the importance of and the opportunity for private enterprise that provides the justification for this 'Annual'.

The opportunities and expectations of the private sector are ably dealt with in an editorial. Mr. Shyam Nandan Mishra, Deputy Minister for Planning, writes on the diffusion of benefits of industrialisation. Mr. John Sherman Cooper expects larger U.S. private investment in India with the stimulus provided by the International Finance Corporation. Mr. Lal Bahadur Shastri visualises great development in the sector of railways. The potentialities of fertiliser industry in India are outlined by Mr. K. C. Reddy, Minister for Production. Dr. P. S. Deshmukh, Minister for Agriculture, deals with raw cotton supplies and Mr. Shantilal Mangaldas, President, Federation of Indian Chambers of Commerce and Industry, outlines the export prospects of the textile industry. Mr. H. P. Bagaria, Director, East India Jute & Hessian Exchange Ltd., pleads for a larger jute crop for India's jute industry.

Mr. K. K. Birla presents a powerful case against any issue of further licences for the establishment of sugar factories as there is a likelihood of waste of capacity and also of financial resources which could with advantage be utilised for development of other industries. His contention is that in view of the possibility of increased production from the existing units by a higher recovery, larger crushing following augmented supplies of cane, and longer crushing season, as also by new units already sanctioned, production would increase to 2.5 million tons. Mr. G. P. Birla, President, Indian Paper Mills' Association estimates large increases in the consumption of paper in the next decade and urges the need, therefore, of an early assessment of availability of raw materials like bamboo and grass. The other major industries covered in the Annual are: Coal, Cement, Heavy Chemical, Aluminium, Oil Refining, Automobile, Defence, Telecommunications and Telephones, Electricity Generation, Iron and Steel, etc Banking, Management Problems and a number of related subjects are dealt with by experts in the respective fields. Space, however, forbids detailed reference to all the sections of what should easily rank as a first class publication.

MIND YOUR OWN BUSINESS

What is my business?

To be the objective judge between points of views.

What tools do I need for the job? Facts—nothing but naked facts, as recorded in KEESING'S—leaving you free to form your own opinion.

What is KEESING'S? The one and only KEESING'S is an ingenious News-plus-Reference service. It is issued every week in loose-leaf supplements which record the important happenings of our time, registering all the essential data on Politics, Economics, Social Questions, &c., **the world over.**

What is unique about it? Its 'living' Index which is constantly renewed to embrace the latest items, giving immediate access to every entry, while the special Binding Case is designed to hold the loose-leaf material in solid book form for permanent reference purposes—and so you build up your own authentic work of reference on present-day developments: unbiased, concise, always up to date, and **on a truly global scale.**

What is my next step? Just fill in the coupon, post it now, and look forward to full particulars about this useful and fascinating requisite for minding your own business efficiently, responsibly, objectively.

COMMODITY NEWS AND NOTES

RECORD NORTH INDIAN TEA CROP

The North Indian tea crop during 1956 established a new record of 536,660,000 lbs. compared with 534,200,000 lbs. in the previous year. This was achieved in spite of the fact that the production in December 1956, was nominal at 2,900,000 lbs. due to complete stoppage of plucking by the end of November last year under the Crop Regulation Scheme. The total crop last year was 25,780 lbs. higher than the average for the previous three years. The increase in production is attributed entirely to the ever-increasingly replanted areas of young tea which are now reaching maturity.

RISE IN SUGAR OUTPUT

Production and despatches of sugar from indigenous factories amounted to 4.51 and 3.19 lakh tons up to December 31, 1956, in the current season as against 3.58 and 2.43 lakh tons respectively in the corresponding period of last year, according to a Food Ministry press note.

EXPORT OF SUGAR TO PAKISTAN

The Indian Sugar Mills' Association, which has been entrusted by the Government to undertake export of 50,000 tons of sugar, has taken up the work with promptness, it is learnt. The Association is already reported to have contacted prospective buyers in various countries and negotiations are expected to start soon with neighbouring countries such as Pakistan and Ceylon which are interested in Indian sugar. The Association has set up an exports division to organise the work.

RISE IN CASTORSEED PRICES

The Board of the Bombay Oilseeds and Oil Exchange Ltd., at its recent meeting, considered the situation arising out of the recent consistent rise in the prices of castorseed and groundnut. There was an opinion that a system of deterrent margin should be introduced into the futures trading in castorseed and groundnut with a view to arresting the upward tendency in their prices.

COTTONSEED OIL RESIDUE

Cottonseed oil grease or cottonseed oil residue (residual product obtained in the refining of crude cottonseed oil) will be treated as cotton seed oil for purposes of export outside India. Announcing this, a notification issued by the Joint Chief Controller of Exports, Bombay, said cottonseed oil grease or cottonseed oil residue will accordingly be licensed freely for export up to the end of June 30, 1957.

JAPANESE RAYON YARN FOR INDIA

Representatives of the Indian art silk industry are now conducting negotiations in Japan with the Japanese rayon industry for bulk purchase of three million lbs. of rayon yarn. The Indian Art Silk Industry expects to import rayon filament worth Rs. 2 crores from Japan as soon as the deal is concluded.

FORWARD TRADING IN PEPPER

Forward trading in pepper commenced in Cochin from January 15 under the auspices of the Indian Pepper and Spice Trade Association, Cochin. The regulation of futures contracts in pepper will, it is stated, help stabilise the pepper trade in the country at a time when India is keenly facing competition for this commodity in world markets.

COAL PEGGING LIMITS RAISED

The production of coking coal of selected 'A' and 'B' grades in 1957 would be pegged to the overall ceilings of 7.90 million tons as against 7.70 million tons in the preceding year, it is learnt. The overall ceiling of production in respect of grade I and II coking coals has been fixed at 4.40 million tons and 3.90 million tons respectively in 1957, against the pegging limit of 4.20 million tons and 3.10 million tons in 1956, it is further learnt.

EXPORT OF ONIONS

The Joint Chief Controller of Exports has announced that a small ceiling of export of onions is available for reallotment out of the unutilised quota announced in November 1956. Exports will be permitted till the end of February 1957 or till the ceiling is reached, whichever is earlier.

CANADIAN STEEL AND IRON OUTPUT

A further increase in Canadian production of steel imports and pig iron occurred in November according to the Bureau of Statistics. Steel ingot output amounted to 432,922 tons, up 6 per cent, over the previous November's figure of 406,722 tons. The 11 months total was 4,745,322 tons, a rise of 17 per cent. Pig iron production totalled 298,900 tons, up 5 per cent, from the corresponding month a year ago. Output for 11 months was 3,254,406 tons or 11 per cent more than the corresponding figure a year ago.

RECORD SOUTH AFRICAN GOLD OUTPUT

South African gold production reached the record total of 15.892,935 ozs. last year. It was 1,290,668 ozs. higher than in 1955, the output for which at 14,602,267 ozs. was the last since the record war-time total of 14,406,761 ozs. attained in 1941. Growing production from the new Far Western Rand and Orange Free State gold fields accounted for last year's fresh income. The 1956 output had an aggregate value of close on £200 million. The 1955 value (excluding certain amount of miscellaneous production) was £177.4 million and that for 1954 was £158.6 million.

BIG FALL IN CAR PRODUCTION IN U.K.

The British motor industry is faced with the most serious contraction in output and employment it has had to meet for over 20 years, it is learnt. In some of the largest factories in the country, car production has been cut up by 40 per cent since the announcement of petrol rationing.

RAISINGS AND DESPATCHES OF COAL

A total quantity of 85,007 tons of coal were carried by coastal shipping to various centres in India and 102,824 tons were exported to foreign countries, from various coalmining areas in India during December, 1956. About 100,452 tons of coal were despatched to Pakistan during December, 1956 as against actual despatches of 91,590 tons in November, 1956. For this purpose a daily average allotment of 149 wagons was made during the month. Raisings of coal during the month of November 1956 from all coalfields in India amounted to 3,323,227 tons and despatches to 3,025,063 tons. The average daily loading for December, 1956 from Bihar and Bengal coalfields was 3,384 tons.

DEVELOPMENT OF COTTON GINNING

The Ministry of Production has sanctioned a loan of Rs. 25,875, as subsidy for the development of ginning of cotton in the National Extension and Community Development Blocks in Madras State. The loan covers 50 per cent of the cost of purchasing 1,350 gins for 9 ginning units and the cost of purchase and supply of cotton to the units. Presently sanctioned for a year, the loan, which is interest free, is renewable for a further period, if continued assistance is required for the purpose.

U.S. ALUMINIUM RECORD

Primary aluminium producers in the U.S. set a new all-time production record during 1956 as well as for the fourth quarter of the year, according to the Aluminium Association. Total output last year amounted to 3,358,861,859 lbs. over 227 million lbs. above the 1955 record.

COMPANY AFFAIRS

AIR-INDIA INTERNATIONAL CORPORATION

The third year (April 1, 1955 to March 31, 1956) of the Corporation's existence was one of continued and rapid expansion. An idea of the Corporation's growth since its inception in 1953 can be had from the following figures. The unduplicated route mileage has registered an increase of 82.2 per cent from 10,364 on August 1, 1953 to 18,886 on March 31, 1956. The increase in fixed assets is of the order of 384.9 per cent from Rs. 156.83 lakhs to 760.43 lakhs. In hours flown, C.T.M. operated and operating revenues, the figures have gone up from 8,779, 11,551,000 and Rs. 239.05 lakhs to 20,889, 35,242,000 and Rs. 676.53 lakhs respectively. The proportionate percentage increase in the three items is 58.6, 103.4 and 88.7 respectively.

The financial results show that the Corporation made, during the year ended March 1956, an operating profit of Rs. 6.54 lakhs (approximate) after providing Rs. 72.50 lakhs for depreciation and Rs. 18 lakhs for obsolescence of spares and stores. The net profit comes to approximately Rs. 3.78 lakhs after taking into account the non-operating expenses and revenues and after providing Rs. 2.91 lakhs for deferred taxation. The results for the year reflect a credit in respect of the write back of depreciation to Profit and Loss account of Rs. 7.56 lakhs previously written off mainly in respect of the Constellation lost in an accident in the South China Seas in April 1955. But for this credit there would have been a net loss of Rs. 0.87 lakh in which case there would have been no need to provide for deferred taxation and the operating profit would have remained unaffected. In the absence of any final decision of the Lebanese authorities, the Corporation has not been able to take into account credit estimated at Rs. 6.50 lakhs in respect of its claims for refund of municipal and financial taxes on fuel uplifted at Beirut. If that credit were included, the operating profit would have been Rs. 13.04 lakhs and the net profit Rs. 7.46 lakhs.

Together with the previous year's carry forward of Rs. 0.23 lakh, the net profit amounts to Rs. 4.01 lakhs. The Board has disposed of this by appropriating Rs. 1.94 lakhs to Insurance Fund and Rs. 1.72 lakhs to General Reserve. The balance of Rs. 0.35 lakh has been carried forward.

Compared to 1954-55, the operating profit shows a substantial drop from Rs. 32.79 lakhs to Rs. 6.54 lakhs. The fall has been attributed mainly to the increase of nearly 50 per cent in the capacity offered during the year as compared to the previous year. Traffic takes some time to build up after every phase of major expansion and the fall in profits could not be entirely unexpected. The increased capacity offered is being absorbed by traffic as the estimated results of the first four months of the Corporation's current working year show.

During the year under review, the dispute between the Corporation and Air-India International Ltd., regarding the value of the accumulated privilege leave of staff taken over by the Corporation was settled. Accordingly, Rs. 5.34 lakhs was paid to the Company in Bonds and Cash. The total amount of compensation finally paid to the Company was thus Rs. 282.25 lakhs.

Towards its programme of expansion during the next five years, the Corporation has placed orders for two more super constellation aircrafts at a cost of about Rs. 3.25 crores inclusive of spares. This will increase the total number of its constellations to eleven.

THE PUNJAB NATIONAL BANK LTD.

The working of the Bank for the year ended December, 1956, shows satisfactory progress both in deposits as well as profits. The deposits at the end of the year under review exceeded Rs. 106 crores, registering an increase of Rs. 16 crores (or 17.8 per cent) over the previous year's figure of Rs. 90 crores. The increase in deposits during the year compares favourably with the 1955 increase which amounted to Rs. 14 crores.

The net profit of the Bank (subject to audit) for the year is Rs. 90.20 lakhs which includes Rs. 2.35 lakhs brought forward from the 1955 account. The year's profit is Rs. 20.80 lakhs more than that of the previous year's figure which was Rs. 69.40 lakhs and included Rs. 4.99 lakhs brought forward from the previous year.

During the year, the Bank opened 14 new offices, bringing the total number to 339.

THE BANK OF BARODA LTD.

The profit of the Bank for the year 1956 (subject to audit) amounts to Rs. 43,25,752 which includes in it the sum of Rs. 3,35,546 being the amount brought forward from the previous year's account. An ad-interim dividend was paid for the half-year ended June 1956, at the rate of 12 per cent per annum, free of income-tax, which absorbed Rs. 6 lakhs. The Directors have provided a sum of Rs. 15.75 lakhs for taxation and another Rs. 8.75 lakhs for bonus to staff. They have also proposed a final dividend of Rs. 4 per share, also free of income-tax, amounting to Rs. 8 lakhs. The total dividend for the year thus amounts to 14 per cent. The balance of Rs. 4,75,752 has been proposed to be carried forward.

UPPER JUMNA VALLEY ELECTRICITY SUPPLY CO., LTD.

The Company's working for the year ended March, 1956, shows that after providing for all charges, placing Rs. 9,914 to statutory Contingencies Reserve, Rs. 79,930 to Tariffs and Dividends Control Reserve, Rs. 45,518 to General Reserve and bringing forward Rs. 31,490 from the half-year ended March, 1955, and deducting Rs. 31,094 in respect of dividends paid for the half-year ended September, 1955, there remains a balance of Rs. 65,585 available for distribution. The Directors have recommended the following disposals: Payment of a dividend at 10 per cent per annum, free of income-tax for the half-year ended March, 1956, which absorbs Rs. 24,875. An additional payment of two annas per share, also free of income-tax which takes away another Rs. 6,219. The balance of Rs. 34,491 is to be carried forward.

The Company has maintained a steady progress both in units sold and revenue earned during the last three years. The figures for March of each year 1954, 1955 and 1956 are: Units sold — Rs. 7,418,260, Rs. 8,947,732 and Rs. 10,430,517 respectively. The figures of revenue are Rs. 14,34,080, Rs. 15,41,462 and Rs. 19,02,317 respectively.

With the release of additional power by Hydel, enabling the Company to connect many additional consumers during the year, considerable improvement has occurred in the revenue position. Extensions and strengthening of mains and services will need to be made for which the Company is considering to incur a capital expenditure of Rs. 5 lakhs.

World Bank Loan for Railways

THE team of the World Bank's consultants on railways arrived in this country this week. It is currently engaged in a preliminary discussion of its survey of operations of Indian railways in certain sectors which have been selected for priority in the Bank's assistance. Initial exchange of views has prepared the ground for this investigation. A delegation on behalf of the Railway Board was deputed to the United States about three months back to appraise the Bank of the urgency of immediate finance for the railway investment programme. The mission of consultants which has now come here is the outcome of this exchange of views. There is ample assurance in Mr. Eugene Black's letter of November 15 last to Mr. T. T. Krishnamachari that the Bank will accord very sympathetic consideration to the requirements of the railways. The technical assessment which the experts have been asked to make will form the basis of the Bank's first loan for the railways in their programme of development during the second Plan. It is proper, therefore, that the picture should be viewed in the right perspective.

The railway development programme was drawn up on the assumption that the increase in

freight traffic during the second Plan, expressed in terms of originating tons, would be of the order of 61 million tons. Due to the imperatives of rationing the anticipated resources in finance, provision was made to raise the capacity of the railways to carry additional traffic of 47 million tons over the five years. About 40 million tons of the allotted increase will be absorbed by the movements of coal and raw and finished materials of the steel factories. Cement is another basic material for which provision has been made in this allotment of increased capacity, but not to the full extent as now transpires. The revised estimates of freight traffic show that the increase will be of the order of 75 million tons primarily on account of the higher targets prescribed subsequently for production of food and cement. The Railway Ministry's demand for an outlay of Rs. 1,350 crores, on the basis of the original estimate of traffic, was cut down by about 17 per cent to Rs. 1,125 crores. Considering the latest assessment of the magnitude of the demand on rail capacity, elaboration will hardly be needed to bring home the intensity of pressure on the railways.

The Bank's loan will be related to the foreign exchange requirements of the development programme. These requirements have been placed at Rs. 425 crores in the Plan on the broad allocation of Rs. 163 crores for locomotives and freight wagons, Rs. 125 crores for specialised types of rolling stock and Rs. 137 crores for steel. About Rs. 40 crores of the allocation for steel represents quantities to be procured at actual import costs outside the Steel Equalisation Fund. The indigenous potential of manufacture of railway equipment has been exploited to practicable limits as in the case of raising locomotive and wagon production capacity. The prospect of seeking further relief in this direction during the Plan period is negligible. This is, therefore, the irreducible minimum of the import component of the railway programme. Since the Plan was prepared, global prices of steel have been moving up and indications are that the upward trend will extend well beyond 1958. The element of increased import prices is an important factor which will need due weight in the assessment of help for the railways. During the current licensing period of January-June, railways have been called upon to hold back their import expenditure due to the small size of the margin of foreign exchange that can be drawn upon. This is a jerk in the import schedule which anticipates a reasonable phasing of orders and deliveries. It need not, however, be apprehended that the procurement programme will be actually slowed down, if the Bank's loan is made available in a substantial size. Expansion of transport is basic to the development of other sectors of the economy and transport has always been approved by the Bank as a priority object of its assistance.

The quantum of assistance will be determined by the technical appraisal which the Bank's consultants will place before it. It is essential, therefore, to examine how the performance of railway operations lends itself to a claim on the Bank's resources. It is common knowledge that the first Plan by and large saw the completion of the rehabilitation of railways after the abnormal depreciation of assets and equipment consequent on war-time and post-partition strains and stresses. Meanwhile the density of traffic is rising. It is second only to that in the United States in respect of freight traffic; but the combined freight and passenger traffic density on Indian railways is the highest in the world. In spite of the disparity in the growth of traffic density and expansion in provision of rolling stock and equipment, Indian railways are rendering a creditable account of improvement in their operating efficiency.

Certain indices of performance on the broad gauge, which accounts for 80 per cent of the freight traffic, serve as positive proof of progress in efficiency standards. Train miles per route mile operated in 1955-56 on Indian railways were 8,321 which compared with 3,444 in the United States. Net ton miles per track mile is a vital index which shows that Indian railways recorded performance of 1,152,480 as against 1,331,717 in the United States, 665,200 in West Germany and 978,075 in South Africa. Their achievement of 46.6 wagon-miles per wagon-day in 1955-56 is impressive in the sense that operations have been raised to the war-time pitch without anything like the rigorous war-time controls on traffic. Passenger traffic operations have attained similar levels and it ought to be remembered that the Railway investment programme provides for only half of the expanded capacity required in the passenger sector on conservative estimates. In other important spheres, including primarily more intensive utilisation of stock, railways are stabilising their performance at higher efficiency levels. While continuous improvement in efficiency has been counted upon as a factor in raising capacity, real and major relief must come from increased outlay.

A situation has emerged which demands that development projects involving appreciable expenditure of foreign exchange must be allotted priorities consistent with their urgency. Coal and steel programmes unquestionably come on top of all—a fact which is clearly recognised in the Plan itself. The Rourkela and Bhilai units will go into production in 1958-59, but even prior to that in 1957-58 their raw material stocks will need to be built up on the spot. The next year will see TISCO and IISCO exerting pressure on traffic as their expanded capacity is put into commission. Meanwhile, movements of coal in full train loads will be mounting up steadily. Steam traction has reached the saturation point in the coal area and precisely for this reason electrification has claimed first priority in the region. AC electrification of lines will reduce operating costs by 13 per cent in relation to steam locomotives and 6 per cent in relation to diesel locomotives. In the intervening period before the gains in capacity and costs resulting from electrification are realised, a fleet of 100 diesel engines involving an outlay of Rs. 13 crores is the only answer to the demand for higher capacity. This fleet can be used later as a standby to relieve congestion arising from time to time on different lines. In the steel belt new line construction of 220 miles is an imperative necessity. Doubling of track on the Bina-Bhopal, Ratlam-Godhra and Madras-Bezwada sections is called for in the immediate future. These projects together with programmes of rationalisation of marshalling yards and signalling equipment form the first stage in railway development.

The Bank's initial loan will be needed, on reasonable expectations, to finance the import cost of these projects. Positive indications of the size of the loan, it is presumed, will be available in June this year. Already a year and a quarter of the present Plan period will have elapsed by that time. It is indeed urgent that preliminaries should be expedited to cut delays which involve risks of retarding the progress of other programmes.

Fair Deal for Automobiles

DARING private enterprise and State protection alike have made the Indian automobile industry what it is today. Its performance has won deserved recognition at the hands of the Tariff Commission and the Government of India. That the industry has progressed to a stage at which the six approved manufacturing concerns have an annual assembling capacity of very nearly 50,000 vehicles, is no mean achievement in the context of heavy odds in a highly competitive field. It is, again, remarkable that the sales of locally assembled cars and trucks by approved manufacturers have reached in 1956 annual rates of about 12,500 and 17,500 respectively as against 700 and 300 in the case of other assemblers and 500 and 125 respectively by way of imports.

From the point of view of the future progress of the industry, the Commission's recommendations regarding automobile prices would have to be considered crucial and important. The Commission was required to determine the fair ex-works and selling prices of motor vehicles manufactured in the country. The problem of fair prices was not squarely faced in the recent past although a system of price control was in operation. This system involved the fixing of prices at the levels voluntarily suggested by the manufacturers themselves. Under this system the question was not considered whether the control prices were fair in relation to the actual costs of production of the firms concerned and to the rates of profit which could be considered fair in each case. The Government sanctioned in due course *ad hoc* increases in most cases on the basis of increases in the landed costs of the vehicles concerned. But when in some cases the price increases were claimed on the ground of higher costs of production of indigenously produced components, the question of price fixation was referred to the Commission. In facing this problem the Commission has had to keep two conflicting considerations in view—namely, the need for encouraging automobile manufacture in such a way that despite the increase in costs involved there would be no losses or **undue** reduction of profits and, on the other hand, the desirability of maintaining prices as low as possible in order to foster the demand for automobiles. It is commendable that the Commission has been able to suggest a proper solution for this difficult problem.

How the Commission has reached the conclusion that "the choice as regards the timing of the necessary price adjustments is best left to the manufacturers themselves", need not be considered here in all its logical and factual details. Suffice it to say that the Commission has made a clear distinction between 'fair prices', which cover the cost of production and leave a fair margin of profit, and 'maximum prices' which may be equal to or above fair prices and that if the fair prices themselves were to be maximum prices in the case of the automobile industry, the manufacturer would have no chance to make up the loss or the shortfall in his fair profits in the event of the actual prices happening to be lower than the fair prices. The existing conditions in this industry are that there is still a considerable amount of internal competition despite the elimination of foreign assemblers and each manufacturer has to maintain his prices at a strictly competitive level (as, for example, in the case of the Hindustan *Landmaster* which, the Commission has found, is actually being sold at a loss) in the interests of maximising his business but that, at the same time, each manufacturer is expected to push forward his programme of manufacture of components thereby increasing his costs. In view of these conditions, there is great risk of the manufacturer receiving less than fair prices, and so the adoption of fair prices as control prices is rightly considered not feasible. The Commission has, therefore, recommended a flexible system under which no maximum prices are fixed, but, subject to a general obligation not to charge excessive prices, the manufacturers are left free to vary prices according to variations in costs.

Although the Government have accepted the Commission's recommendations, they have done so with some qualifications. These conditions are that a month's notice of any variation in prices should be given to the Government, that such variation should be *prima facie* reasonable and that the net dealer prices—the ex-factory prices charged to the dealer—should not exceed the ex-works costs by more than 10 per cent. These conditions are not unreasonable in the context of the long-term interests of the industry. There is, perhaps, reason to believe that the Government would easily accept variations in prices if the approved manufacturers maintain their cost data in meticulous detail to enable the costs of production of individual assemblies as of complete vehicles to be easily ascertained. Such data are bound to be convincing in the eyes of the Government even as they have been in the eyes of the Tariff Commission.

That an industry of the dimensions of the automobile industry has not only to be protected for some time longer against foreign competition but enabled to work at a fair level of profitability, has been fully appreciated by the Tariff Commission in its report and to a large extent by the Government in their resolution on the Commission's recommendations. The Commission has rightly recommended and the Government have promptly resolved that protection granted in 1953 should continue for a period of 10 years. This is good so far as it goes. It is, however, rather unfortunate, though not altogether strange, that the Government have rejected the Commission's related proposal that, in order to give priority to the manufacture of the more essential components like the engine, transmission and axle, import duties on them should be raised, while those on the less important items should be lowered. This rejection is explained on the ground that the recommended change in tariffs is not necessary *at this stage* when the domestic industry is sheltered to a very considerable extent by restrictions on imports. And this explanation is also strengthened by the Commission's recommendation that in the grant of import licences for components special weightage should be given to firms which show the maximum progress in indigenous manufacture. As the Government also favour this course, conversion of existing revenue duties in respect of

the said components into protective duties is not considered immediately necessary. The Government have, however, committed themselves to such conversion, by recourse to the powers under Section 4(1) of the Indian Tariff Act, if *at any time* such a course appears to be essential.

The question is how the present time can be considered inopportune for the purpose. As the Tariff Commission says, "there are significant differences in the competitive positions of different manufacturers at present. Under the manufacturing programmes as approved by Government, some have undertaken, and/or implemented, less onerous obligations than others; those who are importing a larger proportion of their vehicle, and whose costs are therefore comparatively lower, are able to quote more competitive prices than others who have deleted a larger proportion of their c.k.d. pack; and the current import control policy also, with regard to the volume of imports permitted to approved manufacturers, allows full scope for competition between them in spite of the differences in their competitive position in the above respects". The indigenous manufacturing costs of engines, transmission and rear axle in the case of two approved manufacturers, namely, Hindustan Motors and Premier Automobiles, compare very unfavourably with the landed costs ex-duty of such components. In the case of Hindustan Motors, the indigenous replacement costs of the rear axle and the engine for the passenger car *Landmaster* are Rs. 508 and Rs. 1,408 respectively as against the landed costs ex-duty of Rs. 358 and Rs. 1,035 of the respective components; the indigenous replacement cost of the engine for the *Studebaker truck* is Rs. 3,122 as against the landed cost ex-duty of Rs. 1,365 of that component In the case of Premier Automobiles, similar large differences between the indigenous replacement costs and the landed costs ex-duty of the engine and the transmission for their trucks and of the engine for their passenger car are bound. There can be no doubt, therefore, that some concerns would be more disadvantageously placed *even currently* in their internal competition with others. Although Government have not considered it necessary to convert the revenue duties concerned into protective duties immediately, they ought to do it a little later in the context of their own admission that "the existing rates of duty are inadequate for protecting the industry".

Universities: A New Look?

THE year of grace 1957 bids fair to be a momentous year for India, what with its projected or performed celebrations of four centenaries. While the centenary of the first War of Independence (miscalled the 'Sepoy Mutiny') is due to be celebrated this year, the centenaries of the founding of the Universities of Calcutta and Madras have just been celebrated with great eclat and the centenary celebrations of the Bombay University are just impending. It was no mean historical coincidence that the year (1857) which saw the ruthless suppression of a great national uprising also laid the foundation for a system of liberal education which, a hundred years thence, stands as one of the greatest bulwarks of democracy in this country. If the innumerable affiliated colleges of the three oldest universities have, in the twenties, thirties and forties of this century, shared in the general ferment accompanying the movement for national liberation, they now share in the general thrill of building a new India on solid democratic foundations.

The University of Calcutta has been the first to celebrate the centenary — with President Rajendra Prasad most appropriately inaugurating it. It was still more appropriate that the President suggested, on the occasion, to the Universities in India to take up the screening of students at a suitable stage and diverting those aiming at jobs in one direction and those with a genuine desire in learning and research in the direction of universities. No wiser words could have been uttered on the occasion, for the fact remains that our universities have been singularly unconcerned with the problem of educated unemployment which is, in part at any rate, the result of the kind of scholastic education they have been imparting all along.

If the University of Calcutta has been minting degrees at an alarming rate, the University of Madras has a no less prolific record in this regard. This, however, is no slur on these universities nor does it detract from the healthy influence they have steadily exerted over the intellectual and academic life of the country. Neither does it detract from their valuable contribution to the permanent administration which has been manned by successive sets of graduates of high calibre and character. For, it can be rightly claimed that the fairly high degree of administrative efficiency in India is largely due to "the self-effacing and hard-worked university graduate in, or promoted from, the non-gazetted services." And it can be further claimed that the "habit of fidelity and responsibility acquired and forged into a tradition by three generations of devoted workers (graduates) enabled the swift transition from subordination to independence to be carried out with a minimum of dislocation."

While all this may redound greatly to the credit of our universities, the fact remains that most of the graduates *now* being sent out by them are not fit to be absorbed straightway (even if there are openings for all of them) in the services of a welfare State with its ever-expanding activities in the context of economic planning. Although the universities cannot be held directly responsible for any educated unemployment, their possible failure to appreciate the need for reorienting their system of education to the needs of successive Five-Year Plans which alone can absorb the educated in a wide range of gainful occupations, may reflect adversely on their capacity to change in unison with changing social and economic values and compulsions. Will our universities come to have a new look by the end of the second Plan?

what the eye doesn't see...

There are some things you don't see disappearing. You don't see the loss of heat from a badly-insulated steam pipe—but you see the bills, because heat costs money. So it is well worth having your steam systems properly insulated. The best insulating medium for this purpose is undoubtedly Newalls 85% Magnesia, produced by our associates Newalls Insulation Co. Ltd. But it's not just a good product we have to offer... we can offer free technical advice on any insulation problem. Heat or cold insulation is a science. Our highly trained staff can advise you exactly on the thickness to which insulation material should be applied. Too little or too much insulation means less economy—and it is our job to save you money. Practically every industry uses asbestos in one form or another. In our new factory at Ghatkopar, we make a wide range of technical asbestos goods to satisfy the varying needs of India's economy. **The increasing use of Asbestos is an index to India's industrial progress.**

THE WEEK'S NOTES

COMING ELECTIONS IN INDIA

INDIA, THE youngest though the biggest democracy in the world with a 193 million electorate, will go to the polls in stages from February 25 to March 14. The first stage of the country's second General Elections was completed in all the States, except West Bengal, when more than 15,000 persons filed their nomination papers on Tuesday for 458 Parliamentary and 2,340 State Assembly seats. Though a complete picture will be available only on February 9, the last date for withdrawal, it seems certain that the number of candidates per seat will be more than it was during the first General Elections.

This time the number of seats in the State legislatures has decreased from 3,233 to 3,102. The shortfall has been caused mainly by the abolition of Part B and Part C States which enjoyed weightage in terms of seats allotted to them. Partly this is due to the fact that, except in the Telangana area and in two constituencies, no elections are to be held in Andhra State, where elections were held only two years ago.

Thanks to the simplification of the Election Law, under which there can be no large-scale rejection of nomination papers on technical grounds as earlier, the chances of multi-cornered contests have become greater still. At the time of writing, this none-too-encouraging prospect would appear to be a certainty. As the table given below would show, excluding the independents, there are as many as five "all India parties" in the field.

NUMBER OF SEATS TO BE CONTESTED

Name of Party	Parliament (a)	State Assemblies (b)
Congress	481	2,871
Communist	140	730
Praja-Socialist	180	1,300
Jan Sangh	100	1,000
Socialist	35	309
(a) (i) Total number of seats ..	500	
(ii) Number of seats where election is being held ..	494	
(b) (i) Total number of seats ..	3,102	
(ii) Number of seats where election is being held ..	2,996	

The ruling Congress Party is the only party which is contesting almost all Parliamentary and State Assembly seats. The re-integration of splinter groups like Krishak Lok Party and the Akali Dal with the Congress has given it a cohension it seemed to lack until recently. In contrast the Opposition is divided and ineffective. The Praja-Socialist Party has split into two, and confusion is rampant amongst the Communists.

COMMONWEALTH STANDARDS CONFERENCE

THE THIRD quinquennial Commonwealth Standards Conference currently being held in New Delhi marks a welcome departure from the previous conferences inasmuch as it is for the first time held outside London and has on its agenda four technical sessions besides the general session. The technical subjects under discussion include steel, electrical equipment for machine tools, requirements for domestic electrical appliances and cables which are topical as well as of common interest. Unlike many other Commonwealth countries, India has a long way to go before its internal production of steel can match its increasing requirements. It is vital, therefore, to utilise the limited resources as efficiently as possible. It will be recalled that the Indian Standards Institution, on the recommendation of the Planning Commission, is operating a comprehensive project for steel economy, covering almost all aspects of production and utilisation of structural steel through standardization. The present discussions are expected to lead to closer co-ordination and concerted action in this field among the Commonwealth countries. Also, the exchange of information and experience regarding improvements in the quality and design of steel as well as newer techniques should be of considerable interest and use. As the multi-purpose projects and other schemes of electricity expansion have gradually commenced to bear fruit, the demand for electrical and allied goods and their manufacture is bound too multiply. Much can be added to the technique of eliminating risk and waste both in home and in the factories and the country can profit from the deliberations of the technical experts drawn from various countries.

Under general subjects, among the more important are those covering the metric and inch-pound systems, certification marking, modular co-ordination and standards for consumer goods. All these are of particular interest to this country. India has decided to change over to the metric system and though it is not entirely unlikely that most other Commonwealth countries may eventually adopt a similar course, there is very little prospect of such a change in the foreseeable future. It is imperative that any upsets in the prevailing trade practices are prevented, and emphasis has to be placed on the need for evolving suitable means of reconciliation on the basis of existing practices and requirements. It is to be hoped that the present Conference will provide a ground for compromise on this complex question which may ultimately lead to a broader agreement covering other countries of the world. In the field of production and employment, small-scale industries are expected to play an important role. Standardisation has much to do in encouraging and promoting such industries by not only prescribing standards for raw materials but also for finished products in order to make them more acceptable in the home as well as export markets. Any assistance towards this aim from the Conference should be welcome in this country.

F.A.O. DIRECTOR'S SUGGESTION

THE GOOD work being done by the U.N.'s subsidiary organs in the economic and social spheres has been steadily growing, and here the Food and Agriculture Organisation takes a prominent place. Especially the under-developed countries have reasons to look forward to this body for necessary assistance in relieving hunger and famine. It is true that the only cure for chronic food deficiencies in many of the less developed countries lies in increasing agricultural production and economic development which should be supported by suitable international economic assistance through long-term loans, development capital, technical assistance and so on. But apart from this, the idea is now gaining ground for the establishment of a world food reserve for international relief of food shortage. It is in this context that the recent United States proposal in the U.N. Economic and Social Committee for strengthening national reserves in under-developed countries gains interest. The plan in the main calls for consultations between importing and exporting member-countries for promoting the use of surplus foodstuffs in building up national reserves. This would help in meeting emergency situations, prevent excessive price increases arising as a result of failure in local food supplies and from increased demand due to the tempo of economic development. This proposal will certainly go a long way in helping the under-developed countries in their economic development programmes.

While national development and protective action are very important from the long-term point of view, there is at the same time need for emergency relief

in meeting food shortage in various countries. Here, the Director-General of F.A.O., Mr. B. R. Sen, has made a very useful suggestion for the establishment of a high-powered operations committee consisting of one high-level officer from each of the interested international agencies. The Committee will eventually be given some resources of its own in earmarked reserves or funds. The idea is that this group would form a "focal point of joint responsibility" and a "world-wide alert system". It would take speedy action in detecting food shortages in any country and take effective steps in organising relief by canalising all the aid that the other existing programmes can provide. If for instance, as Mr. Sen himself explained, a government, whether donor or claimant, finds the need for urgent immediate contact with a large number of governments for speedy shipments, the committee's services can be brought into play. It will thus be a co-ordinating agency without any question of coercion. The F.A.O. Director's suggestion certainly deserves great consideration at once for its novelty as well as the possibility of effective action it holds forth. It is to be hoped that active steps will be taken in launching another step in international co-operation in meeting one of the elementary needs of man.

POLISH ELECTIONS AND AFTER

APPARENTLY, THE Polish elections have but confirmed the existing order; they were, indeed, expected to do no more. But the elections have a wider significance than this fact would seem to suggest. For the first time in 19 years, the Poles have gone as near as any Communist system would permit towards free elections with alternatives to choose from and a measure of independence to exercise the choice. More than 60,000 nominations poured in for consideration from nearly 15,000 'district' electoral Commissions. Seven hundred and twenty-three names appeared on the final list, some 50 per cent more than the 459 seats in the Sejm, the Polish Parliament. Of the candidates on the list, 50 per cent belonged to the Communist United Workers' Party, 25 per cent to the United Peasants' Party, 10 per cent to the Democratic Party, and 15 per cent to non-Party or progressive Catholic groupings.

The election results show how easily the election could have resulted in an anti-Communist vote. The Communist United Workers' Party won only 53.31 per cent of the seats—that is, 236 seats in a house of 459, thus decreasing its majority. All other parties improved their positions. The United Peasants' Party won 116 seats, as against 90 last time; the Democratic Party 39, as against 25; and independents 67, as against 37. Further, the Communist candidates polled from 90 per cent to 10 per cent of the votes instead of the usual 99 per cent votes. Indeed, the new Sejm is really new: only 83 deputies from the last Sejm have been re-elected. Thus, even though the elections were to some extent circumscribed, it would be naive to dismiss it as merely a perody of democracy.

Mr. Gomulka's victory may be accounted for by a variety of factors. Although the process of "weeding", which must have been resorted to at "district" and "area" levels, played some part, Mr. Gomulka's popularity was undoubtedly an influencing factor. The most important consideration with people was, of course, the bloody suppression of the Hungarian revolution by the Russians. Not only had Mr. Gomulka warned without mincing words that if the electorate did not vote for a reformed type of Communist rule, "Poland will be crossed off the map of Europe"; Moscow Radio also gave broad hints that only Communists could be allowed to rule Poland. The "return" to Stalinism in the Kremlin made these warnings significant. In plain language, the Polish people were told that a vote against Mr. Gomulka would result in Soviet intervention to "save" the people from a "counter-revolution". The Polish electorate was really up a Hobson's choice. The retention of national Communism was the price paid for keeping Russian tanks off the streets of Warsaw, and for saving the country from a "Hugarian tragedy".

Another factor, sometimes apt to be overlooked, is that the Poles will continue to incline towards Russia so long as Western Germany does not accept the Oder-Neisse frontier and renounce its claims to the old one. Having been forced to surrender its eastern territories to the Soviet Union, Poland must retain the former German areas where six million Poles have settled and its heavy industry has developed.

As a result of this election victory, the Poles may demand greater freedom and more relief from their country's improverished economy. This may deepen the existing crisis. Mr. Gomulka will soon have to choose between internal democracy, which is inseparable from complete independence of Moscow, and the ties with Moscow that are necessary for the Polish Communists to remain in complete power. As Mr. Milovan Djilas pointed out, the experience of Yugoslavia appeared to testify that national Communism could break from Moscow, but to retain its identity, would have to construct essentially the same system. Mr. Khrushchev seems to have reached the same conclusion. Communism with its secret police and other instruments of oppression, is inseparable from Stalinism. The victory of national Communism in Poland may be the beginning of a break from Moscow, but can by no means promise the end of internal crisis.

US DISARMAMENT PROPOSALS

AMERICA'S LATEST disarmament proposals which Mr. Henry Cabot Lodge submitted to the political Committee of the United Nations recently stand for an agreement to put all future production of fisionable materials to peaceful uses. The key proposal in the Plan is to bring the testing of inter-continental ballistic missiles and "outer space" objects under international control In addition to the aerial inspection scheme as outlined by President Eisenhower to the Geneva Summit Conference in 1955, the new plan calls for reliable inspection arrangements.

Both in terms of objective and method the American plan has much in common with the Soviet proposals of November, 1956. Both recognise the need to halt and possibly reverse the current race for larger stockpiles of nuclear weapons, to evolve a system of adequate inspection, to utilise fissionable materials for peaceful purposes, to reduce the present level of armed forces and to create an atmosphere of mutual confidence in which the major political problems of the day will be easier to solve. The only difference is that while American proposals envisage a stage-by-stage progress towards complete disarmament, the Soviet proposals favour an immediate ban on nuclear weapons and a reduction of armed forces with only a system of perfunctory control and inspection.

As to conventional arms, the figures for the optimum size of armies appear to be now fixed at 2½ million for the Big Powers and 750,000 for the Smaller Powers. The main problem of inspection, however, remains unsolved. The Americans favour aerial reconnaissance as well as inspection of key airfields, railway stations etc. The Russians on the other hand agree only to the inspection of the European mainland short of their own frontiers.

It was due to Russia's refusal to allow aerial inspection over their territory that the Geneva Summit Conference on disarmament foundered. It was again due to the same reason that the Russian disarmament proposals of November, 1956, were rejected by the Western Powers. It is unlikely that the Russians will accept the US disarmament proposals this time. Their persistent refusal to allow aerial inspection of their territory raises grave doubts about their 'bona fides'.

A Window on the World

(GREAT?) BRITAIN

By

ODYSSEUS

LONDON, January 25, 1957.

THERE IS, I gather, a fairly widespread view in India that Britain is no longer even a second rate power. This view originates in part from the continuing economic difficulties of Britain's Welfare state and in part from the revelation by the Suez adventure that Britain is no longer strong enough to enforce a policy by arms in the face of the rest of the world.

I myself have contributed something to the spread of doubt about Britain's economic staying powers by recurrent expositions here of the weaknesses of the Welfare state, with its negative ideas of equality and security for all, its pre-occupation with dividing the national income fairly rather than increasing it, its failure to grasp that every country — even a Socialist country! — must live in a competitive world, in which survival (even for Socialists) depends on raising productivity and expanding investment. In a word, the British Welfare state (like every other Welfare state in the free world) has overlooked the vital need for incentives, rewards for leadership, imagination, hard work, and high saving.

The economic record of the Conservatives in office, under Sir Winston Churchill from 1951, under Sir Anthony Eden from 1955, was far from un-impressive. Britain has paid her way during these years, but for reasons frequently outlined here (see e.g. "Money In A Welfare State", March 16, 1956. "Nationalised Industries and Inflation," Masch 23. "The Dog in the Barnyard," April 13. "The Revolt of the British Middle Classes", June 29, 1956), I never felt that the governments of either Sir Winston or Sir Anthony were capable of getting down to the positive economic requirements of an expanding economy. Sir Winston was perhaps too set in his old ways. Sir Anthony lacked first first hand acquaintance with industry and economics.

MACMILLAN AND THORNEYCROFT

Mr. Harold Macmillan's pronouncements as Prime Minister, his choice of Chancellor, President of the Board of Trade, and of the younger ministers, and not least his own personality, seem to offer reason for sober optimism.

In the course of personal encounters with Mr. Macmillan on your behalf in recent months, my feeling has grown that in him Britain has an outstanding, positive personality, full of imagination, resource, wit, and resilience, and his television broadcast this week suggested that Britain has at last found a leader who may do for her in peace what Sir Winston did for her in war.

His choice as Chancellor of the Exchequer of Mr. Peter Thorneycroft, a forceful and energetic character, whom (always on your behalf) I have also had opportunities of meeting, is encouraging. To have a man of 47 at this key post, old enough to know his job, young enough to be at the height of his powers, is happy.

Chiding prophets of gloom, Mr. Thorneycroft said this week that politically and economically Britain was still at the centre of things. "We cannot contract out of our position as a great power. We are the centre of the Commonwealth, the centre of a world-wide banking system, the sterling area, and more and more the centre of developments in Europe. And here at the centre we need a sound economy and a sound society. If the centre is sound, the rest will follow—aid to the under-developed countries, participation in the defence of the free world".

Mr. Thorneycroft then went on, in what has become routine in British political speeches, to remind voters that the UK has in the last 25 years lived through a revolution ("No bloodshed, no tanks in the streets.... a tidy revolution") which has brought about a vast redistribution of wealth, substituted full employment for mass unemployment, and expanded social security and welfare in all directions. He warned his audience not to be like those generals who are always getting ready to fight the last war. The battle of the 1930's was unemployment. That battle was over. The battle today "is much more exciting, more hopeful...." to increase the total of wealth and not to devote all attention to the shares.

Mr. Thorneycroft then expounded some of this column's favourite themes: How can wealth be increased? The password, he answered, is not "Security". The increased security of the ordinary man is a valuable gain. But it is not enough. A young man at 21 is not really inspired to go out, to risk himself, to adventure, by the thought of an old age pension at 55.

Nor is the password "Equality". "Certainly", he said, "people are equal in their right to human dignity and freedom, but their talents are not equal. The chances of getting on, even among members of the same family can never be the same, let alone the chances in the same nation. We must make sure that everybody has a chance, and a good chance too.... but that does not mean complete uniformity in schools."

THE "OPPORTUNITY STATE"

To Mr. Thorneycroft the password is "Opportunity". "We need to make the Opportunity state to match and sustain the Welfare state. We want men and women to see the opportunities ahead. If they do, they will set to work to create the new industries we need, to exploit the new inventions, to build up the national wealth and the productive power of the nation. For it is on productive power that the Welfare state itself rests."

Mr. Thorneycroft laid down that the Opportunity state must (1) be industrially competitive; (2) offer incentives and rewards; and (3) save to invest. The concept of an industrially competitive state led him to add: "That, too, is why we are pushing ahead with the idea of joining Europe in a great free trade area. If we and our friends on the Continent can get it, we will have a market of 250,000,000 people, as big as the USSR and as free as the USA, open for any manufacturer who wishes to compete for it...."

Of incentives, Mr. Thorneycroft said "We must not be afraid to reward success. Men who put in extra

effort, men who succeed in the export sales drive, men of all grades who are competitive, men who can beat their rivals abroad, men of true imagination and enterprise — let us see that these men get their reward .... This rule that success should be rewarded must apply all round — to the middle and upper ranks of management as well as to all the rest. They cannot be excluded from the ordinary rules. Success must be rewarded. If it is not, the more enterprising will seek rewards elsewhere. Moreover, success for the men who lead means prospertiy for all who follow."

Of investment, Mr. Thorneycroft said "one of the Chancellor's duties in helping investment is to keep the share that the government demands on national output as low as possible. The less the government spends in other fields, the more can be ploughed back into industry. If we are to invest, we must also save. It is encouraging that, from all the signs, last year looks a record for personal savings."

Regular adicts of this column may be forgiven a suspicion that Mr. Thorneycroft called me in to ghost-write that speech for him. But I expect the truth is simpler: one of the more alert of his aides probably sent him my "The Eastern Economist" pamphlet "Socialism Tomorrow" and marked the chapters "Higher Outputs, Higher Earnings, Wider Choices", and "The Economic Value of Unequal Rewards".

Mr. Thorneycroft explained why Britain's strength should not be under estimated. In 1956, there was an improvement of £300,000,000 in Britain's trade balance. He pointed out that the figures disproved the myth that other sterling area countries earn the dollars while Britain spends them. The increase of 25 per cent in dollar exports alone in 1956 was roughly equivalent to all the sterling area's dollar earnings in 1955 from tin and rubber. Britain's rate increase in production from 1948 to 1956 was as big as that of the USA. "Compared with 1938, our increase in productivity was the greatest in Europe, and a 30 per cent increase in Britain could be compared with one of 10 per cent in Germany".

I revert to Mr. Macmillan. What strikes me in watching him on public occasions is the resilience of his mind and the conscious purpose of his personality. What gives ground for cautious optimism is high progressive outlook.

His public utterances lead one to conclude that his objectives are to be (1) the conversion of the static Welfare into a dynamic Opportunity state ("No one should be allowed to sink below a decent level but everyone should be free to rise according to his gifts, his work, and his worth. There is nothing to be ashamed of in getting to the top....or being paid in proportion to the size of the job you do"); (2) substantial cuts in government spending, particularly, by reconsidering aims and means in defence, in order to check inflation and to expand investment, and (3) the creation of a European free trade area in hopes of securing a mass production market that will raise the national incomes of all its participants and thus provide a bigger surplus of British savings with which to nourish Commonwealth and sterling area investment.

The Macmillan team is blowing a breath of economic Spring into the British air. Of course, I may be wrong. I will not fail to keep you informed either way.

As to the meaning, from the viewpoints of Indo-British relations, the Commonwealth, Anglo-American relations, and of British foreign policy generally, of Mr. Macmillan's retention of Mr. Selwyn Lloyd at the Foreign Office, the problem is not really one of personalities but of the factors that must condition the foreign policy of any British government in 1957. The question is not whether Mr. X or Mr Y would have a better policy but: What policy is possible for Britain in today's circumstances? I plan to outline some possible answers next week.

THE RUINS OF AN ALLIANCE

(From Our Special West European Correspondent)

PARIS, January 25.

WITH that wonderful hypocrisy of which politicians and diplomats have the art, there is now being celebrated the restoration of the Atlantic friendship. Official declarations seek to suggest a touching scene of reconciliation, where the British and French promise never to do it again, and the Americans nobly admit that they too must accept some share of the blame. Nothing in fact could be further from the truth about the present condition of the Atlantic alliance. In the case of Anglo-American relations, the retention of Mr. Selwyn Lloyd in the new Cabinet, the keen British interest in European unity (see Mr. Lloyd's statements in Rome this month), and the controversy with the Texas oil producers all combine to give a true picture of present feelings across the Atlantic than do pious statements about patching up the porcelain. As for Franco-American relations, the friendly Governments of Paris and Washington are carrying on against each other whispering campaigns of a unique scurrility.

While Messrs Pineau and Dulles confer in "an atmosphere of renewed cordiality", their respective departments promote rumours which could only begin at the highest level and which are allowed to leak into the Press with a careful anonymity. The American campaign is to the effect that the State Department possesses documents which, if made public, would bring about the downfall of the present French and British Governments. You cah imagine what effects such rumours could have when circulated in the corridors of the House of Commons or the 'Assemblee Nationale'; they are well calculated to have a bearing on internal political developments in Britain and France. Whether they did in fact play any part in Sir Anthony Eden's departure, one cannot know; their efficacy in France was limited by the fact that it is impossible to have a Cabinet crisis here just before or during the Algerian debate in the United Nations. But the promotion of such stories has caused some bitterness at the highest levels of government on this side of the Ocean, and is quite inconsistent with the fable of Atlantic reconciliation.

Though intended for consumption only in Paris and London, wind of this whispering campaign got back to the United States, and Joseph Alsop had no hesitation in the 'New York Herald Tribune' in laying it at Mr. Dulles's door. The secret documents in question, we are left to suppose, concern Franco-British collusion with Israel about the attack on Egypt. If proofs of this exist (wihch is quite unlikely), they would no doubt, if published, cause the downfall of the British Government; but since Sir Anthony Eden has quit, we may suppose that is no longer an objective of American policy. Public proof of collusion with Israel would be much less likely to cause any trouble in France, not because (as some British newspapers have complacently assumed) French political morality is less exacting than British, but because full support of Israel is regarded in this country as the only honourable policy; the immorality in the case would be held in France to lie with those who are willing to leave the Jews to be exterminated by an Arab dictatorship. Thus when France was the only nation in the world to vote with Israel in the U.N. lately on the withdrawal issue, the French too much self-righteous pride in being thus isolated in virtue.

Virtuous or no, the French whispering campaign against Washington gives nothing in scurrility to the U.S. effort. It is to the effect that the documents captured when Ben Bella and the other Algerian rebel leaders were kidnapped contain proof of active American support for the bloody Algerian terrorist movement. Though nothing official has been said from the French side to confirm or deny this story, it has been allowed to leak out to selected foreign correspondents here with extraordinary circumstantiality. Thus a German newspaper lately published the version that the Ben Bella documents showed that two American petrol companies, Caltex and Aramco, had supplied the Algerian rebels with 10,000 rifles, 1,200 machine guns, 500 sub-machine guns and 600,000 grenades. Naturally, the implication was that the American oil companies are fomenting the Algerian revolt in return for promises that they will be allowed access to the considerable oil deposits of the Sahara Desert which are best approached through Algeria.

When the French Government passively permitted these inspired rumours to circulate, the U.S. Ambassador in Paris had to make himself its spokesman and announce that he had a letter from the French Government saying that they were untrue. The Government still said nothing, and the national radio here persists in announcing when Algerian rebels are captured that they were carrying American arms. The most popular conclusion is that the French Government does indeed possess some evidence of American complicity in the Algerian revolt but is willing not to publish it in return for official American voting support in the Algerian debate at the U.N. What is even more likely is that the Ben Bella documents contain all sort of wild reports which are mostly untrue; thus, there have been rumours that they contain assurances from Mr. Nehru about active support for the revolt, which means presumably that some emissary of the Algerian "national" movement has interpreted a polite interview with the Indian Prime Minister as a guarantee of positive backing.

Even if, as is probably true, all the rumours circulating on these subjects are false, the fact remains that the Atlantic powers are continuing unofficially a period of recrimination which is officially supposed to have ended. At the level of popular opinion and of the daily newspapers, the grand alliance which is represented as having been reconstituted still lies in ruins. The newspapers here are full of a vituperative anti-Americanism of a brand that used to be patented by the Communists, including even the picturesque assertion that the State Department is run by a group of oil companies. When Colonel Nasser said lately (he was promptly contradicted from New York) that he had received offers from Aramco and the Chase Bank to rent out the Suez Canal, the Continental Press was quick to recall that Mr. Hoover (who acted as Secretary of State during the Suez crisis and Mr. Dulles's illness) was a former vice-President of one of the main Aramco companies; this fact was held to explain all U.S. policy in the last six months. Similarly, Continental papers which are usually rather cynical about

British imperial misadventures are now depicting the troubles on the border of Aden and Yemen as a war waged by the U.S. companies Aramco and the Yemen Development Company (of which the diplomat George Allen is said to be president) against the British oil companies operating in the protectorates.

More serious, especially for NATO, is the anti-Americanism of the armed forces after the Suez expedition. The Alsop brothers have said that when the Franco-British invasion fleet was making for Egypt, there was serious thought given in Washington to interposing the American Sixth Fleet. The French version is that the Sixth Fleet was in fact interposed: that it sailed, as though by accident, right across the course of the invasion Armada which it thus gravely dislocated, and that this was in reality a naval engagement in which no shots were fired. Further, that the reports current at the time about Russian planes seen flying south over Turkey and Syria were calculated American inventions. We might see such American actions as justified efforts to save their allies from themselves, but soldiers think differently and the animosity thus produced is influencing NATO, which is supposed to be a harmonious military alliance where the Americans work with the French and British.

While public and official opinion remains in this condition, it is clearly premature to celebrate the repair of the Atlantic alliance. And quite apart from temporary moods, there is apprehension here about the long-range aims of present American policy which is believed to rest on a "devaluation of Europe". This policy is thought here (and this answers the reader who wrote to ask ironically "where will Africa, Asia and Europe be when Russia and America have finished with them") to have two main phases. In the first, American pressure will be exercised on the "imperialist" European powers to abandon every shred of their overseas power, and if necessary Washington will compete ruthlessly with Moscow as the uncompromising supporter of all colonialists claiming independence and all Nassers claiming national prestige against the European powers. America's European allies, principally Britain and France, will be encouraged to submit to this process of loss and humiliation, and if need be they will be subsidised to endure it; but they will not be handled softly, for the USA has to appear (as she did during the Egyptian crisis) the most determined prop of Afro-Asian nationalism. This latter force will also be subsidised heavily, as through the Eisenhower doctrine for economic aid to the Middle East or as through the expected U.S. credits to Nehru's India, in order to keep the newly independent nations within the democratic bloc.

The second phase of the operation will be to use this devoted American following of Afro-Asian nations, in conjunction with the present retinue of 19 Latin American states, to demand the winding up of Russian imperialism. Once Western imperialism is buried, Russian imperialism can be brought to book, and that will mean, as the Hungarian case suggested, the collapse of Russian Communist power. To summarise what is already so brief as to be a caricature, the programme is to get the Eden and Mollets out of Afro-Asia to permit the flowering of a garden full of Kotelawalas and Mohammed Alis who will resume the anti-Communist work begun by the two latter at the Bandung conference. Europe is being asked to see that the final result of this policy, the total defeat of Communism, justifies the admittedly considerable inconveniences of the first phase — of which U.S. opposition to the Suez adventure provided a foretaste.

This, very succinctly and of course too neatly, is what West Europe thinks it is being offered by Washington in exchange for the old Atlantic alliance which at one time was thought by Mr. Dulles to imply American support for Portugal over Goa, but which is now dead in its old form —whatever pretences are made about "patching it up".

KEESING'S supplies a world-renowned weekly Service such as no other Current Affairs publication provides: a most comprehensive yet concise, scholarly and up-to-date documentation of international events and developments—unbiased, authentic and covered by a "living" Index which never lets you down.

KEESING'S will save you many hours of tedious search and bring to you details and data otherwise quite outside your reach, because it is a unique medium of information and reference embracing the whole field of political, economic and social developments **on a truly global scale.**

In KEESING'S you are thus able to put your finger at a moment's notice on the Full Facts: statements, debates, treaties, statistics, committee reports, election results, legislation, etc., in all parts of the world, culled from the genuine news sources of each of the six Continents and compiled after radical item-by-item sifting on the sound basis of 25 years' Fact-finding and Fact-recording experience.

it all boils down to

WORLDGRAM

AGRICULTURE

Coconut Industry Problems: A recommendation has been made to the Food and Agriculture Organization to set up a permanent study group as a forum for international consultations on world coconut economy. Major coconut producing and consuming countries which met in Colombo recently recommended that a bureau be set up for collection and dissemination of information relating to the coconut industry. The recommendations will be considered at a session of the committee on commodity problems to be held at Rome in March. The inter-Government conference agreed that some of the problems facing the world coconut industry could be solved only through regular international consultations under the F.A.O.

INDUSTRY

Certification Mark for Wrought Aluminium Utensils: The Indian Standards Institution has granted two licences; one to Messrs. Deccan Aluminium Stores, 56, 1st Bhoiwada, Bombay and the other to Messrs. Light Metal Works, New Sun Mill Compound, Delisle Road, Bombay for the use of Certification Mark on wrought aluminium utensils. The Standard Mark consisting of the monogram of the Indian Standards Institution superscribed by the number designation of the Indian standard together with the grades of the material, will certify that aluminium utensils manufactured by the firms satisfy all the requirements given in the Indian standard specification for wrought aluminium for utensils (IS: 21-1953). In order to ensure quality of aluminium utensils the Government of India have recently banned the export of aluminium utensils which do not bear the Standard Certification Mark of the Indian Standards Institution. The Indian Standards Institution has so far granted 13 licences to units making aluminium utensils and goods. A few other applications from manufacturers of aluminium utensils are at present under consideration of the Institution.

*

Increased Coal Production During November, 1956: The output of coal in India during November, 1956, registered an increase of 145,521 tons over the figure for the previous month. The output for October and November 1956, according to official statistics released by the Chief Inspector of Mines, was 3,177,706 tons and 3,323,227 tons respectively. Despatches of coal amounted 3,025,063 tons in November 1956 as against 2,940,022 tons in the preceding month. Coal stocks at pitheads amounted to 2,664,206 tons at the close of the month, as against 2,565,782 tons at the beginning of the month. During the month under review 838 collieries were reported to be working with an average daily employment of 332,155 workers. The percentage of absenteeism was of the order of 13.76. Nine coke plants at collieries and elsewhere produced 346,790 tons of hard, soft and other kinds of coke during the month and despatched 176,991 tons.

*

Basic Requirements for Water Supply and Sanitation: The Indian Standards Institution has issued a draft Indian standard code of basic requirements for water supply, drainage and sanitation for eliciting comments. The draft code lays down general requirements regarding plumbing and sanitation, quantity of drinking water required for domestic and other uses and the provisions of lavatories, baths and water closets in different types of buildings. The Code has been prepared with a view to guiding architects and engineers in providing adequate sanitation and water supply facilities in the design of the buildings and planning of water supply and drainage systems by local bodies. The draft code together with other codes on plumbing and sanitation to be published are intended to provide guidance in this respect. Comments on the code may be sent to the Indian Standards Institution, 19, University Road, Delhi-8, before April 2, 1957.

*

Production of Ambar Charkha Yarn: Production of yarn at the Ambar Charkha Training Centres during the month of November, 1956, was 70,312 lbs., which is more than double the quantity produced at the end of October, 1956. The total number of Ambar Charkhas manufactured was 40,000, of which 20,004 have been distributed to 'Parishmalayas.' where spinners of Ambar Charkha yarn are being trained, and 8,765 to spinners for independent operation. The total quantity of cloth produced from Ambar Charkha yarn was 13,741. Of this 2,366 yards was for commercial purposes and the balance of 11,375 yards was produced in the 'Vidayalayas' or training centres for instructors. Up to the end of November, the Ministry of Production released a sum of Rs. 305.52 lakhs for the Ambar Charkha programmes, out of which the All-India Khadi and Village Industries Board distributed Rs. 122.61 lakhs. The Ministry of Production have sanctioned a grant of Rs. 26,400 towards setting up of four Parishamalayas in Punjab, as recommended by the All-India Khadi and Village Industries Board.

*

Aluminium Plants: Inaugurating the first meeting of the recently constituted Development Council for Non-Ferrous Metals, the Minister for Heavy Industries, Shri Manubhai Shah, revealed that the National Industrial Development Corporation, a Government body, had decided to establish an aluminium plant at Mettur in Madras State with a capacity of 10,000 tons per year. The Minister said that a proposal for the establishment of an aluminium plant of the same capacity at Hirakud had already been sanctioned by the Government of India. With the expansion of the existing units and these two additional smelters, the country would annually produce about 30,000 tons of aluminium during the second Plan period. In addition, the planning of an aluminium plant in the Rihand area in Uttar Pradesh had been taken in hand.

TRADE

Imports of Caustic Soda and Soda Ash: Under the Import Policy of the Government of India the imports of caustic soda and soda ash are being canalised through the State Trading Corporation of India (Private) Ltd. The State Trading Corporation has entered into contracts with foreign suppliers for the regular import of these commodities in sufficient quantities. For efficient distribution in the country the Corporation has appointed the following as its Agents: The Imperial Chemical Industries (India) Private Ltd., The Tata Industries Limited, Bombay, the Chemical Importers and Distributors (Private) Ltd., Calcutta, and the Chemical and Alkali Distributors Ltd., Bombay. All enquiries for supplies should be addressed to the Agents.

*

Export of Vegetable Non-Essential Oils and Excisable Goods: With effect from February 1, 1957, a simplified procedure for export by sea of excisable goods under claim for rebate of duty or under bond will come into force. It shall apply to exports of all

excisable goods through the ports of Bombay, Madras and Calcutta, except tea and vegetable non-essential oils. As regards tea, the existing procedure will remain unchanged. As for non-essential vegetable oils, a somewhat different simplified procedure will be brought into effect from the same day. Under the revised procedure, the payment of refund will be made directly by the maritime Collector of Central Excise concerned on production by the exporter of proof of shipment.

*

Import and Distribution of Raw Silk: In order to meet the demand from silk weaving industry in India, particularly in Surat and Varanasi and to protect the interests of the indigenous sericulture industry, imports of raw silk have been canalised through the agency of Government since January-June, 1955. In pursuance of this policy, the State Trading Corporation of India has imported 57 metric tons of raw silk from China and Japan for distribution to the weaving industry through the Central Silk Board, which is a statutory body under the Ministry of Production, Government of India, New Delhi, responsible for the development of the sericulture industry. With a view to maintaining a reasonable level of prices for imported raw silk, the present selling prices will be continued. For the information of the actual users of silk, the ex-godown price at Madras, Calcutta and Bombay are notified as under: (1) Chinese raw silk 20-22 Denier "A" Grade Rs. 33-8 per lb.; (2) Japanese raw silk 20-22 Denier "A" Grade Rs. 35-8 per lb.; (3) Japanese raw silk 13-15 Denier "A" Grade Rs. 37-8 per lb. Allotments of silk under issue to Varanasi, Surat, and other important silk weaving centres.

FINANCE

Excise Duty on Cotton or Art Silk Fabrics Produced on Powerlooms: According to a notification of the Government of India under the Central Excise Rules, 1944, with effect from January 19, 1957, refund of excise duty on cotton or art silk fabrics produced on powerlooms paying duty at compounded rates and exported out of India will be permissible subject to certain conditions. The concession will be available to manufacturers who have obtained the previous permission of the Assistant Collector of Central Excise having jurisdiction. The fabrics intended for export shall be marked on each piece with a special distinguishing mark previously aproved by the Assistant Collector. The rate at which the duty shall be refunded shall be 3 pies per square yard. Full particulars of the prescribed procedure can be had from the Collectors of Central Excise.

*

Stamp Duty on Bills of Exchange: The enhanced rates of Stamp Duty on Bills of Exchange prescribed in the Indian Finance (2) Act of 1956, will come into effect on February 1, 1957. The effective rates, however, are being reduced by executive notification to half the rates provided in the Finance (2) Act.

*

Customs and Excise Revenue Collected in Indian Union Statement for November, 1956: According to the returns received in the Department of Commercial Intelligence and Statistics, the total gross sea and land customs revenue collected in the Indian Union during November, 1956, amounted to Rs. 15.39 crores as compared with Rs. 13.80 crores in the corresponding month of the previous year. The comparison in the subsequent paragraphs should be taken to refer to that of the current figures with those of the corresponding period of the preceding year. Of the total customs revenue collections, import duties accounted for Rs. 12.29 crores as against Rs. 10.78 crores, export duties for Rs. 2.67 crores as against Rs. 2.76 crores and land customs and miscellaneous for Rs. 33 lakhs as against Rs. 26 lakhs. The total gross collection of Union excise duties amounted to Rs. 16.23 crores as compared with Rs. 11.67 crores. During the eight months, April to November 1956, the grand total of gross customs and Union excise revenue realised was Rs. 229.03 crores as compared with Rs. 203.65 crores during the corresponding period of the preceding year. Of this amount, import duties accounted for Rs. 90.43 crores as against Rs. 81.09 crores, export duties for Rs. 16.28 crores as against Rs. 24.47 crores, land customs and miscellaneous for Rs. 2.36 crores as against Rs. 1.17 crores and Union excise duties for Rs. 117.96 crores as against Rs. 96.92 crores.

*

Public and Private Limited Companies in Bombay State: During the half year ending December 31, 1956, eleven public limited companies with a total authorised capital of Rs. 25,15,00,000 and 82 private limited companies with the total authorised capital of Rs. 7,77,16,000 were registered in the office of the Registrar of Companies, Bombay. This includes the following nine big concerns: Jaifabs Rayon Industries Private Ltd. (authorised capital of Rs. 1 crores), New Era Fabrics Private Ltd. (authorised capital of Rs. 50 lakhs) and Cambata Ferro Manganese Private Ltd. (authorised Capital of Rs. 1 crores 50 lakhs) registered as private limited companies, and Indian Rayon Corporation Ltd. (authorised capital of Rs. 10 crores), India Re-insurance Corporation Ltd. (authorised capital of Rs. 10 crores), Everest Cement and Construction Co., Ltd. (authorised capital of Rs. 2 crores), the Rayon Mills Commercial Corporation Ltd. (authorised capital of Rs. 50 lakhs), Anil Hard Board Ltd. (authorised capital of Rs. 1 crore) and Color Chem Ltd (authorised capital of Rs. 1 crore) registered as public limited companies. During the same period five private companies with a total paid-up capital of Rs. 27,900, one public limited company having a paid-up capital of Rs. 4,000 and one association not for profit were struck off the register of companies under Section 560 of the Companies Act, 1956.

GENERAL

Production of D.D.T.: Production of formulated D.D.T. in the Hindustan Insecticides, New Delhi, during the month of December, 1956, was 98.66 tons, which is the highest so far in any month. During the same period 40.8 tons of technical D.D.T. was also produced. The stock position at the end of month was 163.3 tons of technical D.D.T. and 48.19 tons of formulated D.D.T. Despatches of formulated D.T.T. during the month amounted to 42.4 tons. Schemes for expansion of the factory are in progress.

*

Schemes for Khadi Development: The Government of India have sanctioned two new schemes, drawn up by the All-India Khadi & Village Industries Board—one for rehabilitation of weavers and the second for organising peripatetic parties to train people in hand-spinning and weaving. The first scheme will cost Rs. 50,000, while for the latter, a provision of Rs. 1,62,000 has been made.

*

Revision of Cement Prices for Producers: The Government of India have decided to refer to the Tariff Commission the question of revision of prices of cement payable to cement producers. Firms or persons interested in the matter, who desire that their views should be considered, are advised to address their representations to the Secretary of the Tariff Commission, Central Government Office Building, 101, Queen's Road, Bombay-1.

NEWS IN BRIEF

INDIAN

Schemes for setting up 12 units in Madras State for soap making with non-edible oils have been sanctioned by the Ministry for the execution of the schemes.

*

The per capita consumption of paper in India is amongst the lowest in the world averaging about two lbs. per year as compared to over 400 lbs. in the United States, about 100 to 200 lbs. in almost all the European countries and over 50 lbs. in Japan.

*

At present Indian shipping tonnage is about 480,000 GRT with some 110,000 GRT under construction in Indian and foreign yards. The first plan target of 600,000 GRT is expected to be achieved by the middle of 1957.

*

The marked increase in India's shipments to African countries mainly accounted for the rise of nearly 22.5 per cent in cloth shipments during November, 1956, totalling 70,670,000 yards compared with 57,690,000 yards in the previous month.

*

India's production of power transformers is estimated to have recorded a sharp increase from 565,200 kva. in 1955 to 817,200 kva. in 1956.

*

Salt produced in Madras, Andhra and Bombay excluding West Coast will continue to be licensed freely for export during the year 1957.

*

Shipments of coal during December, 1956, were higher at approximately 187,831 tons compared with 152,655 tons in the previous month.

*

The State Trading Corporation of India has imported 57 metric tons of raw silk from China and Japan for distribution to the weaving industry through the Central Silk Board.

*

The Air India International Corporation has made an operating profit of Rs. 6.54 lakhs approximately for the year to March, 1956, after providing Rs. 72.50 lakhs for depreciation and Rs. 18 lakhs for obsolescence of spares and stores.

*

India continues to be one of the best customers of Britain. Exports from Britain to India were valued at £157 million in the first eleven months of 1956 compared with £119 million in the corresponding period of 1955.

*

The time-loss due to industrial disputes during November, 1956, decreased as compared to the previous month, according to the Labour Bureau, Government of India. The total time-loss during the month was 4½ lakh man-days, which was lower by about 47.5 per cent than the figure recorded during October.

*

It is reported the Indian Standards Institution has circulated a draft Indian standard specification for Vinyl coated fabrics (leather cloth).

FOREIGN

A plan for a new hydro-electric station on the Rangitaiki River, near Matahina, in the Bay of Plenty, is expected to be announced by the Government of New Zealand shortly.

*

Dutch imports from Britain in the first eleven months of 1956 showed a rise to Fls. 1,052 million (£98.7 million), against Fls. 952 million (£90 million) in the corresponding period of 1955.

*

West German potash mines increased sales of potash fertilizers to 1,735,000 tons last year from 1,578,000 in 1955. Domestic sales were 949,000 tons and exports 786,000 tons.

*

Britain received a substantially higher Canadian newsprint tonnage in 1956. In December last the UK received 24,962 tons, compared with 29,724 tons a year previously, but the full 12 months total was 355,197 tons, against 306,910 in 1955.

*

Primary aluminium producers in the US set a new all-time production record during 1956 as well as for the fourth quarter of the year, according to the Alumini Association. Total output last year amounted to 3,358,861 lbs., over 227 million above the 1955 record.

*

The East Pakistan Government has abolished the licence fee on jute cultivation, which was Re. 1, (sl 6a) an acre.

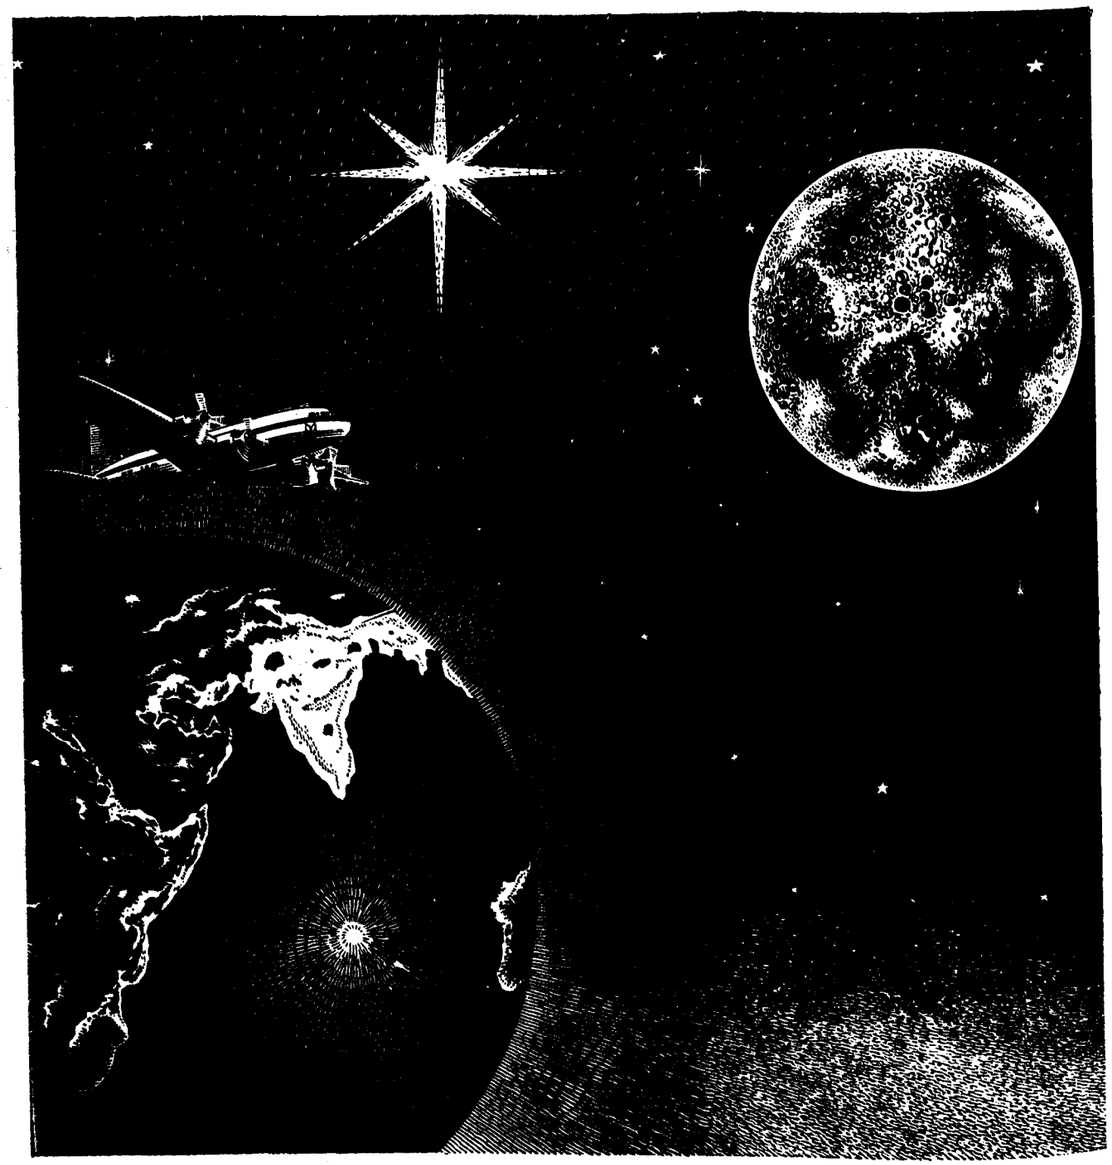
*

A pronounced increase in the turn over of Dutch retail trade was registered during November, 1956 as compared with November, 1955. Among the larger movements were groceries 35 per cent, furniture 28 per cent, footwear 38 per cent, textiles 45 per cent, beverages 35 per cent, and druggist articles 22 per cent.

*

UK oil consumption in the first nine months of 1956 before restrictions on deliveries were imposed was 8.5 per cent higher than in the same period of 1955.

*



Daily average crude oil output in the US in the week ended January 11 amounted to 7,249,000 barrels, according to the American Petroleum Institute.

*

The US Department of Agriculture plans to cut price supports for the 1957 crop of cotton below last years 82.5 per cent of parity.

*

Malayan tin exports to the Continent of Europe last year were of the order of 12,909 tons which represents a substantial increase of 39.8 per cent. However, exports to Britain fell by 32.6 per cent to 1,938 tons and that to the US by 5 per cent to 41,084 tons. Total exports for the year were 73,276 tons.

40 round trips to the moon!

In one year IAC flies over 20 million miles—equivalent to 40 round trips to the moon.

LARGEST internal airline in the East, Indian Airlines Corporation links the cities and towns of India — its 132 daily flights covering more than 20 million miles every year, its staff of over nine thousand ever at your service.

The modern world is a world of flight ... and Indian Airlines Corporation is proud of the role it plays in transporting goods and mail, in bringing the people of India ever closer together ... building a stronger, united nation!

FILLIP TO THE AUTOMOBILE INDUSTRY

By

CROESUS

I HAVE just finished a hasty reading of the full text of the Report on the Automobile Industry which was submitted by the Tariff Commission to the Government of India on October 6, 1956, and on which the latter have taken action only last week. But even this casual reading has convinced me that in this statutory body, Indian industry has perhaps its best friend. It is only when statutory bodies such as the Tariff Commission display independence and objectivity that our democracy can be expected to last. It was quite open to the Tariff Commission just to carry out the behest of the Government as embodied in the terms of reference, but all glory to the Tariff Commission that in respect of the most independent terms of reference, namely, "to enquire into and recommend the fair ex-works and selling prices of the automobiles under indigenous development and to indicate how such prices should be revised as the different phased manufacturing programmes made progress", it had not only the courage to tell the Government that this was not correct and feasible but also to convince it of the stand it took and the recommendation it has made namely, "that the interests of the consumer can be adequately safeguarded by replacing the present system of price control by a more flexible system under which no maximum prices are fixed but, subject to a general obligation not to charge excessive prices, the manufacturers are left free to vary prices at their discretion and periodic investigations are held into their costs and profits to ensure that the obligation is actually fulfilled by them". The Tariff Commission has also told the Government in clear terms that price control alone will not achieve the objective that the Government has in view — and it thus proved this clearly by reference to the Government's own experience in the past — but that a judicious combination of this with import control is necessary to produce the desired effect. One expected that, after the lucid and detailed exposition of this complicated issue by the Tariff Commission, the Government would readily accept the same, but, as so often it does for no conceivable good reason, the Government has evaded a straight decision. Instead it has sought to achieve the objective, which both it and the Tariff Commission profess, in an avoidably cumbersome manner. Thus while agreeing with the Tariff Commission that the existing rates of duty are inadequate for protecting the industry, it feels that the changes in duties recommended by the Tariff Commission, after the most thorough study of the economics of this yet-to-be friendly established indigenous industry, "are not particularly necessary at this stage....." Although it has not made the changes straightway, it is at least possible that the Government felt it necessary to convert the present revenue duties into protective duties so as to enable it to change the tariffs as and when necessary in its own superior wisdom. It is this arrogant assumption of superior wisdom on the part of our bureaucrats after entrusting a work to an expert body that I fail to understanad, except it be that when the expert body makes scme absurd recommendations, a contingency which cannot be ruled out. But the better course would be for the Government to be careful while selecting the personnel of these statutory bodies so as not to have on them persons from whom nothing but absurd recommendations can emanate; after taking care to do so — as I have no doubt the Government has done in constituting the present Tariff Commission, I feel it is only insulting the wisdom of those constituting the Commission. But this is not the first time that the Government has acted thus. The time is drawing so furiously fast for me to reach the post that I am afraid I can only mention in passing my first reactions to the report.

The Report impresses me very much, because it tells bluntly what it expects of not only the automobile manufacturers but the Government of India, the State Governments, the several associations and dealers and also the consumers. If it has told the Government that it is the latter's intention to ensure the establishment of this undoubtedly strategically important industry, it has to shed some of its old thinking and ways, it has told manufacturers not to dabble with too many projects but to confine to what they have on hand and to perfect them; it has also told each of the manufacturers what line is good for them and desirable from the country's interests. To the State Governments, the Tariff Commission has made a very important suggestion that they must change their policies in regard to their implementation of the Motor Vehicles Act, their tax structure and the conditions they impose as to inter-state movement and laden weight. It has impressed upon them the urgent and paramount importance of this in the context of the second Five-Year Plan. And, perhaps at the risk of displeasing the consumers and being misunderstood by them, it has ruled out the possibility of reduced prices for Indian made cars in the conceivable future, but I hope, before rushing to any conclusion, the consumers would carefully study the cogent reasoning of the Commission in arriving at this conclusion.

Above all, in assessing the performance of the individual producers, the T. C. has recognised the achievements as much as the difficulties of the manufacturers and not even the manufacturer against whom the T. C. has made an adverse remark can dispute that here was a most sympathetic T. C. that any industry could wish for. Could this be the reason why the Government, in passing orders on the T. C.'s Report, conveniently passed over some recommendations, such as for instance, the suggestion that the Reserve Bank should devise some credit facilities for the automobile industry? (There is, however, the recommendation of the T. C. with which I find myself in complete disagreement. It is when it recommends that, if imports become necessary, these must be channalised through the State Trading Corporation. If after all its study of the industry and trade in automobiles has not convinced them that the State Trading Corporation is the least fitted agency for undertaking such an expert task, I can only say it is a passing sop to the politician.

BUSINESS NOTES

A GOVERNOR RETIRES

NORMALLY, WHEN a Governor of the Reserve Bank retires, the public at large evinces hardly any interest, but everyone knows that Sir B. Rama Rao's is no such normal retirement and that he himself resigned. What the circumstances leading to this extreme step, least expected from him and that at the fag-end of his extended term of office in this capacity can only be conjectured, and several have been the guesses attempted already. But it must be said to the credit of Sir Rama Rao that, at the farewell organised in his honour by the employees at the Bank in Bombay last week, when he might well have disclosed to the public these circumstances, he chose to keep silent. He deliberately said he did not want to break his silence on the circumstances that led to his decision to leave the Bank but only added that the reports that had appeared in some papers were baseless. Highly conscious of the important place of the Governor of the Reserve Bank, and the possible damage to this great credit institution, even unwittingly, by any remark of his, he wisely refrained from raising a public controversy over the issue.

It is still too early to assess the worth and work of Sir Rama Rao, but there can be no two opinions that it was during his seven-year regime that the Reserve Bank saw some great changes, such as the Banking Companies Act, the introduction of the Bill market scheme, and the Rural Credit Survey. If the testimony of those that worked under him is to be accepted—and there is no reason for doubting their sincereity or 'bona-fides'—Sir Rama Rao was responsible for raising a superstructure in every way worthy of the solid and sound foundation laid by his predecessor Sir Chintaman Deshmukh. Also, from the speeches of Mr. A. G. Ambegaonkar, the acting Governor, Mr. C. S. Divekar, the Chief Accountant, and Mr. A S. R. Chari and Miss Maniben Kara, labour leaders, on the occasion, one could make out that the retired Governor proved to be a very able administrator and cared much for creating cordial employer-employee relations. It was refreshing to listen to two distinguished labour leaders, from whom one is more often apt to hear complaints about employers than praises, give unqualified encomiums to Sir Rama Rao for his firm, yet sympathetic, handling of all employer-employee differences.

One could clearly discern how touched Sir Rama Rao was by the kindness of his staff when he rose to reply to the farewell speeches. While suitably acknowledging the kindness of all employees of the Bank, he feelingly mentioned that the achievements of the Reserve Bank during his regime, for which, he declared, everyone in the Bank had contributed, had earned encomiums abroad. Maybe, this is intended to convey to the quarters concerned in this country—it they care—that these achievements are not adequately recognised.

SPECULATION IN COMMODITIES

THERE HAS been considerable rise in the prices of certain commodities in the past few days, especially in the Bombay futures market in groundnut, castorseed, as also in cotton. The December-January period of any year seems to be a crucial phase as far as the commodity markets are concerned. It was during this period in 1955 that the Forward Markets Commission had to take very drastic steps to curb the "speculative" elements of the cotton futures market. This time, fortunately, the Commission did not go that far, but contrived to keep the speculative rise in the price of groundnuts by asking the Board of the Bombay Oilseeds Exchange to stiffen its margin system. It was commendable on the part of the Commission to have taken the step it did without altogether suspending futures trading in groundnuts or castorseeds.

Whenever the Forward Markets Commission steps into the market (invariably it does so on account of a rise in prices) the question is naturally posed whether there has been actually any speculation and whether the appreciation in values has not been brought about by the natural inter-play of the supply and demand position in regard to the commodity in question. In respect of groundnuts, there has, indeed, been a sustained buying spree, taking the prices to new high levels, groundnut May actually improving to as high as Rs. 166.12 for February. While it is true that the statistical position of groundnut is none-too-happy, it cannot, of itself, be held responsible for such continued firmness, which implies that there has been some bull manipulation.

It is understandable that the Government should be rather anxious to keep in check any undue rise in price of groundnuts, inasmuch as groundnut oil forms one of the chief edible oils. But there is no reason why Government should be equally concerned about a speculative rise in the price of castor. It is well known that the pattern of trading in the castor futures is largely governed by conditions in overseas market because, castor oil is mainly an exportable commodity and any rise in its price would only augment the Government's foreign exchange resources. On the part of the Government, it would seem, there is need to check the rising trend in the price of castor in order to bring about a corresponding decline in the price of groundnut, which is an essential edible oil consumed internally. But it must be clear to those who know the market that any speculative rise in castor could be checked by the Government, without the Forward Markets Commission actually intervening in the market. The simple remedy lies in the Government restricting the export of castor oil or by raising the export duty on castor oil. In the case of groundnuts, speculative rise cannot be checked merely by restrictions on hedge trading or by stiffening the margin system, as indeed it has been demonstrated in the last few days.

Whatever measures the Government takes will have to be supplemented by, say, imposing a limitation of stocks of groundnuts with crushers and 'Vanaspati' interests, as the Government did in the case of textile mills and wholesalers. There is also need to check the sizeable smuggling of groundnut oil both to East and West Pakistan about which there have been frequent complaints. In view of the continuing bullish trend in respect of both castor and groundnuts, as also other oilseeds, despite the restrictive steps taken by the Board of the Bombay Oilseeds Exchange, there is certainly a strong case for a probe into the oilseeds affairs either by the Government or by the Forward Markets Commission, as indeed some market circles have already suggested.

NEW DIRECTIVES ON IMPORTS

THE GOVERNMENT has issued new directives on the allocation of foreign exchange for the import requirements of the private sector. The purpose of these directives is clearly to keep expenditure of foreign exchange to a reasonable minimum. Certain tests have been laid down before the private importer's demand for provision of foreign exchange can be granted. The significance of the new curbs consists in the fact that they apply to the import of capital goods. Projects and expansion programmes for which import licences to buy capital goods have already been issued will not be disturbed and their requirements will be met. In respect of demands of other projects, the criterion to be applied is whether they will be badly needed to maintain current levels of production activity or whether they hold immediate prospect of effecting economy in foreign exchange by eliminating imports or whether

they will step up the output of export industries and augment earnings of foreign exchange. Private enterprisers have been asked to secure participation of foreign suppliers of capital goods in the investment of capital for the projects, or to secure long-term credit or to obtain loans from lending institutions in the countries supplying goods. If these conditions can be fulfilled and the present strain on our foreign exchange resources can be eased, it will be highly desirable. But their fulfilment does not rest with private entrepreneurs to any large extent. Government's attitude to private enterprise, and foreign enterprise in particular, must be made sufficiently attractive.

It is an unhappy occurrence that this urgency should have emerged in the first year of the Plan. It is appreciated all over the country that in view of the rapid depletion of our foreign reserves in the last calendar year strict measures must be undertaken to effect maximum economy in expenditure of foreign exchange. The private sector to which the new directives are issued will no doubt offer willing co-operation to achieve this object. Obviously official policy has erred in not anticipating these developments in good time. A post-mortem on this subject will be useful as a guide for the future. But more important than that, private entrepreneurs are by all means entitled to be convinced that the interim curbs, which will be necessary until external assistance is available, are applied also to unessential and low priority projects in the public sector. It is to be trusted that austerity will be enforced in this sphere equally relentlessly.

LLOYDS BANK

THE YEAR 1956 was yet another year of progress and expansion for the Lloyds Bank. The profit for the year at £2,541,793 was higher by £219,354 as compared to the previous year. The dividend for the year has also been increased by 1 per cent to 13 per cent per annum. The period also was one of steady growth in the number of accounts held in the Bank.

In accordance with the principles of what has been termed the "credit squeeze", stressed by the British Chancellor of the Exchequer, the Bank's advances stood reduced to £278.4 millions in December, 1956, as against £298.5 millions in June 1955. Nevertheless there was a substantial increase in its lendings to such industries as engineering, iron and steel, shipping, etc., which are deemed to contribute to larger exports and thereby strengthen the British economy. It needs to be stated that prior to the West Asian crisis, the "credit squeeze" had succeeded as one of the disinflationary measures to a considerable extent.

Again, outside the ambit of the British "credit squeeze"—that is in India, Pakistan and Burma where only Lloyds among the clearing banks has branches—and particularly in India with a rapidly expanding economy and the consequent increasing demand for bank accommodation, the Bank's lending activities have witnessed a substantial expansion in a satisfactory manner. Another special form of lending is that of medium-term credits given to overseas buyers to help them in purchasing British manufactured equipment. Between these two categories, the lending amounts to £40 millions which is over and above that shown in the published statements. The Bank has always played an important role in the economic affairs of the United Kingdom as well as in some Eastern countries. Recent developments have created a delicate situation, both political and economic, and the Bank fully realises its responsibilities. The Bank's traditions of efficient and conservation management can be relied upon as a safeguard in such situations.

INDIAN ALUMINIUM'S LOAN ISSUE

THE INDIAN ALUMINIUM COMPANY LTD. has issued an attractive Rs. 2,68,13,200 five per cent convertible loan stock 1971-81 at par and payable in full on application in multiples of Rs. 200. The issue has been offered in the first place to existing Ordinary Shareholders of the Company, but a percentage share will be available for allotment to the general public and may be filled up immediately in view of the liberal principal terms and conditions of the loan. The subscription list will open on February 4 and will close on the February 15, 1957, or earlier or later at the discretion of the Directors. Stockholders will be entitled to convert their stock into Ordinary Shares and participate in any dividend after conversion. The Company is keeping available sufficient unissued ordinary shares for the purpose. The 5 per cent per annum interest will be paid on January, for each preceding year commencing in 1958. The redemption will be at par starting with Rs. 25 lakhs on January 2, 1971 to be selected by drawings, and will continue each year till fully redeemed. A comprehensive picture of the issue is given elsewhere in this issue.

The Tariff Commission has estimated an overall demand of 35,000 tons of ingots per annum by 1958, while the country's existing capacity is as low as 7,200 tons. There is thus a clear and urgent need for expanding the production capacity. Towards this end the company's Hirakud smelter is expected eventually to double its present annual capacity of 10,000 tons. The Company envisages a new ingot capacity of 10,000 tons per annum which can increase the total capacity to only 50 per cent of the actual requirements. It is, therefore, more than likely that the new production will be marketed at profitable levels to make available sufficient funds to service and repay loans which will become necessary during the construction period.

STATE TRADING IN CEMENT

THE TONE of the Presidential speech of Mr. Dharamsey M. Khatau at the last annual general meeting of the Associated Cement Companies, reflects the reaction of responsible business quarters to the State's infringement on the freedom of private enterprise. His criticism of the manner in which import and distribution of cement were monopolised in the hands of the State Trading Corporation illustrates the nature and consequences of this infringement. ACC had anticipated the gap in the supply of cement sufficiently in advance of the emergence of a tight situation and it even submitted to the Government a scheme for imports (at an inevitably high cost) and their distribution to the consuming public 'without profit' on the basis of an arrangement of pooling of indigenous and imported cement. The proposals were not heeded and it is obvious that not enough consideration was given to them.

Eventually when it became absolutely clear that imports were imperative without delay, the Government entrusted imports and internal distribution of total supplies to the State Trading Corporation. The selling agencies, already employed by the cement manufacturers, were adopted as the State Trading Corporation's agents for sales. But it is pertinent to remember that the commission of the selling agents already forms part of the ex-works price of cement. As against the manufacturers' selling price f.o.r. destination before the intervention of the State Trading Corporation of approximately Rs. 90 per ton, the State Trading Corporation's price on the identical basis comes to Rs. 102-8 per ton. This is the equalised price for imported and indigenous supplies. Mr. Khatau's speech makes the important point that even after making allowance for higher costs of imports, the full difference between the two prices has no validity. What the transfer of distribution through the State Trading Corporation has achieved is to undermine the functioning of an efficient sales organisation which free enterprise had built over the years. This intervention should at least serve as a warning against

Company Meeting

THE ASSOCIATED CEMENT COMPANIES LIMITED

The following is an abstract of the Speech delivered by Shri Dharamsey M. Khatau at the Twentieth Annual General Meeting of the Associated Cement Companies Ltd., held in Bombay on 25th January, 1957.

"Following upon drastic amendments to the Constitution enabling outright nationalisation, or the assumption by Government of complete managerial control over private property upon such terms as to compensation as the Government of the day might think proper, there have been enacted a series of laws of the most far reaching character. Taken together with the previously existing restrictive laws and the voluminous labour legislation already on the statute book, they furnish such a complete range of weapons in the Government's armoury that it seems pointless to talk any longer of freedom for the private sector. The issue must be joined hereafter on the broader base of preservation of freedom and democratic institutions, because what is now in danger of being smothered is not just the private sector in the industrial field, but Free Enterprise generally."

STATE CAPITALISM

Shri Khatau mentioned the nationalisation of Life Insurance and the resort to State Trading in cement as the two most outstanding recent examples of the suppression of Free Enterprise and the onward march of State Capitalism. He referred to the notable contribution of these two industries and their achievements over the last twenty years and observed that in the case of Life Insurance, the grounds on which that vast and growing industry was nationalised, did not bear dispassionate scrutiny. Nor had the results been conspicuously successful or demonstrably in the larger public interest. In fact there had been an alarming drop in the volume of new business since nationalisation.

STATE TRADING IN CEMENT

"As for State Trading in Cement", the Chairman continued, "the Government's reasons for resorting to this remain a mystery to this day. The Government's decision is all the more inexplicable because the conditions obtaining in the cement industry did not warrant any such measure. The cement industry had on the basis of its performance and record, honourably justified its stewardship.

Referring to the 'cement gap' which existed in the country despite the industry's impressive production efforts and performance, Shri Khatau pointed out that the ACC was the first to foresee the gap which was likely to develop due to the requirements of the second Five-Year Plan. The ACC brought this to the notice of the Government as far back as September 1955 and offered to import cement and to distribute it to the consuming public 'without profit'. "After taking little or no notice of this suggestion for some months", the Chairman continued, "the Government seemed suddenly to feel the urgency to resort to State Trading in cement and sought to justify this step on the following grounds:

(a) The need to import substantial quantities of foreign cement to meet the current 'cement gap.'

(b) The need to sell both indigenous cement and imported cement (which would cost about Rs. 40 to Rs. 45 per ton more than indigenous cement) at an equalised price.

(c) The need to rationalise all railborne cement movements so as to impose the minimum strain on the transport system in the country.

The Chairman met these points by stating: "We had already recognised the existence of the 'cement gap and had offered to import foreign cement and to sell it to the consumer at cost. We suggested that price equalization should be done 'without profit', by raising the price of Indian cement by just so much as would be necessary to meet losses on the sale of imported cement at a common delivered price applicable to both. We suggested that this could be done either through the medium of enhanced excise duty, or by imposing a 'price equalization pool' or 'trust fund', either voluntary or statutory. We also offered to evolve a pattern of distribution which would involve only the minimum rail movement. But the disappointing outcome of all this was that while the Government accepted our main proposals they rejected all the alternative price equalisation mechanism we had suggested. And so the country was launched upon State Trading in cement."

The Chairman then examined the mechanism of State Trading in cement. The entire production is sold to the State Trading Corporation of India and the Corporation pays to the producers of cement the old ex-works price which in the case of the ACC is Rs. 54-8 per ton for naked cement, plus packing charges (varying from Rs. 13-8 to Rs. 14-8 per ton) to be determined by Government each quarter. "But the State Trading Corporation in turn sells the cement to the public at the new equalised price of Rs. 102-8 per ton F.O.R. destination, inclusive of excise duty, selling expenses, freight and other handling charges, all of which are borne by the Corporation. As against this, our selling price F.O.R destination before the advent of State Trading was approximately Rs. 90 per ton. The purchase and sale of cement is arranged by the State Trading Corporation through the existing selling agencies of the cement manufacturers, who were appointed as Agents of the State Trading Corporation for this purpose. The Agents' remuneration for their services comes out of the ex-factory prices originally fixed for the manufacturers. The Cement Marketing Co. of India Private Ltd. is accordingly the agent of the State Trading Corporation since 1st July, 1956 for the sale and distribution of ACC cement at a commission of Rs. 1-8 per ton."

FREE ENTERPRISE AND THE FREEDOM TO TRADE

Stating that the cement industry's 'objection to State Trading was fundamental', the Chairman stated: "We believe that all forms of State Trading constitute a serious infringement of the right of freedom of trade in a democratic society. The mere fact that State Trading 'can' resolve a given problem in terms of agreed objectives is not, by itself, a sufficient justification for its adoption if other solutions of equal, or superior or even slightly inferior validity, are available, which do not involve state interference. Moreover, State Trading lops off the essential sales function from a basic productive industry—a function laboriously built over the years by Free Enterprise, thereby causing grave injury to it. I would also emphasise that State Trading in cement runs counter to the declared policies

of Government itself as enunciated in the Industrial Policy Resolution early last year and in which an attempt was made to strike an admirable balance between State and Free Enterprise. The continual maintenance of such a balance is of the very essence of a socialistic pattern of society, 'if it is to be built on the foundations of a democratic constitution."

"In this context, the recent assurances of the Prime Minister in respect of the urgent need for India's adherence to democratic processes in Planning and of evolving a balanced approach between State and Free Enterprise are indeed welcome. Experience has shown that the concentration of a economic power in the hands of Government, backed by monolithic majorities in the legislatures and operated through a well organised bureaucracy must, in course of time, result. in whittling down both individual freedom and liberty. It is with this larger objective in view that one must repeatedly warn the Government against adopting a doctrinaire and unrealistic approach to problems of planning and in the techniques for achieving industrial development. Issues like Nationalisation and State Trading should be conceived only as the means to an end, and not as ends in themselves.

"Enlightened Free Enterprise working within the framework of planned development is an indispensable part of the democratic set-up, for there is a close interrelationship between socially regulated Free Enteprise and Democracy. Free Enterprise should therefore be positively encouraged to thrive by appropriate incentives and reliefs whenever needed, because it had a legitimate and vital function to perform in national planning and development so long as democracy is the foundation upon which our Constitution rests."

PRODUCTION AND SALES

Turning to the affairs of the Company, the Chairman reported another year of successful working for the ACC. Both production and sales of cement were satisfactory. Yet the results were less profitable than for the preceding year, due to repeated increases in freight rates, the price of coal, imported stores and spares, royalty on limestone, etc. The Chairman felt that this trend of rising costs was likely to continue, and that the Company would have to face up to a substantially higher cost of production in the future. This would be further aggravated by the irresponsible demands for wage increases which were being sponsored by the INTUC, and the threat of hasty legislation to enhance the rates of Provident Fund contribution which was being pressed for by Government.

PLANT REHABILITATION AND EXPANSION

Reviewing the Company's programme of modernisation and expansion, Shri Khatau reported that it was progressing according to schedule and that the Company had formulated plans to expand its installed capacity over the next five years to a total of 5.2 million tons per annum as its contribution to the national target of 12.5 million tons of cement under the second Five-Year Plan. During the year the modernisation and expansion of the Company's Bhupendra, Kistna, Chaibasa and Kymore factories continued satisfactorily. The Chairman also announced the Company's intention to install a third unit at the Sindri Works, "provided that a satisfactory price for the additional raw material (calcium carbonate sludge from the Sindri Fertilizer Factory) required can be negotiated with the Fertilizer Factory".

NEW PROJECTS

The Chairman stated that satisfactory progress had been made in the construction of the Company's new cement factories at Mancherial and at Porbandar and that work on the construction of a new plant at Drug would be started in the near future. All these three factories would operate the dry process, instead of the wet process employed at other ACC factories. The Company's newly constructed refractory plant at Katni was functioning satisfactorily and its output would steadily be stepped up to its rated capacity.

FINANCE FOR EXPANSION PROJECTS

Speaking about the very heavy capital outlay entailed by the expansion programme, Shri Khatau stated that the projects would be financed partly out of the proceeds of the recent issue of new shares and partly by borrowing against the Company's cash-credit arrangements with the State Bank of India up to the full limit of Rs. 4 crores. He continued: "Despite this, however, substantial additional funds will obviously be needed. By far the largest portion of this extra finance will have to come out of the internal resources of the Company consisting of depreciation allocation and undistributed profits retained to the credit of various reserves. This process of ploughing back as large a portion of the profits as was possible is in serious danger of being prejudiced in the years to come by recent trends in bonus awards and in the taxation policies of Government. As for the former, there appears to exist no appreciation whatsoever of the need to plough back into industry an adequate volume of profits not merely for rehabilitation and modernisation of existing plant but also for expansion of capacity; with the result that these needs are virtually ignored and a substantial portion, if not the whole, of the so-called 'surplus' is cheerfully awarded as Bonus. The time has come for some realistic thinking in this matter with a view to evolving a fair and workable formula for the award of bonus so that industry may not be deprived of that steady volume of annual accretions to internal resources so essential for financing both expansion and modernisation. If there must be a curb on industrial dividends, then there must also be one on bonus to industrial workers."

Dealing next with the effects of the recent Finance Act upon industrial development, the Chairman observed: "The Act directly impinges upon industrial development in two ways. In the first place there can be no doubt that with the existing confiscatory level of personal taxation, the Capital Gains Tax and the heavy additional Corporation Tax on dividends in excess of 6 per cent can only act as decisive disincentives to new investment and to ploughing back profits into industry. On the other hand, the deposit scheme for canalising in approved directions the utilisation of corporate funds represented by undistributed profits and the tax saved on depreciation and other allowances need not, in itself, give cause for anxiety. But the effect of the whole scheme will depend entirely upon the flexibility and consideration with which it is operated in practice. In particular, Companies such as ours which may have already used their funds for approved purposes should not be required to make any deposits; and "approved purposes" should include not merely the full range of Fixed Capital and Working Capital requirements of a Company, but also the repayment of moneys borrowed and utilised for those purposes. There is every reason to hope that the Rules which are now being framed will fulfil these expectations. And if the deposit scheme is so operated, it need cause no undue concern; but otherwise, it may precipitate a major crisis in the money market and bring all significant industrial development to a grinding halt."

THE ACC-VICKERS:BABCOCK & WILCOX PROJECT

The Chairman reported that satisfactory progress had been made in the Company's negotiations with Messrs. Vickers Ltd. and Messrs. Babcock & Wilcox Ltd. for the establishment of an uptodate heavy engineering plant, which within a few years, would make India largely self-sufficient in the whole range of cement-making machinery. The new project would also provide a substantial proportion of the country's requirements of water tube boilers and mining machinery.

PAKISTAN

The Chairman stated that the ACC's two factories in Pakistan were operating satisfactorily. As anticipated, prices of coal, stores and other materials had risen sharply in that country, with the devaluation of the Pakistan rupee. But the price increase granted by the Government of Pakistan covered only a portion of the actual increase in costs, and unless production costs declined, Shri Khatau felt that the Company would have to approach the Government there for an upward revision again. Shri Khatau also reported that as a result of the representation by the Company the Pakistan Government had since rescinded certain restrictive clauses in the Cement Control Order which were not warranted in view of the supply position there.

LABOUR-MANAGEMENT RELATIONS

Turning to labour-management relations the Chairman observed: "I am very glad to report that the present year has been one of distinct improvement in our relations with our employees. I am heartened to think that the enlightened and progressive policy which your Company has always followed in promoting the welfare and well-being of its employees is not without its due response from them. And I would like to congratulate my labour friends and officials of the trade unions at the various factories for the generally realistic attitude which they have adopted in solving problems of common interest and for showing an increasing awareness of their responsibilities in our common endeavour. Unlike in past years, there was no strike or stoppage of work to mar the growing accord and understanding based on good faith and goodwill.

"In my report last year I had referred to the unanimous decision of the Industrial Committee on Cement to abolish the contract system wherever possible in the normal working of our factories. With the co-operation of the Unions we were able to implement this decision during the year under review. This provides an excellent example of the Company's workmen and management striving together with singleness of purpose to achieve satisfactory results in solving important issues."

BONUS AND APPRECIATION

The Chairman announced that the Board had recommended this year the payment of a bonus equivalent to three months basic earnings to all employees at the Head Office, the Works and Branch Offices, including those employed in the Cement Marketing Company, and concluded by recording the Company's warm appreciation of the unstinted co-operation and unremitting hard work put in by all members of the Company's staff during the year.

NOTE: This does not purport to be a record of the proceedings of the Annual General Meeting which will be sent separately to Shareholders.

The Eastern Economist Ltd.
52, Queensway, New Delhi

This is an advertisement and not a Prospectus. A formal Prospectus dated 20th December, 1956, has been prepared and filed with the Registrar of Companies, West Bengal.

Consent of the Central Government has been obtained to this issue by an Order, of which a complete copy is open to public inspection at the Office of the Company. It must be distinctly understood that in giving this consent the Central Government do not take any responsibility for the financial soundness of any scheme or for the correctness of any of the statements made or opinions expressed in regard to them.

A licence has been obtained from the Central Government for the establishment of the new industrial undertaking described in the Prospectus and a copy of the licence is open to public inspection at the Head Office of the Company. It must be distinctly understood that in granting this licence the Government of India do not take responsibility for the financial soundness of this undertaking or for the correctness of any of the statements made or opinions expressed in regard to it.

THE SUBSCRIPTION LIST WILL OPEN ON THE 4TH OF FEBRUARY, 1957, AND WILL CLOSE ON 15TH FEBRUARY, 1957, OR EARLIER OR LATER AT THE DISCRETION OF THE DIRECTORS.

SHAREHOLDERS, DIRECTORS AND FRIENDS HAVE ALREADY SUBSCRIBED TO RS. 212 LAKHS OF THIS ISSUE.

INDIAN ALUMINIUM COMPANY, LIMITED

(Incorporated under the Indian Companies Act, 1913)

SHARE CAPITAL

Authorised		Issued Subscribed and Paid Up
Rs. 5,60,00,000	in Ordinary Shares of Rs. 10 each	Rs. 2,01,10,000
Rs. 40,00,000	in 5% Cumulative Redeemable Preference Shares of Rs. 100 each .	Rs. 40,00,000
Rs. 6,00,00,000		Rs. 2,41,10,000

LOAN CAPITAL

Authorised

Rs. 2,68,13,200 5% Convertible Loan Stock.

Now being issued

Rs. 2,68,13,200

Out of this issue, the existing Ordinary shareholders of the Company, Directors and friends have subscribed to Rs. 212 lakhs Convertible Loan Stock. (Aluminium Limited, the Company's majority shareholder, has subscribed to 59% of the issue and in order to permit increased Indian participation, has renounced, with the approbation of the Government of India its right to subscribe in excess of 50%). The remaining Rs. 56 lakhs Convertible Loan Stock is available for allotment to the public.

AVAILABLE FOR PUBLIC SUBSCRIPTION

Rs. 56 LAKHS

5% CONVERTIBLE LOAN STOCK 1971-81 AT PAR

PAYABLE IN FULL ON APPLICATION

Applications must be for multiples of Rs. 200 with a minimum of Rs. 200.

The Convertible Loan Stock now offered for subscription was created by a Resolution passed at an Extraordinary General Meeting of Shareholders held on the twelfth day of November 1956 and is constituted by a Deed Poll as an unsecured obligation of the Company. Interest at the rate of 5 per cent per annum (less tax) will be payable on the 1st January each year for the year ending on the preceding 31st December, except that the first payment to be made on the 1st January, 1958, shall be nine rupees and four annas (less tax) for each unit of Stock of Rs. 200 outstanding on 31st December, 1957.

The following is a summary of the principal terms and conditions upon and subject to which the Rs. 2,68,13,200 Convertible Loan Stock is being issued:

Conversion Rights: Stockholders will be entitled on the terms and conditions mentioned in the Deed Poll, by giving written notice to the Company, to convert every Rs. 200 nominal amount of Stock held by them into fifteen fully paid Ordinary Shares of the Company up to 15th December, 1957, and into fourteen such Ordinary Shares during the period from 1st January, 1958, to 30th June, 1960, inclusive, and into twelve such Ordinary Shares during the period from 1st July, 1960, to 15th December, 1970, inclusive, after which date the conversion rights shall cease to be exercisable. After the 15th December, 1970, the Stockholders will be subject to and entitled to the benefit of all the conditions endorsed on the Stock Certificates except the option to convert. **The Ordinary Shares into which the Stock is converted will rank pari passu in all respects with the then existing Ordinary Shares of the Company and will be entitled to participate in any dividend that may be declared after receipt by the Company of notice of intention to convert.**

Redemption: On the 2nd January, 1971, and on the same date in each succeeding year the Company will redeem at par Stock amounting to Rs. 25,00,000 until all the Stock has been redeemed. The Stock to be redeemed will be selected by drawings. In addition, the Company may redeem at par all or any of the Stock outstanding at any time after 31st December, 1970, upon giving three months' notice in writing and if the Company elects to redeem part only of the Stock, the part to be redeemed will be selected by drawings. The Company will redeem at par any Stock which remains outstanding on the 2nd January, 1981.

HISTORY AND BUSINESS

The Company was incorporated in Bengal on the 17th December, 1938, under the name Aluminium Production Company of India Limited as a private limited company. On the 21st June, 1944, the name of the Company was changed to Indian Aluminium Company, Limited, and on the 28th March, 1945, the Company was converted into a public limited company.

The Company undertook the construction of a rolling mill at Belur, Calcutta, in 1939 for the fabrication of aluminium and its alloys and operations commenced mid-1941 with an initial capacity of 2,500 tons per annum which has since been increased to 7,000 tons per annum. This rolling mill was at first entirely dependent upon the importation of aluminium ingot. However, by 1943, an aluminium smelter to produce 2,500 tons of ingot per annum was constructed and completed at Alupuram, near Alwaye, Travancore. When this smelter commenced operations in 1943 it was dependent on imported alumina but by 1946 the Company was operating its own bauxite mines at Lohardaga, Bihar, and producing alumina at Muri also in Bihar and about 80 miles from the bauxite mines. The capacity of these mining, alumina and aluminium smelting facilities was subsequently increased to produce 5,000 tons of aluminium ingot per annum at which level the smelter is now operating. However, due to recent improvements in operating techniques and the installation of additional furnace pots, it is expected that the smelter will operate at approximately 5,600 tons per annum commencing 1957.

In addition to the above smelting and fabricating facilities, in 1951 an aluminium powder and paste plant was completed at Kalwa, near Bombay, with an annual capacity to produce 600 tons of aluminium powder and 250 tons of aluminium paste, in respect of which India was formerly dependent upon imported supplies. During 1955 the Company completed the installation of a modern extrusion press capable of producing 1,000 tons of extrusions per annum. This extrusion press is located adjacent to the smelter at Alupuram, Travancore.

DEVELOPMENT PLANS

With the evidence that India is becoming increasingly dependent upon the importation of aluminium ingot, and since technological developments in the industry are creating greater demand for aluminium, the Company has decided to construct at the Hirakud power project site an aluminium smelter with an initial capacity to produce 10,000 tons of aluminium ingot capable of easy expansion to 20,000 tons or more per annum in the future. The necessary licence has been granted by the Government of India under the Industries (Development & Regulation) Act of 1951.

Simultaneous with the construction of the new smelter at Hirakud, the Company's bauxite mining and alumina producing facilities will be suitably expanded and subsequent further expansion will provide sufficient bauxite and alumina for all the Company's expanded smelting operations. Pending completion of the necessary bauxite and alumina producing facilities, arrangements are being made, with Government approval, to import alumina to ensure full use of the new smelter.

Negotiations with the Government of Orissa for the supply from the Hirakud Power Project of sufficient electric power to enable the new smelter to produce 10,000 tons of aluminium ingot per annum and for a lease of the necessary land at Hirakud for the establishment of the smelter have reached an advanced stage and it is expected that such negotiations will be successfully concluded in the very near future.

MARKET POSSIBILITIES

The Tariff Commission enquiry into the aluminium industry held in 1955 determined that the then prevailing demand for aluminium was about 20,000 tons per annum and it was expected to increase at the rate of approximately 5,000 tons per annum so that by the end of 1958 it would reach about 35,000 tons as follows: utensils 10,000 tons; electrical conductors 14,000 tons; transportation 5,000 tons; foil, canning and packaging 3,000 tons; engineering, building construction and other uses 3,000 tons.

However, consumption of aluminium in India in 1955 was about 27,000 tons of which approximately 10,000 tons of semi-fabricated products and 4,100 tons of ingot were imported. Since India's present capacity to produce primary aluminium ingot only approximates 7,200 tons there is an obvious and urgent need to expand ingot producing facilities and when the proposed new smelter is in operation it is expected that the new production will be promptly absorbed. Furthermore, since the Tariff Commission estimates that the demand for aluminium will increase at the rate of 5,000 tons per annum the need for smelting facilities in addition to those now planned is evident and it is already envisaged that the capacity of the proposed Hirakud smelter may eventually be doubled from 10,000 to 20,000 tons per annum.

TECHNICAL AND RESEARCH FACILITIES

The highly complicated operations of smelting and fabricating aluminium in this relatively new industry, must necessarily be supported by extensive and unceasing efforts in exploration, engineering and research. Fortunately, due to close affiliation with its principal

Shareholder, Aluminium Limited, Montreal, Canada, this Company is, by agreement able to use and benefit from the research and technical facilities of Aluminium Laboratories Limited, which is a fully owned subsidiary of Aluminium Limited, and is thereby provided with technical information, engineering services and advice regarding all development in the aluminium industry and guidance on operational problems and the development of new products.

The research facilities of Aluminium Laboratories Limited are located in Canada and the United Kingdom and are probably the most extensive of their kind. Aluminium Laboratories Limited's annual budget for research and development exceeds 4 million dollars.

FINANCING

The amount required for the expansion programme and for additional working capital is estimated to be Rs. 8.65 crores, part of which will be financed by the proceeds of the recent new and fully subscribed issue of 4,11,000 Ordinary Shares and this issue of Convertible Loan Stock; the balance will be financed by bank loans, depreciation reserves and undistributed earnings. Part of the proceeds of this issue will be utilised for the purpose of repaying the sum of Rs. 50 lakhs which the Company has borrowed from Aluminium Limited.

The financial information included herein reflects the effect of the increased aluminium ingot capacity which commenced in the second quarter of 1955 when the capacity of the Alupuram smelter was increased from 2,500 tons to 5,000 tons per annum. The increased ingot production was most rewarding and it will be noted that profits of Rs. 20,44,011 in 1955 and Rs. 23,57,567 for the nine months ended 30th September, 1956, were recorded, compared with Rs. 2,69,243 in 1954.

The new ingot capacity of 10,000 tons per annum now envisaged by this Company together with India's existing capacity of approximately 7,200 tons per annum is, as previously indicated, substantially below the Tariff Commission's estimate of an overall demand of 35,000 tons per annum by 1958. Consequently, it is expected that production from the new smelter will be marketed at profitable levels and will provide a reasonable return on the new capital invested as well as sufficient funds to service and repay loans which will become necessary during the construction period.

FINANCIAL INFORMATION

The following is a condensation of the accounts of the Company which have been audited by the Company's Auditors, Price, Waterhouse, Peat & Co.

Dividends on the 5% Cumulative Preference Shares have been paid regularly.

GENERAL INFORMATION

MANAGEMENT

The Management of the Company is vested in and exercised by the Directors. The Company has no Managing Agents.

INTEREST OF DIRECTORS

Mr. K. C. Mahindra is the Financial and Technical Adviser of the Company and receives remuneration for his services as such.

Mr. E. S. Greenwood is the Managing Director of the Company and receives remuneration for his services as such.

Mr. W. A. Russell is a partner in the firm of Place, Sidons & Gough, Stock and Share Brokers, brokers to this issue.

Mr. J. A. Dullea is a Director of Aluminium Laboratories Limited which Company is a party to contracts for the supply of engineering and technical services at cost to this Company.

Save as above no Director has any financial or other interest in any property acquired or proposed to be acquired by the Company.

UNDERWRITING:

The Convertible Loan Stock now being issued is not underwritten.

BROKERAGE:

A brokerage of one-half of one per cent will be paid on allotment of Stock made in respect of applications bearing the stamp of a recognised Stockbroker.

APPLICATIONS FOR STOCK

Applications for the stock, which must be for Rs. 200 or multiples thereof, must be made on the official forms issued by the Company, and sent together with a remittance for the full amount payable on application to one of the undermentioned Brokers, or a branch of Lloyds Bank Ltd., in India, or a branch of The First National City Bank of New York, in India. Copies of the official application forms and the formal prospectus may be obtained from the Registered Office of the Company at 31, Chowringhee Road, Calcutta 16, the Company's Bankers and the following Brokers:

Company Meeting

LLOYDS BANK LIMITED

Incessant Demand for Accommodation

Sir Oliver Franks's Statement

The annual general meeting of Lloyds Bank Limited will be held on February 15 in London.

The following are extracts from the statement by the Chairman, the Rt. Hon. Sir Oliver Franks, G.C.M.G., K.C.B., C.B.E., circulated with the report and accounts for the year 1956:

The profit for the year, £2,541,793, is £219,354 higher than last year and in conformity with the intention announced in the circular letter to shareholders dealing with the scheme of capital reorganisation, since carried into effect, we propose a dividend of 13 per cent per annum, an increase of 1 per cent compared with 1955. Our business in general continues to expand year by year, as evidenced, for example, by the growth in the number of accounts.

THE CREDIT SQUEEZE

Throughout the year, our lending operations have been governed by the principles of the so-called "credit squeeze" initiated by the Chancellor's appeal for credit restraint originally made in July 1955 and reaffirmed, among other occasions, as recently as November last.

We continue to give effect to the Chancellor's wishes. In June 1955 our normal advances to domestic customers, falling within the purview of the Chancellor's directives, amounted to £298.5 millions. By December last, their total had been reduced to £278.4 millions. This contraction masks a substantial increase in our lendings to customers in a group of industries—engineering, iron and steel, shipping and chemicals, whose contribution to exports and to the strength of the economy in general has justified larger borrowings from the banking system.

These figures, of course, relate only to part of our total business. At each of the dates mentioned, the aggregate figure of loans and overdrafts appearing in our published statements was about £50 millions higher than those I have just quoted.

The margin of £50 millions was made up of three special categories of lendings falling outside the scope of the directives. One of these is advances to the nationalised industries. As is well known, finance for these industries is being provided as a temporary measure by the Treasury. Our own lendings have thus fallen substantially and in November last amounted only to about £10 millions. For the rest, the margin is accounted for by two other categories of lending, both of which have been expanding during the period of the squeeze.

EASTERN BRANCHES

First, it happens that alone among the clearing banks we have a number of branches in three overseas countries, whose figures are included among our balance sheet totals. These are our twenty offices in India, Pakistan and Burma. The lendings of these Eastern branches naturally fall outside the ambit of the United Kingdom credit squeeze, since these are rupee advances made against rupee deposits. In India especially, with an economy expanding so rapidly, there is an incessant demand for bank accommodation which, owing to tightness of funds, banks do not always find easy to meet to the full. This demand is reflected in our own advances, which show material expansion.

The increasing business is being handled in a most satisfactory manner by our staff in the East, both European and Asian, and to them I would express our appreciation of their good work.

The second special category of lendings consists of a relatively new form of accommodation, namely medium-term credits extended to overseas buyers to enable them to purchase capital equipment manufactured in this country.

We have made facilities available in this form to assist the export of capital equipment for such projects as power stations, railways, steelworks and hydro-electric schemes overseas, and in some cases this has enabled British manufacturers to secure valuable contracts that would otherwise have gone elsewhere. Among the more important transactions of the kind have been medium-term credits to finance the export of large numbers of civilian jet air-liners to dollar markets.

APPROACH TO MONETARY STABILITY

The "credit squeeze" is, of course, only one strand in a far wider programme of disinflationary measures. Prior to the crisis in the Middle East, these seemed steadily to be achieving their aim. Indeed, in one most important respect they had already brought satisfactory results, namely in swinging our balance of payments back from a deficit of £107 millions in the second half of 1955 to a surplus of £144 millions in the first half of 1956.

This movement is one more convincing demonstration of the truth that our recurring overseas crises since the war had their origin in an excess of demand at home. The favourable turn in the balance of payments could not have come about but for the disinflationary measures.

THE NEW PHASE

It is clear that the events in the Middle East have opened a completely new phase in our economic affairs. Our long-term problems are unchanged; we still have to maintain the value of sterling and to speed up the rate of accumulation. What has gone is the prospect of a smooth transition to a state of monetary equilibrium in the course of the next few months.

At new chapter has been opened. At best, we must reckon with an interruption of some months in the advance towards our long-term objectives. Fortunately, American co-operation has been forthcoming in the measures taken to avert some of the more serious possibilities that were at one time feared. We can now count upon a sizeable flow of oil across the Atlantic and also upon dollar facilities to help in paying for it. Moreover, the danger to sterling arising out of speculative attacks has been dispelled by the action of the International Monetary Fund, under the leadership of Dr. Per Jacobsson, in making available for use if necessary the whole of our quota.

The situation we face is a complex one, calling above all for flexibility and resolution. One overriding principle alone is certain: it is that we must seek to emerge from this temporary period of difficulty with our ability to achieve our long-term objectives unimpaired.

We have to maintain the position of sterling as a world currency fully viable on the basis of existing rates of exchange. This in turn means that we must maintain and improve our position in export markets. We must also be prepared during the emergency to draw upon the reserves to pay for necessary food and

Continued on p. 176 col. 2).

COMMODITY NEWS AND NOTES

CULTIVATION OF CASTOR

The Agricultural Research and Development Sub-Committee of the Indian Central Oilseeds Committee at its recent meeting has suggested that State Governments should be asked to take up cultivation of castor along the bunds of irrigation channels. The Sub-Committee feels that this holds out immense possibilities to extend castor cultivation. Castor cultivation, it says, has become important in view of the utility of its stems in the manufacture of wrapping paper. The Sub-Committee has also suggested that castor cultivation as a border crop should be encouraged in areas covered by the Community and National Extension Service Block areas.

COTTON WASTE PRICES

The prices of cotton waste have dropped substantially in the course of the past few weeks on account of lack of demand from foreign countries. The spurt in demand from the UK and the continent in the wake of the Suez crisis has proved short-lived and Japan, which is one of the major customers for the Indian cotton waste, has remained silent for some months presumably because of the paucity of sterling. Shippers are concerned over the prospects of future exports of cotton waste. It is felt that the Government should now prune the export duty particularly in view of the rising competition in world markets.

REFUND ON COTTON FABRICS OUTPUT

According to a notification of the Government of India, under the Central Excise Rules, 1944 with effect from January 10, 1957, refund of excise duty of cotton or art silk fabrics produced on powerlooms paying duty at compounded rates and exported out of India will be permissible subject to certain conditions. The rate at which the duty shall be refunded shall be three pies per square yard.

DISTRIBUTION OF CAUSTIC SODA

Under the import policy of the Government of India, the imports of caustic soda and soda ash are being canalised through the State Trading Corporation of India (Private) Ltd. The State Trading Corporation has entered into contracts with foreign suppliers for the regular import of these commodities in sufficient quantities.

IMPORT OF RAW SILK

In order to meet the demand from the silk weaving industry in India, particularly in Surat and Varanasi and to protect the interests of the indigenous sericulture industry, imports of raw silk have been canalised through the State Trading Corporation since January-June 1955. In pursuance of this policy, the Corporation has imported 57 metric tons of raw silk from China and Japan for distribution to the weaving industry through the Central Silk Board, responsible for the development of the sericulture industry. With a view to maintaining a reasonable level of prices for imported raw silk, the present selling prices will be continued.

RECORD PRODUCTION OF AMMONIA

Some record figures of production and distribution were attained by the Sindri Fertilisers and Chemicals (Private) Ltd. during 1956. The production of ammonium sulphate for the year exceeded the target of 3,30,000 tons by 1,725 tons, giving an average production of 906 tons per day, which is the highest yet achieved. Production of ammonia for the year 1956 was 94,443 tons, which is also the highest yet recorded. Despatches of ammonium sulphate in the year 1956 were again the highest being 373,921 tons.

SELF-SUFFICIENCY IN LONG STAPLE COTTON

A number of strains of extra long staple cotton in which the country is dependent upon imports have been successfully evolved under schemes sponsored by the Indian Central Cotton Committee. Breeders working on the committee's long staple cotton breeding schemes have successfully evolved strains of 1-1 6" to 1-1/8" length in which the country is short by nearly four lakh bales.

EXPORT OF PEPPER AND CASHEW

The Pepper and Cashew Export Promotion Council, Cochin has recommended to the Union Government enactment of legislation for the levy of a cess on the exports of pepper and cashew kernels in order to promote the activities of the Council. The Council has accepted the recommendations of the trade delegation sponsored by it in the matter of promoting the exports of cashew and pepper and chalked out a programme of work for the year in the light of the recommendations and suggestions made by the trade delegation.

GROWING USE OF MAN-MADE FIBRES

Rayon and man-made fibres are of increasing importance to Lancashire textile manufacturers, whose consumption of yarn comprises 70 per cent cotton and 30 per cent rayon and synthetic fibres and whose cloth output is 71 per cent cotton and 29 per cent cloth made wholly or partly from man-made fibres. The strength of rayon's position in the industry is well illustrated by the fact that a decrease of 7 per cent in total output of cloth in 11 months of 1956 was entirely due to reduced production of cotton cloth.

RECORD UK CHEESE OUTPUT

Cheese production in England and Wales last year rose by 30,000 tons to the record figure of 81,500 tons. The industry's turnover was nearly doubled over the previous year establishing a turnover of £22 million for 1956. A further expansion of sales of English cheese is anticipated through various export markets.

CANADIAN SALES OF NEWSPRINT

Britain received a substantially higher Canadian newsprint tonnage in 1956, the Newsprint Association of Canada has reported. In December last, the UK received 24,962 tons compared with 29,724 tons a year previously but the full 12 months' total was 355,197 tons against 306,190 in 1955. The Association reports that Canadian newsprint rated capacity for the current year is 6,756,071 tons or 21,701 tons daily, representing an increase of 5,13,557 tons over 1956 and an average increase of 1,586 tons daily.

(Continued from p. 175)

raw materials. Only so can we hope to achieve our second and parallel objective, which is to maintain a high level of production and employment. We must be thankful that the reserves now seem large enough to permit these two objectives to be reconciled—but also resolute to use the respite given to produce a lasting consolidation of the position.

A great task of reconstruction lies ahead of us. To a very large extent, this task is a political one. We have to restore relationships that have been gravely damaged with many of our overseas friends and allies, above all our relationships with the other members of the Commonwealth and with the United States. These are not subjects which the annual statement of a bank chairman can properly discuss at length. But success in these endeavours so conditions the speed with which we can hope to solve our economic problems that it would be equally inapproriate to end without stressing their paramount importance.

COMPANY AFFAIRS

THE CENTRAL INDIA SPINNING, WEAVING & MANUFACTURING CO., LTD.

The Company's working year ended June, 1956, has been an unsatisfactory one. The financial results show that after transferring Rs. 5 lakhs from Rehabilitation of Buildings and Machinery Fund, and providing Rs. 6 lakhs for depreciation, the profit amounts to Rs. 37,631. Together with Rs. 3,703 being sum brought forward from the previous year, it totals Rs. 41,334. A sum of Rs. 28,119 has been transferred from this to the Reserve Fund leaving Rs. 13,215 as balance which has been carried forward.

The poor results have been attributed mainly to the Mills being involved in a prolonged strike lasting nearly three months, which was the outcome of a dispute arising due to transferring a large section of workers to third shift necessitated by renovation purposes. As a result of the closure, the loss in production has been estimated to be about 1 million lbs. of yarn and 13 million yards of cloth, besides the indirect loss in production which generally occurs after such closures because of the inevitable time taken in returning to normal operations. The rehabilitation and renovation programme sanctioned by the Directors involves an expenditure of Rs. 1.70 crores. The main items of new plant and machinery proposed to be installed are ring frames, looms, winding and warping units and high-speed sizing machines. In the year under report, new plant and equipment valued at about Rs. 3.04 lakhs was installed. Meanwhile, the installed capacity of the mills had to be temporarily reduced substantially.

Among other difficulties were the unseasonal rains resulting in reduced crops as compared to the original estimates, whereas the consumption by mills went on increasing. This created scarcity conditions and many varieties of cotton touched ceilings. There was a continual increase in the excise duty on cloth. Again, under an Agreement between the Millowners' Association and the National Textile Workers' Federation (Madhya Pradesh) the dearness allowance was increased with retrospective effect from July, 1955, which added about Rs. 5 lakhs to the Company's annual wage bill.

In view of the unfavourable circumstances, the Directors have recommended a dividend of 5 per cent, tax free, on preference share, for the year under review, to be paid out of the Dividend Equalisation Fund. No dividend on Ordinary Shares has been recommended.

THE AMALGAMATED COALFIELDS LTD.

The Company's profit for the half-year ended March, 1956, after the inclusion of Rs. 26,953 brought forward, but before providing for taxation is Rs. 3,19,343. Taking out the provision for taxation (Rs. 1,33,233), it reduces to Rs. 1,86,110. From this, Rs. 30,000 has been placed to Dividend Equalisation Reserve. The Directors have recommended a dividend at the rate of 10 per cent per annum without any deduction for income-tax, which absorbs Rs. 1,27,500. That leaves Rs. 28,610 to be carried forward. Capital expenditure incurred during the half-year on buildings, machinery and development amounted to Rs. 3,28,483, as compared to the previous half-year's Rs. 3,00,396.

As for raisings and despatches, while there was a slight improvement in raisings compared to the previous half-year, despaches show a marginal decline which has been attributed to a short supply of wagons.

It will be recalled that the selling prices of coal were revised by the Government to offset the increase in costs due to the Coal Tribunal Award. The Company's coal price was increased by Rs. 3 per ton but did not cover the entire period of the implementation of the Award. Also, the increase was considered inadequate, as a result of which the Government had considered to re-examine the Company's accounts.

THE PENCH VALLEY COAL CO., LTD.

After providing for taxation (Rs. 1,07,620) and including Rs. 33,343, being the amount brought forward, the Company's profit for the half-year ended March, 1956, totals Rs. 1,73,984. The Directors have placed Rs. 30,000 to Dividend Equalisation Reserve, leaving a disposable balance of Rs. 1,43,984. The Directors have further recommended payment of a dividend at the rate of 14 per cent per annum, without any deduction for income-tax paid by the Company, absorbing Rs. 1,10,250. The balance of Rs. 33,734 is to be carried forward. Capital expenditure incurred during the half-year on development machinery and buildings amounted to Rs. 1,76,175 which is somewhat more than Rs. 1,35,454 of the previous half-year.

Raisings and despatches have been well maintained during the half-year under review, a contributory factor being the increased offtake of Khaperkhada Power House on the Narrow Gauge which was met from the Company's collieries by the Broad Gauge.

In the case of this Company also, the increase of Rs. 3 in the price per ton of coal was considered inadequate and the Government had agreed to re-examine the accounts.

THE BOMBAY SAFE DEPOSIT CO., LTD.

The results of the Company's working for the year ended September, 1956, show a profit of Rs. 68,982. From this has to be deducted the amount of Rs. 38,800 being provision for taxation (Rs. 32,000) and staff bonus and gratuity fund. After adding transfers from repairs and renewals and reserve funds and carryforward of the previous year, the amount totals Rs. 36,339. The Directors have recommended a dividend of Rs. 30 per share, free of income-tax, which absorbs Rs. 36,000. The balance of Rs. 337 is carried forward.

The transfers from the two reserves mentioned were made as it was considered reasonable to spread the expenses, incurred on essential repairs, etc., over a number of years. The Directors also hold that furniture, fittings, etc., have been written down adequately in the past and, therefore, no provision has been made for depreciation.

INDIAN VEGETABLE PRODUCTS, LTD.

The profit for the year ended September, 1956, before providing for taxation, depreciation, etc., is Rs. 7,34,824. An amount of Rs. 2.90 lakhs has been provided for taxation and another Rs. 68,315 for depreciation. After deducting these amounts and others provided for staff gratuity and bonus and adding the carryforward of the previous year, the total profit produced amounts to Rs. 2,75,075. To Reserve Fund has been allocated Rs. 55,000. From the balance of Rs. 2,20,075 the Directors have recommended payment of bonus, tax-free, at the rate of Rs. 10 per share which absorbs Rs. 2,11,750. The balance of Rs. 8,325 is to be carried forward.

The Kashmir Crescendo

THE Security Council's Resolution on Kashmir on the eve of the Republic Day and the immediate reactions to it have produced an emotional upsurge which is rising to a crescendo in India, in Pakistan and in Kashmir itself. The Resolution reminded the Governments and the authorities concerned of the 'principle' (embodied in previous Resolutions) "that the final disposition of the State of Jammu and Kashmir will be made in accordance with the will of the people expressed through the democratic method of a free and impartial plebiscite conducted under the auspices

of the United Nations". Although right now, in the context of the impending General Elections in India, the emotional aspects of the Kashmir problem look like overshadowing its other aspects, Mr. Nehru has done well to declare that he and his Government have no wish to go back on any international commitment now or in the future and they would continue to seek a solution to the issue by peaceful means. The significance of this declaration lies in this that the other aspects of the problem are likely to invite greater attention after the elections.

Signs are not also wanting that the other aspects relevant to a solution are surely impinging themselves upon the minds of statesmen abroad. Already the United States Secretary of State has stated that he "does not consider India to be in violation of the U.N. despite the dissolution of the Kashmir Legislature and the formal incorporation of the State into India".Although the United States still believes that a plebiscite should be held 'to determine the future of Kashmir', Mr. Dulles does visualise the possibilty of 'another' agreed solution between the parties — India and Pakistan. The use of the words 'another solution' in Mr. Dulles's statement is significant, for it is just possible that its content and character could be different from that of a plebiscite covering the whole of Kashmir. The French Foreign Minister's statement that the "Security Council cannot impose solutions on India with regard to the Kashmir question" is no less significant. The Western recognition that an 'out-of-Council' settlement would be preferable may restrain emotions both in Pakistan and in India and pave the way for possible negotiations between the two countries.

The prospects for such direct negotiations (as in the case of the recent Indo-Pakistan Trade Agreement) may not, however, be immediately rosy in the context of General Elections. But the prospects would be there in a fair measure as the Security Council is not likely, in the context of what Mr. Dulles and Mr. Pineau have stated, to agree to a precipitate course, which might create more difficulties. In the circumstance an 'out-of-court' settlement becomes a logical and pragmatic necessity. That the United States and other Western nations may be helpful by making their good offices available in some way or other, can also be postulated with a reasonable degree of certainty.

The vital question is whether direct talks between India and Pakistan will bear fruit. They well may if the real bone of contention — namely, the Kashmir Valley — does not constitute a stumbling block in negotiations. It may be recalled that India has all along accepted for all practical purposes, the inclusion, under the Pakistan Constitution, of 'Azad Kashmir' (the mountainous area to the north and west of the Kashmir Valley) into Pakistan. For its part Pakistan cannot seriously question the constitutional incorporation of Jammu (predominantly populated by Hindus) into the Indian Union. What remains, therefore, is the Kashmir Valley which is predominantly populated by Muslims. It is the future of the Kashmir Valley that really matters, but it is the one thing that raises some basic questions regarding the wisdom or otherwise of a further territorial disposition on the basis of religion.

In a theoretical sense a plebiscite runs counter to the idea of division on the basis of religion and has, therefore, its inherent merits. But there are practical considerations in the matter of applying the principle to the Kashmir Valley. It is the contention of the Indian Government that the people of Kashmir are having a run of economic prosperity and secular peace in the conditions made possible by its being a part of the Indian Union in which forty million Muslims are living at peace and continuing their economic avocations undisturbed. This is in a way confirmed by the Kashmir Government which has chosen to cement further the legal and constitutional relationship of its State with India.

A plebiscite (possibly confined to the Kashmir Valley) may or may not confirm this contention even if fool-proof steps are taken to ensure that it (the plebiscite) is carried out in conditions in which legitimate appeals to the people not involving exploitation of extreme sentiments would be possible. If even in such conditions a plebiscite were to go in favour of Pakistan, India might have to accept the verdict in a spirit of resignation. If, on the other hand, a plebiscite were to go in favour of Pakistan in an atmosphere of extreme emotions, it might not be conducive to harmony between the two major communities in the Indian Union.

Any possible repetition of the 1946-47 history in such circumstances might only result in further estrangement between India and Pakistan — a thing that would not be in the best interests, both short-run and long-range, of either country. This is the supreme practical consideration that may have to govern the procedure of conducting any such plebiscite. If this consideration is kept in the fore in possible negotiations between India and Pakistan, it may be that a smooth *modus vivendi* would more easily suggest itself for the final settlement of the problem.

A Plan for Rubber

THE major challenge which confronts the rubber industry is that of expanding its output at an extraordinary rate within a brief period. This challenge has been thrust on it by the swift rise in consumption in the wake of the coming phase of development of rubber-intensive industries. It is also a legacy of a prolonged period, since the war, of excessive tapping in disregard of maintenance and rehabilitation of plantations. Indifference to normal practices of replenishment is now bringing its retribution. It is to this question that the Plantation Enquiry Commission has primarily addressed itself in this third and last report — on rubber.

On conservative calculations demand is estimated to shoot up from 30,000 tons in 1956 to 40,000 tons in 1960 and 65,000 tons in 1970. The industry and planners have almost reconciled themselves to the inevitability of a big gap of 14,000

tons between demand and domestic production at the end of the present Plan as output cannot be stepped up on the required scale in the short run. The plan proposed by the Commission envisages additional production of natural rubber of 20,000 tons in 1965 above the current annual production of 24,000 tons. It seeks to accelerate the pace of expansion and advance the period of ten years suggested by the Rubber Board for a programme of replanting of 70,000 acres by three years. In its approach to the problem of output it lays a purposive emphasis on quality production. Licensing for replanting and new planting is to be determined on a strict selective basis of high yielding trees. Output per acre which is currently the lowest in the world is to be stepped up three-fold to 800 lbs. This should not prove difficult in view of the selection of superior varieties. The majority report is right in accepting the principle of extensive cultivation by new plantings as an integral part of the expansion programme. Additional 50,000 acres are to be brought under new planting. It has wisely rejected the plea of the sole dissenting member for participation of Government in new planting.

The Commission is critical of the indifference of growers to their primary obligation to replenish the reckless depletion of trees since the war. There has been a failure on their part to utilise, according to purpose, the element of the rehabilitation allowance and depreciation in the prices fixed for rubber. The published summary of the Commission's report indicates that the prescription suggested for tea and coffee plantations is to be applied to rubber plantations in appropriate directions. Its views on the problems of big growers and estates and the means suggested to meet them can be gathered only when the full text of the report is released. But it would appear that it has lapsed into the error of recommending a course of curbs which would put their financial management in a strait jacket. The restraints implied on dividend distribution, disposal of profits or their repatriation go ill with its finding that the industry's profits cannot be regarded as excessive. Big growers and estates have to bear much the larger share of the task of raising the rate of output in a short span. They will need to pool all their financial resources for re-investment and fresh investment. Englightened self-interest will dictate the necessity of exploring practicable measures including interim retraint on return. There is inherent virtue in voluntary discipline. The line of demarcation between prudent regulation and direct intervention is indistinct and apt to be violated.

It seems that the Commission's anxiety over a rapid increase in production has been responsible for lack of full appreciation of certain issues. It has endorsed the Government's tentative project of a synthetic rubber plant which has already raised a storm of controversy. Producers of natural rubber view this proposition as a potential peril. It cannot be overlooked that their sector of the industry must necessarily be regarded as the mainstay to satisfy the demand. Their apprehensions about forces of fierce competition being let loose are genuine. The Commission has urged that new plantings must be related *inter-alia* to synthetic output. It has uttered a warning that the natural rubber industry must minimise its costs to face the competition of the synthetic product. The problem of co-ordination which will emerge in the event of the establishment of the synthetic rubber plant is bound to create a headache. The Commission has been content with emphasizing the need for co-ordination.

The small grower — with holdings of 50 acres or below — occupies the major attention of the Commission. This is not unexpected in view of his importance in the industry. This importance assumes a strategic angle when his position in the problem State of Kerala is realised. The extent of fragmentation is easily gathered from the fact that the total number of holdings with an average area of 2 acres is as high as 23,400. Anything below 4 acres per tapper cannot but be considered as an uneconomic holding. The problem posed is to raise this majority of small holdings to the level of economic units. The Commission has urged that an area of 12,000 acres of new plantings should be earmarked for conversion of uneconomic holdings into economic ones. The acreages of 70,000 for replanting and 50,000 for new planting are to be divided half and half between big and small growers. Out of the aggregate area of 35,000 acres allotted to the latter for replanting, three-fifths is to be reserved for distribution to holders of 15 acres or less. This scheme of allocations proceeds on a reasonable appraisal of priorities. It is not clear whether areas of new planting are available within convenient distances from the existing holdings of small growers. Kottayam district which accounts for the heaviest concentration of small as well as uneconomic holdings typifies the real dimensions of this problem.

The recipe of co-operative organisation has been recommended for intensive as well as extensive cultivation at the level of the small grower. It is difficult to share the Commission's optimism in the feasibility of the co-operative technique in the near future. Co-operation, left to the initiative of holders themselves, has made no mentionable headway. The Commission has urged the necessity of State-partnered co-operatives. This pattern implies government control and direction. The implications of State intervention do not seem to have been worked out in elaborate detail. It has recommended what it calls joint farming co-operatives, but it has taken scrupulous care to explain that it does not suggest pooling of lands. This qualification is to be welcomed. Any attempt at joint cultivation by pooling of lands may meet with stiff resistance and, even if brought about, it is undesirable for it may end up in collectivisation. Co-operation as envisaged by the Commission is in effect hardly different from the conventional multi-purpose type which would require steady growth.

The Commission frowns upon the scheme of graded subsidies prepared by the Rubber Board. It condemns subsidies as charity grants and urges long-term loans on easy conditions even for small growers. The cost of the two-pronged programme for growers possessing 15 acres or below is conservatively placed at Rs. 3.3 crores. It does not take into account the cost of acquisition of new land. The outlay on the total programme will be considerably higher. How to raise it is a crucial issue. This part of the Commission's recommendations is unconvincing. It will require positive reconsideration.

Burma's Unsolved Problem

THE Karen-Communists are active again in Burma. Last week they burned and destroyed key military installations at Pegu, (hardly 50 miles from Rangoon) and seized and looted the town. This violent defiance of the Burmese Government in close proximity of its seat of power has been followed by large-scale and well-armed raids in villages near Mahwe and Moulmein and in the upper region of the Irawaddy delta. Earlier, in January the Karen-Communist insurgents had successfully raided Tautabin, and attacked the Kachin State, until now one of the most peaceful spots in Burma. There were also reports of renewed rebel activity in the Pakokku district, stronghold of the Communists, which had been cleaned up after a six-month long full-scale army operations last year.

Reports about Chinese military incursions into the Burmese territory and the continued infiltration of Chinese civilians across the border are also causing concern in Rangoon. But a young State like Burma, without alliances, is faced with a dilemma. If it seeks support from other nations, it may be accused of violating its neutral policy and provoking its powerful northern neighbour. At the same time, if it acquiesces in encroachment by China, it loses prestige at home. The task of the Burmese Government is made still more difficult by the fact that quite a considerable number of the Burmese people are predominantly left-wing in their political thinking.

The sporadic civil war and simmering Communist violence have prevented local and foreign business houses, genuinely interested in developing Burma's economy, from making long-term investment. This has resulted in the persistence of the economic crisis which overtook the country during the Second World War. In fact, the crisis reached its climax last summer. Burma's gross domestic produce in 1955-56 was only about 89 per cent of that of 1938-39, while there was a decline in total gross investment from Kyats 1,014 million in 1954-55 to Kyats 965 million in 1955-56. Per capita output is only 75 per cent of what it was before the war, and per capita consumption is only about 70 per cent. Similarly, the export of rice and rice products has fallen from the index figure (base—1952) of 111.8 in 1953 to nearly 62. And rice still accounts for three-fourths of Burma's overseas earnings. The barter deal with Russia in 1955 for the disposal of the preceding year's surplus and a good portion of the 1955 crop, has aggravated the crisis. By shipping rice without arranging at the same time what was to be taken in return and at what price, Burma made itself vulnerable to unilateral price increases and unpredictable delivery schedule of imports. For instance, 60,000 tons of cement (one year's supply) arrived at the beginning of the monsoon and without enough available warehousing space to store it. The Russian goods were either found unsuitable or were available more cheaply elsewhere. Moreover, Soviet deliveries to Burma had fallen between £4 and £5 million short by the end of September, 1956. By comparison, the Chinese have been particular in their deliveries. But there is a limit to Burma's capacity to make use of the goods and materials that China can provide at its present stage of industrial development. Further, the Burmese are annoyed with the Chinese because they have resold Burma's rice in other countries where the Burmese themselves hoped to find a profitable market.

To make matters worse, the cost of living index of a working class family, calculated on 1941 as base year, has risen to 338. This is the highest point it has reached in Burma since independence, with the exception of 1949 when the Communist rebellion was at its most intense. The Burmese Government's attempts to control prices and organize a fair distribution of commodities have failed because of the weakness of the distributive machinery and continuing pressure of inflation. The shortfalls in the fulfilment of the Four-Year Development Plan, drawn up on the assumption of a high level of resources from the rice crop, has aggravated the situation further.

The renewed Communist activity in Burma in the wake of economic crisis is a matter of concern not only for that country. Pakistan and India cannot remain indifferent to the growing threat to Burma's security. This would deprive these two countries of a secure frontier on their eastern borders and expose them militarily, politically and ideologically. In spite of their enlightened self-interest in the preservation of independent Burma, both India and Pakistan are unable to help it in its present crisis. They are in a position neither to give her considerable economic aid, nor to provide her with military protection against internal subversion. Burma's policy of neutrality, like India's, which is primarily born out of an anti-colonial neurosis, does not allow her to accept aid from the West. Without foreign aid, however, it is doubtful if Burma can come out of the wood.

There are, of course, certain redeeming factors in the otherwise bleak picture. Apart from the welcome decision of U Nu to take up the reins of the Government once again, the country's new Four-Year Development Plan, beginning from 1956-57, has given high priority to the expansion of direct production, diversification of agriculture, export promotion and essential imports. In order to remove seasonal unemployment in the countryside, small-scale and cottage industries, which are capable of providing part-time employment, will be developed. The success of the Plan is already beginning to be reflected in the increased employment opportunities. But to overcome the economic crisis fully Burma still needs £20 million aid. The West would be wise in not seeking to drive a hard bargain from this young democratic country at the present juncture. The World Bank, too, can lend a helping hand by granting a loan for the establishment of an industrial finance corporation. Without such timely help, there is danger of the country's security being unable to withstand continued onslaughts. Writing as early as 1939, in his brochure, "The Chinese Revolution and the Chinese Communist Party", Mao Tse-tung observed: "In defeating China in wars, the imperialist powers have taken away from the Chinese many dependent States.....like Burma, Bhutan, Nepal and Hong Kong". The moral can hardly be missed.

THE WEEK'S NOTES

AN ELECTION-EVE DEBATE

TO APPRECIATE the need of Opposition in a democracy is to appreciate democracy itself, for one cannot be separated from the other. Those who do not recognise an Opposition in a democracy as an essential absolute will, sooner or later,—in fact sooner than later —like to dispense with democracy itself. This has been the experience of history. In our own country, without any mature tradition of parliamentary democracy and with no strong Opposition, the danger of one-party rule has loomed large on the political horizon. The position today is that for the last ten years the Congress has enjoyed a virtual monopoly of power with its command of overwhelming majorities both in Parliament and State legislatures. The continuation of this position—quite apart from the merits and virtues of the Congress Party— is conceivably fraught with serious danger to India's nascent democracy.

Mr. Jaya Prakash Narayan's plea for a strong, healthy and responsible Opposition is therefore timely. Thoughtful people in the country would fully share his concern about the present weakness in Indian democracy. But few of them would be naive to support his appeal to Mr. Nehru to 'give a helping hand" in the building up of an Opposition. Doubtless, Mr. Nehru is a national leader. Doubtless, the founding of the Opposition is a national task at par with national reconstruction and planning. But such an appeal amounts to a confession of failure of the present leadership of the Opposition parties. This failure evokes derision rather than sympathy because even during the first General Elections in India in 1952, fifty-three per cent of those who exercised their franchise had voted in favour of the candidates of a motley crowd of Opposition parties. In its own way the Congress Party may be said to have continuously been contributing its mite to the creation of a suitable climate for Opposition. It has failed to root out corruption and has committed a number of mistakes. If Mr. Jaya Prakash Narayan and other Opposition leaders have failed to command allegiance of a strong section of public opinion, we should look for the causes in their lack of correct understanding of the needs of the people and of the essentials of the organisation of political parties. Mr. Nehru's reply to Mr. Narayan's request is, therefore, pertinent. He stated that he could neither choose candidates for the Opposition parties, nor coerce people to elect them. After all, Mr. Nehru cannot produce Opposition out of his hat like a rabbit.

One is also entitled to ask what is Mr. Narayan's own contribution towards the removal of this major lacuna in our parliamentary system. It would have been more appropriate for him to lend his tremendous political stature and prestige, his organisational talent and indefatigable energy to build up the Praja-Socialist Party into an effective Opposition rather than expending these qualities in the Bhoodan movement which is being well looked after by Vinoba Bhave. At the moment Mr. Narayan does not seem at all to be prepared to take up the leadership of the P.-S.P. His refusal is thus incompatible with his expressed anxiety for a democratic opposition.

Mr. Jaya Prakash Narayan's plea for treating the Opposition with "sympathy, courtesy and patience" deserves serious consideration. There is a trend among some of the leaders of the ruling Congress Party to impugn the "integrity, patriotism and good sense" of one simply because one has dared to criticise the Prime Minister. It is distressing to find the kind of innuendoes in which some of those nearest to the Prime Minister have recently been indulging.

SOVIET AID FOR HEAVY MACHINERY?

IN THE last six months, two missions, one Soviet and the other British, have been in India studying the possibilities of developing heavy machinery manufacture in this country. The Soviet team has recently submitted its report to the Government of India and the preliminary broad outlines now available appear to be encouraging. The project would be in two parts —fabrication of machinery for steel and other plants and a foundry and forge project for the manufacture of heavy castings and forgings--with an annual capacity of 80,000 tons of machinery and equipment. It is out of the common inasmuch as the machinery for the works is expected to be multipurpose which can be used for the manufacture on a large-scale of various types of equipment as required. Another attractive feature of the project, which can be taken up in the second Plan period itself, is that it would absorb some 10,000 hands. The more important details about financing the project are still under discussion. The total cost of the scheme is estimated at Rs. 94 crores which should prove difficult for India to undertake unless the Soviet Union is willing to offer terms along the lines of the Bhilai Steel Project. It will be recalled that, in addition to the long-term credit of Rs. 50 crores for Bhilai, the Soviet Union has agreed to help to the tune of Rs. 60 crores in the industrial progress of this country. Whether the latest project will be over and above the others will be watched with interest.

Provision of Rs. 15 crores has been made, in the second Plan, for setting up heavy foundries and forge shops and for heavy structural shops, through the National Industrial Development Corporation and the project has already reached an advanced stage. This is in addition to a heavy steel foundry envisaged for stepping up the capacity of the Chittaranjan Locomotive Works. Other schemes include Rs. 20 to Rs. 25 crores for the manufacture of electrical equipment, Rs. 2 crores for the expansion of Hindustan Machine Tools, Rs. 10 crores for the manufacture of industrial machinery and machine tools (also under NIDC) and Rs. 1.2 crores for the expansion of Government Electric Factory at Bangalore. If the Soviet offer materialises, the country will have taken a long stride towards self-sufficiency in this vital field. Since, however, the UK mission's report is still to come, a final decision may have to be postponed. Meanwhile, a misgiving that arises is whether the Indian Railways will be able to cope with the ever-increasing pressure, which would be highly accelerated by the Soviet scheme. Obviously, every effort will need to be made to bear the pressure of the schemes which would ultimately help in relieving it.

PROBLEMS OF MANAGEMENT

IN A timely address to the Delhi Management Association, Lala Charat Ram has focussed attention on the magnitude of the management job in the second Plan. It is patent that the country is now short of adequate managerial skill to implement the various development plans in both the public and private sectors, and the demand is bound to rise at a continually high rate in the coming years. Apart from the question of shortage, the nature of the job itself has become more difficult as the primary problem before it is one of making a project out of a blue-print. Furthermore, the functions of management have become widened with the increasing role of Labour Unions and demand for Labour participation in industry. All these pose a great chal-

lenge in training competent managers and it is a good sign that the Government as well as the universities and industry are bestirring themselves to fill the lacuna. The universities and industry should, however, see to it that their programme is complementary and meets the real requirements of the country. The scope for taking advantage of foreign technical assistance is also considerable here, and this should be explored with great care.

All this is good in so far as it goes. Management has now become in essence a profession like any other, but it has yet to evolve its own standard of ethic. The power that a manager possesses over the lives and happiness of a number of people is as immense as that of the lawyer or the doctor and so something more is required of the man who enters this calling than mere technical ability. It must fall to the managers themselves to assert their professional status and set their own standards. Even in private enterprise, profit is no more considered the sole test of good management and it is giving place to the concept of productivity which can only be attained by efficiency, proper co-ordination and improved industrial relations. As Peter F. Drucker says in 'The Practice of Management,' "it is the test of an organisation that it make ordinary human beings to perform better than they are capable of". It is the manager's job to create such an organisation. Industrial relations are also of great importance, and it is highly necessary to foster the spirit of responsibility and co-operation among the workers. In the ultimate analysis, the worker's attitude to the firm depends on the firm's attitude to him and here management must give the correct lead. It is by no means an unimportant part of the case for having a private sector that in it various individual experiments are possible. Will it be too much to hope that managements in private enterprise will pioneer new standards in this fertile field?

WORKERS' EDUCATION

THE GOVERNMENT of India have just appointed an eight-member team of experts to advise them in formulating detailed schemes to cover all aspects of workers' education. This is a welcome step towards industrial democracy, for it aims at educating the workers in the ways of responsible citizenship. The team which has been appointed in co-operation with the Ford Foundation, will make concrete proposals regarding the education of trade union representatives in the principles and techniques of trade union organisation, management and finance. It will also make proposals regarding the education of union representatives for responsible and effective participation in management. The team has been appointed in pursuance of the recommendations on labour policy in the second Five-Year Plan. The recommendations have laid down that the workers be trained in trade union philosophy and methods as also in the methods of management so that they can develop their organisation and take an effective part in the joint councils of management to be set up in industrial undertakings.

Industrial progress in this country depends to a great extent upon the growth of a healthy trade union movement under enlightened and responsible leadership. The old type of militant trade union leader who is brought up on the philosophy of class war and who looks upon himself more as an agent of his political party than as a representative of workers and who is not conscious of any obligations to the community, is a misfit in the present social order. He needs to be educated on the role he has to play. Besides, in order to organise a genuine trade union movement which does not depend on outsiders for leadership and to enable it to participate in management much training beyond literacy is required. It is good to find that the government has stepped into this sphere and is aware of all these problems.

The international team is expected to submit its report on the detailed schemes by March next for a further discussion in a more broad-based seminar. The seminar will include members of the team and representatives of trade union organisations. It is to be hoped that when concrete proposals are worked out by the education team, they may well command the greatest common measure of agreement among all the parties concerned — namely, the government, the employers and the employees.

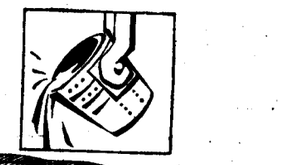
IBN SAUD IN THE UNITED STATES

ONE OF the world's last absolute monarchs, the King of Saudi Arabia is currently visiting the United States. Obviously, the United States Government's main interest in inviting him for a visit at the present juncture is to "sell" through him the Eisenhower Plan to the Middle-Eastern countries. Besides, another important agreement is to be negotiated with him for the renewal of the lease of the U.S. military bases at Dhahran.

King Ibn Saud's visit assumes added importance because he has gone to Washington armed with authority to speak for three other Arab States, namely, Egypt, Syria and Jordan. It is he who will discuss on behalf of the Arab world the Eisenhower Plan with the President and convey to him their objections and seek clarification on such points which though acceptable in principle remain from the Arab point of view rather vague. Since the President has publicly assured that any offer of military aid would be in conformity with the obligations of the United States to the United Nations Charter and subject to the overriding authority of the Security Council, he should be able to dispel any lingering doubt among the Arab States about the motives behind his Plan. Also, he himself should be able to appreciate the basis and importance of the neutral foreign policy which the Arab States want to pursue.

Although the talks between the Republican President and the absolute monarch are still inconclusive, they have reportedly gone "extremely well, with good many misunderstandings cleared up." Diplomatic speculation is rife that the Eisenhower Plan will be modified to remove the Arab objections. There is, therefore, every chance that strong ties may well emerge from the current talks. This optimism is well founded because of three factors: one, President Eisenhower's public assurance that his Plan is no more than a "protective shield" against "overt armed aggression from any nation controlled by international Communism"; two, the common oil interest of America and Saudi Arabia; and, three, the growing realisation in the Arab world, which had recently been swayed towards the Communist bloc after the Anglo-French abortive military adventure in Egypt, that the Arabs would not, as King Hussein of Jordan has put it, be able to get rid of the "new imperialism" if once it strongly got established in the Middle East. It was perhaps due to this consciousness that Egypt, even during the recent crisis, did not accept the Russian offer of "volunteers".

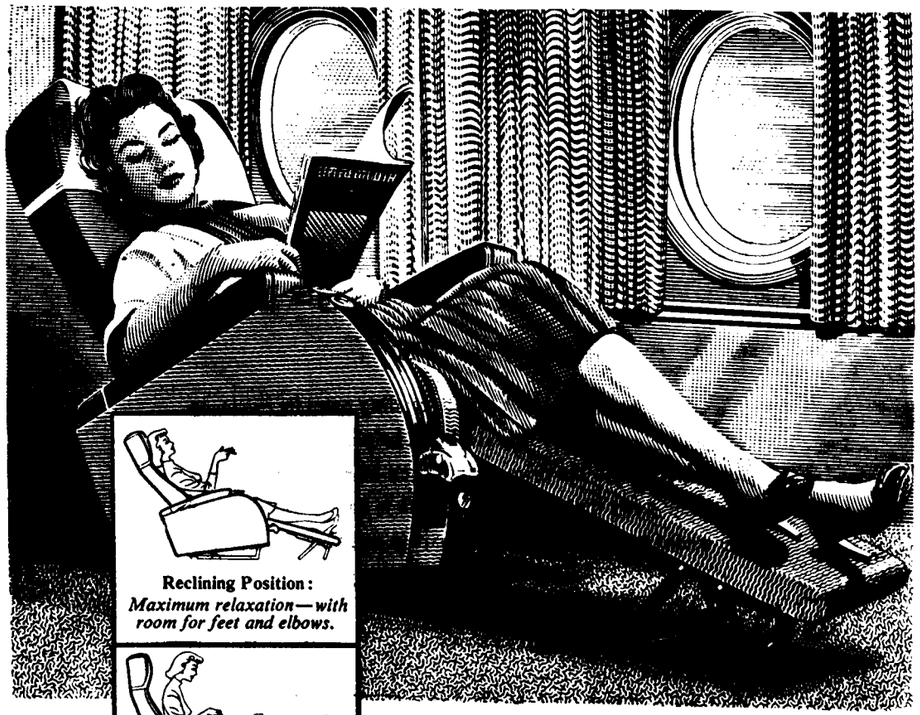
It would be an important contribution to the cause of peace and the free world, if President Eisenhower used his influence to force the French grant national freedom to Algeria, release the frozen Egyptian funds in the United States and renew the offer to finance the Aswan Dam project. For they would give a shattering blow to the prestige of the Kremlin in the Middle East.



steel brings you the news

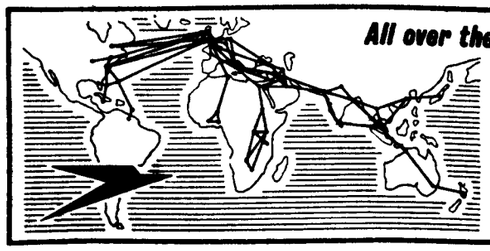
Yes, that paper you are reading owes its existence to steel. It is steel that helped to manufacture the paper, did the printing and even helped to collect the news that it carries. There is hardly any facet of life where steel does not play a part in one way or another.

TATA STEEL



SERVES THE NATION

Steel, today, is very much to the fore in the nation's thinking. India's steel-making capacity is being rapidly enlarged to provide a sure and solid basis for the country's advancement.



TN 1018

FLY TO
LONDON
IN "SLUMBERETTE" LUXURY

B.O.A.C. Luxury First Class services to London offer you the wonderful comfort of "Slumberette" seats—designed to give maximum relaxation all the time. *Sit up* and enjoy the marvellous B.O.A.C. food and wines ... *sit back* and read in armchair comfort ... or adjust to the *reclining* position and you have a blissfully restful bed. You fly by 4-engined, fully pressurized *Constellation*. Attentive service, night and day. No tips or extras.

Generous petrol allowances for visitors to Britain. Full details from your local Travel Agent or B.O.A.C., Speedbird House, Service Road, Connaught Place, New Delhi. Phone: 43978, 44234, 45085 and 47356.

FOREIGN POLICIES WITHOUT "POWER"

By

ODYSSEUS

WHAT foreign policy is henceforth possible for Britain?

A foreign policy is based on the national interests at stake and the power available for their support. It is an illusion that all national interests can invariably be attained by negotiation alone. Some conflicts of national interests between countries are inevitable. These conflicts are resolved by negotiation when supported by the knowledge that power is available to uphold national aims if negotiations show signs of bogging down. Since virtually no nation is powerful enough today to support its negotiations alone without help from friends with similar aims, an important part of foreign policy consists in cultivating the friendships, and helping forward the interests of, other countries whose interests coincide with one's own. This two-way traffic of mutual support implies compromises in the formulation and carrying out of policy. No country, not even the U.S.A. or the U.S.S.R., can expect to have its own way in all matters. The final test of any policy is whether it has in fact advanced or injured the national interests.

By these tests the foreign policies of France and Britain, and of many other countries, in relation to the Suez canal, the Israeli-Egyptian situation, and the Middle East, have been at fault and continue at fault.

Take first France and Britain. Their interests are that the Suez canal should be freely navigable to the ships of all nations, that they should be able to buy and transport oil freely from the Arab countries, that the Middle East should be at peace, and that no countries hostile to themselves should establish influence in the region.

MIDDLE EAST TENSIONS

These Franco-British interests in the Middle East were between 1954 and 1956 increasingly threatened by a variety of factors which included: (1) The persistence of hostility between Israel and the Arab countries, and particularly between Israel and Egypt, which threatened the peace of the whole area; (2) Egypt's denial of the canal to ships bound for Israel (in defiance incidentally of the U.N.O.'s injunction to Egypt), which created a risky precedent for the future of the canal; (3) the continuing friction between Israel and Egypt which led Egypt to seek foreign arms. Fear that a re-armed Egypt might let war loose on Israel and involve the whole Middle East led France and Britain, and the West generally, to be reluctant to supply arms in the quantities sought. So (4) Egypt turned for arms to the Communist countries, thereby inviting Soviet influence into the empty space created by the departure of British troops from the canal under the 1954 Anglo-Egyptian agreement. (5) The infiltration of Soviet power into the vital canal and Arab oil area alarmed Britain and France. (6) The build-up of Egyptian armaments together with persisting Egyptian Commando raids into Israeli territory alarmed Israel. So (7) Israel decided that her national survival depended on striking first, while she still had the advantage, and destroying Egypt's Soviet armaments in a large-scale preventive raid.

What in these alarming circumstances did French and British interests dictate?

An outbreak of war between Israel and Egypt might, owing to the importance of the Suez canal and of Arab oil to so many countries, be difficult to localise. The possibility of World War III could not be excluded as the ultimate development. Britain and France ought to have known that they were not strong enough to enforce peace in the area by sending troops to ensure neutrality between Israel and Egypt. Moreover, in the face of Middle Eastern and Asian nationalist sentiment, any such attempt would align powerful forces against them.

What to do? Back to first principles. What is the key to the formulation of a foreign policy? The national interest. Very well then: What other countries were interested in the Suez canal, Arab oil, and the denial of the Middle East to Communist infiltration? Answer: At least the whole of Europe, North America, and all Asia except China.

In other words, the interests of virtually the whole world outside the Communist countries coincided with those of Britain and France. Surely here was an overwhelming conglomeration of power that could have been mobilised to tell the Middle East that in order to ensure (1) peace between Israel and Egypt, (2) passage through the canal to ships of all nations, (3) that the countries of the Middle East should not become Soviet satellites, and (4) peace throughout the area, France, Britain, the U.S.A., Australia, India, Pakistan, Canada, New Zealand, Indonesia, Belgium, and half a dozen others, were combining to maintain the costs of sufficient troops (under the U.N.O. aegis, if you like) in the area for as long as was necessary.

But the fact that the Franco-British attempt to protect their interests by "going it alone" was indefensible from everybody's viewpoint, including their own, should not prevent us from trying to understand how such a wrong decision came to be taken. Their failure to consult their natural allies over the threatened crisis in the Middle East arose from their conviction that consultation would be useless.

The U.S.A. had no consistent policy in the area. Mr. Dulles seemed unaware that innumerable countries, friendly to the U.S.A., had any stake in the use of the Suez canal or Arabian oil, or in keeping the U.S.S.R. out. He was thus breaking the first rule of a foreign policy: Find out who your friends are and help their interests along. If you don't, you must not be surprised if they ultimately, in desperation, decide to act without you. Equally, the natural friends of France and Britain in Asia were conscious of the evils of colonialism to the point of failing to see who their friends were and where their interests lay.

In saying this, I am aware of the unpopularity of the viewpoint that I am submitting. It is offensive to the many important non-Communist countries who have convinced themselves that (1) mutual support for common interests is dangerous (they call it "entangling alliances"); that (2) the use of force can be avoided by the unilateral renunciation of its use; that (3) foreign policy is not concerned with interests at stake, and the power that can be mustered with the help of friends to support them, but with upholding moral principles, like the Panch Shila, or the Kellog Pact

outlawing war, or the Stimson doctrine of refusing to recognise territorial changes brought about by force.

WHAT IS "AGGRESSION"?

I am not arguing that a successful foreign policy aims at protecting interests regardless of moral obligations. Policies, such as those of Hitler and Stalin, based on purely cynical calculations offend deep human instincts; at home, they fail to unite the whole nation behind them, and abroad they arouse deep antagonisms that take shape in combinations of power against them. But I am arguing that we muddle ourselves by using in international affairs, where they make nonsense, words which apply to the internal administration of law and order. "Aggression" inside India is when a dacoit uses violence for private ends. Such acts can be legally defined and the community accepts the machinery of police and law courts to prohibit them. But internationally "aggression" cannot be defined (a U.N.O. commission has just given up the attempt in despair) and not one single nation in the world accepts the U.N.O. as the final arbiter of all international relations on all occasions.

If the individual nations do not combine to stand up for their interests, no one else will. The individual nation must choose what it considers to be the best means of defending its interests. It may have to commit "aggression" (as did Israel) in order to defend itself from a threatened attack or from "non-violent" foreign subversion, or perhaps a tribal invasion, or frontier unrest. Some "aggressions" are justified. Some are not. But to brand as "aggressor" any nation which uses violence first, regardless of the interests involved, produces total absurdities.

For example, when France and Britain, in consequence of Hitler's invasion of Poland, were at war with Germany in 1939, the U.S.S.R. attacked Finland in violation of the League Covenant. The question was: Should Britain and France (then the leading League powers) uphold the Covenant? The answer should have depended on (1) the extent to which the Soviet action affected French and British interests, (2) the amount of power at the disposal of France and Britain, on the one hand, and of Germany and the U.S.S.R. on the other. In the event, France and Britain decided to join Finland in war against the U.S.S.R. and would have done so if Sweden had not prevented them by refusing to allow their troops to cross Sweden. If Sweden had allowed troops through, France and Britain would have found themselves simultaneously at war with Germany and the U.S.S.R. This would have been unimpeachable from the viewpoint that all "aggression" must be resisted without discrimination. But surely the object of a foreign policy should not be to promote national suicide?

In 1956, judged by its results — the closure of the canal, the loss of oil supplies, the shock to Commonwealth relations and to the solidarity of the free world—the Franco-British decision to impose their own solution in the Middle East was wrong. But was the subsequent action right of those members of the U.N.O. who condemned France and Britain as "aggressors"? Of the seven leading factors of interest and power in the Middle East — Egypt, the other Arab countries, France, Britain, Israel, the U.S.S.R. and the U.S.A. — Egypt, the Arab countries, the U.S.S.R., and the U.S.A., supported by innumerable countries in Asia and elsewhere, combined in U.N.O. to jeopardise the interests of France, Britain, all the world's maritime nations using the Suez canal and of all the nations dependent on Arabian oil, and to give enormous encouragement to the aspirations of the U.S.S.R. to become the predominant power in the Arab world, with Egypt as her leading satellite. That this is in the interests of the Communist countries in Europe and Asia is clear. But is this one of the objectives of our foreign policy?

"But", someone protests, "Egypt's sovereignty must not be infringed." In the real world, there are no sovereign countries left. We all need friends and allies to attain our national objectives — and that means compromises in foreign policy, which in turn means limits to sovereignty.

Space compels me to break off at this crucial point in the argument, which leaves many questions raised and unanswered to be tackled next week.

WEST EUROPE'S SHOTGUN WEDDING

(From Our Special West European Correspondent)

PARIS, February 2.

THE enthusiasts for European unity are very much in charge of things this winter, and half-baked proposals are being rushed through national parliaments and whirlwind conferences, in the hope that during this year the major foundations of a United States of Europe will have been laid. The haste and bustle of the operation are positively absurd, and are leading to confusion that is covered up in the name of "progress". Conferences are held between European Foreign Ministers where the only care is to be able to announce after a few days of feverish discussion that "we have made great progress", with less thought being given to the value of the texts thus solemnly signed. Experts produce treaties 200 pages long in which almost every page has a few blanks to be filled in later by the politicians. Naturally, the blanks concern the most crucial parts of the subject, so the apparently impressive draft treaty is actually quite hollow. Nevertheless, the existence of this solid document gives the impression that the work is almost completed, so the politicians foregather for a hurried week-end conference where they rush through vague and ill-considered "compromises", which often succeed in undoing weeks of patient work on the part of the experts.

For example, last month's meeting in Brussels on the European common market had been preceded by many weeks of intricate logic-chopping by the experts in which they had eventually agreed on such scholastic distinctions as this; coastal fishing is "agriculture" but deep-sea fishing is "industry"; wine is an agricultural product but aperitifs are industrial products, while much thought was given to an urgent Italian enquiry whether spaghetti was an agricultural product like wheat! This complex document was then laid before the Foreign Ministers, and when some dispute arose on a quite separate question between the Italians and the French, the Belgian Foreign Minister hastily produced a "compromise" which, among other things, totally obliterated the subtle distinction between agricultural and industrial fishing. The experts got back from the Ministers a revised document that made them hold their heads and groan. The Ministers nevertheless were able to announce "more substantial progress".

Similarly, Guy Mollet tried to rush through the French Parliament a motion authorising him to press ahead with the European unity talks, and chose to do this just on the eve of the U.N. debate on Algeria when it was obviously impossible for Parliament to bring down the Government no matter how dubious the Deputies were about its European policy. The debate was carried on in such haste and confusion that a former Prime Minister admitted to having signed an important declaration that he had not even read. The upshot was a favourable vote which is liable to several contrary interpretations, and which would not necessarily be repeated under another Ministry and under less feverish conditions.

Why are these important matters being dealt with so inconsiderately? The Government's critics here allege that the rediscovered enthusiasm for a united Europe is a simple diversion designed to distract attention from the Suez fiasco. But even if it were true, this could only apply to the French Government, and would not explain the equal precipitation of the other five West European Governments who have no Suez skeleton to hide. No doubt Suez has something to do with it, not as a cause but as a pretext: the sense of isolation produced in France by the failure of the Egyptian expedition is regarded by the unity party in France and elsewhere as providing a suitable atmosphere in which to promote plans conceived years ago. A more important reason for haste is that France and West Germany have two "good Europeans" as premiers, Mollet and Adenauer, neither of whom might be in office at the end of this year. There are to be elections in West Germany in November and in any event Dr. Adenauer is very old; while no one can forecast how far into the summer M. Mollet's Government will last. So there is a sense of urgency among the unity enthusiasts, and an ardent wish to get Germany and France irrevocably committed to some sort of union, no matter how vague in its outlines, while the going is good.

But more fundamental still is another simpler and more honourable calculation: the firm belief that it is only the first step that counts. No matter if the first step is taken in confusion, or for the wrong reasons, or on the basis of a misunderstanding or on the strength of a factitious "compromise"—once it has been taken no one will want to turn back and the rest will be comparatively simple. It is quite possible that in private many of the politicians now celebrating the "substantial progress" being made toward European unity would admit that this progress is largely artificial and that they have no solid reply to the criticisms of such as Mendes-France. But they feel that however grave the objections to European unity, once Europe has begun to unite these difficulties will be resolved, whereas if one waits until the difficulties are resolved (if one waits for instance until France is able to meet West German competition) then nothing will ever be done. And of course they may be right.

However, an inevitable consequence of this haste to get something done is that the European unity plans suffer so many compromises that they gradually change their sense. The plan for a common market began as an essentially liberal idea, to create a large area of free trade, in the 19th century sense of free trade. But it is becoming subject to so many reservations, exclusions, exceptions and safeguards that the final result (supposing it ever comes to life) will not be more liberalism but more planning and intervention, on a larger scale. On the contrary, the Euratom scheme began life as global plan for atomic energy, but it has been subjected to amendments in a contrary sense, so that in its final form it will be less a joint instrument for atomic development than a more or less useful aid to private enterprise. Without passing judgment on either of these contradictory developments, it is clear that "European unity" covers no one policy or philosophy.

The factor that is tending to make Euratom more "liberal", against all expectations, is the French desire to build their own atomic weapons. If France were interested only in the peaceful uses of atomic energy she could consent to co-operate with West Germany, who is debarred by the Paris Treaties from building atomic weapons, and with the smaller West European nations, who have no ambitions about an atomic bomb;

and she could consent, by entering fully and without reserves in the Euratom organisation, to depend on the United States for a supply of atomic material. But because she wishes to have a military atomic industry as well as a civil one, she can do neither of these two things but has, instead, to insist on reducing Euratom to a minor adjunct to her own atomic industry. So Euratom will become, mainly, a centre for the exchange of information, the encouragement of research and the devising of a common security code; it will thus be not the master but the servant of private atomic industries in all West European countries and of the military atomic industry in France.

In one respect, French ambitions in the military field are inciting Euratom to a venture in true common production. This is the plan for a common factory for the separation of isotopes. It is a thoroughly uneconomic plan because the United States has indicated that it will sell atomic fuel to Euratom at 17 dollars a gramme, which is about half the price at which a Euratom factory could produce it. But the French nevertheless favour an independent European isotope plant, no matter at what cost, because apart from the disadvantage of relying on one supplier, they have in mind the condition that the Americans attach to all their sales of atomic fuel: that it be used only for peaceful purposes, not military. A European factory would enable the French to get atomic fuel which they could use for military purposes.

In the course of this month meetings will be held at the highest level (which means essentially that Mollet and Adenauer will confer) to produce a few more "compromises" that the experts and Foreign Ministers have not been able to devise. So it is quite probable that by this summer West Europe will, on paper at least, have achieved an apparently substantial measure of unification. But even if the treaties incorporating these unification measures are ratified by the national parliaments, it will be necessary to remember that few of the real difficulties will have been settled. The serious work of uniting West Europe will remain to be done, and will be liable to be upset, discontinued or cancelled at any stage by the coming to office in West Germany or France of a party less devoted to unity than the present Governments of Adenauer and Mollet.

A CORRECTION

'FAIR DEAL FOR AUTOMOBILES'

In the leading article entitled 'Fair Deal for Automobiles' in our issue of February 1, 1957, we have since noticed a factual error in our comment in respect of import duties on some components. The last two sentences of para 5 in the leading article are corrected to read as under:

> "As the Government also favour this course, increasing the import duties in respect of the said components is not considered immediately necessary although they have agreed to convert the existing revenue duties into protective duties. The Government have, however, committed themselves to such increase, etc..... "

The last sentence in Para 6 is corrected to read as follows:

> "Although Government have not considered it necessary to increase the import duties immediately, etc..... ".

WORLDGRAM

AGRICULTURE

Rice Production: Indications are that world rice production in 1956-57 may exceed the high level of last season as a result of larger acreages and favourable conditions in many producing areas, states the Commonwealth Economic Committee 'Rice Bulletin' just published in London. First estimate of acreage under rice in India shows an increase of 4.8 per cent over the previous year, while "some increase" in production is expected in Pakistan. Ceylon also is growing more rice. In Burma the harvested area is reported to have reached a post-war peak of over 10,000,000 acres. In Formosa, the second rice crop was also large—a record total of nearly 950,00 tons of brown rice (the equivalent of 1,239,000 tons of paddy) being forecast of which 70 per cent had been harvested by the end of November. In the Middle East, rice harvests are reported to be good, those in Iran and Iraq being well above the average, and possibly equalling peak figures of two years ago. Other countries reporting good yields are China and the Philippines.

*

Orissa Warehouse Bill: The President has given his assent to the Orissa Warehouse Bill, 1956. This Bill is an ancillary measure to the Agricultural Produce (Development and Warehousing) Corporations Act enacted by the Central Government to facilitate the setting up of Central and State Agricultural Produce Corporations. The Bill provides for the licensing of warehouses and the issue of transferable receipts by warehousemen. Provision is also made for ensuring the safety of goods against damage or deterioration, inspection and grading of goods and other incidental matters.

*

Orissa Agricultural Produce Markets Bill: The President has given his assent to the Orissa Agricultural Produce Markets Bill, 1956. The Bill has been promoted with a view to ensure a fair return to agriculturists in Orissa by regulating and controlling the operations of middlemen. The Bill provides for the constitution of Market Committees in selected areas consisting of elected representatives of traders and officers appointed by Government. These Committees will be responsible for licensing traders and commission agents and will exercise strict supervision over their operations as well as fix market charges etc. The Committees will make available to agricultural producers up-to-date market intelligence. The Orissa Government have estimated that the agriculturist gets only about six to ten annas in the rupee out of the sale proceeds of his produce and is a prey to unfair practices and undue exactions by middlemen.

*

M.P. Land Reclamation Extension Bill: The President gave his assent to the Madhya Pradesh Reclamation of Lands (Extension to Bhopal Region) Bill, 1956, on January 25. The Bill replaces an ordinance, promulgated earlier, which extended the provision of the Central Provinces Reclamation of Lands (Eradication of Kans) Act, 1948, to the Bhopal area. The ordinance was to have expired on January 27. The ordinance was promulgated following the decision of the Judicial Commissioner, Bhopal, that the Bhopal Reclamation and Development of Land (Eradiction of Kans) Act, 1954, under which the work of land reclamation and development in Bhopal was being carried out, was unconstitutional and void. The ordinance enabled the land reclamation work to continue.

INDUSTRY

Development of Handmade Paper Industry in Manipur: For implementing a scheme of development of handmade paper in Manipur State, the Ministry of Production have sanctioned a loan of Rs. 26,085, which represents 50 per cent of the non-recurring cost of building, machinery and working capital required for the scheme.

*

Standard for Handloom Cotton Lungies: An Indian Standard specification for handloom cotton lungies, striped or checked has been published by the Indian Standards Institution. This is the last of the standards included in this series of Indian standard specifications. This standard prescribes general requirements of the fabric, such as quality of yarn, freedom from defects in cloth, and specific requirements such as ends per inch, picks per inch, weight, breaking strength, width and length, colour fastness and scouring loss. Methods of test for the determination of the above characteristics have also been either included or referred to. The constructional details of different varieties were prescribed after a careful scrutiny of the manufacturing particulars and corresponding samples of handloom cotton lungies produced in different parts of the country and also the specification on the subject formulated by the Expert Committee of the All-India Handloom Board.

*

Production of Telephone Cables: The total length of telephone cables of different varieties manufactured at the Hindustan Cables Factory at Rupnarainpur in West Bengal between April 1, 1956, to the end of December, 1956, amounted to 437 miles. The production target for the year 1956-57 was 576 miles of cables. The scheme for the manufacture of coaxial trunk cables by the factory was finalised in the course of the year and production is expected to begin during 1958. When in full production it is expected that 300 miles of coaxial trunk cables would be manufactured every year in the factory. The cost of the scheme for manufacturing trunk cables is about Rs. 82 lakhs.

TRADE

Schedules to Indo-Soviet Trade Agreement Extended: Letters were exchanged in New Delhi recently between the representatives of the Government of India and the Union of Soviet Socialist Republics, extending the validity of the Schedules 'A' and 'B' attached to the Trade Agreement which was signed on December 2, 1953. The Schedules have been modified to include the following items:

Schedule 'A' (For imports into India) 1. Aluminium and 2. Rough Emeralds. Schedule 'B' (for export from India) 1. Cashew nuts, Hydrogenated oils, Footwear, Woollen Fabrics and Mica. The Trade Agreement is valid till December 2, 1958.

*

UK Trade with India in 1956: India, Ceylon, and Pakistan bought goods from the United Kingdom in 1956 totalling in value £226,366,686, and in return UK purchases of goods from the sub-continent totalled £203,435,297. These figures are given in the United Kingdom trade returns for last year, which have just been published. In 1956 India bought United Kingdom goods worth £167,837,042—£37,000,000 more than in the previous year. Britain bought Indian products worth £141,467,590. Britain imported from Pakistan goods worth £22,773,332, and sold her products valued at £32,603,869 Ceylon's trade with the United Kingdom in 1956 was: imports of British goods, £25,925,775; exports of Ceylonese products, 39,194,375.

*

Indo-Czechoslovak Trade Agreement Extended: Letters were exchanged recently in New Delhi between the representatives of the Government of India and

the Government of Czechoslovak Republic extending the validity of the Indo-Czechoslovak Trade Agreement up to March 31, 1957, pending further negotiations between the two countries. The Trade Agreement was signed on November 17, 1953, and was initially valid up to December 31, 1954. It was extended from time to time and was valid up to the end of 1956.

*

Export of Indian Engineering Products: A Delegation sponsored by the Engineering Export Promotion Council has left Calcutta for Nairobi on a tour to study African markets for Indian engineering goods. During its tour lasting three weeks, the delegation will visit Nairobi, Mombasa, Zanzibar, Dar-es-Salam, Addis Ababa, and Khartoum. Before returning to India, the delegation will pay a visit to Aden. A number of engineering goods from India are being imported into British East Africa. The prospects for improving this trade further are considered good. The markets in the Sudan and Ethiopia also offer scope for Indian engineering products. Aden being a free port caters to the needs of neighbouring countries.

*

UK Aviation Exports in 1956: British aviation exports last year passed the £100,000,000 mark for the first time. The December figure of over £7,000,000 brought the year's total to nearly £104,500,000. It was an all-time record, and beat the previous year's total by no less than 58 per cent. The Society of British Aircraft Constructors pointed out recently that exports of aircraft and parts, excluding engines, amounted to nearly £72,000,000—a figure far exceeding the total aviation exports of any previous year. Of this amount the USA took £17,200,000 worth, confirming its place as Britain's best customer. Australia was second with £11,000,000, and Sweden third with nearly £8,000,000.

FINANCE

Loan for production and Marketing of Handicrafts: Credit facilities for the production and marketing of handicrafts against firm orders and for supply of the products to the indentors, will be available to Indian Co-operative Union, New Delhi, by the loan of Rs. 28,000 sanctioned by the Government of India to the Union. The loan is repayable within one year from the date on which it is drawn and will bear an interest of 3½ per cent per annum.

*

Low-Income Group Housing Grants: During December, 1956, the Government of India distributed loans totalling Rs. 35 lakhs to two State Governments under the Low-Income Group Housing Scheme. Of this, Rs. 24.5 lakhs were paid to the Andhra Pradesh and Rs. 10.5 lakhs to the Punjab. During November, 1956, Rs. 13.13 lakhs were paid to Madras under the scheme. Out of a provision of Rs. 7.2 crores made for the current financial year under the scheme, Rs. 2.3009 crores were distributed up to December 31, 1956.

*

Aid to Sericulture Industry: In order to develop and popularise the sericultural industry, which is a major cottage industry in Dehra Dun valley, the Ministry of Production have sanctioned a grant of Rs. 30,240 to the Uttar Pradesh Government for utilisation in the current financial year. The grant, under which children in primary schools in the district would be given training in rearing silk worms from mulberry plants, represents 50 per cent of the total cost of the scheme. The training programme will be initiated in 10 centres in the first instance.

*

Funds for Road Development: A sum of Rs. 16,72,500 has been sanctioned by Government of India for road development works in Andhra, Bombay, Manipur and Uttar Pradesh. Statewise the break-up is: **Andhra:** For the construction of minor and major bridges on Pahadishariff-Kalwakurthi Road Section II in Mahbhoobnagar district at an estimated cost of Rs. 1,16,200, Government of India have sanctioned a grant-in-aid to the extent of Rs. 1,16,200. **Bombay:** A grant-in-aid of Rs. 8,42,550, being three-fourth of the estimated cost of Rs. 13,01,500, has been sanctioned for the construction of the Sub-section Tathowra to Mol, of the section Phaltan to Mol of the Phaltan-Aundh road. **Manipur:** Rs. 16,700 have been sanctioned for the reconstruction of Mabailok bridge on the Tiddim road; a sum of Rs. 1,18,100 for the surface painting of Moirang Kumbi road (28-33 miles); and for survey operation of new roads in Manipur during the second Five-Year Plan, a sum of Rs. 1,89,500 has been sanctioned. **Uttar Pradesh:** A grant-in-aid of Rs. 3,89,000, equal to the estimated cost, has been sanctioned for the improvement and reconstruction of the bridle road from Dharasu to Bhatwari in the Tehri district.

GENERAL

Total Number of Voters Throughout India Excluding Jammu and Kashmir: The total number of voters on the electoral rolls throughout India excluding Jammu and Kashmir State is 19.3 crores according to a statement prepared by the Election Commission. Uttar Pradesh with 3.47 crores voters has the largest electorate followed by Bombay with 2.43 crores. The following is the text of the statement: Andhra Pradesh: 1,76,60,665; Assam: 43,74,089; Bihar: 1,95,63,747; Bombay 2,43,86,525; Kerala: 75,59,047; Madhya Pradesh: 1,38,80,209; Madras: 1,75,99,056; Mysore: 1,01,23,618; Orissa: 79,51,805; Punjab: 91,12,743; Rajasthan: 86,93,031; Uttar Pradesh: 3,47,70,434; West Bengal: 1,51,18,061; Delhi: 9,76,306; Himachal Pradesh: 6,84,628; Manipur: 3,30,111; Tripura: 3,45,849. Total number of electors in the last general elections was 17,32,13,635.

*

N.E.S. Blocks for Andaman and Nicobar Islands: The Ministry of Community Development have allotted two National Extension Service Blocks to the Andaman and Nicobar Islands. One of these Blocks will be in the South Andaman area and the other one in Car Nicobar area. Work in both the Blocks will be started on April 1, 1957. The allotment of these two Blocks raises the total number of N.E.S. Blocks allotted for 1957-58 to Andhra, Assam, Bihar, Bombay, Madhya Pradesh, Madras, Mysore, Orissa, Punjab, Kerala, Uttar Pradesh, West Bengal, Rajasthan, Jammu and Kashmir and to Manipur and Tripura to 283.

*

Wage Board for Cotton Textiles: The Government of India have decided to set up a Central Wage Board for the cotton textile industry. The decision has been taken in pursuance of the recommendation contained in the second Five-Year Plan regarding the establishing of tripartite Wage Boards for individual industries. After some experience has been gained with the working of the Board, the principle will be extended to any other industry for which such a Board may be considered necessary. The Wage Board for the cotton textile industry will have, besides an independent Chairman, six members — two each representing the employers and the workers connected with the industry and two independent members. Announcement regarding the appointments of a Chairman and the members of the Board will be made shortly.

*

National Projects Construction Corporation: The State Governments of Assam, Bihar, Rajasthan, Madhya Pradesh, Kerala, Jammu & Kashmir and Orissa have agreed to participate in the National Projects Construction Corporation set up by the Government of India. The Corporation was registered as a private limited company recently. The participation of other States is under consideration of the respective Governments.

NEWS IN BRIEF

INDIAN

With effect from February 1, 1957, the rate of interest on advances to Schedule Banks against Government and other eligible securities under Section 17(4)(A) of the Reserve Bank of India Act, 1934, has been raised to four per cent per annum.

*

Loans and subsidies totalling Rs. 35,62,005 were sanctioned by the Government of India during November, 1956, for the construction of 1,617 tenements under the Subsidised Industrial Housing Scheme.

*

The Government of India propose to bring into force from February 15, 1957, the Act amending the Industries (Development and Regulation) Act of 1951.

*

The Government of India and Pakistan have ratified the Trade Agreement which was signed by representatives of the two Governments on January 22, 1957, at New Delhi.

*

A new Open General Licence, giving general permission to all persons to import from Pakistan goods specified in a Schedule attached to the O.G.L., has been issued by the Government of India.

*

The Government of India have decided to introduce an Apprenticeship Training Scheme to meet the ever-increasing demands for skilled craftsmen under the industrial expansion during the second Five-Year Plan period. It is proposed to train 5,000 apprentices during the period.

*

The Government of India have appointed an eight-member Team of Experts to advise them in formulating detailed schemes to cover all aspects of workers's education.

*

The Government of India have decided to introduce evening classes at important centres to help industrial workers better their propspects. In these classes, the workers will be taught shop arithmetic, blueprint reading and trade theory. About 10,000 workers are expected to benefit under the scheme during the second Five-Year Plan period.

*

Production of minerals in India during 1955-56 was. Iron ore—42,69,020 tons; Manganese-ore—1.64 million tons; Copper—7,281 tons; Gold—2,11,461 ozs. and Silver—1,52,883 ozs.

*

India produces nearly 50,000 tons of cashew kernels annually out of which over 30,000 tons are exported.

*

Over 11,100 villages and towns are proposed to be electrified during the second Plan period.

*

A sum of over Rs. 20 crores is proposed to be spent for the development of India's forest wealth under the second Plan.

*

The Indian leather industry provides employment to about 8,00,000 workers and earns foreign exchange worth over Rs. 23 crores per year.

FOREIGN

Sweden's total gold and foreign exchange reserves at the end of 1956—including the Riksbanks holdings and the net claims of the country's commercial banks—improved by Kr. 214 million to Kr. 2,765 million.

*

The Japanese Government hopes to increase exports from £892 million in the current financial year to about £1,000 million in the year commencing April.

*

The value of South African exports of prescribed materials under the Atomic Energy Act in November was £3,681,825 against £1,865,371 in the same month last year, according to a preliminary estimate by the Department of Excise and Customs.

*

China's textile machinery industry will produce 1 million spindles and 25,000 looms this year, of which a proportion—still unannounced—will be earmarked for selective export.

*

With the recent opening up of new manganese ore deposits Brazil will rank among the US's main supplies of manganese and will reduce the latters dependence on more distant sources, namely India, South Africa and the Gold Coast.

*

Nine Japanese shipping firms have decided to raise their freight rates on the Japan-New York line service by 10 per cent, the Nippon Yusch Kaisha Shipping firm announced recently. They will ask foreign shipping companies to act similarly.

*

Favourable attention has been given by Japan Export Association to a plan calling for sale of two fertilizer plants to Pakistan. Total cost will be $106 million. One unit with a daily capacity of 100 tons each of urea and ammonium nitrate will be set up in West Pakistan. East Pakistan will be site of a second unit with a daily capacity of 50 tons of urea and an equal amount of ammonium nitrate.

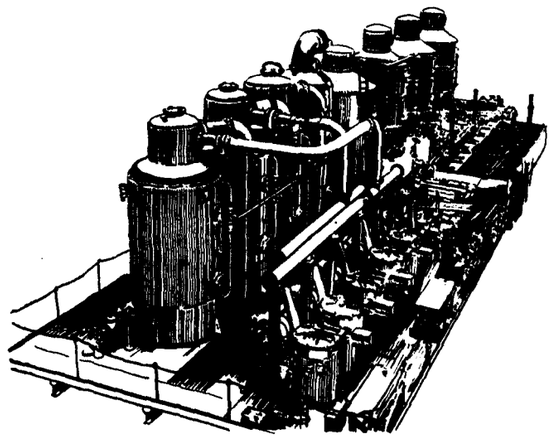
The Government of Kenya has announced a new loan of £2.5 million to finance new development projects.



*

Germany's foreign trade surplus reached the new record level of £42.6 million in December, 1956. The previous peak, attained last April, was £34.7 million.

*

The Norwegian cost of living index rose to 139 points in December, after having been steady at 140 points during the preceding three months, reports the Central Bureau of Statistics (1949=100).

Evaporators and Boiling Pans

sugar mill equipment to be manufactured in India

Texmaco has just concluded an agreement with Stork Werkspoor of Holland, world's leading designers and manufacturers of sugar mill machinery, for the manufacture of Evaporating Plants, Vacuum Pans, Crystallisers, Dryers and other equipment.
Texmaco, pioneer manufacturer of a wide variety of engineering products, again opens another chapter in the history of India's industrial development.

Another TEXMACO Project ... serves India's basic industries

PRODUCTION OF MACHINE TOOLS

THE inauguration this week of the Development Council for Machine Tools marks an important landmark in the country's attempt at developing its heavy industry. Since the machine tool industry forms the basis of all manufacturing activity, it occupies the place of prime importance in the engineering industry. It also forms the backbone for the production of capital equipment. The Union Minister for Heavy Industries has hence aptly remarked that the state of the machine tool industry is an index of the technological advancement of a country in its engineering industry and machinery manufacture.

Another aspect to be borne in mind is that since it is a basic industry, its role is to be judged not only from the economic angle but from its strategic position. In the absence of a well-developed machine tool industry, the country has naturally to depend on imports of basic machines required for industrial production. This results not only in a drain on the foreign exchange resources but makes the country helplessly look out in making progress in a vital sector of the industrial field. Thus the setting up of the Development Council for machine tools underlines the fact that this industry is to be developed on its own right as a primary necessity for the nation.

It was under the stress caused by the second World War that the Government set up the Machine Tool Directorate which was authorised to take immediate steps to organise the industry and persuade the general engineering and jobbing workshops to enter the machine tool manufacture. In 1942, the total number of graded machine tools manufactured was only 273. It was 8,810 valued at Rs. 1,75,000 in 1946. A recent census of machine tools installed in the country showed that the country had over 80,000 numbers as at the end of December, 1956. Over 50 per cent of these were, however, older than 10 years which means that they have actually passed their normal useful life already. The census figures also reveal that the rate of installation of machine tools during the last five years is of the order of 4,400 machines per year.

It is, however, clear that whatever little progress has been made is not commensurate with the needs of an expanding economy and the rapid industrial growth envisaged. It is estimated that in the next five years, the requirements of machine tools may be of the order of 1,70,000. This figure is based on the relationship between the number of machine tools installed and the consumption of steel. With the current consumption of steel at 2 million tons annually and about 80,000 machine tools in operation, the requirement for the latter is likely to be doubled when steel consumption rises to 4½ million tons at the end of the second Plan. The revised Industrial Policy resolution has placed machine tools under Schedule B which means that in the programme of manufacture in this field, there is wide scope for both the private and public sectors. Hence there is no question of any clash between them in its development and they will have only complementary roles to play.

In terms of value, during 1951, machine tools worth Rs. 47 lakhs were produced whereas in 1956, the figure rose to Rs. 99 lakhs. However, imports which were of the order of Rs. 3 crores in 1951-52 also increased to Rs. 6.4 crores by 1955-56. So, based on the current demand for machine tools, which is about Rs. 8 crores annually, it is estimated that it would go up to about Rs. 15 to Rs. 17 crores in the next five years. In this context, therefore, Government's target that the industry should aim at a level of production of the value of Rs. 10 crores by 1960-61 seems to be absolutely necessary if the wide gap between demand and production is to be filled to a reasonable extent.

The problem now is how to set about on the task. There are at present three factories in the public sector: the Hindustan Machine Tools, the Praga Tools Corporation and the Machine Tool Prototype Factory at Ambarnath. The Machine Tool Committee appointed by the Government has recommended a broad base for the development of this industry. It has suggested that different types of machine tools can be developed by different units simultaneously to produce within two or three years such items as are required in large numbers. It has also urged modernisation of plant in some factories to carry out this broad-based development. It should be quite possible for the factories in the public sector to reach an annual production of Rs. 5 crores by the end of the second Plan and the balance of Rs. 5 crores has to be made up by the private sector by planning for expansion and by setting up new installations.

There is at present no manufacturing capacity for the production of heavy machine tools which are mainly required by the railways. As existing units in the country are not in a position to manufacture them, the Machine Tools Committee has recommended that Government should take the necessary steps to create capacity for the purpose. So far as lathes are concerned, though they are being manufactured successfully in this country (the Hindustan Machine Tools, which brought out its hundredth lathe this week, has surpassed its targets and has doubled its production as compared with the original target of 57 lathes fixed for 1956-57) the indigenous capacity for the manufacture of low price modern lathe seems to be small compared with the demand and this is a field that should be explored more intensely in the future.

The machine tool industry has to face a number of problems. One is the dearth of technical personnel, which is endemic in the entire field of industry. The advanced countries have developed their skill in the manufacture of machine tools as a result of long experience and so, for sometime to come, it is necessary for the country to go in for technical help from these industrially advanced countries. Government should also encourage greater foreign collaboration on satisfactory terms for further expansion of the industry. There is also need for sending a number of young men abroad for training in the latest methods of machine tool production for utilising their services here as the expansion programme of the industry gets into stride.

The Machine Tool Committee has stated that the greatest lacuna in the development of the industry is the absence of original design technique and the existing talent for machine tool design in the country is negligible. It has, therefore, suggested that particular attention should be given to engage the services of first class designers from abroad. At the same time, carefully selected young engineers should be sent to factories abroad for necessary design training. Then there is also the question of maintaining quality and standards. Here again the Committee has made a valuable suggestion. It has recommended that it is not enough

if the machine tool satisfies certain geometrical tests when manufactured but they should maintain this accuracy for a long time and to ensure this, there must be periodic inspection after installation. Here is a challenge to the manufacturers to keep abreast of the developments abroad to see that good quality is maintained by the industry.

Shortage of essential raw materials like pig iron and steel is another shortcoming the industry has to face and along with it financial assistance for expansion or installing additional plant and equipment. In both these respects, Government have a responsibility to see that the handicaps in the way of the development of the industry are removed. Finally comes the question of protection. Government have stated that they are against any general raising of import duty on machine tools and the only course therefore open to protect the indigenous products from similar imported products is by exercising import control.

In view of the fact that the public sector is bound to loom large in the manufacture of machine tools, it is most relevant to recall the revealing criticism of the Colombo Plan expert, Mr. J. D. Scaife, in regard to the working of the State-owned factories at Jalahalli and Ambarnath which caused some controversy year before last. Mr. Scaife had especially drawn attention to the large percentage of idle capacity in the country ready to be made use of to minimise the country's dependence on imported tools. It had been estimated on the basis of answers received in another official enquiry that hardly 60 per cent of the capacity would be utilised for peak production of tools. This is a very serious state of affairs and certainly the problem of bringing idle capacity into use cannot be overlooked. The Development Council for Machine Tools (the 11th of its kind) has come not a moment too soon and its activities will be watched with great interest in the proper planning and acceleration of the programme of production of machine tools.

CAPITAL EXPANSION UNDER COMPANY LAW

(By C. V. NARAHARI RAO)

IT will be interesting to start with the definition of "capital" under the Companies Act of 1956. There is only one definition in Section 2(32) of "paid-up capital" or "capital paid-up". In other words this can be treated as "subscribed capital", which expression is also freely used in the Act, for example in Section 81, though the term has not been actually defined. Sections 85 and 86 speak of two kinds of share capital: "Preference Share Capital" and "Equity Share Capital". But other commonly used expressions such as "issued capital", "authorised capital" (used in Section 97) have not been defined at all in the new Act and have to be understood as formerly in their ordinarily accepted sense.

The memoranda of association of companies have necessarily to contain a clause relating to the number of shares, denomination of each share and total value of what is called "authorised capital" and when we say "share capital" we usually mean the former, though one may follow up a further question "Is it fully paid-up?", to understand completely the position of a company's capital. It is nowhere categorically stated in the Act that "share capital" shall only mean "authorised capital" (apart from the two kinds of share capital mentioned in Sections 85 and 86), though when a company is registered at first its share capital is known only by its "authorised capital" as it will not be known initially how much of this capital which is going to be issued will be actually subscribed or paid-up. While the fact is that the "paid-up" or "subscribed" capital is represented by the value of the shares there is no reason why each of these should not more appropriately be called "paid-up share capital" or "subscribed share capital", as is generally done. In other words, there is no particular point in restricting the meaning of "share capital" only to "authorised capital", as is sought to be done in some quarters. The question assumes some importance when a company seeks to increase its share capital, for it may be asked whether it is the increase of the authorised capital or paid-up capital or both.

As a first preliminary for any proposed issue of fresh capital, whether by way of increasing the subscribed capital by issuing new shares which will form part of the increased share capital (i.e., authorised capital) or by way of making up the unsubscribed original capital after the first allotment, the consent of the Government of India has to be obtained by an application under Section 3 of the Capital Issues (Continuation of Control) Act of 1947, unless exemption is secured under Section 6 thereof. Consent of the Controller of Capital Issues is not made necessary for exceeding the present limit of authorised share capital even if the total value of the paid-up capital of the company after the subscription to the new shares should happen to exceed the present authorised share capital limit. Nevertheless, a public limited company having a share capital cannot issue any fresh shares over and above the authorised limit without amending its memorandum of association in this behalf. Such amendment could be made only by virtue of Sections 13, 16, 17 and 94(1)(a) of the Companies Act of 1956, if such alteration of the memorandum is authorised in the company's articles of association.

There are two sections in the new Companies Act, namely 81 and 94, which deal with increase of capital. The former appears immediately below a main topical heading "Further issue of capital" and with the same title for the marginal heading of the section. The marginal note of Section 94 is "Power of limited company to alter its share capital," while sub-section (1)(a) of it deals also clearly with "increase of share capital by issuing new shares". Both sections are therefore concerned with increase of capital (in its fullest sense) and it is a question which particular section applies to an instant company. It cannot be stated that Section 94 alone applies to a company, for the actual procedure to be followed in increasing the capital is laid down in sub-sections (1)(a) to (d) of Section 81. The distinction between Sections 81 and 94 is that the former treats of additional issues of capital in a company while the latter treats of not only that but also alterations in capital such as consolidation and division of all or any of its share capital into shares of larger amount, of conversion of all or any of its fully paid-up shares into stock or reconversion of that stock into fully paid-up shares of any denomination, of sub-division of its shares and cancellation of shares which at the date of the passing of the resolution have not been taken up. In the same way it cannot be stated with any dogmatism that Section 81 is quite independent of Section 94, for example at least in so far as in issuing the new shares there is any attempt to sub-divide, consolidate, or do any of those things which are mentioned in the latter section.

Sub-section (1) of section 81 states that the offer to existing shareholders will have to be made "subject to any directions to the contrary which may be given by the company in general meeting, and subject only to those directions". Under Section 94(2) it is clearly stated that the powers conferred by Section 94 shall be exercised by the company in general meeting. It is stated that there is not such a specific enjoinment on the company in Section 81 to call for a general meeting when the new issues will be restricted within the authorised limit of capital. One argument is that a general meeting will be necessary only if there are any directions to the contrary to be given by the general meeting to the company and not when otherwise. This argument cannot be valid for the simple reason that unless the general meeting is convened it will have no opportunity to express any opinion, whether contrarily or approvingly. The Board of Directors of the company will be taking unwarranted responsibility on themselves to make the offers straightaway to the shareholders (more so if to others) without any directions from the general meeting of shareholders. Then the shareholders will get deprived of their right under Section 81 to express their opinion, and it will amount to a contravention of the law.

Another argument is that the general meeting referred to in the section is not one which has to be convened for the specific purpose of the issue of the new shares but it would be sufficient if a general meeting at any other time, even at the commencement of the business of the company, had laid down general principles in this behalf. The suggestion is far-fetched having regard to the language of Section 81. The general directions given at the first general meeting could only mean the rules and regulations of the company as embodied in the memorandum or articles of association of the company which should have been approved at that general meeting. When it is apparent from the language of Section 81(1) that the new directions which the general meeting may give may even override or modify the existing provisions in the articles of association—compare sub-section 81(1)(c)—the obvious intention of the legislature should have been that the general meeting alone should come to a decision on what terms and conditions the new shares should be issued in the special circumstances at the moment. And when the bulk of the new shares is ordinarily going to be issued 'pro rata' to themselves in the first instance it is but perfectly legitimate that in a common meeting they should decide whether the new shares will be beneficial to them and also whether they are willing to make further investments in the company.

The reasonable view to take is that there cannot be any difference of opinion on the point that the general meeting spoken of in Section 81(1) is one to be held now or in the immediate future, called for the sole purpose of deciding the terms for the new offer and to give directions to the Board for proceeding with the allotment accordingly. The Report of the Company Law Committee in para 52 is also helpful in arriving at a conclusion on this issue. In re-drafting Section 105-C of the Companies Act of 1913 on which the present law is based, the Committee has explained: "In order to resolve conflicting judicial decisions and to clarify the intentions of the legislature, as we understand them, we propose that this section should be concerned with all the increases in the subscribed capital of a company after the first allotment has been made. Our recommendations on this point are as follows: (i) that the additional capital should be offered to the holders of equity capital in the company in proportion to their holdings of paid-up capital unless the company in general meeting sanctioning the issue decides to the contrary;.....(iv) that subject as above, nothing in the company's memorandum or articles of association or in any agreement with a third party should authorise the directors to dispose of the new shares otherwise." It seems to be apparent from the above that the directors have no power to dispose of the new shares without consulting the general body of shareholders, notwithstanding any existing provisions in this behalf in the company's articles of association.

It has also to be remembered that the power of the directors for disposal of the shares newly to be issued is different from the power of allotment given to them. The power of allotment arises only at a later stage after the general body of shareholders have given the necessary instructions in this behalf for disposal. The power of disposal by themselves arises from the effect of the renunciation or declining or refusal of acceptance or in the only contingency of the impossibility of giving directions for allotment on a 'pro rata' basis to existing shareholders of the new shares by the general body.

BOOK REVIEWS

THE MAHATMA

Gandhian Technique and Tradition: By R. N. Bose, M.A., I.A.S.: Published by the All-India Institute of Social Welfare and Business Management, Calcutta 7: Pages 227: Price Rs. 5.

Gandhiji touched nothing which he did not adorn. With him social life was an integrated whole, and practically every part of it received his alchemic touch and carried the impress of his dynamic personality. In every field of social endeavour in which he operated the quintessence of his effort lay in a kind of humanism which, paradoxically, had in it a divine content. With such a unique personality harmonious relations between capital and labour constituted an article of moral faith. Gandhiji, however, was no mere preacher, for he practised what he preached in the Ahmedabad Textile Labour Association which he helped fashion in his own unique way. The healthy influence he exerted over a considerable part of the Indian trade union movement over a period of 30 years till his last days is not only still alive but shows promise of growing in the context of our Planners' advocacy of workers' partnership and participation in management which is, perhaps, a variant of the Gandhian concept of 'marriage of capital and labour'. The Gandhian technique in industrial relations is, therefore, a fascinating field for study. The All-India Institute of Social Welfare and Business Management and its able and devoted researcher Mr. R. N. Bose (who is Labour Commissioner, West Benagal, and also part-time Professor of Industrial Law in the Institute) amply merit congratulations on their pioneer work.

The book is in two parts—the first part dealing in particular with the Gandhian philosophy of labour. The Gandhian way in industrial relations, the Gandhian principles and techniques in solving disputes, the Gandhian Plan for improvement of labour-management relations, the Gandhian scheme of wages and the Gandhian trade unionism are all lucidly described. Gandhiji's views on bonus, labour indiscipline, climate of conciliation and workers' partnership and participation in management are also presented in an equally lucid manner. The second part of the book dealing with the Gandhian legacy in other spheres contains, besides, a noteworthy comparative study of Gandhiji and Jefferson and their thoughts.

As even this illuminating book in its brief compass does not quite exhaust all the details of the Gandhian technique, the author has rightly taken on hand a more ambitious research project covering the entire Gandhian heritage in Indian trade unionism. Being in part a piece of historical research into the concrete methods by which Gandhiji actualised his ideas in the period 1917-47, it calls for a good deal of field investigation. The project would also cover such issues as industrial urbanisation, workers' standard of living, trade unionism in a socialist order of society, labour welfare, etc. With possible assistance from the Central Government, Mr. Bose, one hopes, may well succeed in what, by all accounts, is a worthy and timely endeavour in the cause of class harmony and thus of social stability. In this noble work the Institute may possibly welcome encouragement from the principal organisations of employers and of employees alike, which have a stake in sound and cordial management-labour relations.

PLANNING

Yojana: An English fortnightly: Edited by Khushwant Singh: Published by the Ministry of Information and Broadcasting, Government of India, Delhi-8: First issue dated January 26, 1957: Pages 20: Price Annas Two.

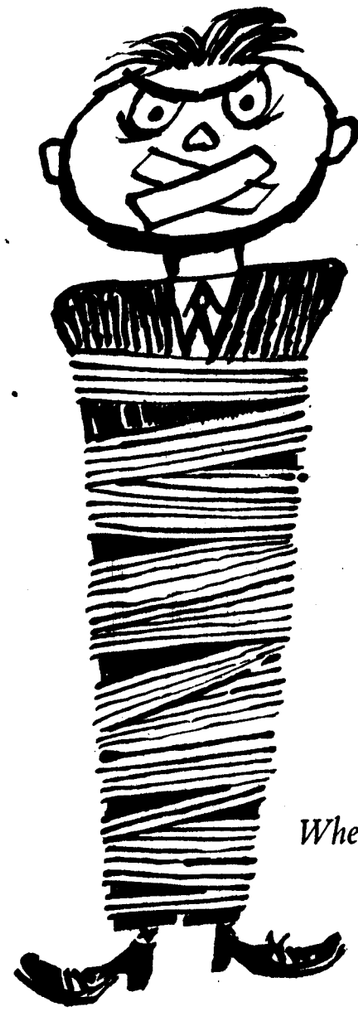
Yojana means Plans. It sounds as a very felicitous name for a periodical charged with the task of carrying the message of the second Five-Year Plan and of bringing knowledge of its various projects to villages, co-operatives, panchayats and other voluntary organisations and to public servants and non-official public workers. The potential market for the present English and Hindi versions of "Yojana" and for its projected versions in all regional languages is large and thus very inviting. It may not be difficult for a journal so well conceived and edited as "Yojana" to reach in the first instance tens of thousands of readers in a potentially larger market. The readership may well run into several lakhs if arresting photographs, purposive stories and articles easily intelligible to the laymen come to be supplemented by simple dialogues and telling cartoons. If the English version of "Yojana" is merely translated into different languages the results may be disappointing unless, of course, the English version itself is so simplified as to be digested effortlessly by a person who has not been able to go beyond the higher elementary or the secondary stage in education. This aspect may also be very much in the minds of the publishers. It is not, therefore, too much to hope that "Yojana" may come to command in due course a circulation large enough to pay its own way without much of either Government subsidy or private advertisements.

THE ECONOMIC WEEKLY

The Economic Weekly—1957 Annual Number: Published at 15, Tamarind Lane, Fort, Bombay-1: Editor Sachin Chaudhuri: Pp. 150: Price Rs. 2-8.

The recent heavy withdrawals from the country's sterling balances and the upward revision of the estimates of foreign exchange requirements of the second Five-Year Plan have naturally caused considerable disquiet about the prospects of the fulfilment of the Plan as scheduled. It is, therefore, very appropriate that our contemporary from Bombay in its latest Annual should have launched on a discussion on this very vital and topical question of the foreign exchange gap through a number of articles. It may be of some comfort to our planners that the conclusion reached—though with a lot of reservations and qualifications—is optimistic enough and the problem made to look not so intractable. Among the notable articles in this section is one by Dr. B. N. Ganguli who has made a timely warning in respect of the export trade of the country and has pleaded that it is high time we kept the prices of our actual and potential commodities on a reasonably competitive level. Mr. V. K. Ramaswami has analysed the mechanism of import control and tried to show how it takes into account the changing needs of the economy as a result of industrialisation. Among other articles in this section, there are two provocative ones, one on "Delhi's quest for loans and Export credit" which deals with the investment climate of the lending countries and the other on "Foreign Exchange reserves, where the question is posed whether the present statutory requirements about minimum reserves should not be modified to give the country greater freedom in the immediate future.

Apart from this section, the Annual has also devoted considerable space to the other aspects of the Indian economy like Agriculture and Community Development and Money and Prices. Mr. M. L. Dantwala has written on "Dawn at Koraput" where he discusses how this district in Orissa is making a great experiment in Bhoodan movement which has taken the form of gramdan. The subject of co-operative farming, so much in public discussion, is treated in an objective way by Amlan Datta. Mr. I. P. Desai's article on "Changing profile of an Indian City" where he has discussed the results of the recent survey of Poona is revealing inasmuch as the occupational structure of the population has not materially changed. The Number also contains well-informed articles from foreign contributors who include John Kenneth Galbraith who writes on "The National Economy of the United States", Daniel Thorner and Shigetu Tsuru. Politics is also not neglected. Mention can be made here of the article on "India's First Elected Parliament" by C.V.H., discussing the achievements of the country's supreme legislative body in the various fields and on "The state of the Congress" by Sisir Gupta. Altogether, the Annual is a well-brought out number where there is a good deal to provoke one's thought, and this at a modest price.



MINING

Indian Mining Journal: Special Number on Coal Washing in India: Edited by H. Ghosal, 6/2, Madan St., Calcutta-13: Pages 106: Price Rs. 5.

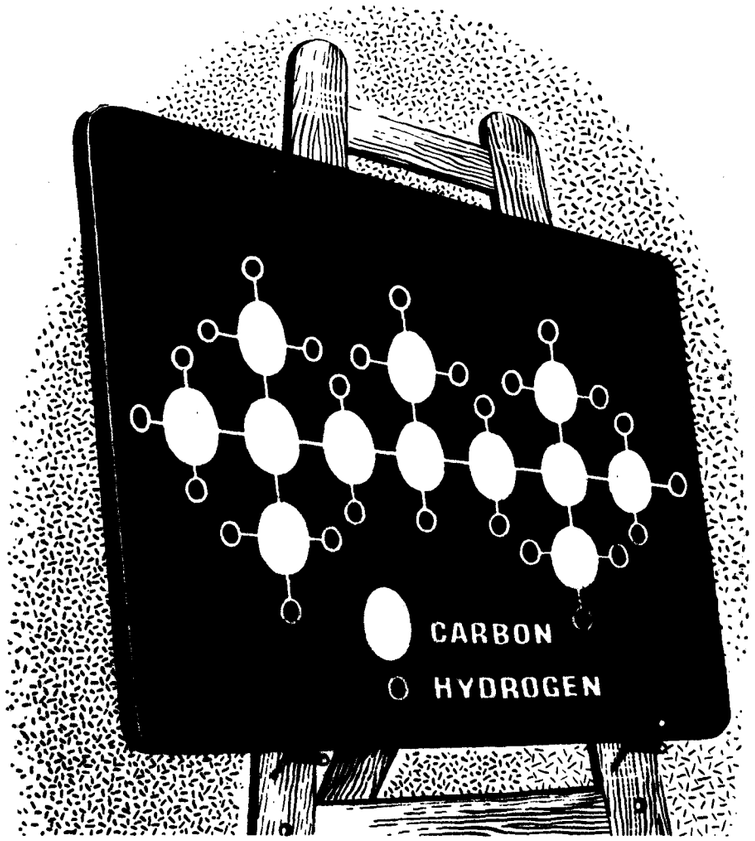
The Special Number of the Indian Mining Journal, carrying altogether 22 articles, deals with a cross-section of the problems of coal washing in India. Coal washing on which depends the efficiency of the Iron and Steel industry presents peculiar problems. Researches have shown that Indian coals are generally 'unwashable' in the common sense of the term. What happens on gravity separation with Indian coal is that a heterogeneous inconsistent mixture is often sorted out into several consistent grades of coals, the proportions of which vary according to the nature and the size of the coal and the method of washing adopted. All this needs serious thinking on the part of the planners, the consumers and the producers specially at a time when big washing plants are to be set up. (It may be recalled incidentally that the largest washery in Asia has already been finalized for the State collieries at Kargali). All these technical matters are dealt with elaborately in the Number. The articles were originally contributed as papers mostly by eminent technologists to a symposium on coal washing organised by the Fuel Research Institute.

The Special Number should be particularly useful to industrialists, coal technologists and researchers in the field.

Escape? **Impossible!**

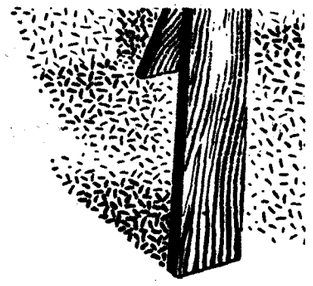
Liquids, steam and gases cannot escape from stuffing boxes, glands and cocks if they are sealed with Turner's "Firefly" asbestos packing. Use it and your worries about leakages are over.

By arrangement with Turner Brothers Asbestos Co. Ltd., England, we make "Firefly" Packings. We spin asbestos fibre into yarns, and then plait these yarns into packings which provide the perfect seal, unaffected by the temperatures and pressures normally encountered in industry.



Turner's "Firefly" Packings are just one of the many technical asbestos products that we at AM & FM make to meet the needs of India's industry. The increasing use of Asbestos is an index to India's industrial progress.

Where There's Industry There's Asbestos



We supply:
- 'FERODO' BRAKE AND CLUTCH LININGS
- 'FIREFLY' ASBESTOS PRODUCTS
- SPRAYED 'LIMPET' ASBESTOS
- 'NEWALLS' INSULATION MATERIALS
- 'PATTINSON'S' BRAND MAGNESIA CHEMICALS
- 'SINDANYO' ELECTRICAL INSULATING BOARDS

AM & FM

ASBESTOS, MAGNESIA & FRICTION MATERIALS LTD.

AN EDUCATION IN Oil

This is not an abstract design in an Art Class. It is one of the chemist's symbols for the structure of hydrocarbons. And hydrocarbons are the most important ingredients in oil—that vital fluid on which India depends so much for the progress of industry, transport and agriculture.

In the Assam Oil Company, chemists, physicists and geologists are engaged all the time on research, helping to find new sources of oil, devising more efficient and more economical methods of refining oil and discovering new uses for oil.

The results of such research mean that more and more of the oil and oil products which are needed for our expanding economy come direct from India's own oilfields.

Economic Report from the U. S.

OPTIMISTIC OUTLOOK FOR 1957

(By GUY SIMS FITCH)

WASHINGTON, Jan. 29.—Economic activity in the United States is off to the favourable start generally expected for 1957. It is too early, of course, to tell whether the trends now apparent will hold for the entire year, but some significant clues exist. The National Association of Purchasing Agents who buy the supplies and equipment needed by American industry, are in as good a position as any to scrutinize the current business scene. What they see is an underlying and unshaken confidence, tempered by a salutary dose of caution.

Thus, their report for the month just ending shows a moderate upturn in new orders, a slowly rising production curve, and a continued high level of employment. Their chief worry at the moment seems to be the upward movement of prices. Most of them are attempting to hold down the cost of the materials they buy, to give their companies a good competitive position in consumer markets. Some of these business executives also point to problems raised by the current tight money situation—a situation which makes it harder for their companies to finance the purchase of needed equipment and the expansion of productive facilities. Nevertheless, most of them favour the Government's restrictive monetary policies as a sound move, since inflationary forces are still present in the economy.

Supporting the views of these purchasing officials are the continued high business outlays for new plant and equipment. Financing difficulties and narrowing profit margins have caused deferment of some projects but most of the capital outlays now being made were decided on a year or more ago. As part of long-range programmes, they are not likely to be put off.

On the consumer side, too, there are some interesting clues to the economic future. The Survey Research Centre of the University of Michigan has just completed an analysis of consumer buying intentions. This periodic survey, which has proved an accurate barometer in the past, visualizes no major change in the steady rise in consumer spending in 1957. Consumer confidence appears as high as ever, and most people feel as well off financially as they did a year ago. More significantly, perhaps, fewer people feel worse off than it any time in the past four years. This does not mean that the consumer will give the economy a great forward shove in 1957, as he did in 1955. With the economy already operating in high gear, that kind of a shove is in fact not needed. The Survey does picture the consumer, however, as a satisfied and optimistic person who can be counted on to contribute his share to the nation's momentum.

Aside from these private sectors, which account for about 80 per cent of the economy's activity, governmental expenditures also may be rising this year under the twin stimuli of larger outlays for collective security as well as for public service programmes. On balance, then, the first month of 1957 shows that the trends so far are in line with the forecasts. These were that 1957 would see another moderate rise in US economic activity, accompanied by some price increases but with the prospect that the underlying prosperity and stability of the economy will be maintained.

OFF TO A GOOD START

The Second Five Year Plan has allocated Rs. 710 crores for industrial and mining developments, which is an increase of Rs. 537 crores over the First Plan. Village and small-scale industries receive Rs. 200 crores—an indication of the all-round industrial effort conceived in the Second Five Year Plan.

In this unprecedented expansion of our industries, paper will play an important role. In mills, mines, construction yards... wherever plans and estimates have to be made...paper will provide the means of record and communication.

HAVE WE A BANK RATE?

By

CROESUS

IT was certainly a novel idea that the Reserve Bank of India struck upon when, last week, it bargained for achieving the same results as by a straight increase in the Bank Rate without actually doing so. This, it sought to do by raising the rate of interest on advances to scheduled banks against Government and other eligible securities to 4 per cent per annum, with effect from 1st instant. Opinion is bound to differ, however, on whether it is this action which has led to the all-round hardening of short-term interest rates. For it is known that such a trend has been in evideence for quite a while past; actually, some banks it would appear, had informed their clients that the rate of interest on advances would be raised even before the surprise decision of the Reserve Bank was made known.

Be that as it may, the latest decision of the Reserve Bank has caused a certain amount of genuine confusion even in informed circles. The question has actually been raised by a contemporary as to what, according to the Reserve Bank, the Bank Rate is today. The Reserve Bank will perhaps point to Section 49 of the Reserve Bank of India Act, 1934, and say that the Bank Rate is the rate "at which it (the Reserve Bank) is prepared to buy or rediscount bills of exchange or other commercial paper eligible for purchase under the Act". Now, if this definition is literally interpreted, I wonder whether anyone can seriously claim that we have, in fact, a Bank Rate at all. Strictly speaking, the Reserve Bank is neither buying nor rediscounting bills of exchange or other commercial paper eligible for purchase under the Reserve Bank of India Act. And some go further and say — quite rightly — that, with all the restrictions on dated maturity and third party custody that we have in India in regard even to these eligible commercial paper, we can hardly profess to have a full-fledged bill market as in advanced western countries, granting, for the sake of argument, that the Reserve Bank does buy or rediscount such paper. This is, however, a situation for which the Reserve Bank is hardly to blame; it cannot certainly be blamed for a fault which is rather that of the framers of the Act who incorporated this section in the Reserve Bank of India Act presumably bodily from the Central Banking Legislation of other dominions, without taking into account conditions peculiar to our country. In so far as the scheduled banks have at least been allowed to draw money against what are called "usance bills" and not only against Government securities, credit must be given to the authorities of the Reserve Bank for having created conditions approaching as nearly as practicable in this country to the real bill markets in Western countries. The popularity of the usance bill scheme which has been in vogue since 1952, can no longer be questioned.

The latest decision of the Reserve Bank means that, whereas the so-called Bank Rate (or the Usance Bill Rate, for the sake of convenience) — exclusive, of course, of stamp duty — remains unaffected at 3½ per cent, the rate at which the Reserve Bank will advance money against Government securities will be 4 per cent, that is half a per cent over and above the Bank Rate or the Usance Bill Rate! Unless it be to cause a further credit squeeze, if it is not to get over the undertaking to the electricity industry, as suggested in certain quarters, it is not clear as to what the intention of the Bank is in taking such a sudden decision. I reliably learn, for one thing, that this has not been done with a view to discouraging scheduled banks from approaching the Reserve Bank for accommodation against Government securities, inasmuch as, with few exceptions, the portforlio of Government securities of nearly every Bank has already reached an irreduciably low level, so that, even if they want to, they cannot dump Government securities on the Reserve Bank. Some explanation, therefore, is clearly called for from the authorities in this behalf, if only to throw light on the decision for lay men like me, if not for experts on banking.

Meanwhile, I wonder whether it is at all a proper policy to charge a higher rate of interest on advances against Government securities than on advances against usance bills, which is what it will amount to in fact. In other words, can the authorities themselves regard commercial paper as a relatively better security for making advances than Government securities? For, although, together with the stamp duty, the total incidence to banks of even the usance bill may come to about 4 per cent, taking the interest rate as such, that on advances against Government securities now becomes comparatively higher or costlier. Is it not axiomatic in banking that the higher the rate of interest charged, the greater is the risk element involved? The authorities must weigh the consequences of any such psychological reaction in the minds of prospective investors in Government securities, especially when they have a heavy borrowing programme ahead of them.

TRADE BETWEEN INDIA AND DENMARK

WITH the recent visit of the trade-cum-goodwill delegation from Denmark, bright prospects for the expansion of Indo-Danish trade have been envisaged. That there was great scope for expanding the trade between Denmark and India was reiterated by Count K. G. Knuth-Winterfeldt, leader of the delegation. Count Knuth-Winterfeldt detailed the ways in which Denmark could help India in the implementation of the industrial and agricultural schemes of the second Plan.

During its stay for over a fortnight the delegation concentrated on the expansion of the trade between the two countries which in recent years has assumed a rising trend. It was no purpose of the delegation to negotiate any bilateral agreement as Danish trade policy is at the present time liberal as it has always been by tradition and also because business men and influential politicians aim at the freest practicable conditions for the foreign trade. It is interesting to note that Denmark has liberalized her imports from OEEC countries up to 84 per cent based upon the importation in 1948 and during the past year the Danish authorities have extended a part of the liberailization to the Dollar area.

In respect of trade, it is noticed that the balance of trade has been consistently adverse to this country. Although India's exports to Denmark have risen from Rs. 1.11 crores in 1953-54 to Rs. 1.29 crores in 1954-55, to Rs. 2.04 crores in 1955-56 and to Rs. 1.06 crores in April-October, 1956, the increase in imports from Denmark has been more pronounced with the value rising

from Rs. 1.63 crores in 1953-54 to Rs. 2.11 crores in 1954-55, to Rs. 4.18 crores in 1955-56 and to Rs. 2.73 crores in April-October, 1956. Among the items exported from India to Denmark are jute and coir manufactures, cotton textiles, tobacco and tea, while imports include machinery, vehicles, chemicals, provisions, drugs and medicines. As regards exports from Denmark to India the most important increases have been in machinery (non-electric), chemical raw materials and compounds, explosives and miscellaneous chemicals. Imports into Denmark from India have increased notably in animal products and casings, coffee, tea and spices, fodder, timber and forest products, vegetables and animal oils and fats, yarn piecegoods and other piecegoods.

It is not only in regard to India that Denmark has been able to increase its foreign trade; with Western countries too she has increased her foreign trade considerably. Statistics reveal that total Danish foreign trade has been steadily increasing since the end of the Second World War. In the year 1955, exports amounted to 7.2 billion Danish crowns and imports to 8.1 billion. These figures are the highest ever reached and as the Danish population count only about 4.4 million it will be seen that the export per capita in 1955 was about 1680 Danish crowns or 240 dollars. The reason why Denmark has been able to build up its trade and industries is due to the advantages of transportation offered by her favourable location close to the seas. In fact, Denmark has virtually no raw material resources. The country lacks coal, iron and all other metals. It may sound strange but it is a fact that it was Danish agriculture that prepared the ground upon which the important Danish industry and trade has been built. In former days Denmark was predominantly an agricultural country and this sector of the economy still plays an important part in Danish society.

With this background of the trade and economy and the wide range of goods which can be exchanged between India and Denmark it is safe to aver that there are large openings for Indo-Danish trade. The openings in India exist in quality machinery, fishing and more than anything else in dairy industries, cement, tractors, railway rolling stock and office machinery. Danish export goods, such as dairy equipment, milk products, pharmaceutical machinery and canned goods are well received in the Indian markets and their export can be further increased. In return there exist possibilities of developing further markets in Denmark for Indian goods, such as textiles, handicrafts, coffee, tea and tobacco. It is high time these possibilities were explored intensively by appointing a full-fledged commercial office so that the import and export markets there could be closely studied and commercial intelligence made regularly available to India. Indian exports have, of course, to take special care to build high reputation for quality and prompt performance according to terms of contract. There is need of frequent contacts between representatives of business organisations in Denmark and Indian firms in order to obtain technical know-how in fields like manufacture of machinery for the execution of the second Five-Year Plan. It is now for trade interests in both the countries to stimulate expansion of the two way traffic.

Economic co-operation between the two countries can be extended to other fields. That Denmark will be able to help India in the implementation of the second Five-Year Plan by supplying machinery and technical know-how is indeed heartening to the country. During the course of its discussion with the Planning Commission, the trade delegation gave the impression that Denmark might consider collaboration in the manufacture of diesel engines and dairy equipment. Denmark could build ships, tankers and fishing boats for India. While the latter could be delivered within seven or eight months from the time the orders were placed, ships of about 9,000 tons could be delivered either in 1961 or a little later. Although Denmark would not be in a position to offer long term credit for the supply of machinery, she could at least credit up to three or four years. There is the possibility of India importing Danish breeding cattle and poultry for cross breeding to improve her quality of cattle and poultry. While the offer of credit for three to four years duration is welcomed, it is felt, perhaps credit for slightly longer periods might be necessary in view of the recent restrictions on import of capital goods. The view is that payment before the arrival of imported machinery should not exceed 20 per cent of its value and the balance should be repayable in not less than seven years after the arrival of machinery in the country.

BUSINESS NOTES

MINIMUM WAGE FOR COAL MINERS

IN DECLARING its award on appeals preferred against the decision of the All-India Industrial Tribunal (Colliery Dispute), the Labour Appellate Tribunal (Special Bench) has been apologetic that the minimum wage which it was fixing would fall short of what could be necessary to sustain a comfortable living.

The Appellate Tribunal's claim that increases in the emoluments of coal miners will not entail any increase in the price of coal does not hold water. There are certain positive elements which would inevitably inflate production costs and therefore the selling prices of coal. Dissenting from the lower Tribunal, the Appellate Tribunal has separated the statutory bonus from the minimum wage which has been fixed at Rs. 69-1-0. This change would mean that there would be an increase on this account in the total emoluments of annas five per day which the statutory bonus provides. It must be remembered that this bonus is statutorily fixed on the plea that in its absence there would be a spate of demands in different coal mines for bonus from year to year. The bonus does not bear any relation to the profits of coal mines or productivity of workers. The Appellate Tribunal has applied the principle of equal pay for equal work and has raised the minimum wage for women miners from 75 per cent of the wages of male miners as granted by the lower Tribunal to parity. In the third place, the dearness allowance has been linked to the cost of living. This arrangement would certainly introduce a factor of instability and uncertainty in wages and the cost structure of the industry. Furthermore, the work loads have been reduced in the case of some regions.

It will be recalled that the Award of the lower Tribunal had made it imperative to increase the price of coal by Rs. 3 per ton. Experience in the interim period has shown that this increase is not adequate. It is, therefore, clear that the additional burden which will be placed by the liberal variations made by the Appellate Tribunal will exert pressure on prices. It would be a happy outcome if the concessions granted by the Appellate Tribunal will reduce absenteeism and stimulate workers' productivity as the Appellate Authority hopes. Past experience does not necessarily corroborate this optimism.

EXPANSION OF SHIPBUILDING

MR. N. R. PILLAI'S annual presidential speech which was delivered on January 25 last, shows that the Hindustan Shipyard has started gathering momentum in its building activity. The first ship in the series of modern diesel ships whose construction has been taken up in the yard was completed last year. The "State of Kutch", the largest ship built at Vishakhapatnam, was launched and work on the first naval craft was begun. There was, however, a slowing down of the rate of construction because of difficulties of delivery of steel and shortage of trained technicians. Adequate quantities of steel are being procured to last up to the middle of 1958, while training of skilled personnel is proceeding at a modest speed. Certain works are to be completed before the rate of production can be raised from 2½ ships to 4 of the latest diesel type per year. The dry dock on which preparatory work has been started must be completed. How long it will take to set up the factory to build marine diesel engines, it is not easy to be positive. Schemes furnished by foreign firms which have offered collaboration are under scrutiny. Besides these, other ancillary schemes will need to be started. But expansion of Vishakh yard is proceeding steadily and the rate of progress is reassuring.

Development of shipping which has been so tardy hitherto seems to be threatened in the near future too. The Hindustan Shipyard has its limited capacity fully booked until the end of the second Plan. Foreign shipyards, too, have their order books full up to April 1961. The only solution in the next five years to expand the merchant navy speedily is to obtain second-hand "Liberty" vessels from the United States mothballed fleet. Efforts in this direction are under way. Owing to the limited sources of supply, the Planning Commission has earnestly started preparing the schedule of expansion in the third Plan. Unless orders for delivery in the third Plan period are placed now, the chances of expansion appear restricted. The second shipyard will have to be constructed in the earlier phase of the third Plan. A British team of shipbuilding experts has been made available to India under the Colombo Plan technical aid programme. Its task will be to recommend a suitable site and to draw the first project report. Technicians for this yard will be drawn from the pool which is being developed at Vishakhapatnam. The overall prospect of imports until the end of the third Plan and expansion of domestic building capacity urgently call for the greatest vigilance in implementing the schedule of expansion of tonnage. Earlier pitfalls in the working of the Vishakh yard ought to serve as severe warnings.

CULTIVATION OF QUALITY TOBACCO

THE DELIBERATIONS of the recent meeting of the Indian Central Tobacco Committee and the Tobacco Research Workers' Conference have been quite fruitful in so far as they have helped in focussing immediate attention on stepping up the quality of Indian tobacco. As a cash crop, tobacco has proved a "veritable gold mine" for the country. It has contributed Rs. 35.6 crores to the Union exchequer as its share of excise duties during the last year and it gives to the producer on an average Rs. 32.4 crores every year. Besides, as an earner of foreign exchange, it has helped the country earn Rs. 11 crores a year and this gives it a strategic importance which the second Plan has recognised and hence stressed the need for stepping up its export.

But demand in the importing countries is becoming more and more exacting and discriminating and here, therefore, one has to face the question of quality. The Union Minister for Agriculture pointed out how the British purchaser was becoming more and more meticulous about quality in his purchases and if that aspect were left unattended, it was likely to affect the export trade to a considerable extent and undermine tobacco cultivation. It is true that of late some new markets have evinced interest in Indian tobacco, especially China and some countries in Europe, Africa and the Middle East. In view of the fluctuating conditions of foreign trade and the shifting national policies, India cannot depend entirely on one country and has to be in touch with the market conditions of various countries for catering to their demand. Realising the urgency of the matter, the Government have, therefore, provided, additional funds to the Central Tobacco Committee for intensification of research mainly with a view to improving quality during the second Plan period. The question of quality, it must however be noted, has relevance not only with regard to exports but for internal consumption also, for it is obvious as the standard of living improves, there will be increasing demand for quality tobacco for the growing cigarette industry, which has shown good recovery since 1955.

BALANCE OF PAYMENTS DURING 1948-1956

INDIA'S OVERALL balance of payments during the eight-year period ending March 1956, as comprehensively reviewed in a Reserve Bank of India publication, shows a trade deficit of Rs. 387.4 crores. This excludes errors and omissions, outflow of private capital, and

official long-term transactions which bring the total up to Rs. 969 crores. The combined receipts of official donations and loans amounting to Rs. 223.4 crores, however, reduced the net deficit requiring accommodation from official assets and other sources, to Rs. 745.6 crores. Loans received aggregated Rs. 125.4 crores, the vast bulk of which (Rs. 121 crores made up among others of Rs. 909 crores US wheat loan and Rs. 30.2 crores from the World Bank) went to help in augmenting the resources for the first Plan. The foreign exchange assets dropped during the period by Rs. 720.7 crores and foreign exchange liabilities rose by Rs. 22 crores.

The review has divided the eight years into three distinct periods. The first covers 1948-49 to 1951-52 and has been described as one of 'inflationary pressures and shortages'. The second, termed as a period of 'mild recession' ends with 1953-54, and the last, ending March 1956 has been called a period of 'expanding economic activity'. The trade deficits during the first period amounted to Rs. 610 crores. The second period witnessed a sharp decline of the deficits to Rs. 83.2 crores, while in the third they went up to Rs. 109.5 crores. The average annual deficit for the first Plan period has been worked out at Rs. 103 crores compared to the much larger figure of Rs. 275 crores annually as envisaged for the period of the second Plan.

Area-wise, while in the beginning the share of the O.E.E.C. countries in India's trade was restricted, due to dislocations caused by the war, it went up as time passed. This increase was at the cost of the dollar area whose imports and exports dropped substantially. The sterling area's share also fell during the second period but in the third period regained the position as in the first. In the case of the rest of the non-sterling area, imports went on declining from period to period whereas, in exports, there was a rise of nearly 38 per cent from 11.7 per cent in the first period to 16.1 per cent in the third.

FLAGS OF CONVENIENCE ON THE RISE

SHIPPING IS by far the most international of all industries. Accordingly, any development of far-reaching importance to shipping in one country vitally affects all the other maritime countries also. Ships are very important to a country's national economy, not only in that they make a notable contribution to a country's balance of payments position by way of "invisible exports", but they also help world trade as a whole by carrying commodities that enter that trade across the seas.

A noteworthy development in the field of shipping since the past few years has been the phenomenal increase in the tonnage of merchant ships registered in countries with little or no claim to any importance as great trading nations such as Liberia and Panama. Thus, Liberia, which had no merchant fleet at all in 1939, has today 5,584,000 gross tons and ranks as the fourth country possessing the biggest merchant fleet in the world! Similarly, Panama, which had just 718,000 gross tons in 1939, possesses today a fleet of as much as 3,926,000 tons! It is interesting to see what this is due to. The main reasons that have attracted non-nationals to register their ships in countries like Liberia, Panama, Costa Rica and Bermuda, which are described as "flags of convenience" countries in shipping parlance, we are told, are low costs of operation, easy conditions and procedure of registration and, above all, the absence of or the prevalence, if at all, of only a low level of taxation. Whenever the level of taxation in the resident country, that is the country to which the owners of a ship belong, is heavy, there has been a tendency among shipowners, particularly of Britain, to register their ships in countries such as Liberia and Panama where taxation is more or less non-existent. This phenomenon, described variously as "flags of convenience" "runaway flags" or "no tax" flags has become particularly widespread since 1954.

Referring to this trend, Britain's Transport Minister disclosed last month, whilst replying to a debate on shipping in Parliament, that 113 ships had been transferred to the registry of these "flags of convenience" countries. Apart from attracting the attention of the shipping interests, not only of the U.K. but of other countries as well, this trend has been a cause of considerable concern to leading shipping countries of the world, inasmuch as it affects all maritime countries. The search for a solution of this rather difficult problem has, therefore, begun to exercise the minds of shipping interests. As asking these "flags of convenience" countries to levy afresh or increase existing taxes is out of the question, the only practicable alternative would appear to be to obtain the observance by these countries of international conventions on safety, etc. so as to bring some sort of regulation into the operation of the ships at least insofar as it concerns wages and conditions of the crew and such other measures. After all, these are neither against their interests nor is it difficult to enforce these conventions, which, for the sake of humanity at least, must be respected by all the countries of the world, not excluding Liberia, Panama, Costa Rica or Honduras.

PROSPERITY THROUGH TAXES!

IT HAS become almost endemic with every Union Minister for Commerce and Industry to pass remarks and make observations, off and on, calculated to unsettle the minds of the business community, if not altogether undermine the confidence of the investing public. While Mr. T. T. Krishnamachari, as the Union Minister for Commerce and Industry, had occasion to rattle the mercantile community by his oft-changing policy statements in regard to the textile industry, it has now become the duty of Mr. Morarji Desai, the present incumbent of that office, to keep the trading and commercial interests on the tenterhooks of suspense over the question of taxes.

Addressing the Surat Chamber of Commerce last month, Mr. Desai warned the business community that the new taxes introduced by the Government were "just the beginning". This observation, coming from a responsible Minister, on top of the much-quoted statement made by Mr. Krishnamachari not long back, that he would not hesitate to seek the Parliament's help 'for more taxes in season and out of season', is hardly conducive to better business. And yet, Mr. Desai believes that "the Government, which represents the people, is framing laws and regulations and imposing taxes for the benefit of the people". This is perhaps the first time that taxes have been directly linked to benefits of the people. Mr. Desai might as well have proceeded with his argument and taken credit for defining a perfect economic democracy by adding that, in the ultimate analysis, it is only a question of taxation of the people, for the people and by the people!

At a time when the business community is not sure where it stands, be it in relation to the relative roles of the public and the private sectors, or in reference to the volume of taxation that it has to bear, it is, to say the least, naive, on the part of the Union Minister for Commerce and Industry, to hope that "if people, particularly the mercantile community, earned more, they would pay more taxes". One cannot shut one's eyes to the basic economic and business tenet that the fear of heavy taxation is a certain disincentive to making more money. In the circumstances, it is certainly a hard nut to crack if one remarks — which Mr. Desai, in effect, does — that the way to prosperity lies through taxation!

RESERVE BANK OF INDIA

APPLICATIONS are invited for the following posts in the Reserve Bank of India:

(A) POST AND SCALES OF PAY:

1. Probationary Assistants, Department of Research and Statistics/Legal Division.	Rs. 250-25-450 E.B. 25-650
2. Economic/Statistical Assistants, Department of Research and Statistics.	Rs. 175-12½-300 E.B. 20-440
3. Field Inspectors	
4. Field Investigators	Rs. 90-5-100-8-140 E.B. 10-250 E.B. 12½-300.

Note:—Candidates possessing exceptionally good qualifications and experience of value to the Bank and those having experience of field investigation work, may be given a higher starting pay in the prescribed scale.

In addition to pay, the selected candidates will be eligible to draw local pay, house rent allowance and dearness allowance at the rates prescribed by the Bank from time to time.

(B) AGE LIMITS AS ON 1ST JANUARY, 1957:

1. Probationary Assistants, Department of Research and Statistics/Legal Division.	Not less than 21 years and not ordinarily over 24 years.
2. Economic/Statistical Assistants. 3. Field Inspectors 4. Field Investigators	Between 18 and 24 years.

(a) **Undergraduates:** Between 18 and 22 years.

(b) **Graduates:** Between 18 and 24 years.

The maximum age limit is relaxable but not beyond 30 years, in the case of -

(1) Probationary Assistants in the Department of Research and Statistics possessing special qualifications and experience of value to the Bank;

(2) Probationary Assistant in the Legal Division;

(3) Candidates having extensive field experience;

(4) Candidates with approved war service;

(5) Ex-employees of Banking Institutions whose services had to be terminated for reasons of economy or as a result of the Banks going into liquidation;

(6) Personnel retrenched from Government offices after at least one year's service, applying through Employment Exchanges; and

(7) Candidates belonging to the Scheduled Castes or Scheduled Tribes.

(C) QUALIFICATIONS:

1. Probationary Assistants,
Department of Research and Statistics.
Essential : A brilliant academic record with a first or high second class Master's degree in Economics or Agricultural Economics or Commerce or Statistics/Mathematics.
Desirable : 1. A period of research work in
a) Agricultural Economics
b) Co-operation
c) Rural Sociology, or
d) Sampling Theory.
2. Experience gained in a responsible position in a Co-operative Institution/Department.
3. Experience of field investigation work

2. Probationary Assistant, Legal Division.
Essential : Applicants should be Advocates or Solicitors and must possess high academic qualifications in law and practical experience of work in an Advocate's or Solicitor's office or experience of independent practice, **for a minimum period of four years.**

3. Economic/Statistical Assistants.
Essential : A first or high second class M.A. or M.Com degree in Economics or Statistics of a recognised University.
Desirable : Practical experience of research in Economics or Statistics.

4. Field Inspectors.
Essential : At least a second class Bachelor's degree in Economics, Commerce, Agriculture, Mathematics or Statistics of a recognised University.
Desirable : 1. Practical experience of the working of Co-operative Credit Institutions or Agricultural Marketing and Processing Societies or Industrial Co-operatives.
2. Experience of field investigation work.
3. Special study of Agricultural Economics or Rural Sociology.

5. Field Investigators.
Essential : Marticulation or equivalent examination of a recognised University or Board in first or second class with at least 50% marks in English, Mathematics and Geography.
Desirable : 1. A Bachelor's degree of a recognised University.
2. Experience of field investigation work or of work in Co-operative Institutions.
3. Knowledge of two or more vernacular languages.
Note:- Field Investigators and Field Inspectors should be able to speak and write one or more of the following vernacular languages:
(1) Bengali, (2) Gujarathi (3) Hindi (4) Kannada (5) Punjabi (6) Tamil (7) Telugu.

The selected candidates for the posts of Probationary Assistants, Department of Research and Statistics/ Legal Division will ordinarily be on probation for a period of three years.

The selected candidates for the posts of Probationary Assistants in the Department of Research and Statistics should be prepared to work in Districts selected for Rural Surveys and should be able to conduct the field work, if required.

The selected candidates for the posts of Field Inspectors and Field Investigators will be appointed on a temporary basis for a period of one year in the first

instance but are likely to be made permanent and they will be stationed in Districts selected for Rural Surveys and will be required to carry on investigations in selected Villages in such Districts.

The selected candidates for the posts of Economic/Statistical Assistants will be required to appear for a written test.

Candidates who wish to apply for more than one category of posts must submit **separate** applications accompanied by **separate** application fees **and they should also mention prominently on their applications the other posts applied for by them.**

Applicants for the posts of Probationary Assistants must remit fee of Rs. 7-8 by Postal Order, Cheque or Bank Draft on a **Scheduled Bank payable at Bombay** along with the application. Applicants for the posts of Economic/Statistical Assistants and Field Inspectors must remit an application fee of Rs. 2 in a similar manner. The application fee is in no case refundable. Bonafide Refugee candidates who are **Not in Employment** applying through any of the Government Employment Exchanges are exempted from payment of application fees while in the case of candidates belonging to Scheduled Castes/Scheduled Tribes the fee will be reduced to ¼th.

Applications should be in the candidate's own handwriting. Applications for the posts of Probationary Assistants, Department of Research and Statistics/Legal Division, Economic/Statistical Assistants should be in the prescribed form obtainable from any office of the Reserve Bank. Applications for the posts of Field Inspectors and Field Investigators should be on plain paper and must contain the following information:

Name in full; educational qualifications — Examinations passed with subjects, distinctions, classes and marks obtained; Schools, Colleges and Universities attended; date of birth; age; address; place of birth and domicile; community; details of previous office/research experience, if any; period of approved war service, if any; **number of languages able to speak and write;** father's name; father's occupation; extra curricular activities; proficiency in games, etc.

All the applications should be accompained by copies of two testimonials (originals should not be sent; the Bank does **Not** accept responsibility for returning the originals if sent through oversight) and forwarded to the Secretary, Central Recruitment Board, Reserve Bank of India, Central Office, Post Box No. 406, Bombay No. 1 so as to reach him on or before the 18th February, 1957. **Candidates already in service must submit their applications through their employers.** Candidates belonging to Scheduled Castes or Scheduled Tribes should mention this fact prominently on their applications and also enclose a copy of certificate to that effect from a competent authority.

Appointments will be subject to candidates being found medically fit for service in the Bank. If any candidate desires to have his application acknowledged he should send it by "Registered Post Acknowledgment due". Apart from those who may be specially called, interviews will not be granted to candidates nor will the Bank enter into any correspondence with them.

Canvassing in any form will be regarded a disqualification.

COMMODITY NEWS AND NOTES

BRIGHT FUTURE AHEAD FOR U.S. WOOL

Among the commodities that enter international trade, wool occupies a very important place. The wool textile industry is therefore receiving increasing attention not only at the hands of the Government of India but also of Britain, the U.S.A. and other countries. In Britain, the Wool Textile Delegation has asked the Board of Trade for statutory powers "to amend the levy orders for export promotion and scientific research in the British wool textile industry." The progress of the wool industry in America has been such that the industry finds itself in a very strong position at the beginning of this year. Giving an appraisal of the industry's outlook, the Wool Bureau of New York states that the industry faces 1957 with "greater strength and confidence than at any time in the past five years." During the year 1956, the industry has done very well in America. This is evident from the fact that both the consumption of the mills and the output of woven woollen fabrics have increased by 7 per cent in the first ten months of 1956 as compared with the corresponding period of the previous year. In view of the considerable increase in the offtake of wool, as reflected in the steadily declining stockpile of wool with the Commodity Credit Corporation, the President of the U.S. Wool Bureau has predicted that "1957 will be a bright year for wool."

WORLD RICE OUTPUT TO GO UP

As a result of the cumulative effect of larger acreages under rice cultivation and more favourable climatic conditions, production of world rice in the 1956-57 season is expected to exceed the high level of output recorded in the previcus season. According to the Commonwealth Economic Committee's 'Rice Bulletin', just published in London, the first estimates of acreage under rice in India shows an increase of 4.8 per cent over the previous year, while "some increase" in production is expected in Pakistan, with Ceylon already reporting more rice production.

There have been fairly sizeable yields in most rice-producing countries. Thus, in Burma, production of rice is expected to reach a new post-war peak inasmuch as the harvested area is already at a fresh high level of 10,000,000 acres. A record rice output of the order of 950,000 tons is forecast under the second rice crop in Formosa, while in the Middle East, rice harvests have been put well above the average with prospects of equalling the peak figures of two years ago. China and the Philippines have also reported good yields of rice during the 1956-57 season.

US GOVERNMENT COTTON SALES

The US Government of Agriculture will soon decide whether to continue the cotton export programme in its current form—sale of Government stocks by the commodity credit corporation—or change to a programme similar to that of the wheat export scheme. Under the wheat scheme, private traders sell abroad from their own stocks and draw a subsidy from the Government to make up the difference between domestic prices and lower foreign prices. Farm organisations and Congressmen from the cotton area have argued against any change this year. The cotton exchanges, however, seem to prefer the subsidy scheme.

JORDAN TO EXPORT MORE PHOSPHATE

The Jordan Ministry of Economy has granted permission for the Jordan Phosphate Company to export a record 450,000 tons of phosphate this year to Europe and the Far East. It is expected that the quantity to be exported during 1958 will be even greater.

BRAZIL MANGANESE FOR US

With the recent opening up of new manganese ore deposits, Brazil will rank among the US's main suppliers of manganese and will reduce the latter's dependence on more distant sources, namely, India, South Africa and the Gold Coast. These deposits are in the Amapa territory in the Amazonian region and are being explored jointly by Brazilian interests and the Bethlehem Steel Company which holds a 49 per cent interest in the undertaking.

CHINA'S NEW TEXTILE MACHINES

China's textile machinery industry will produce 1 million spindles and 25,000 looms this year, of which a proportion will be earmarked for selective export. Largely on the advice of Soviet experts in Shanghai, the technical level of China's expanding textile machinery industry has been improved since last summer. It is admitted also that blueprints of new textile machinery designs in the UK and the US have been studied and adapted.

MORE AREA UNDER GROUNDNUT

The All-India Second Estimate of Groundnut, 1956-57, puts the current year's area and production at 11,299,000 acres and 3,559,000 tons (of nuts in shell) as against 10,968,000 acres and 3,372,000 tons for 1955-56, according to the Directorate of Economics and Statistics, Union Ministry of Agriculture. This shows an increase of 331,000 acres or 3.0 per cent in area and 187,000 tons or 5.5 per cent in production during the current year as compared to last year.

The increase in acreage during the current year has been reported mainly by Bombay, Mysore and Andhra Pradesh and to a smaller extent by Madhya Pradesh, Madras, Punjab and Uttar Pradesh and has been attributed generally to favourable climatic conditions at the sowing time. The increase in production has also been shared mainly by Bombay, Andhra Pradesh and Mysore and to lesser extent by Madras, Madhya Pradesh and Punjab. The increase in production has been attributed partly to increase in acreage and partly to timely rains during the growing period of the crop.

INCREASED PRODUCTION OF SUGAR

The production and despatches of sugar from indigenous factories amounted to 6.20 and 3.82 lakh tons up to January 15, 1957 in the current season as against 5.28 and 3.03 lakhs tons respectively in the corresponding period of the last year. The stocks with the factories on January 15, 1957 stood at 7.65 lakh tons as compared with 6.37 lakh tons last year.

ILLEGAL TRADING IN GRAM IN PUNJAB

The Forward Markets Commission has warned against the carrying on of trading in forward contracts of gram in several places in the Punjab. Such trading it says, is punishable in accordance with Section 20(1)(C) of the Forward Contracts (Regulation) Act. All forward contracts in gram are prohibited throughout India under Section 17 of the Forward Contracts (Regulation) Act, 1952. Similarly, forward contracts in cottonseed other than non-transferable specific delivery contracts are prohibited under Section 15 of the Act, except through associations recognised under the Act for the purpose.

TEA EXPORT DUTY REDUCED

The Government of India have issued a notification fixing the price of tea, for the purpose of determining the export duty, at Rs. 3-15 per pound as against Rs. 4-3 per pound in force from January 1, 1957. The export duty at this price will be annas six per lb. The export duty during January, 1957 was eight annas per lb.

A Liberal Deal for Railwaymen

LAST Sunday the Railway Minister made a surprise announcement of a fresh deal for railway employees in certain non-gazetted categories. The element of surprise was by no means confined to the timing of the announcement. The liberal scale on which redistribution of posts in different grades and salaries has been made was not altogether expected by representatives of railwaymen's trade unions who were summoned to the conferernce at short notice. A few at least among them made no secret of their immediate reaction. It is true that the revision of grades, promotion opportunities and salary scales was promised to the cadres of non-gazetted officials who have now benefited by it. A categorical assurance to this effect was given by Mr. Lal Bahadur Shastri in his budget speech in February last year. But the manner in which the settlement was finally brought about cannot conceal the unmistakable impress of haste.

It is claimed on behalf of the Railway Ministry that an elabo... investigation was conducted into the quest... grades and salaries of the cadres ...ern... e course of the year. This claim is hard... ot in toto in the face of a vital but eler... fact. No estimate whatsoever has been ... d by the Ministry in regard to the incidenc... revision on the salary bill of the railway... gure of anything between Rs. 1 and 5 cr... freely mentioned which the Ministry is ... either to corroborate nor to rebut. The ...sed scheme has been given retrospective effect from the beginning of the current financial year. It is obvious, therefore, that the increased cost in the salary bill will have to be incorporated in the revised estimate of expenditure for this year in the caretaker budget which the Railway Minister will present to Parliament in about a month's time. The omission of any mention of the approximate cost of the revised

scales in Mr. Jagjivan Ram's speech making the announcement is certainly a matter of no small surprise.

The *raison d'etre* of the redistribution of grades was to enlarge the scope for promotion and higher emoluments to which access was not open in an adequate measure. This objective could be achieved only by increasing the number of posts in the higher grades and reducing them at the levels below. Sixteen categories of employees have been brought within the coverage of redistribution of posts, but the technique employed was virtually the same with minor variations. Two cases illustrate how the change has been introduced. The number of posts for higher grades of station masters has been increased threefold to 9,000, while the lowest scale of pay for this category, applicable mostly to roadside station masters, has been raised to Rs. 100-185. Upward variations have been made for the starting grade of assistant station masters. Clerical cadres in the senior categories have been awarded an omnibus scale of Rs. 80-220 for promotion above a specified recruitment grade. The Central Pay Commission's express suggestion for prescribing this scale on the minimum test of holding a university degree has been modified for the purpose of general application. A simple departmental examination has been substituted as a test for eligibility. In the rest of the categories liberalisation has been secured by sanction of larger number of posts in higher grades, while in a few the allowances have been raised substantially.

An important issue which the latest deal for railwaymen raises is one of principle. It relates to a proper promotion policy. While it is essential that the morale of employees must be maintained at the requisite level, the causes of discontent must be carefully scrutinised on their own merit. In any event, considerations of efficiency cannot be relegated to a subordinate place. A sound policy for promotion must achieve the twin objectives of morale and efficiency. So long as reasonable opportunities are thrown open for promotion and selection to positions of responsibility proceeds on the criterion of ability, there is hardly any reason to find fault with the overall policy. The main argument which has necessitated the scheme of redistribution of posts and regradation of salaries, it is said, is the fact of higher work-load and responsibility having been placed on the employees in the sixteen categories. Increased burdens may have been placed on certain cases of individual posts or categories of employees. But the error would appear to lie in the categorical assertion of the validity of this argument as a proposition of universal application. It should not be overlooked that employment in Indian railways is expanding now at an annual rate in the neighbourhood of 20,000. Another important factor which merits due weight is the absence of any machinery for job analysis which has not been taken up for consideration in real earnest by reason of the opposition of labour on the ground of apprehended retrenchment. But by official and non-official testimony tendered before the Estimates Committee, standards of efficiency on the railways have not been maintained at the necessary pitch.

The liberal deal which has been meted out covers 170,000 employees who form a little less than half of Class III categories of employees. Non-gazetted cadres comprise 36 per cent in Class III and 63.75 per cent in Class IV of the total staff of the railways. The criteria on the basis of which the promotion grades and salary scales have been revised in the case of the 18 per cent of the staff are not clear. In some individual schemes of revision departures have been made in the scales or rules of convention laid down by the Central Pay Commission. It is possible that these departures had some justification. This reasoning overlooks the fact that similar justification may be pleaded by employees in the categories not covered by the revision. The present beneficiaries happen to be white collar employees. Actually, no time has been lost by trade union spokesmen to espouse the "cause" of Class IV employees. Resulting anomalies like the loss of parity in the pay of skilled workers and clerical staff at some levels, which was secured in terms of the Pay Commission's suggestions, are being magnified.

It would be naive to believe that the course adopted in the present deal will not contribute to a chain reaction. This reaction, it need not be supposed, will be confined only to the public sector, although it had to face some heavy trouble recently as in Assam over the postal strike which has been called off on a definite understanding. It is paradoxical that while the Finance Minister needs unqualified support of the entire country in curbing the forces of inflation, his colleague in the Labour Ministry should have chosen to lend his full weight to the demand for a general wage increase. The Railway Ministry needs to make a reappraisal of its policy on labour in the light of the supreme task of creating sound defences against inflation. The whole trend of its attitude to trade unions reveals that the apparent cordiality of relations has been purchased by successive arrangements of accommodation to the demands of railwaymen.

Priorities in Community Development

PERSPECTIVE planning is the order of the day. This is particularly true of agriculture which, in India, would be called upon to perform a near-miracle over the next 20 years. If Indian agriculture *must* feed 500 million people by 1976 and meet the heavy raw material requirements of an industrial sector which will more than treble its output by that year, it must expand to nearly twice its present level. Almost the whole of this expansion can come about only by an increase in per-acre productivity. This productivity increase, in its turn, would have to result from extension of irrigation, intensive application of chemical fertilisers and organic manures, propagation of improved seeds and adoption of improved cultural practices. These directions in which alone progress will largely follow have been appropriately recognised by the Community Projects Administration. But the activities of the Community Projects Administration and National Extension Blocks in these directions have yet to gather momentum. As productivity increase should be the dominant objective of the network of development and extension blocks (which are to cover the entire country by the end of the second Plan), the critical but constructive comments made in the latest four-part report of the Estimates Committee are as timely as they are valuable.

The Estimates Committee estimates that crop-yields can be raised by anything from 10 to 20 per cent by the use of improved varieties of seeds alone at little or no additional cost. This estimate is probably based on the performance of improved seeds evolved in research stations to-date. As plant breeding research can be expected to reach a still higher level of competence in the next 10 years, newer seed varieties can also be reasonably expected to account for a fourth of the production increase even by the end of the fourth Five-Year Plan. The only question here is whether seed multiplication farms and seed storage facilities can be increased to cater to the needs of *all* landholdings and of *all* crops in the next 15 years. It is intended to have a 25-acre seed farm in each of the ultimate 5,000 National Extension Blocks which will be functioning all over the country by the end of the second Plan. The seed farm will only provide for the initial multiplication of the nucleus improved seeds and even here it is doubtful if 25 acres would be sufficient although it is understandable that resources availability sets the limit in this regard. While this is a big problem by itself, the even bigger problem of storage distribution and further multiplication of seed by the farmer will remain to be tackled. There is also the problem of making each village a unit of seed multiplication in accordance with the Estimates Committee's recommendation. Yet another problem is to construct godowns for stocking of seeds at the rate of one godown for 30 villages, in addition to a warehouse and marketing organisation for each taluk. These problems should receive priority attention on an equal footing with minor irrigation.

The Estimates Committee, in drawing attention to the objective of Community Development to cover at least half of the agricultural land with irrigation facilities, notes that just 2 million acres have benefited by new irrigation (from tanks, surface wells, tube-wells, etc.) in all the community development and N.E.S. blocks as at the end of March last year. It is admitted that this progress has been very unsatisfactory. As minor irrigation facilities have involved an expenditure of just under Rs. 40 only per average acre (as against Rs. 500 per average acre in the case of major irrigation projects), the slow progress in this sphere demands a satisfactory explanation. If even in Community project and national extension areas only 2 million acres have been brought under minor irrigation, there is no reason to believe that in the rest of the country 8 million acres have been covered by such irrigation by the end of the first Plan. The statement of the representative of the Community Development Ministry that 10 million acres were brought under irrigation through minor irrigation works might have to be taken as referring to the first Plan's target and not to the actual performance. This rate of progress would have to be greatly accelerated so that additional irrigation could actually cover at least 10 million acres (at a cost of about Rs. 40 crores in all) by the end of the second Plan. As irrigation alone can nearly double the per-acre yield, the same priority attention should be given to it as in the case of improved seeds. If the first Plan deficit under this head is not made good in the second Plan period, it may be very difficult to increase the target to more than 5 million acres in each successive five-year period.

The Estimates Committee thinks that proper manuring (with compost and green manures) can increase the acre-yield by anything from 25 to 30 per cent. This is an over-estimate for the reason that as far as the *entire* cultivated area in the country is concerned, the maximum mobilisable resources in organic manures may be adequate for only half the cultivated area if an acre of land is to receive its full quota. If, on the other hand, an average acre can have only half of its maximum requirement, anything more than a 12½ to 15 per cent increase, on this account, in total agricultural output over the next 20 years cannot be safely estimated. To discourage the burning of cattle dung and to make alternative arrangements for fuel may well take a long time. Chemical fertilisers, therefore, may have to come into the picture to a greater extent than now, although a note of warning is required against the indiscriminate use of fertilisers which may result in the exhaustion of soil fertility after the first few years. If, as the Committee recommends, the research on fertilisers is intensified for the purpose of ascertaining different varieties of fertilisers for different types of soil, both organic and inorganic manners may well account for a fourth of the required increase in agricultural output.

Another direction in which priority effort has to be put forth concerns the use of chemical pesticides and the adoption of improved cultural practices. As the loss of grains due to plant diseases and insect pests in the fields and storage is estimated at 20 per cent, the organisation of a plant protection service is called for. In this case, as in that of better cultural practices, demonstration and example alone may do the trick, but these are slow, long-term processes which can be expected to account for a fourth of the required increase in agricultural output only by about the seventies. The development schemes concerned with this and other priorities described earlier would involve such immense problems of organisation and administrative co-ordination, of mobilisation of financial and physical resources, of training of tens of thousands of personnel for construction, persuasion, demonstration and co-operation (in a few limited fields), of many-sided agricultural research, and so on, that the Community Projects Administration would be well advised not to fritter away its energies and resources on any grandiose project of joint farming which cannot be successfully organised on a large scale without undermining democracy itself in the process. It is a fallacy to argue that a large-sized farm would give a higher acre-yield than a small-sized farm. This is simply not true. Where intensive cultivation is the recognised objective of community development and national extension, the smallness of a farm can be no inhibiting factor. For, even in the case of dry farming, per-acre productivity under extensive cultivation of a large farm is known to be lower than under intensive cultivation of a small farm. This is even more true of wet farming where a farm has necessarily to be comparatively small in size if a high per-acre yield is to be obtained. The only problem here is that of scattered plots of a farmer's holding, and the only sensible thing to be done is to consolidate his holding in such a way that it could constitute a reasonably compact farm, small though it be. This can be attempted through possible co-operative consolidation societies.

The Birth of Ghana

ON March 6 will emerge the tenth dominion in the British Commonwealth — Ghana. It will have a Government run by Africans themselves and not merely by White Settlers, as in the Union of South Africa. The day chosen for the final transfer of power is the anniversary of the day in 1844 on which a bond was signed between the British authorities and certain Chiefs transferring jurisdiction to the former. Ghana will consist of the British colonies of Gold Coast and Ashanti, the Trust Territory of Trans-Volta Togoland and the Protectorate of Northern Territories covering about 91,834 square miles with a population of 4.5 million.

The new dominion will have a cabinet and parliamentary system of Government modelled on the prototype in the United Kingdom and other independent Commonwealth countries. Every citizen of Ghana, without distinction of religion, race or sex, if he has attained majority, will be entitled to vote. It is proposed to set up regional assemblies and Houses of Chiefs in each of the four constituent units. These will have effective powers in specified fields. A commission will be appointed to determine the precise nature of those powers and the composition of these assemblies. Any amendment to the Constitution would require a vote of two-thirds of the total membership of the National Assembly; most important amendments would in addition require the concurrence by a simple majority of two-thirds of the regional assemblies. A special provision has also been made to ensure concurrence of the region concerned in matters involving boundaries or the powers of the regional assembly. The Constitution also guarantees "traditional dignities" to the 10,000 chiefs, though no undue powers or undue emoluments have been granted to them.

Ghana's initial education in self-government began when the first Legislative Council was set up for the colony of Gold Coast in 1850, six years after it was conquered. Since then, gradual control of their own affairs has been delegated to the people with widening representation. From 1946, when for the first time the Legislative Council had an African majority constitutional advance was rapid. In 1949, a wholly African committee under the chairmanship of an African Judge Mr. (now) Sir Henley Coussey was entrusted with the task of working out a new constitution. Its recommendations have formed the basis not only for the constitution under which the elections were held in 1951 but for subsequent constitutional developments. The 1951 legislature also included representatives of the Northern Territories and of Trans-Volta Togoland for the first time. The Constitution which was introduced in 1954 will be replaced by a new one conferring dominion status on Ghana.

Potentially, the new dominion is among the wealthiest countries in the world. It is rich in gold, diamonds and mineral ores; it has luxuriant forests, abundant ivory and plentiful cocoa. Cocoa exports alone net in about £84,000,000 per year. Already it has a favourable balance of trade of nearly £15,000,000 a year. But as yet only the outer, superficial layer of its resources has been tapped. The blue-print of the £150,000,000 Volta scheme envisages the building of a dam and hydro-electric station on the lower reaches of the river Volta. Associated with the scheme is the construction of a new harbour and a railway system.

All this should not, however, obscure the difficulties which the leaders of Ghana will face. On the political front, there are fissiparous tendencies among traditional tribal forces who distrust the new leaders, the new political institutions and the new way of life. As late as November 20, 1956, the two main Opposition parties, the National Movement and the Northern People's Party demanded "separate independence for Ashanti and the Northern Territories". There is also a strong Ewe demand for separation. They even threatened violence and bloodshed to achieve their objective. This will be a supreme initial trial for the new state and particularly for the Opposition. They ought to realise that African statesmanship is now on test, and that they do nothing to retard progress. They must show that it is possible for Africans to establish and run a unified sovereign State.

Apart from political difficulties, the new dominion will have to face economic and administrative hazards. Ghana's independence will coincide with the lowest price for cocoa for many years, low sterling reserves and a somewhat dim outlook for business. A difficulty of even greater import will be that Ghana's elevation to self-governing status will result in the forefeiture of the financial assistance which it has been receiving from the Colonial Development Corporation. And it is not a member of the Colombo Plan. Moreover, in view of the recent anti-Western feelings reminiscent of those witnessed recently in Iran, Egypt and some other Middle Eastern countries, the new State will need to adopt a prudent and realistic policy to attract foreign capital so indispensable for the development of all under-developed regions. Lack of indigenous capital, need for capital equipment and technical know-how and scarcity of skilled labour cannot be over-emphasised. One can only hope that the British Government would support its wise political act with some system devised to replace the aid given by the Colonial Development Corporation and thus ensure the immediate uninterrupted economic development in Ghana. The new dominion can also raise its resources of foreign exchange by diversification of agricultural and exploration of mineral wealth. There will also be problems of administrative apparatus with the departure of some of the experienced British civil servants after independence. Here again there will be need to move slowly and retain British co-operation.

As opposed to the policy of "liquidation" of their own imperialism by the British, France is desparately clinging to outmoded imperial policies of blood and terror in Algeria. It is seeking a solution by war and is, thus, losing the opportunity to go and leave behind a friend as it has done in Morocco and Tunisia. In the present wave of resurgent nationalism in Africa, it is inevitable that Algeria should be free. Delay in recognizing the sovereign status of this African colony may well cause the incursion of Communism into the region. The danger is real in view of the present Soviet policy of support to Arab nationalism for ulterior motives. The only wise way is Britain's; its graceful departure from the Indian sub-continent in 1947, and now from Ghana, could be emulated profitably—for France itself as well as for the free world.

The Call To Save

As citizens of India, you are called upon "to work wholeheartedly for the full and timely realisation of the tasks, targets and aims of the Second Five Year Plan."

The Plan has been embarked upon. Its success depends upon your providing capital for its working. In this effort no amount is too small—the man who saves a rupee and the man who saves hundreds—both are rendering national service.

Save as much as you can and entrust your savings to the nearest office of your Bank. In doing so you will help to build a new India and also create a valuable estate for yourself and your family.

The State Bank's branch at Delhi, one of the more than five hundred offices waiting to take care of your savings throughout India.

STATE BANK OF INDIA
INDIA'S LEADING BANK

THE WEEK'S NOTES

ELECTION PROSPECTS IN WEST BENGAL

IN THE coming elections the ruling Congress Party faces from the Communist Party the biggest challenge in West Bengal. The C.P.I. has put up there 104 candidates for the 252-member State Assembly, while it is supporting candidates for the 252-members State Assembly, while it is supporting candidates of the United Left Election Committee in almost all other seats. Both sides are equally confident of defeating each other. What makes political observers anxious is the fact that this time the Communists have been able to form a united front with four major Leftist parties, namely, the Praja-Socialist Party, the Revolutionary Socialist Party, the Forward Bloc and the Marxist Forward Bloc on the basis of an agreed common programme. This United front would be able to avoid the spliting of Opposition vote. In the last general elections it was a division of the Opposition vote that considerably helped the Congress Party, which, with only 39 per cent of the polled votes, was able to bag a little over 150 seats in a House of 238. Ever since, the Leftist parties have been striving for unity.

During the last general elections many of the Communist leaders were in jail. Conditions are different now. They have had opportunity to conduct struggles — some of them successfully — against what they describe as the "anti-people policies of the Government". This has given them a status in public life which cannot be glossed over. Moreover, the C.P.I. hopes to "expose the Congress brand of Socialism, by referring to its builders who, significantly enough, include a large number of rajas, maharajas, and millionaires," as Mr. Ajoy Ghosh, General Secretary of the Party alleged. High prices of necessaries, growing unemployment, congested schools and colleges are a few of the major problems which rob an average Bengali family of its love for the Congress Party.

But most of these assets are balanced in favour of the Congress Party by the fact that the C.P.I. is fighting this election with a programme which is not distinguishable from its own. It will be difficult for the electorate to choose between their respective 'socialisms'. The only exception is the promise of the Communist-dominated United Left Election Committee to readjust West Bengal's boundaries on the basis of language and contiguity. Organizationally, too, the C.P.I., this time, has not entered the electoral arena as a united team. Divergent views on de-Stalinization and Russia's intervention in Hungary have led to confusion in the minds of the Party's rank and file, which saps much of their energy and undermines its "striking power". The disclosures about Stalin's atrocities at the 20th Party Congress of the Communist Party of the Soviet Union by Mr. Khrushchev has shorn Communism and its devotees of their assumed moral superiority. Russia's refraining from vetoing the Western resolution on Kashmir in the Security Council even after Marshal Bulganin and Mr. Khrushchev had publicly declared that Kashmir was an integral part of India, has brought Communism in disrepute in this country and made Indian Communism unpopular. In contrast, the Congress Party has been fortunate in having Kashmir as an election issue. The slogan "vote Congress to save Kashmir" or "a vote against the Congress is a vote against Mr. Nehru's policy on Kashmir" cannot fail to receive popular support.

The success of the Congress Government's two Five-Year Plans, especially in the matter of food, has robbed Communism of much of its ammunition. The praise showered on India's achievements since independence by the Russian leaders, Marshal Bulganin and Mr. Khrushchev, by Marshal Tito and, last but not least, by Mr. Chou En-lai has also taken the edge out of Communist propaganda. This time the Communist will not be able to criticise the Congress Government's foreign policy; the Indian people have seen that the Kremlin itself wooes Mr. Nehru. The Congress Party has also a solid Muslim vote — about 12 per cent of the West Bengal electorate. Thus, though there is a fair chance of the Congress Party's ultimate success in the West Bengal elections, there is certainly no room for complacency.

INSIDE PAKISTAN

THE PROCEEDINGS of the Awami League Council at Kagmari in East Pakistan provide a challenge as well as an opportunity for the coalition government of Pakistan to modify its present political and economic policies. Whether the resolution on foreign policy, and particularly concerning military pacts, was a new one or the reaffirmation of an old makes little difference to the basic controversy raging over the pursuit of such policies. The hard core of the Awami League has made it abundantly clear that a programme of national reconstruction, with emphasis on developing the eastern wing, needs to be given priority over all others. Reports on the Council's proceedings suggest that East Bengal is not entirely happy with the swiftly deteriorating relations between Pakistan and India. This is understandable inasmuch as, in the prevailing unfavourable climate, some of East Pakistan's pressing problems like flood control can hardly be solved without a proper co-ordination with India. But it is more than unlikely that Karachi or Mr. Suhrawardy will pay much heed to Kagmari. The biggest single factor that determines the current policies of Pakistan is her antagonism towards India. After having whipped up tension in West Pakistan to its present high pitch, her rulers may not be expected to adopt a policy of reversal in the foreseeable future. Since it is so, the split in the two wings of Pakistan and more so in the Awami League will go on extending which should render the coalition government weak. Again, if the Awami League members in the coalition fail to match their practice with the principles laid down by the party, they will only help in its disintegration and the resultant confusion.

That Pakistan continues to lay heavy emphasis on military aspects is indicated by her latest budget with a defence outlay of Rs. 100 crores, of which Rs. 81 crores is on revenue account. In percentage terms, the outlay represents 60 per cent of Pakistan's revenue receipts which include gross earnings of railways, or 5 per cent of her national income estimated around Rs. 2,000 crores. A direct comparison with India's percentage expenditure on defence is not possible since here the railways are covered by a separate budget. If, in the case of Pakistan, railway receipts are taken out, the percentage of defence outlay will go up still higher. The high defence allocation has been made possible by increasing the tax burden on the common man in Pakistan; excise duties on some of the essential consumer goods like tea have had to be doubled. The inescapable result that will follow will be that economic distress will be aggravated. East Pakistan will be in a particularly disadvantageous position as it usually bears a larger proportion of the tax burden whereas it is the beneficiary of a smaller proportion of central expenditure. The people there are passing through an acute shortage of food grains. An idea of the high cost of living in East Pakistan can be formed from the official figures; while the general cost of living index for industrial workers in June 1956 was 314 in Narayanganj (an industrial suburb of Dacca), it was 108 in Karachi and, relatively,

as low as 91 in Sialkot. It is, therefore, not surprising that East Pakistan's exasperation should have reached a point at which faint whispers of demand for a separate economic set-up including a separate plan and an industrial development council are already audible to the keener observer.

CEYLON'S FOREIGN POLICY

THE NINTH anniversary of Ceylon's independence celebrated in the island last week was invested with a special significance by the participation of the Chinese Premier. Ever since the Bandung Conference where China made her debut, her influence among the Asian countries has been steadily growing and as a champion of anti-colonialism, she has been sedulously working on a planned policy of eliminating Western influence in Asia. It is natural that Ceylon after attaining her freedom should try to get rid of all vestiges of colonialism. Mr. Bandaranaike in fact put in the forefront of his programme the elimination of British bases in Ceylon. He largely succeeded in this during his talks in London last December when Britain agreed to hand over her bases to the Ceylon Government this year although details regarding the facilities required by Britain at these bases after their transfer have still to be worked out. The pursuit of neutrality by a small country tending towards socialism, however, requires enormous vigilance. Mr. Chou En-lai remarked that in the past few years, Ceylon and China had begun "mutually beneficial relations" in the spheres of economy and culture. But at the same time he felt that the possibilities of having further co-operation on a broader scale had yet not been fully exploited. Mr. Bandaranaike as Premier of one of the Colombo Powers may like to play an increasingly important role in resurgent Asia along with China. But in view of the nature of the country's economy and the many ticklish and unsolved problems before her, Mr. Bandaranaike may, sooner or later, find that he cannot go too far in that direction. Anti-colonialism need not mean adopting an anti-West attitude which would only result in throwing the baby along with the bath water in the present stage of Ceylon's development.

The country depends on her plantations which are foreign-owned and nationalisation will be no easy affair if it is to be on the basis of any fair compensation. While her population is increasing at a rate of 2.8 per cent a year, unemployment is estimated at 500,000 as of last year according to a Central Bank survey. The task ahead of the country remains one of maintaining the vigour of its export industries (tea, rubber and coconut), increasing its own food production and diversifying its economy. Recently the Government set up a National Planning Council to include in its scope problems facing the entire economy. But the main fact remains that the country is very much dependent on external assistance which has played a significant part in her development programme. The total amount of capital aid authorised under the Colombo Plan so far amounts to Rs. 95 million and here the share of the United States, Canada, Australia and New Zealand is considerable. Besides, the country also needs foreign technical assistance and also participation of private foreign capital in many of her development projects. All these may naturally weigh in any realistic shaping of her foreign policy.

SOVIET PLAN FOR 1957

HEAVY INDUSTRY — the base for arms production — will continue to receive priority over consumer goods in the Soviet Economic Plan for 1957. The planned increase in output of heavy industry is 7.8 per cent over that of 1956, as compared with 5.9 per cent for consumer goods. Under the 1957 plan, gross industrial production goals have become much less ambitious than they were last year. In fact, the increase scheduled is the lowest since the Five-Year Plans began in 1928 (excluding the war years, of course). Among the points which the annual plan stresses is the proposed drive to speed up automation in Soviet industry by 30 per cent in the current year. The Russian target for coal, admitted to be a weak feature of the economy, is to be 446 million tons as against the 1956 figure of 429 million tons. Oil output is to go up to 97 million tons, compared with 83.8 million tons in 1956; iron to 38.1 million tons, compared with 1956's 35.8 million tons; and electric power will rise to 211 milliard kilowatts compared with 192 milliard kilowatts in the last year. The importance given to heavy industry is of special interest to this country which has been offered Soviet machinery and a capital goods for its industrialization projects.

On the agricultural front, the volume of agricultural procurement will increase in 1957 as compared with 1956. While promising a better life for the workers, the Chairman of the State Economic Commission indicated that 28 per cent more new housing would be built in 1957 than in 1956. The annual plan expects the national income to go up by eight per cent while last year it was estimated to have gone up by 12 per cent.

The new USSR budget envisages for this calendar year a total expenditure of 603,820 million roubles. Of this total, 16 per cent would go to the armed forces. (as compared with the 18 per cent of last year's total expenditure of 569,400 million roubles). The reduction in military expenditure comes to just 5.6 per cent only. As the reduction in armed forces has not resulted in the anticipated 15 per cent cut in the military budget, the inference should be that the standing army has been streamlined and rendered more powerful with its improved and costlier equipment.

CHESTER BOWLES ON THE MIDDLE EAST

MR. CHESTER BOWLES, a former American Ambassador in India, during his recent visit to New Delhi, spoke on the Middle Eastern crisis to the Rotarians. His diagnosis of the disease which has vitiated the body politic of the region was as accurate as his remedy was original. But the remedy he has suggested is hardly practicable. According to Mr Bowles, the export of Soviet armaments to Egypt and Syria, the "seizure" of the Suez Canal by Egypt, the terrorist raids on Israel by Fedayen, and the Anglo-French adventure, had created the present crisis. For restoring peace and security in the area, Mr Bowles suggested that the Colombo Powers, in whose impartiality Israel and the Arab nations had faith, should help resolve the crisis. These Powers, he said, could achieve this by impressing upon the Arab States that Israel had come to stay, and by persuading Egypt to accept the principle of free use of the Suez Canal by ships of all nations.

In view of repeated and loud professions about Arab-Asian solidarity at the Bandung Conference and in the United Nations, Mr. Bowles's suggestion seems to be a challenge to the Colombo Powers. But it is doubtful whether this will usher in peace, even if the Arab-Asian nations are able to resolve the present crisis. So long as sub-human conditions of existence persist in the area, Communism will remain an attractive alternative. But betterment of living conditions would call for gigantic aid from outside. This the Colombo Powers are not in a position to give. The Colombo Powers also cannot provide a "protective military shield" to the Arab States, which the latter urgently need to counter possible internal subersion. Such economic aid and military protection can only be granted by Mr Bowles's own country. This aid and protection will be acceptable to the Arab States only if these are not accompanied by interference in their domestic and foreign policies.

A Window on the World

A FOREIGN POLICY FOR BRITAIN

By

ODYSSEUS

LONODN. (By Air Mail).

WHAT foreign policy is henceforth possible for the UK?

Should the UK say in effect: "Since we can no longer compete in the maintenance of the full panoply of costly nuclear weapons with the USA and the USSR, we will renounce the use of force as an instrument of policy. We will switch to industrial use all the capital and labour now tied up in war production. We will then become totally dependent on the goodwill of the USA for survival, but what of that? We shall grow fat and prosperous".

Were the UK to adopt such a policy, it would eliminate its power to influence the course of international affairs and relations.

I concede at once that in relation to the American and Soviet giants, the UK's influence has been substantially reduced, but most people who make this observation seem to think that this is the same as saying that the UK has no influence at all.

As a matter of cold fact, the Anglo-French Suez adventure has had the unintended result of teaching the USA — and several other countries — a sharp lesson, namely, that it is dangerous to show persistent indifference to the interests of those whose friendship you wish to retain.

Incidentally, as far back as March 30, 1956, in an article entitled "The Approaching World Crisis", I forecast the likelihood of war in the Middle East and the infiltration of Soviet power across our East/West line of communications. And again after Colonel Nasser had seized the canal, and 10 weeks before the Anglo-French adventure, I elaborated reasons here on August 17, 1956, for concluding: "So that the possibility of a war brought on by European desperation must be regarded as one of the factors in the situation." I had no inside information. I merely applied reasoning the logic to the observable facts.

In writing this, I am not condoning the nature of the Anglo-French Suez intervention: I am explaining how it came about, and why, deplorable in manner though it was, it has led the US State Department, and a number of other foreign ministries, to take warning that baffled and ignored friends fall back on reckless courses. There is today (or at any rate there should be) a more realistic appreciation in the foreign ministries of the free countries of Asia that the fact that Britain and France went the wrong way about tackling Colonel Nasser does not mean that persistence by Colonel Nasser in his policies towards the Canal, Israel, the Arab States, and the USSR, will promote peace or Asian interests.

After that diversion, I revert to my question: Should the UK renounce the use of force as an instrument of policy and concentrate all her resources in building up her economic strength?

THE RENUNCIATION OF FORCE

The renunciation of force in foreign policy makes sense (as Mr. H. G. Morganthau, Director of Chicago University's Foreign Policy Studies, said in an article in the "New York Times" on January 6) only on three assumptions:

(1) That no other country continues to pursue its interests by using, threatening, or implying force.

(2) That if, e.g. Country B does continue to rely on force, a group of other countries with interests in common retain sufficient force to deprive Country B of the advantage of having been the first to use force.

(3) That e.g. Country A's interests cannot be threatened by subversive action, infiltration, partisan or tribal warfare, or by non-violent agitation, instigated from abroad, against any of which Country A can only defend itself by the threat or the use of force.

These three assumptions do not correspond to the facts of international relations.

If the UNO were what many people seem to think that it is — a supra-national tribunal of justice with supra-national powers of enforcing international decisions — a nation would be justified in renouncing the use of force. But although the UNO has many uses and virtues, its decisions are reached by bargaining in the lobbies and they do not reflect abstract principles of justice but changing coalitions of power and interests.

That being so, if Country A were to declare that it would cease to use its own force, in conjunction with its friends, to pursue their common interests, or that it would never use force first, or would not use it in certain regions, or would use it only when authorised by the UNO — then Country A would expand the freedom of action of Country B whose interests were opposed to it and would limit its own freedom of action. In substantial degree, Country B could not without regard for the interests of other nations and the nation that had foresworn force would have condemned itself to helpless inaction. By the time that the point was reached at which Country A must fight or yield all, Country B might have gained a decisive advantage. What is more, Country A's declaration that it would not use force against B unless B used force first would be an invitation to B to find means, short of force, to further its interests at the expense of others.

The apparently conclusive argument against the use of force except in reply to froce is the risk of atomic war. I submit that the exact opposite is true.

The renunciation of force increases the risk of atomic war, because the country which has foresworn force is impotent before the threat of force. Even the most unwarlike of nations reaches a point from which it will, in sheer desperation, refuse to retreat and at which it will stand and fight rather than commit national suicide. But a succession of retreats up to this point may have weakened Country A decisivly and/or may have led its enemy Country B to underestimate both Country A's strength and its will to fight. If either the USA or the USSR came to believe, rightly or wrongly, that it could destroy the other without being destroyed in the process, the risk of atomic war would become acute.

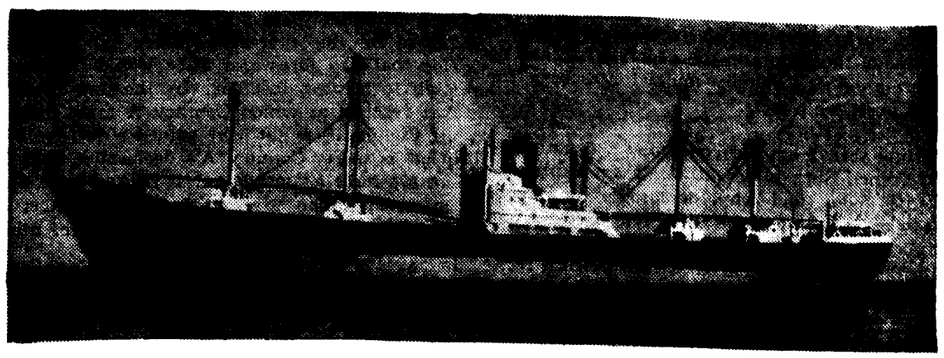
Weakness born of fear to use force leads to war. Peace is secured by the rational use of force. This means joining your force with that of friendly countries to support negotiations. It means recognising that, in an imperfect world, a bird in the hand is worth two in the bush.

In other words, it means being content to secure a realistic compromise that works, and be hanged to grandiloquent talk of "aggressors" and all the epithets that spring on readily to the lips of orators making propaganda speeches "for the record" at UNO.

If you insist on brandishing principles on all possible occasions, you promote inflexibility in international relations and intransigeant attitudes. True diplomacy promotes clarity of thought, and oils negotiations, by making no difficulty about admitting that what is at stake are divergent national interests — things that nobody need be ashamed of — to be ironed out by patient negotiation and readiness to compromise.

DEADLOCK PREFERRED TO COMPROMISE

The trouble about the contemporary use of principles is that so many people would rather have a deadlock with another country, leading to a continuously poisoned atmosphere, blowing up into periodical crises, than agree to a compromise, because that might admit that their cause was not wholly righteous and just. They seem to prefer nursing a national grievance and enjoying the feeling of moral superiority, and being in the right, to a compromise which would clear the air and perhaps render possible the diversion of funds and energies from national defence to more constructive spheres.



The classic example of the folly of the fear that the use of force begets war was the refusal of the British Conservative and Labour parties in the inter-war years to maintain Britain's armaments on a reasonable footing and their insistance on subordinating national policy to decisions of the League of Nations. Thus encouraged, Hitler, Mussolini, and Stalin in Europe, and Japan in Asia, proceeded to further their interests with steadily rising disregard for other countries. By the time that the free world took alarm and tried to make a stand, it was too late. World War II had become inevitable.

For these reasons, the UK will not today renounce the use of force as an instrument of policy. But I cannot emphasise too strongly that this is not the same as saying that the UK proposes to rely on the use of force alone.

One of the lessons brought home to London by the Suez adventure is the necessity of mobilising international opinion in support of any foreign policy. In other words, the British will rely first on trying to work out a common policy among a group of nations with the same interests. This should henceforth be — I had almost written "easier" but let us compromise on — less difficult, since one of the lessons brought home to Washington by Suez is the necessity of taking notice of the interests of your friends.

Secondly, the Suez adventure revealed the inadequacies of the present state of the British armed forces. The UK therefore plans to dovetail its production and weapons with US production so as to avoid duplication. Mr. Sandy's proposal that the UK should be content to "buy American" where she is behind hand, and to concentrate her production on those spheres where she is ahead, was welcomed in Washington. Over the next five to ten years, this will certainly render British policy more dependent on American, but the Macmillan government is looking further ahead and believes that, in the longer run, dovetailing armaments production will release capital and labour for more productive uses, and that this addition to economic power, plus the prosperity to be derived from a European common market, should build up Britain's strength and enable her ultimately to afford as much independence as any country can afford in the second-half of the atomic twentieth century.

That, at any rate, is how the problem looks from London.

NEW LIGHT IN DARKEST AFRICA

(From Our Special West European Correspondent)

PARIS, February 8.

WATCHING a debate in the French National Assembly a few days ago, I was not surprised to see many Africans in the public gallery for the matter in discussion was a law granting the 13 French African territories democratic rights in advance of those given to India in the 1935 Government of India Act, although still far short of those given in the 1947 Independence Act. But, what would surprise many of my readers and what marked the difference between this debate and those in the British House of Commons, was that not all the black faces were in the public gallery. Indeed, the French Parliament was at the time presided over by a negro, Monsieur Modibo Keita, a deputy from the French Sudan. On the Government bench sat a Cabinet Minister much concerned with the subject in discussion, for he was also a negro, M. Houphouet-Boigny, a deputy from the Ivory Coast. Leading the debate was the vice-president of the Overseas Territories Commission (a standing committee of the Assembly), who was M. Said Mohammed Cheik, a negro deputy from the Comoro Islands. The "rapporteur" on the law in debate (or spokesman of the select committee) was a substitute judge of the French High Court, also a negro, M. Apithy, representative of Dahomey. And scattered around the semi-circular chamber, sitting among all parliamentary groups from the Communists to the conservative parties, were negroes elected in the same way and with just the same status as the white French deputies.

So before attempting any facile comparisons with the British laws that brought India to independence, one would have to take account of the totally different constitutional framework in which these French laws are devised. Whatever its faults and virtues, the 1935 Government of India Act was not presented by a Government that included Indian Ministers to a House of Commons that had an Indian Speaker and contained many directly elected Indian M.P.'s. Moreover, the African members of the French Assembly do not consider their presence in Paris temporary or as having as its object the securing of laws that will make their membership of the Assembly unnecessary, by obtaining total autonomy at home. They intend to stay members of the French Assembly, while arguing for limited "States' rights" for their home territories. In other words, their objective is not the independence of their respective countries (a project they reject as the Balkanisation of Africa), but a federation in which those countries will indeed have much more autonomy than the French Assembly is yet willing to grant but will for all that remain constituents of the same Republic as metropolitan France.

This fact is important, because the laws in debate at the time consisted, naturally, of lists of subjects some of which were handed over to the control of the African territories while others were reserved to the French Assembly. This sort of law is common to all gradual movements toward home-rule, but obviously it takes on a very different colour when the metropolitan legislature to which certain powers are reserved itself includes representatives elected from the overseas territories. So there was not much dispute, at least at this late stage, about which subjects should be reserved and which allocated to the local administrations. Discussion centred rather on how the local administrations should exercise the power being granted to them. The African deputies were not unanimously content with the upshot of the debate, and in fact M. Apithy refused to pilot his Bill through the House when restricting amendments were forced on him; but others were favourable if not enthusiastic, while frequently the Africans were divided on the normal French party lines: Communists, socialists, radicals and conservatives.

The laws before the house were eventually passed in much more liberal form than the Government had at first intended, and the reasons for this will be mentioned below. Their scope briefly is this. They concern the eight territories of French West Africa (Senegal, French Sudan, Mauritania, Niger, Upper Volta, Guinea, Ivory Coast and Dahomey), the four territories of French Equatorial Africa (Gabon, Middle Congo, Tchad and Oubangui-Chari), and finally Madagascar. In each of these countries there already exists a local legislature, elected by universal direct suffrage except in Madagascar. The new laws will empower these legislatures to elect a council of Ministers which will govern the internal affairs of the territory under the presidency of a centrally appointed governor. The Minister who gets most votes from the legislature will be the governor's deputy and will, in limited cases, be able to act for him. The council will be liable to answer the enquiries of the legislature, and will resign when it itself judges that it has lost the legislature's confidence. This latter formula is plainly a watered down version of ministerial responsibility; moreover the governor retains extensive powers. The list of powers reserved to Paris is long: army, security, education, customs, radio and overall economic planning. The individual territories in West and Equatorial Africas will further co-operate in forming similar governments for each of those regions as units, where a similar balance between French and local powers will obtain. Finally, all these territories will continue to elect deputies to the French Assembly as before.

Plainly, these measures do not constitute any sensational leap toward full self-government; but then no one has pretended they do and no one is trying to pass them off as the full and final measure of French liberalism. Rather, the debate finished with everybody quite clear on the fact that this was just the first stage, and that before very long the African deputies (and the many French deputies who support them) will be back asking for more. But nevertheless these recent laws are a substantial advance from simple colonial status, and an advance that matches (if it does not actually exceed) the present social and economic development of tribal Africa. The concessions the French Assembly has made are greater than one would have expected from it two or three years ago, and this suggests that at last France is drawing the moral from her disastrous experiences in Indo-China and North Africa. Not that West and Equatorial Africas now show the least sign of going the way of Indo-China, but wisdom in these matters is to anticipate colonial demands by concessions which err on the side of generosity. This appears to be the course France has chosen in darkest Africa.

Not only are these laws better than one would have expected two years ago, but they are, as I have already said, more liberal in their final form than when

they were first framed. This is because in the interim France had granted to her trusteeship territories in Africa, Togoland and Cameroun, almost complete autonomy. "Almost" complete, it must be emphasised, not entirely so; indeed India argued, in the recent debates on the changes in Togoland in the UN Trusteeship Council, that the measure of autonomy involved was deceptive. But this overlooked the fact that further gradual development toward greater freedom is provided for; a majority in the UN, including some members of the Afro-Asian bloc, did not overlook this, and approved the French dispensation. At all events, the Africans in the French colonies regarded Togoland's progress as enviable, whatever Mr. Krishna Menon thought of it, and pressed in Paris for greater liberality for themselves. The present laws were the compromise outcome of that pressure.

In general, the French colonial empire in Africa is subject to several external pressures which make it urgent for Paris to promote home-rule in this region lest foreign influence set the pace. The first of these has just been mentioned: the progress that has to be made, on UN insistance, in the trusteeship territories, which whets the appetite of Africans in the neighbouring colonies. The second is the quicker pace at which Britain is granting independence to her territories in the region, notably the Gold Coast and Nigeria. Although the Africans in the French territories are in favour of federation rather than independence within a commonwealth, they still want their own civil status not to fall behind that given their neighbours in the British colonies. A third pressure comes from the north: this is the attraction that newly liberated Morocco is trying to exercise on the adjoining colonies of Mauritania and French Sudan. A fourth pressure comes from the north-east: this is the Islamic propaganda of Nasserian Egypt, directed through the former Anglo-Egyptian Sudan toward the French territories of Niger and Tchad. The population of French West and Equatorial Africa is 22 millions and of this number almost nine millions are Muslims, so there is ample material for pan-Islamic propaganda from the north and north-east.

So France's problem in darkest Africa is not the leisurely task of gradually preparing the Africans for democratic home-rule, but rather the more delicate task of implanting solid democratic institutions that will preserve the connection with the metropolitan country, and doing this slowly enough for it to be effective but quickly enough for it not to be outbid by foreign demagogy. This has to be done in the face of sniping and subversion from hypocrites abroad who demand, in the name of "democracy", the speedy establishment of cardboard republics—not because the Africans will be free in cardboard republics but because cardboard republics are the easy victims of neo-imperialist domination. Still we cannot regret that the task has to be accomplished in such conditions because, in dealing with the old imperialist powers, we always have the suspicion that without such pressure the task might not even be begun at all.

Finally, in evaluating the progress toward autonomy that France is permitting in her African territories, we should not make the mistake of comparing it only with France's achievements in Morocco and Tunisia and with Britain's achievements in Nigeria and the Gold Coast. We should also compare it with the total absence of such progress in the neighbouring territories of the Belgian Congo, in the Portuguese colonies of Angola and Portuguese East Africa and in the Spanish African colonies — not to mention South Africa's "protectorates". Except for the last-named, one rarely hears these territories mentioned. This is another example of the paradox that the democratic imperialist powers, who are making a genuine if sometimes reluctant effort to promote their colonial dependencies, come in for all the abuse of the professional anti-imperialists while the really ruthless imperialists, from Russia down to Portugal, who sit quiet and do nothing, benefit from benevolent neglect.

WORLDGRAM

AGRICULTURE

West Bengal Panchayat Bill: The President has given his assent to the West Bengal Panchayat Bill, 1956. The Bill has been promoted with a view to build up a system of village Panchayats in West Bengal. It provides for the setting up, at various levels, of village bodies invested with certain executive or judicial powers. At the base, in each rural area, there is to be one or more Gram Sabha, consisting of all adult persons whose names are on the electoral roll of the Legislative Assembly. For Every Gram Sabha there is to be a Gram Panchayat whose functions include ensuring of water supply and construction of village roads and bridges etc. Provision is also made for the constitution of Anchal Panchayats to be elected by a group of Gram Panchayats from among members of the Gram Sabha. Anchal Panchayats are to be responsible for taxation and maintenance of the rural police. The Bill also makes provision for the supersession and reconstitution of Gram Panchayats, Anchal Panchayats and other ancilliary matters.

INDUSTRY

Limits and Fits for Engineering: The Indian Standards Institution has circulated a draft Indian standard recommendation for limits and fits for engineering. The system of limits and fits recommended in this standard comprises suitable combinations of 16 grades of tolerances, or, in other words, grades of accuracy of manufacture, and 21 types of fits for both hole and shaft, ranging from fits of extreme interference to those of extreme clearance. It covers almost all the engineering requirements from very coarse to very fine gauge manufacture. It also defines many terms falling within this field and includes suitable figures to elucidate the point. Comments on this draft standard may be sent to the Indian Standards Institution, 19, University Road, Delhi-8, before April 11, 1957.

*

Development Councils for Electrical Industries: The Government of India have reconstituted the Development Councils for Heavy Electrical Industries and Light Electrical Industries. The new Development Council for Heavy Electrical Industries, which will cover industries manufacturing electric motors and machinery and equipment for the generation, transmission and distribution of electric power. The functions of the two councils remain unchanged. They are required to recommend targets of production, co-ordinate production programmes, suggest norms of efficiency, promote arrangements for better marketing and recommend measures for improving quality.

*

Extension Centres for Small Industries: Schemes to establish 34 Industrial Extension Centres to provide technical assistance to small-scale industries have been approved by the Government of India. Schemes for 15 more centres are under scrutiny. It is proposed to set up 60 such centres in the first two years of the second Plan period. The Extension Centres, which will be spread all over the country, are being set up to help specific small industries or groups of such industries concentrated in a particular locality. They will assist individual manufacturers in resolving the more common technical problems and refer difficult problems to the Regional Small Industries Service Institutes for advice. The centres will work under the guidance of the Institutes.

*

Standard for Seedlac: The Indian Standards Institution has just published an Indian standard specification for seedlac (revised). This standard is a revision of the Indian standard on seedlac which was published in 1949. In addition to the methods of test in the draft ISO recommendation, the Indian standard includes methods of test for the determination of bleach index and bleachability and non-volatile matter soluble in cold alcohol. The standard deals with terminology and sampling of seedlac and prescribes seven grades of seedlac namely, special A, B, C, D, E and F which are independent of colour designation, name of host trees or season, or any other proprietary name for various types of seelac now available in the market. In addition it includes requirements for volatile matter (moisture), matter insoluble in hot alcohol, colour index, bleach index and bleachability, non-volatile matter soluble in cold alcohol and ash. The Indian standard, which is based on the draft ISO recommendation for seedlac, is a step which will help to smoothen out the export trade because it is expected that the importing countries like the UK, the USA, France, Germany and others would also base their national standards on the draft ISO recommendation for seedlac.

*

Coal Tar Solvent Naphtha Draft Standard Issued: The Indian Standards Institution has issued a draft Indian standard specification for coal tar solvent naphtha, light, grade 2 for eliciting comments. The draft standard prescribes the chemical composition, physical properties and methods of test for the material commercially known as coal tar solvent naphtha, light, grade 2. Comments on the draft standard may be sent to the Indian Standard Institution, 19, University Road, Delhi-8, before April 21, 1957.

TRADE

Import Licences during July-December, 1956: Import licences of the total value of Rs. 461 crores were issued by the Offices of the Import Trade Control Organisation during July-December, 1956. This compares with the total value of licences issued during the earlier half year January-June 1956, which was Rs. 517 crores. The value of the licences issued in July-December 1955 was Rs. 344 crores. The total number of licences issued during the second half of 1956 was 1,38,361 as against 1,29,506 licences issued during the period January-June 1956. The Import Control Offices both at the headquarters in Delhi and at the ports disposed of a record number of applications for import licences during the period under review. The number of applications received was 2,03,071 as compared with 1,60,462 in the earlier half yearly period and 1,42,617 during July-December 1955. There was thus an increase of 26 per cent in the number of applications received as compared with the previous licensing period. The number of applications disposed of was 2,02,871 leaving only 200 applications pending—less than 1 per cent of the total receipts. The comparable figure of applications disposed of in the previous licensing period was 1,60,285.

*

Foreign Sea and Air-Borne Trade of India in December, 1956: The provisional figures of foreign sea and air-borne trade of India on private and Government accounts during December, 1956, according to data so far available in the Department of Commercial Intelligence and Statistics, Calcutta, are as follows: MERCHANDISE: Excluding transit trade of Pakistan but including that of other land frontier countries: Exports Rs. 54.85 crores, re-exports: Rs. 60 lakhs (transit trade Rs. 2 lakhs); Imports Rs. 67.69 crores (transit trade Rs. 1 lakhs); Total Trade Rs. 123.14 crores. TREASURE: Exports of gold Rs. 1 lakh; Currency notes Rs. 18 lakhs; others negligible. Imports of

currency notes: Rs. 1.11 crores; others negligible. BALANCE OF TRADE: The merchandise import figures are exclusive of the value of certain consignments of Government stores awaiting adjustment. Subject to this deficiency in import figures and to the exclusion of figures for transit trade and the total value of exports (including re-exports) of merchandise, gold and silver fell short of imports by Rs. 12.24 crores.

*

Increased Volume of UK Trade in 1956: During 1956 Britain had sold goods worth £3,173 million to oversea countries. Re-exports totalled £146 million. Imports in 1956 stood at £3,890 million. The December trade figures were: exports, £253.7 million; re-exports, £11.2 million; imports, £307.8 million. The area pattern of United Kingdom trade in 1956 showed a striking increase in exports to countries outside the Sterling Area, and especially to the dollar area—much greater than in any year since 1950. To such destinations there was a rise in exports and re-exports (excluding silver bullion repayments to the USA) of nearly £254,000,000, or 16 per cent. Two-fifths of this increase went to the dollar area, bringing exports to £250,000,000, or 24 per cent more than in 1955. Total exports to Western European countries also increased more sharply than in previous years. Most of the remaining increase in exports was to non-dollar Latin America, Japan, and Indonesia. Exports to the Middle East were somewhat higher than in 1955, principally to Iran.

FINANCE

Committee to Enquire into Customs Procedure and Organisation Appointed: The Government of India have accordingly (by a resolution published in the 'Gazette of India', dated February 2, 1957) appointed a Committee to conduct a comprehensive enquiry into Customs procedures and organisation and to make recommendations for their improvement. The enquiry will 'inter alia' cover the procedures for clearance of goods and passengers' baggage through the Customs, the administration of Import, Export and Exchange Control regulations, methods of classification and valuation of goods, procedure for grant of custom refunds and drawbacks, and liasion between Customs, Port Trust and Trade Control authorities. The Committee will function in the Revenue Department of the Ministry of Finance, Government of India, New Delhi.

*

Assistance to Village Industries: The Ministry of Production has sanctioned, among others, grants and loans totalling Rs. 89,900 for seven state schemes for the development of village industries. Among industries that will benefit are the village leather industry in Andhra Pradesh and Punjab, the handpounding of rice industry in Mysore, handmade paper industry in Jammu and Kashmir, the village pottery industry in Madras and the soap-making industry in Manipur. For executing specific schemes for development of handpounding of rice, Mysore has been sanctioned a grant of Rs. 14,530 and a loan of Rs. 24,000. Jammu and Kashmir has been sanctioned a grant of Rs. 16,250 for the development of handmade paper. A loan of Rs. 15,900 and a grant of Rs. 750 have been sanctioned for Andhra Pradesh and Punjab respectively for the development of village leather industry. Madras has received a grant of Rs. 9,000 for the development of the village pottery industry, while Manipur has been sanctioned a grant of Rs. 9,550 for the development of soap-making with non-edible oils.

*

Private Companies Founded in Northern Zone during November: Eighteen Private Companies with authorised capital of Rs. 1,22,20,000 were incorporated during the month of November, 1956, in the Northern Region consisting of Delhi, Punjab and Rajasthan. Of these, one company formed in Delhi had an authorised capital of Rs. 50,00,000. One Company having an authorised capital of Rs. 2,00,000 went into liquidation during the month under review. Nine Public Companies increased their subscribed and paid-up capital by Rs. 83,670 and Rs. 52,632 respectively. Sixteen Private Companies were prosecuted in Punjab and Rajasthan for failure to file the returns with the Registrars during the month. Of the pending cases, 19 were disposed of in Delhi and Punjab.

*

Company Formation in Northern Zone in December: One public Company and 14 Private Companies, with an authorised capital of Rs. 1 lakh and Rs. 134 lakhs respectively, were incorporated during the month of December 1956 in the Northern Region consisting of Delhi, Punjab, Rajasthan and Uttar Pradesh. Of these, one company formed in Punjab had an authorised capital of Rs. 50,00,000. Two public companies and 9 private companies, with an authorised capital of Rs. 22,00,000 and Rs. 68,60,000, respectively, went into liquidation during the above month. Six public companies raised their subscribed and paid-up capital by Rs. 15,66,880 and Rs. 9,55,690 respectively.

GENERAL

Electricity Output: During October, 1956, 753 public electricity supply undertakings produced 822.5 million kilowatt hours (kwh.), of which 670.1 million kwh. were sold to ultimate consumers. Power production during September, 1956, was 811.1 million kwh. One Diesel generating station and seven purchasing undertakings were the new additions during the month. The Diesel generating station is at Kasimpur in West Bengal. The purchasing undertakings are at Dasnagar and Tufanganj in West Bengal, Badbag and Kendrapara in Orissa and Umaria in Madhya Pradesh and Mansa and Dhansula in Punjab. Output and sale of power during October, 1955, were 719.3 million kwh. and 591.1 million kwh. and during October, 1939, 216.4 million kwh. and 180.0 million kwh. respectively.

*

Development of Indian Handicrafts: Two pilot schemes in the Nilgiris in Madras—one for the starting of a training-cum-production centre for the Kurumbas in mat-weaving and basket making, and another for training Toda women at Nigachimand in embroidery work, a scheme for the opening of three training centres —two for fancy weaving and one for carpets and druggests weaving in the Community Project Blocks in U.P., a scheme for the continuation of the Arts and Crafts Design Centre at Cuttack, and finally two schemes for the development of the kalamkari industry in Andhra Pradesh through the Balyalguda Cottage Industries Co-operative Society are among those which will benefit from grants and loans totalling Rs. 75,757 sanctioned by the Ministry of Production for the development of Handicrafts in different States. For the training-cum-production centre for the Kurumbas, the sanctioned grant is Rs. 11,015, while for the scheme for training in embroidery at Nigachimand, it amounts to Rs. 13,136. The grant for the Arts and Crafts Design Centre at Cuttack is Rs. 14,282, and that for the training centres in Community Projects in U.P. is Rs. 28,974. For the Kalamkari industry in Andhra Pradesh, a loan of Rs. 7,500 and a grant of Rs. 850 have been made.

*

Working Conditions for Dockyard Labour. Out of the 22 dockyards in India, 17 employed 36,709 workers whose wages ranged between Rs. 12 to Rs. 38 a month. The minimum dearness allowance varied between Rs. 18 to Rs. 58-8 per month. The employment in dockyard, however, fell from 52,809 in 1953 to 36,709 in 1955. The fall which was more than 30 per cent was pronounced in the case of contract labour.

NEWS IN BRIEF

INDIAN

The Union Government has set up an expert Committee to recommend measures for the promotion of exports.

*

The first Government oil drill would go into operation at Jwalamukhi by the end of this month, according to the latest information available at the Ministry of Natural Resources.

*

The Government of India has sanctioned 18,000 automatic looms for the production of 350 million yards of cloth.

*

Out of India's quota of 400 million dollars the International Monetary Fund has agreed to release 200 million dollars (about Rs. 100 crores) in the course of the next twelve months in favour of the Government of India.

*

The labour incentive scheme which has been in operation in the Chittaranjan Locomotive Works for about one year has resulted in the output of the works going up by 30 per cent and increased emoluments to workers, according to official sources in New Delhi.

*

The third national convention of farmers of India will be held in New Delhi from March 20 to 25, 1957. The convention is being called under the auspices of the Farmers Forum.

*

Calcutta port registered an increase of 216,922 tons or about 2.78 per cent in the total trade passing through the port in 1955-56, as compared with the previous year.

*

It is reported that the Centre is already supplying 70,000 tons of wheat a month to Uttar Pradesh and an additional allotment may be given shortly.

*

The Board of the East India Cotton Association is understood to have decided to include "four average quality" of cotton for the purposes of tendering in the hedge contracts.

*

The Government of India has announced that the total quantity of Indian cotton released for export is 2 lakhs bales and not 150,000 bales.

*

The Indian art silk industry has entered into agreement with its counterpart in Japan to make a bulk purchase of more than three million lb. of rayon yarn from Japan at prices 10 per cent cheaper than the ruling prices in Europe, India's main source of supply.

*

A cash contribution of £8,00,000 and provision of technical aid for the execution of the Delhi milk supply scheme have been promised by the New Zealand Mission.

*

A press note issued by the Central Board of Revenue says that the rates of stamp duty on promisory notes falling under entry No. 49-B of the first schedule to the Indian Stamp Act are being fixed at the same levels as the rates on bills of exchange of equivalent amounts.

FOREIGN

The Bank of England has lowered its interest rate for lending money from 5½ to 5 per cent.

*

American round-the-world air service will come to Bombay for the first time when Trans World Airlines inaugurates its new global flights later this year.

*

An Asian College Press Conference will be held in Manila from February 18 to 24 under the joint auspices of the Student Councils Association and the College Editors Guild.

*

It is reported a five-man United States trade mission will soon leave for India when they will tour the country to assist and advise businessmen on Commercial activities in the U.S.

*

It is reported approximately 100,000 tons of rock phosphate would be available for export from Israel in 1957. The first year during which large-scale exports will become feasible.

*

German shipbuilding output last year amounted to 987,718 gross registered tons of ocean-going merchant tonnage against only 884,978 tons in 1955. Exports accounted for 566,159 tons against 422,672 the previous year. The value of delivered tonnage was DM 2,135 million (£182 million) against DM 1,971 million (£168 million) in 1955.

*

About 220 foreign enterprises, including 107 subsidiaries, are now sharing in Dutch industrial production. Their annual contribution to Dutch output amounts to about Fls. 750 million (£70 million) gross, of which more than 50 per cent is exported.

*

British output of man-made fibres reached a new record in 1956. A total of 482.6 million lbs. was produced, as increase of 2 per cent on 1955.

*

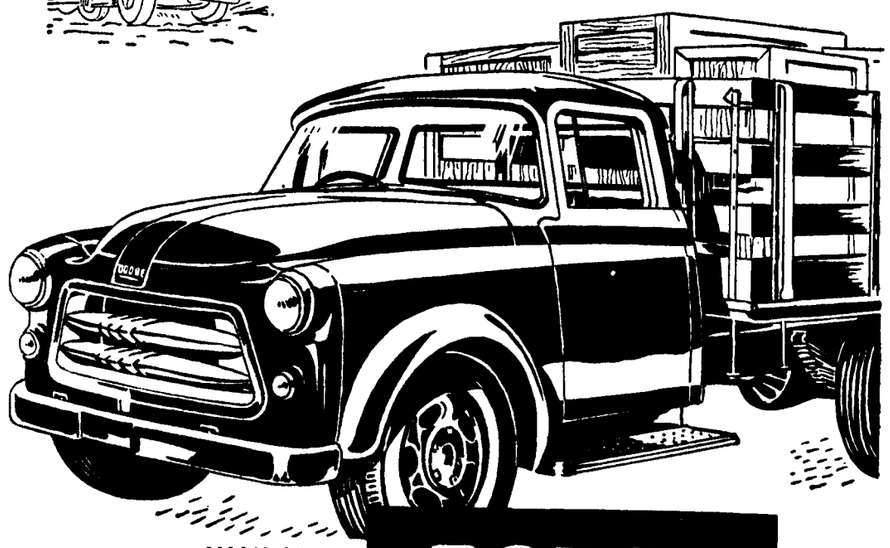
Britain's hosiery industry was working at record levels during August, September and October last year. According to figures published in the Board of Trade Journal, production in the three months August to October last was 6 per cent greater than in the corresponding period a year earlier.

*

The Washington State International Trade Fair, sparing no effort to make the 1957 exposition more profitable and interesting to national government exhibits and buyers than ever before, is sending a merchandise expert to six Asian countries to advise on samples for the coming fair.

*

Holland's two leading shipping companies, the Royal Rotterdam Llyod and the Nederland, have decided to increase passenger fares on the Cape route by about 15 per cent with effect from 1st March.



*

Output of coke in the European Coal and Steel Community in 1956 reached a new record level of 74.8 million metric lbs. This represented an increase of 9 per cent over the 1955 figure of 68.6 million metric tons.

Experience says DODGE trucks are Profitable to run

Dodge trucks get there quickest at lowest cost. Their ruggedness and every engineering feature lead to maximum performance with maximum economy. Their speed and sharp turning angles save time. All this adds up to more trips, more loads, more profits.

Special Article

SMALL BUSINESS IN AMERICA

THERE is far too much talk in our country about encouraging small-scale industries and far too little of actual work and of a suitably planned approach to the problem. Even the few honest efforts made here and there do not last evidently because of the lack of adequate encouragement. And even where encouragement is given, the absence of an agency to follow up how the assistance given is actually used by the recipient unit of the industry, precludes a proper assessment of the position. Nor are there special and specific bodies of the two Houses of Parliament to keep track of the problems of these industries. Whatever has been done so far—reports by expert bodies, formation of directorates, etc.—barely touches the fringe of the problem.

But it is not only in our country with all these handicaps that the small-scale industries present a problem; their lot does not seem to be very much different even in countries like the USA, where the small-scale industry is supposed to be a pet and privileged child of the State. "The small business man" (this term includes both the small industrialist and the small trader), it is claimed by Americans, "is the traditional symbol of individualism and our free enterprise system". And yet President Eisenhower has found it necessary to busy himself with a new programme based on a recent report (published in August last) of a Special Cabinet Committee on Small Business, which was headed by Dr. Arthur F. Burns, the then Chief Economic Adviser to the President. This report recognised that problems pertaining to small businesses did exist and also recommended certain types of assistance, such as tax relief, reduction of reports and red tape, improved procurement and stepped-up anti-monopoly action, among others.

This report and the difficulty of formulating policies for the President's proposed programme form the subject-matter of an interesting discussion in the latest Monthly Letter of the First National City Bank of New York. The first difficulty with regard to small businesses arises in regard to the definition of what small business is. There is then the problem of devising steps, which, while being helpful to small business, must not adversely affect bigger units, some of which at least have grown big in the normal course by adopting fair business practices. Now, no definition can be fool-proof, nor can it satisfy all criteria, as the reported differences between the Small Business Administration and the Senate and the House Small Business Committees in the US show.

It is interesting to note that, according to Mr. Eisenhower, the number of small businesses in the USA are approximately four million—which is estimated to be about 95 per cent of the total business population in that country at the beginning of 1956—providing employment to more than 25 million people and accounting for about a third of the national output of goods and services. These small business men belong to the category of those (whom one finds all over the world) who do not care to work for others but prefer to risk their time, their ingenuity and their savings in an enterprise of their own choosing. Really speaking, it is these who constitute the core of free enterprise in any country and not the tall poppies only —the tall poppies don't even constitute a majority as some of our official spokesmen seem to believe and, what is worse, also base their policies on this belief. If, in India, we say it is anybody's fundamental right to practice whatever profession he chooses, the Americans say it is the inalienable right of anyone in America to lose one's shirt. That is his cherished right. Although we too say we cherish such a right, some of the policies and measures of our Government do not appear to reflect this conviction.

Instead of isolating the complex and varied problems of small business, the discussion in the F.N.C.B. Letter seeks to approach the difficulties that crop up in what it calls "those broad areas that greatly influence small firms' ability to get started and grow" and names big Government, big labour, and big business as such areas. Mark the order in which these areas have been listed; it also shows the order of the extent of hurdles to small business that these constitute. Contrary to popular notion, the discussion convincingly brings out that it is not really big business that is the bugbear and undoing of small business, but that distinction belongs first to big Government and next to big labour. This is not very different in our country either. Let us see in what way big Government and big labour behave, according to the F.N.C.B. Letter.

The first problem that big Government creates for small business—why, for that matter, for every business—is the heavy burden of Federal taxes. Examining how heavy taxes affect business, the Letter says: "These levies hit small business in two ways: first, they infringe on ability to plough back profits into the business. Retained earnings are normally the principal source of money for the expansion of a successful business. Second, the small firm looking to outside sources finds wealthy bankers few and far between. Their numbers have been decimated by the wealth-redistributing effects of twenty-four years of steeply progressive income and estate taxes". This is also the experience in the UK. One would naturally expect any Government to profit by these glaring experiences of other countries, but, in their superior wisdom, our rulers seem to believe in themselves experimenting the very same policy all over again to be convinced of its proved results and that with a vengeance. Thus, ploughing back is sought to be effectively discouraged in our country by both heavy taxes and, now, by compulsory deposits of reserves.

The second problem that big Government confronts small business with in America, we are told, is the orders which Government places. Apart from intricate military items, most of these are the products of private economy. The trouble with Government orders is that they are not spread out (as seems to be the case with the order of the Defence Department) but are subject to annual appropriations.

A third source of nuisance to small business—this is a source of nuisance to almost all businesses in our country—is stated to be the Government operation of such things as ice cream plants, laundries and false teeth factories. True our Governments have not quite descended to this level, and it must come as a surprise to many in this country that even in that haven of free enterprise that the US is, the Government should be operating nearly 20,000 commercial-industrial activities in competition with private industry! But this does not make it less of a nuisance.

Yet another headache occasioned by big Government is "the mountain of paper work required of a

small business man, partly in connection with the work he is supposed to undertake as an uncompensated collector of taxes levied on employees and customers". This is, of course, in addition to "the mountain of rules, regulations and edicts promulgated by Governments, State, and local, as well as Federal, which tell the business men everything from the kind of language he can use in advertising his product and the working conditions he must provide if working on Federal projects to the kinds of ingredients he can put in his product and the level of wages that must be paid". The small business man in India may have something to comfort him, in that his confrere even in America suffers from the same handicaps, but public opinion both here and in the USA rightly regards this as too much of a nuisance to the poor devil of a small business man.

The headaches that big Labour causes even more acute and here, again, our small business is a fellow-sufferer. Our labour leaders will do well to take note of what their demands mean to our small industries, even as they are to small business in America. The F.N.C.B. Monthly Letter compendiously terms the set of problems that big Labour creates for small business as "the wage-price-cost squeeze". The upward trend in the cost of doing business in recent years has particularly affected small business, we are told, because they are marginal producers and are, in consequence, less able than larger companies, to pass on increased costs in higher selling prices. These small businesses are forced to accept patterns of higher wage rates and other benefits as per agreements between labour and large-scale employers which they can ill afford, so that there is a rise in costs which is beyond what they can recoup by higher selling prices and the result is a squeeze on their already narrow margin of profit. A well-known labour leader—Harold J. Ruthenberg—recently exhorted to the Unions to adopt a realistic view-point, co-operate with and not drive the small manufacturers to the wall. According to him, "the Unions—not the cupidity of big business—are a prime mover in the tremendous merger programmes that have been under way in the last several years in American industry. They force a small company over the horizon, over the hill where they have got to go and get under the umbrella of a big company by becoming a division of it—selling out".

It is noteworthy that it is not any wanton action of big business that harms small business. Inherently, big business has certain advantages which small business does not have, such as, for instance, ability to command quantity discounts (because it can place at any time orders for a large quantity) and availability of credit. Here, the F.N.C.B. Letter pertinently draws a distinction between lack of credit and lack of capital. Many small business men do not actually mean credit facilities when they complain that they cannot raise funds. There are also other ways listed by the Letter in which big business has an edge over small business, as, for example, pace of technological changes, growth of radio, television and other mass media which big business can more easily take advantage of than small business. On the other hand, small business also has certain advantages denied to big business, such as the ability to have closer personal touch and do more of a custom job, attracting customers on the basis of speciality products, quality and personal service rather than price and greater flexibility to switch-over from one line to another to meet changing market conditions and tasks. Finally, in more cases than not, the two are complementary and supplementary and not competitive and suppressive of each other at all. This vital interdependence has been strikingly brought out in a recent study by the Du Pont Company as follows: "Contrary to popular belief, the bigs and the littles do not compete directly for the same business. The bigs do the jobs for which they are best-equipped—volume production, large-scale research and developments. Only companies with large resources can participate in these fields requiring heavy investment in development and productive facilities. The small companies, on the other hand, excel in processing, converting and distributing the products of big business".

From the point of view of India, what is noteworthy about this discussion is not the complexity of the problem as such, which everyone recognises, but what President Eisenhower proposes to do to meet it. His programme is expected to provide for a 20 per cent cut in the present 30 per cent. Federal taxes on a Corporation's first $25,000 of income; for accelerated depreciation on used machinery purchases up to $50,000 a year; option to taxpayers of paying death taxes over a period of up to 10 years in cases where the estate consists largely of investments in closely held businesses; and option to Corporations with 10 or fewer stockholders of being taxed as if they were partnerships, thus enabling them to avoid being taxed twice on their earnings, all involving a loss of $600 million to the American Exchange every year. These must, of course, remain of academic interest to small business in India, where our Finance Minister is intent not on reducing taxes but on enhancing them even beyond the maximum limit of possibility set by the Taxation Enquiry Commission.

In summing up, the Letter observes that no programme, however well-conceived, can be a cure-all and that there are limits on what can be accomplished to small business. However, it says the Government can help all business, not small business only, by pursuing "monetary, fiscal and house-keeping policies that foster sustained expansion in overall business activity without contributing to price-inflation". This advice can as well be offered to our own Government today.

BOOK REVIEWS

INDUSTRIAL INDIA

Industrial India Annual 1956: Edited by T. V. Jayaraman: Published by the All-India Manufacturers' Organisation, 4th Floor, Co-operative Insurance Building, Sir Phirozshah Mehta Road, Bombay-1: Pages 196: Price Rs. 3-8.

This exquisitely-produced Annual of 'Industrial India' is a worthy and welcome addition to the recent annuals brought out by other institutions. The publication is in two parts—the first containing general articles and the second giving special reviews of industries. The leading articles in Part I cover India's socialist pattern, tax problems, role of tariffs in industrialisation, resources for the Plan and the economics of atomic industry. The restrained tone of these articles renders the criticisms made therein all the more convincing. The editor thinks that the socialist pattern, "has still in it a hard core of the Sarvodaya spirit or philosophy". This is a consoling thought. Mr. Murarji J. Vaidya, Chairman of the Editorial Advisory Board, who writes on what a truly indigenous pattern of socialism should be, makes the pregnant observation that "the concept of socialism has to be moulded into an Indian pattern where the basic concepts of human liberty, of moral values and of voluntary and spontaneous sharing of the material possessions and resources are emphasised as against a regime of controlled and super-imposed pattern of life". In the context of what Vinoba Bhave has achieved, the author thinks that there is a promise of fulfilment of the ultimate objective of social welfare through a just economic order based on moral values. The lack of a two-party system, the 'cult of personality' ingrained in the ruling Party, the domination of the legislature by the executive and the failure to make a clear distinction between the state, the government and the party, are referred to more in sorrow than in anger in another leading article.

The article on the economics of atomic industry is very interesting. It drives home the point that in view of the heavy capital requirements of this industry, countries with limited resources cannot develop it. When a country like India has not made full use of her other sources of energy like coal, oil, hydro-electric power etc., there is no point, the Editor says, in wasting the limited resources in the development of new forms of energy. The immediate possibilities of atomic energy are described as very limited, for atomic raw materials are very limited in supply. The article entitled 'Tax Problems and Austerity' makes out a good case for a sectoral study of tax burdens as a global picture of the overall income generation in the country is insufficient and misleading. The article on the role of tariffs in industrialisation pleads for making them an integral part of the business of planning. Among other illuminating articles in Part I mention may be made of the 'Income Targets of the Plan' by Prof. Hannan Ezekiel, the 'Labour Policy in a Socialist State' by V. V. Giri, the 'Role of Research in Industrial Development' by Dr. S. D. Mahant and the 'Productivity of Labour in Industry' by Dr. N. C. B. Nath. Part II of the Annual, covering minerals, heavy and basic industries, engineering industries, transport, plantations, ceramics, and other industries, is very valuable on the score of up-to-date facts and figures found in a series of articles. The Annual as a whole, printed on art paper and reproducing a number of photographs, has an impressive look. What is more, the factual articles in the Annual invest it with reference utility of a reliable kind.

POPULATION

Population Review: January 1957: Vol. 1, No. 1: Published by the Indian Institute for Population Studies, Gandhinagar, Madras 20: Editor Dr. S. Chandrasekhar: Pp. 54: Price Rs. 5.

This bi-annual journal of Asian demography is the official organ of the Indian Institute of Population Studies recently started to popularise existing knowledge about population problems and to add to it by further research. The Editor is a well-known student of demography and the 'Review' is thus bound to go a long way in filling the lacuna in this field. In a country like India where poverty and lack of resources are the major problems, the control of population is of crucial importance and it is a good sign that here the Planning Commission and the Government of India are bestirring themselves. But independent study and research of demographic problems is no less important and urgent. The first number of the 'Review' contains some good articles. Mr. R. A. Gopalaswami writing on 'Family Planning and National Planning' explains how family planning is vital as a means of stabilising the size of the nation thereby promoting national welfare. Prof. Stuart Kirby, in an article entitled "An approach to Population Policy in Asia", pleads for fresh applications of the lessons of rationalist thought on population problems. Dr. LeRoy Allen explains the family planning study conducted by the Vellore Christian Medical College in a rural area as a part of a comprehensive health service. The journal also contains some good book reviews especially on population problems. Though a bi-annual, the price seems to be rather on the high side.

POLITICAL SCIENCE

Laski Institute Review: Vol. I No. 1: December, 1956: Published by the Harold Laski Institute of Political Science, Ahmedabad: Editor Purushottam G. Mavlankar: Price Rs. 2.

The original contribution of Professor Laski to political and social thought is so immense that it may require a good many years to be systematically assessed. India has particular reason to be grateful to Laski's memory, for he so warmly identified himself with the cause of her freedom. It is, therefore, appropriate that an institute of political science named after him should have been started in Ahmedabad in 1954 to encourage the scientific study of political problems. The 'Laski Institute Review' which has made its debut as a bi-annual under the auspices of the institute, naturally deserves good reception. In a message which the journal carries, Mr. Nehru points out how Prof. Laski not only taught Economics and Politics, but how to apply them to human welfare. Therein perhaps lie the lines on which the journal can profitably look forward. Being the first number, the 'Review' consists mostly of reproduction of speeches of leaders and distinguished persons made on different occasions. It is to be hoped that the future issues will contain articles written specially for the journal keeping in view the ideals of Laski to whom 'service to thought is the noblest calling".

WORKERS' EDUCATION

Co-operation: A Worker's Educational Manual: International Labour Office, Geneva: Pages 157: Price Rs. 6/-.

It is being increasingly recognised that for the successful working of industrial democracy, a systematic programme of workers' education is very essential. In his report to the I.L.O.'s Annual Conference in June 1956, Director-General David A. Morse said that the aim of the workers' education programme was "to promote among the workers, in all parts of the world, an objective knowledge of the social conditions and problems confronting them so that they will be able to deal with these problems in an intelligent, rational and responsible way". To give concrete shape to it, the I.L.O. began in 1956 to prepare a number of courses in the form of concrete manuals written in concise language for the purpose of educating both teachers and pupils in this field.

The course covered in this book is concerned with co-operation. It consists of 14 lessons which deal comprehensively with the different aspects of this vast subject ranging from the origins of the movement and problems of structure and management to the relationship between the State and the Co-operative movement. Each lesson is followed by a series of questions. The questions sometimes go further than the relevant lesson, and some of them call for further research which can be affected by means of the publications suggested for reading on the part of the pupil. There are bibliographical references at the end of the book.

The work done by the International Labour Office in this field merits ample appreciation. The publication of this manual has accidentally coincided with the appointment by the Government of India of an eight-man team for workers' education. It could be of great use in the formulation of a programme of workers' education in this country.

The Business World

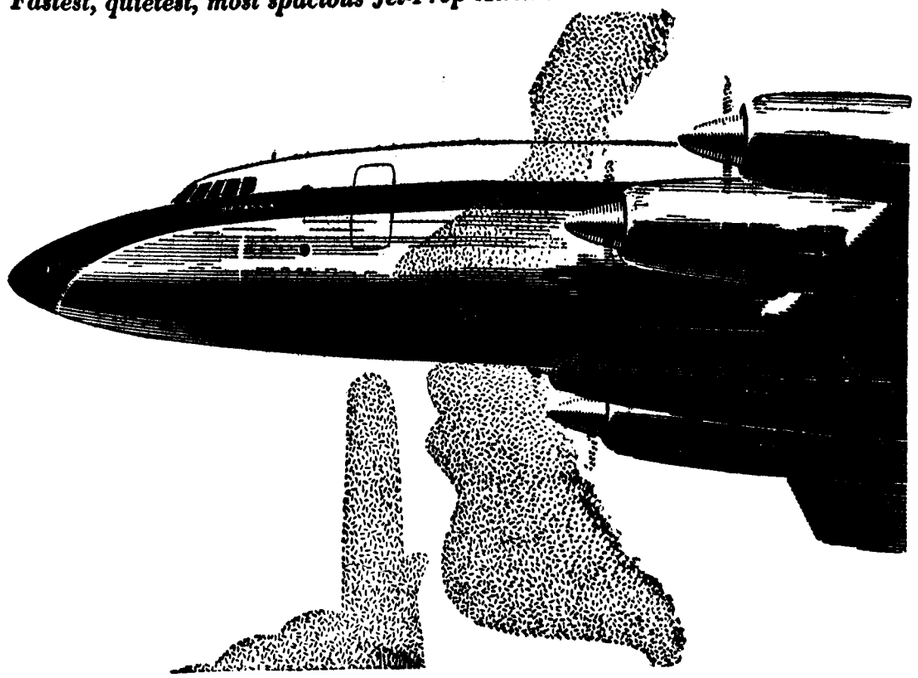
ARBITRARY PRESCRIPTION FOR COTTON

By

CROESUS

OF late commodity markets have been behaving rather queerly. There are clear signs that the Forward Markets Commission, which has been entrusted with the task of supervising the efficient and satisfactory functioning of these markets, is beginning to assume more and more powers. Only, presumably due to the painfully long-drawn out episode of the cotton crisis in December-January 1955-56, the Forward Markets Commission has lately been extra cautious in its approach, as witness its tackling of the situation in the oilseeds market not long ago. When there was a marked increase in prices of groundnut and castor futures, the Forward Markets Commission called pointed attention to this trend and asked the Bombay Oilseeds Exchange to take necessary remedial action. At the instance of the F.M.C., the Bombay Oilseeds Exchange promptly stiffened the margin system which has stopped a further rise in prices, at any rate for the time being.

In the case of the cotton futures market, there was a period late last month when there was quite an upsurge in prices. The Jarilla contract was taken up as high as Rs. 681 on January 28, the rate which was quoted even on the very first day of the resumption of trading inaugurated by Mr. Morarji Desai, the Union Minister for Commerce and Consumer Industries, on June 18, 1956. True, the rate was taken up even higher —Rs. 706—at one time, but, then, for the greater part of futures trading in cotton, the predominant characteristic has been distinctly bearish. Accordingly, opinion has steadily gained ground in the cotton market in Bombay that, unless something is done, this bearish characteristic of the contract will continue to plague the market to the detriment of effective hedge trading. It was in this connection that the East India Cotton Association mooted the question of bringing about some amendments to its by-laws. By-law 55, which provided for the fixation of tendering differences on the basis of futures prices, for example, was sought to be amended, so that tendering differences could be fixed in relation to spot values. This amendment, it was firmly believed in market circles, would, in the first place, remove the wide disparity between spot and futures prices and thereby lay the axe at the root of the inherently bearish bias of the hedge contract obtaining now. Along with the amendment to by-law 55, it was also suggested, by a large section of the trade, that a suitable amendment should be effected to by-law 61 dealing with the invoicing back provision. This school argued that it was essential to safeguard the interests of buyers in case of failure of sellers to tender and the only remedy to do so in some measure was to amend by-law 61 simultaneously with by-law 55. Against this, however, it was argued by some that amendment to both the by-laws simultaneously would only amount to inviting trouble, in that it would accentuate the avoidable bullish implications of the present hedge contract. In other words, they said it would, in effect, mean the substitution of one evil for another; if the bearish slant of the market were replaced by an undercurrent of sustained bullishness, there was no knowing what actions the F.M.C. might take.



While conflicting views were being expressed thus by the trade and the mills over the issue of amendments to the East India Cotton Association by-laws, the EICA decided in favour of amending by-law 55 with effect from the coming settlement, while recommending 'status quo' in respect of by-law 61. This decision was still awaiting the approval of the F.M.C., when, like a bolt from the blue, came the EICA's latest proposals, following a meeting on February 1, 1957, to help assist the Government in curbing the inflationary trend in the country. By an official notification, the EICA appealed to the trade to fall in line with the overall policy of the Government to curb inflation and also pleaded for the co-operation of the trade to enable it successfully to implement some of its new proposals to check speculation. These measures include, among others, the raising of the margins in respect of futures and the stoppage of trading in delivery contracts. Strangely enough, the EICA also let it be known that the 'status quo' would be maintained in respect of by-law 55; that is, it declared, in effect, that the much-debated amendment of the by-law also was to be put in cold storage.

Naturally enough, the cotton trade generally has taken very strong exception to the rather arbitrary manner in which the EICA has thus proceeded to prescibe its own novel—if it is too much to say, imposed—remedies to cure the prevailing cotton malaise. The question is accordingly asked: "Why has the Forward Markets Commission's duty been taken over by the EICA, which is supposed to function as the spokesman of the cotton trade?" The trade is frankly perplexed as to what desperate need there was for the EICA to proceed with the measures to curb imaginary speculation it has so suddenly proposed now. For it can be easily established, besides being known to all, that there had been no speculation in the cotton futures market at the time when the EICA met to consider the question, nor, for that matter, either immediately preceding or following it. Even when the Jarilla contract ruled around Rs. 681 as on January 28, 1957, there was no such move by the EICA in anticipation of Governmental interference. Nor was there any move by the F.M.C. to come to the aid of the market when the contract suffered a precipitous decline to Rs. 618 as on December 28, 1956. In the circumstances, it is rather stretching the point too much to suggest, as the EICA seems to, that the recent recovery movement was directly attributable to speculation. Not even when the contract was ruling around Rs. 706 was it considered alarming either by the F.M.C. or by the E.I.C.A. How then has it come to be felt that the much lower level of Rs. 681 was reached because of speculation? It must be pointed out here that this level was reached towards the end of January, when there were definite evidences to show that Indian cotton had suffered some damage qualitatively, and, what is more, the sustained demand for Indian cotton then was further aided by the approach of the tendering period.

In the light of the foregoing, it is clearly crying wolf—and also acting on that basis—by the EICA to confront a distinctly declining cotton market with a set of arbitrary measures meant to stop an imaginary 'speculative rise in prices'. The only explanation to all these can be that a large majority of the traders themselves are interested in perpetuating the bearish phase of the market. This is, indeed, a situation fraught with grave consequences, although it must appear to the authorities propitious at the present inflationary juncture. Let the F.M.C. take note of this.

STARTING LONDON—KARACHI—CALCUTTA—SYDNEY—MARCH 1957

Fastest, quietest, most spacious Jet-Prop Airliner in the world

THE B·O·A·C

Whispering Giant

Britannia

Meet the "Whispering Giant" *Britannia* — now in service between London and Johannesburg. Its very *size* is enough to astonish you—yet it's so *smooth* in flight at nearly 6 miles a minute, you'll find it hard to believe you're moving at all. The standard of comfort is revolutionary; the spaciousness of the cabins a miracle of planning; the service beyond comparison. The B.O.A.C. *Britannia* is equipped with the latest radar for fair-weather flying all the way. At your journey's end you are as fresh as when you first stepped aboard...and you reach Australia or London *hours sooner!*

Britannia flights are additional to luxury 'Connoisseur' and Tourist Class services operated by QANTAS *Super-G* Constellations.

Join this great new service at KARACHI

Economic Report from the U. S.

THE AMERICAN GOVERNMENTAL SYSTEM

(BY GUY SIMS FITCH)

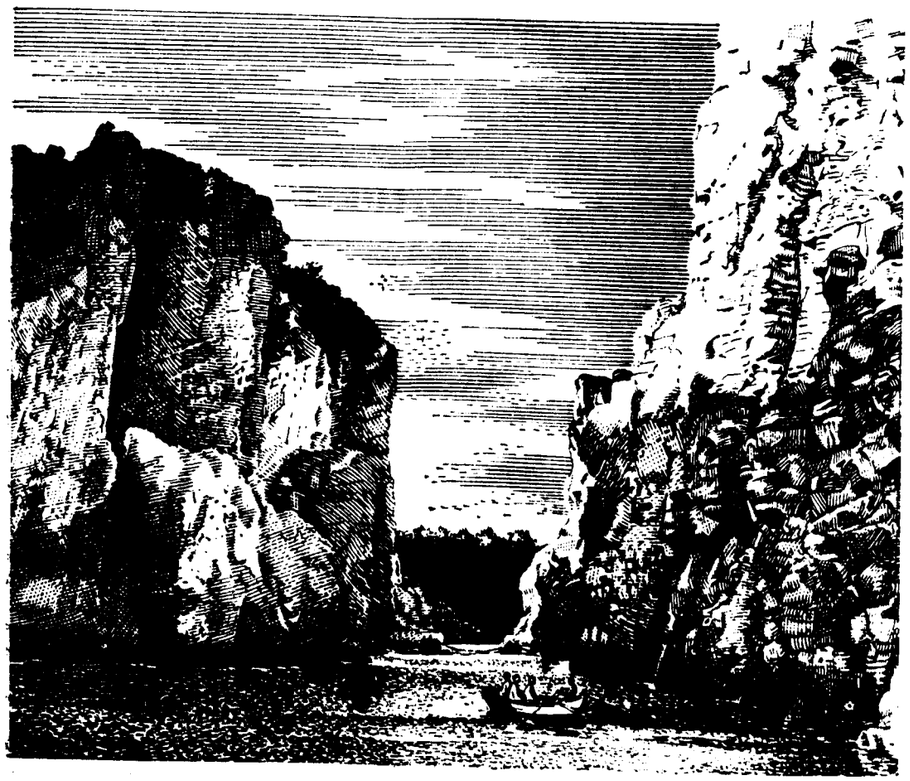
WASHINGTON, Feb. 6.—Under the American governmental system, States and local Communities bear primary responsibility for many vital public services. Over the years, spending by these governmental units on schools, highways, hospitals and other facilities has consistently exceeded the expenditures for these purposes by the Federal, or National, government in Washington. In fact, much of the Federal spending in these fields has taken the form of financial aid to the States. And the States, in turn, have helped local communities meet their obligations.

In the past decade, under the impetus of population growth, rising living standards and correspondingly increasing demands, State and local spending has shown a steady, and indeed, a spectacular rise. Thus, while total Federal expenditures have fluctuated, largely in response to national defence needs, total State and local outlays have gone up continuously, year by year. In 1956, State and local governments spent all told $32,800 million on goods and services, three times the 1946 total, and nearly double the 1950 total. From 1955 to 1956, governmental spending — Federal and non-Federal — rose by $3,100 million to a total of $79,900. million of this increase, fully $2,700 million was accounted for by increased State and local outlays.

This year, States and communities face a particularly heavy task in meeting the need for men for new and expanded facilities. Their central problem thus now is how to bring revenues in line with soaring expenses, which probably will exceed $35,000 million in 1957. A few States still have surpluses accumulated in prior years, but most have depleted their reserves and must find new funds.

This inevitably calls for larger tax receipts. In 1955, more than 3,000 tax revisions were instituted by State legislatures, nearly all of them upward. These tax revisions, along with the stimulus of record business activity and consumer earnings helped narrow the gap between outgo and income. But now the States must find ways of keeping their budgets in better balance if they are to continue providing the necessary public services. Among these services are more and better highways; more aid to local public schools; expansion of State institutions for higher education health and welfare. To meet these needs, States have been drawing on diverse sources. These include general sales taxes, individual corporate and income taxes, and special taxes on motor fuel.

By and large, States have left the taxation of real estate and personal property to local governments. These levies thus have been the backbone of financial support for counties/cities, towns and other local units. But local governments also feel pinched financially, as their costs, particularly for school construction and maintenance, have been going up. So the local government needs more help from the States, thereby increasing the pressure on State budgets. The likelihood is, therefore, that many State legislators this year once again will be considering upwards revisions in their tax schedules to provide for the rising outlays they see ahead.



Quite aside from the national economic impact of State and community projects, there is one especially heartening aspect to this development. It lies in the attitude of the people themselves. They not only want new and better facilities, but they are willing to pay for them. They have shown this by their general approval of higher tax rates where necessary, and by their votes in State and local elections for special bond issues to help finance the public services they require.

Around India with Brooke Bond

A masterpiece of nature—**The Marble Rocks**

Thirteen miles from Jabalpur is located one of the scenic wonders of India—the Marble Rocks. Here the Narbada enters a mile-long gorge, flanked on either side by high white rocks, often tinted with delicate shades of blue, yellow and pink. At the end of the gorge, the river comes cascading down in a tumultuous, roaring waterfall. The Marble Rocks are always a glorious sight but they look unique on full-moon nights, with their shadows reflected in the clear waters of the Narbada.

Around here, as everywhere in India, fresh Brooke Bond Tea is made available through a unique system of fast distribution from factory to shop. Brooke Bond is the only tea firm with five blending and packing factories, each serving its own part of the country, from which fresh stocks are rushed to every shop.

BUSINESS NOTES

BANK RATE AND THE ELECTRICITY INDUSTRY

IT SEEMS to be the unenviable lot of the electricity industry to become a frequent victim of contradictions arising out of diverse legislations. There was, first, the difficulty in regard to the question of depreciation between the Income-tax Act and the Electricity (Supply) Act giving rise to the deferred tax. Then there is the problem created by statutory requirements of the Finance (No. 3) Act which stipulates, inter alia, that depreciation funds and past profits should be paid into the Reserve Bank which conflicts with the provision under the Electricity (Supply) Act which lays down that depreciation funds are to be invested in the business. Past profits, if any, have already found their way into the business, especially as this capital intensive industry is short of venture capital. Under the Act, it is also obligatory that the Contingencies Reserve, required to be created under the Act, be invested in Government Securities.

Now, apart from the fact that the electric supply licensee is critically short of development finance and has to depend upon the funds subscribed by the consumers for providing depreciation, as required by the Sixth Schedule to the Electricity (Supply) Act, he cannot reasonably be expected to use such monies to make the deposit under the Finance (No. 3) Act. True, inasmuch as the expenditure incurred on plant to discharge the obligations under the Indian Electricity Act would be deemed as a "purpose connected with the business of the Company approved by the Central Government" and, therefore, where a deposit has had to be made by a licensee from funds earmarked for investment in plant, the deposit would be refunded. But in discharging the obligations under the Finance (No. 3) Act, it should not be forgotten that the licensee would be obliged to postpone fulfilling his obligations laid down by the Indian Electricity Act at least until such time when an application for the refund of deposit is made and the deposit is actually refunded. In other words, the Finance (No. 3) Act would become inconsistent with the electricity laws and, therefore, it seems to be necessary for the Government to lay down that depreciation monies, accumulated under the Electricity (Supply) Act, are exempt from the scope of the relevant provision under the Finance (No. 3) Act regarding deposit. Unless this exemption is given, the position of electricity undertakings would be highly unenviable. For, even when they have no finance to make the deposit, as required by the Finance (No. 3) Act, they would not be able to escape the penalty consequent on failure to deposit, namely, loss of income-tax depreciation allowances. This naturally means a corresponding increase in tax liability.

The latest to affect the electricity supply industry is the decision of the Reserve Bank of India to increase its lending rate for advances against Government Securities and other eligible paper. It is not clear whether this rate or the Usance Bills rate, exclusive of the Stamp Duty, would be regarded as a Bank Rate. To the electricity undertakings, this is a very material point inasmuch as the Standard Rate has been linked to the Reserve Bank Rate so as to enable the former to be automatically adjusted with money market. Now, following the increase in the effective lending rate by the Reserve Bank, the object of Electricity Supply Act is, for all practical purposes, frustrated. In other words, so soon after the enactment of the Electricity Supply Amendment Bill 1956, it already seems to have become out-of-date, thanks to the Reserve Bank's latest decision. It is to be hoped that at least this experience will serve to bring home to the authorities the advisability of linking the rate of return to the electric supply industry to long-term interest rates rather than to short-term rates as at present. It is needless to add that the requirements of finance of industries generally and of the electricity industry in particular are, by nature, of a long-term character.

A CRITIQUE OF KALDOR'S REPORT

A MOST provocative contribution on the subject of tax reform in this country came last year from Prof. Kaldor. His proposals to some extent have stolen the thunder from the report of the Taxation Enquiry Commission. With the revival of the capital gains tax in an aggressive form and the almost certain prospect of further taxation measures in the coming budget, considerable attention has been riveted on Kaldor's report which, in essence, attempts to add to public revenues mainly at the expense of the current incomes of higher groups which in fact are contributing most to building the economy. This at once raises the crucial problem of incentives towards both enterprise and accumulation in the private sector and it is here that a brochure on this subject issued by the Federation of Indian Chambers of Commerce and Industry comes as a timely exposition on some of the not-so-well-understood and much less appreciated aspects of the subject.

The Federation rightly holds that a major defect in respect of the treatment accorded to the problem of finance in the second Plan is that it has tended to ignore the basic needs of the private sector and also the inter-relations between the sources of finance for the private and public sectors. When making estimates of additional taxation, account is seldom taken of the likely effect of such additional burden on private savings and investment. If one were to consider only the question of diverting resources to the public sector in adjusting the tax system, it will result in leaving very little resources for the private sector which has to fulfil an investment programme to the tune of Rs. 2,400 crores under the Plan. From this point of view, the Federation, therefore, holds that an additional tax burden of the order of about Rs. 100 crores per annum as suggested by Mr. Kaldor will very likely lead to serious adverse consequences. Similarly his proposals for changes in business taxation will react on the capacity of private enterprise to finance the industrial projects out of its own earnings as envisaged in the Plan. The net effect would be that industrial savings so much relied upon in the Plan for capital formation, will be seriously impeded and the private sector will not be left with the necessary resources to perform the tasks expected of it. The Federation is thus correct in holding that Mr. Kaldor seems to lay much greater emphasis on the use of taxation in redistribution of wealth and income than on its impact on saving and investment.

The brochure, besides making a detailed analysis of the various proposals of Mr. Kaldor based on the experience of many Western countries also deals with other problems like deficit financing, tax evasion and so on which merit detailed study. It will, however, be worth while to underline the main conclusions drawn by the Federation's study. These are: a developing economy needs all the encouragement and assistance that a good fiscal system can give; the immediate task is to encourage capital formation so as to fulfil the targets set for the second Plan and hence a judiciously balanced tax structure, which provides incentives to save and invest, should form an integral part of economic policy; the four new taxes that Mr. Kaldor proposes will tend to nullify the advantage resulting from a reduction in income-tax which he has suggested, for, additional tax burden at this stage of economic development can have but one effect, viz., to check the expansive forces in the private sector which

alone can give the required dynamism to the country's economic system.

BRITISH BANK RATE REDUCED

THE REDUCTION in the British Bank rate from 5½ per cent to 5 per cent, announced on February 7 last, need not be taken as indicating a shift in policy. The rate of 5½ per cent which prevailed for about a year represented a near-crisis level. Already, opinion was being voiced that there was no need for the continuance of such a rigorous measure of monetary discipline after the initial need for a severe squeeze on credit had lost its edge. The reduction which was effected last week was not unexpected. This lowering of the rate is regarded as a technical adjustment rather than as a deliberate change in policy. The Bank Rate of 5½ per cent had gone out of touch in recent weeks with short-term money rates which had declined steadily. The strain which the Suez crisis put on the British economy made it clear that the danger of inadequate expenditure on capital investment and of a high rate of private consumption was certainly not of the same magnitude as a year before. But most important of all, the decisive action taken in strengthening the gold and dollar reserves by the borrowing from the IMF and the waiver of interest on the American and Canadian loans brought about quick improvement in Britain's payments position which was further fortified by the arrangement for credit from the Export-Import Bank. These factors which lent strength to the sterling reduced the risk in lowering the Bank Rate.

Mr. Thorneycroft has emphasized that the change in the Bank Rate does not in the least lessen the urgency of restraining public as well as private spending and of stepping up investment and exports. So far as India is concerned, the change in the British Bank Rate is not such as will produce any marked direct result. The rate in Britain is still high as compared to the rate in this country. The pressure of exchange banks for short-term money in the Indian market is unlikely to be reduced considerably. But the modification of credit policy in Britain is bound to give impetus to economic activity in that country, particularly to its export industries. This is to India's benefit. British exporters have intensified the policy of granting medium-term credit to importers of capital equipment. This export promotion technique which comes at an appropriate time for this country is not likely to be slackened on account of the recent relaxation in monetary policy in Britain.

TREND OF CLOTH PRICES

THE HEAVY accumulation of cloth stocks with mills, the tight money conditions (notwithstanding the recent relaxation on bank advances against textiles,) and consumer resistance, all these together, seem to explain the quiet, if not declining, trend in textile prices lately. As a matter of fact, in as many as 38 brands of mill cloth, with a trade-mark, consisting as many as 33 of the medium variety, there was a decrease in prices even below the levels that prevailed in December 1955. (It may be recalled here that Mr. T. T. Krishnamachari has promised to do away with the additional increase in excise duty and other burdens on the industry if and when cloth prices go below the December-1955 level). It must, however, be added that in quite as many cases, the mid-January 1957 prices are still a quarter to one anna (and in only some stray cases, more than four annas) higher than the levels prevailing in December 1955. In regard to the prices which are higher than in December 1955 also, it is pertinent to point out that it is the medium variety that is mostly involved. Only slight increases in prices are recorded in respect of about a dozen different trade marks of cloth of the coarse variety.

At a time when the piecegoods market has had to pass through an uneventful and dull period for nearly half the buying season, it is imperative that the authorities realise that further reliefs, in the line of relaxation on bank advances against textiles, should be granted immediately to help give life to an otherwise lethargic piecegoods market. At this time of the year, the market ought to be lively and at the top of its activity particularly because of the paucity of stocks frequently reported from the consuming centres. In actual fact, however, the piecegoods market is anything but lively, a state of affairs for which the Government has itself to thank!

BOMBAY TRANSPORT

THE BOMBAY Electric Supply and Transport Undertaking, which plays a vital role in the day-to-day life of that premier city of India, witnessed yet another year of steady progress and expansion during 1955-56. This was in spite of a series of civil disturbances and strikes during the period caused by the commotion over States' reorganisation. The total income at Rs. 807.07 lakhs was up by Rs. 66.97 lakhs compared to the preceding year, though the overall surplus at Rs. 60.30 lakhs shows a drop of Rs. 1.15 lakhs from the 1954-55 figure. There was an all-round increase in the number of buses, carrying capacity, passengers carried and the route mileage. The strength of the fleet of 586 in March 1955 was increased by 45 and correspondingly the carrying capacity went up from 32,169 to 34,638 passengers. The increase in the total number of passengers carried (323.57 millions) was of the order of 11 per cent. The route mileage was up at 340.08 at the end of the year under review as compared to 333.70 in the preceding year. BEST maintained its tradition of providing more transport capacity in a crucial area where the pressure of traffic is increasing progressively. During the year, bus fares were so revised as to give widespread benefit to the various categories of passengers including the long-distance, the short-distance and the suburban passengers.

In regard to the tramways, the flat fare of one anna for any distance, which was unremunerative and called for revision, was abolished and graded fares were introduced. The abandonment of the experiment need not come as a surprise at all. The new measures, however, failed to yield the desired result of reducing the recurring losses in this section. Partly because of the disturbances, but mainly due to the rationalisation to bus fares, which attracted more traffic to that section, there was no substantial rise in the tram earnings. To an extent, the damage caused to some sections of the tramway was responsible for accelerating the decision to abolish a few services. This had, however, the adverse consequence of creating some unemployment, though BEST was able to re-absorb a large percentage in its other departments. In course of time, Bombay may have an underground railway system if its feasibility is technically enforced. The very preliminary steps of investigation and inviting economic and technical advice in this connection have already been taken.

AVOIDANCE OF DOUBLE TAXATION ON INCOME

The Indo-Ceylon agreement on the avoidance of double taxation of income between the two countries has been notified in an Extraordinary issue of the 'Gazette of India' published on February 8 last. With this notification all legal formalities for giving the agreement the force of law in India and Ceylon are complete. Talks between official delegations of the two countries took place in India on January 1956. The agreement, which was signed in Colombo in September 1956, was approved by both the Houses of the Ceylon Parliament. The Ceylon Government have notified the agreement in the 'Ceylon Government Gazette' of January 18, 1957. Assessments for the years ending March 31, 1953 and for subsequent years will be governed by this new agreement. For the two previous assessment years viz. the years ending on March 31, 1952 and March 31, 1951, relief will be available in accordance with the Income-tax (Double Taxation Relief) Rules, 1942, which held the field till January 26, 1950.

A Letter to the Editor

LANCASHIRE'S CASE FOR TEXTILE IMPORT RESTRICTION

Sir,

I have read "Fairplay's" letter dated January 22, 1957 addressed to the Editor regarding "Lancashire's case for agreed restrictions of imports". I am glad that he at least concedes to me the freedom to express my views, although he charges me with having made "entirely inaccurate" statements. I would have been very glad if he had specifically pointed to the inaccurate statements in my article. However, from the so-called facts (which are five in number) that he has adduced, I am led to believe that these are rather his views than established facts, as I shall presently show.

To take his first point, namely, that Lancashire does not allege dumping against India. I am afraid that "Fairplay" has not cared carefully to study this controversy from the beginning. Let me, therefore, quote for his edification the wording that appears in the "Manchester Guardian" of May 4 last. In putting forward before the Labour Party their view of how imports ought to be stopped through a centralised buying commission, the United Textile Factory Workers' Association, Manchester, used these words: "discriminating against countries practising 'unfair methods of competition' a definition (of countries) which would undoubtedly include India". I need not add that the term "unfair methods of competition" is a euphemistic expression for dumping.

The question of advantage to Indian mills accruing from supplies of low-priced cotton has been discussed thredbare, again, in the "Manchester Guardian" in the correspondence that passed between a member of the industrial staff of that paper and Mr. T. Swaminathan, Commercial Minister at the Indian High Commission in London last year. Further, in the course of the debate in the House of Commons early in March last, Mr Peter Thorneycroft, then President of the Board of Trade, categorically said "that the argument that Indian cotton exports are getting a subsidy could not be substantiated." He said: "India is not wrong in selling her own raw materials to domestic industry below the world prices. Incidentally, in this case, it is a world price sustained by American policy."

Then, again, it is a truism that the extent of the advantage of low-priced cotton supplies to Indian mills varies from time to time, because this follows the course of world cotton market, as Mr. Thornycroft has stated above. Should India be blamed for this?

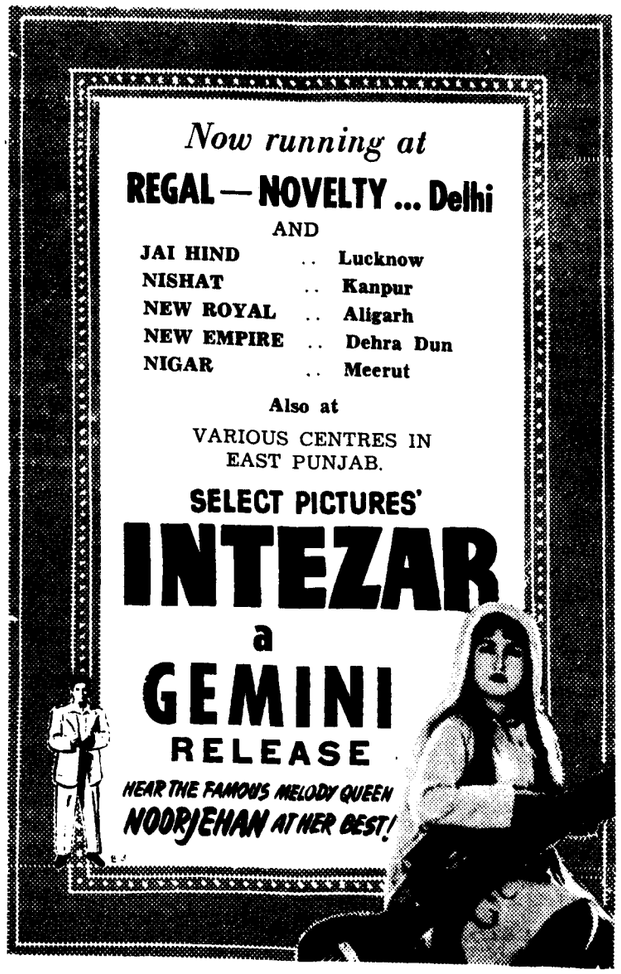
"Fairplay" says that it is totally untrue that Lancashire only imports coarse and medium cloth for re-export after processing. Let me quote from the "Case for Protective Action by the Government" submitted to the President of the Board of Trade last year by the Cotton Board and supported by all the main sectional interests in the UK cotton industry—the so-called "Grey Book." It says: "The principal incursion has taken place in grey cloth and there are minor incursions in coloured woven cloth yarn and made-up goods...." In another place, the same document speaks of "the advantage of 2½d to 3d per yard on medium cloths" to India.

"Fairplay" next goes on to argue that not less than 60 per cent of textile imports are retained for sale for home consumption. I would like to know on what basis these categorical assertions have been made by "Fairplay". I have heard that there was a random sample survey by some Lancashire interests which would appear to have indicated that out of the total exports from India anywhere between 40 and 60 per cent is retained for sale on the UK market. It is admittedly very difficult to arrive at a decision on the basis of any random sample survey by an interested party. As far as I have been able to follow from papers here, the debate in the House of Commons did not result in any official figure being placed before the House in confirmation of this statement of "Fairplay".

"Fairplay" also asserts that it is "totally untrue" to say that finishing and importing interests have not supported Lancashire's case. I would refer him to the distinguished editors of leading British papers who were recently in India on whose authority it is that I have made this statement. The mere presence of one or two representatives on the UK Textile Delegation which recently visited India does not disprove my statement: nor does the fact that they were among the unanimous signatories of the Grey Book. Here, again, I must repeat that these were interested parties.

"Fairplay" contends that it is not correct to say that, if Indian imports to UK are restricted, these would probably be replaced by Japanese imports, as I have suggested. It is true that Japanese imports are limited by a trade treaty. This is no doubt the current position. But if "Fairplay" had taken the trouble to follow the Anglo-Japanese talks of last October in London, he would have noted the dilemma of Britain in the context of the US and other countries taking the view that Commonwealth and British colonies must open up markets to Japanese goods to a greater extent than they have already done. A report in "The Hindu" relating to these talks, it is interesting to note, stated that "Lancashire's textile manufacturers are deeply worried about the Japanese competition and the Government would obviously have to watch its steps, but any suggestion that Japan should be admitted to the GATT on condition that she agreed privately to curtail exports to British colonies is likely to be rejected by Japan". I suppose what relates here to British colonies would also apply to Britain herslef. This apart, if it is not Japan, India's imports are sure to be replaced by imports from Hong Kong or Pakistan. As a matter of fact, the "Economist", London, on October 27, 1956, observed that, even after the Indian industry might be persuaded to agree to an unofficial ceiling, that would still leave the door open to a possible increase in imports from Hong Kong and, in time also, from Pakistan, which has a young modern industry intent on expansion and with costs perhaps below India's. By advocating unofficial measures of protection, the British Government is setting Lancashire to slime the slippery slope."

I am glad to find that, at least on one point," Fairplay" has partially accepted my statement. But though he admits that Lancashire did experience a revival of trade at the end of 1956, he goes on to argue that this was but a temporary upsurge caused by the situation in the Middle East and by a rise in the American raw cotton market. He further complains that orders have again dropped off. This is not peculiar to Lancashire. The trade all over the world is subject to ups and downs. However, I do not know why "Fairplay" has omitted to mention that there has been quite a relaxation in the restrictions on imports of British textiles in Australia which is Lancashire's largest single outlet for cotton, yarn and cloth. In his latest despatch to "Commerce", its Manchester Special correspondent refers to this and says that "manufacturers' quotas of textiles are being increased by 60 per cent over the



allocations of July last year and other traders' textile quotas are being increased by 20 per cent".

Before I conclude, may I refer to the reaction in Hong Kong to the proposals of the UK Textile Delegation. It is now well known that the Delegation's visit to Hong Kong proved abortive and that Hong Kong producers turned down the Delegation's proposals. It is interesting to note that Hong Kong textile manufacturers stressed the need to employ the Island's growing population, a trend which, in all conscience, is much more of a problem to us in India. As I have indicated in my previous article on the subject, Hong Kong spokesmen also have made the point that imports of grey cloth are used by Lancashire's finishing trade to enable her to compete with Japan in the cheaper export markets.

Finally, I cannot but add that India was at least accommodating to the extent that she agreed to a ceiling, although this was made subject to the condition that a similar formula must be made applicable by the UK to the other Commonwealth countries, particularly to Hong Kong and Pakistan. Now that Hong Kong has refused to accept any ceilings, it is a moot point whether the textile interests in India will be prepared to accept the plan for a voluntary imposition of a ceiling on our textile exports to Lancashire. It also remains to be seen whether, frustrated in their attempts thus, the Lancashire interests will succeed in prevailing upon the British Government to impose protective customs duties or quantitative restrictions upon cloth imports from India and other Commonwealth countries. This seems to be a remote possibility in the context of the replies that both Mr. Low, Minister of State and Mr. Thorneycroft, gave at the debate in the House of Commons on a Labour opposition motion regarding Lancashire cotton industry in March last.

Yours faithfully,

CROESUS

BIRLA BROS. LTD.

COMPANY AFFAIRS

TATA LOCOMOTIVE AND ENGINEERING CO., LTD.

The working results of the Company for the year ended March, 1956, are highly satisfactory. While, for the year under review, provisions for depreciation, taxation and allocations to several reserves, are either much higher or are made when there were none for the previous year, the net profit has shot up to Rs. 77,79,942 from the nominal Rs. 3,303 of the preceding year. Adding the carry forward of Rs. 50,350, the amount totals Rs. 78,30,292. From this, Rs. 18 lakhs has been appropriated to the General Reserve and Rs. 59,00,313 to Dividend Reserve, leaving Rs. 1,29,979. The dividends recommended by the Directors to be paid from the dividend reserve are: (i) Arrears of dividend on cumulative preference shares—Rs. 34,95,833; a 5 per cent per annum dividend on preference shares, for the year,—Rs. 10 lakhs; and a 6 per cent per annum maiden dividend on ordinary shares — Rs. 25,84,636. making a total of Rs. 59,00,313. (Dividend on preference shares is subject to deduction of income-tax.)

It will be recalled that the prices to be paid to the Company by the Railway Board for locomotives and boilers were in dispute which has now been settled as the Government has accepted the Tariff Commission's recommendations on the subject. The high profits shown for the year, therefore, include the profit earned by the Company in respect of boilers for 26 months and of locomotives for 21 months. This has largely enabled the Directors to pay off all arrears of dividend as well as the current dividend on ordinary shares.

There was a marked increase in the activities of the Company during the year under review as evidenced by the steep rise in the turnover of the year to nearly three times that of the previous year. The target output of 50 complete locomotives was met during the year as against 47 in the preceding year. The indigenous content of the units was substantially higher than the 75 per cent as stipulated by the Railway Board. The attention being paid to increasing efficiency and reducing costs, has borne fruit. Further improvement in this direction as well as increased output, as envisaged by the Company, are expected to reduce costs still further. In the Automobile Division, the manufacture of Tata-Mercedes-Benz diesel truck and lens chassis has made substantial progress. A total of 3,093 units were produced as against 443 in the previous year. The manufacturing programme of the division was decided to be doubled during the year from 3,000 to 6,000 units annually, as approved by the Government of India. In view of this expansion, the layout and equipment of the Alloy Iron Foundry was revised. Its implementation has, however, been delayed, but the Directors hope to bring the project into operation in 1958.

THE BRITANNIA ENGINEERING CO., LTD.

The trading results of the works department of the Company for the year ended December, 1955, show a profit amounting to Rs. 18,24,127, which has registered a substantial increase over the previous year's figure of Rs. 11,90,036. In the Agency department, however, the profit has slumped to Rs. 13,294, being less than 50 per cent of Rs. 30,788 for 1954. After charging interest, debenture interest, commissions, depreciation and providing for taxation payable on the year's profits and taking into account the carry-forward from 1954, there remains at credit a balance of Rs. 9,45,544.

In view of the various modernization and expansion schemes which the Company has undertaken, and in order also to provide for possible bad debts, the Directors have set aside a total sum of Rs. 6,67,365 comprising Rs. 4 lakhs as machinery reserve, Rs. 1,67,365 as depreciation reserve and Rs. 1 lakh as reserve for doubtful debts. That leaves a balance of Rs. 2,78,179. From this balance, the Directors have recommended payment of a dividend at the rate of 15 per cent per annum (or Rs. 1-8 per share) on the 1 lakh ordinary shares. The dividend absorbs Rs. 1.50 lakhs, leaving Rs. 1,28,179 to be carried forward.

KOTHARI TEXTILES LTD.

The result of the Company's working for the year ended June, 1956, after providing a sum of Rs. 5,99,160 for depreciation, is a profit of Rs. 6,24,560. The carry-forward of Rs. 29,382 increases the total to Rs. 6,53,942. The profit for the year is somewhat less, which the Directors attribute to a 'go-slow' policy and strikes of the labourers. Out of this profit, the Directors have recommended to pay a 6 per cent per annum dividend on the preference shares for the period under review, which absorbs Rs. 72,000. Another Rs. 2.40 lakhs is absorbed by the dividend of 10 per cent per annum on ordinary shares. An amount of Rs. 3 lakhs is transferred to the general reserve, which leaves a balance of Rs. 41,942 to be carried forward to the next year. (The dividend has been recommended on old shares. On the Company's recent issue of Rs. 6 lakhs preference shares and Rs. 18 lakhs ordinary shares, the dividend is not payable for the period under review).

The total installed capacity of the Mills is 300 automatic looms and 43,000 spindles and doubling spindles, of this, almost all the spindles are working while the 40 looms that were not working were expected to go into production early. The Directors hope that the projected new mill to be installed in Coimbatore, for which 24,000 spindles have been ordered, would start production towards the end of the current year.

"Hydrated Magnesium Silicate..."

...a fibrous mineral possessing resistive properties to combustion, corrosive liquids and other chemical and physical phenomena. ...or just asbestos...one of the most useful minerals known to man. It is made up of millions of tough, thin, tightly-compressed fibres, and is acid and fire-resistant.

We at AM & FM specialise in manufacturing a wide range of technical asbestos products from this rock-like mineral in our new factory near Bombay. These technical products play an unobtrusive but vital part in the day-to-day operations of transport and industry. The increasing use of asbestos is an index to India's industrial progress.

Where There's Industry There's Asbestos

COMMODITY NEWS AND NOTES

DEPOSITS OF IRON ORE IN ANDHRA

Two large deposits of iron ore containing an estimated reserve of nearly 389 million tons of ore have been located in Andhra State by the Geological Survey of India. The deposits, which are available in the Guntur and Nellore districts, will it is stated, last some centuries. Of the total deposits, nearly 296 million tons contain 33 to 37 per cent of total iron in the rock. The remaining are of a lower grade with only 25 per cent content. The Geological Survey points out that some more deposits may be revealed if further mapping of the area is carried out.

SALT PRODUCTION

Attainment of self-sufficiency in salt and encouragement of export of this commodity to foreign countries have been the main objectives of the policy of the Government of India in regard to salt. India attained self-sufficiency in salt in 1951 when the production was 744 lakh maunds. The peak production of 861 lakh maunds was achieved in 1953. Although the production in 1954 and 1955 declined to 739 lakh maunds and 811 lakh maunds respectively, the production in 1956 increased to 889 lakh maunds which is the highest indigenous production so far achieved. The target of salt production fixed for the second Five-Year Plan period is 1,000 lakh maunds per annum. As there is surplus production of salt in the country its export to foreign countries is encouraged. The main countries of export are Japan, Indonesia, Nepal, Malaya, Maldives etc.

EXPORT OF COTTON

The Government of India have decided to release for export a further quota of 2 lakhs bales of Indian cotton. Out of these 1,50,000 bales will be of all varieties of cotton of staple length ¾ inches and below, excepting Bengal Deshi. This is the second export quota since December 1 last, when two lakh bales of Indian cotton were released for export. It has been officially stated that out of the two lakh bales released for export earlier, 70,000 bales had been shipped out of the country and the entire quota has been sold abroad. Due to the Suez crisis most of the Indian cotton has been sold to Eastern countries like China, Japan and Hongkong.

IMPORT OF AMERICAN COTTON

No further import of American cotton under the Indo-Burma-US tripartite agreement would be allowed into India till new textile exports to Burma under the agreement could be made, it is learnt. The monetary ceiling equivalent to the value of Indian textiles exported to Burma under the agreement was reached on February 4. The Government of India have licensed the import of about 16,500 bales of American cotton out of 25,000 bales earmarked under the agreement. With the Government's announcement of January 30 last, that monetary ceiling for the import of American cotton under P.L. 480 had been reached, import of American cotton into India could now be done only under the Indo-Burma-US tripartite agreement. But under this agreement also, import of American cotton could take place only after further exports of Indian textiles to Burma.

INDIA TO BUY JAPANESE RAYON

The Indian art silk industry has entered into an agreement with its counterpart in Japan to make a bulk purchase of more than three million lbs. of rayon yarn from Japan at prices 10 per cent cheaper than the ruling prices in Europe, India's main source of supply. The bulk deal worth Rs. 85 lakhs is the biggest contract to be obtained by Japan from India and marks Japan's re-entry into the Indian market in post-war years to supply rayon yarn at competitive prices. At present European countries, mainly Italy, are the principal suppliers of art silk yarn to India.

COFFEE SALES FOR EXPORTS

The Coffee Board sold 591 tons of coffee for export on January 22 of the 1956-57 crop, according to a Press Note issued by the Board. The quantity consisted of 480 tons of Plantation "A", 66 tons of Plantation "B" and 45 tons of Plantation Triage. The average prices secured per cwt. were Rs. 662-14, Rs. 352-12 and Rs. 312-9 respectively. The Board sold on the same day 279 tons of coffee out of the 1955-56 crop for export. According to the Board's latest statement of pool stocks and sales, it received up to January 19, 1957, 34,019 tons of coffee against the 1955-56 crop and sold up to the same date 21,351 tons in pool sales, local sales and allotments. The quantity sold for export up to January 15 this year amounted to 7,475 tons.

EXPORT OF SUGAR

Indian sugar mills have been able to sell about 15,000 tons of refined sugar for export out of a quota of 50,000 tons recently released for the purpose by the Government. Most of the business is reported to have been done through a London brokerage firm for Basra on a c & f basis at a price ranging between £62 and £66 per ton. A small quantity has also been sold for East Africa and Singapore. The total offtake of sugar from factories during the first two months came to 316,000 tons against 243,000 tons last season. The stock of indigenous sugar with the mills on December 31 was 658,000 against 526,000 tons on the same date last season.

RECORD WORLD OIL OUTPUT IN 1956

World oil output last year totalled 835 million tons, the highest figure yet and an 8½ per cent advance on 1955. In both Venezuela and Canada, record rises in output were achieved. Canadian production went up by 30.8 per cent—the highest increase in the world—to make Canada the seventh largest producer outside Eastern Europe and China. Production in the US accounted for 42 per cent of the world total at 352 million tons. Total output in the Middle East was 172 million tons, five times the 1946 level. Petroleum Press Service points out that the deficiency in Middle East supplies has given impetus to the new expansion in Venezuelan output. 1956 production of 129 million tons was 14.8 per cent higher than in 1955.

An Encouraging Assurance

MR. JOHN B. HOLLISTER'S Press conference here in the capital city on Wednesday this week will rank as a significant event on the economic front in the recent past. The Director of the International Co-operation Administration made a frank clarification of the attitude of his Government to India's need of foreign economic aid in the execution of the second Five-Year Plan; but of no less importance was his reference to the possible role of American private enterprise in this task. His personal discussions with the Prime Minister, the Finance Minister and the members of the Planning Commission were doubtless of value in appreciating the effort which the country is ready to make in the achievement of the Plan as well as its genuine requirements of external co-operation. The sum total of his reactions to these talks and to what he personally saw in his short tour was expressed in his assurance at the Press conference. He announced that America's assistance to the execution of the Plan would be "substantial". This assurance coming from an authoritative spokesman of a country which possesses the greatest potential to offer financial and technical assistance is really heartening.

India's major problem in the implementation of the Plan and the one which is foremost in the mind of the Government at the present time is that of procuring adequate foreign exchange. The sharp adverse turn which her balance of payments took in the first half of the current financial year has brought home to the Government the urgency of taking prompt action to negotiate suitable arrangements to obtain the requisite amount of foreign currency. The World Bank's team of consultants is here to examine the requirements of the railways. About 45 per cent of the gap of Rs. 1,100 crores anticipated in the original estimate will be met by withdrawals from the sterling balances, unutilised funds of foreign assistance made available in the first Plan. World Bank's loans for projects in the second Plan actually sanctioned so far, net loans for the steel plants after making allowance for repayment due before March 1961, and the like. This provision will be met partly by the element of

increase in import prices which is not assessed so far but is likely to account for the bulk of the additional outlay of Rs. 500 crores necessitated by rising costs. The resultant shortage cannot be expected to be met on any reasonable hypothesis from any one source and Mr. Hollister confirmed this informed view when he stated that not all the foreign exchange required can be expected from America.

America's fund of goodwill and her readiness to offer assistance have been drawn upon in a good measure since Independence. Her contribution accounted for four-fifths of the external finance of the order of Rs. 300 crores made available for the first Five-Year Plan. This is only part of the picture. Aggregate American aid, channelled through Government and private sources in the last nine years, has touched the level of Rs. 475 crores. There can be little doubt now that India can look forward to tapping this source with greater effect. The ICA Chief who has been charged with responsibility to administer a programme of two billion dollars worth of assistance to sixty countries has some elbow room in making the allocations. It is by no means wishful to expect a fair share of the programme, given tactful direction of policy and approach on the part of the Government here.

Hitherto, India's effort was concentrated mainly on obtaining assistance on a government-to-government basis. The need for government credit to finance the Plan continues. But in the final analysis, private enterprise can make a massive contribution by export of capital and technical skills. India provides incentives for the flow of foreign capital and assuredly her great assets are her political stability, development potential, and leadership at the top in the public as well as private sectors for proper direction of programmes of expansion. Her post-freedom record clearly demonstrates that, far from treating foreign private capital with discrimination, she has scrupulously followed a policy of equal treatment, while in appropriate cases like the oil refineries she has offered reasonable safeguards consistent with the element of risk. She has all along honoured her pledges in policy pronouncements, especially those relating to remittances or repatriation. Foreign private capital, and American private capital in particular, is basically interested in long-term investment holding prospect of reasonable return. It does not hesitate to plough back a part of profits for further development. It is to this fruitful source that India's future appeal of incentives ought to be directed.

The stage has now definitely arrived when passive declarations of policy on foreign capital cannot serve the purpose of attracting it on the scale required. Our external publicity in this sphere needs to be put on a more rationalised basis than before. It is true that the task of publicity has been rendered difficult by impatient harping on the slogan of the socialist pattern of society. Precisely for this reason leadership in the political field must exercise restraint and moderation. The integral place which has been assigned to private enterprise and the recent refreshing pronouncements in this regard by the Prime Minister and the Finance Minister should serve to dispel misunderstanding. There is some appreciation abroad of the situation under which the State is participating in industrial development. Collaboration of foreign private enterprise in State-sponsored projects has helped to clarify the pragmatic approach of the Government to the question of accelerated development.

The genuine place accorded to private enterprise in the future set-up deserves to be explained in the context of the Industrial Policy Statement of April last. The three-fold classification of industries for operation by the State or private enterprise is by no means exclusive. It is not only overlapping but it leaves by design room for participation by private enterprise even in several industries specified as the State's responsibility. This flexibility has been motivated by considerations of obtaining resources in investment and technical skills. A clearer exposition of the Government's policy should go a long way in dispelling such doubts as may be still lingering in the mind of the foreign investor.

Coal Without Policy

ONCE again the coal industry has been foisted with the unenviable privilege of facing the spotlight. This time it is the decision of the Labour Appellate Tribunal that has brought it to the stage. The summary of the decision which was published at the end of the last month gave at best a very broad idea of the fresh boost to wages which the appellate authority has declared. A clearer picture now emerges from the full text of the decision. The predicament in which industry was placed for a short span between Government's acceptance of the Award of the Original Tribunal and the grant of increase in prices of coal in the middle of last year need not be recalled here. This week a deputation of colliery owners' associations approached the Production Ministry to press its claim for a revision of coal prices. It is a foregone conclusion that an increase in prices will be granted to meet the cost of higher wages. This will be the second increase for this specific purpose in the course of one year. What must cause concern, however, is that the more vital question of levying a surcharge on coal prices for development is being ignored when it is clear that this method will have to be accepted as one of the ways to raise resources.

The increase in wages granted by the Appellate Tribunal comes at a time when wage restraint ought to be accepted as one of the imperatives in erecting protective barriers against inflation. There can be no two opinions that a sound structure of wages should be provided for coal miners inasmuch as the strategic importance of the industry as the major source of supply of fuel in the economy and the strenuous nature of work involved make it obligatory that conditions of contentment should be created for a vigorous drive for production. The original Award had fulfilled this objective. A reasonable wage, apart from the difficulty of defining its relative character, should not be withheld over the entire range of industries provided the eceonomy can afford it. The danger inherent in a discrimination in granting it to some industries and not extending it to others is plain. Any course of action which would disturb peace in the industrial sector and feed the forces of inflation would be unfortunate, more so in view of the prospect during the second Plan period. What was the approach of the Appellate Tribunal to the case of coal miners? It is best explained in its own words: "We are giving what we consider to be a reasonable wage in the existing economic conditions of our country..... We appreciate that we have to look after the interests not only of the employers and of labour but also of the public in an adjudication of this character. While we are the custodians of such public interest we are to the same extent the inheritors of the public conscience which cannot be satisfied unless the persons who toil and moil for the community's good are given at least a modest livelihood. That is but a first step in a socialist pattern of society". He would be a bold critic who would assert that the original Award failed to satisfy the public conscience.

The Appellate Tribunal has raised the total emoluments of all the categories of workers by introducing three major changes in the original Award. The Lower Tribunal's scheme of minimum wages which was based on the integration of three components—the basic wage, dearness allowance and the statutory bonus—has been substantially altered by the separation of the last component. One of the fundamental objects of rationalisation of the wage structure by means of a higher minimum wage is to rid the industry of the bane of absenteeism. The statutory bonus, which is made conditional on attendance for a specific number of days in the quarter and non-participation in illegal strikes, remained intact in the minimum wage structure of the original Award which raised the lowest wage by 40 per cent in the composite scheme. A substantial increase of this order at one stroke was calculated to offer sufficient incentive for regular attendance and hard work. No convincing reasoning could be adduced for maintaining it separately, particularly when it is linked neither to output nor to profit. The Appellate Tribunal's analysis of the operation of the statutory bonus scheme has led it to a categorical conclusion which needs to be highlighted. The Tribunal has given a clear verdict of failure in regard to the bonus as an incentive to attendance and furthermore it has urged the advisability of considering the problem afresh to base the bonus on production.

The cash and food concessions—the latter taking the form of supply partly free of cost and partly at fixed prices irrespective of higher market prices—was intended purely as a war-time emergency measure. With the lapse of the emergency, in the normal course it ought to have been terminated. If employers have acquiesced in it, it is because of the same factor of embarrassment which has tied the hands of the Government in this matter. Considering this basic character of these concessions, there was hardly any real justification for raising its cash value from As. 6 to As. 10 per day for inclusion in the wage as the Appellate Tribunal has done. The structure of the dearness allowance has been altered by making it variable with changes in the All-India Average Consumer Price Index Numbers (General) with the base 1949=100 according to a prescribed formula. This modification introduces an element of uncertainty in the cost structure. The case for adjustability of the allowance with the cost of living index is weakened by the express stipulation which makes any fall in the index below 102 inconsequential. Actually it had sunk as low as 96 in 1955.

The Appellate Tribunal has brought the wages of female workers to parity with those of male workers in place of the ratio of 75 per cent fixed in the original Award. In so far as the quantum of total wage cost is concerned, this modification does not raise a major problem. The Tribunal has made a fervent plea for the principle of equal pay for equal work. What is of real significance in this issue is the attitude and bias displayed by it. Application of this principle to piece rates raises no controversy. In respect of time rates the Tribunal's attitude is that it would be permissible to fix differential rates if output is demonstrably unequal. In contrast, the approach of the Government of India to this question is realistic. While accepting the principle of equal pay for equal work, the Government has clarified its action in deferring ratification of the ILO Convention and immediate application of the rule to all workers on the ground *inter alia* that an elaborate and objective investigation would be necessary to determine the extent of its violations. It does not make an outright presumption of equal performance.

The net effect of the higher minimum wage scales prescribed by the Appellate authority will have to be subjected to close scrutiny before its real impact on the industry can be assessed. The Tribunal has raised the minimum wage for the lowest category, when bonus is earned, by Rs. 9-3-4 to Rs. 78-4-4 per month for surface workers and by Rs. 9-9-10 to Rs. 81-12-8 per month for underground workers. Since the increases will take retrospective effect from May last year when the original Award came into force, the industry will have to bear the burden of arrears which are estimated at Rs. 4 crores. Presumably it cannot be reimbursed for this payment, which, in effect, will make inroads on its resources so badly needed for expansion. The Tribunal suggests that part of the new increase in the wage bill should be borne by the industry by reason of the latitude granted to it to make uncontrolled profits from exports. This suggestion reveals lack of objectivity. The export market for coal is not free from competition, India's exports are negligible and a fraction of the industry benefits from the export trade. Increase in prices is inevitable to counterbalance the wage rise now awarded. It is placed at Rs. 1-14-0 per ton. Prices had to be raised by Rs.3 per ton after the original Award.

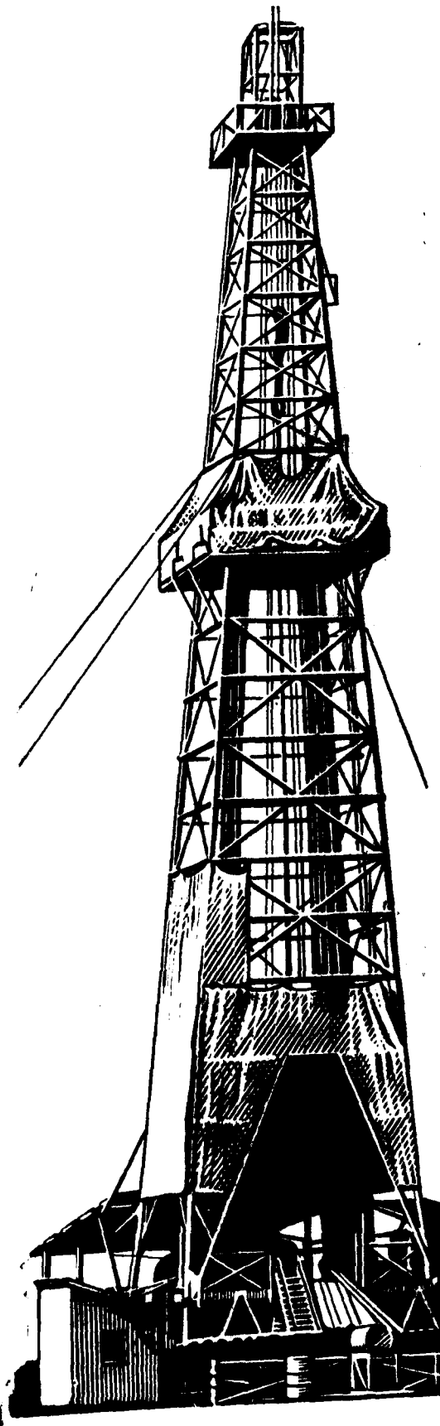
Coming in the wake of last year's increase in production costs consequent on the application of the original Award, this fresh addition ought to focus attention on a proper policy for this industry. It hardly augurs well for the second Plan. More than half of the additional target of 22 million tons in the Plan is earmarked for the public sector which will achieve it mainly by opening up new collieries to be exclusively reserved for it. Public sector collieries have betrayed a failure in financial self-sufficiency, for not less than eight out of the existing eleven are run at a loss. Twenty crores of rupees out of the total outlay of Rs. 60 crores required by this sector for implementing its part of the coal plan have not been provided so far. No adequate consideration seems to have been given to the private sector's requirements of resources to fulfil its allotted share. The proposals for amalgamation of collieries in this sector, made by a special committee of enquiry recently, if approved by the Government, threatens to sow confusion in the midst of the Plan. The success or failure of the coal plan, like that of the transport plan, will assist or obstruct the progress of the whole Plan. It is high time a halt was cried to this drift in the policy for the coal industry.

Spotlight on Thailand

THAILAND will go to the polls on February 26 to elect 123 members to the 246-member National Assembly of Representatives, the rest to be nominated by the King. Political campaigning, which is in full swing, is reported to be most lively and keen yet in Thai history. This is so because the Prime Minister, Field Marshal Pibul Sanggram, has decided to give up the security of a nominated seat and discard the safe, provincial pocket-borough of Nakron Nayoke. He filed his nomination papers from one of the six constituencies of Bankok city, a stronghold of the main opposition party, the Democrats. The Premier's choice has been interpreted as a challenge by the Democrats, whose leader, Mr. Khaung Abhaiwong, himself a former premier, is also contesting from another Bankok constituency.

Only three parties, namely, the Premier's Seri Manangasila Party, the Democratic Party, and the newly-formed Socialist Front of the four Leftist parties have entered the electoral arena on the national scale. There are, besides, a large number of local groups and parties. It is, however, generally accepted that the main contest is between the first two parties as they alone are contesting all the seats. The Socialist Front has put up candidates for only half the seats. Judging from good publicity it has been able to get from Thai language newspapers, it seems to have considerable hold in the country.

The ruling party has gone to the polls with some "achievements" to its credit. It claims the credit for giving stability, both economic and political, to the country; for enhancing the country's prestige abroad by its complete support to the United Nations; and for establishing beneficial relations with the United States of America. The main plank of the Democratic Party is the abolition of the nominated half of the National Assembly and a call for urgent change in the administration. The Socialist Front's programme hinges on a drastic reorientation of Thai policies, both at home and abroad. It stands for a policy of non-alignment in foreign relations and the reconstruction of the nation's economy on socialistic pattern. It is against Thailand's participation in the South-East Asia Treaty Organisation. The Socialist Front thus represents a new element in Thai politics.



The Seri Manangasila Party seems to have a slight edge on the other two parties because of better organisation, ample funds, and the fact of enjoying unhindered and unlimited political power in a country where corruption has been tolerated for many generations. The Democrats are, however, expected to be able to secure enough seats to form an effective Opposition because, in the absence of strong party affiliations, individual merit and other considerations will weigh with the electorate. If the Socialist Front also manages to get a few seats, as it is likely to do, due to popular outcry against rise in price level, as evidenced in a number of strikes and lockouts, the majority party may not have everything its own way.

These developments in Thailand are interesting for another reason also. Unlike other Asian countries, Thailand is pro-West and thrives on American aid. Doubtless, both the policy of neutrality (which is synonymous with independence in this part of the world) and Thailand's policy of military alliances are in fact attempts to the same end, namely, national independence vis-a-vis Communist China. Thailand has adopted the exceptional policy because it does not suffer from the anti-colonial neurosis, being the only country which was never conquered by any Western Power. Moreover, Thailand is more immune to Communism than other Asian countries, having as it does a well-fed and contended peasantry, with a high proportion of small-holders. Again, of the three million Chinese in this country nearly two-thirds have acquired Thai citizenship and the remaining one-third are obviously not interested in politics. Deep ingrained respect for authority and love of monarchy also contribute much to comparative Thai immunity to Communism. Even among the small politically active class, Communists can appeal only to a handful of intellectuals.

Although Thailand does not have a formal comprehensive plan for economic development, there are a series of development programmes for individual sectors under the direction of various ministries. Among these plans, the most important are the following: a second highway of 3,600 kilometres at an estimated cost of Baht 1,615 million; improvement of railways at a total cost of Baht 1,268 million; modernization of air transport and improvement in livestock; conservation of forests; flood control; and increased navigation facilities. A rice seed improvement project, which will cost Baht 4,000,000 million, will increase paddy production by nearly 30 per cent. The Chao Phya River Barrage Project, costing about Baht 930 million, when completed, will help irrigate an additional area of 2.3 million acres, enabling a second crop during the dry season. Besides, 600 tanks have been constructed at an approximate cost of Baht 46 million to improve irrigation facilities.

The development of domestic resources and output is, however, handicapped by shortage of capital resources and lack of technical skill. To overcome these deficiencies, Thailand has received 74 million dollar aid from the United States of America since 1954, besides getting technical aid worth about half that amount. It has also received 37 million dollar loan from the International Bank for Reconstruction and Development since 1950. The United States has also sent 400 experts and technicians. The Colombo Plan countries have also given Thailand technical assistance.

Improvement in the general economic situation is already visible. Production of rice and most of other agricultural crop has steadily increased, in most cases reaching a record level. The production of tin, which is the most important extractive industry of Thailand, has increased by over 13 per cent. Similarly, the production of cement, paper and manufactured tobacco has increased. The deficit in the balance of payments has been greatly reduced. For the first time in several years there has been a favourable balance of trade. The percentage of literacy among those of ten years of age and over has increased from 56 in 1947 to about 70 in 1955. In the past two years contracts have been concluded with four United States universities to improve teacher-training, vocational training, and higher education in agriculture, engineering and public administration. Yet it would be disastrous to be complacent about further improvements in the economic and social fields because, like all of China's neighbours, Thailand is also exposed to the pressure of this Asian Power.

A TOWER OF STRENGTH in India's Economy

The Americas and the Middle East are not the only places with oilfields ! Oil is produced here in India, too, and derricks are a familiar part of the landscape at Digboi in Upper Assam. The Assam Oil Company has been operating this oilfield for over fifty years, producing some 300,000 gallons of high quality petroleum products daily.

Everyone in the country benefits from this flow of home-produced oil. It speeds food production. Keeps factories running smoothly. Keeps goods moving by rail, road, sea and air. Takes people to work and provides work for them—as well as saving precious foreign currency.

The Assam Oil Company itself employs over 8,000 'oil men'. It spends much time and money in looking ahead. Not only in training technicians and executives, but also in finding new sources of oil and new methods of processing it into the much-needed petroleum products which are so vital to India's expanding economy.

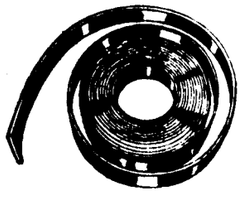
ASSAM OIL COMPANY

TURNING A NEW ROLL

We have turned a new roll ; and it has cost us three and a half crores of rupees.

To what purpose, pray ?



At the end of the rolling, we get coils of flat, steel strip—skelp, as the steel man calls it. The skelp is passed on to the Indian Tube Company, which welds it into tubes.

So what ?

Merely that steel tubes pipe up water from deep inside the earth to parched fields, helping to grow a rich harvest. In the cities, countless homes receive a protected supply of water through these pipes.

Soon, a new plant will turn out the kind of steel tubes that go into the making of bicycles. Remember also that the locomotive speeding along the track is kept going by steel tubes which hold the steam.

Tata Steel's new Skelp Mill, the first of its kind in India, has a capacity of 200,000 tons. When there is enough steel, this mill will roll all the skelp and strip the country needs.

TATA STEEL

THE WEEK'S NOTES

TOYNBEE ON THE INDIAN EXPERIMENT

AT A time when Indo-British relations on the political plane seem to be somewhat strained over Kashmir, it is happy to note that yet another link between the two countries has been forged in the field of thought and culture by the visit of Dr. Arnold Toynbee to India. The Delhi University, by honouring this distinguished British savant, 'one who in his own own way has illuminated the great adventure of human learning' as Dr. Radhakrishnan so happily put it, has indeed honoured itself anad has shown in what high regard Dr. Toynbee is held in this country. In another respect also, the visit of this eminent historian is most propitious. To one who is exercised over the future of Democracy in this Atomic Age, the visit should serve as an opportunity to study at first hand the Indian experiment in democracy — with the added interest provided by the ensuing elections.

One of the main arguments of Dr. Toynbee in his celebrated work, 'Study of History,' is that man achieves civilisation not as a result of superior biological endowment or geographical environment but as a response to a challenge in a situation of special difficulty which rouses him to make a hitherto unprecedented effort. Growth, however, originates with creative individuals or small minorities of individuals who have the double task of achieving something and then converting the society to which they belong to the new way of life. Since the majority can follow the leadership of creative leaders only by imitation, there is one danger to be guarded against and that is, in the process of imitation, the use of persuasion may give place to compulsion in which case the creative minority becomes a dominant minority and the disciples "a reluctant and alienated proletariat".

To Dr. Toynbee, therefore, the problem of right leadership is of paramount importance in the successful working of democracy, because in the modern age, with the franchise given to the masses, their illiteracy and inexperience are utilised by a small minority to put itself in positions of power. In every country power is thus confined to a minority. To guard against abuse of power by the ruling minority we require statesmen possessing "vision, moderation, perseverance and patience'. Dr. Toynbee holds that the Indian experiment is fortunate in two respects. One is that the minority in India regards its power as a trust to be used on behalf of the majority and the other is the application of the democratic way of persuasion in making the peasant masses 'come to terms with the modern world,' unlike in Russia and China, where the methods adopted are those of coercion and force. India has thus become a focal point in an experiment of 'great importance to mankind', and no wonder Dr. Toynbee should have expressed the view that this experiment is being watched by the whole world as "the success of democracy in the world depends on the success achieved in India."

CONFUSION AMONG COMRADES

LENIN, THE architect of the Communist party organisation, remarked that "a communist party will be able to perform its duty only if it is organized in the most centralised manner, only if iron discipline prevails in it, and if its party centre is a powerful and authoritative organ wielding wide powers.....whoever weakens ever so little the iron discipline of the party of the proletariat.....actually aids the bourgeoisie against the proletariat". Strangely enough, however, ever since the pronouncement of anathema on Stalinism and commendation of "independent roads to socialism" at the 20th Congress of the Communist party of the Soviet Union in February last year, the "iron discipline" has weakened. Cracks have appeared in the monolithic structure of the Communist parties throughout the world.

The confusion, which was till recently limited to the theoretical plane and as such could only be discerned by specialists has now in India become exposed to the public gaze. During the election campaign the party leaders have issued not merely contradictory statements, but have also publicly contradicted each other. While Mr. Ajoy Ghosh, General Secretary of the C.P.I., has characterised as a "hoax" the Congress Party's slogan of a "full socialist order of society," Mr. S. A. Danga, a member of the party's politburo, has described it as a "positive step towards the building up of a welfare State". Again, while crypto-Communists like Dr. A. V. Baliga, Dr. Mulkhraj Anand, and Mr. Balraj Sahni are supporting Mr. Krishna Menon, the Maharashtra unit of the C.P.I. is actively campaigning for his opponent Mr. Peter Alvares. Similarly, Mr. E. M. S. Namboodripad, the theoretician of the Indian party, has accused Mr. Ghosh of "ignorance". Referring to a statement by the latter, Mr. Namboodripad said that Mr. Ghosh did not know the conditions in Kerala when he observed that the possibility of the Communists forming a Government was restricted to West Bengal. It seems true indeed, as Mr. Nehru remarked recently, that the Indian Communists have lost not only their moorings but their balance as well.

FOODGRAIN PRICES IN INDIA

THE RISE in prices in general and those of food grains in particular is an all-India phenomenon. Every passing month registers advance. The Index Number of Food articles (base 1945-50=100) today stands at 399.7. It is reported that in West Bengal, the rising prices of atta and rice, particularly during the current paddy harvesting season, are posing a perplexing problem to the authorities and causing serious concern to the consumers. In some States food grain prices in the open market are about 50 per cent higher than in the fair-price shops. In Uttar Pradesh the situation is alarming. Various causes have been responsible for the rise in food prices in that State. The U.P. Government blames the Centre's refusal to restrict regional movement of food grains for the current rise. Cornering of a substantial part of the daily off-take by certain dealers and the Centre's inability to meet U.P.'s demand of monthly quota are considered to be other contributory factors for the rise in prices.

How is the situation to be met? The imposition of food control may not be favoured on account of its unpopularity in early years. Can fair price shops be relied upon? In U.P., experience in this regard has not been a happy one. Malpractices have prevailed in the cheap grain shops. The way the food grains supplied to these shops pass into the hands of the profiteers is well known. Stocks in fair price shops have also been found to be inadequate in many places to meet the rising demand.

The Government is, however, confident of meeting the situation. In spite of the malpractices prevailing in the fair price shops, the Government still seems to have great faith in them and hopes to solve the problem of rising food prices by proper distribution and adequate supervisory staff. Stocks, official and private, it is pointed out, are adequate and will be further reinforced as the harvests are completed. The only difficulty is in regard to transport. Whether the Government will be able to provide adequate transport facilities, it remains to be seen.

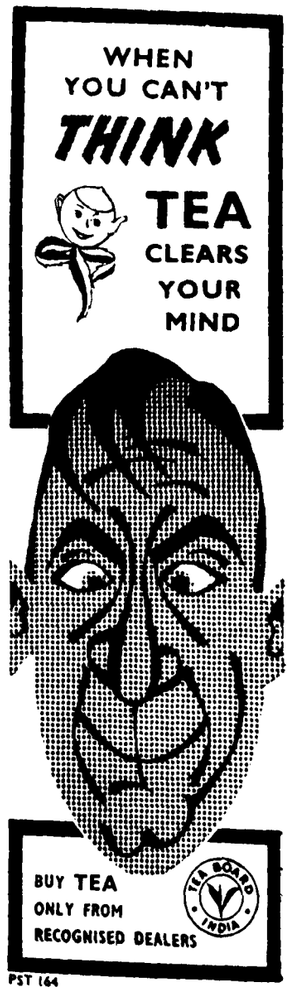
The Government of India appear to be fully seized of the seriousness of the situation. So, bank advances

to rice merchants have just come to be restricted with a view to arrest the upward trend in the price of rice. This is particularly intended to discourage speculative transactions in rice which might tend to raise its price. In directing the Reserve Bank of India to reimpose curbs on advances the Government of India have taken a right step. It is high time the directive was extended to wheat as well.

NENNI'S DEFECTION AND TOGLIATTI'S FUTURE

THE DECISION of the Nenni Socialists to break with the Communists and to join the Social Democrats has upset the Italian Communists' apple-cart. Though pressure has been exerted for a break between the two by a powerful section of the Socialist Party for several years, the demand became almost unanimous only after Mr. Khrushchev's revelations at the 20th Congress of the Communist Party of Soviet Union and Russia's subsequent armed intervention in Hungary. The recent re-approbation of Stalin's has evidently been the proverbial last straw.

The revulsion from Communism is mirrored in the new programme of the Socialist Party. A neutral policy has been adopted, aimed at overcoming division of the world into military blocs; progressive disarmament; reinforcement of the United Nations; and, above all, the avoidance of war. On the economic front, also, the Nenni Socialists will support the European common market and Euratom so long as democratic control is guaranteed, interest of the workers in the backward areas protected, and complicity with colonial politics avoided.



Sgr. Nenni has obviously lost his hold on the party; strangely, it has coincided with the decision to end united front with the Communists. The trend is reflected in the election to the 81-member central committee of the Socialist Party: Sgr. Nenni's group has won 27 seats, and Sgr. Basso's, which is against any undue haste towards unification with the Social Democrats, has secured 15 seats. The pro-Communists, led by Sgr. Pietrini, have managed to get only nine seats. It is possible, of course, that his support to ending the United front came because Sgr. Nenni had lost his hold on the party.

With the Socialist Party's merger with Sgr. Saragat's Social Democrats, the latter will emerge as Italy's second biggest group after the ruling Christian Democrats, pushing the Communists to third place. It will thus cause further discomfiture to the Communists who are already weakened by internal dissensions and the defection of Sgr. Reale and other intellectuals from the Party. What remains to be seen, however, is Sgr. Togliatti's next move. He had failed, in spite of his attacks on the Kremlin rulers, to keep the Nenni Socialists with the Italian Communist Party. Will he recant his recent statements and rejoin the fold of the faithfuls, or allow himself to be purged by the Stalinists inside the Party?

PAKISTAN'S PRESSING PROBLEM

THE STRONG reprimand by the Director of International Co-operation Administration of the US Government in Pakistan seems to have awakened the authorities in Karachi to the grim food position inasmuch as a Commission has been set up to investigate causes of food shortage and suggest permanent remedies. In the current year, Pakistan faces an estimated food deficit of 7.25 lakh tons, of which 3.25 lakh tons will be in West Pakistan which was till lately generally a surplus area. The reasons for this abnormal change in the position are not difficult to find. Ever since its inception, Pakistan's economic problems have been over-shadowed by the stresses and strains of politics in which a whole row of governments has come and gone. It is known that nature has not been unfavourable during the past few years over this sub-continent which has largely helped India to cut down her food shortages. There is thus none to blame for Pakistan's present deficits other than her own policies.

Before anything else, Pakistan needs a thorough agrarian revolution in the form of drastic changes in land tenure. To provide incentives to cultivators to produce more, such inducements as relief in water tax and land revenue are absolutely necessary. There is no dearth of technical assistance and agricultural equipment and tools which come to Pakistan in abundant supplies from America. In her Western wing, she has a network of canals for irrigating a substantial and fertile area. All that is needed is to put the claims of economic development before all others. No country can possibly live indefinitely on doles, and this has been made plain by Mr. John Bell. A cry of 'jehad' or an undue emphasis on military preparations are no substitutes for food. It is only proper that Pakistan should now directs her attention to solving the more pressing problems with determination.

A Window on the World

WELCOME TO GHANA!

By

ODYSSEUS

ON Wednesday, March 6, a new member enters the Commonwealth family of free nations — Ghana, hitherto a Crown colony known as the Gold Coast.

Thus, within ten years of the emergence of India and Pakistan with independent, co-equal status in the Commonwealth, we have a third non-European member — the first in the continent of Africa. This is a momentous event which opens far-stretching horizons and deserves much more than passing attention.

I must, for my part, confess that until the newspapers began to make increasing mention of the impending change in the status of the Gold Coast, the sum total of my knowledge of its affairs was confined to the fact that it is situated at the bottom of that part of the west coast of Africa that bulges out into the Atlantic, and that it is entirely surrounded by the enormous territories which go by the general name of French West Africa and which stretch all the way from Senegal on the West across to the Sudan on the East. As there may be others as unknowledgable as I was about Ghana, I propose in view of its approaching change of status to share with you this week the results of the intensive researches that I have made, and next week to reflect upon their political and international significance and implications.

The population of Ghana is 4,620,000. Its area is 91,843 sq. miles, which compares closely with Jammu and Kashmir whose population is 4,400,000 and area 92,780 sq. miles. On the other hand, whereas Kashmir is a mountainous country with a mild hot-weather climate, Ghana lies wholly within the tropics. Although there are some ranges of hills, none rise higher than 3,000 feet and the climate varies from the hot and dry to the hot and wet. Cocoa is by far the most valuable export. Its production employs 185,000 people. It is the State's principal revenue raiser. Exports in 1954, the peak year for cocoa prices, reached £84 millions in value and were £4 millions higher than the budget revenue for that year. It is the domestic source from which the State's £72 millions Development Plan of 1955 can hope for finance.

TOASTS IN COCOA?

Mr. Gbedemah, the Gold Coast Finance Minister, described cocoa in his 1956 budget speech as "the life blood of the country" — a simile which should arouse a sympathetic quickening of the pulses in the North and South secretariats of New Delhi, which will perhaps, as a brotherly gesture to the new State, consider issuing an instruction to our diplomatic missions abroad to substitute cocoa for the coloured waters in which toasts are now drunk on ceremonial occasions. (As one of India's leading diplomatic correspondents said to me some time ago as we came out of a party at the Raj Bhawan: "Wonderful party! I've never seen the water flow like champagne before"). However, fortunate it may be from the point of view of the consumer (who is the forgotten man of the twentieth century), the substantial fall in cocoa prices has dealt the Gold Coast a blow. The reserves, wisely built up by the administration during the years of high prices, are enough to meet development budget deficits for some time, but sooner or later Ghana will have to look to foreign aid if its big schemes — such as the £150 millions Volta river plan — are not to be shelved. As an independent state, Ghana will no longer qualify for the British Colonial Development Corporation's funds. The UK government has promised to study the problem of alternative sources and Ghana already plans an approach to the World Bank.

AN AGRICULTURAL COUNTRY

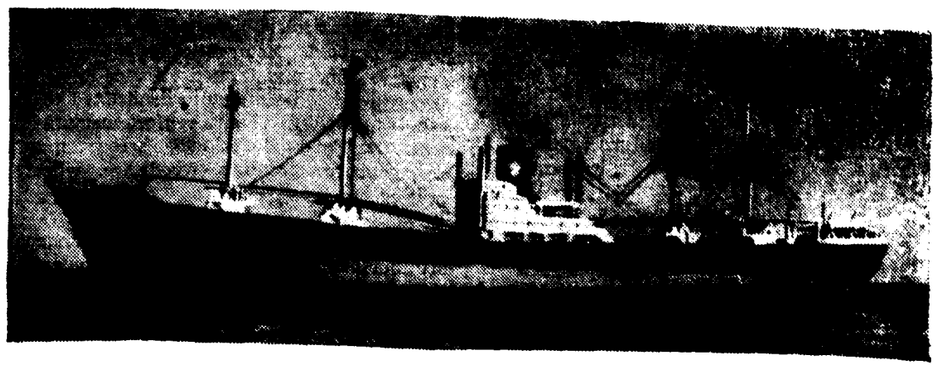
March 6 will see the addition of an essentially agricultural and raw material producing country to the comity of the Commonwealth. Apart from cocoa, there is some export of palm oil, palm products, and a little copra, cocoa-nut oil, coffee, and limes. Mining is important. In 1955, exports of gold totalled 723,905 fine ounces worth £9 millions; diamonds were valued at £5½ millions; manganese ore: 539,580 tons worth £5.2 millions; and 116,285 tons of bauxite, worth £203,505. Total value of all exports in 1955 was provisionally estimated at £96,505,000 and of all imports £87,868,000. The 1954-55 budget showed revenue estimates of £80 millions and expenditure of £79 millions. This is approximately Rs. 104 crores, or about one fifth of the Government of India's revenue estimates.

Dr. Nkrumah, the Prime Minister, has told his Legislative Assembly that it would be many years before Ghana could hope to find from its own resources savings and industrial know-how. Providing that suitable arrangements were made for the training of Africans, Dr. Nkrumah declared that he wished to give every encouragement to foreign investors. He said that he had no plans for nationalisation but that if a future government were to consider the nationalisation of any particular industry, adequate compensation would be paid. Meanwhile his government grants tax relief to companies formed to enter any pioneer industry, which has been statutorily defined to include food canning, biscuits, cement, confectionery, fertiliser, footwear, leather products, nails, screws, matches, paper, soap, tobacco products, woodware, wheat and flour milling.

The people of Ghana are not homogenous. There are four main linguistic groups and some fifty different languages or dialects are spoken. The coastal territories (whence the Gold Coast derived its name) are occupied by what are claimed to be the most advanced people from whom are drawn most of the civil servants, educated classes, etc. The central area (Ashanti) is inhabited by peoples who have considerable historical and social importance, tribally organised under chieftains. They are not to be compared with the Indian princes under British rule because the Ashanti chieftains form an integral part of the administration and social system. The northern territories are inhabited by peoples described as less sophisticated. There has been a good deal of resistance among all the peoples outside the coastal areas to being placed under the permanent majority rule of the inhabitants of the more populated coastal areas, but these differences have been overcome with the help of a report drawn up after a tour of investigation, at the request of the (popularly elected) Gold Coast government, by Sir Frederick Bourne, whom many will remember as chief secretary of the Punjab from 1941 to 1945 and later as governor of the Central Provinces. Sir Frederick recommended

a substantial devolution of power from the centre to regional assemblies, and this was accepted by Dr. Nkrumah's government.

INDEPENDENCE WITHIN 56 YEARS



Africans were comparatively late arrivals in the mixed territories which are to be known as Ghana. They first came in the thirteenth century A.D. Various sea-faring European nations set up trading posts on the coast from the fifteenth century onwards. The British turned up in 1620 but made no attempt to establish political rule until 1821 when this came about over the coastal area as a result of the British Government's decision to eradicate the slave trade to America. Penetration of the interior did not begin until as late as 1873 after the Ashanti war. This was followed by the gradual spread of control over the whole area, a process which was not completed until 1901.

Now, 56 years later, within the memories of many survivors of those early colonial days, the Gold Coast will join the free nations of the world.

Since 1946, when for the first time the Legislative Assembly had an African majority and represented Ashanti as well as the coast, advance has been rapid.

In 1949, a wholly African committee, under the chairmanship of Mr. Justice (now Sir Henley) Coussey, was entrusted with drawing up a constitution. Their recommendations were adopted for the 1951 elections and have been the basis of all subsequent developments. The 1954 constitution follows the British parliamentary model, except that there is only one House. All parties were anxious to press on to independence but the Opposition parties (representing the non-coastal areas), which held 25 seats in a house of 104, were anxious for a loose federation to protect the internal autonomy of the Ashanti and northern territories. Mr. Alan Lennox Boyd, the British Colonial Secretary, who has throughout played an active and constructive part in these proceedings, found a way out of the deadlock by declaring that if a general election were held, the British Government would accept a motion calling for independence if passed by a "reasonable majority" in the new house. The election resulted in an over-all majority for Dr. Nkrumah's party which won all 44 seats on the coast, 8 out of 21 in Ashanti, 8 out of 13 in Trans-Volta Togoland, and 11 out of 26 in the North — figures which show that he is in a minority outside the coastal areas, and which might have given a reactionary Colonial Secretary an opportunity of going back on his pledge. But the UK government accepted the majority verdict. This aroused further outcry in the minority areas but Mr. Lennox Boyd was able to find a formula, which reconciled all parties, during his flying visit to the Gold Coast between January 24 and 30 of this year.

Having thus set forth the facts this week, I will try next week to show why I believe that the emergence of the first African member of the Commonwealth must have important consequences for the Commonwealth and for the future of the whole of Africa — north, south, east, and west — not forgetting the Union.

MEDITERRANEAN DIPLOMACY

(From Our Special West European Correspondent)

PARIS, February 15.

CERTAIN comings and goings in the Western Mediterranean this month have revived discussion of a Mediterranean alliance that would link together in new "post-imperialist" relations the Arab and European states on the shores of the inland sea. To date, only the Moroccans and Spaniards take these schemes seriously, so reports that such a pact is imminent (such reports have just appeared in Borba) can be heavily discounted. But, pact or no pact, the choice of possible partners for a possible pact already shows how certain capitals conceive the future of international relations in this area; and such conceptions can be instructive. When I first wrote about a Mediterranean pact, from Spain last summer, the advocates of the alliance were talking vaguely and ambitiously about a treaty that would connect all the Mediterranean states from Egypt to France, Israel as well as Syria. Subsequent events have shown even the dreamiest diplomats that the mere existence of Suez, Israel, Cyprus and Algeria make such schemes absurd. Now they have resuscitated the proposal in a much more limited and hence rather more practical form: the suggestion now is that the alliance should include three European States, France, Italy and Spain, and three Arab States, Morocco, Tunisia and (looking into an uncertain future) Algeria.

Most of the trouble spots are in the Eastern Mediterranean; the Western basin contains only one, Algeria, and the advocates of the new alliance hope that it might even assist in the liquidation of that dispute. But the restriction of the alliance to the Western basin has another significance: it is intended to express the unwillingness of Morocco and Tunisia to associate with Egypt and the Arab League. The new Muslim states in North Africa, whom I have referred to here as the "Arabs of the West", want to have as little as possible to do with Cairo and what Cairo stands for in their eyes: namely, Nasserism, pan-Islam, Communist flirtations, anti-semitism, violent nationalism, racialism and the absence of all social conscience as regards the economic condition of the people. The Western Mediterranean alliance would, in the plans of the Sultan of Morocco, provide an alternative to the blind alley of Arab League adventurism.

The Sultan's spokesmen are denying that he has in mind any definite proposal for an alliance, but the lines of his thought can be guessed from the course of the Mediterranean cruise he has just completed. He went first (by an Italian ship) to Cannes in the South of France, where he had cordial talks with Maurice Faure, one of the younger and more liberal French Ministers (who has since gone to Tunis for similar talks with Mr. Bourguiba.) This interview was intended to put an end to the recent family quarrel between Rabat and Paris caused by the kidnapping of the Sultan's guests; it appears to have succeeded for, immediately after, France and Morocco signed a pact for economic aid. The Sultan then proceeded to Italy where he toured privately but had talks in Rome that are admitted to have dealt with the general idea of a Western Mediterranean pact. Mohammed V then went to Madrid where he was received with sumptuous courtesy by the other ardent supporter of a Mediterranean alliance, General Franco, with whom he is pleased to confess he shares many ideas, especially on the threat of Communism. In Madrid the Sultan also received emissaries from the Algerian rebel movement, to mark the fact that he envisages Algeria as a full member of the alliance. Moreover he met King Ibn Seoud of Arabia, whom he took back with him to Rabat to continue the campaign which President Eisenhower had begun, to use Seoud as a moderating influence on Colonel Nasser. Finally in Rabat, the Sultan prepared to receive Mr. Bourguiba of Tunisia for the talks that were interrupted in Carthage last October by the kidnapping of Ben Bella.

Thus the Sultan's round trip covered the ground that he and Franco would like to see included in some closer association. Notice that the journey did not take him into Eastern Mediterranean waters to visit any Arab "brothers" in the Near East; the contact with King Ibn Seoud only occurred after the King had been, as it were, disinfected by a stay in Washington. And this first diplomatic sortey of the head of newly independent Morocco took place before any Moroccan ambassador has been sent to Cairo (despite Colonel Nasser's entreaties) and before Morocco has shown any interest in the Arab League.

Mr. Bourguiba's visit to Rabat fits into the same picture. The Tunisians are less interested in a Western Mediterranean alliance than in a sort of Commonwealth connection between France and the three North African territories, but the purpose of this proposal is identical: to preserve the Western orientation of North Africa and to isolate it from the adventurism centred in Cairo. Tunisia has naturally less to do with Spain than has Morocco, for Spain was one of the "co-protectors" of Morocco and still preserves footholds in the country; but the Tunisians have close links with Italy, and would not necessarily be averse to the widening of their Commonwealth scheme to include two other European nations. The further extension of Mr. Bourguiba's tour, down to Accra for the inauguration of independent Ghana (the Gold Coast), is meant to have symbolic value only.

For the Spaniards, the passage through Madrid of these Arab potentates is a diplomatic triumph, for Franco, has argued for years that only Spain can serve as the hyphen between Islam and the West. In fact the encounter in Madrid of two kings from either extreme of the Arab world was a mere accident; Seoud came in response to an invitation addressed to his father in 1952, while Mohammed V came on other business; but Franco is using the coincidence to renew his campaign in Washington for a new approach to Islam, through Madrid. As usual, Franco's pro-Arab policy is promoted in a double-faced way: while Spain defends France in the Algerian debate in the United Nations, Madrid Radio urges on the Algerian rebels, and rebel leaders receive the customary honoured welcome in Spain.

But Franco is simultaneously engaged on an even more complicated piece of double-dealing, which has the same object of enticing the USA into making Spain the pivot of her Mediterranean policy. This is the negotiation with Moscow about the 520 tons of Republican gold. For years past Franco has been the most passionate champion of anti-Communism and has denounced all talk of co-existence between East and West. But his interest in the Arab world has shown him

that (as every Asian statesman knows) ardent anti-Communists get less out of Washington than do the waverers, the blackmailers and the apparently undecided. Drawing the moral from Washington's scrupulous protection of Nasser, Franco decided to try his own hand at the wavering game, and began tentative but well advertised contacts with Moscow. The opportunity for this came when Negrin, a former Republican Spanish leader, died in Paris leaving to Franco a supposed receipt for 520 tons of gold that the Republicans entrusted to the Russians at the end of the Spanish Civil War. The receipt, supposing it exists, would not suffice to get four annas worth of brass out of Moscow, let alone £200 million worth of gold — unless the Russians thought they could buy something with it, for instance the opening of a Russian embassy in Madrid and a trade pact covering the purchase of Spanish mercury and other metals. The repatriation of many Spaniards from Russia and the interesting talks of a supposed Spanish Red Cross mission in Moscow suggest that the Russians are ready to take the matter further, and Madrid has delicately drawn Washington's attention to this fact. Franco cannot seriously envisage a close association with the Russians (any more than Nasser can, in all probability), but he can hope to wheedle more aid out of the Americans, which would strengthen his tottering economy and give him more power in a proposed Mediterranean alliance.

But the proposals for a Western Mediterranean pact cut across a grander and yet more promising French scheme: the association of the French African territories with Euromarket. The French argument is that the Sultan's political reveries are all very well but the economic future of North Africa has more to gain from an association with German industry, and this means the establishment of a European common market which is then extended to include French Africa in return for German investments in that area. Franco and Mohammed V may have all sorts of ideas in common on the question of Communism, but Spain has no money to invest even if she gets her 520 tons of Moscow gold. Italy has none to invest either, for she has an underdeveloped economy in her own backyard, in the Italian mezzogiorno. France would have to supply all the investment in a Western Mediterranean pact, as she is doing already but at great cost to her economy. Hence the hope of getting the Germans to put up a proportion of the capital required in Africa. This brings us back to the question of Euromarket, and the colonies, which has been discussed several times here lately. The Euromarket experts meeting in Brussels have not been able to settle this problem and it will soon be discussed at the highest level, in a meeting between Adenauer and Mollet.

WORLDGRAM

AGRICULTURE

Provident Fund for Plantation Workers: The Government of India have decided to extend the benefit of copulmsory contributory provident fund under the Employees' Provident Funds Act, 1952 to workers in plantations of tea (except in Assam where a similar Act of the State Government is already in operation), coffee, rubber, cardamom and pepper employing 50 or more workers. A gazetted notification, requiring the recovery of provident fund from wages for and after the month of May, 1957, is being issued by the Ministry of Labour, Government of India. With this extension approximately 3.60 lakhs additional workers are likely to get provident fund benefits and their monthly contributions to the fund including the employer's share are estimated to amount to Rs. 16.52 lakhs.

INDUSTRY

Specification for Cement: The Indian Standards Institution has issued, for eliciting comments, a draft revision of the Indian standard specification (IS: 269-1951) for ordinary, rapid-hardening and low heat portland cement. The original specification was published in 1951 as a tentative standard for a period of three years. Since its publication, a series of investigations were initiated on a number of problems connected with test methods as well as performance requirements specified in that standard. Experience of the manufacturers and the users in following the standard was also collected. In the light of these investigations and the experience gained, this draft revision has been prepared incorporating some important changes. Further changes include simplification in the test of fineness and addition of an optional test for testing soundness of cement by autoclave expansion method. Comments on the draft revision may be sent to the Indian Standards Institution, 19, University Road, Delhi-8, before April 28, 1957.

*

Production of Penicillin at Pimpri Factory: The highest figure of penicillin processed so far at the Penicillin Factory at Pimpri, run by the Hindustan Antibiotics (Private) Ltd., was attained during January 1957, when 1,514,250 mega units of crude penicillin was processed into various salts as compared with 1,118,572 mega units processed during the month of December, 1956. Production of penicillin during January 1957, amounted to 1,569,000 mega units as compared with 1,040,000 mega units during December, 1956. During January 1957, 1,007,370 vials of Penicillin were filled both at Pimpri and Bombay, as against 1,051,198 vials filled during the month of December, 1956. Sales of the products of the Pencillin factory have shown marked progress after they were centralised at the Bottling Plant in Bombay. In January 1957, the sales went up to Rs. 7,06,303 as compared with Rs. 4,63,556 in December, 1956. Various schemes in connection with the future development programme of the factory, to achieve a 60 per cent expansion, have been taken in hand and are making progress.

*

Laying and Maintenance of Linoleum Floors: The Indian Standards Institution has issued for eliciting comments, a draft Indian standard code of practice for laying and maintenance linoleum floors. This code intends to guide the users of linoleum in regard to the preparation of the sub-floor and the base, fixing of underlay, laying of linoleum and its maintenance. Comments on the draft code may be sent to the Indian Standards Institution, 19, University Road, Delhi-8, before April 21, 1957.

*

Draft Specification for Oil Paste for Paints: The Indian Standards Institution has issued, for eliciting comments, a draft Indian standard specification for oil paste for paints, yellow ochre. This draft standard prescribes the requirements and the methods of test for yellow ochre for oil paste for paints used in the manufacture of ready mixed paints. Comments on this draft standard may be sent to the Indian Standards Institution 19, University Road, Delhi-8, before April 29, 1957.

*

Draft Standards for Fire Fighting Equipment: The Indian Standards Institution has issued for eliciting comments, 12 draft specifications covering fire fighting equipment. The specifications cover couplings, delivery hose couplings, suction hose couplings, breechings both for delivery and suction, revolving head branches, suction strainers, fire hooks, fire bells and washers.

TRADE

Record Cyprus Trade in 1956: The oversea trade of Cyprus last year broke all records. Figures just published in Nicosia show that exports during the 12 months were valued at £22,000,000, and imports at £39,000,000. These figures compare with exports of £18,000,000 and imports of £3,000,000 in 1955 the previous record year. "The trade has increased so sharply despite the Eoka campaign of terrorism is a remarkable tribute to the resilience of the Cyprus economy," said the Director of Commerce and Industry. He added: "Progress is likely to be even more marked when the country's whole attention can be turned to peaceful pursuits". The United Kingdom, the United States, and Western Germany were the main customers of Cyprus., whose principal suppliers were the United Kingdom, the United States, Western Germany, Italy and France.

*

Import of Cement: Through the efforts of the States Trading Corporation over one lakh tons of cement were imported up to the end of January 1957. Of this quantity, about 46,000 tons have arrived at the port of Bombay, 34,000 tons at Calcutta, and 24,000 tons from Pakistan via the Wagah-Attari route. About 15,000 tons are expected to arrive at the ports of Vishakapatnam and Madras before the end of this month. The imports would have been much larger but for the closure of the Suez Canal. Nevertheless, imports from countries not affected by the Suez Canal situation are continuing regularly. It is expected that a further quantity of about two lakh tons will be imported by the end of August, 1957.

*

Exports of Guar Gum Banned: The Government of India have reviewed the export policy of guar husk or gaul hull (also known as guar gum) export of which was being allowed freely hitherto as an uncontrolled item, and have decided to ban its export with immediate effect.

*

Indo-Italian Trade Agreement Extended: Letters were exchanged recently between the representatives of the Government of India and the Government of Italy extending the validity of the Indo-Italian trade agreement up to Decembe 31, 1957. The trade agreement was concluded on July 29, 1954, and was valid up to December 31, 1956.

Trade and Goodwill Delegation from Sweden: A Trade-cum Goodwill Delegation from Sweden has arrived in this country at the invitation of the Government of India. The object of the delegation's visit is to study the progress made by India in the various sectors of industry and to explore possibilities of expansion of trade and industrial collaboration between the two countries. An Indian Goodwill Mission visited Sweden last year. India's imports from Sweden in 1955-56 were valued at Rs. 7.86 crores and her exports to Sweden Rs. 1.57 crores. Trade between the two countries is regulated by a Trade Agreement. Sweden accords to Indian goods the same treatment as accorded to goods originating in O.E.E.C. countries.

FINANCE

Indo-U.K. Agreement on Avoidance of Double Taxation. An Agreement between the Government of India and the Government of the United Kingdom for the avoidance of double taxation and the prevention of fiscal evasion with regard to estate duty was signed on April 3, 1956. The Agreement came into force in India with effect from June 30, 1956, but its provisions are also applicable retrospectively, if the accountable person so elects. The Central Board of Revenue have now prescribed, by Rule 38 of the Estate Duty Rules, 1963, the procedure for claiming relief under the said Agreement in cases where estate duty has been paid both in India and in the United Kingdom on the same property. The Rule has been notified in the Gazette of India.

*

Drawings from International Monetary Fund: The Government of India have negotiated with the International Monetary Fund for a drawing of $127.5 million. Of this amount, $60 million will be drawn immediately and the remaining $67.5 million will be drawn after a month. In addition, the Fund has agreed to a standby credit under which India will have the right to draw an additional sum of $72.5 million at any time during the next twelve months.

*

U.S. Assistance for India's Malaria Control Programme: The Government of India and the United States have signed a supplementary project agreement under which India will get $6¼ million for her malaria control programme. This is the first agreement under the U.S. Development Assistance Programme for the fiscal year ending June 30, 1957. The money will be used to obtain from outside India 9,200 long tons of 75 per cent water wettable DDT powder and 200 long tons of 50 per cent water wettable Dieldrin powder. Under the agreement, the Government of India will provide the rupee equivalent of $2.3 million to meet the costs of local operations and inland transportation, etc. India's nation-wide Malaria Control Programme, now in its fifth year of operation, envisages the extension during the current year of the operations so as to give some measure of protection to about 200 million people living in malarious areas.

*

Subsidised Industrial Housing Grants: Loans and subsidies amounting to Rs. 1,12,42,800 were sanctioned by the Government of India during December, 1956, for the construction of 2,832 single-room tenements in the Bombay State under the Subsidised Industrial Housing Scheme. Of this, Rs. 56,21,400 will be loan and the rest subsidy. Two hundred tenements will be built at Rajkot, 50 at Morvi, 60 at Wankaner, 100 at Saurendranagar, 74 at Dhrangadhara, 50 at Limbi, 100 at Veraval, 60 at Sika, 100 at Porbandar and 40 at Shahpur. Seven hundred seventy-four tenements will be put up at Bandra and 1,224 at Koliwada, subsurbs north of Bombay City. The total amount of loans and subsidies sanctioned to various States and organisations till December 31, 1956, for the construction of 87,646 tenements and 150 shops since the inception of the scheme in September, 1952, is Rs. 24,75,35,930.

*

Registration of New Companies in Eastern Region: Thirty public companies with an authorised capital of Rs. 50,64,60,000 and 221 private companies with an authorised capital of Rs. 57,14,53,500 were registered in the eastern region comprising West Bengal, Assam, Bihar and Orissa under the New Companies Act during the first nine months after the Act came into force on April 1, 1956, according to a review made by the Regional Director, Eastern Region, Company Law Administration, Calcutta. During the same period, 106 companies went into liquidation in this region.

GENERAL

The Bristol Britannia: The Bristol Britannia, which is to be introduced by B.O.A.C. into regular service on March 2, between London and Sydney through India, is the largest turbo propeller airliner in the world and the first long range aircraft of this type. Universally known as "the Whispering Giant", the Britannia has a wing span of 142 feet, a length of 114 feet and an all-up weight of 155,000 lbs. (67 tons). Its four Bristol Proteus 705 turbine engines each develop the equivalent of 3,900 horse power and they give the aircraft a cruising speed of 360 miles per hour. It normally flies at heights between 20,000 feet and 25,000 feet but the cabins are fully pressurized and air-conditioned so that passengers do not feel any effects of heights. The Proteus engines are smooth running and the Britainnia is fitted with weather detection radar equipment which gives the pilot an indication of storm centres up to 150 miles ahead of the aircraft and enables him to avoid areas of turbulence. The Britannia is already operating three services a week in each direction between London and Johannesburg. Two of these services are routed via Rome, Khartoum, Nairobi and Salisbury to Johannesburg. Starting on March 2, the Britannia will go into service between Britain and Austraila on the Kangaroo route, operated by the Corporation in partnership with Qantas Empire Airways. There will be three services a week in each direction between London and Sydney-Calcutta will be a regular stopping place for the Britannias flying on the Australian services and the other points of call will be Zurich, Istabul or Beirut (depending on developments in the Middle East), Karachi, Singapore, Djakarta and Darwin. Later this year Britannias will also go into service on B.O.A.C. routes between Britain and Aden, Ceylon, Hong Kong, and Japan, with halts at Delhi or Bombay.

*

Model Schemes for Setting Up Small Industries: A number of model schemes for setting up small-scale industries and technical bulletins on different manufacturing processes have been prepared by the Small Industries Organisation under the Ministry of Commerce and Consumer Industries. These schemes give the basic data regarding the requirements of plant and equipment, raw materials, capital investment and other details. They are intended to help the small entrepreneur who may not possess the basic knowledge about different aspects of small industries.

NEWS IN BRIEF

INDIAN

The Government of India has sanctioned a scheme to set up a cement factory in Pampore, about ten miles from Srinagar. The scheme will involve an expenditure of Rs. 15 lakhs.

*

A scheme for the grant of financial assistance to colliery owners to enable them to provide dispensary facilities to coal-mine workers has been sanctioned by the Government of India.

*

Te sugarcane planting programme for better recovery of sugar during the 1957-58 season, by replacing old varieties and extending the area under early maturing varieties by up to 30 per cent has been drawn up for the Rohilkhand range in U.P.

*

It is reported preliminary inspection of the site has been completed for the establishment of the heavy electrical machinery factory near Bhopal. The factory will be the first of its kind in India.

*

The Joint Chief Controller of Exports, Bombay, has announced that the ceiling fixed for the export of onions from Bombay port has been reached and no further applications would be entertained with immediate effect.

*

It is reported forward trading in oilseeds will start shortly in Calcutta under the auspices of the Calcutta Wheat and Seeds Association.

*

Two 100-ton open herth furnaces were put in operation recently marking the first stage in the gradual expansion of production which will raise Tata's steel output to two millions by 1959-60.

*

It is reported that no ceiling would be put on the loan to be given by the Industrial Finance Corporation of India to any type of industry.

*

The Ministry of Commerce and Industry has announced that licences for export of pashmina wool for the period January-June 1957 will be issued from New Delhi on the recommendations of the Government of the State in which the stocks intended for export are located.

*

A scheme for the installation of automatic flashing beacons in the Sunderbans to facilitate night navigation was approved by the Ganga-Brahmaputra Water Transport Board at its meeting held recently.

*

It is reported Dacca Navigator Chains on the east and west coast of India might possibly be completed before the mansoon of 1958.

*

The Government of India have acquired the aircraft-carrier 'Hercules' (15,700 tons) from the British Government. The 'Hercules' is being modernised and refitted in the United Kingdom.

FOREIGN

The United States Secretary of Agriculture has announced price supports for 1957 United States Crops, including cotton. The minimum price for 1957 cotton will be 28.15 per cent per pound gross weight on basis of middling ⅞ inch cotton at average locations.

*

World oil output last year totalled 835 million tons, the highest figure and an 8.5 per cent advance on 1955. Canadian production went up by 30.8 per cent—the highest increase in the world — to make Canada the seventh largest producer outside Eastern Europe and China.

*

The magazine "Editor & Publisher" reports that the number of daily newspapers sold in the United States each day has reached an all time record of more than 57 million.

*

A Spanish trade delegation, comprising Government officials and business men, has arrived in Cairo to investigate the possibility of selling more Spanish products to Egypt.

*

The Bank of Japan has announced a deficit in Japan balance of payments for January, and forecasts that deficits would probably continue this month and next.

*

A contract for the delivery of 100,000 tons of Burmese rice to the Soviet Union in 1957 was signed in Rangoon recently.

*

British Guiana exported $3,793,804 worth of greenheart timber during 1956, an increase of $860,000 on the previous years exports. The United Kingdom, the United States and Holland were the chief importers.

*

The Anglo-Norwegian Economic Committee, which met in London recently, reached an agreement on the level of quotas to be established by each country for the import of goods in the sector still subject to bilateral negotiation.

*

Mineral production in Southern Rhodesia in 1956 reached a record value of £23,260,547, according to the Department of Mines. The figure is about £2¼ million higher than in 1955 and over £4 million above the 1954 total.

*

The Maize Industry Control Board in South Africa has concluded an agreement with Egypt for the sale of 40,000 tons of maize to Egypt for shipment in four loads during April and May at £20 per ton f.o.b.

*

It is reported about two-thirds of the Kr. 160 million (£10.6 million) imports to Sweden from the Soviet Union under the recently signed 1957 agreement will consist of liquid and sold fuels. The quota for oil and oil products has been raised from 850,000 tons to 900,000 tons and the quota for coal and coke is unchanged at 150,000 tons.

*

Rubber production in Ceylon during December amounted to 11,440 tons, bringing production for 1956 to 95,389 tons. Compared with 93,830 tons in 1955.

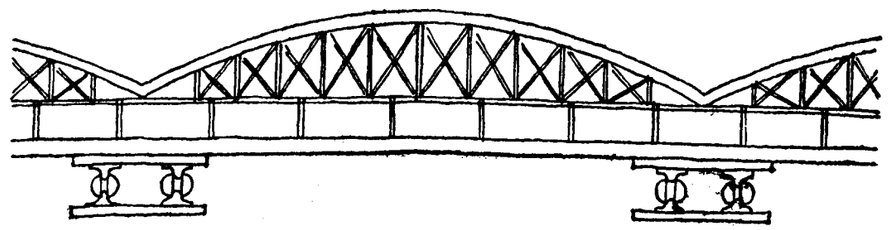
*

Japanese production of chemical fibres amounted to 981 million lbs. in 1956, 27.9 per cent above the level of the previous year. Rayon filament output reached 227 million lbs. (up 16.4 per cent) and acetate and rayon staple 690 million lbs. (up 28.5 per cent).

WHAT HAS HE TO DO WITH CEMENT ?

Cement builds his home. It is in the pavement on which he walks, the school in which he learns the arts of man, the hospital which he may need, the swimming pool, sports track and gymnasium that build his team spirit and his muscle. It is in the dams, power houses, factories, grain silos . . .

CEMENT— more and yet more cement — is the need of his future. The Associated Cement Companies Limited, which has doubled its output between 1948 and 1955, will double its production again during the next five years. The success of the Second Five-Year Plan and the future of India's youth both depend upon Free Enterprise.



The ACC is helping to build his India of tomorrow.

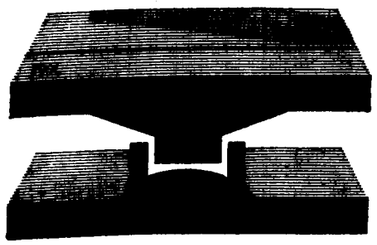
Bridging the Future...



Rs. 25 crores are to be spent during the next five years on bridges alone. For these reinforced concrete and structural steel bridges, thousands of cast steel roller and rocker bearings will be needed. These cast bearings form an integral part of bridge construction because they allow for free movement of the bridge caused by temperature variations.

We, at Mukand, have a large expansion programme under way. Production capacity at the Mukand foundries is being stepped up to supply India's construction and engineering companies with the cast steel roller and rocker bearings which they will need. We are proud of our role in India's industrial progress.

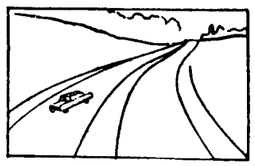
the tyre with BUILT-IN PEACE OF MIND

Now from Firestone comes the modern safety tyre—the New DeLuxe Champion Tubeless Tyre. It gives you and your family protection never before provided in any tyre at any price. It's the first and only tyre with *built-in peace of mind.*



BLOWOUT SAFE

No longer any fear of dangerous blowouts—This tyre is fitted with an air-tight Safti-Inner Liner instead of a tube. There is nothing to rip, tear or explode.

PUNCTURE SAFE

The Safti-Inner Liner of the New DeLuxe Champion Tyre tightly grips puncturing objects and slows down the loss of air—so there's no more fear of having to change tyres on a busy road.

MORE MILEAGE

The New DeLuxe Champion Tyre gives longer mileage because the tough tread compound wears more slowly, and because its flatter tread wears more evenly.

Economic Report from the U.S.

U.S. TRADE POLICY

(BY GUY SIMS FITCH)

WASHINGTON, Feb. 12.—Another Presidential message required by law now has taken its place alongside the state-of-the-union, the budget, and the economic reports, as a major annual communication to Congress: This week, Mr. Eisenhower submitted to Capitol Hill his first regular report on the operation of the U.S. Trade Agreements Programme. The Programme itself has governed U.S. trade relations with other countries since 1934. No annual Presidential report was necessary. But in 1955, Congress wrote the reporting requirement into the legislation by which the trade programme has extended for three more years. The report thus represents a reaffirmation of long standing policies. But it is particularly appropriate that the first annual trade message should come from Mr. Eisenhower. For the past four years he has given the programme not only his endorsement, but a new and vital impetus.

It is Mr. Eisenhower's conviction that international commerce not only contributes to U.S. economic well-being, but also "beneficial to the community of nations and conducive to the establishment of a just and lasting peace in the world." U.S. foreign trade policy, therefore, "seeks to promote the continued growth of mutually profitable world trade." It is a matter of record that the Eisenhower Administration has consistently worked towards this goal. One of Mr. Eisenhower's major recommendations after becoming President in 1953 was a three-year extension of the Trade Agreements Act. In 1955, Congress not only approved that extension, but granted the President additional tariff-cutting authority.

This authority was put to use last year, when the United States and 21 other contracting parties to the General Agreement on Tariffs and Trade (GATT) met in Geneva to negotiate multilateral tariff concessions. The U.S. also co-operated in strengthening the 35-Nation General Agreement. More effective and simple provisions have been devised. Particularly those that fit the needs of newly developing countries. Another encouraging tendency noted in the report is that countries with balance-of-payment difficulties are seeking a solution, of their external financial problems through internal measures rather than through the imposition of import quotas, which often have been a greater trade impediment than tariffs. One element of the President's Trade Programme which has not yet received congressional approval is U.S. membership in the proposed Organization for Trade Co-operation (OTC), designed as a permanent administration body for GATT. The President's recommendation to join OTC, on which Congress failed to take action last year, will probably come before the national legislature again this year.

By contrast the President succeeded in obtaining approval for another long-sought piece of legislation — one that is not included in the present report but deserves mention. Last year, Congress adopted a Customs Simplification Act, which will not only ease the procedures by which foreign goods enter the United States, but reduce duties on many of them. But perhaps the strongest indication of Mr. Eisenhower's liberal trade policies is his attitude on requests for added tariff protection. He has rejected several proposals for upward revision of tariffs on imports which were claimed to threaten American industry with "injury". Of six such "Escape Clause" recommendations made in 1956 — by itself a modest number — the President turned down five. The continuing liberalization of U.S. trade policy has been a gradual, and thus at times a slow process. But the more important fact is that steady progress has been made — and sometimes in the face of vociferous protectionist opposition.

CAUVERY BRAND CHEMICALS

CAUSTIC SODA (flakes)
LIQUID CHLORINE
STABLE BLEACHING POWDER
SLAKED LIME
HYDROCHLORIC ACID
FERRIC CHLORIDE
BURNT LIME
CALCIUM CHLORIDE

BECAUSE 'CAUVERY' brand chemicals are produced under careful control, each shipment will be of the same high quality and constant uniformity. The Business World

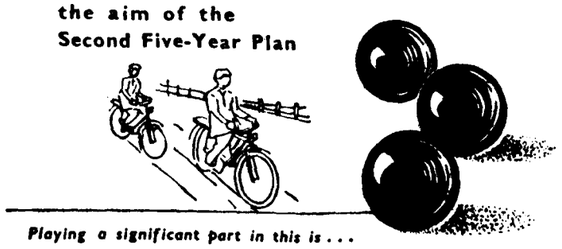
PROGRESS OF BICYCLE INDUSTRY

THE bicycle industry in India has justified the protection it has been enjoying for the last ten years. Its progress has been spectacular. Today there are as many as 18 large-scale units with an annual capacity of 1,273,500 bicycles against 2 units with a capacity of 120,000 in 1950-51. Four more units have been licensed recently with a total capacity of 234,000 cycles. Besides, there are 41 small-scale manufacturers with a sanctioned capacity of 219,000 and nearly 500 factories which manufacture only parts and accessories. Corresponding to the rise in installed capacity, production has increased considerably during the period of the first Five-Year Plan. During 1956, 660,000 cycles were manufactured by 14 units as against 101,000 in 1950-51. The demand has, however, all along outstripped supply so that more than a lakh of bicycles were imported in the first eight months of the current financial year. The progress of the industry in the first Plan is given in the table below:

Year	Numbers Produced ('000)	Numbers Imported ('000)
1950-51	101	166
1951-52	120	283
1952-53	211	198
1953-54	289	90
1954-55	401	89
1955-56 (Estimated)	550	130

When the first Plan was formulated, it was expected that demand at the end of the Plan period would be met entirely from indigenous production and that there would even be a surplus of 30,000 cycles to be exported in the last year of the Plan. It is evident, therefore, that although the production target has been exceeded, demand has surpassed all sober estimates. It is expected, however, that a beginning will be made in 1956-57 in exporting Indian made bicycles to neighbouring countries on a competitive basis. Meanwhile, the internal offtake is estimated to rise to about 11 lakhs at the end of the second Plan as a result of an increase in the standard of living, expansion of trade and construction of new roads within the country and a possible fall in the price of mass-produced bicycles with indigenous components. Thus the total requirements of cycles will rise from 6.8 lakhs at the end of the first Plan to 12.5 lakhs by 1960-61.



The greatest handicap of the industry hitherto has been the dependence on foreign sources for essential materials. The estimated value of imports of bicycle components and accessories at Rs. 175 lakhs in 1955-56 was more than half the total consumption by the manufacturing units. It is gratifying that many of the ancillary services are being built up and the industry is less dependent now than before on imports. In fact, it is a condition on the new units licensed that they will not be permitted to import more than Rs. 24 worth of components per bicycle even in the initial stages. Today most of the larger units which turn out complete bicycles also manufacture, or are expected to manufacture, a good number of parts. Self-sufficiency in steel tubes is now within sight and will be attained when the Indian Tube Company Ltd. of Calcutta and Tube Products of India, Madras start production to supplement the production of the two established manufacturers, Godrej and Boyce and Premier Automobiles. Steel strips will be produced by Indian Tube Co. and J. K. Iron and Steel Company. Though the manufacture of special steel is receiving the attention of the Government, the probability is that it will have to be imported even at the end of the second Plan.

Cycles produced in this country have yet to go some way before their productive potential and manufacturing costs are improved. A decade of high tariff protection finds Indian prices comparatively high and quality rather poor. A comparison of the c.i.f. prices of imported vehicles and the wholesale prices of the same category manufactured in India shows that the cost of production is considerably higher in India than in England and other European countries. The causes of the price differentials have been recognised by the Tariff Commission in earlier enquiries. If, therefore, the industry is to be assured of steady expansion and development of an export market sustained efforts should have to be made to improve its competitive strength. The question of continuance of protection beyond December this year has to be examined in this context. The steps to be taken to reduce the prices of Indian cycles are engaging the attention of the Development Council which was constituted is 1953 and success in this direction is being achieved steadily. During recent years the selling prices of bicycles manufactured in the country were revised progressively. The premier producer, Hind Cycles, has given a reassuring lead in this respect. The Development Council has also made various recommendations to maximise production and improve quality.

An important aspect of the bicycle industry is that there is a number of small-scale units scattered all over the country, a large proportion of which is in upper India. While some of them are well organised and have modern equipment and trained technicians many are small proprietory concerns. Though the products of these small concerns are often sub-standard they are absorbed locally on account of their cheapness. In recent years, however, the small manufacturers have improved their production techniques and quality considerably in order to compete with the organised factories. The Development Council has suggested that raw materials of correct quality should be made available to small-scale units and that they should have the advantage of bulk purchases. Adequate technical help is also necessary if they are to make substantial progress.

The question of continuance of protection beyond December 1957 has been taken up for investigation by the Tariff Commission. In his inaugural speech at the opening of the enquiry, the Chairman Mr. Damle made an able survey of the progress recorded by the industry. There can be no doubt that on the score of its performance as well as from the viewpoint of its importance as a vehicle with fast increasing popularity protection will be continued.

BUSINESS NOTES

SECURITIES CONTRACTS REGULATION

THE COMING into force this week of the Securities *Contracts* (Regulation) Act, 1956, marks the first event of far-reaching importance to regulate throughout the country the business of dealing in securities and to create an organised and efficient securities market. It has been laid down in the Act that only stock exchanges recognised by the Central Government will be permitted to function. Recognition will be granted after the Government is satisfied that the rules and by-laws of the exchange ensure fair dealings and protection to investors. In the areas where stock exchanges operate, every contract entered into by any person not a member of the recognised exchange will be illegal under Section 13 of the Act. Where no stock exchange exists, the working is to be regulated by a system of licensing of persons who deal in stocks and shares. This Section will come into effect after the areas and States to which its provisions are to apply have been notified, which will be done after the necessary recognitions have been accorded. The monopoly of dealing in securities will rest with the officially recognised exchange in each region, which abolishes the Kerb market.

One immediate and important consequence of the enforcement of the Act is that all option dealings entered into after the commencement of the Act are declared illegal. This is calculated to check gambling speculation and promote genuine investment. Among other more important provisions is the one authorising the Government to call upon an exchange or a member to furnish all necessary information and to conduct a formal enquiry, if required.

It is fair to expect that by putting an end to all unauthorised transactions, a large element of stability will be imparted to the share market and unhealthy speculation will be curbed. While there may be no two opinions regarding the laudability of the objects of the Act, the real test of its value lies in how the Government exercises the vast powers vested in it. In order to allow the stock exchanges to function efficiently, it is imperative that the authorities should limit themselves to a general system of control leaving the exchanges free to manage their internal affairs. It is necessary that the Government should scrupulously avoid all chances of introducing regimentation in stock market dealings and should permit the exchanges to enjoy a full measure of autonomy and flexibility. This can be ensured if the reserve power to the Central Government to frame by-laws, in certain circumstances, after consulting the exchanges or powers like the taking over of the functions of the Governing Body of a stock exchange are used only after all other possible measures fail to bear the desired result.

INDUSTRIAL FINANCE

A WELCOME disclosure was made by Mr. K. R. K. Menon, Chairman, *Industrial Finance Corporation*, when he recently said at Madurai that a new scheme of issue of interim loans had been taken up by the Corporation. Under the scheme, if the Corporation is satisfied about the economics of a project and the security generally, and if it finds that half of the money intended for the purchase of machinery has been spent, it would give interim loans on a liberal basis. He also said that for augmenting the resources of the Corporation, certain proposals had been submitted to Government for consideration. There is thus some likelihood that it may go into the money market by issuing debentures. About nine years ago, the Corporation was brought into being with the object of providing finance to industry in such cases where it was not possible to raise necessary funds from the public by way of share capital. Even though this qualification has been ignored in some exceptional cases to provide funds to various enterprises, the operations of the Corporation cannot be termed more than modest. Since its inception up to the end of June last year, the Corporation had sanctioned loans totalling a little less than Rs. 44 crores, of which only about Rs. 17 crores had been disbursed, for reasons not always of the Corporation's making.

It may be argued that the Corporation has sanctioned all loan applications which answer the necessary requirements. But that is not entirely sufficient to allay the fears that in case there is a larger demand put up by the institutions needing funds, the Corporation may not be able to match the supply with the needs. Over the last three years particularly, there has been a progressive increase in the loan sanctions indicating a corresponding increase in demand. In 1955-56, the demand was almost double that of the preceding year, which should be expected to multiply in the future. For obvious reasons, the second Five-Year Plan has not been able to make a provision of more than Rs. 15 crores to increase the Corporation's resources, but the allocation seems to be all-too-meagre for the anticipated demand. Against this background, an appeal to the money market appears to be a good alternative in order that deserving enterprises may not have to starve for necessary funds. Another aspect of the Corporation's operations that calls for early attention is the necessity of modifying the formal procedure under which loans are given so that all the avoidable delay between the making of a loan application and the actual disbursement may be eliminated.

WORLD COTTON FACES BETTER SEASON

"ECONOMIC ACTIVITY in the United States is off to the favourable start generally expected for 1957", wrote our American Correspondent last week in his Economic Report from the U.S. An equally optimistic outlook is forecast not only for American cotton but also for world trade in that commodity. The most significant feature of the 1956-57 cotton season is the anticipated improvement in the relationship between aggregate supply and disappearance within the free world.

Inasmuch as the imbalance between supply and disappearance has been the major source of trouble in the international cotton world for the past several years, the importance of establishing a reasonable equilibrium between supply and demand in this behalf cannot be overemphasised. Analysing the satistical position of world cotton for the current season, the International *Cotton Advisory Committee, Washington*, points out that there is every likelihood that cotton supply would stabilise at around last season's level of 51.5 million bales. Of this, carry-over stocks on August 1, 1957 are expected to be a little over 22 million bales as against 20.6 million bales in 1955-56. The increase in carry-over, however, more than likely to be cancelled out by a decline in production from 30.9 million bales to 29.5 million bales. This decline in free world cotton production will be largely influenced by the extent of response in the U.S. to the Soil Bank Programme.

As regards disappearance, two factors, namely, "the impetus given to textile production by the present disturbed international outlook" and the prospects of a sizable increase in total free world exports, would work in favour of maintaining the tempo of disappearnce at a higher level than in the past seasons. In fact, at the recent outlook conference in the U.S. Department of Agriculture, the opinion was expressed that "consumption outside the U.S. might increase by about one

million bales which, after taking into account an expected slight decline in U.S. consumption, would result in a net increase in free world consumption of some 80,000 bales". In conjunction with this, when one remembers that there is a distinct possibility of the free world cotton exports, reaching the record figure of 13 million bales, it is easy to visualise that the rapid increase in supply since 1950-51 would soon be halted effectively — if it has not been done already — and accumulation of stocks would be a thing of the past. No wonder, therefore, that the I.C.A.C. comes to the conclusion that "although there are problems that are far from being solved, the world cotton situation is presently somewhat more hopeful than in recent seasons." It should also be noted here in favour of a better world cotton season ahead that "despite fear of a collapse in cotton prices, prices in most markets have shown a rising trend since the beginning of the season."

GROWTH OF RUBBER INDUSTRY

ENCOURAGING PROGRESS has been shown by the rubber industry in India in recent years. In 1956 production rose to 23,444 tons which was 4 per cent higher. But consumption is shooting up at a rapid rate. Over the last five years consumption increased by 50 per cent. Domestic production is expanding at a faster rate than until recently. During the five years it increased by 18 per cent.

A few months ago it was thought that manufacturers requirements by 1961 would be 40,000 tons. Mr. Cecil Stack, Chairman of the Association of Rubber Manufacturers in India, however, opines that consumption will reach 60,000 tons. Local production according to him is not likely to exceed 27,000 tons despite present plans to replant 70,000 acres in South India with better yielding trees. This replanting would take place over the next ten years and its benefit will only begin to be felt by 1963. While 100 per cent progress is envisaged in India over the next five years it is interesting to note that rubber consumption in the USA will rise by 35 per cent in the next nine years. A greater rate of progress is to be expected when one takes into account the fact that the per capita consumption of rubber in the United States was 20.7 lbs. whereas in India it was only 0.2 lbs. Figures for other countries are—China 0.3 lbs., Japan 2.3 lbs., Russia 3.8 lbs., West Germany 7.4 lbs. and UK 11.71 lbs.

The requirements of synthetic rubber are placed at 15,000 tons by 1961. It is pointed out, that negotiations are in progress for the establishment of a carbon black factory and also for the manufacture of high tenacity rayon yarn. If these plans materialise, the Chairman believes a considerable step forward will have been taken in making the industry self supporting in regard to its raw materials.

Research and technical development are very important for the rubber industry. It is heartening to learn that the Council of Scientific and Industrial Research is investigating the question of setting up an independent institute for this purpose. Since adequate finance is not readily available, as pointed out by the Chairman, it would be best that the work be carried out at one or more of the industrial laboratories already established in different parts of the country.

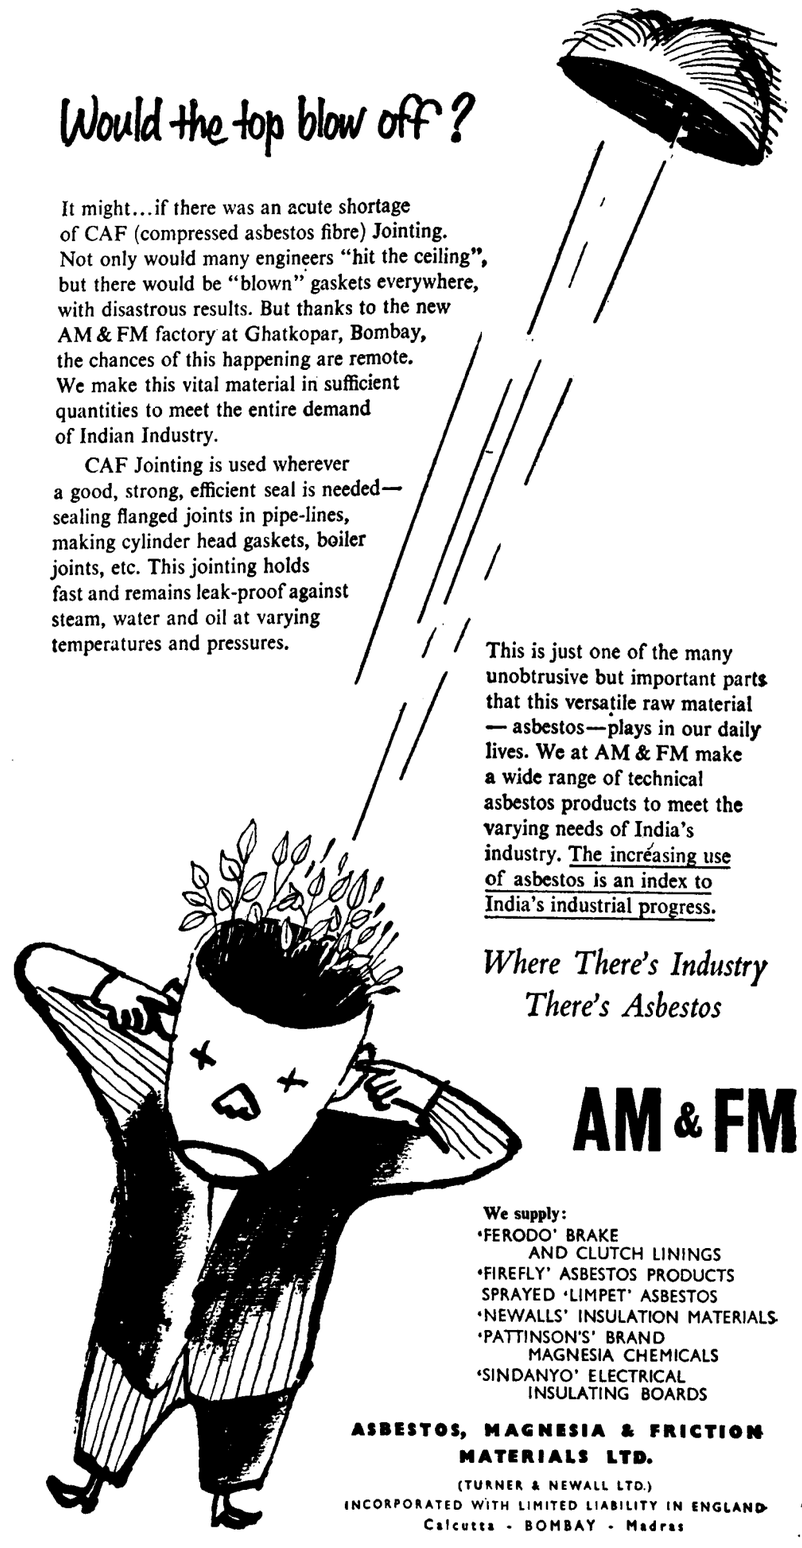
A PLAN FOR COCONUTS

AT THE meeting of the Indian Central Coconut Committee, inaugurated by Mr. S. Nijalingappa, Chief Minister of Mysore, at Bangalore recently, all the diverse aspects of the coconut industry, with particular reference to the imperative need to step up production, came up for detailed discussion. Emphasising the significance of the country becoming self-sufficient in its coconut requirements, Mr. M. S. Randhawa, Deputy Chairman of the Indian Council of Agricultural Research pointed out that it was high time that India ceased to be dependent on imports of copra and coconuts from Ceylon and Malaya. Elaborating the various measures undertaken by the Committee to enable India to become self-sufficient in this behalf, Mr. Randhawa remarked that a comprehensive scheme has already been launched, through the initiative of the Committee, to check widespread damage to coconut plants, arising from root or leaf diseases, especially in the State of Kerala which, since the reorganisation of the States, has become the foremost coconut growing region in India accounting for 10.8 lakh acres, with Mysore coming next with only 2.13 lakh acres under coconut cultivation! Thanks to Central assistance, it had been possible to spray the palms in question with effective pesticides and thus restore them back to life.

Mr. Randhawa stated that the total production target of seedlings for the nurseries, run by the Coconut Committee and its research stations and by the State Government was about 20 lakhs of which, so far, only 11 lakh plants had been produced at a total cost of Rs. 16 lakhs. In his opinion, the target of production of these nurseries should be raised by 100 per cent.

While recognising the need for self-sufficiency in coconut production, the Chief Minister of Mysore made a pertinent suggestion to the effect that the Committee should give loans to the coconut cultivator and make provision for return of this money in easy instalments. So far, only fertilisers were given as loan in kind but, of course, with the facility given to the grower to repay this in suitable instalments in the course of three years. Among the important resolutions adopted by the Committee at the meeting were recommendations for the abolition of the cess of four annas per hundred weight, collected at present on copra crushed in mills; the need to enlarge the area under coconut during the second Plan period; the appointment of an Expert Reviewing Committee to examine the work at the various research institutions; and the approval of a scheme to start a coconut nursery in each of the N.E.S. blocks in Kerala State.

HINDUSTAN AIRCRAFT EXPANSION



THE HINDUSTAN AIRCRAFT LIMITED, Bangalore, which will roll out its thousandth rail coach, some time in March, is busy not only maintaining its production schedule but also taking every step in the direction of further expansion. According to its Deputy General Manager, the target of rail coach production has been stepped up and it is expected that the factory would be able to produce one coach per day when the proposed plan to manufacture light-weight all-metal integral coaches, in collaboration with a leading rail coach manufacturing firm in Germany, is effectively put through.

In answer to a question put by Pressmen in Bangalore, the Deputy General Manager is reported to have disclosed that a new factory, for manufacturing coaches for the metre gauge, in collaboration with a foreign firm, has already been proposed by the Railway Board itself. It may be noted here that both the Hindustan Aircraft factory at Bangalore and the Perambur Integral Coach Factory at Madras are engaged in the production of coaches for the broad gauge only. Another disclosure — this is credited to the General Manager — is in relation to the drawing up of a blueprint for the production of transport planes, a scheme which is stated to be currently under the examination of a Committee appointed by the Government of India. Under this scheme, the Hindustan Aircraft is expected to enter into an arrangement with the Dutch firm of Fokkers-Friendship for the design and the technical 'know-how' necessary for manufacturing an ideal transport plane suited to Indian conditions.

Would the top blow off?

It might...if there was an acute shortage of CAF (compressed asbestos fibre) Jointing. Not only would many engineers "hit the ceiling", but there would be "blown" gaskets everywhere, with disastrous results. But thanks to the new AM & FM factory at Ghatkopar, Bombay, the chances of this happening are remote. We make this vital material in sufficient quantities to meet the entire demand of Indian Industry.

CAF Jointing is used wherever a good, strong, efficient seal is needed—sealing flanged joints in pipe-lines, making cylinder head gaskets, boiler joints, etc. This jointing holds fast and remains leak-proof against steam, water and oil at varying temperatures and pressures.

This is just one of the many unobtrusive but important parts that this versatile raw material — asbestos—plays in our daily lives. We at AM & FM make a wide range of technical asbestos products to meet the varying needs of India's industry. The increasing use of asbestos is an index to India's industrial progress.

Where There's Industry There's Asbestos

COMMODITY NEWS AND NOTES

IRON ORE BANDS IN PUNJAB

A two and a half-mile long iron ore band, containing an estimated reserve of over 2 million tons in Mohendragarh of the former PEPSU State, has been traced by the Geological Survey of India. Investigation reveals that the iron ore bands form the backbone as well as the flanks of a low ridge running north-south in Chhapra, Antri and Beharipur areas. At the north and south ends, the bands disappear under the alluvium and sands. An analysis of the samples of this ore carried out at the Geological Survey of India laboratory showed that the ore is good enough for conversion into pig-iron. The iron ore bands are massive, sometimes joined, and have almost uniform strike and dip. They stand out very prominently along with the crest of the ridge or along its flanks.

The Geological Survey also reports the existence of extensive reserves of good quality lime-stone in Dehra Dun-Mussoorie areas—not difficult of access from the Dehra Dun Railway Station in U.P. The quarriable reserves of lime-stones in the area are estimated to be of the order of 406 million tons.

PRODUCTION OF SUGAR

The All-India first estimate of sugar produced directly from cane in vacuum pan factories puts the current season's production at 19.38 lakh tons as against the actual production of 18.62 lakh tons during the previous season, according to the Directorate of Economics and Statistics, Union Ministry of Agriculture. This shows an increase of 76,000 tons or about 4 per cent in production during the current year as compared to the last year. The increase in sugar production has been shared by U.P. (51,000 tons) and Bombay (23,000 tons).

RECORD COAL OUTPUT

The output of coal from the existing collieries in January 1957 was 3,08,000 tons as against 2,62,000 tons during January last year. This is the highest production ever obtained in the last five years. Output of coal in the Bokaro coalfield in January, 1957, was 1,12,000 tons, which is the highest in any month since the process of departmental coal-raising was started.

FORWARD TRADING IN LINSEED

Forward trading in linseed will start shortly in Calcutta under the auspices of the Calcutta Wheat and Seeds Association, it has been announced. The Central Government by a resolution on November 19, 1955, recognised two associations, one in Calcutta and the other in Bombay to conduct forward trading in linseed under the Forward Contracts Regulation Act of 1952. It had earlier been banned under the Oilseeds (Forward Contracts Prohibition) Order of 1943.

IMPORTS OF CEMENT

State trading in cement was introduced with effect from July 1, 1956, and the distribution of indigenous cement as well as the import and distribution of foreign cement was entrusted to the State Trading Corporation of India (Private) Ltd. Through the efforts of the Corporation, over one lakh tons of cement were imported up to the end of January 1957. It is expected that a further quantity of about two lakh tons will be imported by the end of August, 1957.

U.S. STEEL PRODUCTION

United States steel producers are lowering their 1957 production sights. Industry executives disposed in early January to predict a record-breaking performance this year, are now more inclined to believe that the mills will do well to equal the previous peak of 117 million tons reached in 1955. Output last year fell to 115.2 million tons. Chief reason for the change in sentiment is a disappointing volume of motor-car purchases, it is stated. Consumer demand for 1957 model motor-cars has been below Detroit hopes and Detroit, in turn, has cut its steel orders.

BRITISH CATTLE FOR RUSSIA

As the result of a deal between Soviet Government farming experts and British breeders of Hereford Cattle, 43 pedigree Herefords are going to Russia. The 24 bulls and 19 heifers will be used by the Russians to improve the standard of beef cattle. The fact that heifers are included in the shipment suggests that the Russians are also establishing pedigree Hereford herds.

JAPANESE MOTOR OUTPUT PLANS

Japanese production of passenger cars, trucks and buses in 1956 reached an estimated 113,000 — 60 per cent more than the preceding year. Producers expect an additional 30 per cent rise in output this year, to 95,000 three-wheel trucks, 3,000 four-wheel trucks, 45,000 passenger cars and 6,500 buses. Exports of three-wheel trucks soared to 1,700 last year, compared with only 151 in 1955. China alone purchased 800 and the major producers hope to increase sales to Peking to 10,000 vehicles yearly.

RECORD COFFEE PRODUCTION

The recently revised current coffee crop estimate stands at just under 38,000 tons — an all-time record for India, it is stated. The prospects for 1957-58 at the moment are stated to be bright though rains in some parts are reported to have hindered the picking of the crop resulting in dropping of fruits to a slight extent. In the light of the recently revised estimates for 1956-57 crop, the exportable surplus out of this coffee crop is now placed at 11,000 tons.

WORLD'S COTTON CONSUMPTION

The International Cotton Advisory Committee has pointed out that world consumption of cotton during the year ending July 31 is expected to reach a new record high of 39,300,000 bales. This would be about 1,500,000 bales over the previous record set last season. At this level, world consumption would slightly exceed the world's production for the first time since the 1950-51 season. It said that significant increases in consumption this year were expected in Japan, India, France, Italy, Western Germany, Pakistan, Turkey, Mexico and Argentina.

U.S. NEWSPAPER SALES PEAK

Newspapers in the U.S. had their greatest circulation last year, with 57 million copies sold daily—an increase of almost 1 million over 1955.

Election

INDIA'S second General Elections are just under way in stages from the Cape to the Himalayas. And the Congress Party, by all accounts, is headed for a massive victory at the hustings. A nationwide Gallup Poll, carried out for the first time in the country, has predicted a 53 per cent popular vote for the Congress and a bigger majority of seats for that Party in the Lok Sabha (Union House of the People). Already the Congress has won 12 parliamentary seats without contest and it is not improbable that the Party will score a majority large enough to invest it with the capacity to change the Constitution, if and when it so desires in the next five years.

ress, the results are known l batches of Vidhan Sabha) constituencies in all the erala, Madras and West 96 seats for which results have come in, 156 have been won by the Congress Party. It is too early to say whether there will emerge absolute majorities for the ruling party in *all* the States, for the elections will be completed only by the middle of March. Already the vaunted Communist stronghold of Telengana in Andhra Pradesh has voted a Congressman to that State's Vidhan Sabha and enabled his party to have an absolute majority. This trend will

probably continue even in the problem States of Kerala and West Bengal where the Communists have been particularly stronger than elsewhere, for the announcement of results in respect of one batch of constituencies before another batch goes to the polls is more likely to have a bandwagon influence in favour of the Congress than to spur the opposition parties on to further effort. But so long as there are imponderables in the matter of voters' turnout, two or three States not excluding Madras may have some surprise in store. Perhaps a larger turnout may help the Congress even in the problem States.

Even if the Congress should fail, by any chance, to get an absolute majority in the problem States, it would not materially affect that nationwide political stability the party has been able to establish. As political stability is the *sine qua non* of progress in an underdeveloped economy, the next five years, at any rate, may well be crucial not only for the success of the second Plan but for the flow of foreign private capital into India. Mr. Hollister's view that ultimately India should be the place where substantial US private capital should be used, appears to have been expressed in full awareness of the present and prospective political stability of the country.

This is good in so far as it goes. But stability without a constructive democratic opposition to the ruling party is not a happy prospect from a long-term point of view. The three national parties opposing the Congress have virtually nothing in common and they will continue to speak in three different voices in the next five years in the Lok Sabha and in the respective Vidhan Sabhas. Anything like a homogeneous opposition that could develop a formidable national challenge to the Congress Party in the third General Elections may have no greater chance of emerging in the next five years than it has had in the last. Whatever be the grandiose programmes the three parties (the Praja-Socialist Party, the Communist Party, and the Jan Sangh) have just presented to the electorate, they will be only of academic interest and least likely to have any constructive effect on the ruling party's policies and programmes. Even when the Congress leaders proclaim that they will always welcome constructive criticism, they *still* want only constructive praise. But even here the opposition parties, bitter as they will be, may have little contribution to make.

As Mr. Nehru and his team of sub-leaders may be expected to brush aside contemptuously carping criticism and servile flattery alike, a judicious mixture of constructive praise and constructive criticism alone may have a reasonable chance of influencing policy and legislation on liberal lines. Neither the Jan Sangh nor the Communist Party can measure up to the role of a responsible opposition which will realise that if it is human nature to criticise, it is also human nature to resent criticism. The Jan Sangh with its distorting emphasis on religious or communalist factors is incapable of developing a constructive economic programme and the Communist Party, however plausible its 'democratic' programme may be currently, is basically undemocratic in the sense that it is not wedded to upholding parliamentary democracy with its inherent methods of bringing about social change non-violently and constitutionally. The only opposition party which can conceivably advance criticism in such a manner that the Congress leadership would not resent it very much is the Praja-Socialist Party.

Mr. Nehru himself appeared at one time to have entertained the hope that the P.-S.P. would so fashion itself. If the Congress Party's greatest strength lies in its nationalistic fervour and emotional radicalism, the P.-S.P.'s greatest asset is to be found in the intellectual powers of its logical and radical thinkers—an asset that should stand that Party in good stead in the Lok Sabha and in some significant Vidhan Sabhas. The only requirement is that if a keen intellect and an impeccable logic are to be really effective, they should be leavened with a little humanism and liberal moderation in deference to the sensitivity of Congress leaders who, after all, have made this country a going concern.

While thus it is theoretically possible to think of the P.-S.P. as a constructive and responsible opposition which, in the fullness of time, may come to form an alternative government, it is amazing that Mr. Sriman Narayan, General Secretary of the Congress, should have added a jarring note to the dignified controversy between the two most popular leaders—Mr. Jawaharlal Nehru and Mr. Jayaprakash Narayan—on the need for and the role of an opposition in a parliamentary democracy such as India's. (Incidentally, according to a popularity rating of the recent pre-election poll, nearly 85 per cent of the people have a very good or good opinion of Mr. Nehru and nearly 40 per cent of them have a similar opinion of Mr. Jayaprakash). Mr. Sriman Narayan's preposterous contention is that "underdeveloped countries like ours can hardly afford the luxury of Opposition only for the sake of opposition."

The General Secretary of the Congress speaks of, what he calls, "certain compulsions of an underdeveloped economy" as if they were solely reflected in the urges of the Congress Party alone. "One of these compulsions", he says pontifically, "is that all well-meaning individuals as well as groups should try to pull on together and frame common national programmes". And he believes, therefore, that the parliamentary system of democracy is not very suitable for countries like India which must give the highest priority to their plans of economic development. It would be a distortion of history and current reality alike not to tell that the advanced economies of the West were at one time underdeveloped and that their economic advance has been coeval with the advance of their distinctive democratic institutions. If the basic compulsion of an underdeveloped country is related to economic progress, there is all the more reason why such a country should not be allowed to degenerate into a political totalitarianism. Here the inherent checks and balances of a parliamentary democracy alone can stand in the way of such degeneration. What is eminently required is a basic unity of purpose in regard to social and economic advance between the ruling party and the opposition in a liberal democracy. There is no reason to believe that such a basic unity of purpose does not obtain in India as far as the Congress and the P.-S.P. are concerned. There can be unity in diversity in the politics of an underdeveloped country like India wherein economic progress has become the common plank of all democratic parties by the compulsive logic of circumstances. The unity is there. One wonders why Mr. Sriman Narayan should be groping in the dark of his own fancy.

A Democracy on Trial

PRESIDENT SUKARNO has announced a new plan for Indonesia which is enmeshed in a continuing political crisis and riddled with army revolts. He has suggested the disbandment of the present parliamentary institutions as they are "not suitable" for the Indonesian people. He has supported his assertion by referring to the continued instability of the country's Government which has bedevilled the Indonesian body politic and thwarted economic development during the last eleven years. His own constitutional recipe is "guided democracy". Under it there will be a "Cabinet, representing all parties" and a "National Council". They will work side by side, the Council advising the Cabinet whether or not it was asked for advice. It is not clear whether the President himself will preside over the Cabinet (as he is to 'head it'), or whether the office of Prime Minister is to be retained. Nor is it clear whether the new Cabinet will be responsible to the President or the "National Council". The Council would be composed of representatives of workers, peasants, intellectuals, "national enterprises", Protestants, Catholics, Muslim scholars and women, besides "the 1945 revolutionary generation", the provinces, the army, navy and air force chiefs of staff, the police, the attorney general and senior Cabinet Ministers.

There is much to be said for the President's argument in favour of his drastic measures for curtailment—if not elimination—of democracy in the country, threatened with chaos. But all this does not prove that the reform plan that he has in view is the right means of forging national unity and ensuring sovereignty of the people. His plan side-steps the main causes of the political crisis. They are: military revolts, regional rivalries and corruption in public life.

Almost in the wake of two "armed interventions" by the Dutch, who tried to put the clock of nationalism back, came the Communist revolt in Madiun in September 1948. It was put down by the young republican government successfully. But soon after, Kartosuwirjo, leader of the Dar-ul-Islam, a fanatical Muslim movement, raised his standard of revolt in west Java. He has been fighting his compatriots ever since; his forces are still active even in the outskirts of Jakarta. The Dar-ul-Islam movement has spread from west Java to Achin, the northernmost part of Sumatra, and to south Celebes.

In May 1950, that is eight months after the Dutch grudgingly transferred sovereignty, the south Moluccan "republic" proclaimed its independence in protest against the Central Government's decision to scrap the federal constitution. In August 1956, when the federal constitution was actually torn up and Indonesia declared a unitary republic, revolt broke out within two months in the Celebes, and still continues. That the demand for local autonomy is not without substance or force is shown by the fact that last year, Sumatra provided 71 per cent of the value of Indonesia's total exports, and received only 10 per cent of imports as against Java which produced 17 per cent of the exports and received 75 per cent of the imports. Attempts to introduce settlers from overcrowded Java have also been bitterly resented by the inhabitants of Sumatra.

To the problem of regional feeling is added the insubordination of the army. The general staff, or at least the professional officers, have been at loggerheads with the Government. The proposal for the reduction in the strength of the army, largely consisting of former guerrillas is not popular with the politicians. The latter fear that the disbanded guerrillas might live by banditry as indeed some have done. At the same time, however, the national finances are under the fearful strain of maintaining so large a force for political reasons.

Taking advantage of the political instability and righteous wrath of the people against corruption, maladministration and a desire for a strong man's rule, some adventurers among army have revolted time and again. Only last August, Colonel Kawilarang, who was then commanding in west Java, made an unsuccessful attempt to arrest the Foreign Minister Mr. Abdulgani, on charges of corruption. Since then, two army officers, Colonel Simbolon, commanding at Medan in north Sumatra and Colonel Hussein, commanding in central Java, have revolted. It was these revolts that led to the rapid disintegration of Mr. Sastroamidjojo's Government, especially after the Masjumi withdrew itself from the coalition. For its continued existence his Government has been dependent upon the Communist support.

The General Elections, held in September 1955, did not improve matters. Though of the 190 parties which took part in the elections, only 29 received representation in the 260-member Parliament, two depressing features of the results ought to be recalled. The communal parties like the Masjumi, the Nahdut-ul-Islam, the Sareket Islam, Perti, etc., annexed 114 seats as compared to the 101 seats won by the non-communal Nationalist Party, the Communist Party, and the Socialist Party. The Communists polled nearly six million votes, that is comparatively more than any other Communist Party outside the Iron Curtain.

Thus, the troubles in Indonesia cannot be put down to the failure of the party Government but to the frequent revolts of the army and the demand for regional autonomy. It is, therefore, difficult to see how Dr. Sukarno's plan of "guided democracy" can resolve the present crisis. His decision to invite the Communists to participate in the new Cabinet and the National Council is sure to alienate the Masjumi Party and strong elements in Sumatra further. That the Communist Party should have already pledged full support to Dr. Sukarno's plan has sinister implications: participation in the Cabinet will give it a chance for subversion on the Czechoslovakian model. Further, it is difficult to see how the forcible merger of all political parties into one will lead to the disappearance of inter-factional differences. It is also not clear how the Presidential rule will be less open to factional pressures or better qualified to solve the problems of reconstitution of the army, regional autonomy, etc. To achieve national unity, which is obviously Dr. Sukarno's objective, it would have been much better to aim at unity of purpose. This might be done by resort to a national plan for reconstruction, by granting autonomy to the various units, and by starting immediately a campaign against corruption. India's successful march on the road to democracy could have been followed with profit. The road that Dr. Sukarno has chosen threatens to distort democracy beyond recognition.

Technical Manpower

THERE has been no lack, on the part of the Government, of real appreciation of the dimensions of the problem of technical manpower in the second Plan. An ambitious programme of industrialisation is bound to exert great pressure on the available and prospective resources in technical personnel. It was not to be expected that a manpower budget should be prepared with meticulous estimates to procure the outturn of trained technicians after the totalitarian pattern. Nevertheless, the broad magnitude of the requirements has been gauged. For the three steel plants in the public sector alone, the demand in respect of technicians below the grade of foremen is placed at 15,000, while in the case of supervisory staff of the foremen rank and above the estimate is not below 2,100 including 120 senior engineers capable of assuming responsibility for direction at higher levels. Part of these requirements is being met by special arrangment. The two steel plants in the private sector which have embarked on bold programmes of expansion will need manpower on a substantial scale. This is only a typical case of the heavy pressure which threatens to strain existing and potential availability. Over a wide range of industries at all levels, the demand for technicians will obviously go on increasing. The Engineering Personnel Committee which has investigated this question thoroughly has arrived at the matter-of-fact conclusion that, even on the assumption of hundred per cent implementation of its recommendations, the shortage in 1961 would be of the order of 1,800 engineers and 8,000 technicians. No time should be lost in giving concrete shape to its proposals.

The Committee's approach to the issue of expanding the facilities for training aims at ensuring immediate results through a structure of institutions which will show enough flexibility to respond to the higher demand that is certain to ensue after the period of the present Plan. It was urged that the establishment of 80 new institutions—18 engineering colleges and 62 polytechnics—is the minimum programme that must be taken in hand. Additional training facilities are recommended to be achieved by stepping up by the capacity of 19 existing colleges by 20 per cent and of 46 polytechnics by 25 per cent. These latter limits took cognizance of the current heavy pressure which is straining training capacity to the utmost. This is a sphere which admits of little choice of alternatives. Nevertheless, the final outcome to be reflected in Government's policy was far from clear until a month ago. The Education Ministry and the Planning Commission were still said to be in quest of short-cuts, inspired among other factors by consideration of economy in expenditure. In fact the alternative plan which they had under close scrutiny promised a saving in outlay of 25 per cent. Three new colleges and 27 polytechnics set the limit to additional institutions in this plan, while training capacity was to be extended in the existing institutions by two-shift operations intended to double the number of admissions, and possibly to treble it in some polytechnics, to secure an outturn which would be in excess of the target of the Committee by over 260 for engineering degree-holders and 680 for technicians holding diplomas. Expansion of the teaching staff was envisaged at the medium and lower levels. The entire scheme was less than convincing and on the score of quality of instruction and possible calibre of trainees its efficacy was doubtful.

The phase of deliberations was brought to a positive close at last week's session of the All-India Council of Technical Education. The Council has endorsed the proposals of the Engineering Personnel Committee with certain modifications. At the college level five new institutions are to be set up, one each in Andhra, Assam, Madhya Pradesh, Orissa and Punjab, presumably with a view to redressing the regional imbalance. The scheme of polytechnic institution, however, has been altered substantially and here the bias is clearly in favour of raising the supply of technicians at the lower level. Twenty-two new polytechnics and 61 junior technical institutions constitute the new set-up. It is likely that the distribution of new polytechnics will fail to satisfy regional requirements and in any event the total omission of Bihar, Madras and Orissa in the allocation in this category may be difficult to reconcile with their needs. The network of junior technical institutions is planned deliberately to bestow special attention on some States which demand it by reason of their industrial backwardness or rising unemployment. Rajasthan and Kerala illustrate the two objects behind the allocation. The exclusion of Andhra, Madras, Mysore and Uttar Pradesh from this class does not argue for ensuring the regional balance in the provision of new facilities. In addition to these institutions, the existing capacity is to be enlarged as suggested by the Committee. The three remaining higher technological institutions and selection of 15 colleges for post-graduate courses complete the plan for higher education. The aggregate outturn expected after this whole expansion is put through, is estimated to be 7,500 engineering graduates and 15,000 diploma-holder technicians per year.

The pace of expansion of institutional facilities for technical training is conditioned by the availability of teachers. In fact, this has often proved a great limiting factor not merely in under-developed countries. The bottleneck is two-fold—as regards numbers and calibre. It is a consequence of post-war development of industry that technical talents are attracted to it by competitive remuneration and the prospect of accelerated promotion as a reward for efficiency. Technical institutions can hardly provide these incentives on the same scale. The new plan for technical education provides for the creation of a pool of trained teachers to be augmented by means of fellowships in selected institutions with an obligatory course of practical training in industry. For students, too, training at the factory level can never be substituted by laboratory or workshop courses in the institutions prescribed as part of the regular curricula. Stock criticism is usually levelled against the quality of technicians that their education is academic in nature and it does not qualify them fully for immediate service. It would be less than fair to lay the blame completely at the door of those responsible for running the institutions. Industry surely owes an obligation to the community, and also to itself, to provide opportunities to trainees for practical instruction in production techniques in factories. Maulana Azad has appealed to it for co-operation. His appeal deserves liberal response.

THE WEEK'S NOTES

PROF. MYRDAL'S PLEA

THE FOUNDATION DAY celebration this week of the Delhi School of Economics, which has made rapid strides even during the short period since its inception, was notable for the very interesting and provocative address delivered by Prof. Gunnar Myrdal. Mr. Myrdal is not only a distinguished economist but the Executive Secretary of the U.N. Economic Commission for Europe. What he says for improving the economy of the backward countries, therefore, merits great attention. It is also a striking coincidence that following Dr. Arnold Toynbee, who was in Delhi recently, another distinguished representative from the West should lay great store by the Indian experiment in democracy as crucial for the world. For, Mr. Myrdal is certain that apart from meeting the demand for justice, political democracy has a great role to play in the strivings for economic development in an under-developed country as the other alternative is "violent revolution and dictatorship." What was provocative in his address was his plea for a "double standard morality" in the commercial policies of the under-developed countries vis-a-vis the developed regions because, as he argued, the former "have rational grounds for asking the latter to liberalise their trade and capital movements unilaterally." To restore world balance, the under-developed countries have to apply nationalistic economic policies and a "double standard morality" is the only way in which they can catch up with the advancing West. It is a tribute to the humanism of Prof. Myrdal that though belonging to the West, he should have come out so fervently for pleading the case of the under-developed countries in their struggle for development.

Another suggestion of Prof. Myrdal for the development of under-developed regions was some form of regional economic integration. Such integration had so far been lacking because of "prolonged economic backwardness, foreign domination and, in particular, political colonialism." More than the developed regions, he explained, the under-developed countries needed "neighbourhood co-operation, agreed specialisation in their industrialisation and indeed 'free trade areas' for themselves behind common protective walls in order to have real success with their development programmes." While regional economic integration may be possible and even necessary in the advanced stage of industrialisation, under-developed countries, whose economies are not complementary and who have to depend for their capital goods requirements on the advanced countries, may have to go slow in pursuing this suggestion. What they require immediately is assistance without any strings and with their national self-respect unimpaired. This calls for international co-operation and further utilisation of the U.N. agencies for routing assistance to the under-developed regions. The adage 'prosperity like peace is indivisible' is never more true than today and a world, where a substantial majority lives in sub-marginal standards despite the great scientific and technological progress of the last few decades poses a challenge to the advanced countries, because their own continued stability and prosperity depend to a large extent on what happens to the rest of the world.

U.S. TRADE MISSION

IT IS significant that despite present political differences, an American trade delegation should now be in this country to explore the possibilities of increased trade between the United States and India. This is an indication that differences on the political plane from time to time need not stand in the way of closer economic collaboration between the two countries. Recently, a number of trade missions from abroad have visited India, the last two being those from Denmark and Sweden. The present six-man mission from the United States (comprising four prominent businessmen and two Government officials) which is led by Mr. F. Preston Forbes, Director of the International Trade Development Division, Office of Trade Promotion, U.S. Department of Commerce, proposes to undertake an extensive tour of the country lasting six weeks.

The rising tempo of development under the second Plan and the easing of the restrictions on dollar imports have naturally increased the prospects of growing imports from the United States and especially in meeting India's capital requirements, because the United States can be of considerable help here among the various exporting countries. In view of the deteriorating foreign exchange situation, the Government of India have recently announced that all projects of industrial expansion will be conditional on the availability of their foreign exchange component either through long-term credit or through financial participation by the collaborating foreign firms. Interest now, therefore, centres on how far the United States manufacturers will be able to meet the supply of capital goods on long-term credit and thus take into account India's special needs and requirements. At the same time it is necessary to point out that increased imports by India can only be sustained by a corresponding increase in American imports from this country and here the possibilities of increased Indian exports of manganese and chrome ores, handloom fabrics and handicrafts are likely to be explored. The possibilities of increased ore exports seem to be quite bright consequent on the shipping space that will be available as a result of the increased American shipments of cotton and foodgrains under P.L. 480 programme to India. The results of the Trade mission are bound to be watched with a good deal of interest in both countries.

"DESTINY OF SOCIALISM"

MR. JULIUS BRAUNTHAL is a former General Secretary of the Socialist International and thus a top leader of the world socialist movement. He has just spoken at Delhi on the destiny of socialism. His hope (or, perhaps, prediction) is that before the close of the present century most countries in the world would adopt the socialist system of Government. This socialism would not be a mere State capitalism but would be based on democratic foundations. The twentieth century changes in the social, industrial and political spheres in many countries have persuaded Mr. Braunthal to believe that most countries, whether capitalist, feudal, monarchic or communist, are drifting towards democratic socialism.

Mr. Braunthal's optimism is no less amazing than that of Mr. Molotov who said some years ago that "we are living in a century when all roads are leading to communism" or of James Burnham who has predicted "the coming defeat of communism." Faith, they say, can move mountains, but the conflicting faiths represented by Braunthal, Molotov and Burnham may only keep the mountains in equilibrium, may be an uneasy equilibrium, for a long time to come. Whether ultimately there will be democratic socialism, cannot be confidently predicted. Mr. Braunthal's wish that all the problems expected to arise from increasing automation in the advanced countries might be solved by socialistic planning of national and international production of goods, may or may not be fulfilled. In predicting crises of over-production and consequent unemployment following automation, Mr. Braunthal sounds no less pessi-

mistic than Marx. But it is just conceivable that democratic socialism may achieve its destiny if the two major power systems in the world somehow manage to extricate themselves from the cold war complexes and devote their energies to the kind of rational organisation of production that Braunthal has visualised.

MR. SHEPILOV'S EXIT

THOUGH THE official announcement merely says that the Presidium of the Supreme Soviet has relieved Mr. Shepilov from his duties "in connection with transfer to other work", his replacement as Foreign Minister is significant. In a country where Ministers remain in office for unusually long periods as compared with those of the democratic countries, Mr. Shepilov's exit, after no more than eight months in office, betrays that the struggle for power among Stalin's successors has, far from being resolved, been "sharpened." This appreciation of the Soviet situation is supported by the fact that Mr. Saburov, boss of Russia's Planning Commission and another member of the Khrushchev faction, was unceremoniously removed from office only a few weeks earlier. This interpretation is reinforced by Marshal Tito's knowledgeable authority about the existence of such struggle in the Kremlin's "collective" leadership.

Mr. Shepilov's removal from foreign ministership is the price he has paid for the failure of the policy of the faction led by Mr. Khrushchev. In Europe, its policies of de-Stalinization and "independent roads to socialism" have resulted in the revolt in Hungary, the alienation of Poland, and accentuated estrangement with Yugoslavia. Its strenuous courtship of the "uncommitted" countries of the Middle East proffering them arms aid, after giving initial dividends, has only brought the United States on the scene. The Eisenhower Plan has incidentally bridged the gap between NATO and SEATO chain of strategic American bases, thus completing the cordon sanitaire around the Communist bloc. The hysterical denunciation of the Eisenhower Plan by Russia is proof of the alarm it has caused in the Kremlin. Mr. Shepilov's "crime", which has caused his downfall, is that he provoked the United States to move into the Middle East to fill in the "power vacuum" caused by the ending of the Anglo-French influence. He had offered "volunteers" to Egypt.

His replacement by Mr. Gromyko, a diplomat of the Molotov school, seems to imply tougher control by Moscow of the policy of its Communist "allies" and possibly renewal of intransigence in its relations with the West. This may be inferred from Mr. Gromyko's reputation for consistent obstinacy which he has built up at the United Nations. There is also evidence to show that since the Hungarian revolt, the "liberal" Khrushchev faction has taken a lead in the re-approbation of Stalin, which in practice can only mean acceptance of a "tough" line not only with regard to the West but also the countries of the "Socialist Camp", particularly Yugoslavia and Poland. It may also mean reintroduction of "iron discipline" in Communist parties throughout the world.

Moreover, it may be noted that disarmament is due to come in for discussion at London shortly. Mr. Gromyko and his preceptor, the Stalinist Mr. Molotov, have in the past been the Soviet negotiators. The spirit of Mr. Molotov will again hover over the discussions at London—as over Soviet foreign policy generally under Mr. Gromyko. Indeed, it is even possible, though remotely, that Mr. Molotov will again at some future time follow his spirit corporeally.

INDIAN RESOLUTION ON CYPRUS

IT IS heartening to know that the Indian resolution on Cyprus, which was approved in the United Nations Political Committee by 76 votes in favour, none against, and 2 abstentions, had been welcomed by the main contenders, Britain, Greece and Turkey. It is also reported that the EOKA terrorist organization has issued leaflets calling for a truce in the two-year old anti-British campaign of violence.

The Indian resolution expressed "earnest desire" that a "peaceful, democratic and just solution of the problem will be found and that negotiation will be resumed to achieve that end." It is to be hoped that the Cyprus question will not be revived at the next Assembly in six months' time and accusations and counter-accusations will not again be hurled at each other by two members of the free world. But to hope that the resolution will by itself resolve the Cyprus question would be tantamount to indulging in political romanticism.

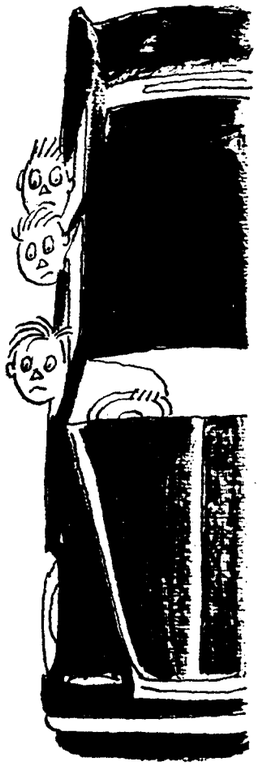
One could say, of course, that the problem in Cyprus is simply one of home rule. But the problem has been complicated by Greek and Turkish claims over the Island, besides the desire of the British Conservative Party to keep it as an outpost in the oil-rich Middle East. Mr. Menon estimated correctly the British policy of "divide and rule" and of granting undue weightage to the Turkish minority of hardly 17.9 per cent over the Cypriots who form 80.2 per cent of the population. He also criticised rightly Greek claims over the Island—"racial affinity does not mean that the Greeks and Cypriots are one."

There is, however, possibility of the problem being solved; all that is needed is the British Government's withdrawal from imperialist positions and its forgetting of the past imperial "glory." After the failure of its gunboat diplomacy in Egypt, the British should realize that their legitimate interests—including oil—cannot any more be safeguarded by the maintenance of a colonial police station. These interests would be better protected by winning the confidence of the Cypriot people—as has been done in the Indian sub-continent, Burma, Ceylon, and Ghana. In any case, the British Conservative Party Government has been forced to cut down defence expenditure in accordance with Britain's new role as junior partner to the United States. This should make it only a matter of time before opposition to the Cypriots' right of self-determination will have to be given up.

The prerequisite for winning the confidence of the Cypriots is the unconditional release of the political prelate, Archbishop Makarios. He alone can deliver the goods which even Lord Radcliffe, with all his constitutional acumen and gadgets, and the British Government with its policy of blood and terror, have failed to do so far.

COALMINING EQUIPMENT

THE RUSSIAN team of experts have recommended, in their report, the setting up of a plant in India for the manufacture of 30,000 tons of coalmining equipment required for the development of the coalmining industry in the country at an estimated cost of Rs. 13.2 crores. In making their recommendations the Expert Team have taken into account the requirements of the public and private sectors in fulfilling the targets of coal production for the next 5, 10 and 15 years.



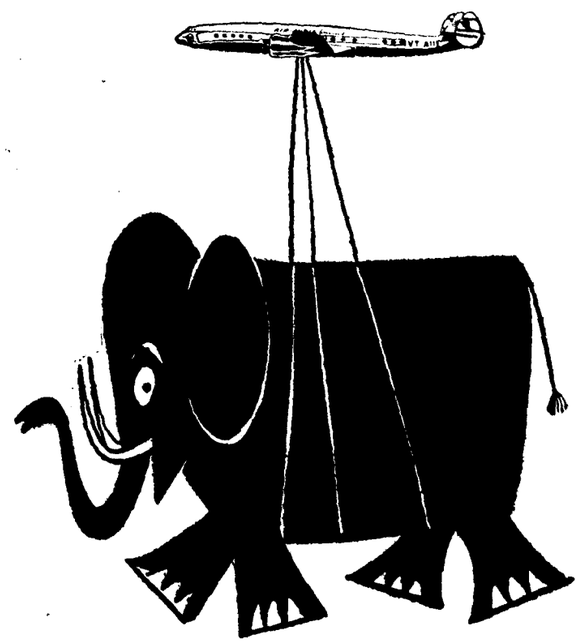
Can your car make a split-second stop ?

As a responsible motorist you know that it should be able to. An emergency may arise any moment...it comes unannounced. So play safe. Among other things, see that you have a really reliable braking system.

Wise motorists all over the world have their brakes tested regularly and have them fitted with FERODO—the brake linings that make motoring safe. FERODO Brake Linings are made with asbestos because they have a tough job to do. In an emergency, their unfailing efficiency can prevent disaster.

There are FERODO Brake and Clutch Linings for every type of vehicle in the country—but these are only a part of the wide range of technical asbestos products which we make at AM & FM to meet the needs of Indian industry. The increasing use of asbestos is an index to India's industrial progress.

Where There's Industry There's Asbestos

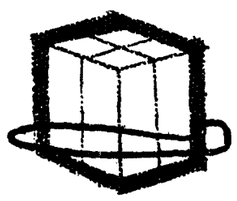


AM & FM

We supply:
- 'FERODO' BRAKE AND CLUTCH LININGS
- 'FIREFLY' ASBESTOS PRODUCTS
- SPRAYED 'LIMPET' ASBESTOS
- 'NEWALLS' INSULATION MATERIALS
- 'PATTINSON'S' BRAND MAGNESIA CHEMICALS
- 'SINDANYO' ELECTRICAL INSULATING BOARDS

ASBESTOS, MAGNESIA & FRICTION MATERIALS LTD.
(TURNER & NEWALL LTD.)
INCORPORATED WITH LIMITED LIABILITY IN ENGLAND Calcutta • BOMBAY • Madras

Carried any elephants lately?



WE transport some pretty fascinating stuff about the globe...take the case of the lovesick elephant that had an urgent date with a Zoo or someone in London. Then there was the ripe Gorgonzola, the film star wanted in a hurry, we were as keen to deliver it; you know how noisy a cheese can get! And of course, we're forever rushing merchandise from place to place — to make sure our customers get on the market before the other man does.

By the way, have you any cargo for any place? There are a thousand good reasons for sending it by Air-India International.

CARGO BY AIR is quick, convenient, saves money on transit insurance, gets you on the market first, brings you the goods when you want them, enables you to fulfil urgent contracts...we're out of breath, but you get the idea!

A Window on the World

THE WARNING OF CASSANDRA

By

ODYSSEUS

ON WEDNESDAY NEXT, March 6, a new, non-European member—the first in the continent of Africa—enters the Commonwealth family of nations: Ghana, hitherto known as the Crown colony of the Gold Coast, about which I gave some background information last week.

Ghana's emergence must act as a spur to the nascent nationalisms at different stages of development over the vast areas of "colonial" Africa. There is no stronger upholder of self-government than this column, but the problem in Africa is not the simple one of going around identifying groups ruled by a foreign power and saying "Let these people free!" If you do that, you will Balkanise Africa.

Ghana illustrates this. The Gold Coast colony was the creation of a foreign ruler who brought four main linguistic groups under one administration. As the prospect of independence came nearer a struggle for power broke out among these groups. In the elections, the Convention People's Party gained substantial majorities. But while all parties sought independence, the peoples of Ashanti and the Northern territories feared the domination of the majority drawn from the coast. Secession has been threatened. These differences led to the eleventh-hour visit of the Colonial Secretary, Mr. Alan Lennox-Boyd, to the Gold Coast in January, in which he was able to work out safeguards acceptable to all parties. The partition of Ghana would have been attended by many of the same misfortunes, suspicions, and animosities, which followed the partition of India. Such animosities are sources of international weakness. They open the doors to foreign arms deals and other sources of friction. Nevertheless, in the case of India, the partition, whatever its unfortunate sequels, has produced two viable states. But just look at the map of Africa.

LARGER THAN INDIA AND PAKISTAN

Ghana adjoins French Africa, which contains different peoples spread over twelve major territories (including Mauritania, Senegal, French Guinea, French Sudan, the Niger Colony, Ivory Coast, Upper Volta, Dahomey, Gabon, French Congo, Oubangichari, and Chad) stretching from the west coast all the way to the Sudan on the east—an area of 1,820,000 sq. miles, i.e., 239,000 sq. miles greater than India and Pakistan together.

The French government has recognised the aspirations of these twelve territories by granting local autonomy. According to "The Economist" of London, the African leaders do not, for the moment, ask for more. M. Senghor, one of the two main African leaders, objects that local autonomy would lead to the Balkanization of Africa. He wants autonomy at the level of the two over-all groups of (a) French West Africa and (b) French Equatorial Africa (See the map). He would like these regional federations to enter as equals with France in a confederal union, in which France, like any other member, would obey the Union's decisions. This is doubtless taking a long view but it is good to hear that such constructive thinking is taking place. I hold no brief for colonialism, but for the sake of world peace, one would prefer to see colonialism evolve into regional democracies than liquidated overnight.

Africa contains not only French West and Equatorial Africa, but British Nigeria, Belgian Congo, Portugese Angola, and other colonial territories. It is important that the anti-colonial nations should maintain steady pressure on the colonial nations to proceed towards self-government at a perceptible pace. It is not, however, in the interests of either the already emancipated colonial peoples, or of those whom they would like to see emancipated, to expect parallel progress on all fronts, or to attempt to force the pace by encouraging the sort of armed strife that so tragically persists in North Africa.

DO WE WANT ANOTHER SUEZ?

That would open West and Central Africa to the intrigues and instigations which have in recent years been infiltrating into neighbouring territories from the cauldron of the Middle East. Small beginnings can have big endings and the aforesaid intrigues and infiltrations were instrumental in bringing Soviet influence into the Middle East, and culminated in the Franco-British Suez adventure—a disaster not merely to France and Britain but to all those nations, in Asia as in Europe, which wish to see the canal freely navigable, oil supplies freely buyable, and communist influence kept away from a vital link in their communications. The free countries of Asia, Europe, and America, should be warned by the Suez precedent and recognise now, while there is still time, that they have a common interest in preserving the peace of West and Central Africa, in ensuring that its constitutional development is not merely rapid but orderly, and in warning those who seek to fish in troubled waters that Africa is a concern of the whole free world. If the free world were to take a firm and united line on this, the Soviets would be unlikely to try to stir up trouble. They are realists. They only try it on when the opportunity is presented to them, as in the Middle East, where all the countries of the free world have been pursuing different policies, against their own interests, and certainly not in the interests of the peoples of the Middle East.

I revert to Ghana. Despite friendly mediation, the differences of race and tradition that exist in the heterogenous regions that made up the old Gold Coast colony have not been, and could not be, wiped out overnight, and the struggle for power continues. There have been new rumblings and threats since Mr. Lennox-Boyd's departure. There is nothing surprising about this. Party government in a democracy involves a constant struggle for power. What is important is to keep the struggle within assemblies, debates, and ballot boxes. This is not so easy because we are living in the midst of a world struggle between the free and the Communist countries, in which the Communists do not

hesitate to intervene, openly or covertly, in the internal affairs of other countries wherever they see a chance of furthering their cause. Chances arise whenever there are dissensions within the free world.

One example of dissension in the free world is "colonialism", and what remains to be seen is whether the countries of Europe and of Asia will realise in time that they have a common interest in ending colonialism as quickly, and as smoothly, as possible. This calls for compromise and an effort of imagination on the part of both colonial powers and colonial peoples (emancipated and due to be emancipated).

The key to national policy in these emotionally befogged controversies is to ask the platitude: What is the national interest? I submit that the national interest of the colonial power will be promoted by ceding self-government at the earliest opportunity (What benefit can there be in spending money and power in holding down an unwilling people?), and that the national interest of the emancipated, or about to be emancipated, colonial nation will be promoted by co-operation with the departing power.

How has Egypt's hostility to the departed colonial power profited her? Have the ships sunk by Egypt in the canal added to her wealth? How will the giant tankers now being built to go round the Cape benefit Egypt? Was the UK hostile to Egypt? What were the hopes with which Anthony Eden forced through parliament the Anglo-Egyptian agreement to evacuate the canal on October 19, 1954? Alan Campbell Johnson's biography of Eden (published in March, 1955, sixteen months before the canal crisis blew up) answers thus:

"The reactions of the Arab world suggested that by her realistic appreciation of changed conditions, Britain had shown the adaptability of her power and had enhanced rather than diminished her prestige. And it was a relief to those responsible for British interests in the several Arab countries that the canal problem, which had always confused Anglo-Egyptian relations, was out of the way. It enabled Egypt at long last to co-operate freely on strategic matters with the west, with which her policies showed that her interests lay. Not least, the end of the Anglo-Egyptian quarrel made for stable conditions in Egypt by enabling the government to devote its energies to social needs."

What wishful thinking, you rightly exclaim! True. But at least it shows a wish to think friendly thoughts about Egypt. Subsequent events constitute an ironic comment on this passage from Alan Campbell Johnson. They suggest that we ought all to collaborate to ensure that West Africa does not become another Middle East.

Should anyone suggest that there is at present no sign of international strife in West Africa, I may recall that this is what some said when I ventured on a warning about Suez and the Middle East as far back as March 23, 1956. Must I change my name to Cassandra?

THE INDIAN OVERSEAS BANK LTD. MADRAS

The South East Asian market — a problem?

Businessmen interested in trade with South East Asia couldn't do better than to consult the Indian Overseas Bank. The bank has extensive experience in trade with South East Asian countries through its chain of branches strategically located all over South East Asia. Before you invest in trade in this area it would be wise to consult the Indian Overseas Bank.

ALGERIA AFTER THE U.N. VOTE

(From Our Special West European Correspondent)

PARIS, February 26.

AFTER celebrating the "success" scored by their delegation at the UN in the debate on Algeria, the French have begun to realise that this success carries with it many obligations, perhaps more obligations than a defeat would have. If the General Assembly had accepted a severe motion of censure on France, such as was first favoured by the wilder wing of the Afro-Asian bloc, Paris would have been able to shrug it off as a piece of impertinence; the only effect of such a motion would have been to encourage terrorism. But the very moderate motion that was in fact accepted (thanks to the milder wing of the Afro-Asian bloc: Lebanon, Iran and Burma), by giving France credit for the liberal measures promised by her delegation, has converted the promise of those measures into a veritable international obligation—an obligation, moreover, not to her enemies but to France's friends. Now for a democracy at least, an obligation given publicly to one's friends just after they have gone to some trouble to support and protect one, is an obligation that has to be met. In short, although she had her way at the UN, France now has to do something urgently to end the Algerian war.

The period of waiting and postponing is now past. First it was a matter of waiting till the 1956 elections were over; then waiting for the Socialist Party Congress; then waiting for the Suez dispute to be settled; finally waiting till the UN debate was concluded. There is nothing more to wait for; the French Government will have to act decisively by this summer. What form of action will be "decisive"? Certainly not a continuation of "pacification", i.e. the simple repression of terrorism. Pacification has failed. After 13 months of fighting by a French army half-a-million strong, terrorism is more widespread than ever; defeated in one place it has spread to another, checked in one form it has assumed another form. In recent weeks terrorists have been killed off at the rate of 1000 or so a week, but ambushes, assassinations and bomb outrages continue nevertheless.

If pacification has failed, so has the terrorism of the rebel movement. All the outrages of the rebels (wrought mainly on fellow-Muslims) have not advanced the nationalist cause one jot; the UN has unanimously decided not to intervene and the French Government is as unshaken as ever in its opposition to a simple recognition of Algerian independence. So for both sides, it is now clear that the future of Algeria will not be decided by violence because this is a case where neither side can win, no matter how long the struggle continues.

Violence being useless, will some generous and unilateral demonstration of goodwill work the change? Probably not, for when two communities have been locked in civil war for two years, it is too late for the most magnanimous proclamations of goodwill to have the least effect. To speak plainly, both the Algerian rebels and the French authorities have been guilty of so many actions of cruelty, treachery and cowardly brutality that not the least shred of trust remains. There is now a breach between the European and Muslim communities in Algeria that no mere words can fill, not even if they were to come from a man whose word is still valued, such as Pierre Mendes-France. Mendes has never had an alternative policy to offer for Algeria, but only his own person, his reputation and his record. These might have been sufficient to turn the tide nine months ago, but not today. A solution will not be found by a change of personalities, and will probably have to be found and implemented by the present socialist government.

The difficulty is that the socialist government's programme for Algeria, as outlined before the UN and thus virtually underwritten by the General Assembly in its final vote, begins with a cease-fire. Only after three months' quietude will elections supervene, and this in turn will be followed by negotiations about the future of the territory in which two communities are condemned to live together. The acceptance of the cease-fire therefore involves the rebels' willingness to trust the government to implement the rest of the plan, and the government's willingness to believe that the rebels will allow elections to be held in genuine peace and freedom. (This latter point is important because the rebel movement is not supported by the mass of the Muslims but is kept going by force and intimidation, and even though open fighting might stop, this intimidation might continue and thus falsify free elections).

Moreover, the rebels have another reason for distrust in that even this programme has not been accepted by the French Parliament but constitutes a unilateral declaration by the socialist party. The other parties are already offended that a one-party policy has been converted into an international undertaking before Parliament has pronounced on it, and some parties proclaim their total opposition to the holding of free and equal elections because these might result in the election of a Muslim majority which would at once claim complete independence—which the French government and people will never agree to grant. The socialist government could be brought down on this point any time in the summer, and for that reason alone the rebels will be reluctant to trust in its plans.

So neither straight violence, nor simple goodwill nor the socialist plan for a cease-fire and elections hold the key to the future of Algeria. The moment has arrived for a new and bolder policy, a complete break with the past and all its lost opportunities and broken promises. And this new policy can only be found through co-operation with Tunisia and Morocco. I outlined here in the issue of January 18 the sort of North African federation or Little Commonwealth that Mr. Bourguiba of Tunisia has suggested, but which the French have not so far seriously considered. Since the UN debate has shown both the urgency of some line of bold policy and the sterility of the old plans, more attention has been paid in Paris to this possibility. Significantly it has gathered support among conservative politicians and was mentioned favourably twice at last week's Moderate Republican Party conference. Monsieur P.-H. Teitgen there admitted that it seemed impossible to devise a "separate" solution for Algeria and recommended that thought be given to the establishment of a community including on the one hand Morocco and Tunisia, and on the other a Franco-Algerian federation.

It is not a question of the free North African states acting as intermediaries or brokers between the French

and the rebels; if these two parties want to negotiate, they can do so directly without need of middlemen. It is rather a question of the independent states providing a caution or guarantee for a deal between two parties who no longer trust each other. Looking further ahead, beyond the stage of negotiations, it is not a question of setting up a joint rule or condominion over Algeria. It would then rather be a question of devising a delicate balance between the rights of the European and Muslim communities in Algeria, in which each community had a god-parent or guarantor, in France and the free Muslim states respectively. This would presuppose a tightening of the bonds between France and the two former protectorates, in some sort of federation of commonwealth; all the parties concerned are ready for this and it is only the continuance of the Algerian war that is preventing the progress of such a scheme.

Morocco and Tunisia would be acceptable protectors for the Algerian nationalists, for they are independent Muslim states. They would also be acceptable partners for France, because they are moderate and democratic states, and thus would not choose to support, among the many conflicting tendencies within the Algerian nationalist movement, those that are under Egyptian or Communist influence. Thus by working through Rabat and Tunis, France would have a chance of dealing with the less extremist section of her opponents, whereas the extremist section would tend to come to the top in direct negotiations carried on in an atmosphere of bluff and blackmail.

But before this line of policy can make any progress, two illusions have to be removed. First, on the French side, the illusion that Algeria is literally an internal French concern which does not interest or affect the neighbouring states. This is absurd because quite apart from sentimental considerations and the natural sympathy of the Moroccans and Tunisians for the Algerian rebels, the continuance of the Algerian war is a perpetual threat to the internal order of the two neighbouring states. Moreover, it requires the stationing of French troops in their territories, and limits the amount of aid they can receive from the only source open to them, the French taxpayer. The second illusion is on the rebel side: the absurd belief that France can ever be brought, by whatever means, to grant the Algerian Muslims simple national independence. This absurdity has never been dreamed of by any French politician outside the Communist Party —and even for the Communists it is probably just harmless dogmatising, for they know they will never have the responsibility of implementing such a policy which would be repudiated by the mass of the French working class. The immediate consequence of any French government even appearing to favour total independence for Algeria would be civil war in metropolitan France, a coup d'etat by the army in Algeria and a war of extermination between the two communities which would repeat on a smaller but much more deadly scale the catastrophe of the Punjab.

The only sort of independence that could be envisaged for Algeria would be an autonomy that was immediately signed away in the formation of a federation that included France and the North African states. In other words, it would not be independence at all but simply a recognition that the people of Algeria were henceforth equal partners with their neighbours and with the French in some larger unit.

NOTICE

SALE OF IRAQI CRUDE OIL

The Iraq Government calls those interested in purchasing all or part of the following quantities of Iraqi crude oil produced from the Kirkuk, Ain Zalah and Zubair fields, during the year 1958, to apply to the Ministry of Economics, Baghdad, or Iraqi Embassies, Legations or Consulates for terms and conditions of sale and qualities of crudes.

ESTIMATE OF AVAILABILITY AT SEABOARD

	TRIPOLI			BANIAS	FAO	
	I.P.C.	M.P.C.	TOTAL BLEND	I.P.C.	B.P.C:	
1st Quarter ..	187,500	37,500	225,000	537,500	250,000	Tons
2nd Quarter ..	250,000	37,500	287,500	537,500	250,000	,,
3rd Quarter ..	387,500	37,500	425,000	550,000	250,000	,,
4th Quarter ..	412,500	37,500	450,000	550,000	250,000	,,
Totals ..	1,237,500	150,000	1,387,500	2,175,000	1,000,000	,,

Purchaser is required to indicate prices offered per ton of crude f.o.b. seaboard terminal.

Purchaser is required to indicate quantities of oil to be purchased.

Purchaser is required to indicate currency in which payment is to be effected; preference being given to those who pay in scarce currencies.

Offers are accepted until May 31, 1957.

Purchaser is required to deposit a bank guarantee to the amount of 1% of the value of the crude oil to be purchased, and the said guarantee to be valid up to 31st July, 1957.

The Government will notify the purchaser before the 15th June, 1957 whether his offer is accepted. If the offer is accepted, the purchaser shall make such arrangements as may be necessary before 31st June, 1957, for the establishment of a confirmed irrevocable letter of credit with a bank acceptable to the Government. Such credit to be in the amount of the value of the crude oil to be purchased.

The Government will consider offers for purchasing Iraqi crude oil for periods extending over one year.

Note: Although a separate net production' figure has been given for Mosul Petroleum Company Limited, it must be pointed out that oil of that Company will not be available separately at the terminals but will probably be available only at Tripoli in a blend with Kirkuk oil of approximately one part Ain Zalah oil to five parts Kirkuk oil.

WORLDGRAM

AGRICULTURE

Community Development Programme: Over one crore families have been benefited by the Community Development and National Extension Service Programme up to the end of September 1955. A review of the progress achieved in the Community Development and N.E.S. areas from the inception of the programme to the end of September 1956 shows that the number of villages covered by the programme was 1.92 lakhs, while the exact number of families benefited by the development activities was 111.40 lakhs. The number of families benefited in the Community Development Blocks was 78.47 lakhs and of those benefited in the National Extension Blocks was 32.93 lakhs. The Development Programme was able to provide full time employment to 1.46 lakh persons. Besides, part-time employment was provided to 5.18 lakhs persons. A break-up of the figures would show that employment opportunities provided were higher in the Community Development Blocks than in the National Extension Service Blocks. Whereas in the former 1.35 lakh persons were provided with full-time employment and 4.55 lakh persons with part time employment, the corresponding figures under the N.E.S. Blocks were 11,000 and 63,000 respectively.

INDUSTRY

Record Steel Output in America: America's steel industry turned out more steel in January than ever before in January—11,001,000 net tons—The American Iron and Steel Institute has reported that production was the second largest monthly output on record, topped only by the 11,048,513 tons produced in October 1956. The institute's ingot production index, which designates average production for 1947 through 1949 was 100, was 154.6 for January and 137.2 for the full year of 1956.

*

Development of Refractory Industry: A Panel of Experts has been constituted by the Government of India to draw up a programme for the development of the refractory industry with particular reference to the requirements of the iron and steel industry. The Panel will prepare a detailed and phased production plan for the next five years on the basis of the capacity of the existing units and the creation of additional capacity for the manufacture of refractories. It will study the technical working of the present units, the raw materials available, the equipment in use and the manufacturing methods. The extent to which existing units which are not utilising their capacity to the maximum can be assisted to step their production will also be studied. The experts will examine whether the present types of refractories produced in the country conform to specifications required by different consuming industries and suggest suitable modifications where necessary to ensure that common standards and specifications are drawn up.

*

Mastic Asphalt for Flooring: The Indian Standards Institution has issued for eliciting comments two draft Indian standards, one a specification for mastic asphalt for flooring and the second a code of practice for laying mastic asphalt flooring. These two draft standards are intended to provide guidance to the users in regard to the quality of mastic asphalt that should be specified and the manner of laying it. The draft code also specifies thickness of finished floors of asphalt for different purposes. Comments on the two draft standards may be sent to the Indian Standards Institution, 19, University Road, Delhi 8, before April 21, 1957.

Standard for Russet Leather: The Indian Standards Institution has published an Indian standard specification for russet leather. Copies of the standard are now available for sale from the Indian Standard Institution 19, University Road, Delhi 8, and its branch offices at P.11, Mission Row Extension, Calcutta and 40/40A, Cowasji Patel Street, Fort, Bombay.

TRADE

Foreign Trade of India by Land during December 1956: According to the land-borne trade returns received in the Department of Commercial Intelligence and Statistics, the provisional figures of total value of foreign trade of India by land with Pakistan, Afghanistan, Iran, and Burma during the month of December, 1956 are as follows:

Merchandise Exports .. .. .. Rs. 85 lakhs

Exports to Eastern Pakistan	Rs.	57 lakhs
,, to Western Pakistan	,,	22 ,,
,, to other countries	,,	6 ,,

Merchandise Re-exports Negligible

Merchandise Imports .. .. .. Rs. 1 69 lakhs

Imports from Eastern Pakistan	Rs.	1,43 lakhs
,, from Western Pakistan	,,	15 ,,
,, from other countries	,,	11 ,,

Total Trade .. .. Rs. 2,54 lakhs
Trade in Treasure—Nil

Balance of Trade: The total value of exports including re-exports fell short of imports by Rs. 84 lakhs.

*

Protection for Wood Screw Industry: The Tariff Commission has taken up for investigation the claim of the wood screw industry to the continuance of protection beyond December 31, 1957 and proposes to conduct a public inquiry in the middle of March, 1957. In this connection the Commission has prepared special questionnaire for producers, importers and consumers. Firms, persons or associations interested in this industry or in industries that use wood screws may obtain copies of the questionnaire from the Secretary to the Tariff Commission, Central Government Offices Building (3rd Floor) 101, Queens Road, Bombay.

*

USSR—France Trade Agreement: Under a recent trade agreement signed between USSR and France, Soviet foreign trading organisations will fill large orders for the manufacture and delivery to the USSR during the aforesaid three years of many kinds of machines and equipment, including metal cutting machine tools, electro technical metallurgical radio and television equipment, powerful technical current, electrical locomotives, equipment for making automobiles tyres for coal concentration factories, for precast structural elements factories and factories for the manufacture of cellulose out of rush grass, for chemical, light and food industries. France will deliver to the USSR rolled ferrous metals, cable, cork rayon, cocoa beans, citrus fruits, ethereal oils and other commodities. The Soviet Union on its part will export to France in payment for its orders and purchases in this country—anthracite, pitch, oil and its derivations, manganese and chromium ores, asbestos, sawn timber, pulpwood, cellulose, newsprint cotton, furs, tinned crabs, machines and equipment etc. The agreement provides for a substantial annual increase in the volume of trade between the USSR and France and the expansion of the

range of exports both ways. It is expected that by the end of the three year period trade between the two countries will have reached a level exceeding the 1955 figures by some two hundred per cent.

FINANCE

Customs and Excise Revenue Collected in Indian Union Statement for December 1956: According to the returns received in the Department of Commercial Intelligence and Statistics, the total gross sea and land customs revenue collected in the Indian Union during December 1956, amounted to Rs. 15.31 crores as compared with Rs. 15.85 crores in the corresponding month of the previous year. The comparison in the subsequent paragraphs should be taken to refer to that of the current figures with those of the corresponding period of the preceding year. Of the total customs revenue collections, import duties accounted for Rs. 11.82 crores as against Rs. 12.14 crores, export duties for Rs. 3.20 crores as against Rs. 3.38 crores and land customs and miscellaneous for Rs. 29 lakhs as against Rs. 33 lakhs. The total gross collection of Union excise duties amounted to Rs. 19.84 crores as compared with Rs. 13.08 crores. During the nine months, April to December 1956, the grand total of gross customs and Union excise revenue realised was Rs. 264.94 crores as compared with Rs. 232.58 crores during the corresponding period of the preceding year. Of this amount, import duties accounted for Rs. 102.25 crores as against Rs. 93.23 crores, export duties for Rs. 21.87 crores as against Rs. 28.10 crores, land customs and miscellaneous for Rs. 2.65 crores as against Rs. 1.50 crores and Union Excise duties for Rs. 138.17 crores as against Rs. 109.75 crores.

*

Personal Income in US in 1956: The Department of Commerce reports personal income in America during 1956 reached a record total of $325,000 million, an increase of about $15,000 million over 1955. Personal income in December was at an annual rate of $333,500 million, unchanged from November. Personal income estimates include wages and salaries, net income of proprietorships and partnerships, farm and non-farm rents, interests and dividends as well as other types of individual income. Wage and salary increases, the report said, amounted to $15,000 million, or about seven per cent higher than 1955. All non-manufacturing industries showed payroll gains in 1956, with the sharpest increases in construction and mining. The largest gain in manufacturing industries was in the machine industries and transportation, excluding auto-manufacturing, which showed a slight decline. The Commerce Department report said average annual earnings per employee rose almost five per cent during the year, and that in most industries, higher average earnings were more important than employment gains in the 1956 wages increases. Personal income increases ranged generally from 6.5 per cent to 8.5 per cent in wages and salaries, nonfarm business income, interests, dividends and transfer payments.

*

Companies Registered during April-December, 1956: During the first three quarters of the current fiscal year 1956-57, 637 companies have been incorporated all over India. Of these, 65 companies are public and the remaining 572 companies are private. The annual rate of new incorporations during the current year is running around 850 companies, as against 1448 companies registered during 1955-56. The monthly average of registrations works out to 70 companies, as against 110 during the corresponding period of 1955-56. State-wise distribution of new registrations during the period under review shows that out of 637 companies registered during the period, 244, 113,85 and 81 have been registered in the States of West Bengal, Bombay, Delhi and Madras, respectively. These four States together account for nearly five-sixths of the total registrations all over the country.

*

Aid for Production and Development of Handicrafts: Loans and grants totalling Rs. 1,98,055 for the promotion and development of different kinds of handicrafts in five States have been sanctioned by the Ministry of Production. A grant of Rs. one lakh has been made to Indian Institute of Art in Industry in Calcutta for the development of handicrafts in West Bengal. Madhya Pradesh has got a grant of Rs. 9,160 and a loan of Rs. 15,000 as financial assistance to a co-operative society of Zari workers at Bhopal. For the pilot project in the marketing of black pottery at Nizamabad in Uttar Pradesh, a grant of Rs. 7,920 has been made. In Andhra Pradesh, financial assistance has been sanctioned for the scheme of weaving of Asia rumals at Chirala, consisting of a grant of Rs. 2,750 and a loan of Rs. 11,250, while a scheme for the expansion of the Arts and Crafts Museum at Patiala in Punjab has been given financial assistance consisting of grant of Rs. 1,975 and a loan of Rs. 50,000.

GENERAL

Ford to Spend $710 Million for Plant Expansion: The Ford Motor Company has announced it will spend a near-record $710 million for plant expansion and tooling in 1957. Earnest R. Breech, Chairman of the Board of the Ford Motor Company, said this 1957 outlay would be exceeded only by the $780 million the company spent for expansion and tooling in 1956. Earlier this month, General Motors Corporation—the world's largest automobile manufacturer—announced that its estimated expenditure for facilities and tooling in 1957 would amount to $1,250 million. General Motors estimates it spent $1,630 million for these purposes in 1956.

*

Employment Situation during December 1956: The number of job seekers registered at Employment Exchanges in India declined by 2,002 during December 1956, on the last day of the month they numbered 7,58,503. Of these, 9,057 including 255 women were known to have some employment. The Exchanges placed 13,656 applicants in jobs during the month. The number of applicants submitted for selection to employers was 89,901 as against 31,415 during November 1956. Of the total number of placements, 4,879 were secured under the Central Government, 5,522 under State Governments, 1,200 under quasi Government establishments and local bodies and the remaining 2,055 with other employers. The number of vacancies notified to the Exchanges during December was 21,814.

*

Training of Craftsmen during Second Plan Period: Various details regarding the training of craftsmen under the second Five-Year Plan were considered recently at a meeting of the representatives of State Governments. The meeting, which was the first of its kind since the Central Labour Ministry's Craftsmen Training Centres were transferred to the administrative control of the State Governments in November 1956, dealt with the development of craftsmen training, provision of buildings for training centres, purchase of tools and equipment, holding of examinations and issue of certificates to trainees and duration of training courses, etc. The meeting agreed that while formulating proposals for new Centres, the possibilities of developing the existing Centres to the maximum extent must be taken into consideration, also, where possible, a second shift should be introduced.

NEWS IN BRIEF

INDIAN

Four Subsidiary Corporations of the National Small Industries Corporation, set up by the Ministry of Commerce and Consumer Industries, are expected to start functioning in early March at Bombay, Calcutta, Delhi and Madras.

*

The Government of India are proposing to set up a Central Indian Medicinal Plants Organisation in collaboration with the Indian Council of Medical Research, the Council of Scientific and Industrial Research and the Indian Council of Agricultural Research.

*

It is reported that about Rs. 9 lakhs mere sanctioned during 1956-57 (up to the end of January) for research purposes in indigenous systems of medicine.

*

On April 1st, the country will switch over to decimal system of coinage, under which the rupee will retain its present value but will be divided into 100 Naye Paise, instead of the present 64 pice.

*

Detailed proposecting of deposits of fuller's earth in Gulbarg District of the former State of Hyderabad has recently been carried out by the Geological Survey of India.

*

One hundred forty-four schemes formulated by State Governments for development of the sericulture industry were sanctioned grants amounting to Rs. 34,01,115 up to the end of January 1957, by the Ministry of Production. Thirteen schemes involving financial assistance in the form of loans, amounting to Rs. 25,01,650, were also sanctioned during the same period.

*

It is reported substantial US help in meeting India's foreign exchange needs has been categorically assured by the Director of I.C.A.

*

The Government of India has decided to increase the export allotment of tea by ten million lbs. to 453.5 million lbs.

*

The Punjab Financial Corporation disbursed loans amounting to Rs. 57,55,900 to industrialists during December 1951. It also sanctioned a loan of Rs. 2,25,000 to a flour mill and Rs. 60,000 to a concern doing cold storage business in the State.

*

Bidi exports from India to Ceylon increased to 1,556,874 lbs. in the first eight months of the current fiscal year from 1,386,274 lbs. in the corresponding period of the last year.

*

During January 1957, the Government of India sanctioned loans amounting to Rs. 17,349 lakhs to Assam and Madras under the Low-Income Group Housing Scheme.

*

The Indian Standards Institution has issued, for eliciting comments, a draft Indian standard specification for rivet loans for structural purposes.

FOREIGN

Colombia and Czechoslovakia have signed a new trade agreement. Under the agreement Colombia will supply mainly coffee in exchange for engineering and other products during 1957.

*

It is reported an Egyptian oil prospecting company will be formed soon and given licences for 61 acres in the Red Sea Zone and the Eastern Desert.

*

Yugoslav output of crude oil in 1956 exceeded by 14 per cent the 1955 level. The oil fields yielded 293,680 tons of crude oil for refining which is 36,475 tons more than in 1955.

*

Sweden's working population between the ages of 15 and 65, it is estimated, will have increased by an average of 22,000 per annum during the years 1955 to 1960 provided the net immigration remains unchanged.

*

Production of coal, steel and pig-iron in the European Coal and Steel Community was at a high level in January 1957.

*

Dutch exports to the UK in 1956 increased from Fls. 1,263 million to Fls. 1,273 million while imports from that source rose from Fls. 1,039 million to Fls. 1,153 million.

*

The Social Economic Council has recommended to the Dutch Government the introduction of a general widows pension and orphan aid which will be a supplement to the general old age pension operative from January 1. The proposed pensions range from Fls. 1.200 (£114) per annum to Fls. 1,800 (£171). These measures would cost about Fls. 125 million per annum (£.117 million).

*

During the current year the US will grant to Ceylon aid to the extent of $7 million. This is $2 million more than the aid granted last year. Part of the aid will be given as a long-term, low interest bearing loan.

*

The Swedish Financier Mr. Azel Wenner-Gren is planning a multi-million dollar industrial project for northern British Colombia. The Plan calls for creation of a string of new communities in the Rocky Mountain "trench"—the valley of the Finlay and Parsnip Rivers.

*

It is reported that the US has released 1,200 million dinars of counterpart funds to Yugoslavia to advance her agricultural production.

*

Malayan Federation Customs and Excise revenue in January amounted to $M. 46.1 million compared with $M. 48.6 million in December. The rubber export duty yielded $M. 13.3 million compared with $M. 12.5 million, while the tin duty totalled $M. 5.1 million against $M. 5.2 million.

Special Articles

STRIDES IN STANDARDISATION

IT is a matter of satisfaction that, in the development of industry and trade, the important role of standardisation is earning growing appreciation and support from the public in this country. On its part, the Indian Standards Institution (ISI), functioning as the national standards body for India, has, during the comparatively brief period of ten years of its existence, largely succeeded in coping up with the increasing demands being made on it. It has by now developed a complex and fairly well-equipped organisation for the preparation and formulation of standards to cater to the needs of the fast-progressing industry and commerce of this vast country. An idea of the work done by the Institution is provided by the fact that, over these last years, it has maintained a steady pace of well over a hundred standards each year, and today the total figure of standards published by its existing 6 Division Councils stands at over 800.

During the financial year 1955-56, for which the Institution's report is now available, it published 144 standards, which is 21 more than the preceding year's figure. However, the annual demand for standards is estimated around 300, which does not seem to be possible of achievement in the foreseeable future, because of the limitations imposed by factors such as the paucity of technical personnel, financial resources, etc. Considering these and the lengthy procedure of the formulation of each standard, which has to pass through various stages, involving continuous consultation, compromise and adaptation, with a view to arriving at the widest possible agreement on prescribing the minimum necessary requirements of an article or a component, the record seems impressive. For this, the ready co-operation extended by the interests concerned is as responsible as the initiative and drive of the controlling authorities of the Institution. One thing that strikes, however, is that in textiles, which form the vast bulk of our export earnings, standardisation has been weighted latterly on the handloom side. Another aspect of work which may be said to have received rather thin attention is in regard to standards on building subjects. For promoting their efficient use, scarce construction materials like timber, bricks and stones, concrete pipes and blocks, etc., should have featured prominently on the priority list. Its absence compels the feeling that such imbalances need to be corrected.

The adoption of standards is voluntary. Nevertheless, the response from the various trades associations is encouraging inasmuch as they generally desire to adopt Indian Standards in the spheres of both purchasing and manufacturing. In so far as the Central Government, as one of the largest organised consumers, has already adopted nearly 600 of the published Indian Standards, standardisation has received a fillip, and manufacturers have no choice but to produce goods conforming to the prescribed requirements. The Tariff Commission, in recommending protection for the applicant industries, also takes into consideration the extent to which a particular industry has been able to conform to Indian Standards. It is not unlikely that the Commission may make, in course of time, the implementation of standards a necessary pre-condition for the granting of protection. This progressive realisation of the role of standards is reflected in the sharp increase in the demand from industry for formulating standards in new fields. As many as 234 proposals were received by the ISI during the year 1955-56 as compared to only 97 in the previous year. Similarly, the number of subscribing members and the financial contributions received have registered advance over the 1954-55 figures. In order to match its performance on a substantially larger scale with the needs of the country, the Institution has drawn up its second Five-Year Plan with a target of producing 200 standards annually, to be increased in course of time.

Since the enforcement of standards by legislation is not desirable in a democratic set-up, except for a few cases where safety or health questions are involved, it is apparently difficult to extend the benefits of standardisation to the ultimate small-scale consumer. To get over this difficulty, many schemes have been tried in various countries. Experience has shown that certification marking and informative labelling are among the more important methods for the purchaser to be assured that goods so certified have been inspected by a competent agency other than the producer, and may be purchased with more than ordinary guarantee. The well-known Kite device of Britain, which came into existence, and use with profit, some 35 years back, has encouraged other countries to try similar schemes. Here in India also the Agmark has achieved a large measure of success in its field. Some four years ago, the ISI was authorised, by a Parliamentary Act, to specify and issue standard marks in respect of goods for which it may have prescribed standards. The scheme has now come into active operation and the Institution has so far issued some 20 licences out of about 150 applications. The figures are obviously on the low side, indicating that either the Institution is exercising restraint and caution in the grant of licences or that the applicants do not answer all the requirements necessary for such issuance. As it is, the certified goods should have not only to maintain the standard as prescribed at a particular time, but should also be produced in accordance with the revisions that may be made from time to time, as a result of unceasing change in physical and material requirements, as well as technological advance.

The highly accelerated tempo of industrialisation in the second Plan period makes it imperative to eliminate all avoidable delays in negotiating and executing big trade transactions. It is obvious that certification marking can be a useful implement in regularising and simplifying the internal as well as export trade. Of course, the scheme is not entirely free from problems. The small-scale and cottage industries, spread over the whole length and breadth of the country, cannot possibly afford testing facilities on their own. In the interests of their healthy growth, the Government should be able, simultaneously with the other schemes for their encouragement, to make necessary arrangements, though it must be recognised that the methods in this sphere have necessarily to be radically different from those in organised, large-scale industries. Again, mutual recognition of marks by different countries, particularly in the Commonwealth, or their recognition in a country where no such marks exist, are other aspects which will need proper thought and action.

As one of its more important functions, the Institution acts as adviser to the Government in respect of standardisation of weights and measures. The country is now on the eve of a change-over to the metric system which is more or less the result of the ISI's recommendations. The recommendations which concerned mainly weights and measures, have touched upon currency also. The change-over entails many complications like the establishment of new series of dimensions and sizes for basic products, ferrous and non-ferrous metals products, building materials and components, textile and other mill stores and a chain of other items. In this connection, two important aspects, namely, imports from countries using the inch-pound system and the needs of the export markets have to be constantly kept in view. The Institution has now issued a guide for inter-conversion of values from one system of units to another. It discusses in some detail the significance of stated values and gives hints as to how to assess their significance for the purpose of conversion. The need for such a guide has existed for a long time in many countries, where more than one system of units for measuring similar quantities have been in use and conversion of values from one system to another raises issues of interchangeability of components, precision of statement, etc. This problem also formed a subject of discussion at the third Commonwealth Standards Conference held recently in New Delhi. The pioneering work that the ISI has undertaken in this field is not known to have been tackled anywhere on the present level.

Yet another project of positive consequence recently taken up by the ISI in earnest is the exploration of ways and means to achieve economy in the utilisation of steel without detriment to the efficiency in service. The country has embarked on a large programme of steel production, but the new units cannot be expected to produce steel to full capacity for a number of years. Even so, the expanding demand will be far in excess of the projected supply and economy in use will continue to be necessary. The ISI programme embraces almost all aspects of steel production, beginning with basic prodcuts and proceeding on to design, fabrication and erection and the final aspects of maintenance and protection from corrosion. Closely related to this is the standardisation of metals and their products in general but structural metals in particular for co-ordinating the metallurgical and the use aspects. The scheme holds out the prospect of considerable saving, by means of standardisation of processes, in the quantities of metals required in the coming years.

THE ELITE OF UTTAR PRADESH

THE missing links in our knowledge of Indian economic affairs are being filled by a series of surveys, a number of them undertaken at the University level. The University of Lucknow has just released a preliminary study regarding the communications pattern of the elite of Uttar Pradesh. The survey makes an attempt to analyse the role of the elite in the economic life of the nation. Rightly or wrongly, the elite constitute a stratum of society which claim a position of superiority and in a way dominate the fate of the community.

The survey covers the city of Lucknow—the capital of the most populous State in the country. The universe constituted nearly 4,000 persons whose names were taken from the telephone directory, civil lists, lists of the professional associations and lists of the citizens invited to public functions. A sample of 900 was drawn in a purely random fashion. Unhappily, the response was nearly 70 per cent as no less than 259 persons declined to answer the questionnaire. The promoters of this study did not think it fit to replace the non-co-operators by new samples. Theoretically, this truncated sample fails to be truly representative of the universe and this is a major weakness of the study. Nevertheless, the samaple is the best available one. Perhaps replacement of such a high percentage would have enhanced the weightage of the lower income-groups.

The table alongside gives the break-up of the sample according to caste, sex, age, income, occupation and education. It makes it clear that the people who count in society come—at least the majority of them—from the upper castes. Also women, despite equality granted to them by the Constitution, have to make a great leeway in order to achieve equality with men. In a sense, inferior caste status and womanhood are two negative values which handicap the entry into the society of the elite. Even though one-fourth of the elite were in the age group of 50 years and above, it is clear that quite a high percentage of persons attain prestige and status in life on attaining middle age. Contrary to common belief, income does not necessarily seem to play a major role in enhancing the social status of a person. Nearly one-third of the people, who were considered in this survey of "the chosen few" from the city of Lucknow, had a monthly income of Rs. 300 or below. Those having an income of Rs. 1,000 and above constituted a little over 12 per cent.

With regard to occupation, the majority of the elite belonged to either business or liberal professions. Public servants and legislators formed less than one-third of the distinguished citizens. What is interesting is that nearly two-thirds had taken university degrees and hardly 10 per cent had completed not even high school education. It goes to prove that education has, without doubt, a clear correlation with the enhancement of status in life.

The respondents were asked whether they were satisfied with the present state of affairs in the country. Surprisingly a little more than half stated that they were satisfied. There seems to be no relationship between their status-scale (defined as a function of income, occupation and education) and their being satisfied with the state of affairs in the country. The analysis shows that there is no evidence to support the hypothesis that as an individual's status improves his outlook about the state of affairs in the country also improves. On the other hand, there seems to be a significant association between status and level of interests. The respondents were asked seven questions of general knowledge covering both national and international affairs to find out how far the elite were interested in socio-economic affairs both at home and abroad. The analysis of the returns showed that wherever the status had risen markedly, the interest in public affairs had widened significantly.

In order to determine the depth of interest in important socio-economic affairs, some specific questions were asked. The five topics most discussed were, cost of living, Indian politics, social problems, attitude to Pakistan and international affairs. The questions which were least discussed were, distribution of provincial boundaries, U.S. alliances, missionaries in India, Formosa issue and radio.

The survey makes an interesting study of the media of communications. The means of communication of the elite are of great importance in an economy like ours where planning dominates economic thinking. It is necessary that the elite get their impressions through means which are healthy and which do not run the risk of being choked. What is more important is the passing on of impressions from the elite to the lower strata of society and this communication between the two sectors is of vital importance for the successful working of our Plans. An important conclusion which this study has established is that not all the elite read newspapers nor do all of them have radios. Those who did not read newspapers formed hardly 3 per cent of the total sample, while as many as 30 per cent did not own a radio. It shows the magnitude of influence which the radio and the newspaper have on the thinking of the elite. What is more significant is that a majority of them consider the printed word as reliable and would not like to check up the authenticity of the information with any other source. After the newspaper, in order of importance, for most reliable sources of information, comes the radio. The least reliable source is considered to be information passed on in person.

This study has established an important conclusion that power in the community is not concentrated but is diffused along democratic lines. It seems that a slow and silent revolution is going on since independence which has dispersed power in society amongst a large number of middle-class people.

The study has undoubtedly performed a useful purpose of bringing the elite of one of the leading towns in Northern India under microscope. The most useful conclusion which needs to be underlined is that the average income of the elite worked out at Rs. 562 per month. Obviously that proves the hypothesis that the middle-classes dominate the community in India, especially in the urban areas.

THE EASTERN ECONOMIST

The following statement about ownership and other particulars relating to THE EASTERN ECONOMIST is published as required by Clause 19-D of the Press and Registration of Books Act of 1867 as modified in 1956:

1.	Place of Publication.	New Delhi.
2.	Periodicity of its Publication.	Weekly.
3.	Printer's Name. Nationality & Address.	Shri Devi Prasad Sharma. Indian, c/o The Hindustan Times, New Delhi.
4.	Publisher's Name. Nationality & Address.	Same as (3) above.
5.	Editor's Name. Nationality & Address.	Mr. E. P. W. da Costa, M.A. (Oxon.) Indian, c/o The Eastern Economist, New Delhi.
6.	Names and addresses of individuals who own the newspaper and partners or shareholders holding more than one per cent of the total capital.	1. Birla Jute Mfg., Calcutta. 2. Kesoram Cotton Mills Lt., Calcutta. 3. Pilani Investment Corpn. Ltd., Gwalior. 4. Birla Cotton Spg. Wvg. Mills Ltd., Delhi. 5 Sutlej Cotton Mills Ltd., Amritsar.

I, Devi Prasad Sharma, hereby declare that the particulars given above are true to the best of my knowledge and belief.

Date: 28th Feb., 1957.

Signature of Publisher.

The Business World

INDO-SWEDISH TRADE

A NUMBER of trade delegations from several European countries have been visiting the country lately. Following the recent visit of the delegation from Denmark came a trade-cum-goodwill delegation from Sweden on the invitation of the Government early in February. Another delegation from Finland is expected in due course.

During its stay in the country the leader of the Swedish delegation indicated that there existed vast possibilities of collaboration between India and Sweden for the purpose of starting or developing some mechanical industries in India. Regarding the possibilities of increasing trade he pointed out that there existed great scope for increasing imports from India of goods like textiles, coffee and tea. Markets for manganese and chrome ares could be found and developed. In view of the heavy outlay of foreign exchange India expects long-term credits as one of the ways to meet her requirements. At the present time she can hardly obtain help from Sweden in this direction. The chances of extending lon-term credits to India are very modest as the Swedish Government has imposed a 12 per cent tax on investment. The high standard of living in Sweden is indirectly responsible for the strains on the funds available in Sweden for investment. In Sweden nearly 30 per cent of the natural income is being invested since the war. This, however, does not imply that collaboration in capital investment has no prospect of being undertaken and encouraged.

The first trade agreement between India and Sweden came into being on the 1st of July 1950. This was only up to 31st December, 1950. After its expiry, further negotiations were started on the 28th February, 1951. As a result, another agreement was arrived at for a period up to the 31st December, 1951. It was extended for a period of 12 months ending 31st December, 1952. On June 1, 1953 another trade arrangement was arrived at which governed trade till January 1, 1955. A new agreement was concluded on 31st May, 1955 for a period of two years beginning from 1st January, 1955. The agreement provided for the usual export and import schedules and laid down that Indian goods in Sweden would receive the same treatment as goods originating in countries belonging to the O.E.E.C. The schedules were approved on 9th May, 1956 for one year, i.e., up to 31st December, 1956.

India's exports to Sweden for the years 1954-55 and 1955-56 have been of the value of Rs. 1.53 crores and Rs. 1.54 crores respectively. While in the same period India imported goods worth Rs. 6.03 crores and Rs. 7.86 crores respectively from Sweden. India thus had an unfavourable balance of trade with Sweden to the tune of Rs. 4.5 crores and Rs. 6.32 crores during the years 1954-55 and 1955-56 respectively. In fact, since the very inception of the trade agreement, India started having an adverse balance of trade with Sweden. The table alongside shows the position in this respect since 1951-52.

An analysis of the trends in the trade between the countries over the past two years reveals that India is importing more machinery of all kinds, paper, paperboard and stationery and instruments, electrical goods and apparatus etc. In fact India is now Sweden's best customer in Asia. India's exports to Sweden consist mostly of foodstuffs, paints, coffee, tea, spices, chemical products, hides, and skins, furs, rubber, textile fibres, yarn, ropes, iron and steel manufactures etc.

Indian industrial progress together with government's import policy for conservation of scarce foreign exchange is likely to affect the pattern of Indo-Swedish trade. A high tempo of development of our engineering and chemical products is therefore expected. But at the same time India's requirements of capital goods in view of her heavy industrial programme during the second Plan would increase. Imports of wrapping and packing paper, nails and rivets, wood screws, hardware, etc., from Sweden are likely to be curtailed as a result of the reduction in import quotas recently effected by the Government.

The scope for Indo-Swedish trade and economic collaboration is bound to expand except during periods of import restriction. As an industrially advanced country Sweden can aid India in implementing her development plans by supplying technical know-how. Since Swedish market is a highly competitive market, Indian goods will have to respond to the needs in Sweden. In this connection more direct contacts by Indian exporters with Swedish importers could be of invaluable help to promote trade between the two countries. Participation by each country in the fairs and exhibitions arranged by each could also contribute to acquiring knowledge of the trade potentialities in each country and the transactions of business. There are good possibilities of export from India of articles like sugar, confectionary, processed oils and fats, for which quality needs to be maintained. Every effort should be made to answer to Swedish standards of imports and goods of the requisite quality should be made available to them at competitive prices.

Indo-Swedish collaboration can be extended in various fields such as pressure lamps and stoves, industrial fans and airconditioning equipment. Sweden could possibly co-operate in the manufacture of these. In respect of ship-building Sweden could assist India. As reported by the delegation, discussions have been initiated by Swedish business men with individual firms for collaboration in the spheres of engineering, machinery manufacture and transport. It is now for trade interests in both the countries to give concrete shape to it.

THE STATE BANK IN 1956

AN unprecedentedly large demand for bank credit as a result of a combination of various factors, a steady rise in advances without a commensurate increase in deposits and an increase in interest rates both on advances and deposits are among the main features of banking operations during 1956 as outlined in the report for the year of the Central Board of Directors of the State Bank of India. The factors responsible for the increased credit demand were broadly the monetary stringency and a continued upward trend in the revised index of industrial production (base 1951=100) which rose from 112.9 in 1954 to 122.1 in 1955 and further to 145.8 in September 1956. Among other contributory factors there was a sharp rise recorded by the general index of wholesale prices (base 1939=100) which stood at 428.9 in December last year as compared to 368.2 a year earlier. Foreign trade also registered an increase of Rs. 115.8 crores in the first nine months of 1956 over Rs. 915 crores of the corresponding period of 1955. Only agricultural production declined in 1955-56 to an index of 113.7 from a slightly higher figure of 116.4 in the preceding year.

In the case of the State Bank of India the increase in advances was of the order of 32.5 per cent from the already high level of a little under Rs. 103 crores in January to Rs. 135.4 crores in March which towards the end of May 1956 reached the figure of Rs. 136.3 crores. At the end of the year, the Bank's advances stood at Rs. 135 crores of which Rs. 100 crores was in the private sector. Flowing from this was a rise of nearly 15 points in the percentage of advances to deposits while in other reporting scheduled banks the increase was relatively lower at 6 points indicating that the State Bank's advances rose faster than those of other reporting scheduled banks. The decline in the slack season was also faster from 65.3 to 61.3 per cent, or 4 points, as against only 1.6 points in the case of other banks.

The rate of rise in deposits was not able to keep pace with the rise in demand for credit. The Bank's total deposits, comprising a dominating percentage of 81 of demand deposits, showed an increase of a meagre 8.8 per cent from Rs. 203.6 crores in January to Rs. 221.5 crores at the end of the year. The expansion in advances had therefore to be financed by drawing upon the investment portfolio and cash balances and by borrowing from the Reserve Bank, to the extent of Rs. 39.2 crores, Rs. 37.4 crores and Rs. 7.8 crores respectively. In a little over six months from the beginning of November 1955 the Reserve Bank's outstanding amount went up by Rs. 68.5 crores. The cumulative effect of the above factors was the forcing up of interest rates on call and deposit money as well as on advances. Thus the call rates ranged between 3 per cent in January and the highest of 4-1/8 per cent in March in Calcutta. Deposit rates now rule at 3 to 3-15 16 per cent for three and six months deposits. Accordingly, the State Bank has now raised its interest rates on savings and fixed deposits and has decided to accept short-term deposits of larger amounts up to 3 months at negotiated rates with a view to augmenting its resources as well as improving facilities to depositors.

Section 16(5) of the State Bank of India Act requires that, in order that banking development, particularly in rural and semi-urban areas, may be stimulated, the Bank should, by July 1960, establish 400 new branches. But in the year under review it has been able to open only 46 branches which shows that the progress falls for short of the requirements. Some measures have, however, been set in motion to accelerate the pace but at best it may be said that the first year has been only a period of preparation and co-ordination. Enjoying the advantage of subsidies in case of losses incurred in branch expansion the Bank should not find it difficult to increase its rate of branch opening.

One of the major responsibilities of the Bank is the extension of liberal facilities to rural co-operative institutions in the matter of advances. In accordance with this, the Bank's policy is to give indirect assistance in regard to the provision of long-term finance for agriculture through Land Mortgage Banks. A liberalised credit scheme has also been put into operation which provides for relaxation in the rigidity of conventional assessments and administrative procedures in the case of small industries. In appropriate cases such applicants can even be considered for clean advances. It must, however, be recognised that relaxation of standards alone cannot solve the whole problem. Improvements in technique and in the quality of products will need to go hand in hand with the measures envisaged to enhance their claim to larger credits. This part of the problem is essentially for the Government to keep in view while giving encouragement to small industries. Nevertheless, the relaxations introduced by the Bank should be expected to encourage and increase the momentum of the development of small industries in the country.

A full picture of the progress made by the Bank and of the efficient financial management can be gathered from the annual address of the Chairman, Mr. H. V. R. Iengar, and the balance sheet published elsewhere in this issue.

BUSINESS NOTES

RECORD TEA EXPORT

AT A TIME when the planners in this country are exercised over the widening gap in the foreign exchange resources, it is a matter of no small comfort to see the bright performance of one of the principal foreign exchange earners during the last year. The quantity as well as the value of exports of tea reached a new all-time record with 516 million lbs. and Rs. 140.6 crores respectively. Compared with the total exports in 1955 which were 363.8 million lbs. valued at Rs. 112.7 crores, the figures speak for themselves. What is of greater interest is that tea exports in 1956 more than recovered the ground lost in 1955 because the value of the exports in 1954 was over Rs. 131 crores and the total quantity exported was about 450 million lbs. Another significant matter to be noted is that the increase in the exports in 1956 was shared by all the principal markets for Indian tea as will be clear from the following table:

	Quantity		Value	
	1955	1956	1955	1956
	(in million lbs.)		(in crores of Rs.)	
United Kingdom ..	248.9	366.5	73.3	100
United States ..	23.7	28.5	N.A.	N.A.
Canada ..	16.3	22.6	5.4	6.5
Egypt ..	12.9	21.6	3.9	5.9
Australia ..	6.1	9.4	2.05	2.71

The striking increase in the exports to Egypt is not only due to India's persistent efforts at increasing her sales in that country but due to the Suez crisis and the blocking of Egypt's sterling balances which has turned to be to her advantage, because this had resulted in Ceylon, which had so far dominated the Egyptian market, lose its advantage as the Ceylon-Egyptian trade had been carried through the sterling. In the case of trade with India, it has continued because Egypt has a direct payments agreement with India. Another important factor is that Russia, which did not buy any tea in 1955, bought a substantial quantity in 1956.

However, there is no need for any complacency in this regard because India has always to reckon with severe competition from Indonesia, Japan and East African countries. This calls for continued vigilance by the Tea Board as well as the Joint Tea Promotion Councils set up abroad in various countries to look after the export side of the industry and properly guide market expansion. But in the last resort, export promotion depends on the internal health of the industry and here the recommendations of the Plantation Enquiry Commission have caused considerable misgivings. Production this year amounted to only 663.6 million lbs. compared to 667.6 million lbs. last year. This is stated to be due to the voluntary restriction on plucking imposed by producers' associations in N.E. India. However, much depends on the long-term policy that the Government has yet to evolve on a realistic appraisal of the conditions in the industry.

HIGHER PRICE FOR COAL

THE GOVERNMENT of India has reportedly decided to increase the control price of coal by Rs. 1-2 per ton. This increase is meant to cover the additional cost of higher wages granted by the Appellate Tribunal to colliery labour. It was stated on behalf of the employers that an increase in price of Rs. 1-14 would be unavoidable to cover the higher wage bill. A very elaborate investigation will be necessary to work out the exact incidence of the higher wages now granted on the labour cost of the collieries. It is, therefore, difficult at the present moment to estimate how far the proposed increase meets the requirements of the situation.

An important problem raised by the Appellate Tribunal's decision related to the liability of colliery owners to pay the increased wages with retrospective effect from the date of announcement of the original Award. This liability has been estimated at Rs. 4.75 crores. An increase of annas six per ton in the price of coal, it is said, is to be levied for a period of two years to meet the arrears of wages due on account of the retrospective payment. This device is a welcome feature of the new scheme of coal price. But agreement will have to be evolved to spread this payment over a sufficient period of time.

It need not be supposed that this is the end of the increase in coal prices. So far, the problem of enabling the industry to obtain financial resources for the coal plan has not been faced. There is hardly any doubt that at least some part of the development outlay required by the industry will have to be found by means of an increase in coal prices.

AN EXPERT ASSESSMENT OF INDIAN RAILWAYS

THE RADIO interview of Mr. J. E. Slater, leader of the World Bank's team of consulting engineers, which was broadcast on the All-India Radio on Sunday last gives some insight into the assessment made by the team of the problem of railway development. There can be no doubt now that the experts are carrying with them a good impression of the present performance and of the need to help the railways to meet their financial requirements in the immediate future. Mr Slater expressed his satisfaction at the manner in which the Railway Board prepared the railway development plan —the care and objectivity with which it has been drawn up.

The team of consultants visited all the railways except the North Eastern Railway. Its personal sample surveys of the operations on lines and yards as well as in workshops congested with heavy work has assured it that the railways are managing their tasks efficiently. Mr Slater refrained from making any comparisons between the operational efficiency of Indian railways with the efficiency of railways in other advanced countries for the reason that the problems were not identical. Priority in development will naturally be given to strengthening and extending the line capacity. The marshalling yards, crossing routes, tracks and rolling stock are the main factors on which line capacity depends.

What Mr. Slater had to say about the problem of locomotives confirms the approach of the Railway Board. He has emphasised that railways should change over from coal traction to electric traction to the maximum extent possible. In view of the prospective availability of cheap hydro-electric power there is, of course, great scope for the adoption of electrically operated locomotives. Although diesel locomotives are cheap, in the present state of India's known resources of petroleum, it would not be advisable to make any large-scale change to this type of locomotives for it is obvious that considerable foreign exchange will have to be spent on import of diesel fuel as an absolute normal requirement.

It is somewhat paradoxical that a team of technical consultants should be charged with the task of tender-

ing opinion regarding the ability of the railways to provide funds for development. This paradox apart, there are positive indications that here too Indian railways have demonstrated their readiness to contribute their reasonable share of development finance. Furthermore, as is now quite clear, they will raise additional finance by increasing their rates and fares. These funds will go to meet the rupee expenditure. The World Bank's loan will be needed for meeting the foreign exchange requirements in a substantial measure. It was not reasonable to expect Mr Slater to give any indication of the team's view on this question. The requirements of the railways in respect of foreign exchange in the plan are of the order of Rs. 425 crores. It is anticipated that the initial loan which will be granted after the experts' report is submitted and discussions are held by the Bank with the Government, will be in the neighbourhood of Rs. 200 crores.

HEAVY MACHINERY PROJECT

THE REPORT of the British Heavy Machinery Mission places emphasis on decentralisation in that it recommends four independent, self-contained units at a cost of Rs. 5 crores each. The Russian scheme, on the other hand, envisages a huge plant for the production of machinery and equipment at an estimated outlay of Rs. 84 crores. This is exclusively as regards the outlay involved. The main problem in any heavy machinery project is the availability of foreign exchange resources. While the Soviet experts have indicated some possible assistance by their Government the British report is silent on the matter. The foreign exchange content of the Russian project is expected to be half the total cost. The National Industrial Development Corporation has also taken up the establishment of a heavy steel foundry and forge shop facilities and the Plan has made a provision of Rs. 12 crores for this purpose. Since the report of the British experts covers the same ground as the Russian report—both in relation to the NIDC project —it is likely that all the schemes will now be studied together in an attempt to co-ordinate them.

Under the Industrial Policy statement of April last, the State has assumed full and exclusive responsibility for the development of the machinery industry. Heavy engineering industries are a natural corollary of the iron and steel works for which the second Plan has given top priority. But it is important to realise that a quite substantial portion of the expenditure on machinery is on items which are required by industries generally and are in no sense specially intended for steel plants. Such requirements are at present met mainly by imports. The programme of development of heavy engineering industries now visualised is thus essentially preparing the ground for perspective planning.

STAPLE FIBRE FACTORY IN NILGIRIS

TEXTILE INTERESTS in South India, in collaboration with the Government of Italy and Italviscosa Eastern Trading, Milan, are reported to be exploring the possibilities of setting up a rayon and staple fibre factory in Mettupalayam at the foot of the Nilgiris. Next perhaps to the completion of the two petroleum refineries rank the achievements of the rayon and staple fibre industry in India's planned economy. From its beginnings, associated with the commencement of the first Five-Year Plan, the rayon industry has progressed, within the short space of over five years, with such confident strides that the private sector may well feel proud of its achievements thus far and sure of undertaking new responsibilities, in this direction, with zest and vigour.

The proposed factory at Mettupalayam in South India, the total capital requirements of which are estimated to be of the order of Rs. 7 crores, will have an installed capacity of 10 tons each of rayon and staple fibre per day. While the Southern textile interests are expected to invest a crore of rupees, the Government of Italy and Italviscosa Eastern Trading, Milan, would appear to have agreed to an investment and long-term loan to the extent of 80 per cent of the aggregate capital outlay.

An important landmark in the history of the rayon industry was established towards the end of 1956 when the Gwalior Rayon Silk Manufacturing (Weaving) Co., Ltd., Nagda, completed its first major extension scheme in record time with a view to making India self-sufficient in staple fibre. The Nagda unit is the only unit producing staple fibre in India. The proposed Rayon factory at Nilgiris, which is also expected to undertake staple fibre production, will be the second unit of this kind.

It is agreed on all hands that, during the last two or three years, there has been a phenomenal improvement in the development of man-made fibres in the principal textile countries of the free world. With the new plant capacity continuing to be installed, providing the basis for further increases in the production of man-made fibres in the future—as for instance in this country—there is bound to be an ever-widening scope for exploitation in this industry.

The national importance of encouraging the setting up of a new factory which would ensure additional production of rayon and staple fibre, in the import of which India has to spend, on an average, Rs. 17 crores, cannot be under-estimated. At a time when there is a concerted drive on all fronts to save as much foreign exchange as possible, the establishment of a new rayon and staple fibre factory, which would eventually lead to a considerable reduction in the import of not only these goods but also of quite a sizable volume of long-staple cotton (staple fibre is a useful substitute for long-staple cotton) which is in short supply in this country, must be deemed a step in the right direction.

STANDARD BATTERIES

THE SPEECH delivered by Mr R. D. Char, Chairman of the Standard Batteries Ltd., at the annual general meeting of the Company, indicates the extent to which valuable exchange can be saved on batteries. He estimated that the railways, telegraphs and telephones and the special batteries for the Defence Services have a demand during the plan period of nearly 2½ to 3 crores of rupees worth of lead acid batteries annually, which are mostly imported. He also pointed out that the company's "Standard RPG" Tudor's Patent railway train lighting cells were now in commission in all the railway systems and foreign exchange to the extent of Rs. 3 crores could be conserved by the country on this item alone if production and offtake were put on an economic war footing. The demand for automobile batteries is also increasing, but the upward tendency may not continue if the road transport industry throughout the country is not allowed to fill the gap in the transport problem. The company has thus to turn its attention to satisfying an increasing demand for many of its products. As finance is one of the main problems they have to face, the Chairman announced that they may issue a further 12,500 shares for increasing the capital of the company by Rs. 12,50,000. The laboratory of the factory has been completely reorganised and special latest testing equipment have been installed. All these indicate that the company can look to the future with confidence in contributing its share to the industrial development of the country.

Company Meeting

THE STANDARD BATTERIES LIMITED

Speech delivered by Shri R. D. Char, Chairman, The Standard Batteries Ltd., Bombay at the Eleventh Annual General Meeting of the Company held on Thursday the 31st January, 1956

Gentlemen,

Allow me to extend to you on behalf of myself and my colleagues on the Board, a cordial welcome to this Eleventh Annual General Meeting of your company.

The Directors' Report and the Statement of Account together with the Auditor's Report for the year ending 30th June, 1956 have been in your hands for some time and I will take these with your permission as read.

In this year under report, I am glad to inform you that there has been a steady increase in the users of our automobile batteries. This upward tendency curve, I am afraid, may start flattening out unless favourable climate is created for the road transport industry throughout the country to quickly catch up and fill the gap in our transport problem. During the year under report, several new processes in the manfuacture, test and control were put into operation and as a natural consequence the period of guarantee on our car batteries was increased from 6 months to one year. In spite of this increased period of guarantee, the percentage of claims, I am glad to inform you, has come down considerably as compared to the previous years. This can only be accounted for the improvement in the manufacturing process and strict laboratory controls.

The laboratory has been completely reorganised and special latest testing equipment have been installed. Some more of the testing and control instruments have been ordered out overseas during the year under report. They are expected during the current period. With the installation of these, the laboratory at our works would be able to tackle all the problems involved in the development, testing and control comparable with any modern unit of our size in Europe and America.

With the continuous operation of our Lead Refining Plant at the southern end of our factory, it was decided to rearrange the various manufacturing process with a view to streamline the flow of manufacture and material handling. Most of the re-organising work is nearing completion during the current year. All this had to be achieved with as little dislocation in the day to day production to meet the regular demands.

You will see from the above that during the year under report, your company had concentrated in improving the quality, test and control and in the reorganisation of the plant. It is expected in the coming years that this new arrangement will substantially reflect on the results of the working of your company.

Our "STANDARD RPG" Tudor's Patent railway train lighting cells are now in commission in almost all the railway systems. Their initial tests at the different railways have been uniformly very good. Your company is looking forward for an early decision from the Government to utilise our capacity. Foreign exchange to the extent of Rs. 30,00,000 could easily be saved during this year and during the next four years of the Plan period foreign exchange to the extent of Rs. 3 crores can be conserved by the country in this item alone if production and offtake are put on an economic war footing. The "STANDARD RPG" railway cells have decided advantages and improvement over the older tubular or 'pencil' type batteries that are familiar to our railways. We are ready and look forward with great hope the decision of our Railway Board.

Prototypes of Telephone cells of "STANDARD TPg." type are on test and your company is confident in the not distant future to get its legitimate share in this field of considerable offtake in the country.

Our "MITEX" microporous rubber separator plant started actually arriving at the fag end of the year under report. The erection is complete and trial runs are being taken. There was quite a bit of delay in shipment from our overseas suppliers.

With the separator plant in production, your factory will be producing cent per cent of all the components, under strict quality control, that go to a modern long life battery for the first time in this country. The effect of this is far reaching.

Most of our equipment and machinery were installed some ten years ago. There have been many improvements and developments in the process and design of important special purposes machines in Europe during this period. Your Directors are constantly in touch with these developments and also through our technical collaborators Messrs. A. B. Tudor of Sweden. Action was taken to replace some of them and add a few balancing units during the year and were received and installed in the current year.

To finance this new capital investment, your Directors issued the balance of the unissued capital of Rs. 5 lakhs during the current year. All this issue is fully subscribed and at present the issued and paid up capital of your company stands at Rs. 25,00,000. As mentioned earlier, we have still to order out some more balancing units in our container plant and other processes to take care of the diversification of production to meet the various demands on your factory. This demand has increased considerably of late.

In achieving this objective, we shall have to face a variety of problems and the most important being finance. Your Directors have given considerable thought to this and will be coming in the near future before you for permission to increase the capital by Rs. 12,50,000 by issuing further 12,500 Ordinary Shares. Arrangements in this connection are being made and when completed will be put before you for approval. I have the assurance from a financing institution of high repute and considerable resources to underwrite this whole new issue. This testifies the financial stability and future possibilities in the diversification of production that is on the anvil of the company.

The Railways, Telegraphs and Telephones and the special batteries for the Defence Services, I have reason to believe, have a demand during the Plan period of nearly 2½ to 3 crores of rupees worth of lead acid batteries annually, which are today mostly imported items. It is your Directors' aim and objective to equip with the necessary facilities to meet the challenge of

the foreign exchange shortage facing our Government in the second Plan period.

You factory, may I say with pardonable pride, is the only hundred per cent national unit in the country, which is organised and equipped for building lead acid batteries for various applications in industries, transport, communication, traction etc., and I have hopes during this second Five-Year Plan to fulfil our due share in reducing the imports on this account.

I take this opportunity of sincerely thanking all our customers, distributors, automobile manufacturing industry and the various departments of the Government for the continued patronage and goodwill shown towards us. It is our business to build better batteries and to this end all our efforts are geared.

The officers, members of the staff and operatives of the Company are fully aware of the great task ahead of us and I thank them sincerely on your behalf for their co-operation.

With these words, I beg to move that the Directors' Report and audited Balance Sheet as at 30th June, 1956 and the Profit and Loss Account for the year ended 30th June, 1956 be and are hereby approved and adopted.

THE STATE BANK OF INDIA

Speech by the Chairman, Shri H. V. R. Iengar, at the Second Annual General Meeting of the Shareholders held in Bombay

I have much pleasure in welcoming you to the Second Annual General Meeting of the State Bank of India.

2. When Dr Matthai addressed the shareholders at the Meeting held in February 1956, the report which he presented covered a period of only six months, viz., from the 1st July 1955, when the Imperial Bank of India was converted to the State Bank of India, to the 31st December 1955. The report which has been circulated to the share-holders for discussion today covers a whole year's working of the Bank in 1956 and provides a fuller opportunity than my predecessor had for considering to what extent, in its actual functioning, the Bank is fulfilling the purposes for which it was nationalised.

3. When it was decided that the Government of India should take up the effective ownership and control of the Imperial Bank of India, several voices were raised against the step, principally on the ground that the role of this great institution, which has played so dominant a part in the field of commercial banking in the country, would be somehow distorted by the intervention of Government. Little comfort was taken from the assurance that Government would not interfere in its day-to-day operations and that in fact it would operate on sound commercial lines with due regard to public interest. Immediately after the announcement about the Government of India taking over the controlling interest in the Bank, the volume of deposits decreased, possibly by transfer to other Scheduled Banks.

4. The working of the Bank since nationalisation has made it clear that the assurance given by Government and embodied in the State Bank of India Act is being scrupulously observed. There has been no interference whatever by the State in the day-to-day operations of the Bank. Certain State enterprises have applied to the Bank for advances and all these have been accepted in full but on normal commercial terms. No discrimination in favour of such enterprises, such as, for instance, in the rates of interest, has been asked for. It would be relevant to point out in this connection that the sanction of advances to State enterprises has not restricted in range or volume the sanction of advances to enterprises in the private sector. On the contrary, consistently with the rising tempo of economic activity, our advances to the private sector of commerce and industry have increased very substantially—from Rs. 72 crores in December 1955 to approximately Rs. 100 crores in December 1956.

5. I think the public has fully realised that the apprehensions expressed at the time of announcement of the taking over of the ownership of the Imperial Bank of India by the State are unjustified. The consequence of it has been that our deposits have been steadily rising. As stated in the report, the increase in deposits during 1956 was 8.8 per cent against 7.8 per cent in the case of other Scheduled Banks. A perusal of the mere percentage increases does not, however, give a full picture of the actual developments that have taken place. During 1956, on account of the tightness of the money market, Scheduled Banks generally raised rates of interest on deposits, in many cases quite substantially. The State Bank maintained its old rates unchanged at a traditionally low level for the first 11 months of the year. The increase in deposits therefore took place in spite of the fact that interest rates in other Scheduled Banks were much more attractive. Even the changes made with effect from the 1st December 1956 may be described as mere readjustments to a rapidly changing situation and in no sense an attempt to catch up with other Scheduled Banks.

6. This seems to be an appropriate moment to refer to the criticism sometimes made about the State Bank, viz., that because it is a State Bank operating in the commercial field it has certain inherent advantages over the other Scheduled Banks and that it is using its privileged position to attract business to itself. If it were, indeed, to be the policy of the State Bank to operate flat out as a commercial institution irrespective of the consequences to other Scheduled Banks, it would have been quite easy to increase its interest rates still further and I have little doubt that thereby a much larger volume of deposits would have accrued to us, some of it perhaps in the form of fresh deposits but a larger proportion as diversions from other banks. As a matter of deliberate policy the State Bank has declined to pursue such a step. We cannot forget the historical traditions of this ancient institution. Moreover, although the Statute authorises us to operate as a commercial bank, it enjoins on us due regard to the public interest and we have interpreted this to include our obligations to the banking structure as a whole. It is not our intention to enter into a race, as we could easily do if we were merely concerned with swelling our profits. On the contrary, it is our hope that by pursuing a policy of moderation in our rates both for deposits and advances, we may act as a steadying influence, more particularly during a period of great stringency when runaway conditions are so easy. Even so the shareholders will observe that our profits have increased, substantially, principally by the larger turnover of our funds.

7. I would like to refer to a new item in the Balance Sheet, viz., allocation of Rs. 10 lakhs to the Staff Welfare Fund. It is my view, with which the Directors are in complete agreement, that steps should be taken for the purpose of improving the working conditions of the staff employed by the Bank. Some of the items about which representations have been made by the staff, for example, housing in the big cities, raise problems of resources which can be handled only gradually. An attractive solution that has been suggested is the formation of co-operative housing societies for members of the staff, such societies to be assisted by the Bank both by the provision of long-term credits on easy terms as well as possibly in other ways. Such schemes have been tried elsewhere and have the great merit that the staff not merely get houses for living in but will also, in due course, own them. Discussions on these lines have been held with the office-bearers of the Federation of the employees' associations and I hope it will be possible to take concrete measures in the near future. In the meanwhile, the sum of Rs. 10 lakhs will enable us to deal with pressing items such as the improvement of canteens and the provision of recreational facilities.

8. It is not necessary for me to comment in any detail on the programme of assistance to the small scale industries and the branch expansion programme, these being the programmes which may be regarded as fulfilling the requirements in our charter to operate "with due regard to the public interest." In the field of small-scale industries our activities are still somewhat exploratory in character. But for a Bank with our traditions it has been a big step to break away from the concept of security of property as the main criterion for making an advance and to be prepared to give credit on the basis of mere capacity to produce and sell. The extent to which we can increase our advances to small-scale industrialists is not, however, a matter solely of relaxing conventional assessments of creditworthiness. It is much more a question of the improvement of techniques, with a consequent improvement in the quality of products and their saleability. In fact, credit and the improvement of techniques have to go side by side. The latter is, however, a matter which is outside the normal sphere of a banking institution. I know that the Government of India are keenly alive to this problem and hope that the steps which they have initiated in this field will acquire increasing momentum during the Plan period.

9. In the report which has been circulated reference has been made to relations of the State Bank with co-operative institutions. Here again is a field in which we are only making a beginning. In the second Five-Year Plan a new impetus is being given to the co-operative movement in the country. The possibilities of progress are immense, and it will be no exaggeration to say that co-operative institutions could form a dominant part in the country's economy. The State Bank will always be ready to play a helpful and constructive part in the development of such institutions. The exact form and pace of such assistance as well as the structure of the relations between co-operative banking and the State Bank are a matter requiring further thought and perhaps experimentation as we go along.

10. In concluding this speech, I should be failing in my duty if I did not pay a tribute to all those who helped in making the transition from a shareholders' bank to a predominantly Government-owned bank smooth and easy. Most of the initial difficulties were solved during the Chairmanship of Dr. Matthai; to him the Bank owes a great deal for the strong position in which it finds itself today. Some problems had been left over when I took charge from him on the 1st October 1956. These related principally to staff emoluments at higher levels and more particularly to the payment of bonus. Government felt that, consistently with their obligations to the widening network of the public sector of the economy, they had to ask the State Bank to conform to certain principles. I am glad to say that these difficulties have since been solved by mutual discussion and I would like to take this opportunity of expressing my obligations to Government for the understanding that they have shown in the matter.

11. One last word but, from my personal point of view, a very important one. This is my last official function in the State Bank for, tomorrow, I am handing over charge to Shri Bhattacharya. I have greatly enjoyed working in this institution and I am sure the experience I have gained, short as it is, will be of real help to me in my new responsibilities. I would like to express my gratitude to the officers and the rest of the staff for their unfailing assistance and I am sure they will give it in equal measure to my successor.

SUNEJA'S

1. **INTEREST CALCULATOR—Rs. 10|-** Contains calculation on daily products, Interest by days and Interest by Months from ¼% to 12% in each case.
2. **EXCHANGE CALCULATOR—Rs. 9|-** Containing tables for conversion of £ Sterling into Rupees and vice versa, conversion of Dollars into Rupees and vice versa.

REPORT OF THE AUDITORS

TO THE PRESIDENT OF INDIA.

We, the undersigned Auditors of the State Bank of India, appointed under Section 41(1) of the State Bank of India Act, 1955, do hereby report to the Central Government upon the Balance Sheet and Accounts of the Bank as at the 31st December, 1956.

We have examined the above Balance Sheet and the Profit and Loss Account and the Accounts relating thereto of the Central Office and the Local Head offices at Bombay and Calcutta and the Returns submitted and certified by the Secretary and Treasurer of the Local Head Office at Madras and by Branch Agents, which Returns have been incorporated in the above Balance Sheet and Accounts, and report (i) that, in our opinion, the Balance Sheet is a full and fair one, containing all the necessary particulars and properly drawn up so as to exhibit a true and correct view of the affairs of the Bank, according to the best of our information and the explanations given to us and as shown by the Books of the Bank; (ii) that where we have called for any explanation or information such explanation and information have been given to us and have been satisfactory; (iii) that the transactions of the Bank which have come to our notice have been within the powers of the Bank; (iv) that the Returns received from the Local Head Office at Madras and from the Branches of the Bank have been found adequate for the purpose of our audit; (v) that the Profit and Loss Account shows a true balance of profit for the period covered by such account; (vi) that, in our opinion, the Balance Sheet and Profit and Loss Account are drawn up in conformity with the law; and (vii) that, in our opinion, Books of Account have been kept by the Bank as required by law.

The audit of the Books and Accounts of the Central Office has been carried out jointly by Messrs. S. B. Billimoria & Co. and Messrs. Ray and Ray. The audit of the Books and Accounts of the Local Head Offices has been carried out at Bombay by Messrs S. B. Billimoria & Co. and at Calcutta by Messrs. Ray and Ray.

COMPANY AFFAIRS

THE DUNCAN GROUP OF TEA COS.

The year 1956 witnessed two developments which are of consequence to the tea industry. In January, an agreement was entered into between the representatives of the industry and employees on an industry-wise basis by which bonuses became payable to labourers for the years 1953 to 1956 inclusive. This has had the effect of increasing the cost of statutory concessions to labour. While in the case of some companies in this group the joint payment for 1953-54 appears in the accounts, the exact formula for calculating the amounts due for 1955 and 1956 has been under consideration, though provision for the estimated amount for 1955 has also been made. The second important occurrence is that the Indian Finance Act. 1956, has given retrospective exemption from taxation in India of agricultural income arising in Pakistan and taxable in that country.

During the year 1955, for which accounts of the ten companies under the group, namely Daurachcrra, the Ellenbarrie, Gungaram, the Hantapara, Killcott, Kotamullai, Ledo, Patrakola, Phaskowa and Teliapara, are available, the tea industry in general has been experiencing some unfavourable features. It has been a year of reduced crops, and the average prices for the different varieties have also declined, in certain cases sharply. This has been attributed to various reasons like adverse market conditions, unfavourable growing conditions, tea pests and sometimes bushes being uprooted as a result of the 1954 drought. The accounts of the companies have been prepared in accordance with the provisions of the Companies Act, 1956. Thus the fixed assets which had been written off up to end of 1954 have been brought back into account and Depreciation Reserve Accounts representing the written down values of these assets have been opened. The financial results of the individual companies are reviewed below.

Daurachcrra Tea Co., Ltd.

The accounts disclose a profit of Rs. 3,20,277. On transfer of this sum to Profit and Loss Account, and after sundry adjustments, there is a balance of Rs. 6,60,922, of which Rs. 4.15 lakhs have been transferred to Revenue Reserve. A special dividend of 15 per cent for 1954 season was paid in March, 1956, while Rs. 1.20 lakhs has been provided against a 20 per cent dividend distribution, leaving Rs. 35,922 to be carried forward. A sum of Rs. 40,836, representing a net loss on exchange from the devaluation of Pakistani currency has been charged to the Profit and Loss Account. The crop was 4,417 maunds as against 5,173 maunds in 1954. The average selling price in Pakistani currency was Rs. 2-4-2 per lb. compared with Rs 2-6-11 in the preceding year.

The Ellenbarrie Tea Co., Ltd.,

The season's working is disappointing. The accounts show a loss of Rs. 627. After sundry adjustments, including a transfer of Rs. 40,000 from the Revenue Reserve, there emerges a credit balance of Rs. 3,837, which the Directors have proposed to carry forward. The crop weighed out at 4,803 maunds as compared to 5,016 maunds harvested in 1954. The average selling price was Rs. 1-14-7 per lb. against Rs. 2-11-8 in 1954.

Gungaram Tea Co., Ltd.

The profit for the year is Rs. 3,23,078, which after sundry adjustments, stands at Rs. 2,96,491. From this Rs. 50,000 has been transferred to Revenue Reserve and an equal amount to Buildings and Machinery Reserve. The Company's authorised capital was increased to Rs. 20 lakhs. A total of 5,040 ordinary shares of Rs. 100 each were credited as fully paid up by way of a capital bonus to registered holders. The Directors have recommended a 7½ per cent dividend, (equivalent to 12 per cent on the old capital) and to carry forward Rs. 95,691. The total crop was 15,998 mds. as compared to 16,568 mds. in 1954. The average selling price per lb. was Rs. 1-11-3 and Rs. 1-14-10 for Gungaram and Ordinary, as against Rs. 2-14-10 and Rs. 3-4-4 respectively for the preceding year.

The Hantapara Tea Co., Ltd.

The year's profits are Rs. 3,39,240, which after sundry adjustments amount to Rs. 4,95,407. Of this, Rs. 1 lakh has been transferred to the Revenue Reserve. This Company's authorized capital was also increased to Rs. 60.75 lakhs. A total of 12,000 ordinary shares of Rs. 100 each were credited as in the previous case. In December, 1955, the dividend on the preference shares was paid leaving a balance of Rs. 3,91,407. The dividend proposed, on ordinary shares is of 6 per cent (equivalent to 9 per cent on the old capital) and the balance of Rs. 1,75,407 is to be carried forward. The crop harvested and the average selling price for the year under review are 34,882 mds. and Rs. 1-13-5 for Hatanpara and Rs. 1-12-5 for Dumchipara. For the preceding year the figures are 38,610 mds. and Rs. 2-15-5 and Rs. 2-12-3 respectively.

Killcott Tea Co., Ltd.

Here, the year's profits at Rs. 3,50,606 stand, after sundry adjustments, at Rs. 2,63,391, of which Rs. 1.25 lakhs are transferred to Revenue Reserve. The dividend recommended by the Directors is of 10 per cent, which leaves Rs. 48,391 to be carried forward. The crop was 12,835 mds. as compared with 14,335 mds. for 1954. The average selling price realized was Rs. 1-14-10 per lb. against Rs. 2-7-4 in the preceding year.

Kotamullai Tea Co., Ltd.

On transfer of the year's loss of Rs. 36,724 to the Profit and Loss Accounts and after adjustments, there is a credit balance of Rs. 16,331, which the Directors have recommended to be carried forward. For reason of having incurred loss, no bonus has been proposed, though the bonus payable by Rampore and Jiajuri Tea Estates in respect of the previous period appears in the accounts. The crop and the average selling prices are Jaijuri 5,725 mds. (5,344 mds.), Rs. 1-15-2 (Rs. 2-12); Rampore 3,789 mds. (Rs. 4,173), Rs. 1-10-7 (Rs. 3); Kotamullai 6,601 mds. (7,512 mds.), Rs. 1-11-2 (Rs. 2-9-4)—figures in brackets represent those of 1954.

Ledo Tea Co., Ltd.

Again, the working has resulted in a loss of Rs. 83,602. After transferring Rs. 1.75 lakhs from Revenue Reserve and other adjustments, there emerges a balance of Rs. 1,760 to be carried forward. The season's crop weighed out at 5,727 maunds, compared to 6,273 mds. in 1954. The average selling price at Rs. 1-9-10 was about a rupee lower than in 1954.

The Patrakola Tea Co., Ltd.

The year's profit is Rs. 38,32,847 which after adjustments stands at Rs. 42,57,130. From this, Rs. 17 lakhs is transferred to Revenue Reserve. The dividend on the preference shares and the special dividend of 30 per cent on ordinary shares for season 1954 were paid and Rs. 12.60 lakhs have been provided for a 35 per cent dividend, leaving Rs. 1,74,719 to be carried forward. The State Bank of Pakistan has permitted remittance of Rs. 20 lakhs out of the Company's Pakistani trading profits which have been received. However, the devaluation of that country's currency has resulted in a loss on exchange of Rs. 20,08,744. The total crop for the year was 50,254 mds. as against 53,571 mds. in 1954. The average selling prices, with 1954 figures in brackets are: Patrakola Rs. 2-2-6 (Rs 2-8-1); Madabpore Rs. Rs. 2-1-2 (Rs. 2-7-10); Kurmah Rs. 2-0-10 (Rs. 2-8-7); Champari Rs. 2-2-9 (Rs. 2-6-5).

Phaskowa Tea Co., Ltd.

The entire trading profit of Rs. 9,968 has been provided for meeting the bonus commitment. For taxation, Rs. 8000 had to be reserved as it had not been finally agreed with the Government in which assessment years part payment of labourers' bonus would be admitted as chargeable items. The crop for the season was 2,987 mds., against 3,201 mds. in the preceding year. The average selling price was Rs. 1-12-5 per lb. as against Rs. 2-10 in 1954.

Teliapara Tea Co., Ltd.

The account shows a profit of Rs. 7,11,533. With adjustments, the credit amounts to Rs. 13,81,706. From this Rs. 8 lakhs is transferred to Revenue Reserve. A special dividend of 30 per cent already paid and a provision of Rs. 2.25 lakhs for a 25 per cent dividend leave Rs. 86,706 to be carried forward. The Company has undergone a loss on exchange of Rs. 1,86,079 as a result of the devaluation of Pakistani currency. The reserve for taxation of Rs. 11.50 lakhs no longer required as a result of the Finance Act has been credited to the Profit and Loss Account. The total crop for 1955 is 11,016 mds. as compared to 13,334 mds. in 1954. The average selling prices for the two years respectively are: Teliapara Rs. 2-4-1 (Rs. 2-7-4) and Satchuric Rs. 2-3-2 (Rs. 2-7-2).

Economic Report from the U. S.

DEBATE ON INFLATION

(BY GUY SIMS FITCH)

WASHINGTON, Feb. 26.—Economists, business men, labour leaders and government officials in the United States have lately been probing the American economy, trying to ascertain not only future trends, but the results of past developments. Their probing has touched off an absorbing debate—most recently on the question of what caused the moderate inflationary movement of 1956.

The weekly publication of the American Federation of Labour-Congress of Industrial Organizations (A.F.L.-C.I.O.), the nation's leading labour organization, criticized this week those who regard "excessive" wage gains as the prime move in last year's 3 per cent rise. The argument that set A.F.L.-C.I.O. editorial pens into motion goes something like this: wage increases last year exceeded productivity gains, thereby pushing up business costs, depressing profit margin, and necessitating higher prices. In rebuttal, A.F.L.-C.I.O. leaders contend that wage increases are important to maintain consumer spending, that business profits last year were large enough to absorb most of the increased labour costs, and that in any case productivity now is rising again at a faster pace.

As is so often the case, debates of this kind tend to be oversimplified. The fact is, of course, that both, profit margins and wage increases, last year were part of that general economic development that was—and still is—stimulated by strong demand for goods and services. Inflationary strains resulted primarily from efforts to expand too rapidly at a time when the US economy was running at near-capacity and maximum-employment levels. In this situation, the US government has been following so-called "tight money" policies. These are designed to slow down the rate of economic expansion by discouraging excessive business and consumer borrowing. The Government has been avoiding direct controls over prices and wages. These it considers neither necessary at this time nor desirable in a free economy. But it has called for voluntary, private restraint to supplement its call for restraint applies equally to business and labour—to pricing policies as well as wage demands.

At this stage of the current debate, another element moves to the forefront. It is the question of how long and how assiduously restrictive policies and private restraints should be employed if and when they begin to have an appreciable effect on economic activity. At this point, the question remains hypothetical, but one that nevertheless must be considered. One view holds that—as a noted economist has put it—a little inflation is better than a little unemployment. Another school of thought holds that inflation, once started, may become increasingly difficult to stop; and, at any rate, even slight price increases year after year eventually cut the purchasing power of Americans, workers included. These discussions have so far resolved little. But they have had one notable effect. They have pushed into the background some dire warnings heard a few weeks ago about inflationary dangers. It is new evidence of the soundness of the US economy that these warnings have had no dramatic effect on its activity. In fact, the imminence of a serious economic downturn has not also been quickly and decisively discounted by many prominent economists, business men and government officials, regardless of their economic viewpoints.

Of late, there have been some signs of an easing of inflationary pressures. Thus, the major point of the present debate may disappear in time or be supplanted by other topics. But while the debate is underway, it is generating the kind of thoughtful self-examination that in the end contributes to a better understanding of the free and dynamic American economy. It is no exaggeration to say that such discussions have been the means of resolving many thorny problems as the US economy has moved on to greater stability and strength.

COMMODITY NEWS AND NOTES

COFFEE PRODUCTION

According to a recently revised current crop estimate, coffee production is expected to be around 38,000 tons, which is an all time record for India. Under the aegis of the Coffee Board, it is targetted to reach a production of 70,000 tons annually under a special fifteen-year scheme. Although rains would appear to have hindered the picking of the crop, resulting in dropping of fruits, to some extent, the prospects for 1957-58 are bright. While the export sales are being well maintained, the revised estimates for 1956-57 crop have provided the country with an exportable surplus of 11,100 tons. If the Plantation Commission's recommendation, that the high quality of coffee earmarked for export be maintained, is strictly adhered to, export trade in coffee can be effectively boosted.

INCREASED OUTPUT OF IRON ORE

The estimated total output of iron ore in India increased to 418,198 tons in December, 1956 as against 376,789 tons in November, according to official statistics released by the Chief Inspector of Mines. Returns received from 123 mines for the month of December, 1956, show despatches totalling 290,726 tons to the iron and steel plants and 96,978 tons to the export market. The reported stocks as at the end of the month amounted to 1,521,635 tons.

OUTPUT OF COAL

The output of coal in India increased to 3,678,262 tons in December, 1956 from 3,324,236 tons in the preceding month, according to official statistics released by the Chief Inspector of Mines, Government of India. Despatches of coal amounted to 3,038,222 tons in December, 1956 as against 3,025,890 tons in November, 1956. Coal stocks at pitheads amounted to 2,766,459 tons at the close of the month as against 2,564,697 tons at the beginning of the month.

MORE AREA UNDER RAPE AND MUSTARD

The All-India First Estimate of Rape and Mustard for 1956-57 puts the current year's area at 2,632,000 acres as against 2,563,000 acres for 1955-56, according to the Directorate of Economics and Statistics, Ministry of Agriculture. This shows an increase of 69,000 acres or 2.7 per cent in area during the current year as compared to last year. The increase in acreage during the current year has been reported mainly by Punjab, Uttar Pradesh and Madhya Pradesh and to a smaller extent by Assam and Bombay and has been attributed to favourable climatic condition at the sowing time. This increase has, however, been offset to some extent by the decrease reported by other States, mainly Rajasthan.

AMERICAN WOOL STOCKS LOW

World wool markets are anticipating sustained demand from the United States according to the Australian wool broking company of Winchcombe, Carson Ltd. In a recent analysis of the American market, the company sees prospects for higher prices for United States domestic wool and an increased reliance on imports. A strong demand for raw wool, particularly during the early months of 1957, is anticipated. Trade stocks in the United States have reached an all-time low. It is estimated that apart from stockpile wools, total stocks in the hands of the trade on January 1, 1957, were only 3,000,000 lbs. On January 1, 1956, the trade held 77,000,000, in 1955, 100,000,000 and in 1948, 364,000,000.

STEEP FALL IN COTTON EXPORTS

The trend of India's cotton exports during the current (1956-57) cotton season till now has been far from encouraging. The volume of raw cotton exports for the period September 1 to February 2 shows a decline of 193,718 bales from that recorded in the corresponding period of the 1955-56 season. The reasons for this sudden reversal in the trend of raw cotton exports are not far to seek. In the first place, the current cotton season started immediately after the announcement of the additional increase on excise duties. The series of restrictive measures adopted by the Government in respect of the textile industry naturally had its repercussions in raw cotton exports. Over and above there was actual damage to cotton both quantitatively and qualitatively on account of bad weather at the beginning of the season. Conditions have become no better since as reports are even now being widely circulated that the cotton crop in middle Gujarat cotton tract has been adversely affected due to the severe cold spell and frost. Apart from this, the Government's artificial ceiling on mill cloth production always acted as a damper and the overall atmosphere was not at all conducive to the farmer putting his best foot forward in the matter of intensive cultivation. When production is itself constrained to be under check, there is bound to be a relative setback in the exportable surplus.

Apart from these, the Suez blockade vitally affected the character and content of India's cotton exports. The decline in India's cotton exports to the UK from 33,236 bales to 13,301 bales also brings out the fact that, as a result of the Suez stalemate, both the direction and the volume of cotton exports have been affected. During the current season, the first export quota announcement came on December 1, 1956 when the season was already three months old, unlike in previous seasons when the official policy in this behalf used to be made available as early as September, and in no case later than October. Subsequent to the December announcement, which granted a quota for 2 lakh bales, another quota was released on February 6, 1957 for a like amount. While this had been fully utilised, shippers have now started agitating for another quota specifically to China, which has latterly shown sustained interest in Indian cotton.

RECORD EXPORT OF TEA

India exported about 516 million lbs. of tea in 1956, the value of which was about Rs. 140.6 crores. The total quantity exported as well as the value of exports were an all time record. The total exports of tea in 1955 were 363.8 million lb. valued at Rs. 112.7 crores.

COFFEE FOR EXPORT

The Government of India has decided to allocate 11,050 tons of coffee for export from the 1956-57 crop. The production of coffee during 1956-57 was estimated at 37,800 tons. The Government had earlier announced an allocation of 7,900 tons for export.

The Commonwealth Link

THE question whether India should secede from the Commonwealth is just come to the fore as a deplorable climax to the dramatic sequence of events since August last—Suez, Kashmir and the General Elections. This is a national issue *par excellence*—much too vital and important to be decided in a fit of nationalist anger. No better index of the utility of the Commonwealth link as a sheet-anchor of India's independent existence can be had than the persistent and fanatical Communist campaign for severing that link. Wisdom and commonsense and this country's long-range interests alike lie, therefore, not in terminating existing friendships but in cementing them further. The present strain in Indo-British relations should be treated as no more than a passing phase. For, if the British have rubbed India on the wrong side, can it be honestly denied that this nation, too, has rubbed them in the same way?

But dispassionate consideration of national issues is easier said than done, for it is not unoften that passions of the moment carry the day. The present is so much with nations as with individuals that the past and the future alike tend to be forgotten, at least for the nonce. These may sound platitudinous, but they merit reiteration if

only for the reason that India's Commonwealth association has had a past of which she need not feel ashamed and a possible future of which she may well be proud. The historic process initiated in 1949 by the British Labour Government—a process whereby the Commonwealth could function, in law as well as in fact, as a free association of an increasing number of sovereign and equal nations, whether white or black—is still on. It is a process which the British Conservative Party or at least a section of it is not able to halt in spite of its pathetic devotion to the utterly impracticable idea of the Commonwealth "as a super-state capable of pursuing a single imperial policy" and as an institution involving "personal loyalty to the Crown as a test of true membership". This idea is as dead as a dodo, and it may have a fossilised existence only in the mind of a Colonel Blimp still cherishing visions of the imperial glory that was. For, most of the Asiatic and African members (present and prospective) of the Commonwealth would not be willing to concede to Britain "the pre-eminent role of the mother country and metropolitan power of the Commonwealth."

The one difficulty which is least relevant in this context is that of sentiment on the score of the Queen being the Head of the Commonwealth. As far as Republican India is concerned, this sentimental difficulty can scarcely be exaggerated for she has accepted the Queen as the symbolic Head of the Commonwealth in the full knowledge that "no vestige or sovereignty or allegiance vests in this role of the Crown". The Crown is only a symbol of the will of the Members to remain in the Commonwealth. If India's historic decision to remain in the Commonwealth was no offence to her Republican sensibilities in 1950, is there any greater reason to suppose that her continued membership thereof is inconsistent with her Republican attitudes? After all, Her Majesty can pay a royal visit to this country only on the advice of our Government.

The real difficulties, if there are any, may lie only in the political and economic relations between India and other members of the Commonwealth. The political failure, todate, of the Commonwealth to resolve the dispute between India and Pakistan and between India and South Africa cannot be interpreted to suggest that its potentialities as a harmonising influence in international relations are exhausted. Even the United Nations to which both the disputes were duly referred, has not fared any better. Where the parties concerned cannot, of their own accord, reach a satisfactory agreement, the only hope is a body like the Commonwealth from the membership of which none of them is excluded. If India should decide to leave the Commonwealth on the ground of Britain's stand on the Kashmir issue, her secession may turn out to be more a hindrance than a help in finding a solution to the vexed problem. Patience, therefore, may have its reward ultimately while impatience may cost this country a great deal. As long as Pakistan continues to lay store by her Commonwealth association, there is all the more reason why India should continue to be in it so that the good offices of other members can be availed of for negotiation and final settlement.

Perhaps the most powerful argument in favour of the Commonwealth link is economic. Quite apart from the need for continuity in the matter of sterling area trade without prejudice to the extension of India's trade with countries outside that area, this country's currency link with sterling suggests the need for continued monetary stability which is no less necessary than political stability for attracting foreign capital for rapid industrialisation. It is well known that British capital is still leading in the matter of post-war foreign investment in India. The familiarity of British business men with the basic elements of stability in the body-politic and the body-economic of this country and the sense of security they feel in India being a member of the Commonwealth, are not negligible factors in attracting capital from other countries like the United States. In the measure that the Commonwealth link contributes to an accelerated tempo of economic growth in India, this country may well become a real force for peace and international understanding. That Mr. Nehru's proclaimed faith in the Commonwealth as the most successful example of political and economic coexistence does not appear to have diminished, is a happy augury.

Bottlenecks at the Ports

NEARLY ten years after the partition of the country concrete proof has been offered that the great damage inflicted on port facilities for the overseas trade is in the process of being repaired. The loss of Karachi to Pakistan dealt a severe blow to these basic facilities and it was obvious that it could not be compensated by expansion of Bombay and Calcutta ports which alone could provide relief to the import-export requirements of the North. The choice of Kandla as India's new major port promises to save what would otherwise have developed into a critical situation for handling the fast growing overseas traffic. There need not be any doubt that Kandla can replace Karachi, sharing on its own a part of the developing sea-borne trade and enabling the traditional major ports to share an increasing burden.

On March 3, two general cargo berths were declared open for traffic at Kandla, besides a few other facilities programmed in the project. The initial tempo of work was well maintained as reflected in the completion of preliminaries. Even the link of communications with the hinterland was created sufficiently in advance. The Kandla-Deesa metre-gauge railway line was constructed in 1952 and another alternative link with Rajasthan is under construction. Nevertheless, it can hardly be denied that the progress on the project proper has been behind schedule. The formal inauguration of Kandla port, as represented in the provision of an oil berth, was delayed until early April 1955. It is no secret that the main factor responsible for the tardy progress was the unenthusiastic handling of work by the foreign collaborating firm of construction engineers.

Speed and vigour are being injected into the task. But it would be an error to suppose that enough tempo has been gained to complete the programme according to schedule. The two cargo jetties which were opened on Sunday last have lagged behind the revised schedule by five months. Two more cargo berths are due to be opened in a few weeks hence. The next stage in development comprises two additional berths to reach the tentative target of six general cargo berths to be completed before the end of the current Plan. This most modern port of India will bear a sizable share of oil cargo in addition to heavy cargo including ores, cement and steel.

The relief which Kandla will provide for Bombay and Calcutta is not likely to remove the strain on the capacity of these ports in full. Calcutta which is the main port for exports is called upon to cope with outgoing traffic of the order of 8.0 million tons, while Bombay which is the major gateway for imports receives imports of the order of 6.2 million tons. Neither port is equipped to sustain the burden of cargo at the present level consistently with normal rates of clearance. Congestion prevails in Madras, Cochin and Vishakhapatnam ports too, although to a lesser degree than in the two premier ports. The first Five-Year Plan saw an increase of only 5 million tons in the capacity of the country's five major ports. It has now been raised to 25 million tons.

Port facilities received less than a fair share of attention in the first Plan. In fact, it would be no harsh judgment to say that they have received a raw deal. The estimate of outlay on development programmes for all the ports during the Plan was placed at Rs. 62 crores. It is difficult to be sure how far this estimate was related to planning in physical terms. Nevertheless, the fact has not been denied that details of the programme were finalised at a late stage in the Plan. Only half the expenditure envisaged in the estimated outlay was incurred, leaving an actual allocation of Rs. 14 crores unutilised. It is not implied that the entire estimated programme of projects ought to have been pushed through during the period. Some part of the projects taken in hand for execution was bound to be left over for completion in the second Plan. But the shortfall of nearly one-third in the expenditure allotted for execution of works cannot be regarded as small.

Bottlenecks at the ports recurred frequently, involving great delays in clearance of outward and inward cargo and heavier freight costs for imports. Part of these bottlenecks was due to the adamantine attitude of labour. Dock labour in India, as in other maritime countries, has proved difficult to tackle. But the situation began to take a favourable turn in the later period of the first Plan. The Vasist Committee's recommendations have been accepted by the Government and their implementation is sure to help improve handling of cargo. Piece-rates, for instance, have been introduced in Bombay reflecting larger turnover. Their extension to Calcutta and Madras is now due. But undoubtedly a worse factor contributing to accumulation of cargo is inadequacy primarily of berths and also of other types of port facilities. Incoming ships have been subjected on various occasions to inordinate delays for unloading or reloading and their turn-round has suffered in consequence. Lack of proper rail facilities for internal destinations has only aggravated the situation at the ports.

The high import content of the physical resources required for the second Plan projects and the stress on export promotion to mitigate the strain on the balance of payments have forced attention to expansion of capacity of major ports on a basis of priority. Incomplete works carried forward from the previous Plan and schemes which were not taken up for execution have claimed precedence in the present Plan. Nevertheless, great urgency is attached to major projects which must be carried through either fully or to an advanced stage of completion by the end of March 1961. Broadly, the projects include rehabilitation of the ports and mobilisation of cargo clearing equipment and facilities with emphasis on mechanisation. Calcutta, Madras and Cochin are to be provided with additional wharves and berths without which further traffic which is bound to offer cannot be catered for with speed and efficiency. The aggregate cost of the new projects as well as the backlog of the first Plan is estimated around Rs. 75 crores. The provision made in the present Plan in respect of the major ports is of the order of Rs. 40 crores, including presumably the unspent allocation of Rs. 14 crores. The gap left in the financial resources needed for the ports handling international trade is thus substantial.

The World Bank's team of technical consultants on ports is coming to this country shortly. Transport in general, and rail transport and ports in particular, threaten to raise serious bottlenecks in the execution of the development programmes. At the present moment the primary preoccupation of the Government is to find the required foreign exchange which will not be earned by our exports. The foreign exchange component of the outlay on ports has not been specifically mentioned in the Plan, but there should be no difficulty in determining its size. Mr. Eugene Black's letter referring to the technical investigation gives ample assurance that the World Bank's assistance would be available on a sufficient scale for port development. Surface transport has usually received preference in the Bank's loan policy. A welcome announcement was made this week that it is participating along with certain New York banks in the grant of a loan of $16.8 million to Air India International for the purchase of jet planes. This is an encouraging development on the eve of the arrival of its experts in this country.

Merdeka for Malaya

BRITAIN'S last major dependency in Asia, Malaya, will be independent in August. The Federation of Malaya Constitutional Commission, popularly known as the Reid Commission, which consisted of five Commonwealth jurists, from the United Kingdom, Australia, India and Pakistan, has recommended for it the creation of a "strong Federal Government". The Malayan Federation will be an independent State within the Commonwealth, but will be neither a Dominion nor a Republic. The Commission has suggested that the Federation should consist of the nine princely States of Johar, Kedah, Pahang, Perak, Perlis, Selangor, Negri Sembilan, Kelantan and Treng-

ganu and the two strait settlements of Malacca and Penange.

Malaya's Head of State (Yang di-Pertuan), who is to be elected for five years from among the present Malayan princes, is to be titular. The Parliament, the Commission has recommended, should be bicameral. Of the 33 members of the Upper House, the Senate, 22 will be elected by the Legislative Assemblies of the constituent units, the remaining to be nominated by the Head of State. It will have powers only to delay a legislative measure, but not to "kill" it. The Lower House, that is the House of Representatives, will comprise 100 members elected for a maximum of five years by single-member constituencies on a territorial basis. The federal Cabinet will be responsible to and removable by the Malayan Parliament.

The Commission has also recommended that the special privileges which are at present being enjoyed by the Malays in the matter of land revenue, educational scholarships, the issue of licences in certain business, and quotas in civil service should be retained till 1972. In that year the position should be reviewed by the Federal Parliament. The suggestion is sensible. The Chinese, being more energetic and enterprising, have been able to afford better and higher education for their children than have the Malays.

At the same time, the Commission has done well by including in the draft constitution provisions ensuring liberal grant of citizenship and franchise. This will allay the fears of the (over 2,216,105) Chinese who are afraid of being squeezed out by the politically powerful Malays. The Commission has further suggested that the new elections should be held on January 1, 1959, that is, only after all the new citizens have been properly registered and electoral rolls prepared. This may help reduce the number of those Chinese who look to Communist China for help and inspiration. The Commission has also recommended, and rightly, the continuance of the existing emergency legislation till the insurgents are completely annihilated. The Commission has, in short, tackled properly the urgent problems—by a judicious balancing of the various claims, by creating a centralized authority, and by stressing a strong policy against subversive elements.

In a note of dissent, the Pakistan member of the Commission, Mr. Justice Abdul Hamid, has suggested strongly that Islam should be declared the State religion and that a special provision should be inserted making the constitutional Head of State responsible for safeguarding the special position of Malays. Any action he might take for this purpose, the Pakistani jurist writes, should be deemed valid even if it is contrary to the provisions of State or Federal Law. He also found the recommendations regarding citizenship for non-Malays to be too liberal. If these sinister suggestions are at all accepted, the work of the Reid Commission will be frustrated in its attempt to ensure harmonious political development in a plural and multi-racial society. The reported rioting in Penang is not a good omen for the proposed constitution which can work only with mutual goodwill and co-operation.

Already, since 1948 a state of emergency has existed in Malaya as a result of the activities of Communist terrorists, nearly all of whom are immigrant Chinese. British and Malayan forces have been engaged continuously in jungle warfare to suppress terrorism. The leaders of the Federation have, therefore, done well in entering into defence arrangements under which the British will undertake to assist the Federation Government after independence in the external defence of its territory. The Federation Government in turn will confer on the British Government the right to maintain in the Federation the forces (including a Commonwealth strategic reserve) necessary for the fulfilment of Commonwealth and international obligations.

It was announced in January 1957, subject to approval by Parliament, that the British Government would provide Malaya with £20,000,000 in the period 1957-61 to defray the cost of emergency measures. Of this £9,000,000 is an outright grant. At a review in 1960 it will be determined how much of the balance of £11,000,000 the Federation will need in the two years 1960 and 1961, and whether all or part of the sum needed will be in the form of an interest-free loan. In addition, a cash grant of £7,000,000 will be made in the period 1956-61, for expansion of the Federation's armed forces, together with grant-in-aid, of equipment to the value of about £5,500,000. Certain surplus installations of British forces in the country will be freely transferred to the Federation. The British Government will also make a cash grant to the Federation of the unspent balance at the date of independence of the Federation's allocation under the United Kingdom Colonial and Welfare Acts. The balance stood at £4,400,000 on January 1, 1956, at the beginning of the Federation's current development programme.

If Malaya is able to overcome the teething troubles which usually accompany transfer of power it has almost all the requisites of economic development. Its territory which covers nearly 50,690 square miles is sparsely populated. Approximately 80 per cent of the area is under primeval jungle, mountain and swamp. Where the country is free of jungle, rubber, rice and other crops are grown. Malaya grows about two-fifths of the world's supply of rubber and together with Nigeria produces about two-fifths of the world's tin. Rubber and tin together account for about 80 per cent of the total value of exports from the Federation — about £190.5 million. Processing of rubber, tin, pineapple, and copra are the main industries, besides a number of secondary industries like cement, soap, footwear, biscuits, and soft drinks. The Federation has a development plan costing £98.5 million. Out of this amount approximately 52.2 per cent is being spent on basic services such as water, electricity, and railways, 37.7 per cent on social services, and 10.1 per cent on rural development, irrigation and drainage. Over £800,000 million was allocated to the Rural and Industrial Development Authority. But like all underdeveloped countries, Malaya too lacks capital, skilled labour and technical know-how. In respect of these essential resources of development it can surely induce foreign co-operation by adopting appropriate policies.

steel brings you the news

Yes, that paper you are reading owes its existence to steel. It is steel that helped to manufacture the paper, did the printing and even helped to collect the news that it carries. There is hardly any facet of life where steel does not play a part in one way or another.

TATA STEEL
SERVES THE NATION

Steel, today, is very much to the fore in the nation's thinking. India's steel-making capacity is being rapidly enlarged to provide a sure and solid basis for the country's advancement.

THE WEEK'S NOTES

U NU'S RETURN

U NU'S resumption of the Premiership of Burma is heartening. As one who has a notable record in ensuring internal stability, and playing a valuable role in the international sphere, he as Prime Minister should inspire fresh confidence among his people and in the free world. This change may not, however, mean any departure in the policy of the Burmese Government. For, even during U Nu's absence from office, U Ba Swe followed policies formulated during the former's stewardship.

His return is opportune for another reason also. In recent months there has been a grave danger of internal subversion in Burma. The Karen-Communist rebels have again become suddenly active; Chinese military incursions into Burmese territory have been reported; and Chinese civilians' infiltration has allegedly increased. These uncertain political conditions, coupled with the continuing economic crisis bedevilling the country since the second World War, have stood in the way of the ruling Anti-Fascist People's Freedom League fulfilling several of its promises. This failure has caused cynicism among the people and provided fruitful breeding ground for anti-social elements. It was to counteract the growing Communist influence, as evidenced in the results of last General Elections, that U Nu had resigned from Premiership in June last to devote himself wholly to the re-organization of the ruling party and to eradicate corruption from public life.

Since then, however, matters have become worse. Galloping inflation has overtaken the country; consumer goods have become scarcer; black market has thrived, and corruption has remained unabated. Besides, the Communists, who had been forced to give up violent and insurrectionary methods during U Nu's former tenure of office, have once again reverted to political gunmanism. The National Assembly's unanimous approval of U Nu's return to Premiership shows that the experience of his countrymen during his absence from office has not been happy. It also shows that U Nu has himself realized the futility of his notions of political asceticism which had goaded him to take recourse to voluntary exile—from office. One thing, however, is clear; if he now decides to take strong measures to put down Communist violence, he will have the wholehearted support of his countrymen.

But in order to save democracy in Burma, U Nu would have to overcome the economic crisis. He can save his country from being sucked into Communist orbit successfully only if the free world sheds its parochial attitude towards uncommitted countries like Burma and gives generous economic aid. After all these countries, being former colonies, cannot but be prone to be suspicious of every Western move. Due allowance will, therefore, have to be made for their susceptibility.

SWING TOWARDS LABOUR?

RESULTS OF recent by-elections in Britain must have caused the ruling Conservative Party some heart-searching. At any rate, there could have been no complacency about them. Last month, the party suffered its first defeat in a by-election since it came back to power in 1951. Allowing for the deficiencies of the Tory candidate and the presence of an Independent Loyalist, Labour's triumph at North Lewisham in turning a General Election Tory majority of 3,236 into a Labour lead of 1,100 was a great blow for the Conservatives. This week came two more wins for Labour—one from Wednesbury and another from Carmerthen (Wales). In the former, Labour defended its seat which was, of course, expected. But what was remarkable was that once again the Tory vote slumped and the drop this time was 12 per cent whereas Labour's share climbed by 1.8 per cent. The more serious blow, however, was the result of the Carmerthen by-election. Here, Lady Megan Lloyd George (daughter of the late Liberal Prime Minister of Britain, Lloyd George) who deserted the Liberal Party recently and joined Labour defeated a Liberal candidate. The striking feature was that the Liberal candidate was supported by the Conservatives in the hope that the alliance would enable Labour to be kept out of what was a traditional Liberal seat before 1955. Actually the Labour majority this time was 3,009 which was 2,500 more than in the 1955 General Election whereas the Liberal candidate polled nearly 4,000 less.

Now, what is the lesson of these by-elections which in a country like England are held in great importance as they point to a trend in popular attitude to Government policies? It is fairly obvious that in the background was the issue of the Suez 'misadventure' and its aftermath though its importance was sought to be minimised by domestic issues like housing and the rising cost of living. It may be that Labour concentrated more on domestic issues especially the Rents Bill to which there was a good deal of opposition from the tenants. (A sequel to the by-election was that the Bill has been slightly modified to make some of its features less objectionable). However, two things stand out clearly. One is that there is considerable dissatisfaction even among Conservative supporters over Government's policies and the other that there seems to be a definite swing towards Labour. A public opinion poll conducted by a Tory newspaper recently revealed that if General Elections were to be held immediately, 48½ per cent of the electorate would vote for Labour whereas the Conservatives would only get 45½ per cent. Now the question is whether the Government will go the country to seek a fresh mandate. That would depend on Mr. Macmillan as well as the outcome of the remaining three or four by-elections.

RUMBLINGS IN THAILAND

THAILAND IS not unused to a coup d'etat. But the recent attempt at one is not of the usual weekend type; it is of special significance. According to the Government communique there exists in the country "an organised group of people with foreign support who are making a move to cause subversion and finally to take control of Thailand." The emergency, it said, had been declared "to protect the constitution, the monarchy and the religion." Elucidating this later, Lt.-Gen. Surachit Chausureni, official spokesman of the Thai armed forces, said that the activities of the subversive elements first came to light in January last when there was a wave of strikes in Bangkok. Those elements evidently seem to have now taken advantage of the general dissatisfaction over the conduct of the recently-concluded general elections.

The Thai Government has refused to disclose the name of the "foreign powers" which are at the back of the subversive elements. But in view of the friendly ties between Thailand and the West, these powers can perhaps only be the Communist countries. This interpretation is reinforced by the fact that Marshal Pibul Sanggram's Seri Manangesila Party is pro-West and an ardent supporter of SEATO. Its recent electoral victory —though narrow—was not, therefore, to their liking. Moreover, the Communist powers seem to have intensified their subversive activities because Bangkok is SEATO Council's headquarters.

It is, however, highly regrettable that the Thai Government should have deemed it fit to seek "co-operation" of the members of SEATO to smash the plot. Even such friendly co-operation is likely to be mis-construed by the anti-West elements among the Afro-Asians who have not as yet forgotten their colonial past. Another reason why the recent developments is to be regretted is that democracy in Thailand is likely to receive a set-back as a consequence of it. It has, however, to be remembered that it is the denial of democracy that often results in strengthening Communism and not vice versa.

In fairness, the introduction of limited democracy in the country was the work of Marshal Pibul Sanggram and not due to any popular struggle. In truth, Thai masses are as yet politically apathetic and there are traditions of "strong men's rule" in that country. The only relieving feature in this bleak situation is that the Sanggram Government has not resorted to indiscriminate arrests or to a reign of terror. On the other hand, it has publicly proclaimed that no one would be arrested unless there was 'prima facie' case against him, or unless the situation deteriorated. The appointment of a commission to go into allegations of the Opposition regarding malpractices in the conduct of the general elections is also welcome.

UNIVERSITY AUTONOMY

DR. JOHN MATHAI'S thesis that the entire system of making Governors of States as Chancellors of Universities be ended, deserves to be seriously considered. The criticism should not be dismissed as an expression of discontent by a vice-chancellor. It is in no way a reflection on the competence of the Governors. Under the present system, as constitutional heads the Governors have to act on the advice of the Ministers, and this leaves room for political influence to trickle into the University administration. As a vice-Chancellor of the Bombay University Dr. John Mathai has had a sad experience. Throughout the tenure of his office he had to switch on from the Chancellor to the Ministers and back again to the Chancellor. All along it implied the old tradition of grudgingly conceding autonomy to the Universities, which was resented by Dr. Mathai. There can be no two opinions that the system is out-moded and needs to be discarded. Not only is it a source of friction but is also a cause of embarrassment to the Governors as Chancellors in relation to the Universities.

The occasion of Dr. Mathai's remarks was a Senate discussion on an item referring to a letter dated January 5, 1956 from the Secretary to the Governor of Bombay suggesting that an age limit of 60 years be fixed for the post of the Rector. The Senate's reason for not accepting the age limit was that the relevant Statute as passed by the Syndicate on August 17, 1955 did not contain any age limit and that, therefore, the Senate did not see any ground for modifying this decision. Secondly, the Senate did not think that the appointment of the Rector could be treated on the same footing as the post of the University Teacher or Registrar, since the Rector's appointment was a tenure appointment for a fixed period of five years.

The principle that Dr. John Mathai upholds is unexceptionable. Over three years ago, the Congress Working Committee in a resolution on the educational system, condemned the intrusion of politics in the academic atmosphere of universities. Therefore, there is nothing wrong in demanding that Universities should not be permitted to suffer the activities of politicians. It would indeed be to the credit of the Government if it allowed universities to manage their own affairs. The alien government wanted to keep universities under its control, so it arranged for the Governors to be Chancellors. A national government such as ours may have everything to gain from a possible state of affairs in which universities function as free institutions in a free society.

SOBER COUNSEL

MR. HOMI MODY, in his recent address to the Employers' Federation of India as its President, has done well in focussing attention on the serious implications in regard to Labour's claim for increased wages. The campaign for a 25 per cent increase in wages initiated by the Labour Unions affiliated to the INTUC is certainly a matter for serious concern especially in the context of reports that the Union Minister of Labour has given his blessings to this move. The argument is that the increase is essential to "enthuse workers in fulfilling their onerous responsibilities in implementing the second Plan and in the interest of industrial peace". Mr. Mody has rightly contended that nobody would deny the workers' due share but higher wages must be related to productivity and the profits of the industry. It is a bit odd that when it has been decided to set up Wage Boards for different industries to go into these issues carefully (so that both Labour and Management may have opportunities to present their case fully) there is a campaign for rushing to a hasty decision that is bound to affect vitally the whole range of industry.

Mr. Mody also drew attention to the fact that apart from the agitation for an 'ad hoc' increase in the basic wage, there had been other proposals to add to labour costs. Here he instanced the increase in the employers' contribution to the Employees' State Insurance Scheme from 1¼ per cent to 3½ per cent of the total wage bill and an increase in the rate of contribution by employers to the statutory Provident Fund from 6¼ per cent to 8-1/3 per cent of the wages including dearness allowance. In the solicitude that Government seems to bestow on a section of the community, there is a total disregard of the effects they are likely to have on the industry and the consumer alike. The recent increases in wages granted by the Appellate Tribunal to the coal miners and the announcement of a new deal for a section of Railway Labour have already started a chain reaction. Will Government step in to cry a halt to this trend which may not only have adverse effects on the economy but also lead to social discontent among the less favoured sections of society?

AN ELECTION PROMISE

MR. PRATAP SINGH KAIRON, Chief Minister of Punjab, is reported to have made an astounding promise at an election meeting last week. The promise was that "education up to matric would be made compulsory and free in Punjab within the next two years". Mr. Kairon, like other Congress leaders who have recently exceeded the limits set by their own party manifesto, does not appear to have thought twice before making such a rash promise. In any case he had no need to do so, for the early stage of elections in his State had clearly pointed to a massive victory for the Congress Party.

If Mr. Kairon had confined his promise to education up to, say, the 6th or the 7th standard, he might have sounded realistic and practical. As a matter of fact, a modest promise of the kind would have been partly in consonance with Article 45 of the Constitution in its Directive Principles of State Policy. This Article, which is not mandatory, merely states that "the State shall endeavour to provide, within a period of ten years from the commencement of this Constitution, for free and compulsory education for all children until they complete the age of fourteen years". Seven years have rolled by since the Constitution came into force. It may well be a great achievement if Mr. Kairon could find the necessary resources in money and in teaching manpower for free and compulsory education up to the 6th or the 7th standard in his State which has a deplorably low literacy percentage.

what the eye doesn't see...

There are some things you don't see disappearing. You don't see the loss of heat from a badly-insulated steam pipe—but you see the bills, because heat costs money. So it is well worth having your steam systems properly insulated. The best insulating medium for this purpose is undoubtedly Newalls 85% Magnesia, produced by our associates Newalls Insulation Co. Ltd. But it's not just a good product we have to offer... we can offer free technical advice on any insulation problem. Heat or cold insulation is a science. Our highly trained staff can advise you exactly on the thickness to which insulation material should be applied. Too little or too much insulation means less economy—and it is our job to save you money. Practically every industry uses asbestos in one form or another. In our new factory at Ghatkopar, we make a wide range of technical asbestos goods to satisfy the varying needs of India's economy. **The increasing use of Asbestos is an index to India's industrial progress.**

Where There's Industry There's Asbestos

A Window on the World

SHOULD INDIA QUIT THE COMMONWEALTH?

By

ODYSSEUS

SHOULD INDIA QUIT the Commonwealth?

In view of the profound disagreement with the UK revealed over Suez and over Kashmir, there are those who urge that India should quit at once.

The suggestion that any member of the Commonwealth should quit because of serious disagreement with the UK implies, I submit, a misunderstanding of the UK's position in the Commonwealth. As Mr. Graham Spry (who will be remembered as Personal Assistant to the late Sir Stafford Cripps, with whom he visited India in 1942, and who is now Agent General in London for the Canadian Province of Saskatchewan) argued—in a remarkable talk entitled "Canada, the UN Emergency force and the Commonwealth," given recently before the English Speaking Union—to quit the Commonwealth because of a disagreement of policy with the UK is to assume that the Commonwealth is an exclusive association with a single foreign policy formulated by Britain, or that the Commonwealth belongs to Britain rather than Britain to the Commonwealth, or that Commonwealth loyalty is loyalty to Britain rather than loyalty to the Commonwealth.

Mr. Spry (who is a Canadian) pointed out that the standard of Commonwealth unity is not central authority or uniformity, or exclusiveness, but is to be found in the degree of co-operation that can be secured among an association of communities with national and international objectives, concerned to work out among themselves, and no less with others, practical compromises on particular, concrete problems. Basing himself on this definition Mr. Spry dramatically and resoundingly claimed that the Commonwealth abundantly justified itself by making the major contribution to the solution of the Suez crisis in November, 1956.

Disagreement over Suez there was but not disruption. "On the contrary," declared Mr. Spry, "though each member responded according to its own interests and convictions, as in free countries must be expected, as must under British constitutions even be desired, there was evident a notable will to save the situation and to use the vast measure of common understanding for common objectives."

TWO ALMOST DISASTROUS FAILURES

At the same time, Mr. Spry said, there were, prior to Suez, "two sorry, almost disastrous failures. For both failures all of us in the Commonwealth bear our full share of responsibility."

The first was the failure of the nations of the Commonwealth to understand, and to act decisively together, on the dangers that had been mounting in the Middle East, an area of vital strategic and commercial significance to the UK, India, Pakistan, Ceylon, Malaya, Australia, New Zealand and South Africa, as well as to the rest of South East Asia, Western Europe, Canada, and the USA. One result of this failure was the inability of the Commonwealth nations to convey to the USA what the Middle East means to all of us, and indeed, should mean to the USA. "In this failure", declared Mr. Spry, "the USA fully, grievously, vastly shared. The US Vice-president and the Canadian Foreign Secretary have both said precisely this."

The second failure was the UK's failure to advance its ends by working in a coalition. In the classical definition of Sir Eyre Crowe, Permanent Under Secretary to the Foreign Office in 1914, Britain, in seeking and defending her particular national interests, should ensure that her "national policy . . . is so directed as to harmonise with the general desires and ideals common to all mankind and, more particularly, that it is closely identified with the primary and vital interests of a majority, or as many as possible, of other nations."

Commenting on this, Mr. Spry said that the Anglo-French ultimatum to Egypt and Israel was doubtless conceived as serving common interests far beyond those of Britain and France alone. Moreover, the dangers were urgent and the provocation great. Extenuating circumstances existed. But this policy contradicted the basic British doctrine of acting in coalition, and for a few days in November, 1956, it threatened to assemble against Britain the most powerful coalition in all her history.

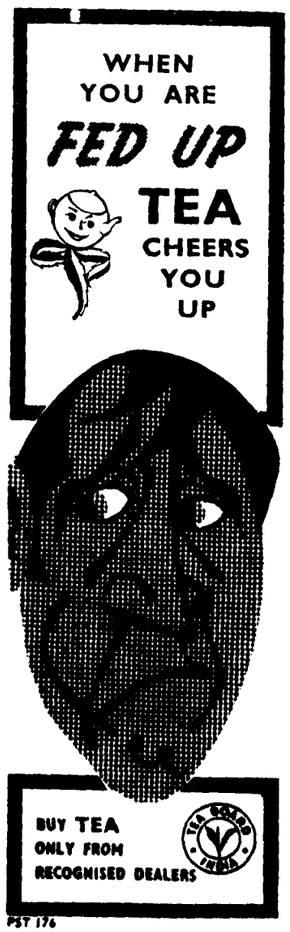
This, I submit, would have been catastrophic, not merely for Britain but for the Commonwealth and the whole free world, because sudden and violent changes in the balance of power heave the world around like an earthquake and benefit no one. Change is unavoidable and necessary for progress, but it should be evolutionary.

Catastrophe was avoided by the Commonwealth initiative of Canada, India, Pakistan, and Ceylon who, believing that Britain's policy was wrong, disagreed frankly, and sought to revise it sharply. In this they were acting in accordance with the objectives, spirit, and interests of the Commonwealth association and (as Mr. Spry pointed out) "as friends of Britain." The policy was revised. The revision was made readily by Britain herself. It was honourably facilitated by the UN Assembly and by the road out of the impasse suggested by old and new members of the Commonwealth.

On November 1, the USA introduced a resolution in the UN calling for a Cease-fire which was passed by 64 votes to 5, with 7 abstentions. Mr. Pearson, the Canadian Foreign Secretary, criticised the US resolution on the ground that it was inadequate because "peace is far more than ceasing fire". The US resolution did nothing to solve the problems that beset the Middle East. A cease fire was a preliminary step, not a solution. Mr. Dulles immediately endorsed Mr. Pearson's suggestion for a UN force. It is to be inferred from a speech of Mr. Pearson's that his UN force suggestion had earlier been approved by India and others in private discussion.

In the event, the policy initiated by Canada carried the day. It was the only policy which—as distinguished from recommendations of unilateral national action, of appeals for withdrawals, and of

setting up study groups—proposed physical intervention under the charter and the use of the concerted will of the UN members.



DAMNING CRITICISM

The essential principle underlying Canada's policy is that of the coalition, as developed over the centuries by British experience. The damning criticism that can be made of the British action in Suez was that it was in complete contradiction of the whole of British historical experience. The instrument for carrying out the policy initiated by Canada is the United Nations. The policy could not have been carried out by the Commonwealth alone. The Commonwealth is not an exclusive association. Each of its members has its own other outside relationships and interests—inherent in geography, religion, race, and commerce. The Commonwealth is not equipped to function as a third world force, but it is powerful and cohesive enough to help lead, and to shape, world relationships towards peace.

Canada's policy expressed a Commonwealth approach to a crisis. The whole Commonwealth united behind it. The UK first suggested UN action, and Canada, finally supported by every other member of the Commonwealth, proposed the police force. The UN Advisory Committee of Seven has four Commonwealth members—Ceylon, India, Pakistan, and Canada. The commander of the force is a Canadian. The fabric of the force is pre-dominantly Canadian and Indian. The signals, engineers, and air transport are largely Canadian. Of the 6,000 men drawn from ten countries and five continents, some 2,000 are Canadians, and 1,200 are Indians.

You might, of course, argue that if Canada and India had not belonged to the Commonwealth they would have acted in the same way in pursuit of their own national interests and of the common good. I would not deny this. But the special relations nourished by the constant exchange of diplomatic, economic, commercial, educational, and social information that goes on between them all the time, as between all Commonwealth countries, creates an ease of association, a familiarity with each other's viewpoints and likely reactions, and a team spirit born out of the friendships, intimacies, and daily personal contacts that go on between Commonwealth staffs in all the capitals of the world—all this enables each individual Commonwealth member to exercise far greater influence directly on Commonwealth policies, and therefore, indirectly on world affairs, than any one of these individuals could hope to exercise alone. The sincerity of the aims and motives of Canada and India on their joint action over Suez are not questioned in Britain. It is recognised that they were acting (as Mr. Spry said) "as friends of Britain". Any who may feel inclined to question the UK's sincerity and motives over the Kashmir quarrel might bear this in mind.

To talk of quitting the Commonwealth when one disagrees with the policy of another member is to cut off one's nose to spite one's face. One's power to exercise one's influence to modify the policy that one dislikes would be substantially decreased, and one's power to secure support for one's own policies handicapped. Commonwealth diplomats and government servants know this. What has to some extent hitherto prevented the general public from grasping it has been a hangover from decades long gone by in which the UK was regarded as the controlling member. If the Suez crisis shows that the Commonwealth does not belong to the UK, but the UK to the Commonwealth, and that the loyalty of all individual members, is not to the UK but to the Commonwealth, it will have had at least one useful by-product.

DANGER IN GERMANY

(From Our Special West European Correspondent)

PARIS, March 2.

FOR both Germanies, East and West, the coming summer will be a time of serious political tension and possibly worse. The NATO authorities have plans ready for the deployment of non-German troops along the border between the two states at the first sign of serious unrest in East Germany, and it would be a reasonable supposition that the Russians on their side have similar precautions in mind. A repetition of the Hungarian revolt in East Germany would have much more grave consequences if it threatened to involve the West Germans, who would almost certainly move to the assistance of their kin and neighbours. That is why an outbreak in the East would have to be hermetically sealed off; both sides are tacitly agreed on that.

The question is not academic, for all the materials of revolution exist today in East Germany. It is only the 22 Soviet divisions that are keeping 16 million East Germans quiet. But the position of the Communist regime is becoming more insecure, for reasons directly connected with the anti-Soviet revolutions in Poland and Hungary, and these difficulties will probably reach a peak in the summer, just when political passions in West Germany are at a peak during the election campaign. The West German elections are to take place in the autumn and there has already begun what promises to be a long, violent and demagogic electoral battle in which naturally the dominating issue will be German reunification. And while reunification is being passionately discussed in the West, just across the border the economic difficulties of the Communist regime will be deepening. This situation, while not necessarily explosive, is obviously uncomfortable.

The difficulties of the Communist puppet government of Pankow arise from the fact that it can no longer rely on the economic support of the neighbouring Communist governments in Poland and Hungary. Ever since the East Berlin workers' revolt in midsummer 1953, the Ulbricht regime and its Russian masters have been making a serious effort to improve the economic condition of the East German workers, while continuing a policy of ruthless repression against the intellectuals and middle classes. This programme had met with some success, and, as living conditions improved somewhat, the East German workers, though far from content, showed no willingness to repeat the adventure of June 1953; this was why they lay low during the anti-Soviet disturbances in Poland and the revolution in Hungary. But this improvement in East German conditions was being achieved at the expense of its Communist neighbours, and indeed it was precisely this fact that brought on the revolutions in Poland and Hungary, where economic conditions were being screwed down by the Russians in order to keep the East Germans quiet. The first result of the troubles in Poland and Hungary was to put an end to this subsidisation of the Pankow regime, whose future is, therefore, once again in jeopardy.

The Poles had been obliged to supply coal at ridiculously low prices to the East Germans, but since Mr. Gomulka came to power these deliveries have fallen from a rate of seven million tons a year to about two million tons. The fuel shortage has undermined all East German industry and forced the Pankov regime to abandon its five-year Plan. The abandonment of the Plan has been passed off by the government as a return to a more liberal economic system, but this attempt to make a virtue of necessity cannot disguise the fact that production is threatened. The Hungarians had been obliged by the Russians to supply agricultural produce to the East Germans at similarly low prices, and it was this forced surrender of a large part of the country's foodstuffs that drove the Hungarians to revolt. Since the uprising, deliveries of Hungarian produce to East Germany have virtually ceased, and it was the cessation of requisitioning that explained why there was no famine in Hungary after the civil war — the country was actually better fed despite the ravages of war than when it had to sacrifice its food to the East Germans.

Thus the Ulbricht regime has lost two of its three main props; the only one that remains is the 22 Soviet divisions. Admittedly these constitute a pretty substantial prop, especially perhaps in East Germany where in 1953 the workers had a taste of what Russian repression means. But conditions have changed since 1953, for in the event of an open clash between 16 million East Germans and the 22 Soviet divisions the former would now have as allies or benevolent neutrals nine million anti-Soviet Hungarians, 25 million neutral but friendly Poles and 49 million West Germans whose behaviour in such a situation is unpredictable. The dangers are increased, not reduced, by the fact that the Pankow government is obliged to continue the cautious process of destalinisation it had initiated before the Hungarian troubles. It is openly admitted by the regime that there is dissatisfaction among the East German students and that there has been a penetration of "bourgeois ideology" among the intellectuals and among the party rank and file; one has no wish to exaggerate the importance of these signs of discontent, but one is the less inclined to under-estimate them for having missed their significance in Hungary last summer.

The grave embarrassments of the East German regime cause no satisfaction in West Germany, where the immediate future is regarded with frank anxiety. The readiness of Moscow to intervene in the West German electoral debate by offering reunification terms which, although mere propaganda, help the cause of the left-wing opposition, is seen as especially dangerous. This summer's election campaign in West Germany is going to be an eventful one, for the diplomacy of the great powers will be directed toward favouring one party against another, and thus we can expect to see some reckless offers and promises made.

The Adenauer coalition in Bonn has based its whole policy on the support of the NATO alliance, and its main anxiety is that no weakening of this alliance takes place this summer, and in particular that no Western troops are withdrawn from West German soil. In a sense, and for very different reasons, Adenauer is as keen to see Western troops remain in Germany as Ulbricht is to see the 22 Soviet divisions remain there. Yet West Germany's allies are hoping to get their troops out of Germany. France, indeed, has already got most of hers out, to fight the war in Algeria. Britain has just made an attempt to reduce her military commitments in West Germany because of the intolerable burden these impose on her economy; under combined West German and American pressure Britain has had to postpone this reduction, at least until after next autumn's elections. It is no secret that some of Pre-

sident Eisenhower's advisers favour a similar reduction or withdrawal of American troops. This was the supposed content of the famous Radford plan, which caused such an angry reaction from Adenauer that it had to be disowned in Washington. It was also the main idea of Mr. Stassen during his stormy term as "disarmament minister". So far the U.S. Administration has rejected all such suggestions, mainly out of loyalty to Adenauer, but this line of thought still represents an influential section of American opinion.

The Western desire to withdraw troops from West Germany does not stem from disinterest in German reunification. It comes rather from the realisation that the presence of Russian and Western troops in Germany increases the danger of an "accidental" war, does nothing to further German reunification and moreover would have no influence on the course of an eventual war because that would be decided not by land troops but by atomic missiles. For the Government in Bonn, however, the actual, physical presence of Western troops is necessary not because such troops would decide a possible armed conflict but because their involvement would guarantee the continued interest of the Western allies. Once an issue can be settled by atomic weapons and only by atomic weapons, there is no guarantee that the greatest friend and ally will choose to run the risk of suicide by intervening; the automatic involvement of that ally's own men is the only surety against the desertion that the Hungarians have just suffered at the hands of the West.

If this line of reasoning seems excessively cynical, the West Germans can reply that it is after all exactly the reasoning of the British and French today. London and Paris have realised, after Hungary and Suez, that without for a moment questioning American good faith it is nevertheless true that faced with the choice between deserting an ally and plunging the world in a suicidal atomic war, the Americans would at least be entitled to hesitate — and in that moment of hesitation, the fate of Britain and France would have been decided by Russian missiles. That is why West Europe is no longer able to rely on the blanket protection of American atomic power, but must seek to have its own atomic weapons. It seems likely today that a country will choose to use the "absolute weapon" only when its very own security is directly and instantly involved — from which it follows logically that for total security it must possess such weapons itself. Hence the voyage of Mr. Duncan Sandys to the USA to get missiles that the British will be able to shoot off without waiting for American approval; hence too France's decision to press ahead with the manufacture of its own bomb. This insurance is denied to the West Germans, who are prohibited by treaty from manufacturing atomic weapons; so their only surety is to retain as many American, British and French troops on their soil as possible.

The upshot is that although the presence of Russian and Western troops in Germany is the main obstacle to German reunification, both the East and West Germans have to insist on the presence of those troops. Without the Russian troops, the East German regime would collapse; without the Western troops, the Bonn government would have no guarantee that reunification would not take the form of incorporation into the Communist bloc, by force if necessary. The stalemate seems total. But it is just when problems seem most insoluble that they receive a solution, for both sides realise the vanity of persisting in hopeless courses. So the coming year in Germany is fraught with danger but for the same reason it contains a hope too; the hope of an overall settlement as soon as Russia and the West admit that the dangers each side is faced with in Germany are too great to be tolerated.

the detection of
the threat of disease...
...in time

X-Rays are an indispensable adjunct to modern medical practice. With the help of X-Rays the presence of disease or illness is detected, its nature and extent assessed instantly and exactly. Treatment then becomes more definite and direct, cure more certain and rapid.

Today the eyes of X-Ray watch over the health of the nation. They probe and seek for signs of illness and infection, give warning to doctors to mobilise the means of meeting and overcoming the threat of disease as it appears.

Philips take pride in the fact that many of Philips X-Ray units are helping to cope with this great task in many parts of India. These units, already installed in hospitals and clinics, are giving true and valued service in the constant fight against disease and illness.

PHILIPS SALES AND SERVICE GO HAND-IN-HAND

Oil from abroad costs valuable foreign exchange. Oil from inside India saves it. And we must have ever-increasing quantities to cope with the expansion of industry and agriculture.

Scientists and engineers are keeping Assam's oil industry working at full pressure to produce as much oil as possible from our own oilfields. Additional wells are constantly being drilled, yet even in an established area they are not always productive; in spite of modern knowledge and equipment, successful drilling still remains something of a gamble.

But no effort is spared to find oil and turn it into the fuel, lubricants and by-products which are so vital to the progress and prosperity of India.

WORLDGRAM

AGRICULTURE

Grow More Food Programme: Schemes costing Rs. 67.77 lakhs under the Grow More Food programme for Kerala State during 1957-58 were sanctioned at the joint meeting held recently between the representatives of the Union Ministry of Agriculture, Planning Commission, Union Ministry of Finance and the Ministry of Community Development. The total ceiling fixed by the Planning Commission for the Grow More Food schemes of Kerala State for 1957-58 is Rs. 71.09 lakhs. The Central share of assistance to the schemes so far approved amounts to Rs. 47.18 lakhs as loan and Rs. 10.40 lakhs as grant making a total of Rs. 57.58 lakhs to which the State will contribute Rs. 9.79 lakhs. This makes a total layout of Rs. 67.37 for the State's Grow More Food scheme on the basis of present sanctions.

*

Improvement of Cattle in India: Planning of cattle development schemes on long-term basis, establishment of separate Animal Husbandry Departments in States, production of better cattle breeds and discouragement of the industrial use of cattle feeds and fodder resources were some of the important suggestions that emerged from the annual general meeting of the Central Council of Gosamvardhana held recently. Other suggestions which the Council made related to increasing the fee for cattle impounding under the cattle Tress Pass Act, establishment of Gharmalayas for the economic utilization of dead animals, controlled grazing of forest lands and discouraging the use of oilcakes for manurial purposes through educative propaganda. The Council also pleaded for undertaking schemes for salvage of dry cattle and supply of fodder seeds and cuttings on subsidised rates.

INDUSTRY

Standard Specification for Sodium Nitrite: The Indian Standard Institution has published an Indian standard specification for sodium nitrite, technical. This standard prescribes the requirements and the methods of test for sodium nitrite, technical. Copies of this standard are now available for sale from the Indian Standards Institution, 19 University Road, Delhi-8, and its branch offices at P-11 Mission Row Extension, Calcutta, and at 40/40A Cowasji Patel Street, Fort, Bombay.

*

Rivet Bars for Structural Purposes: The Indian Standards Institution has issued, for eliciting comments, a draft Indian standard specification for rivet bars for structural purposes. The requirements for this material had been covered hitherto by the Indian standard specification for structural steel (IS: 226-1955). The Committee responsible for this standard felt that the provisions applicable to rivet bars should be excluded from IS: 226-1955 and issued as a separate specification. The draft, therefore, prescribes requirements for rivet bars for structural purposes made from plain carbon steel. The standard has been divided into two parts; part I covers clauses on general requirements while part II includes clauses on specific requirements such chemical composition tolerances, etc. All values appearing in this draft are given in metric units. In order to help the industry to familiarize itself with the metric system, equivalents in the inch system are also given.

*

Conversion from Inches to Millimetres: The Indian Standards Institution has published an Indian standard guide for inter conversion of values from one system of units to another. This standard is intended to serve as a guide in converting numerical values of physical quantities from one system of units of measurement to another system of units. The Standard guide puts forth the Indian standard procedure, which is general enough for use in the inter-conversion of all quantities from one set of units to any other. It also discusses in some details the significance of stated values and shows how to assess their significance for the purpose of conversion. It lays down a standard practice for stating and specifying values, so as to make their significance self-evident beyond doubt and not subject to different interpretations.

TRADE

More Coffee Released for Export: The production of coffee of the 1956-57 crop is estimated at 37,800 tons. After providing for consumption in the internal market during 1957 and for a suitable carry-over for 1958, the Government of India have decided to allocate 11,050 tons for export out of the 1956-57 crop. As an allocation of 7,900 tons was announced earlier, an additional quantity of 3,150 tons of coffee is now made available for export.

*

New UK Trade Agreement with Japan: Britain signed a new trade agreement with Japan recently. The agreement marks the conclusion of negotiations which began on October 1, 1956, between delegations of the two countries. Financial and trade questions of common concern were discussed. The new arrangements with Japan, says a Board of Trade announcement, cover a period of one year ending September 30, 1957, and provide for import facilities and related matters between Japan, on the one hand, and the United Kingdom and its dependent territories, on the other. The arrangements maintain, with very minor exceptions, all the trade quotas previously available to United Kingdom exporters. The previous trade quotas available to Japan have been maintained, with increases in value in a few cases. The arrangements allow for some small relaxations in restrictions on Japanese imports, while additional facilities have also been obtained for UK trade with Japan.

FINANCE

Aid for Road Development: Sums totalling Rs. 28,92,827 have been sanctioned by Government of India for road development works in Tripura and Pondicherry. Of these, a sum of Rs. 27,54,127 is for road development work in Tripura. The amount sanctioned for Tripura covers three development items: Rs. 22,00,300 for the improvement of Udaipur-Sabroom from Matabari to the 26th mile post; Rs. 5,46,300 for the construction of Kailashahar-Kumarghat Road; and Rs. 7,527 for survey operation in connection with the opening out of the Kailashahar-Kumarghat Road in Tripura. For the improvement of the Cuddalore Road in Pondicherry State, the sum sanctioned is Rs. 1,38,700. Government of India have given technical approval for the development and improvement of Kandalpur-Machgaon Road from miles 16½ to 31½ (excluding bridges) in the district of Cuttack at an estimated cost of Rs. 22,64,000. Technical approval has also been given for the widening of the existing 12-ft. road to 24-ft. width of the Simla-Nahan-Paonta-Dehra Dun Road from the 68th to 73rd mile in Himachal Pradesh at an estimated cost of Rs. 4,65,100.

Financial Assistance to Village Industries: Financial assistance in the form of grants and loans amounting to Rs. 3,22,815 has been sanctioned by the Ministry of Production to State schemes for development of hand-pounding of rice and bee-keeping and for promotion of the pottery industry. Uttar Pradesh has received two grants—one of Rs. 12,600 for a scheme for hand-pounding of rice and the other of Rs. 30,215 for a scheme for bee-keeping in Almora. For the development of pottery industry on an intensive basis, through co-operative societies, registered bodies or statutory State boards a grant of Rs. 1,40,000 and a loan of a similar amount, have been sanctioned by the Ministry, to be utilised by the Chairman of All-India Khadi and Village Industries Board for setting up and working model pottery centres. The Ministry has also released a further sum of Rs. 5,00,000 out of a total of Rs. 18,00,000 sanctioned to the All-India Khadi and Village Industries Board as loan for development of hand-pounding of rice industry. Thus the total amount released for the purpose during the year 1956-57 comes to Rs. 13 lakhs.

*

Central and State Government Loans: Government Promissory Notes of the following Loans enfaced for payment of interest at Delhi and New Delhi, interest on which falls due for payment during March, 1957, will now be accepted by the Public Debt Office, Reserve Bank of India, New Delhi for payment of interest to facilitate delivery of their securities and interest warrants on the due dates.

Central Government Loans

3 per cent Conversion Loan 1946

4 per cent Loan 1960-70

2¾ per cent Loan 1976

State Government Loan

3 per cent Loan 1960

2¾ per cent Loan 1961

3½ per cent Loan 1962

4 per cent Loan 1967

4 per cent Loan 1968

Holders of the above loans are advised to lodge their securities well in advance of the due dates. In view of the heavy work involved, the period for delivering securities tendered for payment of interest will be extended to six clear working days.

*

Company Formation in Northern Zone: Three public companies with an authorised capital of Rs. 4,15,00,000 and Rs. 2,51,20,000 respectively, were incorporated during the month of January 1957, in the Northern Region consisting of Delhi, Punjab, Rajasthan Uttar Pradesh. Of these, one public company and two private companies were registered with an authorised capital of more than Rs. 10 lakhs.

one public company, having an authorised capital of Rs. 1,00,00,000 and seven private companies, having an authorised capital of Rs. 28,90,000 went into liquidation during the period under review.

Low-Income Group Housing Grants: During January, 1957, the Government of India sanctioned loans amounting to Rs. 17,349 lakhs to Assam and Madras under the Low-Income Group Housing Scheme. Assam was given a sum of Rs. 10.13 lakhs and Madras Rs. 7.219 lakhs. The total amount of loans sanctioned to various State Governments, since the inception of the scheme in November, 1954, is Rs. 1,361,649 lakhs.

*

Double Income-Tax Relief between India and Ceylon: According to Article II of the Agreement for Relief from or avoidance of Double Taxation of income between the Government of India and the Government of Ceylon, double income-tax relief for the assessment years 1950-51 and 1951-52 should be computed as if the provisions of the Income-tax (Double Taxation Relief) (Ceylon) Rules, 1942 applied. The time limit for filing the claims for the double income-tax relief for the assessment year 1950-51 expired on March 31, 1955. However, as all the formalities for giving effect to the aforesaid agreement were completed only in the first week of February, 1957, it has been decided to extend till March 31, 1957, the time limit for entertaining claims for double income-tax relief for the assessment year 1950-51. Instructions already exist for admitting similar claims for the assessment year 1951-52 if made before March 31, 1957.

GENERAL

US Assistance for Geological Survey of India: The Government of India and the United States recently signed two supplementary project agreements that will provide $500,000 of development assistance funds for help in the current Geological Survey of India and $102,000 of technical assistance funds for financing the work of the heavy equipment training centres at Kotah and Nagarjunasagar. The additional photogrammetric equipment to be purchased with the development assistance funds will allow production of large-scale maps required for projects under the second Five-Year Plan in such fields as Railway Valley Development, Natural Resources, Exploration, Flood Control, Road and Railway Construction, Land Reclamation and general urban and countryside development. The Government of India will provide inland transportation and local expenses for the imported items of equipment and the establishment charges.

*

Production of Fertilisers and By-Products at Sindri: A total quantity of 7,576.86 tons of ammonia and 27,927 tons of sulphate were produced in the Sindri Fertilisers and Chemicals (Private) Ltd., during the month of January, 1957. During the same period 2,25,38,600 K.W.H. of electric energy was generated.

In the Coke Oven plant, 19,535.02 tons of coke and 1182.40 tons of coal tar were produced during the month. Other products manufactured in the factory were motor benzol 20,307 tons; pure benzone 7,142 gallons, pure toluene 3,517 gallons and solvent naptha 2,300 gallons.

During the month of January, 24,828.67 tons of ammonium sulphate, 1,203.62 tons of coal tar, 25,000 tons of coke, 5,200 gallons of motor benzol, 2,850 gallons of light solvent naptha and 1,350 gallons of pure toluene were sold.

The entire quantity of electricity generated in the power plant was consumed in the factory itself.

NEWS IN BRIEF

INDIAN

It is reported various policy decisions and administrative steps have been taken by the Union Government in connection with the formulation of what is described as a comprehensive "manpower budget" for the country.

*

The Indian Government has decided to set up a wholly State-owned Export Risks Insurance Corporation with an authorised capital of Rs. 50 million, 10 per cent of which will be paid up.

*

After a continuous increase for three years, iron ore production received a slight setback during 1956 and totalled 4,237,000 tons, compared with 4,260,000 tons in the previous year.

*

A pilot scheme to help the educated unemployed enter into avenues of employment other than 'white collar' jobs has been sanctioned by the Government of India. Under the scheme, four work and orientation centres will be set up in the country, one each in the States of Kerala, Delhi, West Bengal and Uttar Pradesh.

*

An eleven member Committee to devise methods for popularising discoveries of science and creating science mindedness in the country has been set up by the Council of Scientific and Industrial Research.

*

The President has given his assent to the Madras Inams (Assessment) Bill, 1956, and the Madras District Collectors Powers (Delegation) Bill 1956.

*

The Leipzig Spring Fair will take place from the 3rd March to 14th March. India will be represented by an information booth of the Ministry of Commerce and Consumer Industries and private exhibition stalls.

*

There are 119 woollen mills functioning in India with 3,950 powerlooms and 157,064 spindles (61,032 woollen and 96,032 worsted).

*

According to the Indian Sugar Mills' Association, the sugar production during the month of January, 1957 was 3,64,216 tons, bringing the total production during the first three months of the season 1956-57 to 8,16,399 tons. The corresponding figures during the last season were 3,55,000 tons and 7,12,000 tons respectively.

*

India's export earnings from cloth exports in 1954 were Rs. 66.93 crores, they declined to Rs. 57.76 crores in 1955. During the first eleven months of 1956 the estimate of these earnings is Rs. 51.56 crores—a fall of 23 per cent since 1954.

*

The Indian Government will shortly buy from Japan $734 million (Rs. 349.36 crores) worth of Nipponese light and heavy machinery and industrial plants. This will include railway rolling stock, textile equipment, machinery for aluminium refining and sugar refining plants, machinery for chemical fibre and cement production. In return India will supply part of the steel which Japan will require for her automobile plant at Djakarta in Indonesia.

FOREIGN

Eleven major UK banks have decided to adopt a nation-wide system for automation in banking. This decision has been reached by the Committee of London clearing Bankers.

*

It is reported a group of engineers representing Siderurgia National, the Portuguese steel company, will visit Britain shortly to examine steel plants there.

*

A preliminary two-year agreement between Swedish employees and the Confederation of Trade Unions concluded recently provides for a 2 per cent wage increase this year and 2½ per cent in 1958, when the working week will be reduced from 48 to 47 hours.

*

A survey of machinery installed in the world's spinning mills compiled by the International cotton Federation shows a total of 131.34 million spindles at July 31, 1956 compared with 129.48 million a year earlier.

*

World wheat production for the current crop year of 1956-57 is likely to be about 121 million metric tons some two million tons below the production for 1955-56.

*

The World Bank is sending a mission to Argentina at the request of the Argentina Government to study the general economic situation and the Governments' investment plans.

*

General Motors Corporation has disclosed that the average hourly wages of its employees in the United States hit a record of $2.48 in 1956.

*

World's leading manufacturers of agricultural machinery will display their latest products in the international show of agricultural machinery held in Paris from 5th to 10th March, 1957.

*

The number of foreigners registered for work in Sweden on October 1, 1956 equalled 134,676 i.e. the highest figure hitherto. Thus compared to the figure computed at the same time last year, the number of foreigners had increased by over 13,000.

*

David A. Morse, Director General of the International Labour Organisation has announced the ratification by Israel of two ILO conventions on the freedom of association. Israel has now ratified 20 such convention, which have each been signed by more than 23 countries.

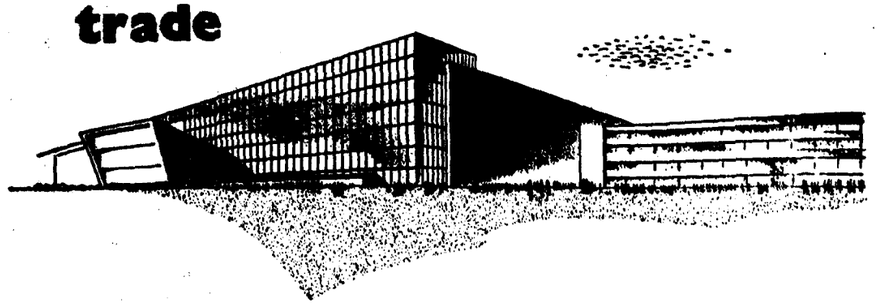
*

The International Bank for Reconstruction and Development has reported a net income of $18 million for the six months ended 13th December, 1956, which compares with $13.7 million for the same period in 1955.

*

Imperial Chemical Industries, Ltd. the largest producer of titanium in Great Britain, recently announced substantial reductions in the price of its wrought titanium and titanium alloy products. While continuing to vary according to the form of wrought product and the grade or alloy of titanium ash, prices will in general be lowered by 10 per cent.

*



UK oil production reached a new post-war peak in January. British petroleum announced recently that its oil fields produced 6,714 tons during the month, mainly as a result of increased production from its Egmanton field in Nottinghamspire, discovered in 1955.

the centre of world trade

Hannover opens the door to better and bigger business deals. That is why leading industrialists and businessmen from all parts of the world visit the German Industries Fair, Hannover - many of them every year - without fail.

Industrial groups exhibited include: Mechanical Engineering, Electrical Engineering, Chemistry, Rubber Manufacture, Precision Mechanics and Optics, Iron and Steel, Tools and Office Equipment of all kinds. Consumer goods group: China, Glass, Jewellery and Silver-ware, Clocks, Watches and Cutlery.

German Industries Fair Hannover • 1957

COMBINED HEAVY & LIGHT INDUSTRIES.

April 28 – May 7

THE SOCIALIST PHILOSOPHY

(CONTRIBUTED)

THE election manifesto, issued by the Indian National Congress, says that its objective is to establish a "full socialist order of society", giving freedom, welfare and equality of opportunity to all. The second Five-Year Plan also says that it has been drawn up so as to give concrete expression to the decision of the Government and the people to usher in, by gradual stages, "a socialist pattern of society"

The reiteration of the socialist ideal has been criticised on two grounds. On the one hand, it has been said that socialism is a new concept in the armoury of the Indian National Congress, introduced mainly to "steal the thunder" from the parties of the left. On the other hand, it has been averred that there is nothing revolutionary or new in this objective — Congress has been saying today exactly what the Labour Party had said in Great Britain during the period between the two wars.

As regards the first criticism, it may be conceded that socialism is not an entirely new concept with the Congress. Ever since the beginning of the present century, Congress leaders have pointed their accusing fingers to the exploitation of the common people which had been going on throughout the country. It is true that, on most occasions, the attack was directed against isolated acts of omission or commission on the part of an alien Government, but, by about the thirties of the present century, there had emerged, out of these attacks, a vague socialist ideal. Thus the entire socio-economic programme of the Karachi (1931) session of the Congress was punctuated by socialist philosophy. The resolution passed at this session said that 'Swaraj', as conceived by the Congress, meant, first and foremost, the economic freedom of the masses. As many as thirty specific measures were listed in the resolution — measures intended to bring about, in due course, a socialist society.

Even so, it took quite some time for a definitely socialist pattern to evolve. At the Lucknow session of 1936, the agrarian programme merely highlighted the struggle between socialism and Gandhism. At the Faizpur session of the same year, socialism was, as it were, Indianised. It was only in 1945 that the Congress, in its election manifesto, openly emphasised the need for the "planning and co-ordination of social advance in all its many fields" and called upon the people to give their seal of approval to "a programme for the prevention of the concentration of wealth and power in the hands of individuals and groups and of the growth of vested interests inimical to society". Simultaneously, it put forward a plea for the social control of the mineral resources, means of transport and the principal agencies of production, distribution and exchange.

Since then, the goal of a socialist pattern or order of society has been reiterated on many occasions — both in the inner councils of the Congress and on the public platform. The latest manifesto of the Congress merely goes back to the fundamentals of the socialist philosophy — a trend which is in keeping with the transformation in contemporary socialist thought in many Western countries. To quote from the manifesto again, "Socialism does not rest content merely with signifying changes in the economic relations of human beings. It involves fundamental changes in the socialist structure, in ways of thinking and in ways of living. Caste and class have no place in the socialist order envisaged by the Congress. The old idea of privilege on the basis of birth or caste or class or money or the hierarchy of office, must be discarded. Men should be judged by their labour, their productive and creative efforts, and their services to society and humanity".

It is this stress over ways of thinking and ways of living which is the most significant contribution of socialism to the modern world. Yet, only a few years ago, socialism was losing its moorings in the blind alley of collectivism or statism. The socialist society was being envisaged more as an institutional pattern in which the control over means of production, and over production itself, was vested in a central authority. Between 1920 and 1945, nationalisation was regarded almost as an end in itself: it was fondly believed that once the State controlled production and the agencies which entered into production, the worker would be able to secure for himself the full product of his labour, an adequate standard of living and freedom in his daily life.

It will be useful to enquire at this stage how the socialist ideal has developed. Although socialism is generally supposed to have had its origin in the works of Karl Marx, there were numerous theorists before Marx who, dissatisfied with the existing state of the society, gave vent to their dissatisfaction in planning ideal societies in which property was held in common and injustice was unknown. Prominent among these were Robert Owen of England, who drew the picture of voluntary communities where all property would be held in common, and Charles Fourier of France who put forward, in his **Nouvean Monde industriel et societaire,** an idealistic scheme of social reconstruction. They amplified and expounded the utopian socialism of the seventeenth century, preached by More in his "Utopia", Campanella in his "Civitas Solis" and Harington in his "Oceana".

Modern socialism, however, dates from the nineteenth century—as an expression of revolt against conditions created by the capitalist structure of production, distribution and exchange. Intellectuals like Babeuf, Morelly, Fichte, Proudhon and Sidney Webb were appalled by an economic system which combined unparalleled material progress with equally unparalleled human misery. Moved deeply by the injustice of distribution which prevailed in the midst of efficiency of production, these socialists asserted that the existing economic system was wrong and that it must be replaced by another. Others like Marx and Engels went a step further: they said that competition and free market—the two pillars of the capitalist system—would themselves lead to its down-fall. Free competition, instead of remaining free, would stimulate the capitalists to create monopolies, while the workers would be forced, by the stern logic of the labour market, to organise themselves in self-protection. Finally, the recurring and deepening crises which occurred in industry and trade would make the collapse of capitalism inevitable.

It is important to remember, however, that, even in the heyday of 'laissez-faire', the capitalist system never coincided with the above theoretical model of orthodox economics. Its own inner dynamics on the

one hand and increasing democratic pressures on the other have changed it almost beyond recognition. The success of piecemeal reforms, the growth of collective bargaining, the introduction of social services, the constant extension of redistributive taxation, the spread of co-operative and municipal enterprise, and the coming of full employment have transformed the economic system in many capitalist countries almost beyond recognition.

It was soon discovered, however, that the transformation was superficial. Material values were still accepted as the main criteria of progress. Although the capitalist no longer spoke of private profits, his language was still that of higher production, national solvency and a rising standard of living. The socialist, on the other hand, wanted to see embodied in the economy the universal human ideals of equality, freedom and fellowship. He judged the economic system not by mere economic results (output, trade, costs and incomes), but by philosophic terms—what it did to the dignity of the people or the quality of their lives.

To the modern socialist, therefore, the quantitative improvements which have been gained—less unemployment, higher wages, shorter working hours, increased pensions and more money for the social services—are only the preliminaries to the real struggle for a qualitative change, for a society with a different content, combining a fuller life for everyone with some finer, more co-operative way of living together. As has been aptly remarked by Prof. R. H. Tawney, "What is repulsive is that some classes should be excluded from the heritage of civilisation which others enjoy, and that the fact of human fellowship, which is ultimate and profound, should be obscured by economic contrasts, which are trivial and superficial".

It took the modern socialist quite some time to arrive at the above conclusion. For years, the socialist in liberal democratic countries pinned his faith on nationalisation or the reduction of monopoly profits or industrial co-ordination as the means to bring about the socialist order. Experience has, however, shown that these yield results which are elusive in character and negligible in quantity. In many countries, the Civil servant has merely transferred the interest on the once privately owned capital of the nationalised industries to the Treasury, while redistributive taxation has merely limited the private accumulation of capital. Industrial co-ordination has not led to industrial democracy.

The Indian National Congress is now speaking in terms of fundamental changes in the social structure and in ways of thinking as well as of living. But can it be truthfully said that it has returned to the 'essence' of socialist philosophy? As everyone is aware, it is possible to have within the facade of socialism a life in which the common man is exploited as ruthlessly by a centrally planned economy as by a harsh free economy. Socialism does not mean more public enterprise, more planning, more money spent on the social services: it means the imprint of a social purpose behind all our economic activities and the emergence of a society in which the individual has the fullest freedom and opportunity to develop himself into a social (as opposed to economic) man.

One looks in vain for this true socialist ideal in the policies and programmes pursued by the Congress Party in Parliament. The measures of nationalisation which have flooded the country during the past few years have not brought to an end the exploitation of the common man. The most charitable explanation which can be offered is that an all-powerful Collectivist State has stepped into the shoes of the 'selfish' private entrepreneur. We are still far off from the goal of "economic and industrial democracy" envisaged by thinkers like G. D. H. Cole: in the three-cornered fight between employers, workers and consumers for the appropriation of the national dividend, the community as represented by consumers is having the worst deal. This, of course, is due to the weak position of consumers: a universal boycott is even less conceivable than a general strike. It was once thought that the State would provide the necessary "countervailing power", but events seem to show that it has miserably failed to do so. The establishment of a "Welfare State" is not, as is often imagined, "socialism". A "Welfare State" has existed in the past, and still exists today, in totalitarian countries, but no impartial student of history would say that the common man there enjoys true freedom. The mere replacement of the selfish individualism of the Liberal school by the tyrannical collectivism of an omnipotent State does not, and cannot, bring about socialism.

The ultimate aim of the socialist is to give to the individual the maximum amount of liberty: this can be achieved only if the State co-operates with the community to provide the atmosphere in which this liberty can be enjoyed. Socialism is neither the resentment of the hungry and the oppressed, a kind of slave uprising against the privileges enjoyed by certain classes or groups of men, nor is it the mere antithesis of individualism and 'laissez-faire': it is a partnership in which all can, and should, share the common inheritance of the means and opportunities of good living and happiness.

BANKING IN TRAVANCORE-COCHIN

THE report of the Travancore-Cochin Banking Inquiry Commission has brought out some revealing features of the banking structure in that area. The Commission was appointed early in 1956 to investigate the position of banks comprehensively having regard to the special characteristics of the economy of the State. On account of its variegated crop pattern, Travancore-Cochin's economy is comparatively free from the cycles of seasonal activity common in the rest of India. This has been an advantage to the banking system of the State and to business generally. The economy, though primarily agricultural, has attained a high degree of monetisation, the principal reason being the preponderance of cash crops in its agricultural activity.

It is no exaggeration to say that banking in Travancore-Cochin has developed according to its own genius. It is interesting to note that the business conducted by banks is often not limited only to the twin functions of acceptance of deposits and dispensing credit. Till recently the business of 'kuries' or 'chitties' formed a substantial portion of their total business. In fact most of the banks in this area have grown out of 'chit' and 'kuri' funds. The wild growth of banking in the thirties may be attributed to the fact that no law was in existence in the former States of Travancore and Cochin governing the various aspects of commercial banking so that prudent commercial banking principles were hardly followed in the conduct of business.

Travancore-Cochin stands foremost in regard to the number of banking offices with one banking office for an average of 15,891 persons. The average number of people per banking office works out to 15,900 in Japan, 7,600 in the USA and 4,600 in the UK. One peculiar aspect of the banking scene in Travancore-Cochin is the preponderance of the small-sized banks, i.e. banks with working funds of less than Rs. 10 lakhs. Thus of the total of 136 banks which replied to the Commission's questionnaire as many as 95 are of small size. This is because banks are not concentrated in cities and large towns but are generally spread out into the rural interior. Thus, even before the Rural Banking Enquiry Committee stressed the need for banks in the rural parts of the country, there had been a wide-scale expansion of rural banking in Travancore-Cochin. Even then, only 7 per cent of the credit needs of the rural people are met by commercial banks. While there is no doubt that the small banks played a significant role in financing agriculture, it should be noted that the personal and other advances most of which would be normally used for unproductive purposes amounted to as much as 45 per cent of their total advances.

Banks in this area generally suffer from various structural and managerial defects. One is that over one-third of the total advances of banks incorporated in the State as on December 31, 1955 was granted on personal security. As a result many of them were saddled with a large amount of bad and doubtful debts. Close to the unsecured advances were advances against real estate which formed 26.9 per cent. Again, interest rates charged and paid by banks are comparatively high. The lowest rate paid by as many as 122 banks incorporated in this State on current deposits was over ½ per cent while the highest rate quoted by 85 banks was over 1 per cent. As many as 115 out of 123 banks having savings accounts paid over 2 per cent. The minimum rate paid on fixed deposits by most of the banks varied from 2 per cent for three months to over 4 per cent for two years and more. Nearly 80 per cent of the total deposits carried interest at not less than 3 per cent. This is not surprising as time deposits accounted for 74.5 per cent of the total deposits. The highest rate charged by 99 banks on secured advances exceeded 10 per cent while the lowest rate quoted by 118 banks was over 5 per cent. The comparatively high rates charged by local banks on advances were partly due to the competition among them to attract deposits and partly due to their practice of advancing a high proportion of their funds against real estate and personal security. The special conditions of the economy of Travancore-Cochin perhaps warrant some consideration in respect of advances against real estate.

The main weaknesses, however, are over-capitalisation, over-extended advances and low real value of paid-up capital and reserves. The smaller the bank the greater is the likelihood of its being over-capitalised. Thus 84 per cent of the reporting banks show an over-capitalised position. In the Commission's analysis a bank is considered over-capitalised when its capital and reserves exceed 10 per cent of its deposits. Even if this norm is put at 20 per cent the position does not after significantly. More than 55 per cent of the banks deviate from the all-India norms in respect of over-extended advances portfolio and high proportion of advances against real estate and clean advances. Again the nominal value of paid-up capital and reserves of 39 reporting banks is less than the minimum requirements laid down in Section 11 of the Banking Companies Act. The infirmities from which the banks in Travancore-Cochin suffer are not confined to only the small sized banks but affect all the groups more or less equally. The Commission comes to the conclusion that many of the difficulties confronting the Travancore-Cochin banks are more due to their managerial policies than to their structure. This can be illustrated by one fact. The fall in the ratio of gross profit to working capital between 1951 and 1955 despite the rise in the ratio of gross earnings shows that payments by way of interest on deposits had risen considerably during the period.

One of the major defects of small banks in India is their propensity to overtrade at the expense of liquidity. It, therefore, seems desirable to insist on all banks maintaining a reasonably large proportion of their cover in the form of cash, gold or unencumbered approved securities. Section 24(1) of the Banking Companies Act fixed the proportion at 20 per cent. It is the contention of the Travancore-Cochin banks that as their deposits are mostly on a time basis and the cost of money is high in their case, strict adherence to Section 24 would seriously affect their earnings. They argue that the higher rates of interest paid on deposits can be compensated for only by utilising more of their funds for lending than by keeping them idle or by investing them in Government securities. The Commission has, therefore, recommended that the present concession given to them upto March 31, 1957, viz. maintenance of 15 per cent of the total demand and time liabilities in eligible assets, may be continued for a further period of three years. It can be seen from a study of all-India banking statistics that while there may be seasonal variations in advances, well-managed banks as a rule do not lend more than 60 per cent of their deposits. Banks are the repositories of the savings of the public and any indiscriminate use of the deposits is liable to bring distress in its train. What is necessary is that banks in Travancore-Cochin, irrespective of their size, should be enabled to carry on their normal operations without at the same time sacrificing any of the sound canons of banking. The ratio of 20 per cent is clearly necessary for Travancore-Cochin banks in the long run. But the interim concession suggested by the Commission is advisable to prevent probable inconvenience to them.

The Commission opines that there has been considerable degree of unhealthy competition which has led to the pursuit of unsound banking practices. Apart from the weaknesses detailed above, such features as the concentration of borrowings in a few hands and larger advances to directors, their relations and concerns in which they are interested, are found to exist among a large number of banks. Elimination of unsound and uneconomic units, which predominate by and large in the small-sized and medium-sized groups, will go a long way to impart a healthy tone to the banking system. Though the Commission rejects the the idea of any drastic reorganisation it has recommended the selective weeding out of the weaker ones by a process of amalgamation or merger. Such mergers or amalgamations will in the long run help to bring about equilisation of interest rates and other charges and enable the new units to lend proportionately more. It may be remembered that the Banking Companies Act and regular inspection by the Reserve Bank became operative in Travancore-Cochin only from a very recent date, i.e. 1951, unlike in other parts of India.

One criticism against the Travancore-Cochin Banking Inquiry Commission is that it has not faced its task squarely on certain points and provides no clear answer to some of the problems posed on the plea that a "fuller enquiry" is necessary. For example, on the question of the bankers' stand that borrowings from scheduled banks against approved securities should be excluded for purposes of computation of liabilities, the Commission is indecisive and suggests instead that "the matter may be further examined by the Government of India." The Commission was appointed to investigate the banking system in Travancore-Cochin "in a comprehensive manner" and it is unnecessary that another body should be constituted for studying certain aspects which were clearly within its terms of reference.

BOOK REVIEWS

THE GANDHIAN WAY

Gandhi Marg—A Quarterly Journal of Gandhian Thought: Vol. I, No. 1: Editor S. K. George: Published by Gandhi Smarak Nidhi, Mani Bhuvan, 19 Laburnum Road, Bombay-7: Subscription Rate Rs. 5 a year in South Asia, 10s. or $2.00 elsewhere, post free.

'Gandhi Marg' means the 'Gandhian Way'. This at once strikes one as a very appropriate title to a journal published by the Gandhi Smarak Nidhi which is devoted to "the principal object of spreading the gospel of Gandhiji— the gospel of truth, non-violence, peace and brotherhood of man, and its application to every walk of life". The first number of the journal is a promising beginning in the direction of spreading the Gandhian gospel and of resurrecting such Gandhian values as are under a cloud of late.

The journal will give news of the activities of the Nidhi in its various branches. As Gandhiji was a constructive revolutionary and as his activities touched life at many points, contributions from Gandhian students all over the world will also form part of this Quarterly. Gandhiji belonged to the entire world, not only to India. And the Gandhian tradition is also a world heritage. It is, therefore, still more appropriate that the very first number should have included eight articles written by such well-known Western friends as Horace Alexander, Muriel Lester, Roy Walker, Richard B. Gregg, Dr. A. E. Morgan, Reginald Reynolds, Wilfred Wellock and H S. L. Polak. The subjects covered by them deal, among others, with the service spirit of Gandhiji, the Gandhian reverence for all faiths, the Gandhian alternative to Western materialism and the Gandhian pacifism. The Indian contributors include the familiar names of Pattabhi Sitaramayya, G. Ramachandran and Kalelkar. It is regrettable, as the Editor himself admits, that more Indian friends have not promptly sent articles as the Western admirers and followers of Gandhiji have done. This initial phase of indifference may soon pass away, and the Quarterly is bound, in due course, to fill the void created by the closure of 'Harijan' and shape itself as a monument to the Mahatma.

NATIONAL POLITICS

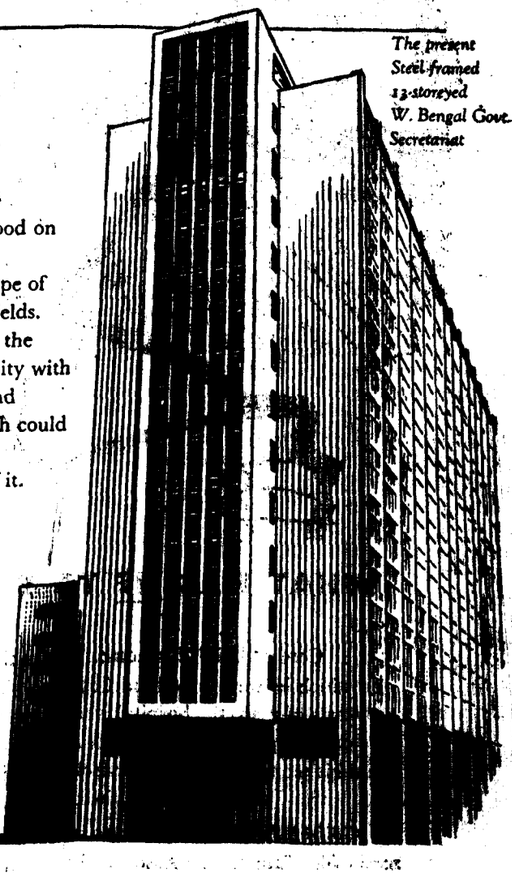
National Politics and 1957 Elections in India: Edited by S. L. Poplai: Dewan Chand Indian Information Centre: Pherozshah Road, New Delhi: Pages: 172: Price Rs. 4/-.

The book under reveiw, published on the eve of India's Second General Elections, is a valuable and timely contribution to the study of politics in this country. It intends to provide an up-to-date account of the fluctuations in the strength of different parties during the last five years and this purpose is largely achieved in the introductory chapter which gives an account of the fortunes of the different political parties since the last general election. The other useful features in the book are the Policy Statements of all the four all-India parties. Election Manifestos of the parties, a brief account of the by-elections between the two general elections and a short note on the procedure followed by different parties for selecting candidates. Most of the work in connection with this book has, of course, been that of compilation. The real conrtibution is, therefore, made only in the introductory chapter (written by Mr. Sisir Gupta) which surveys the Indian political scene over the years 1952-1956. As this survey is confined only to 46 pages of the book, the treatment of the subject is rather brief and even sketchy at places.

This, however, does not detract from the fact that Mr. Sisir Gupta, who seems to be very well informed on the politics and political parties of the country, has made some astute observations in the opening chapter. One can hardly differ with Mr. Gupta when he says that "the political history of the five years following the first general elections is a history of consolidation by the majority party and confusion among the others." While he gives credit to the shrewd move of the Congress party in anticipating the trend of opinion within the country and adopting the 'socialistic pattern of society' as its goal at the Avadi Session in 1955 and thus causing confusion in the ranks of the opposition, he rightly observes that "the successes of the Government of India in various fields raised the prestige of the party in power". No full coverage of the political situation in India and about the activities of the different political parties is provided, but one does get a rapid and fast moving account of the circumstances which have contributed to the strength of the Congress and the weakness of the Opposition parties. Mr. Gupta's account along with the Policy Statements and Party Manifestos of the different political parties, should prove an excellent guide to an understanding of the second general elections which are just under way in India.

METALS ANNUAL

The Eastern Metals Review (Annual Number): 38, Strand Road, Calcutta: Price Rs. 5: Pages 160.



The Eastern Metals Review Annual Number contains a number of interesting articles dealing with metal trade and industry. The number is divided into six sections. In Section A, the important articles are "schemes for development of non-ferrous metals in India", "Minerals in the Canadian economy" by G. F Mintenko, and "Non-ferrous metals industry in the USSR". So far as the development of non-ferrous metal industry is concerned, some new schemes emerged during the year 1956 and concerted action thereon is foreseen in due course. Section B is mostly devoted to the aluminium industry. The suggestions made for the future development of aluminium industry in India are highly practicable. It is essential that if the industry is to stand on its own legs, its cost of production should be kept to the minimum, otherwise we will have the familiar spectacle, which is plaguing some other important industries in India, of high costs to the ultimate detriment, not only of the country but also the consuming public. It is a pity that this obvious requirement is being overlooked and production is proposed to be decentralised by setting up three small plants in the different parts of the country. There may be some advantages in decentralised production, but the much greater advantage of lower cost of production of the larger units will be lost.

State trading in manganese ore was undertaken on the plea that the mineral industry was not developing along sound lines. The main objective was to earn more foreign exchange by reorienting the mineral trade through government on more rational lines enabling the country to increase exports of ores. But from the way the State Trading Corporation has handled the trade by the introduction of the quota system for the export and movement of manganese ores, it is not clear how it would help the Government export policy. The greatest harm which would result from the Government's decision to canalise exports of manganese ore through the State Trading Corporation, would probably be the drying up of the traditional source of finance by the erstwhile exporters and traders.

" Where now the city stands,
there was once naught but the city's site. " OVID

Calcutta

On August 24 1690, when Job Charnock stood on the banks of the Hooghly, he saw before him a depressing landscape of mud hovels, swamps, and paddy fields. On that very site has risen in the course of the years a pulsating city with heavy industry, modern transport and busy docks—a metropolis which could have made little progress but for STEEL—thousands of tons of it.

WHAT HAS HE TO DO WITH CEMENT ?

Cement builds his home. It is in the pavement on which he walks, the school in which he learns the arts of man, the hospital which he may need, the swimming pool, sports track and gymnasium that build his team spirit and his muscle. It is in the dams, power houses, factories, grain silos . . .

CEMENT— more and yet more cement — is the need of his future. The Associated Cement Companies Limited, which has doubled its output between 1948 and 1955, will double its production again during the next five years. The success of the Second Five-Year Plan and the future of India's youth both depend upon Free Enterprise.

The ACC is helping to build his India of tomorrow.

MACHINE TOOLS AND THE PRIVATE SECTOR

THE demand for machine tools is bound to increase rapidly in the coming years with the contemplated programmes of industrial development under the second Plan. It is with a view to reducing the big gap that is likely to arise between demand and the indigenous output of machine tools that Government have given high priority to the development of this basic industry. The constitution of the Thacker Committee early last year to determine the lines on which the machine tools industry should develop explains the awareness on the part of the Government that the progress in the industry is too slow to meet the ever-expanding requirements of the country. The setting up of the Development Council for Machine Tools was a corollary to the acceptance by the Government of one of the main recommendations of the Thacker Committee. The Council has been entrusted with the task of keeping constant watch on the progress of the industry and recommend measures for its rapid development.

The programme for the expansion of capacity that the Machine Tool Committee has recommended indicates that there is no clash between the private and public sectors. In fact, the Minister for Heavy Industries, while inaugurating the Development Council, pertinently explained the complementary roles of these two sectors in the development of this vital industry and pointed out there was no question of any rivalry or competition between the two. It is in the light of this that one should consider the many useful suggestions contained in the speech of Mr. S. L. Kirloskar for the development of machine tools in the private sector at the recent annual meeting of the Indian Machine Tool Manufacturers' Association.

The Machine Tool Industry on an organised scale was established only in 1941 as a result of the impetus given by the second World War. Though the industry has been making some progress, production has not been able to meet demand. Thus, while the value of the output of machine tools has increased from Rs. 47 lakhs in 1951 to Rs. 1 crore in 1956, demand has increased from Rs. 3 crores to Rs. 8 crores so that imports which have been rising steadily reached a figure of about Rs. 7 crores in 1956 compared to Rs. 3.86 crores and Rs. 3.29 crores in 1954 and 1955 respectively. The share of indigenous production in the total machine tools required by the country is still as low as 13 per cent. Though these figures do not take into account the production in the State-owned Hindustan Machine Tool factory at Bangalore and the Prototype Machine Tool Factory at Ambarnath, they will not materially alter the imports because production in these State-owned factories are confined only to a few types of machines which means that a substantial part of the country's requirements has yet to be met by imports resulting in the draining of valuable foreign exchange.

To meet the increasing demand, Government have laid a target that the industry should aim at a level of production of the value of Rs. 10 crores by 1960-61 to be divided equally between the private and public sectors. Mr. Kirloskar has catalogued many of the difficulties facing the private entrepreneurs in starting new machine tool factories partly because of Government's unhelpful attitude to the private sector which serve as a damper and partly because of the risk involved in the industry and the enormous fluctuations in demand. Even the State-owned factories started with large capital may have to face difficulties in disposing of their production because of their high price and the type of machine. So, Government must bestir themselves to develop the proper climate which would enable private entrepreneurs to go ahead in meeting the variety of requirements of the country without any inhibition. Various measures are required to help the private sector to expand production which include obtaining of technical know-how from abroad, financial assistance and help in obtaining raw materials.

With regard to technical know-how, it is necessary for Government to encourage greater foreign collaboration on satisfactory terms. In this connection a report that has appreared recently that representatives of fourteen US machine tool manufacturers met officials of the US Commerce and State Departments to discuss the possibilities for developing the machine tool industry in India is encouraging. It was stated at the meeting that the US Government was interested in assisting India in its plans for expansion of its machine tool industry as a means of implementing President Eisenhower's Foreign Aid Programme. The meeting was also told that Government's plan for help to India would be based on licensing or investment arrangements "for mutual profit" between US and Indian private enterprise instead of through loans and grants. So, the possibilities of US aid can be explored profitably for expansion of the private sector.

Apart from foreign technical collaboration, the Machine Tool Committee itself in its report has suggested that there is need for government help to the private sector both in the matter of easy availability of raw materials and of finance. The problem of scarcity of essential raw materials like steel, graded pig-iron, coal, coke, etc. requires immediate attention and it is up to the Government to improve the supply position. Government also should see to it that wherever possible, orders against Government's requirements would be placed on the indigenous manufacturers. Yet another way in which Government can be of help is by directing the users of machine tools to find out how they can make use of the machine tools that are being already made in the country to the maximum extent. The setting up of an Import Advisory Council for machine tools to review Government's policy from time to time and recommend measures for restricting imports of foreign machine tools comparable to the types manufactured in the country would also assist in checking the accelerated rate of imports of machine tools.

The Minister for Heavy Industries has recently suggested the starting of 'shadow' factories for manufacturing machine tools which means that each manufacturing unit must take up the manufacture of different types of machine tools. Even here, it is necessary for Government to come forward with necessary finances to encourage the existing engineering factories to take up the manufacture of machine tools. It may be of interest to mention here that some of the present successful machine tool makers had made a similar experiment. For example, Kirloskar Brothers had started the manufacture of their lathes in their engineering factory and when it proved successful, a separate limited company was formed later. Finally, Government should also encourage small manufacturers to manufacture graded machine tools through the supply of technical know-how and financial assistance as suggested by the Machine Tool Committee because it has been found that small-scale manufacturers, particularly in the Punjab are making ungraded machine tools and selling them profitably which indicates the demand for them.

Even during recent years, in spite of several handicaps, many factories in the private sector have made satisfactory progress in the manufacture and development of new and improved types of machine tools. Given suitable assistance and favourable conditions, there is no doubt that the private sector can rise to the occasion in meeting the requirements of the country in a vital field of industrialisation.

INDO-U.S. TRADE

A UNITED STATES trade mission is currently touring in this country, exploring the possibilities of promoting Indo-US trade. Although sponsored by the United States Department of Commerce, the delegation is non-official. It is, therefore, all the more significant in so far as it indicates an increasing interest on the part of the US business concerns in the commercial affairs of India. In the first Five-Year Plan and up till now, the interest was confined mainly to the government level and India has been a beneficiary of large US loans and aids towards financing her development projects. But whatever may be the extent of such loans, the need for earning dollars does not diminish. It is true that to the extent that the present delegation, like others of a similar nature, has not come with the purpose of entering into any specific trade deals, to that extent direct and immediate results may not be expected. Nevertheless, the real importance and advantage lies in the fact that representatives of trade and commerce on either side will be provided the opportunity to ask and answer questions relating to the expansion of trade. There is a growing consciousness on both sides that immense possibilities exist for such expansion on private level and the present talks can be hoped to bear good fruit.

The world dollar shortage is the result of a combination of various factors including the relatively low dependence of America on imported goods and her high standard of living, which exerts its demonstration effect on other countries, resulting in a higher demand for American goods. However, India's problem is slightly different. Her total imports, which were showing a steady decline from 1951-52 to 1953-54, started going up from Rs. 656.44 crores in 1954-55 to Rs. 678.99 crores in 1955-56 and were worth Rs. 385.30 crores for the first half of the current year. Except for 1953-54, when the imports of capital goods were comparatively low, the trend in such imports has continued to be upward as against imports of consumption goods which are declining. Thus, in the years 1954-55 and 1955-56, India's capital goods imports stood at Rs. 149.21 crores and 241.23 crores and reached Rs. 174.88 crores in the first six months of 1956-57. Imports of consumption goods went down from Rs. 190.33 crores to Rs. 183.45 crores in the two full years, though they were again up, as a result of import liberalisation, at Rs. 103.31 crores in the first half of 1956-57. It is, therefore, obvious that India's needs are mainly of capital goods for the implementation of her Plans. As time passes, it is becoming more and more clear that the country will have to depend largely on American capital goods. For one thing, the other potential suppliers in Western Europe, particularly West Germany, cannot be completely looked upon to match the supplies with India's ever-expanding needs. The stresses and strains of politics are likely, in the long term, to engage West Germany in shouldering heavier military responsibilities of the NATO as evidenced by the latest agreement on these commitments with UK, which may affect her payments position and also the output of her capital goods manufacturing industries. For another, since India cannot be expected to pay immediately for all her imports, she will need supplies on long-term credit. Here, again, advantage lies on the side of the United States, with her abundant supplies of capital at comparatively lower rates of interest.

Trade trends in India in recent months, for which figures are available, show that the high levels of development expenditure in the public sector and of investment in the private sector, coupled with a progressive liberalisation of import restrictions in conformity with the needs of development, have accounted for some increase in imports. For instance, during the six months April to September, 1956, imports from the United States into India were worth Rs. 45 crores as against Rs. 44 crores worth of exports. For the corresponding period in 1955, the position was somewhat different; the balance was favourable to India with her exports of Rs. 45 crores and imports of Rs. 42 crores. The unfavourable trend, as revealed in the 1956 figures, is no cause for concern. This is to be expected and is consistent with the country's development programme. For a developing economy, engaged in raising the industrial potential, balance of payments deficits are inevitable and, in fact, are indicative of growth.

To say this is not to suggest any complacency. India's endeavour should be, as far as possible, to increase her exports so that the swing to deficits is not so large as greatly to strain her meagre foreign exchange resources. America's intake of Indian jute goods, tea, mica, manganese ore, etc., forms a considerable percentage in her total imports of these commodities. But with her expanding economy, it is not entirely unlikely that such exports from India may be boosted further. Another item in which possibilities of increased exports to the US exists is handloom fabrics which happens to be on the list of favoured production items. A Handloom Survey Team for Export to America has reached the conclusion, after an intensive tour of the country recently, that India has a large potential market for handloom fabrics for export. The sales potential in the United States of this type of goods depends on the extent that improvement in quality and standardisation required for the American market is achieved. There can be no doubt that the present exchange of information will help in a better understanding of each other's needs.

Economic Report from the U. S.

THE STOCK MARKET

(By GUY SIMS FITCH)

NEW YORK, Feb. 26.—The United States economy—and for that matter the public at large—is taking the current stock market decline in stride. The prevailing view among financial analysis seems to be that the upward push of the past two years, which brought stock prices to four times the 1946 level, was subject to some adjustment sooner or later. And even with market quotations slipping, Americans are keeping their eyes on the bright promise of the future.

Symptomatic is an exhibit opened here this week by the New York Stock Exchange. Its aptly named theme is "own your share in American business." It emphasizes the need for more investment capital, shows how stocks can be bought by the public, and explains the workings of the monthly investment plan, that recent innovation whereby a person can become a part owner of American industry by putting up as little as $10 a month. Also on display are such things as a model of an undersea farm, which one day may help meet the food needs of an expanding population; of an earth satellite that soon will be circling the globe; of a solar battery that converts sunlight into electricity; of an atomic energy plant to turn the wheels of industry.

It will take capital investment on an unprecedented scale to bring this world of tomorrow to reality. And that is where the stock exchanges enter the picture—not so much as forums for financial trading, but as centres for investment. Purchase of corporate securities helped finance the United States remarkable economic growth of the past decade. Not only the "market," but wages, employment, production—indeed, everything that goes into economic activity—rose to record highs. What have been the outstanding characteristics of the market's past 10 years? First and foremost has been the broadening of its base. There are more stockholders now than ever before—nearly 9 million of them. And there are more of them in the low and medium income groups. In addition, there has been a rapid growth of so-called institutional investment: by private pension funds, investment groups, insurance companies.

About the only element that has not set a new record—and happily is not likely to—is the total of stock market credit, a prime factor in earlier financial slumps. By Government regulation, most stock trading today is on a cash basis, thereby insulting the market against any precipitous breaks. Now financial analysis are looking forward to another big decade for capital investment, regardless of any temporary fluctuations in stock prices. The prevailing view is that the next 10 years will see the gross national product—the nation's total output of goods and services—climbing some $200,000 million to the $600,000 million mark. This would call for an estimated $375,000 million in new capital. Of this amount, according to most experts, some $60,000 million would have to come from new equity financing—an annual investment rate nearly triple last year's $2,300 million.

Institutions are expected to provide about half of the new equity capital. The rest would come from individual investors, whose number is seen rising to 12.5 million. This further broadening of corporate ownership, say some experts may well be accompanied by increasing public influence on managerial decisions. As the present stock exchange exhibit demonstrates, much is being done to educate the American public on its growing investment role. The American investor thus is fast becoming the best informed ever, one capable of meeting intelligently the challenges and opportunities of the future. And chances are that 10 years from now, as today, the experts will be probing the growth potentialities of the decade ahead.

BUSINESS NOTES

A REALISTIC POLICY FOR COAL

THE ORIGINAL dynamism in the policy for the coal industry in the current Plan seems to have come to a pause. Events since May last when the second Five-Year Plan was approved by Parliament show that Government is not clear in its mind as to the exact course which its policy should take. The target of 60 million tons of output, implying an increase of 22 million tons during the period of the current Plan, is not ambitious in the light of the scale on which development of industry is contemplated. Having fixed this target, the immediate logical step was to come to definite decisions on raising resources for the development of this order. Tentatively, incomplete provision has been made for the public sector which has been assigned the target of producing 12 million tons of additional coal. But in respect of the private sector which has to produce the extra 10 million tons, Government is hesitating to take a firm course of action.

This vacillation cannot be allowed to persist for long because the first year of the Plan is already drawing to a close. Mr. R. Maulik, Chairman of the Indian Mining Association, has explained that the private sector of the industry is prepared to fulfil not only its own allotted share of the additional output but the entire extra quantity of 22 million tons. In fact the blue-prints which private enterprise has submitted to the Production Ministry make provision for increased output of 30 million tons. The condition which it has laid down for the expansion programme is unexceptionable. It is that the industry must be enabled to raise internal resources to finance the programme. When the rate of expansion far outpaces the normal rate of the growth of industry's internal resources and external finance is not fully available, it is plain logic that resources must be raised by levying a development surcharge on the selling price. This policy is already being followed in regard to steel and cement. It is time that some realism was brought to bear on the policy for coal. The Chairman has stated in unambiguous words that the additional price, or the element of development in it, may be earmarked expressely for the purpose of expansion. A more categorical assurance can be hardly expected. The inevitable effect of any further hesitation in facing the situation will be a shortfall in the target.

A shortfall in the target of the private sector will be a matter of serious consequence. At the present time the private sector accounts for more than three-fourths of the total production. At the end of the Plan, in spite of forced expansion of the public sector, it will produce two-thirds of the output. It has delivered the goods and there can be no doubt that, given the required resources, it will deliver them in the future also. Its blue-prints for development schemes are pending before the Production Ministry for a year now and only the first sanctions are coming forth. No comment seems necessary on this delay. Firm decisions for this industry involve considerable technical knowledge and inside experience. It is amazing, therefore, that the public sector which is virtually a novice in this sphere has been granted representation on the Coal Board while the private sector is denied a place in it. This discrimination is inconsistent with joint participation in a bold venture and may result in neglect of the excluded partner. The two merge finally in the national sector. Realism demands that the resources of both should be drawn upon at all levels.

NEW AGREEMENT FOR HINDUSTAN MACHINE TOOLS

WITH THE signing of a new agreement between the Government of India and the Swiss firm of Oerlikon Machine Tool Works, the Hindustan Machine Tool Factory enters a new phase of working. The agreement, which supersedes the first one entered into eight years back, provides for the termination of the financial partnership of the Swiss firm in the company. The firm's holding of Rs. 30 lakhs worth of shares, in a total issued capital of Rs. 4 crores, will be transferred to the H.M.T.F. against value and interest to be paid by the Government of India. Among other stipulations, Oerlikons will surrender the right to the 5 per cent free shares, transfer the licence and authority of the manufacture of machine tools to the H.M.T.F. as well as the right to sell such machinery in Burma, Ceylon and Pakistan in addition to India, for a total consideration of Rs. 25 lakhs. Provision has been made for technical collaboration in the manufacture of or research into machine tools of the required specifications, which can, however, be terminated at six months' notice on either side.

It will be remembered that there was a considerable time lag between the launching of the project and its coming into actual production. The delay was the result, first, of the Government's failure to obtain sanction, from the proper authorities, for over a year and a half after the signing of the agreement. Later, it took the foreign firm nearly a year to decide on the type of the lathes to be manufactured by the factory initially, during which design changes were either made or given up after trials. This shows a lack of foresight and proper planning on the part of Oerlikons which are always vital for the efficient execution of any plan. Consequently, the H.M.T.F. was involved in monetary loss. Various other criticisms have been levelled against the factory touching upon the rationalisation and streamlining of the requirements of the country in the various types of machine tools. The entire subject has been dealt with by the Estimates Committee in one of its reports. A new chapter, however, begins now. There are also reassuring indications that the spheres of production of specific types of tools will be earmarked for the public and private sectors with the objects of obviating any possibility of overlapping.

REVISED TARGET FOR CEMENT

ACCORDING TO a recent report, it is stated that the Government of India are likely to revise the plan target for cement. Production of cement was about 2.7 million tons in 1950-51 and the capacity of the industry was 3.3 million tons. But last year, it rose to about 5 million tons and it is expected that an annual rated capacity of seven million tons may be reached this year. In view of the rising demand for cement necessitated by the various schemes of development like the river valley projects, construction and expansion of ports, air fields, roads, factories and housing, the Planning Commission has raised the target to 16 million ton by 1960-61. Even this target is likely to be surpassed and a revised target of a capacity of 20 million tons seems to be now under active consideration.

The bulk of cement manufacture in the country is in the private sector and production has to be increased by expanding the several existing factories as well as by starting new ones. There are now 28 units in the country and necessary steps have to be taken not only for an extensive expansion of these but to continue to work them to full capacity. It is stated that Government has already approved schemes for the establishment of 31 new factories taking into consideration the question of regional distribution. The cement industry has, however, to face a number of problems, the chief ones being adequacy of transport and the supply of raw materials like limestone and gypsum.

Good deposits of limestone occur only in a few concentrated places. As for gypsum, because of their demand by the fertiliser factories, there is likely to be a shortage. Yet another problem is the raising of additional capital for expansion of capacity and it is difficult to gauge what the effects will be on capital formation by the recent taxation measures. Finally there is the problem of importing capital equipment because the country is not in a position to meet the need for machinery required for large-scale expansion. Here one may come across the foreign exchange difficulty. The cement industry however, is in a relatively better position as regards procuring machinery and equipment which is being manufactured in India on a progressively increasing scale. All these pose a great challenge to the industry and it is for Government to make the necessary concessions in various directions for the industry to realise the target.

CENSUS OF INDIAN MANUFACTURES

THE EIGHTH Census of Indian Manufactures for 1953 is now ready. Only some of the broad features of progress can be touched here. The summary discloses an increase in the number of registered factories in the country from 6,758 in 1949 to 7,140 in 1953. During the same period, the productive capital investment in these factories including the fixed and working capital, increased to over Rs. 726.65 crores from about Rs. 509.58 crores. The Report says that the gross ex-factory output was valued at over Rs. 1,112.67 crores in 1953 as compared with about Rs. 969.37 crores in 1949. There had been, however, a decline in the number of workers and supervisory personnel. Their total number was about 11.28 lakhs in 1953 as against 16.85 lakhs in 1949.

The industries covered by the Census are cotton, woollen and jute textiles, chemicals, iron and steel, aluminium, copper, and brass, genreal and electrical engineering, cement, glassware, ceramics, plywood and tea chests, paper and paper boards, matches, soaps, bicycles, sewing machines, electric lamps and fans, paints and varnishes, distilleries, starch, vegetable oils, sugar, fruit and vegetable processing, biscuit-making, rice milling and wheat flour. This is a fairly representative coverage.

The Census did not cover Jammu and Kashmir and the former States of Madhya Bharat, Hyderabad, Mysore, Travancore-Cochin, Bhopal, Bilaspur, Manipur, Tripura and the Andaman and Nicobar Islands. For the purposes of the Census, only registered factories which used power and employed 20 or more persons per day were taken into account.

As usual, valuable statistical information is contained in the census about the factories in various industries, their capital, employment and output. For each industry there is a chapter in which details about the number of factories, distribution of ownership and gross receipts, consumption and buy-products, salaries and other benefits to employees are given. The full report should provide a wealth of statistical information of great value.

ROLE OF COMMERCE BODIES

CHAMBERS OF commerce and trade bodies have been rendering yeoman service to the economic development of the country. Even during British rule, commerce and industry made good progress as a result of the services of these bodies. Government not only held their views in high esteem but also modified their policies as far as possible to the requirements of trade and industry. But today, the trend seems to have been reversed. Policies are framed not only without any regard to the pronouncements of these bodies, but also in a way that affect the interests of the business community. This is precisely what Mr. D. N. Hosali, the out-going President of the Mysore Chamber of Commerce underlined in his refreshing address at Bangalore recently.

Discussing the merits and demerits of the two important economic systems—capitalism and socialism—Mr. Hosali pointed out that capitalism, as it has shaped during the past 25 years, is decidedly a better method of economic development. Ever since the publication of Lord Keynes' epoch-making book—the General Theory of Employment, Interest and Money—which was a repudiation of 'laissez faire' economics, capitalism has undergone a tremendous transformation. Lord Keynes has shown that it is possible for a Government to achieve the goal of full employment and the maximum utilisation of resources while preserving the private sector. Speaking about socialism, Mr. Hosali said that socialism in practice had not fulfilled its promise of bringing about equality. The same degree of inequality existed both in socialist societies and capitalist societies. Referring to the application of socialism to underdeveloped countries in general and India in particular, Mr. Hosali declared that "Socialism in India now is putting the cart before the horse. It is distributing poverty and obstructing development and worst of all it is putting into power a vast and irresponsible bureaucracy which will make either political or economic democracy impossible". Endorsing the opinion of the classical economists, he said that backward economies should be built up by free enterprise to the point where they could begin thinking about a different system.

HIGH-TENSION INSULATOR FACTORY

THE FIRST high-tension insulator factory, undoubtedly a major project, was switched into action the other day in Bangalore by Prime Minister Mr. Nehru. This project with an estimated cost of Rs. 85 lakhs and capacity to manufacture 2,500 tons of insulators annually has been undertaken by the Mysore Government with the technical collaboration of the reputed Japanese firm of Nippon Gaishi Kaisha Ltd. To start with, it will manufacture 40 to 50 tons per month and production will be stepped up to 2,500 tons in another two years' time to meet a major portion of the country's requirements. Ball clay raw material required for this industry, it is reported, would be available with the recent discovery of good plastic layer at Neiveli.

While inaugurating the factory, Mr. Nehru dwelt upon the role of small-scale and large-scale industries. He emphasized that there could be no conflict between small-scale and large-scale industries and since both had the common object of raising the standard of living of the common man, a proper balance between the two should be struck and maintained. No one denies that whereas heavy industries were necessary for the preservation of India's freedom, small-scale and household industries were important if the life of the rural population was to be improved. The only thing to guard against is the excessive enthusiasm of developing small-scale industries without modernising and rationalising their production techniques. No small-scale industry can develop dynamism unless it assimilates new technological advances.

The enterprise is the result of Indo-Japanese co-operation and it is hoped that it would give impetus to many more colloborated projects participated by the two countries. With the opening of the project, a significant advance has been made to attain self-sufficiency in high tension insulators. It is expected to meet the requirements of the several electrification schemes undertaken in the scond Five-Year Plan.

Company Meeting

Speech by

Shri R. MAULIK

Chairman

INDIAN MINING ASSOCIATION

At the Annual General Meeting on 1st March, 1957 at 11 A.M.

at the

BENGAL CHAMBER OF COMMERCE AND INDUSTRY

Gentlemen.

As we meet here today, votes are being cast throughout the country to elect the Government representing the people's choice. There is none among us who is in doubt as to the results; we can confidently count upon a political stability in India which few other nations in the world could claim for themselves. We can realise how fortunate we are in this respect only if we recognise how ambitiously we have charted out economic targets for achievement. Economic progress cannot be attained without the prior condition of political stability. What is even more important, individual advancement, whether morally or materially, is best—and perhaps only—served by a democratically elected Government. For this reason, we must make allowance for the fact that, in recent months, the second Plan endeavours at Government level should have been obscured by the election campaign. In the result, however, we have had the regrettable consequence that valuable time, which could profitably have been utilised in furthering the second Plan, has been lost. If we are to make sure that the second Plan is to be fully implemented, the primary responsibility for under-writing its success will devolve upon all of us who are gathered. Coal is the very basis for development, it is coal which has to feed and fire industries as they develope in this country. In terms of the second Plan, we have been called upon to increase production from 38 million tons to 60 million tons. Of the anticipated increase in production of 22 million tons, 10 million tons must come from the private sector in coal.

There are few of us here who would think that such a target is not within the ability of the industry. I venture to suggest that, provided we are permitted to do so and so long as there is sufficient inducement and incentive, it is within the capacity of the private sector in coal to deliver the full 22 million tons of additional production. Unfortunately, this past year has, for a number of reasons not witnessed any substantial progress in respect of the coal plan.

I shall not at this stage refer to the increase in costs arising from the Tribunal's Award last May; nor I think, is it germane to the issue for me to point out that the Appellate Tribunal's findings have further increased the costs of production for the coal industry. For, the simple fact of the matter is that we must be prepared, as we have experienced in these past few years, for steadily mounting costs of production. But what I think it is my duty as Chairman of your Association is emphatically to draw attention to the need for Government realistically to revise their coal selling price policy.

It has happened that we in the coal industry nave been called upon to bear steadily increasing operational costs; this, we could have done without difficulty except for the fact that our representations to Government as regards coal selling prices have not had the desired results. Now, let me pose the question: what is the basis on which, in the case of a controlled industry, Government should determine the selling price? The first consideration is, perhaps, one of ensuring that in the light of India's objective of a socialistic pattern of society, the return to the industry is reasonable and just—and not extortionate. In the second place, as affecting a vital consumer product, there will doubtless be solicitude for keeping in check as far as practicable any increase in the price. I need, however, to point out that price policy has to be attuned to a third consideration which, in the circumstances of India's ambitious planning policy, has been rendered the most basically important. I refer to the inter-connection between the selling price for a commodity and the development of that industry. In this context, I may point out that Government are alive to this new and basic concept of a link between development endeavours and selling prices. There are two other Industries wherein selling prices are determined by Government on this basis. These are steel and cement. In both, Government have accepted the proposition that, in the price paid to the industry for its products, there should be a special element which is intended to contribute to the industry's internal resources with which and on which it could proceed with development plans. It may be noted that steel, cement and coal form the triumvirate of the fundamental raw materials on which alone a country can plan ambitiously for industrial development. In regard both to cement and steel, not only the decisions but the policy as it has evolved has been such as to suggest, if not altogether ensure, that the targets of production will be attained.

In coal, it is a different story, it is a somewhat dismal story. While the general index of wholesale prices has risen from 297 in 1947 to 427 in February 1957, the rise in the price of coal has merely been of the order of 15 to 16 per cent. The additional costs that, therefore, the coal industry has had to shoulder, over and above the labour cost arising from the Tribunal Awards include the higher prices of machinery and stores as well. It is no secret that the resulting higher costs were, on the basis of the selling prices, wholly beyond the ability of the industry to afford. Nor could there possibly be any margin by way of unappropriated profits which could be ploughed back for purposes of development. It has been and is our painful duty to draw the attention of Government to this vital fact. Especially in these days when money is so tight, capital for expansion has largely to be found

in the internal resources of a company. And this brings me to another basic fact.

The Finance Minister, Shri T. T. Krishnamachari, has proposed that a moiety of the reserves of a company should be deposited with Government. His intention is to ensure that there is no dissipation of unappropriated profits; the intention may also be that these should be canalised into productive endeavours in the national interest. I agree that all available money should be pressed into service on behalf of the second Plan. But, of course, we need to make it clear that, in the case of companies where the reserves on the liabilities side of the Balance Sheet are matched by money ploughed back into the business appearing on the assets side whether in the form of additions to block or as increased working capital the past reserves will not attract the new statutory requirement. In the case of the coal industry, the financing of development in the past has almost exclusively been done by utilisation of profits ploughed back. That is to say, in the coal industry, the resreves represent moneys which have long since been transformed into expanded block or which are being used to finance output. We of this industry would, therefore, welcome a categorical assurance that, in cases where reserves have clearly been utilised in or been set apart for development work, the new deposit regulations will not be enforced.

Now if I may, I should like to revert to this all important question of selling price policy. We in this industry only ask that the basic criterion for determining such prices, as it already exists in steel and cement, should also be extended to coal. As I have already stated, capital is hard to come by in these difficult tight money days. The bulk of the financial requirements for expansion and development has necessarily to be found in the internal resources of the industry. Such internal reserves can only be built up by the provision of a special element in the selling price which in the customery way, could expressly be set apart for such purpose. Moreover, in these days, when the increase in prices for a wide range of commodities has been sharp, is coal to be the only industry which is to have status quo prices?

Let it also be recognised that Government do not believe, nor will they find an answer to, inflation by merely keeping coal prices in check. On the contrary, such an intention on the part of the Government will, as I shall presently show, be self-defeating. The inevitable consequences of a selling price which makes no allowance for the demand of development, will be to retard development. In other words, the inevitable consequence is that coal production will not go up to the extent and at the rate envisaged by the second Plan. I need hardly say that, in the result a vital raw material will be in short supply. Need I add that, thereafter, inflationary conditions will be fostered in every industry that, for lack of coal, is unable to attain targets of production?

I trust that I have not altogether failed in the task that I have set out for myself. That task is to inform Authority, with all the emphasis that this Association has at its command, that Government's selling price policy must immediately and without delay take note of the basic consideration that the margin available to the producer must be sufficient and adequate to finance the 16 million tons of additional coal production that we, as an industry, are expected to achieve by the end of 1960-61.

It is, I am sure, not out of place for me here to stress that the selling price for coal, in so far as it affects the return to the investor and therefore to the producer, has to take account of the very nature of coal mining—the fact that it is a wasting asset. I can in this context do no better than to quote from an eminent authority, who defines the principle of depleting reserves in the following words:

> "Most industries and enterprises have an intermediate life apparently perpetual and therefore are not called upon to replace the original investment. This does not mean that such industries (railroads, utilities, manufacturing, wholesale and retail houses etc.) will continue for ever; it means merely that, except for competition, nothing is apparent which will cause a termination. Mining, however, differs from an ordinary industry in this respect; when the ore bodies are mined out, there is nothing left. The original capital investment must, therefore, be returned to the investor by the time that the profitable life of the enterprise is ended. When the operating company does not make any provision for perpetuating its life by investing a portion of its earnings in other properties, the usual procedure is to remit periodically to the investor a dividend sufficiently larger than the risk return on his investment to enable him, if he re-invests this overplus at a safe rate compound interest, to replace his original capital at the expiration of the life of the mines. This overplus constitutes a return on the invested capital."

The second duty that I have is to express this industry's view that Government should, in the national interest, pay to the coal industry the attention that it deserves. As at present constituted, we have in Delhi a Ministry to look after coal which is being overburdened with work. On the one hand, the Minister for Production, Shri K. C. Reddy, who is also the Chairman of the National Coal Development Corporation Ltd., is expected to draw up, approve and implement the series of plans and projects which will increase production of coal in the public sector by 12 million tons. On the other hand, it also devolves upon Shri Reddy to examine, scrutinise and sanction the schemes for development in the private sector of coal production. These are responsibilities which one Ministry and one Minister cannot alone shoulder. This is patently clear, if we look at the events of the last year as affecting coal. The Ministry has been hard put to it to register the necessary progress in the State projects. But, preoccupied as the Ministry has been with this work, it has also happened that there has been untoward delay in the disposal of the matters relating to the private sector in coal. The fact is, that it is nearly a year since plans and blue prints were submitted to the Ministry for the expansion in production to the tune of 30 million tons. Naturally, the private sector in coal has sought to make available production in advance of the country's expanding demand. But the fact is, that nearly a year has elapsed before the first sanctions are being received for proceeding with development work. The division of responsibility at the Government level as between private and public sectors will do incalculable good. In the first place, it would free the existing Ministry to give their undivided time and energy to the furtherance of the State projects. In the second place, a proposed new Ministry for coal in the private sector and for the overall policy as we have suggested would enable development in the private sector to proceed at a brisk pace .

I should make another point clear; and that is, that coal cannot properly be thought of as belonging to the private sector or to the public sector. It is a national asset which the country as a whole has to work with all available means and at optimum efficiency. There is no room for, and no need for, controversy as to targets of production that ought to be set for either sector. What matters is total production. If the one

sector, due to unavoidable reasons, is unable to achieve targets, it is the duty of the other to make good any shortfall in production. For our part the Indian Mining Association is determined that the second Plan should not fail because coal production has not achieved the target set. This determination on the part of the private sector as a whole is evidenced in the fact that the plans submitted to Government for expansion involve a total of not 10 million tons as allotted under the Plan, but 30 million tons. The coal industry will pledge itself to the proposition that neither doctrinaire politics nor ideological dogmatism will be permitted to prevent the coal production target from being attained. In the notion that, in India's mixed economy, there is to be co-operative co-existence as between Government endeavours, on the one hand, and efforts by the private sector on the other, the Indian Mining Association assures the country that every effort will be made not only to attain but to exceed targets.

While expressing the confidence that there appears to be the possibility of better appreciation of our difficulties and earlier solution of our problems, if the Planning Commission's greater interest and Shri K. C. Neogy's recent visit to the coalfields are taken to be suggestive, it is necessary for me in some detail to describe the events of the past year as affecting the Mining Industry.

Recent history in the matter of coal prices proves to be extremely interesting. In July 1947, a rise in coal prices was permitted so that the wage increase of workers could be met; but, barely 2½ years later, in November 1949, coal prices were revised slightly downward. Since then, although the cost of production has steadily been mounting, there has scarcely been any compensatory revision of prices. The only increase allowed was during 1956; and this was intended partially to meet the additional labour costs arising from the Award of the All-India Industrial Tribunal (Colliery Disputes) in May 1956. It is important to recognise that the sole instance of a price increase being granted was not for affording any increased margin to the industry but only so that the industry could be compensated for the enhanced wages of labour; in fact, it was pointed out at the time that the rise of Rs. 3 allowed was insufficient to cover the additional financial burden which the industry, by terms of the Award, had to bear.

Besides the higher cost of labour, prices of other essential equipment and stores have also risen substantially since 1947. Steel today costs 130 per cent more than it used to in 1947; one has to pay 50 per cent more for cement as compared to the price a decade ago.

The prices of coal, however, continue to remain at an uneconomic level. Surely these prices can bear to be upgraded a trifle. They would even then be the lowest in the world. The cost of coal expressed as a ratio of the gross ex-factory value of various products and bye-products is, on average, 1.96 per cent; in the case of other fuels and electricity, the relevant ratio is 3.45 per cent. Coal and coke work out to 11.25 per cent of the cost of steel as against 12.70 per cent in the case of other fuels. The apposite figure in the case of cement is 14.22 per cent for coal and 18.28 per cent for other fuels. Another pointer to the inexpensiveness of Indian coal is brought out in the fact that the cost element of coal in UK-produced steel is 40 per cent as against 11.25 per cent in India; for cement, coal works out to 30 per cent in the UK as contrasted with 14.32 per cent in India. I trust that the conclusion is clear that whether on the basis of world prices or whether on the basis of the cost of coal as compared to other fuels, the nation should comfortably be able to take in its stride some increase in the coal selling price.

I should now like to describe at some length the labour position. You are aware that, as a result of agitation by Trade Union leaders in the coal fields, a special tribunal was appointed by Government in February 1954 to go into the matter of wages and amenities of colliery workers.

One year later, the Tribunal was reconstituted and the proceedings started anew. The award of this tribunal was published on 26th May, 1956 and became effective from that date. The Association in consultation with other producer organisations, decided not to appeal against the Award. This, however, did not mean that we agreed with all the findings of the Award.

Certainly, we did not agree that the minimum wage should be Rs. 69-1-0 inclusive of bonus for the unskilled surface worker. Besides, there were some anomalies to be noticed in the Award; but, taking into consideration the prevailing circumstances and mainly as a gesture of goodwill to the workers—who had been engaged in litigation for over two years—the decision was taken not to prefer an appeal. Furthermore, the Association of its own accord rectified some of the anomalies which existed in the Award. Workers were evidently satisfied with the new dispensation. Nevertheless, some of the minor trade unions appealed; and, at later stages, all the trade union organisations participated in the proceedings of the appeal and in attacking the lower tribunal's Award. Ultimately, the employers found that, in spite of their efforts, they could not avoid litigation. It may be noted that they were placed in a position of considerable disadvantage because, in extending their gesture of goodwill, they had implemented the lower tribunal's Award.

The decision of the Appellate Tribunal was announced on 29th January, 1957. The wages of workers were further increased; and other major modifications of far reaching consequence were made. The decision, moreover, has been given with retrospective effect from the date of the original Award; and, in the result, the industry is immediately burdened with the awesome liability of over Rs. 4.25 crores. Where this money is to come from, the industry does not know. In fact, the retrospective aspect of the decision strikes at the very root of the industry. Undoubtedly, it will have serious repercussions on the progress of the development plans now in hand.

Wages have been substantially increased; other facilities and amenities have been granted on a very liberal scale. Obviously, these must and will be reflected fully in the price of coal since as much as 76 per cent of the production cost is accounted for by labour charges. Unfortunately, the rise in the level of wages for labour and an improvement in working conditions have not been accompanied by a better showing in productivity figures.

Perhaps, it would be wise on our part to remember that productivity will not increase and the standard of living of colliery workers will not improve unless steps are taken to educate the workers that they themselves must make an effort at improving their living conditions. In this regard, the trade union organisations have done nothing in the diffusion of such education and whatever has been done by the Coal Mines Welfare Organisation has failed to elicit the desired results.

This lack of improvement in productivity, however, does not deter the constant agitation for wage increases. At its last annual conference, the INTUC has put forward a demand for a blanket increase of 30 per cent in wages for the workers of major industries; and, if the decision in regard to the justifiability or otherwise of such demand depends upon the discretion of outside

bodies, prices of coal are bound to rise since the producers will have little to say in the matter. It is strange that the employer should have the dubious distinction of having a say neither in the wage increase to labour nor in the selling prices of his product. As far as the consumers are concerned, they need to appreciate that they cannot hope to continue to get coal at the present low prices. On the one hand, some benefit might accrue to the consumers when, in due course, productivity in the industry improves. On the other hand, however, there has to be dissemination of information as to the efficient use of coal and prevention of waste. Secondly, in so far as the workers are concerned, we must note with regret that the coal industry continues to be affected by the power politics of rival groups of trade union leaders. That the workers are mere pawns in the political game of the leaders has been amply demonstrated by the illegal, unjustified and unwarranted strike made last year in the West Bengal coalfields. It may be recalled that two of the largest groups of employers were affected; and the consequent loss in output amounted to 3 lakh tons. The Association places on record its appreciation of the action taken by the employers concerned in holding out against the strike threat; in the alternative, if the unreasonable demands had been met due to pressure, the coal industry would have been thrown into chaos.

Great stress is being laid these days on more rigorous safety measures. The Mines Act and the Coal Mines Regulations are in the process of being amended. The provisions are most drastic; and as was pointed out at the Fifth Session of the Industrial Committee on Coal Mining held last year, considerable modification of the draft provisions is called for. What is required is advice as to the manner whereby safety measures can be improved—not rigid enforcement of drastic rules. Furthermore, if the mine manager is held personally responsible for every act of omission or commission in the mine, it will be impossible for him to function. He will always be in a state of uncertainty and apprehension; and this will affect the overall supervision of the mine and hamper his initiative as principal person responsible for the production of coal. We have also to realise what the regulations, if they become enforceable as envisaged by Government, will mean to the Industry. In monetary terms, we shall have to incur immediate expenditure to the tune of several crores of rupees; of this, I understand about two crores of rupees will be in the form of foreign exchange. There is no doubt that the Labour Ministry should take all possible precautions for the safety of workers in the mines; but there should be the realisation that in view of the very nature of mining operations, it is impossible to have 100 per cent safety—which is what appears to be aimed at. Cent per cent safety can be vouchsafed only if no mining operations take place at all. I would suggest that all concerned in this connection give this matter their serious thought so that a satisfactory solution can be reached. While on the subject of safety, I would point out that the overlapping jurisdiction of the Coal Board under the Production Ministry and the Mines Inspectorate under the Labour Ministry is likely to hamper production.

The transport position has continued to improve but, as has been always the case in the Coal Industry, wagon supply is still not sufficient to meet the demand of the coal consumers. Considering the condition of the Railways during and after World War II and also the post-Partition period, our Railways are to be congratulated on their achievement. The fact, however, remains that rail transport will be the limiting factor to all industrial production in the second Five-Year Plan. This is especially applicable to the Coal Industry. The daily requirements of wagons of the Coal Industry during the second Plan period are as follows: for 1957-58, 4,860 wagons; 1958-59, 6,519 wagons; 1959-60, 6,481 wagons; 1960-61, 6,304 wagons.

Out of these, the daily requirements of West Bengal and Bihar will be 3,778 wagons; 4,603 wagons; 4,810 wagons; and 5,016 wagons respectively. The present guaranteed supply of wagons for the West Bengal and Bihar coalfields is 3,500 wagons a day, of which 950 wagons are from the South Eastern Railway. The actual demand for the current year is 3,778 wagons a day. The daily requirement of the consumer is, therefore, not met to the extent of about 278 wagons. At the same time the requirements of the Railways themselves have also increased. Therefore, although the daily supply of wagons has improved, there is a shortfall in the minimum requirements in comparison to the total demand of the country as a whole; consequently, a general overall shortage of coal supply, particularly domestic fuel, continues to be experienced. It is essential, therefore, that immediate steps should be taken to increase the minimum guaranteed supply of wagons during the current year with a view to reaching the target of 3,778 wagons. From the general trend of discussions in the Coal Transport Advisory Committee, it appears that little improvement can be expected over the South Eastern Railway for the next few years. Thus, the Collieries in West Bengal and Bihar, who are served by the South Eastern Railway, will be handicapped so far as increased output is concerned. I would like to suggest that, since the Railways are anxious to improve the wagon position, it may be of advantage to hand over the control of that portion of the South Eastern Railway which serves the West Bengal and Bihar coalfields to the Eastern Railway. One of the essential pre-requisites in order to reach the target of increased production and expansion envisaged during the current Plan period is an increase in siding facilities and relaxation of indent limitation. The Industry has been drawng the attention of all the authorities concerned to this matter; and we trust that we can count upon the co-operation of the Railways in this regard.

The scope of Government control over the Coal Industry is incredibly sweeping. Production, selling prices, distribution, method of mining, workers' wages and workers' amenities—practically all aspects of normal business are controlled. The Ministry through which the Industry is controlled is mainly the Ministry of Production. The system of controls has been in force for the last decade and a half. In my opinion, it is totally outmoded. The system of controls should be thoroughly reviewed by a committee on which the coal producers should be adequately represented. Such a revision and reorientation of policy are, in the light of the present trend of events and the need for a quick increase in output, surely imperative.

The Coal Board, which was formed in 1952 under the Coal Mines Conservation and Safety Act, has been unable to do much besides pegging the output of coking coal. The policy of the Coal Board has till recently been incongruous; while what is required is increased production of coal, the Board's policy seemed to be to obstruct it, with its restrictive policy. I am, however, glad to say that the Board lately seems to have altered this policy and is realising the urgency of coal development.

I may now refer to developments in sand stowing. We have now reached such a pass that it is doubtful whether sufficient sand will be available for carrying out stowing in the Jharia coalfields. As early as 1953, Shri Michelmore in addressing you from this Chair had reached this conclusion:

"I feel I must raise once again the doubt which has long been in my mind whether adequate supplies of sand will continue to be available after the completion of the Damodar Valley Corporation."

He expressed grave doubts as to the future availability of sand and requested that this problem should engage the serious attention of Government. It was only less than a year ago when a Committee was appointed to go into the matter of the availability of sand, and we still await information as regards the Committee's findings.

This Association, along with other coal producers' organisations, have been repeatedly requesting Government for granting adequate representation of the private sector on the Coal Board. Unfortunately, however, this request has not yet been acted upon by Government. The present constitution of the Coal Board is practically departmental except for the Chief Inspector of Mines and Chief Mining Engineer of the National Coal Development Corporation. It is a matter of regret that, while the public sector has been given representation on the Coal Board,—and there is always the danger of its playing a dominant role in the deliberations—the private sector, which is responsible for 75 per cent of the output of coal in the country, is denied the legitimate right of voicing its opinion in the deliberations of the Coal Board. It is essential that the Coal Board should be reconstituted on a broader basis and include the representatives of the private sector. The present position amounts to discrimination on the part of the Production Ministry in favour of the public sector. There is always the danger that the interest of the private sector may be neglected. Moreover, since the Production Ministry seems to depend completely on the advice of technical experts drawn from the public sector, it would not be an unjustified apprehension that the problem of the private sector will not get due emphasis and consideration in discussions with foreign experts or in shaping the overall policy.

The policy of import licences so far as mining equipment is concerned will have to be considerably relaxed because the Coal Industry has been called upon to produce 22 million tons more in the next four years and this can be only achieved by large-scale utilisation of machinery.

Gentlemen, I would assure all concerned that my criticisms are not prompted by any factious spirit but offered with the best of intentions. I would emphatically state that if the above difficulties are not remedied increased coal production targets will not be attainable. Moreover, it is already time that we in this industry should start thinking in terms of the third Plan, and the target to be achieved by 1965. For, current thoughts indicate that the country will need 120 million tons by the end of the third quinquennium. A doubling of production in such manner will necessitate much effort —and, what is more important, preparations being made well ahead. Is it, therefore, too much to ask of Government, in the interest of the second no less than the third Plan, that their policy needs to be reorientated in order that development work is not unduly postponed

I would be failing in my duty if I do not offer our thanks both on my personal behalf and on behalf of your Association to our Coal Controller, Shri P. M. Nayak, who has always given us a patient and sympathetic hearing. I have no doubt that he has appreciated our problems and has done everything in his power to solve them. The recent activities of the Coal Board point in this direction.

The speech of the Chaiman of the Indian Mining Association will be incomplete unless a reference is made to mining interests other than coal. I will now refer to them.

The Mining Leases (Modification of Terms) Rules 1956 were published on the 6th September. The object of these Rules is to bring leases granted prior to the commencement of the Mines and Minerals (Regulation and Development) Act, 1948 into conformity with the Mineral Concession Rules 1949.

A Controller has now been appointed for purpose of these rules with his headquarters at Ranchi. Those with leases covering minerals other than coal, petroleum, natural gas, and minor minerals, should now have submitted their returns to the Controller. If their leases exceed 10 sq. miles in area or if they are at present enjoying a low rate of royalty, they must now be awaiting the Controller's instructions.

Probably the most controversial event of the year has been the advent of the State Trading Corporation, particularly in the way in which the activities of this Corporation have expanded, not only in size, but in the variety of goods involved, ranging from tobacco to iron ore. Originally it was believed that the Corporation would restrict its activities to countries preferring to barter or sell on a Government to Government basis, and originally iron ore only appeared to be involved. Subsequent developments have shown that there would appear to be no limit either in regard to countries, quantities or commodities. At present the Corporation appears to be concentrating mainy on iron ore exports and having granted itself one fourth of the total country's export quota, rumour has it that it contemplates controlling the entire exports of iron ore by the middle of this year. I can only say, "what next?"

On 3rd September, the Government of India reimposed an export duty on manganese ore at rates varying from Rs. 10 to Rs. 30 per ton on ore with a manganese content of over 38 per cent and with varying scales independent of the manganese content. The manganese ore market, like many minerals, fluctuates widely. Having suffered a recent slump, prices have again been good during the year and exporters have not had great reason to complain about this duty. Their next concern will be to know if Government can, as speedily, remove the duty when prices fall as they invariably will.

One unfortunate point about this duty is that the Government machinery is ill equipped to impose such a duty as the Collector of Customs has not an adequate qualified staff, nor the laboratory facilities to carry out the necessary analyses. He is also unwilling or not prepared to accept the results of qualified, world renowned analysts, but insists on independent sampling by his own organisation. To do this work efficiently his organisation would have to be capable of doing the full amount of such work now carried out by all of the local analysts. I have just heard of cases where the Customs Authorities have now informed shippers that they must pay an increased rate of duty on parcels which were shipped five months ago and which have reached their destination, via the Cape, and have probably now been used in the manufacture of steel and for all I know may be on the way to India in the form of machinery. Under the sales contracts the sellers will ask the foreign buyers to pay this additional duty —a request which cannot enhance India's reputation in the worlds' metal markets.

As in the case of coal, the severe wagon shortage has restricted the market and on some lines the volume of traffic also has been restricted by the Railways improvement and doubling programmes. Fortunately these

are temporary restrictions and we look forward to increased traffic movement in the near future.

For exports from some of the Orissa mines considerable assistance has been given by the Railway permitting BOBX Hopper type wagons being used temporarily for ore traffic. Without the use of this there would have been an even greater wagon shortage and the trade is grateful for this assistance.

It is regrettable that there must often be a sting in the tail of my remarks, but the fact is there are no weighbridges capable of weighing these large wagons and their carrying capacity appears to have been rated about 5 tons in excess of what can usually be carried.

Gentlemen, since the mining industry as a whole is faced with so many problems it is only right that all organisations should work in close co-operation. I am happy to say that during the past year we have done so and for this our thanks are due to the other organisations, especially the Indian Mining Federation and the Indian Colliery Owners' Association.

Before I conclude, gentlemen, I want to pay a tribute to the valuable assistance which has been given to me by your Committee, and, in particular, by the Vice-Chairmen, in the past year.

It is sad that during the year Shri Peary Mookerjee who was a member of your Committee passed away. He had served the Association sincerely for a number of years and he was one of its main supports. We have missed him much during the time of crises and his loss to the Association is irreparable.

I thank the members of the Standing Coalfields Committee and the Hony. Joint Secretaries, Shri W. J. Jameson and Shri W. D. Forrest. I also wish to record my deep appreciation of the services rendered by the Secretariat of the Association, the Labour Department of the Bengal Chamber of Commerce and Industry and the Secretariat of the Joint Working Committee.

COMPANY AFFAIRS

THE ORISSA MINERALS DEVELOPMENT CO., LTD.

The profit and loss account for the half-year ended June, 1956, after providing for all charges and making provision of Rs. 1.80 lakhs for taxation and Rs. 82,805 for depreciation, shows a profit of Rs. 1,18,835. Adding the balance of Rs. 1,18,835, brought forward from the previous half-year it totals Rs. 3,36,299. From this, a total sum of Rs. 35,632 has been transferred to reserves under general, tax contingency and development rebate heads, leaving a balance of Rs. 3,00,667 available for disposal. The Directors have recommended payment of a 20 per cent dividend on the 2 lakh ordinary shares, without any deduction for income-tax payable by the Company, which absorbs Rs. 2 lakhs. The balance of Rs. 1,00,667 has been carried forward.

In the period under review, the Company's iron ore raisings have dropped to 148,538 tons from the higher figure of 191,184 tons in the preceding half-year. In despatches also, there has been a considerable fall from 214,729 tons in the previous half-year to 143,521 tons in the period under report. The decline in both raisings and despatches has been attributed to the lock-out following the strike on April 20, 1956, which continued for two months. The steel works order was maintained in the Company's books at 40,000 tons per month during the period.

In the case of manganese ore and manganese dioxide also, raisings and despatches were lower as compared to the preceding period. Manganese ore raisings were 13,525 tons compared to 29,146 tons and sales were about 50 per cent less at 14,025 tons as compared to 22,107 tons in the previous half-year. Manganese dioxide raisings at 395 tons show a sharp drop to less than half of the 800 tons previously, and sales were 1,435 tons compared to 1,711 tons of the preceding period. However, the market continued to improve inasmuch as the prices at which the various grades could be sold during the period were satisfactory. But, according to the Directors, during the first few months of the half-year, the availability of transport was far from satisfactory which was partly responsible for the less than favourable results.

The accounts do not include those of the Eastern Shipping Syndicate, which have been drawn up separately for the period ended December 1956. In accordance with the provisions of the new Companies Act, the accounts of the Company will be made annually henceforth for 12 months-ending June.

THE BURRAKUR COAL CO., LTD.

The accounts, which are drawn up for the half-year ended June last year, show a profit of Rs. 4,23,331 after providing for all charges as well as Rs. 3,20,278 and Rs. 4,93,978 for taxation and depreciation respectively. Adding to the profits Rs. 1,15,376, brought forward from the previous half-year, it amounts to Rs. 5,38,757. From this amount, Rs. 1.28 lakhs has to be deducted, which has been transferred to tax contingency, development rebate and debenture redemption reserves. The balance of Rs. 4,10,757 has been proposed by the Directors to be disposed of by paying dividends on (1) First preference shares, of 7 per cent per annum, tax-free, (Rs. 80,493); (2) Second preference shares, of 6 per cent per annum after deduction of Income-tax (Rs. 9,956) and (3) Ordinary Shares, of 6¼ per cent per annum, tax-free (Rs. 2,84,140). The balance of Rs. 36,168 is to be carried forward.

Compared to the preceding half-year, the raisings as well as despatches of coal were lower at 500,931 tons (518,165 tons in the previous period) and 517,428 tons (526,106 tons in the previous period) respectively. At the Loyabad coke plant, 48,416 tons of metallurgical coke was manufactured during the period as compared to 40,712 tons in the six months ended December, 1955. Relative despatch figures were 48,266 tons and 40,491 tons respectively. The plant went into full production by October, 1956, at an output of 8,000 tons per month.

As a result of improvement in the transport position, the Company's stocks at the collieries were reduced by over 17,000 tons to 30,328 tons.

According to the Directors, the Award of the All-India Industrial Tribunal (Colliery Disputes) caused considerable trouble, as many points contained in it were open to different interpretations. The Rs. 3 per ton increase in the price of coal, they feel, does not fully cover the extra payments to be made to labour under the Award, at the Company's collieries. Further, the Company has not received any instructions regarding the part it will be permitted to play in connection with its expansion programme, so that order for the equipment required to increase output could not be placed.

THE STANDARD COAL CO., LTD.

For the year ended December, 1956, the Company's profits are Rs. 40,064 after providing for all charges and making provision of Rs. 30,029 for taxation and Rs. 1,000 for depreciation. Together with Rs. 17,347, being the amount brought forward from the previous year, and Rs. 70,000, being excess provision for taxation no longer required, the profit totals Rs. 1,27,411. Deducting from this a sum of Rs. 30,000 which has been transferred to general reserve, the balance available for disposal is Rs. 97,411. The Directors have proposed to dispose of the amount by paying Rs. 80,000 in the form of a 10 per cent per annum dividend, tax-free, and carrying forward the balance of Rs. 17,411.

THE BANK OF INDIA LTD.

The Bank's operations during 1956 have resulted in a profit of Rs. 1,05,29,924, which includes Rs. 13,26,630 brought forward from the previous year. An interim dividend was paid for the six months ended June, 1956, at 6 per cent, free of income-tax, on the paid-up capital of Rs. 2.50 crores, which absorbed Rs. 15 lakhs. Provision made for income-tax and super-tax absorbs another Rs. 28 lakhs and bonus to staff Rs. 13.75 lakhs. The Directors have proposed to pay a final dividend, for the half-year ended December, at 10 per cent, also free of income-tax, making 16 per cent for the year, which will absorb Rs. 25 lakhs. A sum of Rs. 8 lakhs has been recommended to be placed to the Bank's reserve fund, leaving Rs. 15,54,924 to be carried forward.

To mark the celebration of its Golden Jubilee, which fell during the year, the paid-up capital of the Bank was increased by Rs. 50 lakhs to Rs. 3 crores, by making a bonus issue to the shareholders of 1 lakh 'A' fully paid shares of Rs. 50 each from that part of the reserve fund representing premiums received on past issues of shares.

THE BANK OF MYSORE, LTD.

The result of the Bank's working for the year 1956 is a surplus of Rs. 20,59,973, which, together with Rs. 1,81,937 brought forward, aggregates Rs. 22,41,910. The appropriations that have been made are: Rs. 4 lakhs as an interim dividend at 12 per cent per annum and a bonus at 4 per cent per annum, tax-free, paid for the half-year ended June; and Rs. 2.50 lakhs transferred to reserve for income-tax and super-tax. The Directors have now proposed to pay a final dividend at 16 per cent per annum, also tax-free; for the year ended December, 1956, which will absorb Rs. 4 lakhs. For income-tax and super-tax, and bonus to staff, Rs. 3 lakhs each have been provided, leaving Rs. 5,91,910 to be carried forward.

COMMODITY NEWS AND NOTES

MORE AREA UNDER RICE

The All-India Second Estimate of Rice for the year 1956-57 puts the current year's area and production at 72,512,000 acres and 23,900,000 tons respectively as against the corresponding adjusted estimate of 71,886,000 acres and 23,515,000 tons for 1955-56, according to the Directorate of Economics and Statistics, Ministry of Food and Agriculture. This shows an increase of 626,000 acres or 0.9 per cent in area and 385,000 tons or 1.6 per cent in production during the current year as compared to last year.

The increase in acreage during the current year has been shared mainly by Uttar Pradesh and Andhra Pradesh and to a lesser extent by Madhya Pradesh, Madras and Bombay and has been generally reported to be due to favourable seasonal conditions at the time of sowing. The increase in production has been reported mainly by Bihar, Assam, Madras, Mysore and Orissa and has been reported to be due largely to favourable climatic conditions during the growing period of the crop. The increase is particularly marked in the case of Bihar.

ALL-INDIA THIRD ESTIMATE OF SESAMUM

The All-India Third Estimate of Sesamum, 1956-57 puts the current year's area and production at 4,996,000 acres and 417,000 tons as against the adjusted Third Estimate of 5,423,000 acres and 434,000 tons respectively for 1955-56, according to the Directorate of Economics and Statistics, Ministry of Agriculture. This shows a decline of 427,000 acres or 7.9 per cent in area and 17,000 tons or 3.9 per cent in production during the current year as compared to last year.

FALL IN RUBBER PRODUCTION

Production of indigenous rubber in India in January this year fell by 724 tons while consumption rose by 32 tons compared with the production and consumption figures of the previous month. According to a statement issued by the Rubber Board, the production and consumption figures for January were 2,190 tons and 2,679 tons, those for the previous month being 2,914 and 2,647 tons respectively. Consumption of imported rubber during the month was 335 tons. Stock with estates and dealers and stock with manufacturers as on January 31 together amounted to 8,982 tons of synthetic rubber.

INCREASE IN SUGAR PRODUCTION

The production and despatches of sugar from indigenous factories amounted to 10.03 and 5.50 lakh tons up to February 1957 in the current season as against 8.96 and 4.48 lakh tons respectively in the corresponding period of the last year. The stocks with the factories on February 15, 1957 stood at 9.81 lakh tons as compared with 8.61 lakh tons last year.

INDIAN HEMP EXPORTS TO ITALY

Prospects of increasing exports of Indian hemp to Italy are good in view of the higher prices of the indigenous product in that country. The price support policy of the Italian Government has increased the price of Italian hemp to a level that Italian industrialists are compelled to import their requirements of the commodity. India is the largest supplier of hemp to Italy and Indian hemp accounted for 2,667 tons out of a total import of 3,869 tons imported into Italy in the first eight months of 1956.

US RUBBER PRODUCTION

US rubber manufacturing industry set two new records in January this year, according to the Rubber Manufacturers' Association. Consumption of new rubber exceeded 140,000 long tons for a new monthly high while production of all types of synthetic rubber was over 94,000 long tons during the same period. New rubber consumption at 140,090 long tons compared with previous peak month of June 1955 when 136,389 long tons were consumed.

FALL IN WORLD WHEAT OUTPUT

World's wheat production for 1956-57 is likely to be about 12.1 million metric tons, some two million tons below the production for 1955-56, according to the report of the UN Food and Agriculture Organisation. The figures do not include production in East Europe, the Soviet Union and China. The report showed that in the US and Canada, the two major producers and stockholders, efforts to cut production had been defeated by high yield.

EXPORT OF PAPER PRODUCTS

The value of paper and paste-board exports from India rose to Rs. 6,000,000 in the eight months April to November 1956 from Rs. 4,600,000 in the corresponding period of the previous year. The value of these exports was Rs. 7,000,000 in 1955-56 against Rs. 6,700,000 in 1954-55. The items in this category consists mainly of paste-board and stationery, the quantity of paper being negligible.

IMPORT OF UNCUT PRECIOUS STONES

The Government of India have decided to allow a small quota of five per cent for the import of rough precious stones, unset and imported uncut including rough diamonds. Under the import policy for January-June 1957 the import of unset and imported uncut precious stones is banned. The permission to import a small quota is, however, being given as a result of representations made by the indigenous industry engaged in cutting, drilling and polishing of precious stones for essential supplies of raw materials requirements.

WORLD WOOL CONSUMPTION

World wool consumption in 1956 rise by 8 per cent to the highest level since the war according to the latest issue of the Commonwealth Economic Committee's bulletin 'Wool Intelligence'. Over the whole of last year world consumption rose from 2,614 lbs. to 2,830 million but the increase was unevenly spread. The most striking growth was in Japanese wool usage which increased in each quarter of last year and which for the whole of 1956 was 41 per cent higher than in the previous year.

RECORD UK OIL OUTPUT

UK oil production reached a new post-war peak in January. British Petroleum announced that its oilfields produced 6,714 tons during the month, mainly as a result of increased production from its Egmanton field in Nottinghamshire, discovered in 1955. The total compares with an average output of 5,500 tons a month before the suez crisis.

Israeli Withdrawal and After

SANER counsels have at last prevailed. Israel has withdrawn its forces from Gaza and Sharm-el-Shaik under the pressure of world public opinion and of the United States which has contributed much to its viability. Besides being the first step in the reopening of the Canal, the withdrawal is a tribute to the United Nations. To the world, especially to the countries east of Suez, it offers much needed respite from tension that lately looked so difficult to relieve. It closes the chapter of aggression in the Middle East story.

But while this augurs well, there is no room yet for *complacency*. The Suez dispute is back to where it stood before the Anglo-French military action in October last year. Besides, there is an important difference between the situation, then and now. Bitterness between the Jews and the Arabs is more acute than ever before. The dispute over the operation of the Canal has at the same time reappeared in its original virulence. The talks between the nationalised Suez Canal Authority and the so-called Canal Users' Association

over the collection and utilisation of the Canal dues presents a problem full of dangerous potentialities.

The Western powers are still opposed to the payment in full of the tolls for the transit to the nationalised company. Their recent proposal is an attempt to reopen the question of nationalisation and that implies a challenge to Egypt's right of exclusive control over the operation of the Canal. Britain and France, with the support of the United States and Norway, have put forward an interim plan for the operation of the Canal under which the Canal dues will be deposited equally with the Egyptian Authority and the World Bank, pending a final settlement on management. Fifty per cent of the dues, paid to the World Bank, would be spent partly on the Canal clearance and its repair and partly kept as a reserve fund. President Nasser has rejected, and rightly, these Western proposals. Its acceptance by him would have implied Egypt's acceptance of an imposed settlement and compromise of its sovereign right over the Canal. Egypt cannot be blamed if it sees in this Western approach an attempt at blackmail, especially as the Western powers have, according to reports, threatened to boycott the Canal.

The threat of boycott is presumably being held out in the hope that Egypt is now in no position to withstand it. Her economic difficulties are reported to be serious. Salaries of high officials in Cairo and of its diplomatic representatives abroad are said to be in arrears and Egypt has defaulted in payment of Communist arms loans. Another indicator of the pressure on Egypt's economy is to be had in the open market value of the Egyptian pound which has dropped from 2.80 dollars to nearly 2.15 dollars.

On the face of it, Egypt's stand is by comparison both reasonable and well justified. Egypt has accepted six principles incorporated in the United Nations formula for settlement of the Suez dispute. The principles are: free and open transit without discrimination, respect for Egypt's sovereignty, insulation of the operation of the Canal from politics, fixation of the tolls by agreement between Egypt and the Canal users, spending of a share of the tolls on improvement and settlement of future disputes by arbitration. Given readiness to arrive at a rational settlement, there should be little difficulty in evolving a formula in terms of these principles that would be in consonance with Egypt's dignity and users' rights. The Menon plan offers such a solution. It envisages Egyptian management of the Canal under some form of supervisory and consultative body consisting of representatives of the Canal users selected on a geographical basis. The guarantees that Egypt gives can be registered with the United Nations, thus making it responsible for ensuring their fulfilment.

It is no use ignoring, however, that peace will not come to the Middle East unless the Arabs accept the fact that Israel has come to stay and that it must no longer be treated as a belligerent nation. Especially, after the unconditional withdrawal of the Israeli troops, there is no basis for either party to the armistice agreement to assert or exercise any belligerent rights. The relevant question, therefore, is what would happen if Israel were to test the right of innocent passage through the Gulf of Aqaba or the Suez Canal? Mr. Hatem, an Egyptian spokesman, has not categorically stated that Israel would not be allowed such passage; but it appears from his statement that his country still proposes to deny that right to Israeli ships as reprisal of its "preventive war" against Egypt. This surely is an over-simplification of a complex issue. After all Israel is not the only law-breaker. Egypt too falls in that category. It was Egypt which, despite the armistice, waged war against Israel by blocking to it the Suez Canal and the Gulf of Aqaba, by organizing guerrilla warfare across the Israeli border, and by ignoring the 1951 resolution of the Security Council which denied Egypt belligerent rights over the Canal.

It will be wrong on the part of Egypt to take too narrow and legalistic a view of its claims as that would only make the area a happy hunting ground for interested parties. The best possible — and perhaps the only practical — solution would be to refer the dispute about the Gulf of Aqaba to the International Court of Justice, while allowing Israel the right of innocent passage during the interim period. So far as the future of the Gaza strip is concerned, the United Nations has to reconcile Israel's claim for the security of her borders with Egypt's sovereign rights in the area. While the control of the area must be restored to Egypt, means will have to be found for preventing violation of the Truce Agreements. Erecting physical barriers like electrified barbed wire fences along the armistice line is, however, both advisable anad practicable, for UNEF cannot obviously be permanently stationed in the area.

Egypt would do well to appreciate that after the Israeli withdrawal from the Gaza strip, it ceases to be the aggrieved party. Now its position is different. If it puts forward too strong demands regarding the control of navigation in the Suez Canal or the Gulf of Aqaba, it may alienate the sympathies of countries whose economies are suffering from the Middle East crisis, and also antagonize the United States which has so far been on its side. Israel also would do well to realize that international guarantees alone cannot ensure its continued existence. Its existence, in the last analysis, would depend on how much goodwill it shows towards its Arab neighbours and how far it can allay their suspicions. In Arab-Israeli dissensions lie the seeds of serious threats to their sovereign status — through foreign intervention or through internal subversion. Eminent Jewish leaders like Dr. Einstein and Dr. Weizmann, who appeared before the Anglo-American Committee of Inquiry on Palestine, asserted that the Jews did not desire to dominate the Arabs. They even offered to meet the Arab leaders to arrive at some understanding. Other leaders of Israel agreed with this assertion. The opportunity to demonstrate this was denied them when the Arab armies tried to wipe out Israel soon after its formation. After the armistice in 1949, Jewish leadership again made overtures to the Arabs. Unfortunately, the Arab leaders were not strong — or courageous — enough to accept the olive branch. However, the position at present is hopeful. A strong Arab leadership has emerged under President Nasser, King Ibn Saud and President Al Kuwatly. It could come to a settlement with Israel without being disowned by the Arab world.

Tightness for Tonnage

THE critical situation which confronts the programme for the development of shipping does not appear to have been fully appreciated. There is a strong trend to decry the target of 900,000 GRT fixed for the second Plan period as a puny target. True, India is aiming at achieving in 1961 a little less than one-half of the tonnage target prescribed by the Shipping Policy Committee for fulfilment in 1954. Under normal conditions no criticism of the target approved for the second Plan would have been too strong. But this criticism has ceased to be of any practical significance just because the outlook for the expansion of shipping is not only not normal but grave. The financial provision made in the Plan for the acquisition of the additional tonnage was admittedly inadequate. After the allocation of Rs. 20 crores for the two government-participated or owned overseas shipping corporations, a residue of Rs. 17 crores was all that was left to take care of the rest of the development programme. There was only a pious assurance that a constant watch would be kept on the situation and measures would be taken to implement the conservative programme in full. Developments so far disclose a steep rise in the prices of ships which threatens the achievement of even the accepted minimum programme.

Government, however, cannot be accused of not being alive to the quick pace of developments. The search for resources in terms of berths at overseas shipbuilding yards, for second-hand ships and provision of finance including credit have continued all along and will have to be continued without remission. The possibility of acquiring second-hand tonnage always formed a plank in the expansion programme. It is, therefore, with a sense of relief that this country has received the news of Senator Humphrey's resolution for legislation authorising the United States Maritime Administration to sell to us twelve Liberty ships from the moth-ball fleet. The resolution is now transmitted to the Senate's Inter-State and Foreign Commerce Committee and it would appear that about a year's time may be required before the formalities for the deal are gone through. Available details of the pending motion show that India will be granted the option of buying twelve Liberty ships of a specified tonnage or a larger number of the same aggregate tonnage. An important condition to be attached to the sale will provide for the use of the ships for coastal services. This condition will not, in fact, operate in restraint of our choice. Our requirements of additional tonnage for coastal operations in the second Plan period have not been properly assessed. The Chairman of the Scindia Navigation Company puts the extent of under-estimation at 60,000 GRT, assuming that old ships are retained in service.

The crux of the problem, however, remains unresolved and it would be an error to minimise its genuine dimensions. A scrutiny of the progress of the shipping expansion programme reveals a most upsetting conclusion. Orders placed for the construction of a tonnage of 170,000 towards the fulfilment of the additional volume required for the second Plan are estimated to have absorbed nearly Rs. 35 crores out of the total outlay of Rs. 37 crores to be provided by the Government and Rs. 2 crores out of Rs. 10 crores to be raised by the shipping companies from their own resources. The outstanding extra tonnage still to be provided, together with 90,000 tons on account of replacements, raises the additional tonnage to be acquired to 220,000 GRT. At current prices it may cost about Rs. 48 crores leaving a wide gap of Rs. 38 crores in the outlay actually provided. This gap cannot be measured in its full implications merely in terms of rupees. The capacity of the Vishakhapatnam yard has been fully booked till the end of March 1961 on the assumption that deliveries of ships will take place strictly according to schedule. The period may be extended further in view of recurring irregularities of supplies of strategic materials. Any additions to the tonnage can be only by means of either new ships to be constructed in the foreign yards or second-hand ships to be purchased abroad. In either case the balance of acquisitions involves expenditure of foreign currency. This is the true character of the challenge.

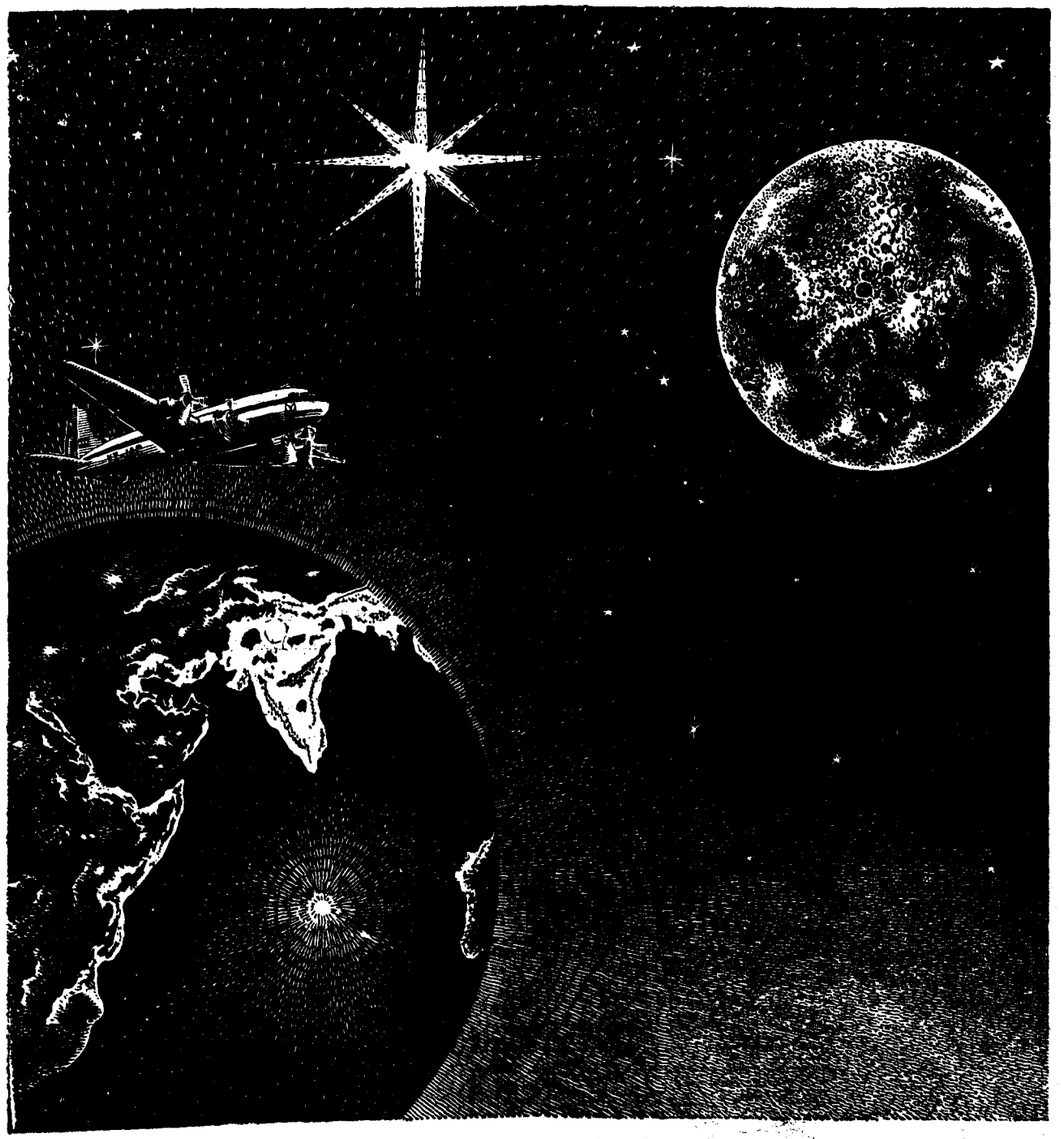
The solicitude of private shipowners for finding a working solution to this hard problem cannot be any the less strong than that of the Government. They have in fact made positive suggestions for a way out of the impasse. Two amounts, more or less equal in value to the balance of Rs. 10 crores now left out of the allocation made in the Plan, can be brought by them into the pool. The one accrues from the depreciation funds and the other can be built out of the instalments due in the second Plan period for repayment of purchase loans advanced by the Government. The presumption seems to be that Rs. 10 crores which they have to raise from their own resources are exclusive of depreciation reserves. The accruals from these reserves and the component of instalments on account of purchase of ships plying the coastal trade fail to answer the hard core of the problem of foreign exchange. At best the contribution on account of loan repayments in respect of ships earning freight revenue in foreign exchange can go directly to reducing the foreign resources gap to about Rs. 40 crores. The success or failure of the modest expansion programme for shipping depends upon our ability to cover this gap. There need be no need for defeatism. This minimum plan must be carried through.

One of the most potent assets of the shipping industry is its capacity to redeem its loan capital at a rapid rate. The whole process of redemption can be pushed through within a reasonably short period of about seven years. Here is an industry which can offer a reliable assurance to make deferred payments punctually out of its current earnings of foreign exchange. This proposal is said to be under the active consideration of the Government at the present time. Its convincing feature is the offer of the initial advance as high as 20 per cent during the period of construction. Available data indicate that Denmark, Norway, the Netherlands, Belgium and Japan will find the capacity of their yards relatively less burdened with cargo liners after 1958, but except for Norway and Japan the pressure of tanker construction will rise in the subsequent period. This trend should caution the advisability of starting immediate negotiations. If action is taken to this end in full consultation with the private sector, it will be proof of this country's earnest desire to supplement the World Bank's loan for shipping by its readiness to resort to a major conventional source. Indeed, it would argue for a sizable Bank loan.

Wide of the Mark

SIR JOHN KOTELAWALA is a colourful personality in the politics of Ceylon. He has a deserved reputation for startling verbal thrusts, and he can hit hard — hardest where Communism is the target of his attack. But unfortunately he can also over-reach himself sometimes, forgetting that the extreme things which can be truly said of Communism are more effectively said in the language of restraint and moderation. Hard words, they say, break no bones, but the former Premier of Ceylon is the last person to be deterred by any such aphorism. His latest performance at the annual meeting of his United National Party is thus of a piece with his native capacity for verbal aggressiveness, although, paradoxically, it does credit to his abiding democratic faith.

This democratic faith, however, cannot extenuate the ridicule he is reported to have poured on Mr. Bandaranaike and his followers. His contemptuous description of the members of the Mahajana Eksath Peramuna (Government Party) in Ceylon's Parliament as "uncivilised fellows who are tree-climbers" is certainly not in good taste. The only redeeming circumstance is that despite his evident bitterness, Sir John Kotelawala has proclaimed his determination to throw out *purely by democratic means* "this strange discordant administration composed of pseudo-democrats, Communists and other anti-democratic elements." Whether the Bandaranaike Government deserves to be thrown out is a matter to be decided by the people of Ceylon. What may interest people in India are the alleged Communist affiliations of Mr. Bandaranaike and his Government and the actual performance of that Government to date.



Sir John has levelled the serious charge that Mr. Bandaranaike "is getting himself and this country thoroughly enmeshed in the coils of the python of international Communism." Continuing, he has also expressed the fear that "like a python, international Communism will wrap itself round Bandaranaike and his Government before completely swallowing them." Shorn of their hair-raising metaphors (which give the impression that the former Premier exaggerates the Communist threat), these statements convey that Communism is gaining ground in Ceylon. This is not unlikely, for every under-developed country in Asia faces the same threat. To say, however, as Sir John fears, that "the Communist Party will surely receive all the funds they need from the embassies of their masters, who, till the M.E.P. Government was formed, sent only instructions for local Communists but could not transmit funds," is something more serious. This may or may not happen, but the responsibility for removing this kind of fear is clearly that of the Bandaranaike Government.

While Sir John may stand on some sure ground in his presentation of the Communist threat, his downright criticism of the Bandaranaike Government's economic policies does not stand close scrutiny. The former Premier has alleged that more money is going out of the country than is coming in, that thousands of educated youths are unemployed and that the country is heading for economic ruin. This picture of Ceylon's economy is belied by facts. The "Economic Survey of Asia and the Far East, 1956" — just issued by the United Nations — records that Ceylon's economy has remained more or less unchanged, that price stability has not been appreciably disturbed and that no marked strain has developed in the balance of payments. What little strain there has been to a trading economy like that of Ceylon is due to the closure of the Suez Canal — resulting in interruption and delay in the flow of imports and exports and involving increased freight and insurance costs. Foreign reserves remain at practically the same safe level as at the beginning of 1956. The country now has a sizable foreign exchange reserve of about Rs. 120 crores.

This is not the whole story, for Ceylon's economy has its other bright facets too. The index of agricultural production, for example, has risen from 142 in 1953 (based on 1934-38 100) to 160 in 1956. The index of per capita cereal production has also risen from 125 in 1953 (again based on 1934-38 100) to 142 in 1956, and the country now produces about half of its requirements of rice locally. Although industry has normally contributed only about 5 per cent to the gross national product, the increase in imports of capital goods from about an eighth in value of all imports in 1953 to about a fifth of all imports in the first half of 1956 is an indication of some industrial advance. The index numbers (based on 1953=100) of quantum of imports and exports in the third quarter of 1956 were 108 and 115 respectively. The budgeted deficit of about Rs. 15 crores for 1956-57 is explained by the increased expenditure on social services, particularly on consumer subsidies for rice and sugar. As at the end of October 1956, the net public debt was only Rs. 94 crores—something considerably less than the 1956-57 budgeted revenue of Rs. 121 crores.

These facts do not, of course, convey that Ceylon's economy is oozing unprecedented prosperity. But neither do they suggest that the economy is heading for ruin. If anything, it appears to be well poised for progress in the context of the recent establishment of the National Planning Council and of the Government's announced industrial policy of State ownership and control of *only* basic industries and of necessary encouragement to private enterprise. It, therefore, goes without saying that Sir John Kotelawala is very wide of the mark in his economic criticism.

It may suit Sir John's internal political purposes to paint a lurid (though misleading) picture of Ceylon's economy under Bandaranaike's stewardship, but it is amazing that he should have considered it necessary to sow some seeds of suspicion in the sphere of relations between India and Ceylon. The insinuation that in order, ostensibly, to forestall Communist subversion, India herself might take over her neighbour, amounts to a gratuitous insult to this country. No such hypothetical situation could arise, for Ceylon will come to have all the basic ingredients of economic stability and prosperity if Sir John Kotelawala stops his scare-mongering and his Party dedicates itself to constructive thinking and effort aimed at neutralising possible Communist influence. That the United National Party is probably thinking on these lines, can be inferred from its decision "to work towards the creation of a democratic Socialist State in the country." The sands of democracy are certainly not running out in Sir John's country.

40 round trips to the moon!

In one year IAC flies over 20 million miles—equivalent to 40 round trips to the moon.

LARGEST internal airline in the East, Indian Airlines Corporation links the cities and towns of India — its 132 daily flights covering more than 20 million miles every year, its staff of over nine thousand ever at your service.

The modern world is a world of flight ... and Indian Airlines Corporation is proud of the role it plays in transporting goods and mail, in bringing the people of India ever closer together ... building a stronger, united nation!

Escape? **Impossible!**

Liquids, steam and gases cannot escape from stuffing boxes, glands and cocks if they are sealed with Turner's "Firefly" asbestos packing. Use it and your worries about leakages are over.

By arrangement with Turner Brothers Asbestos Co. Ltd., England, we make "Firefly" Packings. We spin asbestos fibre into yarns, and then plait these yarns into packings which provide the perfect seal, unaffected by the temperatures and pressures normally encountered in industry.

Turner's "Firefly" Packings are just one of the many technical asbestos products that we at AM & FM make to meet the needs of India's industry. The increasing use of Asbestos is an index to India's industrial progress.

Where There's Industry There's Asbestos

We supply:
'FERODO' BRAKE AND CLUTCH LININGS
'FIREFLY' ASBESTOS PRODUCTS
SPRAYED 'LIMPET' ASBESTOS
'NEWALLS' INSULATION MATERIALS
'PATTINSON'S' BRAND MAGNESIA CHEMICALS
'SINDANYO' ELECTRICAL INSULATING BOARDS

THE WEEK'S NOTES

INDONESIA IN TRAVAIL

WITH THE reported rebellion in Borneo, the writ of the Central Government of Indonesia, at the moment runs no farther than the island of Java. The Celebes, the Moluccas, the entire island of Sumatra—largest and richest in the archipelago —are already under the control of rebellious army officers. If nothing is done to stop the rot seizing the young republic, it is likely to disintegrate into small units, none of which may be in a position to preserve its independence for long. Indonesia thus faces a serious threat to her existence as a nation.

What is politically significant is that all these series of coups, which started in December last, have apparently been easy and bloodless. This obviously means that the army enjoys support of the masses and acts merely as their spearhead. This interpretation is supported by the fact that President Soekarno's several appeals (both in his capacity as Head of State and is Commander-in-Chief) have failed to make even the slightest impression either on the civilian population outside Java or on the defiant army officers. The demands of the rebels are not anti-national in a sense; they are not, at present, demanding a sovereign status for various islands under their control. Their demands, according to Mr. Nasir-ud-din, the Security Chief in the Central Sumatra, are "simple". They are: a change in the Cabinet by the replacement of Dr. Ali Sastraomidjojo; a rapprochement between President Soekarno and Dr. Mohammed Hatta; local autonomy for the constituent units; a rational re-allocation of the Government funds; and exclusion of the Communists from the Cabinet and the "National Council", if they ever come to be constituted under the Soekarno Plan of "guided democracy". In fact, it was President Soekarno's announcement to reorganise the Central Government and his intention to place Communists in key positions that precipitated the present crisis. Should President Soekarno continue to refuse to entertain these demands, it is no longer inconceivable that he may be reduced to the status of a mere figure-head while real power passes into the hands of a number of army juntas. Such an event will be both tragic and ironical; tragic, because it will be the end of a leader who wanted to do but good to his country; and ironic, because in his effort to save his country from army dictatorship he had unwittingly paved the way for it by his plan of "guided democracy".

What can save democracy in Indonesia and its territorial unity is the reconciliation between President Soekarno and Dr. Hatta. The new Government should give top priority to the eradication of corruption and intrigue, grant a larger measure of autonomy to the bigger islands and bring under civilian control the army which, as a result of its "revolutionary" inheritance and guerrilla origin, has too often meddled in country's political affairs. If President Soekarno and Dr. Hatta fail to rise above narrow, personal prejudices, death of democracy and independence in Indonesia will be attributed to them by posterity — and not to the democratic system which they have failed to run.

BEACON LIGHT OF AFRICA

SPEAKING ON Ghana's independence day celebrations, organized by the African Students Association (India), Mr. Nehru rightly observed that Ghana's independence by a peaceful withdrawal of the British ruling authority was an event of "great importance". Ghana is a symbol and witness of that longing for freedom which pulsates throughout Africa. Its independence — a momentous event — will surely give a powerful impetus to the freedom movement in the Continent. Ghanaians have, also, set the general pattern of the struggle -- almost Gandhian — against the domination by a White minority.

The Government of independent Ghana seems to be aware of their country's new role. In his first pronouncement as free Ghana's Prime Minister, Dr. Kwame Nkrumah said that Ghana could contribute most to the independence of the rest of Africa "by the force of its example"; while its failure would gravely harm all those millions of Africans who put their trust in Ghanaians and looked to them to prove that the Africans could build a State of their own based on democracy, tolerance and racial equality. These are words of wisdom. For, the success in the mission he outlined would depend largely upon the success Dr. Nkrumah achieves in forging a new platform for national unity in Ghana herself. Anti-colonial emotions, which forged national unity so long as Ghana was under British rule, can no longer be played upon now that Ghana is independent. And there is especially the problem of reconciling the people of Ashanti, who resisted bitterly British annexation and are hostile to the new regime. The hostility of the Ashantis is partly due to tribal considerations but mainly to the Western way of life. This sets a problem of statesmanship. Coming years will show whether Dr. Nkrumah is able to deploy his talent and imagination to resolve this problem. But it augurs well that he is alive to the difficulties he faces.

On foreign policy, too, Dr. Nkrumah showed maturity and wisdom. He has decided not to align Ghana with any bloc. The country's policy would not in any way be allowed to be affected by the aid it might receive from others. As a realist, however, he has pleaded to the Commonwealth countries to undertake development expenditure in Ghana on a basis of equality and mutual benefit. He believes, and rightly, that the "major role" of the new State in the Commonwealth and international affairs will be that of championing the rights of subject races in Africa and elsewhere. If Ghana follows this policy, there is bound to be considerable scope for co-operation between India and Ghana. The Indian Prime Minister has already publicly stated that nothing would give greater pleasure to the people of India than to render what help they could to the people of the State of Ghana.

MACMILLAN'S DILEMMA

RESULTS OF two more British by-elections, which came last week, go to show that the tide has now definitely turned against the ruling conservative party causing considerable uneasiness to its leadership. Warwick and Leamington is a stronghold of the Conservatives, which Sir Anthony Eden had the distinction of representing for 33 years, and so it cannot be considered a marginal seat like North Lewisham. In the by-election held to fill the seat of Sir Anthony, the Conservative candidate had a bare majority of 2,157 votes over his rival Labour candidate, whereas Sir Anthony during the last General Elections had a majority of 13,466. The Conservative share of the total votes polled dropped by 12 per cent, while Labour's share rose by the same figure. At Bristol West also, the setback to the Tories has been equally severe and pronounced, and the Tory majority has been reduced from 22,981 to 14,162. The pattern of the five by-election results that have come so far is undoubtedly a severe blow to the Tory Government reflecting the unpopularity of its policies, domestic as well as foreign, among a wide section of the people. It is at the same time a clear indication of the definite swing towards Labour notwithstanding the siz-

able votes polled by Independents in some of the elections. The elation among Labour is thus visible in the optimistic forecast of its organ, 'Daily Herald,' which has hazarded the view that if one were to go by the Warwick figures and a similar trend were to prevail throughout the country, Labour would have a majority of more than 260 in a House of 652.

Now the question is whether the Government can postpone a general election for a long time in the face of the popular verdict in the by-elections? Mr. Macmillan is reported to have told a committee of his party in the Commons recently that there would be "no General elections for two years or more," and that his Government would not be "deflected" from its course by the recent losses. This is indeed a pity because there is evidence of considerable discontent even among the rank and file of the Tory party over Government's policies, which has not been removed by the exit of Sir Anthony. However, it is not difficult to understand the dilemma before Mr. Macmillan. If the Government goes to the country now, the chances of victory are undoubtedly uncertain. If, on the other hand, it postpones the election, Government's prestige is likely to be impaired further which it may not be able to retrieve for a long time to come. Interest now, therefore, centres on the remaining two by-elections and there is no doubt that Labour would muster all its resources to hit hard so that it may force Government to order a dissolution of the House.

THE RETURN OF DE VALERA

HAVING CAPTURED 78 seats in the 147-member Irish Parliament, Mr. de Valera's Fianna Fail (Party of Destiny) commands a working majority in the Dail, which is further increased as a result of the decision of Sinn Fein (We Ourselves)—which has won four seats—to boycott the Dail as long as it is in a minority. Two important consequences that the elections have produced are that a man of high personal prestige and popularity has been returned to power and that, with the downfall of the coalition government, a large element of stability has been imparted to the Irish administration. It is perhaps the desire for stability, more than any hope of radical changes, that is mainly responsible for the defeat of the outgoing Government, in which Fine Gael (United Ireland) was the major partner. It is generally held that there is hardly any difference between the two parties on the more important economic policies. However, the animosities that grew out of the civil war of 1922, following the treaty of independence with Britain, are fresh on both sides. Mr. de Valera was opposed to the treaty on the ground that it divided Ireland into two parts. Though the veteran septuagenarian has not given up his stand, the main plank of his party's election campaign was that the coalition government was composed of divergent interests and could be scarcely effective in solving urgent problems. (It will be recalled that the majority in the old Dail comprised the Fine Gael, the Labour Party, Farmers, New Republicans and Independents against the substantial Opposition of 67 members of Fianna Fail).

The most important problems that would urgently engage Mr. de Valera's attention are those of growing unemployment and other economic crises resulting in the evil of poverty. The magnitude of those problems, coupled with outmoded and wasteful forms of agriculture in the country, has assumed such proportions that only a government enjoying the full co-operation of all parties may be able to resolve. For a smooth working of any developmental programmes, the new Government will need to ease the tension created by the raids of the illegal "Irish Republican Army" into the North, of which the vast bulk in the South disapprove. However strong the urge may be for re-union, it cannot become a reality by resort to violence. A friendly approach, on the other hand, may not only generate mutual confidence but lead to immediate results by way of trade and commerce which should contribute to prosperity on either side.

INCOME-TAX POOL: PUNJAB'S CASE

PUNJAB HAS a strong case for a relatively greater share in the divisible income-tax pool on the score of a big strain on the State's slender financial resources as a result of the maintenance of defence arrangements along the 300-mile long border with Pakistan. Up till now the State has been spending a big sum every year on the maintenance of armed police responsible for the maintenance of peace on the Indo Pakistan border. Although the Union Government has agreed in principle to share the border defence expenditure, it seems the greater burden will still have to be borne by Punjab itself. While one would not deny that a general measure of needs furnished by population and contribution should form the main basis in the distribution of income-tax, it would be perfectly justifiable to give a moderate weight to the demand for a greater quota on account of the precarious financial position of the State which, by no means, is of its own making. At present, Punjab owes about Rs. 200 crores to the Centre. According to the Finance Minister, Punjab's debt will be Rs. 181.5 crores by the end of the current financial year. This debt is entirely on account of the Bhakra-Nangal, Harike and other irrigation and power projects and road-building schemes. In fact the Rs. 170-crores Bhakra-Nangal project is mortgaged to the Union Government.

It is not only on account of the maintenance of defence arrangements that Punjab deserves a greater help from the Centre. The integration of PEPSU into Punjab imposes certain obligations on the bigger State to look to the needs of the underdeveloped area. The former State of PEPSU has a budget of some Rs. 9 crores. Last year there was a budget deficit of a little over Rs. 2 crores. Its revenue position is threatened with the expected introduction of prohibition. In this context it may be remembered that the total excise revenue of this area is Rs. 2.1 crores of which Rs. 1.2 crores is derived from liquor alone. The position being what it is, PEPSU is likely to be an additional strain on the already strained financial resources of Punjab. The Finance Commission which is shortly visiting Punjab may, it is hoped, take into account the special conditions in the strategic State and recommend a fair deal appropriate to its rather heavy requirements.

JARDINE HENDERSON, LIMITED

NOTICE is hereby given that an Interim Dividend at the rate of $2\frac{3}{4}$ per cent less Indian Income-tax thereon, will be paid to the Registered holders as on the 6th April, 1957, of the 50,000 Cumulative Preference Shares of Rs. 100 each in the Company in respect of the year ended 31st March, 1957.

The Share Transfer Books of the Preference Shares will be closed from 28th March to 6th April, 1957, both days inclusive.

By Order of the Board,
D. FORDWOOD,
Secretary.

A Window on the World

DESPOTISM OR DEMOCRACY FOR ASIA?

By

ODYSSEUS

FOR the second time, the biggest genuinely democratic general election in the world has taken place in India, without more fuss than is legitimate in what should be a grand, national debate, on policies and personalities, that should set the course of the Republic for the next five years.

Indeed, these elections should do much more than that. The really fundamental questions that need to be asked are:

(1) Is India able to give Asia a practical demonstration that there is another and better form of government than varieties of despotism, autocracy, and dictatorship?

(2) In particular, has India the political strength and know-how successfully to resist the most dangerous of these despotisms—Communist rule?

(3) Can India's federal and state parliaments and politicians produce results? Can they raise the standard of living of India's masses with greater or less speed and efficiency than the Communist regimes?

(4) Can India's democracy fight corruption and provide honest government and administration, with greater or less success than, for example, the Communist Chinese claim to have achieved?

Unless these questions can all be answered with "Yes", the holding of general elections merely paves the way to the general disillusionment that is the prelude to revolutions.

Indian independence has not only set Indians politically free but it has liberated the minds of scholars—Indian and British—from the fear of being thought anti-Indian or pro-British, pro-Indian or anti-British. Before 1857, Britain had a high standard of scholarship on India, from Sir William Jones (1746/1794) onwards. But almost everything written between 1857 and 1947 was distorted by the heat of the nationalist struggle. If you were an Englishman you leafed through any new book on India in order to ascertain whether it was pro-British or "friendly to the under-dog". Equally, if you were an Indian, you skimmed through it to see whether the book was pro- or anti-Indian. If it was "pro", you read it to fortify your own convictions. If "anti", you struggled through in order to refute it. The test pages were those devoted to discussion of India's unity. Any writer who emphasised India's multifarious creeds, castes, peoples, and languages, was pro-British and anti-Indian, because the conclusion was that India would disintegrate into chaos on the day that the British quitted. Anyone who emphasised the fundamental homogeneity of Hinduism, and the blood brotherhood of Indian Muslims and Hindus, was anti-British and pro-Indian, because this implied that the presence of the British was not essential to hold the Indian nation together.

NEW PERSPECTIVE OF INDIA

Today, happily, the British can recognise without dismay that there is a fundamental unity of religion and culture in India, and Indians can admit without disloyalty that pulling against this unity are a diversity of regional, linguistic, and other loyalties. These concessions to the facts can be made because what is at stake today is not who shall rule India, but how best can Indians solve their share of the problems that Providence has seen fit to allocate to them.

These remarks are a preliminary to directing your attention to a book by Professor W. H. Morris-Jones, entitled "Parliament in India", published a few days ago by Longmans Green.

Professor Morris-Jones combines a sympathetic understanding of Indian national feelings with a profound scholarship, enlivened by colourful anecdotes and a pleasingly dry humour. The result is an outstanding contribution towards answering the four questions of my second paragraph—a book which no Indian politician, civil servant, publicist, newspaper commentator, and nobody who wants to understand the mechanics of Indian public life, can afford to overlook.

Professor Morris-Jones begins by noting that India's constitution reveals her to be a union of states in which the federal Parliament has exclusive power to legislate on ninetyseven subjects ranging from defence, foreign affairs, inter-state commerce, railways, civil aviation, and patents, to film censorship. It has the exclusive power to legislate on any matter not enumerated in the other two lists of Concurrent and State Subjects. Where a State law is repugnant to a Union law, the Union law prevails. Moreover, under certain conditions, the Union Parliament can invade the State List, can over-ride the State legislatures, and can take over the entire State by inaugurating the rule of a Governor appointed by the Union President. Not even the existence of a State is sacrosanct, because the Union Parliament can make and unmake States as it wills.

Such a marked central bias must clearly flow from some profound experience of unity. And this we discern in the experience of the hundred years prior to 1947, during which India was governed under a strong unitary system, which coincided with the rapid and increasingly intensive development of all means of communication. Centralisation, resisted for long in the UK, was effected over the vast Indian sub-continent. Such reversal of this centralising trend as was initiated by the devolution of some power to provincial governments was conditioned by the dominating position of the Indian Civil Service, a corps with an all-India outlook. The I.C.S. certainly debated the pros and cons of centralisation, but they did so essentially from the viewpoint of administrative convenience.

Not everyone in India found it easy to grasp the idea of an Indian nation. For the Madrassi villager, even the district headquarters town was often remote enough, while Bengal, the Punjab, or Gujerat, were strange, far-off worlds that scarcely impinged on his consciousness.

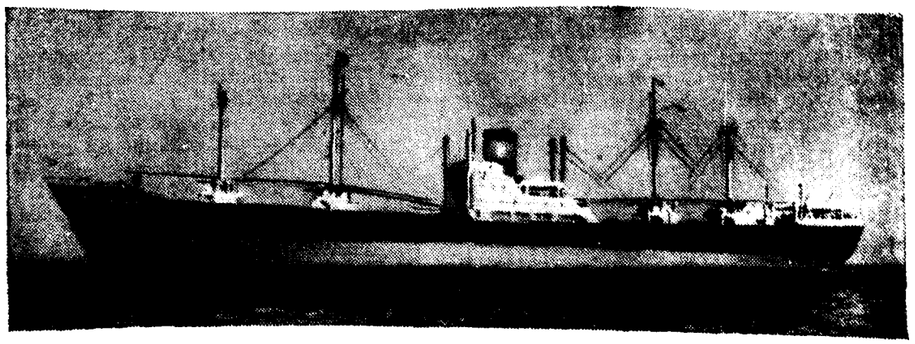
From 1885 onwards, the governmental and administrative emphasis on India's unity was re-inforced ever more strongly by the Congress Party's demand for self-government and by its proclamation of India's political

unity—messages which were ultimately carried to the masses by Mahatma Gandhi's genius.

Came independence, and with it the need for a constitution embodying India's past political experience and designed to fulfill her future political aims. Partition struck a severe blow to national unity, and with the departure of the British the compelling need to suppress regional and other differences in the interests of a common national revolt vanished. Would India's regional loyalties set up pulls stronger than the unifying forces of religion and culture?

If the framers of India's Constitution had enjoyed the experience of unified rule and common revolt in the past, they had also shared common hopes and anxieties for the future, and the unitary character of the Constitution flowed from their hopes and anxieties as well as from their experiences. So that a strong centre was not only the reflection of an existing unity but also a device intended to insure against the as yet untested strengths of regional loyalties and sectional divisions.

INDIA'S TWO POLITICAL UNITIES



The partition of India showed that an economic unity could be shattered on the rocks of political antagonism. The mere existence of a centrally-biased Constitution, plus an all-India economic Plan, might alone have been insufficient to preserve national unity. But, as Professor Morris-Jones shrewdly points out, the two inherited political unities—the unity of the higher administrative service and the unity of India's principal political party—remained intact.

The Indian Administrative Service continues to think in terms of administrative unity far more than would State-recruited services, and with the spread of State Enterprise in great all-India ventures like the new River Valley, the Airways, and other corporations, the unifying influence of the I.A.S. has spread into spheres untouched by the I.C.S.

I have on more than one occasion regretted the absence of a strong political Opposition to the Congress Party. I do not need to elaborate once more the dangers to the preservation of genuine democracy that spring from continued One Party domination. Dictatorship, whether by an individual or a party, is perilous to progress as much as to freedom. A One-Party government is constantly tempted to overcome difficulties and silence critics by police-state methods. A feeble Parliamentary Opposition cannot do much to defend civil liberties.

All this having been said, it nevertheless remains true that were Congress to be defeated in a General Election, there is, for the time being, no prospect of its being succeeded by another strong, all-India party, with experience of government and administration, policy-making and office. Its place could only be taken by coalitions of small parties as stable as quicksand. The farcical history of PEPSU would be repeated on an all-India scale, to the delight of Peking and the Kremlin and the dismay of the free world. If civil liberty is imperilled by prolonged One-Party government, it would vanish in the chaos of No-Party government.

My allotted span for this week is up. I adjourn the attempt to answer the four questions with which I opened. But before closing, I leave you the following thought to mull over: Had it not been for the combination of (1) the British steel frame inherited, and developed, by the Indian Administrative Service, with (2) the national sentiments cultivated throughout the land by the Congress Party in its struggle towards independence, and the experience of men and affairs, and of government and administration, accumulated by the Congress Party over half a century of pre-independence agitation and of pre-independence political office, the answers to be given next week would be gloomy indeed, instead of constituting what I have in mind call "A (Sober) Success Story".

FIDDLING WITH THE INDEX

(From Our Special West European Correspondent)

PARIS, March 9.

THE calculation of cost of living indices is well established in India where it was pioneered many years ago by private enterprise, and has lately been taken up with enthusiasm by labour ministries both in the States and at the Centre. For laymen (and "laymen" here includes almost all the people directly affected, officials, workers and employers) the significance of economic indices remains one of life's great mysteries. Like other mysteries that closely influence our daily life, the cost of living index becomes the subject of much superstition and magical thinking, and can even—as in the case to be mentioned below — bring on acute political schizophrenia. We saw a bad case of Primitive Index Worship in India a few years ago when Delhi devised a national working class cost of living index by averaging out various provincial index numbers—a process rather similar to the ancient Greek practice of identifying every new god they heard of abroad with one of the inhabitants of Olympus: they averaged out three new Syrian goddesses and got Minerva. A much worse case of Primitive Index Worship is now exhibited by the supposedly logical French who at this moment find themselves in the supremely illogical situation where if the price of potatoes goes up by one anna a seer in Paris, the whole economy is let in for an inflationary increase in all wages and prices of about £200 million overnight. Naturally, in this situation the Government's main thought is to stop potatoes going up an anna, so that the Finance Minister comes to resemble a doctor who plunges the thermometer in ice to stop the patient's temperature rising.

A doctor who is really determined to keep the thermometer down will go to extreme lengths, for when a logical mind begins to think magically there is no limit to lunacy. Certain unnamed administrations known to my readers used to have a very simple way of fiddling with a cost of living index that threatened to rise awkwardly: they just falsified the figures so that the index could not rise. But this is cheating and is frowned on by good magicians. Another method is not to take the patient's temperature, but to take somebody else's temperature; the Indian form of this popular subterfuge was to include in the index only the official prices (at which no sales were being made) and ignore black market prices (which everyone paid). The beauty of this form of cheating is that elevated moral reasons can be urged in support of it, e.g. the black market shouldn't exist, so it doesn't exist. Alternatively, the doctor can use a broken thermometer. Popular varieties of broken thermometer exist which record not the patient's temperature today, but what it was ten years ago; these are indices with such remote base-years that they no longer mean anything.

M. Ramadier, who is France's financial doctor today, can use none of these methods so he has devised another. Admittedly, he is using a deliberately broken thermometer (his cost of living index excludes fruit and vegetable prices, for the astonishing reason that "they vary too much") but the wretched instrument still wants to rise. So he pays it to stay down. This costs him £24 million per degree and so far he has spent over £100 million to keep the index down to a "healthy" level. Naturally, this £100 million is all inflationary finance, and thus tends inevitably to make the fever worse, but it keeps the thermometer down and that's what matters in Primitive Index Worship. It is worth seeing how this case of schizophrenia developed because it contains a lesson which it is not too early to learn in India. The lesson is that employers and trade unions should be resolutely suspicious of all official attempts to construct cost of living indices and should if necessary hire economists to protect them from being bamboozled into index worship.

The French retail price index is based on the cost of 213 articles (which were selected and weighted after family budget surveys) in Paris; to this index were related basic wages in Paris and other parts of the country according to the following sliding scale: every 5 per cent rise in the index will require a 5 per cent rise in the basic wage. The index stood at 142 when this connection was established by law in 1952, so the question of a jump in salaries would not arise until the index got to 149.1. For about four years, because of stable prices, there was no danger of this, but since the Algerian war began to generate inflationary tendencies the retail price index has been threatening to cross the fatal line of 149.1. The Government determined to stop it doing so, and to date it has operated by official decree 15 separate manipulations of the prices of certain of the 213 articles. Some of these manipulations have been in the realm of high fantasy: thus a sales tax is taken off dry sausage because it is in the index, but price rises are allowed in garlic sausage because it is not in the index; municipal charges for garbage collection are reduced because they affect the index while beans double in price; and so on. I know a man who runs a bathing establishment and who was highly honoured when his entrance fee was included in the official index —he has just been served with an order to cut his entrance fee to a level that will put him right out of business but which helps keep the index down.

In fact, almost no one in France earns the basic wage (everybody earns more) so this exaggerated care for the consequences of a rise must seem absurd. But the result of five years of index worship is that dozens of other wage agreements, both public and private, are linked to the basic wage and thus indirectly to the famous index. And not only wages and salaries: rents and business leases have been linked to the index too, and in such a way that in certain cases a one-anna rise in the price of milk, by pushing the index over the threshold, could cause a 50 per cent rise in house rents. Moreover, many agricultural products have been linked to the index, more or less loosely it is true: these include wheat, barley, oats, tobacco and linseed. Even this long list of prices that depend on the cost of living index covers only cases known to the Government; heaven knows how many private contracts include a stipulation about variation with the cost of living. Such stipulations are very popular in a country that has had a taste of inflationary depreciation of the currency.

But the automatic effects of a jump in the index are probably less serious than the psychological effects. When everybody waits expectantly for the index to rise to a new plateau, demands bank up like water behind a dam to come rushing out once the fatal limit is crossed. The Government here thinks, and there is evidence to support the fear, that if one 5 per cent rise is permitted, it will unloose such a chain reaction of price rises that another 5 per cent rise will follow in

very short time—and then may be another. So the Government justifies the payment of £100 million of subsidies and tax reductions on the ground that this is cheaper for the economy as a whole than letting all wages and prices rise automatically on the sliding scale. Similarly, a doctor could argue that his patient might get sicker if he knew how high his temperature really was.

For these reasons the technique of fiddling with the index can have a certain limited usefulness, where it is a question of staving off accidental and temporary rises in the cost of living which, if allowed to occur, might have chain-reaction consequences that would not be temporary. In such instances, it resembles the British system of declaring certain goods to be"utility" goods and defending them from price rises while other prices increase, or the system rightly favoured by 'The Eastern Economist' in specific circumstances of paying expensive rice subsidies in order to protect the Indian economy from general wage increases. But when the criterion becomes simply whether an article is included in the official index or not, we have left the field of rational economic policy and are launched on magic.

A grave danger of fiddling with the index is that in the medium run it is self-defeating because it becomes every producer's ambition to keep his products out of the index, so that he can increase his prices without being accused of boosting the cost of living. This leads to the politicalisation of statistics and can have disastrous consequences. The gentleman who runs the bathing establishment will not be so keen next time to be included in the official index. Being an individual, he will probably not have much choice, but where it is a whole major industry, with a powerful lobby in parliament, the pressure to be left out of official calculations can be serious. There is even reason to suppose that fruit and vegetables are forgotten in the French index not so much because of seasonal variations (which can be allowed for statistically) as because the peasants saw what was coming and refused to play. Worse, the pretence of defending the cost of living can become an instrument of political pressure, as when a newspaper that does not support the Government is prohibited from increasing its selling price because the index includes newspaper prices.

The lesson for Indian trade unions and employers to draw from French experience is to think twice about basing any agreements on an index over which the Government has any control. Above all, it is important that no one single index number comes to be the basis of a wide range of price movements. Once too many movements depend on one sliding scale, official policy is to see that the scale never slides. The worship of one index number can introduce an element of rigidity into the economy that is highly embarrassing because every jump from one plateau to the next becomes cataclysmic in nature. Indian officials, like officials everywhere, are fond of casting suspicion on privately constructed index numbers such as are maintained in India by several institutions. Only Government, they say, should calculate such important economic measurements; and of course once officials have the field to themselves they begin to "centralise" the indices and it is not long before one index becomes so important, that the temptation to fiddle with it is irresistible. Cost of living indices have a role to play in economic policy and their importance will continue to increase in India. Honestly used, it is now recognised that they can have an anti-inflationary effect. But to be safe from fiddling they must be multiple in number, regional in application and calculated from base-years that are being constantly modernised.

WORLDGRAM

AGRICULTURE

Grow More Food Programme for Orissa: Schemes costing Rs. 32.08 lakhs under the Grow More Food Programme of Orissa State during 1957-58 were approved at the joint meeting held recently between the representatives of the Union Ministry of Agriculture, Planning Commission, Union Ministry of Finance, Ministry of Community Development and the representatives of the Orissa Government. The ceiling fixed by the Planning Commission for the Grow More Schemes of Orissa State for 1957-58 is Rs. 33.56 lakhs. The Central share of assistance to the schemes so far approved amounts to Rs. 20.81 lakhs as loan and Rs. 6.98 lakhs as grant, making a total of Rs. 27.79 lakhs to which the State will contribute Rs. 4.29 lakhs. This altogether makes an outlay of Rs. 32.08 lakhs for the State's Grow More Food schemes on the basis of present sanctions. The gap of Rs. 1.48 lakhs between the Planning Commission's ceiling and the present sanctions will, however, be made up by a scheme for lift irrigation which the State Government will submit later. Necessary loan and grant by the Centre will be sanctioned on receipt of the scheme.

*

Central Warehousing Corporation: The Central Warehousing Corporation has come into existence. Among the important functions of this Corporation will be the setting up of a chain of about 100 warehouses during the second Five-Year Plan period spread all over India. It will also promote the formation of State Warehousing Corporations in each State which in turn will establish about 250 warehouses at important centres in the States. The authorised capital of the State Warehousing Corporation is Rs. 20 crores divided into two lakh shares of the face value of Rs. 1,000 each. Half of this share capital will be issued in the first instance.

*

Sheep Breeding Schemes: Progress of several sheep breeding schemes from Madras, Bombay, U.P., Rajasthan, Jammu and Kashmir was discussed at a meeting held recently by the I.C.A.R. Goat, Sheep and Wool Committee. The scope of work of the Wool Committee has now been expanded after its reconstitution as a Scientific Committee. It will examine the technical aspects of all schemes connected with the rearing of goats and sheep besides wool development. It will also plan research work and make available the results of research of proved economic value to extension workers for adoption by producers.

*

Green Manuring: Technical programmes connected with green manuring schemes and research on the nature and extent of the intake of different forms of phosphates by leguminous green manure crops and their availability to paddy were discussed by the I.C.A.R. Agronomy Committee, recently. The object of the co-ordinated green manuring scheme is to find suitable types of green manuring crops under different soil and climatic conditions and to fit them into important cropping schemes, both under rainfed and irrigated cultivation. Other important schemes discussed included a study at Khalsa College, Amritsar, of the cost of the reclamation of saline and alkaline lands. Among the reports approved by the Committee were those on Co-ordinated Weed Control schemes in Andhra, Assam, Bhopal, Calcutta, Gwalior, Himachal Pradesh, Madras and Nagpur and a co-ordinated scheme of pasture grasses and fodder production in Bhopal, Bihar, Bombay, Coorg, Mysore, West Bengal, and the I.A.R.I., Delhi (where a grass land survey is being carried out directly by the I.C.A.R.)

INDUSTRY

Manufacture of Cement in India: The production capacity of the cement industry in the country will increase to about 16 million tons by the end of the second Plan period, according to a Government Press release. There are now 28 cement factories in the country of which two are owned by the U.P. Government and the Mysore Government. Of the other factories, all privately-owned, seven are in Bihar, four in Bombay, three in Madras, two each in Mysore, Andhra, Madhya Pradesh and Punjab and one each in Orissa and Kerala. By 1960, it is expected that there will be 64 factories, spread all over the country with a capacity of 16 million tons. Schemes to establish 31 new factories have been approved by the Government of India in addition to schemes for expansion of several existing factories. The new units now approved, will have a total capacity of 5.6 million tons. Of them, seven will be established in Andhra Pradesh, seven in Bombay, three each in Rajasthan and Madhya Pradesh, two each in Assam, West Bengal and Madras and one each in U.P., Bihar, Orissa, Pondicherry and Mysore.

*

Manganese Sulphate from Indian Ores: A new process for the production of manganese sulphate from Indian ores has been worked out at the Central Electro-Chemical Research Institute, Karaikudi. The new process involves mainly mixing of the Ore with a reducing agent—charcoal or coke—roasting of the mixture at a moderately high temperature followed by leaching of the calcine with dilute sulphurid acid. The leach liquor after removal of impurities is concentrated to saturation when crystals of manganese sulphate separate out. Recovery is about 60 per cent. The product obtained is totally soluable in water. Parties interested in understanding the commercial development of the process may correspond with the Secretary, National Research Development Corporation of India, Mandi House, Lytton Road, New Delhi-1.

*

Phenolic Moulding Materials: The Indian Standards Institution has published an Indian standard on methods of sampling and test for phenolic moulding materials, Part I (tentative). Part II of the standard is under preparation. This standard covers the methods of test which are common to the detailed Indian standard specifications for individual phenolic moulding materials. It contains definitions of terms used in trade and industry and methods of sampling. The standard prescribes the methods for determining apparent powder density, density of moulding and bulk factor, time of flow, shrinkage, tensile strength, impact strength, water absorption, acetone soluble matter, electric strength (minute value at 90°C, surface resistivity, volume resisitivity, and power factor and permittivity.

*

Preparing Cuprous Oxide in India: A new method for preparing cuprous oxide has been developed at the Central Electro-Chemical Research Institute, Karaikudi. The operating conditions have been standardised in the laboratory and a pilot capable of producing one pound of copper oxide per hour has been designed, fabricated and operated successfully. Parties interested in undertaking the commercial development of the process, which is covered under Indian Patent Nos. 52394 and 56532, may correspond with the Secretary, National Research Development Corporation of India, Mandi House, Lytton Road, New Delhi-1.

*

Hydrants for Fire Fighting: The Indian Standards Institution has issued, for eliciting comments, three draft Indian standard specifications for hydrants used

for fire fighting purposes. These three drafts cover stand post type hydrant and under ground hydrants, sluice valve type and double valve type. The drafts lay down requirements regarding materials, dimensions, constructions, workmanship and finish. Comments on these drafts may be sent to the Indian Standards Institution, 19, University Road, Delhi-8 before May 1, 1957.

*

Drafts Standards for Three Varieties of Cotton Cloth: Three draft Indian standard specifications for cotton cambric, scoured, cotton mosquito netting square mesh, dyed, and cotton cellular shirting dyed have been issued by the Indian Standards Institution for eliciting comments. These drafts cover general requirements, such as quality of yarn and cloth; and specific requirements such as ends and picks per centimetre (or inch), weight per square metre in gram (or per square yard in ounce), constructional details and warpway and weftway breaking strength, length and width and shrinkage of cloth. References to relevant Indian standards for determining the values of characteristics given under the specific requirements have been mentioned in the drafts.

FINANCE

World Bank Loan to Air India: The world Bank announced that Air India International has arranged to borrow $16,800,000—$11,200,000 from five United States Commercial banks and $5,600,100 from the World Bank —to buy three long range jet passenger planes. The loan, which carries the guarantee of the Government of India was signed in Washington on March 5, 1957. It bears an interest of five and a half per cent per annum including the one per cent commission charged by the bank. Amortisation will be in four semi-annual instalments beginning April 1, 1956 and ending October 1966.

*

Rise in Britain's Gold and Dollar Reserves: The Sterling area's gold and dollar reserves rose by $63 million during February, the British Treasury announced recently. The total reserve—a barometer of Britain's economic position—stood at $2,147 million on February 28. On provisional figures for the month the UK had a surplus of £8 million with the European Payments Union, clearing house for European trade—the second successive profit in monthly trading with Western Europe. The rise in the Reserves during February is almost entirely due to India's withdrawal during the month of $59 million from the International Monetary Fund. Such withdrawals are automatically banked in gold dollar reserves.

TRADE

Schedules to Indo-Polish Trade Agreement Extended: Letters were exchanged in New Delhi recently between Shri S. Ranganathan Secretary, Ministry of Commerce and Consumer Industries and H. E. Mr. J. Grudzinski, Ambassador Extraordinary and Minister Plenipotentiary of Poland in India, extending the Schedules to the Indo-Polish Trade Agreement, signed on April 3, 1956, up to December 31, 1957, with the following modifications:

Schedule 'A' (Import from Poland into India).
The following items have been omitted·
- Electric fans,
- Sewing Machines,
- Rayon Fabrics and
- Bentwood Furniture.

Schedule 'B' (Exports from India to Poland)
The following items have been added:
- Flax manufacturers,
- Paints and lacquers,
- Bristles,
- Plastic goods.
- Electrical accessories,
- Hardware,
- Boots and Shoes,
- Linoleum,
- Canned fruits and meat products,
- Jams, chutneys, pickles, fruit squashes and sauces,
- Soap and toilet products and
- Cashew shell oil.

The trade between the two countries has been on the increase since the signing of the Agreement. The exports during April-November, 1956 from India to Poland were valued at Rs. 76.22 lakhs as compared to Rs. 32.60 lakhs during 1955-56. Imports from Poland during April-November 1956 were valued at Rs. 192.07 lakhs as compared to Rs. 43.15 lakhs during 1955-56. The main items of Indian exports to Poland are: Mica, iron ore and hides and skins. Main items of Polish exports to this country are metals, iron and steel goods and paper.

*

Sandalwood Oil for Export: Grading as a means of exercising quality control is being extended to cover more commodities within its purview. Under the sandalwood Oil Grading Scheme which forms part of the Essential Oils Grading Scheme, all sandalwood Oil which is earmarked for export from this country is being compulsorily graded under Agmark with effect from February 1, 1957.

GENERAL

New Agreements for Machine Tools Production. The Government of India have signed a new Agreement with Oerlikon Machine Tool Works Buehrle and Company, Zurich-Oerlikon, the Swiss firm of consultants for the Hindustan Machine Tools (Private) Ltd., Bangalore, the effect of which will be terminate the financial partnership of the Swiss firm with the Government of India in the management of the Company. This agreement, which supercedes the agreement date l March 28, 1949, stipulates for the transfer by the firm of the shares, valued at Rs. 30 lakhs, held by them in the Hindustan Tools (Private) Ltd., under the original agreement, on payment to them by the Government of India of the value of the shares together with interest thereon from the date of investment, after deducting the interest already paid and subject to a maximum of the sum equal to the interest on the share capital for a period of five years at 5 per cent.

*

Industrial Disputes and Relations in India: The time-loss due to industrial disputes during December 1956 declined by 38.3 per cent as compared to the preceding month, according to the Labour Bureau, Government of India. The total time-loss during the month was 2¾ lakh man-days. This figure was also lower than the monthly average time-loss during 1955 by about 43.1 per cent. The number of fresh disputes during the month was 78 and those involved 35,880 workers. The corresponding figures during the previous month were 83 and 29,938 respectively.

*

Development of Sericulture and Handicrafts: Schemes for the development of cottage industries, in respect of handicrafts and sericulture, for the year 1957-58 prepared by the various State Governments have been discussed between the representatives of the Ministries of Production and Finance, representatives of the All-India Handicrafts Board and the Central Silk Board and of the State Governments in a series of meetings held in New Delhi in the last few days. About 165 such schemes in connection with development of sericulture were received by the Central Silk Board from the various State Governments while the All-India Handicrafts Board received about 200 schemes for the development of various descriptions of handicrafts.

NEWS IN BRIEF

INDIAN

The production and despatches of sugar at indigenous factories amounted to 11.69 and 6.35 lakh tons up to February 28, 1957 in the current season as against 10.67 and 5.98 lakh tons respectively in the corresponding period of the last year.

*

The Indian Standards Institution has issued for eliciting comments a draft Indian standard specification for ready mixed paint brushing, oil gloss, genuine zinc oxide, for general purpose.

*

A Financial Agreement was signed in New Delhi recently between the Government of India and the Government of the Union of Burma.

*

The total required road mileage for India under the Nagpur Road Plan is 3,31,000 (of which the surfaced mileage is 1,23,000).

*

At the beginning of the first Five-Year Plan, India's total road mileage was 2,48,509 (with 97,546 miles of surfaced roads) which rose to 3,16,668 (with 1,21,617 miles of surfaced roads) at the end of the plan period.

*

Under Community Development Projects and National Extension Scheme, a total road mileage of 44,259 (of which 6,120 was surfaced) was constructed during the first Plan period.

*

During the first Plan period, 30 major bridges on National Highways and 3 on other roads in the Central sector were constructed and 42 bridges were in progress at the end of the first Plan which will be completed during the second Plan period, and, in addition, construction of about 72 major bridges will be taken up.

*

Under the second Plan, a provision of Rs. 55 crores has been made for the development of National Highways which will include construction of 1,200 miles of missing links and 114 major bridges and improvement of 4,000 miles of existing sections.

*

For the development of the gur and khandsari industry, the Ministry of Production has sanctioned grants and loans amounting to Rs. 4,90,600 to be utilised during 1956-57

*

The Government of India have decided to construct a dam across the river Sankh near the Rourkela Steel Project to augment the supply of water to the steel plant and township being built there.

*

The Government of India have decided to continue for one more year the grant of subsidy for the sale of detoluated benzol as motor benzol to be used as an admixture with petrol.

*

The production of soda ash, caustic soda and liquid chlorine—basic chemicals required for the development of chemical industries required in the country—is to be increased nearly four-fold during the second Five-Year Plan.

*

The Ministry of Production has sanctioned a loan of Rs. 2 lakhs to the Government of West Bengal to implement the scheme for stabilization of the raw silk market.

FOREIGN

World production of tin-in-concentrates in 1956 (including China but excluding Russia) was 174,500 tons or 2,500 tons below the previous year.

*

No new taxes or duties are proposed in Norway in the coming financial year. The Finance Minister proposes to increase the State cost of subsidies from £24.75 million to £29 million, the rise being required to cover the increase in subsidies on milk introduced subsequent to the passing of the current years Budget.

*

The Nigerian Government has proposed removal of the import duty in newsprint and reduction of import duties on cocoa and solid chocolate by 50 per cent in its 1957-58 budget presented to the House of Representatives.

*

It is reported Israel will participate in the Marseilles Fair this year, opening on September, 14. This will be the first time that Israeli firms will be represented at a French trade fair.

*

It is reported US coal production is capable of reaching 1,000 million tons per annum, or double the current rate of production.

*

Canadian newsprint production and deliveries rose substantially in January, production amounting to 558,564 tons, or 6.7 per cent more than the previous January's 523,319 tons.

*

Paper production last year was down slightly on 1955, states the Board of Trade Journal. Weekly average output of all types of paper was 45,382 tons in 1956 against 45,901 tons in the previous 12 months.

*

South African foreign trade totals for 1956, now available, show a deficit of £81.7 million, against £112 million, in 1955.

*

It is reported an agreement on the amount of West German reparations to be made available to Israel in the fiscal year starting in April 1, 1957 has been signed by Bonn.

*

South Africa's total gold and foreign assets in the week ended February 22 totalled £133,836,000 compared with £31,883,000 a week earlier.

*

Italy's industrial output last year rose by 8 per cent compared with 1955, and this despite a comparatively unfavourable year for Italian agriculture and the difficult fiscal situation during the last few months of the year.

*

Consumption of both natural and synthetic rubber in the United States advanced in January to 140,090 tons, a figure 18 per cent higher than the 118,505 tons used in the previous month, and comparing with a total of 132,231 tons for January, 1956.

*

'The Tulsa', Oklohoma Journal reports that free world crude oil production climbed 660,200 barrels daily last December over the November total to bring production to 14,358,400 barrels daily.

*

It is reported that income-tax would be imposed on income from rubber, tea and coffee cultivations in Burma.

For every hour in the air, a Clipper receives two hours of maintenance on the ground.

Every day Clippers must pass the world's toughest fitness test

Before and after each flight, a rigorous inspection is made of all operating parts. Even in flight, the state of a Clipper's* health is under constant scrutiny—through the electronic eyes of Pan Am's Engine Analyzer.

Every 11 weeks engines are taken down with critical interest. Instruments probe vital parts. From nose to tail each square inch is thoroughly inspected, every part replaced at the slightest drop from peak efficiency.

AMERICAN FOUNDATIONS IN INDIA

ONE of the striking features of the American way of life is the systematic organisation of private philanthropy. The growth of business and industry in an expanding economy during the last seven or eight decades in the United States resulted in the amassing of large personal fortunes by the captains of industry who, however, diverted a large part of the funds for the welfare of fellow human beings. The same enterprise and ability shown in the development of business was displayed in the organisation of philanthropy so that today it is estimated that there are several thousand active foundations in the United States (seventy-five of them having assets of $10 million or more) devoted to the service of humanity. Non-political and independent, these foundations have exerted great influence in the advancement of human welfare and it will come as a surprise to many that by their experimental activities, they have influenced in many fields social patterns and institutions, private as well as governmental. For example, the Rockefeller Foundation is stated to be not a little responsible for setting the pattern for the public health programmes of the United States and for many of the agricultural programmes subsequently carried on by the States and local governments. While many of these foundations have confined their activities within their country, some of them have transcended their physical boundaries and embraced many parts of the world. An attempt is made here to explain the activities of two of them, the Ford and Rockefeller Foundations that are extending their help to this country in its fight against poverty and for raising the standard of living of the masses.

The Ford Foundation, which was founded in 1936 embarked on a career of an expanded programme in 1951—thanks to the additional resources made possible by increased gifts from its founders—with the following principal objectives: promotion of international understanding and world peace; advancement of economic well-being; expansion and improvement of education; and enlargement of scientific knowledge of human behaviour. Its one major course of action in the contribution to international peace has been to help some of the less developed countries of the world to overcome their low standard of living and learning and its programme of development is conducted entirely in the Near East and South and S.-E. Asia. Apart from India, the Foundation is now making grants for development activities in Burma, Egypt, Indonesia, Iran, Iraq, Israel, Jordan, Lebanon, Nepal, Pakistan, Syria and Turkey. As these countries are faced with more or less similar development problems, the Foundation's grants are marked by a uniform pattern. The main purposes are: improving rural life and educational institutions and practices; increasing the effectiveness of government operations through training and improvement in administration; and encouraging development through research on fundamental social and economic problems. During the last five years, the Foundation has sought to translate these objectives through effective grants and by establishing a flexible pattern of development. It has given assistance in two ways; by making grants to public and private agencies in these countries and by enabling them to make use of expert consultants. The basic consideration has always been to give support wherever it can to democratic endeavours in the several countries aiming at a higher standard of living.

The Foundation's work in India since 1951 lay in assisting the Government with financial aid in a wide range of activities nearly all of which were connected with the Five-Year Plan. Broadly they covered the following five main groups: rural development with special emphasis on training men and women for village work; development of small industries; advancement of education; strengthening of public administration and cultural interchange. The total grant on these heads so far has been of the order of about $17 million. The Foundation after formulating the programmes in consultation with appropriate Government agencies that are consistent with its objectives makes available financial assistance and once the programme is launched, it is directed and administered by the Government. All the projects supported by the Foundation are designed to be continued on a permanent basis even after the termination of the Foundation assistance. The method of financing is generally based on the following pattern. The Foundation makes funds available over a period of three years paying all costs in the first year, half in the second year and one-third in the third year. The Union and State Governments make up the balance and bear the entire cost of the projects after assistance from the Foundation stops. Apart from Government, a few special projects involving private agencies have also been granted assistance.

Among the various Government projects to which the Foundation has lent assistance, special mention must be made of the rural development programme and small industries development. The Foundation has assisted in 15 pilot projects which the Ministry of Agriculture proposed as the forerunners of the present community projects and the subsequent National Extension Service. Apart from the projects, the Foundation has given support to the programmes for training men and women at all levels for rural development work. It had also assisted in the setting up of an Evaluation Organisation by the Planning Commission to evaluate the methods and effectiveness of rural programme as a guide to future planning. For development of small industries, the Foundation sponsored late in 1953 an international study and planning team which visited the country and drew up a comprehensive plan to revitalise the industry. Many of the proposals of this far-reaching programme have been put into action by the Government. The Foundation has sanctioned grants not only to provide architectural services in the constitution of the four institutes proposed by the team but also for the purchase of equipment and for the services of foreign consultants. Among other projects aided by the Foundation, mention should be made of its contribution in the field of education, research in economic and social sciences, public administration and in book publishing. With regard to public administration, the Foundation sponsored the visit of Mr. Paul Appleby whose report has helped the Government considerably in their several important reorganisation proposals in administrative structure and methods. It has also made available funds to the Institute of Public Administration in financing its programme which includes the training and foreign study of administrative persons selected by the Government. In the matter of book-publishing, it has sanctioned a grant to the Southern Languages Book Trust to sponsor the publication and distribution of good books at low cost in the four regional languages of the South. Apart from these, the Foundation awards annually fellowships to young Americans for studying special aspects of Indian affairs and assists American Universities to carry on research in India which would

A Letter to the Editor

"ANOMALOUS POSITION OF THE SECRETARY UNDER THE COMPANIES ACT, 1956"

Sir,

One company in New Delhi and a banking company in Lucknow have written to me questioning the correctness of the undermentioned passage in my contribution which was published in 'The Eastern Economist' dated November 16, 1956.

> "For one thing at least his responsibility is full. For example for failure to give notice in writing to the company as required by section 308(2) making disclosure of his shareholdings he will be like them risking heavy punishment of imprisonment for a term which may extend to two years or fine which may be up to five thousand rupees or both."

The first company states that on a reading of section 308(2) no such provision, as has been quoted by me, is found in the Act which casts responsibility of the nature referred to. The second company says my remarks do not appear to be correct because section 308(2) requires the formality to be observed only by directors or by a person who is deemed to be a director in terms of section 307(10)(a).

I wish to clarify the position thus—

Failure to give notice in writing, making disclosure of shareholdings, is stated by section 308(2) and the punishment is prescribed in sub-section 308(3). Sub-section 308(1) says that "every Director of a company, and 'every person deemed to be a Director' of the company, by virtue of sub-section (10) of section 307, shall give notice, etc." And sub-section 307(10) says that "any person in accordance with whose directions or instructions the Board of Directors of a company is 'accustomed to act', shall be deemed to be Director of the company". Surely, the Secretary being the person on whose directions the Board is generally accustomed to act, shall be deemed to be a Director of the company. It may be that the Secretary's advice may not always be acted upon, or in full. Anyway, "for the purposes of this section (307)," he is a person to be deemed a Director. Para 5.013 of "A Layman's Guide to the Indian Company Law" published under the authority of the Government of India says in this connection. The Directors will ordinarily be held to act according to the instructions of a person (Secretary), if they are in fact in the habit of doing so, not out of love and affection, but because of any influence which that other person may exercise over the Directors 'by reason of his shareholding or otherwise'. Surely we are dealing only with Secretaries who hold shares and who are also in the position of exercising some influence over the Directors by virtue of their considerable knowledge of the respective companies' affairs.

And for default made in complying with sub-sections (1) and (2) of section 307—to maintain a register of directors' shareholdings, etc.—every "officer" of the company who is in default is punishable. The punishment for such default stated in sub-section 307(3) is for default in maintaining the Register, while the punishment for the Director concerned, and one deemed to be a Director concerned for the purposes of the section, is prescribed in sub-section 308(3)—imprisonment for a term which may extend to two years or fine which may extend to five thousand rupees or both. This is one reason.

There are still better reasons for the conclusions I have drawn. I have explained in detail in my original article how under the Companies Act, 1956 the Secretary is ranked equally with the Manager or as an alternative to him and also for certain purposes specified in many sections he is bracketed not only with the Manager but the whole hierarchy of managing personnel: director, managing agent, secretaries and treasurers, etc. Please see the definition of "officer" in section 2(30) and the definition of "responsible officer" in the Companies (Central Government's) General Rules and Forms, 1956 in Clause 2(1)(v) (b).

Now dealing particularly with the register of shareholdings and disclosure by the "officers" of the company, regarding such details to enable the company to maintain such a register, I have to invite your attention to Forms 32, 33 and 34 prescribed by the above mentioned Rules and Forms, 1956. Form No. 32 purports to be "Particulars of Directors, Managing Directors, Managing Agents, Secretaries and Treasurers, Manager and 'Secretary'—pursuant to section 303". Column 5 of this Form may also be noted where other directorships, managing agencies, secretaries and treasurerships, managership and 'secretaryship' are clubbed together. There are similar features in Form 33 where there are "Alterations in the particulars" of exactly similar officers. Again in the title to Form 34, regarding the maintenance of another register, pursuant to section 306, similar characteristics are seen.

So, where in the Act, for certain purposes, all these offices are clubbed together and a punishment is prescribed in the same section for any default by any of them, it should be reasonable to infer that every one of them must merit the same degree of punishment for the same kind of default. An argument will be necessary only if one says that the Secretary alone among all these officers is to be treated differently: no section in the Act makes such specific discrimination for a lesser liability to the Secretary for a common default by the company or a common kind of default by individual "officers" of the company.

It will be seen therefore, that while the framework of the statute seems to impose equal liability on the Secretary for defaults only, as in the case of the other "officers", the Secretary is discriminated against for all other advantages or remuneration, etc. that are the privileges of the others to enjoy. Hence my development of the theme 'Anomalous Position of the Secretary.'

Yours faithfully,

C. V. NARAHARI RAO

COIMBATORE,

The Business World

MORE ABOUT THE U.S. TRADE MISSION

By

(CROESUS)

THE US Trade Mission has been here for a full week and though nothing concrete can be said to have emerged as a result of the discussions, I am in a position to state that there is now a better understanding of the respective points of view among Indian business men and the members of the Trade Mission. This is very important because, as more than one Chairman of the commercial bodies with which the Mission had discussion pointed out, a technically and industrially advanced country such as the US can be of immense benefit to an underdeveloped country such as India and that too especially at the present time when the latter country has an ambitious plan of economic development in the form of the second Five-Year Plan.

As has been pointed out in the columns of 'The Eastern Economist' ere now, it is becoming quite clear that India will have to depend more on imports of American capital goods than on those from other countries, not excluding West Germany. It is not that European countries like the UK, West Germany, and, for that matter, even East Germany, are not prepared to export capital goods to this country. But their commitments, especially in the case of the former two countries, in respect of military responsibilities connected with the NATO, might not enable them to increase their exports of capital goods to this country to the extent that they might wish and we might desire. But this is not the position in regard to the USA.

Mr. G. P. Kapadia, Vice-President of the Indian Merchants Chamber, observed last week, when the members visited the I.M.C., that America has "abundant capital resources, invaluable experience and technical know-how mastered through many years of industrial development and technological advancement and, above all, the willingness to assist underdeveloped nations in the task of reconstruction. It is a recognised fact that foreign investment has great potentialities for speeding up economic development and raising the standards of living of the underdeveloped countries. It is, therefore, essential that the advanced countries like the USA should take the leadership in promoting these high levels of trade that will bring to all the economic strength upon which the freedom and security of all depends".

It was appropriate that on the same occasion Mr. Kapadia should have also surveyed the trade between the two countries in recent years to provide a background to the prospects for expansion in the volume of Indo-US trade. India's share in the US total imports is barely two per cent. But even so, India supplies to America a large variety of strategic and essential materials, such as Manganese, Mica, Jute, and, Tea, among others. In return, India imports from the US industrial and other machinery, vehicles, patroleum products, etc.

The break-up given alongside of imports and exports for the years 1954-55 and 1955-56, which Mr. Kapadia gave, provide a comprehensive picture of the present pattern of Indo-US trade.

Incidentally, the I.M.C. Vice-President dwelt too on India's intensive efforts lately to find new markets for Indian products of semi-manufactures in the U.S.A. as in other advanced countries and made a passing reference to the gradual decline in the exports of some of our traditional items to the U.S.A., thanks to the emergence of synthetic substitutes, but, at the same time, he added, the position has been retrieved, to some extent, by exports of home furnishings, handloom fabrics etc. on a steadily increasing scale, and it is expected that, ere long, there might be a growing market in the U.S. for Indian teak furniture, arts and crafts and other cottage industry goods. Some of the members of the Mission themselves pointed to the growing market in America for these typically Indian goods, and it is to be hoped that the possibility of introducing these goods on a larger scale in the American market will be thoroughly explored and that the Mission will interest American business men to go in for more and more of these goods.

It is very necessary that America should take more of Indian goods if India is to be enabled, in her turn, to import capital goods from America in order to implement the second Five-Year Plan. During the second Plan period, it has been estimated that India's requirements of capital goods from abroad, including those for replacement, would amount to Rs. 16,000 million, which gives an idea of the amount of foreign exchange that is necessary even after taking into account all the conceivable foreign exchange earnings that India can account for during this period by special export drives and so on.

But our problem is not only one of foreign exchange but also of getting our supplies of capital goods on long-term credit from our overseas suppliers; the minimum period for which such credit is needed is seven years, as the Government of India has indicated. Mr. Kapadia did very well, therefore, in asking the Mission to explore the possibilities of securing phased long-term credit. In this connection, it is of interest to refer to what Mr. Robert W. Kerr, one of the members of the U.S. Trade Mission, said, when he met members of the Maharashtra Chamber of Commerce. As a result of their talks with Indian business men, he said, the members of the Mission would be able to make certain

recommendations to private U.S. investors that might increase the flow of U.S. capital to India. But he took care to add that one of the best ways to attract U.S. capital to India was to make the deal attractive to American business men. I do not know, as it was not possible for me to be present at this meeting, whether Mr. Kerr dilated on how to make the deal attractive. He also wanted Indian business men to remember that India was competing with several other countries for U S investment and that, therefore, unless India's terms were competitive, the American business man might prefer or find it more attractive to invest elsewhere. But Mr. F. Preston Forbes, the Leader of the Mission, mentioned, in the course of his talk to press men, the example of Netherlands Government, which has introduced many incentives for getting foreign aid, and listed concessions in taxation and assurances as to availability of labour. His reference to concessions in taxation provoked a pressman to ask him whether he found Indian taxation very high, to which the Leader of the Mission replied. "Your taxation is not certainly low". As regards availability of labour, there should be no difficulty with all the surplus manpower — there is an annual accretion of two million to the working population alone — that India has. While this is perfectly understandable, it is a moot point whether India would be able to offer the same terms as, say, for instance, some of the other American countries, where the return of outlay is believed to be as much as 18 to 20 per cent!

It seemed to me that on the specific question of long-term credit, Mr. Kerr, who said that this was the one question that the Mission was confronted with wherever it went, was rather doubtful of the extent to which American manufacturers would like to sell on long-term credit to a distant market, especially when they have not only a vast material market but also relatively more attractive market nearer at hand. Nevertheless, it is significant that he made a specific reference to certain private U.S. banks which were coming forward to lend money to enable overseas buyers to purchase in America, and cited the instances of the Air-India International buying Boeing Air-planes with the help of these banks. Here is a field of suppliers' credit that needs further exploration.

Any effort at expanding the volume of Indo-American trade, it must be noted, is worth while not only for this country but even for America itself. America must realise and the talks of the Trade Mission convinced one that America has done, so, that a stage has been reached when the production potential of America has far surpassed the needs of even her vast internal market and must needs have a growing export market for an outlet; otherwise, there would be a hiatus, if not a complete halt, in the further expansion of the U.S. economy. In other words, it is not improbable that the American economy would cease to be dynamic which, I daresay, is something that no sane American would view with equanimity.

Finally, reference must be made to the imperative necessity for the conclusion of the long-pending Indo-American Treaty of Friendship and Commerce, which, as Sir Chunilal B. Mehta remarked, at the reception to the Mission accorded by the Bombay Rotary Club, 'is the best means of guaranteeing increased trade between the two countries'. The need for this has been stressed time and again by the commercial bodies in this country. I very well recall the speech made on June 19, 1946 by Mr. Mahomed Husein Hasham Premji, the then President of the Indian Merchants Chamber, when the Chamber representatives met the late Sir Girja Shanker Bajpai, who was at that time Agent-General to the Government of India in the United States of America, when he declared that the problem of Indo-American commercial relations would be more fully solved by entering into a direct treaty of commerce and navigation with America. The proposals in regard to such an agreement had been put up some years even before then. But it is not known at what stage the proposals for such an agreement stand. It would make an interesting disclosure if the authorities, both in India and America, were to go into this question and give a statement as to the history and fate of the said proposals.

help in building a sound body of knowledge on Indian problems.

Created in 1913 by a special Act of the legislature of the State of New York as a separate body to "promote the well-being of mankind throughout the world", the Rockefeller Foundation has confined its activities to certain special fields like public health and medical education, biological and medical research, agriculture, the humanities and the social sciences. The Foundation has always laid emphasis on encouraging talent and the development of leadership and with this object has awarded a number of fellowships and travel grants which have been held by individuals from 98 countries and territories.

The Foundation's work in India started in 1920 in Madras Presidency with hookworm studies and control measures and since then its activities have expanded considerably. The health and medical programmes of the Foundation have always been carried on in co-operation with the Central and State Governments. Emphasis in the earlier period was given to public health services, field studies and the training of personnel. But recently, it has given support for research in virus diseases, medical education and research and population studies. The Foundation has contributed towards the building and equipment of the All-India Institute of Hygiene started in Calcutta for public health training and research. It is also co-operating with the Indian Council of Medical Research which has established a virus research centre in Poona. With the importance the Foundation has attached to the training of personnel, it has awarded a number of foreign fellowships in professional education, public health administration and biological and medical research. Further, as the best means of assisting the further development of medical education in India, it has now decided to concentrate its programme in a few medical colleges.

Although the Foundation has so far paid more attention to the medical and public health fields, recently it has widened its activities. It has now been decided that the Foundation should offer its co-operation to the Indian Ministry of Agriculture in the work of the Agricultural Institute at Pusa. Here it will give its assistance not only in the Institute's research activities but also in the training of personnel. Besides these, it has also lately interested itself in the social sciences and humanities and has given grants to several universities and educational bodies. Mention should be made here particularly of a grant from the Foundation which will aid a field study of population dynamics in India carried on by Harvard University with the co-operation of the Government of India and the Christian Medical College in Ludhiana. The Foundation has so far spent more than five million dollars by way of projects and grants-in-aid, fellowships and travel grants.

Apart from the Ford and Rockefeller Foundations, there are also other American Foundations which have contributed in smaller ways either through financial assistance to several needy projects in India or by the award of fellowships and travel grants to deserving individuals. The work of these institutions may not be spectacular, but it is bound to have lasting effects, thus cementing further the friendship and bonds of goodwill between Indians and Americans.

The mariner and the marabou

WE have nothing against the *Leptopilus Marabou*. In fact, we can't but admire his magnificent detachment from the world's worries, his ability — if not to rise above it — at least to look above it.

But let's face it — a marabou is not a packageable item. Catch him with both legs on the ground, and you have some hope. Grab him when he's contemplating and you're faced with a sort of isosceles triangle, topped off with a lot of (very pretty) cotton wool. So we gulped a little when a Japanese naval officer asked us to send his latest acquisition after him. (Marabous hate sea voyages — the horizon keeps moving up and down.)

Maybe *you* are thinking of sending something to Japan? If you are, don't forget we fly twice a week to Tokyo — and whatever you send takes just 24 hours to get there.

Marabous and mica, mangoes, mice and machinery — Air-India International's Cargo Department handles them all. Let's hear from you.

Cargo by air:

* *saves money on insurance*
* *gets goods on the market quickly*
* *involves less tied-up capital*

"...and a bonus of goodwill to the management —for installing the

'Tushar'

WATER COOLER!"

QUICK DIVIDENDS in improved staff relations — and greater efficiency! That's what investment in a TUSHAR Water Cooler brings you.

The TUSHAR provides a constant supply of cool, hygienic drinking water for your staff and clients. It's easy to operate and most economical to run. Why not get in touch with Voltas Limited, and order a TUSHAR *now?*

With the TUSHAR you get:

- A continuous supply of instantly-cooled water at the touch of a button — no unhygienic refilling or storing.
- A choice of two handsome models.
- Ease of installation.
- Economical to run.

'Tushar' WATER COOLERS

A modern must for factories, offices, schools, hotels, hospitals and colleges

Economic Report from the U. S.

FOREIGN AID

(By GUY SIMS FITCH)

WASHINGTON, March 6.—Foreign aid is a much-discussed subject in Washington these days. Within recent weeks, a number of studies in this field—among them congressional studies—have been issued, and more are due to come. What may turn out to be the most significant of these is a report to President Eisenhower by his citizen advisers on the Mutual Security programme, headed by Benjamin E. Fairless, one-time steel company executive.

The report, culminates five months of intensive examination of the foreign assistance activities of the US Government. The Fairless report makes no pretense of being a detailed analysis of every aspect of this highly complicated subject. But it is a cogent statement of broad policy objectives and methods. And since its authority stems from the President himself, a number of its recommendations may be translated into specific legislative proposals to Congress. Those who believe in the wisdom of US foreign aid, programmes can take considerable comfort from the Fairless report. Its main conclusion is that these programmes, both in their economic and military phases, must be continued as long as world conditions require. But he leaves little doubt that foreign aid will be with US for years to come.

Behind this view is the conviction that foreign aid Plays a distinct part, along with liberal trade and investment programme, in the economic advancement of free nations, and in the maintenance of their collective security. Once this is said, the question remains of how mutual assistance can best be carried out. Here, the Fairless report recommends long-term loans as consistent with the desires of most recipient nations and in keeping with lasting economic improvement efforts. Outright grants would not be ruled out, but would be used only in exceptional cases where loans are not feasible.

More careful selection of projects receiving American assistance, financial or technical, also is considered important in attaining the twin goals of flexibility and efficiency. Some 2,000 aid projects are authorized annually—a number of, Fairless believes, could be reduced substantially. Instead, the Fairless group recommends concentration on those projects which give promise of achieving the most lasting and beneficial results. Stress would be placed, particularly, on projects that further the self-help efforts of recipient nations. Just how much aid can the United States afford to give? Assuming that world conditions stay pretty much as they are, Fairless considers the present annual spending rate of $7,900 million feasible and adequate. This is broken down into $3,900 million for military assistance, $1,700 million for purely economic aid, and $2,300 million for the support of US Agencies abroad.

In time, however, as other free countries become stronger economically, the expectation is that they will need less direct aid from the United States. And as future progress leads to reductions in government operations Fairless looks forward to a corresponding expansion of private activity in the United States and other countries.

TOWER

OF STRENGTH

in India's

Economy

The Americas and the Middle East are not the only places with oilfields ! Oil is produced here in India, too, and derricks are a familiar part of the landscape at Digboi in Upper Assam. The Assam Oil Company has been operating this oilfield for over fifty years, producing some 300,000 gallons of high quality petroleum products daily.

Everyone in the country benefits from this flow of home-produced oil. It speeds food production. Keeps factories running smoothly. Keeps goods moving by rail, road, sea and air. Takes people to work and provides work for them -- as well as saving precious foreign currency.

The Assam Oil Company itself employs over 8,000 'oil men'. It spends much time and money in looking ahead. Not only in training technicians and executives, but also in finding new sources of oil and new methods of processing it into the much-needed petroleum products which are so vital to India's expanding economy.

BUSINESS NOTES

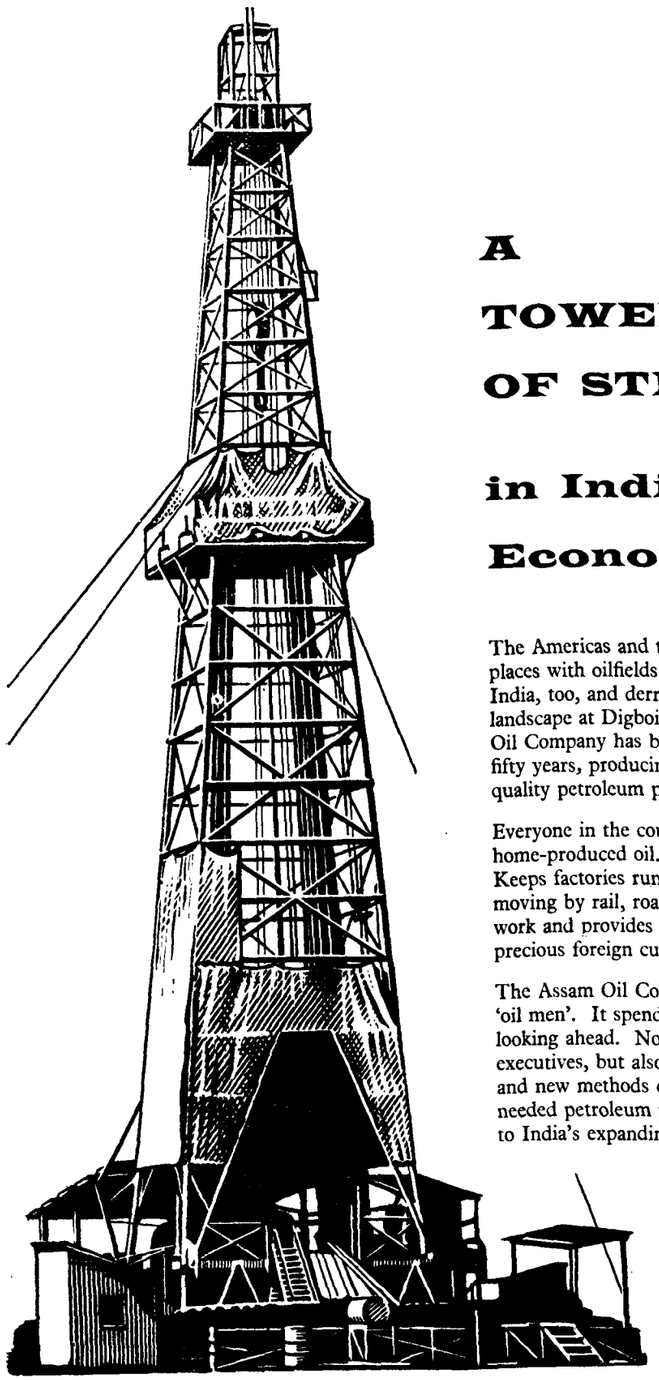
EGYPTIAN COTTON IMPORTS

CONSIDERABLE GROUND appears to have been covered in the negotiations between the textile officials in Bombay and the members of the Egyptian Trade Mission which has just come to this country. Although lacking official confirmation, it is strongly suggested in market circles that the Egyptian Government would be only too willing to extend any concession towards increasing Indo-Egyptian trade on a sizable scale. The very cordial relationship that exists between the two countries, thanks to the stand taken by India in the West Asian turmoil, with particular reference to the Suez Canal, is expected to pay rich dividends in the matter of smooth trade negotiations between the two countries. In respect of import of Egyptian cotton, it is now reliably learnt that the Mission has expressed itself in favour of giving a discount of 7 per cent in price, of which 6½ per cent would go to the trade, while the balance might be retained by the Government of India.

If the price discount as mentioned above becomes a fait accompli — for some reason, the trade is still insisting upon a higher price discount of 20 to 25 per cent — it is quite possible that a sizable volume of Egyptian cotton imports would become the order of the day. The recent increase in the export duty imposed by the Government of Sudan on cotton and the virtual ban on the import of East African cotton are two factors which should help considerably in the import of Egyptian cotton into India. If it is also possible for India to effect payment in rupees, as there is reason to believe it might turn out to be eventually, then the final hurdle would have been crossed to make a beeline for an uninterrupted inflow of Egyptian cotton.

A very significant aspect of the Indo-Egyptian trade which has not so far figured in the negotiations between this country and Egypt is the proposal that the State Trading Corporation should have a say, if not a controlling authority over any deal between the two countries. Thus, it would seem that though direct trade between the traders of the two countries would be allowed to continue as heretofore in the normal way, such might not be permitted without the express approval of the Corporation! The implied consolation is that traders might not be hampered by red tape at every stage of a given transaction even if no deal could be transacted without the knowledge and approval of the STC.

SUGAR FOR EXPORT



IT IS a matter of considerable significance that India is gradually turning into an exporter of sugar when till lately she was not able to match her production with the rising domestic demand, following decontrol towards the end of 1952. Between the first and the last years of the first Plan period, the rise in consumption was well over 50 per cent, from some 11.7 lakh tons in 1951-52 to an estimated 19 lakh tons in 1955-56, without a commensurate increase in production. The year 1953-54 was particularly disappointing when production had slumped to as low as 10 lakh tons, or over a lakh tons less than in 1951-52. The huge imports over the years represented a large drain on the country's foreign exchange resources. In 1955-56, however, the comparatively high prices of cane provided incentives to the cultivator to grow more. Sugar production attained the all-time peak of 18.5 lakh tons with the result that prices tended to come down. The shortage of wagons on the N. E. Railway in the early part of the selling season also depressed prices. The export surplus that has now emerged, of which some has been sold and partly shipped to the United Kingdom is, therefore, a welcome development.

That the exportable surplus needs to be boosted further cannot be over-emphasised. For one thing, the elimination of imports cuts off a heavy burden on the foreign exchange. For another, the country can earn some of the coveted foreign exchange, even though it cannot be of any very substantial extent, in view of the envisaged production capacity of 25 lakh tons against an estimated domestic consumption of 22.5 lakh tons at the end of the current Plan. Nevertheless, the steps that the Indian Sugar Mills Association is taking for creating a stable and regular foreign market are commendable. The Associations' President, Mr. S. S. Kanoria, has recently stated that everything would be done rigidly to adhere to specifications and good packing of sugar for export. A remarkable step envisaged is the pooling, in a special fund, of all profits earned from the export for its promotion. Given good sugarcane crops, and improved culture for increasing the sucrose content, the sugar industry may be expected to play its role satisfactorily in the coming years.

COMPROMISE ON PLANTATION AWARD

EVER SINCE the publication of the award of the Special Industrial Tribunal for Plantations on October 24, 1956, the plantation industry has had to pass through a period of stress and strain. The magnitude of the harm that would be done to the plantation industry if the award had been implemented with retrospective effect from March 1952 cannot be underestimated. It had been calculated that the Madras Plantation Companies would have to pay about Rs. 12½ crores to labour as per the award besides having to meet the increase in the annual wage bill of about Rs. 2½ crores. Barring perhaps Bombay Burmah, it would not have been possible for any other company to pay up the arrears without resorting to borrowing on a heavy scale. And, what is more, since the margin of profit, by the increased cost of production as a result of the higher wages to be paid to labour, would be reduced by about 5 as. per lb. of tea there would be very little left for the shareholders, who had put their capital anticipating a return of 7 to 8 per cent thereon.

It is against this background that one has to judge the extent of relief that the latest compromise on the award has brought to the plantation industry as a whole. Shareholders and investors in plantation companies, especially at Madras, heaved a sigh of relief at the amicable settlement of this outstanding dispute between plantation labour and management. The award provision regarding payment of wages with retrospective effect has been given a decent burial and this has been particularly welcomed by the Management. On the part of labour also, there is not much room for grouse. Inasmuch as the revised scale of wages would take effect from the date of the award, viz. October 24, 1956, labour stands to gain the immediate benefit of the payment of the difference in wages between that date and the date of the compromise in question. Labour has also gained another round, namely, in respect of the revised contribution of provident fund. As against the Central Government's earlier notification, extending the provident fund facilities to labour in the plantation industry, effective from May 1, 1957, the compromise award makes it effective from January 1 this year. As regards other terms of the compromise, it has been generally accepted that the bases adopted for the areas under the three important plantation products provide a new

A very significant aspect of the Indo-Egyptian trade which has not so far figured in the negotiations between this country and Egypt is the proposal that the State Trading Corporation should have a say, if not a controlling authority over any deal between the two countries. Thus, it would seem that though direct trade between the traders of the two countries would be allowed to continue as heretofore in the normal way, such might not be permitted without the express approval of the Corporation! The implied consolation is that traders might not be hampered by red tape at every stage of a given transaction even if no deal could be transacted without the knowledge and approval of the STC.

SUGAR FOR EXPORT

IT IS a matter of considerable significance that India is gradually turning into an exporter of sugar when till lately she was not able to match her production with the rising domestic demand, following decontrol towards the end of 1952. Between the first and the last years of the first Plan period, the rise in consumption was well over 50 per cent, from some 11.7 lakh tons in 1951-52 to an estimated 19 lakh tons in 1955-56, without a commensurate increase in production. The year 1953-54 was particularly disappointing when production had slumped to as low as 10 lakh tons, or over a lakh tons less than in 1951-52. The huge imports over the years represented a large drain on the country's foreign exchange resources. In 1955-56, however, the comparatively high prices of cane provided incentives to the cultivator to grow more. Sugar production attained the all-time peak of 18.5 lakh tons with the result that prices tended to come down. The shortage of wagons on the N. E. Railway in the early part of the selling season also depressed prices. The export surplus that has now emerged, of which some has been sold and partly shipped to the United Kingdom is, therefore, a welcome development.

That the exportable surplus needs to be boosted further cannot be over-emphasised. For one thing, the elimination of imports cuts off a heavy burden on the foreign exchange. For another, the country can earn some of the coveted foreign exchange, even though it cannot be of any very substantial extent, in view of the envisaged production capacity of 25 lakh tons against an estimated domestic consumption of 22.5 lakh tons at the end of the current Plan. Nevertheless, the steps that the Indian Sugar Mills Association is taking for creating a stable and regular foreign market are commendable. The Associations' President, Mr. S. S. Kanoria, has recently stated that everything would be done rigidly to adhere to specifications and good packing of sugar for export. A remarkable step envisaged is the pooling, in a special fund, of all profits earned from the export for its promotion. Given good sugarcane crops, and improved culture for increasing the sucrose content, the sugar industry may be expected to play its role satisfactorily in the coming years.

COMPROMISE ON PLANTATION AWARD

EVER SINCE the publication of the award of the Special Industrial Tribunal for Plantations on October 24, 1956, the plantation industry has had to pass through a period of stress and strain. The magnitude of the harm that would be done to the plantation industry if the award had been implemented with retrospective effect from March 1952 cannot be underestimated. It had been calculated that the Madras Plantation Companies would have to pay about Rs. 12½ crores to labour as per the award besides having to meet the increase in the annual wage bill of about Rs. 2½ crores. Barring perhaps Bombay Burmah, it would not have been possible for any other company to pay up the arrears without resorting to borrowing on a heavy scale. And, what is more, since the margin of profit, by the increased cost of production as a result of the higher wages to be paid to labour, would be reduced by about 5 as. per lb. of tea there would be very little left for the shareholders, who had put their capital anticipating a return of 7 to 8 per cent thereon.

It is against this background that one has to judge the extent of relief that the latest compromise on the award has brought to the plantation industry as a whole. Shareholders and investors in plantation companies, especially at Madras, heaved a sigh of relief at the amicable settlement of this outstanding dispute between plantation labour and management. The award provision regarding payment of wages with retrospective effect has been given a decent burial and this has been particularly welcomed by the Management. On the part of labour also, there is not much room for grouse. Inasmuch as the revised scale of wages would take effect from the date of the award, viz. October 24, 1956, labour stands to gain the immediate benefit of the payment of the difference in wages between that date and the date of the compromise in question. Labour has also gained another round, namely, in respect of the revised contribution of provident fund. As against the Central Government's earlier notification, extending the provident fund facilities to labour in the plantation industry, effective from May 1, 1957, the compromise award makes it effective from January 1 this year. As regards other terms of the compromise, it has been generally accepted that the bases adopted for the areas under the three important plantation products provide a new

standard for fixation of wages which might be expected to be adopted by the adjacent States of Kerala and Mysore, in due course. With the accord obtained by this compromise, there is a complete transformation in the outlook of the plantation industry.

LOAN TO AIR INDIA INTERNATIONAL

IN ORDER to maintain its competitive services among the airlines serving India and to standardise the Corporation's fleet, Air India is purchasing three Boeing long-range jet airplanes (model 707-420). For this expansion, the AII has arranged to borrow $16.8 million to finance the dollar costs of these jets The loans will carry the guarantee of the Government of India. The borrowing was a joint operation whereby five United States Commercial Banks granted Air India a credit of $11.2 million and the World Bank, under a separate agreement, lent the Corporation $5.6 million. The Boeing aircrafts which will be due for delivery in 1960 are to be equipped with Rolls Royce engines and the total cost, including spare engines and parts is estimated at $23 million, out of which $22.1 million will be in foreign exchange (16.8 million in dollars and the equivalent of $5.3 million in sterling). The commercial banks loans are repayable between 1960 and 1962 and the World Bank's between 1965 and 1966. The World Bank loan bears interest of 5½ per cent per annum including the 1 per cent commission charged by the Bank. For financing the sterling requirements, Air India International is in consultation with the Government of India. It is hoped that with all the financial reputation that the company commands it would not be difficult for it to secure the sterling finance.

This loan is not the first of its kind granted by the World Bank to an air company. Quantas Airways of Australia received a similar type of loan from American International investors and the World Bank in November 1956. The only difference in the two loans is the rate of interest charged. While Quantas could raise the loan from American institutional investors and the World Bank at 4¾ per cent, the Air India International will have to pay 5 per cent to the Commercial Banks and 5½ per cent to the World Bank. If the progress of air travel and the AII's increasing share in it is kept in mind, it seems certain that this investment would be fully self-liquidating in a reasonably short period.

That Air India International has been making striking progress is sufficiently proved by its balance sheets. The cut in foreign exchange allowance for travel will affect the company's revenues in the sense that some of the existing clientele will fall off. But its optimism about acquiring larger traffic adequate to raise the frequency of service from 6 to 7 per week shortly is based on sound expectations.

THE BANK OF INDIA

A PARTICULAR feature of the banking business in 1956 was monetary stringency which became more and more pronounced as the year progressed and has extended into the current year. The prevailing ratio of advances and bills discounted and purchased to the deposits of all scheduled banks at 75 per cent is the highest since the Reserve Bank started publishing the figures in 1935. An inevitable result that followed was the rise in interest rates on deposits without a rise of similar extent in the rate of interest on advances. In February last, the Reserve Bank raised, by half a per cent to four per cent, the rate at which it would grant loans to banks against Government securities, leaving the Bank Rate unaltered. Rather than facilitate banks to raise their rates on advances, this measure creates a difficult position inasmuch as the banks are obliged to issue notices to their customers when they decide to increase the rates. Understandably enough such a course cannot be palatable to either side.

In his annual speech Sir Cowasjee Jehangir, Chairman of the Bank of India, referred to various features of banking in 1956. Among other developments during the year, like the increase in rates of stamp duty on usance bills of exchange and usance promissory notes, the Finance Act (No. 3), which was enacted in December last, makes it obligatory for business companies to make compulsory deposits with the Government in certain circumstances. This provision is likely to produce its own repercussions on the deposits of scheduled banks. It is not difficult to see that this may aggravate the tight money conditions and thus create further hardships for trade and commerce.

During the year the Bank of India witnessed a satisfactory growth in business from Rs. 89 crores in 1955 to Rs. 96 crores in the year. There was a corresponding increase in the profits, after all appropriations, which stood at Rs. 92 lakhs, about Rs. 7 lakhs more than the preceding year's figure, and higher than any previous year. The total dividend for the year is 16 per cent, free of income tax, and to the Reserve Fund has been added Rs. 8 lakhs, making it amount to Rs. 310 lakhs. Considering the difficult phase through which banking business had to pass last year, this represents an achievement

ELECTRIC FANS

IN A hot country like India fans are rather a necessity than a luxury. This bodes well for the future of this industry. But its progress during the first Five-Year Plan was below expectations, even though there was a considerable production increase. Perhaps, this was due to the slump that the industry faced during 1952-53 after the termination of the Korean War. It is, however, hoped that the target of 600.000 fans per year by the end of the second Five-Year Plan would be achieved without much difficulty. The present capacity is 4,01,700 and the 19 existing units, with their expansion programmes, will be able to meet the total demand.

Shortage of raw materials often creates problems though the situation has improved during the last five years. At present 20 per cent of the raw material requirements (like electric winding wires, carbon brushes and capacitors) is being met by imports. A beginning has already been made by a unit in Calcutta and another in Bombay in producing synthetic enamelled winding wires. The State-owned heavy electrical plant has under consideration a proposal for the manufacture of insulating materials. Shortage is also experienced in hard coke, pig-iron and electrical steel sheets.

It was recommended in the first Plan that a rebate should be allowed on import duty paid on raw materials used in the manufacture of fans for export. Though necessary legislation was passed, the Government has been tardy in enforcing it. A relaxation of the rules is necessary in view of the fact that we are trying to create an export market as well. The second Plan has estimated an export of more than 40,000 fans by 1960-61. The popularity which our fans, particularly the ceiling type, have gained in some neighbouring markets has shown that we can compete with other countries. In 1955 we exported 17,318 fans valued at Rs. 20.3 lakhs to as many as thirty-three countries. Singapore was the largest importer. Among other countries which imported fans in substantial quantities were Ceylon, Kuwait, the Sudan, Malaya, Nigeria, the Bahrein Islands, Tanganyika and Zanzibar.

Company Meeting

THE BANK OF INDIA LIMITED
BOMBAY

Speech of the Chairman to be delivered at the Fifty-first Annual General Meeting of the Shareholders of The Bank of India Limited on Thursday, 7th March, 1957.

Ladies and Gentlemen,

With your permission the balance-sheet may be taken as read.

At the time of our Annual General Meeting in 1956 the currency in circulation was Rs. 1,406 crores, whilst at the corresponding time in 1955 it was Rs. 1,241 crores. This year it is Rs. 1,515 crores. The increase on last year's figure is Rs. 109 crores. I consider that the substantial needs of the second Five-Year Plan have tended to prevent an increase of this order from spelling material inflation.

The year 1956 saw a major event in State ownership. This was the nationalisation of life assurance business in India from 19th January, 1956. There was a transition period during which, until the inauguration of a Government corporation with legal status, Government custodians managed the life assurance business through the organisations of the old life assurance companies. A body corporate, the Life Insurance Corporation of India, was brought into being by an Act called the Life Insurance Corporation Act, 1956, and functioned from 1st September, 1956. On that date, the Corporation took over fully, the interim period ended and the operation of nationalising life assurance in India was completed. The matter of compensation to the old companies remains.

A far-reaching event in 1956 and one which intimately concerns the Bank was the coming into force from 1st April, 1956, of the Companies Act, 1956. Some of the provisions of this voluminous legislation are most complicated and not easily carried out. Your Directors have devoted much attention to meeting the requirements of the Act. The Extraordinary General Meeting of 11th October, 1956, for the bonus issue passed some resolutions to meet the Act. You will see further evidence of the Act's requirements in the Agenda of this Meeting.

The year has seen further taxation imposts and Government restrictions. In my speech last year, I spoke of the Finance Bill for 1956—the Budget—which had just then been introduced. It provided for substantial increases in taxation, particularly on companies. In December, 1956, supplementary Finance Acts, called Finance (No. 2) Act, 1956, and Finance (No. 3) Act, 1956, were enacted. They enhance the existing burdens on free enterprise. The No. 2 Act, amongst other things, greatly increases the rates of stamp duty on usance bills of exchange and usance promissory notes and can, therefore, be said to be "in restraint of trade" so far as the banking business is concerned. The No. 3 Act will oblige companies to make compulsory deposits with the Government in certain circumstances. If I may be permitted to use a somewhat srtong expression I would say that this is the adoption of the principle of "forced loans" to the Government of the country. I do not think I am alone in this view—or in my rooted objections to the principle. This legislation will also have the effect of aggravating the already very tight money conditions to which I will refer later. The Act also resurrects the Capital Gains levy which was in force from 1946 to 1948. In the latter year it was allowed to become dormant. There was then a recession in trade. I imagine the levy ceased to produce much revenue to the tax-gatherer. In the present resurrection the impost is tightened in that the minimum amount of capital gains assessable is reduced from Rs. 15,000 to Rs. 5,000. The Act also enhances further the burden of the tax on dividends paid by companies levied by the main Finance Act of 1956, passed earlier in the year.

The Banking Companies (Amendment) Act, 1956, was enacted at the end of 1956 and came into force on 14th January, 1957. The main Banking Companies Act, 1949, gave the Authorities wide powers over banks. The amending Act enhances these powers. The Reserve Bank of India is empowered, under certain circumstances, to order that a general meeting of a banking company be held to elect fresh directors and any such election duly held "shall not be called in question in any court". This is autocratic legislation. It is not the first example we have had. To take redress out of the control of the courts is undemocratic, to say the least. It is against the canons of justice as we know them. It is a dangerous practice to have started. It is a dangerous practice to develop. The appointment or remuneration of a managing or whole-time director or manager or chief executive officer of a bank must now have the approval of the Reserve Bank of India. An officer of the Reserve Bank of India shall, in certain circumstances, be entitled to attend the board meetings of a banking company.

This is an exceptional year for the industrial and commercial life of India. The Budget is ordinary introduced at the end of February. This year it is being postponed to a date in March or April, due, it is said, to the Elections. I do not think the Government realise the inconvenience the postponement causes to industry and commerce. The Government might have arranged the Elections in such a way as not to interfere with the usual date for the introduction of the Budget. The uncertainty that the delay causes does not strike the members of the Government who are, I fear, inclined to look to their own convenience and not always to that of the public. The anxiety due to the delay has been enhanced by rumours set afloat by irresponsible remarks. The rumours may or may not have any foundation but they cause damage by bringing about a lack of confidence in the future. Private enterprise can only thrive on credit and confidence. We are already possibly the highest taxed country in the world and rumours of still higher direct taxation shake the confidence of the public.

When will Government learn to cut their coat according to their cloth? Five-Year Plans are all very

well on paper and are sometimes praised by foreigners who do not have to consider where the required money is to come from. One pertinent question about the gigantic schemes in the second Five-Year Plan is whether we are going to get value for the money we spend. This, in my opinion, is very doubtful. Leaving aside the very high costs prevailing today, some money is lost by mistakes made by even the best of authorities. We cannot forget that mis-calculations are almost bound to occur in all schemes, big and small. If only a portion of what one hears be correct, the amount lost in some of the schemes undertaken in this country would run into huge figures. It is earnestly to be hoped that the Government will reconsider their grandiose schemes before they are compelled to give them up after incurring losses.

During 1956 the Bank celebrated its Golden Jubilee. The Bank was established fifty years ago on 7th September, 1906. It started business in November, 1906. Golden Jubilee functions were held at Bombay and at all other places where the Bank has branches. Special articles and supplements in the press were arranged. A Golden Jubilee brochure was printed and circulated. A medal was struck and distributed to shareholders and customers. The Bank's Head Office building was illuminated for some nights in November. The illuminations had, I think, the full approval of you shareholders resident in Bombay Also, to mark the completion of fifty years of the Bank's life, the Paid-Up Capital was increased from Rs. 250 lakhs to Rs. 300 lakhs by making a bonus issue to shareholders of 1,00,000 "A" fully-paid shares of Rs. 50 each from that part of the Reserve Fund representing premiums received on past issues of shares. The new issue has been made in a smooth manner, greatly assisted by you shareholders deciding that no fractional coupons should be issued but that the proceeds of fractions should be given to shareholders in cash. We have thus been saved the inconvenience of having outstanding coupons not presented.

The business of banking in 1956 operated under the handicap of a significant scarcity of funds, a condition which became more evident as the year progressed. It has been even more pronounced since the end of the year. There is an increasing unsatisfied demand for bank accommodation. It is a long time since a credit-worthy customer could be so doubtful of getting an advance from his bank against even really good and acceptable security as he is today. With the sustained and effective—I might almost say preferential—demands for finance for the projects of the second Five-Year Plan, there is little likelihood of any early easing of the money situation. Rather is the reverse the case. The position is made worse by the Government's insatiable tax levies. Industrial concerns can only meet the peremptory demands of the tax-gatherer by surrendering money they need for working capital or for maintenance and renovation and development of plant. They are obliged to apply to banks for money to replace the funds they have had to pay in taxes. They find the tightness of money prevents their demands being met. Their business and their profits—and their shareholders—suffer.

As an indication of the money situation I may bring to your notice that the ratio of advances and bills discounted and purchased to the deposits of all scheduled banks is now 75 per cent. This is the highest ratio since the Reserve Bank of India started publishing the figures in 1935. Interest rates on deposits with banks have risen to levels not seen for many years. Against a Bank Rate of 3½ per cent we have to pay more than 4 per cent per annum for deposits fixed for some periods. The rates of interests on advances do not rise proportionately to the rise in deposit rates. I mentioned this in my speech last year and it has been particularly the case in 1956. Deposit rates go with the prevailing rates of interest and depend upon the supply of and demand for money. With very few exceptions, the rates of interest on our advances are related to the Bank Rate. If there is no change in the Bank Rate, and it has now been stationary since 15th November, 1951, our rates of interest on advances do not automatically rise. We have, of course, increased our rates of interest by notice to our customers. Notice is more provoking to them than an automatic increase due to a rise in the Bank Rate, where they do not need to receive any intimation from the Bank. They see the rise in the Bank Rate and recognise that interest on borrowings must, accordingly, rise.

Because the Bank Rate has been kept at 3½ per cent in recent years of rising money rates, it has, to some extent, lost its character as the standard of interest rates in the country. Even the Reserve Bank of India recognises this, because, from 1st February, 1957, it has raised from 3½ per cent per annum to 4 per cent per annum the rate at which it will grant loans to banks against Government securities. This is not the official Bank Rate. The Reserve Bank of India thus admitted the increase in interest rates but did not alter the Bank Rate.

Our foreign exchange business turnover has developed greatly and, with it, our earnings from that side of our trading. We are not only doing a larger volume of foreign exchange business than in earlier years, but we are financing larger individual transactions. There is, I think, an assured future for India as a foreign exchange market. Amongst the currencies of Asian countries our rupee stands very high. As a counter in international exchange its use is increasing. I trust that those in authority over the management of our currency will do all they can to see that the value and reputation of the rupee in foreign markets are maintained.

I would now refer you, ladies and gentlemen, to the balance sheet.

The total at foot of the balance sheet is over Rs. 96 crores. The figure of the previous year was something over Rs. 89 crores. This increase of Rs. 7 crores indicates the growth during the year of the Bank's business.

The profit figure for 1956 is Rs. 92 lakhs, an increase of Rs. 7 lakhs over the figure of about Rs. 85 lakhs for 1955. Before the profit figure has been struck, usual appropriate and prudent provisions have been made. I think you shareholders will be satisfied with the profit figure. It is higher than that of any previous year and represents quite an achievement in these uncertain days.

The provision for taxation absorbs Rs. 28 lakhs against Rs. 25 lakhs last year.

Your Directors propose to place to the Bank's Reserve Fund the sum of Rs. 8 lakhs, making the Reserve Fund Rs. 310 lakhs.

A final dividend of 10 per cent, free of income-tax, is proposed, absorbing Rs. 25 lakhs, and making, with the interim dividend of 6 per cent paid last August, a distribution of 16 per cent per annum, or Rs. 40 lakhs for the year, free of income-tax. The carry-forward is Rs. 15½ lakhs against Rs. 13 lakhs last year.

COMPANY AFFAIRS

THE AHMEDABAD ELECTRICITY CO., LTD.

The profit of the Company for the working year ended September, 1956, amounts to Rs. 60,49,803 after charging depreciation in accordance with the provisions of the Electricity (Supply) Act, 1948, amounting to Rs. 44,94,327. The Company considers that there is no present liability for taxation on the profits of the year owing to income-tax depreciation allowances. To the profit has been added Rs. 8,44,000 transferred from the Equalisation of Dividends Reserve, and Rs. 313 brought forward, making a total of Rs. 68,94,116. From this, Rs. 9,38,708 has been placed to General Reserve in respect of the year under review, which is in accordance with an agreement entered into with the Bombay Government in 1955. After providing Rs. 3,35,915 to the statutory contingencies reserve and writing off a total sum of Rs. 42,263 under various heads, there remains a balance of Rs. 55,77,232. Again, Rs. 20,77,680 has to be deducted from this as ad-interim dividend of Rs. 2-8 per share, proportionate to the amounts called up, leaving Rs. 34,99,552 available for distribution. The Directors have recommended a dividend, for the half-year ended September, 1956, at the rate of Rs. 4 per share (making 6½ per cent for the year) which absorbs Rs. 34,99,112. The balance of Rs. 440 has to be carried forward.

During the year, 6,895 new connections were made. The total sales in kilowatt hours, at the end of the year were, 548,693,435, showing a 12.90 per cent increase over the previous year. The generating capacity of the Company's 'A' 'B' and 'C' stations at the end of the year was 110,400 kw., which shows an increase of 10,400 kw. over the previous year. Eight new sub-stations for general supply, 10 for rural electrification and 2 for industrial 11 kw. supply were erected and Commissioned during 1955-56. According to the Directors, coal deliveries have been causing some anxiety, but constant efforts made it possible to maintain stock at a reasonable level.

SAUGOR ELECTRICITY SUPPLY CO., LTD.

The accounts of the Company for the half-year ended June, 1956, show that, after providing for all charges and placing Rs. 1,939 to statutory contingencies reserve and Rs. 8000 to general reserve, there remains a balance of Rs. 10,970, including Rs. 2,247 brought forward, available for distribution. From this amount, the Directors have recommended payment of a 5 per cent per annum dividend, free of income-tax, for the half-year, which absorbs Rs. 7,500, leaving Rs. 3,470 to be carried forward.

Over the last six half-years, the Company's revenue and units of electricity sold have shown a steady increase. Thus, the revenue for the half-year was Rs. 2,37,436 as compared to Rs. 2,25,792 in the previous half-year. The units sold were 741,004 as against 682,701 in the preceding accounting period. The erection of the new thermal station at saugor has been reported to have been delayed due to heavy rains. However, it is expected to be Commissioned in June this year.

UPPER GANGES VALLEY ELECTRICITY SUPPLY CO., LTD.

In the case of this Company also, the accounts are for the half-year ended June, 1956. After providing for all charges and placing Rs. 4,221 to statutory contingencies reserve and Rs. 30,000 to general reserve, there remains a balance of 36,947, including Rs. 8,097 brought forward. The recommended dividend at 10 per cent per annum, free of income-tax for the period under report, absorbs Rs. 29,925. The balance of Rs. 7,022 is to be carried forward.

Like the Saugor, the Company's progress over the last three years has been satisfactory. As against 4,214,945 units of electricity sold in the preceding half-year, the figure for the period under review is 4,365,805. There is a corresponding increase in the revenue from Rs. 7,05,546 in the half-year ended December, 1955, to Rs. 7,50,265 for the half-year ended June, 1956.

THE KOHINOOR MILLS CO., LTD.

The Company has fared well during the year 1956, in spite of the difficult position caused by uneasy trading conditions for Indian cotton and the increase in excise duty from September, 1956. The Company has made a profit of Rs. 20.79 lakhs as against Rs. 21.22 lakhs last year after deducting depreciation of Rs. 11.21 lakhs, Rs. 20.5 lakhs for taxation and Rs. 1.5 lakhs for employees' pension and gratuity. The total dividend per share remains unchanged at Rs. 18, the final dividend being Rs. 12.

Among other appropriations, while depreciation absorbs Rs. 11.21 lakhs, taxation takes Rs. 25.50 lakhs. Development Revenue Account and Equalisation of Dividend Reserve Account have been allotted Rs. 75,000 each. After allocating Rs. 18 lakhs for dividends a sum of Rs. 1.63 lakhs has been left to go forward to next year's accounts.

The Company earned Rs. 6.87 crores by sales of cloth, yarn and waste. Selling agents Commission has been reduced by Rs. 2.26 lakhs at Rs. 10.53 lakhs. Salaries, wages and bonus amounted to Rs. 1.74 crores as against Rs. 1.75 crores in 1955.

EASTERN INVESTMENTS, LTD.

For the year ended December, 1956, Company's profit stands at Rs. 5,29,212, after all charges are provided for and after making provision of Rs. 5,44,728 for taxation and paying an interim dividend on the cumulative preference shares at 2½ per cent per annum, less tax, amounting to Rs. 46,094. Together with the preceding year's balance brought forward, of Rs. 3,06,138, the profit totals Rs. 8,35,350. The Directors have recommended payment of a final dividend of 2½ per cent per annum (making 5 per cent for the year) on 25,000 issued preference shares, less tax, absorbing Rs. 46,094. Another Rs. 4,61,340 is to be paid as dividend on 51,260 ordinary shares, tax-free, at 9 per cent per annum. That leaves a balance of Rs. 3,27,916 to be carried forward.

COMMODITY NEWS AND NOTES

EXPORT OF SUGAR

A consignment of 2,217 tons of Indian sugar was shipped from Bombay last week for Basra. The cargo is part of 50,000 tons of sugar being exported by India for the first time. Recently small consignments of sugar were despatched from Bombay to East African and Persian Gulf Ports.

COTTON YARN EXPORT

Packings of cotton yarn made by mills in counts of 79s. and above will be taken into consideration for purposes of calculation of quarterly export quotas of cotton yarn. Announcing this, the Joint Chief Controller of Exports, Bombay, has said that allotments will, however, be issued in counts up to and including 36s. (including double yarn) and counts from 87s. to 78s. (including double yarn).

IMPORT OF METALLIC YARN OPPOSED

The Surat Chamber of Commerce has represented to the Union Ministry of Commerce and Industries that import of metallic yarn should be totally banned as this led to prejudicial competition with indigenous 'jari'. The Chamber has stated that metallic yarn was at present "liberally" imported and was replacing jari in handloom cloth "thus nullifying the protection granted to jari."

EXPORT OF JAGGERY

Cane jaggery and cane jaggery powder (gur) will continue to be licensed freely for export up to the end of December 1957, it has been announced. The licensing will be done on the shipping bill as hitherto.

CEYLON TEA OUTPUT

Ceylon produced 30.2 million lb. of tea in January this year compared to 26.8 million lb. in January last year according to official figures released in Colombo.

WORLD OUTPUT OF TIN DOWN

World production of tin-in-concentrates in 1956 (including China but excluding Russia) was 174,500 tons below the previous year according to the International Tin Study Group. World tin metal output last year was 177,000 tons as compared with 178,500 tons for 1955.

UK CAR INDUSTRY'S EXPORT DRIVE

The British motor car industry is poised for its most intensive export drive since the war ended. On the basis of orders already received, overseas sales are expected to be appreciably better than last year. America and Canada are the markets upon which most hopes are pinned. Switzerland is another market in which British manufacturers hope to do better.

CEYLON TO BUY INDIAN SUGAR

Ceylon has just concluded a deal for the purchase of 8,000 tons of Indian sugar, according to the Permanent Secretary, Ceylon's Ministry of Food and Agriculture. This will be the first time Indian sugar will be offered in Ceylon. First shipments of sugar are expected in April.

CRUDE OIL FOR ISRAEL

Arrangements have been completed for the chartering of a number of tankers to bring crude oil to the Red Sea port of Eilat. Their arrival is scheduled to coincide with the completion of the 8-inch oil pipeline from Eilat to Beershaba, 120 miles to the north. The first tanker is due to arrive at Eilat in the middle of April. It has been officially announced that a special Government company will be formed with a capital of I£400,000 (£80,000) to manage the oil pipelines.

US CRUDE OIL OUTPUT

US crude oil, output reached a new peak in the week ended February 22, according to the American Petroleum Institute. Production averaged 7.56 million barrels a day or 51,800 barrels more than in the previous week. Crude oil runs to refineries averaged 7.79 million barrels a day compared with 7.97 million in the previous week.

COAL PRODUCTION IN US

US coal production is capable of reaching 1,000 million tons per annum or double the current rate of production according to a New York report. The forecast is made by Mr. Cyrus Eaton, Chairman and Mr. Walter J. Tuohy, President of the Chesapeake and Ohio Railway in the annual report for 1956 in which it is indicated that 1957 output of soft coal will aggregate some 530 million tons. The long-term increase is predicted on the expanding needs of electric utilities and the steel industry and a continuation in the coal export boom.

WEST AFRICAN COCOA MARKETING

The announcement that the Gold Coast and Nigeria have no intention of altering the system of marketing their cocoa has put an end to persistent rumours that the Gold Coast Government was considering the establishment of a cocoa market in Accra after the achievement of independence. This would have meant the break-up of the marketing organisation in London which the Gold Coast has shared for some years with the other British West African countries.

DEMAND FOR RAYON FABRICS

There has been a revival in the foreign demand for Indian rayon fabrics, imports of which had continued to decline, it is stated. During the first nine months of 1956, India exported 2,202,455 yards of rayon fabrics compared with 1,967,935 yards in the corresponding period of the previous year, showing an increase of 11.91 per cent. Among the importing countries Ceylon headed the list in the total quantity imported while Aden excelled in the comparative increase in the offtake. Demand also revived from Afghanistan.

The Elections and After

YESTERDAY, March 28, India's first Lok Sabha was adjourned *sine die*. Thus, there came to an end — which was appropriately noted in two happy utterances of the Speaker and the Prime Minister — a record of work of which the country, as well as the Members of the first Lok Sabha elected on adult franchise in India, can well be proud. In the last five years there may have been unnecessary haste to add to the volume of legislation. Some of the amendments to the Constitution, in particular, were precipitate and, it would appear, undesirable. But, by and large, there has been written into the Statute Book of India in these five years an impressive volume of both necessary and progressive legislation. Tribute should be paid to the Congress Party which has initiated much of this legislation but tribute should also be paid to the character of the criticism and opposition which Members other than those of the Congress Party have brought to their task. In the main these criticisms have been constructive and, at times, such as on Bilingual Bombay, creative even more than constructive. One of the best tributes that can be paid to this Lok Sabha, which is to be formally dissolved on April 4, is that it has set a fine example for future work for its successor.

It is now possible to indicate, although a few results are still outstanding, the character of its successor. Although much has been changed in respect of individual Members—and one need not underwrite the element of surprise in this election — it is broadly true to say that the spirit of the new Lok Sabha will not be substantially dif-

ferent from the old. An element of uncertainty is written into persons but it is remarkable in this case how the impersonal results, particularly in the Centre, have run true to form. Indeed, the prediction of the Indian Institute of Public Opinion published in a Blue Supplement in *The Eastern Economist* of February 22 has been fulfilled, with a percentage error of less than four points in the Congress poll for Lok Sabha seats. The fact that an all-India poll with a sample of only 3,000 interviews could go so close in a prediction of this kind seems to indicate that the volume of uncertainty in the Centre is still remarkably small. Nevertheless, even in an impersonal sense the element is there, and something at least should be said about the character of the surprises which have come upon us in this election.

Almost certainly, the major surprise both at home and abroad — possibly more abroad than at home — is the arrival to power by democratic means of the Communist Party in Kerala. It is not generally recognised that this has happened with a minority vote. It is true that the Communists had a majority over the Congress in the Lok Sabha seats of which they contested only 15 as against 17 contested by the Congress and polled 2,267,888 votes against the Congress' 2,102,887. But in the Assembly elections which brought the Communists to power, the Congress polled 38.2 per cent of the votes as against 36.5 per cent of the Communist Party. Thus, in Kerala there lives the old political paradox that with fewer votes a party may have a substantial lead in seats. Excluding the Independent seats, six of which are more or less attached to the Communist Party, the Communist Party has 60 seats against only 43 won by the Congress.

This points at once to the fact that it is Congress strategy which has been in error. Perhaps the error might have been avoided if Mr. S. K. Patil had not been, most unwisely, entrusted with the responsibility of getting Mr. V. K. Krishna Menon in from a Bombay constituency, where the issue was in some doubt at the beginning and where the final verdict shows no abounding confidence. In any case, the price of Mr. Krishna Menon's victory was heavy. It is clear that Mr. Patil did not appreciate fully the importance in Kerala of an alliance with the P.S.P. or even with the Muslim League in the special circumstances there obtaining. The results in Kerala must convince the Congress that even its foremost strategists can bite off far more than they can chew. The Congress has been laid low in Kerala by its refusal to negotiate from its weakness there. It has been defeated by over-confidence, and by its failure to win friends amongst the democratic parties.

While it is unhappy that the Congress failure here has produced a result which may have serious psychological consequences abroad, one should not exaggerate the tragedy of the current situation. The Communists have come to power with a minority vote in circumstances which must make their tenure of office unstable; and, if wisdom should now arrive, the Congress High Command will devise a strategy for victory. If, as is likely, such an agreement is reached there will be a soul of good in things evil. The general feeling in the country is one of expectation that the Congress will learn from its defeat in this State to think in more conciliatory political terms in the interest of the maintenance of Parliamentary democracy over all areas of the Indian Union.

Almost certainly the reverses in other areas of India have less significance, both in the short and long terms. In Orissa where the Ganatantra Parishad has 51 seats against 56 of the Congress, it is to be remembered that the Congress has polled nearly the same vote as it did in the last elections, namely 38.3 per cent. If the Ganatantra Parishad has raised its votes from 20.51 to 28.68 per cent this has been largely at the expense of Independents and not of the Congress. It is possible that the Congress in the next five years may endear itself more to the people of this State, where political neglect and bad administration have been almost as marked as in the old State of Travancore-Cochin.

For the rest, the Congress Party has come to power in every State of the Indian Union in a position of security although, particularly in Bombay, the reverses have been heavily marked on individuals both in Gujerat and Maharashtra. There is no doubt that here the dislike of Bilingual Bombay has been a deciding factor in creating an opposition different in character and purpose from the Leftist elements of the previous opposition. But there is no possibility of the opposition in Bombay State ever becoming the government. *Prima facie* there is no evidence that we are on the way to a transfer of power from the Congress to any other party in any other State.

What is true of all these States of the Indian Union is true, *a fortiori*, of the Centre. Here the Congress comes to power with a vote of about 49 per cent of the total valid votes polled against 45.2 in the last election. The Congress still enjoys at the Centre the supreme capacity to legislate as it wills, and even to amend the Constitution. Whether it is good for a single party to have this power may be contested, but at least it proves to the world that in the area where economic policies are determined, the Indian people have placed their trust in continuity of policy and firm stability.

One may look from many angles upon this election and find in it many causes for satisfaction and pride. Anyone who has been engaged in the field to watch the momentous administrative operation of conducting the most exacting elecon the capacity of India's civil servants, who, even more than in 1951, have surpassed themselves in their integrity, administrative skill and devotion to duty. It is possible to differ here and there on the verdict of the people, but over the country today there must be no difference on the manner in which, under a supremely able Election Commission, the will of the people has been drawn from millions of minds to be placed in a workmanlike form and shape in the legislatures of the country. By and large, there can be no doubt that the result obtained is a true reflection of the will of the Indian people.

Again, the Congress Government comes to power shaken here and there by mishaps, particularly, to some old and trusted politicians. The Indian people will, it seems, not be taken for granted. But equally they will not be shaken by violent prejudice or by wild promises from a sound assessment of the qualities of the candidates and the parties they represent. In this mature judgment of the Indian people, there is the sheet-anchor of India's democracy. The ship may sway, but this anchor will hold. Therein lies our strength, and in that faith we will conquer.

The Mind of Indian Business

THE Annual Meeting of the Federation of Indian Chambers of Commerce and Industry held in Delhi last week underlines one point more than any other. Contrary to the usual belief that with the arrival of the Forum of Free Enterprise there exists strong feeling amongst leading business men on the economic policies of the Government of India, the general tenor of the discussions showed how obviously many leading elements of business in the country represented by the Federation were on the Government side. Shri Lakshmipat Singhania's Presidential Address was both in tone and in substance a non-critical and, indeed, even a friendly speech. Quite apart from the agreement it drew from the Prime Minister — particularly on the danger of obsolescence of the mind — there was in this speech no suggestion that the business community is deeply disturbed about the current policies of the Government.

Almost certainly this undue caution in the business world represented at the Federation meeting is as far removed from the real structure of the mind of Indian business as the agitated criticisms which are represented in some degree or another by business men who are supporting the daring approach of the Forum of Free Enterprise. Thus it is that two wings of leading Indian business opinion are both in a sense off centre at the present time. There is urgent need for a description of the business mind as in fact it is — a resultant of two components, one of patriotic co-operation with a National Government, particularly one associated with the outstanding hero of the Indian Revolution, and on the other hand a critical feeling that the policies adopted are unsuited to the market-place and to the environment in which the business man lives and works.

These two strands in the making of business mind at present were reflected in practically every important speech and in most of the resolutions placed before the meeting. As usual all the resolutions were passed unanimously and it was not to be expected that differences of opinion, which undoubtedly exist even on the phrasing of some of these resolutions, would be reflected in the ultimate vote. But if one can make a comment on these resolutions and on the speeches which supported them, many of which were very able, one would point to the surprising extent to which the concept of the socialist pattern of society has been accepted by the Indian business community. There were notable speeches like those of Mr. Shanti Prasad Jain, Sir B. P. Singh Roy and Mr. L. N. Birla which indicated that something was seriously wrong. Mr. Jain pointed to the weakness of Indian agriculture, particularly in its administrative aspect, Sir B. P. Singh Roy stressed the problem of transport on which he speaks with exceptional authority, and Mr. L. N. Birla spoke on the problem of monetary stringency which in the short period context might well be the most severe of all. There will be general agreement with what they all said, but one had a feeling that the capacity of the business community to solve all these problems on the lines proposed was so limited that, in point of fact, what was being set out was a mere submission to the Government and not an instrument of action for the Federation itself. Almost all major leadership has passed from the business community.

The resolutions passed must be read in this context. They are conciliatory even on that most outstanding of issues which has assumed the magnitude of a serious crisis and put the tempo of the progress of the Plan under suspension all too suddenly. The resolution on foreign exchange resources deserves in point of immediate urgency the greatest significance. This is a matter in which the entire future of the Plan, and indeed of the economy in the short period, is at stake. The remedies to resolve the impasse must be decisive and capable of yielding quick results, for, time is of the essence in this issue. The spirit of the Federation's resolution fails to convey the element of the urgency. It highlights the fact that the action taken by the Government falls far short of the real needs of trade and industry.

One might commend the Federation for its frontal approach on the problems of financial stringency. In spite of the acute turn which it took this year, the Government of India has shown insufficient disposition to tackle the problem. Here, at least, the emphasis placed by the Federation was right. On foreign exchange there was little said that was new. The long list of measures which the resolution has urged to augment foreign exchange resources—austerity in consumption, conservation of foreign exchange by further modification of import policy, export promotion by diversification of markets and commodities as also by a campaign for insistence on quality production, simplification of administrative procedure, emphasis on a positive programme of raising invisible earnings, and so forth—is good so far as it goes. This problem, however, could not be dilated upon in the resolution which was intended primarily to suggest ways and means to improve the export-import trade.

The more one assesses the place of the Federation in the counsels of the Government and the more one evaluates the conciliatory temper of the speeches that were made last week, the more one is convinced that the business community has accepted with good grace and, perhaps, with less courage than is due to it, the station which the Government of India, in its wisdom, has chosen to assign to it. *The Eastern Economist* believes that the business community does not do justice to itself in this complete acquiescence in a minor role in the making of economic policy and of implementing it. It is the business community which understands best the problem of production and should exercise great influence in the making of a production policy, even if not in the implementation of that portion of it which goes now increasingly into the public sector. One certainly had the impression last week that the business community was apologetic about its own philosophy and that this philosophy was not ardent, if it was expressed at all. One might ask of the exponents of the business way of life whether they are losing faith in themselves and are anxious now only to accommodate themselves on the best possible terms to a political current which they are unable to correct or control.

India and Poland

THOUGH India and Poland have different political systems, there is a historical parallel between their respective experiences. Both the countries have been victims of foreign aggression; both of them have struggled hard for their independence; and both of them have been partitioned against their will. Both India and Poland have started late on the road to industrialization. In both countries, there is a disproportionate development in industry and agriculture and insufficiency of consumer goods.

The Polish Prime Minister, Mr. Jozef Cyrankiewicz's visit to India has not unnaturally evoked interest in this country. It is the first time since the Hungarian crisis in October last that an East European leader is visiting a non-Communist country. And that leader is also the one who has successfully helped his country free itself from the stranglehold of the Russian octopus. Many in India may even discern an identity of approach between the leaders of India and those of Poland for securing national independence. Poland's present status is a result of no violent upheaval. That in the process the imperialist nature of the Russian concept of "Socialist solidarity" has been exposed was quite incidental, though this has shown the way to other Soviet satellites to rid themselves of the Russian tutelage.

Mr. Cyrankiewicz's utterances in India have not belied the hopes of those who wanted to have a first-hand information of the recent developments in Eastern Europe. According to him the "painful lesson from history was that democracy, freedom and peace were interdependent". Narrating the happenings, he told the members of the Indian Parliament that before October last Poland's relations with Russia did not always correspond with the letter and spirit of the agreements between the two countries. The full realization of this subservience began "rather timidly" in 1953, that is after the death of Stalin. It was then felt that the deviations from the path of democracy had made it impossible for the Poles to utilize fully the fruits of "our revolution, our industrial potential, and our political institutions". The "faults" were over-centralization and bureaucratization of the State-apparatus. They limited the initiative of the masses and resulted in "deviation from social democracy which should be in the first place a democracy for the masses". Now all the factors that distorted these relations in the past, we are assured, have been removed.

The "October Days", Mr. Cyrankiewicz said, have brought a great political activization of the Poles. This was evidenced in the recent general elections. The elections held in January last, the Polish Premier asserted, were a "big step towards building a sovereign democratic and socialist country". Mr. Cyrankiewicz disclosed that there were many differences among the members of the new Polish Parliament (Seym) in matters of religion and economic and philosophic outlook. "I have often been on hot spots as your Prime Minister Mr. Nehru finds himself sometimes", he stated. The Polish Premier hoped that the new Seym would now be able to play more effectively its role in increasing Poland's share in the world-wide struggle for peace. Poland, he said, stood for lessening international tension, for progressive disarmament, for eliminating the last vestiges of colonialism, for scrapping military pacts and for collective security. Left to themselves, the Poles, by and large, would prefer to be neutral like India. But so long as Poland remained sandwiched between Soviet Communism and the West, thanks to the strains and stresses of the cold war, it was inevitable that Poland's relations with the world at large would not be free from inhibitions. It was due to this that despite her essentially neutralist and pacific aims, Poland found herself compelled to adhere to the Warsaw Pact, sometimes described as a counterblast to the North Atlantic Treaty Organization. The Polish Premier assured, however, that the moment a system of collective security came into being, the cold war abated somewhat and Germany re-united under a truly democratic regime, Poland would be "the first to throw away the military burdens which weigh so heavily on our economic life and slow down our progress".

It is India's hope that improvement in international affairs will give the nations of Eastern Europe untrammelled liberty to lead their lives according to their own wishes and in peaceful co-operation with the rest of the world. India also believes that the forces, which brought India and Yugoslavia together, are at work in regard to the relations between Poland and her and the world at large. This is enshrined in the joint statement issued by the two Prime Ministers and in a cultural agreement signed between the two countries.

It is hoped that the visit of the Polish Prime Minister besides promoting better understanding would include learning from each other's experience, particularly because problems facing the two countries are identical in several respects. India can draw an appropriate lesson from the failure of the Polish policy of over-ambitious industrialization which led to the Poznon riots and the "October Revolution" last year. This may help us to examine our own plan of industrialization which is apparently beyond our means. A similar attempt in Poland resulted in acute misery, dire privation and rigid State control of the masses and later of course to the explosion of October last. Co-operativization of agriculture is another field to give us a necessary warning, especially because it is becoming increasingly fashionable in our country. The Gomulka report of October last has exploded the myth that co-operative farming is the answer to all agrarian ills. Mr. Cyrankiewicz's presence in the country should be availed of to know the actual nature and real worth of this remedy. It is wise to profit by others' mistakes.

If the Poles have discovered to their cost why peasant individualism should not be interferred with or ridiculed, we in India should pause and think of the consequences should we rush into reckless co-operativization of agriculture. The Poles, under Mr. Cyrankiewicz and Mr. Gomulka are not reactionaries but level-headed revolutionaries. Their experience should be of inestimable value to us in this respect.

Pray consider the case for

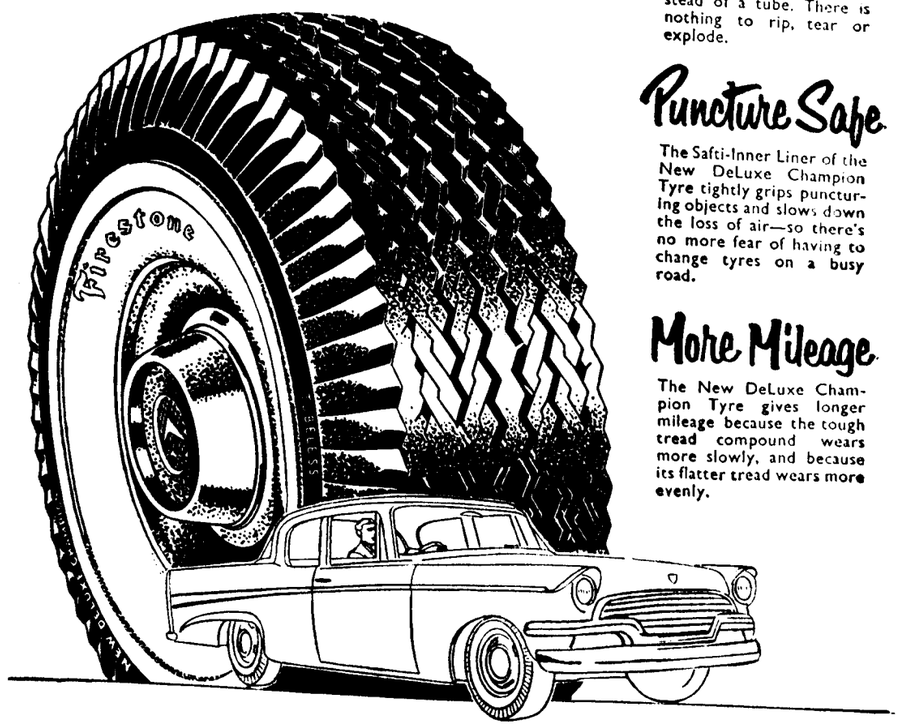
Cargo by air

"M'LUD and gentlemen of the Jury, the case for CARGO BY AIR rests on a few simple facts — facts which businessmen are quick to grasp and appreciate. To summarise, M'Lud —

Cargo by air saves time — obviously! But in addition to cutting down actual transit time, it often does away with the need for warehousing at ports of despatch or arrival. Cargo by air, in fact, gets your goods *where* you want them *when* you want them!

Cargo by air costs less — it cuts down handling and warehousing charges, gives you a quick return on capital outlay, costs less for transit insurance.

Cargo by air is MODERN — in this age of speed and competition, the other man has learnt the value of cargo by air. And it is high time, M'Lud and gentlemen of the Jury, that you do, too!"



The Judge, remarking that he could add nothing to this masterly expose, invited the Jury to consider the case. This they did without leaving the box, and all good men and true returned an overwhelming verdict for:

CARGO BY AIR EVERY TIME!

AIR-INDIA International

9-A Connaught Place, New Delhi.
Tel: 42106 & 40503

the tyre with
BUILT-IN PEACE OF MIND

Blowout Safe
No longer any fear of dangerous blowouts—this tyre is fitted with an air-tight Safti-Inner Liner instead of a tube. There is nothing to rip, tear or explode.

Puncture Safe
The Safti-Inner Liner of the New DeLuxe Champion Tyre tightly grips puncturing objects and slows down the loss of air—so there's no more fear of having to change tyres on a busy road.

More Mileage
The New DeLuxe Champion Tyre gives longer mileage because the tough tread compound wears more slowly, and because its flatter tread wears more evenly.

Now from Firestone comes the modern safety tyre—the New DeLuxe Champion Tubeless Tyre. It gives you and your family protection never before provided in any tyre at any price. It's the first and only tyre with *built-in peace of mind.*

Firestone New DeLuxe Champion TUBELESS TYRE

THE WEEK'S NOTES

A CONSTRUCTIVE APPROACH

THE LEADERS of government in India have always stated that they would welcome constructive criticism from the business community. It is gratifying to find that the kind of criticism most likely to influence the influential has just come from the Federation of Indian Chambers of Commerce and Industry by way of some resolutions passed at its 30th Annual Session. These resolutions contain a number of helpful and constructive suggestions calculated to bring about a modification of certain governmental policies. These suggestions are advanced in a spirit of patriotism, and it is not improbable that some of them may come to be accepted.

The key resolution on economic policy brings out clearly the appreciation of the business community for "the various measures taken by Government towards increasing the volume of production — agricultural and industrial — and employment opportunities" and its anxiety to co-operate with the Government "in the present predicament of a rise in prices, a rapid decline in our foreign exchange resources and tightness in the money market". This resolution appropriately suggests that increased weightage be given to the improvement of agricultural production and facilities provided therefor. It is obvious that this cannot be done without additional financial outlay. The Federation has not indicated how the additional resources for financing agricultural schemes are to be obtained. To expect that the higher targets of agricultural production can be achieved without additional development expenditure, is a little unrealistic. As land taxation including land revenue, agricultural income-tax in some States and local cesses account for less than 1.5 per cent of national income in India and as the General Elections are now completed, it would not be difficult for the Centre to advise all the State Governments to levy a development cess on land revenue. This is the only fasible immediate alternative to a time-consuming reorganisation of the structure of land taxation designed to net in more land revenue.

The resolution on economic policy is most timely where it pleads for "a monetary policy which while putting appropriate restraint on non-essential expansion, speculation and consumption, encourages production of essential items." This theme is taken up in greater detail in another resolution which emphasises the need for taking corrective measures to ease the current tightness in money market. How the stringency has come about is succinctly described in the preamble of the resolution. There can be no two opinions on this, for the Government themselves have testified to the phenomenon. Whatever differences there are between the business community and the Government, they can only be in respect of what remedial measures are to be applied. Here the Federation's suggestions are that the policy and programme of re-discounting of Bills by the Reserve Bank be liberalised further; that an active Open Market Operations Policy for Government securities be adopted; that compensation on account of nationalisation of life insurance and of other properties acquired by the Central and State Governments be given immediately; that quicker remittance facilities be provided to Banks for reducing the amounts of money in transit, etc. These suggestions are self-explanatory and are **prima facie** moderate and reasonable. The Finance Ministry's action thereon will be watched with interest and hope.

A VOICE OF REASON

A NOTABLE speech, at once critical and constructive, in the Lok Sabha last week came from Mr. Ashok Mehta, who made a searching analysis of the state of the country's economy in the course of the budget debate. With prices rising, production falling and currency expanding, the signs are all evident for what he called a "serious economic unbalance". In two of the essential necessities of life, food and cloth, he said, the position of the country was "vulnerable" as it had still to depend on foreign assistance. If to this were added the problem of the rupee and foreign exchange resources which has developed into an acute form even during the first year of the second Plan, it is easy to see why Mr. Mehta should have been forced to warn the Government of the complacency governing its approach to the "tremendous crisis ahead". In the face of this, it is hardly surprising that Mr. Mehta should have strongly felt that unless the overwhelming support of the common people in the policy of total mobilisation of resources was achieved, Government would be compelled to modify the Plan or extend it to a period of seven years. He has thus voiced the apprehension of a substantial section of the people in this country including this journal in the over-optimism that characterises Government's approach to the second Plan as it is and its ability to carry it through in the face of heavy odds.

In the course of his speech, Mr. Mehta also drew attention to two other questions that deserve great attention coming as they did from a Socialist leader of his standing. One is the refreshing way in which he has dealt with the problem of wages which is being distroted by a doctrinaire approach by even some spokesmen of the Government, not to speak of trade union leaders. Pointing out how it was important to step up production, he has pleaded for linking wages to productivity of labour which is the only correct way of looking at this vexed problem. The other one was with regard to housing which he again set in the proper perspective. Being a non-productive activity, housing could not naturally claim any priority along with food and clothing and the cry for increased housing schemes should not evoke any misplaced sympathy when the country is faced with more urgent problems. The Finance Minister himself was one of those who applauded warmly Mr. Mehta's speech. Does this mean that his suggestions will have some effect on Government's attitude in the implementation of the Plan?

NAYE PAISE

APRIL FOOLS' Day this year will have an added source of confusion in the new decimal coinage system. Though the new system is utilitarian from the long-term point of view, millions of people who have to deal in naya paisa will find it a rather strenuous experience. The situation will be complicated by the fact that for the next three years both the old and the new coins will remain in circulation. It is clear that the change-over will not be quite smooth, because the conversion rates are not strictly exact. For example, while one pice will be equivalent to two naye paise, two present pice will fetch only three naye paise and three only five paise. The illiterate people, particularly in the rural areas, will be at a disadvantage since the unscrupulous dealer will often be able to outdo them in fine calculations. Beggars will be hit hard since the naya paisa they will get is 33 per cent less in value.

In spite of the initial difficulties, however, the new system has various advantages It is in line with the metric system of weights and measures, which is commended for its sheer simplicity. With increasing monetisation of the Indian economy, it will become almost a practical necessity in course of time. In fact this system is widely prevalent throughout the world. Of the 144 countries which issue their own currencies,

as many as 105 use the decimal coinage. The United Kingdom is perhaps the only exception among the industrialised countries. The lapse in the case of the U.K. may be explained by the fact that it is too late for her to effect a change-over now since in that event she would have to scrap thousands of calculating machines which are already in use. Even in Asia, a number of countries have accepted this system of coinage, and it may be mentioned that our small neighbour, Ceylon, has stolen a march over us in this respect.

Expert opinion has for long been advocating its introduction in this country, and in fact this matter has been pending with the Government for the last ten years. Historically, the first step in this direction was taken as far as back as 1867 when the Government decided that the decimal system should be adopted in stages. For a variety of reasons, however, the Act of 1871 never came into force. After the formation of the National Government in 1946 a Bill was introduced but owing to the impending political changes it could not be pursued. The volume of opinion in favour of decimal currency has increased considerably since Independence and hence the Indian Coinage (Amendment) Act of 1955. Reform of the coinage system is vital inasmuch as it touches the life and habits of every citizen. For its success, therefore, full understanding of the scheme is essential. This calls for extensive publicity through all available media.

THE PROBLEM OF CEYLON 'INDIANS'

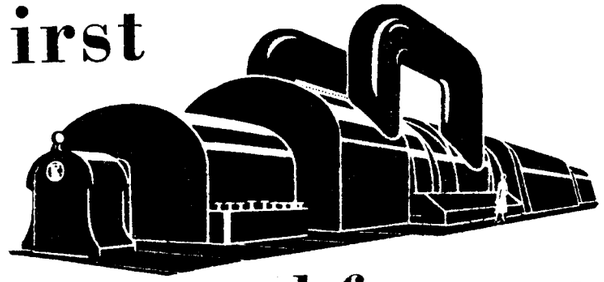
THE PROBLEM of Ceylon 'Indians' is still in a state of flux. So far less than 60,000 persons of Indian origin have been registered as citizens, while more than 500,000 have been rendered stateless. The current situation is dismal enough, and it is strange that the Citizenship Bill which was enacted with the sole object of helping persons of Indian origin to acquire citizenship rights has not been able to render any significant help. During the course of its implementation only five per cent of the persons of Indian origin have been helped and 95 per cent hindered. In addition to the question of citizenship, there is the problem of language which agitates the minds of Tamil-speaking Ceylonese.

Various plans are being mooted to solve this vexed problem. The keynote of the tentative plan of the Ceylon Government is "naturalization without voting rights". According to the plan naturalization will enable over 900,000 Indian estate labour hands to travel freely between Ceylon and India on Indo-Ceylon passport. The object of denying voting rights to Indians is to prevent an upset in the political balance of power of the Sinhalese in the hill country although this has been camouflaged by adducing economic reasons, including unemployment among the indigenous people. The proposal is bound to be resisted by Indians since naturalization without voting rights would be nothing more than confirming them as foreign labour working to maintain Ceylon's foremost economic units, the tea and rubber plantations. Indians have emigrated decades ago and have worked for a strong economy for Ceylon. Having been in Ceylon for decades now, there is nothing illegitimate to demand that they be treated as Sinhalese. The proposal is nothing but unfair to those who are ready to accept Ceylonese citizenship and all its obligations. The solution to the language issue with the reasonable use of the Tamil language within the Act making Sinhalese the official language, however, may appear satisfactory, as it would safeguard the minority interests.

The real solution of the citizenship problem, it is considered in some circles, can be evolved only by negotiations between the Ceylon Government and representatives of the people of Indian origin. While no one would object to this demand of Mr. A. Aziz, President of the Democratic Congress, it seems rather doubtful if the Democratic Congress, divided as it is, would be able to negotiate satisfactory terms. The Government of India will have to continue to interest itself in the matter.

RECONCILIATION AT BERMUDA

AFTER MANY months of grim estrangement between the U.S.A. and the U.K., Bermuda has provided a breath of fresh air and a large measure of relief. Both sides seem to have put in genuine efforts toward a friendly understanding of each other's points of view and a reconciliation of differences over their respective policies has thus been effected. It, however, needs no emphasis that the differences were only on approaches and not on principles. Ever since the end of the last war, the world has been gradually but unmistakably driven to the edge of a dangerous precipice. The division between the free and Communist worlds is critical enough, but differences between the two leading countries of the free world are still worse, and, if carried too far, may well prove to be disastrous for the entire world, more so the weak nations. Appropriately enough, Mr. Eisenhower and Mr. Macmillan engaged themselves in a free and frank exchange of views and produced tangible results over their common problems concerning West and East Asia, NATO, European co-operation and more specifically defence, with emphasis on the dreaded atom.



In point of fact, these problems have bearing, in one way or another, on almost all countries, whether aligned or otherwise. The world is waiting with bated breath for some limitation on nuclear tests before radiation may increase to unmanageable and hazardous proportions. Yet, what has happened during the past many years has shown beyond doubt that there cannot conceivably emerge a final or satisfactory solution without recognising the fundamental considerations of estimating objective scientific requirements and the needs of defence in a divided world with a precarious balance. The idea of a unilateral abandonment of test explosions appears to remain only a pious hope. In such a situation, a self-imposed restraint is the only possible solution, at least for the short period. This may appear to be a small step, nevertheless its significance should not be minimised. The Bermuda communique is, therefore, important inasmuch as the U.S.A. and the U.K. are agreeable to such a restraint, provided the U.S.S.R. responds in equal measure. The ball has thus been passed to the Russians and everybody will be watching their next move. Meanwhile, Britain's net gain is the missiles arrangement with the U.S.A.; (the latter may draw upon the U.K.'s well advanced research in the constructive role of atomic energy). No more will the U.S.S.R. be in a position to issue threats like the ones which were implicit in her declarations over the Suez canal crisis.

On the Egyptian crisis, the Bermuda meeting has underlined the importance of compliance with the United Nations resolutions which lay down that the Gulf of Aqaba should be free to all shipping and that the UNEF should keep the peace in Gaza. However, the communique is silent over what would be the course of action in case Egypt fails to abide by the resolutions. This is understandable in so far as the meeting coincided with the discussions between the U.N. Secretary-General and President Nasser, and nothing could have been said to affect the course of their deliberations. Whatever may ultimately turn out of the current crisis in West Asia, it needs to be constantly remembered that no political settlement in the area can attain finality if it is not accompanied by a solution of that area's pressing economic problems. If the West Asian countries are to be saved from the Communist danger, then it is essential for the Anglo-Americans to adopt a sympathetic and helpful attitude, both materially and morally, towards their betterment programmes.

The ENGLISH ELECTRIC Company Limited, has been awarded contracts for the first five 200 MW steam turbo-alternator sets to be ordered and produced in the United Kingdom.

The Company is the first manufacturer to have on order at the same time units of all the standard ratings of the Central Electricity Authority, U.K., namely:—

200 MW,	2350 p.s.i.g.,	1050° F.	reheat cycle
120 MW,	1500 p.s.i.g.,	1000° F.	reheat cycle
100 MW,	1500 p.s.i.g.,	1050° F.	straight cycle
60 MW,	1500 p.s.i.g.,	1050° F.	straight cycle
60 MW,	900 p.s.i.g.,	900° F.	straight cycle
30 MW,	600 p.s.i.g.,	850° F.	straight cycle

first and foremost

The Company supplied the generating plant for Drakelow Power Station and Stourport B.2 Power Station, which have recorded the highest thermal efficiencies of any central stations in England.

INDIAN DEMOCRACY: A (SOBER) SUCCESS STORY

by

ODYSSEUS

DEMOCRACY, like any other system, has its weaknesses. The need to reconcile differing viewpoints may, for example, make for a slower pace of economic advance. And in inexperienced hands, as in the National Assemblies of the French Revolution, parliament may become a talking-shop, stultifying action. These weaknesses are to the fore in any newly inaugurated democracy. There is always a Napoleon ready to exploit the people's disillusionment that freedom has not, of itself, solved all problems. By offering speed and efficiency, dictators (whether individuals or a monolithic party) can get away with murder — metaphorically and literally.

As Professor W. H. Morris-Jones says in his outstanding book "Parliament in India" (Longmans, Green 1957. 35 sh.), the existence of parliament in India is no guarantee of its continuance.

If it is to survive, parliament must satisfy four expectations. It must (1) sustain and control the leadership of the government in such a way as to encourage initiative but not arbitrary government; (2) offer channels whereby grievances and aspirations can be heard; (3) provide a platform for the debate of policy so that alternative courses may be adequately considered; (4) afford opportunities not merely for the expression of public opinion but also for the education of broad sections of the people so that their opinions may be worth expressing.

For the ventilation of grievances, Parliament provides Questions, the liveliest time of the parliamentary day, on which the reputation of many a minister or member has been made or marred. Public interest in Questions is shown by the space given them in the press and by the frequency with which they provide matter for headlines and comment. In the four 1953 sessions of the Lok Sabha, 11,014 Questions put were followed up by 18,908 supplementaries. Other opportunities for the ventilation of grievances are Adjournment motions; Demands for grants; the bi-weekly Half-hour Discussions in which members can secure debate on any Questions to which they feel that they received inadequate answers; and finally, of course, in the debates on Bills in which it is often possible to put forward special interests.

CONGRESS: OPPOSITION AND GOVERNMENT

Even though these opportunities are fully exploited by members of the Lok Sabha, it can be objected that India lacks an opposition strong enough to force any serious modification of policy on the Government. Certainly there is an important element of truth in this objection, but Professor Morris-Jones makes the sound point that the Congress Party itself provides lively internal channels through which many representations can find their way upwards. The Congress Party is large enough to provide elements of both Government and Opposition within itself. It has after all, as we have just seen, to face the electors at stated intervals and it would ignore representations from below at peril of its political future. I do not suggest that the combination of Government and Opposition in one party is desirable, but it can at least be said that the situation is tolerable for the time being.

In its legislative record, Professor Morris-Jones observes that study of the debates of India's Parliament reveals that the main issues of principle are brought out and debated. The parties are, of course, (as in other countries) committed to their various views, but to an increasing extent they are learning that they must listen to others if their own contributions are to be effective, that they must debate, not merely make set speeches.

Without regarding it as a matter for congratulation that there is no effective Opposition, we can agree that it is wrong to imagine that the Indian Government is uncontrolled. From the Parliamentary committees, and from within the Party, come criticisms and suggestions that cannot be too easily brushed aside, and there are indications that these channels of control are being improved as the experience of members in public business grows.

Nobody would pretend that the millions who make up India's rural masses follow Parliament's day to day proceedings with passionate attention. For that matter in Western democratic countries a comparison of the small circulation attained by those newspapers which devote adequate space to serious news with the mass circulations of those which devote most space to entertainment suggests that the masses in no country are enthusiastically politically minded. The Professor's findings coincide with the analysis published here on August 26, 1955, in which comparison of a British with an Indian newspaper revealed the greater space devoted to parliamentary reporting in India. But when all qualifications have been made, Parliament in India can still be properly described as a public forum which contributes to the education of public opinion. Professor Morris-Jones records that during the seventy-two day Budget session of 1953, 50,000 tickets were issued for the visitors galleries and he found tightly packed and attentive crowds in the galleries at Poona, Trivandrum, and other State legislatures.

The potential value of a public forum is that it can benefit (a) the spectators, who may, by watching, learn and (b) the participants, who may have at least to find reasons with which to clothe the interests that they represent. A wide range of views finds expression in India's Parliament. Moreover, the influence of Parliament is more than political. "The habit of orderly public discussion once established helps to set the tone of public life in general," says Professor Morris-Jones, "Parliamentary behaviour can communicate as well as embody an understanding of how leadership can be combined with fairness, adherence to principles with toleration of different views. These ideas have already become part of the outlook of many sections in India. Their expression in an institution helps to ensure that they will be passed on to new generations."

Is Parliament un-Indian? This suggestion was resented in pre-independence days because its implication was that the British could not quit India. Today it can be readily conceded that, as has often been argued here (See e.g. "Is Democracy Possible in India?" January 23, 1953), democratic institutions are foreign to Asia, where government has been organised by the few far above the heads of the masses. Nor, for reasons advanced

here as recently as December 14, 1956, do I admit that village panchayats, admirable though their potentialities are, have hitherto had anything to do with democracy as practised in secret ballots and the election of representatives to legislate and govern on behalf of their constituents. The proceedings of a panchayat, a local group of village neighbours, cannot be identified with the proceedings at New Delhi in a body of 500 members assembled from all over India. Nevertheless, if democracy is new to India, it has developed steadily and firmly since the initial step towards it was taken by the Charter Act of 1833 which differentiated between the administrative tasks of the Governor-General and the lawmaking functions of the Governor-General-in-Council. From this embryo a direct line of development leads to the 1957 Parliament elected on adult franchise from an electoral roll of 193 millions.

Democracy is grounded on modern Indian experience. Moreover, does any other institution similarly grounded and equally serviceable for the purposes of a modern industrial state, exist in India? Sarvodaya could not run the Five-Year Plans or negotiate for the building of a steel plant. Sarvodaya may supplement Parliamentary democracy, but it is unlikely to supplant it.

Is Parliament a facade which hides the authoritarian dictatorship of the Congress Party? Those who used to think of independence as synonymous with the removal of a strong central government have to learn that the British Parliamentary system encourages powerful governments.

Is Pandit Nehru a dictator? "A durbar without a prince is nonsense," retorts Professor Morris-Jones, "but the Indian Parliament, for all the valuable influence of the Prime Minister, will still make very adequate sense when Pandit Nehru is no longer there." The life of an institution is longer than that of a man.

Do regional and caste loyalties falsify the true democratic process? Certainly these loyalties exist, but they have increasingly to compete with new loyalties, and the working of Parliament is one of the most important among the many factors contributing to weakening the old loyalties.

On the whole, then, and with qualifications for which we have no space, we can agree that Parliamentary democracy is justifying itself and strengthening its hold on India. The biggest unanswered question is whether the Five-Year Plan will progress at a pace tolerable to the people. It can at least be argued that if the Plan fails to fulfil all hopes, the fault is not likely to lie in the system of government so much as in extraneous and unpredictable catastrophies, such as the closing of the Suez canal or a persistent failure of monsoons.

Professor Morris-Jones concludes hopefully: "The 'experiment' is working and parliamentary institutions are more firmly established in the way of life of the Indian people than they are in that of many a country in Europe. One writer has referred to 'the totally novel stresses which may develop when the existing generation of Indian politicians and officials nurtured in British ways of thought and government, has disappeared.' There would be more to fear in this if it did not seem much more likely that experience of both Parliament and Civil Service has been so continuous that the 'ways of thought and government' are being passed on from one generation to the next — and passed on as Indian, not British."

"I look upon an increase in the power of the State with the greatest fear, because although while apparently doing good by minimising exploitation, it does the greatest harm to mankind by destroying individuality which lies at the root of all progress."

ENTENTE CORDIALE (LIMITED)

(From Our Special West European Correspondent)

PARIS, March 22.

THE city of Paris is preparing feverishly for the welcome she is to offer next month to the Queen of England. From all appearances, it will be the sort of royal welcome that only passionate republicans know how to offer a monarch. The treasures of the centuries are being pushed out of the Louvre to make space for a dinner that will be eaten before the averted gaze of the Venus de Milo and under the wings of the Victory of Samothrace; a theatre at Versailles that was last used by Louis XVI and Marie Antoinette has been refurbished; and every street in the city of revolutions has its citizens' committee to arrange elaborate decorations. One hesitates to think what lengths the Parisians would have gone to if the forthcoming visit had taken place in the circumstances foreseen at the time it was arranged last October. When Messrs Eden and Mollet planned the Queen's tour last autumn, at the euphorious height of the Entente Cordiale, it was intended that the armless statue with averted gaze displayed at the dinner should be that of Colonel Nasser, and that he should stand next to the Winged Victory of Suez. These plans having miscarried, Sir Anthony Eden will not even be present at the function. One wonders whether the Entente Cordiale will be either.

There was not a lot of cordiality or understanding at last week's meeting in Paris between Messrs MacMillan and Mollet. By one of those accidents that acquire significance in diplomacy, M Mollet could not even take dinner with the British Prime Minister and Foreign Secretary; he preferred to go to his grandson's second birthday party. This contrasts with the great friendliness of Messrs Eden and Mollet last year, when the Egyptian expedition was being planned. On none of the points discussed last week was agreement reached and on several major issues French and British views are totally opposed.

But Anglo-French disagreements are so far limited to the politicians and do not involve their peoples. The Entente Cordiale has actually stood up very well to the disastrous failure of the joint Suez campaign, which might easily have produced endless recrimination. After all, the decision to call the campaign off was taken unilaterally by the British and only agreed to by the French because they could not continue alone; decisions taken in such circumstances are apt to leave bitterness. But, although I have heard people in England say "The French led us astray" and although I have heard people in France say "The British let us down", on the whole both nations have agreed to put the blame on higher forces over which they had no control. That small section of French opinion that was opposed to the Suez adventure has been able to praise the British socialist opposition; and the small section of British opinion that was opposed to the final surrender has been able to praise the constancy of French determination. So there has been as much mutual admiration as recrimination across the Channel.

The evolution of public opinion in each country since last November has also taken a contrary course. Britain has suffered rather severely economically from the consequences of the Suez war and the closure of the Canal. France has suffered hardly at all, and if her economic situation today is hazardous this has less to do with Suez than with the continuance of the war in Algeria. There has been much repentance in Britain, some of it no doubt hypocritical, but serious enough to warrant the sacrifice of Sir Anthony Eden on the alter of public conscience and to cause a substantial loss of Conservative electoral strength. There has been no repentance whatsoever in France, where most people would be ready to begin the Egyptian campaign all over again tomorrow if it were guaranteed of better success. M Mollet is not only still in office, but the pro-Suez parties have gained in by-elections. M Mollet's Government may not last through the summer, but when it falls it will be on internal economic issues connected with the inflation caused by the Algerian struggle. And it will be replaced by a Government even more inclined to energetic action in the Middle East.

The unflinching French support of Israel throughout the recent crisis could also have caused further misunderstanding between London and Paris, but in fact British opinion, including the socialist opposition, has veered round to a more pro-Israeli line. Some anxiety was felt lately in Paris when it was rumoured that London was willing to compromise with Colonel Nasser in order to get the Canal open again as soon as possible, and M Mollet argued the case for continued intransigeance to Mr MacMillan last week. Actually, the main decisions in the Middle East lie henceforth neither with Britain nor with France, but with the United States, so Anglo-France differences of viewpoint are likely to be of minor importance — unless the British should revive Sir Anthony Eden's unhappy idea of some "revision" of Israel's frontiers. The vast contraction of both French and British influence in the Middle East has removed one of the major causes of friction in the past, but it is no comfort to these two nations to know that they can now be better friends because they have lost much of their former power.

Whereas, at the popular and sentimental level, the Entente Cordiale is as healthy as ever, at the political level several intricate disputes are brewing that could cause tension in the near future. These concern the British effort to withdraw troops from the Continent for economic reasons, and the French effort to get European capital into the French colonies in return for a reduction of tariff discriminations. The first of these is the more pressing for the British. London's plans for a reduction of the British Rhine Army have been universally condemned by her partners in NATO, headed by the Americans; there is no doubt that these plans originate not in a new British judgment on defence necessities but in the anxiety of the Conservative Party to get some spare cash wherewith to buy back popular favour after the disastrous electoral results of the Suez misadventure.
